Analysis Correlation Between Accommodation in Function and Number of Tourists Arriving in Romania during 2000–2008

ANDREI Ruxandra

Romanian-American University of Bucharest
ruxandrei@yahoo.com

Abstract

Romania's progress demands to be included the principals of sustainable development in it's development strategy. Within this framework the importance of studying and analyzing the tourism evolution can be noted.

The need of knowledge regarding the fluctuations canned by the results of the tourism related activities allowed the approach of the issue related to the correlation stage of the accommodation capacity and the number of tourists arrived within the accommodation structures in Romania during the 2000-2008 period.

The mutual involvement relationship, existence, direction form and intensity of the connection between the two indicators are analyzed within this paper.

The conclusions following the analysis of the obtained results, shape as an upper phase in filling in the image of the Romanian tourism, bearing in mind the establishment and application of sustainable development strategies.

Key words: tourism evolution, accommodation structures sustainable development strategies.

JEL Classification: L83

1. Introduction

Tourism is considered as one of the "wonders" of the modern world, by it's size and the coverage of activities. Tourism appeared since antiquity, but wore different forms, specific to the changes of times which it served, enlarging it's content and the sphere of activity. It strated as a form of entertainment for the elite, but in time by the diversity of the participants, became a mass activity. Nowadays, tourism is one of the greatest sectors with the fastest growth in international bussines.

At the moment, representing one of the biggest industries in the world, is considered one of the most important factors in global economic development. Tourism, represents a social and economic phenomenon specific to modern civilisation, well anchored in the life of society, as such beeing influenced by it's evolution. Targeting large segments on the market and fully answering to their needs, tourism detaches itself through a high dinamism, both national and international.

Analized in the relationship with national economy, tourism acts like a dynamic element of the global sistem. Tourism involves a specific request of goods and services, request that means a growth in the production sector of these goods.

Given that is more obvious the relationship between tourism and the sustainable development of the human society, we will understand, with ease, the concerns for especially presenting the landscape and the enviormnet, of natural values.

Romania's progress means including the principles of sustainable development in it's development strategy. In this context the importance of studying and analyzing the evolution of turistic activities, of the past years, can be seen.

The necessity of knowing the fluctuations recorded by the results of tourism activities, allowed the aproach of the problem regrading the relationship between the working accomodation capacity and the number of tourists received by Romania between 2000 and 2008.

Adaptation of the tehcnical and material inventory to the turistic request represents one of the basic particularities of tourism, from which the accomodation, an essential component, makes an equilibrium point for the touristic activity.

2. Analysis correlation between accommodation in function and number of tourists arriving in Romania during 2000 – 2008

Essential element in running the accommodation process, capacity of working accommodation is an indicator that has deep implications in establishing the efficiency of the turistic activity.

Studying the evolution of the working accommodation capacity from Romania involves an analysis in the dynamics of this indicator:

Table 1 Capacity of working accommodation and number of tourists received by turistical structures in Romania

Years	Working accommodation (thousands places/days) x_i	Number of tourists in accommodation (thousands) y_i
2000	50,20	4,92
2001	51,88	4,88
2002	50,75	4,85
2003	51,63	5,06
2004	53,99	5,64
2005	54,98	5,81
2006	56,50	6,22
2007	57,14	6,97
2008	59,19	7,13
Total	486,26	51,48

Sursa: *Breviarele statistical, Romanian tourism* " - National Institute of Statistics, editions: 2001-2009.

The statistical data presented in table 1, allowed a graphic representation with the purpose of highlighting the evolution tendency of the analyzed indicator.

The evolution tendency of working accommodation, indicates a growth of working accommodation in Romania, between 2000 and 2008. This growth of the number of places/days is the result of the efforts made by the people involved in the running of turistic activities with the purpose of giving to tourists as many places as possible in the 365 days of one year.

The second approached indicator for establishing the relationship is the number of tourists received by the turistical structures in Romania between 2002 and 2008 (table 1).

The Reciprocal relationship of involvement, existence, direction, form and

intensity of the bond between the capacity of working accommodation and the number of tourists received by the accommodation is studied by applying a few correlation methods.

In general, links between phenomena are based from the fact that each phenomenon occurs under the influence of a complex of factors, some essential, others with a smaller influence and less significant. Research these links are based on the use of methods and simple methods for the interpretation of the links or the applicable analytical methods and processes by using mathematical functions.

Linear regression method involves determining the form and analyze the links between indicators, based on an algorithm applied and presented in Table 2.

Table 2 Algorithm for calculating the linear regression and correlation ratio

Years	x_i^2	$x_i y_i$	y_i
2000	2520,04	246,98	4,68
2001	2691,53	253,17	5,13
2002	2575,56	246,14	4,83
2003	2665,66	261,25	5,07
2004	2914,92	304,50	5,70
2005	3022,80	319,43	5,97
2006	3192,25	351,43	6,38
2007	3264,98	398,27	6,56
2008	3503,46	422,02	7,11
Total	26351,2	2803,19	
Years	$(y_i - \bar{y})^2$	$(y_i - \bar{y})^2$	y_i^2
2000	0,0576	0,64	24,2064
2001	0,0625	0,5376	23,8144
2002	0,0004	0,7569	23,5225
2003	0,0001	0,4356	25,6036
2004	0,0036	0,0064	31,8096
2005	0,0256	0,0081	33,7561
2006	0,3481	0,25	38,6884
2007	0,1681	1,5625	48,5809
2008	0,0004	1,9881	50,8369
Total	0,6664	6,1852	300,8188

Solving the normal equation system to determine the parameters a and b, as follows:

$$\begin{cases} na + b \sum x_i = \sum y_i \\ a \sum x_i + b \sum x_i^2 = \sum x_i y_i \end{cases} \Rightarrow \begin{cases} a = -8,87 \\ b = 0,27 \end{cases}$$

So the linear equation:

$$\hat{y} = -8,87 + 0,27x_i$$

The existence and the intensity of the bonds between the capacity of working accommodation and the number of tourists

received by the accommodation in Romania, were analyzed through applying the method of linear regression, the ratio of correlation and the correlation coefficient.

Determination of the ratio of correlation (R) involves, first of all, finding the determination coefficient (R^2).

$$R = \sqrt{R^2}$$

$$R^2 = 1 - \frac{\sum(y_i - \hat{y})^2}{\sum(y_i - \bar{y})^2} = 1 - \frac{0,6664}{6,1852}$$

$$R^2 = 0,8923 \quad (89,23\%)$$

The number of tourists received by the accommodation is influenced in proportion of 89.93 % by the capacity of working accommodation, the rest being influenced by other factors.

$$R = \sqrt{0,8923} = 0,9464 \approx 0,95$$

Because the regression coefficient is bigger than 0, the bond between the capacity of working accommodation and the number of tourists received by the accommodation is direct. Also, the value of the correlation ratio 0.95, shows us that the bond between the two indicators is very strong.

Applying the correlation method involved determination of the correlation coefficient

Table 2 Calculation algorithm of the correlation coefficient

Years	x_i^2	$x_i \cdot y_i$	y_i^2
2000	2520,04	246,98	24,2064
2001	2691,53	253,17	23,8144
2002	2575,56	246,14	23,5225
2003	2665,66	261,25	25,6036
2004	2914,92	304,50	31,8096
2005	3022,80	319,43	33,7561
2006	3192,25	351,43	38,6884
2007	3264,98	398,27	48,5809
2008	3503,46	422,02	50,8369
Total	26351,2	2803,19	300,8188

Applying the calculation algorithm led to obtaining some results, that were used in the relationship

$$r = \frac{n \sum x_i y_i - \sum x_i \cdot \sum y_i}{\sqrt{[n \sum x_i^2 - (\sum x_i)^2] \cdot [n \sum y_i^2 - (\sum y_i)^2]}}$$

Which led to obtaining the next result :

$$r = \frac{196,046}{\sqrt{40706,183}} = \frac{196,046}{201,7577} = 0,9716$$

Value of the correlation coefficient, 0.97, shows the existence of a strong bond between the working accommodation and the number of tourists received by the accommodation.

Because, the value of the the correlation ratio is equal with the value of the correlation coefficient, we can highlight the tendency of linearity of the bond established between the analyzed indicators.

3. Conclusions

We can mention that the bond established between the capacity of accommodation and the number of received tourists by accommodation in Romania, represents an important key for the future of Romanian tourism. Si, in the terms of a sustainable development of tourism in our country it is asked to maintain the best ratio between working accommodation and the number of tourists, because the evolution of one in an opposite direction quickly disturbs the evolution of the other.

We can speak of a best ratio in the conditions of an offer that includes a working capacity at a high standard of quality, with prices that more social categories can afford and a high number of tourists, but inside the boundaries of environmental standards of employment of an area, which allow maintenance, reliability and the quality of the places made available.

In general, the structural changes made to the accommodation since 2000 until 2008 are not significant. This situation is not a favorable situation for Romanian tourism, knowing the advantages that Romania would had economically, in the terms of a significant growth in foreign tourists arrivals in the accommodation.

An important factor that determined this evolution is represented by the loss of financial power of the Romanian population, because of the slow growth of income compared to the leap of the prices and the start of the actual economic crisis.

Thoughts on Globalisation and Equality in Contemporary World

Abstract

In recent years, it has become increasingly common to raise concerns linking the two main themes of this paper, globalisation and equality. Globalisation is quite often blamed for exacerbating social and economic inequalities both within and between countries. As well as exacerbating pre-existing inequalities, it is also claimed that it is creating new forms of inequality, such as inequalities in power to shape the rules which regulate the emerging global order. Whether or not it is exacerbating pre-existing inequalities, or creating new forms of inequality, this highly debated matter of globalisation certainly makes some inequalities more morally or politically significant than they would otherwise have been.

Key words: globalisation, McDonaldization, society, consumption practice, fast-food industry

JEL Classification: Z1

Much has been written on the subject of globalisation, particularly in the past decade, that would make it a ‚trendy’ topic. We are aware of the fact that another addition to the list may appear self-indulgent. However, many topics and aspects still need to be discussed and clarified.

Definition: (wiki source) **Globalization** (or **globalisation**) in its literal sense is the process or transformation of local or regional phenomena into global ones. It can be described as a process by which the people of the world are unified into a single society and function together. This process is a combination of economic, technological, sociocultural and political forces.[1] Tom G.

Palmer of Cato Institute defines "globalization" as "the diminution or elimination of state-enforced restrictions on exchanges across borders and the increasingly integrated and complex global system of production and exchange that has emerged as a result." [2]

Thomas L. Friedman "examines the impact of the 'flattening' of the globe", and argues that globalized trade, outsourcing, supply-chaining, and political forces have changed the world permanently, for both better and worse. He also argues that the pace of globalization is quickening and will continue to have a growing impact on business organization and practice. [3]

Noam Chomsky argues that the word globalization is also used, in a doctrinal sense, to describe the neoliberal form of economic globalization. [4]

Herman E. Daly argues that sometimes the terms internationalization and globalization are used interchangeably but there is a slight formal difference. The term "internationalization" refers to the importance of international trade, relations, treaties etc. International means between or among nations. "Globalization" means erasure of national boundaries for economic purposes; international trade (governed by comparative advantage) becomes inter-regional trade (governed by absolute advantage). [5]

Globalisation basically describes a process by which regional economies, societies, and cultures have become integrated through a globe-spanning network of communication and trade. The term is sometimes used to refer specifically to economic globalization: the integration of national economies into the international economy through trade, foreign direct investment, capital flows, migration, and the spread of technology. However,

globalization is usually recognized as being driven by a combination of economic, technological, sociocultural, political, and biological factors. The term can also refer to the transnational circulation of ideas, languages, or popular culture through acculturation.

Globalization most often refers to the growth of transnational politics, the integration of the world economy, and a subsequent blending of cultures around the world. While there might be remote areas still untouched by free trade, television, or migration, the scope of globalization's impact is by definition global. There are few regions of the world unaffected by the global flows of investment, tourists, pollution, people, crime, and so on.

The world economy is becoming more internationalized and globalised. Trade barriers are lower than ever before and will probably get lower. There are also some technological factors which increased the volume of trade in recent years. First, the vast amounts of data which can be kept on computers and communicated instantly mean that the knowledge of traders of what is available at what prices around the world is widespread. Not only is the flow of information much greater than it used to be, but the ability to handle the large amounts of information provided is much greater, courtesy of the computer. A global market-place in this sense can be a reality. Secondly, the weight to value ratio of many goods is probably much lower than it was. Thirdly, cheap air transport means that perishable commodities like strawberries and flowers can be carried quickly and, again because of a low weight/value ratio, are worth transporting all around the globe. Fourthly, containerisation makes even the trading of heavy commodities by sea much cheaper than it was. Most importantly, the shifting of goods from ships to lorries to trains and so on, which is a very expensive aspect of transportation, is vastly simplified. Finally, the instantaneous movement of information makes it possible to trade services between countries which would have simply been untradeable before.

We can usefully distinguish three sorts of capital movements which are all rather different things. First are movements of capital across state boundaries which are for 'real investment'. Second are exports of capital

goods where the commodities used to make further commodities are exported. Third are speculative moves of capital. The first and second need not be particularly closely correlated. Capital goods may be purchased with money provided internally or by a third party. Conversely loans might be made by one country (that is, capital exports) which are used for consumption purchases in another. Notoriously, loans can be used for military purposes which are not, of course, expanding the productive capacity of the recipient country.

Both capital movements and the movement of capital goods are likely to be increased rather than decreased by the same factors as related to trade in general. The wider the knowledge of opportunities—which is very wide today—the more trading is likely to take place. In addition, the nature of capital goods is altering so that, like consumer goods, they are easier to transport.

Capitalism, as a primary engine of globalization drives the movement of people, the exploitation of resources, the opening of markets, and the diffusion of technology. It extends commodity chains across the planet in search of the lowest price for labour, the greatest expertise, the cheapest materials, and the largest markets.

What does globalization mean to those experiencing it? Above all, many commentators notice that the trend creates cultural possibilities that might have been impossible in the modern era when state, economy, culture and people were more tightly aligned. The effect of globalization is to increase the number of choices for actors to the extent that '[m]ultiple identities and the decentering of the social subject are grounded in the ability of individuals to avail themselves of several organizational options at the same time' (Nederveen Pieterse 1995: 52)[6]. In other words we might say that theoretically it generates a host of new organizational forms that increase the options for local actors, without altering traditional forms. Thomas Friedman considers globalization as the dreamed-of opportunity for economic development and political liberalization for 'backward' peoples around the world. [7] Postcolonial scholars smell crypto-imperialist motives in the exploitation of subaltern labour markets and natural resources (Antonio and

Bonanno 2000)[8]. Arjun Appadurai (1996) sees globalization as the unraveling of the quintessential modern project of nation-building, undermined by a myriad hybrid identities and cultures.[9]

Various points of analysis and perspectives can be invoked and identified, however, since our approach is mainly an economic and cultural one, a main feature needs to be underlined: the key cultural changes of the late twentieth century are the increasing commodification of social life and the increasing velocity and centrality of media. Commodities and media became the material of self-creation as well as legitimate objects of social scientific inquiry.

When focusing on culture and commodities in the late twentieth century one it is difficult to ignore McDonaldization and its relation to globalization. It is a new process and as we learn from Weber, it has a profound effect on the way individuals experience their world. The term describes the rationalization of society—the places and spaces where people live, work and consume—using the fast-food restaurant as a paradigm. The process is a direct consequence of the ascendance of four related processes: a push for greater efficiency, predictability, calculability, and replacement of human with non-human technology (Ritzer 2000a). McDonaldized venues, then, emphasize standardized products and quantity over quality. These practices and values give McDonaldization a competitive advantage over other models of organization; they make it possible to manage large numbers of people (be they employees or customers) in an efficient way. A fifth consequence of McDonaldization is the irrationality of rationality; that is, its principles tend, among other things, to devalue consumers and workers. Promoters of the McDonaldization thesis, George Ritzer and Todd Stillman assert that social life is being accessed by rationalized systems, thus “fundamentally changing the way people work, consume and interact in a wide variety of settings” (2003: 34). This phenomenon, argue the authors of the study on “*Assessing Americanization, Globalization and McDonaldization*” (in Beck et al. (eds) 2003) keep changing traditional ways of life, often to the detriment of local practices.

The McDonaldization thesis is also supported by a group of anthropologists in their study entitled *Golden Arches East* (1997). Their attitude towards the effects the new production/consumption practice is mostly positive. James L. Watson, for example, notes that when it opened in Hong Kong in 1975, McDonald's was the first restaurant to consistently offer clean restrooms, driving customers to demand the same of other restaurants and institutions. Similarly, David Y. H. Wu argues that, during the first few years of the McDonald's franchise in Taiwan, the company was reputed for starting “a revolution in consumers' awareness of public sanitation” (134). This revolution led to improved standards of sanitation and hygiene in the urban areas.

As we have seen in the examples above, some critics suggest that the company should be given credit for increasing the standard of service in the markets that it enters.

On the other hand, when analyzing the impact McDonald's had on East Asia and Hong Kong in particular, the same researchers draw attention on the ‘localization’ of transnational systems (72). In this sense, a classic case of the “localization” of transnational systems is represented by McDonald's experience in Beijing. Two of the most important features of McDonald's in the United States, namely efficiency and economic value, appear to be far less significant in Beijing's cultural setting. “When Chinese workers load their families into a taxi and take them to McDonald's, spending onesixth of their monthly income in the process, efficiency and economy are the least of their concerns. When customers linger in McDonald's for hours, relaxing, chatting, reading, enjoying the music, or celebrating birthdays, they are taking the “fast” out of fast food”, remarks Yunxiang Yan while focussing on the manner the American fast-food system was appropriated in the Chinese capital. The conclusion reached by the critic is that “the McDonald's restaurants in Beijing have been transformed into middle-class family establishments, where people can enjoy their leisure time and experience a Chinese version of American culture” (73).

Most leading transnational corporations,

McDonald's included, rely their development on their capacity to increase consumer demand and expand the fast food market. In other words, to build on their initial success, McDonald's restaurants must localize their foods (and some of their cultural associations as well), converting them into something that is routine and ordinary for the residents, while somehow maintaining their image as the symbol of the American way of life. To his purpose, McDonald's management has made remarkable efforts to fit into the host cultural setting.

Moreover, a key feature of this localization process is that McDonald's has been regarded as a model of management and food hygiene by local imitators as well as by government officials.

If so far the focus has been on presenting the positive impact of transnational corporations on the local society and economy, we should also give credit to the critics brought against the process of globalization. Among the many accusations proliferated stand the introduction of unhealthy eating habits and the introduction of unhealthy eating habits. Besides, McDonald's has been the target of criticism for allegations of exploitation of entry-level workers, use of sweatshop labor to produce "happy meal" toys, ecological damage caused by agricultural production and industrial processing of its products, selling unhealthy food, production of packaging waste, exploitative advertising (especially targeted at children, minorities, and low-income people), and contributing to suffering and exploitation of livestock.

The main service features of McDonald's establishments, as we have seen, are based on cleanliness, efficiency, and economy. These characteristics affect the ways in which such food service is perceived by people in the indigenous culture. Cleanliness may turn out to be extremely important, but not always. Efficiency may or may not matter to clients in different cultural settings.

Economy, so critical in fast food service competition in the United States, does not seem to be quite relevant elsewhere, because all Western fast foods are likely to be

relatively expensive for consumers abroad. Consequently, the success of United States fast food outlets overseas is not at all necessarily a function of the features for which they are originally advertized. These are just some of the concerns which have an effect on the problem of food culture and globalization. Many more arise as a result of the introduction of fast food restaurants like McDonald's into diverse cultures around the world. Some changes are embraced by the residents while others are seen as a threat to the traditional way of life. Some are adverse to the idea of globalization as a hold and perceive McDonald's as a representation of this ideal and as a result hold them responsible.

The cases presented here are all East Asian. But we should point out that, other than geographically, the term does not connote much that is useful for our analysis. East Asian or East European, such lifestyle changes presuppose among other things a clientele economically able and willing to try new foods, who do not perceive their behavior in this regard as intentionally deviant. What they are trying is *new* as they see it, not *bad*. Those who see their innovative behavior as positive, however, may be flanked by other customers for whom such retail outlets are attractive precisely *because* they are viewed—by them and by some nonpatrons—as socially negative or questionable. That is to say, these new institutions may serve (as new things may, anywhere) as media of protest or resistance, and certainly of change.

Abstract

Our research aims at constructing a creativity composite index designed to capture the growing role of creativity in driving economic and social development for the 27 European Union countries, including Romania.

The paper proposes a new approach for the measurement of EU-27 creative potential and for determining its capacity to attract and develop creative human capital. We apply a modified version of the 3T model developed by Richard Florida and Irene Tinagli for constructing a Euro-Creativity Index.

The present research represents the first attempt to apply the 3T framework at the EU-27 European level and in a dynamic manner, covering an extended period of time.

The resulting indexes establish a quantitative base for policy makers, supporting their efforts to determine the contribution of creativity to economic development.

Key words: creativity, EU-27 creative potential, creativity index .

JEL Classification: L80

1. Context

It became apparent nowadays that Europe's position in the world is increasingly determined by its capacity to innovate, both socially and economically. The role of creativity in this perspective was so far largely overlooked, with the mainstreaming of creativity in policies to foster innovation and with the move towards measuring the socio-

economic performance of the sector growing to be a recent concern.

While the perception of creativity as having only a marginal economic contribution still persists, this may explain to a certain extent the lack of statistical instruments to quantify the contribution of the creative sector to economic growth.

Our research represents an attempt to remedy this situation and aims to contribute towards filling this gap, by constructing a creativity composite index designed to capture the growing role of creativity in driving economic and social development for the 27 European Union countries, including Romania.

According to recent research undertaken by the European Commission [5], the creative sector is a growing one, developing at a higher pace than the rest of the economy. Also, the sector growth in terms of jobs out-performs the rest of the economy. Furthermore, it drives many other sectors of the European economy, and in particular innovation and ICT sectors.

By attending to these considerations, our paper is mainly focused on exploring measurement possibilities of creativity in a European comparative manner, with the final goal of positioning Romania's creative sector in the European creative economy.

We attempt to answer the following questions: is it possible to assess creativity by using existing statistical data series and large scale surveys? Is it possible to measure creativity in a comparative manner at European level?

Therefore, in the following sections, we highlight the methodology used to construct

creativity indexes, as well as the main results obtained. We also provide an interpretation of our findings and conclude by emphasizing on the potential of creativity to promote and sustain competitiveness.

2. Methodology and Data

Our research proposes a new approach for the measurement of EU-27 creative potential and for determining its capacity to attract and develop creative human capital. We apply a modified version of the 3T model developed by Richard Florida and Irene Tinagli [2] for constructing a Euro-Creativity Index.

Our work extends and adapts to the current European and Romanian context the conceptual framework and indicators introduced by Richard Florida [1] and further adapted by Florida and Tinagli [2], as well as other works such as Europe in the Creative Age [5] and Global Creativity Index [4]. It is based on the 3T model of economic development – talent, technology and tolerance – used to analyze and compare 27 European countries.

A European and Romanian Creativity Index are developed, by adding new relevant indicators to the existing framework, as well as by a dynamic approach to the study of creative sector development for the 2001-2007 period of time.

Our index is based on a wider set of indicators and sub-indicators than those used in previous studies, representing more specific and appropriate tools for capturing the creative vitality of countries in Europe.

The present research represents the first attempt to apply the 3T framework at the EU-27 European level and in a dynamic manner, covering a large period of time.

The resulting indexes establish a quantitative base for policy makers in their efforts to determine the contribution of creativity to economic development.

Our proposed European-Creativity Index has a three-dimensional structure, as follows:

- the Talent Index, based on three indicators: the creative class index, the human capital index and the scientific talent index;
- the Technology Index, composed of three indicators: the innovation index, the technology innovation index and the research&development index;

- the Tolerance Index, based on three dimensions: the tourism openness index, the students index and the creative talent index.

For the purpose of the study, we are calculating nine component sub-indexes, which represent the annual composite indexes mentioned above; annual aggregated creativity indexes, which represent the annual European Creativity Indexes; a global aggregated creativity index, which is the European Creativity Index corresponding to the entire period of time analyzed; trend indexes, both at composite index level and at aggregated level (i.e. the European Creativity Trend Index and the Global European Creativity Trend Index), as well as the Creativity Matrix.

The talent measures include:

- the Creative Class Index, which measures the number of people employed in creative occupations as percentage of total employment. The data used is drawn from the International Labor Organization statistics for the 27 European countries. A similar procedure was used by Florida&Tinagli, as well as by the European Commission for approximating statistics for the cultural and creative sector;

- the Human Capital Index represents the percentage of population age 25-64 with a bachelor's degree or above and is based on EUROSTAT data;

- the Scientific Talent Index is calculated as the number of researchers per thousand workers and is based on data collected from EUROSTAT. The data is referring to people employed in research-related activities by sector, expressed in full time equivalents.

The European Talent Index is a composite index that combines these 3 sub-indexes. It is calculated based on a system of scores, the country with the highest values being assigned the highest score (which is 27). For the other countries, a distance indicator is calculated, reflecting their relative difference in values of the sub-indexes from the top.

The technology measures include:

- the Innovation Index, calculated as the number of patent applications to the EPO per million inhabitants and is based on data from EUROSTAT.

- the Technology Innovation Index, calculated as the number of high-tech patent applications to the EPO per million inhabitants

and is also based on EUROSTAT data.

- the R&D Index, which represents the R&D expenditure as percentage of GDP and is drawn from the EUROSTAT data.

The European Technology Index combines the three measures illustrated above. It is based on a scale from 0 to 27 and is calculated in a similar manner with the European Talent Index.

The tolerance measures include:

- the Tourism Openness Index, calculated as the number of international tourist arrivals as percentage of total population. The choice of this indicator has been determined by the need to illustrate the tolerance to foreigners, as well as the degree of exposure to social and cultural diversity. The data is collected from UNCTAD.

- the Students Index, which represents the number of students studying abroad and the number of foreign students studying on the domestic market, as percentage of the total number of students. The data for constructing this index is drawn from EUROSTAT.

- the Creative Trade Index, calculated as creative goods and services export as percentage of total exports. This is the indicator used by UNTACD [6] to determine the level of development of the creative sector and it was included in our study in order to emphasize the economic dimension and impact of the creative sector. Data is drawn from UNCTAD statistics.

The European Tolerance Index combines the three measures indicated above. It is also based on a system of scores ranging from 0 to 27.

The annual European Creativity Index is computed as follows: the values corresponding to the nine sub-indexes are ranked, the country with the highest value being ranked the first; the ranks are normalized; the index is calculated as the difference from the maximum value (i.e. 1) of the average of the nine values calculated.

The methodology for calculating the Global European Creativity Index is similar to the one presented above: the aggregated values are obtained as a difference from 1 of the average of each group of three normalized values.

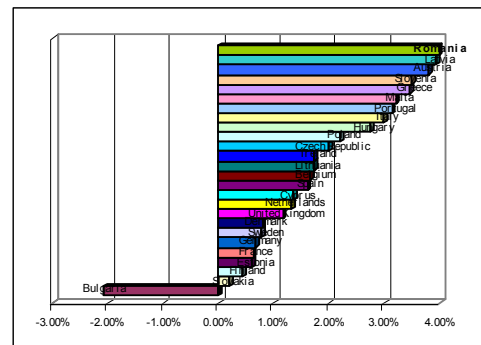

Trend indexes are calculated based on the average annual growth coefficients and following the methodology illustrated above.

The correlation matrix (the Creativity Matrix) is a bidimensional representation of the relationship between the European Creativity Index and the European Creativity Trend Index. It allows for the classification of the countries analyzed in four different categories: *leaders*, which are countries with developed creative economies and with high growth rates in creative potential; *up and comers*, which are countries with lower European Creativity Index scores, but with higher growth rates; *losing ground*, which are countries with relatively high European Creativity Index scores, but cannot sustain the growth of their creative capabilities; and *laggards*, which are countries with low scores for their European Creativity Index and with low rates of creative growth.

3. Results and discussion

The values of the Creative Class Index indicate that for some of the European countries the percentage of people employed in creative occupations is constantly over 30% (Sweden, Denmark, the Netherlands, Finland, Germany), demonstrating their orientation towards an occupational structure that favors the development of the creative sector. The involvement of the recent EU member countries like Czech Republic, Slovenia and Slovakia in the development of the creative class is surprising, illustrating their commitment to stimulate creativity and creative talent. The creative class represents only 17% of the working class in Romania, but the growth rhythm is impressive, Romania being on the top position with respect to the growth potential of the creative class.

Figure 1. European Creative Class Growth Index

For the composite European Talent Index, a polarization of the European countries is apparent: some countries constantly register high values (e.g. Finland, Denmark, the Netherlands, France), while others are occupying the last positions for the entire period of time (e.g. Spain, Greece, Cyprus, Portugal).

As for Romania, it sits on the 25th-26th position of the ranking, with low values of the sub-indexes, especially of the Scientific Talent Index (the lowest number of researchers in Europe). Still, Romania ranks the first with respect to its growth rhythm, determined particularly by the trend of the Creative Class and of the Human Talent Indexes.

Figure 2. European Talent Growth Index

The results obtained for the European Technology Index indicate that the Nordic countries occupy the first positions. Their orientation towards innovating and developing new technologies is also supported by the amount of expenditure allocated for research and development, illustrated through the respective values of the R&D Index.

Romania sits on the last position, due to the very low number of patent applications, as well as to the extremely low level of R&D expenditure as a percentage of GDP (i.e. 0.45%). With respect to the growth rhythm, Romania is on the middle of the European countries ranking, having a moderate increase, determined especially by the increase in R&D spending.

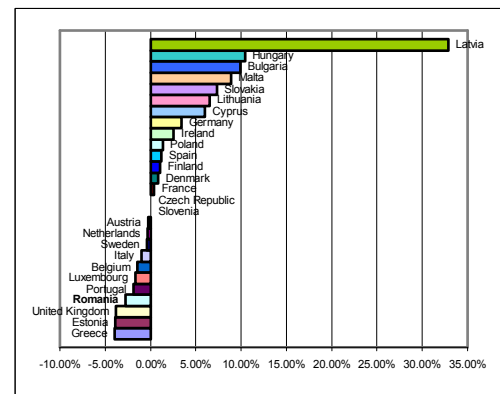

Figure 3. European Technology Growth Index

The results obtained for the European Tolerance Index reveal a change in the ranking of the European countries: Slovenia, Luxembourg, Hungary, Estonia occupy the first positions, particularly as a result of the values registered by the Tourism Index and by the Creative Trade Index. The evolution of the European countries performance is more volatile for this index.

Romania ranks better for this index, especially due to its international trade with creative goods and services. Still, its growth rhythm is negative, indicating a deterioration of its international position, both in terms of international tourism, as well as international creative trade.

Figure 4. European Tolerance Growth index

The results for the European Creativity Index confirm the positioning of the Nordic countries, with Finland as the top performer, followed closely by Sweden, Denmark and the Netherlands. At the other end of the ranking, four nations are laggards: Lithuania, Greece, Bulgaria and Romania.

Figure 5. Evolution of the Romanian Creativity Index

By analyzing the evolution of the Romanian Creativity Index, we can conclude that the best values of the component indexes registered by Romania are for the Creativity Trade Index, for the Human Capital index and for Students Index.

Figure 6 illustrates the contribution of each component of the European Creativity Index (ECI) to the aggregated value. We notice that for the developed economies, the value of the ECI is significantly determined by the Talent and Technology Indexes, while for the countries occupying the middle ground, the contribution of the Tolerance index tends to increase. Romania's ECI score, ranking the last for the entire period analyzed, is largely determined by the Tolerance and Talent Indexes.

Figure 6. The contribution of the ECI components

Figure 7 points to an indirect correlation between the values of the ECI and economic growth: the average values for the 2001-2006 period of time indicate that countries with high values of the creativity index had low rates of economic growth.

Figure 7. Correlation ECI – economic growth

The analysis of the trend indexes indicates that Romania is in a much better position, confirming the high growth rates illustrated above for some of the composite indicators. Also, countries that were top performers based on the values of the annual indicators register quite low growth rates.

Figure 8. Romanian Creativity Trend Index

The contribution of the nine indicators to the Romanian Creativity Trend Index highlights the fact that the impressive growth rate of the number of people employed in creative occupations contributed the most to the aggregated value of the trend index, which ranks Romania on the ninth position among the 27 European countries analyzed. The other indexes that contribute towards increasing the aggregate value of the Romanian Creativity Trend Index are the Human Capital Trend Index and the Innovation Index, illustrating the potential of Romania to engage in a catching up process, and the need for policy initiatives aimed at supporting creative sector development.

Figure 9 illustrates the contribution of each component of the trend index to the aggregated value. It is important to emphasize the reverse level of contribution to the aggregated value as compared to the European Creativity Index. Here, we observe an increased contribution of the technology and talent indicators for the highest growth countries, which are mostly the developing ones, as compared to the higher contribution of the tolerance index for the developed countries, representing the laggards of this ranking.

The Creativity Matrix places Romania on the group of countries with low scores of the creativity index, but with high growth rates (“up and coming”), indicating its potential to improve its position among the European countries.

Figure 9. The Contribution of the European Creativity Trend Index components

Figure 10. The Creativity Matrix

4. Conclusion

Our research represents the first systematic effort to apply the methodological framework proposed by Florida & Tinagli to all the 27 European Union member countries and for a longer period of time. The results obtained are relevant and illustrative.

The creative class represents on average about 30% of employment in the EU, registering an annual growth rate of 8%, higher in particular for countries with low index values. Romania ranks the first among the EU-27 countries in terms of the growth of its creative class, being in a very good position to mobilize and harness creative assets.

Our analysis confirms the results of Florida and Tinagli, according to which the epicenter of competitive Europe is transferred from traditional powers like France, Germany, Great Britain to a creative cluster of Northern European countries, namely Finland, Sweden, the Netherlands. Finland tops the aggregate rankings of the creativity index. Sweden, Netherlands and Denmark recorded also high values, suggesting their commitment to a development path centered on harnessing the creative economy potential.

Even if it occupies the last position of the ECI ranking, Romania, along with other European countries like Bulgaria, Latvia, Czech Republic, Lithuania recorded high growth rates of their creative potential.

Attracting creative talent is a highly dynamic and very sensitive process. Traditional leaders of this market can easily lose their position, due to the emergence of new and vibrant creative centers. The European Union, capitalizing on its advantages determined by low levels of cultural and trade barriers, is well positioned to exploit the potential to develop the creative economy.

Consequently, the ability of states to attract, retain and develop creative human capital and to exploit creative capabilities tends to become, to a significant extent, the key to global competitiveness. Thus, our survey confirms that talent and creativity have at a greater extent than traditional inputs such as labor or capital, the capacity to deliver sustainable economic growth and social development.

Direct Foreign Investments - Factor of Economic Growth in Romania

BOTESCU Ion
Ovidius University of Constanza
ion_botescu@yahoo.com

Abstract

The former socialist countries' transition process towards the market economy was based to a great extent on the foreign direct investments these countries have attracted after 1990. Not even Romania was an exception to the rule. Being at first characterized by a difficult start regarding the FDI entries, Romania has accomplished between 2004- 2008 a series of performances in this domain. Within the same period of time, remarkable economic growths have been registered. In this paper-work I intend to emphasize this connection between the increased volume of FDI entries and the accentuated rhythm of economic growth.

Key words: foreign direct investment, gross domestic product, quotient correlation, global financial crisis

JEL classification: F21

1. Introduction

In general, a growth of the average annual rhythms of the inputs of foreign direct investments in a country determine a more dynamic economic growth which is reflected in the GDP evolution.

This trend is also manifested in Romania's case, fact represented by the level of the correlation coefficient between the two phenomena. It is remarkable, when taking into consideration the current account deficit, that Romania in the following years to do the actions that assure a consistent absorption of direct foreign investments.

2. The growth of ISD inputs – important factor in the evolution of the Romanian GDP

The foreign direct investments entries are very significant for Romania because they supply necessities caused by the lack of capital, increase the utilization of labour force and of other production factors and improve the production structure due to the implemented technologies which have a good effect on our country's exterior commerce. The shortfall in the commercial balance sheet that led in the last years to a shortage larger than 10% in the actual GDP has enforced Romania towards a FDI chase.

Even though Romania had plenty of advantages when comparing to the former socialist countries, the FDI entries were under the possibilities and the necessities of the Romanian economy. Therefore, between 1991 and 2003, the flow of FDI entering Romania reached 11060 million dollars, being close to the number of 11366 that represent the FDI attracted in 2006. This reality has been determined by a series of factors that were discouraging for the foreign investors. Out of these factors we can remember the following: the lack of a stable economy, a defective external perception of the businesses interior climate, the dysfunction of the legislative frame, a significant reduction of the Romanian market absorption potential caused by the diminution of the population's buying force, the lack of a strategy for developing some economic sectors and braches, the conditions of trade on the local market, the inadequate infrastructure, a slow privatization, the regional conflicts etc.

Starting 2004, the annual medium rhythm of foreign direct investments entering Romania has been superior to the previous

period. As a result, between 2004 and 2008 the annual medium of FDI entering Romania reached 9100 million dollars, as compared to 850 million dollars in the period between 1991 and 2003.

This considerable growth of FDI entries in the previous years is due mainly to the NATO's decision in November, 2002 to invite our country to join this organization, followed by its effective adhesion in 2004, as well as by the perspective of Romania's adhesion to the EU in 01.01.2007.

Reaching the level of the communitarian countries, the Romania's adhesion has lead to a more consequent enforcement of the running reforms that have favourable consequences upon the converging process within the EU. The necessary environment for increasing the performance index of the FDI (index used within its UNCTAD analyses) will be created if managing the problems concerning the growth of the justice's independence, the efficiency of the fight against criminality and corruption and the achievement of a better transparency in the public administration's activity.

We should also mention the fact that the great performances Romania has achieved in the previous years in its activity for attracting FDI are due to the strengthening of the privatization process which included the Romanian Commercial Bank, S.N. Petrom, Electrica Dobrogea, Electrica Banat, Distrigaz North, Distrigaz South etc.

Practically the between the inflows of FDI and economic growth there is a direct link of

cause and effect. With all the difficulties found in the quantification of this link, it is believed that the inflow of FDI influences very much the economic growth, when it represents more than 40% of the GSP of a country.

Besides the high level of FDI entries, Romania has achieved between 2004 and 2008 one of the fastest economic growing rhythms in EU. As a consequence, we can affirm that there is a direct connection between the level of FDI entering Romania and its GDP's growing rhythm. In order to establish the intensity of the connection between these two economic indicators, which is between the annual FDI entries and the GDP, we can utilize the correlation coefficient (c). This coefficient varies in the [-1;1] interval. The closer the value of c is to the interval's extremity, the stronger is the correlation between these two indicators. If c records the '0' value, we can say that there is no correlation between the two variables.

The formula used for calculating the correlation coefficient is:

$$C = \frac{n \sum xy - \sum x \sum y}{\sqrt{n \sum x^2 - (\sum x)^2} \cdot \sqrt{n \sum y^2 - (\sum y)^2}}$$

where:

x – FDI's annual entries

y – GDP's annual level

n – the number of years for which the analysis in being made

Tabel no. 1 The evolution of the GDP and the FDI entries in Romania
- millions euro -

	2004	2005	2006	2007	2008
FDI entries (X)	5183	5213	9058	7250	9024
GDP (Y)	76137	79259	97200	121670	139669

In order to make the calculations easier we sistematize the information in tabel no. 2.

Tabel no. 2 The systematization of data needed for calculating the correlation coefficient
- millions euro -

Anii	x	y	Xy	X ²	Y ²
2004	5183	76137	394618071	26863489	5796842769
2005	5213	79259	413177167	27175369	6281989081
2006	9058	97200	880437600	82047364	9447840000
2007	7250	121267	879185750	52562500	14705685289
2008	9024	139669	1260373056	814325762	19507429561
TOTAL	35728	513532	3827791644	270081298	55712786700

It results: $n = 5$; $\Sigma x = 35728$; $\Sigma y = 513532$; $\Sigma x^2 = 270081298$; $\Sigma y^2 = 55712786700$
 $\Sigma xy = 3827791644$;

$$c = \frac{5 \cdot 3827791644 - 35728 \cdot 513532}{\sqrt{5 \cdot 270081298 - 35728^2} \sqrt{5 \cdot 55712786700 - 513532^2}} =$$

$$\frac{19138958320 - 18347471296}{\sqrt{1350406395 - 1276561441} \sqrt{278563933500 - 263715115024}} =$$

$$\frac{791487024}{\sqrt{73844954} \sqrt{14848818476}} = \frac{791487024}{8593,3 \cdot 121885,7} = \frac{791487024}{1047142586,8} = 0,75$$

When the coefficient reaches the value of 0.75, it means that there is a strong correlation between the annual entries of FDI and the GDP's evolution in Romania.

Referring to the substantial economic growth registered by Romania in 2004-2008 we have to say two things. First, it was a statistical success that had no durable character. Second, under many aspects in Romania have growth the differences among regions with direct implications over equilibrated economic growth.

3. The ISD evolution in the current international context

Within an increasing globalized economy, the intensification of the regional integration processes is more visible. Beginning 1st January, 2007 by adhering to the EU, Romania's economy has registered on a trajectory that expects the growth of the external opening level. The attraction of FDI and the growth of Romania's economy cannot ignore the international economic context.

The globalization of the financial crisis has lead among others to a diminution of the international commerce and the flows of foreign direct investments. There has been an accentuation of the crisis of liquidities at an international level, fact that has determinate the augmentation of the credits required by developing countries.

The entries of FDI in the year 2009 have been with 48,8% smaller than in the lass year, their value being 4,899 billion euros, ensuring the financing of the current account deficit in proportion of 96,9%, according to BNR data. In the first two months of 2010 FDI attracted by Romania have been of 466 million euros 2,8 smaller than the one recorded in the similar period of last year.

In comparison to 2004-2008, when the economic growth was in average 6%, in the year 2009 Romania's economy has been reduced by 7,1%. The activities that have been affected the most have been constructions, transportations, telecommunications, hotels and restaurants etc.

The final consumption has recorded, in comparison to 2008, a diminution of 8,2%, in

2009 the most affected being the households with a reduction of 10,8%.

It is necessary that the fiscal packages launched by several governments for decreasing the effects of the crisis to be coordinated at a global level, if not, their multiplying effect within economy will be strongly felt. In this situation, it is recommended to make investments in the infrastructure, in the education, in the health system and in the regenerative energy.

In order to get out of the financial crisis, the ONU experts recommend the following measures:

- Reorganization of the financial systems, at the same time offering a better surveillance of them. The role of the International Monetary Fund and the World Bank should increase within this context;

- Development of a multiple monetary system of reserves, taking into account the complexities presented by the financial global system which is based on the dollar as a reserve currency;

- Simplification of the access to liquidities, considering besides other matters the establishment of a regional reserve.

The FDI entries at a global level have registered a new record in 2007, considering all negative aspects caused by the global financial crisis that began in the second half of this year. The former record of 1409 billion dollars, which was recorded by the FDI flow in 2000, has been overtaken in 2007 when this indicator showed 1978 billion dollars. In conformity with data offered by UNCTAD in 2008 there been a diminution of the flows of FDI on a world scale, there data being of 1697 billion dollars. For 2009 and 2010 the forecasts are more pessimistic.

4. Conclusions

Being confronted not only with a major deficit of the external balance of trade, but also with a high volatility of the exchange rate and with a decline of the profitability level within industry and constructions, Romania should also take into consideration the tendencies manifested at an international level, tendencies that are far from being favourable for itself. If we take into account the fact that the Romanian states have given right to foreign capital to exploit the petroleum deposits and that our banking market is controlled in a proportion of 90% by foreign capital, we can assume that the situation of our country within the financial crisis context becomes even more complex.

Due to the fact that the privatization offer in Romania has decreased considerably, the attraction of FDI flows, which are mandatory for our country's commonwealth, depends to a considerable degree on the measures to be taken by the actual government in the direction of establishing a stable economy and achieving a healthy economic climate.

Demo-economic Processes within the Context of Globalization

BRAN Florina
Bucharest Academy of Economic Studies
florinabran@yahoo.com

Abstract

Globalization is one of the most challenging contemporary processes for governmental decision makers. It contributes to important demographic and economic changes with potential impact on development and quality of life. In the paper there is performed an analysis of these transformations in order to outline the most common patterns that will help decision makers to harness the benefits of globalization at minimum cost for their nations. There are used data from international statistics and the outcomes of the most recent global outlooks. The most important concern that was identified is related to the structural changes in the favor of the elder people, especially in the developed economies.

Key words: globalization, labor, population growth, average age.

JEL classification: F41, F01

1. Introduction

Currently the continuous demographic growth is the main source of pressure on natural systems. This major problem is very important due to the fact that population increase leads to a rapid consumption of resources and environmental degradation. The intensity of human activities increases the pressure on environment by either the uncontrolled consumption of resources and space or by the generation of wastes that cannot be absorbed by nature. The latest UN assessments, in a relatively short period of time, 50 years, since 1950 until 2000, at global level the economic activity increased five times and the population three times. Such an economic and demographic expansion will

represent a dramatic potential pressure on natural resources and on ecological systems.

A more and more visible trend is urbanization. Demographic explosion will pose serious environmental problems. It is still not clear how municipalities will deal with waste management and sewage treatment in cities with populations larger than the one of some countries. The overpopulation and the concentration of population in urban areas such as the mega-cities (with more than eight million inhabitants) increased pollution levels beyond acceptable limits due to the emissions of toxic gases, discharge of sewage, and wastes. It also created pressure by the large number of buildings that cover the vital natural cover surfaces.

Considering these alarming trends the paper aims to reveal the impact of globalization in this framework. The overarching question to be answered addresses the potential of globalization to aggravate these processes. Global demographic data is computed to create empirical support for the demonstration.

2. Demographic processes

The large urban areas are the most important resource consumers in terms of energy, water, and food. While the population increase, the allocation of natural resources per inhabitant decrease and hinders life quality or even survival.

In the next decades the population will increase with one billion people in each. If only the basic needs are to be considered this evolution will deplete biodiversity by restraining the surface of natural ecosystems in face of agricultural and urban areas (Bran et al., 2004).

World population is the result of a long evolution that begun long ago than the human species emerged on Terra. This continuous

process was not always uniform. In the last period it evolved on a curve with exponential shape (Erdeli and Dumitrache, 2001).

Humans evolution becomes a cultural fact 50 000 years ago and the period comprised between this moment and the present time could be divided in two phases: classic and modern (Bran and Ioan, 2009). The modern phase is featured by a continuous and accelerated growth of global population. Growth rates increase slowly until the 1965-1970 then they reach the maximum point (2% per year). Another approach differentiates among three periods based on the threshold of population growth. These thresholds are also associated with important technological progresses, as follows:

- First period: starting at approximately 8000 b.H. the global population increased very slowly and at this threshold there is recorded a fifty times increase of growth rate. Between 8000 b.H and 1750, the population increased from approximately 5 million to 800 million. This acceleration is explained by the agricultural revolution that reduced the direct ecological dependence (hunting, picking) by replacing it with dependence on agricultural production provided by crops and livestock. Agriculture allowed people to produce more and safer food, which in turn supported more people.

- Second period: For ten thousands years from the agricultural revolution the population increased constantly. After 1750 the population starts to increase 10 times faster (with an annual rate of 0.6%), so that in 1950 it reaches 2.5 billion inhabitants. This threshold is determined by the industrial revolution that changed the patterns of goods production. Due to the industrial revolution the welfare recorded unprecedented levels, especially on the account of a better sanitation.

- Third period: this period starts in 1950 and reaches its maximum point in 1970' with an annual growth rate of 2%. That means an annual increase with 70 million people in 1950 and with more than 100 million people in the last decade. This growth is provoked by the medical revolution. Thus the medical techniques perfected in Europe and North America was exported in poorer countries from Latin America, Asia, and Africa, and the

traditional mortality causes were diminished sharply. The penicillin, vaccination, DDT allowed the cheap and effective control of many infectious diseases such as malaria, small-pocks, and tuberculosis. In Latin America, Africa and Asia countries mortality decreased with 60 to 60% at the end of 1940s.

In the last decades world population had exponential increases and the time needed for doubling decreased constantly. Therefore the moments of adding a new billion to the world population was shorter and shorter (Bleahu, 2001):

- from 1 to 2 billion: 100 years (1830-1930);
- from 2 to 3 billion: 30 years (1930-1960);
- from 3 to 4 billion: 15 years (1960-1975);
- from 4 to 5 billion: 13 years (1975-1988);
- from 5 to 6 billion: 11 years (1988-2000);

From an ecological standpoint, the evolution of a species is determined by the optimality of conditions and the absence of restraining factors. The excessive increase of effective leads to self-toxicity or reduced the availability of food or space resources becoming a self regulating factor.

3. Development, population and economies

The current distribution of world population reveals major spatial inequalities. These are explained by a long evolution and variations in influences from local conditions. Asia concentrates more than a half of the global population on a territory that represents only 20% from the land surface. America holds only 13% of the population, Africa 12%, and Europe 9%, but on a significantly larger surface.

According to computations made by demography experts the annual rates of population growth were as follows: 0.3% in 1700; 0.5% in 1800; 1.5% in 1900, and 1.7% in 2000. In the last years the most rapid growth was recorded in Africa with an annual rate of 2.8%, and the slowest growth occurs in Europe (only 0.3% annual rate).

The most recent estimates of population growth made by UN shows that the population will increase with 3.3 billion in the first half of the XXI century. Most of this growth will occur in the developing world. A revised

version indicates that some of the largest increases are forecasted for India and black Africa. These are also the regions stroked most powerfully by famine (Bari, 2001).

It is estimated that some countries like Nigeria, Ethiopia, and Pakistan will triple their population by 2050. It is also expected that Nigeria will host 339 million people by 2050, figure that is larger than Africa's entire population before 1950. It was calculated that the population of India will be larger with more than 600 million people in 2050. Further, despite active and quite effective demographic policies, the population of China will also increase with 300 million people at the same horizon of time.

The repartition of population will remain unequal: Asia will support around 60% from the world population, followed by Africa (18%). China will remain the most populated country in the world, followed by India.

The fastest growth rate is forecasted in Africa. Its population in 2025 will be the double of the 1995 population. The slowest growth rate will be recorded in Europe. Its population will stagnate, the 2025 level being comparable with the 1995 ones.

TABEL 1. Topul țărilor cu cea mai mare populație

Rank	Country	Population	%of world population
1	 China	1,336,070,000	19.63%
2	 India	1,177,400,000	17.3%
3	 USA	308,765,000	4.54%
4	 Indonesia	231,369,500	3.4%
5	 Brasil	192,540,000	2.83%
6	 Pakistan	168,840,500	2.48%
7	 Bangladesh	162,221,000	2.38%
8	 Nigeria	154,729,000	2.27%
9	 Russia	141,927,297	2.09%
10	 Japan	127,530,000	1.87%
11	 Mexico	107,550,697	1.58%

	Mexic		
12	 Filipines	92,226,600	1.36%
13	 Vietnam	85,789,573	1.26%
14	 Germany	81,882,342	1.2%
15	 Ethiopia	79,221,000	1.16%
16	 Egypt	77,915,000	1.14%
17	 Iran	74,196,000	1.09%
18	 Tukey	72,561,312	1.07%
19	 Congo	66,020,000	0.97%
20	 France	65,447,374	0.96%

Source: UN, 2010

4. Labor relevant population structure

Population ageing is determined by the decline of fertility in the last decades. In the last fifty years fertility rate decreased globally will almost a half, from five to 2.7 children per woman. After another half of century it is expected that the fertility rate to be even lower (2.1 children per woman). In the most developed regions of the world fertility rate is of only 1.5 in 2000-2005, being significantly lower than the 2.8 value recorded in 1950-1955. This means a more than 60% decrease in fertility rate. In less developed countries the fertility rate remains high (over 5 children per woman).

Until 2050 the changes will be very little in developed nations (1.7 in 2025-2030; 1.9 in 2045-2050). In developing nations will be also a decrease from 2.9 to 2.4 in 2025-2030, and 2.2 2045-2050. Less developed countries will record a strongest decrease of this indicator from 5.0 until 3.6 in 2025, respectively 2.5 in 2045-2050. Combining this evolution with the decrease in mortality rate and increase of life expectancy ageing is foreseeable. This trend will be more evident in developed nations.

5. Globalization drives demographic processes

Globalization is defined as the process of intensifying the interdependencies among

markets and world businesses. This process accelerated dramatically in the last two decades as a result of reduced transportation costs for both goods and people, and of reduced policy barriers to trade and investment on the part of the public sector. Frankel (2000) gave some metrics of these progresses. Thus the air transport revenue per passenger mile almost halved between 1930 and 1990. He also pin point that jet air shipping and refrigeration contributed significantly to important changes in the structure of goods that are available for international trading.

The most common understanding of globalization envisages the development of global financial markets, increase of multinational enterprises, enhanced influence of these on national economies, globalization of information and culture. Social and economic life mirrors globalization by changes such as: global nature of science and technology; global marketing; world financial system; communication infrastructure; world institutional framework (Bran and Ioan, 2009).

Globalization represents a contemporary process which is taken more and more into consideration by the national or international policies and by the strategy adopted by most international corporations. Even if it is well known, there still are divergent opinions in what concerns the content of the globalization process and the way it should be defined. The latter tries to encapsulate as much as possible the content of the phenomenon, its causes and potential impact on the society.

The analysis of globalization is possible only by means of validating conceptions belonging to the dimensions and fields of activity it influences. In order to know the phenomenon as a whole one has to stop and analyze the individual processes, in order to understand them and only than explore more accurately their impact and create an homogenous image of the phenomenon.

Even if it is considered as being a process that has developed during the last decades, the attempt to explain its origins and identify the vectors that triggered and continue to accelerate this process leads to the identification of certain points throughout the entire history of human kind.

Poverty is defined as being “depriving the population or some categories of population of wellbeing”; in other words, it assumes a low living standards, or it doesn’t even assure the minimal life necessities. To be poor means to be hungry, to not have clothes and a house, to be sick and not to have access to medical assistance, to have a low level of education or to be illiterate. In defining poverty, those who were interviewed haven’t eliminated the social aspects. Thus, it refers to increasing criminality and violence, limited freedom of choice and action, the absence of the control over the one’s life.

A fifth of the total population uses three quarters of the wealth of the world and natural resources. This division is made in general on geographical limits, named traditionally the world of industrialized countries and the “third world”, or North and South. This wealth-poverty polarization is rising permanently because the rich regions already passed through demographical transition, and their population is relatively weakened, while the southern population will continue to increase in the next 60 years. In half of this time, only the seventh part of the world population will control at least three quarters of the world’s wealth.

The gaps between poor and rich population are dynamic, a gap that today expresses under-development tomorrow might stop to have the same role, although it keeps the same value. Everyone should come to an agreement about establishing a limit for showing where the underdevelopment begins and where starts the stage of developed country, that quantitatively shouldn’t be confused with the average of the developed countries gross domestic product and it should be determined on the base of a indicators system, describing also the quantitative side and the qualitative one of the development. Until it will be elaborated this kind of limit (created for each state’s issues and based on all states co-operation), defining under-development through gaps will contain the use of gross domestic product indicator.

6. Conclusions

Globalization is among others the result of the human actions and natural catastrophic,

that threaten the life of the existent species and even the base of the future human development. There is a global problem of the degradation of the environment, the clearing of the forests, atmosphere and ocean pollution, spreading diseases and political and social dangers increased by the unpredicted moves of the population on the globe.

In the last five years, two initiatives have brought hope that national governments and international institutions can be mobilized against poverty:

- establishing Millennium Development Goals (MDG s);
- creating Poverty Reduction Strategies (PRSP s).

The connection between poverty and environment is strong. Poor rural families use a source of incomes and have many subsistence activities. Many of these are very tied of nature, as small farms, fishing, wood gathering, medicinal plants. Ecosystems' goods and services are often the only values that poor people have access. This generates the base capital for economical substantiation and overcoming the subsistence income level, although this potential is overlooked.

The Relationship Between Information Technology and Tour-operators

CIUCHETE Stela Georgiana
Academy of Economic Studies, Bucharest
georgiana_ciuchete@yahoo.com

Abstract

The advances in information technology have seen a radical change in the way that travel agents do business today. There are travel agents that have chosen to ignore the advances in technology; however, in the future, travel agents will have a choice of either using technology to change the way they do business or competing against those who do.

At the moment there are still great gaps in terms of technology between countries, which enables fast growing companies such as Tez Tour to fill a niche and gain new market shares due to their technological lead and managerial practices.

Key words: Travel industry, Internet, Interface.

JEL Classification: L83, L86, M15

1. Introduction

In a world where the Internet and good communications accelerates the globalization, having connections across borders becomes a competitive advantage.

The easy access to a constant stream of information is making the opportunities countless, adding to the equation that the Internet and supplementary techniques such as different types of software are still very young, the opportunities will keep on emerge.

Central reservation systems (CRSs) and global distribution systems (GDSs)—Sabre, Amadeus, Galileo, and Worldspan—were developed first by airlines and then by hotel companies to enable travel agencies (and other similar businesses) to access schedule and pricing information and to request reservations for clients. These businesses became the primary users of travel information systems,

thus providing important links between travelers and industry players (World Tourism Organization Business Council, 1999).

The reason for a global distribution system is the optimal sale of travel-related products. This requires a system where travel agents can reserve travel products for customers, cancel and re-arrange reservations, quote fares and follow up on the service provided.

The success of CRSs and GDSs paved the way for the Internet, enabling the travel and tourism industry to quickly exploit its many strengths. Today, the travel and tourism industry is one of the most significant users of Internet technology, which has become one of the most important communication tools for travelers as well as travel and tourism enterprises.

Internet applications and other technological innovations have influenced tourism in a variety of ways and resulted in fundamental changes in industry structures and traveler behaviors. For instance, online reservation and payment options are used by many travel suppliers and consumers and have led to the emergence of tourism as one of the most important e-commerce categories. It can be argued that the primary reason for this rapid adoption of e-commerce in tourism lies in the close fit between the characteristics of tourism products and the capabilities of e-commerce applications.

The travel and tourism industry is comprised of all organizations that are involved in the production and distribution of travel and tourism products. It can be viewed as an umbrella industry with a complex distribution chain containing a set of interrelated businesses, such as transportation companies, accommodation facilities, attractions, catering enterprises, tour operators, travel agents, and providers of recreation and

leisure facilities, as well as a multitude of government agencies.

Given the way in which information technology is reshaping the structure of both commerce and society in general, its importance to the success of all types of tourism companies can only grow in the future. As a result, tourism companies have changed dramatically the way in which they conduct their business and are under pressure to invest further in new technology in order to maintain their competitive advantage.

2. Benefits of information technology to the Travel Industry

The internet enabled travel agents to access tourism destination web sites and give passengers customised information on the destinations chosen – pictures of hotels, tourist attractions, weather conditions.

The benefits of IT:

- Increased productivity
- Cost saving
- Improved communication
- Fast and efficient service of customers
- Increased access to information
- Computerised database of customers
- Automated final documentation for tourists

Search engines play a fundamental role in creating traffic to travel websites. Search has become increasingly important in travel and tourism in that about two-thirds (64%) of online travelers use search engines for travel planning (Travel Industry Association of America, 2005). In addition, the Hitwise US Travel Report shows that search engines account for about 30% of upstream traffic to travel websites. Search engines, through their indexing, matching, and ranking technologies, control what information is available to consumers and how it is presented. Tourism suppliers and intermediaries, if they want their websites to be accessible through search, have to accommodate search engines and engage in sophisticated search engine optimization strategies and/or search engine advertising.

3. Study case – Tez Tour Romania

Tez Tour Romania, one of the two international tour-operators on the Romanian market, started operating on May 2007, after the early-booking period was over (this being the most active period of the year in terms of selling tourism packages). In spite of this, in the summer of 2007 Tez Tour Romania sold approx. 15.000 holiday packages, operating seven charter flights per week to Turkey from Bucharest and Timisoara. In its first year, Tez Tour gained 20% of the Romanian market share for Turkey.

On the Romanian market there were some specialized tour operators on selling packages to Turkey as Alibaba Tour, Mr. Peter or Kusadasi, but also tour operators to whom Turkey was an important stake as J'Info Tours, Prestige Tours and Prompt Services. How did Tez Tour manage to sell so much when the clients seemed to be divided between Romanian tour operators?

Unlike other companies Tez Tour offers services that take the process of booking a reservation to a higher level. The classic way to make a reservation is a complex method that has numerous steps and requires an overwhelming period of time. After the tourist makes a decision regarding the destination, he has to express his wish in writing by filling in a reservation form, for which he receives an order ticket. The following step of the process consists of a call made by the agency to the tour operator to check if the client's solicitation can be satisfied. It usually takes three days for the tour operator to give an answer, which can be both positive or negative. The reservation will be validated only if the tour operator has given an affirmative reply. Had the answer been NO the tourist is called to express another option and the algorithm starts from the beginning.

Tez Tour manages to avoid this long and frustrating process by using an online reservation system. Nevertheless, Tez Tour is the first and yet the only company in Romania that has put to use such a system. The main advantage of the online reservation system is that the time coordinate has been reduced to

only ten minutes. After this incredibly short time, the tourist leaves the closest Tez Tour partner agency having the confirmed reservation, the voucher and the plane ticket, if the payment for the stay has been made.

When approaching a new market this company pays close attention to details. This is another thing that has helped Tez Tour to enter and survive the Romanian market which seemed divided among the grand tour operator companies. The newness this company brought consisted of a focused attention on the client. Therefore, Tez Tour has signed contracts with the market leaders in airline transportation, which offer services of the highest quality and at the same time have a maximum degree of safety. Moreover, tourists benefit of impeccable services once they have reached their destination. After the check-out the tourists will be guided and provided with information by Tez Tour representatives, who unlike guides from other companies speak Romanian regardless of the destination.

The popularity of the company increased among the Romanian tourists due to the consistent interest of the company in assuring the most comfortable and trouble less stay for its clients. In addition, in every hotel with which the company collaborates there is a Tez Tour bureau, where the representatives speak Romanian and are willing to assist the tourist in any problems that may occur during their stay.

Tez Tour Travel System. Beginning with the year 2007, Tez Tour radically improved its IT structure. An integrated information network has been established between travel agents, Tez Tour incoming-outgoing offices and hotels.

The traditional fax method has been replaced with an efficient online web structure that enables fast and error free information exchange between involving parties.

Tezagency.com is an internet portal that is used by Tez Tour Agents worldwide to book new reservations and track their progress online. Information about flight dates and availability, stop sales, special offers can also be retrieved from the system.

Tezcenter is used by Tez Tour Outgoing offices to track the reservations entered by local agencies. The system allows the offices

to accept and deliver the reservations to incoming Tez Tour offices.

Tezreservation is the operational center of incoming offices where reservation requests from outgoing offices are accepted and sent to hotels to be processed. The answers from hotels are then sent to related agencies through the same network.

Tezhotels is used by the hotels to process the reservation requests sent by Tez Tour incoming offices. The hotels accept or decline the requests online, therefore enabling a continuous and instant information flow. Hotels can also access check in, check out lists for confirmed reservations, guest info and forecasts about future reservations from the system.

Tezdestek is used by Tez Tour Operation center to track and organize the transportation of tourists from various locations. All arrival, departure and excursion group transportations are handled through this system by assigning guides and vehicles. The system also generates various reports to monitor the performance of the whole system.

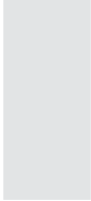

Tezguide is the information portal used by Tez Tour guides to track excursion operations. Guides also access to vital information about reservation and transport operations through this system.

TezTour Agency Network is developed by TezTour to enable a fast and reliable communication system between TezTour and its agencies. The system works online from the Internet and any operation whether initiated by agency or Tez Tour is instantly traced from the system.

User interface is designed to be very simple yet effective enough to complete the major tasks performed by agencies. The system shares similarities between common e-mail systems, where inbox plays an important role. The equivalent of the inbox in the system is the homepage.

Homepage displays the hotel status for daily reservations and open reservations (incomplete-reservations that have not been replied from hotels or Tez Tour). Open reservations are displayed on the homepage till they are finalized. You can click on the reservations to see the details. Each reply type has a specific color code for better visibility.

The color code only represents confirmation status of hotel bookings. The table below explains the meaning of the color codes:

Color	Letter	Status	Explanation
	I	Inserted	Reservations that have not been accepted by your local Tez Tour Office yet.
	A	Accepted	Reservations that have been accepted by the incoming Tez Tour Office. Ready to be sent to the hotel.
	B	Booking	Reservations that have been sent to hotels by the incoming Tez Tour Office.
	E	Preliminary Confirmed	Reservations that have been automatically confirmed by the system.
	W	Waiting	Reservations that have been put to waiting list by hotels.
	Y	Confirmed	Reservations confirmed by the hotels.
	N	Not Confirmed	Reservations that are declined by the hotels.
	M	Multi-state	State for bookings for more than one hotel. Shows that all the hotels have not been confirmed yet.

 P Cancel Confirmed
Cancellations requests that have been accepted by hotels.

Sursa www.tezagency.com

Entering new reservation procedure has 6 basic steps:

A. REGION. The agent has to select the departure city, Arrival Country and Region respectively. Click on the continue button.

B. HOTEL. The reservation agent has to fill in all the required fields and click on the ADD HOTEL button. If you are not going to add more hotels to your reservation you have to click CONTINUE button. If you are going to make reservation for more hotels for the same tourist, fill in the hotel tab and click ADD HOTEL button again. You can add up to 5 hotels currently. When you are done with add hotels, please click CONTINUE button.

C. TOURIST. Fill in the personal details of the tourist and click ADD PERSON button. Continue adding people until you have completed entering all the people for the reservation. Click CONTINUE button to go to next stage.

D. FLIGHT. Available scheduled flights for your selected date will be listed. If there are no scheduled flights available for your selected date or if you would like to enter a different flight please click on the ENTER AGENT DEPARTURE button to enter a flight for departure, click on the ENTER AGENT ARRIVAL button to change or enter the arrival flight. When you are done with flight selection please click on the CONTINUE button.

E. TRANSFER. An automatic group transfer will be assigned to the tourists. Please note that for agent flights a group transfer can not be guaranteed; please choose an individual transfer for agent flights. Click on the CONTINUE button to advance to final step after you have chosen the transfer type.

F. PREVIEW & SEND. All the information you have provided will be listed. Please check all the fields. If there are errors or missing information please return to regarding information tab by clicking on tabs above and fill the missing or wrong information, then

return to preview tab by pressing the tab button. If all the information is correct please press the SEND button. Your information will be processed and an alert window will pop up telling you that your reservation is inserted to the system and will provide you with two numbers: Order number and voucher number respectively. Please note these numbers for future retrieval.

SEARCH ORDER. You can search for your previous orders from this menu. To search by order number just fill in the order field and click SEARCH button. Your order will be listed. Click on the order number to see the details of your order. If you are going to search with different criteria please click on the DETAILED SEARCH button.

SEARCH FLIGHT. You can also search for flight availability for your selected destinations and travel dates. Please enter the required fields and click SEARCH button. Available departure and arrival flights will be listed.

STOP LIST. Stop dates for hotels in specific country regions can be listed by this menu. Please fill in the required fields and click SHOW button to see the list of hotels in stop sale.

SPECIAL OFFERS. To reach the list, first select departure city and related country and press SHOW button. A new list regarding to SPOs will be listed. To read the details about the SPO please click on one of the SPO text. A detailed list will be presented with prices. To start reservation you have to click on one of the prices. Prices with red are preliminary confirmed reservations.

SEARCH TOUR. If you are not going to make a specific reservation and would like to search for an available tour that suits your requirements, please use SEARCH TOUR menu. Fill the search criteria for your tour. If there are available tours for your selection they will be listed accordingly. You can start a new reservation by clicking on the price or SPO number. Region and hotel tabs will be automatically filled by the system, you will continue from the tourist tab.

SEARCH HOTEL. If you are looking for information about a specific hotel you can use SEARCH HOTEL menu. Please fill in the fields of your choice and click SEARCH button. The information will be listed. You can

click on the info text to reach the hotel information page. If there are specific SPO for your hotel, they will also be listed. You can start reservation by clicking on the SPO number.

4. Conclusion

Information technology has changed the business of selling travel and it will continue to drive travel agents to learn new skills and make more use of technology to remain competitive and profitable.

Through the use of automated reservations systems spanning many of the principals on a worldwide basis, the travel agent can now almost instantly check fares, availability and process reservations without the previous high costs of communication.

Considerations Regarding Countries Participation to International Trade

DOBRE I. Claudia

“Ovidius” University, Faculty of Economic Sciences, Constanța
dobre_claudia@yahoo.com

Abstract

In a closed economy, the speed and pattern of economic development is determined by the labour, capital, natural resources and technology available in the domestic economy. This has implications for all five drivers of productivity growth. Competition is limited by the number of firms that are viable. Innovation, enterprise, investment, and the development of skills are limited by the prospective returns which can be earned by selling to the domestic market. In an open economy, these constraints are less binding, and economic growth can proceed more rapidly. International trade allows domestic resources to be transferred away from goods and services which can be produced more efficiently abroad, and into goods and services which can be produced more efficiently at home. The ongoing global financial and economic crisis has the potential to usher in a period of a global recession that may seriously undermine all countries' process of economic growth. In particular, the crisis may put a brake on and also reverse efforts in developing countries and by the international community to assure development gains from trade.

Key words: comercial tariff, economic growth, economic crisis, developing countries

JEL classification: F1

1. Introduction

It is well known that periods of openness have generally been associated with prosperity, whereas protectionism has been the companion of recessions. In addition, the trade performance of individual countries tends to be a good indicator of economic performance since well performing countries tend to record higher rates of GDP growth. In total, there is a common perception that even if imperfect

competition and second best situations offer the possibility of welfare improving trade policies, on average free trade is better than no trade.

This is a correct perception of things. However, the choice is generally not between free trade or no trade; in addition, the stylised facts referred to above do not demonstrate any causality between openness and growth—the distinction between growth and development deserves further comment. Hence, as illustrated by the contrasted results of developing countries, it would be a misperception to conclude that openness to trade systematically ignites the rocket of development. The majority of developing countries have joined the World Trade Organization (WTO) and have taken initiatives aimed at opening their economies. Nevertheless, the outcome has not been systematically positive since export performance sometimes remains disappointing and these countries steadily follow contrasted development paths.

The growth-enhancing effects of trade derive from exposure to imports as well as gaining larger markets for exports. Imports are critical for the dynamic competition and technology effects listed above. Imports also provide direct benefits to consumers by allowing access to a wider range of goods at lower prices, rather than restricting consumers to those goods and services which can be produced domestically. Conversely, seeking to restrict imports would require transfer of domestic labour and capital into import-substituting activities, regardless of whether this represents the best use of these resources. Unrestricted access to imports also supports exports by reducing the prices of essential production inputs.

2. Theoretical considerations

The relationship between trade openness and growth is a highly debated topic in the

growth and development literature. Yet, this issue is far from being resolved. Theoretical growth studies suggest at best a very complex and ambiguous relationship between trade restrictions and growth. The endogenous growth literature has been diverse enough to provide a different array of models in which trade restrictions can decrease or increase the worldwide rate of growth. Note that if trading partners are asymmetric countries in the sense that they have considerably different technologies and endowments, even if economic integration raises the worldwide growth rate, it may adversely affect individual countries.

It is worthwhile to note that the theoretical growth literature has given more attention to the relationship between trade policies and growth rather than the relationship between trade volumes and growth. Therefore, the conclusion about the relationship between trade barriers and growth cannot be directly applied to the effects of changes in trade volumes on growth. Even though these two concepts, trade volumes and trade restrictions, are very closely related, their relationship with growth may differ considerably. This is because there are several other very important factors that affect a country's external sector, such as geographical factors, country size, and income.

In other words, one should be as clear as possible about which openness measure he uses and what are the exact mechanisms through which it affects the growth. In either case, barriers to trade affect investment decisions. Where investment decisions are primarily influenced by trade barriers rather than by the inherent economic advantages of production in a given location, there may be a risk of investors increasing resistance to trade reforms (because they have a vested interest in maintaining the relevant barriers), reducing competitive pressures in the longer term [Dobre, (2009)].

Changes in the structure of employment and production are a necessary part of economic development and flow not just from openness to trade but also from technological developments and changes in consumer preferences. The benefits of structural change are apparent in hindsight, but often resisted as they occur. For example, the "lump of labour" fallacy – namely, that there is a fixed amount of work to go around in any given economy – has often led to concern that technological

improvements will lead not just to a reduction in the number of people needed to complete a particular task, but to a reduction in the number of working people needed in the economy as a whole. This can lead to delays in implementing technological innovations which have important potential productivity benefits.

Such fears have not been borne out by experience. While new technology has displaced workers from particular tasks, firms and industries have responded by taking on expanded or different priorities, and employment levels have remained high. Similarly, countries which are open to trade maintain high levels of employment by redeploying labour and capital into the production of goods and services which are valued in competitive markets. The process of redeployment inevitably brings transitional costs, which may fall particularly heavily on those least well equipped to cope with change – for example those with non-transferable skills. But the outcome for the economy on a whole is clearly positive; and there is a great deal governments can do to minimise transitional disruption to individuals' lives.

Changes are currently particularly striking in trade in services. Until recently, international trade has been much greater in goods than services. The distribution of production and consumption of services is now changing, as advances in technology and substantial declines in communication costs mean that an increasing range of services can be produced remotely and traded internationally [Estevadeordal, Frantz, Taylor, (2002)].

The relocation of some service sector jobs to countries with a more competitive ratio of labour cost to skills – 'off-shoring' – presents an opportunity, as well as a challenge, for developed economies. As with trade in goods, increasing imports of services produced more cheaply abroad means that the overall costs of services fall. This provides direct benefits to consumers, and lowers the cost structure of businesses, allowing them to raise profits and increase employment and investment.

Higher productivity and a lower cost structure also bring second round benefits that permeate through the economy. These include releasing labour to be reallocated into higher value-added and higher skill jobs. However, the extent to which these benefits are realised will depend on the domestic response to the challenge of foreign competition in services,

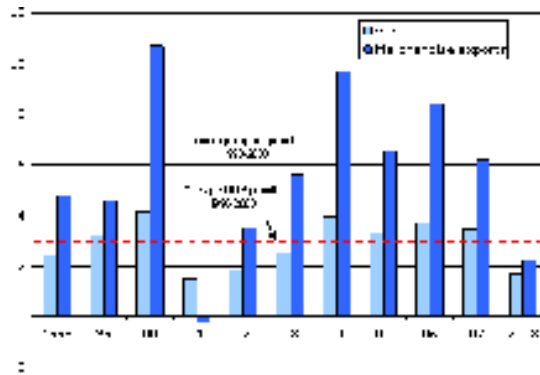

including the availability of appropriate opportunities for upskilling workers. Where a large proportion of the workforce is engaged in low-skilled and low wage activities which are exposed to direct competition, a comprehensive programme of skills enhancement becomes an essential element of any response.

Many firms in different sectors are taking advantage of the opportunity to source cheaper services through imports. Providers of computer, financial, and general business services in particular are benefiting. Firms use different levels of offshore contracted services, ranging from back-office processing and customer contact functions (including call centres) through to wider corporate functions, knowledge management services and research and development. McKinsey Global Institute have estimated that the potential cost reduction for businesses from importing less skillintensive services is between 30 and 50 per cent.

Changes in the structure of production and employment are an intrinsic part of capturing the efficiency and productivity benefits of greater openness to trade. It is for this reason that flexibility – the ability of individuals and firms to respond to economic change efficiently and quickly – is an important concomitant to open markets.

3. Global growth and developing countries

According to data available online from the World Trade Organization (WTO), the value of world merchandise imports and exports (in current prices) totaled more than \$31.8 trillion in 2008, a 52 percent increase from 2003! In volume terms, world merchandise exports grew an average of 5.7 percent annually from 1998-2008. While merchandise trade is expected to decline about 10 percent in 2009 due to the global recession, the outlook for 2010 and beyond remains healthy. The International Monetary Fund (IMF), for example, in its —World Economic Outlook—October 2009 report, estimates that trade volume will increase 2.7 percent in 2010.

Source: WTO 2009

The expansion of trade in the UK and Europe was part of a wider movement towards more open markets in the period following the second world war. The link between openness and economic performance can also be seen on a global scale. Trade barriers rose substantially following the First World War as countries reverted to protectionist policies in order to promote domestic output and employment. This led to a marked slowdown in the pace of world trade growth: the volume of trade grew by only 40 per cent between 1913 and 1950, compared with some 400 per cent between 1870 and 1913. As a proportion of GDP world trade fell significantly – on one estimate trade volumes fell from 22 per cent of world GDP in 1913 to just 9 per cent of GDP in 1938 [Lewer, Van den Berg, (2003)]. After the second world war, governments began consciously to adopt more outward-looking policies. This impetus led to the establishment of the General Agreement on Tariffs and Trade (GATT) in 1947, which provided a framework for progressive mutual reduction in tariffs. The original GATT negotiations were long and arduous, and came close to collapse on many occasions, reflecting the tensions which exist between the benefits of trade and the economic changes associated with opening markets. Despite these tensions, the first GATT negotiations succeeded in reducing tariffs by around 20 per cent; and the framework for multilateral trade negotiations thus established led to further reductions of around 35 per cent in the Kennedy Round (1964-67) and 33 per cent in the Tokyo round (1973-79). These reductions applied primarily to manufactured goods: substantial barriers to trade remained in agriculture, textiles and services. The benefits flowed mainly to developed economies with developing countries remaining largely outside the GATT

process. Nevertheless, as trade barriers fell, both global trade and global income per capita increased. In particular, the strong growth of both exports and output between 1950 and 1973 stands in marked contrast to the weak performance of both in the first half of the century.

As trade barriers fell in the industrialised world, some developing countries also began to open up to trade, leading to the emergence of new markets and contributing to substantially accelerated growth in the more successful economies. From the early 1980s to the late 1990s average tariff rates in developing countries halved, from around 30 per cent to 15 per cent. Over the same period, trade volumes increased significantly, and the composition of developing country exports changed: the share of manufactured goods in developing countries' exports rose from around 25 per cent to over 80 per cent in 1998. Trade between developing countries became – and continues to be – increasingly important, growing twice as fast as world trade: 10 per cent versus 5 per cent between 1990 and 2001. However, these flows are concentrated among emerging markets in Asia: Africa's share of South – South exports is extremely small [Rodríguez, (2007)].

The fact that developing countries took longer to move towards more open policies in part reflected a strong commitment to import substitution in many countries – restricting imports of manufactured goods in order to shift demand towards domestic production, with the aim of promoting rapid industrialization. These strategies had mixed results. In a number of countries, import substitution enabled domestic industries to develop. However, in the medium term, continuing such policies meant that development was constrained by the limited resources and markets which the domestic economy could provide [Rodríguez, Rodrik, (2001)]. These effects were compounded by continuing protectionism in developed countries, which prevented developing country producers from accessing lucrative markets. Longer-term success required countries to draw on resources which could be supplied more cheaply by the rest of the world, and to exploit economies of scale by producing for foreign as well as for domestic markets.

The current global crisis – preceded by the food crisis, volatile energy prices and climate change challenge – is a major blow to

attaining the MDGs for developing countries. Addressing the dampening impact of the crisis on international trade and investment to restore growth, and reviewing development policies and partnerships to create sustainable practices and greater resilience to future shocks, must be key priorities in the multilateral agenda.

Most developing countries are now closely linked with the global economy by trade and foreign direct investment flows, and their economies are more sensitive to falling international demand (and conversely to expanding demand). The degree of exposure and integration of developing countries' economies to external markets has greatly increased in recent years. Developing countries' exports on average accounted for more than half of their gross domestic product (GDP) in 2007, up from about a quarter of GDP in 1995.

The ongoing reduction of trade and investment flows is starting to restrain the development prospects of developing countries. They are currently seriously hurt through falling commodity prices, demand-driven drops in exports exacerbated by the deficit of credit and trade finance, capital outflows, declining remittances, and contracting investment. The prospects are more dire for export-oriented developing countries, especially those with a small domestic economy, where the reduction in international demand is more likely to raise unemployment. In some developing countries, workers are shifting out of dynamic export-oriented sectors into lower-productivity activities. Potentially, all these effects could bring millions of people back into poverty.

The decrease in merchandise trade appears to be affecting all developing regions and most types of goods. Moreover, South–South trade, which has been the most dynamic component of world trade for over a decade, is declining too, especially intra-Asian trade. The quick contraction of developing countries' manufacturing trade is largely due to today's highly globalized production and marketing schemes. Among the most affected sectors are automotive products, office and telecommunications equipment, and electronics, as well as textiles and clothing.

Many commodity exporters, particularly those in West Asia, Africa, and countries with economies in transition that benefited from the commodity price boom with considerable

terms-of-trade gains, are now facing the downside of their commodity dependence, manifested in a substantial shrinking of export revenues. More than 90 developing countries earn at least 50 per cent of their exports from commodities (47 of them being non-fuel commodity exporters).

UNCTAD currently estimates world merchandise trade to fall between 6 and 8 per cent in 2009. Exports from developing countries and countries with economies in transition could potentially decline in the range of 7 to 9 per cent in volume, in 2009. Developed countries' exports are projected to decline by up to 8 per cent this year. The trade contraction in value would be much greater.

The crisis is also spreading to trade in services and to service sectors in general. Maritime transport is particularly affected, as are tourism and construction services. There is also a growing reduction in the employment levels of migrant workers from developing countries. This is expected to lead to a further fall in remittance inflows to developing countries, which began to slow down in 2008. Conversely, trade in ICT-enabled services appears to be less influenced by the economic downturn, as companies see the offshoring of services as one method of enhancing their competitiveness.

Lower trade volumes will be the main channel of transmission to exporters of manufactures and services (including tourism). The volatility of commodity prices will also affect exporters of primary goods. In countries like Congo, Equatorial Guinea, Gabon and Nigeria, oil provides more than 50 per cent of government revenues from commodity exports. In Côte d'Ivoire and Guinea, cocoa and minerals account for a fifth of revenues. Cotton and aluminium exports provide a fifth of tax revenues in Tajikistan. In Trinidad and Tobago, and in Bolivia, commodities account for 22 and 12 percent of GDP, respectively. The prospects for commodity prices remain poor. Recent projections by the World Bank forecast a 25 per cent reduction in energy prices in 2009 and a 23 per cent fall in non-energy commodity prices (World Bank, 2009). Remittances often provide a safety net in recipient countries.

Income from migrant workers helps stabilise consumption levels when recipient economies contract. But remittances have been falling since 2008 in the range of -1 per cent to -6 per cent. The decline in remittances will be

devastating to countries that largely depend on them. For instance, remittances make up 45 per cent of Tajikistan's GDP. Guyana relies on remittances for a quarter of its income.

4. Conclusion

At the national level, the crisis has made it timely to review development strategies so as to make them more sustainable against future external shocks, focused on delivering broad-based and inclusive development, and responsive to the imperatives of preserving the environment, while also providing new economic opportunities. Developing countries need to continue to address income inequality and to invest more in education, training, trade-adjustment assistance, health care, community development and tax policy. The role of the state in promoting development has increased in light of the crisis, and there is a need to reflect on how this role can be effectively articulated.

A major challenge for developing countries is to continue to attract foreign investment during the crisis to stimulate economic activities, especially for such investment that serves long-term development goals and enhances competitiveness. Public investment programmes can help. Public-private partnerships are also important. Bilateral and regional investment agreements can encourage FDI. However, national efforts to maintain and attract foreign investment must not result in "race to the bottom" policies.

Specific Infrastructure – Development and Variation Factor in the Leisure Industry

DRIDEA Catrinel Raluca
MURGOCI Cristiana Ștefania

murgoci.cristiana.stefania@profesor.rau.ro

Abstract

This paper's target is to highlight the role of the tourism infrastructure. As an integrated part of the tourism industry, the leisure services are becoming more and more important in the development and diversification of the existing touristic offer, thus providing an attraction bonus to the various destinations through its varied and innovative character. The best use of leisure services is closely related to equipment, existing infrastructure, which is intended to be emphasized throughout the paper presented.

Key words: tourism infrastructure, leisure services, recreational tourism .

JEL Classification: L83

1. Introduction

Tourism is, today, a mass phenomenon, an important branch of national and international economies, with many contributions of the whole society. Positive influence is noted by its impact in increasing GDP, growth of exports, generating jobs, raising culture and education, improving cooperation relations and peace between countries, environmental protection, and others. Through its content and role tourism has become an independent industry with major implications for existing economic segments.

Tourism as a social-economic and cultural phenomenon has proved to have many followers that aim to travel and spend their free time in a way as enjoyable as possible.

Thus, tourism development is determined not only by the desire of people to escape from everyday reality, but by their need to spend leisure time in a pleasant manner. Among the

key concerns of tour operators is the need to spend free time at destination in a pleasurable manner. Development of activities designed to meet this requirement is based on content development of vacations and re-value of free time. In this context, the tourism firms and destinations have created and developed the leisure services, in order to enhance their popularity and revenues.

2. Leisure travel

The tourism and travel activities have increased, as people are more and more interested in learning about new cultures, civilizations, meeting new people, costumes and traditions, practicing a diversity of sport oriented activities, etc.

Due to the importance increase of the travel and tourism industry, the positive influence as a distinctive sector of activity, it's essential components have significantly changed over the years.

At first, the main components were lodging and food and beverage, later on the leisure segment has risen in the eyes of the consumers. Leisure is represented by the equipments, events and forms offered by tourism units, resorts, or tourism areas that are capable to assure customers satisfaction, enjoyment, and favorable memories.

Leisure or recreational services are defined as those services provided by various organizations to occupy free time. The recreational services usually contain: food and beverage consumption outside the residence, time spent away from home, fun activities during the stay, holding the role of participant or spectator in the various sporting activities, cultural activities, etc.

As a constituent part of a successful tourist offers, leisure services play a fundamental role in meeting the needs of tourists,

regardless of motivation or holiday travel forms practiced, age or social-professional profile of tourists. Moreover, it appears that demand for recreational services in the holiday has grown so much that it became a tourist motivation itself. This way, the more diverse and original the character of a touristic destination, the more it is likely to be chosen, presenting itself as a distinct form of assessment in attracting tourist flows.

Also, the shift from a passive to an active recreation changes the position held by leisure in the recreational activities. Mutations occurring in the structure of occupations and jobs, the decrease of the physical effort, but also the increase of the stress levels affects the growth of the share of recreational activities.

International leisure services have expanded the way of expression through a multitude of forms of entertainment, which would provide a very pleasant stay and especially would influence the decision to return to that destination. Increasingly more destinations have tried to individualize the image presented by offering new and novel means of entertainment such as cultural attractions, special crafts, natural and entertainment parks, specific sports, gambling, casinos, festivals, concerts, etc. Sure, all these forms of entertainment have taken a new dimension and is distinguished by specific regions worldwide, through investments, through rehabilitation, through their promotion, through adapting to customer needs and more.

3. The role of recreational tourism infrastructure

Recreational services have emerged as a way of escaping the monotony of work, daily activities and to express fun, relaxation and rest for participants. The opportunity to benefit from these services is closely connected to the specific infrastructure needed. This way, the variety of forms of entertainment can be analyzed in terms of importance held by the infrastructure, whether the services are specific to the resort or they're affiliated to the hotel units. To develop and improve recreational services, and thus the role of tour organizers, actions must be taken to their specific development and modernization. Recreational infrastructure development determines the extent to which the organizers

of tourism and tourist resorts maintain a competitive advantage or not.

For tourist activities the existence of various resources is vital - material and technical basis to enable and facilitate access to tourist attractions that led to the achievement of travel. The presence of technical and material basis influences the emergence, growth and large scale of the tourism phenomenon by providing conditions for accommodation, food, transportation, recreation, etc. within specific facilities. Thus, a close relation [9] between material and technical basis and extent of travel exists, namely - tourism development depends on the equipment and quality of tourist areas and in turn the technical and material structure is structured and organized depending on the demand for tourism.

Using as a criterion the main destination [6], the technical and material basis can be classified into two categories: the technical background material - the material and technical infrastructure that is tourism specific. General infrastructure includes: ways of communication, means of transport, telecommunication facilities, gas supply networks, electricity, heating, commercial establishments, sanitation facilities, etc. Among the tourism infrastructure is found accommodation, food, recreation, treatment, transportation, cable transport facilities, tourist villages, holiday villages, etc. Facilities in the first group are general and target both tourists and residents, while in the second group are those intended solely for tourists. On the general infrastructure is widely accepted that it is vital for both residents and tourists and also determines destination development economically, socially and touristic.

In the infrastructure for tourism, leisure differs depending on a number of criteria: depending on the venue, according to the tourist area, the types of activities, etc.

Based on the criterion - the venue - approval is shown in the hotel and outside their establishments in tourist resorts. At resorts, many of them have developed a reputation through existing recreational facilities: facilities for various sports fields, installation of lifts, etc., and those found in urban centers such as concert halls, cinemas, theaters, etc.. Recreational activities are usually dependent on the natural environment - climate, terrain, geographical location - of the resort, but tourism development

opportunities in the region in the premise of sustainable development - protecting places for fishing, nature reserves, specific locations for the development of amusement parks, organizing picnics, etc. Other equipments, usually sports related, can be arranged easier, not being strictly dependent on the nature of the place - volleyball, football, basketball, miniature golf, gyms, etc. Cultural equipments are independent of specific geographic area - cinemas, theaters, cultural centers, concert halls, shows, etc. Recreational services in the hotel units have the same functions and require investment in equipment of this type: concert halls, variety, dance, film screenings, gyms, aerobics, fitness, equipment and facilities designed for children games, etc.

Depending on the tourist area, the recreational infrastructure is split in specific areas: the seaside, mountain resorts, and urban centers. Recreational facilities include general facilities (swimming pool, miniature golf, gyms, stadiums, tennis, cinemas, theaters, clubs, etc.) and those specific to the destinations: the seaside - dolphin aquarium, furnished beaches, recreational water sports, etc., the mountains - winter sports equipment, lifts (cable cars, chairlifts, ski lifts), the spa - treatment equipment etc.. The typology of recreational activities brings to the fore a variety of specific forms of recreation equipment, for example - sports, crafts, shopping, etc.

A special category of recreational equipment is the amusement parks. Amusement, aquatic, or theme parks, are representative. Broadly analyzing the offer of recreational facilities and one may decide that specific equipment is found mainly in amusement parks. Their offer determines the upward trend in the number of tourists, defining itself as an attraction in it, regardless of its location and access opportunities.

The development of theme parks over time has been different in every country, reflecting differences in a number of factors including [3]:

- *the level of economic development and the distribution of wealth;*
- *the transport system; the natural environment and built heritage;*
- *the national culture;*
- *the degree to which tourism is a matter of incoming*
 - *foreign visitors rather than domestic demand.*

For example, as specialist concurred, the Magic Kingdom at Walt Disney World, Lake Buena Vista attracts more than 16 million tourists, Disneyland, Anaheim over 14 million tourists, Universal Studios, Japan over 10 million tourists, etc.

Of the wide variety of attractions, amusement parks are noted for the ever growing interest of tourists, by their reputation through constant association with fun, using this word is a leitmotiv of the entire stay. In amusement parks, recreational facilities are very diverse, its variety being a criterion for long-term guests on its premises.

Also its variety involves a wide addressability among amateur tourists. The specific facilities are [4]: roller coaster, carousel, compressed air catapults, water tornadoes, water roller coaster, rafting, enterprise-class ships, rotating platforms, etc., but also leisure facilities such as exhibition surprises, prize competitions, music performances, dance, theatre, circus, reading, games, etc..

Amusement parks differ from other recreational attractions through a few characteristics that personalize their touristic offer [7]:

- wide accessibility by being located near major thoroughfares, but also within the city, centrally as a focal element of attraction
- a medium lifetime due to the dependence on the location, usually April through October, but by exploiting indoor facilities some amusement parks are permanently open;
- use a variety of facilities and tourism products - food, accommodation, shopping, creative craft workshops, performances, dance, performing arts, and others, virtually bringing together under the same setting a lot of tourist attractions, thus the clear and growing interest of consumers;
- the specific offer of amusement parks takes into consideration a whole typology of consumers, addressing the case of families with children, young people that are in love, seniors, including individual consumers of products and activities that are meant for amusement;
- most times the distance is not a decisive criterion when choosing to visit an amusement park;
- flat - rate payment system - ticket spending stimulates a significant number of

hours per day and thus an increase of goods and services purchased, etc.

A well known model of expansion is the one of the amusement parks that meets organizational management efforts to consistently attract significant numbers of tourists, get higher revenues and attain a more important position in the tourism industry. Also in the category of amusement parks, water parks must be maintained, developed mostly in seaside resorts worldwide and develops the concept of indoor and outdoor to reduce seasonal phenomenon. Here we can mention the creation of a hybrid between theme parks and water as a tendency of modern society to pursue a variety of activities, and increased responsiveness to the needs of consumers.

Designing a theme park involves creating a theme that is a basis for developing the entire building, the equipments and the combination of activities such as games – roller coaster, mechanical wheel, etc. with the passive shows, theater, etc. Interesting to note [2] is that the thematic concept has expanded into other recreational facilities, speaking today of a new idea - the thematic society.

Cruises have adopted the idea of themes, but not limited to facilities on board vessels but also including the visiting ports, for example, many companies buy private islands in the Caribbean to make them anchor points and to provide the experience of the yesteryear Caribbean, furnished with specific features to recreate this image.

The revenues and the number of visitors actually show how parks contribute to the attractiveness and competitiveness of destinations and shows how effective the investments in infrastructure are. It is important to analyze the economic situation of U.S. amusement parks, because the tourist market is the most explosive development of amenities.

Analysis of the number of visitors in American parks shows a steady increase, from 280 million visitors registered in 1995 to 351 million visitors in 2007. This increase is due to the amusement parks image among consumers, their role in choosing destinations, and especially the intensive efforts of park management for global development and promotion of the concept. Equally apparent is an increase of 7.4 billion U.S. dollars in 1995 leading to the 12.7 billion in 2007, part due to significant growth of the number of visitors

but also because the visitors use diverse tourism products and services.

*Fig1. Amusement and theme parks
in USA dollars*

Year	Visitors - mil	Revenue - bln
1995	280	7,4
2001	319	9,6
2006	335	12,1
2007	351	12,7

Source: International Association of Amusement Parks and Attractions www.iaapa.com

Although it arose in Europe, amusement parks industry flourished in the U.S., but also in other regions numerous amusement parks have been founded. Experts have estimated for 2005 the number of theme parks, the number of visitors and revenue levels at global level [1]: 362 parks, 606 million visitors, and 15.118 billion U.S. dollars respectively. It should be noted that estimates were exceeded due to the impact amusement and theme parks have on destinations, high investments in this sector and the high level of attractiveness, etc.

A similar concept to amusement parks is suggested by the famous all-inclusive clubs that not only include accommodation and food, but the transfer, transport, entertainment, animation, all within the same premises and at an inclusive price.

The first club which completed the concept is the famous Club Med, presenting itself as "inventor of the good mood", with ever new activities that impose appreciation and are copied internationally. Club development through action of vertical integration with travel agents, cruise lines and wide promotion determined high revenues, for example about 1800 billion in 2007.

Tourist equipment is needed, as is apparent, but the way it is organized helps to distinguish between success and failure. A wise use of leisure facilities determines the increase of the attractiveness of destinations, increase of economic efficiency and reduces the phenomenon of seasonality. An inefficient use can lead to intensive destruction of wildlife by exploiting natural areas without measure, disturbing the local population, changes in attitude and behavior of said population, the existence of rigid rules which upset tourists, etc.

The leisure market is repositioning its image by developing new leisure equipments, by growing the areas, by creating an active environment with an accent on the need and wants of each segment of customers. As a result, local councils suggest the development and organization of several investment projects in tourism infrastructure modernization. Thus, establishing the needed strategies takes into consideration the importance given to leisure facilities, their size, level of attractiveness, the necessary investment, the payback period and others. Regardless of the type of strategy chosen, development and modernization of leisure infrastructure is a basic pillar of the development of tourism activities and related destinations.

Based on these considerations, tour organizers and representatives of tourist resorts have reconsidered the role played by leisure travel providing optimum locations for leisure and entertainment practice, analyzing the needs of recreational equipment, opportunities to attract customers, natural setting and the dependence of leisure activities on this setting.

In conclusion, the role of infrastructure in the tourism market is crucial. Even more the necessity of assistance through plans to create or repair the general infrastructure the touristic one is the frequent targets of successful destinations.

Leasing – the Area Most Affected by the Financial Crisis

DUGAN Silvia
DINDIRE Dindire

“Constantin Brancoveanu” University of Pitesti
dugan_silvia@yahoo.com

Abstract

Financing operations through the leasing system represent a real oxygen break for the economic agents for whom investments are an essential requirement for the development of their activity. Leasing imposed itself in our country the same way it has done it before throughout the world (maybe less in the economies of the third world countries), first of all by simplicity. Taking into consideration that the competitive environment from our country has become more and more drastic, the reaction speed of the companies to the changes in the external environment being vital. Leasing, through its efficiency, satisfies in very short periods of time, the economic agents' need for investment funds. Using leasing, the economic agents can also avoid the complicated procedures of bank credits, which presuppose tying up some elements from the society's patrimony or from the private one in order to establish guarantees.

Key words: business sustainability, real estate leasing, equipment leasing

JEL Classification: G32

1. Introduction

The leasing market acts as a sponge, absorbing the trends of several important areas of the economy. The decline in industrial production, in services, constructions and especially in real estate, generated a disaster in this market, in 2009.

2. Negative developments of Romania's leasing market

Since the second half on 2008, the main trend on the leasing market in Romania has been the drastic reduction in the volume of contracts. After seeing increases of 45% in

2005, of 57% in 2006 and of 51% in 2007, the leasing market, in 2008, saw a decrease of 3% compared to 2007. The disaster occurred in 2009 when the leasing business volume decreased by 74% (Graph no. 1).

Graph no. 1. Dynamic leasing market in Romania (billion euros)

Source: data processed by the author

Concrete, it is a market that barely exceeds one billion euros, given that in 2008 heading for a value of 4.2 billion euros. Analyzing the leasing market development, we note that it is now at approximately the level recorded in 2004. Leasing has suffered significant decline in the European countries, but not to the same scale. According to EUROPELEASING reports, the European leasing markets have declined by 36% in 2009 compared to 2008, differentiated by countries, as follows: in Spain and the Czech Republic it decreased by 57%, in Poland by 52%, in Italy by 41%, in England by 39%, in France by 25%, in Germany by 23% [3]. In Romania, the most significant declines have come mainly from the segments that, until 2008, had developed enormously, i.e. from sales of equipments and cars. Cars financing reached about 686 million euros in 2009 compared with a value of almost three billion euros, as was the leasing market for cars in September 2008, meaning a decrease of 76%.

Equipment leasing recorded the largest decline of 77% in 2009 compared to 2008 [1]. From the segment equipment, construction

machinery has been the most affected. The decline of this segment was caused by the cut of many real estate projects in the private sector and by stopping construction of public projects. If in 2008, 54% of equipments leases were financed construction equipment, in 2009 only 27% of equipments purchased are still in this category. Medical equipments leasing was one of the few sub-categories which saw increases, reaching 8% of total funding leasing.

Also, **real estate leasing** decreased by 40% in 2009 compared to 2008, so that financing for property acquisitions hardly exceed 183 million euros [2]. This segment was supported mainly by transactions of sale & lease-back for hotels and office spaces, because retail and residential cannot even be mentioned after blocking the market. Thus, funding for office spaces increased by 9% in 2009 (up to 23%), compared to 2008. It seems that at least five years will have to pass until the serious funding for this sector will continue. According to estimates provided by Asociația Societăților Financiare din România - ALB Financial Companies Association in Romania, the year 2010 is projected to be just as full of challenges as 2009. If in 2009 the volume of contracts reached 1.25 billion euros, this year it is estimated to achieve the level of one billion. Generally, one is counting on maintaining a market and optimistic forecasts show even a slight increase. This is based mainly on the attempt to restart some engines of the economy such as industrial production, infrastructure, transport and, why not, agriculture. In terms of the players who currently develop business on the leasing market, the year 2010 is not likely to cause insolvency or bankruptcy. But risk is not excluded for small companies, especially if they do not adopt economic recovery measures, or if they do not adapt to new market conditions. Small businesses need to review the structures, resources and internal flows, which means taking measures to ensure **business sustainability**.

Finally, they must adjust the portfolio configuration according to changes in the market demand. However, when they think of recovery, leasing companies still put their hopes in cars, because most cars were purchased between 2005 and 2008 and it is assumed that, after five years of use, owners will change them. Thus, probably in 2011, 2012 the leasing market will begin to recover.

3. Measures of survival

The main objectives of leasing companies are and will be the further survival in a hostile economic environment and the conservation of the portfolio. This significant decline has forced leasing companies to carefully review business strategies in order to move safely from the double-digit annual growth to similar decreases. Adaptation consisted in shifting the focus from sales and from obtaining a market share as high as possible to centering on portfolio management, systematic reduction of expenditures, careful estimation of risks and selection of customers, collect flows, cleaning portfolios, repossession and removal and remarketing. On the other side of the equation, amid the deterioration of main macroeconomic indicators, the user of leasing services was forced to move from a consumerist mentality (much less correlated with cash flow) to maintenance strategies or even survival in times of crisis. In these circumstances, leasing companies have had to face the degradation of the customers' payment behavior, which increased the percentage of customers with late payments, increasing the number of contract termination and repossession and removal, as well as the level of provisions. In the last 12 months, the growth of the reselling activity meant, for leasing companies, the allocation of significant human and material resources, the most affected being the subsidiary companies of banks or the independent ones. The advantage held by captive companies was represented by their access to know-how and to existing infrastructure within the groups they belong to, from the storage areas to the existence of specialized service sites or even specialized entities / specialized sales force in second-hand cars market. The condition for profit-seeking (in captive companies and large independent firms) or for survival (for small firms) will be adapting to new market conditions for 2010 as well. Taking into account that the foundation of business activity is the customer, it can be considered that this year too, the leasing companies will suffer from lack of liquidity with which they have been faced since last year. It must be said that most customers are legal entities with certain priorities for repayment of debts.

Therefore, it would be no surprise that the trend started last year - the submission of requests for renegotiation of contracts - to maintain at the same rate. In addition, it is expected that the number of bad debtors increases. The rate of non-performing financing has increased for two reasons: one would be the customers who can no longer afford to pay and another is that of people who just abuse on the facts. Although they do not need it, they come with requests for grace period or deletion of penalties. In terms of customers, it must be said that some of them noted that the goods purchased through funding have become more expensive than what the new market offers now and they are tempted to abandon those goods, becoming clients of bad faith. They will suffer because the law takes the donors' side in this regard and they will appear in the central of Banking Risks with an inappropriate payment behavior. Because the lenders continue their pursuit even after the recovery of the goods, the loss of the good payer status is followed by other disadvantages. For the corporate customers this can mean going to judicial enforcement of the company and in the cases where the assets do not cover the amount or are even non-existent, one proceeds to following the manager or administrator for judicial enforcement of personal property.

4. Conclusions

In time of crisis, financial leasing is a solution for agriculture. Seeing how difficult it is to obtain support from the banking institutions, some of the farmers have turned their attention to leasing companies that have personalized offers that can maintain liquidity, optimize costs and gain financial flexibility. Financial products tailored to the activity of farmers and according to season, rapid processing and especially advantageous

financial offer are some of the issues to persuade them to use the services of leasing companies. In financial leasing, the benefits and risks of using the property transfer to the user at the date of signing the minutes and, at the end of the lease, the customer exercises the option to purchase at residual value. In these conditions, access to modern equipment becomes quick without affecting cash flow. Moreover, it remains positive because the rates are paid while using the goods and the Value Added Tax is paid gradually over the entire contract period. For companies that have jobs blocked because of the recession and need employees, a solution appeared: some marketing or food industry companies "lease" employees for short-term projects. An example would be the market research firms, call center companies. But, the simplification of the employment process does not imply lower costs. The leasing agency fee is between 5% and 15% of the total employee costs, depending on the project duration. The higher the "loan" duration the lower the leasing fee is. Generally this fee is calculated according to the specialization of the employee, to the period of the project, and to the amount of employees required. The law says that the maximum duration of a lease is 18 months, the average period for "employees in the lease" being about six months. In Romania, the labor legislation faces those who offer this service on the market with quite a few problems. Thus, companies have to pay monthly the wage of a temporary worker even if he is placed inside a company or not.

Global Economic Crisis

University of Craiova
BRAILOIU Liviu

Abstract

The global economy is in the middle of the deepest and most widespread post-war recession. U.E. economy is not spared either. The strong increase in the financial crisis in autumn 2008 has led global economic downturn which, in turn, has further weakened the financial sector.

Over time, the ambitious political actions taken by governments and central banks in late autumn 2008, have prevented a collapse of financial systems and managed to bring a degree of stability, but financial markets and institutions still remain under stress.

The global economy is in a deep recession. The economic situation remains very uncertain [1]. Investor confidence in the banking sector remains fragile, despite improvements that marked certain market segments. This forecast assumes that the measures in place to support the banking sector will begin to have a greater impact in coming quarters, which also facilitates the transmission of monetary policy stance to support the real economy.

An improved performance of the banking sector by the end of 2009 should provide the basis for a progress of bank loans. As the financial crisis has intensified, global trade and industrial production has virtually collapsed in the last quarter of 2008.

Key words: economic crisis, recession, GDP

JEL classification: E3

1. Introduction

Statistical indicators suggest a strong contraction of real GDP, which has continued

in the first quarter of 2009.

Looking ahead, tighter financial conditions and low confidence in the financial system will continue to weigh more heavily on economic activity, but they are likely to be gradually offset by the impact of expansionary macroeconomic policies.

Recession hit worldwide. World GDP is expected to contract by around 1.5% in 2009, even if the recession will become less pronounced in the advanced economies. The GDP is projected to fall by around 3% in U.S. and 5.25% in Japan in 2009.

Moreover, the economic downturn affected ever more the emerging and developing economies [2].

While China appears to be in a relatively good position to withstand global downturn, given the arsenal of policy tools available yet, its economic growth will mark a sharply slowdown this year (up to about 6%).

As an effect of the significant stimulating political impact in the world and the gradual resumption of trade flows, global growth is expected to recover from the deficit to reach 2% in 2010, while world GDP is expected to decline by 1.5 % in 2009.

2. Global Rise Influence Factors

In this context, GDP is forecast to go down with 4% in both the EU and the euro zone in 2009. The slowdown will affect almost all Member States, which will register negative growth rates this year.

For both regions (EU27 and euro area), the GDP should stabilize in 2010 and then begin a gradual recovery process, while improving financial conditions, external demand growth and support of macroeconomic policies.

Inflation is expected to continue to decline

in 2009, while unemployment, budget deficits and debts will increase.

At the EU27 level, differences between Member States on economic growth are high. If the five largest EU economies, real GDP is expected to contract in 2009, with approximately 5.5% in Germany, 4-4,5% in Italy and the United Kingdom and 3% in France and Spain [3].

Economic activity is expected to stabilize broadly in all higher economies in 2010, with the exception of Spain, who will face a contraction of almost 1%. Moreover, the population growth continues to play a positive role for Spain as the low GDP per capita - 4.5%, is in line with euro area average in 2009 and is expected to be reduced to -2% in 2010.

Recession is also expected to seriously affect the demand components, except for government consumption and public investment. They are supported by budget stimuli proposed in the European economic recovery plan. In 2009, exports and investment are expected to diminish very strongly (with 12.75% and respectively 10.5%). European exports reflects the plight of world trade, while the decline in investment raises the lack of investor confidence, the bleak prospect related to the demand evolution, a sharp decline in the capacities utilization and tighter financing conditions.

Moreover, while an involuntary accumulation of stocks contributed positively to GDP growth late in 2008, a correction is now expected, which could have a significant negative impact on economic activity in the short term. Private consumption is also projected to fall as a result of deteriorating labor market conditions; although the negative impact on real disposable income growth is partly offset by the rapid decline in the inflation rate.

In terms of discretionary tax measures, some of them aim to stimulate consumption and help increase revenue. Government consumption and public investment growth should also strengthen the economic activity. It is considered that the absence of such stimuli should determine the decrease of the GDP growth by 1% in 2009 and 0.65% in 2010.

The work factor markets cannot escape the downturn. Reflecting the normal lag between

changes in employment and production levels, employment is expected to diminish by 2.5% in both the EU27 and the euro area in 2009 and 1.5% 2010. Employment could fall, to about 8 million and half people in 2010, in sharp contrast to the net creation of 9.5 million jobs during 2006-2008.

As a cumulative effect, the unemployment rate is projected to increase in the EU27 by almost 11% in 2010 (11.5% in the euro area). While this phenomenon is evident in all Member States, the most pronounced increases in unemployment are expected in countries facing a substantial regression of activity (construction, in particular), such as Estonia, Ireland, Latvia, Lithuania and Spain.

Due to the actual conditions of labor factor markets and the low capacity for its use in different countries and sectors of the economy, nominal wage pressures should decrease substantially by 2010 [4].

Inflation due to rising consumer prices has moderated in the recent months, following the global trend. The same trend is also present at raw material prices. Disinflation will continue in 2009, estimated inflation being close to 1% in the EU27 (0.5% in the euro area) in 2009. Significant decreases in inflation rates are expected in the Baltic economies and Bulgaria, which recorded double-digit inflation in 2008.

Moreover, because of overcoming the negative effects of increased energy and food prices, inflation is expected to decline gradually to about 1.25% in 2010.

Trade balance will not change (comparing the falling of imports more than exports); the current account deficit will become 2% of GDP in the EU27 and 1.25% in the euro area during 2009-2010.

The budget deficit is projected to be more than double in 2009 in EU27, amounting to 6%, compared to 2.3% of the GDP in 2008, with a similar trend for the euro area. This deterioration (cf. Table 1) is due, in part, to the impact of slowing economic activity, reflecting the importance of automatic stabilizers, but also important discretionary measures that were introduced in the Recovery Plan.

In particular, the expenditure ratio is projected to increase by more than 3% of

GDP, in UE2007, in 2009 (and a further 1% in 2010), as a result of further increasing of the social benefits and transfers and spending capital and collective consumption, but also because of the considerable decline in the nominal GDP.

The revenue ratio is expected to decline as well, reflecting the effects of previous revenue and erosion of tax bases. As a result, 21 of the 27 Member States are expected to exceed or stagnate to over 3% of GDP reference value in 2009. A further deterioration in the budgetary outlook is expected in 2010, as a result of the unchanging effect of macroeconomic policies and the fact that some economic growth is possible. This deficit will increase to over 7% of GDP in the EU27.

Table 1: Evolution of macroeconomic indicators in the EU 27

% Real annual change	2005	2006	2007	2008	2009	2010
GDP	2,0	3,1	2,9	0,9	-4,0	-0,1
Private consumption	2,0	2,3	2,2	0,9	-1,5	-0,4
Public consumption	1,6	1,9	1,9	2,2	1,9	1,7
Total investment	3,6	6,2	5,4	0,1	-10,5	-2,9
Employment	0,8	1,5	1,7	0,7	-2,6	-1,4
Unemployment rate	8,9	8,2	7,1	7,0	9,4	10,9
Inflation rate	2,3	2,3	2,4	3,7	0,9	1,3
Government Deficit (% of GDP)	-2,4	-1,4	-0,8	-2,3	-6,0	-7,3
Public debt (% of GDP)	62,7	61,3	58,7	61,5	72,6	79,4
Adjusted current account balance (% of GDP)	-0,7	-1,1	-1,0	-1,5	-1,9	-2,0

In addition to the precarious budgetary situation, public debt is also affected by the measures of financial rescue plans, such as bank recapitalization. In general, government gross debt is expected to increase from 61.5% of GDP in 2008 to 72.5% in 2009 and 79.5% in 2010 in the EU27 (i.e., from 69% in 2008, almost 84% in 2010 in the euro area).

Many uncertainties related to economic

situation and prospects of economic development show that the global economy is facing its worst recession since the Second World War. With the deep recession, significant risks remain. Such a risk would be that of worsening of estimates for the evolution of economic activity, in particular the effect of financial crisis and the negative feedback between different sectors of the economy. For example, a more marked deterioration in the real economy may worsen the market correction mechanisms related to households in some countries and can enhance the recovery process of bank debt. Some economies with substantial external financing needs face the risk of sudden changes in investors' risk preferences and difficulties in securing the necessary funding, as in the case of the economies of Central and Eastern Europe.

Table 2: Evolution of macroeconomic indicators in the euro area

% Real annual change	2005	2006	2007	2008	2009	2010
GDP	1,7	2,9	2,7	0,8	-4,0	-0,1
Private consumption	1,8	2,0	1,6	0,5	-0,9	-0,3
Public consumption	1,5	1,9	2,2	2,0	2,0	1,7
Total investment	3,3	5,6	4,4	0,0	-10,4	-2,7
Employment	0,7	1,4	1,7	0,7	-2,6	-1,5
Unemployment rate	9,0	8,3	7,5	7,5	9,9	11,5
Inflation rate	2,2	2,2	2,1	3,3	0,4	1,2
Government Deficit (% of GDP)	-2,5	-1,3	-0,6	-1,9	-5,3	-6,5
Public debt (% of GDP)	70,0	68,3	66,0	69,3	77,7	83,8
Adjusted current account balance (% of GDP)	0,2	0,1	0,4	-0,7	-1,2	-1,3

Moreover, it is conceivable that the widespread economic downturn could trigger protectionist trade distorting measures.

Furthermore, turning points of macroeconomic developments (in Table 2) are

difficult to detect. Certain stabilization has been recently observed, some of the sectors indicators showing a shy recovery trend.

3. Conclusions

Given the unprecedented adverse macroeconomic developments over the past 25 years, we believe that the minimum point was reached. Furthermore, the implementation of many proposed measures to restore financial market stability and to support the economy might be effective in winning back investor and consumer confidence.

Given the weaknesses arising from the trade and global growth in 2009, economic growth prospects in 2010 are increasingly uncertain.

Given the nature of the current crisis, which is manifested at global level, and whose origin is reflected in the financial and banking system, the global economy will most likely begin to rise in 2010.

Efficient Actions for Cutting Down the Costs in Tourism Industry Companies in a Crisis Period

GABROVEANU Emilia
RADNEANTU Nicoleta
STAN Roxana Elena

Romanian-American University of Bucharest
emilia.gabroveanu@gmail.com
stancanicoleta@yahoo.com
seroxana@gmail.com

Abstract

A decision making process, deployed on different organisational levels needs to support on data regarding the registered costs and other relevant analysis, derived from the inside of the company, provided by a managerial accountancy that has to answer to the necessity of information required by the company's management.

This article exposes several considerations regarding the managerial control importance of costs calculation and accountancy, as well as the directions for cutting down the expenditures in this stage of Romanian economy.

How can be achieved a permanent awareness of the management in order to achieve the performance objectives? In practice it is a question to which we receive answers in a more or less ambiguous manner.

Key words: economic crisis, tourism industry, competition

JEL classification: L83

1. Introduction

The impact of the world economic crisis is present in all Romanian activity areas including the tourism industry. We consider that the turnover and costs of a company in a crisis periods are the first vulnerable points. Due to the fact that the turnover depends on the customers – we cannot influence it very much. In exchange we can get an

improvement of the company position on costs. Knowing and cutting down the costs is an actual urgent matter in the decisions making process in the tourism industry companies also.

A survival exercise in this period for each commercial tourism industry company is costs management. Reducing the most concerned expenditures by the companies that act in this branch of national economy also (the staff expenditures, the expenditure for transportation and protocole, the expenditures with consumable goods, consultancy services) can be made without affecting the business.

The role of managerial accountancy is to assure both the collection and distribution of expenditures related to tourists offered services and the calculation of price on each service package.

2. Efficient action trends for cutting down the costs in the tourism industry companies – a requirement in a crisis period

The competition environment determines the requirement of an efficient company management and implies the best possible use of available resources in the purpose of achieving the company's goals, out of which the efficiency objective is obviously in the front line, through effective management of costs that affects the results. Managers need a wide range of information in order to plan, control and decide.

The costs management is a key issue now and in the near future. The responsibility for

costs management is still unclear in many companies. There are managers who still believe that is enough to use financial accounting and the management accounting is a matter of instinct or intuition. Such an opinion can be very dangerous or even may cause the company's rapid decline. We think that the company's personnel must be involved too in the company efforts' to reduce costs and to help creating a culture in this respect. To achieve the assumed objectives decisions should be made aiming at the same time as their implementation to give the expected results. A society that focuses on reducing the costs has to create its own policy to follow this trend.

Economic independence and autonomy of the companies in the tourism industry causes difficulties to orientate in the systems of economic connections and, therefore, increases the role of management information, leading to the need of speeding up the creation and development of the costs management – as basis of the managerial accounting.

The structure of the calculation and costs accountancy should be organized in order to effectively respond to a system of a modern managerial control.

The practical exercise of the managerial control can be successfully achieved if the company is divided into certain components other than those imposed by the organization scheme. These components become centres of responsibility; well defined actors, with defined tasks will respond by the activity in each area of these responsibility.

Of course that one of the tasks is reducing the costs and hence the cost of products or services. In this context, more efficient lines of action will need to be set.

A responsibility centre is an organizational division of the patrimony property unit where the responsibilities referring to allocated resources and activity are localized.

There are several types of responsibility centres:

- a) *Cost centres*, where the product, work or service should be obtained at the minimum cost and the highest quality;
- b) *Revenue Centre*, where turnover regarding the product, work or service must be high;
- c) *Profit centres*, where the costs regarding the products should be minimal, and the revenues

from the sale of products - maximum;

- d) *Investment Centres*, where a high yield should result from the investments. The investment centres are scheduled on the long term, while the profit centres are concerned by the short-term return.

For each centre responsibilities regarding the level of revenues and expenditures are established.

For practical reasons, costs are classified in controllable and uncontrollable - on one hand, and in technical and discretionary - on the other hand.

Cost is controllable if the amount allocated to a responsibility centre can be significantly influenced by the actions performed by the management in that specific centre.

Thus, the costs generated by the consumption of economic means are controllable if they can be significantly influenced by the manager of the centre.

At lower levels of management, the authority does not allow certain costs controlling and, therefore, these costs could be considered *uncontrollable*.

As regards the costs of labour, there are limits imposed by the wage rates set up by the human resources department, or by Unions negotiations. However, the centre manager can significantly influence the cost of labour by controlling its employees' idle time and their working efficiency.

Some uncontrollable costs can be transformed into controllable costs, through the centre manager intervention. For example, the maintenance and repairs expenses for the cost centre are allocated to the other responsibility centres based on a coefficient, which define them as uncontrollable costs. But if a beneficiary centre is classified by the number of hours worked by the staff of the maintenance and repairs centre, then the beneficiary centre manager can influence the costs of maintenance and repairs and that costs become controllable.

Technical or technological costs are those whose value can be estimated by the consumption of goods and staff salaries and whose amount depends on the number of physical production units.

Discretionary costs are those which depend on the managerial policy and could be modified by simply changing them.

For a discretionary cost there is not an exact value, but reasonable standards could be set for the control of activities included in it. Thus, the financial accounting department expenses cannot be determined exactly, but the performances of employees who work there can be measured, by the number of documents recorded within an hour.

There is a movement of items from the category of discretionary costs to the technical costs: costs of sales, advertising and publicity etc.

At technical costs, increased production generates increased costs. At discretionary costs, there is a dependency of these costs by the management's policy.

Based on the above facts, it appears the necessity of intervention in the organization, calculation and costs accountancy.

Reducing the costs in the tourism industry companies is only possible if there are some reserves mobilized in this context.

The ways to follow could refer to reducing the cost of acquisition, reducing the stocks and the material consumption, reducing the labour expenses, and the operating expenses of tangible assets, costs of development, sales, administrative and advertising.

a) *Reducing the cost of acquisition* is done by surveillance of the market outlets; through questionnaires sent to known and potential suppliers, through organizing visits to fairs and specialized exhibitions; reporting – to ordinary suppliers – of some companies from where the acquisition might be more beneficial in order to force the other suppliers to make price reductions; setting agreements with current suppliers which could provide discounts;

b) *Decreasing the stocks* that generate costs of storage and immobilized capitals could be achieved through:

✓suspending the purchases of materials with low mobility;

✓grouping of stocks according to their size and their speed of rotation;

✓establishing of a program for stock management, to analyze if all the materials worth to be kept in stock in the future;

c) *Reducing consumption of materials* is done by evaluating, comparing and selecting those materials which can be obtained through some cheaper processes;

d) *Reducing costs of production* is done by: correcting the set of rules for the working time (reorganizing the jobs and rationalizing the production) reorganizing the transport within the company to reduce their costs, combat energy waste by controlling the consumption in the main locations, reducing repair work by eliminating the causes that generate them, the cost reduction of the materials by nature of the inventory objects by studying the causes of their deterioration;

e) *Reducing operating costs of tangible assets* is achieved through: custody of all maintenance and repair works to a department within the company, whose role is to maintain the normal operating conditions as well as the modernization of fixed assets, staff training in order to maintain the current fixed assets, introduction of computerized surveillance and security systems (hence the reduction of personnel expenses), training of personnel responsible for the equipment maintenance and repairs in accordance with the principle of preventive maintenance;

f) *Reduction the labour expenses.* These expenses have a significant share of the total costs in most businesses. Since the wages of workers under the trade union pressure cannot be reduced, the issue of efficient use of labour has to be studied.

Skilled labour is the most effective, because the knowledge and skills they possess allow them to use rationally the working time, to use more efficient means of production and to provide high quality services.

To reduce these costs on the tourism industry enterprises we recommend:

- Recruitment and training of qualified personnel at the appropriate level;

- Permanent evaluation of staff;

- Improving the personnel motivation (differentiated salaries, incentives, profit-participation);

- Improving personnel level of skills;

- Improving the process of decision making and the procedure of authority delegation.

Reducing the relative costs of development is achieved by selecting and scheduling the development projects after the efficiency calculations, drawing up a scheme of probable development costs and their time schedule, performing the research works,

experimentation and design at time, detailed planning of data related to the periods of execution.

Reducing the distribution costs is achieved through the use of a commercial policy based on well documented marketing studies, focusing the sales efforts over company's relevant customers; removal of unprofitable products and services from the sales plan, reducing expenses for travel, recruitment and training of staff having negotiating aptitudes; remuneration of staff used in the sales-based on commission, to raise his interest, keep preparing and updating a list of reference customers, analysis of administrative and production spaces, in the purpose of recovering unused storage capacity.

Reducing the administrative and advertising costs is done by making only those administrative works that contribute to maintaining and developing the company, reducing the number of pages of advertising leaflets; sending a well prepared and complete documentation for the company and its products to specialized magazines.

In reality, the company's management receives monthly reports about actions aiming to reduce spending.

Achievement in good conditions of the action of cutting off expenses and implicitly of the cost involves a thorough and realistic analysis of all activities, levels, structures and dynamics of all factors used in the company. Reduced expenditure should not affect the quality of products and services, as any saving made over quality is a loss for the company.

In this purpose, the management of the company should not limit in finding solutions only by simply reducing costs, but to try to educate their own organization over the fact that in any profit centre or cost, the expenditures can be reduced constantly. Only the mere reduction of costs by identifying and cutting excess spending is not enough. Managers must build a strategy based on cost reduction, developed on the long term, to focus more on how to achieve company goals, either the manner in which the money are spent. This approach can lead to long term improvements and a better understanding among employees of the reasons for which costs must be "controlled".

3. Conclusions

The system of costs management involves a set of methods developed for planning and control of the company's activities that generates costs and expenses in relation to the short and long term objectives.

In order to obtain a real reduction in spending a joint effort of all company employees is needed, regardless of their domain of expertise, aiming to adopt and implement the rationalization measures in all activities.

Achieving the objective aims some action regarding: modernization of the product, marketing and promotion, human resources, connecting with other policies of national economic development, monitoring and evaluation.

Significant decrease of costs can be determined by:

- ✓ Knowing the practical ways to increase cash flow and the profitability;

- ✓ Construction and implementation of controlling concepts developed for monitoring and analysis of costs;

- ✓ Orienting to flexible businesses, targeted to meet the requirements of customers / market - k-organizations;

- ✓ Replacement of traditional data collection and interpretation of results, in whole or in part, with procedures (information programs which to determine the closest suppliers, raw materials that meet quality standards, with the lowest expenditures on transportation, insurance, storage, etc.);

- ✓ Access to new IT resources. Achieving commercial transactions based on electronic transmission of data - electronic commerce - which in tourism caused significant changes (book on-line electronic payments, electronic presentations regions, hotels and restaurants, discussion forums), thus reducing the information costs, costs of recording, processing and storage of the information, as well as the time required for these activities.

- ✓ Access to skills, knowledge and programs in tourism stakeholders. Creating associations to identify and understand the problems caused by the economic crisis and to communicate the results to its members so that they take measures that will reduce costs of losses generated by this crisis.

✓ Easier access to ideas or solutions to common problems of tourism units through the creation of international databases on different causes encountered in their work and access to similar cases worldwide.

✓ Increase quality by training the tourism staff, through technical assistance, through participation in pilot activities conducted in an informatized environment.

✓ On-line assistance for travel services offered;

✓ Using best practices in the field and alignment to international standards relating to tourism activities.

Mechanisms and Policies for Romanian Balance of Payments' Equilibrium

GAGEA Andreea
STĂNCULESCU Anca-Maria
Academy of Economic Studies, Bucharest
andreeagagea@yahoo.com
sam33ro@yahoo.com

Abstract

The article analyses Romania's balance of payments' evolution and point out mechanisms and appropriate policies for its' internal and external equilibrium. The results of the analysis reveal that Romania's balance of payments is still in an unfavorable imbalance situation, but there are also signs of recovery in terms of commercial deficit. In the last years, Romania's current account deficit has shrunk rapidly on the back of a collapse in imports and a falling financial account surplus. However, going forward, it is expected a more sustainable balance of payments position on the medium term.

Key words: balance of payments, commercial deficit, imports

JEL classification: F30

1. The analysis of Romanian Balance of Payments' evolution

The current account deficit is Romania's most delicate problem, especially if taking into account the influence of the macroeconomic imbalance upon the integration in the European Union in the next period.

The current account deficit continually increased after 2002 and maintained its positive evolution as a share in the GDP, but its values became worrying beginning with 2007, when it surpassed over 10% of the GDP. At the end of 2007, the deficit was approximately 14% of the GDP.

The accumulation of the external debt, due to internal or external deficits, beginning from a certain share of the GDP, can affect a country's financial stability on a medium and long term as well as the investors' perception upon that country risk. Moreover, if the international context evolves unfavorably (which was the case at the beginning of 2008 and 2009), a high current account deficit may become a hardly sustainable one even in the short run.

The analysis of the structure of the balance of payments obviously shows that the creation and maintaining of these worrying values of the current account deficit have been primarily due to the *negative and continually increasing imbalance of the trade balance*. Its values were 11.8 billion Euros in 2006 and 21.5 billion Euro in 2007, determined by the broad discrepancies of the evolutions of exports and imports. Although both flows significantly increased over time, their evolutions were not similar. Thus, total exports increased by 16.2%, and imports by 25.1 % in 2006. In 2007, the discrepancy grew deeper: exports increased by only 13.7% and imports by 25%. The difference in the dynamics of the 2 flows might have risen also due to the change of the method of registration for imports, as the general trade system for intra-comunitary trade was introduced.

In 2006 and 2007, the significant economic growth was mainly determined by the increase in the domestic demand based on investments and consumption, both

tendencies leading *imports increase*. *Leu's appreciation* is the main cause for the lower dynamics of the exports as compared to the imports, in both years 2006 and 2007, but, at the same time, *exporters' difficulties to adapt to external markets exigencies* also influence the current account deficit.

It appears that *the exports to the European Union have partially compensated the expenditure generated by the imports from extra-communitary countries*, as while the latter had a share of only 33.8% of Romania's international trade in 2006, it only generated around 45% of that year's trade deficit.

Accordingly, Romania's *current account deficit has shrunk rapidly* in 2009 on the back of a *collapse in imports and falling financial account surplus*. Going forward, we expect the aftermath of the financial and economic crisis to usher in a more sustainable balance of payments position over the medium term. As such beyond our revised 3.7% of GDP, current account deficit penciled in, we forecast the shortfall to narrow further to 1.0% and 0.3% in 2010 and 2011, respectively.

Reflective of the *collapse in imports and withering financial account inflows*, the correction to Romania's balance of payments position continued apace during the third quarter of year 2009. According to the latest data provided by the National Bank of Romania (NBR), the current account deficit narrowed to 3,3 billion Euro during the first nine months of the year, from a record 13,0 billion Euro for the same period a year earlier. This remains supportive of our long-held view that *Romania's balance of payments position would adjust to a more sustainable long-term equilibrium as domestic demand moderates and appetite among foreign investors to fund a yawning current account deficit dissipates*. Moreover, in percentage of GDP terms, it is now expected the deficit to shrink to 3.7% from a previous 3.0% in 2009. Beyond then, we forecast the shortfall narrowing to 1.0% and 0.3% in 2010 and 2011, respectively.

The *key factors driving the adjustment* so far in year 2009 have been the *shrinking trade deficit and fall in current transfers*. In the case of the former year 2008, we continue to highlight the more severe decline in imports relative to exports, which is behind the improving trade position. While exports fell, the

rate of decline in imports was almost double. This in turn has seen the trade deficit narrow to 4,77 billion Euro from a hefty 14,6 billion Euro over the same respective period of time. Given our view that *exports will be one of the first drivers of growth to recover*, while *import demand will remain weighed down over the medium term*, we expect to see further improvement in the trade account. Indeed, we stress that with the *Euro zone tentatively emerging from recession*, external demand for Romanian goods will concomitantly pick up, especially in light of the *sharp depreciation of the leu earlier in the year*. In addition, we believe that *imports of capital and consumer goods will be weighed down* by relatively *tighter credit conditions, rising unemployment and the uncertain economic outlook* which is deterring large-scale domestic investment.

Taking into account the *dezinflation* and the financial and economic international crisis, *the leu had a tendency of supra-appreciation, which negatively affected the exports*. According to some analysts this supra-appreciation reveals exports' real evolution, as share in GDP, which continually decreased in the last years, which implies *an important international competitiveness loss*.

The second item of the balance of the current account, which causes important deficits for Romania's economy, is the *balance of incomes*. According to the National Bank of Romania (NBR), the main cause is the *repatriation of profits from foreign direct investments FDI and bank deposits*. According to NBR, the high amount of FDI inflows and of their positive imbalance in the balance of payments lead to and influenced the nominal appreciation of leu as well as the current account deficit sustainability.

Current account transfers, meanwhile, have still contracted 29.7% through to September 2009. Given that this account is made up largely of transfers to the government, it is likely that *payments to Romania from the EU budget are the key factor keeping current transfers afloat*. As we all know, current transfers constitute a significant component of the current

account, and have prevented a more severe deficit from emerging. Alongside the sharp correction in the current account, the *financial account surplus has similarly shrunk*. Going forward, we note *two positive developments in the short term*. First, the financial account has not been besieged by volatile forms of external financing such as portfolio investment, with foreign direct investment instead taking up the leu's share. Given that *FDI typically represents a more stable form of financing and a longer-term commitment to the economy*, we continue to view positively the predominance of this form of financing. In addition, the continued improvement in risk appetite since 2009 and concomitant recovery in international capital market conditions will remain supportive of current account financing going forward.

Since most big companies have been made private, we can estimate that the *annual FDI inflows won't be massive in the near future* if Romania doesn't improve its comparative advantages: a favorable quality-price ratio of the labor force, the improvement of the physical and immaterial infrastructure, bureaucracy and corruption decrease.

Therefore, in regard of the balance of current transfers' evolution in the following years, we can estimate a moderate nominal increase, thus contributing to the diminution of the commercial and incomes deficits. Hence, the balance of current transfers is estimated to diminish its share in the GDP in the following period.

2. Mechanisms and policies for ensuring the internal and external Balance of Payments' equilibrium

The balance of payments is equilibrated when, over several years, *autonomous debits equal autonomous credits* in terms of accepting the existing exchange rate.

We can say that any economic policy which render trade flows or payments with the rest of the world, affect one way or another the balance of payments. To reduce or eliminate the negative balance of payments disequilibrium we can act in several ways, outlined below:

☞ *The national currency devaluation* sensitize the increase of the exports and decrease of imports. The measure in which imports fall and exports rise depends also on the elasticity of demand relative to domestic currency

depreciation rate - reflected by the price change. As far as this elasticity is higher, either for imports or for export or for both flows, *trade balance equilibrium* is achieved faster. Devaluation effect is felt mainly in the medium term, that is after the period in which contracts have already been executed. In the short term, it may occur increases in imported products, as an immediate response of the importers to future effects of the devaluation.

☞ *Improving domestic products* to increase product quality in order to maintain exports at a high level, even if the prices remain high or possibly growing. The imposing of these products on the market by maintaining high quality standards represents an alternative with sustainable successes against national currency devaluation.

☞ *Interest rate policy*, which is frequently cited as growth rate is followed, in normal conditions of development worldwide, by an influx of foreign capital, an increase of investment in the country with stain positive impacts on balance of payments equilibrium as follows:

➤ if the interest rate increases, this will decrease demand for durable goods, resulting in the fall of durable goods' imports, which will equilibrate the balance of payments' surplus;

➤ if the interest rate increases, then it will increase also the incoming foreign capital into the country and stain will increase investment in our country, which will equilibrate the balance of payments' surplus.

☞ *Deflation* (stopping the inflationary process through various measures such as capital reduction, withdrawal of money) is a measure with positive implications on trade balance, whereas in situations where it acts on the income, it's reflected on imports in the following extent:

➤ if the household income diminishes, aggregate demand will fall and that will lead to lower imports, which will lead to the balance of payments' equilibrium;

➤ if revenues fall, aggregate demand will decline and the inflation will decrease, hence will result an increase in

unemployment, that will lead to the decrease of the national income` growth rate.

Such income policy is not only unpopular, but is not recommended on long term, because the reduction in the growth rate of the national income it is allocated to investment funds decreases, with undesirable repercussions on the domestic industry` competitiveness in the case of the external markets.

☐ *The control of imports* through protectionist measures may lead to a diminishing of the negative trade balance, but the costs of such policies can be very high, as inflation increases and creates the risk of some similar protectionist policies from the external partners envolved on the external markets.

The *policy for the balance of payments` equilibration* has the purpose of maintaining balanced the external account and, thereby, boosting economic growth as a result of the economic relations with foreign countries.

A *negative balance* for several years in a row shows that the country may be importing more than it exports, which leads to depletion of country`s foreign reserves or, if it resort to loans, the situation can not be tolerated for too long because creditor countries may charge fast the debt plus the interest rate.

If the loans come from the International Monetary Fund, the institution may condition future loans, diminishing government` freedoms in managing country`s affaires.

If the *investments balance is negative*, it means that country's firms invest more abroad than the firms in other countries invest in our country. This brings, of course, profits to the domestic firms and, hence, higher income to residents.

If the *investments balance is positive*, due to higher investment of foreign firms in our country, will increase our country's economic potential, but on the account of a deferred in the increase of residents` income.

Also, there are *specific tools available to government* with the purpose of influencing the trade with other countries:

☐ The *devaluation of the national currency* (a common measure designed to encourage exports) makes the exports become cheaper for external beneficiaries:

➤ the national currency` devaluation lowers the export price, leading to the increase of

exports and the balance of payments` equilibrium;

➤ the national currency devaluation` increases the prices of imported products, leading to higher inflation, lower imports of goods and, finally, the balance of payments` equilibrium;

➤ the rising of the imported goods` price leads to the restructuring of consumption for domestic products, which result in encouraging domestic production and, hence, a lower unemployment.

☐ The *taxation directed to discourage* those products that can be made in our country may represent another tool at the government`s disposal. In this sense we can assert that:

➤ if the customs duties on a particular product increase, it increases the price of that product and lower the demand for this product; also, lead to a higher employment rate of growth;

➤ the protectionist policy is limited by the international arrangements in the domain;

➤ the protectionist policy is risky if it`s maintained on medium to long term, as it can be easily countered by a similar tactic of the partner countries, which would make it difficult for our country to export on a higher level.

☐ Another specifically instrument is the *external trade flows` control*, meaning that the government may act through the central bank in order to encourage or discourage foreign investments abroad by firm demand`s acceptance or refusal to make transactions with that foreign countries, granting or not the necessary currency.

Given those outlined above, we can state that:

✓ the balance of payments` economic instruments are a powerful weapon at the governments` reach, which can determine the increase of the price of imported goods;

✓ the *protectionism* is beneficial for economic growth and reducing unemployment, but on long term it may become unpopular due to the expensive imported products and the replace of this products with lower quality domestic products;

✓ the protectionist policy determine other partner countries to apply the same

protectionism, thus, negating the benefits mentioned above.

3. Conclusions

In conclusion, we can assert that the *commercial deficit is likely to maintain* at high levels which calls for the attention of the Romanian authorities, as it is a significant source of economic and financial instability. The supervision of the commercial deficit's evolution is highly necessary also due to the fact it represents, among other indicators, *a warning signal concerning the country's vulnerability to the present state of the international economic crisis*. Undoubtedly, the current economic and financial crisis can and should be considered also as an opportunity, which facilitates development and promotes investments in emerging niche industries in order to reduce the gaps of development within the Romanian economy. Whereof, in present, Romania is vulnerable according to three of the warning indicators for such a crisis: the supra-appreciation of the real effective rate of exchange, the share of the current account deficit in the GDP and the exports growth rate.

Accordingly, we highlight *several reasons to remain cautious over the medium term*. First, Romania's worsening fiscal position, as well as the *potential deterioration in the medium-term political and economic outlook*. Hence, we stress that despite the improvement in global liquidity, *credit markets are unlikely to return to pre-crisis conditions anytime soon*, with the resulting lack of external funds preventing European Commission from running the enormous current account deficits seen in previous years.

Finally, we note that the recovery in risk appetite has been driven largely by unprecedented fiscal stimulus and ultra-loose monetary policy the world over. The eventual return to more restrictive policies as governments rein in bloated fiscal deficits, and central banks exit from quantitative easing, could yet *derail financial stability and see a renewed constriction in credit conditions*. Similarly, many investors will continue to take advantage of sustained low interest rates to increase emerging market exposure, while remaining highly sensitive to financial market.

The Economic and Social Benefits of Air Transport

GHEORGHE Camelia
SEBEA Mihai

Romanian-American University

sebea.mihai@profesor.rau.ro

Abstract

Air transport is an innovative industry that drives economic and social progress. It connects people, countries and cultures; provides access to global markets and generates trade and tourism. It also forges links between developed and developing nations. Like most human activities, air transport has an impact on the environment, mainly through noise and emissions that affect local air quality and the climate. The industry fully recognises its responsibility in this regard and is determined to accelerate action aimed at mitigating its environmental impact – while preserving and enhancing its economic and social benefits.

This paper provides new and updated data regarding these benefits, including the creation of jobs; contribution to gross domestic product (GDP) and tourism development; and the provision of humanitarian aid and medical assistance. Based on a study undertaken for ATAG by Oxford Economics, this document is an essential source of information that will enable those interested in the industry to be well informed about the economic and social impacts of aviation.

Key words: transport, environment impact, aviation

JEL classification: L9

1. Air transport - a major contributor to global economic prosperity

Aviation provides the only rapid worldwide transportation network, which makes it essential for global business and tourism. It

plays a vital role in facilitating economic growth, particularly in developing countries.

Aviation transports over 2.2 billion passengers annually and facilitates world trade, helping countries participate in the global economy by increasing access to international markets and allowing globalization of production. The total value of goods transported by air represents 35% of all international trade.

Air transport is indispensable for tourism, which is a major engine of economic growth, particularly in developing economies. Over 40% of international tourists now travel by air.

Air transport improves productivity, by encouraging investment and innovation; improving business operations and efficiency; and allowing companies to attract high quality employees.

The air transport industry generates a total of 32 million jobs globally, through direct, indirect, induced and catalytic impacts. More than that, aviation's global economic impact (direct, indirect, induced and catalytic) is estimated at USD 3,560 billion, equivalent to 7.5% of world Gross Domestic Product (GDP). Some 2,000 airlines around the world operate a total fleet of 23,000 aircraft. They serve some 3,750 airports through a route network of several million kilometres managed by around 160 air navigation service.

Air transport is a highly efficient user of resources and infrastructure. Its occupancy rates exceed by far those of road and rail transportation. Air transport pays its way and invests substantially in vital economic infrastructure. Unlike other transport modes, the air transport industry pays for its own infrastructure costs (i.e. runways, airport terminals, air traffic control), rather than these being financed through taxation and public investment or subsidy (as is typically the case

for road and railways). Companies in the air transport industry also make substantial tax payments to national treasuries.

Air transport contributes to sustainable development. By facilitating tourism and trade, it generates economic growth, provides jobs, improves living standards, alleviates poverty, increases revenues from taxes, and fosters the conservation of protected areas.

Air transport is often the only means of transportation to/from remote areas, and promotes social inclusion by connecting those living in such communities with the rest of their country. The air transport network facilitates the delivery of emergency and humanitarian aid relief anywhere on earth, and ensures the swift delivery of medical supplies and organs for transplantation.

Air transport improves quality of life by broadening people's leisure and cultural experiences. It provides a wide choice of holiday destinations around the world and an affordable means to visit distant friends and relatives.

2. Air transport is responsibly reducing its environmental impact

Air transport's contribution to climate change represents 2% of man-made CO₂ emissions and this could reach 3% by 2050, according to updated figures from the Intergovernmental Panel on Climate Change (IPCC). This evolution is based on a growth in aviation CO₂ emissions of 2-3% per year, with an annual traffic growth of 5%. The air transport industry is now working towards carbon-neutral growth – no increase in carbon emissions in spite of traffic growth – as a first step towards a carbonfree future.

Aircraft entering today's fleet are 70% more fuel-efficient than 40 years ago, consuming 3.5 litres per passenger per 100 km. The Airbus A380 and the Boeing 787 – consuming less than 3 litres/100pkm – compare favourably with small family cars. The statistics show that 25 million tonnes of CO₂ have been saved in 2008-2009 through the shortening of hundreds of air routes, other air traffic management (ATM) improvements and aircraft operational savings and a further 25% fuel efficiency gain is targeted for 2020. Moreover, aircraft entering today's fleet are 20

decibels (dB) quieter than comparable aircraft 40 years ago. This represents a reduction of 75% in noise. Research programmes aim to achieve a further 50% reduction in noise and CO₂ emissions and an 80%.

3. The economic benefits of air transport - air transport generates employment and wealth

The air transport industry is a vital part of the increasingly globalised world economy, facilitating the growth of trade, tourism and international investment, and connecting people across continents.

Direct impacts - the air transport industry itself is a major direct generator of employment and economic activity, in airline and airport operations, aircraft maintenance, air traffic control and management and activities directly serving air passengers, such as check-in, baggage-handling, on-site retail and catering facilities. Not all of these activities necessarily happen at an airport, with some taking place at head office. Direct impacts also include the activities of aerospace manufacturers selling aircraft and components to airlines and related businesses. Providing these services generated almost 5.5 million direct jobs globally in 2009 within the air transport industry and contributed USD 408 billion to global GDP. This is as large a world industry as the pharmaceuticals sector.

Figure 1 - Direct employment by sector in the air transport industry (2009)

Of the 5.5 million jobs directly generated by the air transport industry:

- 780,000 people work in the civil aerospace sector, involved in the manufacture of aircraft systems, frames and engines, etc.
- 2.0 million people work for airlines or handling agents, including flight crew, check-in staff, maintenance crew, etc.
- 380,000 people are employed by airport operators, in airport management, maintenance, security, etc.
- 2.3 million have other jobs on-site at airports – for example, in retail outlets, restaurants, hotels, etc.

Figure 2 - Global economic impact – GDP in billions of USD

Induced impacts - the spending of those directly or indirectly employed in the air transport sector supports jobs in industries such as retail outlets, companies producing consumer goods and a range of service industries (e.g. banks, restaurants, etc.). 2.9 million induced jobs globally are supported through employees in the air transport industry (whether direct or indirect) using their income to purchase goods and services for their own consumption. The induced contribution to global GDP is estimated at USD 220 billion in 2009.

4. Air transport generates wider catalytic (spin-off) benefits

The air transport industry's most important economic contribution is through its impact on the performance of other industries and as a facilitator of their growth. These "catalytic" or "spin-off" benefits of air transport affect industries across the whole spectrum of economic activity:

- Air transport facilitates world trade, helping countries participate in the global market by increasing access to international markets and allowing globalization of production.
- Air transport is indispensable for tourism, which is a major engine of economic growth globally, particularly in developing economies.
- Air transport improves productivity, by encouraging investment and innovation; improving business operations and efficiency; and allowing companies to attract high quality employees.

Air transport's influence on investment and innovation

Good air transport links influence where companies choose to invest. According to a survey, 52% of companies consider international transport links to be an essential factor when locating businesses in Europe. Similarly, other surveys have found that the investment decisions of firms in a wide range of countries have been significantly affected by the absence of good air transport links.

Moreover, air services are important in encouraging innovation. For example, they increase the size of the market in which firms operate, which means that the cost of research and development can be spread across a larger sales potential. They also enable networking and collaboration between organisations internationally, which facilitates the transfer of knowledge. Surveys have found that over a quarter of companies believe that innovation and investment in research and development would be quite badly affected if air transport services were constrained.

The economic catalytic impacts generated by air transport are greater than the combined direct/indirect/induced impacts.

Air transport's impact on business operations and efficiency

- Opening up new markets: Air services enable companies to expand in rapidly growing distant markets. They also expose companies to stiffer competition, encouraging them to become more efficient.
- Servicing and meeting customers: Air services allow more effective communication between companies and their clients, helping them make new sales and better meet the needs of existing customers.
- Improving production efficiency: Business is becoming increasingly global. Air services allow managers of multinational companies to visit overseas sites and subsidiaries in other countries; widen the range of suppliers and partners with whom firms can work; and facilitate the spread of best practice in business operations.
- Providing fast and reliable delivery of high-value products: The global supply chain is becoming increasingly dependent on the rapid and reliable movement of goods internationally, which only air transport can provide. Air services allow firms to shorten delivery times, minimize inventory costs and limit interruptions to production. In addition, customers increasingly demand fast delivery and efficient handling of product returns and replacement, particularly as Internet shopping and e-commerce expand.

Air transport's impact on the labour market

Air transport also enhances the competitiveness of business by making it easier for companies to attract high quality employees from around the globe. This is particularly important for senior staff and professionals for whom access to good international links influences their decision on where to live and work.

5. Air transport contributes to world trade

Air transport is an important facilitator of international trade, thereby promoting economic growth and development. Forecasts suggest that the global economy will become even more dependent on trade over the next decade. World trade is expected to nearly double, rising at more than twice the rate of

global GDP growth, with China, India and emerging markets leading the way.

Airfreight's role in international trade

40% of the value of inter-regional trade in manufactured goods is transported by air. Larger amounts of traded goods within regions are transported by other modes, including road and rail. According to IATA estimates, the total value of goods transported by air in 2010 is estimated to have been over USD 3.5 trillion, representing 35% of all international trade. The air transport industry is vital to international trade in time-sensitive goods. Rapid delivery is particularly important to businesses whose customers are running streamlined production processes or who need urgent delivery of spare parts for machinery and equipment, as well as for exporters of perishable products such as food and flowers (many of whom are in developing countries).

Passenger air services' role in international trade

Passenger air services are also vital for international trade: around two-thirds of companies consider air services to be vital or very important for sales and marketing, enabling them to meet potential customers. And air services are important for the growing trade in financial and business services globally, estimated to be worth USD 1,380 billion in 2006. While technologies such as videoconferencing can be very helpful, many companies still consider flying for face-to-face meetings to be essential for winning new business and developing client relationships.

6. Air transport stimulates tourism

Tourism makes a major contribution to the global economy. It directly contributed USD 1,830 billion to world GDP in 2009 and generated 79 million direct jobs globally – 2.8% of total employment. By 2018, the World Travel & Tourism Council (WTTC) expects the tourism industry to employ directly more than 98 million people globally.

The air transport industry plays a major role in supporting tourism. Over 40% of international tourists now travel by air, up from 35% in 1990. At the same time, the WTTC estimates that foreign visitors account for just under 25% of overall tourism spending around the world. This includes spending by

business travellers, as well as those on leisure trips or visiting friends and relatives. Tourism is particularly important in many developing countries, where it is a key part of economic development strategies. In Africa, for example, the jobs of an estimated 1.5 million people directly employed in tourism are supported by overseas visitors arriving by air, representing 25% of all tourism jobs in Africa.

The contribution of air transport to tourism employment and GDP

Direct: 7.7 million direct jobs in tourism globally are estimated to be supported by the spending of foreign visitors arriving by air. This includes jobs in industries such as hotels, restaurants, visitor attractions, local transport, car rental, etc., but it does not include air transport industry jobs.

Indirect: A further 6.0 million indirect jobs in industries supplying the tourism industry are supported by visitors arriving by air.

Induced: These direct and indirect tourism jobs supported by air transport generate a further 3.4 million jobs in other parts of the economy, through employees spending their earnings on other goods and services.

7. Air transport is a significant tax payer

Unlike other transport modes, the air transport industry directly pays for its own infrastructure costs (i.e. runways, airport terminals, air traffic control), rather than these being financed through taxation and public investment or subsidies (as is typically the case for road and railways). In addition, companies in the air transport industry make significant tax payments to national treasuries.

Levying user charges - the air transport industry covers its infrastructure costs (airport operations and air traffic management) through the payment of user charges by airlines to airports and air navigation services providers. These charges, which totalled USD 42 billion in 2009, are generally included – and sometimes explicitly identified – in the price of the airline ticket.

Levying taxation - the air transport industry pays substantial taxes to local, provincial and national authorities around the world via aircraft or passenger duties, domestic value-added tax (VAT), customs or

immigration levies, etc. In the United States, for example, taxes and fees levied on aviation were about USD 16 billion in 2006, corresponding to 26% of airfares.

Air transport is the only transport mode that fully pays for its own infrastructure - the user charges collected by airport operators pay both for the day-to-day services they provide to airlines and their customers, and also for the massive investment in runways, terminals and other infrastructure required for a modern, efficient air transport service. In contrast, while road users pay fuel duties and vehicle excise taxes, most governments fund their countries' investment in new highways and in road maintenance. User charges are typically not applied as such except in the form of a toll charge on some highways. Moreover, as well as receiving public support for infrastructure investment, most States heavily subsidise their rail sectors. In Europe, for example, governmental aid to the rail sector is USD 70 billion per year.

Air transport makes a net contribution to public funds in the developed world - according to a recent study, air transport frequently makes a net contribution to public funds. This study compares road, rail and aviation in terms of infrastructure costs versus taxes and charges per 1,000 revenue-kilometre (000 rkm):

- Germany: Aviation infrastructure costs represent USD 112 per 000 rkm, while user charges and taxes generate USD 125, thus resulting in a net surplus of USD 13 per 000 rkm. Conversely, revenues from German rail users represent USD 41 per 000 rkm, while infrastructure costs amount to USD 107, resulting in a public subsidy of USD 66 per 000 rkm.
- France: The situation is comparable with a net contribution of aviation to public funds of around USD 83 per 000 rkm and government subsidies for rail of USD 97.

8. The social benefits of air transport

The impact of the air transport industry is not just a result of the economic activity it generates or facilitates. Air transport also contributes to people's quality of life in a number of other ways that are not captured in standard economic indicators: for example, by

contributing to sustainable development, supporting remote communities, providing humanitarian aid and widening consumer choice.

Air transport contributes to sustainable development by supporting and promoting international tourism. Tourism helps reduce poverty by generating economic growth, providing employment opportunities, increasing tax collection and fostering the development and conservation of protected areas and the environment. This is particularly important in Africa, which is home to nearly 15% of the total protected areas worldwide, and where many countries are seeking to develop nature-based tourism for international visitors.

Air transport provides access to remote areas - where other transport modes are limited. Many essential services, such as food deliveries, hospitals, education and post, would not be available for people in such locations without air services. And residents would be isolated from family, friends and business contacts.

Air transport delivers humanitarian aid - it play an essential role in humanitarian assistance to countries facing natural disasters, famine and war – through cargo deliveries, refugee transfers or the evacuation of people trapped by natural disasters. They are particularly important in situations where access is a problem – for example, ‘air drops’ are among the first response of aid agencies to stem a humanitarian crisis. Air transport also plays a vital role in the rapid delivery of medical supplies and organs for transplantation worldwide.

Air transport contributes to consumer welfare - travel and tourism provide substantial consumer welfare and social benefits:

- Making foreign travel and a wider range of holidays available – international air travel from China, India and other emerging markets is increasing particularly rapidly as their residents’ living standards improve.
- Increasing understanding of different cultures and nationalities, which facilitates closer international integration.
- Supporting the development of multicultural societies – allowing immigrants to maintain

contact with their friends and relatives at home.

- Improving living standards by widening choice – seasonal fruit and vegetables, for example, are now available year round at reasonable prices. Meeting the needs of overseas visitors has also helped widen the range of leisure and cultural activities available in many countries.

9. Conclusions

The air transport industry is an innovative and environmentally responsible industry that drives economic and social progress. The growing availability of affordable air travel has considerably widened aviation’s role in our global society. *Flying is no longer a luxury!*

The air transport industry is responding to the growing demand for mobility by investing heavily in:

- technological innovation;
- safety and security improvements;
- fleet renewal with quieter and more fuel efficient aircraft;
- airport, air route and air traffic management enhancements;
- business simplification and improved customer services.

The industry’s efforts must be matched by government action to:

- further liberalise aviation markets without micro-managing air transport nor over-taxing it;
- support infrastructure improvements by approving essential increases in airport capacity as well as new and shorter routes;
- provide a global framework for a sustainable mass transportation system, which is not based on national rules and without distorting competition between industries and transportation means.

Risk Characteristics and Their Impact on Tourism Industry

GHEORGHE Camelia
Romanian-American University
gheorghe.camelia.monica@profesor.rau.ro
CIUCHETE Stela Georgiana

georgiana_ciuchete@yahoo.com

Abstract

Tourism and air transport are the areas most vulnerable to change public perception. News media about earthquakes, terrorist attacks, violent conflict or emerging infectious disease in an area determined tourists to cancel trips or change their holiday plans. The impact of these events on the airline business or the destination can be very powerful, sometimes requiring long periods to return to normal.

Key words: tourism, air transport, public perception

JEL classification: L9

1. Introduction

Tourism is by nature an area exposed to natural disasters of all types, such as: hurricanes, tsunamis and earthquakes (eg, Hurricane Katrina in 2005 in the USA, the 2004 tsunamis in Indonesia, earthquakes in San Francisco in 1989 and in 1999 in Taiwan), extended droughts and associated fires, etc. Direct effects of such events are shown by the impact of tourism infrastructure (transport, communications, electricity), by the damage of the tourism superstructure (accommodation and recreational facilities) and environmental damage, the raw material of tourism (beaches, forests, fauna, monuments, etc.). Their impact on tourism demand depends on a variety of factors, including their intensity and magnitude of the frequency with which they held (and thus the likelihood of recurrence) and the period during they are produced (season or low season). Moreover, the time necessary for returning to the circuit as a

tourist destination is influenced by the period of reconstruction the infrastructure and superstructure destroyed or damaged and the ability of media to reassure visitors that the risk of recurrence was reduced or eliminated. In undeveloped countries and areas with economic problems, rapid reconstruction can be reduced for lack of resources to develop and implement appropriate strategies. Meanwhile, the affected regions are facing a problem that an economically developed countries experience a much lower level: governments often exaggerate the damage intensity in trying to get international aid for reconstruction and minimizes the tourism industry destruction to persuade tourists to return as quickly and so to continue the activity.

2. Sources of risk

Regarding the safety of visitors, host communities and tourism employees, there are identified four major sources of risk [4 p. 56]:

1. Human and institutional environment - the risk exists where tourists can become victims of common delinquency (theft, fraud, assault, etc.), of violence, harassment, organized crime (embezzlement, the slave trade, coercion), of terrorism and illegal intervention (attacks against state institutions and the vital interests of the state), of deflections and taking of hostages, of wars, social conflicts and political and religious turmoil, weak protection of public and institutional services.

2. Tourism and adjacent sectors - can become sources of risk and personal security of visitors, physical integrity and economic interests in the absence or because of the superficiality of safety standards in tourist

establishments (faulty workmanship, lack of protection of anti-seismic or fire, etc.), inadequate sanitation and lack of respect for sustainable development, lack of protection against illegal activities, crime and delinquency in tourism facilities, fraud in commercial transactions, breach of contracts and litigation staff.

3. Individual tourists - can jeopardize their own safety and security, and host communities through: dangerous sports and activities, by eating unhealthy foods and beverages, by causing conflicts among residents as a result of inappropriate behavior besides local communities or through failure to comply with local rules or by visiting dangerous areas through such illegal activities (drug traffic, etc.)

4. Physical and environmental risks - can occur if the tourists are not aware of the natural characteristics of destination, especially of flora and fauna, if they are not prepared to travel from the medical point of view (vaccination, prophylaxis), are exposed to hazardous situations arising from physical environment. Physical and environmental risks are largely the results of ignorance of tourists regarding travel.

In addition to the above, it can be identified risks relating to both tourists and economic entities engaged in tourism:

A. Risks regarding organizing of travel - they may occur when there is bankruptcy of the organizer, the tour-operator agency, transportation company and tourists can lose some of the value holidays or at worst, its full value. Most events of this type are however covered by insurance, but reimbursement of amounts due from customers may vary from case to case.

B. Risks regarding the quality of service at the destination - occur when tourists were wrongly informed by the organizer of the package holiday, by the distributor or the travel agent. In this situation, according to individual contract concluded with the dealer to purchase the package, the tourist can inform responsible society, call upon the authorities and may recover part or the entire amount spent or can act in court.

In general, the risk perception of tourists travel is an image based on the likelihood of negative consequences associated with decisions and tourist behavior. The risk is not

a tangible part of the journey, but is what tourists perceive and experience during the purchase and consumption of tourist services. In addition, travel risk perception is one of the major factors that can influence decision making regarding choice tourist destination and purchase services. By its nature, tourism is a segment of the services sector with unique characteristics (intangibility, inseparability, variability and perishability), which may increase risk perception compared with the purchase of tangible products. Moreover, tourism is affected by other specific risk factors, such as the possibility of bad weather, wary communities, discontinuities of travel caused by economic events, lack of adaptation to local gastronomy, terrorism, conflict, crime, political unrest, epidemics, natural disasters. These factors may influence the risk perception of travel experienced by tourists, and therefore, the decision to spend the holidays.

Regarding the risk analysis and valuation of the consumer sphere, there are identified the following: quantitative sources of risk, qualitative risk factors, variables that influence consumer and differentiate risk factors, such as criminal or terrorist threats.[3 p. 112]

The most important elements of quantitative risk assessment of the sources are the probability of appearance and the magnitude of damage. Both variables may be the result of distorted perceptions, subjective, dependent on various influences, and using in this situation of some mental practices of the consumer is the act that may lead to a distortion of the probability effects. Practices used for this purpose are mainly based on reality, as a direct result of experience; both are characterized by stability, which allows external observers, aided by their knowledge, to create situations of a possible behavior consumer. Such a situation can be illustrated by highlighting the temporal component for double interview, at an interval of one month, a number of 500 subjects, after the terrorist attacks of September 11, 2001. Thus, the question whether the terrorist attacks and their consequences have had an impact on travel behavior in terms of future travel for tourism, in November 2001, one month after the event, 65% of subjects responded negatively, 29% positive and remaining 6% stated that they do not know. Three months later, at the same

question, same subjects gave negative responses in a proportion of 69%, positive responses - 14% and 17% were undecided.

Risk assessment is performed by a number of *qualitative characteristics*. Among them, the voluntary assumption of risk is acceptable in a less tragic than the dangers imposed. This is important because visitors have to have the opportunity to voluntarily assume risk. Thus, bold advertising that distorts reality, not only producing dissatisfaction to tourists, but it can deprive the opportunity to decide themselves whether or not assume risk.

Risk factors depend on a number of *demographic variables* such as age, gender and education, but also on the cultural environment from which the consumers. Thus, women have a deeper perception of risk than men, and young people aged 18-24 years perceive it more shallow than those older. Regarding the cultural and tourist education, an example is that after the nuclear accident at Chernobyl, 80% of tourists from Scandinavia had have travel insurance if headed to the region, while the percentage of Spaniards who adopted the decision was only 20%.

In addition, however, caused panic among tourists belonging to a national group can have disastrous effects on tourism. For example, Miami was known as a destination where the crime rate exceeded the average, but a murder on a German tourist in 1993 caused a pronounced decline in the number of German visitors. This means that, for tourists, there is a big difference between being subjected to threats and become potential victims themselves. Criminal activities are an ongoing part of everyday life, but in the context of tourism, it gets much deeper values, so that tourist activities (discovery of new places, to new activities, risk taking) are vulnerable targets of tourists, and material damage is not as important as are the intangible, which can exacerbate vulnerability or damage the positive image about holidays spent.

If the level of risk perception is higher than the personal boundaries of each individual bear, the tourist will seek to reduce risk exposure by canceling or changing travel destination. Typically, the value of these limits are reached quickly in case of a discretionary tourism product than a tangible product. Therefore, risk perception has a direct impact and can result in losses larger than those

caused by the event itself. Researchers found, too, that the perception of risk has a much stronger influence in terms of avoiding a specific region than in the decision to visit a certain area (for example, those who fear the risk of terrorism are likely to avoid in moving the Middle East).

Some tourist destinations are associated with a higher risk than others. For example, the Caribbean is located on the path of hurricanes, and therefore is more exposed to storms of this magnitude than most of the regions in Europe. Some Middle East states have experienced long periods of controversial political statements, so that area might seem more risky for potential visitors. Other countries have suffered due to natural or human hazards, what has brought media attention, this causing an increase in risk perception among potential visitors. Indonesia, for example, is a destination that has been subject to major natural disasters, and, in addition, to terrorist attacks in recent years. All this had a negative impact on the tourism industry, both nationally and internationally.

Tourism is sensitive not only to natural disasters, but may be affected by human produced events, such as outbreaks of war, terrorist attacks or political issues (Tiananmen Square in 1989, the war in former Yugoslavia in 1990, the 1991 Gulf War, attacks in Luxor in 1997). In addition, regarding the impact on travel industry, tourists have become primary targets of terrorist acts to try perpetrators of receiving increased media attention. Most acts of violence have played an overwhelming role in the decision making process of travel, creating fear and uncertainty among consumers and raising barriers to organizing holidays, thereby limiting the development industry.

Tourists can perceive terrorism as having a greater risk than natural disasters when traveling to a particular destination. Natural disasters are relatively rare and, unlike the terrorist attacks are not particularly focused on harm tourists. Moreover, if taking into account travel to volatile political areas such as Middle East countries, visitors are more concerned about problems caused by humans than natural ones.

In recent years, the perception of risk associated with terrorist travel suffered essential changes because of higher magnitude

and frequency of attacks. If in the past they were held to a relatively small scale, the events of September 11, 2001, terrorist attacks in Bali in 2002 and 2005, bombings in Madrid in 2004, incidents in Turkey and Egypt in 2005 and attacks on transport network London in 2005 have made of terrorism risk an important issue at international tourism industry. The extent to which tourists perceive the risks of terrorism depends on the region who travel often, the characteristics of each incident and the news that they report.

If the disasters of any kind can affect any destination, the time needed to reconstruction varies significantly from one destination to another. Among the factors explaining differences in time in terms of rehabilitation, the most important are: when the attack occurred, the development of the tourism industry in the region, the magnitude of the attack, frequency of attacks and responses to the event.

In the same context, the International Labour Organization said that the period following the terrorist attacks of September 11, 2001 brought a loss of jobs in the tourism industry and involved in air transport by more than 11 million people, which meant 1 / 7 of total employment. CEO of International Air Transport Association reported in 2003 that the war in Iraq has cost international airlines over \$ 10 billion, the loss suffered putting it on the second place after the \$ 30 billion due by September 11. Meanwhile, a study by the Tourism Association of America estimated that over 70% of Americans were not interested in vacations abroad.

3. Impact of negative events on tourism industry

Studies on the impact of terrorist acts on the tourism industry in 6 states where tourism is an important, showed the evolution of indicator "number of arrivals" before, during and after the event (Fig. 1) (statement captures the effects of terrorist attacks in the U.S. in 2001, Spain in 2004, Kenya in 2002, United Kingdom in 2005, Indonesia in 2002 and Egypt in 2004).

Figure 1 - The effect of terrorism attacks on the number of arrivals

Considering that (-1) is the year before the attack, (0) the year of the attack and (1) year thereafter, it is interesting to note how the six states were divided into two groups: on the one hand, Egypt, Indonesia and the United States, which saw a decline in the number of tourists in the year following the attacks, and the other part of Kenya, Spain and Great Britain, whose number of tourists increased from year to attacks. One explanation may be that the situation in Egypt and Indonesia, attacks were directed mainly to international tourists, while the events in Madrid and London were targeted transport system. U.S. attacks were unprecedented and shocked the whole world, while those in Kenya have focused mostly on Israeli visitors.

Figure 2 - The effect of terrorism attacks on tourism expenditure

It is also important to note that all these countries have invested heavily in advertising campaigns after the events, therefore, in addition to the indicator described above, the analysis of tourist expenditure is a problem that should not be neglected (Fig. 2). When the tourism industry is under pressure and tries to recover after some shock, it is not surprising that tour-operators and tourist destinations make massive price cuts to turn into a competitive destination and to attract both more visitors. Moreover, it is expected that interest expenses decreased to know a much stronger pace than the decline in the number of visitors.

The model of evolution of tourism expenditure in the same period and for the same 6 countries (Fig. 2) confirmed that the 3 countries that suffered the greatest losses in terms of tourist arrivals had followed the same decline in tourism expenditures, while countries that retained or received a higher number of visitors increases in case of volume of revenue.

Regarding the lower tourism expenditure, this is manifested both by reducing tariffs to accommodation and air tickets. For example, the air fares have dropped dramatically after September 11, 2001, in an attempt to persuade passengers to return without fear of further attacks. Moreover, the growth of low cost airlines has stimulated lower air fares at a time the price of oil has seen a substantial increase. However, it is easy to see that these measures were insufficient in the immediate aftermath of attacks in the U.S. to recover the trajectory volume tourism expenditure.

4. Conclusions

It is therefore important to note that the tourism industry risks are different both in nature and the large coverage area. Risks are not only the likelihood of simple events, but may have major negative effects on tourists, tourism employees, local communities, businesses, infrastructure and community resources. Moreover, they may exceed the capacity of community resources and facilities available for managing an immediate response and long term can cause problems in terms of restoration and rehabilitation.

The Social Responsibility Influence of Corporations on Sustainable Development

GRIGORESCU Adriana

National School of Political Studies and Public Administration of Bucharest

adrianag@snsa.ro

SASEANU Andreea

Academy of Economic Studies Bucharest

saseanu@yahoo.com

Abstract

The social responsibility of corporations is a concept that refers to the debt which companies (as social actors) has with respect to all the parties involved in the development of actions presupposed by their economic activity. The concept refers to all categories of companies, from micro-enterprises, up to multinational companies. The companies' task in the social responsibility of corporations refers to the fact that the respective company has to act bearing in mind the consequences, positive or negative, caused by their activities into the society, the company having the obligation of minimizing the negative effects.

Key words: social responsibility, sustainable development, European Union, OECD

JEL classification: R11

1. Introduction

The social responsibility of corporations or CSR (Corporate Social Responsibility) refers to the way in which businesses balance their values and behavior with the expectations and needs of the interested parties – not only of the clients and shareholders, but also of the employees, suppliers, communities, authorities and of the company as a whole. Balancing all of these interests, the company's ability to meet all of these expectations and to bring solutions have to be realized in an organized manner by totally integrating the concept of social responsibility within the management systems and, consequently, in all the

companies' activities, in the organizational culture, in the essence of the business.

This integration process is realized in time and in conformity with some governing principles, with some managerial models and regularly in the framework of certain agreements which the companies sign at a global level with international organisms. Therefore, international norms and standards are imposed in order to ensure measuring and comparing the performances attained by the companies with regard to CSR.

Important Romanian companies are implementing the CSR framework according with the main international approaches. An example is Petrom, a company dealing in petrol distribution.

2. International framework

From the international institutions perspective, CSR (Corporate Social Responsibility), is an idea which refers to the contribution that the companies should have to the modern society development.

As the states and international institutions realized that adopting the CSR principles by the companies serves the sustainable development objectives, consequently appeared the need of certain international standards in order to define what a „desirable corporate behavior” means.

The United Nations, European Union and the Organization for Economic Co-operation and Development are three of the most important institutions involved in the elaboration of a framework to define CSR and establish the indicators for a transparent evaluation.

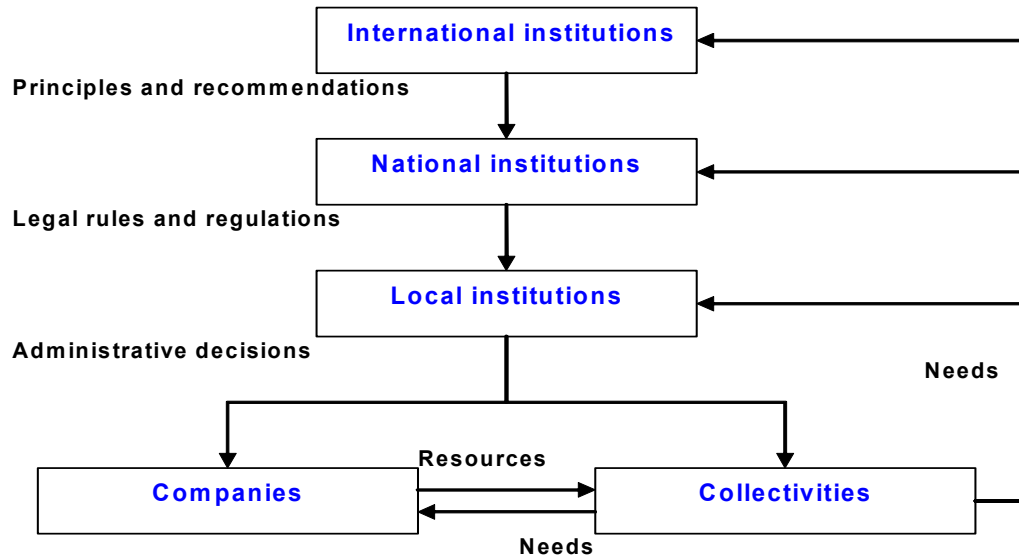

Fig. no. 1 Presentation of CSR

This framework was accompanied by recommendations and principles that would guide the states and local authorities in formulating public policies in order to promote, ensure transparency and support the CSR initiatives.

By analyzing figure 1, we can say that a company is “socially responsible”, if it knows the CSR principles internationally promoted and it aims at its integration locally.

If, before the year 2000, sustainable development was a subject approached in macro-economical terms, nowadays it is especially debated in micro-economical terms, at the level of economic entities. This subject mainly regards the large multinational corporations, considering their turnover and presence in all the countries of the world, including those in which the respect for human rights or the fight against corruption do not constitute a priority of the governments.

Generally, sustainable development applied at the level of corporations and economic entities materialized in the concept of “social responsibility of corporations”. The European Commission in the “Green paper” dedicated to this concept defines it as follows: “The voluntary integration by the companies, of social and environmental preoccupations in their economic activities and in their relation with the stakeholders”.

This definition raises three fundamental principles:

- Voluntary action of the companies;
- Triple approach: economical, social and environmental;
- Reporting to the companies’ stakeholders.

Sustainability and responsibility have been reunited under the „umbrella” of social responsibility of corporations (CSR- Corporate Social Responsibility), which became a global movement.

As the welfare of a country is not only measured in its GDP, but also in the aspects of education, health, freedom of speech, income allocation etc., in the same way, the state of an economic entity is no longer evaluated solely through the financial result. A large part of the companies’ capital is presently non-corporate, founded especially on people’s intelligence and less on infrastructure. It is related to image, brand, to passing from quantity to quality.

Offering only inexpensive products and services is no longer sufficient. Companies must also offer guaranties with regard to the origin of the raw materials, manufacturing or purchasing conditions, respecting the environment and human rights. Clients get more easily attached to ethical products, even though they are sometimes more expensive. Ethics is present nowadays at the Stock Market (Stock Market Indexes of corporate social responsibility), among the banks’ criteria for granting loans (McDonough ratio) and the investors’ criteria for placing their

capital. Last but not least, ethics is a demand of the local communities and public authorities. Therefore, the interests of corporations can no longer advance independently from the stakeholders who ensure their durability: shareholders, employees, consumers/ customers, suppliers, subcontractors, population, authorities. The companies stand before a challenge: that of conciliating all of these interests, which is not related with generosity, but with lucidity and intelligence.

European Union is interested in CSR, which considers to be a means to the end established at the European Council from Lisbon, from the year 2000 of becoming „**the most competitive and dynamic economic system in the world, able to sustain the economic development through more and better jobs and more efficient social cohesion.**”

In order to guide the companies in the CSR implementation, the European Union has also elaborated a series of principles, which aim at two dimensions of the relationship between the company and community:

3. The internal dimension

In the direct relation with the employees, the companies have the responsibility to:

- Ensure the improvement in the lives of the employees, in the workplace and outside the workplace.
- Ensure a safe and healthy work.
- To responsibly approach the restructurings in the case of a crisis, taking into consideration the interests of all the stakeholders.
- To minimize the impact of the activities undergone on the environment and natural resources.

4. The external dimension

In the relation with all their stakeholders, the companies should:

- Support the development of the communities where they activate.
- Support the development of the local economic systems by signing partnerships with local distributors.

- Respect human rights stipulated in the Universal Declaration of Human Rights from 1948.

- Protect and encourage the protection of the environment at a global scale.

European Union recommends companies to integrate these principles within their code of conduct and to report on the way in which they have been applied.

The Organization for Economic Co-operation and Development (OECD) developed from the Organization for Economic Co-operation (OEEC), founded from 1947 in order to support the Marshall Plan implementation.

Created as an economic homologue of NATO, OECD took over the responsibilities of OEEC in 1961. The mission of the organization is to help the states to reach sustainable development on an economic plan.

5. OECD Perspective

In order to coordinate the companies' actions to reach sustainable development at a global scale, the OECD has elaborated, in 1976, “Guidelines for Multinational Enterprises” – a series of guidelines that have to be taken into consideration by any company, regardless of the domain in which they activate, aiming at the human rights, environment protection, the consumers' interests, corruption and competition. In the year 2000, the revised variant of the “Guidelines for Multinational Enterprises” was published.

According to “OECD Guidelines” the companies should:

- contribute at the economic, social and environmental development, supporting the principle of sustainable development;
- respect human rights in all the activities they carry on;
- encourage the development of local communities;
- not accept exemptions that are not included within the local legislative framework related to the environment, health, security, work and taxation;
- support and apply the equitable principles and practices of company management;
- develop and apply efficient management systems for establishing a relation of

confidence with the societies in which they activate;

- promote the company's values in front of the employees through training programs;
- not discriminate and not sanction the individuals or institutions that warn the management team of the company's irregular practices;
- encourage business partners to apply the "OECD Guidelines";
- not involve unjustifiably in local political activities.

The European Union and the governments of the States Member OECD support the principles stipulated in the "Guidelines".

6. Social impact

The current global context is characterized by the emergence of a relation of forces in the economic-financial game; forces of constraint for corporations, which generate legal risks and especially reputation risks which could affect the performance, as well as the durability of multinational corporations.

With regard to multinational companies, the public opinion expresses increasing demands of transparency and responsibility. The impact of the public opinion within the society often has repercussions in a reactive and remonstrative manner. The source of this attitude is the suspicion manifested towards the large companies. Losing confidence in the company, as an institution, is mostly caused by the painful experience of industrial mutations and workplace instability, as a consequence of the delocalization.

The role of large multinational companies is a complex one, nowadays, these companies being actors with full responsibilities in the social context. The corporations' legitimacy is conditioned by general interest criteria for the society which they cannot avoid. Peter Drucker stated: "In the society that follows, the largest challenge for a broad-reach company – especially a multinational one – will undoubtedly be its social legitimacy: its values, its mission and its vision."

Civil society acknowledges the legitimacy of the companies responsible socially and towards the environment, through various instruments: taxes, administrative authorizations, specialized notification

agencies, Stock Market Indexes for social responsibility, granting awards, through labeling, etc. The Civil society has the obligation to put pressure in the sense of promoting laws, regulations and standards of excellence with regard to the corporate social responsibility.

7. Petrom example

For instance, within the company Petrom, through the CSR programs, expressed by the slogan "Respect for the Future!", the company is trying to take into consideration the needs of their current customers, as well as the interest of the future generations related to environment protection and to the sustainable development of the society. The company is conducting CSR projects in order to support the employees of Petrom, the Education, Sports, Environment Protection, Quality and Local Communities.

In order to support the Petrom employees, through the "Think Ahead" program there has been organized a series of information campaigns with respect to environment protection. In addition, Petrom has performed programs to inform and train vulnerable communities with respect to disasters, together with the Romanian Red Cross. In order to support the Education, the CSR policy of the group initiated the "Petrom Olympics" project, which granted support to 1300 children and young performers in sports, art, literature, computer science, chemistry etc. by offering grants for their affirmation in nationally and internationally known competitions.

The „Respect for the Future” program aims at helping the employees and the communities become aware about responsibly using the natural resources.

In the domain of environment protection, Petrom has launched "Parks of the Future", one of the largest projects of green spaces rehabilitation. The latter project has been awarded the highest distinction, Golden Award for Excellence at the Romanian PR Award.

The most recent award received by the Petrom project was bestowed from the European Excellence Awards in Berlin. "Parks of the Future" was nominated in the top 5 companies from the South-Eastern Europe,

being selected from a number of more than 600 registered from the entire European continent.

In the context of the constant transformation and regulation of CSR, the dimension produced by its voluntary character offers an unlimited exploration space for managers in which the art of being a manager can conciliate utility, efficiency and personal fulfillment, can ensure at the same time the durability of the company and harmonizing the relations with the society.

8. Conclusions

Corporate social responsibility (CSR) has expanded into the business environment and does no longer represent the privilege of some pioneer companies, but has transformed into a necessity to all multinational companies that have embarked into the globalization game. The market is expanding, the responsibilities are increasing. The integration of social responsibility, as we have seen, is a complex process and which is elaborated on a long term. The economic environment is characterized by rapid transformations which require a rapid adaptation. In this context, risk management and the integration of social responsibility are essential to any company.

As we have demonstrated, CSR is not only a reactive and defensive commitment, but, first of all, proactive. Therefore, CSR becomes a

space of strategic exploration, a challenge for the managers, an instrument to harmonize the companies' relationship with the environment in which they activate.

Public Goods in the Global Economy

ILIESCU Elena Mihaela
"Titu Maiorescu" University of Bucharest
mag_mihaela@yahoo.com
CONSTANTINESCU Maria Florentina
Court of Accounts of Romania
lenk_r@yahoo.com

Abstract

Given the path that on which the economic life has irreversibly entered and the fact that economic business results have a direct impact on the environment overall, both theorists and directly involved subjects in the global economy, puts more emphasis on the concept of global public good.

The concept of a global public good is in fact the global economy, an extension of the concept of public good. In order for a public good to be considered a global public good has to fulfill the quasi-universality of the benefits arising from its use by the countries, nations and generations. As a result, the role of the international organizations is emphasized regarding the production of global public goods.

Inge Kaul argues that ONU is the home of the global public goods, and sees the organization as the intermediary global public goods, called to produce final global public goods, such as peace, security and global justice.

Charles Wyplosz designates the financial stability as a global public good. The viability of the claim is sustained by the current context of the global economic crisis.

Epidemiological monitoring of overall health status is also an example of a global public good, confirmed by the global panic created by the influenza pandemics occurred in recent years.

We can conclude that global public goods management represents a starting point less abstract and less threatening for the national interests than for the global governance.

Key words: public goods, international organizations, ONU

JEL classification: H41

1. Introduction

Human existence assumes a permanent consumption of both private and public goods.

In the economic theory the two specific conditions of public goods are very well known:

1. Non-rivalry in consumption
2. Non-exclusivity.

Given the path on which the economic life has irreversibly entered and that the results of economic activities have a direct impact on the global environment, both the theorist and the directly involved subjects in the global economy, puts more emphasis on the concept of global public good.

The concept of a global public good, in fact constitutes within the global economy, an extension of the public good concept, adding a third conditions to the two already known conditions: the availability around the world.

Therefore, for a public good to be considered global public good it has to meet the condition of quasi-universality of the benefits arising from its use by the countries, nations and generations.

The benefits of these goods must reach a broad spectrum of countries and groups of people and meet the needs of present generations without jeopardizing those of future generations.

From this perspective, we can say that the humanity is the beneficiary of the global public goods, involving without doubt, an international cooperation at all levels. Therefore, we can't talk about good global governance without referring to its object – the global public goods.

2. Managing and providing global public goods

The starting point of all these reform attempts should be their management.

A fundamental role in contributing to the production, management and provisioning of public goods lies with ONU, being the international organization with the necessary structure and legitimacy for such a mission.

A major importance regarding the global public goods should be given to the international laws and regimes that produce the common pillars for development in transport, communications, trade, environmental protection, space and seas exploration, etc.

Peace and security represent the supreme example of global public goods, for the provisioning of which, on a global level, the globalization institutions are fully responsible. This is why the ONU reform must be supported by strengthening its capabilities to provide global public goods, the organization has a vital role in preventing and combating conflicts, in promoting sustainable development, development of human rights and of international law.

For goods such as peacekeeping, humanitarian assistance, public authorities' rehabilitation, construction and democratic governance benefit all legitimate protagonists, except only some local interest groups.

Opposite to these, Inge Kaul argues that ONU is the "home" of global public goods, and sees the organizations as an intermediate global public good, called to produce the final global public goods, such as peace, security and global justice.

As a result, the role of the international organizations on producing this global public good is emerging, having as levers of interventions:

- Operating with caution in promoting capital liberalization;
- Description of some conditions for its acceptance by individual countries;
- Avoidance of the overly restrictive macroeconomic policies and structural adjustment policies which were not effective;

- Supplementing the ex- post conditionality ex-ante conditionality;

Using only the two criteria of the public goods (non-rivalry and nonexclusive) is very difficult to identify the global public goods. Due to the world diversity and inequality among its actors, it is possible that some global public goods are more accessible to some than to others, without violating the two fundamental features.

With today's economic progress, intergenerational transmission of global public goods assumes new forms. Slowing down global warming, maintaining the ozone layer within normal levels, reducing disease, maintaining cultural and biological diversity have positive impacts on current and future generations.

The list of global public goods is always open, the examples being most diverse. Thus, this category would include equity and justice.

In order to maintain these assets rules are being issued which produce social cohesion and foster the appropriate level of cooperation without which the social conflicts can't be prevented or mitigated.

Accepting the idea that power of the nation-state has weakened, it follows that the provisioning of national public goods at a national level doesn't depend only on its own performance but also on how the globalization undermines or reinforces its ability to make decisions regarding benefits sharing.

Charles Wyplosz designates the financial stability as a global public good, through antithesis to the volatility of financial flows, characterized as a clear global "public bad".

The viability of this claim is strongly supported by the current context of the global economic crisis.

Opposite to the environmental qualification as a vital global public good there are no significant controversies. But disputes arose regarding the economic foundation of the great issues on conservation and environmental protection. Global warming is one of the most pressing global issues.

A very sensitive factor has been identified by Geoffrey Heal within the privatization of what was traditionally the state exclusivity in provisioning public goods and services.

Massive privatization led to increased negative externalities and hence to responsibilities reduction for producing the negative environmental consequences.

For example, the increase in the concentration of carbon dioxide in the atmosphere is, *inter alia*, the result of numerous individual or companies decisions, some located outside the governmental control.

It is for governments to intervene with regulatory and incentive measures of some environmental policies whose effectiveness would be limited in the absence of a comprehensive global policy.

Epidemiological monitoring of overall health status is also an example of a global public good. The global panic created by the pandemic influenza occurred in recent years clearly confirms the nature of global public good health of the world population. There are deep connections between the global health at a global level and epidemiological events, and also between the economic flows and global interest [5].

Many analysts consider the knowledge as a classic model of the global public good. For example, Stiglitz, stresses the importance of knowledge for development, giving it a major responsibility within the international community. He believes knowledge to be an essence of development, being complementary to the public or private capital [6].

Stiglitz also classifies information as a global public good. This feature is uncertain, however, because access to information depends on the possession of modern global communications.

New technologies represent a strategic investment, but the effect is that the market is an inappropriate tool to fairly generate and distribute information as a public good overall [7].

Also the public good nature of the technological knowledge and the fact that they can be always used without depletion, lead to some complex issues.

This is because generating innovations require specific institutions, in this case free markets being insufficient. For example, commercial innovation represents a product based on both scientific knowledge base (which are generally public) and on applied

engineering (based on patents which arises in private firms. In this respect a successful innovation requires an academic, government involvement and an industry to operate, actually difficult to put into practice in developing countries.

Global management of public goods is important to be made with the institutions' help and through regulations because:

- national laws are relative and changeable according to the changes in nation-states; are applicable to the companies or individuals on their territory. In globalization, the economic space than geographic area, but we cannot say the same about rules and institutions.

- it should be taken into account the nature of the followed rational economic behavior of individuals (utility maximization) and by businesses (maximizing profits).

This leads to externalities in production and consumption.

As a result of globalization, the externalities are increasingly felt across national borders. Although it is universally recognized the need for global governance institution, building institutions and binding international regulations for sovereign states, involves negotiations often from irreconcilable point of view, if seen only as occasions to defend the national interest.

The specifics of contemporary globalization such as reducing the power of national governments, not to be pursued by a growth in the international cooperation and global governance, makes national governance more difficult and the global governance inadequate.

The absence of global regulation due to the conflict between national sovereignty and global governance creates significant impact on the global economy.

If each nation acts solely in terms of self-interest, the result on a global level will be minimum, because each country will rely on other countries to cover the costs of a agreements which lead to the strengthening of global public goods.

In this context public goods will witness an excess of demand, and the public bad an excess of supply.

These issues are very evident in conservation.

Highlighting the two categories of global products is very important because it involves different ways of action. Limiting the global "bad" involves firstly self-restraint, while developing global public goods require positive contributions from all countries.

J. Stiglitz [8] groups the global public goods in six categories:

- I. global security;
- II. global economic stability;
- III. knowledge;
- IV. global environment;
- V. humanitarian assistance;
- VI. global health.

3. Global externalities

Providing these public goods represent the heart of global collective action.

If there are global public goods there is no doubt that global externalities exist also. These could be regulated by global institutions.

For this purpose ONU should not only seek to increase its role but also to encourage the mobilization of the international financial institutions' resources in joint projects.

This represents the interaction between economic global public goods handled by the international financial institutions and other international institutions.

For example there is a certain interdependence between global economic stability and global security.

Policies that lead to increased unemployment or drastic reduction of the income may lead to and often do lead to civil instability, ethnic conflicts, dispute within and between countries. Also the economic policies indifferent to the environmental quality are in general those that produce negative ecological consequences.

When they manifest globally, the counter-action must be done globally and the costs similarly divided.

Since international institutions provide global public goods, the expansion of demand will lead to the expansion of international organizations.

As a result, those international organizations and programs that comply with more current requirements will experience an appropriate dynamic.

We can conclude that global public goods management is a starting point less abstract and less threatening to national interests than global governance.

Abstract

Currently, the sense of responsibility opposite to their own professional development is more important than ever due to potential relocation of many economic activities worldwide, leading to the assessment of each job in terms that create value and unique skills that you can stake.

There are no "American" or "European" jobs in the globalized world, but there are jobs that will inevitably revert to the most able, intelligent, effective and cheap, regardless of where they come from or where they live. Experience proved that outsourcing labor is not only cheaper but more effective.

On this basis, Friedman built the inequation $CQ + PQ > IQ$, which expresses an absolute truth that whenever a very curious and passionate individual would be preferred to one with endowed with intelligence.

So for us to fold to this flat world, education, training and continuous transformation have an important role.

Keywords: outsourcing, jobs, global chain

JEL classification: M55

1. Introduction

In the context of current reality, the effects of globalization must be viewed also from the perspective of transition from the globalization of corporations to the globalization of the individual.

It is no longer a secret that those who work often have the feeling that their work is

integrated globally since: buy from someone in Australia, sell to someone in France and work with someone in India.

Currently, a sense of responsibility opposite to their own professional development is more important than ever due to the potential relocation of many economic activities worldwide, leading to the assessment of each job in terms of creating value and through unique skills that you can put in stake.

Therefore, the new reality, in order to make sure that your work will find its place in the global chain; you must understand how to compete successfully, how you can acquire the skills needed to work at the pace required. It is also desirable to do your job at least as good as anyone else in this world.

2. The role of labor as an input in the globalization process

All this happens in the globalized world, where work doesn't represent anymore the main input of production, but is the very essence of wealth. The capital tends to substitute labor, although it is the product of its accrual.

In the same line of thought, new technologies and the speed with which they change, require the allocation of education, training and continuous transformation.

In another line of thought, the external factors of labor end up by becoming more important than the work itself and compete, in any event, to the sensitive reduction its duration [1].

This aspect is very interestingly surprised by Th. Friedman in "The Earth is flat."

He says that it was never desirable to be mediocre at work, but within the world closed between "walls" mediocrity could offer you a decent wage with which you could do pretty well.

In the "flat" globalized world you don't want to be mediocre at your job because in countries like India and China are young people hungry with your job.

There aren't "American" or "European jobs in the globalized world ", there are only jobs that will inevitably revert only the most capable, intelligent, effective and cheap no matter where they come from or where they live.

The paradox is that now we talk more and talk about labor when its functions are being reduced.

The new market organization focuses on labor flexibility, change, mobility at the expense of trust between colleagues, of loyalty and fidelity to the institution or company. The wage contract resembles more likely to a commercial one, which is under continuous negotiations, offering to the labor market a more "mercenary" aspect.

Salaries are confidential and individualized, each trying to save himself and to make the best of the short-term risks and exposing himself to danger.

Work has become a source of new tensions, fear was much, a lot has been discussed about unemployment and social exclusion, and lately about growth without the creation of new jobs.

Current unemployment, caused mostly by knowledge and skill degradation induced by continuous movement should be understood only as a part of a wider and sustainable crisis, the employment crisis itself.

To get to the end of it in this "flat" world, the "homework" [2] has to be optimized. Companies change all that work patterns in order to compete well with the others who do the same thing.

This implies that education must be adapted, that teachers must change their teaching methods and the young generation to completely shift their studies.

Friedman in his paper "The Earth is Flat" refers to creating a middle class in this "flat" world and seeks to develop with responsibility the new work model that can cope better with the flat world platform and to address simultaneously the following issues: "What

kind of jobs for the middle class creates now the successful businesses and entrepreneurs? How should the employees prepare for these jobs and how can teachers support them in that direction?"

According to his theory the clear idea emerges, that the current direction required by globalization the key to success is finding the path to become an "untouchable", so your job can not be done faster and better by a robot or a stranger more skilled than you or on less money than you.

For this, we need to focus to get an overview on the disparate analysis, to find solutions to build relationships and put less emphasis on signing contracts.

To those presented it can be stated that there are three categories:

1. Really special people, which occupies a major role, which nobody can ever outsource or trade through electronic transfer because they have a global market for the services they offer and hence can claim "global" revenue. It is the example of: Madonna, Elton John, or for instance a famous scientist or a well-known doctor.

2. People on a good local level, because their work must be done in a properly defined place, implies some specific local knowledge or direct interaction with a person (patient, client) with which they have the facility to interact.

In this category there is a large number of persons, for example, chef, dentist, masseuse, babysitter, gardener, lawyer, etc. Regardless of how sophisticated is the exemplified job, their wages will be dictated by local supply and demand game.

3. Jobs which until recently were occupied by middle class, which were considered non-tradable but due to globalization are becoming increasingly interchangeable. For example, data processing, accounting, radiology, credit analysis, etc.

Basically, the days when an accounting job was very secure and well paid are gone. It is very important for the middle class to understand the competitive intensity of the future, otherwise they will have to re-orientate themselves and will be isolated. Democracy cannot be determined in the absence of a middle class.

Concluding that the global world priorities are automation and outsourcing of more and

more old middle class jobs the natural question arises: What will the new jobs be and on what skills will they be based on?

The answer comes from the improved skills field which will make you as an individual, special or anchored, intangible, on a specified period of time.

The most important skill to be gained within the global world is the ability "to learn how and what to learn", to absorb all the time, to learn on your own new ways of doing old things or new ways of doing new things.

During this period, where many jobs are subject to outsourcing, the holders of any job must cultivate their ability to adapt in order to survive.

This way the differentiation between two persons will not be what they already know to do, but how quickly they can adapt and learn further, because what we already do will be quickly overcome.

In order for this to be attained the worldwide educational systems should be changed, such that education within the global world must focus not on creating engineers, economists, doctors, engineers, but on creating best possible engineers, economists, doctors.

A good example of this is one where the manager of an engineering company asks the U.S. chancellor of the Georgia Tech University:

"Don't send me engineers which may be replaced by a computer. This sort of activity I outsource it to India.

Send me adaptable engineers - who can think, in several disciplines." [3]

A proven fact is that when jobs are shipped abroad, not only saving on wages are made but also they get a 100% increase in productivity, because when you transfer a poorly paid job with lack of prestige from America to India it becomes a prestigious and well paid employment.

An Indian employee in Bangalore will work as three Americans or Europeans, and without taking six weeks of leave. This way the success is guaranteed with employees less paid but at the same time more motivated and committed.

Thus we conclude that outsourcing is not only cheaper but also more efficient.

The simultaneous process of flattening and interconnecting the world has made it easier for foreigners to innovate without having to

emigrate. Thus, they may be today's top employees of major multinational companies with good wages at home.

Allan E. Goodman (President of the Institute of International Education) states that "when the earth was round, foreign scholars could not return to their countries because there were no laboratories in which they could work or an Internet connection.

Today these things exist so that foreigners are returning home, where they can live more comfortably than in New York and can work as efficiently".

3. Education - a lever to reduce global disparities on labor market

A top place in reducing disparities between job owners is represented by education.

In Education Week magazine the article "Children of immigrants are in the top results in mathematics and science competitions" was published, resulting from the study conducted by Stuart Anderson (American journalist) for the National Foundation for American Policy.

From the articles' text, following the study revealed that 60% of leading students in science and 65% of those in mathematics are children of foreigners who have recently immigrated. The analysis was accomplished for the winners in three different academic competitions: Intel Campaign for Science Talent Identification, Team USA for the International Mathematics Olympiad and the U.S. team for International Physics Olympiad.

The paper quoted Andrei Muresan, 18 years old, finalist of the Intel competition, whose parents moved from Romania to the United States five years earlier.

He enrolled in a U.S. state in Class VII and discovered that the curriculum was very slight compared to that in Romania, saying that "In the mathematics and science classes (which covers about the same matter) we learnt the same things I have learned in Romania in the fourth grade." It is known that the U.S. participates every four years on a comparative study "Trends in International Mathematics and Science Study" in which students are evaluated at the end of the fourth and eighth grade. It is the largest study on education which was carried out ever.

Overall, in this study were involved about one million students from 41 countries and were used 30 different languages. Test results showed that American students have made non-significant progress compared the other participants in the study. This attests the fact that American labor force is lower in science, compared to the co-participant countries.

Therefore, we can conclude that the flattening of the world makes us equal before opportunities to highlight the knowledge we have gained.

Based on these ideas it can be said that the ideal owner of a job in the world flattened by globalization is the one whose intelligence can be measured with coefficients:

IQ - intelligence quotient

CQ - curiosity factor

PQ - professional qualities

On this basis, Friedman built the inequation $CQ + PQ > IQ$ [4], which expresses an absolute truth, namely that whenever a very curious and passionate individual would be

preferred to an individual endowed only with intelligence, lacking curiosity and motivation.

In conclusion, in order to fold ourselves to this flattened world, education but also training and continuous transformation have an important role.

The Roadmap to Recovery - Main Measures Adopted in European Countries for Tourism Recovery

JUGANARU Ion Danut
"Ovidius" University of Constanta
juganaru@ccina.ro

Abstract

The present economic and financial crisis influenced considerably the tourism sector, at global level. Thus, in 2009, international tourist arrivals dropped by 4% and revenues from international tourism decreased by 6%, at global level.

The governments in most of the countries with significant tourism attractiveness have analyzed the impact of the crisis on tourism and have elaborated and adopted policies, strategies and concrete measures, meant to support tourism re-launch.

World Tourism Organization (UNWTO) created a "Tourism Recovery Committee", entitled "Tourism Resilience Committee", ever since 2008. Also, a "Roadmap to Recovery" was created including a series of measures which were meant to encourage the recovery of tourism activity.

The present paper presents a few lessons to be learned from the evolution of the crisis and how the governments from many countries of the world reacted, as well as some of the measures adopted by some European countries for the rebound of the tourism sector, affected by the crisis, measures which were identified and included within the document authored by UNWTO, entitled "1st Roadmap to Recovery".

Most of these measures represent best practice examples and should be taken into consideration in view of applying them also in Romania.

Key words: tourism, crisis, measures

JEL classification: L83

1. Introduction

The economic and financial crises we currently experience, is one of the most significant in modern history, with global dimensions. During 2009, the travel and tourism sector was confronted with two major difficulties [1]:

1. The attempt to understand what is happening in global economy and the way in which tourism industry is influenced.

2. The attempt to find ways out of the crisis and to progress.

The World Tourism Organization (UNWTO) has answered these difficulties in two ways:

-At the beginning of the crisis, towards the end of 2009, a "Tourism Recovery Committee" was created (UNWTO Tourism Resilience Committee TRC), in the attempt to acknowledge, analyze and diminish the effects of the crisis on tourism and to learn from experience and best practices from different countries of the world. The Committee is a platform for UNWTO members to receive and share information on the current economic downturn and its impact on the tourism sector. TRC has become operational since 2008, and has already held four meetings, the last of them in Berlin, on March 12, 2010, having as president the Egyptian Minister of Tourism.

-Secondly, a "Roadmap to Recovery" was established – a strategic reference framework, which was later developed and adopted during UNWTO's General Assembly, which took place in October, in Kazakhstan.

The "Roadmap to Recovery" suggests a series of measures that can be adopted to strengthen tourism industry, to stimulate sustainable growth and to formulate the principles of tourism contribution to "green economy".

2009 was one of the most difficult years the tourism sector has ever experienced in the last decades. In 2009, the domestic tourism demand was less influenced than the international one, proving once again the importance of developing domestic tourism strategies.

International tourist arrivals dropped 4%, while incomes from international tourism registered a 6% drop, according to UNWTO estimates. For a sector which experienced a constant growth during the last years, the results registered in 2009 by tourism are rather disappointing.

Statistics show that the growth registered during the last months can be a signal of tourism rebound, at global level, according to the considerations of IMF, and that global economy heads for growth, even more rapidly than expected. Given these conditions, UNWTO forecasts a 3-4% increase in international tourist arrivals and an increase by 1-2% of international tourism incomes, in 2010.

2. Lessons to be learned from the evolution of the crisis

On analyzing the evolution of the crisis, several conclusions can be drawn and several questions can be formulated which can help us better understand the challenges we are going to face during the next period [1], such as:

a) Although global economy signals are encouraging, we have to acknowledge that growth relaunch (essentially guided by the public sector) is still weak, uneven and fragile. A serious problem is that there are still several risks to re-experience the crisis, and some countries of the world haven't recovered yet from recession. The main challenge is the high unemployment rate, but the situations registered in some countries, where public debt and budget deficit are extremely large, are also alarming. Therefore, the measures concerning economic recovery and growth stimulation have to be strengthened at global level. A set of measures must be elaborated for a more favorable position of the tourism sector within the new economic cycle.

b) The new global challenges, as well as the recent economic crisis, can only be faced by an international collaboration, at global level

and within forums, such as UN, G20, G7 and other entities.

In several countries of the world, the government had a prompt reaction and took measures to limit the effects of the crisis, proving that their initiatives were efficient.

Thus, certain governments reduced taxes for the hotel business sector, granted financial aids to small tourism enterprises and adopted measures to stimulate growth. These measures were beneficial and may be considered best practice examples for other states.

c) Tourism is influenced by several external factors, which also influence considerably its development capacity. Among these factors are: security, armed conflicts, threats on population health (such as the swine flu epidemic), natural disasters (earthquakes, floods, etc.), the tendency to increase taxes in order to compensate an ever increasing public deficit, etc.

d) Tourism can rapidly create jobs, especially for young people and women. The general trend represented by a drop in the number of jobs, determined by the decrease of tourist activity, is one of the main problems addressed by the governments of the countries with a significant tourist offer. Solutions to preserve current job in tourism, as well as to create new ones, are sought.

e) The way in which the situation evolved during the last period has highlighted certain structural weaknesses of the tourism sector, in both public and private sector. There is a need for comprehensive, clear and energetic public policies, future-oriented, as well as for solid public-private partnerships, redefined on the new bases of innovative practices and models.

3. The main measures recently adopted by European countries for tourism recovery

The document entitled "1st Report on the Implementation of the Roadmap to Recovery", authored by UNWTO [2] presents the measures adopted by countries in all large tourist regions of the world, falling under the following categories:

I. RESILIENCE

1. Focus on Jobs Retention and Sector Support;
2. Understand the Market and Respond Rapidly;
3. Boost Partnership and “Coopetition”;
4. Advantage, Innovation and Technology;
5. Strengthen Regional and Interregional Support.

II. STIMULUS

6. Create New Jobs – particularly in SME`s;
7. Mainstream Tourism in Tourism and Infrastructure;
8. Review Tax and Visa Barriers to Growth;
9. Improve Promotion and Capitalize on Events;
10. Include Tourism Aid for Trade and Development;

III. GREEN ECONOMY

11. Develop Green Jobs and Skills Training;
12. Respond Effectively to Climate Change;
13. Profile Tourism in Green Economy Strategies;
14. Green Tourism Infrastructure Investment;
15. Promote a Green Tourism Culture.

Due to paper size limits, we shall further refer only to a couple of the measures grouped in the first two large categories.

The document includes the measures adopted in 20 European countries, yet Romania is not among these.

Among the measures adopted by the European countries the following may be highlighted:

In **Austria**, there is a bank specialized in financing tourism activities (Austrian Tourism Development Bank), owned by three of the largest Austrian banks. This bank, given the services it provides, facilitates investments and improves the liquid assets of companies in tourism sector. These instruments proved to be efficient, and created new ones, which are to be implemented during a period of maximum 2 years. Basically, we are talking about subsidies for SME`s in tourism sector, bank guarantees of up to 4 million Euro per company, small grants for certain investments, micro-credits, introduced as instrument for small investments (of up to 50 thousand Euro), with an interest of 2.5% per year and a financing period of maximum 2 years, with government guaranties, to stimulate investments and support restructuring of the

companies affected by crisis, which were financially stable in 2008.

In **Belgium**, the Ministry for Tourism elaborated the strategy for the period 2009-2014, establishing the most important measures to be adopted in view of supporting the tourism sector. Among these measures are the programs that stimulate destinations with tourism potential: cultural cities, seaside area, the program “The Support Centre Holiday Participation”, which encourages every Belgian citizen to participate in tourism activities, holiday packages subsidized by the Government. Moreover, the Belgian government intends to develop the program entitled “Tourism for all”, especially with subsidies for disabled persons, old people, young people and families with children.

In what concerns partnerships and “coopetition”, a strategic socio-economic plan began to be applied, meant to act with and for the main “players” on the tourism market in Belgium, accompanied by a Tourism Pact, within which all actors are asked to take the responsibilities they are ready to respect. Also, the Tourism Flanders Bruxelles Agency is to be restructured.

In what concerns the professional training field, the Belgian government guarantees the delivery of high quality tourism training courses, at high school and university level, and Tourism Flanders has developed a quality framework for education and accreditation of guides and accompanying persons for tourist groups.

The Flemish community in Belgium presented « The Flemish Plan for Recovery », including general incentives, meant to strengthen credit line guarantees for businesses, activating labor market policies, as well as the strengthening and speed-up of public and private investment in tourism.

The government intends to play a more active role in its events policy, concentrating on the events with a strong tourist attraction potential. The event subsidizing policy shall be continued, especially for those events which may attract foreign tourists.

Bulgaria intends to elaborate a development project for Plovdiv airport, an investment for which the government shall spend 26.4 mil euro for the construction of a new terminal, thus increasing airport capacity to 500.000 passengers per year.

In **Croatia** public-private partnerships have been developed. 5 main fields of co – promotion have been established, and funds allocated for tourism promotion have increased by 60% in 2009, compared to last year, making Croatia, as tourist destination, more present in the global media..

Czech Republic intends to reduce the impact of the crisis through EU financial grants. The Ministry of Regional Development adopted several programs meant to develop the tourism sector and the competitiveness of the Czech Republic starting with 2009.the objective of the projects is to establish, in collaboration with tourism professionals and experts, the National Tourism Quality System, a new system of standardization and certification of tourist services.

The Czech Tourism Authority (an organization financed and created by the Ministry of Regional Development) has elaborated, beginning with 2008, two market research projects, one of them regarding incoming tourism, and the other concerning domestic tourism. The results of these market researches shall lay at the bases of a better planning and implementation of the marketing activities for the next period and for a better targeting of promotional activities, both on the domestic and on the external market.

The Czech Ministry of Regional Development elaborated and submitted for approval the National Program for Tourism Support 2010-2013. The objectives of the sub-program for 2010, entitled “Tourism for all” are to support tourism entrepreneurs (hotels, restaurants, travel agencies) and to create new tourist products, focusing on the development of social tourism products, as well as on marketing and promotion programs.

The target groups selected within this sub-program are families with small children, families with a low-income, old people, people with disabilities, and young people, meaning people who tend to spend their holidays off-peak, due to lower prices. Moreover, up to 20% of the total expenses included in the budget of this sub-program can be used to incur expenses such as pool entrance fees, children play spaces, etc. The funding covers 50% of project costs, while the other 50% are incurred by the applicants.

In **Cyprus** a fiscal program for recovery was approved, amounting to 500 mil. Euro out of which 51 mil. Euro were allocated for tourism. Among the measures adopted, we can mention the reduction of airport taxes, in view of increasing the country’s tourism attractiveness.

Also, a grant which encourages Cypriots to spend their holidays in their own country was introduced.

In **France**, one of the main measures implemented was to apply, beginning with July 1st 2009, a lower rate for the VAT, amounting to 5.5% (compared to 18.6%, the previous rate), for sales registered in public catering units (except for alcoholic drinks).

In **Germany**, several measures were taken at Lands’ level, to support economic growth and provide jobs. Thus, loan and guarantee programs operated by banks for the promotion of Lands have been revised and re-launched, in accordance with the present crisis situation, and the governments of each Land increased the amounts allocated for guarantee.

On the other hand, the federal government appealed to the tourism industry, to adapt its offer by taking into account the ever changing touristic clientele, ensuring a higher quality of services, as well as developing new products and services, through a highly skilled and qualified personnel.

Among the measures adopted by the federal government and by the governments of the Lands, regarding tourism sector, we mention:

- The first package of incentives developed by the federal government, adopted in November 2008, is meant to ensure investment funding and investors’ support.

-the second package of incentives, known as “ The package for jobs and stability”, adopted on January 14th 2009 including measures destined for the promotion of investments , in view of country modernization; labor market policies, intended to prevent layoffs, tax exemptions and support for families; ensuring credits for businesses, etc. The federal government allocated almost 80 mil euro to finance the two packages of incentives.

DZT (German National Tourist Board) improved its tourist marketing activity, having as motto ”Affordable Hospitality-Great Deals, Easy Booking”, in the attempt to draw foreign tourist attention on the cheap travel offers available in Germany.

In Italy, the government negotiated with 5 of the largest Italian banks regarding the facilities provided to access credits of up to 1.6 mil euro, especially for SME's operating in tourist sector.

Along with France and Spain, Italy concluded a marketing partnership, which includes co-marketing operations, meant to develop common travel products and to attract, as single destination, tourist from emergent and far – away markets.

Social aids are provided to families with small incomes, representing special discounts for holidays/vacations spent in Italy during intermediary season, thus helping families go on vacations, and, at the same time, maintaining a functional hotel industry.

In Holland, the government decided to repeal the recently introduced departure tax, amounting to 11-45 Euro per passenger, for outbound flights in Dutch airport. In what concerns the increased advertising effort, Netherland Board of Tourism & Convention (NBTC) launched the Cityzapping campaign, to promote the country as multiple urban destination, given the short distances between the cities and the affordable railway transport offer.

Further, we can mention the promotional offer of NBTC and Amsterdam Tourist & Convention Board (ATCB), offering 1001 free of charge nights in Amsterdam hotels, for early booking.

In Poland, the Ministry of Sports and Tourism intends to develop projects meant to increase the accessibility of tourist services for children and young people, for people with disabilities and old people, measures included within the “Tourism Development Directions until 2015”. Based on this document, Polish Tourism Organization adopted its own marketing strategy (The Marketing Strategy of Poland in the Tourism Sector for the Period 2008-2015). Adding to this, in what concerns Poland's efforts to promote the itself as a tourist destination, the country will be the official partner of the International Tourism Bourse in 2011 - (ITB) the largest specialized tourism event worldwide.

To attract a larger number of tourists from neighboring countries, Poland signed small border traffic agreements with Ukraine, Belarus and Russia, and the fees for entry visa

in Poland was diminished to 35 euro, in 2007 and 20 euro, starting with January 1st, 2010.

Also, a monitoring of the market and of crisis effect was achieved. Two studies on the impact of the global crises on Poland's tourism were elaborated, including recommendations on the measures to be adopted so as to diminish these effects.

4. Conclusions

To conclude with, from the analyses of the above given examples, one may observe that several studies regarding the impact of the crisis on the tourism sector have been elaborated, in many European countries, and the results of these studies and analyses lay at the very foundation for the adoption of policies, strategies and programs of measures which have began and will continue to be implemented during the years to come.

Many governments have recognized travel & tourism as being a real dynamic “engine” for economic and social progress in the respective countries. In those countries where tourism was recognized as a priority for the economy and where the corresponding measures have been adopted, immediate positive results have appeared [3].

Many measures adopted in the European countries to support tourism recovery could have been adopted in Romania as well, but have not been yet introduced, and any delay in the implementation of such measures shall lead to the decrease of our country's competitiveness as tourist destination, to the decrease in the number of foreign visitors coming to Romania and the increase in the number of Romanian citizens which will choose to spend their vacation in other countries, due to the poor value for money of the tourist offers in our country, compared to the offers of other competing external destinations. All these shall result in the diminishing of revenues from tourism and the decrease in the number of jobs in tourism and related sectors.

We consider that it is not too late for the Romanian government and the Ministry of

Tourism to adopt additional measures, meant to support tourism rebound, and for the tourism operators to rethink their offers, to improve the quality of the services, and to

create new, attractive and competitive products.

The Issues of Competitiveness. Romania's Competitive Positioning in Global Context

KARDOS Mihaela
„Petru Maior” University of Targu Mures
mihaela_kardos@yahoo.com

Abstract

The concept of competitiveness has always been of interest in economic literature, presented under various definitions and aspects, from determinants of competitiveness at microeconomic level to the issues regarding countries' competitive performance in global environment.

Competitiveness is approached from different perspectives, such as productivity, technological innovation, capital investment, structural policies, education and training, technological progress, macroeconomic stability, good governance, the rule of law, transparent institutions, optimal market size, the ability to produce better and cheaper, etc., none of them excluding the other.

Based on such indexes, rankings measuring countries' competitiveness have been developed, in order to provide the less competitive useful information in shaping future policies.

According to such a ranking (The Global Competitiveness Score, by World Economic forum), Romania's competitive position has slightly improved in the last years, but there are a large number of indexes showing regress (e.g. budget deficit, infrastructure, flexibility of wage determination) or and some problematic issues for companies (e.g. tax regulations, instability of public policies, access to finance).

In order to further solidify the country's competitive position, despite major short-term challenges, it has to put economy on a more sustainable footing, focusing on institutional environment, strengthening the financial sector and invest in infrastructure, education and innovation.

Key words: competitiveness, Romania,

competitive position

JEL classification: O50

1. Determinants of competitiveness

The issue of competitiveness has emerged as a key issue for companies and nations in the globalization era, given the fact that the intensification of globalization expands the range of nations involved in international competition.

Competitiveness is one of the most dynamic economic concepts, complex and meaningful, with many definitions and methods of measurement, long debated by economists around the world. Competitiveness is inextricably linked to the notion of competition, expressing, overall, the capacity of persons, companies, economies or regions to maintain themselves in the local or international competition and to benefit from it.

The determinants of competitiveness are many and complex. Economists have long tried to understand what determines the wealth of nations. This attempt has ranged from Adam Smith's focus on specialization and the division of labour to neoclassical economists' emphasis on investment in physical capital and infrastructure and, more recently, to interest in other mechanisms such as education and training, technological progress, macroeconomic stability, good governance, the rule of law, transparent institutions, market size, and many others.

The central point, however, is that they are not mutually exclusive. This can partly explain why, despite the present global economic crisis, we do not necessarily see large swings in competitiveness rankings, particularly among countries that have already put into

place many of the elements driving productivity.

Competitiveness is part of a broader category of integrating factors for development, besides quality, supply conditions, financial sector, professional services, strong businesses and close connections to research institutes, industrial cooperation, domestic competition, capital and resources, strategies, etc.

Evolution of specialization and economies success depend, primarily, on the competitiveness degree of firms in domestic and international market, on their evolution profile, the assimilation of technical progress and less, on the existence of natural resources.

According to the modern theory of economic development, comparative advantages based on traditional factors have decreased, because international trade contributes to similar facilities regarding classical production factors. Also, the trend of globalization in production makes modern, multinational companies not to depend only on the endowment of production factors.

In the same time, financial capital circulates freely in global economy and is invested in countries where it finds most efficient conditions. Therefore, competitive advantages have become critical in terms of conditioning economic development.

Competitiveness means productivity, seen as added value. It has a dynamic character, forcing companies to give up inertia and foster innovation. Other various concepts - reduced cost of work force, low taxation, currency depreciation, increased exports and abundant natural resources - are either the result of increased competitiveness or potential stages of competitive development.

Competitiveness is created at microeconomic level, as sustainable prosperity is created by companies. At company level, competitiveness determines "the correctness of a firm's activities that may contribute to its performance". [1] A competitive firm is the one producing high quality goods and services at lower prices than its competitors. Consequently, the quality of business environment is fundamental.

Competitiveness occurs at company level and only through it is generated in industries and economy. Firms are those creating and supporting competitive advantages and only

they can lead to accomplishment of goals set at national level.

In an article published in *Foreign Affairs*, in the past decade, Paul Krugman said that the firms are competing entities, not the national states. In some sense, this statement is undisputed.

On the other hand, agglomeration effects, imperfect functioning of markets, cumulative processes, existence of multiple equilibriums in real space indicate that firms take into account the context in which they operate and make strategic decisions, supporting competitive dynamics in regional and in global economy.

Therefore, the concept of competitiveness can not only be applied to companies, where it is created and manifests itself directly, but also to national economic systems.

From a nation point of view, competitiveness can be defined in various ways. All these approaches and classifications have a common denominator, expressing the country's ability and capacity to effectively use the opportunities of global markets. The competitiveness of a nation can be defined as its ability to attract and maintain activities increasing economic prosperity [2] or, as the ability of firms, sectors, regions, states or supranational bodies, in international competition, to ensure a sustained relative high income from the use of inputs and also higher incomes from labour capitalization. [3]

This definition clearly emphasizes the decisive impact of competitiveness on the income levels of a nation and hence, on the living standards of the country.

Another definition was given by the General Directorate for Economic and Financial Affairs of the European Commission: competitiveness is a country's capacity to achieve the coordination of growth with external balance; the fundamental importance of international trade is found at the basis of external performance for industrialized countries. [4]

However, stressing the role of product differentiation on competitive strategy of firms, industrial economy has limited this approach, believing that it is not an adequate basis for a comprehensive assessment of competitiveness.

This definition focuses primarily on the enlarging spectrum of variables to be

considered when analysing competitiveness (productivity, technological innovation, capital investment, structural policies, etc.). Secondly, this definition regards competitiveness in terms of relationship between growth and external balance.

But competitiveness is not a zero sum game, meaning that nations benefit from the growth registered by other nations. This is because growth in a particular part of the world leads to new markets for products and services coming from other parts. Thus, being competitive does not mean causing disadvantages for other trading partners.

From other perspectives, available definitions for competitiveness concern, "the ability to create preconditions for high-income" (Uri, 1971), "the ability to sell" (Orlowski, 1982), "the ability of countries to produce, distribute and sell goods and services in global economy and to determine earnings to lead to increasing living standards" (Scott and Lodge, 1985), "the national productivity" (Porter, 1990), "the ability to generate proportionately more wealth than a country's competitors on international market" (Management Forum, 1994).

A competitive country is one that creates, produces and puts on the market goods and services, either of better quality or at lower prices, compared to other countries. Also, a competitive country tends to get market shares to increase welfare of its citizens. Increase of a country's market share depends on four factors: [5]

- Potential to exploit knowledge created elsewhere in the world, depending on the technological level of the country;
- Creation of new knowledge/ technologies in comparison with its competitors;
- Developing the capacity to use knowledge, compared to competitors;
- Changes of relative prices in their own currency.

Productivity is the determinant key for the nation's main objective: to ensure on long term a high standard of living for its citizens. In other words, a nation's goal is to increase prosperity for people.

A higher level of national prosperity is the result of three forces' interaction: [6]

- Competitiveness of firms, profit-driven;

- Competitiveness of people, personal welfare - oriented;
- Competitiveness of nation, geared toward prosperity.

National competitiveness is influenced by macroeconomic and microeconomic factors. Government plays a key role in establishing macroeconomic stability and ensuring adequate social and political institutions. [7]

The first source of competitiveness of a nation lies in its companies, where added value is created. Therefore they need an environment where to be able to compete. Such an environment is based on four attributes of a nation, which is the diamond national advantage: [8] factor - related conditions; demand - related conditions; supporting industries; strategy and structure in companies, as well as rivalry between them.

Among the sources of competitiveness, so-called "competitive bunches", most important refer to: [9]

- competitive advantage regarding internal market structures;
- competitive advantage regarding access to raw materials;
- competitive advantage regarding technology;
- competitive advantage regarding human resources quality;
- competitive advantage regarding domestic demand.

The concept of national competitiveness plays a key role in the current uncertain economic environment and is a major concern for all nations. In the globalization era, national competitiveness is based less and less on economies of scale and more and more on knowledge products and services. Countries compete not only for markets, technology, skills and investment, but also for raising living standards.

Increasing economic competitiveness is a determinant key of economic growth on a market open to strong competition. In addition, the exploitation of competitive advantages must be an ongoing objective, taking into account the challenges of globalization.

Increasing competitiveness should not be viewed as a process of exploiting short-term benefits, but as a process of establishing an

economic structure based on capital investment and research, innovation processes.

A country becomes competitive when manages to build that environment allowing each company to become effective, to survive or to grow in any national or international economic environment. Competitiveness is created at microeconomic level, but it is maintained and strengthened at macroeconomic level.

From these multiple approaches, scientists have come to select the most significant for the future. These led to the *Decalogue of "gold" rules*, which would contribute to achieving and maintaining a country's competitiveness. These relate to: [10]

- Creating a stable and predictable regulatory environment;
- Building a flexible and adaptable economic structure;
- Massive investment in both traditional and information-technology infrastructure;
- Stimulating the accumulation of private and domestic investment;
- Development of global market aggression, and, equally, ensuring internal attractiveness for foreign direct investment;
- Attention for quality, speed and transparency of governmental policies
- Maintaining a sound economic correlation between wages, labour productivity and taxation;
- Preservation of modern social structures, by reducing wage disparities and strengthening middle class;
- Massive investment in education, as well as continuous training of population;
- Creating a balance between proximity economy and globalization economy to ensure a substantial level of wealth creation, while preserving an appropriate value system.

Currently, the most important challenge is to manage these new economic crisis based issues, while preparing economies to perform well in a future economic landscape characterized by growing uncertainty.

In a difficult global economic environment, it is more important than ever to put into place strong fundamentals underpinning economic growth and development.

2. Romania's competitive position in global world

The place of a country in world economy is the reflection of its ability to specialize in those areas that best exploit the existing potential and resources and lead ultimately to obtaining competitive products.

Competitiveness is a plural concept, including both quantitatively and qualitative aspects. The widespread use of this concept reflects the need of a nation and its companies to examine their position relative to competitors on the global market. Competitiveness of a nation is a relative term, because we are interested in how well a country performs relative to another. Countries do not seek absolute performance, but from a comparative perspective.

Benchmarking the competitiveness of a nation requires the use of a composite index of competitiveness. [11]

Annually, under the auspices of The World Economic Forum, a Global Competitiveness Report is drawn up. The primary objective of this report is to evaluate the competitiveness of a large number of countries. The Global Competitiveness Report is based on The Global Competitiveness Index, a composite index, consisting of 12 sub-indicators (institutions, infrastructure, macroeconomic stability, health and primary education, higher education and training, goods market efficiency, labour market efficiency, financial markets complexity (sophistication), technological readiness, market size, business sophistication and innovation. Some of them are obtained from a survey on managers, others from processing statistical data.

According to the Global Competitiveness Index 2009-2010 [12], Romania ranks 64 of 133 countries, a slight increase in comparison to the 68th place, the previous year. According to a score on a scale from 1 (the worst) to 7 (the best), Romania scores 4.11 points, almost the same as in 2008-2009's Report (4.1).

Thus, Romania outruns other 3 EU countries, namely Latvia, Greece and Bulgaria, in comparison with the previous year, when it was on the penultimate position among EU members. This trend is because at

the time of the report, based on statistical data from 2008 and a survey among managers in spring 2009, Latvia (at least) was more strongly affected by the crisis.

Romania is placed ahead of countries like Greece, Portugal or Italy, standing on the 75th place, in terms of macroeconomic stability, but is exceeded by Bulgaria (ranked 45). One of the best scores was received for the sophistication of financial markets, the 56th place that Romania occupies positioning it ahead of countries like Greece, Italy and Latvia.

Best place in the ranking (41) is obtained for the "market size" index, but Romania loses points in terms of goods market efficiency (ranked 61, before Bulgaria, Hungary and Italy) and labour market efficiency (79th place, superior to Italy – 117th, Greece – 116th or Portugal – 103rd)

The most important problems for business environment are tax regulations (15.7% of managers' responses) and the instability of public policies (15.1% of managers' responses). Two years ago, instable public policies were mentioned only in 7th place among obstacles in business environment. Other important barriers refer to: access to financing, tax rates, government bureaucracy, corruption and inadequate infrastructure or work force.

Several indicators have deteriorated, such as the budget deficit (ranked 113), down 15 places. The lowest score (2.67) was obtained for infrastructure, showing even a greater deterioration. Our country occupies the 110th position, compared with the 105th last year, the last among EU countries. At quality of roads index, Romania is ranked on the 129th place in 133 countries.

As it is difficult to conceive that Romania is placed behind countries like Zimbabwe, more relevant is the comparison with other European countries. Germany and France are in top, Hungary is on the 57th position, Bulgaria on the 102nd and Poland on the 103rd.

Romania is the 128th regarding transparency of public policies, the 117th regarding favouritism in government decisions and the 112th regarding waste of public money, which confirms that the way public policies are established, is the largest competitive disadvantage of the country today. Romania has made progress in technological indicators,

in particular mobile phone subscriptions (ranked 33), and preserved its place for business expenditure for research (ranked 74).

Romania has made a significant regression regarding labour market indicators, in particular the flexibility of wage determination (ranks 84, down 3 places).

According to the same report, in 2008 Romania's economy was in the second stage, the so-called "efficiency driven" stage and in 2009 it passed to an intermediary stage, called "transition from efficiency driven to innovation driven", reflecting the smooth transition from one stage of development to another.

Therefore, the best way to improve economic competitiveness is to enhance innovative activities. While certainly the model of growth based on efficiency will be upgraded, the process is very slow, involving many stages and adjustment of national economy. Romania should focus its resources on building an economy based on knowledge and innovation. This is the only way leading to competitiveness and, therefore, we need massive investment in education, research and development.

Another international institution analysing countries' competitiveness is The International Institute for Management Development in Lausanne (Switzerland) which has been making yearly, for over 20 years, a study aiming to establish a ranking of most competitive countries. [10] This ranking is determined based on four main criteria: economic performance, efficiency of government policy, business performance and infrastructure, having 329 sub-indexes.

According to this study, Romania ranks 54 in the global top of competitiveness (which examines 57 countries), down 9 places from 2008, the last among European countries. Romania's score was 46.94% of U.S. competitiveness, considered the reference level.

As figures demonstrate and the present critical situation is more and more sensed, after years of buoyant growth, falling unemployment, and rapidly rising living standards, Romania has been hit hard by the global economic downturn.

Its high dependence on outside finance, affected it heavily when liquidity dried up

around the end of 2008. The second wave of contagion and the steep drop in global demand further drove it into recession.

Yet, the present situation provides an opportunity to strengthen economic fundamentals and overall competitiveness in order to put growth on a sustainable footing and prevent future crises.

Most of all, the country's institutional environment will need to be strengthened, in spite of the progress achieved since the early days of transition, as governments is still considered inefficient, corruption is rampant and public trust in politicians is low. Also, stronger private and public institutions would ultimately reduce vulnerability related to greater integration with the global economy.

The present crisis has also highlighted weaknesses in the country's financial sector, in terms of ease to access financing through the local equity market and access to loans.

On all these counts, advances will not only facilitate recovery over the next few years, but will further solidify the country's competitive position going into the future. But to do this, it must seize this opportunity to put its economy on a more sustainable footing, despite major short-term challenges.

Today's difficult economic environment underscores the importance of not losing sight of long-term competitiveness fundamentals amid short-term urgencies.

Competitive economies are those that have in place factors driving the productivity enhancements on which their present and future prosperity is built. A competitiveness supporting economic environment can help national economies to weather business cycle

downturns and ensure that the mechanisms enabling solid economic performance going into the future are in place.

Abstract

Trade represents the cornerstone of modern civilization. The globalization expanded the exposing degree of the companies to international competition; the markets have been liberalized and the remarkable progresses in the field of communications technology generated the integration of the financial operations and facilitated the fast handing over of the information related to the market. The economic liberalism and the free trade, as a dimension of the liberalism, were one of the factors that generated and supported the globalization process.

Key words: free trade, globalisation, liberalism

JEL classification: F10

1. Introduction

In the XVIIIth century and the first part of the XIXth century the philosophers, the sociologists and the economists defined political programs which served as a guide for the social policy first of all in England and in the United States of America, and then in the Continental Europe and in other parts of the world. But nowhere these programs were thoroughly implemented; not even in England, considered the motherland of the liberalism and the well-known model of the liberal country, the partisans/supporters of the liberal politics did not succeed to apply all the principles of this philosophy. To liberalism, considers Ludwig von Mises, was not permitted to reach its complete fructification; but even like this, sequentially applied and without the possibility to completely expose its valences, the liberalism “changed the face of the world”. [1]

2. The world from *Pax Britannica* to *Pax Americana*

The starting point of the new world-wide order was represented by the spreading of the liberal ideas (from the end of the XVIIIth century till the second half of the XIXth century); the liberal statute grew at the beginning in the Great Britain and, thanks to the power and to the prestige enjoyed by it, the liberal economic and political norms extended in a large part of the rest of the world. The PAX BRITANNICA was characterized by an open world-wide commercial system and by the freedom of circulation of the capitals and of the persons; the Industrial Revolution, started in England, expanded both on the continent and in the United States of America and in Japan; the industrialization and the technological modernizations generated a sustained economic increase which was enclosed by an expansion of the commerce. During this period of hegemony of the Great Britain there was not any formalized institution to coordinate the world-wide economic order; London was the one who managed and regulated the liberal order. [2]

In the last decades of the XIXth century, the liberal economic order woven around the England started to show signs of weakness; it was felt the necessity for a more active involvement of the state in the economy, what launched on the one hand protective pressures and on the other hand, the impulse to look new territories and markets. The supremacy of the Great Britain started to be threatened by the entrance with more force of Germany and of the United States of America in the world-wide arena. The period between the two world wars was marked by military and commercial rivalries and by the coming out of the fascist states and of the Marxist-Leninists ones. The

world-wide order was “saved” by the ascension of the United States and by the triumph in the Second World War.[3]

The PAX AMERICANA built during the post-war period, was marked by the refreshing of the liberal economic principles in the Western Europe and by their penetration in the new developing states. On the other hand, in the Eastern Europe there was developed an alternative to this new liberal economic order; it is about the socialism promoted under the leadership of the Soviet Union. The conflict between the two worlds lasted until the end of the '80s; the rhetoric of the Cold War, which promoted the freedom against the oppression, represented the ideological “binder” which was the basis of the international system during this period.[3]

During the first two post-war decades, the Western Europe and Japan regained their prosperity, the United States of America substantially exporting liquidities in the rest of the west world through loans and corporatist investments; during the same period, in many countries from the Third World, arose aspirations of economic development. The liberal world-wide order was “administrated” by the United States of America till the end of the '60s and the beginning of the '70s; the “crack” was determined by the War of Vietnam. The American dollar started to lose its pylon position of the international system; on the one hand there were large expenses generated by this war; on the other hand, the American politicians opposed themselves to the internal fiscality increase, necessary to the remittance of these expenses. The crises which manifested in the '70s and '80s, destabilized the liberal economic order and counterfeited the hegemonic position of the United States.[4]

The end of the Cold War and the disappearance of the Soviet Union from the world-wide arena generated heated debates at international level regarding the nature of the new world-wide order; when the United States of America became again the only true superpower, that arose the conviction that the liberal values triumphed over and that the world was at the beginning of an unprecedented peaceful and prosper period. The observers less optimists showed their conviction that the bipolar stability during the Cold War (named by some historians “the

long peace”) was replaced by a multi-polar world where the conflicts cover many forms – cultural, religious, economic, political. During the Cold War, within the block formed by the United States of America and their allies, the economic cooperation was subsequent to the political cooperation; the accent that they put on the security and on the consolidation of the alliance represented a political binder in the economic sphere, facilitating even the compromises when there appeared economic divergences.

The ceasing of the Cold War modified this state of fact; the ex allied countries against the communist colossus became more preoccupied with their own economic interests; at the same time there also appeared a perspective modification of the Occidental Europe and Japan confronted by the United States of America in the sense that both of them showed an availability sentient reduced to recognize the leader position of the United States. The reunified Germany engaged itself in the leader part of the integrationist process consolidation in Europe, and the Japan oriented itself more and more towards the development of a regional Asia-Pacific economy. This reorientation of the main economic forces priorities can generate significant consequences in which concerns the future of the world-wide economy system.[5]

3. The new world order

“The Achilles’ heel of the world-wide order after the Cold War, considers R. Gilpin, is the fact that the public understands not very well the economic liberalism, the functioning of the market system and the manner in which the capitalism creates the welfare”. [6] The economists’ arguments regarding the benefits of the liberalism are often eclipsed by prejudices and requests interested by the protection against the disloyal commercial practices, the cheap products, the cheap work, etc.

The economy, considered from a mondo perspective, passed from the international stage through which started, to the global one, as we know it nowadays; since the appearance of the international economy (the XVII-XVIII centuries) the world-wide economic and

political system knew deep changes. The technological revolution, the information economy, the redistribution of the economic power at a world-wide level, the demographic revolution, is just a few from the forces which model the economy and world-wide politics architecture. The globalization is, in essence, a term which describes a reality of the contemporary economy; appeared in the '60s, became in great vogue in the '90s. The pro-globalist thesis assign to the globalization the character of desirable and irresistible force which attenuates the bounds, releases the individuals and enriches all that it touches. But it is also often convicted, not without reason, being assimilated to an evil force which deepens the differences, destroys the cultures, undermines the democracy, and propagates the Americanization.[7]

The globalization manifests itself by a process/phenomenon of accentuation of the interdependences between the countries, of a stronger and stronger integration of the markets on the background of the reduction of the restrictions concerning the goods, services and capitals circulation. This is what Martin Wolf calls "liberal globalization", phenomenon whose consequences reflect in the increased impact which the economic changes from a part of the world have on what is happening in other parts of the world. From this liberal perspective the economic integration at the world-wide level appear when the people have the freedom to accomplish their proposed objectives, the technology competing with this. [8]

The technological determination of this process of intensification of the world-wide integration is undisputable, but its part is sometimes too much overrated. It is obvious that the liberal doctrine built on the individual freedom, on the open and free market, on the private property, is a motive power of the world-wide economy globalization.

The integration of the world-wide market is not a recent process; as we previously mentioned the liberal economic order based on the free circulation of goods, services and capitals started to outline from the second half of the XIXth century. But the first stages of the world-wide economy integration have been particularly generated by the technological innovations from the transports and telecommunications field, the efforts of

the markets liberalization having a minor part. Nowadays, the two forces inverted their parts; the governments' action towards the liberalization of goods and capital floods became the engine of the contemporary globalization. In other words, as Jagdish Bhagwati remarks, the history of globalization "must be written in two colors ink: one for the technological changes and the other for the action of the states".[9]

The reality proved that if the action of the states intensifies the process of the world-wide economy integration, the same action of the states can also obstruct it; the First World War and, subsequently, the Tariff Smoot-Hawley have marked a "breach" in the progress of the economy globalization, which was eliminated through the multilateral efforts started in the first post-war years.

The mondialization, remarks Antoine Ayoub, far of being a new phenomenon, is, in essence, just "a new name given to an old concept.... established masterly and almost definitively by the founding parents of the political economy (Smith, Ricardo, Mill) "[10]; this old concept represents the free trade which expands not only on the goods, but also on services, capitals, people and ideas, leaving aside the political frontiers which exists between the countries. In this acceptance, the mondialization becomes the direct consequence of the free trade expansion from national to cosmopolitan, a sort of "universal association of all de nations" about which was talking List. At its turn, the free trade in order to capitalize its potentialities requires two conditions: on the one hand it is necessary the progressive elimination of the custom-house obstacles and of the regulations between the states and, on the other hand, it is essential the ensuring of a competition as free and correct as possible both inside each economy and between the economies which form the world-wide system. In the Ayoub's logic, the mondialization is preceded by the instauration of a market economy which in essence, is not something else but the reflection in the reality of the liberal doctrine. The characteristics that Ayoub assigns to the market economy completely respect the logic of the liberalism: the defense of the private property, the freedom to undertake and contract and the existence of the free competition. The main consequences of the

trade's liberalization are of economic nature, but we don't have to neglect those of political, cultural nature, etc; the most advantaged are the consumers, as a result of the reduction of prices, without affecting the quality.

The old theory of the relative advantage and the one of the world division of labor maintain their topicality and represent, in the Ayoub's acceptance "the foundation and the justification of what we call mondialization"[10]. The theoretical basis of the phenomenon which nowadays rouses many controversies must be looked, according to Ayoub, in the classic political economy.

4. Conclusions

Free trade, as a size of economic liberalism, outlined the world economic order; the "architecture" of contemporary economy is the result of the interconnection among trade, investment and technology. On the one hand, the development of trade would not have been possible without technological progress and, on the other hand, the transfer of technology is facilitated and boosted by markets opening. But globalization of the economy can not and should not be viewed strictly as a continuous and irreversible process; the two World Wars and the 30's period turned the Golden Age into the Dark Age and have changed the balance of forces in the world arena. In today's economy, characterized mostly by dynamism, volatility is a term that can be associated with many issues; interest rates are volatile, exchange rates are volatile, even comparative advantage lies into volatility.

In this context a number of questions arise: How will capitalism, as a practical reflection of liberalism in this century, look like? How

will the competitive market faced with increasing concentration of economic power in the multinational companies (some of them making turnovers comparable or even greater than the GDP of many countries, especially developing countries) be? What will be the role of the state? Limiting of powers will be self-imposed or imposed by the global economic context? Will the WTO succeed to make that "universal association of all nations" for the purpose of which List proposed an educator protectionism?

Abstract

Business tourism is one of the most dynamic components of tourism activity, and enhancing international relations, especially the economic ones are reflected in the increased demand for business travel.

Business tourism is a form of tourism with commercial, government or education purposes, with the leisure side as a secondary motivation. Business tourism requires, in general, moving to another location, at a distance greater than 50 km from the place of origin of the business tourist, travel determined strictly by a business, an event or an educational purpose.

Business tourism refers broadly to people travelling for purposes related to their work, namely, movements in official interest, commercial or otherwise, participation in various events organized by economic enterprises or administrative bodies for their representatives.

Although these actions involve a remunerated activity, they are treated as tourism as their organization and involves the use of tourist accommodation facilities, food, entertainment and consumption of specific services provided by the organizers of the trip.

Key words: business travel, team-building, conference tourism, business destination.

JEL Classification: L83

Business tourism includes broadly people's travels for purposes of their work, namely, official travels, commercial or otherwise, participations in various economic enterprises

manifestations organized by administrative bodies for their representatives [13]. Although these travels involve enrolling of paid activities, they are considered tourism because it implies the consumption tourist endowments and the use of specific services.

In terms of content, the forms of business tourism are structured in [1, 14]:

- individual business travels (delegations), common to many trades, for which those involved accept the travel outside the city of residence;
- tourism meetings, including a wide range of events (conferences, seminars, team-building sites, products launches, annual meetings, etc.) of companies or associations to facilitate communication with and between employees, customers, shareholders or members;
- fairs and exhibitions, very different, for products presentations;
- incentive travels and those travels that employees receive from the employer as a prize for the best results in their labour;
- "corporate" events, including generous forms of entertainment that companies offer the most valuable customers or potential customers to build or strengthen the business relationships.

Business tourists are more demanding, less price sensitive and more concerned with status. They also have a program that is to be respected. Thus, transport services are of great importance: the means of transport must be fast, comfortable and appropriate in terms of the program, the punctuality and the prestige

of the carrier are of interest, the booking systems should be effective [16].

Figure 1. Business tourism has its own unmistakable motivations and forms of expression

We can consider as the main motivation for business tourism the meeting of the supply and the demand in trade fairs and exhibitions, business meetings, transactions and negotiations, the conduct of missions programs, as well as the extensive promotion of a company, of products, of regular innovations in various fields. The main steps of this event ends with the conclusion of economic agreements, mutually beneficial in the international division of labour, goods and services market, as forms of exchange value and use values.

The international conference market comprises three main segments - business conferences, governmental conferences and association conferences. The market association conferences are mobile and can be attracted by a variety of destinations. The number of conferences and the number of participants and their relatively high purchasing power can also be taken into account. Romania's capacity to attract this market segment is weak.

In its review of international conferences organized by the members of Congress in 2005 and the International Association of Conventions and Conferences (ICCA) identified 5315 international conferences in nearly 100 countries. Of these 12 have been organized in Romania. This ranks Romania on the 53rd place among host countries.

Table 1. International Association Meetings held in the selected countries in 2003-2008

Country	2003	2004	2005	2006	2007	2008	Place
Hungary	64	51	76	75	94	97	20

Whole world	4,500	4,468	4,981	5,014	5,497	5,315	-

Source: International Association of Conventions and Conferences 2003-2008 ICCA

There are two reasons for this poor performance. First, Romania does not have many conference centres specifically for this purpose, which meet the requirements of the international market of conferences and exhibitions - the segment associations, government and business. The second reason is that, despite the courageous efforts of the National Association of Professional Organizers of Conferences and Exhibitions, a lack of market studies and promotional activities to ensure international conferences is felt.

The main exhibition centre, Romexpo, is in Bucharest. This totals 52,100 m² exhibition space in 36 rooms. The exhibition rooms are functional, but not all are inter-connected, and many of them do not have facilities to international standards. According to the urban plans approved by 2008, there will be built a new 12,000 m² exhibition space that will provide the connection to some existing spaces.

Most exhibitions are held in the Romexpo exhibition centre in collaboration with the commercial organizations. Every year about 40 exhibitions take place. Around 20% of the exhibitors come from abroad. The total number of visitors is unknown. Romexpo also has 8 meeting rooms with the capacity of between 50 and 300 employees. These are not well connected to each other and need to find creative solutions to provide catering services for large-scale meetings. It is apparent the demand for conference facilities with seating capacity of 1000-1200 for launching products and other commercial events.

Constanta, at the moment, has begun construction of a small exhibition centre in Mamaia, combined with a conference room of 250 people. This centre will provide catering mainly for local and regional events.

The National Association of Professional Organizers of Conferences and Exhibitions (RCB) seeks to promote Romania as a destination for the conferences and exhibitions sector and acts as a clearing house for contacting the organizers of conferences and exhibitions who are looking for appropriate spaces. RCB is a member of the Association International Conventions and Conferences (ICCA), but it is the only private organizer of conferences and exhibitions member of the association. The majority of exhibition organizers is partly owned by state or local budgets and is funded either through direct loans or grants through the form of charge for accommodation. This reliance on private sector funding has limited the general activities and effectiveness of RCB. As Romania creates new modern conference and exhibition centres, the development of RCB will be necessary to effectively promote this product.

Business tourism is conducted throughout the year, in specially designated areas, resulting in the exposure of specific services, trading, accommodation, security, aesthetic accommodation, telecommunications, video and TV, copying, transfer, catering, media services, graphics, etc..

The main features of the business tourism are:

- it is the area with the highest quality;
- it reaches the highest peak in spring and autumn, but it is recorded in summer and winter months as well;

- it completes the free tourism sector;
- the investment in business tourism leads to urban regeneration;
- a large number of investments for infrastructure are designed especially for business tourism (hotels, restaurants, transport and communications facilities) and provide benefits that can be used by classical tourists and indigenous peoples;
- the high quality of service personnel required by the business tourists is found in the services provided by them;
- research suggests that approximately 40% of business travellers return to the destinations with their families, but this time for personal reasons;

○ business tourism has less adverse environmental impact than classical tourism;

Business travels may have an internal or external character according to the direct beneficiary and their results.

The forms of business tourism having an internal nature address to employees of businesses and have as objective the motivation of the staff aimed to raise productivity growth and to improve performance.

They are reflected in:

- seminars or meetings with company management employees (for knowledge, solution of problems, sharing the experience.)
- to provide training and updating staff training;
- reward travels (incentive);

The actions with an external nature aims at the proper conduct of business and prosperity of companies as a whole and consists of the professional nature travel (working on site, assisting) and participation in fairs, exhibitions, congresses, symposia;

Also, the business travellers can be classified in the following forms:

a. General business tourism refers primarily to activities of persons working for a short period of time away from the place of residence (e.g. journalists).

b. Tourism meetings are determined by the participation in events such as meetings, conferences, seminars, symposiums, congresses and are considered one of the most common forms of business tourism.

c. The main destinations for tourism meetings are: USA with 894 shares, France

(757), Great Britain (722), Germany (505), Netherlands (385) and the cities of Paris (361), London (268), Brussels (194), Vienna (177), and Geneva (166).

d. Trade fairs and exhibitions which are defined as "the provision of products and services for invited audiences in order to determine a sale or to inform the visitor" as a form of travel they stimulate the journey of two categories of people: exhibitors and visitors.

In recent years, Romania has taken a strong impetus to tourism. The foreign firms choose cities in Romania to organize congresses and conferences, at which even hundreds of people can participate. "From our experience as a representative of Business Travel International, Romania is preferred for conferences, due to the generous infrastructure. There are fully equipped conference rooms and the staff who organizes such events is well prepared," said Cristina Irimia, marketing manager of J'Info Tours travel agency.

In addition to the congresses or conferences, recipients are part of a whole package. "The package offer is complex. First, housing is offered in higher-standard hotels and transfers from airport to the hotel, the airline tickets and secretarial services are included in the package. Organizers make available conference rooms equipped with everything needed, plus simultaneous translation services. There are also organized visits, entertainment programs and dinners for participants," said Cristina Irimia. The market development and competitive prices have turned Romania into a favourite destination for such a travel. "The costs are lower than in other European countries. We found a trend of increased business tourism and travels in Romania and an approximate 15 percent increase of this type of tourism", says, Cristina Irimia.

Tourism in major cities in Romania is focused on the business tourism, as long as there is no concept of cultural tourism development. "When we talk about urban centres, business travel is about 60-65%," said Paul Marasoiu, presidential general manager of the consulting and market research company in the hospitality industry Peacock Hotels / Global Hotel Management.

Business Tourism is the main source of income for the local hotel industry, especially in recent years as the number of people coming to Romania on business has increased considerably.

The main destinations for those who come on business are Bucharest, cities of Transylvania and Banat, Constanta. "Here the most superior class hotels were built", according to an analysis by the Romanian tourism strategy project for the period 2007-2013. The specialists in the field believe that currently there is insufficient accommodation to meet the organization of all major events for which there is a demand, which makes forecasts for future years indicate an increase in the number of the three, four and five star hotels.

New hotel projects will be run in Timisoara, Arad, Oradea, Cluj, Sibiu, Alba Iulia, Iasi, Constanta and the Danube Delta and treatment resorts. Also, in Bucharest, the number of projects of investment in new hotel capacity is expected to increase. "The lack of adaptation of the offer to the demand makes in many cases that hotel operators and organizers of events refuse profitable businesses because Bucharest is unable to accommodate an event that may require a large attendance of over 2,000 people," the strategy shows.

Bucharest is by far the most attractive location for both tourists and investors, attracting approximately 75-80% of all events," as it is stated in the tourism document strategy. The analysis performed by the consulting firm Peacock Hotels on the three star hotels segment in Bucharest shows that there is a total of 43 such hotels, with a total of 2198 functional rooms totalling approximately 4500 seats. This means extremely limited availability in comparison with other capitals of other countries in Central Europe, which have an impressive number of such locations, consider the specialists.

In the case of the three star hotels in Bucharest, the average annual net tariff over the last few years is within the range of 59-66 euros without breakfast, which costs an average of eight Euros (without the local toll and VAT). The average tariff provides an average annual occupancy rate of 65-67%. In the first half of this year, the average occupancy level of hotels of three stars in the capital rose by about 3-4%, while the net

average rate increased during the same period with 4-6%, said the consultancy company representative. As for the maximum rates for the three star hotels, they are at 135 euros for double rooms (with an actual average of 88 euros) and 120 euros for single rooms (average of 78 euros). With the proportion of 82% of accommodation capacity in hotels of three stars, the maximum rates charged are at about 100 euros.

According to the statistics, in Bucharest, there are 7 five-star hotels and 19 four stars. We do not take into account the 1 and 2 star hotels because they do not correspond in terms of European standards," said the representatives of the Peacock Hotels consultancy company. Projections indicate that over the next 8-9 years, in Bucharest, the accommodation capacity will increase from 4.500-4.800 rooms, currently at about 9,000 rooms. Of these, nearly 54% will have a level of comfort of three stars, while 28% will be at 4 stars.

The segment of business travel could be most affected by the financial crisis, being estimated to fall by up to 10% in 2009. Companies are rethinking budgets and cut the amounts paid for travelling. On the other hand, officials say the travel agencies have not seen a downward trend in the business segment.

Within the business tourism, a wide range of companies operates: travel agents, hotels, agencies, interpreters, organizers of trade fairs and conferences, business centres, etc. They are gathered within the "Convention Bureau" professional structure.

Along with the **Romanian Convention Bureau**, another professional association with significant activity in fairs and exhibitions-ASOEXPO must be mentioned.

The professional organization of conferences, meetings and other events may be considered the most efficient and profitable component of tourism. Maybe that is why an increasing interest of the investors in developing this type of offer is observed, especially in Bucharest, Timisoara, Brasov, Oradea, Arad, Cluj, Sibiu, Constanta and others. However, tourism professionals argue that, currently, there is still a shortage of accommodation spaces for events, especially those events involving the participation of a large number of people (over 300 people).

A dynamic component is organizing "incentive" trips; more and more Romanian companies, with modern management, use as a means of motivation the paid travels by the company offered to the employees who deserve them. These companies also use modern methods of training, the product launches or team-buildings. Thus, there have appeared more and more travel agencies specialized in providing services related to these types of events.

A Vocabulary Analysis of the Restaurant Menus

MIHUT Silvia

“Ovidius” University of Constantza
mihutsilvia@yahoo.com

Abstract

The present paper explores the genre of restaurant menus by analyzing existing online lists of breakfast, lunch and dinner options. It shows that a menu is a reflection of the restaurant itself and its vocabulary, whether formal, casual or playful, matches the restaurant concept, location or theme. In addition to providing the food and drink items, menus can also be used to offer other information to the customers. The restaurant menu vocabulary describes the owner/chef's philosophy about food and cooking, his/her experience, the mission statement of the restaurant operation or the particular location/culture.

Key words: restaurant menu, descriptive language, menu vocabulary, restaurant image

JEL classification: D 83

One restaurant menu is different from others if the owner/chef decides what will separate his/her food and beverage presentation from the rest of the market. This is the driving force behind the restaurant menu writing.

The assumption of the menu writer is that not everyone, who will eat in the restaurant, knows the restaurant offers and he/she, consequently, makes use of a particular language variety, meant to reflect the business identity.

The menu design does not begin with the printing of what the restaurant can serve, but it starts before that. The art of menu writing begins with the conception of the eating place. When a restaurant is opened, a theme is set and this theme emanates through all the elements of the dining space. This topic will dominate what is inside the menu, from its

earliest version until the latest updates. Having a subject matter helps define clearly the menu, keep it simple, not only for the guest's eyes, but also for the restaurant's. The theme will give the owner/the chef an idea of what to include in the restaurant menu and will tell him/her what not to write in the list.

After establishing the restaurant's theme and listing the possible items to include in the menu, the next step is for the chef to write down the menu entries. If we take a look at most restaurant menus, we will see that they are arranged sequentially: appetizers, soups, salads, main entrees, desserts and beverages.

Each item has a short title and a simple description below the title. The picture includes details about the main ingredients, the taste, the manner of cooking and the calorie count.

Although the explanation is what helps a customer know about the type of food and beverage the restaurant offers, it has to be short as not many people are patient to read through long explanations. A sentence is enough as the owner/the chef wants to intrigue the guest. If the customer has more questions, the restaurant waiter may give further information about a dish or may recommend a house favorite.

Gregg Rapp says in the article “The Menu Magician” from *Time Magazine* that there are four types of customers. Some customers are called *entrees* as they do not want a lot of description, just the bottom line on what the dish is and how much it is going to cost. Others are called *recipes* as they ask many questions and want to know as much as they can about the ingredients. On the other hand, *barbecues* share food and prefer talkative servers, who wear personal identifiers, while *desserts* are fashionable people, who want to order fashionable things.[1]

Menu descriptions can stimulate increased sales and particular food is recast in a new language light. For instance, *chicken liver* is

what Daniel Meyer, a New York City restaurant owner, calls a *torpedo*. The same *chicken liver* may be unattractive and unpopular, but when an enhancer is added, *chicken liver* becomes *applewood smoked bacon*, on the menu at Meyer's restaurant *Tabla*. This new name not only excites the taste buds, but it goes to work on the mind and makes the dish sound chic. [2]

The menu descriptions are not usually monotonous, but interesting enough to make the customer's mouth water. The restaurant menu writer usually includes the dish's major ingredients and uses ethnic names if they fit to add the menu an authentic air. For example, *Chicken Margarita* sounds better than *Chicken topped with spicy tomatoes*. The menu writer explains what is in the dish, namely *spicy tomatoes*, in the description itself. Too much of technical jargon in the menu is usually avoided as not all customers will be able to read and understand all this.

Inserting local/global geography or history into a menu item name is also a way to make the restaurant menu unique. For example, *Maine Lobster Roll* sounds inviting, whether one is eating it in Maine or somewhere else. Following the same trend, *Texas Barbequed Ribs* and *Georgia Peach Pie* make a good impression everywhere.

Brian Wansink noticed in "How Descriptive Menu Labels Influence Attitudes and Repatronage" from *Advances in Consumer Research*, volume 29, [3] that descriptive menu labels increase sales and he divided descriptions into four categories: geographic labels like *Southwestern Tex-Mex salad*, nostalgia labels like *ye old potato bread*, sensory labels like *buttery plump pasta* and brand names. Finding that brand names help sales, chains are increasingly using what is known as co-branding on their menus, such as the *Jack Daniel's sauce* at *T.G.I. Friday's* [4] and the *Minute Maid orange juice* on the *Huddle House* menu. [5]

As a form of advertising, the text written on printed menus is famous for the promotional statements and claims that express subjective rather than objective views.

The purpose of the menu text is to impress customers with the notion that the dishes served at a restaurant require such skill, equipment, and exotic ingredients that the customers could not prepare similar foods at

home. In some cases, ordinary foods are made to look more exciting by replacing everyday terms with their French equivalent. For example, instead of stating that *A pork chop has a dollop of applesauce*, high-end restaurant menus state *Tenderloin of pork avec compôte de pommes*. In a similar way, although the French term *avec compôte de pommes* is an exact translation of *with applesauce*, it sounds more exotic and more worthy of a high level restaurant. Menus may also make use of the French term *concassé* to describe *coarsely-chopped vegetables* or of *coulis* to describe a *puree of vegetables or fruit*. Another example is the French term *au jus*, which means that *meat is served with its own natural gravy of pan drippings*. Restaurants which put *with au jus* on their menus pretend to be far more sophisticated than they really are.

Menus commonly emphasize the processes used to prepare foods, call attention to exotic ingredients, and add French or other foreign language expressions such as *spring mushroom civet*, *plin of rabbit* or *orange-jaggery gastrique* to make the dishes appear classy and unusual.

Higher-end menus often add adjectives to dishes such as *glazed*, *sautéed* and *poached*. Wansink [3] said that vivid adjectives can not only sway a customer's choice but can also leave him/her more satisfied at the end of the meal than if they had eaten the same dish without the descriptive label.

Moreover, there are restaurants like *Huddle House* and *Applebee's*, which add vocabulary related to intense satisfaction. For example, at *Applebee's*, dishes are described as *handcrafted*, *triple-basted*, *slow-cooked*, *grilled* or *slammed with flavor*. [6]

Brian McGrory mentions in an article from *The Boston Globe* newspaper that, when going to a high-end restaurant, he sometimes feels that he needs a dictionary just to decipher the meaning of *gianduja ice cream*, *hazelnut financiers*, *yellow watermelon* and *bulgur crackers*, which are considered impenetrable listings from the dessert menu. [7]

The name of the *Tabla* appetizer, *Boodie's Chicken Liver Masala*, [2] derives from the field of menu psychology because Boodie is the mother of Floyd Cardoz, *Tabla's* executive chef. It is known that people prefer the names of mothers, grandmothers and other relatives

on the restaurant menus and research shows they are much more likely to order those restaurant entries. We can exemplify by *Grandma's zucchini cookies, burgers freshly ground at Uncle Sol's butcher shop this morning* and *Aunt Phyllis's famous wedge salad*.

In the world of menu design, a dollar sign is usually avoided by one owner/chef, particularly at a high-end restaurant. First, it may sound like "You have to pay" into a guest's fragile psyche and secondly it can look aggressive and vulgar. The price of *Boodie's Chicken Liver Masala*, [2] for example, is \$9, written simply as 9, without no dollar sign as this is a friendly and manageable number. Moreover, consultants and researchers say that the price formats that end in the numeral 9, as in \$12.99, which tend to signify value but not quality, are also omitted from a restaurant menu.

Dining places around the world are continuously revising their menu vocabulary as they are hoping that some magic combination of words can try to persuade by begging guests to spend a little extra money.

Allen H. Kelson, [8] a restaurant consultant, said in his article "Ten Commandments for Menu Success," published in *Restaurant Hospitality Magazine*, in 1994, that, just like advertisements, menus contain plenty of subliminal messages. Restaurants might play up a profitable dish by using more appetizing adjectives and placing it next to a less money-spinning dish with less description so the opposition invites the customer to order the cost-effective dish.

Floyd Cardoz, who is the executive chef of *Tabla*, said he considered the menu to be an important tool for communicating with his customers. Even brief descriptions on menus

like *Tabla's* and *Craft's* seem for him wordy, compared to those on the menu at *Alinea*, which on a recent night featured esoteric dishes called *Peanut Butter* and *Bubble Gum*, with a few more words that did not provide much more illumination. Next to *Lemon Soda*, the menu simply said *one bite*. He said that *Alinea* offers no à la carte choices, but only predetermined tastings, so the menu is not attractive. He considers the restaurant menu "a language tool," meant to "uphold the philosophy of the entire restaurant with every component - the sense of nostalgia, the sense of humor." [9] *Alinea's* executive chef, Grant Achatz, said that "with *Bubble Gum*, there is a kind of mystique to the lack of description." [10]

In conclusion, descriptive language in the restaurant menus is customized to fit the image of the restaurant itself, such as the style of the eating space or the background of the foods.

Verbal Communication Skills in Different Tourism Contexts

MIHUT Silvia

“Ovidius” University of Constantza
mihutsilvia@yahoo.com

Abstract

The present paper deals with the problems verbal communication conducts to in the tourism sector. Language plays a major role in determining the causes and the means of overcoming communication barriers. The theoretical part of the present paper sustains the importance of various elements verbal communication consists of, pointing out its roots and determinants. The practical part reveals the fact that, along with an ever growing number of tourism contexts, language has gained its position of mediator between the sender and the receiver. The research in the field of verbal communication, regarding the tourism sphere, gives a positive perspective on verbal communication at the workplace, showing the path to avoiding linguistic misunderstandings.

Key words: verbal communication, communication skill, tourism workplace, tourism context, sender, receiver;

JEL classification: D 83

1. Introduction

Tourism workplace describes any work setting involved in the domestic tourism industry, in the inbound tourism industry, or in the outbound tourism industry. There are many different types of businesses in tourism, but the market itself is essentially a single stream, with many common elements. Tourism operators may include but are not restricted to traveller accommodation providers, transport operators, amusement attraction operators, food and beverage establishments, visitor information centres, tour operators and travel agents. Verbal communication is in accordance with all aspects of tourism workplace policies, procedures and expectations, regarding both

the sender and the receiver, in a wide range of contexts.

Domestic tourism, also known as *internal tourism*, consists of people staying in their own country, but visiting a different city/place in which they do not live in. *Incoming tourism*, also known as *inbound tourism* or *export tourism*, covers all international tourist traffic entering a country. *Outbound tourism* means when people go out of their own country for a holiday, business trip, a.s.o. *Tourism contexts* make reference to situations that occur in the day-to-day operation of a tourism workplace. *Tourism workplace policies and procedures* direct to documented instructions about workplace expectations. These may include but are not restricted to customer service delivery, personal presentation, legislation, organisational structure and business objectives. *Tourism workplace expectations* refer to those anticipations outlined in a job description, tourism workplace policies and procedures workbook, or equivalent. *Sender* is the tourism employee. *Receiver* refers to the customer, who may include, but who is not restricted to an individual, a couple, a family or a group. [1]

2. Basic communication skills for work in tourism

The basis of the verbal communication, which gives the tourism operator a competitive advantage, is the interaction between people. If a tourism provider has the purpose to provide/to obtain information, the essential communication skills involve, in general, the capacity to exchange a few words in a public contact role and, in particular, the capacity to obtain the wished information. Such abilities entail to understand and to make oneself understood orally, to gather, to select and to organize information, to understand the global meaning of a text, to summarize using one's

words, to describe charts and tables, to understand causal relationships, to distinguish opinions and to express the interview answers in a clear manner.

If a tourism provider wants to analyse the information, the central communication skills comprise the capacity to examine various elements of a verbal communication in order to identify strategies, which can be used to reach a definite goal. These skills refer to the capacity to speak in order to inform, to explain, to involve, to thank, or to complain, the capacity to tell implicit from explicit in a conversation, in order to deduce, to know, to presume, or to take for granted, the capacity to use a more proper linguistic code and the capacity to produce different dialogue typologies, suitable for different context situations. The capacity to enrich one's self-knowledge, through a comparison with different themes or different opinions about such themes, in order to mould and to defend one's opinion, in the relationships with the clients or with the work team, and the capacity to use the active listening with the other "opinion makers" are also necessary.

Verbal communication in tourism must include appropriate language, articulation, voice modulation or voice projection. Verbal communication is one manner for people to communicate face-to-face. Some of the key components of verbal communication are sound, words, speaking and language. Some words may be imitative of natural sounds, but others may come from expressions of emotion, such as laughter or crying. Words alone have no meaning. The development of languages reflects class, gender, profession, age group and other social factors. The huge variety of languages usually creates difficulties between different languages, but, even within a single language, there can be many problems in understanding. [2]

Speaking can be looked at in two important areas: interpersonal and public speaking. Since the majority of speaking is an interpersonal process, in order to communicate effectively, a tourism operator must not simply clean up his/her language, but learn to relate to people. In interpersonal speaking, etiquette is very important. To be an effective communicator one must speak in a manner that is not offending to the receiver. Etiquette also plays an important role in an area which

has developed in most all business settings, namely in hierarchical communication. In tourism today, hierarchical communication is of utmost importance to all members involved. The other major area of speaking is public speaking. Some of the key areas of public speaking are speaking to persuade, speaking to inform, speaking to inspire or speaking to motivate.

Verbal communication may be evaluated in a tourism workplace when appropriate situations arise, or, in a training environment, if simulated workplace conditions are able to be provided. This fact reflects the standards of a tourism workplace. One-way verbal communication will involve an individual presenting a relevant tourism topic face-to-face to a group. Interactions may be face to face, on the telephone or they may require a combination of both. Two-way verbal communication will involve an individual communicating within a tourism context, with at least one other person, either face-to-face or over the telephone.

3. Verbal communication skills in two different tourism contexts

The specific form of communication does not occur in a vacuum. It is, or it should be, intimately related to particular situations, in which it is used. The circumstances of a communicative act are referred to as the *context of communication*. Two tourism situations will demonstrate suitable language used in appropriate *tourism contexts*. Gotti [3] describes two levels of expression for the language of tourism. This language may be similar to general discourse, when it is adopted in interactions between tourism clerks and guests, or highly specialized discourse, when it is used by the employees in the tourism field to communicate to one another. Our analysis involves some research in tourism industry discourse and it includes the use of appropriate language in accordance with two different tourism situations.

4. The first tourism context - booking a hotel room

In what follows, we shall investigate a common dialogue, between a hotel

receptionist and a tourist, on booking a hotel room. It involves a two-way verbal communication, in order to reveal several hotel conversation strategies. They disclose the similitude to general discourse [4] together with specifically-devised elements referring to the tourism context, when the tourism language is adopted in interactions between specialists and non-specialists.

Receptionist: "Good afternoon, San Felice Hotel. *May I help you?*"

Mrs Ryefield: "Yes, *I'd like* to book a room, *please.*"

Receptionist: "Certainly. *When for, madam?*"

Mrs Ryefield: "March the 23rd."

Receptionist: "How long will you be staying?"

Mrs Ryefield: "Three nights."

Receptionist: "What kind of room *would you like, madam?*"

Mrs Ryefield: "Er...*double with bath. I'd appreciate it if you could give me a room with a view over the lake.*"

Receptionist: "Certainly, *madam. I'll just check what we have available. Yes, we have a room on the 4th floor with a really splendid view.*"

Mrs Ryefield: "Fine. *How much is the charge per night?*"

Receptionist: "Would you like breakfast?"

Mrs Ryefield: "No, *thanks.*"

Receptionist: "It's *eighty four euro per night excluding VAT*"

Mrs Ryefield: "That's *fine.*"

Receptionist: "Who's the booking for, *please, madam?*"

Mrs Ryefield: "Mr and Mrs Ryefield, that's R-Y-E-F-I-E-L-D."

Receptionist: "Okay, *let me make sure I got that: Mr and Mrs Ryefield. Double with bath for March the 23rd, 24th and 25th. Is that correct?*"

Mrs Ryefield: "Yes, it is. *Thank you.*"

Receptionist: "Let me give you your *confirmation number. It's 7576385. I'll repeat that: 7576385. Thank you for choosing San Felice Hotel and have a nice day.*"

Mrs Ryefield: "Goodbye." [5]

Regarding the content of this ordinary tourism workplace conversation on booking a hotel room, one can notice that the dialogue contains basic elements for this tourism situation. Therefore, the hotel clerk gives the following information: the name of the hotel,

the kind of room, the number of the floor, the view which can be admired from the room window or the charge per night. He asks for the date of arrival, the length of stay, the wished type of room and the tourists' surname. The guest asks for the charge per night and gives details about the intention to book a room, about the date of arrival, about the length of stay, about the exact dates, about the wished type of room, about the view which can be seen from the room window, about the fact that the tourists do not desire breakfast, about the fact that the tourists agree with the price, about the tourists' name and about the confirmation number.

The simple format of the dialogue, which consists of an exchange of replies between the sender (the receptionist) and the receiver (the customer), displays the following linguistic features, mirrored by numerous lexical forms/syntactic structures:

a. the use of general business-related terminology (e.g. *VAT*)

b. the use of specific hotel-related expressions (e.g. *I'd like to book a room, please, How long will you be staying?, How much is the charge per night?, Would you like breakfast?, Let me give you your confirmation number*)

c. informality (e.g. contracted forms of the auxiliary verbs, elliptical constructions, in which verb phrases are omitted such as *when for, three nights, double with bath*, the fill pause word *er*, which signals a change of some kind and the necessity to fill spaces in a conversation, the colloquial form *thanks* and the verb *get*, which is characteristic to the spoken discourse, instead of the verb *understand*).

d. accuracy (e.g. the insertion of both customers' surname, the spelling of the customers' surname, the insertion of the hotel name, the insertion of hotel specific messages such as the confirmation number and the dates included in the stay, the insertion of the question *Is that correct?* or of the sentences *I'll repeat that* and *Let make sure*, which ask for the confirmation of the previously given information, and the insertion of the room price)

e. politeness (e.g. asking for something and answering to the request in a respectful manner, the introduction of the refined forms of language *may, could, 'd appreciate, 'd like,*

please, that'll be fine, madam, have a nice day, thank you)

f. grandiousness (e.g. the adjective *splendid* and the construction *with a view over the lake*)

5. The second tourism context-making a tourism-related presentation

The second tourism text is an extract from Larry Dwyer's presentation, entitled *Tsunamis, Hurricanes, Terrorism, and???: Lessons for the Global Tourism Industry*. The main topic is the need for effective marketing response in order to encourage tourists to return to destinations affected by natural disasters. The transcript represents one-way verbal communication and it comprises highly specialized vocabulary, in a well-organized discourse. The presentation is uttered by a specialist in the tourism sphere:

The *tourism industry recovering from crisis* will naturally seek rapid *recovery* from losses they sustained during the *crisis* period. This often involves an intensive *marketing campaign* to focus positive awareness of a *recovering destination* coupled with a range of *consumer incentives*. *Destinations* should avoid *overselling or misrepresenting their product* and be ethical in the choice of *promotional content* or they *could* create their own *crisis*. Also, *incentive programs* to encourage *tourists* to return to *destinations* should avoid the trap of *irresponsible discounting* which *may* attract large numbers of *travellers* but at *prices* which are *unsustainable* for the *enterprises*. While *price reductions* may generate *additional tourism flows* in the short term, the *expenditure injections* may not be commensurate with the numbers, resulting in what has been called '*profitless volume*.' The focus *should* be on *marketing strategies* which *will* be perceived as beneficial to *consumers* without compromising the *financial viability* of the *businesses* involved.

To be successful, *incentive campaigns* must avoid the impression of desperation. The essential balancing act is between offering the *consumer* a perceived benefit for travelling to a *recovering destination* and it *being financially viable* for the *business* to offer the benefit. *Value-added incentives* are a more *cost effective* form of *marketing incentive*

than *discounting*. A *free breakfast at a hotel* is a relatively small cost for a major *hotel* but its value to the *consumer* is perceived as high. The major problem with *discounting* is that it results in a *measurable decline of profitability* and it tends to set a level of *consumer price expectation* which is difficult to change at a later date. This *can* help to maintain *tourism-related expenditure* while minimising the *possibility of erosion of destination image*. [6]

This part of the tourism presentation focuses on analysing a point and on giving recommendations. The language is used in accordance with the formal context, in which the tourism-related presentation is made. Various linguistic characteristics are shown by the vocabulary items/grammatical structures involved:

a. the use of general business-related vocabulary (e.g. simple nouns such as *benefit, businesses, consumers* and *enterprises*, compound nouns such as *consumer incentives, incentive programs, price reductions* and *expenditure injections*, noun phrases such as *financial viability, incentive programs, irresponsible discounting, unsustainable prices, profitless volume, incentive campaigns, value-added incentives, consumer price expectation, additional tourism flows* and *measurable decline of profitability*, the adjective *cost effective* and the verb phrase *being financially viable*)

b. the use of tourism-related vocabulary (e.g. compound nouns such as *tourism industry* and *tourists travellers* or noun phrases such as *recovering destination, free breakfast at a hotel, tourism related expenditure* and *erosion of destination image*)

c. the use of the marketing-related vocabulary, with reference to the secondary topic of the extract (e.g. compound nouns such as *marketing campaign, marketing strategies* and *marketing incentive*, the noun phrase *promotional content* or the verb phrase *overselling or misrepresenting their product*)

d. high-level explicitness (e.g. the use of many adjectives, as tools of a descriptive language, high use of the present tense simple, the repetition of words such as *crisis, consumer, destination, benefit, incentive* and *discounting* or various morphological forms of the same word such as *recovery* and *recovering*)

e. high-level objectivity

f. a subjective representation of what should be "going on"(e.g. agent-oriented modal auxiliary verbs such as *will*, *should*, *may*, *must* and *could*, which express future obligation, necessity, possibility or ability and the noun *possibility*)

6. Conclusion

Verbal communication in the two different tourism situations ranges from everyday speech to highly technical discourse. In both cases, we can distinguish the language of tourism, as a specific subsystem of the general language, with its own lexical, morphosyntactic and textual choices, used within a specific professional realm, by both experts and non-experts.

Abstract

Tourism employees contribute directly to GDP creation. Although, it has an important contribution to GDP production, tourism has a special role in creating the added value.

Key words: employees, tourism industry, GDP

JEL classification: P52

1. Introduction

In the of general area of the domestic economy, tourism acts as a global dynamic element, represented by a specific demand for goods and services, demand that determines the enlargement in their production. The tourism demand influences a permanent adaptation to the offer, materializing in the development of tourism infrastructure and indirectly in stimulating the production of active sectors: the constructions of new transport facilities, leisure facilities for winter sports, nautical activities, etc. As a conclusion, the development of tourism activities leads to a significant production contribution.

2. The macroeconomic impact of tourism

Although, it has an important contribution to GDP production, tourism has a special role in creating the added value. Also, being characteristic, the use of human labor, intelligence and creativity, tourism participates to the creation of added value in a larger

proportion than other segments, with similar development particularities. Therefore, tourism stimulates the increase of production in different areas, as specialists show that some branches activity it's strictly determined by the tourism initiatives.

Tourism also, represents a method of diversifying the structure of countries economy. In this context, it is imperious that the tourism activities adapt to the more and more varied, complex needs of tourists, aspects influencing the appearance of a new leisure services, such as cable transportation.

Tourism represents a modality of superior fructification of all resources categories and in special the natural ones: the beauty of the landmarks, the curatives of mineral or thermal waters, the climate conditions.

There are countries that realize up to 80 % percents of GDP (Maldives Islands) of tourism activities, countries with a developed economy (France 7.3% in the GDP, Swaziland- 7% GDP) that have increased percents of tourism contribution to GDP. Regarding this situation, Romania presents itself with a contribution of 2-3 % percent to GDP.

For our country, in this actual stage, as a result of the lack of usage of tourism resources, and insufficient improvement, tourism constitutes a segment with large possibilities of enhancing and therefore remains an important field of activity.

Tourism as a big consumer of labor plays an important part in the economy. It creates new working conditions, by attracting the surplus of human resources from different sectors, determining the diminishing of the unemployment. The large number of those that

work in the tourism industry can be explained by the limited possibilities of mechanization of tourism operations.

Romania finds itself, in regard to the evaluation of the Tourism International Council, in the 76 place, in a world hierarchy, as for the contribution of tourism to GDP.

The Gross National Product represents the sum of added values brute of different institutional sectors of different fields of activities, to which it's been added excises and subtract the products subsidies (that are divided on sectors and fields of activities). Also, this account balance represents the total economy production.

Gross Domestic Product is a measure of the total flow of goods produced or services rendered in an economy over a given period of time, usually a year, in a process (actually, a lot of them) started by inputs (inputs = goods and services used in production), finished by outputs and are sometimes used for intermediate products (which go through several cycles of production, and are rather meant for intermediate consumption in order to obtain other products, and not to become the final product by themselves). GDP is an aggregation of final results of the engagement of various inputs. (According to Marshall, inputs are things needed to create a commodity. In modern terminology, reference is made to the above mentioned "input" which broadly includes: land, labor and capital (but is generally recognized that clustering is not unassailable, given the possibility of sub classification of each input into several components).

It is worthy to note that products subject to intermediate consumption are not collected (considering only goods used for final consumption by the population or investment goods). This is because values of intermediate goods are already contained implicitly in final goods prices.

Grade of "gross" indicates that there was no "cleaning" of the expenditure data of goods for replacement parts (used or exceeded), of the technical and material, by subtracting replacement costs the Net Domestic Product (NDP) would have been obtained.

Grade of "internal" indicates that there was no inclusion of the income from the investments made and the properties held abroad by locals, and there was no subtraction

of the income generated in the country by foreigners. By applying these two operations on GDP we obtain GNP (Gross National Product).

Research of the Romanian economy in the period 1995-1997 shows a pronounced decline. Gross domestic product marks a significant decrease as a result of changes that occurred in the whole economic structure of the country, changes caused, in turn, to the improvised economic policies. The changes have led to a sharp decrease of production in all branches, but also to a dramatic effort to adjust production capacity and labor force to the requirements of market economy. The two trends are influenced by a multitude of factors, some very aggressive, among them being: increasing import penetration rate on the Romanian market, the inevitable competition with domestic products, the continued worsening budget deficits, financial bottlenecks and decapitalisation of economic agents, low level of quality of the Romanian products which were losing or had already lost important external markets.

3. Analysis of number of employees in tourism and GDP using a single factor econometric model

Specifying an econometric model involves choosing a mathematical function that can be used to describe the relationship between two variables.

Table: 1. Relationship between GDP and number of employees in Romania during 1999-2008

Years 1999-2008	GDP -USD-	Number of tourism employees
1999	1,10413	371,14
2000	1,15008	372
2001	1,21404	358,609
2002	1,38474	354,043
2003	1,69985	357,072
2004	2,14675	362,854
2005	2,83548	361,201
2006	3,80616	392,297
2007	5,49231	417,74
2008	6,67191	438,663

Source: www.WTTC.org

Based on the available data a single factor econometric model can be built:

$$y = f(x) + u$$

where:

- y equals the real values of the dependent variables (average monthly revenues);
- x equals the real values of the independent variables (commercial surface);
- u equals the residual variable, representing the influences of the other unspecified factors of the y variable, which are considered random factors with little to none influences over the y variable.

Existence and intensity of the relationship between GDP and the number of tourism employees were analyzed by the regression method.

Using multiple regressions involves estimating parameters of the regression function, performed by the method of the smallest squares:

Table 2: Study of the linear regression model

SUMMARY
OUTPUT
Regression
Statistics

Multiple R	0,930969
R Square	0,866703
Adjusted R Square	0,850041
Standard Error	0,763472
Observations	10

ANOVA

	<i>df</i>	<i>SS</i>
Regression	1	30,31977
Residual	8	4,663113
Total	9	34,98289

	<i>Coefficients</i>	<i>Standard Error</i>
Intercept	-21,4109	3,358749
X Variable 1	0,063824	0,008849

<i>F</i>	<i>Significance F</i>
52,01637	9,14E-05

<i>P-value</i>	<i>Lower 95%</i>	<i>Upper 95%</i>	<i>Lower 95,0%</i>	<i>Upper 95,0%</i>
0,000215	-29,1562	-13,6656	-29,1562	-13,6656
9,14E-05	0,043417	0,084231	0,043417	0,084231

ANOVA refers to the decomposition of the total variance (**SST**) of the dependent variable into two components: **variance explained by regression (SSR) and unexplained variance (SSU) or residual variance**.

Rule of decision on the acceptance of the model is: large values for F test statistic and low values for Significance. Significance F is the error value obtained by rejecting null hypothesis when in fact it is true.

SUMMARY OUTPUT offers information about indicators that show us how good the model we are analyzing truly is.

These indicators are: the ratio of correlation (Multiple R) determination coefficient (R Square) and adjusted determination coefficient \bar{R}^2 (Adjusted R Square). Regression is better as the values of R^2 and \bar{R}^2 are closer to 1.

The third table gives us information about the estimated values of coefficients in the regression model in column **Coefficients**, standard errors of coefficients in the **Standard Error** column, elements for applying the significance test *t-Student* for each factor (columns *t Stat* and **P-value**). So the t-Stat value column is obtained by dividing the forecasts from the standard error of the estimator for each model estimator, and thus obtaining the resulting calculated value of t test for each model estimator. This calculated value is compared to the value from Student distribution table.

The value of the correlation ratio $R = 0.93$, confirms the existence of a strong direct link between the two indicators analyzed: GDP and number of employees in tourism.

By using the theoretical linear adjustment equation, $\hat{y} = \hat{a} + \hat{b}x_i$, in studying the link between the two indicators, it becomes:

$$\hat{y}_i = -21,41 + 0,06x_i$$

The regression coefficient = 0.06 shows that by increasing number of tourism employees by 1 the resulting average increase is approximately 0.06 people.

Value derived by applying the test "t" Student: $t_{\text{calculat}} = 7.212237$ (P-value = $9.14E-05 < 0.05$) for regression coefficient b, as well as the marginal values of the same positive sign, Lower and Upper (0.043417 and 0.084231) show that the coefficient is statistically significant.

The value of the determination coefficient $R^2 = 0.8667$ shows that 86.67% is the influence on GDP of the number of tourism employees, the remaining 13.33 being subjected to change by other random, non-essential factors.

The result using the Fisher test: $F = 52.016$ (P value = $9.14 E-05 < 0.05$), shows that the model used expresses very well the established correlation between the number of employees in tourism and GDP in Romania during 1999-2008.

The results for the coefficient a, which is free time by *t-Stat* (-6.37466), *P-value* (0.000215 < 0.05), the margins with a negative sign, *Lower* and *Upper* (-29.1562 and -13.6656), show that the coefficient is also statistically significant.

Elements aimed at the acceptance of the model as valid and the existence of the statistically significant a and b parameters in the model, is considered a step which creates the possibility of forecasting GDP and number of tourism employees in coming years.

Tourism and travel industry is categorized as one of the largest industries in the world with over 225 million people and generating 9.6% of global GDP to 2008 year.

In Romania, tourism and travel industry is expected to contribute directly 2.1% to Gross Domestic Product in 2009 (i.e. EUR 10.8 bn or U.S. \$ 3695.2 mn), rising in nominal terms EUR 29.9 bn or U.S. \$ 9546.4 mn (2.5% of total) in 2019.

The Tourism Economy contribution (% of total) should rise from 5.7% (EUR 28.9 bn or U.S. \$ 9,942.6 mn) to 6.6% (EUR 80.2 bn or U.S. \$ 25,648.1 mn) in the same period.

Employment in tourism in the Romanian economy is expected to arrive by the end of 2009 to 582.000 employees, 6.8% of all employees.

For 2019 it is estimated a total of 631,000 employees in the tourism economy, i.e. 7.9% of all employees in the country.

In 2007 the travel and tourism industry were involved 287,000 employees around 3.4% of all active employees on the labor market in Romania, and estimates for 2019 indicates a total of 306,000 employees in total employees in this industry at that time.

4. Conclusion

Finally we can say that the development of tourism industry can bring great economic benefits to the world and may even be the only chance of survival for many poorly-developed countries.

Should focus on labor involved in their training, because placing the key business is the human resource.

Romania in the Context of Community Trade Policy Mechanisms

NISTOR Costel
MUNTEAN Mihaela-Carmen

rozalia.nistor@selir.com

Abstract

The trade policy is one of the main pillars of the EU's relations with the rest of the world. More importantly, the implementation of a common commercial policy was part of the original plan of intergovernmental economic integration which is the origin of the European Union. The common commercial policy intends to support the sustainable development by involving a large number of countries in the community trade system. In order to do so, the European interests and certain values should be promoted, values regarding the concept of democracy, rule of law, environmental protection, social rights, public services, cultural diversity and food security, global markets opening by constantly eliminating the hindrances that prevent the international trade and by reducing the tariff barriers as well as by benefitting of the globalization potential by adopting a mutual set of rules that governing markets and by ensuring compatibility of the trade liberalization with the other social values.

Key words: trade policy, common commercial policy, Romania

JEL classification: F13

1. EU dimensions and trade policy instruments

The policy that is being currently applied by the European Union and implicitly by all Member States distinguishes 3 dimensions, which can be grouped as follows:

1.1. Unilateral dimension mostly achieved within the World Trade Organization, which aims at promoting the market access rules in ensuring effective global governance. An example of this type of policy is represented by the policies regarding tariffs reduction and technical barriers elimination concerning trade, as far as the trade in goods is concerned. Within this dimension the expansion of the values promoted by the European Union is being tried to be accomplished, such as those connected with the environmental protection, food security, cultural diversity, the most difficult aspect to be promoted being the adoption of standards on labor. The difficulty of such an approach is obvious taking into account for example, the differences regarding the work-related rules in the European Union and China.

1.2. Regional dimension aims at signing certain bilateral agreements and adoption of specific measures concerning a third state or regional association. Currently 121 countries are potentially related to the EU through some regional trade agreements, most of them being negotiated during the '90s. The motivation of bilateral trade policy employment in the European Union trade policy is given by:

- the development of trade on the world level and the increasingly demand for generally accepted rules of the game by the participants under the WTO, the need to stimulate development on all levels and to promote the regional one;
- support of some new concepts of the European Union such as "neighborhood policy" or "Extended Europe" which have already had results in the relations with the Mediterranean countries. The EU has signed

association agreements and trade liberalization with Algeria, Egypt, Israel, Jordan, Lebanon, Morocco, Palestinian Authority and Tunisia. The EU main regional agreements include:

- Economic Partnership Agreements negotiated with A.C.P. countries (African Caribbean Pacific) – the Cotonou Agreement. The ACP Economic Partnership Agreement, signed in February 2000, promotes the non-reciprocal trade preferences granted under the Lome Agreement for another 8 years, while the EU intends to negotiate reciprocal free trade areas with subgroups of countries from Africa, Pacific and Caribbean;
- Free Trade Agreements with the European Free Trade Association, EuroMed, Mercosur, Mexico and South Africa; customs unions with Turkey, Andorra and San Marino;
- Partnerships and Cooperation Agreements with Russia and Ukraine.

1.3. Unilateral dimension is used to implement and adopt unilateral measures as additional instruments of trade policy to ensure proper development and political stability of the European Union's priorities. These measures have been frequently taken the form of trade concessions that are granted by the EU to the third country based on some economic interests to accelerate trade with a certain region and increase the economic benefits for both sides.

The instruments used by the European Union within its unilateral trade policy are the following:

• **Generalized System of Preferences (GSP)**, which is the classic instrument for stimulating development by granting the preferential customs duties. GSP grants either a duty-free access or a tariff reduction for the products imported from countries that are subject to these preferences, depending on the sensitivity of the products and the type of preferences granted to these countries. 178 countries and territories take advantage of the preferences granted by the European Union, which is by far the body which grants the highest number of preferences of the Organization for Economic Cooperation and Development.

▪ **Everything But Arms Initiative (E.B.A.)** which is a scheme of preferences granted to the least developed countries. Special arrangements are provided to a number of 49

countries classified by the United Nations as being the least developed. E.B.A. provides duty-free access to imports of all products from the least developed countries, without quantitative restrictions on imports except arms and ammunition. These preferences are granted by the EU indefinitely. The World Bank concluded that this measure, once fully implemented, will increase these countries exports to the European Union by at least 15-20%.

▪ **Granting of asymmetric preferences**, for example for the Balkan countries or Moldova, in order to ensure peace, stability, freedom and economic prosperity in the region, according to the "enlarged Europe" concept. In 2000, the EU Council granted the extension and improvement of autonomous EU tariff preferences for Western Balkan countries. This regulation had as consequence that 95% of imports from these countries have been exempted from customs duties. Moreover, in the context of the stabilization and association process it aimed at liberalizing trade in Croatia and the Former Yugoslav Republic of Macedonia.

Regarding the application and implementation of its trade policy, EU has employed two categories of instruments, namely:

A. Defensive instruments, as those tools that ensure fair conduct of trade and that defend the interests of European companies. These instruments were established in accordance with the World Trade Organization provisions which acknowledge the Member States entitlement to defend themselves against unfair trading practices. The main instruments employed in current in practice are the following:

▪ **Anti-dumping measures** that are designed to counteract dumping, especially those which take the form of trade distorting practices. The dumping phenomenon occurs when extra community entities redirects sales of goods to the community area below the sales price from the countries of origin markets or even below the production cost.

▪ **Anti-subsidy measures** that are designed to combat subsidies provided by government that distort trade if they help to the artificial reduction of production costs or export prices to the community area.

▪ **Safeguard measures** can be taken by any member of the World Trade Organization, and hence the European Union member states countries and require temporary additional restriction of imports of a particular commodity if the domestic production of those goods is significantly threatened by the recording of damage.

B. Offensive instruments that aim at opening the markets access and eliminating trade barriers through multilateral, bilateral and unilateral actions. The main offensive instruments are the following:

▪ **Regulations on trade barriers** that allow community economic entities to claim the European Commission Community trade barriers that restrict their access to a third country markets. Regulations can be also used to evaluate the situation of breaching the international trade rules with negative implications. If the lawsuit is won, you can appeal to WTO mechanisms for resolving disputes.

▪ **Database regarding the community economic entities access to third markets** which allow to obtain information on access conditions in third country markets, to use systematic methods of tracking by the European Commission of complaints on uncompetitive practices and last but not least to ensure the compliance of the EU trading partners of the obligations under the signed agreements. This database is not a direct action instrument, but a support instrument that also substantiate the measures and initiatives which the EU can take against those trading partners that bring about commercial difficulties to community traders.

2. Applying the European Union common customs tariff

Romania's adhesion to the EU has brought about, as it is well known, significant changes regarding intracommunity goods exchange. Moreover the changes that occurred in the foreign trade relations with EU member countries caused implicitly changes concerning the rehabilitation of international trade in goods and services.

The European Union is currently the largest global trade player, covering approximately 20% of world exports and imports. It plays a

key role in promoting world trade which is mainly based on trade rules agreed by the WTO. Starting January 1, 2007, Romania's trade policies are accomplished by applying the European rules. Thus, Romania has withdrawn its involvement from all previous free trade agreements and in the future will apply the Community legal framework of foreign trade.

Of all the implications brought about by the integration into the European structures, the one that had the greatest impact had the common customs tariffs. Thus the overall tariff level has shown a downward trend compared with the corresponding pre-accession period, taking into account that approximately 70% of Romania's foreign trade has been conducted with EU member states.

EU regulations regarding the common commercial policy shall be binding and directly applicable in all Member States. Therefore, on the accession time, Romania withdrew its membership from the European Agreement and the Central European Free Trade Agreement (CEFTA) and free trade agreements signed with Moldova, Turkey, Israel, Serbia - Montenegro, Albania, Bosnia and Herzegovina, EFTA (European Free Trade Association). In the same context, all non-preferential trade agreements and economic and trade cooperation agreements were cancelled.

Romania's trade had been largely conducted in the Free Trade Agreements (approximately 83.91% from 70.56% in exports and imports) during the pre-accession period. Concerning the weight, the Romanian trade exchanges under these agreements mentioned above, the first place was occupied by the European Union holding 67.8% of exports and 74.6% of total imports during January-October 2006, which means that the majority of imported products reduced the price level, as a result of the customs duties cancellation.

Among the free trade agreements signed by the European Union, which are applied by Romania as a member state as well beginning with January 1, 2007, agreements with Mediterranean countries, with Mexico, Chile, South Africa and the Stabilization and Association Agreements with Western Balkans countries are also included. Moreover non-preferential trade agreements with third countries and other commitments concerning

the economic and trade cooperation shall be applied.

Regarding the commercial benefits, the adoption of the Community trade policy has as consequence the significant improvement of Romanian products and services access on the European Union's unique market and on the third countries markets in return to the import liberalization measures in Romania. In addition, Romania as European Union state member, will be able to promote more effectively its interests in international trade negotiations, taken into account that the European Union is the world trade leader, therefore having great negotiating power.

In terms of marketing costs, by applying the EU rules a considerable increase in the degree of liberalization of imports of goods and services can be accomplished both on the *most-favored nation treatment* and on preferential basis, therefore the corresponding reduction of the national production protection over the foreign competition.

The costs on the financial plan arise from the need for Romania's participation in the financial assistance for EU development through the European Development Fund, established in *UEACP, MEDA* financial program, established in the Euro-Mediterranean Partnership, the Common Fund for Commodities financing and other similar funds.

3. EU trade policy impact on Romania

On the short term, the adoption of European Union common customs tariff can have a negative impact, manifested by trade deficit increase due to the average level of tariff protection applied by Romania during the pre-adhesion period was higher compared with that used in the Community. By participating in the Customs Union, Romania was forced to reduce tariffs, thus meeting the requirements of the EU. As a direct consequence of this measure, the domestic market is currently facing an additional influx of goods from third countries, resulting in a significant increase in imports.

In addition to working out the problems related to conversion between different types of duty, the adoption of the Common Customs

Tariff duties has also implied the import custom duties alignment to the existing ones applied in the European Union on Romania accession time. Custom Duties charged by Romania during the pre-accession based on the most-favored nation clause reach an overall average of 18.4%, but which if spread out it shows a level of 29.5% for agricultural products, 21.3% for fishery products and 15.2% for industrial products. In comparison, the customs duties charged by the EU in relations with third countries reach an overall average of 6.3%, of which 16.2% is applicable to agricultural products, 12.4% to fish products and 3.6 for industrial products.

Table no. 1 Level of custom duties applied by Romania to the main product groups before and after EU accession

Product group	General Average	Agricultural Products	Piscicultural Products	Industrial Products
Period				
Preadhesion	18,4	29,5	21,3	15,2
Postadhesion	6,3	16,2	12,4	3,6

Source: C.E., Regular Report on Romania's progress towards accession

Figure no.1 Level of custom duties applied by Romania to the main product groups before and after EU accession

Regarding the food products, the adoption of common customs tariff will reduce or even eliminate customs protection. The most significant reductions in customs duties levels had to be made in beverages, spirits and vinegars - from an average of 121.1% to 8.1%, tobacco and manufactured tobacco substitutes

- from an average of 51.8 % to an average of 21%.

Concerning imports which do not compete directly with domestic products such as coffee, coffee-based products, olives, peanuts or whiskey, the border protection reduction affected only the state budget revenues from customs duties without any significant implications on the commercial flow or resident commercial operators.

On the other hand, however for a less significant number of products, the common customs tariff induced a significant increase in customs duties. These duties are subject to trade with live animals - where the custom duties were increased from 15.4% to 26.2% and cereals – they rising from 14.2% to 47.3%.

For some agricultural products, the customs duty tariff increase caused by the common customs tariff was so high (rice from 117 to 141.4%, meat 99 to 105.5%, tomato 97.6 to 104.2%, apples 66.4 - 70.4%) that this aspect has brought about domestic production increase and imports reorientation to the Community, thus being able to induce a certain increase in domestic prices.

Table no. 2 Changes induced by common customs tariff aligning on certain food products (%)

Product	Alcoholic beverages							
	Alcoholic beverages	tobacco and tobacco substitutes	live animals	Cereals	Apples	Tomatoes	Meat	Rice
Preadhesion	121	51,8	15,4	14,2	66,4	97,6	99	117
Postadhesion	8,1	21	26,2	47,3	70,4	104,2	105,5	141,4

Source: Țarcă, Viorel, Comerțul exterior în strategia dezvoltării economiei românești, pag. 217

Nevertheless, the new duties have involved relatively minor changes to a few products such as pork and poultry, prawns, a species of bananas, soya beans, some vegetable fats and oils, flours, meals and certain fish products or shellfish and soy oil extraction residue.

Figure no. 2 Changes induced by common customs tariff aligning on certain food products

	Import	Export	Import	Export	Import	Export
2006	65285	178365	41866	21197	9753,8	37962,89
2007	83588,4	361374	56389	24973	127113,87	75689,94

* thousand EURO

Source: Ministry for SMEs, Commerce, Tourism and Liberal Professions, the Romanian Trade Promotion Centre

Regarding the industrial products, the application of the single tariff has brought about a decrease in border protection, because as far as the average customs tariff were significantly higher than the European average. Thus, according's total imports weight, the most significant reductions were recorded in the import of drugs (8-10%), plastic articles and plastics (13.5%) in various metal processing products (7.5 to 17, 6%), replacement parts for piston engines (12.3%), machinery or apparatus used for filling, sealing and labeling (13.3%), non-automatic sewing machines (16.3%) and cars (20%).

4. EU accession impact on agricultural products trade

The *acquis communautaire* adoption in food products refers to the EU rules that were taken over as far as the Common Agricultural Policy is concerned, which involves a single internal market for food products and a single trade policy for trade in those products with third countries. The *acquis* implementation meant complete suppression for Romania on a mutual basis from January 1, 2007, of customs duties on foodstuffs imports from the Community, Romanian food prices alignment to unique prices guaranteed by the EU due to the price system of intervention, then the adoption and application of technical regulations, product standards, veterinary and phytosanitary standards of the European Union in the agro alimentary sector.

Moreover, the *acquis* adoption has also brought in certain contribution to the Community budget for the agro alimentary sector financing and taking advantage of its products, the application of the common customs tariff on imports of agricultural products in third countries and the *acquis* adoption regarding the rural development.

Regarding the mutations brought about by the single customs tariff implementation on the internal market, the graphical modeling of the import duties impact on a small country such as Romania, will be taken into consideration concerning its trade with food products, especially its maize, alcoholic beverages and live animals trade.

Figure no. 3 Impact of single customs tariff on maize trade

p1	p2	X1	X2	Y1	Y2
14,2	47,3	37962,89	75689,94	9753,8	127113,87

$$A_{ABCD} = (75.689,94 + 37.962,89) * 33,1 / 2 = 1.880.954,34 \text{ EURO (producers profit)}$$

$$A_{CEFA} = (127.113,87 + 9.753,8) * 33,1 / 2 = 2.265.159,94 \text{ EURO (consumers loss)}$$

$$A_{HGFB} = (127.113,87 - 75.689,94) * 33,1 = 1.702.132,08 \text{ EURO (state profit)}$$

$$A_{DHB} = (75.689,94 - 37.962,89) * 33,1 / 2 = 624.382,68 \text{ EURO (net loss)}$$

$$A_{GEF} = (127.113,87 - 9.753,8) * 33,1 / 2 = 1.942.309,16 \text{ EURO (net loss)}$$

$$A_{DHB} + A_{GEF} = 2.566.691,84 \text{ EURO (aggregate net loss)}$$

Common Customs Tariff increases the domestic price from 14.2 units to 47.3 units, thus the producer's surplus increases the trapeze area $ABCD$. The difference of 33.1 units will be redirected as direct debits to the state budget, the revenues total being illustrated by the rectangle area $HGFB$. In this case, the losers will be consumers, because they will have to pay a higher price than the one set up during the pre-accession period, consequently reducing the consumption of this particular commodity, situation whose truth value is supported by increasing the exported quantity in 2007.

Thus, a reduction in consumer surplus is achieved which is equal to trapeze area $CEFA$. Therefore, a part of the consumer loss is transferred to the Government in the tax collection process equal to the rectangle area $HGFB$, another part is transferred to domestic producers, respectively the trapeze area $ABCD$.

Two dimensions can be identified, the triangles areas DHB , GEF that can be found neither in budgetary levies nor in the producer's surplus. The two areas represent the net welfare loss resulting from the customs duty change, i.e. costs incurred by Romania as a result of the price distortion due to the free trade regime.

Pro or Anti-Crisis Measures in Romania?

Abstract

The global crisis leaves no country unharmed and no doubt remains about this. But, should we wait for global solutions or we must try to make our one way through crisis? Global crisis is not only economic; it is politically constructed in different ways, depending on state, region and history. The most problematic effect of the actual crisis is the increasing unemployment, so that, the first aim of this paper is to estimate the evolution of the unemployment costs in period 2002-2009. Secondly, based on information from National Institute of Statistics (NIS), National Agency for Employment (NAE), Eurostat and in correlation with specific literature and Romanian government decisions we make a forecast of the unemployment costs for the next two years. We tried to reveal the fact that some of government decisions in crisis period can aggravate the situation and not support the economic recovery.

Key words: crisis, unemployment, Romania

JEL classification: J64

1. Introduction

We are all agreeing the idea that the global crisis needs global solutions and concerted efforts.

Global crisis is not simply 'economic'; it takes place within a capitalist political economy which is, ab initio, structured through a system of nation-states which maintain a kind of formal sovereignty in tension with an extreme material inequality. It is hardly surprising that 'crisis' is politically constructed in different ways, depending on state, region and history. [1]

The major economies share neither the same political system nor the same historical reference points, which makes coordinated action difficult.

Leaders of the world's largest economies, known as the G-20, met in London (April 2009) to explore possible responses to the global financial crisis, to that end, they decided to levy sanctions against clandestine tax havens and to institute strict financial regulations. Such regulations included tougher controls on banking professionals' salaries and bonuses, and increased oversight of hedge funds and credit rating agencies. While France and Germany were emphasizing stricter financial regulations, the United States and the United Kingdom were advocating public spending to deal with the economic crisis. On the Pittsburgh Summit of G-20 (September 2009), the officials decided to let the burden of economic recovery in private demand account, relieving the public demand.

One of the most important consequences of the crisis is the permanent and increasing number of unemployed. Year 2010 may be for Romania, exit from the crisis year, but it is very possible to be in the same time, the most burdened with negative consequences of the crisis year, too.

Unemployment phenomenon generates a range of costs; they may be monetary and non-monetary, direct or indirect, economic and social. Unemployment affects not only the unemployed but also those who are in employment, because they participate with a share of their income at public funds to social security. Another important cost of unemployment is the loss of production and income that it entailed.

To summarize, we can state that unemployment is a phenomenon that affects, in different degrees, all nations/regions/areas

and has many negative economic and social effects. Among the most important, we mention these: *non-use and wastage of a part of the labour force from a country/area*, with a more negative aspect, so that the society and the individuals bear significant costs of education and workforce training unoccupied, expenditure still not recovered; lead to reduced incomes, and increasing social tensions, as a factor in lowering the standard of living and worsening quality of life, contribute to increased economic and social costs that an economy has to bear in the form of unemployment benefits. [2]

2. Estimating unemployment costs

Next, we'll try to make an assessment of the costs of unemployment in the period 2002-2009.

From all the social and economic *costs of national unemployment*, we focused on economic and, especially, on the money, aimed at following (see Table 1).

Assuming that the unemployed person should be pursued gainful activity, considering the average values of labour productivity (calculated as ratio of real GDP per person employed, even if GDP is the result of more factors working together, such as: labour, capital, total factor productivity etc.) correlated with the number of unemployed corrected, we can determine which is the *loss of national GDP* (see relation 1). We mention that we made a recalculation of the number of unemployed allowances based on data provided by the National Agency for Employment and Statistical Yearbook of Romania, correcting the number of unemployment with unemployment duration, thus resulting in an average of unemployed being unemployed for over 1 year, we added the unemployed without allowances obtaining so, the final average number of unemployed corrected.

$$\text{Loss of GDP} = W_L \times U_c \quad (1)$$

where: W_L - labour productivity;
 U_c - unemployment corrected.

Thus, loss of national GDP has increased steadily until 2007, due to the productivity growth, especially as a consequence of real

GDP growth – supported by demand in conjunction with a high rate of consumption and an expansion of lending -, correlated most of the time with a diminishment of the number of unemployed. On the other hand, if we observe the evolution of weight of loss of GDP in total GDP in period 2002-2007 it decreased from 5.6% at 4.1% in 2007. Year 2008 reveals a change in the trend evolution of the unemployment; the number of unemployed increased from 368,000 persons (December 2007) till 625,000 at the end of 2008 (according to NIS). The NAE' source of dates gives us an overview of 2008 year, in which unemployment felt steadily until October when the balance between in - out was tilted decisively in favour of becoming unemployed. We mention that GDP and the labour productivity are calculated at real values, so the nominal losses may be following another trend.

In terms of loss of GDP, 2010 year highlight a late measure, regarding technical unemployment, according with the Government is saving funds generated by the difference between the cost supporting employers in the direction of keeping staff and the cost of unemployment.

By revolving the average wage that would be obtained if it were rendered unemployed labour and compensation they received as unemployment benefits we may obtain a picture on the *net loss of income (NLI)* (see relation 2).

$$NLI = (ANW \times U_A - U_B) + ANW \times U_{notA} \quad (2)$$

where: ANW – annual net average wage;
 U_A - unemployed with allowances;
 U_B - unemployment benefits;
 U_{notA} - unemployed without allowances.

Thus, at national level, there was a net loss of income, following up by the increase in net average wage and deepening the phenomenon of chronic unemployment. This loss of income limits the ability of consumption and investment being put onto the future capacity growth in global demand for goods and services and, thus, the possibilities of creating new jobs.

The existence of a large numbers of unemployed imposed on budget revenue, too, therefore, we can determine the *loss of*

budgetary revenue (LBR) due to unemployed (relation 3). We mention that we don't take into account the employer and employees contributions at unemployment benefits budget and the other contributions to the state's budgets; all these would increase the budgetary losses.

$$LBR = AGW \times U_c \times 16\% + U_B \quad (3)$$

where: AGW - annual gross average wage;

U_c - unemployment corrected;

U_B - unemployment benefits.

* - is representing the flat tax on income.

Loss of budgetary revenue is increasing; this lost diminished the demand for goods and services from the state side and is affecting employment, the effects induced on finding alternatives ways of providing financial resources to the state income tax contribution account.

The total loss of budgetary revenue is much higher, because, we could add to the unemployment, others causes, like the various forms of activities on informal labour market.

In Romania, informal employment takes various forms such as subsistence agriculture, wage-employees who do not declare their earnings, employers not registering their employees, workers without labour contracts, tax evasion and social security evasion both by employers and employees, under-declaration of earnings, false self-employment and many others. Many of these forms constitute deliberate actions to hide earnings in order to evade paying taxes and social security contributions; others represent activities at the subsistence or survival level that can hardly be regarded as evasive. [3]

3. Romanian Government measures

According to data from the Organization for Economic Cooperation and Development (OECD), most developed countries have registered economic growth in the first quarter of this year, confirming what analysts have said lately, namely that the crisis ended; but which is the Romania point of view?

Table 1. The unemployment costs in Romania, in period 2002-2009

Indicator/ Year	2002	2007	2008	2009*
Real GDP (bn. USD)	41.2	111.8	125.5	95.4

Source: NIS, NAE, estimates of the authors

Even if for Canada, Germany, Italy, France or U.K. the crisis was ending, it led to difficult inheritance left: high debt, monetary and trade imbalances, especially between the largest consumer, the United States and the largest producer - China.

Economic balance of this year is a disastrous one for our country. Global economic downturn has affected all Romanian companies, from the largest to the smallest neighbourhood business. The access to banks funds for the business environment is blocked by the state because the Government, through the Ministry of Finance, borrows from private banks almost all the money supply to pay salaries and pensions for budgetary persons. According to sources from the financial environment, thousands of companies across the country expects VAT reimbursement funds, at which they are entitled, and the

Fiscal State Control delay to refund it, deadlines being exceeded months in a row. Instead, for every invoice issued, but not received, the state requires businesses to pay VAT, decapitalizing them and pushing them in to towards bankruptcy. Establishing a flat rate tax to be paid even for companies which resulted in no profits determinates that this year 120,509 companies to suspend operations. In this context, there are fewer voices announcing the return of Romanian economy in 2010.

The global economic crisis imposes global measures for recovering, as well as national measures.

According to the European Commission's analysis, unless policies face up the new challenges, potential GDP in the EU could fall to a permanently lower trajectory, due to several factors. First, protracted spells of unemployment in the workforce tend to lead to a permanent loss of skills. Second, the stock of equipment and infrastructure will decrease and become out-dated due to lower investment. Third, innovation may be hampered as spending on research and development is one of the first outlays that businesses cut back during recession. [4]

The European Economy Recovery Plan (EERP) was adopted by Commission in 26 November 2008 and has two key pillars: to boost demand and stimulate confidence (200 billion Euro -1.5% of Union's GDP) and as direct short term action to reinforce Europe's competitiveness in the long term ("smart" investments in energy efficiency to create jobs and save energy, in clean technologies for sectors like construction and automobiles, in infrastructure and inter-connection to promote efficiency and innovation).

The economic crisis starts to be felt in Romania, for the first time, in automobile industry. The Romanian government reacted by accelerating "Jalopy" program for sustaining the sale of new cars, tractors and agricultural machines, too. As well as the implementation of the "First house" program that generates a slow movement on purchasing of houses till 60,000 Euro – the real estate market offers at this price, generally, old and with one or 2 rooms apartments and houses, "Jalopy" program limits the demand at around 60,000 Euro – if we don't take in to account the fact that for obtaining this value you must

have an income net wage of 3,400 lei/ month, almost 3 times more than the average wage (1,282 lei/month in 2009). Since 2010, for new construction, the state guarantees loans till 70,000 Euro. The government solutions seem not to achieve their targets of increasing the sales of new houses and new inland cars for supporting the construction sector and the national automotive industry. More national economists disapprove the measures taken by national authorities in crisis period such us: minimum tax (with its expressed goal of curative and cleaning effects); ensuring the pension point to 45% of the gross average wage; late measures for reactivation of the real estate market with loan state guarantee; few programs to stimulate the economy and support the employers; lack of strategy to combat unemployment and others.

Romania's biggest problem is, still, current-account deficit: far more money has been pouring into the country than going out. Much of the money comes from the estimated 2 - 2.5 million Romanians - around 10 percent of the population - who work in countries such as Italy and Spain and send earnings back. But with those economies now suffering as well, many emigrants are expected to return home bare hands; even the protection system for unemployed in these countries is vastly superior to the national system.

4. Forecasts for unemployment costs

The forecasts for years 2010 and 2011 were made based on Eurostat forecasts for real GDP growth evolution [5] and on government announcement of the dismissal of 70,000 budget employees in 2010 and another 230,000 in 2011-2015 period. If we consider that 80% of the total unemployed are from private sector, the dismissal from public sector will induce an increasing of unemployment at 1.059 million persons in 2010 and 1.289 million persons in 2011, if emergency measures would not be carried out to support and revive the productive sector so that to absorb labour force.

The unemployment costs in 2 years will be double. In the present conditions, Romania, with an unbalanced social security budget, with a strong current-account deficit, and, generally with a long-term deficit will induce

never ending dependence loans of the foreign capital.

Statistically, in Romania, beginning with 2008 the unemployment increased and, in present conditions, despite the NAE communications that the unemployment is around 8.39% at the end of March this year from 5.6% (in 2009), we sustain the official forecast of the IMF official for 2010 for over 1 million unemployed (see Table 2).

Table 2. Forecasts of the unemployment costs for 2010 and 2011 years

Indicator/ Year	2009	2010	2011
Real GDP (bn. USD)	95.4	96.2	99.4
Employment (th. pers.)	9527	9177	8947
W _L (th.lei/pers.)	10	10.5	11.1
NIS unemployment (th. pers.)	709	1059	1289
U _A corrected (th. pers.)	324	484	589
U _{notA} (th. pers.)	273	408	496
U _c (th. pers.)	597	892	1085
Loss of GDP (%)	6.3	9.7	12.1
Loss of GDP (mn. USD)	5978.9	9344.2	12047.9
AGW (USD)	663.4	639.7	689.6
ANW (USD)	484.4	471.5	509.0
U _B (mn. USD)	597.1	716.3	877.5
NLI (mn. USD)	2872.9	4328.3	5750.7
LBR (mn. USD)	12622.9	16740.1	21105.9

To support our aforementioned opinion, we highlight the following aspects:

- in March 2010 were 765,285 unemployed, 462,289 with allowances and 302,996 without allowances, an unemployment of 8.39% (NAE) but the ILO calculation for the same indicator are higher with 1-3%. Standing ILO unemployment rate that is higher than NAE's one because some of those who declare themselves unemployed not fall in employment agencies as people seeking employment;

- according to the Government communication, in less than two months over 57,300 persons from 2,190 companies came into technical unemployment (around 1% from the employment), due to a settlement, starting from 1 February 2010, who for no more than 90 days, during the temporary suspension of activity, total or partial, of a employer, said that the state budget will pay all social security contributions, following that the employee to receive 75% of base salary job properly filled. Also, the employee is exempt from income tax. In consequence, it is possible that some of these persons, after 3 months, to increase the number of unemployed.

5. Conclusions

In terms of GDP growth, 2002-2007 period was one of the most appropriate time for the Romanian economy in all it' history, but even the unemployed number is decreasing from 761 thousand at the beginning of 2002 at only 368 thousand persons at the end of 2007, the number of employees decreased, too, with around 119 thousand, so that some hundreds of unemployed are lost in the process. Some of them decided to emigrate in countries like Italy, Spain, UK, Germany and so on and send earnings back and this has generated an increase in consumption (the rate of consumption was more than 100% the last few year before the recession).

On the other hand, Romania had between 20-50% of total employment in informal sector, depending on the definition used. The informal employment includes two main groups: those who work informally because they have no real alternative for survive (the survival agriculture) and those who deliberately avoid taxes and social security contributions (non-registered firms or firms which not registered their workers and hire them without labour contracts or with workers paid with "envelope payments"). [3]

The great financial crisis had hit Romania with a delay of one year, period in which Romania was more concerned about the European Parliament elections (2007), Parliamentary elections (2008) and culminating in the 2009 with Presidential election than to the recession and the measures that must to be taken.

Although the recession may be seen as a period of cleaning and restructuring, if the government doesn't find appropriate alternatives to keep unemployment under control the consequences will be catastrophic for our country.

The Concept and Definition of EU Tax in EU Law and the Compatibility with the Romanian Law

PAUN Ciprian Adrian

JULA Octavian

„Babe-Bolyai” University of Cluj-Napoca

ciprian.paun@econ.ubbcluj.ro

octavian.jula@econ.ubbcluj.ro

Abstract

The accession of Romania to the EU took place in a moment in which the concepts referring to taxes are clearly marked by the Founding Treaties stipulations and by ECJ jurisprudence. Romanian fiscal law has suffered successive modifications in the past 18 years. The modifications have been inspired by Romania's accession negotiations to EU, and also by the economic changes of the period. Because of the European Commission technical sustaining, Romania started to define concepts like “tax”, “duties”, “taxes” or “taxation” using the communitarian meaning of the Founding Treaties and the ECJ jurisprudence.

Key words: taxes, fiscal law, Romania

JEL classification: F36

1. Interpreting the article 269 of the EC Treaty

The Article 269 of the EC Treaty comprises an extremely generous stipulation in the first paragraph and extremely exigent conditions in the second one. If we take into consideration two different articles of the Treaty: Art. 37, paragraph 2 and Art.269, paragraph 2. In Article 37 EC Treaty, the legal settlement is formulated in the following manner: “The Council shall, on a proposal from the Commission and after consulting the European Parliament, acting by a qualified majority, make regulations, issue directives, or take decisions, without prejudice to any recommendations it may also make.” The

Article 269, second paragraph, affirms that: “The Council, acting unanimously on a proposal from the Commission and after consulting the European Parliament, shall lay down provisions relating to the system of own resources of the Community, which it shall recommend to the Member States for adoption in accordance with their respective constitutional requirements.”

According to our opinion, the Article 269 of the EC Treaty does not give the possibility to adopt a regulation because of the recommendative formulation of the second paragraph. Unlike the second paragraph of the Article 37 which uses the verb, “make”, art.269 uses “recommend”. In the same time, from the point of view of the fiscal strategy, the tax can be included in a special protocol annexed to the treaties, signed by the presidents or prime-ministers or in a Council Resolution.

Romania is a national state, from the constitutional point of view, and it does not have the judicial-institutional culture of federalism. That is why the doctrine interpreted in a restrictive way the stipulations of the Founding Treaties in full consensus with the French judicial doctrine. According to the Romanian Constitution, Article 148, second paragraph: “As a result of the accession, the provisions of the constituent treaties of the European Union, as well as the other mandatory community regulations shall take precedence over the opposite provisions of the national laws, in compliance with the provisions of the accession act”. Art. 139 of the Romanian Constitution stipulates in paragraph 1 that “Taxes, duties and any other revenue of the State budget and State social security budget shall be established only by

law.” This text is applicable only to national budget but, according to art.56 par.1 “Citizens are under the obligation to contribute to public expenditure, by taxes and duties.”

From the description of the above texts, it results that the adoption of an additional special protocol to the EC Treaty or a Council resolution concerning the collection of an EU tax would not contravene the Romanian constitution. In the same time, this kind of settlement would constitute a legal base for the collection of all three types of taxes mentioned in the Commission Report. A resolution of the Council, followed by a constitutional ratification would not give more legitimacy to the citizen-community relation. The ratification is in Romania a technical-judicial proceeding, which can pass unnoticed by the simple citizen.

To include a stipulation dedicated to the European taxes in Romania’s Constitution will offer the chance of a better involvement of the citizen, because the modification of the constitution supposes the approval of the citizens through referendum. The proceeding is very complex and does not justify the modification of the Constitution in order to include such an article.

2. EU TAX based on Article 308 of the EC Treaty?

Article 308 of the EC Treaty stipulates that “if action by the Community should prove necessary to attain, in the course of the operation of the common market, one of the objectives of the Community, and this Treaty has not provided the necessary powers, the Council shall, acting unanimously on a proposal from the Commission and after consulting the European Parliament, take the appropriate measures.” In our case, the common market functions since 1957 using finances previewed by different normative acts. The problem is, as mentioned in the Romanian speciality literature, assuring more independence to the EU institutions in their relation with the member states. In the present state, the member states contributions and VAT levies supply the EU budget. The European Union is trying to find solutions to allow it to expand its competencies above the ones mentioned in the founding treaties.

Article 308 cannot be used as a legal base to institute the EU taxes.

3. Interpreting Article 37 second paragraph of the EC Treaty as a legal base for EU Taxes

The Common Agricultural Policy has been a very important subject on the member states’ agenda, and also for the founding institutions since the beginning of the Communities. Article 37, second paragraph contains a proposal to streamline the activities in the agricultural domain. According to ECJ, two conditions must be fulfilled in order to apply the stipulations from the mentioned article.

The stipulations must have as a purpose the production and trading of agricultural products, as it is mentioned in the first Annex of the EC treaty.

The legal regulation must contribute to the accomplishment of CAP.

In the same time, the majority required by the Article 37, second paragraph is a qualified majority, while Article 94 of the EC treaty imposes unanimity for tax collection. Considering the arguments mentioned above, there is no way the second paragraph of the Article 37, can be used as a legal source for the EU tax based.

4. Provisions primarily of a fiscal nature” and the interpretation of the Article 175, second paragraph of the EC Treaty

Article 175, second paragraph of EC Treaty, introduced by the Treaty of Nice refers to the environmental policies. The first part of the article contains the following provision: “By way of derogation from the decision-making procedure provided for in paragraph 1 and without prejudice to Article 95...” If we check with Article 95 of the EC Treaty, we notice that it does not have as an object applying fiscal provisions, as mentioned in paragraph 2. “The Council shall, acting in accordance with the procedure referred to in Article 251 and after consulting the Economic and Social Committee, adopt the measures for the approximation of the provisions laid down by law, regulation or administrative action in Member States which have as their object the establishment and functioning of the internal

market. 2. Paragraph 1 shall not apply to fiscal provisions, to those relating to the free movement of persons nor to those relating to the rights and interests of employed persons.” Noticing the logic of the communitarian texts, one can conclude that the provision from the Article 175, paragraph 2 is a special provision dedicated to the environment, which also, comprises taxation stipulation. The expression “Provisions primarily of a fiscal nature” indicate that the stipulation can have a different content or can contain other measures, but must have the judicial nature of a fiscal provision. Using an energy-based fiscal resource should be connected with the environmental protection purpose. In this case a tax on the energy consumption can be promoted due to the Article 175, paragraph 2 of EC Treaty. If this tax had not been tied to the communitarian interest in the environment, it would not have been possible to revendicate it from that provision.

5. No Taxation without representation!

The point of view sustained earlier concerning the EU institutional levels of development remains valid. Through its institutional structure, the European Community is an interesting compromise between the member states interests and the interests of the European citizens. A new political and institutional system, proposed by the European Constitution has been rejected by the direct vote of the European citizens of France and Holland. Considering this, it must be mentioned that EU democratic deficit is a problem of communication and transparency. If the simple European citizen had more time to read the evaluation of his personal gain due to the creation of the EU, he would have a more opened position in front of the communitarian project. Not having an access to the academic media, magazines, books, conferences, the communitarian citizen selects from the mass-media the information that intrigues him. Most of the times, the media presents the negative part of things, respecting the criticising role it must have in the society. We will not read in the papers how impressed were the Romanian students that have visited Brussels because it is a news that does not sell!

The members of the European parliament expressed their opinions about EU's own resources in the latest Report of the Committee of Budgets, concerning the future of such resources, publicised on 11.01.2007.

The report starts from an actual legal basis: „the current Own Resources Decision of 29 September 2000 that entered into force on 1 March 2002, has as its main features: an own resources ceiling of 1.24% of the Union's GNI, an allowance for the Member States for their collection cost of traditional own resources of 25%, a maximum call-in rate of VAT of 0.50%, a value added tax base of the Member States restricted to 50% of their GNP (capping of the VAT base) and a rebate in favour of one Member State with exceptions for some other Member States concerning the financing of this rebate”. The proposal “calls therefore for a two-stage approach aiming, in its first phase, at an improvement of the current system of national contributions, for which the following political principles should be applied:

- Equality between Member States
- Simplicity of presentation for elected representatives and citizens alike
- Solidarity and equal dignity amongst Member States
- Establishment of a political link between a reform of revenue and a review of expenditure as it is already correctly included in the Interinstitutional Agreement
- Provisional and transitional character of the system, (...) and in the second one, it proposes principles “which have emerged in all contacts with national parliaments, as cornerstones for any future own resources system:
 - Full respect for the fiscal sovereignty of the Member States
 - Fiscal neutrality
 - No changes to the order of magnitude of the EU budget
 - Progressive phasing-in of the new system
 - Establishment of a clear political link between a reform of revenue and a reform of expenditure”

6. Conclusion

The conclusion of the project is extremely clear “the project reiterates that, in all contacts with the national parliaments of the Member States, a general consensus has emerged that the time for a genuine new European tax has not yet come; has chosen to respect this wish of an overwhelming majority of the Member States' parliaments and not to pursue this option for the time being. Stresses, however, the interest in examining the creation of a new system of own resources based on a share of a tax already existing in the Member States, the idea being that a certain percentage of an existing tax would be fed directly into the EU budget as a genuine own resource, thus establishing a direct link between the Union and the European taxpayers; underlines that this kind of solution would only mark a return to the principle laid down by the Treaty of Rome, whereby European expenditure has to be financed by European resources. In the same time it recalls that the candidate taxes most commonly mentioned for this purpose during the exchanges with the national parliaments are the following:

- VAT
- excise duties on motor fuel for road transport
- excise duties on tobacco and alcohol
- taxes on corporate profits”

In conclusion, the idea of sustaining an authentic European tax has more supporters in the “non-democratic” structures like the Commission than in the original European democratic forum- the European Parliament.

New Characteristics of Services within the Knowledge-based Society

PLUMB Ion

ZAMFIR Andreea

Academy of Economic Studies, Bucharest

ionplumb@yahoo.com

zamfir_andreea_ileana@yahoo.com

Abstract

The study investigates the main changes in characteristics of services within the knowledge-based society as compared to the industrial society. The findings of this study reveal an ambiguity in characterizing services and goods within the knowledge-based society. There is a “grey” zone, populated by tangible and/or homogeneous and/or separable and/or durable services, as well as intangible and/or heterogeneous and/or inseparable and/or perishable goods. The study was carried out by combining a wide variety of sources, such as research papers, literature reviews, conceptual papers and books. The results reported in this research may be used for designing new methods for the management of services so as to consider the changes in characterizing services.

Key words: knowledge-based society, industrial society, characteristics of services, goods.

JEL classification: L80

1. Introduction

The evolution of society from an industrial society to a knowledge-based society determines conceptual transformations of services. Therefore, the aim of this study is to analyze the main characteristics of services in a comparative manner, both within the industrial society and within the knowledge-based society. The characteristics of services have a significant influence on the management of services due to the specificities of the managerial methods used. Our findings reveal an ambiguity in characterizing services and goods within the knowledge-based society. There is a “grey”

zone, populated by tangible and/or homogeneous and/or separable and/or durable services, as well as intangible and/or heterogeneous and/or inseparable and/or perishable goods.

The research was conducted using evidence provided by articles (such as research papers, literature reviews, and conceptual papers) as well as books. It has illustrated the influence of the knowledge-based society on the service sector by identifying logical connections between changes in society and changes in characteristics of services. The research question was answered by analyzing published sources, and by evaluating and interpreting evidence. Answering the research question was difficult, due to the variety of approaches, concepts, definitions, and classifications found in the literature.

2. Background

In the last decade, services became the main dynamic component of economic competition within developed countries. The broaden interpenetration and integration relations between the sector of services and other sectors of the economy and the growth of economic development opportunities through the extension of international transactions with services may be the main causes of the increasing role of services within national economies. Moreover, nowadays people often buy goods for the services that these goods are offering to them.

Within the industrial society the predominant conception on services is that services have a series of characteristics that allow for their identification on one hand, and their delineation from other fields of economic activity (especially from goods) on the other hand. Over many years, researchers have conceptualized a range of characteristics that

were considered to distinguish services from goods within the industrial society, having implications for management practice. However, these characteristics may not correspond with the new conceptions on services in a knowledge-based society.

The most common characteristics of services identified by several authors are intangibility, variability, inseparability and perishability [1, 2, 3, 4]. These characteristics will be further investigated in order to reveal how they were conceptually changed throughout the years and whether they are still relevant within the context of the knowledge-based society.

3. New characteristics of services

The intangibility of services means that a service is “an act or performance that cannot be seen or touched” [5], or tasted, felt, heard, smelt before purchase or even before consumption. According to [6] intangibility of services may be defined as “lacking the palpable or tactile quality of goods”.

As a consequence of intangibility clients cannot perceive or evaluate the services before consumption and therefore their confidence regarding those services is limited. Thus, the sale of services depends on the provider’s capacity to point out the visible parts of the services (e.g. personnel, equipments, prices, etc.). There are some factors that contribute to revealing the visible parts of services: (a) the environment in which the service is provided (for instance, in case of higher education the inadequate temperature in classrooms, the noise or the furniture design may significantly influence the students’ behaviour and attitudes); (b) the communications regarding the service (e.g. brochures, advertisements, advertising spots); (c) the price of the service, which more or less indicates the level of quality.

In recent times, scholars have questioned intangibility as a characteristic of services, considering it to be “an ambiguous and limited concept” [7] with “myopic and goods oriented” focus on manufactured output [6].

According to [7] intangibility seems to be linked to pre-purchase activities characterized by lack of clients’ experience with the service, but they argue that this could happen in the

case of some goods too. Also, during the delivery of many services the clients are experiencing through their senses some tangible performance activities.

In addition, other authors [6] criticize this characteristic of services on the basis that: (1) services often have tangible results, (2) tangible goods are often purchased for intangible benefits and (3) tangibility can be a limiting factor in distribution. Furthermore, they argue that “a more central weakness with differentiating services from goods in terms of tangibility is that the distinction represents the producer’s orientation, rather than the consumer’s, and thus what should be the marketer’s orientation” [6].

Intangibility does not characterize all services in all their stages of existence: “Although the concept of intangibility might sometimes remain useful – for example, in relation to the growing number of e-services – we conclude that it is not a universally applicable characteristic of all services during all stages from pre-purchase through delivery, consumption, and output” [7].

Moreover, due to the development of services and the increasing complexity of the economy, many goods require complementary services in order to be used, and conversely, there are services that require the existence of goods. According to [8] a company can offer to its clients: (a) a relatively simple, pure, unmixed good, the company’s offer being limited to a tangible good, with no service added (e.g., perfumes, detergents, etc.); (b) a good with more services added, in which case the company supplies a basic good that is complemented by several additional services (for example, a manufacturer of refrigerators offer the product and also warranty service, or transport service at home); (c) a service with other goods or services added, the offer being a basic service, supplemented by certain goods or services (e.g. airline service is made up of the basic service – transport, as well as more goods or services such as drinks, food, watching movies, listening to music, etc.); (d) a relatively simple, pure, unmixed service, in which case the offer consists of a single service, unaccompanied by another good or service (e.g., the service provided by a psychologist, the counselling service offered by a lawyer, etc.).

It should be noted that in their effort to

achieve customer satisfaction most companies nowadays tend to offer goods with services added, or services with other goods or services added. For example, a company that produces packaged foods (relatively distinct goods) may install telephone lines to inform customers and to offer them food recipes. As well, a lawyer who provides legal counselling (a relatively distinct service) can offer to its customers Internet access for the time waiting to be spent pleasantly.

On the basis of what has been revealed above we may bring to a close by saying that within the knowledge-based society it may be appropriate to maintain the concept of intangibility only for some services. To some extent companies offer products that are not tangible or intangible products, but different combinations of tangible and intangible outputs of their activity. Diversification of services has made the delineation of services from goods more difficult, and intangibility may be a characteristic for some goods too.

The variability of services may be encountered in the service literature as heterogeneity, differentiation, diversity, inconsistency, or non-standardization [7]. The term heterogeneity is used when [6] evoke this characteristic of services, defining it as “the relative inability to standardize the output of services in comparison to goods”. Variability suggests that “different customers require different types or levels of service in different situations” [5]. We note the (intentional) repetition of the word “different” that may have the role to emphasize the idea of change. The services cannot be identically repeated since their results depend on the time when they are provided, on the place where they are provided and on the service provider’s and client’s states of mind, dispositions, health, tiredness, etc.

This characteristic of services, irrespective of the name it is given in the literature (more frequently, heterogeneity or variability), is very much correlated with the concept of standardization. This concept came into view during the industrial revolution when mass production that characterized it required standardization in order to evaluate its quality. However, within the knowledge-based society many services may also be standardized, and this means that variability is no longer a reliable criterion to delineate services from

goods. The same output of a service (a mixture of standardized offerings) may be provided to several clients belonging to relatively homogeneous groups (market segments), and thus services are relatively standardized [6]. For example, a lecture may be considered a standardized, homogeneous service because it is identically provided to all the students present in the classroom. Nevertheless what each student absorbs is very heterogeneous because it depends on his/her capacity of perception.

On the other hand, scholars [6, 7] have lately emphasized the idea of replacing heterogeneity with customization on the ground that customization is more responsive to demand because clients may create the service package that best suits their needs by selecting services from a variety of standardized modules. For instance, mobile telecommunications service is standardized in design, but offers modules for customizing specific elements, such as alternative service plans on subscription (in case of voice services), alternative data service plans, different prices, etc. Similarly, banking services offer modules for customization such as different ways of performing operations (alternative channels transactions: phone, internet, front-desk), different bank accounts, different cards, alternative bill paying options, etc. As a result, variability or heterogeneity is no longer a distinctive characteristic that distinguishes all services apart from all goods.

The inseparability of services or the simultaneity of services is related to their production and consumption. It designates the simultaneous nature of service production and consumption, contrasting with the sequential nature of production, purchase and consumption that characterizes physical products [6]. The inseparability of services also means that customers are involved in the service mix [5]. For example, a taxi operator drives the taxi, and the client uses it, therefore the physical presence of the taxi driver and client are indispensable to provide the service. Also, the client must be physically present in order to use the services of a hotel, of a restaurant, or of a ski resort. Besides the fact that the client is physically present, he/she also interacts with the service provider. For instance, the patient communicates information to the physician, thus really

participating to the service providing. Furthermore, one can argue that the customer is always involved in the “production” of value, in the case of both goods and services [6].

In order to outline this participation of the consumer to the service production process and the transfer of work from the provider to the client, the term “coproduction” is used (the client is a coproducer in the case of many services) [7]. However, the generalization that inseparability is a distinctive characteristic of all services is criticized, arguing that “there is a large group of *separable* services that do not involve the customer directly, with the result that production and consumption need not be simultaneous” [7]. Examples of such “separable services” performed in the client’s absence are: laundering clothes (cleaning), repair and maintenance services, transporting freight, government services (defence, police, maintenance of infrastructure), banking, etc.

Regarding **the perishability of services**, we note that services tend to perish in the absence of consumption because their value exists only when they are required by the clients. Therefore, the services are forever lost if they are not required and used (consumed). The perishability of services means the relative inability to inventory services as compared to goods [6]. Perishability is “a multidimensional concept encompassing productive capacity, the producer’s output, the performance experienced by customers and the output they obtain from the service” [7].

The perishability of services as a general criterion to delineate services from goods has been questioned, as well as the other characteristics of services. Based on the fact that there are perishable tangible goods and long-lasting benefits resulting from many services, scholars state that “perishability in value potential is a characteristic of all market offerings rather than a characteristic disadvantage of services”. Furthermore, they emphasize that both tangible and intangible capabilities can be inventoried [6] and therefore “inventoriability (storage of output) is not (should not be) a normative goal for what are traditionally categorized as either goods or service firms”. They claim that “the normative goal should be to find ways to maximize the service flows desired by consumers while minimizing output inventory

and its limitations” [6].

Additionally, [7] state that there are some service performances and output that can be captured through recording and to be sold, replayed, and resold later. For example, performances of information-based services such as education, entertainment, music, information and news can be recorded on CDs, DVDs, or other storage media for later reuse and resale. However, this is only an exception to the rule that, generally, services cannot be stored and resold later.

We may conclude that the four “unique” characteristics of services have considerably changed during the past few years. Consistent with [9], “as the domain of services has expanded, the boundaries that define it have become more obscure. (...). Issues regarding the scope and the future of services persist”.

The new “delineation” of services from goods may be seen as the vagueness of the demarcation between these products. There is a “grey” zone, where we find tangible and/or homogeneous and/or separable and/or durable services, on one hand, and intangible and/or heterogeneous and/or inseparable and/or perishable goods, on the other hand. This ambiguity in characterizing services and goods has determined changes in types of services (for instance the emergence of high-tech services based on knowledge and information and communication technology) within the knowledge-based society. Knowledge-based services are delivered by highly educated and informed employees responding to specific, diagnosed customer demands by offering and delivering customized value-added solutions and relations.

4. Conclusions and further research

This study has shown that the characteristics of services have changed within the knowledge-based society as compared to the industrial society. Within the industrial society the predominant conception on services was that services have a series of “unique” characteristics (namely intangibility, variability, inseparability, and perishability) that allow for both their identification and their delineation from other fields of economic activity (especially from goods). However, within the knowledge-based society the demarcation between goods and services is

blurring. There is a “grey” zone, populated by tangible and/or homogeneous and/or separable and/or durable services, as well as intangible and/or heterogeneous and/or inseparable and/or perishable goods. This conclusion is based on the premises that: (1) within the knowledge-based society it may be appropriate to maintain the concept of intangibility only for some services. To some extent companies offer products that are not tangible or intangible products, but different combinations of tangible and intangible outputs of their activity. Diversification of services has made the delineation of services from goods more difficult, and intangibility may be a characteristic for some goods too; (2) the variability or heterogeneity is no longer a distinctive characteristic that distinguishes all services apart from all goods; (3) the inseparability of services may be maintained as a concept only for some services, which are not separable services; and (4) the perishability of services is no longer valid as a criterion due to information-based services development.

Further research in this area could focus on investigating the changes in types of services that have appeared due to the ambiguity in characterizing services and goods. Another direction for further research could be to identify the opportunities and challenges for service providers within the knowledge-based society. We also suggest that research could focus on examining the changes in the

management of services due to the knowledge-based society.

Advantages and Risks Offered by Romanian to Foreign Investors

POPA Lucia - Ramona
"Constantin Brâncoveanu" University of Pitești
lucia_ramona10@yahoo.com

Abstract

Romania a EU member state confronts with serious economic and social problems increased by the world economic crisis. Since the foreign investments represent the engine of economic development, the paper proposes to analyze the reasons which determines the foreign investors to make placements in different areas of the world and also the factors existing in Romania. The study makes use of the data base offered by specialty international publications such as World Investment Report, UNCTAD as well as by data offered by National Bank of Romania, National Statistics Institute, Romanian Agency for Foreign Investments.

The results of the study show that Romania represents interest to investors largely because of its natural resources and skilled workforce but remunerated by competitive prices, because of its fiscal advantages such as 16% taxation, and of advantages offered by the market and its strategically position.

The conclusions of the paper show that the solution of weak points, of so much necessary infrastructure of improving, the educational system as well as the adjustment of corruption and bureaucracy problems may determine the drawing of a larger volume of DFI which are vital for Romania in order to overpass the economic problems it faces nowadays.

Key words: foreign investors, economic and social problems, Romania

JEL classification: G10

1. Introduction

The foreign investments have the role to complete and stimulate the local efforts of a state, sustaining the rise of competition, of

resource efficiency, of the assets and capabilities of that state.

The decision - making process in connection with direct foreign investments is based on the motivations it represents both for the economies of host countries as well as for the countries of origin, motivations which concentrate in the form of capital inflows, technology transfer managerial and administration survey creation of new working places, the increase of purchasing power, market diversification, the rise of profit and the consolidation of links with market economy.

The foreign investor has many possibilities of activity internationalization, but the chosen variant will be the one corresponding to his interests. The maximization of income from sales, the return maximization, the settling of the firm rate development and its continuous rhythm, the shareholders remuneration for their contribution to the productive process with an amount at least equal with resource opportunity costs and capacities they offer the company, the observance of management and employment interests, etc., all this determines the reasons for direct foreign investments.

2. The reasons for direct foreign investments

- The investors motivated by resources represent that category of investors who try to exploit certain production factors, at low costs with regard to those which might be got in the country of origin, a thing which makes them more profitable, more competitive.

The reasons for which they make investments are the existence of basic raw materials (minerals and farming products, specific to producers belonging to processing

industry motivated by the low processing costs, but also by the necessity to assure a long-run supply sources; of a semiskilled and skilled workforce, as a rule they come from countries in which the expenses with the workforce are high, the aim being the export of semi-finished or finished products in their own countries or the sale on the local market of the host country or for getting high-technology, superior management and experience in marketing.

- Investors motivated on the market represent the category of those investing in a country or a region, other than the origin, with the aim to increase sales, either in the host country or in the neighboring ones. In this way the customs barriers, the growth impact and the importance of the respective market are removed, a thing which makes for an investor the production at the working place to be more efficient than the export. In general, this investment comes to replace the profitable exports got by corporations in some countries, in case of some import barriers (or of other nature) of the host countries.

Generally, the main reason of getting such investments is given by the market extension, its growing potential, the level of local demand for the products or services offered by the company, and last but not the least by the importance of the role and place held by this in the market portfolio of the company.

- Investors interested in efficiency may appear when the company places parts of its chain of added value in different countries, with the aim of rising global probability. This motivation is specific to mature corporations whose production is standardized, which have production experience in different locations and the capacity to exploit opportunities resulting from cost and price difference among countries.

The expenditure of corporations through this form of direct foreign investments presupposes, in the main, the development through foreign units of production, marketing, research, finance, transport and purchasing activities. In each of these domains there are important competitive advantages which the company can develop through operations in the country of origin and on the international markets, the process

presupposing international specialization. As regards the marketing activity, the multinational company will extend activities to use the most efficient promotion channels, to create and reinforce the identity of a brand, but also to establish distribution, of the service system, etc.

The financial activity will extend depending on the access level to financial instruments and to the capital sources, on the international capital markets, the Eurobond and shares included. The purchasing activity is done by taking over the raw-material suppliers, with the aim to diminish costs and to keep the position on the market. The research-development activity instead is done in most cases in the country of origin and it is very difficult to move it in other countries because of reticence and lack of trust to foreign markets.

Through investments motivated by efficiency, the corporations also follow the risk diversification, an objective which, as a concept, integrates in the theory of financial diversification, of CAPM (Capital Asset Pricing Model) model which, in case of direct foreign investment takes the form of systemic risk, specific to the organization connected with the business environment of the origin country of the multinational firm. By the diversification of activities beyond the frontier, these can be achieved a reduction of the risk peculiar to the firm. In the same time, the profits of a country can be negatively correlated with the profits of another country, and an investor can get a greater stability as regards profitability, by diversifying its portfolio and by investments done in different countries.

Diversification is the motivating force of international investments looking for efficiency, allowing the spreading of risk at corporation level. More than that, the managerial strategy of international diversification has in view the risk diminution associated to the income of the respective firm components, by making investments in economies being in different stages of the development cycle, having as a final goal the prevention from major exposure to recession which may affect the mature economies.

- Investors motivated by strategic assets represent the category of investors who make DFI with the aim to get assets of some firms in order to promote the strategic objectives on a long term and especially to assure competitiveness on international level. They follow:

- to add new assets to the existing ones in order to enforce their position on different markets:

- to increase their profits by gaining new markets and research-development centers (to diminish the transaction costs, to increase flexibility and to share risks).

By this type of investments, the integration of international production takes place by localizing any component of the chain of added value which can contribute in a large extent to the corporation profitability. In this stage, the corporations have the tendency to concentrate more on the function of deep knowledge in the detriment of the production functions which by means of more independent forms like: licensing, management contract, subcontracting, etc., are spread at international level.

Some companies are totally drawn back from production, letting it go under the contract producers. Their aim is innovation, a fact for which they can make mixed arrangements with competitors, suppliers, customers or with the large research laboratories or universities.

Romania, an EU member state confronts with many economic and social discrepancies as compared with the other member countries. Even if in the period 2004- 2008 it drew a large volume of foreign investments, they do not represent the potential and need of Romanian economy for investments in technology, management, knowledge.

3. The main factors which draw foreign investments in Romania

Advantages due to resources:

- skilled work force, whose level of wages is inferior to the average of European Union, who have solid knowledge of foreign languages, technology, IT, engineering, etc.

Since the wages are 2.5 times lower and productivity is only 0.5 times lower than in the neighboring countries, Romania can become

in the following years the source of growing efficiency for great investors, who concentrate more on costs reduction.

According to some studies in sociology, the workforce is potentially adaptable to the changes in professional environment and able for an intense regime if it is offered motivations and incentives, by using training programmes it can reach a level of productivity similar to those of EU. Another advantage is the tradition in certain sectors such as wood processing, food industry, textile industry, civil works, machine building;

- rich natural resources, shallow and under- ground waters included, fertile farming fields, oil and natural gases (petrol, coal, different metaliferous and non – metaliferous minerals- Fe, Cu, Pb, salt), which offer investors the possibility to associate with partners or local firms. Another advantage is that of raw material reserves for certain economic sectors such as wood processing and civil works;

- significant touristic potential of the Romanian Carpathian mountains both for their display on a third of the country area of 66.303 kms, and for its central position, its general configuration and altitude, imposes as a basic component in the geographic and landscaping structure of Romania. The Carpathians also enlist as importance in touristic activities with their tourist variety and potential: going hiking, having a rest, winter sports, climbing, hunting and fishing, nautical sports, balneotherapy;

- Economic advantages:

- economic growth in the period 2004-2008;

- decreasing evolution of inflation level;

- growing interest of foreign investments – main destination of DFI flow in the region (source: Ernst & young, SEE Attractiveness Survey – South East Europe: An Emergent FDI Destination in Europe, April, 2008);

- a sound fiscal policy (16% corporation rate). Unique tax quota presupposes the same taxes both for natural person and for companies, therefore a system of correlated taxation, with a unique tax quota, for all kinds of income from different activities. The success of this rate depends on its level i.e. the lower it is the more efficient its collection. Beginning with 1 January 2005 all taxes

become 16%- taxes on global income, on banking interest, stock exchange gains, but also estate taxes from firm and private transactions;

- Romania was among the first EU member countries that passed to the European unique tax quote;

- Political advantages:

- stability factor in the region – Romania being a NATO member country;

- stability guarantee in South- East Europe;

- EU member status from 2007. The quality of European Union member is necessary and beneficial for the political and social stability in which an investor decides to start a business. The accession to EU is associated with the increase of direct foreign investments due to predictable level, legislative stability and last but not the least to the continuous decrease of financing costs. The status of a member state brings some more trust for both local and foreign investors. In the same time the European accession brings beneficial effects on SME such as: a better access to markets, competition increase, the improvement of legislation and regulations, access to new technologies and a better cooperation to innovation, access to structural grants and also more correct acquisition procedures;

- Advantages resulting from international relations:

- bilateral agreement concluded by Romania with other states regarding the mutual promotion and protection of investments;

- bilateral diplomatic relations with 177 states out of 191 UNO member states, to which are added: the Holy Chair, the Sovereign Military Order of Malta and the National Palestinian Authority;

- member of United Nations and of other international organizations: OSCE, the European Council, the International Francophone Organization;

- the conclusion of free trade treaties with UE, EFTA, CEFTA countries;

- member of World Trade Organization (WTO) beginning with January 1995.

- Advantages offered by the market and geographical position:

- Romania is one of the largest Central East and East market (7 place, with a population of over 21 million inhabitants);

- access gate to the unique European market (about 500 million consumers);

- attractive location – situated at the crossroads between the European Union, Balkans and CIS, Romania is crossed by three important pan European corridors; corridor no.4 which connects West to East Europe; corridor no.9 which links the North and the South of the continent and corridor no.7 which facilitates the navigation within Europe.

- Legislative advantages:

- fiscal policy regulated by Fiscal Code;

- legal provisions similar to those of EU (the implementation of Community Acquis); the juridical frame is competitive as compared to the frame existing in competitive countries in the region and which regulates the fiscal incentives and the encouraging policy of the great investment projects;

- Other advantages:

- mobile phone networks in well developed GSM systems;

- well- developed industrial infrastructure, petrol and petrochemical industry;

- the existence of international bank branches and agencies;

- facilities offered by sea and river navigation.

Investment interest is also influenced by other factors such as political stability, the unitary character of the state, the Romanian culture and civilization, the Latin origin of the language the same with other four important European countries (France, Portugal, Italy, Spain);

There are some rigorous principles lying the Romanian legislation which regulates the regime of capital foreign investments:

The liberty of juridical forms and of the ways of making investments. By this principle the foreign investors are guaranteed the free choice of juridical forms of investments, by observing the legal provisions and also the type of contribution to the capital of trading company (cash or in kind);

Free access to all sectors of Romanian economy, investors can freely choose the type of activity they will undertake in Romania, taking into consideration the regulations which

settle the way of getting license and State monopoly for certain activities;

Equal treatment for Romanian and foreign investors, either resident or not.

The natural and juridical persons who invest in Romania benefit from equal treatment, regardless their nationality, office or house. The non-resident persons investing in Romania benefit from the right to transfer abroad their income, without any restrictions, after having paid taxes and duties provided by law, according to customs regulations.

Investment protection against nationalization, expropriation or other similar measures.

Investments made in Romania cannot be nationalized, expropriated or have other similar measures, except the cases in which such a measure meets cumulatively the following conditions: they are necessary for public utility, they are undiscriminating, they develop according to law provisions, they are made by paying previous, adequate and effective damages;

The guarantee of rights and facilities. In order to encourage investments, there are provided some fiscal and customs facilities in accordance with European legislation and practice.

Nevertheless Romania meets difficulties in drawing foreign investors, as our country has to recover a very high difference from the rest of European countries in infrastructure because out of about 80.000 km of net roads, only 20% represent the national roads. As regards the railway infrastructure, it can reach the European standards over ten years because investments in this sector have not been made any more.

The bureaucracy existing by counter queues and the run from one counter to another, the window pane between the citizen and the office worker, insufficient transparency and also the poor development of private public partnership, represent another problem still unsolved by the Romanian State.

The fluidity of bureaucratic mechanisms, the eradication of corruption but also the legislative and financial stability – all these are problems the foreign investors confront with.

Beside this there are a series of risks the foreign investors face with: the emigration of skilled work force, legislative instability, lack of credibility of business environment, the

suppression of many research centers, generalized corruption, the formation of a extremely high rate of unemployment which might lead the national economy to bankruptcy.

4. Conclusions

Romania needs a significant volume of foreign investments in order to solve the social and economic problems emphasized by the world crisis and to reduce the difference from the other EU member states

Although the size of the internal market and the costs of production factors are the main motivations of multinational companies to invest in Romania, an ever greater attention is paid to a stable economic and political environment, to the quality of governmental institutions, to the transparent juridical system, to the level of access to information and to the infrastructure level of development.

The Impact of Direct Foreign Investments on the Economic Growth in Romania

POPA Lucia - Ramona
„Constantin Brâncoveanu” University of Pitesti
lucia_ramona10@yahoo.com

Abstract

In the actual context of world economy, the foreign investments tend to become, beside the resources of each country, the main financing and stimulating source of economic development.

The foreign investments represent a way by which, in the economy of host country it is introduced the behaviour specific to the market economy and where an improvement of production factors quality takes place. The present paper tries to analyze the foreign investments contribute to the growth of Romanian economy.

Key words: foreign investments, economic growth, Romania

JEL classification: G10

1. Introduction

The foreign investments strongly influence the economy of host country with implications whose effects are felt regionally and globally.

The amplitude of foreign investments propagates effects in all the economic, financial, social, natural, scientific, educational, environmental, etc fields, as well as in the domain of juridical relations, of international relations and cooperation among states. The problem of direct foreign investments influence on the host country is not only delicate but also questionable, due both to various possible effects and to the possibility of generating positive or negative effects, depending on the DFI flows and on the real conditions existing in the receiving country.

From conceptual point of view the positive implications at macroeconomic level refer mainly to the fact that foreign investments

sustain the economic growth, a fact which may be attained differently, depending on the form the direct foreign investment takes. When the investment is made „on an empty place” the economic growth is due to the creation of new productive capacity, additional working places, to the tax payment. When participating in privatization, the positive effects appear when the activity of the economic agent is effective and his competitiveness rises, thus allowing the survival of the private organization on a long term.

The effects generating welfare are: the accelerating growth of GNP and GDP, the development of a certain type of performant technology, the assurance of a competition increase, the income raise to social domains, the improvement of means to protect the environment, the keeping of cultural and traditional identity.

The welfare distribution mostly depends on foreign and domestic firms strategies, on the microeconomic and macroeconomic position, on the government policies used by any host country.

2. Theoretical aspects

The bidirectional relation between direct foreign investments and the economic growth is due on the one hand, on their impact on the economic environment in each country and on the other hand, on the positive influences which the sustainable economic growth has on the received foreign capital flows. According to the specialists in the field, for a given country, the periods of intense economic growth are characterised by drawing some important direct foreign investment flows.

In the same time, the investments (inland and foreign) represent an essential factor of economic growth, the models elaborated in this way (the best known being of R.F.

Harrod) reflecting the real functional relation between the accumulation rate and the growing rhythm on the national income, by means of the capital rate. There should not be neglected the fact that the potential positive impact of DFI drawn in a certain country on its economic growth must be considered through the light of redistributing GDP of the implanting country to the benefit of the investing transnational companies.

Therefore on the background of an increased globalization sustained by the internationalization and diversification of production, the transnational companies achieve abroad greater added value than in the country of origin, as a result of lower production costs.

Many foreign companies which make investments in the developing countries have in view the low costs of production factors in order to have an increased efficiency. Thus with the same selling price of the end products the added value of the production achieved abroad includes a greater profit than the one obtained in the country of origin of the transnational companies, so that by the DFI made, these companies may be a factor of redistributing GDP in the host countries.

In a survey published during 2000, Robert Lipsey submitted the results of a regression analysis that targeted a country's economic growth over a period of 5 years, by making use of the following economic indicators:

- Investment rate in GDP (INV);
- Real GDP growth rate (ROG);
- FDI inflows as percentage in GDP (FDI);
- Modification of the labor force occupation rate (PART);
- The level of education at the beginning of the period (SCH);
- Modification of the prices in the analysed country as compared with the international prices (PR);
- Real GDP/ capita level as compared with the one registered in USA at the beginning of the period (RGDP/ US).

The researcher used the following relation between the above mentioned indicators:

$$ROG(t)=f[ROG(t-1),INV(t-1),FDI(t-1),SCH(t),PART(t),PR(t),RGDP/US(t)]$$

The conclusions of the research have been, in essence, the followings:

1. The impact of the FDI inflows received during the previous years over the economic growth rate is elusive, mainly due to the fact that the foreign direct investments effects intermingle with those of the other economic growth factors;

2. A significant FDI impact over the economic growth has been observed into combining the foreign direct investments and labor force education.

Although the FDI impact over the economic growth is elusive and difficult to quantify, practice showed that in most cases, there is a positive relation between the inward foreign direct investment stock and real GDP growth rate that strengthens even more as the inward FDI stock and the real GDP gets bigger. Generally experts consider that FDI significantly influence the economic growth of the receiving country the moment the value of this indicator exceeds the 40% level.

Companies achieve foreign direct investments in order to capitalize in a more money-making manner the own advantages that

Dunning referred to as ownership or competitiveness advantages. Ascertaining that holding these advantages implies a minimum development level of the source countries John Dunning analyzed the FDI inflows from the dynamic point of view, trying to serve an explanation for the alteration foreign direct investment level and structures received and engendered by a country, as per the economic level.

John Dunning initiated the concept of Investment Development Path. According to this theory (Dunning and Narula), the countries run through five development stages, starting from an infant stage associated to pre-industrialization and ending with the final stage, typical for the well developed countries.

During the first stage, the inflows and outflows of foreign direct investments are almost absent as the local market is more reduced, the infrastructure is not adequate, the labor force is not prepared, and legal framework is hardly developed.

During the second stage, countries develop certain location advantages owing to the infrastructure, resources improvement and the internal market growths. Consequently it is registered an increase of foreign direct

investment inflows, especially in the traditional branches of the processing industry and in the intensive branches in terms of labor force as well as in constructions, distribution and commerce. During this stage we assist at a more rapid increase of the inward FDI stock than the GDP.

The third stage is characterised by a less spectacular growth of the FDI inflows which are overcome by the foreign direct investment outflows, being specific only to those countries that have managed to create a stable legal system and a physical and commercial satisfactory infrastructure. Consequently for the first time, it has been registered an increase of the net outward FDI stock, though it may be the case for negative values to appear.

The powerful companies shall become more competitive and shall involve in resource capitalization investments (in less developed countries) and assets or market capitalization (in developed countries). At this stage the government has a very important role as it can support the local companies in generating some competitive advantages as well as their capitalization by means of foreign direct investments.

The fourth stage characterized by the prevalence of the output foreign direct investments as compared to the received ones, is specific only to those countries that targeted a certain degree of economic maturity. The localization advantages are given especially by the created production factors and the ownership advantages are mostly the result of the scattered assets coordination and organization from the geographical point of view. The transnational corporation are more inclined to internalize commerce and production.

During the fifth stage the outward and inward foreign direct investment stock is very high the net position being almost zero. At this investment development stage, the competitiveness is no longer accurately reflected by the absolute GDP value, but by the net outward investment position.

According to this theory, the Investment Development Path varies from one country to another as per the economic growth level. In the beginning, the FDI inflows prevail, being directed towards resource-based industries or towards a low/medium level of knowledge. Further on the foreign direct

investments outflows prevail and the received FDI move towards industries intensive in technologies and knowledge.

3. The impact of direct foreign investments on the economic growth

In order to identify the received DFI influences on the Romanian economic growth, we will analyse the correlation between GDP (billion RON) and the DFI flows drawn (billion RON) in the period 1990-2008.

Figure 1 Correlation GDP-DFI in the period 1990-2008 (billion RON)

Source: INS, BNR

If up to 1999, there cannot be identified a correlation between the received direct foreign investment flows and the gross domestic product, because of the low levels of foreign capital input concretized in a low rate of DFI stock in GDP, respectively 8.28% (1999), beginning with 2000, the Romanian economy has entered an ascending line registering an increased economic growth, at rates between 32.13% in 2000 as compared with 1999, of 20.19% in 2004 as compared with 2003, of 16.16% in 2006 as compared with 2005 and of 18.09% in 2008 compared with 2007.

In the same time, there were also received important DFI flows, with rates between 28.8% in 2000 as compared with 1999, of 65.25% in 2004 as compared with 2003, of 40.83% in 2006 as compared with 2005 and of 30.55% in 2008 compared with 2007, Romania becoming the greatest receiver of

foreign capital in the South-East Europe, alongside Bulgaria.

The correlation analysis confirms the bidirectional relation between direct foreign investment flows draw in a country and its economic growth. Beginning with 2000, in the Romanian economy becomes manifest the favourable impact of direct foreign investments on the economic growth which, in its turn, has produced a significant increase of foreign capital input.

Even if the DFI stock as a ratio in GDP does not exceed th level of 40% considered by some specialists necessary to register a significant impact, the firms which were set-up as a result of direct foreign investments have become, in time, one of the engines of the growth of Romanian economy, positively and significantly influencing the gross domestic product achieved beginning with 2000.

The Romanian economy destabilized by massive investments in huge objectives, great energy consumers, suddenly passed from a centralised economic and political system to a transition period lacking clear objectives and human resources professionally trained to build a new system based on the principles of market economy.

As regards the input of foreign investments, they do not express the Romanian potential, having low rates compared with other neighbouring countries, the highest values being registered in the period between 2004-2008 and the lowest in the period between 1990-1996. As regards the investment output in Romania, they were insignificant.

If we analyse the structure on the fillds of activity of the number of commercial units with foreign investment to social capital we notice that the professional services in the retail business and industry have the greatest number of companies while in agriculture, transport and civil building the least.

Figure 2 The structure on fields of activity of companies with foreign investment to social capital, during 1991- December 2008

Source: Business units with capital foreign investments, Sinteza Statistica no 131, Romania Chamber of Commerce and Industry and of Bucharest Country, Buc. 2009

As regards the structure on fields of activity of the value of foreign capital subscribed by companies with foreign capital investment, between 1991 and December 2008, we notice that the industry and professional services registered the greatest values but in civil building, tourism and agriculture the lowest.

Figure 3 The structure on fields of activity of social capital value subscribed by business units with foreign capital investment, in the period 1991- December 2008

Source: Business units with capital foreign investments, Sinteza Statistica no 131, Romania Chamber of Commerce and Industry and of Bucharest Country, Buc. 2009

According to data of the Chamber of Commerce and Industry in the period 1991-2008 the greatest foreign investments depending on region of economic development were registered in Bucharest, Ilfov, North-West and West of the country, and as regards the countries in the Bucharest Country, in the Timis Country in Cluj and in Prahova countries.

Source: Business units with capital foreign investments, Sinteza Statistica no 131, Romania Chamber of Commerce and Industry and of Bucharest Country, Buc. 2009

Most of foreign investments are achieved in the countries having an important activity as regards production, commerce, services and building works.

4. Conclusions

Since a sustainable economic growth is possible only under the conditions of a harmonious development to include all the regions of the country, the diminution of regional differences, even through the sharing of foreign capital should represent a real priority of decisional factors. In this way, the first steps should aim at some main directions:

- a more active involvement of development agencies and of the agency for foreign investments (ARIS) in the promotion of the country regions as investing areas by elaborating concrete projects and by identification of potential foreign investors. The drawing of foreign investors through real

projects which have in view the specific character of the area and its maximum taking into account of its potential, especially in the underdeveloped areas as regards the economic development, might contribute to the decrease of regional differences;

- the significant growth of absorption level of European funds and their efficient use, which might generate a development of physical and institutional substructure with a positive impact on the drawn DFI flows;

- a more efficient use of EU policy as regards the state assistance, even that referring to foreign and inland investments, by eliminating aids of „saving- restructuring” type and their direction mainly to the objectives which have in view the long- term benefit effects such as: regional development, the development of innovation, research and development activities, the raise of workforce training level, sustainability of small and medium enterprises which are the backbone of an economy.

A greater contribution to the Romanian economic growth can be attained by drawing a greater amount of DFI to be directed not only to the speculative sectors such as retails or estates but to sectors to produce a sustainable development such as innovation and high technology capable to generate export competitiveness. In the same time, once the direct foreign investments will be accumulated in significant stocks, the business companies which will become the engine of the economy, positively influencing the country gross domestic product.

Cross-cultural Negotiation: Cultural Assumptions and Social Expectations

ROGOVEANU Raluca –Nicoleta
„Ovidius” University of Constanta
ralu_ionita@yahoo.com

Abstract

In any cross-cultural context, the potential for misunderstanding is great since the process of negotiation is always influenced by new behavior and social environments. The difference between international negotiation and domestic business negotiation lies in the fact that the former is influenced by a wide diversity of environments. This article analyzes the main cultural systems that condition the planning and the development of cross-cultural negotiations (communication-related factors, protocol issues) as well as the common obstacles that prevent international negotiations from achieving full success. Such factors require changing perspectives that determine the selection of appropriate tactics and strategies of the negotiations to be adopted since what is right, reasonable, or appropriate are parameters largely dependent on the cultural values of the country in which the act of negotiation takes place.

Key words: cross-cultural, negotiation, cultural differences

JEL classification: F50, F51

Negotiation is the process by which at least two parties attempt to reach an agreement on matters of mutual interest. Negotiations involve two elements: the substance of negotiation as such and the process. The latter is irrelevant when negotiations are conducted within the same cultural setting. Only when dealing with someone from another country, with a different cultural background does process usually become an obstacle to matter to be negotiated; this becomes more evident in intercultural negotiations, when cultural differences must be bridged. When two people communicate, they rarely project the same

type of “reality “by means of their words, since effective meaning is determined by each person's own cognitive and cultural conditioning. Culture influences negotiation in three four ways: by determining one's perception of reality; by dismissing information inconsistent or unfamiliar with culturally accepted notions; by projecting meaning onto the other party's words and actions.

The negotiation process is an interplay of perception followed by information processing and reaction, all capitalizing on implicit assumptions regarding the issue being negotiated, and on an underlying matrix of conventional beliefs and social expectations.

It is naive indeed to start an international negotiation with the simplistic assumptions that "after all, people are quite alike everywhere and behave much as we do." (see Hendon & Hendon 23). Despite many similarities in term of language preference and clothing style, there are innumerable other elements that dissociate people from different cultural backgrounds. Consequently, the effective negotiation style used at home can be thoroughly inappropriate when dealing with people from other cultures. Heightened sensitivity, more attention to detail, and perhaps even changes in basic behavioral patterns are required when working in another culture.

In some cultures, the attention of people is directed more toward the specific details of the agreement (documenting the agreement), while other cultures may focus on how the promises can be kept (process and implementation). Americans negotiate a contract; the Japanese negotiate a personal relationship. [...]American and Russian people are not similar; their ethical attitudes do not coincide: they evaluate behavior differently. What an American may consider

normative, positive behavior (negotiating and reaching a compromise with an enemy), a Russian perceives as showing cowardice, weakness, and unworthiness; the word "deal" has a strong negative connotation, even today in contemporary Russia. Similarly, for Russians, compromise has negative connotation; principles are supposed to be inviolable and compromise is a matter of integrity. The Russians are not alone here: a Mexican will not compromise as a matter of honor, dignity, and integrity; likewise, an Arab fears loss of manliness if he compromises. (Hendon & Hendon 45)

Nations tend to develop a "national personality portrait" that influences the types of goals and processes the society pursues in negotiations. In international negotiations, you bring to the negotiating table the values, beliefs, and background interference of your culture which guide our presentation and interpretation of the data. Cross-cultural negotiators bring into contact unfamiliar and potentially conflicting sets of categories, rules, plans, and behaviors. Difficulties sometimes arise from the different expectations negotiators have regarding the social setting of the negotiation. These patterns can encompass styles of decision making (the way officials and executives structure their negotiation communication systems and reach institutional decisions) and logical reasoning (the way issues are conceptualized, the way evidence and new information are used or the way one point seems to lead to the next, paying more attention to some arguments than others, giving different weight to legal, technical, or personal relations). (see Hendon & Hendon 51)

A negotiating style is deeply embedded to a cultural system, being therefore shaped by each nation's culture, geography, history, and political viewpoints. A successful negotiation should start from acknowledging the sense of difference of the members gathering round a table. Unless one is willing to be empathic so as to see the world through the other's eye, one may never become a sophisticated negotiator. Even so, no one can avoid bringing along his or her own cultural assumptions, and prejudices into a negotiating situation. The way to succeed in cross-cultural negotiations is by fully understanding others, and by using that understanding to one's own advantage to realize what each party wants from the

negotiations, and to turn the negotiations into a win-win situation for both parties.

A negotiator is able to communicate, to understand, to plan, and to anticipate more effectively when he is familiar with the other party's cultural background. In intercultural context, preparation includes reading about the history and customs of the country in question and discussion with others who have had experience dealing with citizens of the foreign country. The focus of these preparations should be on culture rather than on language. Armed with flexibility and with intimate knowledge about the "other" culture, the negotiator should be careful in avoiding irritating things. Although planning is crucial, implementation is even more important, as even the best laid plans often go wrong.

The most common obstacles in cross-cultural negotiations are: (see Frank 1992):

Insufficient understanding of different ways of thinking.

Insufficient knowledge of the host country--including history, culture, government, status of business, image of foreigners.

Insufficient recognition of political or other criteria.

Insufficient recognition of the decision-making process.

Insufficient understanding of the role of personal relations and personalities.

Insufficient allocation of time for negotiations.

Over two-thirds of U.S.-Japanese negotiation attempts fail, even though both sides want to reach a successful business agreement (The U.S. Department of Commerce estimates that for every successful American negotiation with the Japanese, there are twenty-five failed efforts.) This is illustrative of the fact that barriers to a successful agreement are of a cultural nature rather than of an economical or legal nature. Each side understands facts from its own ethnocentric background and experience, and neither side is fully aware of why a resolution could not be reached. Yet, it is precisely this ignorance concerning the culture of "the other" and the "unnatural" expectations of the other side that hinders effective negotiation.

In cross-cultural negotiations, many of the skills which are guaranteed to make for an ideal negotiator within the confines of his

native country may prove worthless or unacceptable in alien cultural settings. The stereotypical image of a successful European and American negotiator is that of a persuasive communicator, highly skilled in debates, able to overcome objections with verbal flair. Yet, these valuable assets may be regarded by members of other cultures as unnecessarily aggressive, superficial, insincere, even vulgar and repressive. To the Japanese, those very same traits indicate lack of confidence in one's convictions and insincerity. Instead, terms such as thoughtful, cooperative, considerate, and respectful are the "must have" traits in the Japanese and many Asian cultures.

The two business negotiators are separated from each other by a different way to perceive the world, to define business goals, to express judgment and affection, to show or hide expectations and interests.

A good negotiator should never take things for granted, nor should he imagine the outcome of a bargaining as determined by a fixed set of unalterable circumstances. His realism should be proven by his endeavor to "reinvent" the balance of forces, in a permanent attempt to have precedence over his interlocutor. His flexibility should not dismiss a firm position and he must distinguish between situations where it would be disastrous to make a threat and from others where it is essential to be slightly more aggressive. Sophisticated negotiators know that the best deal is one that is good for both sides. If the agreement is mutually beneficial, both sides are stimulated to maintain it. It is better to recognize the possibility of renegotiation at the outset and set down a clear framework in accordance with which to conduct the process. In short, the successful negotiator must envisage the possibility of redoing the deal, while still controlling the process.

A successful negotiator is eager to note to the distinctive qualities of the people with whom he is negotiating. He has to appreciate the meaning of their actions so as not to mislead or be misled by them, and to make his own points in a way that promotes advantageous outcomes. Effective negotiators operate as detectives searching for clues to the values and interests of their counterparts. They avoid assumptions about partner concerns;

they look for what does matter to the partner rather than what should matter. Other attributes of a successful, complete negotiator include: having outstanding communication skills; being persistent; having flexibility, tact, open mindedness, subject knowledge; being willing to take risks; having physical stamina, self-confidence, decisiveness, creativity, willingness to listen, self-control, and a long-run outlook; and being sensitive to the interests and needs of others. (Hendon &Hendon 23).

To enhance his/ her own expertise, a business negotiator can employ cultural experts, translators, outside attorneys, financial advisors, or technical experts who have a certain degree of familiarity with both the counterpart's and the negotiator's cultures. These experts serve the role of "agents" (who replace the negotiator at the negotiating table) or as "advisers" (who provide information and recommend sources of action to the negotiator). The use of go-betweens, middlemen, is a largely spread practice within many cultures and increases significantly one's chances for success.

The cultures that emphasize dialogue, mediation and compromise (as American and many European cultural systems do) acknowledge the importance of negotiation as the least troublesome method of settling disagreements or alleviating conflict between two parties in a dispute. Negotiations may be exploratory and serve to formulate viewpoints and delineate areas of agreement of convention. Or it may aim at working out practical arrangements. The success of negotiation depends upon whether (a) the issue is negotiable (b) the negotiators are interested not only in taking but also in giving and are able to exchange value for value and compromise.

For instance, the Arabs want direct, face-to-face discussions, but tend not to bring open disagreements into a formal session. In fact, rather than admit that they disagree, many Arabs will say they agree, but then take actions that suggestively hint that they do not agree at all, hoping that the other party will get the message. In Algeria, an American consultant once said: "My clients never disagree with my recommendations. They just do not try to implement the ones they dislike." (see Hendon &Hendon 35)

The Japanese are willing to meet face-to-face, but they also use third parties much more frequently than Americans do, since they prefer to use that buffer. They are uncomfortable with open conflict and hardly ever express it directly. They talk about it, or do not react at all, or give indirect hints that they disagree. In fact, they hardly ever say no directly; one must infer it from the way they say yes. In Tokyo, the running joke (though true) is the Japanese have twenty ways to say "No" without having to say it.

In Japan and the Arab countries, direct negotiations are combined with social activities. Yet, in both cases the focus is on good manners. One purpose of these activities is to demonstrate hospitality and a more subtle purpose is to determine whether you are the sort of person with whom they want to do business. Consequently, the social process can be as important as the negotiations process.

The Russians tend to regard negotiations as debates. Their ideological orientation guides them into believing that giving and taking are seen as immoral, a compromise of their principles. Instead of trading concessions, they restate their original position, with all of the arguments supporting it.

When negotiating with someone from your own country, it is often possible and acceptable to develop communications by making reasonable cultural assumptions. The situation can backfire when two cultures are involved, since making assumptions about another culture is often counterproductive due to the fact that it can lead to misunderstandings and miscommunications. The international negotiator must not allow cultural stereotypes to influence his or her relations with local businesspersons.

National negotiating styles combine culture, history, political system, and economic status. Some cultures favor the search for compromise; others will opt for consensus, while others will fight until the "opponent" surrenders. Some cultures prefer a deductive approach: first agree on principles and later apply such principles to particular issues. Other cultures think inductively: deal with real-life problems and principles will follow suit.

The process of international business negotiation is largely influenced by two groups of variables:

1. Background factors, which includes the parties objectives. Other aspects include third parties involved, such as consultants, agents, and the respective government. The position of the market (seller's vs. buyer's) and finally, the skills and experience of the negotiators.

2. Atmosphere-related factors, which can often include those as perceived cooperation / conflict, power and dependence (that one of the parties gains more power in the relationship) and perceived distance (that the parties are unable to understand each other). Finally, this category also comprises the expectations of sides, long-term expectations of the true deals or benefits and short-term expectations concerning the prospects of the present deal. Weiss (1993) identified twelve variables in the negotiations process which will lead to understand negotiating styles better.

Basic Concept. Different groups conceive of the purpose and process of negotiation differently. Negotiation may be seen as a conflict (one side prevails over another), as a competition (to identify who is best) or as a collaborative process (to formulate some undertaking). If Americans tend to see negotiations as a competitive process, the Japanese see it as a collaborative enterprise.

Criteria for Selecting Negotiators. Negotiators may be selected on the basis of their previous experience, their status (or relationship with the powers structures), knowledge of a particular subject, or valuable personality traits. Americans tend to select negotiators on the basis of ability and experience; the Japanese look for high-status negotiators.

Issues Considered. Different groups stress different aspects of the negotiations. Some groups emphasize substantive issues directly related to the agreement while others stress relationships. Americans tend to stress substantive issues (price, delivery, quality), while the Japanese are more concerned with building relationships.

Protocol. Various groups have their own particular etiquette associated with the negotiation process and their observing the protocol varies according to its perceived importance. Protocol factors that should be considered are gift giving, entertainment, dress codes, seating arrangements, numbers of negotiators, timing of breaks, and planned

duration of the process of negotiations. Degree of formality or informality is an important component of protocol that should be assessed. Americans tend to be informal whereas the Japanese are conservative and formal.

Communications. Groups communicate in many ways and tend to develop preferences for one or another form of communications. Some groups rely on verbal communications, others on nonverbal such as gestures, space, and silence. The more varied the methods of communications, the more complex is the communications context. Americans tend to be verbal; Japanese often use periods of silence and use extensive non-verbal means in their putting a message across.

Nature of Persuasive Arguments. Some groups rely on facts and logical arguments, others on tradition and the way things used to be tackled in the past, still others on intuition or emotion and others on the beliefs derived from a religion or philosophy. Americans emphasize empirical information and rational arguments while the Japanese rely more on sensible intuition.

Role of the Individual. In some groups, an individual's success or failure can heavily influence the outcome of the negotiation process. In other groups, individuals are subordinate to the negotiating group and their personal ambitions are obliterated in the process. Americans are individualistic; the Japanese are collectivist and rely on the group as a whole in the negotiations process.

Trust. This is of vital importance if groups are going to work together to ensure their mutual benefit and all groups seek to establish trust with the other parties in the negotiation process. Each group may, however, establish trust on different coordinates. Some groups consider past experience and past records, while others base their judgment on intuition and emotion and still others feel secure when penalties are stipulated in case the performance standards are not met. Americans look to the past record of those with whom they are negotiating and trust in sanctions; the Japanese are more concerned with the relationships that have been built with their counterparts.

Risk-taking Propensity. Any type of negotiation involves a degree of risk because the final outcome is unknown when the

negotiations begin. Different groups consider uncertainty and risk as relatively desirable or undesirable. Some groups therefore welcome new ideas and unexpected suggestions whereas others prefer to remain within the boundaries of accustomed agreements. Americans tend to take risks and accept uncertainty; the Japanese are more likely to avoid risk.

View of Time. Some people view time as limited and punctuality, agenda, and specified timeframes are important to them. Others view time as plentiful and always available; therefore they are more likely to expect negotiations to progress slowly and are flexible about schedules. Americans view time as rare commodity that must be fully used so as not to be wasted; the Japanese have a laxer perspective upon time.

Decision-making Systems. Decisions may be made by individuals or by the group as a whole. Within a group, participants may defer to the person of highest status or to the most senior group member. Some other groups accept the decision of the majority of the group members and other groups seek to achieve consensus among group members and postpone the final decision until all members have agreed.

Agreement. In some cultures, written agreements are a must but in others, verbal agreements or a handshake is enough. In some cultures, agreements are detailed and contingencies and potential event are thoroughly discussed and elaborated; in others, broad general agreements are preferred and specificities are worked out as they arise. In some cultures, agreements are legally binding; in others, much more emphasis is placed on a person's obligation to keep his /her word.

Since people come from have different cultural backgrounds, they tend to interpret verbal and non-verbal signals differently. Their ability to encode and decode messages differently increases the chances of misunderstanding. The first step in preventing this is to acknowledge that people react, think and act quite differently from us. To imagine otherwise is to display a potentially destructing ignorance, likely to lead to a great deal of frustration for members of both cultures. An ethnocentric position (which makes one imagine that their cultural beliefs, reactions and assumptions are always right) is

only a byproduct of gross ignorance and cultural misunderstanding. It is imperative that in the global economy cross cultural awareness should be seen as a necessary asset investment in the personality profile of present day and prospective negotiators.

Country Risk in The Contemporary Global Economy - Theoretical Concept and Operational Tool

ROVINARU Flavius – Ioan
DECEANU Liviu – Daniel

flavius.rovinaru@econ.ubbcluj.ro
liviu.deceanu@econ.ubbcluj.ro

Abstract

Economic globalization has advantages and disadvantages. We believe that the first ones' dimension is significantly higher than the inconveniences' one, and, as Professor Pascal Salin¹ said, globalization is an objective necessity.

However, the negative side of the internationalization of economic life is a reality, the country risk being an important vector of it. More than a mere academic specialty, the concept of country risk has now become an operational necessity, being the focus of analysis institutions (rating agencies, for example), but also of the different categories of agents interested in ratings (governmental creditors, various borrowers, banks, investors, multinational companies, exporters, etc.).

Currently, risk assessment in the world of international businesses differs significantly from that methodology used several decades ago; risks have multiplied and diversified, and are present in any international economic transaction. Foreign direct investments in particular face the problem of country risk; it covers all the obstacles that affect the implantation process – administrative, institutional and social behaviors and practices that discourage the investment. In order to improve economic decisions, a serious study of the country risk is necessary; this analysis is based on fundamental issues accompanying economic, financial and political imbalances.

Key words: country risk, globalization, foreign direct investments, multinational companies, ratings

JEL classification: F34

1. Considerations on the concept of Country Risk and its evolution

Certainly, the activities of economic agents can not be separated from a context of risk, of uncertainty. What varies is the intensity of risk, its manifestation forms; its presence is a constant of economic life.

Phenomena occurred in recent years on the global economic scene have generated and continues to generate mutations in the semantics of different concepts. These include **country risk**, an economic concept, and in the same time an important instrument used in the decision making process world wide.

Currently, economic globalization and financial liberalization, as well as the dilution of national state concept and the interdependence of economies are obvious realities, as the recurrence of crisis – of different types – who have expressed and manifested. Result of deregulation, but also of dangerous and irresponsible behavior, as most authors tend to emphasize, or, conversely, the disastrous consequences of regulation, of rules imposed on different markets, after the opinion of a liberal minority with some solid arguments, global economic and financial crisis entered in its fourth year of event.

Of course, the crisis is a form of manifestation of the risk, obviously as a result that crossing a period of crisis leads to changes in risk analysis itself. In fact, as shown in some studies [9], the concept of

¹ Former President of the Mont Pelerin Society, Professor at Université Paris-Dauphine.

country risk (which means losses of various types generated by economic relations with a foreign partner, private or public, caused by particular events influenced by governmental factors) has undergone significant shifts in the five decades over which it has been studied. Thus, if during the decades 7 and 8 of the last century the analysis was done to a national scale, and national states presented an importance in country risk analysis, which is associated with political and social climate of a country, and its solvency too, in the last two decades, economic globalization, the network-type activity of corporations and the interdependence of economies has so profoundly transformed the country risk, significantly widening its coverage.

A number of understandings of the term are highlighted in the literature; so, we can talk about the country risk as the fruit of sovereign actions, political decisions, but also as an economic or financial risk. In the first category we highlight the political risk, broadly covering those actions of national governments which are harmful to foreign private companies, or the uncertainty often driven by the vacuum of power and law due to changes in the political regime².

Of course, a country risk analysis that focuses only on political risk would be shallow. The vision would then be too narrow, simplistic, in a context where the risk has a much broader scope. Financial deregulation in recent years (or regulation itself, according to some opinions³), connections between states and economies have made political risk to join the economic, financial and even systemic risk⁴.

Moreover, recent papers have multiplied the approaches of the country risk concept, together with entities that deal with its analysis. For example, studies⁵ in the last

decade develop new perspectives from which the risk can be contemplated:

- The perspective of the economic actor type reached by risk (creditor): banks, investors (financial or industrial risk), exporters (commercial risk);

- The Type, nature of risk (specific entity receivable, generating the risk) - in this regard, authors such as John Calverley (1990) develop the sovereign risk and the non-transfer one;

- The type of crisis that leads to the manifestation of risk: we evoke here the sovereign risk and the political one (with their clear differentiation), as well as the economic risk⁶ and financial risk.

At the same time, we add to this the fact that country risk approaches can depend on the type of state considered or on the nature of the considered agent. It should be distinguished, for example, between sovereign and country risk. In general, the note given by the analysts to the sovereign coincides with the maximum score of state (sovereign ceiling), no local agent does receive a rating higher than that of the sovereign. This approach is not always the correct one, as revealed in his book *Economie du risque pays* Nicolas Meunier; for example, during the Russian crisis, Gazprom continued to honor its own debt while the Russian Federation has suspended payments.

The mutations occurred in addressing the concept of country risk over time can be seen in the figure that we show in this paper (Enclosure 1).

2. Country Risk Analysis, its determinants and categories of beneficiaries of the studies

Beyond the concept itself, country risk analysis is a strategic tool in supporting decisions and reducing uncertainty. The challenge is to anticipate changes in the situation, events that may affect the development of transnational business – macroeconomic, financial or socio-political fragility of a state, that are likely to have repercussions on financial or commercial operations.[5] The conclusions of such an analysis are addressed – without claiming completeness – usually to banks, credit

² Authors such as Jarvis (2004) stress the fact that political regime changes are not always harmful and can have beneficial effects.

⁶ Translated mainly by volatility in GDP and GNP.

institutions of all types, investors or exporters. Investors will be interested in industrial risk sizing (which involves the faulty running manufacture or sale process and may extend to expropriation / confiscation) or financial risk sizing (changes to the remuneration of securities), while lenders will be concerned with nonpayment risk or late payment risk. Of course, interest in risk assessment depends on the state considered, so it is evident that taking into account country risk will be re-analyzed especially in the case of a relationship with an emerging state or economic agents from it.

The aspect that we raise further in discussion concerns methods of country risk analysis. In his book [5], N. Meunier evokes two main tracks:

➤ Use of specific indicators and establishment of a diagnosis;

➤ Empirical method - the relationship of a pre-selected set of variables.

Identification of reliable and quality indicators, which help significantly to anticipate difficulties are a major challenge for analysts. This approach has gained particular importance especially after the South American debt crisis of the '80s, event that showed that a state may be in the situation of being unable to pay a debt in foreign currency. Of course, the difficulty of payment must be explained, defined; according to the literature, states in difficulty of payment generally have an external debt higher than the average of the emerging markets. But when can we speak of over indebtedness? What causes it? What are the main determinants of country risk?

Nicolas Meunier brings to the fore, in this context, three concepts, also used by most rating agencies, which set their own thresholds for alert:

➤ Solvency (debt versus the wealth state);

➤ Sustainability (evolution of the states' wealth versus debt evolution – long term orientation);

➤ Liquidity (the ability of debt payment at maturity – short-term orientation).

Among determinants of country risk, we can mention:

- External debt relative to gross domestic product – it should be noted that we are interested in the currency in which this debt is expressed, a major part of the debt being expressed in foreign currencies providing an

additional risk if the national currency is experiencing a depression;

- External debt relative to export volume (we can substitute, without any mistake, with “the external debt relative to the ability to attract foreign currency”) – when the value of the indicator exceeds 150%, we can talk of an alert corresponding to an over indebtedness; from this perspective, it needs to be emphasized that a favorable development of exports improves prospects for external debt repayment;

- External debt service to GDP and external debt service relative to the volume of exports (indicators used frequently by the World Bank to rank states according to the level of indebtedness);

- Currency exchange reserves (upper than three months of imports);

- Total external debt (dangerous if it exceeds 50% of GDP);

- Inflation rate (dangerous if it exceeds the threshold of 10.5%);

- Real interest rate;

- Existence of agreements with the International Monetary Fund (essentially a positive aspect, generating trust, but it can hide a potential crisis);

- Political risk and psychological factors;

- Economic structure of incomes;

- Balance of payments flexibility – in this context, balance of payments analysis presents a particular importance in tracking the various disturbances (supply / demand, savings / investment, private saving / public saving). Also, in this way we can explain the current deficit, and determine the status of international creditor or debtor of the analysed state.

Among methods of country risk assessment, an extremely popular one is to make ratings, these having multiple facets, for both securities issuers and creditors. It is a characterization of the risk to which are exposed economic entity signatory of an international agreement.[4] Analysis is carried out by specialized institutions, or in some cases, specific departments of banks or firms. With regard to specialized companies, it needs to be said that they should provide and disseminate information through press releases, publications or the Internet. In the study *Evaluation du Risque pays par les agences de rating: transparence et*

convergence des méthodes, Yasmine Guessoum distinguish different types of institutions that carry out country risk assessment:

➤ Rating agencies - most notable are Moody's, Standard & Poor's and Fitch, which activity will be explained briefly below;

➤ Insurance companies (e.g. COFACE - Compagnie Française d'Assurance pour le Commerce Extérieur);

➤ Consultancy offices (North South Exports to France, Business Environment Risk Intelligence);

➤ Financial publications (Institutional Investor, Euromoney Publications);

➤ Banks, etc.

An important word to say, in the country risk analysis, has the credit rating agencies. Three of them are well known there are two U.S. agencies, Moody's and Standard & Poor's, and one European, Fitch IBCA. Their evaluations rank the states in terms of loans and bonds issued. Four major classes of risk are defined, for Standard & Poor's and Moody's, the descending order (from highest level of risk, when the country's ability to repay both the debt and interest, to the most unfortunate situation) is as it follows:

S&P: AAA AA A BBB BB B CCC
CC C D

Moody's: Aaa Aa A Baa Ba B
Caa Ca C D

Two nuance indicators are found "+" and "-". They point perspectives, the possible development of note, and are the first to change.

Among the factors used by agencies in conducting evaluations, we include: balance of payments and current account, the level of debt, deficit level, structure and economic growth, exchange rate and convertibility, GDP and GDP per capita, labor cost factor and productivity, level of reserves, interest rates, inflation, liquidity, the political environment, international agreements, etc. The share of different criteria and evaluation methodology are unknown to the public. We note the possibility of classifying factors into two categories: quantitative factors (objective criteria) and qualitative factors (subjective criteria).

Although they overlap largely, criteria used vary from agency to agency, so Standard & Poor's uses 9 families of criteria (political risk,

international relations, social environment, economic structure and growth prospects, flexible tax system, flexibility of balance of payments, external debt and liquidity, borrowing costs, price stability), Moody's, 5 families (political dynamic and social interaction, structure and economic performance, tax indicators, external payments and debt, monetary indicators and liquidity), while Fitch call to no more than 14 families of criteria (policy and state, international position, demographic factors, employment, production and trade structure, dynamic private sector, supply / demand balance, balance of payments, macroeconomic policies, FDI policy, banking and finance, foreign currency assets, the external debt, economic growth).

A problem to us is the transparency of the scoring process, as we mentioned, most institutions do not communicate the process used, and, secondly, a number of factors [4] may cause differences between various evaluations: criteria taken into calculation methodology used, the type of grades awarded. Not finally, the reliability of studies is given by the state matching between of the profile of analyzed state and the share given to the different evaluation criteria.

3. Contry Risk for investors – a tool used in decision making

The behavior of transnational companies is strongly influenced, in addition to traditional factors (differences in production costs, differences in taxation, market size, proximity to sources of raw materials, etc.), by country risk, in all its complexity. However, literature dealing with foreign direct investment is not focused mainly on the study of country risk, even though, we underline, investment and risk are inseparable.

This is because the investment is based on assumptions and not certainty, being exposed mainly to the macroeconomic risk factors [1] such as changes in monetary and fiscal policy, law, etc. Of course, the risk of implantation is boosted by other elements, such as the relation with local firms (the danger being higher when the market is not known), but also by the multitude of irreversible events that culminate with confiscation or expropriation. A strategic

investment decision will always be linked to the international situation, risk aversion, the perception of uncertainty, the host state characteristics (social and economic situation, labor costs and its qualification), market attractiveness, and the institutional framework. Making a successful FDI necessarily involves the exercise of a high control on the market and competitors, as well as high degree of competitiveness. In the same time, there are to be taken into account the communication costs, as well as the possession of essential information. In situations of uncertainty, the optimal decision involves the choice of the export channel, pending the obtaining of information, instead of operating a direct investment; these investments should be made during periods when the risks are minimal, costs are reduced, when it is possible to achieve economies of scale, and the host country market has the right size. From the perspective of foreign direct investments, the thing that mainly interests is the institutional adaptation of the FDIs as well as the borrower's characteristics. The main risks are related to the possible negative effects of financial deregulation or to an external opening which evolves too fast.

We can also include here the transfer risk, which involves dysfunctions of the financial transfers operated abroad (reduction of transfer possibilities), or even cases of debt payment incapacity. International activity of an enterprise is led by its strategy of internationalization [7] - set of techniques, methods, practices and concepts integrated into a complex form that allows carrying out activities beyond national borders of a country. Within this strategy, we plead for the integration – each time – of the relevant variables in the definition of country risk. Its rating will influence the decision, and allow the quantification of the total risk. (integrating macroeconomic and microeconomic risks).

Finally, we say that today, overcoming boundaries – in its literary sense as in its figurative one – supposes investors to be subject to risks, but it is a necessity.

Challenges of globalization have led to spectacular developments in flows of foreign direct investments into developing states (from 10% of flows into emerging states, during 1981-1985, to over 70% in the last 5 years)[5]; the emerging markets environment involves specific risks and, consequently, their study, whether conducted in enterprises' special departments or offered by agencies, represents nowadays one of the key success factors so strongly conveyed in the contemporary concurrenial economy.

The Importance of Corporate Governance in the South Est Europe Countries

SARCHIZIAN Sergiu

Doctoral School of Economics, „Al. I. Cuza” University of Iasi
ssarchizian@yahoo.com

Abstract

Corporate governance is the set of processes, customs, policies, laws and institutions affecting the way a corporation is directed, administered or controlled. Corporate governance also includes the relationships among the shareholders, management, the board of directors and other stakeholders (employees, suppliers, customers, banks).

Policy makers in both developed and emerging economies face challenges in ensuring good corporate governance. The OECD Principles of Corporate Governance set out a framework for good practice which has been agreed by the governments of all 30 countries that are members of OECD.

The White Paper on Corporate Governance in South Est Europe is the result of four Roundtable between 2001-2003 and it is the emulation of experiences of all participants based on the OECD Principles of Corporate Governance.

Key words: corporate governance, policy makers, South Est Europe

JEL classification: G34

1. Introduction

Corporate governance is the system by which companies are directed and controlled. “Corporate governance involves a set of relationships between a company’s management, its board, its shareholders and other stakeholders. Corporate governance also provides the structure through which the objectives of the company are set, and the means of attaining those objectives and monitoring performance are determined. Good

corporate governance should provide the proper incentives to pursue objectives that are in the interest of the company and shareholders and should facilitate effective monitoring, thereby encouraging firms to use resources effectively”[19].

2. Definitions

1. "Corporate governance is a field in economics that investigates how to secure/motivate efficient management of corporations by the use of incentive mechanisms, such as contracts, organizational designs and legislation. This is often limited to the question of improving financial performance, for example, how the corporate owners can secure/motivate that the corporate managers will deliver a competitive rate of return"[11]
2. “Corporate governance deals with the ways in which suppliers of finance to corporations assure themselves of getting a return on their investment”[11]
3. "Corporate governance is the system by which business corporations are directed and controlled. The corporate governance structure specifies the distribution of rights and responsibilities among different participants in the corporation, such as, the board, managers, shareholders and other stakeholders, and spells out the rules and procedures for making decisions on corporate affairs. By doing this, it also provides the structure through which the company objectives are set, and the means of attaining those objectives and monitoring performance"[19]
4. "Corporate governance - which can be defined narrowly as the relationship of a

- company to its shareholders or, more broadly, as its relationship to society -...."
5. "Corporate governance is about promoting corporate fairness, transparency and accountability"
 6. "Some commentators take too narrow a view, and say it (corporate governance) is the fancy term for the way in which directors and auditors handle their responsibilities towards shareholders. Others use the expression as if it were synonymous with shareholder democracy. Corporate governance is a topic recently conceived, as yet ill-defined, and consequently blurred at the edges...corporate governance as a subject, as an objective, or as a regime to be followed for the good of shareholders, employees, customers, bankers and indeed for the reputation and standing of our nation and its economy"[8].

3. The OECD principles

Current preoccupation with corporate governance can be pinpointed at two events. First event, The East Asian Crisis of 1997 saw the economies of Thailand, Indonesia, South Korea, Malaysia and The Philippines severely affected by the exit of foreign capital after property assets collapsed. The lack of corporate governance mechanisms in these countries highlighted the weaknesses of the institutions in their economies. The second event was the American corporate crises of 2001-2002 which saw the collapse of two big corporations: Enron and WorldCom, and the ensuing scandals and collapses in other corporations such as Arthur-Andersen, Global Crossing and Tyco.

In this context, there was necessary to adopt generally accepted standards. The merit for elaborate the first set of corporate governance principles it have the Organisation for Economic Co-operation and Development (OECD). The OECD Principles of Corporate Governance set out a framework for good practices which has been agreed by the governments of all 30 countries that are members of the OECD. They have been designed to assist governments and regulatory bodies in both OECD countries and elsewhere in drawing up and enforcing effective rules,

regulations and codes of corporate governance. In parallel, they provide guidance for stock-exchanges, investors, companies and others that have a role in the process of developing good corporate governance.

The OECD principles for a good corporate governance are:

I. *Ensuring the Basis for an Effective Corporate Governance Framework*

The corporate governance framework should promote transparent and efficient markets, be consistent with the rule of law and clearly articulate the division of responsibilities among different supervisory, regulatory and enforcement authorities.

II. *The Rights of Shareholders and Key Ownership Functions*

The corporate governance framework should protect and facilitate the exercise of shareholders' rights.

III. *The Equitable Treatment of Shareholders*

The corporate governance framework should ensure the equitable treatment of all shareholders, including minority and foreign shareholders. All shareholders should have the opportunity to obtain effective redress for violation of their rights.

IV. *The Role of Stakeholders in Corporate Governance*

The corporate governance framework should recognise the rights of stakeholders established by law or through mutual agreements and encourage active co-operation between corporations and stakeholders in creating wealth, jobs, and the sustainability of financially sound enterprises.

V. *Disclosure and Transparency*

The corporate governance framework should ensure that timely and accurate disclosure is made on all material matters regarding the corporation, including the financial situation, performance, ownership, and governance of the company.

VI. *The Responsibilities of the Board*

The corporate governance framework should ensure the strategic guidance of the company, the effective monitoring of management by the board, and the board's accountability to the company and the shareholders.

4. The White Paper on corporate governance in South East Europe

The First South East Europe Corporate Governance Roundtable was launched in spring 2001 and is a regional flagship initiative of the Investment Compact for South East Europe. The Investment Compact established in February 2000, is a vital part of economic reform activities to be carried out under Working Table II of the Stability Pact for South East Europe, dealing with economic reconstruction, co-operation and development. The Roundtable has benefited from the financial support of the Deutsche Gesellschaft Für Technische Zusammenarbeit (GTZ).

Between September 2001 and March 2003, four Roundtable meetings were organised to discuss improving corporate governance in South Est Europe. Using the OECD Principles as a conceptual framework, the Roundtable examined the five key elements of a strong corporate governance framework described in the Principles: (i) the rights of shareholders; ii) the equitable treatment of shareholders; (iii) the role of stakeholders in corporate governance; (iv) disclosure and transparency; and (v) the responsibilities of the board.

Roundtable meetings were carried out in co-operation with regional and local partners and hosts, whose assistance has been invaluable in securing the success of these meetings. The Romanian National Securities Commission and the Bucharest Stock Exchange co-hosted the first Roundtable in Bucharest in September 2001. The OECD Centre for Private Sector Development and the Turkish International Cooperation Agency (TICA) co-hosted the second Roundtable in Istanbul in May 2002. The Zagreb Stock Exchange co-hosted the third Roundtable in Zagreb in November 2002. Finally, the Securities Commission of the Federation of Bosnia and Herzegovina co-hosted the fourth Roundtable in Sarajevo in March 2003.

The result was the elaboration of White Paper on Corporate Governance in South East Europe.

Other two roundtable took place on 10-11 June 2004 in Ohrid, Former Yugoslav Republic of Macedonia and on 16-17 February 2006 on Istambul, Turkey.

This White Paper proposes a series of practical recommendations and should serve as a means for setting priorities and implementing reforms at the national and regional level. It is a non-binding, consultative document reflecting the discussions and recommendations of Roundtable meetings. It was written, debated and endorsed on a consensual basis by all the Roundtable participants. To ensure maximum relevance, an inclusive approach was adopted, whereby all constituencies with an interest and expertise in corporate governance were considered. Roundtable participants were also invited to provide written comments on various drafts of this White Paper.

The White Paper focuses primarily on publicly traded companies although in many aspects it also addresses issues related to widely held but not publicly listed companies. This is particularly important in South East Europe as privatisation has led in some countries to non listed but widely held companies and economic development will depend, to a significant extent, rely on the the success of these small and medium-sized unlisted enterprises. Finally, the White Paper may also be useful in some aspects of the governance of privately held firms and state enterprises.

5. Recommendations for future action in South East Europe

Taking into account the discussion in the latest Roundtable meeting, the results of a survey undertaken among Roundtable participants and additional research, the Roundtable considers the following topics a priority for its concrete policy work in the future:

- a) effective enforcement of corporate governance rules;
- b) commitment of the private sector, in particular of boards, to the corporate governance reform process;
- c) disclosure of financial and non-financial information.

6. Conclusions

There is no single model of good corporate governance. However, work carried out in both OECD and non-OECD countries and within the Organisation has identified some common elements that underlie good corporate governance. The Principles are build on these common elements and are formulated to embrace the different models that exist.

The Principles are non-binding and do not aim at detailed prescriptions for national legislation. Rather, they seek to identify objectives and suggest various means for achieving them. Their purpose is to serve as a reference point. They can be used by policy makers as they examine and develop the legal and regulatory frameworks for corporate governance that reflect their own economic, social, legal and cultural circumstances, and by market participants as they develop their own practices.

The Roundtables in South East Europe should continue to play an important role in reviewing and comparing progress of countries on priority issues. This will enable policy-makers especially to identify remaining shortcomings to compare and contrast the situation in their country with developments in other countries in the region, as well as to observe and respond to emerging trends.

The participants proposed that the Roundtable report back regularly to future meetings of the Investment Compact concerning progress on the above agenda for action as a way of working to further raise awareness and strengthen support for corporate governance improvements in South East Europe.

How Can We Measure the Corporate Governance ?

SARCHIZIAN Sergiu

*Doctoral School of Economics, „Al. I. Cuza” University of Iasi
ssarchizian@yahoo.com*

Abstract

Corporate Governance Scores represents Standard & Poor's approach to analyzing corporate governance both at a country and at a company level.

The Country Governance Classification reflect the degree to which the macro legal, regulatory, informational and market environments provide a supportive infrastructure for effective corporate governance.

The company Corporate Governance Score provides an assessment of how a company's governance process serves the interests of stakeholders.

The Governace Index ('G') allow the comparison between individual American companies.

Key words: corporate governance, scores, classification

JEL classification: G34

1. Introduction

There is no one model of corporate governance that works in all countries and all companies. Indeed, there exist many different codes of “best practices” that take into account differing legislation, board structures and business practices in individual countries. However, there are standards that can apply across a broad range of legal, political and economic environments. Organisation for Economic Co-operation and Development (OECD) has articulated a set of core principles of corporate governance practices that are relevant across a range of jurisdictions. These are:

- Fairness
- Transparency
- Accountability

➤ Responsibility

These same principles can be used as cornerstones in a corporate governance scoring methodology for individual companies.

2. Corporate governance score

2.1. The concept of corporate governance scores

The most known method for measuring the corporate governance is “*Standard & Poor's Corporate Governance Scores*”. This methodology presents Standard & Poor's approach to analyzing corporate governance both at a country and at a company level.

A company *Corporate Governance Score* ('CGS') reflects Standard and Poor's assessment of a company's corporate governance practices and policies and the extent to which these serve the interests of the company's financial stakeholders, with an emphasis on shareholders' interests. For purposes of the CGS, corporate governance encompasses the interactions between a company's management, its board of directors, shareholders and other financial stakeholders.

A *Corporate Governance Score* ('CGS') is assigned on a scale from CGS-10 (highest) to CGS-1 (lowest). In addition, scores from 10 (highest) to 1 (lowest) are awarded to the four individual components that contribute to the overall CGS. These are:

- Ownership Structure & Influence
- Financial Stakeholder Rights & Relations
- Financial Transparency and Information Disclosure
- Board Structure & Process

This reflects the premise that the quality of a company's governance process can affect its ability both to honor contractual financial obligations to creditors and to maximize the

value of a company's equity and distributions for its shareholders.

"Standard & Poor's Corporate Governance Scores" are designed specifically for financial stakeholders (the company's shareholders and creditors).

The *Corporate Governance Score* ('CGS') consist of two parts:

a) *Country Governance Classification* – the effectiveness of the legal, regulatory informational and market infrastructure. This focuses on how "external forces" at a macro level can influence the quality of a company's corporate governance.

b) *Company Corporate Governance Score*– the effectiveness of the interaction among a company's management, board, shareholders and other stakeholders. This focuses on the internal governance structure and processes at an individual company.

2.2. Country governance classification

The Country Governance Classification assesses the extent to which the external environment in a given country either supports or inhibits healthy governance practices at the corporate micro level. Standard & Poor's use a numeric scale of 1 to 10 to articulate its opinion about the extent of support. A score of 10 is the highest and strong support.

A Country Governance Classification is not an exhaustive study of a country's legal, regulatory, informational market infrastructure, but is a through analysis of these factors that allows Standard & Poor's to form an opinion which this support governance at the company level.

In assessing a country's corporate governance, Standard & Poor's determine the extent to which the external environment in a given country supports or inhibits healthy governance practices at the corporate or micro level.

The external environment can be important in motivating good or bad internal governance practices by individual companies. It is also of importance in formulating answers to the following questions:

➤ What are the rights of financial stakeholders and how do these impact the company's relations with its financial stakeholders?

➤ How effectively does the relevant infrastructure encourage and protect these rights?

The four main areas of focus in this analysis are:

- Legal infrastructure
- Regulation
- Information infrastructure
- Market infrastructure.

2.3. Company corporate governance score

The company *Corporate Governance Score* ('CGS') provides an assessment of how a company's governance process serves the interests of stakeholders.

Individual company governance standards can reflect a company's degree of adherence to externally imposed governance standards. In countries where the external environment is weak, these individual company practices may also reflect the extent to which internal company governance discipline may or may not offset the weaker external infrastructure.

The CGS is intended to be relevant to different national approaches to corporate governance.

The OECD Principles of Corporate Governance form the basis of the methodology used to determine a Corporate Governance Score. In addition to the OECD principles, the work of many other codes and guidelines have also been consulted and synthesized into a set of criteria.

A *Corporate Governance Score* (CGS) is assigned to a company as a result of voting of the scoring committee. The CGS reflects Standard & Poor's opinion of the extent to which a company adopts and conforms to codes and guidelines of good practices of corporate governance overall. A scale of CGS-10 (highest) to CGS-1 (lowest) is used. A score of 0 will be awarded where a company is unable or unwilling to provide enough information for a meaningful analysis.

In addition, each of four components that contribute to the CGS receive individual scores of 10 (highest) to 1 (lowest). Standard & Poor's also analyses sub-categories of the four main components, to evaluate the corporate governance standards of individual companies. These four components, and the sub-categories are:

- a) *Ownership Structure & Influence*

Sub-categories:

- Transparency of ownership
- Concentration and influence of ownership

b) *Financial Stakeholder Rights and Relations*

Sub-categories:

➤ Voting and shareholder meeting procedures (including regularity, ease of access to, information provided, etc.).

➤ Ownership and Financial rights (including dividends, ability to exercise rights, registration and transferability of shares)

- Takeover defenses

c) *Financial Transparency and Information Disclosure*

Sub-categories:

➤ Quality and content of public disclosure.

➤ Timing of, and access to, public disclosure

➤ Independence and integrity of audit process

d) *Board Structure & Process*

Sub-categories:

➤ Board structure and composition.

➤ Role and effectiveness of board.

➤ Role and independence of outside directors.

➤ Director and executive compensation, evaluation and succession policies.

Each of these components contributes to the overall score. However, in the case of extremely poor financial transparency and information disclosure, a meaningful assessment of other governance factors may not be possible. So poor transparency by itself can either result in a low overall governance score or it can mean that a governance score is not possible.

2.4. How company score and country governance classification will fit together

The *Country Governance Classification* reflect the degree to which the macro legal, regulatory, informational and market environments provide a supportive infrastructure for effective corporate governance.

A high Country Governance Classification (i.e. strong support) will not mean that an individual company will be highly scored itself. There is no “floor”: An individual company in

a positively assessed country can receive a low CGS if so warranted.

Likewise, because the analysis focuses on what a company does, rather than what is required by law or regulation and because the analysis benchmarks a company’s corporate governance standards to codes and guidelines of good corporate governance practices, there is no sovereign constraint. A low score for a country (i.e. weak support) will not necessarily mean that a company in that country will receive a low CGS. A well-governed company in a negatively assessed country may receive a high CGS.

The importance of the *Country Governance Classification* is that it indicates Standard & Poor’s opinion about the degree of protection that investors, and other financial stakeholders, would receive should a previously highly scored company’s corporate governance standards deteriorate.

3. The governance index (‘g’)

Three American professors¹ analyzing yearly the corporate governance in over then 1.500 large American companies, between 1990-2000, create “*The Governance Index*” (‘G’).

The index value is between 1-24, for every firm it is add one point for every provision that restricts shareholders rights (increase managerial power). Most of these provisions are directly related to management’s options to resist a hostile takeover.

This 24 provisions are:

- Antigreenmail
- Blank Check preferred stock
- Business Combination laws
- Bylaw and Charter amendment limitation
- Control-share Cash-out laws
- Classified Board
- Compensation Plans
- Director indemnification Contracts
- Control-share Acquisition laws
- Cumulative Voting
- Director’s Duties
- Fair-Price Requirements
- Golden parachutes
- Director Indemnification
- Limitation on director Liability

¹ Paul A. Gompers, Joy L. Ishii and Andrew Metrick

- Pension Parachutes
- Poison Pills
- Secret Ballot
- Executive Severance agreements
- Silver Parachutes
- Special Meeting requirements
- Supermajority requirements for approval of mergers
- Unequal Voting
- Limitation on action by Written Consent

Most of the provisions can be viewed in a similar way; in almost every case, these provisions give management some tool to resist different types of shareholder activism, be it calling special meetings, changing the firm's charter or bylaws, suing the directors, or just replacing them in one fell swoop.

In most cases, the existence of a provision indicates an active move by management and an attempt to restrict shareholder rights. There are two exceptions to this rule – “*secret ballots*” and “*cumulative voting*” – in which the provisions tend to come from shareholder pressure. A secret ballot, also called “confidential voting” by some firms, designates a third-party to count proxy votes and does not allow management to know how specific shareholders vote.

Cumulative voting allows shareholders to concentrate their directors' votes so that a large minority holder can ensure some board representation. Both of these provisions tend to be proposed by shareholders and opposed by management after they have been proposed.

In contrast, none of the other 22 provisions enjoy consistent shareholder support or management opposition; in fact, many of these provisions receive significant numbers of shareholder proposals for their repeal. Thus, the presence of “secret ballots” and “cumulative voting” to be increases in shareholder rights. For the Governance Index, it is add one point for all firms that do not have these provisions.

The Governance Index (G) has five subindices for each of the five categories:

- a) tactics for delaying hostile bidders ('Delay')
- b) voting rights ('Voting')
- c) director/officer protection ('Protection')
- d) other takeover defenses ('Other')
- e) state laws ('State').

Every subindice has many provisions. In total are 28 provisions, but 24 are unique.

The Governance Index (G) divide companies in three categories:

➤ $G \leq 5$ - the “Shareholder Portfolio” is comprised of the firms with the strongest shareholder rights (lowest management power)

➤ $6 < G < 13$

➤ $14 < G \leq 24$ - the “Management Portfolio” is comprised of the firms with the weakest shareholder rights (highest management power)

The conclusions of the study are very interesting:

➤ Corporate governance is strongly correlated with stock returns during the 1990s: an investment strategy that purchased shares in the firms with the lowest G (strongest shareholder rights), and sold shares of the firms with the highest G (weakest shareholder rights), earned abnormal returns of 8.5 percent per year.

➤ At the beginning of decade, there is a significant relationship between valuation and governance: each one-point increase in G is associated with a 2.4 percentage point lower value for Tobin's Q . By the end of the decade, this difference has increased significantly, with a one-point increase in G associated with an 8.9 percentage point lower value for Tobin's Q .

The results for both stock returns and firm value are economically large and are robust to controls for industry effects, sample composition changes, or sample subperiods. Taken together, this evidence indicates that stock market investors were surprised by the relative performance of high- G and low- G firms in the 1990s.

➤ An investment of \$1 in the (value-weighted) Management Portfolio on September 1, 1990 would have grown to \$3.39 by December 31, 1999. In contrast, a similar \$1 investment in the Shareholder Portfolio would have grown to \$7.07 over the same period. This is equivalent to annualized returns of 14.0 percent for the Management Portfolio and 23.3 percent for the Shareholder Portfolio, a difference of more than nine percent per year.

One possible explanation is that the performance differences are driven by differences in the riskiness or “style” of the two portfolios.

4. Conclusions

Corporate Governance Scores allow the comparison of individual companies within a national context as well as comparisons of companies in different jurisdictions.

However a high score of *Country Governance Classification* will not mean that an individual company will be highly scored itself. A well-governed company in a negatively assessed country may receive a bad *Country Governance Classification*.

The Governance Index ('G') allow the comparison between individual American companies. It measure "the level" of corporate

governance in American companies and show relevant advantages of the companies with the strongest shareholder rights (lowest management power). It is not relevant for other countries.

Abstract

We must remember that intelligence is not enough. Intelligence plus character-that is the goal of true education. The broad education will, therefore, transmit to one not only the accumulated knowledge of the race but also the accumulated experience of social living.” Starting from these words of Martin Luther King the paper explores the challenges of nowadays education considering the constraints and shift in values and principles that globalization generates in today's society.

Key words: education system, globalization, moral society

JEL classification: F01

1. Introduction

Recent investigations in the study of demographical trends at global level are currently making light on a very controversial aspect, although ignored by global institutions like UNO, UNDP, G20, and by the organizations with attributions in educational field (as UNESCO, Youth International Authorities and others). The so-called „demographic winter” phenomenon, which reveals the dramatic consequences of the modern life, marked by familial and moral decline, by miscarriage, vulgarization and homosexuality normalization, by the poisoning influence of the majority of mass-media and the “Hollywood culture”, are inoculating egocentrism, frivolity and irresponsibility. Considering this demographical trend offers a new dimension to the way in which abundance and resources of the world are distributed and also gives a new vision on elementary educational issues.

2. The obsolete model of actual education system

The globalization of education is reflected itself in the extension and unification of educational practices, used by all those public and private entities, involved as active social educators. Over time, the public education systems in developed or emerging countries, which promote formal education, are illustrating with consistency the practice of a classical education system. In the field of non-formal education there are used more innovating and diverse methods of education, but unfortunately few of these are oriented upon individual behaviour reshaping in the global context, and they are looking only to proliferate consumerist habits, by preparing youngsters for a successful professional career start. The presence of NGO's with international coverage and professional training companies has fixed the currently understood “development in education” in comfortable limits. This makes room for a reshape of educational fundamentals and, more obvious, for the ultimate purpose of learning.

Most people think that education should equip them with the proper exploitation instruments so that they can forever trample over the masses. Still other thinks that education should furnish them with noble ends rather than means to an end. The function of education, therefore, is to teach one to think intensively and to think critically. But education which stops with efficiency may prove as the greatest threaten to society. The most dangerous criminal may be the man gifted with reasons, but with no morality.

Socially speaking, the technological revolution, the broaden access to information and the modern lifestyle facilities have made possible the appearance of an irreversible

phenomenon in the conflict between generations. In our present times, the children, “sons of globalization” have access to multiple sources of information, with the internet being most of the time an instrument of self-education. The balance is leaning in the favour of the power of informed youth, who become “teachers” explaining the new world order to the eldest. This theory takes into consideration the acceleration of technology and the way of our lifestyle, but, beyond its observational character, it does not bring up the discussion on the relevance of educational systems, visible outmoded, which attempts to destroy the moral and statutory principles. The wisdom is transmitted from the old generation to the youth and not backward.

Therefore we are missing the questions regarding the way bodies responsible for educational issues should reconsider the basic fundamentals of this basic activity, which clearly has guided the evolution of our world so far. It isn't enough for organizations like UNESCO or UNDP to confront the absence of primary education and the discrimination regarding access to education in underdeveloped countries, to avoid resettling the educational needs inside an inappropriate system. It is necessary to deal with these aspects in proper time, because we consider education the key-element which can slow-down the process of planet and people self-destruction.

3. Proposals regarding reinventing educational fundamentals and systems

The proposal regarding fundamental reshaping and reviewing the individual education, approached in all stages and cycles of life, starts with the assumption that “man has to be educated to act responsible towards the environment and civilization, and not to interfere in the harmony and balanced world development with its behaviour”. This observation, not exactly recent, triggered a chain of initiatives in the educational system in countries like France, Italy, Germany, including Romania, but we consider that implementing a subject like Civic Education in the gymnasium module is not enough, neither convincing.

We feel that the new fundamentals and principles of education, which must be known,

understood and applied by every teacher, through all the range of educational processes in the long life learning of individuals, and also in the non formal educational processes whereat people have access during existence are:

1. *Self-consciousness* - is essential because it allows every individual to find his role in society, to know his weak points and to develop them according to his unique talents genetically inherited. A person aware of his/herself can easily act in choosing the occupation or the career to practice that he or she will be able to direct his energies to and recognize the real problems that the world and society faces. Consciousness-based education, introduced in 1971 by Maharishi Mahesh Yogi is unique in its ability to effectively develop the total brain potential of every student.

2. *Stimulating creativity* – this special quality is reflected in the mental and social process of generating new ideas, concepts, associations and permits individual adaptation to unpredictable contexts and situations. There are simple techniques associated to lateral thinking that can promote this capacity for example: improvisation, fiction as imaginary product, (randomness improvisation, PS).

3. *Communication* – in the actual forms and methods used as learning practices, communication is not capitalized as being the supreme value, because mostly individual activity it's encouraged which promotes inappropriate values like egoism, indifference, self-interest. Without communicating problems and discussing difficult situations, there is no way to claim solving the issues in optimal parameters of time, quality and accuracy. The man cannot act in terms of social responsibility, as a “macro attitude”, which we consider as being shallowly approached, especially in the economic environment.

4. *Promoting a responsible role in society*- education must train one for quick, resolute and effective thinking. To think incisively and to think for one-self is very difficult. We are prone to let our mental life become invaded by legions of half truths, prejudices, propaganda. At this point, we often wonder whether or not education is fulfilling its purpose. A great majority of social educated people do not think logically and scientifically. Even the mass-media, the classroom, the platform or the pulpit

in many instances do not give us objective and unbiased truths, To save man from the morass of propaganda is, in our opinion, one of the chief aims of education. Education must enable one to sift and weight the evidence, to discern the true from the false, the real from the unreal, and the facts from the fiction.. This is the way in which one can develop and practice an active role in society.

5. *Receptiveness to change* – in order to be able to intervene in the actual course of the life circle, accepting and promoting the changes is considered a healthy habit, which stimulates the flexibility and the disruption of existing corporately stereotypes, which are leading humanity to destruction because of the ignorance or simply because of unknown problems that Terra is facing. From this perspective, the change tackling implies a real transformation at psychological level and of human behaviour, therefore to satisfy those priorities needed to be handled immediately. Here we refer to the necessity of re-conversion of world economy from a military economy to a civil one, immediate solutions for energetic and environmental problems as well as for the underdevelopment and poverty aspects propagated into the world.

6. *Global vision upon world* – the actual educational system, as a whole, is constituted by a sum of operations (method-evaluation-communication), whose final objective must reflect a pragmatic and global view of the world. At present, the youth is informed regarding global problems through sources like mass-media, not allowing the opportunity of a healthy analysis, not making possible a debate and a thoroughness facilitation that could lead to the understanding and building up personal opinions regarding aspects like underdevelopment, global economical relations, international monetary system, etc.

7. *The ability of solving problems* –solving problems is the easiest way to recreate conditions and actions in an artificial manner, experience which allows people and students to deal with in a constructive way and to develop solutions for different problems. Learning systems which are basically built like this are superior because it helps individual to recognise and adapt to specific economic, social, psychological, spiritual context and to detect real problems in any form, associating

optimal alternatives of decision. For example, simulating a complete economical context for a start-up company leads to the stimulation of the individual creativeness and decision-making abilities.

8. *Multidisciplinary teams* – to permit reshaping and the restructuring of the curricula in the needed form in order to develop these abilities and capacities, we are suggesting even some changes in the study of disciplines, considering the logical and contextual relations between them and providing an understanding of all existing corelationsat a certain point.

In recent years, there have been promoters that recognise the importance of remodelling and updating the learning systems and they have introduced some of his principles through various pedagogic and psychology methods and ideas which become guidelines in university educational systems from regions around the world. The recently pointed opposition between the open education model and the traditional closed education model is more and more obvious.

4. Conclusions

To conclude, we would like to secify the way these ideas wre generated and which were their fundamentals. This actual study is not a result of a thorough research activity neither a genius idea. We are ourselves products of a classic, formal education system, but also had some benefits from the non-formal education methods by involving in different NGO's developing soft skills and hard skills both. We consider that these educational practices are not enough adapted to the global context that we are facing everyday and that specialised literature is expessing, bringing up to the light its pronounced effects of human existence on Terra. It is therefore absolutely necessary to support the propagation of open education in the world so that to improve the living standards of all individuals in the shortest time possible.

Policy Priorities for Supporting Romanian Small And Medium Enterprises Internationalization

STANCULESCU Anca-Maria
Academy of Economic Studies, Bucharest
sam33ro@yahoo.com

Abstract

The article analyses the necessities and requirements of the Romanian small and medium enterprises in order to identify the main policy priorities for supporting their internationalization. Having considered the role and necessity of small and medium enterprises internationalization policies, the main policy directions are discussed. Since in the case of Romania, an important part of the problems associated to supporting small and medium enterprises development and internationalization is related to the lack of resources, a special focus is put on the policy priorities providing resources for internationalization.

Key words: enterprises, internationalization, policy priorities

JEL classification: F2

1. Introduction

The interest in small and medium-sized internationalization primarily arises from the new, amplified role they have acquired at a national and international level, bringing them to the forefront of the economic development, due to the fundamental economic changes taking place at the beginning of the 21st century. The transition to a knowledge-based economy, with all its implications, provides opportunities and motivations for small and medium enterprises internationalization, in a global, regional and national context.

Supporting small and medium enterprises internationalization involves both the development of specific policies targeted in this effect and sector development policies, which are linked and enhance each other. Many of the issues associated with the

internationalization of Romanian small and medium enterprises are actually general problems of the sector, such as low productivity, lack of capacity, limited financial resources, low accessibility and implementing of the new information and communication technologies, etc.

2. Necessity and role of small and medium enterprises internationalization policies

The necessity for policy incentives for supporting small and medium enterprises internationalization primarily arises from their critical role for the stability and potential of any national economy, and since most of them face resources limitations, they need support to acquire the necessary capacities in order to develop internationally.

Currently, statistics show that in almost all the countries small and medium enterprises completely dominate in the economy, as they share over 99 percent of all firms, hold substantial shares and generate the largest part of the GDP, value added and employment in every country. We may thus argue that small and medium enterprises make a vital contribution to the economic and social development. In Romania, small and medium enterprises count for 99.5 percent of all the enterprises and generate about 60 percent of the total employment and 50 percent of the value added ([4], p. 3).

Small and medium enterprises have the highest dynamism in a market economy, which is evidenced by their number, evolution, turnover and employment volumes, significantly higher than those of large firms, and show high flexibility and adaptability to market requirements and changes, being

avored by their smaller size, faster decision making process and direct involvement in current operations. Thus, they provide the main component of an economic background favorable to a market economy, characterized by flexibility, innovativeness and dynamic. Small and medium enterprises are also the seeds for future large firms, particularly in the new, high technology based areas of economy.

Support programs for small and medium enterprises internationalization have been traditionally focused on promoting exports and have been usually developed independently of other policies. At an institutional level, they are developed by internationalization or export promotion agencies. We may assert that such programs are traditional for most of the countries in the world. The first export promotion agency - still in force - was created in 1919 in Finland. Over time, the number and importance of such programs have considerably grown, and now they can be found in almost every country. The efforts under such programs are justified by the impact achieved - for each \$ 1 of export promotion, it has been estimated a \$ 300 average increase in exports ([11], p. 1). But internationalization is not limited only to export. Cross-border cooperation, participation in profitable networks, technology transfers, subsidiaries abroad are strategic alternatives for internationalization that may be approached by small and medium enterprises, which often combine different approaches of the internationalization strategy that reinforce each other. Such promotion incentives for small and medium enterprises, however, are less common than export promotion incentives.

Supporting small and medium enterprises internationalization as a means of promoting exports contributes to the improvement of a country's commercial balance and balance of payments, which further results in an improvement of its international position.

Policy incentives for small and medium enterprises internationalization mainly grounded on the fact that due to the limited resources and expertise, small and medium enterprises require support to successfully compete in international markets. In the absence of any policy support, most small and medium enterprises do not proceed to internationalization. At the same time, small and medium enterprises can benefit

disproportionately from the positive effects generated by internationalization ([15], p. 237-253), in the sense that the internationalization of small and medium enterprises provides significant opportunities for economic growth and increased competitiveness, resulting in long-term sustainability. Considering the crucial role of small and medium enterprises for a country's economy, supporting internationalization thus determines the country's economic sustainability.

Policy incentives for internationalization aim to create a suitable environment and direct internationalization initiatives at a national but also regional and local levels. Institutional and political decentralization is widely practiced and recommended as local authorities and development agencies are very active in designing and delivering entrepreneurship programs, including export promotion and internationalization. Given their proximity to small and medium enterprises, regional and local authorities should be empowered by national governments to take the appropriate measures aimed at promoting growth and internationalization of small and medium enterprises. Specialized agencies for small and medium enterprises support and promotion also play an important role in their internationalization. Such agencies often provide valuable information, platforms for networking and facilitate the exchange of ideas and best practices ([14], p. 53).

3. Policy directions for small and medium enterprises internationalization

One of Romania's main policy priorities, aimed not only to the facilitation of small and medium enterprises internationalization, but also to the development of the sector, is to implement the recommendations of the European Union, and in particular the framework established by the Small Business Act ([1]). In the context of the international financial crisis and the problems arising from this, the implementation of the Small Business Act has been given less importance in the European Union countries and Romania. However, the ten principles embodied in the Small Business Act have not lost their opportuneness; on the contrary, these, together with their associated measures are part of the

solutions that can effectively counter the financial crisis with its effects.

The transposition of the Small Business Act at a national level would first require the pass of a law to ensure the compulsory application of the "Think Small First" principle, which acknowledges the small and medium enterprises central role and directs the design and implementation of policies and measures on the small and medium enterprises. The development of a national action programme on the implementation of the Small Business Act is also needed, in partnership with the small and medium enterprises sector and the organizations representing small and medium enterprises. This programme should include measures for the implementation of the Small Business Act, including measures for cutting red tape and reducing administrative burden, support measures for bankruptcy - in order to give a "second chance", measures facilitating small and medium enterprises participation in public procurements. According to the European practice, it is recommended to name a representative for small and medium enterprises at a national level for the management of the implementation process of the Small Business Act and the specific European Union recommendations on small and medium enterprises.

The implementation of the Small Business Act principles provides a framework conducive to small and medium enterprises development, necessary for a better implementation of the specific measures to support internationalization. The European Union provides in this respect a number of recommendations ([2]) and good practices models ([3]) that can be taken into account in determining the appropriate policies, tailored to the Romanian small and medium enterprises.

Internationalization policies should be primarily aimed at creating the foundations for a long-term orientation and sustainability. In this respect, such policies should be rooted in the motivations and barriers specific to Romanian small and medium enterprises, by widening the motivations and, especially, reducing and eliminating the barriers. It is recommended that policies should be directed rather to the increase of the number of small and medium enterprises with international activities, than to the support of those

enterprises that already have international activities, respectively, all the small and medium enterprises should be targeted, as a better approach in the long term because internationalization acts as a primary determinant of further internationalization, and moreover, the earlier an enterprise internationalises the faster it seems to grow ([13], pp. 537-554).

The development of policies and programmes to support internationalization should begin at a national level. However, their implementation is essential to be achieved as "close" as possible to the small and medium enterprises, which involves coordination between national, regional and local levels. This would provide the policies flexibility and opportunity to accurately identify the actual needs and requirements of small and medium enterprises. Political and institutional decentralization is crucial for the internationalization policies proper implementation, in order to avoid redundancy, and also to facilitate the access of small and medium enterprises to support programs.

Export promotion is one of Romania's concerns, but we can not assert that Romanian small and medium enterprises benefit from specific, sustained measures. The main institutions involved in supporting Romanian firms' internationalization are the Foreign Trade Department – as part of the the Ministry of Economy, Commerce and Business Environment of Romania, and the Romanian Centre for Trade and Investment. Other more advanced forms of internationalization, are only tangentially addressed.

The main domains where small and medium enterprises can internationalize can be identified by taking into account the stages of internationalization and the possible benefits available to Romanian firms. Generally, these domains are reflected by the structure and volume of Romania's exports - as shown in Table 1, as export often is a first stage of internationalization. In the structure of exports, six sections of the Combined Nomenclature hold 74.2% of total exports, suggesting the domains in which Romanian small and medium enterprises could engage more, exceeding the initial phases of internationalization.

We may also assert that Romania holds competitive advantages rather for traditional sectors of activity, characterized by still low, but growing, costs. For example, the average monthly costs of labor remains low even by the standards of the Eastern Europe, but they have significantly increased in recent years. Their sustainability as domains for internationalization is therefore questionable. For the development of internationalization policies for Romanian small and medium

enterprises that are sustainable in the long term, it is necessary to increase their competitiveness, especially through innovation. Linking policies for competitiveness and growth with internationalization policies is a trend starting to appear fundamentally in developed countries, supported by the positive correlation between technology, innovation, knowledge and internationalization ([10], pp. 1-26).

Table 1. Romania's structure of exports, 2009

Section of the Combined Nomenclature (CN)		FOB Exports during 1.I-30.XI 2009				
		Value million lei-	Value -million euro-	Structure in % as against total exports	in % as against 1.I-31.XII 2008	
					For values expressed in lei	For values expressed in euro
XVI	Machinery and mechanical appliances; electrical equipment; sound and image recorders and reproducers	32577,9	7680,0	26,4	109,9	95,3

Source: National Institute of Statistics, "International Trade Statistics", no. 12, 2009.

4. Policy priorities providing resources for small and medium enterprises internationalization

One of the main reasons why small businesses do not take into account internationalization as a strategic option is the lack of information about the available opportunities and support measures. Increasing awareness through a coordinated, streamlined system, including centers and access points, connected to the European Union information system is a necessity in this respect. In Romania, a firm that would like to internationalize face significant difficulties solely related to the access to information on the formalities, requirements, procedures and support it may benefit, because the information sources are numerous and incomplete, outdated and unclear.

This requires the coordination of the institutions and information centers at a national level as a prerequisite for the internationalization policy for Romanian small and medium enterprises.

One of the most sensitive issues is that of financing small and medium enterprises internationalization. Availability and access to financial resources is a fundamental requirement for internationalization. The policies supporting small and medium enterprises internationalization should primarily ensure the financial expertise on the

existing mechanisms and the ways to access them, for both exports and more advanced forms of internationalization. Allocation of financial resources for small and medium enterprises internationalization is included among the measures providing the allocation of financial resources for the support and development of the sector, involving, for example, enhancing the capital of the National Credit Guarantee Fund for small and medium enterprises, by specifically targeting internationalization.

As a member of the European Union, Romania benefits from the access to structural funds among which many are specifically targeted to supporting small and medium enterprises internationalization, however, their

absorption rate remains very low. Increasing the access to structural funds would impose increasing the awareness in this regard, simplification and compression of the procedures for the allocation of structural funds, implementation of the recommendations of the European Union, increasing access to advisory services in area. A necessary, although not sufficient, measure for the Romanian small and medium enterprises to positively respond to initiatives for supporting internationalization, is to develop and strengthen the international orientation of the Romanian entrepreneurs. Entrepreneurial orientation exists and is regarded as high in Romania, although this is offset to some extent by the lack of knowledge in the area of entrepreneurship ([16], p. 28). Achieving the awareness concerning the international orientation of the decision makers in small and medium enterprises should precede the next phases of the policies supporting internationalization, which are the establishing and implementing of effective support measures. In this respect, greater attention is required concerning the entrepreneurial education, incorporating the international dimension, namely, international entrepreneurship.

The Romanian Government has introduced entrepreneurship education in the "National Priority for Human Resources Development, Promoting Employment and Social Inclusion and Strengthening Administrative Capacity", as part of the "National Development Plan 2007-2013" ([7], p. 294). In this document, it is acknowledged that education makes a significant contribution in fostering entrepreneurial skills and attitudes in the Romanian society. Generally, it can be argued that there is an impressive variety of initiatives and curricular and extra-curricular activities, providing a significant number of best practices for Romanian universities on entrepreneurship education. However, an integrated approach to higher education and a clear policy support from the Ministry of Education is required, in order to increase the role and value of entrepreneurship education, including international orientation.

As previously argued, linking policies for competitiveness and growth with internationalization policies requires providing access to technologies, knowledge, innovation

and know-how. In this respect, a significant issue and departure point should consider the fact that the technological intensity is relatively low among the Romanian industries; it is disputed, however, the growth of certain high technology sectors, particularly IT. IT and other areas characterized by high technological intensity are those that mostly allow - and require - rapid internationalization, of the "Born Global" type, as they are characterized by more intense competition and higher degree of globalization. These are areas that can be encouraged in a long-term orientation of the policies supporting Romanian small and medium enterprise internationalization.

Supporting small and medium enterprises internationalization, in order to achieve maximum efficiency, should include providing individualized support, by identifying the areas where support is needed and providing this support, according to the specific needs, capabilities and resources of each enterprise. Such support should focus on an individual assessment of small and medium enterprises which requires considering the variables that influence the internationalization process - available financial and human resources, enterprise size, stage of internationalization, industry, geographical location, target markets, etc. In this respect, the individualised support system may provide an approach that should be both holistic and individualized, allowing for the identification of the characteristics, skills, capabilities, activities that contribute to achieving performance on international markets. This measure requires complementarity with other support measures, such as increasing awareness, providing expertise, financial support, etc.

5. Conclusions

The identified policy priorities for supporting small and medium enterprises internationalization are aimed at implementing the recommendations of the European Union and creating the foundations for sustainability, in a long-term orientation, based on the motivations and barriers specific to Romanian small and medium enterprises, by widening motivations and, especially, reducing and eliminating barriers. Promoting exports and

foreign implantation should consider linking policies for growth and competitiveness with internationalization policies, by coordinating policies at national, regional and local levels. Promoting exports and foreign implantation should consider linking policies for growth and competitiveness with internationalization policies. Internationalization policies should provide availability and access to information, technological and financial resources, including increased access to structural funds, development of the international orientation of Romanian entrepreneurs and, for maximum efficiency, providing individualized support to small and medium enterprises.

Sustainability in the Hotel Industry

SZTRUTEN (LEFTER) Gina Gilet
*Academy of Economic Studies, Bucharest and
Romanian - American University, Bucharest
lefter_gina@yahoo.com*

Abstract

The tourism industry has a dual relationship with the environment but has for many years claimed to be a “smokeless industry”. In fact, accommodation facilities interact with their environments during every stage of their life cycle, often negatively. Resorts are frequently developed in pristine and fragile ecosystems with little or no consideration for the local natural or cultural environment. Many of the services offered by these establishments require the consumption of substantial quantities of energy, water and non-durable products. The resource-use efficiency of the many end-users in such facilities is frequently low, and the resulting environmental impacts are of significant magnitude.

Keywords: tourism industry, environment, resource-use efficiency

JEL classification: D62

1. Introduction

The international awareness of the trade’s substantial negative impacts on the environment has been increasing in recent years. While the average visitor may not yet be vocalizing clear-cut requirements for more sustainable practices in the tourism sector, the increasing environmental awareness among travellers is gradually translating into a growing environmental demand. In response, hotel companies begin to consider environmental issues in their business practices.

The environmental concern starts to be a key challenging issue for organizations nowadays. In fact, there is a growing trend

towards “green” consumerism, which in turns affects companies’ strategy.

The hospitality industry is not considered as one of the biggest pollution emitters, neither the one consuming the biggest quantity of non-renewable resources, but it is particularly interesting because of its increasing economic importance and the higher environmental concern it is showing. The whole process by which the hotels define policies, strategies as well as develop environmental practices in order to reduce their negative impact on the natural environment is named as Environmental Management. Those hotels that have followed this process and strive to be more environmentally friendly through the efficient use of energy, water and materials while providing quality services are defined as “green hotels”.

“Green hotels” are also referred to as earth friendly inns, eco-friendly lodging, eco-lodges, eco-hotels, and eco-resorts. These lodging establishments feature innovative and imaginative programs for conserving natural resources, reducing waste, minimizing pollution, while maximizing sustainability.

Many of these facilities are designed and constructed with a concern for environmental quality. While other properties consist of recycled and/or renovated buildings with upgrades to conserve energy and water, minimize waste, incorporate natural landscaping, or utilize recovered building materials. Some properties also support local environmental efforts or groups and/or offer environmental education or excursions.

Certification is an important step in implementing the sustainable practices.

The certification of tourism operations to sustainability standards has emerged as an

important way for hotels, tour boats and other tourism operators to demonstrate that their practices help the environment and ensure the well-being of staff and local communities.

To assist tourism operations in meeting certification standards, some organizations have been created to validate the hotel's sustainable environment practices. For example, Best Management Practices (BMP) program is amongst the most performant ones, which provides tourism operations with dynamic workshops and seminars, training materials, technical assistance and diagnostic evaluations. BMP analyzes are aimed at identifying areas where an operation is not in compliance with the 'baseline criteria'.

The baseline criteria cover environmental aspects such as wastewater treatment and the protection of endangered wildlife species, social aspects such as worker safety and interactions with local communities, and economic aspects such as profitability and quality.

Benefits of Being Certified:

- State employees are recommended to stay at certified properties.

- Certified facilities can advertise.

- Facilities will be placed on Green Lodging list and recommended to other companies and trade organizations looking for environmentally conscience hotels and convention facilities.

- Facilities will be showcased during department presentations and functions.

Examples of changes made by hotels while implementing the BMPs include:

- o Teaching local schoolchildren and teachers composting techniques and purchasing the resulting compost;

- o Training local youths in hotel management and offering them jobs when they complete school;

- o Sponsoring a community fair that allows local businesses and artisans to sell their products and interact with visitors and hotel staff;

- o Creating a recycling program, with recycling containers distributed throughout hotel grounds and regular pick-up of recyclable items by a local business for resale;

- o Changing to a milk supplier that can recycle empty tetrapak packaging;

- o Converting from disposable batteries to rechargeable ones;

- o Converting from incandescent light bulbs to energy-efficient fluorescent ones;

- o Maximizing natural light by installing skylights in guest rooms and painting walls light colors;

- o Installing an anaerobic digester to convert hotel sewage and grey waters to electricity, which is then used to power clothes dryers;

- o Relocating the hotel's water tank to the top of a hill to eliminate the need for an electric pump;

- o Installing a water dosing system in the laundry room and water-measuring gauges at the entrances of different sections of lodge;

- o Encouraging guests to reuse towels, reducing the amount of water needed for laundry;

- o Converting from non-biodegradable, high-perfume soaps and detergents to biodegradable, non-scented ones.

- o Creating decorative books for guest rooms that provide guidance on appropriate behavior in natural areas, water conservation measures, rules about flora and fauna extraction, and other BMP-related information;

- o Installing labels around the hotel grounds describing the ecology of edible plants, recipes made from them, and information on related indigenous traditions;

- o Training staff not only on practical conservation measures but also on the ecological and social rationale behind them.

- o Installing measuring gauges at wells and other water sources to monitor water consumption levels;

- o Creating written policies, registers and documentation relating to all aspects of hotel management and organization.

Training and technical assistance on sustainable tourism BMPs can dramatically improve the level of hotel compliance with sustainability criteria. Whether or not hotels go on to pursue certification with a national-level program, the BMP program is having a positive impact on the way hoteliers and staff interact with guests, local communities and the environment.

Hilton International is an example of a worldwide known company that has put Corporate Social Responsibility (CSR) and environmental sustainability high on their priority list. Hilton Worldwide is a group founded by Conrad Hilton, with a history of nearly 100 years (since 1919), considered the world leader in terms of hospitality, with headquarters in Beverly Hills, USA. It has more than 3,400 hotels under the umbrella of the 10 brands developed over 81 countries worldwide.

To ensure sustainable practices in countries where Hilton operates, are considered:

- The allocation of environmental tasks to each member;
- Focus on environmental commitments: efficiency energy, carbon emissions reduction, reduce water consumption, reduce quantities of waste products, programs on alternative energy use, sustainable management of buildings and other operations;
- Ensure that environmental initiatives and tactics addressed have a positive impact on Customer Experience;
- Continuous improvement of environmental performance;

- Ensure better collaboration with suppliers and business partners in improving their environmental performance;
- Promote the use of best environmental practices in place, in order to influence the use of land to be in harmony with nature;
- Supports environmental initiatives in local communities.

A comprehensive environmental programme has been developed and implemented chain-wide. It is based on five common stones: Environmental Policy, environmental education (elearning), environmental reporting (Hilton Environmental Reporting), a creation of sustainable facilities (Sustainable Hotel Siting, Design and Construction Guidelines), and internal communication (Hiway).

Most of these initiatives are based on a 10-year experience of environmental work at Scandic (Scandinavian based hotel brand, and a part of Hilton since 2001). Scandic has introduced the concept of a 97% recyclable hotel room (eco-room), and developed its own Environmental Construction Standard (SERECS), listing materials that may not be used in their facilities, and specifying acceptable alternatives. Currently more than 10,000 rooms in the Scandic stock are 97% recyclable, while a number of hotels have been built or refurbished according to the eco-hotel standard. Between 2003 and 2009, energy consumption in the Swedish Scandic branch was reduced by approximately 19% on a kWh/m² basis and 15% on a kWh/guest night basis (with 2003 as a reference year). In the same period, water consumption was reduced by approximately 6% on a liter/guest-night basis, and the amount of unsorted waste decreased by approximately 48% on a kg/guest-night basis (NB: only properly reporting hotels are included in the analysis). Furthermore, 77 out of 123 eligible hotels (62.6%) have been eco-labeled with the Nordic Swan Eco-label, the most demanding ISO Type I label for the tourism accommodation. The results of the environmental program at the Hilton level will be more clearly visible in a couple of years, but the right direction has already been established.

2. Conclusions

This experience shows that the hotel industry can be an important partner in introducing sustainability into the built environment, and that responsible practice makes a good business sense. Thus, in the present what motivated hotels to become green, as well as the steps they followed in turning into green, including the definition of goals, the implementation of practices and the potential barriers that make this process difficult to execute. To achieve a sustainable tourism, they need an integrated approach, partnerships with stakeholders.

A priority in the process of sustainable development held in every hospitality company is the component that includes the activities of planning, operational planning and tourism as an integral part of sustainable development strategy of the area, region or country.

Aspects of Economic Crisis and Globalization

TALMACIU Iuliana

“Constantin Brancoveanu” University of Pitesti
iuliana_talmaciu@yahoo.com

Abstract

The origin of the U.S. financial crisis has its foundation in the fact that commercial banks and investment banks lent vast sums—trillions of dollars—for housing purchases and consumer loans to borrowers ill-equipped to repay. The easy lending pushed up housing prices around the U.S., which then ratcheted still higher when speculators bought houses on the expectation of yet further price increases. When the easy lending slowed and then stopped during 2006-2007, the housing prices peaked and began to fall. The housing boom began to unravel and now threatens an economy-wide bust.

The housing bubble started to burst in 2006, and the decline accelerated in 2007 and 2008. Housing prices stopped increasing in 2006, started to decrease in 2007, and have fallen about 25 percent from the peak so far. The decline in prices meant that homeowners could no longer refinance when their mortgage rates were reset, which caused delinquencies and defaults of mortgages to increase sharply, especially among subprime borrowers.

Key words: economic crisis, globalisation, housing prices

JEL classification: R20

1. Introduction

It is becoming increasingly clear that the financial meltdown of 2008 and the subsequent economic contraction that continues to this day represent more than just another recessionary cycle. More importantly, they represent a structural change, a new phase, the phase of the dominance of "finance capital," as the late Austro-German political economist Rudolf Hilferding put it.[1]

The U.S. economy faces four cascading threats: First, the sharp decline in consumer spending on houses, autos and other durables, following the sharp decline in lending to households, will cause a recession as construction of new houses and production of consumer durables nosedive. Second, many homeowners will default on their mortgage payments and consumer loans, especially as house values fall below the mortgage values. Third, the banking sector will cut back sharply on its lending in line with the fall in its capital following the write-off of bad mortgage and consumer loans. Those capital losses will push still more financial institutions into bankruptcy or forced mergers with stronger banks. Fourth, the retrenchment of lending now threatens even the shortest-term loans, which banks and other institutions lend to each other for working capital. Interbank loans and other commercial paper are extremely hard to place.[2]

The global economic crisis, which first emerged as a financial crisis in one country, has now fully installed itself with no bottom yet in sight. The world economy is in a deep recession, and the danger of falling into a deflationary trap cannot be dismissed for many important countries.

Firefighting remains the order of the day, but the urgent search for means to prevent the global economy from falling over the precipice must not be at the expense of a sober analysis of the reasons for the crisis, even in the short term.

The article highlights three specific areas in which the global economy experienced systemic failure. The United Nation Report (2009) investigates three interrelated issues of importance to the developed and developing countries alike, and proposes measures to address the systemic failures they have entailed:[3]

- how the ideology of financial deregulation within and across nations allowed the build-up of pressures whose unwinding has damaged the credibility and functioning of the market-based models that have underpinned financial development throughout the world;

- how the growing role of large-scale financial investors on commodities futures markets has affected commodity price volatility and fed speculative bubbles;

- the role of widespread currency speculation in exacerbating global imbalances and fuelling the current crisis in the absence of a cooperative international system to manage exchange rate fluctuations to the benefit of all nations.

2. Effects of the crisis

From the first quarter of 2006 to the third quarter of 2008, the percentage of mortgages in foreclosure tripled, from 1 percent to 3 percent, and the percentage of mortgages in foreclosure or at least thirty days delinquent more than doubled, from 4.5 percent to 10 percent. These foreclosure and delinquency rates are the highest since the Great Depression; the previous peak for the delinquency rate was 6.8 percent in 1984 and 2002. And the worst is yet to come. The American dream of owning your own home is turning into an American nightmare for millions of families.

Early estimates of the total number of foreclosures that will result from this crisis in the years to come ranged from 3 million (Goldman Sachs, International Monetary Fund) to 8 million (Nuriel Roubini, a New York University economics professor whose forecasts carry some weight because he was one of the first to predict several years ago the bursting of the housing bubble and the current recession). So far, there have already been almost 3 million mortgage foreclosures. Another 1 million mortgages are ninety days delinquent (foreclosure notices usually go out after ninety days), and another 2 million were thirty days delinquent. Therefore, a total of about 6 million mortgages either have already been foreclosed, are in foreclosure, or are close to foreclosure. Six million mortgages are about 12 percent of all the mortgages in the United States. The situation could get a lot

worse in the months ahead, due to the worsening recession and lost jobs and income, unless the government adopts stronger policies to reduce foreclosures.

Defaults and foreclosures on mortgages mean losses for lenders. Estimates of losses on mortgages keep increasing, and many are now predicting losses of \$1 trillion or more.

In addition to losses on mortgages, there will also be losses on other types of loans, due to the weakness of the economy, in the months ahead: consumer loans (credit cards, etc.), commercial real estate, corporate junk bonds, and other types of loans (e.g. credit default swaps). The estimates of losses on these other types of loans range up to another trillion dollars. Therefore, total losses for the financial sector as a whole could be as high as \$2 trillion.

It is further estimated that banks will suffer about half of the total losses of the financial sector. The rest of the losses will be borne by non-bank financial institutions (hedge funds, pension funds, etc.). Therefore, dividing the total losses for the financial sector as a whole in the previous paragraph by two, the losses for the banking sector could be as high as \$1 trillion. The blow to the rest of the economy would happen because the rest of the economy is dependent on banks for loans—businesses for investment loans, and households for mortgages and consumer loans. Bank losses result in a reduction in bank capital, which in turn requires a reduction in bank lending (a credit crunch), in order to maintain acceptable loan to capital ratios. Assuming a loan to capital ratio of 10:1 (this conservative assumption was made in a recent study by Goldman Sachs), every \$100 billion loss and reduction of bank capital would normally result in a \$1 trillion reduction in bank lending and corresponding reductions in business investment and consumer spending. According to this rule of thumb, even the low estimate of bank losses of \$1 trillion would result in a reduction of bank lending of \$10 trillion! This would be a severe blow to the economy and would cause a severe recession.

Bank losses may be offset to some extent by “recapitalization,” by new capital being invested in banks from other sources. If bank capital can be at least partially restored, then the reduction in bank lending does not have to be so significant and traumatic. In addition to

the credit crunch, consumer spending will be further depressed in the months ahead due to the following factors: decreasing household wealth; the end of mortgage equity withdrawals (which were very significant in the recent boom); and declining jobs and incomes. All in all, it is shaping up to be a very severe recession.

3. Lessons of the crisis

Developing countries are paying a steep economic price for a crisis that originated at the centre of the world's financial system. They need to consider how they can protect themselves from external financial shocks. Moreover, most developing countries are rightly trying to build deeper and more (functionally) efficient financial systems, and this crisis should be seized as an opportunity to expose the hidden risks of financial development and how more sophisticated financial systems require more, and not less, regulation.

During 2008, the United States stock market lost about 35 per cent of its value. Compared with other industrial countries and with the largest emerging markets, it did relatively well. All large emerging markets had dollar returns which were well below those of the United States. Sovereign spreads tripled in the second half of 2008 and private capital flows to emerging economies collapsed by 80 per cent with respect to 2007. At the same time, interest rates on United States Treasuries are at historically low levels. There seems to be a flight to quality in the country at the centre of the crisis.[4]

- Financial development requires more and better regulation

Developing countries tend to have financial systems that are less functionally efficient than those of the advanced economies. Given the importance of finance for investment in fixed capital and growth, several developing countries adopted ambitious structural reform programs aimed at modernizing and improving their own financial systems. However, there are serious doubts as to whether these pro-market policies were successful in their aim of increasing the social efficiency of their financial sectors.[5]

Developing countries are often characterized by a non-competitive financial system in which banks make good profits by paying low interest on deposits and charging high interest rates on loans, which they only extend to super-safe borrowers. Shareholders and bank managers are content with rents arising from limited competition, but the financial system is hardly conducive to investment in fixed capital and to economic development. Credit will be limited and unlikely to flow to potentially high-return investment projects in the productive sector. If the country decides to reform its financial system and if policymakers are well aware that the reform process should target functional efficiency, the task is not an easy one. Even if policymakers know that financial instruments that may have high social returns in a more developed country may not be appropriate for their less developed economy and try to target the reform process to the real needs of their country, financial regulators will soon start facing new problems. By reducing bank margins, the reform process leads to a whole new set of incentive problems.

The old system was inefficient but relatively easy to control. A more competitive environment alters the incentive structure of bank managers in two ways. First, as their compensation now depends on returns to investment, bank managers will face more upside risktaking.

Second, since bank managers know that they are evaluated against their peers, they have incentives to herd and take hidden tail risk. Detecting this behaviour, which has the potential for generating large systemic shocks, requires sophisticated regulators.

On the investment bank side, the loss of stable income from brokerage activities may provide incentives for increasing leverage and entering into activities that involve maturity transformation; in other words, for the creation of a shadow banking system. But, again, regulators may not be ready for this new structure of the financial system and still work under the assumption that only commercial banks have systemic importance.

This example shows that one perverse outcome of otherwise successful financial reforms is that, by reducing margins, they may induce bankers to take more risk than they are prepared to absorb or than regulators are able

to understand. This does not mean that developing countries should not try to improve the functional efficiency of their financial system. However, the process needs to be gradual and accompanied by a stronger and more comprehensive regulatory apparatus.

- *There is no one-size-fits-all financial system*

Developing countries face a difficult trade-off regarding the design and regulation of their financial systems. On the one hand, access to finance is necessary for economic development. On the other hand, as seen above, a more sophisticated financial sector is also likely to lead to an increase in total risk. If the second effect dominates the first, financial development may lead to an increase of systemic risk. Until recently it was believed that good financial regulation could be a solution to this trade-off and most countries could build financial systems that are both sophisticated and stable. The current crisis suggests that this objective may not be within the reach of most developing countries, at least in the near future. In choosing where to position themselves in the continuum between financial sophistication and stability, developing countries should recognize that there is no model that is right for all countries or at all times. Each country needs to find the model, which is most appropriate for its current level of development, needs, and institutional capacity.

Countries with stronger regulatory and institutional capacity may want to adopt a more aggressive process of financial liberalization and embrace a more market-based financial system. Other countries may want to be more cautious and stick to traditional banking. Some countries may find that their regulatory capacities do not even allow the proper working of private banks and may decide to rely more on State-owned banks. If they decide to do so, they should not be discouraged by the claim that "State ownership tends to stunt financial sector development, thereby contributing to slower growth".[6] Many examples in developed economies have shown that the prejudice against State-owned banking is not justified and that "sophisticated" financial systems may badly fail. After all, the current crisis shows that once the chips are down and all bets are off, all banks are public.

The world economy has just been through a severe recession marked by financial turmoil, large-scale destruction of wealth, and declines in industrial production and global trade. According to the International Labor Organization, continued labor-market deterioration in 2009 may lead to an estimated increase in global unemployment of 39-61 million workers relative to 2007. By the end of this year, the worldwide ranks of the unemployed may range from 219 to 241 million - the highest number on record.

Meanwhile, global growth in real wages, which slowed dramatically in 2008, is expected to have dropped even further in 2009, despite signs of a possible economic recovery. In a sample of 53 countries for which data are available, median growth in real average wages had declined from 4.3% in 2007 to 1.4% in 2008. The World Bank warns that 89 million more people may be trapped in poverty in the wake of the crisis, adding to the 1.4 billion people estimated in 2005 to be living below the international poverty line of \$1.25 a day.

In this climate, globalization has come under heavy criticism, including from leaders of developing countries that could strongly benefit from it. President Yoweri Museveni, who is widely credited for integrating Uganda into world markets, has said that globalization is "the same old order with new means of control, new means of oppression, new means of marginalization" by rich countries seeking to secure access to developing country markets.[7]

Yet the alternative to global integration holds little attraction. Indeed, while closing an economy may insulate it from shocks, it can also result in stagnation and even severe homegrown crises. Current examples include Myanmar and North Korea; before their economic liberalization China, Vietnam, and India were in the same boat.

To ensure a durable exit from the crisis, and to build foundations for sustained and broad-based growth in a globalized world, developing countries in 2010 and beyond must draw the right lessons from history.

In the current crisis, China, India, and certain other emerging-market countries are coping fairly well. These countries all had strong external balance sheets and ample room for fiscal maneuver before the crisis, which

allowed them to apply countercyclical policies to combat external shocks.

They have also nurtured industries in line with their comparative advantage, which has helped them weather the storm. Indeed, comparative advantage - determined by the relative abundance of labor, natural resources, and capital endowments - is the foundation for competitiveness, which in turn underpins dynamic growth and strong fiscal and external positions.

By contrast, if a country attempts to defy its comparative advantage, such as by adopting an import-substitution strategy to pursue the development of capital-intensive or high-tech industries in a capital-scarce economy, the government may resort to distortional subsidies and protections that dampen economic performance. Without the ability to take timely countercyclical measures, such countries fare poorly when crises hit.

To pursue its comparative advantage and prosper in a globalized world, a country needs a price system that reflects the relative abundance of its factor endowments. Firms in such a context will have incentives to enter industries that can use their relatively abundant labor to replace relatively scarce capital, or vice versa, thereby reducing costs and enhancing competitiveness. Examples include the development of garments in Bangladesh, software outsourcing in India, and light manufacturing in China.

But such a relative price system is feasible only in a market economy. This is why China - which appears to be faring well in the crisis, meeting its 8% growth target in 2009 - became an economic powerhouse only after instituting market-oriented reforms in the 1980s. Indeed, all 13 economies with an average annual growth rate of 7% or more for 25 years or longer, identified in the Growth Commission Report led by Nobel laureate Michael Spence, are market economies.

Pursuing its comparative advantage strengthens a country's resilience to crisis and allows for the rapid accumulation of human and physical capital. Developing countries with such characteristics are able to turn factor endowments from relatively labor- or resource- abundant to relatively capital-abundant in the span of a generation.

In today's competitive global marketplace, countries need to upgrade and diversify their industries continuously according to their changing endowments. A pioneering firm's success or failure in upgrading and/or diversifying will influence whether other firms follow or not. Government compensation for such pioneering firms can speed the process.

Industrial progress also requires coordination of related investments among firms. In Ecuador, a country that is now a successful exporter of cut flowers, farmers would not grow flowers decades ago because there was no modern cooling facility near the airport, and private firms would not invest in such facilities without a supply of flowers for export.

In such chicken-and-egg situations, in which the market alone fails to overcome externalities and essential investments go lacking, the government can play a vital facilitating role. This may be one of the reasons why the Growth Commission Report also found that successful economies all have committed, credible, and capable governments.

4. Possible solutions for the economic crisis

Instead of wasting \$700 billion on a bailout of the guilty that does not address the problem, the money should be used to refinance the troubled mortgages, as was done during the Great Depression. If the mortgages were not defaulting, the income flows from the mortgage interest through to the holders of the mortgage-backed securities would be restored.[8] Thus, the solvency problem faced by the holders of these securities would be at an end.

- The financial markets must be carefully re-regulated, not over-regulated or wrongly regulated.

- The trade deficit is more difficult to reduce as the US has permitted itself to become dependent not merely on imports of foreign energy, but also on imports of foreign manufactured goods including advanced technology products. Steps can be taken to bring home the offshored production of US goods for US markets. This would substantially reduce the trade deficit and, thus,

restore credibility to the US dollar as world reserve currency. Follow-up measures would be required to insure that US imports do not greatly exceed exports.

- The issuance of credit cards must be brought back to prudent standards, with checks on credit history, employment, and income. Balances that grow over time must be seen as a problem against which reserves must be provided, instead of a source of rising interest income to the credit card companies.

- Fractional reserve banking must be reined in by higher reserve requirements, rising over time perhaps to 100 percent. If banks were true financial intermediaries, they would not have money creating power, and the proliferation of debt relative to wealth would be reduced.

The Great Depression lasted a decade because the authorities were unable to comprehend that the Federal Reserve had allowed the supply of money to shrink. The shrunken money supply could not employ the same number of workers at the same wages, and it could not purchase the same amount of goods and service at the same prices. Thus, prices and employment fell.

The world is now so far down the path of integration that turning back is no longer a viable option. We must internalize lessons from the past and focus on establishing well-functioning markets that enable developing countries fully to tap their economies' comparative advantage. As part of this process, a facilitating role for the state is desirable in developing and developed economies alike, although the appropriate role may be different depending on a country's stage of development.

Ultimately, in today's complex and interlinked world, even the most competitive economies need a helping hand as they climb the global ladder.

Advance Pricing Arrangements an Alternative to The Transfer Pricing File. New Developments in Romania

TRANDAFIR Adina
RISTEA Luminita
„Spiru Haret” University of Constanta
atrandafir04@yahoo.com
luminita.ristea@consultingr.ro

Abstract

The targeted objectives are to understand the necessity of implementation of the advance pricing arrangement (APA) by the Romanian national tax authority as a technical support in dealing with cross-border transactions between related parties.

The paper first identifies the concept of advance pricing arrangement ("APA") together with the adopted OECD framework and then presents the main aspects in respect of the implementation of APA in Romania as a procedure that may provide secure solution for both the taxpayers and tax administration relating to any transaction subject to transfer pricing.

Key words: transfer pricing, advance pricing arrangement, double taxation, international transactions, cross-border transactions

JEL classification: L1

1. APA around the World

According to International transfer pricing – Advance pricing arrangements “the aim of the advance pricing arrangement (APA) program is to give businesses an opportunity to reach an agreement with the Tax Office on the future application of the arm’s length principle in their international dealings with related parties, thereby resolving any uncertainty around these dealings.”

We have analyzed and obtained information about 52 states all around the world in respect of the stage of implementation and application of APA .

We have observed that from all 52 states analyzed, 25 (Argentina, Austria, Azerbaijan,

Brazil, Chile, Cyprus, Denmark, Ecuador, Finland, Greece, India, Ireland, Kazakhstan, Luxembourg, Malaysia, New Zealand, Norway, Philippines, Portugal, Russia, South Africa, Sweden, Switzerland, Ukraine, Uruguay) have not specific regulation about APAs regime in their national laws.

These countries apply unilateral, bilateral or multilateral APAs usually only for the cross-border transactions. Japan introduced in 1986 transfer pricing taxation and in 1987 the Advance Pricing Arrangement (APA) being the first country in the world which implemented such procedures.

Following analyses, we have observed that 27 countries (representing 52% of the number of the countries included in our research panel) implemented regulations relating to the advance price agreements in accordance with OECD guidelines and a number of 38 countries (representing 73, 1% of the number of the countries included in our research panel) conclude APAs weather it is required or not, as follows: unilateral agreements (13, 51%), bilateral and multilateral agreements (7, 9%), mixed agreements represents (78, 95%).

At the European level the analysis of the 25 countries concludes that only 48% of the countries have included in the national laws regulations in respect of APA and but 54% of the rest of the countries may negotiate APA and this means that in total a percentage of 76% of the analyzed countries may conclude APA.

Throughout the American continent among the 11 countries analyzed, 6 of them have specific APA national regulations and the other 5 countries have not introduced new regulations in national legislation and cannot conclude any agreements. The three states of North America included APA in the domestic legislation and apply the mixed APA. From

the other eight states of South America 37.5% have implemented APA regulations in the domestic legislation and unilateral, bilateral and mixed arrangements may be signed. The other 62.5% of the countries do not have transfer pricing regulation and do not allow any conclusion of any advance pricing agreement.

Concerning the Asian continent, we have analyzed a number of 12 states. Eight of these have adopted normative acts on the price in advance. According to the available information, the only country that has signed unilateral agreements is China. Although 38.5% of the countries reviewed have not normative acts in the field and only 15% do not agree to any conclusion.

2. APAs – OECD Guidelines

The term APA refers to a procedural arrangement between a taxpayer or taxpayers and a tax administration intended to resolve potential transfer pricing disputes in advance. The APA differs from the classic ruling procedure, including verification of the factual assumptions on which the determination of legal consequences is based and continual monitoring of whether the factual assumptions remain valid throughout the course of the APA period.

More than that, an APA is defined in the first sentence of paragraph 4.124 of the Transfer Pricing Guidelines as “an arrangement that determines, in advance (emphasis added) of controlled transactions, an appropriate set of criteria (e.g. method, comparables and appropriate adjustments thereto, critical assumptions as to future events) for the determination of the transfer pricing for those transactions over a fixed period of time.” It is also stated in paragraph 4.132 that “The concept of APAs also may be useful in resolving issues raised under Article 7 of the OECD Model Tax Convention relating to allocation problems, permanent establishments, and branch operations.”

It is important to distinguish the different types of APAs: unilateral, bilateral or multilateral APAs. In the Transfer Pricing Guidelines (see paragraph 4.130) the arrangements solely between a taxpayer or taxpayers and a tax administration are referred

to as “unilateral APAs”. The Transfer Pricing Guidelines encourage bilateral APAs and recommend at paragraph 4.163 that “Wherever possible, an APA should be concluded on a bilateral or multilateral basis between competent authorities through the mutual agreement procedure of the relevant treaty.” A *bilateral APA* is based on a single mutual agreement between the competent authorities of two tax administrations under the relevant treaty. A *multilateral APA* is a term used to describe a situation where there is more than one bilateral mutual agreement.

It should be noted that, in the vast majority of cases a bilateral APA will be concluded under the mutual agreement procedure of a double tax convention.

However, in some cases where a bilateral APA has been sought and the treaty is not appropriate, or where a treaty is not applicable, the competent authorities of some countries may nevertheless conclude an arrangement using the executive power conferred on the heads of tax authorities.

Although, commonly an APA will cover cross-border transactions involving more than one taxpayer and legal enterprise, i.e. between members of a Multinational Enterprise (MNE) group, it is also possible for an APA to apply to only one taxpayer and legal enterprise.

Objectives of the APA process are:

- to facilitate principled, practical and co-operative negotiations, to resolve transfer pricing issues expeditiously and prospectively, to use the resources of the taxpayer and the tax administration more efficiently, and to provide a measure of predictability for the taxpayer.
- to be successful in the meaning that the process should be administered in a non-adversarial, efficient and practical fashion and requires the co-operation of all the participating parties.
- to eliminate the potential double taxation.
- to be conducted in a neutral manner, as regards the residence of the taxpayer, the jurisdiction in which the request for the APA was initiated, the audit or examination status of the taxpayer and the selection of taxpayers in general for audit or examination.

Treaty issues

The eligibility of a taxpayer to apply for a unilateral APA will be determined by the

specific domestic requirements of the relevant tax administration. MAP¹ APAs are governed by the mutual agreement procedure of the applicable double tax agreement, Article 25 of the OECD Model Tax Convention, and are administered at the discretion of the relevant tax administrations.

In some cases the taxpayer will only request a unilateral APA. The reasons for the taxpayer not requesting a MAP APA should be explored. Following the guidance given by the Transfer Pricing Guidelines at paragraph 4.163 that “wherever possible, an APA should be concluded on a bilateral or multilateral basis”, the tax authorities should encourage the taxpayer to request a MAP APA if the circumstances so warrant.

The negotiation of a MAP APA requires the consent of the relevant competent authorities. In some cases, the taxpayer will take the initiative by making simultaneous requests to the affected competent authorities. In other cases the taxpayer may file a request with one jurisdiction under the relevant domestic procedure and ask it to contact the other affected jurisdiction(s) to see if a MAP APA is possible. Consequently, as soon as is administratively practicable, the competent authority in that jurisdiction should notify the relevant tax treaty partner(s) to determine whether they want to participate.

However, Article 25 does not oblige the competent authorities to enter into MAP APAs at the request of the taxpayer. The willingness to enter into MAP APAs will depend on the particular policy of a country and how it interprets the Mutual Agreement Article of its bilateral treaties. Additionally, the taxpayer must qualify for the benefit of a particular treaty (e.g. by qualifying as a resident of one of the Contracting States) and must satisfy any other criteria contained in the Mutual Agreement Article.

When deciding whether a MAP APA is appropriate, a key consideration is the extent of the advantage to be gained by agreeing a method for avoiding the risk of double taxation in advance.

Although a MAP APA by its nature involves an agreement between tax administrations, the process needs

considerable involvement by the taxpayer or taxpayers in order to be successful. Consequently, the taxpayer should submit a detailed proposal for review by the relevant tax administration and be prepared to provide further information as requested by the tax administration.

3. The Romanian APAs regime

In Romania, APAs entered into force recently since 2006. The legislative regulations is the Government Decision no. 529 of 30 May 2007 approving the procedure for issuing individual tax solution and the anticipated price in advance published in Official Gazette no. 395 of 12 June 2007.

The evolution of transfer pricing aspects in Romania shows increasingly interest of the local tax authorities for this topic. It is expected that in the near future transfer pricing is going to be one of the main areas of investigation in the tax inspections.

Given the requirement and the introduction of formal documentation in case of transactions with affiliated persons, multinational companies are advised to pay close attention to the price that developing these transactions and the risk of possible disputes with the tax.

Since 2006, taxpayers may take the initiative to address the tax authorities to clarify in advance the tax treatment of transactions with affiliated persons. In this regard any taxpayer who carries out transactions with affiliated persons may request an APAs.

According to The Romanian Procedural Tax Code, the APA is defined as administrative act issued by the National Agency for Fiscal Administration to address a request from the taxpayer relating to the determination of the terms and conditions to be determined, for a period fixed prices transfer, if the transactions between affiliated persons. APA takes the form of a unilateral act issued by the tax and not an act that involves bilateral and direct taxpayer. However, taxpayers who disagree with the content of the APA may notify tax authorities issued within 15 days from the date of communication. In this case, the agreement will not produce any legal effect.

¹ MAP, refers to the bilateral or multilateral APAs

The issuing procedure has been regulated by a specific procedure that includes the issuing and monitoring the agreement being a four-phases process.

Phase I - Preliminary Discussion

Prior to submission of the issue of an agreement, taxpayers may request the National Agency for Fiscal Administration a preliminary discussion to assess the feasibility of an issue price in advance.

Phase II - Submission of application for issue

Documentation to be submitted for issuance of an advance price includes elements covered by the country-specific documentation of the Code of Conduct on transfer pricing documentation for those affiliated in the European Union. By request, the applicant shall propose the content of the price in advance. The documents available to the tax authorities should be written in Romanian. If documents are available in another language, the taxpayer must ensure translation by a certified translator.

Lodging is conditioned to pay a charge for issuing / amending the amount varying depending on the category of taxpayer and annual transaction value. In the case of large taxpayers and transactions whose value exceeds the consolidated annual 4 million euro charge for issuing the agreement is 20,000 euro and the rate of change is 15,000 euros. In the case of other taxpayers, the tariff issue is 10,000 euro and the rate of change is of 6000 euro. In the category of major contributors fall taxpayers whose annual turnover exceeds 70 million lei, and banking companies, insurance companies, financial investment companies, etc.

Phase III - the issue of APA

At this stage the National Tax Administration is issuing the APA. Contents agreement should make reference to the date of issuance, the date on which produces legal effects, details of affiliated persons and transactions made with the methodology for determining the price of transfer, assumptions critical period to be covered by the agreement, etc. The taxpayer's request, the validity of the price in advance can be extended. Also, the agreement may be extended to cover other transactions with related parties or may be revised to take account of circumstances

which were not foreseeable or were inaccurate forecasted at the time of the agreement.

Phase IV - Submission of annual report

Any taxpayer who is the beneficiary of an APA, must submit an annual report on how to implement the terms and conditions in the reporting year. This report is to be submitted by the deadline stipulated by law for filing the annual financial situations. Not filing of this report lead to the cancellation agreement.

In Romania, the taxpayers are offered the opportunity to apply for any type of agreement the price in advance: unilateral, bilateral and multilateral.

Bilateral and multilateral agreements can be issued only for transactions with affiliated person's resident tax states with which Romania has concluded agreements to avoid double taxation, on the basis of the article "The amicable."

Term agreements for the issue price in advance are unilateral 12 months and 18 months for the bilateral and multilateral. These time limits are suspended for the tax authorities require additional information.

APA produces legal effects only for the future, beginning with the fiscal year following that in which the transaction was concluded with affiliated persons. By exception, the APA can be applied in the fiscal year in which application, if it is expressly mentioned in the agreement and if the application was filed prior to concluding the transaction. The APA is issued for a period of up to five years. Exceptions may make contracts in the long term, such as royalty contracts.

In the near future it is expected an increasing number of taxpayers who conducted transactions with affiliated persons have the possibility to get the APA. In Romania are expected most applicants to be represented by contributors developing transactions with affiliated persons of significant value, taxpayers who face the issues of unclear legislation on transfer pricing or taxpayers whose policy of transfer prices was influenced by the restructuring business model.

In a first stage, given the novelty of the concept and procedure of issuing the price in advance, it is expected that the issuance of agreements to be a unilateral process easier and faster to situations in which involved and

the tax authorities of other states. However, as the tax will accumulate experience, taxpayers will benefit fully from the many advantages of bilateral and multilateral agreements which are undoubtedly an effective tool to avoid double taxation.

4. Conclusions

On the basis of the main aspects presented in our study it can be stated that any concluded APA offers the taxpayer an operation in the field of transfer pricing free from risks. The transfer pricing documentation, which constitute the basis of the APA application should be prepared by the companies and submitted to the Tax Authority in order to

avoid possible future risks during a fiscal audit. APA may be very useful for most of the national and international company groups, especially for the main activity as well as the intercompany transaction with high value, being an alternative of the transfer prices file documentation prepared usually by the consultants engaged by these companies. In other words, every negotiated and signed APA may give to each company an insurance policy in the relationship with the Tax Authority.

Strategies and Techniques in Business Negotiating and Selling: Case Studies

ZAMFIR Cristina-Mihaela
"Ovidius" University of Constanta
cristina_m_zamfir@yahoo.com

Abstract

This paper is the result of my research into the applications of useful strategies and techniques in real business situations. I analyzed the way in which various aspects of particular techniques have been adapted to meet the needs and representations (map) of the world of different categories of business people, salespeople, negotiators, or customers. In applying the techniques to elicit performance in customer service communication, I observed both verbal and non-verbal elements of successful business communicators in a specific context. In this respect, I interviewed two groups of banking specialists, and the results were extremely valuable both from the business perspective and the linguistic one.

The project was undertaken in the summer of 2009 when I participated in many business encounters and recorded the strategies, values, language and interactive skills in developing rapport with the target clients in conversation. The capability to communicate, understand / identify the clients' needs and offer consultancy was rendered by certain combinations of strategies, language patterns, values, beliefs and physiology.

In this paper, I shall describe two of the situations that I consider to be relevant, i.e. the negotiating and selling of a banking service, on the one hand, and the defusing technique, on the other hand, as well as their linguistic approach.

Key words: negotiation, manager, strategy, technique

JEL classification: M21

1. Introduction

In the market place of today's business environment, strong linguistic skills are required for professional performance. Business activities centre around strategies and techniques which help managers take responsibility for their communication and control over the process and results.

I have encountered situations in which managers applied specific techniques in order to bring about a change in their companies and introduce constructive ways to problem solving situations. I have analyzed two business situations, approached business linguistic structures, and dedicated an important part to the type of language used nowadays in negotiating and selling.

In order to clear up such aspects, Romanian banking clerks were interviewed at Piraeus Bank. I have insisted on the paraphrase listening techniques, which involve repeating the other person's words and phrases to deepen rapport and keep information flowing.

Dialogue 1: Negotiating a credit line

STEP 1: WELCOMING THE CLIENT

Client: Good afternoon.

Manager: Good afternoon, Mr. Petrescu. Welcome back – it's good to see you again.

Client: So am I to see you.

Manager: Have a seat. How are you?

Client: Fine, thanks. I need some information about some various issues.

Manager: At our last talk, you got the card from us. I hope it has been useful to you, hasn't it?

Client: Yes, it has. Last week I came back from a conference and I booked in Germany at a hotel every....

Manager: I am glad to hear that.

Client: I managed everything by means of the card. It was really fine. And fast

reimbursement! I liked it very much! Thank you very much for your recommendation.

STEP 2: IDENTIFYING THE CLIENT'S NEEDS

Manager: Thank you. What can I do for you?

Client: I would like a credit line. I want to purchase some building technology machines, some equipment, and I would be interested in getting a financing.

Manager: How much does the equipment cost, roughly?

Client: Around EUR 25,000.

STEP 3: OFFERING CONSULTANCY

Manager: Let's see the possible options. One of them is leasing. Have you ever turned to it?

Client: I have turned to leasing once, but I would like these machines to be mine. Perhaps I could let them further on.

Manager: Good! If I am right, you need to buy them, then to...

Client: Yes, that's right.

Manager: ... to be able to sublet them. In this case, I can recommend you the investment loan. On what period would you prefer the financing?

Client: I think three years would be fine.

Manager: Yes... Can you pay an advance? The investment loan usually includes your own source.

Client: I could pay around 20-25%.

Manager: Do you have your financial statements on you? First, we should make a calculation of financial indicators.

Client: Fine. I have prepared the company's financial statements for the last year.

STEP 4: CLOSING / FOLLOW UP + CROSS SELL

Manager: I promise I will be handling your file and send you a financing offer by mail on Friday the latest. Is your e-mail address still valid? Is it the same?

Client: Yes, it is.

Manager: Have you heard of our bank's new product - "on line banking"?

Client: No... not really.

Manager: This product may offer you the possibility to consult your balance at any moment, updated. But I will find it a good opportunity then to tell you a little bit more about the product.

Client: Fine, thanks. Now I am really in a hurry. That will be fine.

Manager: Then, let's talk on the phone. I will call you on Friday, as soon as I have prepared the offer.

Client: Thank you very much.

Manager: It has been a real pleasure to see you again, Mr. Petrescu. Have a nice day!

Analysis and comments

Negotiating a credit line

STEP 1: Welcoming the client

From the very beginning, the area manager gives an enthusiastic welcome to the customer by talking to him in a positive and respectful way: "Good afternoon, Mr. Petrescu. Welcome back – it's good to see you again. Have a seat. How are you?" These polite formulas suggest that the interlocutors know each other very well, and their business relationship has been lasting for some time. Besides, the manager keeps an optimistic tone and uses the **partnership language** addressing the client by his name – Mr. Petrescu.

In the warm-up discussion, the manager remembers their previous business encounter – "At our last talk, you got the card" and by asking the **open question** "I hope it has been useful to you, hasn't it?", she wants to check if the client was content with her recommendation. The client's affirmative answer contains a lot of **appreciative expressions** – "Yes, it has been very good", **repetitions** – "I liked it very much, thank you very much...", **explanations** (arguments) – "last week I came back from a conference and I booked in Germany at a hotel everything by means of the card,...And fast reimbursement!". As a matter of fact, it is the customer who starts using what is known in selling as the technique of showing that you appreciate something out of what someone has said or done. People like to receive honest compliments. In this conversation, the message that the client sends when he appreciates what the manager has done at a particular time is that, for him, the manager is a competent and important person: "...thank you very much for your recommendation" similar in meaning with "You helped me very much recommending the appropriate card". The manager seems very pleased by the

compliment and is ready to help her client on a future application for a credit.

STEP 2: Identifying the client's needs

The second step, i.e. identifying the client's needs, concentrates on another technique, that of asking those types of questions which would allow for a complete understanding of the client's financial needs.

Another technique used by the manager is that of **asking the right question** that would guide her towards identifying the customer's needs. Linguistically, the manager uses the open question – “What can I do for you now?” placing herself at her client's disposal. This question gently brings the discussion on the wanted track and towards a productive direction.

Once the intention has been identified, the manager addresses a closed question in order to ask for precise information: “How much does the equipment cost, roughly?” The client currently needs to negotiate a new credit line that would allow him to purchase some machines for constructions.

STEP 3: Offering consultancy

In order to provide consultancy, the manager uses the **technique of informing** the client of the various alternatives that the bank can offer, wanting to identify, together with the customer, that specific product which seems to correspond best to the needs of the customer. The manager uses the partnership language, makes suggestions and concentrates on what is possible or could be a solution: “Let's see the possible options” **signalling** a first possibility – “One of them is leasing”. The good thing that she does is that, immediately after presenting the option, she wants to check if her suggestion is also shared by the client: “Have you ever turned to it?” His client's hesitation taking into account his reasons – “I would like these machines to be mine. Perhaps I could let them further on” – makes her come with a second suggestion, i.e. the investment loan. The manager uses **confirmation type expressions** like “Good, if I am right, you need to buy them, then to be able to sublet them” which give her the certainty that she understood exactly what the client said. In negotiating terms, the language structures that she uses are known as **backtracking** or **summarizing**, when the manager repeats the

words or key phrases that the client has just used. The manager's short review will make the client understand that she listened to what he said. This **checking understanding strategy** offers the manager a clearer picture and allows her to propose a second option: “In this case, I can recommend you the investment loan”. Technically, the manager suggests a productive approach, offering reasons and presenting the steps that are necessary to be taken: “Can you pay an advance? The investment loan usually includes your own source”. In this way the manager is answering the client's unsaid why?: Why should I pay an advance? Although there is not a subordinate conjunction (because or since in this case), the relationship between the manager's question and answer is a causal one. What she means to say is You should pay an advance **because** the investment loan usually involves your own source. In negotiating and selling, this technique is very important and necessary, especially when a manager has to ask many questions or ask for confidential information.

STEP 4: Closing / Follow up + Cross sell

In the follow-up discussion, the manager proves that she is confident in what she says – “I promise...” and guarantees that she will personally deal with his file. In selling, clients are impressed when the service providers consider their problem as being their own. Ensuring the client that he will receive a quality service and special attention, the manager wins the client's trust and, implicitly, his fidelity. In the dialogue, this technique is rendered by a phrase containing a future simple, a future continuous and a deadline: “I promise I will be handling your file and send you a financing offer by mail on Friday the latest”.

At the end of the conversation, the manager makes use of the cross sell technique. By means of the **'hook' question** “Have you heard of our bank's new product – ‘on line banking’?” her intention is to promote a new banking service for those clients who might be interested. ‘Hook’ phrases are very useful as a selling strategy to attract and determine the customer to also buy a new product, other than the one he has originally agreed on.

‘Hook’ questions usually start with the verb *hear* in the present perfect simple and the verb *know* in the past tense simple. Examples of

this type could be: Did you know that you can benefit from the most convenient life insurance? Did you know that you can check the balance of your account through the Internet? Have you heard of our credit promotions? and so on.

The manager's business vocabulary includes:

- nouns: leasing (when a company pays to use equipment rather than buying it),

balance (the difference between the total amounts of money coming into and going out of an account in a particular period of time).

- noun phrases: financial statements (a statement showing the financial state of a business, at the end of a particular period of time, including its balance sheet, profit and loss account, and other necessary information.

financial indicators (one showing the state of a company's finances or of a financial market).

online banking (a service provided by banks that allows people to pay money from one account to another, pay bills etc over the Internet).

- verbs: sublet (to rent property that you rent from its owner to another person).

- collocations: procure a card (obtain a card that is needed for a particular task).

make a calculation (use numbers in order to find out an amount, price, or value).

The client's business vocabulary includes:

- nouns: reimbursement (paying back the money that someone have spent because of their work).

- noun phrases: credit line (an arrangement with a bank for a loan or a number of loans).

- verbs: let (to allow someone to use machinery or equipment in return for rent).

- verb phrases (collocations): get a financing (get money for an investment), turn to leasing (to start to use leasing as a new method of financing).

Dialogue 2: Defusing Technique

Client: Good afternoon.

Manager: Good afternoon.

Client: I have got a problem. There is no more money left in my account.

Manager: Have a seat, please.

Client: I don't know what's going on.

Manager: Tell me what it is about to help you.

Client: Today, when I checked the account balance, some money was missing.

Manager: When did you check the balance last?

Client: I checked it yesterday and the money was there. Now I haven't got the same amount.

Manager: If I get it right, you tried to make a cash withdrawal and the funds were insufficient.

Client: Yes, they were.

Manager: What's your name, please? Let me check.

Client: My name is Petrescu Virgilius.

[The manager checks her client's account on the computer]

Manager: Yes, it stands like this: The fee for the renewal of your card was charged yesterday. RON 15 represents the amount that was reimbursed on the card, it is probably the same amount...

Client: What do you mean? What fee?

Manager: There is an annual card renewal. This is the tax we charge for your card.

Client: I think I remember...

Manager: You were let to know that when you got your card.

Client: Oh, I forgot that. I am sorry, I didn't know this was the issue... I thought some money had been stolen.

Manager: Anyway, we'll always be here to help you clear up things.

Client: Thank you. Good bye!

Manager: Good bye!

Analysis and comments

Defusing Technique

The dialogue is based on the use of the **defusing technique**, i.e. improving a difficult situation by making people less angry and by dealing with the causes of a problem. The manager considers two aspects: on the one hand, defusing the situation, and, on the other hand, defusing tension and anger on the part of her interlocutor. The first thing that the manager does is to invite the customer to seat down "Have a seat, please" because he seems very worried. The client expresses a strong feeling by describing the unfortunate situation that he has just gone through: "I don't know what's going on", complains on a vigorous and sceptical tone "Today, when I checked the account balance, some money was missing" and demands some explanation. The manager shows that she understands him and that she is

interested in his situation – “Tell me what it is about to help you”. This is a good strategy on the part of the manager who sympathizes with her client’s problem and is willing to provide a solution. She uses the **open question technique** – “When did you check the balance last?” and then summarizes the client’s words. In this way, she uses the **technique of checking understanding** by means of a conditional clause – “If I get it right, you tried to make a cash withdrawal and the funds were insufficient”. The manager checks, presents the new facts – “Yes, it stands like this: The fee for the renewal of your card was charged yesterday. 15 RON represents the amount that was reimbursed on the card, it is probably the same amount...”, although the client still seems confused and worried by asking curtly “What do you mean? What fee?” The manager eventually offers him the motivation for the missing amount of money, motivation which is perfectly justified and of which the client should have been aware. She remembers him that each year the bank charges for any card renewal – “There is an annual card renewal. This is the tax we charge for your card”. This is the point where the manager starts leading, by using a positive, kind tone – “You were let to know that when you got your card”. Consequently, the client behaves in a less angry way by taking the blame on him, starting to smile and even apologizing – “I think I remember... Oh, I forgot that. I am sorry, I didn’t know this was the issue...” Towards the end of the conversation, the manager uses a technique which is very important in establishing cordial business relationships, i.e. assuring the client of her total availability and the fact that she is doing her best to help him by using the phrase – “Anyway, we’ll always be here to help you clear up things”.

2. Conclusions

The analysis of the basic strategies and techniques used in negotiating and selling brought me closer to understanding how they can help identify and define present states and desired states of various types and levels.

My research was to embark upon an analytical study of the techniques specific to communication, in general, and to business contexts, in particular.

One of the major aims of my research was to demonstrate that many of the techniques and strategies were derived from observing the patterns of excellence in experts from the professional fields of negotiating and selling, and their linguistic expression.

Dealing with all the aspects of such strategies from the linguistics point of view seemed extremely challenging to me. The more flexibility business people have in language, the easier it is to generate results.

The linguistic expressions of pacing and leading strategies, as well as checking on the understating of the other person’s map are considered a powerful tool to strengthen peoples’ ability to assist others in finding new perspectives.

Conceptual Approach Concerning the Main Components of Central Banks Independency

APETRI Anișoara Niculina,
CIBOTARIU Irina Ștefana,
MIHALCIUC Camelia Cătălina
„Stefan cel Mare” University of Suceava
anisoarad@seap.usv.ro,
irinac@seap.usv.ro,
cameliam@seap.usv.ro

Abstract

Concerns specific to central bank independency, both on scientific and practical levels, have highly occurred in the ninth decade of the last century, thanks to the existence of some global and regional factors: adopting the objective related to steadiness of prices, liberalization of capitals movements, decreasing of SMEs, etc. Nowadays, the polemics are mainly guided by taking into account the independency level, which the monetary authority should have upon government; though, the dependence towards companies, banks or other financial institutions should not be neglected either. This paper approaches aspects related to central bank independency, both economical and political, as well as the legal components influence of central bank towards the current monetary-financial economy.

Key words: Economic and monetary union, Central Bank, independency

JEL classification: F15

1. Introduction

The specialty literature has outlined in the last 10-15 years the tendency of increasing the level of independency on central banks; such tendency has proven to be stronger in countries of transition, where wide processes of bank reform were carried out in generally, and of central banks in particular, by replacing the mono-banking system with that organized on two levels: the central bank and commercial bank levels. A very decisive reason for this reform in the situation of countries in transition has been represented by

the strategic objective of them, so as to integrate within EU structures, and respectively of increasing the independency of central banks in the view of integrating within ESCB (European System of Central Banks). In this way, the general tendency in order to increase the independency of central banks (ICB) can be thus justified:

1. **Firstly**, the growth of ICB is aimed to become a general objective, since the central bank that is mainly responsible of maintaining the steadiness of prices should be provided with legal rights so as to accomplish it; though, empirical studies, such as Cukierman (1992) calculations regarding the bank's independence degree, suggest that a negative correlation exists between ICB and performances within inflation field, at least for the developed countries. Approaching the economic reasons of ICB growth may be found to studies of Maliszewski (2000) or Radzyner and Riesinger (1997).

2. **Secondly**, the decisive reason so as to increase the level of ICB in Europe relied on the creation of EMU (Economic and Monetary Union), which assumed wide changes to EU member countries firstly, and to countries aiming to the statute of EU member secondly; the aim consisted in accomplishing the criteria as concerns the legislative convergence foreseen by the Treaty and Statute of ESCB (European System of Central Banks), before reaching the last stage of EMU, meaning the adopting of Euro.

According to Bruni thoughts (2005), the central bank independency seems to be inexistent, and such concept meets all the conditions of a myth: “starting with a fiction story, passing to half-true and reaching up to the popular faith, which forms the values and attitude of people”. Notwithstanding, the author admits that all institutional agreements

under independency current can be useful within offering an efficient monetary policy. So as to understand this multidimensional concept, authors as Grilli, Masciandaro and Tabellini (1991) distinguished two components of central bank independency: the political independency and the economical independency. The authors affirmed this concept, considering that political independency is determined by factors including the election of the Governor and members of the Administration Council of the central bank, and also the election of procuracy duration and explicit mentioning within bank's statute of prices steadiness as primordial objective.

As regards the economic independency, the authors affirmed that the higher independency is, the more the central bank will own the control of volume and conditions to offering credits to executive. The economic independency also depends as far as the central bank might choose and uses the instruments of monetary policy; a particular importance is given by the freedom of choosing the rates of interest on re-financing and the prudential activity of central bank.

Other authors, such as Loungani and Sheets (1997), distinguished three types of independency: independency on selecting the objectives, economic independency and political independency. According to these authors, the independency on selecting the objectives is defined as particular drawing up the objective within statute of central bank, aiming towards the steadiness of prices as main objective of it: the economic independency defined in the same terms as Grilli, Masciandaro and Tabellini, and the political independency, which includes a variety of elements, such as naming and revoking the management of central bank, the duration of procuracy and the level at which the executive participated on drawing up the decisions specific to central bank. Cukierman (1992), and respectively Cukierman, Webb and Neyapti (1992) proposed a methodology on estimating the level of independency by a complex form, taking into account criteria, as: the term and conditions of appointing/revoking the management of central bank, the objectives of central bank, defined in accordance to its statute, the legal ability on autonomous conceiving of monetary policy measures and

the legal limits on aiming the financing by the central bank of the budgetary deficit.

The procedures of estimating the independency of central bank, proposed by these authors, do not include the way of building a series of important issues, such as: the effects on strengthening its abilities on stipulation and prudential supervising. By increasing the ability of prudential stipulation, specific to bank sector, the central bank is allowed to exercise activities of prudential supervising, so as to control a series of information; relying on this information, its decisions on conceiving and implementing the monetary policy, and subsequently on owning an increased operational independency will be more adequate taken. One might notice that mentions as regards the nature of monetary system are not stipulated, where the central bank plays the essential part. In this way, if the mechanisms of such system are relying upon specific rules of a monetary council, the following are assumed: rate of exchange, covering the primary currency issuance, by owning foreign payment means interdiction of monetary financing on budgetary deficit, and also of exerting the function of loaner, as last measure of the economy; therefore, the central bank will be instantaneously isolated toward the pressures of practicing a free and easy monetary policy, incompatible to the fundamental objective of maintaining the internal and external value of the currency. In the same time, the explicit existence within statute of central bank is not taken into consideration, as regards its independency. Referrals to external support, on which a central bank can benefit, are not taken into account, so as to maintain its political and operational autonomy; for instance, such autonomy might be accomplished by the participation of central bank to the international economical-financial bodies. In the opinion of Dima (2004), the concept of independency specific to central banks, proved four major dimensions:

- operational independency – reflecting the legal an effective capacity of central bank, on being able to define by itself the objectives of monetary policy, as well its ability on selecting the instruments used so as to reach final, intermediary and operational objectives, without interferences coming from other authorities of the state:

- financial independency – signifying the ability of central bank on establishing and using, in accordance to the own objectives, its financial resources;

- economic independency – represented by the level at which the central bank is liable to participate at financing the budgetary deficit, as well as the means of carrying out such participation;

- political independency – reflecting the measure by which the legislative frame, that stipulates the functioning of monetary authority, will also allow it to face the pressures of executive and of other authorities of the state.

Cerna (2002) affirmed that “independency of central bank is justified, since it impedes the bad influence of politicians on forum that has to elaborate and apply the monetary policy”. Notwithstanding, besides the conceptual and empirical difficulties that defining and measuring the independency of monetary authority face with, two major critical reasons exist for such solution. Firstly, the independency can only be apparent, but hiding a strong secret dependency, meaning a situation where the influence of politicians is as real as possible, but a bit discrete. Secondly, the independency of central bank involves the bureaucratic managing of currency offer, accomplished by the managers and employees of central bank, which might not be better as comparing to political management.

According to Blinder (1999), the central bank independency signifies two aspects:

- firstly, the central bank owns the freedom of deciding the way of accomplishing its objectives;

- secondly, its decisions are hardly to be influenced by the government or any other body.

Blinder affirmed that central bank independency is provided with a high autonomy, in deciding the way of reaching its objectives, but does not assume the fact that it can establish by itself the objectives.

Concerning the relationship between central bank and government, the specialty literature has emphasized reasoning in favor of independency, meaning:

- arguments based upon public election: in accordance to this point of view, the monetary authorities are exposed to a strong pressure from government, especially when the

economy is in decline, and the executive prefers a fiscal policy free and easy;

- arguments based upon the so-called Sargent/Wallace (1977). In the opinion of these authors, a distinction between fiscal authorities and monetary authorities has to be taken into account; the basic arguments relies on the fact that central bank is independent, can oppose resistance to financing the budgetary deficit by currency creation. Instead, when the fiscal policy is dominant, the monetary policy cannot influence the government decision on covering the budgetary deficit;

- arguments based upon issue of non-steadiness of monetary policy. Authors as Kydland and Prescott, Calvo, Barro and Gordon argued that when decision is adopted for future time, these are proved to be optimal only at the beginning of the period.

According to the analysis of central bank independency, three main reasons so as to establish it are illustrated:

- the independency of central bank is theoretically justified by the reason of politicians constraining, which oblige the central banks to accomplish non-justifiable rates of the inflation. Starting with studies of Kydland/Prescott (1977), these under-optimal rates of the inflation were discussed firstly due to the credibility of monetary policy, caused by non-steadiness of monetary policy. As result, the political independency of central bank is necessary so as to avoid electrical or partisan cycles within monetary policy, which together with the previous results of the elections, might determine high levels on output, considered under-optimal, and by this will contribute to a high under-optimal rate of the inflation.

- many empirical studies, as (Eijffinger/De Haan, 1996), affirmed that in industrialized countries, the level of independency of central bank is inversely correlated to the level of inflation, and as concerns the relationship between the independency of central bank and the increasing of inflation, there is no systematic relationship. As concerns the developing countries (existing in contrast to the developed countries), one might see that legal independency of central bank is not relevant for the current level of central bank independency. The negative correlation between central bank independency and

inflation will be though supported and confirmed, if indexes as the rate of replacing the governor, depending on political vulnerability coefficient of the governor, are used so as to quantify the level of central bank independency;

- the Bundesbank model, which is seen as extremely independent central bank.

2. The main components of legal independency to central banks

Forwards, the legal aspects of the central bank independency will be analyzed, by means of four criteria that derive from amendments of Treaty of Maastricht, classification presented for the first time by Bank of Japan (1995) and subsequently modifies by Bruni (1995). The aspects are the following:

1. the main statute objective;
2. the independency on drawing up the monetary policy;
3. the forbiddance of credits offering to public sector;
4. the statute of governor.

With a view of examining some supplementary elements of these legal aspects on central banks independency, certain modifications of this classification were carried out, as follows (Radzyner/Riesinger, 1997): the second criterion is extended, so as to include the drawing up and implementation of monetary policy, including the choosing the instruments and issues in correlation to it. Moreover, the third aspect is extended to financial independency term and includes two issues: the limits of offering loans to the government and the budgetary independency of the central bank. Within fourth criterion, the personal independency will examine the part and statute of central bank officials, meaning: the “institutional” independency, the “personal” independency, the “functional” independency and the “financial” independency. As regards the “independent” statute of the central bank, related to central bank laws (the statutory independency), one might consider as not being a necessary condition so as to reach a high level on legal independency of central bank, as not being included within this classification system.

1. The independency of main statutory objectives of the central bank

Within specialty literature, a general consensus exists, according to which the

independent central banks aim to have a single objective as concerns the monetary policy, meaning the steadiness of prices (Cukierman, 1992). A reason for which a single objective of the monetary policy is preferred relies on the transparency and credibility necessity of the monetary policy. Having a certain number of multiple macroeconomic objectives, which often might face mutual conflicts, the public perceives the risk that can be offered by changing the objectives, fact that might endanger the credibility of monetary policy. Nevertheless, having a single objective on monetary policy will not signify the ignoring of other macroeconomic objectives, but should have explicitly defined a main objective.

The steadiness of prices is unanimously accepted as being a main desirable objective, in detriment of economical development or of full employments, since it can be influenced by the central bank, through a complex transmitting mechanism, meaning: the using of monetary instruments. The distinction between the internal and external purchasing power of the national currency is sometimes included within the drawing up of monetary policy objectives, which might be a source of conflicts within the monetary policy management, depending upon choosing the rates of changeability.

2. The independency on drawing up and implementing the monetary policy

Within specialty literature, the fact according to which an efficient management of monetary policy should be coordinated by economic politics supervised by government was unanimously approved, but the legal stipulations for the mechanisms of cooperation in this aim might be different from one country to another. In this way, the drawing up of monetary policy will be firstly aimed; only after that, the way on its implementation. Within an environment with reduced budgetary deficits, or even with budgetary overplus, an especial importance is represented by the fact that central bank owns the right of issuing securities, so as to prevent any dependency towards the issuing policy of the government.

Nevertheless, on carrying into effect, the choosing of instruments is somehow limited to certain factors. Firstly, and especially to transition countries, the lack of well developed financial markets has directed to using the direct credits control, at least at the beginning

of transformation process, before the fractioning of monetary and of applying the instruments of monetary policy. Secondly, the choosing of rate of exchange regime, that signifies a decision that should have been taken in most cases in agreement to the government, had a significant impact over the independency level in using the monetary policy instruments (Bade/Parkin, 1988); adopting a fixed regime of exchange rate (with a small or even non-existent fluctuation rate as related to parity) will remove the possibility that a central bank can use the rate of exchange as an instrument of monetary policy. Depending upon how precisely the constraints of “creating” the credit are specified, the instrumental independency can be more or less under such commitment.

3. The financial independency of central bank

The term of financial independency aims the following aspects:

- the budgetary independency of central bank; in other words, the issue refers of the central bank disposes of necessary financial means, so as to accomplish the tasks independently towards the governmental bodies;
- forbiddance of offering credits to the public sector.

As regards the budgetary independency of the central bank, it became essential that bank should determine autonomously the outgoings and its incomings, without being necessary to be previously approved by a governmental body. One might emphasize that central bank should not be financial dependent upon the state budget; the financial dependency might bring the political bodies in the position of exerting the influence over the monetary policy decisions. Another important pattern of the financial independency consists in the way of using and allocating the profits, fact that might establish a topic of decisions related to central bank managements, and which can be described according to bank laws, or can be even the subject of government decisions or of government institutions.

Another issue is represented by covering the potential losses of the central bank, more precisely the stipulation on bank laws of automat covering of central bank losses, by the

state budget; this is seen generally as a more strength guarantee of central bank independency (Cotarelli, 1993). Approach as concerns the transfer of central bank profits to state budget and concomitantly to covering some potential loss from state budget, might be interpreted as being opposite to the following situation affirmed: the profit or losses of central banks are due to some factors with reduced influence over the efficient management of the central bank, seen as “an enterprise”, and these factors are due to some other causes, determined by strategies of monetary policy, such as: the level of interest rate. That is the reason for which central bank performances can be evaluated upon basis of accomplishing the monetary policy objectives, and not upon basis of profit or losses quantification.

The position adopted by IME (European Monetary Institute) as regards the budgetary independency of central banks is the following: an ex ante type influence of some parties, over the budgets and/or of distributing the profit of central bank, which might endanger its independency, if there are no clauses of protection stipulated within law, ensuring the successful accomplishment of central banks obligations (The European Monetary Institute, 1996).

A crucial aspect on financial independency of central bank is conferred by restricting the credits offered by central bank to government: the central bank does not have to be “impeded” on accomplishing the procuracy of steadiness, by the necessity of meeting the financial requirements of the government under the form of extending the direct loans (or easier, by monetary issuance), so as to cover the state deficit. In this way, there is a general consensus on forbidding the credits offered by central bank directly to the government, both under secured form and also under a non-secured form (purchasing government securities directly from the primordial market, facilities or overdraft credit). Credits offered by the central bank indirectly, by purchasing public securities by the central bank on the secondary market, will be allowed by law in the frame of some West-European central banks (Cotarelli, 1993; Leone, 1991).

Notwithstanding, these laws include protection stipulations, which limit this type of transaction, to operations where the monetary

policy carries the out, so as to reach its objectives.

The main explanation so as to absolutely forbid the direct credits offered by central bank to government consists in a necessity that central bank should own a decisive control of monetary mass; in this way, any influence of government over the increasing of monetary mass will be excluded.

4. The independency of central bank officials

This is one of the most important aspects on legal independency of the central bank. It represents the personal independency, which assumes the fact that officials of central bank are in the position of accomplishing the legal obligations.

An especial importance is represented by the role, the statute and the competence of decision bodies to central banks, including: procedures of function appointing and dismissal, the duration of procuracy, the training requirements and professional competitiveness, as well as cases of incompatibility towards function. It was unanimously accepted the fact, according to which the limitation of political influence, within procedures of appointing the central bank officials, will lead towards increasing the level of personal independency of central bank officials, working within management bodies of the central banks. In this way, the; legislation in different countries offers different procedures: either the state's President or government owns the right of appointing a candidate, or this decision has to be taken by the Parliament, including the involvement within decision processes and of parties in opposition.

Moreover, the reasons on which dismissal of central bank officials rely on have to be transparent, to be applied in extraordinary circumstances and to be explicitly stipulate by law. A related problem, as concerns this aspect, aims the possibility of appointing reconfirmation of the central bank officials, situation seen at the general way as not being positive to independency (Neuman, 1991). In this way, the legislative procuracy of central bank officials has to be higher than the elections cycle, where for most of countries it lasts for a period of time longer than four or

five years. Moreover, some specialists affirmed that bank laws have to include requirements as concerns the professional competitiveness, specific to central bank officials. The clauses of incompatibility for top managers of the central bank are necessary so as to prevent the occurrence of some interest conflicts. These general requirements, which are related to the role and statute of central bank officials, are found within the creation of various models on measuring legal independency of the central bank.(Cukierman, 1992; Grilli et al., 1991).

5. Conclusions

One might emphasize that most of world countries have carried out reforms concerning the central banks, especially European Union countries. The main basic reason of these reforms consisted in the fact according to which the independency of Central Bank signifies a mechanism in reaching a low level of inflation and also in reaching the steadiness of prices. This paper also analyzes the main components related to independency of banks, which cooperate in the view of accomplishing this idea.

The Challenges Facing Single Euro Payments Area Adoption in the Light of the Financial Crisis

AVADANEI Andreea

“Alexandru Ioan Cuza” University of Iasi, The Doctoral School of Economics,
andreea_avadanei@yahoo.com

Abstract

The scope of this article is to point out how the present financial crisis is affecting the European payments landscape and the Single Euro Payments Area implementation. The current unpredictable and very challenging market situation has not fundamentally changed the fact that payment services need to continue modernization in order to become more flexible, agile and adapt in order to comply with its important purpose in society. The study is structured on chapters that present the manner in which the credit crisis is changing the payments landscape both for corporate bodies and banks, the possibilities of making a business case for SEPA and the Payments Services Directive in the current economic climate, and the status of Single Euro Payments Area today.

SEPA is needed to ensure the new modern payment platform that can enable Europe to move beyond basic services, increase payments efficiency, embrace innovation and integrate further services in the trade process.

Despite the significant challenges and hurdles that still exist-including, of course, the unsettling impact of general market events over the last years - the foundations nevertheless continue to be put into place for an unprecedented joint initiative between the payment industry, the regulators and the user community with a view to realizing the significant benefits on offer to all stakeholders by taking the SEPA project to its national conclusion. In fact, it could even be argued - contrary perhaps to most commentators' instinctive reaction - that the turbulent market conditions could conceivably have the effect of accentuating rather than reducing the business case imperative and momentum to achieving full SEPA migration in the near term.

Key words: Single Euro Payments Area, credit crunch, corporate bodies, cash management, financial turmoil.

JEL classification: F15

1. Introduction

The dream of full European harmonization is fast becoming a reality. Increasingly, movement of labor and goods is benefiting from the foundation laid nearly half century ago with the creation of the European Economic Community, cemented through the Maastricht treaty in 1999, and further enhanced with milestone events such as the introduction of euro note and coin in 2002.

Further collaboration on economic, environmental and social improvement continues to build on the advances made to date. The Single Euro Payment Area (SEPA) plays an integral role in this development, bringing with it both fundamental changes to the underlying infrastructure of the banking industry and practical improvements in the day-to-day trading activities of the European Community's corporate bodies and citizens.

In its premises, Single Euro Payments Area is an initiative of the aiming at harmonizing the system of cashless payments in the extended Euro zone, creating a coordinated environment of rules, standards and procedures, working as a single domestic payments market in which citizens and economics actors are able to make payments as easily and inexpensively as in their home countries.

This is a demanding objective for 31 mature economies, many of them with proud histories of how patterns and cultures have evolved over centuries and decades. This is not an easy task to overcome and it needs the right balance of change process management in order to insure that important value in existing services is not diminished in the new harmonized European services. Change must move towards

something better in order to justify the burdens and possible pain points of the process.

SEPA came into being because the banking industry refused to modernize its payment systems and instruments and work towards standardization. Self-regulation does not apply to a sector where states have no choice but to step in with public money to avoid knock-on effects.

2008 was a challenging year for the project: it brought the first successful, visible deliverables of SEPA to the market with the introduction of the Credit Transfer and Card Framework. However, much remains to be done to achieve the full objects, and progress needs to continue.

Moving into 2009, there was a major change happening that wasn't expected at the time the vision of SEPA was outlined. Even within the past few months, the banking industry has further consolidated and changed, we are now starting to see the true impact of the financial turmoil on the real economy throughout Europe, with no one remaining unaffected.

The early 1990s was the last time that several European countries experienced serious financial crisis [1]. The Nordic region banks were left with no option but to move away from paper-based and manual solution towards electronic and more value-creating services for their customers. And if the scope previously was primarily to solve the problems on a country and community level-basing solutions on country proprietary regulations, standards and networks-one outcome of the financial crises was the new era and evolution of e-payment services for the benefit of all parties.

Why has Europe been so badly affected? First, Collateralized debt obligations (CDOs) were traded worldwide and financial institutions all over the world, including many in Europe, became exposed to them and to other instruments whose value directly or indirectly fell as a result of the sub-prime loan defaults in the United States. Second, although there has been very little sub-prime lending in Europe, some members states have also seen significant downturns in their own housing markets. Third, given that financial markets are global and financial institutions trade with each other worldwide, EU financial institutions are directly affected when US institutions get into trouble. Sentiment also plays an important part-the extreme crisis of confidence in the US financial markets in recent weeks immediately spreads elsewhere-as is always the case in such

circumstances. Fourth, all this has coincided with other global shocks, particularly soaring oil and commodity prices, resulting in rising inflation and with inflation and with exchange rate volatility. Those factors too have led to an economic downturn everywhere and have also had a negative affect on stock markets and therefore on the amount of capital available to banks to resist the current pressure.

In 2010, no country is isolated. Trade and business deals flow across all physical state borders, emphasizing the need for widely accessible and secure ways of effecting payments. The current crisis can also create a strong momentum to lift the market to the next level of modernization and dematerialization, but this time not merely with a single country dimension. Now it is time to take the European step.

2. SEPA and the changing payments landscape

But what does SEPA really mean for businesses as a corporate? This initiative will be a key accelerator in reducing the number of accounts you need to hold through the use of in-house banks and pan-European accounts, as well as ensure interoperability through open formats and connectivity. In particular, SEPA offers multinationals the opportunity to centralize payment and collection initiation by establishing shared service centers or payment factories, as well as reduce the number of bank relationships as consolidation of the banking industry creates truly pan-European banks.

The pan-European payments landscape is evolving rapidly with the introduction of this project. Couple this with the ongoing impact of the credit crisis, whose effects spread to the wider economy, corporate bodies face numerous challenges and place a premium on efficient cash and liquidity management, especially where they manage a variety of euro denominated accounts in different member states.

The present financial turmoil has clearly shown the importance of liquidity and cash management and the superiority of retail deposits as a source of bank financing. In addition, the focus on driving further working capital efficiencies has never been as important.

There are plenty of opportunities for improvement, though, and corporate bodies should look to take advantage of the tools and techniques that are available today.

For corporations, SEPA can provide advantages to sell cash and liquidity management services; for consumers, it can help attract retail deposits. Moreover, payments are a profitable business in its own right-providing a regular, reliable source of income with average annual volume growth of 8-9% [2]. The way to survive in today's climate is to be pro-active and more quickly. Due to the credit crunch, all corporations need to „go back to basics” in terms of pan-European liquidity management [3].

Despite the crisis, payments remain an attractive business and one where a bank will wish to maintain its competitive edge. To capitalize on these investments, it is crucial that SEPA migration is kept on time and on track-the redundant costs of running duplicate payments systems must be avoided. Therefore although it seems like a new market model, it's actually a return to the old model that has not been seen in recent years of big acquisitions, an increased focus on investment banking products and international growth [4]. Predominantly, banks make money on their core businesses; it has been the peripheral activities where they have experienced the biggest losses, such as in assets generated from the investment banking model of originate and distribute. Today, 'back to basics' has become the banks' rallying call to combat the credit crisis. Previously, banks were expected to grow their bottom line faster than the gross domestic product (GDP), which obviously meant that they were taking far more risks and looking at more complex products, both of which have come undone in the current dip.

While SCT volumes grew steadily and in line with expectations throughout 2008, the sharply worsening financial and economic environment from September 2008 directed everyone's attention to the more pressing concerns of effectively managing liquidity and mitigating risks, including concentration risk. SEPA rapidly become a non-immediate item on companies' to-do list. The project was a top three issue before the crisis escalated in September and October 2008 [5]. That's no longer the case and the reasons for the change are straightforward: corporate bodies simply have more immediate objectives to worry out-such as improving working capital and have less resource available for strategic projects.

The credit crunch has put emphasis on re-using existing liquidity, unlocking balances in accounts and improving working capital so that receivables are received more quickly and payment cycles extended. In such an environment, moving to the new SEPA structure is not on the top of the agenda.

Historically, liquidity management has been about cash concentration and return on capital. Now it's about cash concentration and return of capital-the parameters of what constitutes success have changed. The upshot of the credit crisis is that physical cash concentration is unlikely to disappear in the next five years-if, indeed the large corporations are looking for ways to enhance the liquidity management benefits they gain from other currencies that they work with using structures such as cross currency national pooling or cross-border cash optimization.

Those companies that now operate in a more decentralized, multi-banking environment will ultimately be facing a more costly approach to SEPA and centralization as a result of having to re-engineer processes and invest in technology. Companies that have already invested in centralized liquidity management and shared services centre (SSC) environments may find it quicker and more cost-effective to further realize the benefits of SEPA and the PSD framework going forward.

In the past year, as the banking sector has come under pressure from the financial and economic crisis, one notable trend among companies of all sizes has been an increasing desire to diversify risk. In the current economic development, multinationals and other large corporations are even more likely to spread their liquidity and transactions services across multiple banks. Nevertheless, there are still opportunities to consolidate banking activity.

The challenging market has led to a renewed focus on working capital optimization, shortening the conversion time on accounts receivables and reducing capital costs. Streamlining their account structure-even across multiple banks, is still an effective way for companies to tackle these issues, and SEPA represents a further catalyst for corporate bodies to take advantage of the benefits of centralization.

During the financial crisis, banks' retail payments business has proven to be a solid and stable source of revenue. At the same time, the retail payments are also a costly part of banks' operations.

In the light of the present financial turmoil, the market analysis has led to the following:

- a central management structure is needed—there is a necessity for strong central structure for managing and governing the SEPA and the PSD migration. In August 2009, SEPA Credit Transfer achieved the market share of only 4.5% of the overall community's credit transfer volume [6]. If the sluggish trend continues and SEPA Direct Debit migration follows the same pattern, the perceived SEPA benefits won't be achieved over 6-10 years;

- there is a necessity for the review of the investments and cost aspects of SEPA and PSD migration due to changed economic conditions. These factors, and especially the decline in IT spend, negatively affect SEPA solutions and systems;

- changes in capital markets—the role, origin and cost of capital have significantly changed the allocation of investment and distribution of benefits for SEPA and PSD business case. According to Morgan Stanley, the cost of equity for banks has risen to about 12.5%, while future returns at the end of the crisis may be no higher than 13%;

- banks are currently re-evaluating all their projects and budgets which leads to longer timelines and less functionality for most projects including SEPA;

- corporate bodies and public sector organizations are primarily looking towards direct cost-cutting measures and, rightfully so or not, SEPA seems to have dropped on the priority list;

- national governments are supporting “their” banks with national budget, so logically they are asking for returns that are beneficial to the national interest. For example, the French governments offered loans to Peugeot and Renault in exchange for guarantees that the car makers will not cut jobs or close plants in France; yet also in the Netherlands protectionist measures have been taken especially with regards to SEPA. In the deal for increased government support ING has (among other things) committed to continue support of Dutch domestic debit card scheme PIN, against its original intention. At least these protectionist tendencies will lead to a slowdown in adopting any international initiative among which also SEPA.

3. The new business case for SEPA and the Payment Services Directive

The deterioration in the European and world economy and decline in financial services market can endanger the timeline and level of investment in SEPA and PSD. The business case both SEPA and PSD must be reviewed because it evolved under the changing economic conditions. The regulatory changes from SEPA and PSD present banks with many new compliance requirements, but also offer a series of opportunities, including the chance to: re-assess business models and consolidate payments infrastructure; rationalize legal entity structure if they operate on a pan-European basis; design and tailor new products to enable the capture of new markets; create efficiency savings by applying the standards in the PSD to operations outside of Europe.

Following the postulates of the game theory (Nash equilibrium-prisoner's dilemma) a combination of choices and implementation strategies on the supply side and the implementation/investment choices on the demand side would create a series of economic outcomes for the project. As parts of possible outcomes are the following: adherence to the provisions of PSD, meeting estimated benefits; implementing within the European Commission's timeframe; staying on the level of original planned investment; reaching the required levels of penetration within all stakeholder groups; staying on the level of original planned investment.

Given the current economic conditions and the precarious financial situation some banks have found themselves in, is now really the best time to be forcing banks to invest in SEPA? Having earned money off the *status quo* for some time, banks are finding hard to come to terms with the new world of payments that the PSD beckons it. And the credit crunch is only likely to widen the gap between customers' expectations and banks' ability to deliver new payment services and products.

The Institute of International Finance (IIF) calculated the damaging consequences of the credit crunch: up to June 2008, banks internationally made 476 billion USD (373 bn EUR or 294 bn GBP) in credit write downs and also raised 354 bn USD (278 bn EUR or 234 bn GBP) in capital [7]. By the end of September 2008, the re-capitalization figures further increased to 554 bn USD (435.2 bn EUR or 342 bn GBP) with 338 bn USD for the US, 55 bn

for the UK and 96.1bn EUR for European banks. Morgan Stanley predicted that Europe's banks might need an additional 83bn EUR (105bn USD) capital injection.

Although participation of individual payment services providers is very important for the successful implementation of SEPA (31 national payment systems), the cooperation and coherent actions of 29 national communities, which are subject to PSD, is also important [8]. Therefore the current systemic crises in general, and failure of the whole national economies such as Iceland (not subject to the PSD) and Hungary in particular, are major negative factors and impediments to the successful implementation of these initiatives and legislation.

In more general terms, the business case for SEPA will also become much more compelling when significant competition and consolidation in the infrastructure space will kick in. This would allow multi-county banks to centralize around the pan-European Automated Clearing House and remove the need to be connected to every local ACH. ACH consolidation is needed in order to develop efficiencies for banks as well as customers.

4. Single Euro Payments Area at a crossroads

Today, SEPA is "lost in conversation", because a more important conversation is happening-the one about survival. Some banks have done a little to make the changes needed for SEPA implementation, but most haven't done enough. Despite the financial buffeting that is happening, it is extremely important that a clear and constant focus is kept on SEPA and its benefits.

The credit crisis has undoubtedly changed the banking landscape forever; it has also called into doubt the vision of a Single Euro Payments Area. As SEPA migration in some countries looks like it may be lapsing due to economic conditions, we can outline four main areas that need to be addressed to help the project regain some momentum:

- the European Payments Council must bring together all stakeholders in order to move SEPA to the next critical stage;
- an end date must be set for the retirement of the legacy payments instruments;
- it must be found a way so that the basic SEPA product can be enhanced without creating market fragmentation;

- banks need to collaborate with each other more if SEPA is to be a success.

SEPA is at a crossroads. The current financial current financial market turmoil and related economic decline constitute a less than ideal background for a project that has a far strong policy that business case dimension. But a demonstration now by policy makers and regulators that "better regulation" is more than a motto could still allow European society to reap the benefits of this project in medium term.

2009 has been an ambivalent year in terms of SEPA progress. On the positive side, a crucial milestone has been achieved with the launch of SEPA Direct Debit (SDD) scheme on 2 November. Despite the impact of the financial crisis and internal debates on the SDD business model, the European Payments Council and banks maintained their commitment to the project. Bringing this new scheme to life represents a shift in gear which can provide a new momentum to the SEPA project as a whole. On the more negative side, the actual SEPA Credit Transfer (SCT) take-up is lagging behind expectations. According to the Eurosystem's euro area indicator, in august 2009 only 4.5% of all credit transfers in the euro area were processed in the SCF format. This figure is not satisfactory in light of the fact that SCT was launched in January 2008. High-volume payment users such as public administrations-even if strongly committed to SEPA-are slow in migrating to SEPA.

Without doubt, the financial turmoil and economic crisis have played an important role in this respect. Both providers and users of payments services have carefully scrutinized their investments and focused on critical business operations.

Despite the financial crisis, cashless payments increased, on a global basis, to 250 billion transactions per year in 2008. Of this growth, card payments were the strongest driver. In the European Union, card payments reached a total of over 29 billion transactions in 2008, also growing at a rate of 9% [9]. This shows the immense potential of this means of payment to generate revenue for the financial industry through growth, even at a time when interchange fees are under pressure. SEPA offers tremendous opportunities for further harmonization of the use of cards, making them an even more attractive instrument. But, the harmonization of card standards, more

competition in the European card market can bring additional benefits to consumers.

Therefore, the Eurosystem remains convinced that an additional European card scheme is needed. Three initiatives are under way: PAYFAIR, EAPS and Monnet.

5. Conclusion

Despite the financial crisis, efforts to implement the Single Euro Payments Area remain undimmed. The risk of a mini-SEPA (where legacy national instruments continue to operate after the new ones introduction), remains real unless stakeholders get certainty on key issues: an end-date for full migration to SEPA; evidence that SEPA solutions can provide tangible improvements in operational performance and clarity on standards to be used for SEPA payments so participants can prioritize IT investments and SEPA – implementation plans. In response, European regulators are increasingly supportive to the need to encourage quicker implementation by setting a common and date.

However, the financial crisis has also shown the vital importance of a stable and properly functioning payment system to the wider economy. The payments business roughly accounts for one third of the operational costs of the banks. By overcoming current fragmentation in the payment market, banks can realize significant operational cost savings. This therefore strongly emphasizes the need for

further integration of EU retail payments market through SEPA.

Abstract

The changes occurred in the banking marketing in our country have their origin, firstly, in the changes of the organisational culture which has evolved in the last ten years from the bureaucratic behaviour, categorised excessively, to a specific behaviour for the market economy, based on the knowledge of the clients, on the competition and on the promotion of the mentality of a winner. The organisational culture can be changed in time, as long as the employees are aware of the objectives followed, as long as they are selected and promoted in conformity with these objectives and as long as the feeling of belonging to the organisation has formed which depends essentially on the satisfaction that the employee feels towards the activity he/she enrolls. Due to the stimulation of the own personnel, the banks, through superior wages as for the best paid sectors of the national economy, have managed to attract the interest of the existing professionals, as well as of the young specialists willing to dedicate to a banking carrier. The training programs organised through the means of the Romanian Banking Institute or through distinct programs organised by the banking companies in our country have contributed to the motivation of the personnel, as well as to the consolidation of the new organisational culture.

Key words: globalisation, banking products, banking services

JEL classification: F36

In the context of Romanian banks integration into the European Banking System, as well as the participation on the European unique market, some operational changes must be fulfilled which can favour the development

and the diversity of the modern banking products and services at the level of the European standards. Moreover, even in The Medium Term Development Strategy of the Banking System elaborated based on the National Strategy of Medium Term Economic Development of Romania, one of the objectives was the diversification and the increase of the quality of the financial and banking services (mainly aiming at the integration of the banking services into the ones supplied by the operators on the financial market and, also, at the creation of the conditions for the development of some products and services in accordance with the market requests and for the implementation of modern products and services like the hybrid instruments of finance, the derived financial instruments, the e-banking services). Thus, the leasing is more and more practised, the factoring, the lump sums, the mortgage credit, e-banking etc. and the manual payments will be reduced in economy.

These operational changes which are performed through the accumulation of technical and computerised means allow the acceleration of the settlements.

The operational changes represent a necessity for the banks of Romania because, together with the integration, they will enter the competition, for funds, with the banking companies of the developed states of the EU, which are very powerful and have very much experience within the market economic structures. The structure of the banking products and services offered on the Romanian market For the continuous adaptation to the market changes, the banks need a perspective vision translated into medium and long term well defined objectives, in spite of the inflation phenomenon persistence that seems to have become chronic in an economy characterised

by the trend of under-usage of the production factors and a slight increase of the GDP.

A viable marketing strategy must aim at the consolidation of the position on the market, at the modernisation of the banking products and services offered to the clients and at the consolidation of the trust capital, especially from the part of the population (that acts affectively, emotionally, under the pressure of the mass media looking for the sensational, not the rational, pragmatic, attributed to a learned, informed, cultivated public. It is true that the banks do not educate very much, especially among the young people, in order to create a banking culture, in order to develop the skills of working with the modern payment methods (electronic), but also with the diverse saving instruments. In the developed countries the banks have sets of programs which are dedicated to the pupils and the students who, as adults, have the necessary knowledge and skills to be a lifetime clients and not only occasional clients of the banking system.

The modest level of the incomes and the negative saving that is recorded by a significant segment of the population should not be an impediment in the way of the client formation.

The banking globalisation represents the stage in which the banking services have a world spreading area, becoming universal.

The universal banking services mean the harmonisation of the banking regulations, correlated with the lifting of the barriers in the way of the open competition on all the markets, the increase of the currencies number which is used by those markets and the implementation of offices abroad. We can appreciate that, by taking into account the current conditions of evolution, the banks, both the ones in the Western Europe as well as the ones in the Central and Eastern Europe, will have to face new challenges, to which only part of them will be able to adapt, the ones that have the ability to exploit the new opportunities of the global financial world. The banks have to take into account the features of the financial market that is more united and intensely competitive, that the financial products tend to be more and more homogeneous, and the innovations easier to copy; and the infrastructure (the computer networks or the electronic terminals, the POS networks or ATMs) becomes more sophisticated and more costly. Last but not least, the national regulations tend to become

uniform and to subscribe to international standardised structures, and the solutions for the crises are inspired from the previous experience.

This makes the market be more and more uniform offering equal opportunities to all the participants, but also levelling the incomes and the profit at the same time. The banks of the future will evolve in the sense of the banking focusing, which has a different degree from country to country (banking holdings, consortia and banking unions) and finds its expression through the increase of the capitals volumes and especially of the resources volumes, offering banks the increase of the financial power, an increased innovation ability, wide channels for the products-services, the widening of the incomes sources, the reduction of the costs regarding the maintenance of the markets and the entrance on the new markets nowadays, when the competition has become global. Another evolution aims at the specialisation according to the targeted market segment and, also, the progress of the computer science will lead to the operational integration at the world level. Another aspect of the "new order" in the banking world is the tendency to globalise the banking operations, the result of the strong confrontation between the banks and the non-banking institutions or even non-financial ones which perform banking operations.

This means that besides the collection, the storage and the loans offer operations, the banks should take over other operations as well, thus altering the attribute of traditional commercial bank, correlating the commercial activity with the investment one, and on the other hand, performing insurance, portfolio and management operations and other financial innovations, characteristic of our times.

The banks will have to bear important financial efforts in order to cope with the technological and informational evolutions, to take an interest in the promotion of new banking services and products, to show more attention to the predictions (anticipations) in order to convert any new direction of the diverse environment in which they operate into a development opportunity. Without a doubt, we find ourselves in the middle of a transformation period in which the revolutionary changes in the fields of technology and telecommunications cause major changes in the way all the organisations

and especially the banks and the financial institutions enrol their activities.

During this decentralising, electronic technology and digital era, a larger number of companies will acknowledge the importance of placing at the disposal of people of the information necessary for the enrolment of the banking activity, but these companies will not necessarily be banks, but they can be information companies, retailers of a certain type, free time activity companies or technological companies.

The tendency is concrete at the moment through the increased number of non-banking entities which enter the banking market. Thus, the competition from the non-traditional banks part, the revolutionary evolutions in the field of technology and the increased requests of the clients work together to transform the traditional banking sector. The banks that want to survive and prosper in this new and provocative world must radically and rapidly change. The model of the future retail banking activity is clearly shaped and must not be underestimated: "The virtual bank", as it has been named, is defined as a model in full development of the banking activity, in which more companies are involved to create banking products and services and which the clients can access through more distribution channels. The term "virtual" involves the independence from physical localisation or, in extreme cases, from the banking activity without subsidiaries. The technology is the key-element of this evolution, allowing the electronic performance of the communications and of the financial transactions between client and bank, without the necessity of the client's physical presence in the bank subsidiary.

The current tendency is to increase the number of electronic banks, in parallel with the diversification of the proposed on-line services. If the majority of the large banks count on such a service, the competitive pressure and the marketing tactics aim at the lateral diversification, "Unicredit" and "ING Bank" are already present on the market with virtual services targeted towards the different categories of users. The globalisation process accentuates very many processes in the money transfer industry as well.

The economic power spheres are changing. So are the financial flows trajectories. For instance, the markets that 30 years ago formed the "dais" of the money transfer activity of

"Western Union" are now found on the tenth place or even lower.

While economies we have not expected to record spectacular ascensions, they have taken over the leading positions. Also, structural market changes take place. The countries that several years ago were simply receivers have become origin regions of the endorsers. The majority of the banks focus their attention on the top consumers, neglecting a large number of consumers that lie at the basis of the social pyramid.

The global economy offers favourable perspectives for the banking sector, but it also means a continuous challenge for the banking companies.

Based on the intensification of the international financial flows, a supplementary request for specialised banking services has occurred. If the clients' needs are in a continuous change, new and non-traditional competitors appear, the perspectives of the new distribution channels development open.

The distribution channels management represents one of the main tasks of the banking institutions in the context of the activity globalisation. The development of the banking informatics has lead to the fundamental changes in the distribution system of the banking services, through the creation of new channels which appeal to the telephone connections or to the electronic connections. In the future the banks will plan a spectacular increase of the distribution channels, including the automatic bank desks, the banking kiosks, the debit cards, the telephone services centres, the electronic banking services via "smart cards" and the bank at home, the internet bank. In spite of this development of the alternative channels, we consider that the subsidiary is still the main distribution channel of the banking products and services and it will continue to play an important role for many banks. Its role will change through the focus on the personalised banking services, leaving the clients enrolling more routine transactions through the electronic distribution channels.

Many clients still prefer the relations with the subsidiary, considering that this present distinct advantages than the telephone services or the "impersonal" electronic services. The role of the subsidiary, as the main distribution channel, the design and the organisation have been transformed completely.

Thus, through the space increase placed at the disposal of the clients, the conditions for obtaining the information referring to the banking products, having as effect the increase of chances of sale of the products and services, fact that leads to the growth of the market segment and of the profitability.

The constructive solutions of the banks space are changing, reflecting the attitude changes in the client services and have as purpose the increase of the productivity and of the efficiency in offering the financial services.

However the constructive solution must ensure the good enrolment of the main functions of the banking activity. Also, attention has been paid to the planning of the subsidiaries space, and the efficient categorising has evolved in the future.

The continuation of the rationalisation is inevitable because the structure of the optimal network changes permanently, due to the technological progress and to the delivery and distribution systems in full evolution, the dynamism of the subsidiary as a distribution channel is going to accentuate. The larger institutions, however, have acknowledged that

it is neither efficient from the point of view of the costs, nor necessary to offer the uniform levels of services throughout the entire subsidiary network.

The appearance of the processing and information centres has created many possibilities to reduce the dimension of a subsidiary. As a variant to the process of automation, together with the development of technology, the tendency is towards the extension of some automatic subsidiaries like the "banking kiosk", where there could be easily offered services like: automatic exchange atms, telephone connections and interactive video screens.

The presence of the foreign banking companies is not at all neglected in the change of the organisational culture, and these, through subsidiaries or joint companies or through taking over the majority package within some Romanian banks have decisively contributed to the market dynamic and to raising the standards of the bank commerce, fact revealed by the banking products and services structure presented in Table 1.

Table 1
The structure of the banking products and services offered on the Romanian market

Banking products and services	The foreign banks agencies in Romania and the local banks have merged with foreign banks	Commercial banks in Romania
1. Current accounts and connected products	Yes	Yes
2. Bank cards - debit cards - funding cards - ATM cards - credit cards - electronic transfer of funds	Yes Yes Yes Yes Yes	Yes Yes Yes Yes Yes
3. Home-banking activity: - through the telephone - through the terminal - through the INTERNET	Yes Yes Yes	Yes No No
4. Transfer of Money through: - cash - cheque - drafts - electronic system of cashing - direct debit	Yes Yes Yes Yes Yes	Yes Yes Yes Yes No
5. Inter-banking compensating systems	Yes	Yes
6. Loan systems for natural persons like: - mortgages - personal loans - loans for housing construction - family budget accounts - loans for issuing shares	Yes Yes Yea No	Yes Yes Yes No

9. Executor and management services	No	No
10. Fiscal services: - drawing up the incomes and profit statements - consultancy	No Yes	No Yes
11. Currency and travelling services: - travelling cheques - currency exchange - Euro-cheques - Euro-cards - credit cards - ATM cards - services for exiled persons - foreign currency insurances - bank accounts abroad - open loans - references regarding the clients (in another country) - banking drafts in foreign currency - current accounts - telegraphic transfers	Yes Yes Yes Yes Yes Yes Yes Yes Yes Yes Yes Yes Yes Yes Yes Yes Yes Yes Yes	Yes Yes Yes Yes Yes Yes Yes Yes Yes Yes Yes Yes Yes Yes Yes Yes Yes Yes Yes
12. Corporation banking services: - capital investments - loans for current capital - bonds issue or subscription - financing trading operations - trade finance (commercial letters of credit, warranties) - leasing - today's exchange rate, swap, spot - structured financial arrangements	Yes Yes No Yes Yes Yes Yes Yes Yes Yes Yes	No Yes No Yes Yes Yes Yes Yes Yes Yes No

We may conclude that the presence of the foreign banks in the business environment from our country has forced the Romanian banks to diversify the banking products and services, to focus on the client and his/her needs, wishes, aspirations (in their turn, in a continuous metamorphosis). The road has been opened by the majority of the Romanian banks expected to show significant progresses in the field of rapidity and safety of the modern forms of payment, especially in the component generically called "the monetary field". It will not take too long until the automatic banking desks processing images, with video systems and touch screens, as well as those which cash the cheques and open accounts, will appear. Their localisation will be varied and will include train stations, supermarkets, business centres, as well as any other place where groups of people tend to come together regularly. The operational frame of the banking systems has suffered important changes under the impact of the progress recorded in the information technology. The banking and financial industry adapts nowadays to a new market under the impact of

globalisation and the technological explosion, which have become attributes of the economic reality.

The conditions of the financial market integration into the new economy, on the basis of the information technology development, attribute a specific role to the electronic banking services, with perspectives of accelerated development in the future, due to the main advantages which they offer. The rapid development of the new forms of payment will reduce the need for cash. The introduction of the debit and credit cards has already proved to be a huge success.

Conclusions

Through diversifying the banking products and services, the banks will have to take into consideration the numerous risks to which they are exposed, which have not been fully evaluated and they have to study the effects on their banking incomes, as a consequence of the expansion of the electronic banking activities. In a near future, the information technologies will completely change the current

configuration of the traditional banks. More and more services will become automatic, the clients will prefer to perform themselves the operations through the internet or the telephone, thus the new bank will become more of a business centre. The current traditional bank will transform into a technical work centre, a sort of a bank without physical clients.

The implementation of some marketing and new management techniques and the automation of the majority of the enrolled operations will allow the banks to extend and diversify the activity. The process of continuous improvement of the services and products offered by the banks has favoured a series of factors, among which the evolution of the informational technology which has constituted an important vector. The information technology continues to modify the nature of the banking and financial activity through the new product and services whose purpose is the increase of the banks capacity to serve their clients.

Aspects Concerning the Access to the Structural Funds in Romania

BOB Constantin
SASEANU Andreea
BANACU Cristian

The Bucharest Academy of Economic Science
constantin.bob60@yahoo.com
saseanu@yahoo.com
Cristian.banacu@gmail.com

Abstract

Structural funds are financial instruments through which the European Union acts in order to eliminate the economic and social disparity between regions, with the purpose of realizing economic and social cohesion. As well as the pre-adhesion funds (SAPARD, PHARE, ISPA), structural funds are a form of nonrefundable financing operational also in Romania since 2007. The responsibility for their management falls entirely into the hands of the Romanian authorities, unlike the pre-adhesion funds in the case of which the European Commission played an important role. Structural funds operate on the principle of reimbursement, that is, the final beneficiaries operate the suppliers' payments from their own funds, and later, on the basis of the paid invoices and payment orders which prove the payment execution, it is solicited to reimburse the expenses. The financing is realized on the principle of programming that involves diagnosing the current situation, formulating a multiannual integrated and coherent strategy and defining tangible objectives to be attained.

Key words: structural funds, Romania, economic and social cohesion

JEL classification: E61, F42

1. Introduction

Structural funds (SF) are post-adhesion funds allocated by the European Union in order to reduce the economic disparities between the European countries and the recently adhered countries. These funds are a continuation of pre-adhesion funds, which in our country have been executed through programs like PHARE, ISPA, SAPARD. The nonrefundable financial

assistance within the Economic and Social Cohesion Policy was granted to Romania through Structural and Cohesion funds within the objectives of "Convergence" and "European territorial Cooperation".

The total sum of Structural and Cohesion funds allocated to Romania for the period 2007-2013 is of 19,668 billion Euro, from which 12.661 billion will be allocated through structural funds within the "Convergence" objective, 6.552 billion Euro are allocated through the Cohesion Fund, and 0.455 billion will be allocated to the "European territorial Cooperation" objective.

The aim of the Structural funds is to support the EU Countries, especially the new members to growth and cohesion with the other countries for the benefit of their citizens.

The three main areas of interest are:

- Cohesion/Solidarity
 - Single market creates winners and users
 - Healthier neighbours are good for all
- Support for acquis
 - Environment and other rules impose costs
- All sides win
 - Less corruption and inefficiency means more benefit for producers and consumers

as they were mentioned by David Sweet from Directorate General for Regional Policy, EU, in his presentation of SF.

2. Strategic objectives of SF in Romania

The strategic objectives are settled by each country together with the European Union according with the local situation and perspectives. The National Strategic Reference Framework for Romania (NSRF), the EU funding will be invested in reducing the economic and social development disparities between Romania and the other EU Member States, by generating 15-20% additional GDP growth by 2015.

There are stipulated five thematic priorities to achieve this objective:

- a) **Development of basic infrastructure in line with European standards** – improving the infrastructure of roads, rail, water/waste water, electricity, is a prerequisite for launching economic growth and improving social cohesion. Without proper transport infrastructure the customer access to the products and it conducts to agglomeration of the producers in the areas with high accessibility and as a consequence power habitats are condemned to un-development. The other facilities (water, electricity etc.) cover pressing needs of the companies. Accessibility costs are important issues in the decision process.
- b) **Increasing the long-term competitiveness of the Romanian economy** – global markets, free movement of capitals and labor, increase the competition among the companies. That is why Romanian companies are not competitive anymore on the base of low labor costs. They should identify advanced mechanism to keep their competitive advantage. The Structural Funds offers to the companies and their management a better access to commercial exploitation of research results, sustains the innovation within company and full participation in the knowledge-based economy.
- c) **Development and more efficient use of Romania's human capital** – Romania was a good labor market characterized by skilled workers and low costs. This allowed investors to relocate production facilities and maintain a relatively low unemployment. The new coordinated of the labor market shows that is needed improvements in education at basic skills especially handicrafts, vocational training, lifelong learning etc. New profile of modern employee is designed at this time.

The SF comes to support the transformation of the labor into a force of economic development.

- d) **Building an effective administrative capacity** – role of the administration in the social-economic development, even indirect, is fundamental. The “good governance” concept highlights the importance of an administration supple, flexible and performance. To achieve the wider goals of modernization of Romanian administration is requested a substantial effort that could be obtained by SF support.
- e) **Promoting balanced territorial development (territorial priority)** – the market economy and the less intervention of the state in the economic development creates growing disparities between the regions. The European Union concern is to create balanced coordinates for all citizens. The programs for territorial priority are available to offer support in the less developed region in order to increase the potential and the attractiveness for further investors or development projects.

3. Main areas of SF

For the period 2007-2013 there are financial instruments known as Structural funds, respectively:

- **The European Regional Development Fund (ERDF)**, which supports the sustainable economic development by mobilizing local capacities and the diversification of the economic structures in domains, such as: research and technologic development, innovation and entrepreneurship, informational society, small and medium enterprises (SMEs), environment protection, tourism, energy;
- **The Social European Fund (SEF)**, which contributes to enhancing adaptability of the workforce and companies, increasing the access on the workplace market, preventing unemployment, extending active life and increasing the degree of women's and immigrants' participation on the work market, supporting social inclusion of disabled people and fighting against discrimination;
- **The Cohesion Fund (CF)**, which finances: projects in the domain of environment protection and trans-European transportation network, projects in the domain of sustainable development, as well as other projects that aim at the improvement of air and road traffic management, modernizing urban transportation,

developing and modernizing multimodal transport. The Cohesion Fund helps the member states with a gross domestic product (GDP) per capita of less than 90% from the community average to reduce the differences between the levels of economic and social development and to stabilize the economies. It supports actions within the “Convergence” objective and it is under the incidence of the same programming, management and control rules, as in the case of SEF and ERDF. For the period 2007-2013, the Cohesion Fund is addressed to the following countries: Bulgaria, Cyprus, Estonia, Greece, Latvia, Lithuania, Malta, Poland, Portugal, Czech Republic, Romania, Slovakia, Slovenia and Hungary.

The total sum of the structural and cohesion funds allocated to Romania is of 19.668 billion euro, from which 12.661 billion euro represent structural funds within the “Convergence” objective, 6.552 billion euro are allocated from the cohesion fund, and 0.455 billion euro are allocated to the “European territorial Cooperation” objective.

4. Romanian absorption of SF

Last year, Romania has received European funds amounting to 2.666 billion euro, respectively 2.5% from the community budget and has contributed, at the same time, with 1.217 billion euro, ratio that places Romania on the tenth place from the European Union member states, with respect to financial aids received.

Among all the EU member states, Romania has received the largest amount of money from pre-adhesion funds, respectively 744.8 million euro, as opposed to Bulgaria, which has only received 201.4 million euro, while allocations from cohesion funds amounts to 648.5 million euro.

According to the “White papers of the SMEs in Romania 2009”, more than half the entrepreneurs of small and medium enterprises (55.15%) do not intend to access European funds through Structural Programs and 27.48% are in the information stage. On the other hand, 10.10% of the more decided managers have contacted a consultancy firm, 3.64% are in the project elaboration stage, 2.37% have managed to submit the project and only 1.27% received the approval for the submitted application, as shown in the White papers of the SMEs.

In what regards the intention to access European money, the proportion is higher in the

case of SMEs with a seniority of more than 15 years (51.19%), companies from the Central Region (69.49%), medium companies (67.72%), joint-stock companies (59.18%) or others which activate in the industry (57.45%).

5. Access mechanism of SF

The small interest for accessing European funds is determined by the low level of information with respect to the regulations introduced at the same time as Romania’s adhesion in the European Union. Therefore, only 14.55% from the SME managers have declared that they hold sufficient information concerning the technical documentation necessary for the elaboration of the project and 68.56% of them declared that they have an average level of information about the structural programs.

Structural funds can be accessed on the principle of reimbursing the expenses operated by the eligible beneficiaries. They should pre-finance the projects, from public or private funds, following that the settlements of expenses be done after their verification in the proportion established for every operational program. The level of the grant supported from European funds varies between 30-85% of the eligible expenses of the project.

National co-financing is ensured from the state budget, local budgets or from the customer’s private contribution, depending on the program.

The customary form of structural funds financing is the direct nonrefundable grant (state aid). However, the financial support can also be granted through other types of financial instruments (guarantees, risk capital, and participation at the capital).

In the case of each operation, depending on the project, the maximum value of the grant originating from public resources (the maximum dimension of nonrefundable financing), is established according to the community regulations. The grant value is calculated as a percentage of the total eligible expenses.

In the case of aids for companies, the caps vary depending on the regulations related to state aid, dimension of the company, and in certain cases, the project location. The organisms that manage the program (Management Authority – MA and/or Intermediary Organism - IO) can establish values of the grants which are smaller than the

maxim level admitted by the applicable regulations.

The petitioner must cover the difference between public financing and the cost of the project through their resources or attracted thus co-financing the project. Projects are selected through *calls for proposals* addressed to potential beneficiaries.

It is important to remember that, in the cases in which the projects' beneficiaries are the public authorities or when more than 50% of the project's value of an economic operator is co-financed from the public resources and the projects implementation requires the acquisition of services, goods and works, the national regulations concerning public acquisitions will have to be applied.

In the case in which projects are approved, after the beneficiary's agreement and within a determined period of time, a contract is signed between the beneficiary and IO/MA called Financing Contract.

The approval of the project does not presuppose a simple installment in the entrepreneur's account for him to truly keep his promises. In the majority of cases, the approved funds will reach the addressee in a fragmented manner and only in the moment in which he demonstrates, step by step, that the project is implemented exactly within the conditions accepted by the examining commission.

Therefore, the beneficiary must keep systematic and precise account records related to the execution of the contract. For every project there has to be kept a separate inventory, with all the incomes and expenses during the contract's term of validity.

The beneficiary is obliged to accept the inspections, on the basis of documents or at their headquarter, executed by the Contracting Authority, European Commission, the European Court of Auditors or other authorized organisms, on the way in which nonrefundable financing was used, in conformity with the laws in force during the entire period of validity of the contract.

In this purpose, the beneficiary commits to grant to staff from the Contracting Authority, European Commission, European Court of Auditors or other persons assigned by these institutions, the right to access the locations and spaces where the project is being implemented, including to access the systems and all the documents, computer files regarding the technical and financial management of the project. All of these should be regarded as a

chance in perfecting their own company's management, with the purpose of aligning to the European standards and norms in all domains, from economy, health, culture and infrastructure. In this sense, the use of financial assistance instruments is an excellent means of learning the effectiveness of the activity and a challenge for the ones who are always looking for new forms of action.

6. Assistance schemes

From the perspective of including an investor into the financial assistance programs, there are three methods of working with the European Commission, specified as follows:

- participating to the so-called "calls for proposals" in which each candidate presents the project proposal towards an exactly stated direction in one of the program lines launched by the European Union. The documentation necessary for the elaboration of the project permanently accompanies launching the call for proposal, the candidate having to strictly respect the rules specified. Each candidate must take into account the need to frame the project's theme within the general objectives stipulated in the call for proposals.

- participating at the tenders organized by the winners of some projects in the framework of the anterior stage, this stage being called "calls for tender". Through this calling, companies and/or natural persons are invited to participate at tenders organized with the purpose of acquiring goods/works/services for attaining the objectives inscribed in a project, which has already obtained financing. This type of tenders is internal or international and is available to any participant who meets the conditions strictly defined in the "terms of references".

- participating at the "call for expression of interest" on a theme specified at the moment when the call is launched. The specificity of this call is that the natural/legal person interested in the exposed subjects, they present the availability of participating at different stages of project realization, being included into an active data base that is active during a period of three years.

7. Conclusions

Once the financing obtained and project implementation ensured in the requested period by the reference terms, the company has all chances of becoming a competitor on the

external market that plans and manages its activities according to the rules accepted in the European Community.

Therefore, it is safe to say that, the main advantage of using financial assistance funds is that accessing these funds constitutes indirectly a support in running the business according to the rules common of the European space. Consequently, at any moment, the company's products can be placed on any market, offered on any market, excluding the fear of not being accepted and not dealing well with the competition. Regarded from this angle, financial assistance funds represent a facility with respect to the perspective development of the company, not only a means of realizing an investment at a certain point. The investor who benefited from the external funds can continue to lead their business by the same rigors that they had to take into consideration in the moment of project elaboration, that is:

- Using a time-frame of 5 years for economic projections;
- Using an annual cash-flow with monthly distribution and monitoring its realization;
- Permanently realizing the market researches for launching new products
- Constantly adapting the market strategy to the modifications and defiances it permanently provokes.

Additionally, by benefiting the advantage of the high level management, the investor who has obtained European funds can also access activities related to the financing lines, by participating at the international tenders for acquiring goods, services or products within some projects already in course.

The guaranty of eligibility is constituted by the fact that its offer includes products/services, which have already been acknowledged as being obtained in conformity with the community standards. Regarded in this manner, the company's leap in quality is incontestable: from a simple consumer of funds, the business could become a partner in the development of many other projects and/or a posterior supplier for businesses in a wider geographic area.

Considerations Regarding Social Protection and its Implications on the Romanian Economic and Social Conditions, in the EU Context

BRATU Constantin

Petroleum and Gas University of Ploiesti,

bratu_constantin2008@yahoo.com

Abstract

Considering social security as an autonomous and distinct phenomenon, as a constant and growing concern of the authorities to protect people affected by certain risks, simultaneously and without any reservation, we must accept the existence of a social security law. Social security research in the European context is a necessary step for the national policy of social security, but also to identify and implement the necessary measures to fulfill the requirements of accession to "the European system." Nowadays, is clear that social security is a factor of progress and also a measure of social progress, of society's evolution and of social policy.

Key words: social security, social security measures, European economic area.

JEL classification: F15

1. Introduction

Social insurance relationships were defined as those social relations in which old age material insurance, illness or injury of persons who are subjects to a legal job, their family members or other persons under the law [1]. Indeed, the legal rules laid down by the state which govern the relations of social security, make the law branch known worldwide as the social security law.

Social security operates on the principle of sharing risks. Each insurant makes a contribution to a unit of insurance, if the prescribed conditions for awarding benefits are fulfilled, he will receive the stipulated compensation.

Social assistance is financed on the principle of national solidarity, and from the amounts allocated various assistance and allowances are paid, as well as benefits in kind.

Social security is one of the most important branches of law, through its major implications on the security and protection of citizens against poverty, their marginalization and the risks that may arise throughout life, through major implications on human welfare, on society in general and not least with very important implications on the national economy itself. Everyone, in one form or another, are affected by the norms of social security law, thus the regulations in this area must first consider the general interest of society and secondly the interest, extremely varied, of every individual. [2]

Social security, in this definition, means preventing and resolving situations of disaster that may affect the individual as a member of society that is unable to avoid them in a first phase of risk, although it may solve, and to a certain extent, prevent turning them into disaster.

Social security is a mechanism interposed between an ever present potential risk situation and a potentially disaster situation that can be redress able and maybe avoidable, gathering resources to ensure the mechanism. From this perspective, social security is defined, by reference to some risks, to a mechanism which is established for its protection and to an award or redistribution of resources that have the same purpose. [2]

Social risks are those risks inherent in social life. These social risks arise from common events that affect the economic situation of individuals by reducing spending or by increasing revenues.

2. Concepts regarding the evolution of the idea of social security

Although the term first appeared in the U.S. law since 1935, previously mentioned, introducing the concept has been prepared by various procedures of insurance against social risks and, in particular, by Bismarck German

law. It was considered that the state's defensive mission was not only to protect the existing rights, but also to promote, through appropriate institutions and using available community resources, the welfare of all its members, especially those in need.

The American law regarding social security from 1935, Roosevelt's work, was an effort "to globally confront the problem of society's need to find a set of coordinated solutions" [2].

Under the 1938 New Zealand system it appears for the first time the idea to eliminate the state of origin. The benefit was no longer subjected to origin, but was open to anyone.

The famous Beveridge Report of 1942 [3] support the active fight against poverty. Social security cover the whole population and not just the working class. The author of this report insisted also on the question of risk prevention. As for the definition of social security, the report states: " Social security means guaranteeing a given income."

In the 60s it became clear that, after World War II, it had developed two types of social security systems. First, through Beveridge approach, in which the social security system was developed in response to traditional poverty law. Even if the system was based on the type of social insurance schemes, the emphasis was on the minimum income's protection for the entire population.

On the other hand, Bismarck's approach was referring to social security systems based on mutual aid and social security for different population groups. The emphasis was on a clear definition of the categories of population, for which scheme benefits accordingly to earnings were elaborated. [4]

During the same period it begins to show trends of convergence of the two approaches. This, however, is attenuated, reaching even to stop and manifest the contrary during the crisis in the 70s – 80s. The desire to consider social security as a tool to suppress the generalized poverty culminates in the international instruments on human rights.

In some countries, this is defined in legislation, in other states though, the doctrine is required to clarify the concept. The traditional definitions of social security begin with listing the social risks and continues with a description of programs and schemes covered. Subsequent attempts to define the concept no longer focus on the list of risks to be covered, but tries to establish that social

security is a set of policy instruments to meet a certain goal. [4]

In the I.L.O. report "In the 21st century: The development of social security" social security is described as a response to the acute need for safety in its widest meaning, rather than as a conglomerate of mechanisms to guarantee this safety, while other authors opt for this objective "of ensuring safety".

More recently, authors like Sinfield or Berghman addresses in a much broader concept the idea of social security, defining it as either "full protection against the loss of resources" or as "total protection against damage / casualties.

I believe, however, that none of the definitions cover the concept. One can understand that it is about the full coverage of risks, or social security does not only consider the risks (the discussion should thus start from the issues of terminology). It's not just about the risks, the loss, but also about the support granted in events that, although happy, result in reducing the worker's income, possibly falling below a certain guaranteed level of life.

3. Theoretical attempts to analyze the concept of social security

In general, specialized works on social security or social security law regard one or more similar social security systems or different international legal instruments on social security. Therefore, I will try here a progressive overview on social security theorization, following the emergence and evolution of the concept internationally, the increasing complexity and importance of social security from one historical stage to another.

I will also make a comparative presentation on the evolution of social security discussing various approaches, nuances or connotations that were associated with this concept in different countries or by different authors. I will add up to the theoretical classification of the general concept of social security, the particular issues of migrant workers

Because between the free movement of workers and social security is a direct relation, social protection of migrant workers is an important part of European social security. Internationally, the concept of social security is facing a variety of interpretations, depending on the historical context or the specific conditions of each society. Therefore, I will consider the comparison of various approaches and how they were reflected in national

systems or various relevant international instruments in this field. I regard such an approach to capture the essence of the concept of social security, believing that such an analysis should lead to the identification of proximate genus and specific differences. This is because there is no precise definition of social security in the international law, universally accepted, resulting that most authors have their own vision on the content of the concept of social security.

4. An european approach on social security

The European Union still faces an unresolved problem: is it possible to make an integrated economic area without internal borders while maintaining, within this economic area, different systems of social protection?

An alternative approach to eliminate all obstacles that hinder freedom of movement is difficult to conceive. For this reason it appealed to social security systems, to influence national legislation in this area, so as to eliminate the migrants' social security problems. International coordination of different social security national systems is limited, therefore, by legal instruments, without which coordination would not be possible.

Within the European Community, the legal framework of the coordination was done by The regulation 1408/71 on applying the social security schemes of employees, independent workers and their families moving within the Community. This is a legal instrument applicable in itself that is valid without being ratified by national parliaments. Coordination rules have been defined as rules of international law aimed at adjusting social security national schemes according to one another (and according to other international regulations), in order to regulate transnational issues, targeting social protection of migrant workers, their family members and other similar groups of people [5].

This definition refers not only to adjust the national regulations on social security, but also to adapt to international regulations. Coordination should aim, in fact, also the coordination of international treaties because, for example, in addition to European Union coordination rules, and the European Interim Agreements of the Council of Europe, but also the International Labor Organization

conventions or the bilateral agreements may include coordination rules applicable to the same persons.

Community provisions on social security do not replace the various social security schemes with the common European one, precisely because they have their own characteristics, which would not allow such an approximation. Thus, the enlargement of the Community provisions on the coordination aims at an adaptation of legislation and not at a harmonization, with compliance with the national systems characteristics, avoiding loss of social security rights of migrant workers moving within the European Union as a primary aim.

In other words, each state can individually determine, internally, the benefits granted in accordance with the national law, their calculation manner and the contributions to be paid, with the condition to respect the right of free movement of persons.

The issues regarding the principles and the procedures for implementing the coordination of social security systems will be analyzed in chapter III.

In conclusion, there are sufficient reasons to make a research on social security in the European context.

5. Regulations provided by the European Code of Social Security

The Council of Europe has adopted numerous documents, among which we mention by way of example: the Revised European Social Charter (1996), the European Code of Social Security (1964), the European Convention on Social Security (1973).

The Regulation no. 883/2004/CE applies to: general and special social security regimes, contributory and non-contributory, arrangements relating to the obligations of the employer or shipowner, special cash benefits, which are non-contributory which simultaneously have the features of social benefits.

The European Code of Social Security is almost identical to the International Labor Organization Convention no. 102/1957, but the ratification conditions are more rigorous. The most important document in the European Union in the analyzed area is considered the Community Charter of Fundamental Rights of Workers. According to article 10, every

employee of the Community is entitled to adequate social protection and social security benefits to a sufficient extent.

Thus, essentially, the Code repeats the provisions of the Convention no. 102/1952, with very small changes, requiring the states, however, to meet the standards set out in six parts of the Code, to ratify (as opposed to three parties for the Convention no. 102/1952).

The Code's objective is to gradually expand the national legislation on social security to all active population, including self-employed and, ultimately, the entire population, economically active or not.

Thus, it is determined, for each service, the minimum share of the population to be covered against the respective social risk.

After the development of the European Code of Social Security, the minimum standards improvement process continued, and thus the need to make an Additional Protocol in 1964 and even a revised Code in 1990.

Troubleshooting related to social protection of migrant workers was thus a constant priority of the Council of Europe.

In the category of international instruments on social security, in addition to international agreements (bilateral or multilateral) and the multilateral conventions, supranational law instruments are included, created by supranational systems.

These instruments are mandatory to the member states of the respective organizations, ratification no longer being needed.

These instruments are legally superior to national legislation in this area. In Europe there is only one such supranational organization - the European Union.

Within the European Union, the need to develop social security has been imposed since its creation.

6. Social protection and its implications on Romanian economic and social conditions

In Romania Monitoring Report 2006, published in May, the European Commission does not clarify regarding the preparedness in applying the Community rules of coordination. Currently, even if the social protection system in Romania is not among the most attractive ones in Europe regarding the benefits, the basis of a modern system are established. The benefits cover all social risks, although they

will have to be diversified and improved, with the country's economic development.

The analysis of Romanian social security regulations shows that Romanian legislation is largely in line with the Community rules, Romania is prepared, from the legislative point of view, for the implementation of Community coordinating regulations. The fundamental principles of Community coordination of the social security systems are included in the national legislation. There are, however, required some adjustments or additions aiming the technical aspects, so that no difficulties arise in the implementation of Community coordinating rules or irregular situations. Thus, the way how the fees are paid by the foreign employers to the workers from Romania or for Romanian workers posted abroad will be clarified.

It is also necessary a legal provision to establish the taking into account of foreign revenue for granting of social security benefits. Also the aspects related to export issues in the case of pension benefits administered by special arrangements, as well as considering the periods of unemployment in the Member States to calculate the period of social security contribution must be clarified. Some adjustments of legislation, and also institutional adjustments, are needed regarding the state allowance for children.

Coordinated efforts are desirable to regulate these deficiencies in legislation, so that Romania may be able to apply the EU rules on coordination, with minimum negative effects.

In the 2005 Comprehensive Monitoring Report for Romania, the European Commission stated: "The administrative capacity in the field of social security systems' coordination should be developed and strengthened in the future, in particular, the training of personnel in this field must be ensured". Thus some clarification on the functions and on the way the organization and functioning of departments or institutions involved in social security systems function, to avoid duplication, or discontinuities in their work, is still needed.

It also recommended the development of institutional cooperation to ensure greater coherence and efficiency of the measures established in this field, at nationally level. For example, an inter-institutional agreement could be concluded between the NEA and NHPOSIR to provide synchronized information or proper advice to the insureds, avoiding interruption of payment of benefits.

Also a realistic assessment of the resources required for implementation in Romania of EU coordination rules is needed. A study should be made on the appropriate material basis, the necessary human resources, both quantitatively and in terms of optimal specialization and administrative costs.

The staff's training in the institutions involved will also have to be continued. In this regard, a database to which the personnel involved should have access must be created, which should include relevant Community rules on social security systems coordination, as well as solutions, or interpretations of the ECJ in several cases.

In this regard, a comprehensive study should be conducted on the additional costs of implementing EU regulations, based on statistical data and characteristics of migration flows from Romania. A useful measure would be collecting social security contributions in one fund its management being done by a single system, which would reduce administrative costs and facilitate taxpayer obligations.

A negative aspect which could lead to undesirable effects is the lack of statistical data and the mismatch of relevant information in the field. A computerized database on the insured in Romania is also essential, enabling rapid verification, analysis or predictions on various aspects of coordination. This database should contain complete information about insured and to allow regulated access to each institution involved.

Romania's priorities today is not only is not only in the reform, but also the intensification of Romanian public information process. In this respect, we need a comprehensive information campaign about the rules of coordination, the social security rights of migrant Romanian workers and the organizational coordination of social security systems in Romania.

Improving the administrative framework in the coordination field requires urgent measures that must be implemented before applying the EU regulations for coordination. Mismanagement may be more harmful than inadequate legislation. If the necessary resources, material, financial or human, will not be allocated, organized and properly prepared, serious problems for both beneficiaries and institutions involved or the overall economy may result.

7. Conclusions

The European Union membership has been a challenge for Romania, in terms of assuming the obligations imposed by the integration process. It requires transposition into national law of the entire *acquis communautaire*, as well as developing the administrative and institutional capacity to implement the legislation adopted.

The process of harmonizing the national legislation with EU regulations and the development of the administrative capacity is a key objective, which was recovered in the accession strategy of any candidate state and, at the same time, a legal obligation arising from the European Association Agreement Romania - European Union.

The social field has gained a special importance in the Community law. Currently, EU policies aim primarily to the orientation and needs of its citizens, wishing to build a social Europe and achieve a European social model. Therefore, in the legislative harmonization process, Romania will have to follow the same principles and objectives as the European Union, so that now it should be in a position as close to the Community.

The European integration process intersects with the internal reform process. In Romania, the efforts to meet the criteria required by the European Union express the real interest for harmonization with the EU strategy in social policy.

The issue of the European harmonization is no longer a matter of foreign policy, but rather a debate and accountability of domestic policy.

Currently Romania has established the main lines and means of action for the development of the social system, improving quality of life for all citizens

Since 2001, Romania has significantly accelerated the process of harmonizing the national legislation with the EU, making significant progress towards preparing for EU accession. In the social field, notably social security field, significant progress in legislative and institutional level has been made, but the efforts to improve the framework in this area will be continued, for Romania to be able to fulfill the obligations of Member State of the European Union.

The European Commission noted in the 2005 Comprehensive Monitoring Report for Romania that "Romania generally meets the

commitments and requirements arising from accession negotiations in the fields (...) of coordination of social security systems and expects to be able to implement the acquis at the time of accession. However administrative capacity should be further developed”.

Social security is one of the key aspects of contemporary social policy, with major influence over life and economic development. In time, there have been numerous attempts to define the concept of social security. In some countries it is defined in legislation, in other states though the doctrine is required to clarify the concept.

Not even the international law does provide a definition of social security. The instruments of international and supranational law concerns only the scope and only as an exception they

provide a definition of the content of social security. These definitions do not exclude one another, but complement each other, varying in complexity depending on the realities of time and social developments. The diversity of opinion regarding interpretation of the concept of social security has no negative consequences. The differences should be considered when comparing social security systems and their components recognition.

Features and Management Team Project

BREZOI Alina

ENACHE Roxana

Petroleum and Gas University of Ploiesti

alina_brezoi@yahoo.com

rocatore@yahoo.com

Abstract

For a project, whatever its characteristics, to be effective should be based on a team. Although designed as a team, especially team projects implemented and monitored easily become reality.

Regarding the management team should be good first identifying problems that arise during the project, to be able to choose whether they can be solved by one person or group.

Manager must be a personality complex because in addition to knowledge, abilities, skills, abilities and skills, the manager should develop and attitudes, values and desirable behaviors in the team.

Key words: project team, manager, leadership, company

JEL classification: O22

1. The project team manager

In the project management team has an important role - the characteristics, selection, composition and its management. Project team members will be selected depending on the tasks required by the project, and their number will depend on the size and complexity of the project. In addition to specialized skills, it is important that they have skills for teamwork, good communication to be created.

Each member needs to know which tasks and to assume responsibility. Questions that members should know the answers are:

- What is expected of me?
- That is my role on the team?
- What level of authority? But the responsibility?
- Who will make the assessment? Who are my colleagues?
- What I would use to participate in this project?
- To achieve objectives which are directly responsible?

- Given that I have never done this work, as I will do?

2. The composition and leadership of project teams

The composition and leadership of project teams is the key for successful completion of a project. They are part of the duties of project manager.

A project team consists of members who have different personalities, knowledge, skills and qualities. The role of project manager is to assess the project before staff chooses to build a team to be advantage of the qualities of each member. The training team should be aware of the activities to be carried, the knowledge and skills to undertake that activity, risks involved, possible persons who might be involved in the project. Often, selecting team members begins with informal discussions on the possible availability and desire for involvement in the project. It also proved that the basic core of the team must contain only 2 to 4 persons, for better coordination of all members of the team.

To construct an effective team, should be considered the following suggestions:

- Search for people with experience in project management.
- Encourage the learning of the less initiated in project management from those with more experience.
- Search for people able.
- Note the achievements until the present members.
- Give all necessary information to those who are part of the team to know which is true now and where we want to reach, which are the resources we have and risks involved.
- Designated responsibilities and allow the freedom of each State to define its working methods to achieve objectives.
- Avoid leaving unresolved the problems that arise.

- Seek to find ways to popularize the individual merits.
 - Teamwork incentive to lead to a common vision.
 - Do not drive the project through emotional states.
 - Define clearly what not to do the project. Steps that teams through to its transformation into an effective are:
 - Confrontation - may be conflicts because of different visions of the purpose and working methods chosen
 - Normalization - the members start to take a common vision
 - Achievement - the team starts to become effective transformation - may redefine the team common goal, communication between team members is high, and the responsibilities of each member are understood and accepted.
- Conditions for forming an effective team cover 4 basic elements:
- Sense of purpose: shared vision of purpose and objectives
 - Choosing the right people for the tasks to be performed
 - Resources: technology, working methods clear, effective meetings, documentation, time management, conflict management.

The own characteristics: the good communication, the flexibility, the motivation.

The project team and its characteristics To succeed in our projects should keep in mind that exists when a team has the following characteristics: size (approximately 16-20 members), there is a common purpose, state structures (it is clearly stated position, rank, prestige each member) the structure of role (explicit models of behavior are expected of each member), lead (there is a formal authority, objectives and expectations are raised group, qualities and powers are real), cohesion (each member has the ability, acting as an entity, resistance the forces of rupture), communication, motivation, interests, group norms, nature of the task and environment where you have group activity, homogeneity, heterogeneity.

As a team to be effective should have the features:

- number of members is too small (not more than 3-4), but not too large (not more than 20);
- has the potential of skills and roles (technical, interpersonal, cognitive, affective, negotiation, legislation, language, etc.);
- designed for clear and consistent;

- has clear responsibilities shared between team members (tasks and roles appropriate skills, interests and desires);
- progress is measured continuously;
- there are resources were allocated;
- There is enough time to know the members and understanding cultural differences, values, religious, political, etc.
- there is support from superiors;
- established set of rules for joint activities;
- communication is intense, conflicts are resolved constructively, openly;
- individual and team success is recognized and celebrated;
- product group is consistent with the goals;
- Consistently reflect team work style and factors influencing it.

Creating an effective team is encouraged by: the fact that its members are known as people, as professionals, know you have special skills, personal and institutional reasons, be given a team name, it define the main concepts and targets are established criteria and methods of assessment, working with individuals and institutions motivated and open to define clear roles and responsibilities, to determine how to resolve the conflict, there is a shared perception of common ownership of the project, set ground rules for team work to reflect on achievements and progress, use an appropriate communication system, using various methods of work, to recognize and pool the individual skills, to encourage participation of all members, is celebrating the key points achieved, sufficient time is dedicated to social events, is prevents isolation (due to political orientation, religion, age, economic circumstances, competence, language abilities, etc..) team is guided and led empathic.

3. Project manager

Project management is often the responsibility of a project manager. This should ensure the project within the parameters established, to meet contractual conditions set by the customer or project needs. The project manager must have leadership qualities, to understand the project in its entirety, from beginning to end, to lead, organize, coordinate and control resources and teams.

The project manager must have strong interpersonal communication skills, be familiar with the activities of each section or department, and must have general knowledge about the technology used, unless the project is research and

development (R & D, or R & D - Research & Development).

The project manager should not be directly involved in technical activities, as such would cease to be manager, but will become a mere technician.

The project coordinator is the person responsible for the conduct of the project, the objectives, quality requirements and project deadlines. For his personality, qualifications and ability to coordinate effectively the team members will depend in large part the success of a project. Sometimes, it is the same as the design project.

It should plan the project, organize it, coordinate it and to control. It is the moderator's position and motivation of the team and should ensure, in addition, effective communication between all members. Management style in which it will choose will depend on its characteristics and social processes that occur within the project team.

Skills needed for a good project coordinator are therefore:

- Specialized skills (in basic project management, multidisciplinary, knowledge of general management).
- Methodological skills (organizational skills, focus on goal - strategic thinking, experience in project-based, teaching skills).
- Social skills (capacity management, motivation, delegation of powers).
- Communication skills (communication and negotiation skills, safety in expression, conflict resolution).
- Powers of personality (self, creativity, desire for change, resistance to stress, initiative and responsibility, adaptability, discipline, risk management, integrity, positive attitude towards people: I'm ok, you are ok, a concept seen in transactional analysis, leadership).

They should not necessarily be native, they can be acquired. Choosing a project director will be made by its selection of the possible, by producing qualities demanded so that the risks to which it is exposed to minimal project.

Because the project team members are experts in their fields, they may be superior in this respect the project coordinator, which may generate conflict, but to be managed effectively for successful development of the project.

The project manager shall have the following resources:

- Money
- Staff
- Equipment

- Materials
- Technology
- Information.

In connection with the appropriate leadership style of project work, it varies depending on the situation, the stage reached by the project, the problems to be solved or the people who are part of the project team. A project manager performance is measured primarily according to the objectives, so the style will be chosen for the project tasks. However, it is preferable to a cooperative style authoritarian one when working in a project.

A self-assessment of attitudes towards a team project manager can be based on correlations between X and Y theories of McGregor, in terms of employee attitudes toward work.

Driving style features

1. Authoritarian project manager decides everything.
2. Patriarchal manager decides everything, but before making decisions, trying to persuade members.
3. Advisory Manager decides, but will consult with members before taking decisions.
4. Cooperative team is informed that its point of view before deciding.
5. Participatory team makes proposals and project manager chooses the best option.
6. Democratic decision after team settled within decision, the manager is the coordinator.

Creating an environment for effective collaboration between project members depends also the project manager. It should intervene especially when fails to achieve the desired results (deliverables), when conflicts arise. Otherwise, should the project team can be self-regulating and possible especially when the following conditions are met:

- Specialized skills with the tasks of project members
- Degree of identification with the project is large
- There are good reasons to members
- Are well defined tasks and responsibilities of each member?
- Degree of freedom granted by the project manager is great
- No destructive competition between members.

Responsibilities of project manager are:

- a) The beginning of the project:
 - Defining the scope and objectives
 - Preparing the project plan
 - Personnel Selection

- b) During the project:
- Identify and resolve problems arising
 - Monitoring activities
 - Making decisions
 - Market research
 - Communication with other participants in the project
 - Conducting analysis of budget, time and resources
 - Possible involvement in other projects
- c) The end of the project:
- Final review of budget and actual situation
 - Record of lessons learned during the project
 - Placing team members in new projects.

4. Intuitive manager (modern leader)

With the companies evolved, undergoing changes in the internal organizational structure, relations between employees, computerization and completeness, it must increasingly forming a manager other (no sound), intuitive manager. This intuition fails to harmonize with its rationalism, to have a broader vision, a pragmatic faster growth and therefore increased efficiency.

Intuitive manager concentrates on the purpose and objectives, and the inner attitude, the quality of relationships with other members. Management style and his choice that is participatory, seeking to highlight the qualities of each member and creating a common overall vision necessary for success of a project. It will cause around his desire to progress, knowing the same time to control the conduct of activities.

Manager intuitive qualities are therefore:

- Intuitive perception of the future, risks, emphasizing an attitude open to members, adopting a whole.
- Creativity: fostering creativity members, their innovative ideas.
- Action: involvement, team coordination.
- Vision: constant anticipation of obstacles, strategic vision.
- Training: their skills, learning other members of his experiences
- Communication: listening ability, motivation, promoting a climate of trust.
- Rigor: the specific methods and structures, tracking the results.

Each project participants need to know well the tasks to be achieved and the project to achieve its objectives, the consensus in the results (quality, quantity, effectiveness), the methods and techniques, and deadlines to be completed project.

Demographic Imbalances and the Current Concepts of Social Security

CARP Ana Anton
Academy of Economic Studies of Bucharest
karp_ana@yahoo.com

Abstract

Today, European countries constitute a single voice, repeating the reminder about the aging population phenomenon and the population's "pyramid reverse".

To "relieve the state" of its unique responsibility in providing social security to its citizens, the theory of "security in diversity" has developed, which supports the multi-pillar system at the expense of the redistributive system's benefits.

The theory of „security in diversity” added up by the convergence theory of redistributive system types hides however another aspect: security can be cross-side, which is initiated with the advent of European Directives on social security.

If social security can be undertaken individually, then the other European concept, social cohesion is poor in practical application.

The purpose of this paper is to assess the demographic phenomena that generate the general imbalance of accumulation-distribution in the Social Security System.

For workers moving within the European Union the question of portability of pension rights arises.

I shall focus my analysis on the pension field, which implies specifically tackling problems in the context of European integration.

Key words: labour market, social security, unified rights, cross-border security

JEL classification: F24

1. Introduction

Labour market liberalization in the European Union has made revision of the Lisbon strategy.

The European Commission has proposed removing obstacles to mobility of workers to ensure them with the free movement and also with the portability of pension rights. Portability of pension rights is guaranteed by Regulation 1408/71.

The implementation of this Regulation is layed down in the Council Regulation no. 574/72/CEE. After the adherence, the member countries have the obligation to include the means of implementing and applying of these ones into their own social security systems, to designate the competent authority, the liaison organs and the institutions responsible for applying the regulations.

After Romania and Bulgaria adhered to, the Regulatory Framework has been completed with the Council Regulation no. 1791/2006. Regulation 1408/71 has been continuously modified to take account of national legislative changes and Community rules' evolution also resulted from decisions of the Court of Justice.

Community coordination rules have become bulky and must be replaced and simplified.

One of the fundamental principles of the new Regulation (RE no.883/2004 on social security systems' coordination) is the general principle of equal treatment for workers who are not resident in the member State where they work, including cross-border workers.

Contribution periods completed in another Member State should be taken into account by applying the principle of periods' aggregation.

The aggregation of periods has the purpose of retaining the advantages received or about to be acquired by employed persons or self-insured persons, their supported persons and descendants.

To avoid duplication of applicable national provisions, it is necessary that the person moving within the Community to obey the social security scheme of a single Member State.

2. The current concepts of Social Security

a) Security in diversity

Social security can be assumed by each person through his savings made during working life and also by adhering to an insurance system based on social solidarity. This adherence to „compulsory insurance” [3] scheme is generally followed by each individual, except those who do not employ for a minimum period required by the pension system.

According Georges de Menil and Eytan Sheshinsky, the "return to Europe" [8] of postcommunist countries (Romania, Poland, Hungary) will also consist of a pensions system reform, given the deepening demographic phenomenon of population aging and the PAYGO system deficit.

They argued that the theory of multi-pillar system will be a "security in diversity" in terms of income replacement by pension. How to implement reforms and the chosen path, the type of model chosen depend on the political factor in each country. Hence the authors' fear that although the developed scenarios conclude achieving a surplus in Pillar I, the risk was that the parameters set (the benefits) and the contributions' formula to be altered by politicians.

Today is put again in an acute form the „problem of pensions system's reform” [2], this time the internal reform of the redistributive system is motivated by adverse demography .

Following the trend of European Union countries, in Romania too the Multi-Pillar system was founded, future relieving the redistributive system, respectively the First Pillar of pensions.

The fundamental principle underlying the Multi-Pillar system is to diversify funding sources.

State involves in regulating the Multi-Pillar system and encouraging contributors' attraction by tax advantages offered to employers, through which contributions are collected.

b) Cross-border security

Promoting the multi-pillar system has a positive cross-border effect in the financial market development and capital market, in attracting investments in countries that implement these systems, but also a positive effect in terms of social security of the pension rights by increasing determined benefits and by

portability rights as owners of individual accounts.

For economic growth and jobs' creation, a genuine internal market for financial services has been formed, that allow the financial institutions to operate in other Member States to ensure a high level of consumer's protection in financial services.

The cross-border pension systems refers to the permission guaranteed by a member state to enterprises located in their territories to sponsor institutions for occupational pensions provision authorized in other Member States.

The extent that "social security systems are under increasing pressure and in the future will increasingly focus on occupational pensions as a complementary system; this system should therefore be developed"[11], without questioning the importance of pension systems in social security.

In the core of the objective of strengthening the European social model lies "social protection reliable, sustainable and effective, ensuring a decent standard of living in old age." No.2003/41/CE Directive is a first step towards establishing an internal market for occupational pension schemes, organized at European level.

National regulations are different in terms of employees' participation in independent activities to self occupational pension schemes.

The implementation of the directive had a deadline date of September 23, 2005. The only allowed delay was Article 17 application relating to pension schemes on cross-border basis.

The date by which the postponement of Articles 17 and 20's application has been permitted is September 23, 2010.

c) The portability of pension rights

The portability of pension rights involves the calculation of pension rights and the transfer of amounts due by the person receiving the transfer, regardless of the place of residence chosen by the beneficiary.

The portability problem arises, however, different depending on the pension scheme in which the potential beneficiary has realized the eligibility period.

If the insurance periods have been carried out in Pillar I, the granting of benefits is regulated by Regulation nr.408/71.

It requires the coordination of establishing rights under the rules: „the aggregation of insurance periods”[3], the aggregation when the insurance periods overlap, conversion rules, the

application of pro-rata temporis principle, the revalorization and recalculation of benefits for the implementation of national strategies of recalculation due to inflation or increased cost of living. The revalorization is directly applicable to Community pensions.

In 2009, Konstantina Kalogeropoulou argued the existence of "obstacles to portability of supplementary pension rights"[9].

These obstacles arise when the insured person has contributed to a supplementary pension fund (occupational) and has not achieved the requirements of the pension scheme until the time when applying for the benefits transfer.

3. The demographic decline and human potential's assessment

Economy and social climate have changed. With these, demographic changes have occurred. Increasing life expectancy has increased the period of inactivity and the duration of dependence.

Fertility rate changes also have an impact on financing the social security system.

One other change is in the population age structure and in the ratio of population older than 65 years to younger generations.

The combination of increasing life expectancy and lowering fertility rate leads to a decrease in the dependency rate doubled for persons over 65 years.

This ratio (persons aged over 65 to active population) was 1 to 4, and in 2050 it will be about 1 to 2.

While the population pyramid has reversed, the social security contributions should be borne by fewer people. Therefore it becomes impossible to finance the redistributive system. Pestieau considered that is hard to predict up to where the convergence will go, but on the long run, there will be differences in living standards between different countries. He supported the idea that there can be no pure systems, neither "a full convergence cannot be realistically expected" [10].

To evaluate the potential of the Romanian population, I have used methods of statistical analysis. In the table "Romania - the country with the largest deficit of the total population in 1999-2009, forecasts for 2010", the evolution in absolute and relative values is mirrored (index with fixed base, reference year 1999).

For relevant analysis, I included in this table the situation of deficit populations' countries, like Romania.

Fig. 1 Romania - the country with the largest deficit of the total population in 1999-2009, forecasts for 2010

Romania- the country with largest deficit of total population in 1999-2009, forecasts for 2010					
Tara	1999	2009	(2009-1999)	I (2009/1999)%	2010
Bulgaria	8,230,371	7,606,551	-623,820	92.42	7,576,751 (f)
Latvia	2,399,248	2,261,294	-137,954	94.25	2,248,961 (f)
Lithuania	3,536,401	3,349,872	-186,529	94.73	3,329,227 (f)
Romania	22,483,595	21,498,616	-989,979	95.60	21,466,174 (f)
Estonia	1,379,237	1,340,415	-38,822	97.19	1,340,274 (f)
Hungary	10,253,416	10,030,975	-222,441	97.83	10,013,628 (f)
Croatia	4,527,459	4,435,056	-92,403	97.96	:
Poland	38,666,983	38,135,876	-531,107	98.63	38,163,895 (f)
Germany (incl.ex-GDR from 1991)	82,037,011	82,002,356	-34,655	99.96	81,757,595 (f)

Over the past 10 years, Romania has the largest deficit in terms of total population. It is situated among recently integrated into European Union countries, which also recorded large deficits in the population.

At the opposite pole lies the Nordic countries and Central Europe. Italy, Spain, Portugal, Great Britain, Cyprus, countries receiving migrants [4], recorded positive developments (Spain 115.14%, Italy 105.51%, Portugal 104.71%, United Kingdom 105.21%, Cyprus 116.70%).

The demographic decline is recorded in Romania since 1990. In 1989, the total population was 23,151,564 people in Romania. In 1990, the country recorded the largest population (23,206,720 people), as from 1991 (23,185,084 people) a decreasing trend will continuously occur.

Fig. 2 The demographic decline 1989-2007,

Source: INSSE - Romania

The years 1990-1991 mark from a demographic point of view the structural imbalance between women and men that during 1981-1989 was maintained at a constant level of 50.66% women, compared to 49.34% males. In 2007, the share of women was 51.26% of the total population.

The appreciation of population decline is attributed to several causes of which we mention low fertility rate (1.35 children / woman) and net migration.

Regarding the net migration rate indicator per 1000 people, I find out that the indicator peaked Romania (-26,705) in 2001, just like Bulgaria.

The observed values can be explained in relation to changes in the European Economic Area, and what is relevant is the dependency relationship between net “migration rate indicator” [7] and population deficit indicator, which determines the need for a thoroughly examination of this indicator as a possible variable for the “social insurances model” [5] ,

much more relevant than the fertility rate or natural increase of population

Fig.4 Crude rate of net migration plus adjustment per 1000 persons

Crude rate of net migration plus adjustment per 1000 persons

Source: Eurostat

Romania's human potential at the end of 2007 was as follows: of the total population of 21,537,563 people, 15.27% lay in the category 0-14 years, which was in absolute value 3,288,439 people (children); the working groups of people were 15,049,402 persons, which represented 69.88% of the total population; the number of people aged over 65 was 3,199,722, which represented 14.86%.

I appreciate that the human potential of Romania is satisfactory, average, because the indicator was 21.3% in 2007 and 2008, while the value recorded in the EU27 countries was 25.2%.

What I remark is the weakening over time of this indicator, which rose from 18.6% in 1998 to 21.3% in 2007 and exceeded 20.4% in 2002

Fig. 5 Old_age - dependency ratio

Source: Eurostat

If forecasts confirm Eurostat, 2037, the year of the first generation in Romania that should enjoy the benefits of Pillar II, will find Romania in a deep "demographic" crisis, the dependency

ratio of the indicator $old_age / 15-64$ years reaching 150 % higher level than at present, while the Nordic countries will have a "young" population.

Activity and "employment rates are at low levels" [1] in Romania

The employment rate decreased from 65.4% (1997) to 62.4% (2001). At that time, Romania registered an employment rate higher than the EU27 average (from 60.7% to 62.4%) and started with the year of net migration indicator's maximum (in 2002) to register a decline (57.6% in 2002-2005), that is appreciating at 59% in 2008.

Fig. 6 Romania – Rate of employment

Source: INSSE Romania

Analyzing "the usage of demographic potential"[6], I appreciate that a great human potential of Romania is not put in value.

4. Conclusions

On their active life, the citizens carry out activities simultaneously or in different periods in many countries of the European Union, bringing up the issue of summing the periods of insurance or others the same.

The calculus of determination of the pensions quanta covers procedures of determination of the national pension, but also one of the community, after which it decrees the pension quantum that the European citizen has the right to.

Some problems arise: determining the insured period, the conversion rules, which are decreed by the Regulation no. 1408/71 and 574/72.

This year, Regulation no.1408/71 will be replaced by Regulation nr.883/2004.

Whereas there are many situations in which interruptions of the employment period are due

to involuntary causes: disease or loss of employment without re-employment opportunities, no matter how modern a society based on private pension system is, redistributive pension system based on social solidarity can not be fully replaced in any country and any other private pension system.

If promoting multi-pillar security and cross-border security, the State can not be fully relieved of ensuring the appropriate level of pensions.

The transparency of establishing the pension rights for persons moving in the European Economic Area and ensuring the portability of pension rights is the responsibility of each member of the Community.

The reform of Social Security System must take into account the following fact: the demographic potential is unused and the population aging is mainly due to economic migration and professional mobility.

These features of Romania's demographic variables lead us to choose the correct model of social security in Romania, to be developed to form a basis for real reform.

New generations are becoming fewer, but balancing social security is still possible by promoting appropriate economic and social policies.

Labour Mobility And The Impact On Labor Market

CHIRTOC Irina-Elena
MUNGIU PUPĂZAN Mariana-Claudia
„Constantin Brâncuși” University of Tg. Jiu
irynavoica@yahoo.com
MĂRGULESCU Ana-Maria
Bank Post Gorj

Abstract

EU enlargement involved, generally, two different ways of approaching the issue of labor mobility: that of countries which are generally host mobility flows and countries that are sources of such flows. Economic effects, positive and negative, are registered in both cases, however there are many difficult to quantify. One of benefits of this phenomenon is to reduce unemployment.

Key words: labour market, income inequality, unemployment

JEL classification: F22

1. Introduction

At the dawn of the 21st century, high unemployment rate is the most serious economic and social problem for almost all states. One of every 10 people in the EU is looking for a job in vain. Employment rate in Europe is 61%, or nearly 10 percentage points below the U.S. and Japan. Although millions of new jobs were created in the EU, millions are still unable to find work. And more than half of all applications were made over a year unemployed. No net addition of jobs, some population groups have particular difficulties on the labor market in particular long-term unemployed, young, disabled, women and ethnic minorities. Employment rate of women in Europe is around 20% below the men. Disability is even lower - about 30% below the EU average. The EU would not only provide more jobs, but also provide better labor market opportunities for population groups that hitherto have been at a disadvantage. („European Commission European employment and social policy: a policy for people”). The socio-economic conditions existing in Romania, there

is still a high unemployment, to create some pressure for labor mobility to external labor market.

2. Labour mobility and the impact on employment and unemployed

Labour mobility is a reaction to adjust the supply of labor according to demand territorial location. Fundamental to this phenomenon are numerous causes such as:

- regional disparities on economic development and emergence of new jobs;
- uneven territorial distribution of unemployment;
- territorial income inequality;
- change in marital status;
- health reasons,

External mobility, the effect of removing restrictions on the possibility of moving out of the population, helped reduce the population of Romania after 2000, and therefore reduce labor supply.

Reducing the number of people left in Romania is due to regulations in developed countries, limiting admission of new strangers. In the absence thereof, the external mobility would have a far greater impact on employment and unemployment in Romania.

Young age groups have the largest weighting in the total of people who fled from Romania. Young age group in Romania is the best prepared professionally, but also the most exposed to unemployment, so the higher they tend to migrate.

Deadlock in general economic and social development of Romania, low living standards, lack of future perspective, it causes many young people seek to achieve in more developed countries. Making training courses, fellowships, etc. temporary employment period., are used mainly by young people to stay in better developed countries with higher standard of

living, working and living conditions higher to those in Romania.

It should be noted that the share of persons aged 26-40 years came in at almost 49% share, which is a worrying phenomenon for Romania. Thus, leaving people with a good theoretical and professional experience in Romania is a real brain drain, outdoors, and for developed countries the issue is a brain gain, as these countries receive most valuable professionals for key sectors economy and research, without any expense to have their preparation.

Reducing unemployment rate in recent years is due to the legal and illegal departure of people to work abroad.

Regarding leaving to work abroad in the form of irregular migration, illegal, manifests the various coatings, to find a job there, mostly in the informal sector of the economy. This phenomenon was amplified by multiplying the travel agencies, international transport firms and so-called agency of employment abroad.

From an economic perspective, labor mobility is the main mechanism with trade and capital flows of european integration.

Short and medium term, emigration from Romania primarily affecting labor availability (quantity effect) and thus have an influence on wages and employment. Secondly, influence labor market through changes in regional and sectoral allocation of labor and the relative distribution of production. Thirdly, depending on destination, payments by the Romanian migrants in the country will affect regions of emigration.

Long-term effects of emigration (the effects of growth) on Romania are not sufficiently clear. There are basically two ways in this regard. On the one hand, mobility is seen as representing only a tool that contributes to the convergence of integrated economies. Moreover, mobility can be regarded as a phenomenon that increases development gap between countries (unfavorable locations will lose many inputs). From this "divergence perspective"; is only one factor mobility potential of center-periphery configuration. If the center (EU) continues to draw the human capital of Romania, will grow faster, while Romania will be left behind. Thus, long-term outcome will be a divergent pattern of growth in the EU and Romania.

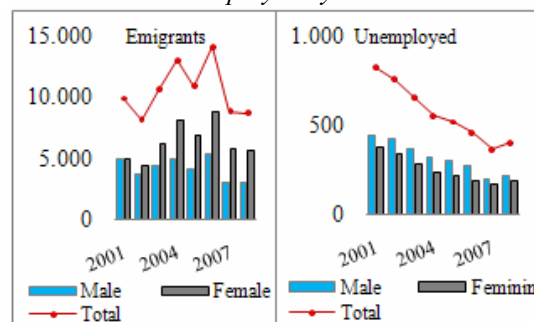

The two mechanisms related to the mobility mechanism are likely to influence the economic development of Romania pre-accession and after gaining EU membership: human capital

outflows due to the emigration of highly skilled (brain drain) and reverse financial flows associated with migration , ie the money sent by migrants in Romania.

Labour mobility affects both employment and unemployment in Romania. Thus, we can estimate that the mobility of people in Romania is that the dimensions of unemployment is lower, because the lack of jobs in Romania these unemployed people would be more mass. This should not be a solution to unemployment, especially that labor mobility has contributed to reducing employment, and if we consider that if Romania's population aging occurs, then the emigration of the Romanians will have negative effect for our country.

Through the emigration is saved internal rate of unemployment but budgets remain without taxpayers (the state budget, social insurance budget, the fund of unemployment, health insurance budget).

Figure 1. Evolution of immigrants and unemployed by sex

Source: Romanian Statistical Yearbook 2009

Figure 1. illustrates that the period 2001-2006 is characterized by an increase in migrants number with 43 points while a number of unemployed decreased by 44%. In the next period (2006-2007) recorded a sudden drop of 37% immigrants and unemployed keeps the same trend of decline, this can be explained by the fact that people found jobs in the country. The period 2007-2008 is characterized by a slight decrease of 1% of migrants and an increase of 9,8% unemployed number. The latter grew by 75,9% in 2009 to 2008 explained by the phenomenon of global economic crisis.

Persons involved in the phenomenon of mobility are usually women who recorded a 49% share in 2001 and reaching 65% in 2008, the total emigrants. The proportion of women in the number of unemployed is lower than that of men, maintaining that on average 43%. Unemployed with education below secondary

school are the most exposed to the phenomenon of mobility

Figure 2. Evolution of the number of unemployed by education

Source: Romanian Statistical Yearbook 2009

Unemployed number is represented (Figure 2.) a fairly large proportion of approximately 75% of these unqualified people with below secondary education, following the unemployed with secondary education in 20% and last place are those with higher education .

Considered very important in the decision to emigrate is the number of existing vacancies in both the home and in the destination.

According to available data from Eurostat for 2008 the largest share of vacancies Germany records by approximately 39% of existing housing in the EU. The UK lies second with 26%, and Romania is placed to the middle of 4%. Most existing vacancies in Germany, UK and Netherlands are in financial intermediation, real estate, renting and business, those holding 47,82% for Germany, 28,05% for United Kingdom, 23,62% for Netherlands of the total supply. Another area where shortages of manufacturing employment is in Germany as representing 10,45%, wholesale and retail United Kingdom and the Netherlands about 17%.

Figure 3. Vacancies jobs in European Union

Source: Eurostat

And can be seen in Figure 3. that in Romania recorded same labor shortage. Unemployed in Romania should therefore be to move towards

an Intersectoral mobility within the country or to find out. Emigration is a topic that reflects the quality of work and domestic employment in Romania, it is primarily the size of wages and working conditions not necessarily (over 50% of those who leave motivated by earnings and 20% by the higher living).

Labour mobility is one of the most important national phenomenon - the structure of employment, unemployment, budget incomes as well as individual and family level.

After the social economic development have diversified the forms of population mobility:

- movement or commuting mobility;
- seasonal mobility;
- residential mobility.

Immigrants adapt to new territory raises difficult issues to resolve social, economic and cultural conditions. Following in the community of a mass departure of young people, change them to reduce the birth rate is decreasing while increasing marriage and mortality, natural increase is reduced accordingly.

An important question arises both now and in the future, which makes and promotes labor movement is the need for countries of destination language knowledge. Ignorance of the language of a person is disabled wants to work is essential and makes sometimes impossible to function in professional practice it is ready.

When Romania entered the EU restrictions have occurred. First is that the restriction concerning the right to work through the free movement of persons have not been operated upon entering our country in the European Union, but after a certain period.

By achieving the right conditions to benefit every citizen of the Union to have the freedom to seek, to work to establish or to provide services in any Member State, there are some limitations on the free movement of individuals. So for example, will remain limitations to the granting of work permits.

3. Conclusions

Currently, there is little mobility of workers from Romania to other EU countries. This is done both through legal and illegally ways. Offer jobs to people from Romania, by the EU countries is low and cover only certain professions, usually poorly paid employment.

„pean market and international flows of labor movements, certain adaptations are needed in

the labor market information system. Eliminate the difficulties of human resource management in general, nationally, in conjunction with other sectors and economic activities can not be

achieved without a picture of the main features of labor. In this regard it is important to develop a uniform system of indicators with a database unit integrating the criteria defining the labor market in general, not only after the administration one but currently available.

Abstract

The Environmental Management System (EMS) represents a part of the company general management. ISO 14000 represents the reference standard for EMS implementation worldwide.

The ISO 14001 Standard can be integrated into other management systems to help the achievement environmental and economic goals. It describes the requirements for registration and/or self-declaration of the organization's EMS. Demonstration of successful implementation of the system can be used to assure other parties that an appropriate EMS is in place. It was written to be applicable to all types and sizes of organizations and to accommodate diverse geographical, cultural, and social conditions. It does, require commitment to the organization's EMS policy, applicable regulations, and continual improvement.

The standard ISO 14001 is divided into six parts and has a total of 18 requirements. The numbering system is identical to the standard.

The organization shall establish and maintain an environmental management system that includes policy, planning, implementation and operation, checking, and corrective action, and management review.

Key words: management system, certification, standard, environment

JEL classification: Q59

1. Introduction

The ISO 14001 standard was approved in 1996 and adopted with no modification as European Norm (EN ISO 14001) in the same year. Romania adopted the standard version as

SR EN ISO 14001:1997.

In Romania, ISO 14001 is the only one normative used for EMS implementation, and the certification procedure (according to above mentioned guide) is already enforced.

The implemented EMS can be certified according to the provisions of ISO/IEC Guide 66:1999 and EA 7/02:2000. The European reference for EMS implementation and certification is the Directive (EC) 761/2001/March 2001 of the European Parliament and of the Council allowing voluntary participation by organisations in a Community eco-management and audit scheme (EMAS II).

The EMAS II transposition is the present objective concerning the EU legislation implementation in the field of EMS's certification/registration.

2. Directives concerning EMS

In Romania, environmental issues are among the most difficult and politically sensitive issues to be negotiated during the accession process, first of all in the following economic fields: energy; mining; chemicals and petrochemicals; iron and steel; building materials.

Two major directives will have an impact on these five sectors:

- Large Combustion Plants (LCP, 88/609) for the energy sector; and
- Industrial pollution Prevention Control (IPPC, 96/61) for the other four sectors.

IPPC is probably the only EU environmental directive that focuses on the industrial sector and covers air, as well as water and waste issues. The Seveso directive (96/82) also will affect the sectors to some extent. If the five sectors comply with these three directives (or more precisely with the corresponding transposed Romanian legislation), they will comply with most of the other directives on air,

water, and waste. Some other minor directives (e.g., noise, eco-label, VOC emissions) may also have an impact on the five sectors.

In December 2001, Romania issued its Position Document for the opening on negotiations on Chapter 22. Romania has asked for transition periods to implement the IPPC and LCP Directives: seven years for IPPC and five years for LCP. The EU responded to the Position Document with a Draft Common Position inviting Romania to submit detailed implementation plans and to explain how it would address the negative effects of the requested transition periods.

This report is divided into five chapters. The first two chapters present an overview of the EU Directives with substantial impact on the industry and an overview of the five sectors.

Air Quality Directives

The major focus of the policy in this field has been the improvement of air quality and reduction of emissions from all sources, in particular photochemical substances and those leading to acidification. The raft of measures introduced so far, known as the “Reference scenario” are expected to protect almost all EU ecosystems from acidification and deliver the health-based ozone target of an eight-hour average of 80 ppb proposed by the US Environmental Protection Agency.

Many provisions are necessary to fully transpose the above mentioned Directives into internal Romanian law:

- Taxes on air pollutant emission with impact on human health and the environment;
- Setting up a National Action Plan on Atmosphere Protection for mitigating the emissions in reasonable steps; and
- Designating an authority to adopt and manage a National System for Assessment and Integrated Management of the Air Quality.

Seveso II Directive 96/82/EC

The Seveso II Directive aims to ensure high levels of protection against accidents involving dangerous substances. The aim of the Seveso II Directive is two-fold:

- *Preventing* major-accident hazards involving dangerous substances; and

As accidents do continue to occur, *limiting the consequences* of such accidents not only for humankind (*safety and health aspects*) but also for the environment (*environmental aspect*).

Development of a new international standard

for environmental performance evaluation (EPE), ISO 14031, has added impetus to an already growing realization that systematic and creditable performance measurement is a necessary element if environmental management is truly committed to continual improvement (See also EMAS Regulation).

IPPC Directive 96/61/EEC

The IPPC Directive aims to achieve integrated prevention and control of pollution arising from emission into air, water and land, from the activities listed in its annex:

- Energy industries e.g. power stations, oil and gas refineries;
- Production and processing of metals ferrous and non-ferrous;
- Mineral industry e.g. cement works, glass works;
- Chemical industry organic, inorganic, pharmaceuticals;
- Waste management e.g. landfill sites, incinerators;
- Other activities such as paper and pulp manufacture, fabric treatment and tanning plants, slaughterhouses food and milk processing and treatment installations, intensive livestock rearing units and installations handling organic solvents.

IPPC is a major step forward in environmental legislation, coordinating for the first time the environmental permitting of industrial activities at an international level, and is aimed at bringing with it major advances in improving the quality of the environment. The IPPC requirements also lead to some costs for investments in new and cleaner technology.

The fully transpose the *Acquis Communautaire* in this area; the following legal acts have to be adopted by Romanian authorities as quickly as possible:

- A government decision on environmental information, detailing procedural aspects for access to information, and ways for its dissemination; and
- Ministerial orders for the approval of the methodological norms and of the regulations for collecting, processing, reporting and dissemination of the environmental information, adding the level of tariffs in this respect.

3. Benefits of UE standards implementation

In 2001, the European Commission conducted a study to estimate the benefits of compliance with the environmental *Acquis* for the candidate countries. The study identified and estimated the environmental, economic and social benefits that are likely to arise from the full implementation of the EU environmental legislation (known as the “*Acquis Communautaire*”) in the candidate countries.

- ★ *Likely Benefits due to Industrial Pollution Control*
- ★ *Health benefits*
- ★ *Non-health economic exploitation benefits*
- ★ *Ecosystem benefits*
- ★ *Social benefits*
- ★ *Wider economic benefits*

To facilitate the implementation of the EU environmental *Acquis* in the five sectors, we have three recommendations:

1. Implementation costs will increase production costs significantly and the five sectors should start preparing detailed investment plans.
2. Extending transition periods would facilitate the implementation of the LPC and IPPC Directives.
3. Industrial strategies should take into account the high costs of complying with the EU environmental *Acquis*.

4. EMS Certification in Romania

Romania adopted the standard ISO 14001 in version as SR EN ISO 14001:1997, its main elements are:

- Environmental policy:
 - ✓ Establishes the framework for the environmental goals of the company;
 - ✓ Establishes the commitment for continual improvement, pollution prevention, reduction of environmental pollution and legal compliance.
- Legal requirements:
 - ✓ Legal requirements identification;
 - ✓ Compliance assessment;
 - ✓ Corrective actions in case of non-compliance.
- Identification and assessment of environmental aspects:

- ✓ Identification of environmental aspects resulted from the activities, product and services of the company;
- ✓ Establishing the assessment criteria;
- ✓ Establishing of the significant environmental aspects;
- ✓ This stage represents the first step for environmental performance improvement.
- General and specific environmental objectives:
 - ✓ Establishing the general and specific environmental objectives;
 - ✓ Measurability of the objectives;
 - ✓ Compliance with environmental policy and significant aspects.
- Environmental management program:
 - ✓ Program for objectives implementation;
 - ✓ Establishing the responsibilities, resources and time schedule;
 - ✓ Continual adaptation;
 - ✓ Establishing the procedures and measures in order to complete the objectives.
- Implementation:
 - ✓ Structure and responsibilities;
 - ✓ Training, awareness and competence of the employees;
 - ✓ Internal and external communication
 - ✓ EMS documentation;
 - ✓ Establishing system and operational procedures;
 - ✓ Prevention of emergency situations and response capacity.
- Control and corrective measures:
 - ✓ Monitoring of environmental aspects associated to the performed activities;
 - ✓ Calibration and service of the monitoring equipments;
 - ✓ Assessment of legal compliance;
 - ✓ Actions regarding non-compliances;
 - ✓ Corrective and prevention measures;
 - ✓ Program and procedures for internal audits.
- Management review:
 - ✓ Assessment of the environmental performance;

✓ Modification of environmental policy, objectives or other EMS elements.

The auxiliary legislation concerns the accreditation of EMS certification bodies and certification procedures of the EMS implemented on the basis of ISO 14001. This legislation includes:

- Governmental Ordinance 38/30.01.1998, approved by Law 245/29.04.2002 regarding accreditation and infrastructure for evaluation of conformity;
- Governmental Decision 456/2000 approving the National Plan of the Governmental Program 2001 and 2001-2004;
- ISO/IEC Guide 66:1999 General requirements for EMS certification/registration bodies;
- EA 7/02:2000 Guidelines for the accreditation of certification bodies for environmental management systems;
- SR EN ISO 14010 14012 Guidelines for environmental audit.

The only accreditation body of certification bodies for EMS in Romania is Romanian Accreditation Association (RENAR).

The RENAR requirements for EMS certification are specified in ISO/IEC Guide 66:1999 and EA 7/02:2000. The ISO/IEC Guide 66:1999 is an international guide setting out criteria for bodies operating assessment and certification/registration of EMS. EA 7/02:2000 provides guidance with a view to harmonise the application of ISO/IEC Guide 66:1999 in the field of EMS, by accreditation bodies, their assessors and certification bodies preparing for accreditation.

According to the originating country, two categories of EMS certification bodies in Romania have already assigned EMS certificates:

- A. Romanian bodies: SRAC, AEROQ, and SIMTEX-CO;
- B. Foreign bodies: TUV and DQS (Germany), Bureau Veritas Quality International (France & England), Lloyds Register and BSI (England); their certification activity is performed through their own auditors or by the local offices.

Because RENAR is a full member of the European Co-operation for Accreditation (EA), the Romanian EMS certification bodies (accredited by RENAR) are recognised in the European Union; consequently the EMS

certificates issued by SRAC, AEROQ, and SIMTEX OC are recognised in the EU.

The certification procedure includes:

- application for certification;
- preparation for assessment;
- assessment;
- assessment report;
- decision certification;
- surveillance and reassessment procedures;
- use of certificates and logos;
- access to records of communications from external interested parties to organisations.

EMAS II stipulates the creation of two important organizations to manage the participation of the companies to the Eco-Management Audit Scheme:

- Accreditation Authority to conduct the accreditation system of the environmental experts;
- Competent Authority to conduct the EMAS registration procedure.

Is it recommended that a law regulating the structure, activities, and competencies of these authorities be implemented.

5. Conclusions

The environmental expert must ensure that the organization has the necessary procedures to control its activity's specific aspects, which fall under EU or Member State legislation. Investigations during the environmental audit must prove that the compliance with legal requirements is assured, as results of the created procedures.

The main cost areas for state authorities are those related to:

- ✓ Establishing and maintaining a network of air quality monitoring stations and associated quality assurance equipment, and reporting the monitoring results.
- ✓ Preparing emissions inventories of greenhouse gases and pollutants that significantly affect air quality.
- ✓ Preparing plans and programmes and strategies to achieve compliance with ambient air quality limits.

Abstract

Migration is a complex process and phenomenon with a multi-dimensional and multi-motivational feature, which generated and continues to generate a series of challenges, costs and social benefits that need to be managed by each country facing this issue, according to the national and local social scale in the current context of globalization.

European Union had been focusing mainly on a philosophy of no visas for work and travel for citizens thus dealing with different specific situations about migration: violence, racism, abuse of all sorts, being forced often, to adopt different positions and policies over time. In the 20th and 21st century, Europeans hadn't been strangers of the social, economic and politic changes, but the globalization challenges have imposed lately a new way of intra-European reconstruction, of a new balanced, prosperous capitalist democracy.

Key words: migration, labour market, country of origin

JEL classification: F22

1. Introduction

Due to social, economical and political circumstances of globalization in the 21st century along with changes in education and business environment, many countries have developed intercultural relations, mainly because of the foreign immigrants.

Over time, many studies about immigrant behavior and population perception analyzed a panel of countries like France, Italy, Spain,

Portugal and Poland, countries that had numerous migrants to America in the 19th century, noticing that these immigrants had no conflict whatsoever in their new environment.

Today, because of globalization primarily, these populations are being completely assimilated and even if all the conflicts are yet alive in the history of these people, they do not suffer as they used to. The purpose of this paper is to highlight the fact that work, viewed as a production factor, represents the main reason that determinates labor force mobility in other regions or countries, as a fast response of a asymmetrical shock in the now context of globalization.

Traditionally in Europe, because of a variety of cultural, linguistic and legal barriers, there tends to be a relatively small mobility. The economic and politic transition in Romania had been affecting the socio-economic environment, changing the old patterns of distribution and forcing people to adopt life strategies which reduce the costs of structural changes [1].

The debates about migration refer often to dualistic labor market, which is mostly legal, but partially illegal, for those who work on the black market. The negative selection of

human capital brings emigrants in an inferior economic sector. This study would look for answers at a series of questions: which are the effects of migration upon the social-economic status of the emigrant? Which are the effects upon the receiving country? How is the country of origin affected?

2. Migration sources in the 21th century

The immigrant flows from the developing countries are being seen in the contemporary era as a spreading phenomenon, being motivated by

economic grounds and issues concerning labor force occupation in their country.

Economy, demography, war, persecution, repression and ecology are mostly accepted as the main sources of international culture, as a major subject in understanding the phenomenon that leads to migration. Before deciding to migrate, any person needs to be willing to cross many borders: real or imaginary. It is very important for every individual to surpass his mentality before choosing to move away from home, family, children, community and social life and settle down in another region, country or continent for a better life [2]. The conception about migration is closely bound to the available quantity of information and mainly by education. At the same time, the migration movement can become an element of dispute whenever the immigrants integration is missing in the migration policies; also the lack of education in accepting the immigrants and understanding this fact is another subject of debate.

The economic analysis of migration is confronting with two important problems: why do people migrate and what are the consequences toward the host country and the country of origin; the second one is referring to the functionality of the labor force market mechanism. The costs and benefits of the emigrant are also important; the decision to migrate is build on a multitude of reasons and causes and in general, in our society it is seen as a result of a cost-benefit analysis influenced by positive and negative factors, detailed in the third section of this paper [3].

In this study we have focused on evaluating the interaction between immigrants and the adoptive country, centered mainly on Romania and the preferred destinations by Romanians: Great Britain, Spain, Germany, Italy, France and Sweden. At the top of the list of European countries that offer opportunities for immigrants to adapt are Belgium, Netherlands, Portugal and Finland and at the opposite pole are Cyprus, Austria, Greece, Slovakia, Latvia. Frequently and normally, Romanian emigrants interact with the inhabitants where they establish. But there are countries in the European Union where the absorption process is quite slow, for example Denmark, where the labor force occupation rate is 76% for the Danish population and 47% for the Nord – West Europe's emigrants.

Germany and Great Britain have the experience of emigrants from the period after the World War II, developing in time, an efficient system of recruiting and absorption of emigrants. For example, Germany had recorded a first flow of 12 million ethnic German emigrants between 1945 and 1949.

After 1955, West Germany had recorded a spectacular growth, that led to a big number of immigrants who came from Italy, Spain, Turkey, Portugal and Yugoslavia between 1950 and 1960, rising the number of foreign employees to 2.6 million persons in 1973, representing 12% of foreign labor force (Source IABS Insitute for Employment Reaserch în Nuremberg).

The last census showed that about 5.5 million immigrants from South-East Europe are legally established in European Union and represent almost 30% of the total residents of tierce countries who have the most immigrants: Turkey, Serbia, Albania, Ukraine, Romania, Bulgaria, Moldavia.

The most important countries of origin of the immigrants from OECD are China (11% of the total immigrants), Poland (5%) and Romania (5%). At the global level, the source-countries, who had the biggest increases of the migration phenomenon, starting with 2000, have been, in order, Bolivia, Poland and Romania. Beside Bulgaria, our country records the highest level of emigration in European Union.

While the illegal migration has a negative impact in the European Union, the countries of origin are being affected by the migration and movement of labor force away from different activity fields. Discrimination can be approached as a risk factor for the health of the immigrants, mostly because of social exclusion and marginalization.

A study about immigrants discrimination has been done in Spain based on 84 interviews and 12 goals in 5 cities: Madrid, Barcelona, Valencia, Alicante and Huelva who covers all the im7portant immigrant communities: Romanians, Morrocan, Ecuadorians, Colombians and South-Africans. The responders have related discrimination situations in their community and in their professional life, characterized by racism, maltreating experiences and low working conditions comparing with the Spanish population. Also, they talked about restrictions in accessible fields of opportunity: constructions, hotels, services, housekeeping and agriculture.

Over the past few years, Spain has been submersed in a social and cultural process of integration, following the growth of migration phenomenon from different countries, assimilating cultures and civilizations. The final purpose of these immigrants is to enter the labor force market to improve the living level of their families left behind.

The European Union labor force market is distinguished lately by new social relations, intercultural changes, different traditions and habits, opinions and moral and religious values that take place between the native population and immigrants workers. In most cases, the situation becomes detrimental for the immigrants, who are vulnerable to all these environment changes. Their presence in these countries is giving birth to a series of discrimination situations, racism, verbal and physical violence.

3. Cost – benefit analysis of the social – cultural migration phenomenon

The research and studies in the past few years done on different countries in European Union, have emphasized that the immigrant population can be seen in extreme different ways by the population. The manner in which the immigrants are being absorbed represents a disputed issue, even taboo in some countries, rising social controversies (an example can be the Mailat case in Italy). In some situations, immigrants are making maintained efforts, after a period of time spent on foreign land, to integrate in the new society, adopting values and traditions that belong to the host country.

But things are quite different in the case of the population that accepts Romanian immigrants, the opinions being divided in two big categories: Europeans that believe Romanians are poor, uneducated, incompetent, with no moral values, and Europeans that think Romanians are sincere, professional, tolerant, competent, intelligent.

Of course, we can talk here about two distinct categories of immigrants: persons that subscribe in the nonqualified class, with medium or gymnasium education and the second category of persons with post-high school education, intellectuals with bachelor studies and more, with experience like: doctors, nurses, teachers, engineers, talking about brain migration. In Canada, 54% of the total Romanian emigrants have university studies (because the selection for obtaining the visa is

of such a manner); in Great Britain, 46%; in USA, 40%; in Spain and Italy, 20% each. At this moment, only 8% of Romanian labor force has superior education, comparing with Europe with an average of 20% and 30% in USA (source: study realized by Kienbaum Consultancy in 2008).

The decisions that founded the Romanian migration have been the attraction elements which are positive factors for the countries of origin and destination elements: geographical and cultural proximity and comparative advantages of the destination country.

The immigrants accept unclean and degrading activities to obtain material resources and go back home wealthier. Small income jobs are the most traditionally occupied by the immigrants, not having other opportunities.

Connected with the demographic change, the economic growth and life improving reforms, the emigration is in general, associated with slow economies: slow economic growth, big unemployment rate, loosing budgeted jobs, anti-emigration conceptions, criminality rate and terrorism – being showed this way by the politicians as having more negative effects than positive ones [4].

In the cost – benefit analysis there are many factors: differences between income in some countries; differences of unemployment rate; level of social protection development; migration costs (moving expenses in the migration country, psychological costs with moving out of the birth country). Migration costs include also searching a new job, a place to live and supporting them until a job is found, time and money for obtaining a passport, visa and intermediary payments in case of illegal migration.

If we take the language factor for Romanian immigrants, we will notice that they are being attracted by countries like Italy, Spain and France, even if some of them will choose Great Britain too (because of the over-populated labor force in the other countries). Still, Europeans and national statistics incline to believe that there will not be many immigrants drawn to Great Britain, and those who choose this destination would have previous experience in the field and are willing to change the life climate from a southern country to Great Britain.

In a study done among Balkan immigrants, having the main subject their intention to migrate to another European country based on mother tongue (study realized in Ireland at

Dublin by Living and Working Conditions Improvement Foundation), 54.8% of the Bulgarians and Romanians have responded that they would not migrate on linguistic grounds. All researchers agree that Italians, Spanish and French people are being closer to Romanians socially, culturally and ethnically comparatively speaking with Nordics: English, Irish, Danish, Swedish, Norwegian, Finnish population.

Most Romanian immigrants accept jobs refused by natives, in some fields like: agriculture, housekeeping, construction, hotel; for the employers in the destination countries, immigrants mean low salaries, inexpensive workers and high income. A greater proportion considers that immigrants obtain earnings by working, but a small part of public opinion believes that they are gaining material resources by stealing or begging [5].

The illegal Romanian immigrants have no education or qualification, increasing the number of poor, thieves, and their children have no official access to health care and education. Mostly who work without papers have small salaries, no insurance and difficult conditions of living.

The Romanian emigrant, more than any others, once on the promise land rewrites his biography, changes, it's ashamed with his origin, his native country, his fellow citizen and even his faith and hides into unknown. These loses of country identity make them increase the number of prostitutes, thieves, beggars, felons and criminals [6].

But the most profound effects who will have ample repercussions are the social and cultural ones. Many Romanians who leave to work and cross borders for the first time and bring with them children, relatives, friends, are founding real colonies, resulting a serious collision of civilization. Some studies among immigrants settled in other countries have noticed that over time, because of changes and culture assimilation, suffer transformation of perception and even emotional alterations.

Psychiatric studies among immigrants have confirmed depression and schizophrenia cases for those who come back home; this is due to the fact that immigrants need to assimilate a new culture, live and work in a stressful environment, need to often change their residence and job. All these social and cultural changes lead in time to stress and reflect upon immigrants, giving in time severe health problems.

The cultural transformations bring in time behavior changes, alterations of attitude, faith, social and moral values, aspiration. It is quite difficult to realize an evaluation additionally to the borrowed cultural elements by the immigrants, depending mostly to the age, sex, religion orientation, geographical zone, social class, vocation or profession the immigrant had initially.

Among immigrants, the term acculturation is often used, meaning a group of individuals, immigrants from different countries with dissimilar cultures who enter into a first way of contact, where both cultures coalesced and lend different basic elements: usual expressions, gesture, preferences, taste for varied services, products, bringing visible modifications into their behavior.

Take a note that after a period of time, the immigrants are borrowing, assuming a new culture, a new language, although it can not be specified for sure how much is the adoptive country lending or how much represents the native culture of the immigrant.

The studies from psychology show that the integration, assimilation and even separation, marginalization process adopted by the immigrant population can be seen in a different way depending to the host population.

At the opposite pole of immigrants, there are individuals with superior studies, either diplomats or attached consuls in some countries, or business men who borrow cultural elements just because of simple necessity, having already well shaped moral and cultural values. The integration form that is mostly preferred in Europe among young men, especially teenagers and young adults by the age of 35 is cultural absorption.

At Brussels in 2008 there had been adopted by the European Union Commission – “The Green Cart of migration and mobility: Challenges and opportunities for education systems”, trying to answer to the elicitions involved by migration and mobility flows inside European Union.

According to national and international data, many migrant children in European Union suffer because of educational disadvantage by comparing with their native class mates: early dropout is frequent to these pupils and application to superior education is lower; the studies realized by psychologies show that second generation of migrant families pupils have lower school performances.

This is based on major gaps between social classes in European Union countries, these children parents with a better financial situation having the tendency to withdraw their children from the classes with a big number of immigrant pupils.

Things become subjective when we talk about intercultural effects, traditions, opinions, moral and religious values, in different countries: France, Spain, Italy, Sweden, Norway, Finland, Great Britain, Ireland, Scotland, but the smallest differences between these perceptions of nations are given by the integration behavior of Romanian immigrants as well.

4. Conclusions

Member to European Union since 2007, Romania is a part of European space of freedom, security and justice, therefore it is important for our country and the society we live in to correctly perceive all the challenges brought by the complex migration phenomenon and labor force mobility at European and international level. Romania is not just a simple gate toward international East – West migration (Spain, Italy, Greece and Portugal or to South – North Europe), we are talking here about a real national labor market who needs workers.

As a big part of the native labor force has emigrated already, mainly in South – West Europe (more than 2.5 millions of workers are over borders, both legal and illegal), the Romanian companies can't find qualified workers to benefit of the foreign investments and structural funds from European Union. Counting the actual crisis we are confronting with, the migration flow will accentuate, because Romania will suffer a long period of time negative effects beside West countries, which will make Romanians migrate hereinafter, even though, at the beginning of 2008, a policy of bringing back the qualified persons (in constructions and health) had started.

The national employers before 2009, instead of rising the salaries to Romanian workers, preferred to import workers from poorer countries like China, Moldavia, Ukraine. These are still accepting lower paychecks comparing with the average salary per economy in Romania, but bigger than their origin countries salaries.

Romania had assumed the role of East frontier after European Union adhesion as a

follow up to the tendencies of the 21th century, the legal and illegal routs of migration are already formed, being flexible and capable enough to adapt at the conjunctural modifications.

The migration phenomenon is a permanent changeable process, which gains ground on divers reasons about family ties, relatives or friends. Young Romanians with superior education prefer countries with bigger perspective on professional achievement and relative easy conditions to integrate into the new communities: USA, Canada, Australia.

For the Romanian immigrant, integration consists of knowing the host country language (reading, writing), legal access on labor market, possibilities of growing professional mobility by rising the level of education and professional qualification, equality in front of law, cultural and religious freedom, respect towards the laws and traditions of the country where they live.

For the host society, emigrants integration requires tolerance, openness, agreement to receive immigrants, understanding the advantages and challenges of a multicultural society, access to information about the vantages of a job, intercultural dialogue, respecting and understanding the conditions, traditions and migrants culture (Source: IOM, World Migration 2003).

Romanian migration, held under strict control during communism regime, had known an apart expansion after 1990, as in migration flow volume and diversity of destinations, reasons and social – economic structure of immigrant population from different zones of Romania.

The migration phenomenon followed an upward tendency and implied all the society classes, becoming concomitantly one of the important migration flows at European level. Over the last few years, extern migration had imposed itself as one of the defining phenomena for our poor and in lack of resources society.

Abstract

The Maastricht Treaty states certain criterias that have to be achieved in order for a EU Member State to qualify in undergoing the 3rd stage of UEM, the introduction of the euro. Slovenia followed a plan based-cooperation between government and national bank, with a clear strategy, adopted the euro on January 1, 2007. Slovakia instead, even though it followed a well defined managed to adopt the euro two years later in 2009.

Key words: Economic and monetary union, convergence criteria, fiscal developments

JEL classification: F36

1. Introduction

According to the Treaty of Maastricht a EU member state must meet the cumulative criteria of nominal convergence (inflation criteria, interest rate criteria, fiscal criteria and the exchange rate criteria) to adopt the euro. Also, even if the Treaty does not also refer to a real convergence, as there are no formal criteria and complete agreement to this effect, some experts believe that should be taken into account some variables such as growth rates of GDP per capita, weight and productivity of various sectors in GDP, because during the 90's, the EU included countries with the same economic level, but today, after the accession of Central and Eastern European countries the situation is different, real convergence becoming a reality.

The purpose of this paper is to present comparative steps that were made by Slovenia

and Slovakia joining the EMU and euro adoption. In the first part of this paper we tried to highlight a relevant issue, namely why two countries that became EU members almost at the same time have adopted the euro in two years difference from one another. In the second part of this paper we analyzed the fulfillment of real and nominal convergence criteria by the two countries, trying to find a logical explanation for the first part.

2. Fulfillment analysis of convergence criteria by Slovenia and Slovakia

Slovenia after EU accession in 2004 has coordinated economic policies with other states on the guidelines set by the Commission and, thus, managed to adopt the euro on January 1, 2007. Although Slovakia joined the EU at the same time, only in 2008 sent the request to develop an analysis of the country, confirming the intention to adopt the euro from January 1, 2009.

The analysis can start with the question: why Slovakia failed to adopt the euro at the same time with Slovenia? A good answer would be that in 2002 (Table 1), it met only 2 of the 4 criteria of the Treaty and in the process of assessing the degree of convergence, an important issue is also sustainable convergence. As shown in the Treaty, the Commission and the ECB reports should consider the dynamics of indicators, although reference values are those observed one year before the exam. In this regard indicators reference values are tracked for a period of 4-5 years (in particular the interest rate and inflation).

Table 1. Economic indicators of convergence for Slovakia

	Inflation	General government surplus (+) or deficit (-)	General government gross debt	Long-term interest rate
2002	3.5	- 5.7	43.3	6.9
2003	8.5	- 3.7	42.6	5.0
2004	7.4	-3.0	41.6	5.0
2005	2.8	- 3.1	34.5	3.5
2006	4.3	- 3.6	30.4	4.4

Source: BCE, Convergence report, 2004 and 2006

Also during 2005-2006 (Table 2) Slovenia fulfilled all convergence criteria, while Slovakia only two of them as can be seen from Table 1. Adopting appropriate measures to rapidly reduce inflation and budget deficit were all recommended as possible, but would lead to a disruption of nominal convergence, something undesirable for euro area members.

Table 2. Indicatory of economic convergence

		Inflation	General government surplus (+) or deficit (-)	General government dept	Long term interest rate
SI	2005 - 2006	2,3	-1,8	29,1	3,8
SK	2005 - 2006	4,3	-3,4	33	4,3
RV		2.6%	3%	60%	6.2%

Source: BCE, Eurostat and European Commission

1)The stability of the exchange rate is not included.

2)Average percentual modifications. The data for 2005-2006 refer to the reference period of November 2005-October 2006.

3).The reference value refers to the November 2005-October 2006 period

To continue this assay it is important to note how each of these countries have fulfilled the convergence criteria.

Monetary policy adopted by Slovenia was based on 2 pillars, taking into account both the monetary and economic development. At the same time monetary policy was supplemented by an exchange rate policy, based on non-coverage of the currency fluctuations, this allowing monetary policy to maintain a high level of interest rate, in order to support the disinflation process. Starting from June 28, 2004 when Slovenia participated in ERM II, monetary policy was focused on maintaining parity vis-à-vis the euro. In the period under review, the Bank of Slovenia was facing maintenance of tolar-euro exchange rate, while

maintaining a high level of interest rate, and thus achieved a uniform distribution, comparable with the interest rate in the euro area. This in turn facilitated the transition to price stability. Disinflation process was also supported by fiscal policy and structural reforms, including the dropping of subsidy for contracts and salaries and, as I said before, the gradual liberalization of financial markets.

Thanks to this efforts, Slovenia managed to reduce the level of inflation, so according to the last Convergence Report, which analyzes the reference period April 2005 - March 2006 the average inflation rate records a level of 2.3%, below the reference value of 2.6% (Table 3).

Table 3. Inflation and long-term interest rate developments in Slovenia

	Dec 2005	Jan 2006	Feb 2006	Mar 2006	Apr.2005 - Mar. 2006
HICP Inflation	2,4	2,6	2,3	2,0	2,3
Reference value					2,6
Long term interest rate	3,7	3,7	3,7	3,8	3,8
Reference value ¹					6,2

Sources : European Commission and European Central Bank

1)Calculation for the April 2005 to March 2006 period is based on the unweighted arithmetic average of the interest rate levels of Poland, Finland and Sweden, plus 2 percentage point.

In the long-term interest rate criterion, Slovenia has not experienced problems, in recent years the long-term interest rate followed a downturn. Thus, during the reporting period of April 2005 - March 2006 (Table 3) long-term interest level was around 3.8%, on average hovering below the reference value of 6.2% set by the criterion of interest rate.

As regards fiscal developments in recent years, Slovenia has not experienced major fluctuations, the deficit ratio has deteriorated from 4.3% in 2001, returning to 2.3% in 2004, to 1.8% in 2005 and 1.9% in 2006 (Table 4). The proportion of government debt increased by 4.5 percentage points from 1999 (first year for which data analysis are available) until 2005. It grew rapidly from 24.6% in 1999 to 29.5% in 2002 (Table 3.1), remaining above 29% in the years after 2005. Thus, the reference year 2005 general government budget balance showed a deficit of 1.8% of GDP and public debt ratio of 29.1%, well below the 3% and 60%

respectively. Compared with the previous year, the fiscal deficit declined by 0.5 pp and 0.4 pp in gross debt ratio.

Table 4. Fiscal developments for Slovenia

	2004	2005	2006
Deficit	-2,3	-1,8	-1,9
Reference value	-3,0	-3,0	-3,0
General government dept	29,5	29,1	29,9
Reference value	60,0	60,0	60,0

Source : European Commission and European Central Bank

Slovenian currency has participated in ERM II since 28 June 2004 for approximately 22 months of the reference period of 2 years, between May 2004 - April 2006. Reference value was set at 239.64 tolar / euro, which was the market value at that time. It was established a fluctuation margin of +/- 15% around the central value.

Analyzing the inflation for a longer period, in Slovakia this has been quite volatile, sometimes high. Starting from 1998 Slovakia had an average annual inflation of 6.5% and recorded a downward trend in general. In the first phase inflation increased from 6.7% in 1998 to a peak of 12.2% in 2000, dropping for the next two years to 3.5%, but in 2003 to rose again to 8.5%, and in 2007 reached a low of 1.9%. This volatile route is primarily due to repeated rounds of increases of administered prices and changes in the sector of indirect taxes.

After exchange rate based on cart was abandoned in 1998, inflation was influenced by a monetary policy which had the primary purpose of achieving a certain level of inflation, while taking into account at the same time the exchange rate reported in euro. An amendment of the Slovak National Bank (NBS) in 2001 established price stability as the primary objective of monetary policy, and in January 2005 were announced explicit inflation levels for 2005-2008. NBS has set an inflation target at 2.5% for December 2006 and below 2% for December 2007 and 2008. And as inflation has been influenced especially by repeated increases of energy prices and indirect taxes, the main goal of monetary policy was to counter the adverse effects of these measures. In late November 2005 Slovak koruna passed to ERM II. Central rate was reevaluated in March 2007 and was set at 8.5%. In fact, Slovak koruna was actually continuing the appreciation against the euro since the late '90s.

Exchange rate appreciation and a series of liberalization measures, including financial markets, implemented in the first half of 2000 and reforms meant to increase labor market flexibility and competitiveness of market products led to limit the pressures upon inflation. Since 2006, there were no major structural reforms adopted, but there was a fiscal policy which focused mainly on price stability.

During the reporting period April 2007 - March 2008, average annual inflation rate in Slovakia was 2.2%, well below the reference value of 3.2% calculated according to the Treaty.

Table 5. Inflation and long-term interest rate developments in Slovakia

	Dec. 2007	Jan. 2008	Feb. 2008	Mar. 2008	Apr. 2005 - Mar. 2008
HICP Inflation	2,5	3,2	3,4	3,6	2,2
Reference value					3,2
Long term interest rate	4,6	4,5	4,4	4,3	4,5
Reference value ¹					6,5

Sources: European Commission and European Central Bank

1)The basis of the Calculation for the Period April 2007 - March 2008 is the unweighted average of the interest rates Arithmetic levels in the Netherlands, Malta and Denmark plus 2 Percentage points.

During the reporting period April 2007 - March 2008, long-term interest rates have averaged around 4.5% (Table 5), well below the benchmark of 6.5% interest rate criterion. Interest rate followed a downward trend between 2001 and 2005, reaching 5% in 2003 and 2004 and 3.5% in 2005, close to the euro area interest rate. These developments reflect the reduction in inflationary pressures and increased confidence in monetary policy.

With regard to fiscal developments, analyzing the period 1998-2007 were observed a number of improvements on GDP ratio. Starting from a level of 5.3% in 1998, the deficit increased rapidly to 12.2% in 2000, reflecting primarily the costs of restructuring the banking sector. Balance improved in the next period, the deficit dropped back to a level of 5.7% in 2002 and continued to decline. Slovakia has been the

subject of Council's decision on the existence of an excessive deficit since 2004, the deadline for its correction was being set for 2007. Slovakia under the Council's decision and thus the reference year 2007, recorded a fiscal deficit of 2.2% of GDP, below the reference value of 3%. The Commission therefore recommends the Council to abrogate the decision of occurrence of the excessive deficit for Slovakia. Concerning the debt ratio, between 1998 and 2007 it decreased by 5.1% cumulatively. Initially jumped from 34.5% in 1998 to 50.4% in 2000, mainly due to debt assumption caused by restructuring the banking sector. The debt ratio declined in 2001 reaching 29.4% in 2007. The initially deficit was the most important factor that increased the public debt ratio. The deficit-debt adjustments produced an effect of increasing debt in 1999 and an overall reduction effect in the next period, largely due to payment of debt resulted from privatization certificates. Thus, in the period under review, public debt registered a value of 29.2% of GDP. Compared with the previous year deficit rate decreased by 1.4% and public debt fell by 1%.

Chart 1. Slovakia's fiscal position

Source : European Commission and European Central Bank

Slovak koruna has participated in ERM II with effect from November 28, 2005 for a period of more than 2 years, from April 19, 2006 until April 18, 2008. Agreement on participation in ERM II was based on a series of political commitments of the Slovak authorities to promote a sound fiscal policy, structural reforms, moderate wages and to reduce credit growth. Central rate within ERM II was set to 38.4550 koruna / euro with a fluctuation margin of + / - 15%. Currency has appreciated gradually and the central rate was revalued by 8.5% and set to 35.4424 koruna / euro, with effect from March 19, 2007. After that date, the crown was traded at a rate higher than the central parity diverting up to 8.9%.

Overall, participation in ERM II was characterized by a gradual appreciation of the currency.

3. Conclusions

The Maastricht's criteria are strict and should be interpreted in a rigorous manner for economic stability and maintaining an adequate level of economic development. Thus, proper assessment and analysis of conditions for participation in EMU will be decisive in preparation of convergence for the states that wish to join the eurozone.

In Slovenia inflation remained stable in the month prior to euro adoption and immediately after it. Average inflation stayed stable at 2.5 % in the last three months, whereas year-on-year inflation amounted to 2.3 % in November 2006 and declined to 2.1 % in February 2007. So, if in Slovenia the euro changeover has not affected long-term inflation dynamics, in Slovakia the things weren't the same. Inflation reached 3,7% [1] in march 2009 compared with the same period of 2008.

Slovenia joined the ERM II a few months after joining the EU, being the only state in the ten who successfully adopt the euro on January 1, 2007. It defined very well it's strategy regarding ERM II, successfully managed not to devalue the currency and ,thus, no need to wait another two years to adopt the euro. Thus, Slovenia was the country with the most easy and direct way to integration, the first country that managed to "broaden" the euro area.

Although Slovakia haven't an equally direct way, managed largely by political support but also by the ability of governments to make progress on fiscal and structural reforms, its efforts are significant and we can not observe the advantage that Slovakia it's having comparing with countries which are not members of EMU: stability, both in money and the business environment.

Romanian Foreign Trade: Before and Three Years after EU Accession

DECEANU Liviu – Daniel
PINTEA Mirela-Oana
„Babeş-Bolyai” University of Cluj-Napoca
liviu.deceanu@econ.ubbcluj.ro
mirela.pintea@econ.ubbcluj.ro

Abstract

EU enlargement in recent years implied profound changes in the new member states' international trade; this is explained by the adoption of new principles of trade policy, new tools, able of reshaping international economic relations, causing phenomena of trade creations and trade diversion. Of course, EU enlargement has also marked significant developments in terms of vision on trade in the old member states, these becoming now union partners (custom union also) with some interesting countries in terms of production costs, potential sales and market size.

For a country like Romania, trade is as important as for any other country, due to its advantages – it represents an important growth engine for states at different stages of development. Exporting and importing provide advantages, but, in the same time, represents a delicate subject.

Key words: foreign trade, EU accession, economic integration, trade creation and trade diversion

JEL classification: F14, F15

1. Introduction

Participation in the economic global cycle contributes, currently, at revealing international transactions as a true factor of economic growth [2]. In this context, we can mention beneficial effects for economies such as getting necessary inputs, the possibility of selling domestic resources surplus, export specialization (of course, in those industries in which comparative advantages are held), diversification of internal offer of goods and services. From this perspective, we found it essential – for a state like Romania, which has traversed a long and difficult transitional period – the adoption of appropriate strategies

concerning foreign trade, particularly in the context of EU accession process, which has a considerable impact on all types of transactions with foreign countries.

As regards foreign trade, it should be stressed that the EU is the main global exporter (assisted, not surprisingly, by China), which attests the appetite of the area for international trade; a significantly increased level of transactions is recorded between member states, which is explained by trade liberalization, the elimination of tariff and non-tariff barriers. This generates, in time, a tendency to income convergence; from this point of view, although the present economic and financial crisis that we are facing (and maybe also a systemic one?) and the economic depression caused by it can reduce the positive effects, it is expected that EU enlargement to 27 countries will induce a convergence of economic growth, through a better allocation of resources, a favorable trend of productivity and increased competition in the European market.

Of course, it didn't occur, nor was expected a spectacular intensification of trade relations, and this is simply because trade liberalization between the European states (old and new EU member states) – and hence the preference for exchanges between them – was already a constant before 2004.

2. Romanian Foreign Trade – pre-accession context

Romania's main trading partners in recent years were the European Union countries. In this context, we emphasise the massive diversion in Romanian trade flows after 1989, and the neglect of some traditional partners with good potential (mainly from the ex-Soviet space), which is, in our opinion, an error. Thus, for example, in 2005 our country's top trading partners were Italy, Germany and France. A year later, France was surpassed by Turkey, followed by Hungary and the United Kingdom

of Great Britain, and eventually Germany would become the main commercial partner of Romania, mainly due to massive imports of cars and technology products. In 2006, our country's foreign trade in terms of export was as follows:

Fig.1 Distribution of Romanian Exports, 2006

Source: Website of the Romanian Center for Promoting Trade and Foreign Investments.

During the same period, imports of Romania were divided between the next trading partners:

Fig.2. Romanian Imports division, 2006

Source: Website of the Romanian Center for Promoting Trade and Foreign Investments.

In 2006, FOB exports – amounted to 25,850.5 million euros – exceed with 16.2% those achieved in 2005, a total of 6 sections with 77% of all exports (machinery and mechanical – 20.3%; clothing, textiles – 16.1%, metallurgical products – 15%, mineral products – 10.4%, transport equipment – 9.8% and footwear and similar articles – 5.4%).

The section of machinery and mechanical devices for the first time overtook the garments section that had long occupied first place in exports. Also in this period, CIF imports – amounting to 40,745.8 million euros, up with 25.1% over the previous year, primarily aimed at the following sections (with a share of 76.5% in total): machinery and mechanical – 24.3%,

mineral products – 14.8%, transport equipment – 11.6%, metal products – 9.9%, clothing, textiles – 8.3%, chemical products – 7.6%.

For both exports and imports, pro-European option was strongly felt (16.3% increase in exports to the EU compared with 2005 and 25.9% increase in imports from the EU).

A reality of recent years is represented by the widening of current account deficit. For example, in the first half of 2006, it increased by 40% over the same period in 2005, according to data published by the NBR. In this context, the danger of macroeconomic stability problems, with – as major cause – the deterioration of current account deficit became an important topic. There are multiple explanations for this situation; firstly, the substantial trade deficit (3.4 billion euros only in the first five months of 2006). At the end of the year, the trade deficit reached 14.895 million EUR (FOB / CIF prices), an increase of 4581 million euros over 2005; among the causes, we can note a substantial increase of imports and the reduction of exports to developing states.

It is also important that in the first half of 2006 the goods trade balance recorded a deficit of more than 52% over the same period of 2005. A positive balance was recorded only for services and current transfers – to note here is the importance of remittances from Romanian workers abroad. Another important source of external deficit was represented by transports, while the balance of tourism has maintained the trend of deterioration (for example, in May 2006 was an unfavorable balance of one million euros). At the end of 2006, as illustrated by a series of reports and studies[6], our balance of payments has shown a widening of the negative current account, the level rising to 9.973 million euros, exceeding by 44.8% the one recorded on the previous year. Also it increased the current account deficit to GDP ratio (10.3% versus 8.7% in 2005). Moreover, the current account deficit is boosted by the lending decisions taken by the private sector to invest. Thus, non-government credit is a contributory factor to the chronic current account deficit of Romania.

Regarding the development of foreign trade in the last decade, we exemplify the following set of data, this time expressed in U.S. dollars (values):

Table no.1 : Romania's foreign trade dynamics in the last decade (million U.S. \$).

Year	Export – FOB	Import – CIF	Balance (Export-Import)
1997	8430,07	11278,55	-2848,48
1998	8301,91	11830,94	-3529,03
1999	8499,53	10392,03	-1892,5
2000	10366,52	13054,49	-2687,97
2001	11384,99	15551,61	-4166,62
2002	13868,84	17856,68	-3987,85
2003	17618,08	24003,17	-6385,09
2004	23485,06	32664,04	-9178,98
2005	27729,60	40462,89	-12733,30
2006	32312,50	47011,25	-14698,75

Source: Website of the Romanian Center for Promoting Trade and Foreign Investments

Graph no.1: Dynamics of romanian foreign trade

In order to better highlight the evolution of Romanian foreign trade from year to year, we present a tabular situation containing indexes – chain based – expressed as percentages, regarding exports, imports and trade balance in the pre-accession period (The formula used: $\text{Index} = \text{Value}_{n+1} / \text{Value}_n * 100$):

Table no 2: Chain based indexes – exports, imports and foreign trade balance

Year	Export index	Import index	Balance index
1998	98.48	104.90	123.89
1999	102.38	87.84	53.63
2000	121.97	125.62	142.03
2001	109.82	119.13	155.01
2002	155.01	114.82	95.71
2003	127.03	134.42	160.11
2004	133.30	136.08	143.76
2005	118.07	123.88	138.72
2006	116.53	116.18	115.44

The data highlight a trend of foreign trade that is characterized by steady deterioration of the balance, 2003 being the year that witnessed the most dramatic change; the evolution

underlines an increase of both exports and imports, the latter being placed at a higher level, which has led to a widening trade deficit. In the considered period, until the final year – 2006 – the index of exports peaked in 2004 (133.3%), while the import index presented the highest value in the same year (136.08%), at a small difference compared to 2003 (134.42%). Value speaking, the trade deficit peaked in 2005 (the negative balance being of 12.733 million dollars), while the most dramatic developments occurred in 2003 when the balance has deteriorated by 60% over the previous year, 2002. The highest level of imports was reached in 2006, standing at high rates also in 2005 (40,462.89 million dollars), amount 3.6 times higher than the one in 1997; exports have witnessed the most spectacular growth in 2004 when the index was of 133.3%. Also, in spite of moderating in 2006, our country's trade deficit continued to grow and the negative trend of the balance is becoming more evident.

Evolution of foreign trade of Romania during 1997-2006 presents a number of important characteristics related to trading partners, to the privileged geographical areas in international trade. Thus, in terms of Romanian imports and their distribution by geographical area, we note:

- Increasing imports from Europe (from 77.66% in 1997 to 84.05% in 2006), with a major emphasis on imports from European Union (67.61% in 1997 to 74.44% in 2006);
- Reduction in imports from CEFTA countries in the context of EU enlargement (7.96% in 1997 to 1.33% in 2006);
- Fall in imports from Africa and the Middle East (from 7.55% in 1997 to 4.56% in 2006);
- Maintaining the level of imports from Asia and Oceania.

In what follows, we focus our attention on our country's foreign trade, trying to catch the main trends of development of foreign trade in the post-accession period.

3. Facts and prospects of post-accession Romanian foreign trade

Projections made before January 2007 have underlined the deepening trend of Romania's trade deficit in relation to its main partners. Of course, a responsible projection could not be achieved without taking into account the experience of states that joined the EU in 2004; from this perspective, we underline the

significant developments of exports and imports of these countries. Growth of exports, about 10% annually, or less, has been replaced by a superior one. For example, for Czech Republic this index approached 30% in the first year after accession. For our country the forecast has proved reliable, the rate being about 17% in 2007; of course, the current economic situation, the possible depression – even world-class – is likely to moderate the pace of Development of international transactions.

The starting point of this brief analysis is the consideration of data provided by the National Institute of Statistics and Economic Studies, which allow preliminary sketch of an image of Romania's foreign trade in the aftermath of EU accession.

Thus, we note that our country exports increased from the early months of 2007 – compared with the corresponding period of the previous year – with 5.0% (in lei) or 11.4% (in euro) – the difference is due to currency appreciation against the corresponding months of 2006.

Higher pace of growth of imports compared to exports against 2006 is due to a variety of factors, among them being the trends in intra-community trade of goods, such as: reduction of intra-community transactions of petroleum products by over 40% compared to the same period of 2006, the downward slope of lohn operations concerning textiles, the conclusion in 2007 of the customs procedures begun before accession by the National Customs Authority, mainly for goods in customs warehouses or free zones (the case of vehicles is eloquent on this issue), influences due to the general trade system (Intrastat) for intra-community trade, goods being recorded at the pass of national border and not at their release in circulation.

Regarding the share of intra-community imports in total imports it can be noted a significant increase, reaching 71.5% of total domestic imports; the increase of EU imports has significantly exceeded the increase in imports from other countries in the first half year.

In this context, the trade deficit has significantly exceeded that recorded during the same period of 2006; it can therefore speak of a deepening of it after the accession. The first seven months of 2007 brought an increase of 62.9% of Romanian trade deficit, trend manifested until the end of the year; this trend

can be explained largely through significant advance of imports from other member states. As we mentioned, one of the predisposing factors of higher current account deficit was the non-governmental credit, joining a series of effects of EU accession. In this context, the likelihood of currency depreciation increases significantly.

In order to offer a better view of the development of post-accession foreign trade, we present the following two comparative tables (covering the years 2006, 2008 and 2009):

1. *FOB Exports – using available data on www.insse.ro*

Sections / share in total exports	2006	2008	2009
Machinery and mechanical appliances	20%	24,1%	26,4%
Textiles	16,5%	14,8%	10%
Metal Products	14,7%	14,6%	10%
Mineral products	11,4%	9,3%	6,1%
Vehicles	9,4%	12,4%	16,8%
Footwear / Chemical products	5,5%	9,3%	7,1%
Top partners (share in total)			
Italy	18,4%	15,4%	15,3%
Germany	15,2%	16,5%	18,8%
Turkey	7,7%	6,5%	5%
France	7,5%	7,4%	8,2%
Hungary	4,9%	5,1%	4,3%
Deficit (million euros)	14896	22708,9	9780,6 (reduced with 58% from 2008)
Exports to EU (Share in total)	67,6%	70,5%	74,3%

2. *CIF Imports – using available data on www.insse.ro*

Sections / share in total exports	2006	2008	2009
Machinery and mechanical appliances	23,8%	24%	26,9%
Textiles	8,6%	8,3%	7,1%
Metal Products	9,6%	11,3%	9,7%
Mineral products	16%	13,8%	10%
Vehicles / Agro-food products	10,9%	12,4%	11,2%
Chemical products	7,4%	14,1%	11,1%
Top partners (share in total)			

Italy	14,8%	11,4%	11,7%
Germany	14,9%	16,3%	17,3%
Turkey	4,8%		
France	6,5%	5,7%	6,2%
Russian Federation	8,8%	5,9%	
China			4,9%
Hungary		7,4%	8,4%
Imports to EU (Share in total)	62,2%	69,2%	73,3%

For 2009, we note a decline in imports far more significant than for exports (FOB exports 29,116.3 million euros, down 13.7% in value in euro against 2008 ... CIF imports 38,896.9 million euros, 32.8% decrease in value in euro from 2008), which allowed contracting trade deficit with 58.5% compared to 2008.

Evolution of the value of Romanian imports had an upward character in recent years, but their structure underwent significant changes. There are notable increases in imports of steel products and transport equipment and a fall in imports of mineral products and textiles. After 2007, a number of phenomena related to trade creation and trade diversion became likely to happen. In addition to the structure of imports and exports, our analysis proves relevant to the list of Romania's main trade partners for import and export. Thus, stand out for the last decade a number of shifts, in case of imports, as:

- Significant growth, due to elimination of various barriers, of imports from EU countries: if in 1997 they amounted to 67.61% of total imports, in 2008 they amounted to 69.2% and in January 2009 reached 74.1%.

- Sharp decrease in imports from AELS members states (1.9% in 1997 to 0.8% in 2007) and CEFTA (7.96% in 1997 to 1.33% in 2006) during the European enlargement; it should be remembered here that from 1 January 2007 Romania and Bulgaria have left CEFTA;

- Considerable decrease in imports from Africa, the Middle East and USA.

Regarding export trading partners, we find:

- Export growth in EU countries, but not spectacular, a peak was reached in 2004 when they accounted for 81.64% of total Romanian exports;

- A decrease of exports to other regions – Africa and the Middle East (12.41% in 1997 and 6.20% in 2006), Asia and Oceania (5.43% in 1997 in comparison to 2.57% in 2006), U.S. (5.85% in 1997 and 3.42% in 2006).

The most obvious aspect of post-accession Romanian foreign trade is the Common Customs Tariff. In average, the tariffs applied

by Romania are lower, and this is a key element capable of stimulating exchanges.

4. Conclusions

Romania's European integration will undoubtedly be a long process, and its success depends on the way Romanian economy as a whole will face many challenges, mainly related to efficiency. Increasing competition from markets and deepening of globalization requires more and more factors to be considered.

In our opinion, Romania's success in international trade is linked primarily to the efficiency of production process, a good guidance and identifying key success factors, the differentiation factors so important nowadays. A series of measures should be taken seriously so that the competitiveness of local products improve and exports increase, such as:

- Identification of required products on foreign markets and of sectors with export potential in the Romanian economy - the current National Export Strategy includes clothing, furniture, wine, glass and ceramic items, chemicals, machine building industry, equipment and auto components, rural tourism, IT sector, communications, farming, etc.;

- Reduction of production costs, increase of efficiency;

- Promoting research and development, innovation and ultimately productivity growth;

- Identifying and use of all sources of competitive advantage;

- Trade finance, development of public-private partnerships;

- Shifting to niche markets, promoting national brands;

- Stimulating investments; increasing the competitive strength of companies;

- Providing support services in conducting business;

- Identify alternative markets.

At the same time, it appears necessary to ensure an optimal correlation between investment, consumption and export, as growth engines. But we are convinced that free market mechanism will help to increase the quality and attractiveness of Romanian production. European integration and its impact on the Romanian trade flows is a complex resultant of forces which can only have a positive effect on the Romanian economy and society. The successful integration into the European and the world economy is a difficult task that awaits Romanian economy; trade liberalization, especially with the EU, has played an important

role since the start of the economic transition process. We believe in the benefits of trade creation for Romania, and we consider that these advantages will exceed, in the case of a proper trade policy, the cost of trade diversion.

Trade Effects of European Integration

DOBRE I. Claudia
"Ovidius" University of Constanta
dobre_claudia@yahoo.com

Abstract

In this paper I have examined the trade effects of European integration, analysing four phases in the process of European integration. The first one (up to 1973) can be seen as an example of "traditional" regional integration, where the main effects stem from the reduction of formal tariff barriers between the member states. The second phase (1974 - 1986) involves consolidation of the customs union agreement together with the first stages of monetary integration. The third phase (1987 - 2000) can be characterized as an example of "new" integration, where the aim was to create a truly single market through the removal of non-tariff barriers and the harmonization of product standards and other rules and regulations with an impact on trade. The fourth phase of integration could be illustrated by the enlarged EU, that emerged after the accession of ten new member countries in 2004.

In the first phase of integration, the trade effects are related to some reallocation of production between the member countries and after 2004, by contrast, the main effects emanate from better use of scale economies, with higher efficiency and external competitiveness as the main results.

A common measure of the integration effects is the amount of trade taking place between countries. During the 1990s, the share of the EU-15 in the new member states markets has remained substantially stable, but since 2004 the rate of growth of imports has increased remarkably. After the accession of Romania and Bulgaria in 2007, there has been an expansion in the intra-EU-27 trade flows. In order to assess the significance of such an "enlargement effect", I checked for the existence of a statistically significant change in the values of trade flows after 2004.

Key words: integration effects, trade, single market, Europe Union

JEL classification: D10

1. Introduction

Twelve countries from Central and Eastern Europe and the Mediterranean joined the European Union in two waves in 2004 and 2007. This was the biggest ever enlargement of the EU and a historic step towards unifying Europe after several decades of division resulting from the Cold War. Five years after the 2004 accessions, the enlargement has emerged as a major success for the EU and its citizens, fulfilling one of the original purposes of European integration.

2. The impact of regional integration agreements

Twelve countries from Central and Eastern Europe and the Mediterranean joined the European Union in two waves in 2004 and 2007. This was the biggest ever enlargement of the EU and a historic step towards unifying Europe after several decades of division resulting from the Cold War. Five years after the 2004 accessions, the enlargement has emerged as a major success for the EU and its citizens, fulfilling one of the original purposes of European integration.

The character of European integration has changed over time. *The first stage of integration*, the period 1962-1973, with the custom union as its centerpiece, could be seen as a typical example of "traditional" regional integration, where the expected trade effects are related to some reallocation of production between the member countries. Looking at the first phase of European integration, we also find that several of the industries with high growth in regional orientation record diminishing external competitiveness. Many of these industries belong to the group labelled "Land intensive", which includes agricultural products and other raw materials that were

protected by high tariff and non-tariff barriers.

The second phase runs from 1974 to 1986, and involves consolidation of the customs union agreement together with the first stages of monetary integration. The mid-1980s also saw a shift in the character of the European trade integration process. The achievements during this period were mainly related to the abolition of internal tariffs (which was largely done by 1968) and the reduction of external tariffs through the GATT and bilateral agreements, e.g. with the EFTA countries. Yet, there was a general feeling that the integration process had come to a standstill towards the mid-1980s, as economic growth in the EC fell behind that in the US and Japan.

To revive the stagnant European economy, the EC therefore launched the so called Single Market Program, which was intended to be completed by 1992. The aim of the Single Market Program was to dismantle the numerous non-tariff barriers that had been created. The Emerson et al. (1988) report, which assessed the economic impacts and gains of deeper integration, grouped the remaining barriers into five categories: tariffs, quotas, cost increasing barriers (e.g. delays due to customs procedures and different national regulations), market-entry restrictions (e.g. government procurement restrictions, restrictions on the entry into some regulated markets) and market-distorting practices (e.g. collusion and abusive use of dominant positions of private enterprises). Most of the economic gains were instead expected to emanate and this "new" form of integration was also expected to improve the competitiveness of European producers in comparison with producers from other countries, e.g. the US and Japan (see Gustavsson and Kokko 2004).

The third phase (1987 - 2000) includes a deepening trade integration process leading to the Single Market, as well as deeper integration in the monetary area, through the European Monetary Union. This process can be characterized as an example of "new" integration, where the aim is to create a truly single market through the removal of non-tariff barriers and the harmonization (or more often, the mutual recognition) of product standards and other rules and regulations with an impact on trade.

An impact on European integration was the development of the multilateral trading

system, together with the great increase in preferential trade agreements between the EU and its various trade partners. As a result, Europe's nominal protection levels have fallen dramatically, and most developing countries have duty-free access to a large share of the European market. In the manufacturing sector, the average tariff has fallen below three percent, which means that there is in principle free trade in most of the product groups. Developing countries in Africa, Latin America, and Asia have apparently been able to exploit these opportunities, and their shares of EU imports have increased substantially since the early 1980s.

The announcement of the Single Market Program not only affected the EC (which now became known as the European Union), but it also had effects outside Europe. Many of Europe's trade partners voiced fears about the emergence of a "Fortress Europe" where internal trade would expand at the expense of trade with the rest of the world. As a result, by the early 1990s, all EFTA countries except Iceland had announced their intention of joining the EU in the future. The first step in this expansion was the establishment of the European Economic Area (EEA) agreement in 1994, which essentially extended the Single Market to include the EFTA countries (although Switzerland opted not to join). In 1995, Austria, Finland and Sweden joined the European Union, but Norway decided to stay outside after a novote in a referendum.

A fourth phase of integration could be illustrated by the enlarged EU that emerged after the accession of ten new member countries in 2004. This enlargement not only involved a larger number of countries than earlier enlargements, but it also differed in character, since the income levels and economic structures of the new members were notably different from those of the 15 incumbents. Following the fall of the Soviet Union, the former socialist countries in Central and Eastern Europe were looking towards western Europe for support and partnership. The EU recognized the need to contribute to the integration of these countries, and required them so called Copenhagen Criteria from 1993. Twelve Central and Eastern European countries - Estonia, Latvia, Lithuania, Poland, Hungary, the Czech Republic, Slovakia, Slovenia, Malta and

Cyprus in 2004, Romania and Bulgaria in 2007, joined the EU.

The present paper deals with the relation between European economic integration and international trade. Establishing a single common market increases competition between the member countries and changes the competitiveness of national industries requiring adjustments in the structure of the production and distribution processes.

This is the aim of this paper, where we show that integration is indeed deep in a number of areas, but it is still a goal in others. There were still relevant differences in the economic structures of the old members and members-to-be and such differences led to think that it would have taken a long time and many efforts to integrate this heterogeneous group of countries. The most common measure of integration is the amount of trade taking place between countries. The free circulation of goods and services within the EU is also one of the pillars of the European single market.

3. Implications of integration on European trade

Enlargement has opened, for enterprises in the old Member States, new markets for exports and foreign investment. It has offered them opportunities to increase their efficiency and competitiveness. With a well-educated labour force and a similar legal, institutional and regulatory environment, new Member States offer ample opportunities in this regard. Although the restructuring involved may imply sizable adjustment costs in the short term, they increase the global competitiveness of EU enterprises and ultimately help safeguard jobs and boost growth all across the EU. Indeed, in several sectors (machinery, furniture, medical instruments, chemicals, wood) investment in new Member States went hand in hand with employment in the old Members.

The structure and volume of European trade has changed substantially during the past four decades, as European integration has become progressively deeper and more countries have joined the common market. While the composition of the EU group has changed over time with the accession of new members, the EU9 group remains constant over time,

including those countries that had joined by 1973 (Belgium, Luxembourg, Denmark, France, Germany, the Netherlands, Ireland, Italy and the UK).

EU exports have grown very rapidly over the period, with particular growth spurts during the second half of the 1970s and 1980s, as well as over a few years in the mid-1990s. The short-term growth rates have obviously been affected by global macroeconomic developments, with events like the second oil crisis in the early 1980s and the crisis in the early 1990s leaving clear marks on performance. However, the main driving forces are likely to be related to income growth and trade liberalization: trade has expanded as trade partners have grown richer and tariff barriers have fallen. However, the tariff reductions have not been uniformly distributed across regions and goods.

Trade liberalization has proceeded faster for the relations between developed countries than for North-South trade. In particular, Europe has been able to reduce its internal trade barriers faster than the barriers to trade with other regions. In terms of goods, the liberalization of trade in manufactures has been faster than the liberalization of trade in agricultural products. These distinctions have also affected EU trade.

Intra-regional trade has increased greatly in importance during the period 1960 - 2000, from about 40 percent to around 60 percent of total exports. Two observations can be highlighted. Firstly, the period from 1962 to 1973 exhibits very rapid increases in the share of intra-EU trade, at the same time as the share of Europe as a whole remains more or less constant. Since no new members were admitted during this period, there is reason to suspect some diversion of trade from non-members (mainly EFTA countries) to members. Secondly, the increase in the intra-EU share since the mid-1980s has coincided with the expansion of the European Union: trade with Europe as a whole, including members as well as non-members, has remained fairly constant at around 70 percent of total exports.

Looking at the commodity structure of EU trade, it would be reasonable to expect the pattern of exports and imports to reflect the comparative advantages of the EU and its trade partners. Overall, capital and technology intensive products were dominant in 1962, with each of the product groups accounting for 27-28 percent of total exports.

In addition, the Northern expansion of the

EU in 1995 added member countries (Austria, Finland, and Sweden) with substantial capacity in human capital intensive and technology intensive sectors. The implication, that the EU has comparative advantages in relatively advanced industries, is well in accordance with the stylized picture of the EU as a region with relatively abundant human capital and technological assets.

Looking separately at intra-EU and non-EU exports, some further observations emerge. Firstly, it is obvious that the increases in intra-EU exports have been concentrated to human capital and technology intensive products: these product groups have increased their shares of intra-EU exports as well as total EU exports.

Turning to the *import* side, a first point to note is that the shares of intraEU and non-EU imports have remained relatively stable over time. In 1962, the intra-EU imports corresponded to approximately 52 percent of total EU imports: in 2000, the share was 54 percent. Capital intensive and land intensive products were the largest product groups in 2000, but technology intensive products were more important until the 1970s. The predominance of land intensive products is probably an indication of remaining trade barriers: there is no reason to believe that the EU would have substantial advantages in these product groups if the European market was completely open to foreign competition.

However, it should be noted that the fluctuations in the shares of the different product groups are uncomfortably large.

During the 1990s, the share of the EU-15 in the new member states markets has remained substantially stable, but since 2004 the rate of growth of imports of the new member states has increased remarkably. After the accession, there has been an expansion in the intra-EU-25 trade flows, also because the amount of trade among the new member states expanded. In order to assess the significance of such an « enlargement effect », I checked for the existence of a statistically significant change in the values of trade flows after 2004.

Trade flows have increased rapidly between the EU-15 and the candidate countries already in the 1990s. In 2003, when most barriers to trade flows had already been removed, even if formal membership was not achieved yet, the EU-15 was the destination of 67% of the future member countries' exports and originated 58% of their imports. For all of the new member states (with the only exception of

Lithuania) before the accession, the shares of trade with the EU-25 were above the average of all members, and they were much higher than the ones of many older members.

The new member states share in intra EU-25 exports has increased substantially in the last few years, and this is true for all the countries involved. After the accession, the new member states shares in the EU-15, which were increasing since the mid-1990s, experienced an acceleration.

During the 1990s, the share of the EU-15 in the new member states markets has remained substantially stable, but since 2004 the rate of growth of imports of the new member states has increased remarkably.

After the accession, there has been an expansion in the intra-EU-25 trade flows, also because the amount of trade among the new member states expanded. The relevance of the new member states in EU trade is much higher than their weight in term of economic development.

An enlargement that takes place during a period of increased globalisation is clearly different from previous enlargements. This can be seen in the rapid increase, albeit starting from a low level, in the market share of the new Member States after 2004. In general, trade by both the new and old Member States grew faster after the 2004 enlargement (by 12.8% and 6% respectively) compared to the preceding five-year period. In most of the regions in the world, trade grew faster from 2004 onwards, compared to the preceding five-year period, with the exception of China.

Interestingly, extra-EU trade grew faster than intra-EU trade after the 2004 enlargement (by 10.4% compared to 8.7% on average in 2004-2007). This suggests that the creation of trade (additional gains due to reduction of trade barriers between the Member States) was stronger than the trade diversion effect (losses due to shifts of trade flows from third countries towards the Member States).

The new Member States as a group increased their market shares in all country groups to which they exported in 2007 compared to 1999, although the shares are still relatively small compared to those of the old Member States. This confirms that, generally, the new Member States were able to improve their international competitiveness

thanks to their transition dynamic during the last decade.

4. Conclusion

The latest enlargements of the European Union have brought greater economic prosperity for all EU citizens and made Europe a stronger player in the world economy. The enlargement helped further unleash the growth potential and increase the resilience of the European economy by deepening economic integration and boosting competitiveness. The enlarged EU is now the largest integrated economic area in the world, accounting for more than 30% of the world's GDP and more than 17% of world trade (excluding intra EU trade).

It is reasonable to conclude that different European regional integration agreements are likely to have different trade effects. The character of European integration has changed over time. The first stage of integration, with the EEC customs union as its centerpiece, could be seen as a typical example of "traditional" regional integration, where the trade effects are related to some reallocation of production between the member countries. The latest stage of integration, by contrast, is an example of a "modern" regional integration agreements where the main trade effects emanate from better use of scale economies, with higher growth, efficiency, and external competitiveness as the main results.

The current severe global economic crisis poses major new challenges for national policies. The crisis impacts all Member States through declining trade, reduced availability of financing, plummeting household wealth and deteriorating confidence. Although EU membership, and even more so euro area membership, provides protection and a stability anchor that expands the comfort zone of investors, the crisis puts a large premium on sound domestic policies. All Member States that have experienced a credit boom have developed similar vulnerabilities, such as a high dependence on foreign savings and weak balance sheets in the corporate and household sectors. The EU is working to

restore stability, transparency and confidence in the financial sector by addressing not only the most prominent failings but also tackling the need for a more profound reform of the regulatory and supervisory system.

Abstract

Budgetary funds are used to finance all EU policies the respective budget year. Budget EU. reflected the key stages of European integration.

Developments such as the single market, enlargement, developing a global vision on Europe, have required each time, changing pattern of EU spending. Existing regional inequalities within the EU are not evenly distributed. European Union looks like a puzzle regions in very different stages of economic development, there are major discrepancies even within Member States, and prosperous regions coexist with poor regions.

Basically, today, U.E. became extremely heterogeneous, with large differences in the development of Member States and regional level.

Key words: European budget, regional policy, European integration

JEL classification: O18

1. Introduction

Budgetary funds are used to finance all EU policies the respective budget year. Expenditure categories are extremely diverse and have a large scope.

EU policies have seen enormous changes in the last decade and the budget has tried both promoting and reflecting this evolution.[1]

2. Regional development and European integration

EU Budget reflected the key stages of European integration. Developments such as the single market, enlargement, developing a global vision on Europe, have required each time, changing pattern of EU spending.

Year 2008 opened a new stage in this development, since, first, policies aimed in particular growth and jobs will absorb most of the EU budget EU expenditure profile has changed considerably over time: traditionally, most of the EU budget was concentrated on a relatively small number of policy areas. However, both within and outside these areas, expenditure priorities and policy objectives pursued have evolved. Budget reform is always a hit intrinsic conservatism.

Despite the fact that reform is a political challenge, there was potential for significant shifts and changes, although sometimes came late response.

Budget structure and its size, a trend continues [2]:

- The beginning of the integration process, each of the– three European Communities had a specific budget. The first budget of the European Economic Community (EEC) was very small, covering only administrative costs;

In 1965, payments for Common Agricultural Policy (CAP) – absorbed 35.7% of the budget and increased to 70.8% in 1985. In the first year of the 1988-1992 financial expenses accounted for 60.7% of the CAP budget. By 2013, the share of traditional CAP spending (excluding rural development) will decrease by half (32%), following a reduction

in real terms occurred during the current funding period; - only 6% of the EU budget

in real terms occurred during the current funding period; - only 6% of the EU budget was spent on cohesion policy in 1965, a share that has known only a mild increase in 1980 (10.8% in 1985).

Single European Act put an emphasis on economic and social cohesion and was followed by a significant increase in expenditure on cohesion. The amount devoted to structural measures already risen to 17.2% in 1988 and will represent 35.7% of EU budget in 2013, with at least two thirds for competitiveness, growth and jobs; funding for other policies (in particular, competitiveness, external actions and rural development) was initially very limited. In the first financial framework, only 7.3% of the budget was reserved for those areas. However, the new emphasis on growth and competitiveness will lead to increased share of these policies by 26% in 2013, of which 10.2% for competitiveness, external actions and 6.3% to 7.3% for rural development.

Expenditure policies for 2007-2013 have new priority objectives of growth and employment and new policy directions such as freedom, security and justice. Meanwhile, the decision to conduct a review confirmed that a more thorough assessment, which provide a context for defining long-term proposals for the next financial framework and distant future.[3] The challenge is to develop a budget for the future, anticipating future challenges in a world facing rapid change. As budget evolves from a financial framework to another, each frame is characterized also by her flexibility. While some programs have continuing costs, changes in the political situation may also test the ability of the EU budget to adapt to produce optimal results and to increase political responsiveness.

EU regional policy, in addition to being focused primarily on how the economy works in the various regions, seeking to find solutions to the following two categories of problems: reduction by elimination of interregional disparities in the economies analyzed chronically; impact assessment using various instruments of regional policy on regional economies under examination.

Regional policy in the EU is a very important role and the objectives established at national level: opportunities for those who want to work, achieving a satisfactory pace of economic growth, income distribution and

welfare in an equitable manner across the whole economy.

In other words, regional policy is the way the benefits of a prosperous modern economy can be allocated effectively to ensure equitable development of the entire society. This has a double impact: on the one hand, allows prevention "arrhythmias" that may occur in the economy, due to excessive economic development in certain areas - the negative externalities of congestion, the emergence of inflation - and provide sustainable economic development and on the other hand, contribute to reducing socio-economic inequalities between some areas and preventive emergence of new inequalities.

Existing regional inequalities within the EU are not evenly distributed. European Union looks like a puzzle regions in very different stages of economic development, there are major discrepancies even within Member States, and prosperous regions coexist with poor regions.

EU regional policy is to concentrate financial resources and technical assistance towards the poorest regions and, in this context, decentralization of regional policy at European level would lead to disputes between regions and between countries, a dangerous competition for allocation of funds, the net detriment of poor countries and regions.

Being primarily a policy of solidarity, EU regional policy must have a unified character in order to ensure consistency measures for regional development and convergence of regional policy instruments in order to achieve the ultimate objective of economic and social stability of the entire Union.

EU regional policy aims to correct imbalances in regional population distribution and location of poles of development in the EU Net support convergence between Member States' economies.

EU regional policy is quite recent, initially, it was not an essential element of EU policy This is because the EU founding Member were developed economically, the only exception being a regional southern Italy.

Extending EU in 1973, which joined Denmark, Ireland and the UK, resulted in the emergence of major regional disparities. This is because northern England and Northern Ireland are faced with high unemployment and a per capita income level below the EU average In addition; Ireland was much less developed economically than other member

states. GDP per capita represented Ireland in 1973, approximately 50% of the E.U. 6.[4]

Accession of Greece, Spain and Portugal to the EU was the last argument in favor of implementing a common EU regional policy, 1990 led to German reunification. Following this process, resulting in 17 million people whose incomes were only 35% of average EU income, Following EU enlargement, in 1995, 2004 and 2007, regional disparities widened further.

Basically, today, EU became extremely heterogeneous, with large differences in the development of Member States and regional level.

3. Conclusions

The main challenges which the European Union must now deal with them refer to:

- economic restructuring
- globalization
- trade liberalization
- technological
- revolution
- aging
- labor migration
- slow pace of economic growth
- rising unemployment
- The global crisis.

In this context, EU cohesion policy needs, which is implemented the most commonly, through tools that are provided by regional development policy.

Structural instruments (2007-2013)

Structural instruments		Objectives	Sphere of content
Structural Funds	F E D R	Convergence Regional competitiveness and employment European territorial cooperation	Lisbon Infrastructure Investment Research and development

	F S E	Convergence Regional competitiveness and employment	Lisbon -Training; - Employment; - Institutional capacity and administrative efficiency

Implementation and Evaluation in Romania of the Integrated Border Security System (SISF)

FULGA Mircea

Ministry of Administration and Interior, DGCTI

MARINESCU Desiree M.A.

Academy of Economic Studies of Romania

desiree_marinescu@yahoo.com

Abstract

EU's objective to „maintain and develop the Union as an area of freedom, security and justice” is transposed into the Romanian national strategy. The EU Member States have a common interest to implement a security system.

The increase of complexity and scale in cross-border crime emphasised the need for an integrated border management. As part of the state border management, the Integrated Border Security System (SISF) consists of a complex of organizational measures and coordination structures with responsibilities in the field, integrating existing surveillance and control systems, incorporating new ones. This system creates the bases for free movement of persons and goods within community borders.

The evaluation of the National Strategy of Integrated management for the Romanian Border is made by the Romanian Inter-ministerial Group for Integrated State Border Management (GIRMIFS) based on the DAC Criteria developed by Organisation for Economic Cooperation and Development (OECD).

Key words: EU border, Integrated Border Security System, evaluation

JEL classification: F52, K39

1. Introduction

This paper is presenting the concept of the Integrated Border Security System (SISF) in Romania as part of the country's integration in European Union.

Following Romania's EU accession on 1 January 2007, according of the Protocol on the Schengen *acquis* integrated in the Treaty on European Union, Romania has to fully accept the Schengen *acquis*. As part of the three pillars, in the field of Justice and Home Affairs the EU objective is to „maintain and develop the Union

as an area of freedom, security and justice”. Romania is achieving it through the national strategy based on the integrated border management.

Creation of a new concept of border security and setting up of new surveillance technologies are of interest for both Romania and the EU, since the Romania's border with Ukraine, Moldova, the Black Sea and Serbia are now EU external borders.

2. The four-tier access control model

The integrated state border management consists of four levels in line with the provisions of Schengen Catalogue „The Control of the External Borders, Removal and Readmission” and the National Strategy of Integrated Management for the Romanian Border.

The four-tier access control model forms the core of integrated border management. Each tier covers specific objectives, as described below:

1) Tier I – Activities developed in third countries, especially in the countries of origin and transit of the illegal migration

The first tier consists of a set of measures that Romania will take in third countries, particularly in countries of origin and transit with migratory potential or in areas with active terrorist activities.

Actions are developed by internal affairs attachés, liaison officers and collaboration with various international institutions in order to prevent and combat cross-border crime carried out in other countries.

2) Tier II – International cooperation regarding the border

The second tier includes measures and actions undertaken jointly with the institutions responsible for state borders in order to enhance the cooperation with other EU

Member States and neighbouring countries. The main measures aim to developing a bilateral legal framework, signing and implementing the legal provisions related to state border, border cooperation, border crime and improved exchange of information.

Cooperation is made by establishing appropriate working mechanisms such as exchange of information, appropriate communication channels, central, regional and local, contact points, emergency procedures, handling incidents, etc.

3) Filter III – Control and surveillance of the Romanian Border

The third tier ensures border control of persons and goods passing the external border, ensuring in the same time adequate border surveillance between border crossing points or on the sea. This filter comprises of measures related to adapting legislation in line with the *acquis communautaire*, provision of infrastructure and proper facilities for control and border surveillance.

Border control has two components:

- *border passing control*: control at border check-points to ensure that people and goods crossing the border are allowed to enter or leave the territory of EU Member States,
- *border surveillance* in order to prevent passing of persons who seek avoidance of border controls.

Thus, border control is part of national crime prevention. The measures detect and reveal human smuggling, stolen property and other cross-border and border-related crimes as well as contributing to the detection of serious crime.

4) Filter IV – Activities developed inside the national territory

The fourth tier sets out measures undertaken within the area of free movement. These actions are carried out on national territory in order to prevent and combat illegal migration and cross-border crime through enhanced searches, controls and surveillance measures based on existing national information.

Member States define specific standards for control measures within their territory, according national law.

3. Operational components of the Integrated Border Security System (SISF)

European Union promotes the principle of open and secure borders. The need for an

integrated border management is emphasised by the increase of complexity and scale in the cross-border crime.

The integrated border management comprises of a complex set of organizational measures and coordination structures with clear and specific responsibilities in the field of border security in order to facilitate the free movement of persons and goods within the community borders, in line with the principles underpinning the European Union treaties.

The integrated border management is established based on five strategic objectives, namely:

1. border control and surveillance based on relevant risk analysis and processed data and information on crime,
2. cooperation of the authorities in the discovering and investigation of cross-border crimes,
3. ensuring implementation of four-tiers model (measures in third countries, cooperation with neighboring countries, border control and control measures within the community space);
4. inter-institutional cooperation both at national (between national authorities with competence in the field – border police, customs, police,) and international level,
5. coordination of national institutions activities with the community organizations.

The main tool to implement the integrated border management is the Integrated Border Security System (SISF). It is a real challenge to policy makers and stakeholders involved, in terms of design and implementation.

The Integrated Border Security System (SISF) is a comprehensive complex system aiming to ensure state border security in order to accede into the Schengen area. It integrates several technical and operational sub-systems on a communication platform specifically designed, composed of several applications enabling real-time information exchange between national and international structures with responsibilities in border control and monitoring. In the same time, the system is open, allowing interconnection with other national and international systems, being characterized by flexibility and heterogeneity.

The institution with direct responsibilities is the Police Border.

The Integrated Border Security System (SISF) has three inter-correlated components,

which act as a whole. These are:

- a. *operational component* represented by the legal framework, trained staff responsible for operating the SISF and operational procedures for the integrated border management,
- b. *technical component* consisting of the support sub-systems of SISF,
- c. *training component* comprising the e-training, testing and evaluation to comprehensive training for integrated border management.

SISF comprises of a group of processes (included in the information sub-system) and

operational elements (represented by actual sub-systems). The processes are defined as a sequence of activities and actions undertaken at different levels in the structures responsible for state border security and consist of collection, selection, processing, analysis, transmission and storage of data and information needed for preventing and combating cross-border crime.

The SISF support sub-systems are operating in close correlation. In figure 1, we present the relation between these sub-systems.

Figure 1. Correspondence between the SISF sub-systems

4. Evaluation of the implementation of the Integrated Border Security System (SISF)

Evaluation is not only a process that analyses the results by reporting the results and outputs to a set of defined criteria and specific performance indicators, but also the process that assesses the performance of existing actions and draws up recommendations for further improvement. In view of this statement, the evaluation is not limited to reporting on the achievements, and also to assist in an efficient allocation of resources and provide input for future actions.

The DAC Criteria developed by Organisation for Economic Cooperation and Development (OECD) define the most relevant criteria to be applied in evaluation. These are considered in evaluation of the development assistance programmes and projects and analyse the key elements of public interventions as defined in the logframe. The five criteria are as following:

1. *Relevance* – examines the extent to which stated objectives are appropriate to the addressed issues and the project feasibility in relation to the environment where it is implemented;
2. *Efficiency* – evaluates the link between resources involved in project, activities performed and obtained results if the cost is reasonable, in other words “value-for-money”;
3. *Effectiveness* – concerns the degree to which the project achieves its objectives through the envisaged activities and provision of foreseen outcomes;
4. *Impact* – follows the impact of short, medium and long term, how the project affects the environment, the political and social aspects, changes in behaviour etc.;
5. *Sustainability* – refers to long-term positive benefits that the project can bring, taking into account its connection with other projects.

The monitoring and evaluation of SISF implementation is based on these criteria. The assessment is made checking the degree of achieving the objectives foreseen in the National Strategy of Integrated State Border Management. Thus, the following issues are pursued with priority:

- coordination of actions of each institution with those included in the National Strategy,

- prioritisation of tasks and consistency with the general objectives for border management,
- allocation of required funds to finance the programme,
- monitoring and on-going evaluation of the implementation status of the National Strategy.

The evaluation of the National Strategy is made Romanian Inter-ministerial Group for Integrated State Border Management (GIRMIFS) during the working meetings. The evaluation reports comprise the status of the SISF implementation and provide recommendations and measures to accelerate implementation and/or to avoid inconsistencies, and to correlate the National Strategy with the up-dated situation in the field.

Practically, the evaluation compares the results of the activities defined in the National Strategy and the Schengen Action Plan and the established objectives. The evaluation conclusions are used to emphasise the future improvements and support the decisions for changes.

Annually, it is elaborated an implementation report of the National Strategy and it presents the status of SISF implementation SISF, actions and activities undertaken in accordance with the Schengen Action Plan.

5. Conclusions

Romania's borders comprise both EU internal and external borders. The Integrated Border Management is part of the common European space and joint efforts are needed to support its security. Therefore, the implementation of the Integrated Border Security System (SISF) is important for both Romania and European Union as a whole.

The Integrated Border Security System (SISF) is a complex system, integrating several sub-systems on a communication platform. It represents an innovative concept. SISF is part of the Schengen *acquis* and Romania is implementing it to promote the open and secure border principle.

Principles of European Union's Action for Consumer Protection in the Internal Market

GHEORGHIU Gabriela
„Ovidius” University of Constanta
gabi_eforiesud@yahoo.com

Abstract

Although there are a variety of directives and regulations which fall within the field of EU consumer policy dealing with a rather diffuse range of consumer issues, it is nevertheless possible to identify certain key principles, or techniques, which are common to many of these measures. Principles analyzed in the present paper facilitate the legislative harmonization in this field at European level in order to encourage consumers to action in the EU internal market.

Key words: consumer protection policy, harmonization, principles, regulation

JEL classification: D18, F15, O52

1. Introduction

The creation, growth and development of the European Union (EU) have, over the last fifty years, freed its citizens from all sorts of restrictions. Progress has been especially marked since the creation of the “internal market”, a decade ago. National frontiers between EU countries have been virtually dismantled and the four freedoms – the freedom of movement across internal EU frontiers of people, goods, services and money – were put in place by 1993. This was the beginning of a process which is constantly expanded, refined and updated.

The internal market allows all these citizens to move around with unprecedented freedom, to choose from a vast range of products and services, and to enjoy top standards of protection for their security and health. They can live, work, study and retire in the EU country of their choice. They enjoy ever-expanding legal rights as citizens and consumers.

2. State of the art

Promoting consumers' rights, prosperity and wellbeing are core values of the European Union. That is why consumer policy is central to the EU's objective of continuously improving the quality of life of all European citizens.

Consumer policy first emerged in the mid – 1970s. Treaty of Rome (1957) did not provide for such a policy and it was not until the Paris Summit in 1972 that the heads of state and government first called for political action in this area.

The first action programme on consumer policy was published by the European Commission in 1975. This reference text cites five categories of fundamental rights which represent the basis for Community legislation in this area:

- the right to protection of health and safety;
- the right to protection of economic interests;
- the right to redress;
- the right to information and education;
- the right to representation.

Other action programmes followed and enshrined a certain number of fundamental rights and principles.

The Single European Act (1987) introduced the notion of “consumer” into the Treaty, consequently allowing the European Commission to propose measures aimed at protecting consumers, taking as a base a “high level of protection”. The Single Act also removed the requirement for unanimity in adopting legislation concerned directly or indirectly with the protection of consumers.

The perspective of completing the Single Market highlighted the existence of an European market of more than 340 million consumers and the need for new rules to increase consumer confidence in the opportunities of cross-border trade.

The Maastricht Treaty (1992) enshrined consumer protection as a fully fledged Community policy, stating as a general principle the Community's obligation to contribute to the "strengthening of consumer protection".

The food crises of the 1990s, such as "mad cow" disease, dioxin-contaminated feed and adulterated oil, marked a turning point in the policy of consumer protection and, especially, food safety. They highlighted the limitations of EU legislation and engendered a strong reaction on the part of the public authorities. The adoption of sector directives has resulted in differing approaches and level of application in the Member States, with legal gaps remaining unfilled in some areas.

European Commission carried out a structural reform of its services based on reinforcing health protection. It reorganized the departments concerned with consumer health and food safety, with separation of responsibilities in relation to the drafting of legislative texts, scientific consultation and inspection, and the transparency and dissemination of information.

The Treaty of Amsterdam (1997) gave a new impetus to consumer policy, stating that the Union's general aim is to protect the health, safety and economic interests of consumers and to promote their right both to information and education and to organize themselves in order to safeguard their interests. A very important provision of the Treaty is related to the necessity of taking into account the consumer protection requirements in defining and implementing other EU policies and activities.

The Treaty of Amsterdam extended the application of codecision procedure to most cases where food safety is an issue, being also fully applicable to consumer protection and public health.

Faced with enlargement, and in order to fully benefit from the internal market, consumers needed simpler and more uniform rules, a similar degree of application throughout the Union, more accessible information and education measures and effective appeal mechanisms. In consideration of these needs, the consumer policy strategy for 2002-2006 set itself three objectives: a high common level of consumer protection; the effective enforcement of consumer protection rules; and the involvement of consumer organisations in EU policies.

The last proposed Health and Consumer Protection Programme for 2007-2013 builds on the two existing Public Health and Consumer programmes and seek to maintain and develop their specific areas of work. Bringing the two policies together generates greater policy coherence, economies of scale, increased visibility and streamlining of procedures, and reinforces the potential to ensure that citizens' interests are taken into account across the board in EU policies.

3. From Minimal to Maximal Harmonization in European Consumer Protection Policy

For many years, the dominant philosophy of consumer protection policy in European Community was the *minimal harmonization principle* applied to certain limited areas. This was combined with *mutual recognition principle of national standards*, unless receiving states could justify imposing higher standards under EC law.[1,2] Although it was recognized that some areas needed to be totally harmonized, for the most part European Community saw its role as creating a floor of rights on which Member States could build. The model was one under which European consumer protection could progressively be improved by building on best practices from the Member States.[3]

Based on minimum harmonization principle a situation has emerged on the EC's Single Market where the level of consumer protection in individual Member States differs. As a result, obstacles to the free movement of goods and services remain in the Single Market, and the effectiveness of the Community laws as a means of harmonization is severely limited. Therefore, the new approach on European consumer protection policy promotes the *maximal harmonization principle* in assuring a proper common framework of rules at EU level.[4,5]

This transition became more important in the context of EU enlargement. Community's consumer protection measures, because of their direct impact on ordinary people, can be a powerful way of demonstrating concretely the advantages of membership for the citizens of the new member states.

Maximal harmonisation goes beyond the previous Community rule of mutual recognition, because the standards are now the

same and there is no scope for more protective national rules. As a result, mutual recognition is being replaced by the *country of origin principle*, under which it is for the home state to implement European laws and control their observance and the receiving state has to trust in their effectiveness and competence.

This new maximal harmonization approach may be challenged for the reason that EU law is no longer a benevolent friend of consumer guaranteeing minimum rights, but becomes the guardian of trade interests. So, business only has to be concerned to lobby hard for favorable European laws and national legislators are unable to react to any remaining consumer concerns.

4. Key Principles of EU Consumer Protection Reglementations

No matter which level of harmonization is envisaged by the EU consumer protection regulatory measures, it is nevertheless possible to identify certain key principles, or techniques, which are common to many of these measures.

- The dominant principle is the *information principle*. It is reflected in a range of different measures requiring that certain items of information are disclosed to a consumer prior to or on completion of a particular transaction. This obligation is often accompanied by a transparency requirement which demands that information is given in plain and intelligible language.

The information principle is based on the idea that sufficiently informed consumer can help himself, while his autonomy of will could still be guaranteed. Information remedies may allow consumer to protect himself according to his personal preferences instead of causing the problem for a regulator to compromise diverse preferences with a common product or service standard. Rules making disclosure of information mandatory have an especially crucial role in transactions such distance-selling, where it is particularly difficult for a consumer to obtain information.

The standard by which the adequacy of the information is to be measured is determined by the „average consumer” - a consumer reasonably well-informed and reasonably observant and circumspect. This assumes that a consumer actively participates in the market and is able to make reasonable use of the information provided to him in order to take a

consumption decision.[6]

But mandatory duties to inform might be needless if the free market by itself produces a sufficient amount of information, so producers or suppliers cannot exploit consumers by charging them a higher price, if they cannot easily distinguish informed and uninformed consumers. As long as it is not sufficiently difficult for enough consumers to acquire information by engaging in comparison-shopping, mandatory intervention seems not necessary.[7]

Also, informational duties are only justified if the benefits to the consumers, by having enhanced consumer choices, outweigh the administrative costs plus the compliance costs of regulatory intervention. Hence, a comprehensive cost-benefit analysis is required.[8]

And, finally, there can be the danger of an information overload. This means that although with an increasing amount of available information the subjective feeling of security of the consumer increases as well, the objective decision-making efficiency is decreasing due to his limited information-processing capacity. Therefore it becomes important to find the optimal, instead of the maximal, amount of information that has to be disclosed.

- Another feature commonly applied in some EU measures is the use of *right of withdrawal or cancellation right*, combined with a „cooling-off” period. This allows consumers to walk away from a transaction which they had previously entered into if they change their mind within a specified time period.

The rationale for such provisions is that consumer is not in a position to be sufficiently aware of all the aspects of a particular transaction at the time of conclusion for different reasons (such as having instable preferences depending on the situation in which he has to make decision, like if he is under stress, or confronting with a monopoly situation from the supplier, due to particular circumstances, or being able to evaluate the quality of a product only after contracting, at the time of consumption), and is effectively given more time to confirm his decision.

But cooling-off periods may also have potential adverse effects. First of all, there is the danger of moral hazard and opportunism on part of the consumers that may be tempted to misuse their right by using the good or service and later withdrawing claiming bad quality. In

addition, delay and uncertainty increases the cost of transaction, which is in effect completed only after expiration of the withdrawal right. If the latter transaction costs exceed the benefits achieved by curing the economic distortions in consumer markets, cooling-off periods may, on balance, be welfare reducing, and even harm rather than benefit consumers.[9]

So, in determining the optimum size of the period of thought given to consumer should be considered both making available a sufficient time to obtain and process all relevant information about the transaction which he is interested, according to its specificity, and preventing any excessive transaction costs that would outweigh the benefits involved.

- A special place in consumer protection measures occupy the *precautionary principle* that can be invoked when urgent action is needed because of a potential hazard to human health and the scientific results available do not allow a determination of the risks involved with sufficient certainty, without being permitted their use as a pretext for promoting protectionist measures that prevent free movement of goods within the single market.

Measures to protect consumers resulting from the application of the precautionary principle may take the form of a decision to act or inact, depending on the level of risk considered as acceptable by society. Thus, any decision must be preceded by an assessment of the involved risk and the potential consequences of any inactions.

- Finally, also in consumer protection area – as all the areas that are not recognized as of Community exclusive competence - is applied the *subsidiarity principle*. Under this principle, European Union intervention should occur only in a subsidiary manner, as far as the objectives of the proposed action may not be sufficiently achieved by Member States, either because of their complexity or because of field action that goes beyond the national borders.

The subsidiarity principle should not be interpreted, however, so narrowly as to be used by Member States to reject the initiatives launched at Community level in order to protect national regulations. Conversely, given that the Single Market success is judged, ultimately, in terms of beneficial effects felt by the consumer, the subsidiarity principle should be managed so that consumer protection within the EU Single Market to be provided with priority in intra-Community transactions and key areas of special interest.[10,11]

5. Conclusions

Despite harmonization efforts undertaken by the authorities in Brussels, the European Single Market remains, at present, largely fragmented along national borders for reasons not solely related to the regulatory process, but rather to the lack of confidence of economic agents in its functionality.

Generally, the Brussels bureaucrats have been remarkably successful in adopting consumer laws with limited resources and have coped well with the challenge of finding compromises between twenty-seven different national systems. However, European consumer protection actions cannot ignore the complex tapestry of national consumer regulations that already exist in this area.

Consequently, while maximal harmonization is unequivocally imperative in certain areas of consumer protection, in others, we appreciate that diversity can be allowed, requiring only a simplification of existing rules, and, where appropriate, even a deregulation, supplemented by a minimum harmonization, in order to help national systems to evolve naturally towards a common approach.

Abstract

Comportamentally, the external trade balance is determined by the state of the national economy, external factors and by the evolution of the currencies in which the trade is done. The evolution of the external trade balance is the mirror of the external imbalance recorded by Romania in the period between 1990-2009. That's why, an analysis in which is needed to discover the sources that cause the trade deficit, is not only opportune, but also imperative, because the existence of the trade deficit determines the amassment of external debt, which subdues Romania to numerous efforts in order to pay back the debt and the interest.

The present paper analysis the evolution of the Romanian external trade balance with its elements, from 1990 till the end of 2009, in order to find out its essential characteristics and what are the sources for the trade deficit of this country, by emphasizing on the continuity and discontinuity factors from the evolution of the external trade balance, and also the resources for financing the deficit. The paper points out the characteristics of the external trade balance evolution, and the measure by which the currency evolution had an influence.

The analysis offers these conclusions: Romania needs urgent measures to attract foreign direct investments to balance the external trade deficit, and needs to assess thoroughly the means by which it finance its deficit; the authorities should focus with the utmost responsibility the idea of a sustainable external trade balance, and to adopt the necessary decisions, because the continuous deficit will put in peril the durability of any economic growth and the deflation process.

Key words: external trade balance, current account, sold, deficit

JEL classification: F39

1. Introduction

In this paper we tend to analyze the evolution of the external trade balance of Romania, with its elements, from 1990 until the end of 2009, in order to find out what are the most important characteristics, and what are the sources for our country external deficit. After that, the continuity and discontinuity factors from the evolution of the external trade balance will be analyzed as well. The paper will assess the characteristics of the current account, and the measure by which the currency evolution has an influence upon the Romanian external trade.

2. Romania's external trade balance from 1990 to 2009. Tendencies

The current account is one of the „two” pillars of the external trade balance in Romania, along with *the capital and financial account*. It registers a negative figure each year from the analyzed period, 1990-2009.

The annual rhythm shows an discontinuous growth of the current account deficit. In the period 1990-1999, the years 1991, 1994 and 1999, the negative account reduces itself from the previous year. The year 1995 points out a growth in the current account deficit compared with 1994. In the period after 2001, *the current account deficit* grows every year, except 2002, 2008 and 2009. In 2008, the annual negative growth of the current account is significantly smaller compared to the previous year. In 2001, 2003, 2004 and 2007, the negative growth of the current account is significantly larger, but, in 2009, it has suffered a major downfall,

reducing itself more than 3 times compared to 2008. The determined influence on the current account was brought by the deficit of the external trade balance, which in 2005, 2006 and 2007 being generated by the explosion of the trade deficit, which marks the tendency of growing economic imbalances (see *Graph 1*).

Graph 1. The Evolution of the Sold of the External Trade Balance Sheet and of the Sold of the Current Account in Romania; years 1990-2009

The growth of the Romanian current account deficit reflects a mix of structural factors and the medium time growth of the external shocks and internal policies. The demise of the current account was the

result of the growing external trade deficit, of the deterioration of the services balance, the growth of the debt degree, profit repatriation and the appreciation from 2007 and 2008 against the EUR and USD, the main currencies that the international contracts of the Romanian entrepreneurs are signed in. For example, the aggravation of the current account deficit in 2005, was boosted by the doubling in the service balance deficit, because of the rise of costs in the transport of imported merchandise.

In 2003, the current account deficit grows exponentially, tendency manifested until 2007. This growth is explained by:

- structural modifications in the national economy, or perhaps, by the lack of these;
- the continuity of the convergence process;

The convergence and the economical restructuring needs high investments, both in the public sector and in the private one. This process gives the current account deficit, *caeteris paribus*, a structural and persistent character on a medium term.

- the continuous growing of the internal prices, in a decreasing rhythm between 1998 and 2007;
- high investment rate (explains the high current account deficit until 2008);

- the appreciation of the national currency in 2007 and 2008, stimulating the demand for imported goods (because of the necessity to regain the lost ground regarding the economic partners, and because of the influence of the substantial inflow of foreign investments, reflecting the perspective of joining the EU, and then becoming a member state);

- the rapid growth of the income, sometimes at a higher rate than the growth in productivity, because of the easy access to credits, materialized in the growing pace of the nongovernmental credit, both contributing to the consumption process in that period, based on the assumption of higher revenues in the future (consumption smoothing), including the high demand coming from the private consumption, that generates premises for a perpetual of high demand;

- rapid development in the last years of some activities that in their essence are non-tradable, like services (trade, financial-banking services) and constructions;

- the slow pace in developing a sector of competitive and diverse goods destined for export, because of the rigidity of the offer;

- free trade that stimulated imports of capital, consumption and services goods;

- total capital account liberalization. Normally, the growing external deficit should drive the national currency depreciation, but because of the attractive interests in Romania, once the total capital liberalization took place, there have been high inflows of foreign currency (as portfolio investments), so a high demand for the local currency, Romania not knowing depreciation in the first two years after joining the EU.

So, in the absence of some effective productive structures, capable of sustaining the economic growth, specific to the process of catching-up (Ansari and Ojemakinde, 2003), consumption has been filed by imports, that generated the growth of the current account deficit.

As an exception for the evolution of the current account of Romania after the year 2000, we need to keep in mind that one of the most important factors of the growing external imbalances is the poor budget performance in the transition economies. The models of public deficit reflects local factors, and the advices coming from the developed economies and the international institutions such as IMF and the World Bank, which determined, in almost all

the developing countries, dramatic fiscal adjustments, because of a high level of governmental spending, and a moderate reduction in the public revenues.

Table 1. Correlation between budget deficit and current account

Year	1995	1996	1997	1998	1999
Budget deficit PIB (%)	-2,6	-3,9	-3,5	-3,6	-1,8
Current Account Balance GDP (%)	-5	-7,3	-5,9	-6,9	-4
Current Account Budget Deficit	1,9	1,9	1,7	1,9	2,2

Year	2000	2001	2002	2003	2004
Budget deficit PIB (%)	-4	-3,2	-2,5	-2,3	-1,1
Current Account Balance GDP (%)	-3,7	-5,5	-3,3	-6	-8,4
Current Account Budget Deficit	0,9	1,7	1,3	2,6	7,6

Year	2005	2006	2007	2008	2009
Current Account Balance GDP (%)	-0,8	-1,5	-2,3	-3,9	-0,7
Current Account Budget Deficit	-8,7	-10,4	-13,5	-12,3	-10,3
Budget deficit GDP (%)	10,9	6,9	5,9	3,1	8,3

Source: personal computations based on public data provided by the National Bank of Romania

In Romania, the budgetary deficit has grown uneven as absolute value, but it revealed a reduction as percentage in GDP until 2005, on account of EU requirements of nominal accession convergence criteria regarding the budgetary deficit. This evolution combined with the results of the report between the current

account balance and the budgetary deficit (whose normal limits are between 2% and 4%) show that in Romania, the budgetary deficit hasn't always been representing a factor of external deficit, in some years it actually limited its additional deterioration (between 2004 and 2007, and in 2009). Unfortunately, the fiscal policy was oriented to the consumptions' reduction and to the reduction of budgetary expenses as GDP percentage, not to stimulating efficient investments, further more their lack determined the high volume of Romanian imports.

Regarding this as a balance between investments and savings, Romania's current account deficit reflects the decisions taken by the private sector of seeking external financing of investment projects instead of concentrating on national savings. Romania has registered a private savings rate (14%) under the one of other transition countries between 1990 and 2005, while the investments as part of GDP occupied a comparative level (20%). Regarding the private savings one can notice a descending trend between 2002 and 2005, fundamentally owed to a raise of consumption and also because of a negative interest rate in certain periods of time, and afterwards this trend reversed. The highest value registered by the public savings rate between 2003 and 2007 was in 2006, when it reached 2.6% in GDP, in 2007 was 1.2% and in 2005 of 1.8%. As regarding the private savings rate, it registered 14.4% in GDP in 2007. On the other side, the investment rate was following an ascending trend, registering 3.6% of GDP in the public sector in 2007, and 26% of GDP in the private sector. As a consequence, the deficit between savings and investments in the public sector decreased between 2003 and 2006 (reaching 0.6% of GDP) and increased considerably in 2007 to 2.4% of GDP. Regarding the deficit of investments and savings in the private sector, it registered a constant ascending trend between 2003 and 2007, when it reached 11.6% of GDP. Analysing this information we can say that the current account deficit is generated in particular by the private sector.

It must also be considered the fact that the impending risk in the revenues balance, would contribute more and more to the current account deficit, because it manifests an increase of repatriating profits and dividends of foreign direct investments, owed to their high stock and to their high interest rates paid for the external loans received, combined with the decrease of

labour income inflows, as a consequence of Romanian families' reunification and also of the slowing economies where they worked, specially in the construction field.

A positive aspect is given by the *high rate of the current account deficit sustainability owed to the high covering through FDI* inflows starting with 1997, excepting the years 2007 and 2009. A convenient perspective for the current accounts' evolution can be obtained through registering a constant competitive FDI inflow and also through continuing a supply expansion, including an export oriented production, investments based on important earnings offered by the Romanian economy and also serving as a substitute of insufficient internal savings.

The external financial markets conditions' deterioration between 2007 – 2009 raised the probability of the current accounts' deficit adjustment (through exchange rate and economic structure). As the current account deficit is higher, the rebalancing trend is more substantial, because as it grows, the external deficit is harder to finance and so it tends to limit.

On the other hand, in 2007, it also manifests the polarization of financial resources, by the sectors that produce untradeable goods, that concludes in a decrease or temperation of the Romanian exports growth. Although this process is normal for the gap recovery, the contraction of untradeable goods sectors resources allocation can generate boom and bust type evolutions, because FDI are not oriented to high tech sectors. Moreover, as the financial flows percentages to the untradeable goods sectors are bigger the economy reorientation flexibility has to be stronger. As regarding Romania, we can notice that both negative influences (the lack of external balance raising and high percentage financing to the untradeable goods sector) are high. Moreover, the untradeable goods sector contribution to GDP formation decreases, its growth rate being outran in the second half of 2007, by the tradeable goods sectors. The companies activating in the untradeable goods sectors are lent more (internally and externally) than those that produce tradeable goods and in superior dynamics.

Usually, in high growth rate economies the gap recovery process is sustained by the more and more efficient tradeable goods sector, a considerable part of real appreciation reflecting the sectors' productivity earnings (owed to

Balassa – Samuelson effect). In Romania, the economic growth is high strating with 2001, and the labour productivity in the industry after 1999, the local currency, leu, appreciation being produced between 2005 – 2007.

Accordingly, in Romania exists a paradox. Although the tradeable goods sector is more efficient, the investments were oriented to the untradeable goods sector. The explanation refers to Romania's features, precisely: high demand in real estate, the undeveloped tertiary sector.

Regarding the current account deficit ascending manifested trends, the authorities must consider in a seriously and responsibly way the current account deficit sustainability problem. Because an appreciation of a real exchange rate tempers the dynamics of the external debt necessary to insuring the current accounts' sustainability, it must be considered when calculating the sustainable level of the external debt. This evolution of the local currency produced in Romania between 2005 and 2007, on the account of thenational currency underevaluation from the beginning of the transition process, on the account of the basic macroeconomy elements (productivity and technology), Balassa – Samuelson effect, also because of the existence of high productivity rates, compared to those at international level, also considering the Romanian workers earnings transfer (that registered an ascending and powerful dynamics and seasonal character).

It must also be considered the fact that the constant growing of current account deficit can affect the durability of economic growth and the deflation process.

The current accounts' deficit problem must be analysed in the context of a globale approach. This determines the necessity of adapting the country specific current account deficit analysis.

The National Bank of Romania tries to reduce the consumption demand (through credit limitation), but the solution remains the supply. Unfortunately, the Romanian supply is still rigid and moreover there are not any unused production capacities. To resist to the international competition, on the internal market, but also on the external markets, the Romanian supply must adapt to the internal demand and also to the international demand requirements, through import reduction and exports stimulation.

The trade balance is constantly decreasing between 1990 – 2008, reflecting the superiority of imports over exports of goods (Table 1). The

trading deficit decreases in 1991, 1993, 1994, 1997, 1999 and 2002. But in 1995, 2000, 2001 and also after 2003, we can notice a negative value of the trading balance, except 2008, when an important decrease of the current accounts' deficit is registered. Accordingly, the trading balance deficit emphasis from year to year, sometimes being very strong, but there can be seen cases when the difference between exports and imports reduces considerably compared with previous years.

One of the most important factors that contributed to the deepening of the trading balance deficit, after 2000 is the ascending dynamics of unguvernamental loan, that separated as a pressure factor on inflation, through stimulating the internal demand. Being placed on a careful position, the central bank had initiated some measures of decreasing the growing rhythm of loans, of monetary nature every year after 2004.

The main sectors that generated trade deficit in 2007 and 2008 in Romania, are „machinery, autovehicles, mechanic disposals and electric equipments, sound and image disposals”, „mineral goods” and „chemical goods” in specially pharmaceuticals. Overall, this three departments have generated since 2002 to present a constant trade deficit of 10% of GDP. The first sector reached a trade deficit of 5% of GDP, reflecting a high necessity of investments, the second generated a deficit of 3.3% of GDP, Romania having in this way a very low energetic efficiency, and the chemical sector registered a trade deficit of 2.3% of GDP, as a consequence of high imports of pharmaceuticals.

The trading balance risks still remain and we can expect to a worsening through the decreasing of exports, in the condition that our main trading partner, the EU, has economic problems and the rest of the countries as well, in the context of the economic recession extension.

The degrading of the trading balance also comes from the agricultural sector, Romania representing a net importer of food products, considering that our country has an unvalued agricultural potential and it depends exclusively on weather conditions, as a consequence of failed development, and a lack of a normal level of civilisation. If the agricultural potential would be valued we could register a surplus.

The groups of merchandise that would register a surplus are „textiles, confections and footwear”, products with a low degree of processing, that can not contribute

considerably to the decreasing of the deficits produced by other groups of merchandise.

Regarding the revenues, it registers a flexible evolution during the period analysed. The payments for *Other capital investments* grow between 1990 and 2001. The years 2002 and 2003 are an exception, registering a slight reduction of debit. Starting with the year 2004, the growth of outflows is regained. During 1990 – 2008, the revenues from *Other capital Investments* have low values, without any growth perspectives, and the payments reduce continuously, reaching higher values than the revenues, the explanation being our country's situation – not enough external loans accessed or given, therefore cashing few interest rates for the loans given before 1990.

As regarding to the current account, *Current Transfers*, through its balance permanently registering surplus, it counteracts partially the deficitary accounts of the Current Account, *Revenues and Goods and services*, contributing in this manner to the improvement of Current account balance.

The Impact of the European Integration Process on the New Member States Banking Sectors

ILUT Bogdan

“Alexandru Ioan Cuza University” of Iași, Doctoral School of Economics
ilut2k@yahoo.com

Abstract

The European integration process has dominated Europe landscape for the last decade. In least than five years between 2004 and 2007 the number of member states has been raised from 15 to 27. An important part of this process is the development of the single European financial market as a mean in achieving a fully functional European community which will allow all member states to obtain a sustainable development and an enhancement in the job creation process. As part of the financial market the integration of the banking system is playing a fundamental role in this task. The aim of this paper is to provide an overview of the impact that the integration of the new twelve member states had on their banking system. In order to achieve that we have underlined the developments in foreign bank development in the new member state while also testing the law of one price in order to establish if it apply in the case of the banking sectors from the new member states. Far from being an exhaustive study on the subject the paper provides the necessary argument for the continuation of the structural reforms and enhancements in the banking sectors of the new member states as a mean for deepening their European integration.

Key words: European integration, banking system, European Central Bank

JEL classification: F36

1. Introduction

The banking sectors from the new member states have developed sharply in the last decade. This was mainly because on the one hand their economies have registered a development rate far superior to the one of the euro zone and on the other hand their ascension

process to the European Union has created the necessary structural changes in the regulation and supervision process that has allowed foreign bank to develop their business here (see [5] and [6]). These two premises have had a direct impact also on the real and nominal convergence of these nations [9], [10]. At the macroeconomic level the raise of the GDP of these countries has registered rates above the EU-15 average rate while the inflation has dropped to euro zone like figures.

Graphic 1. The evolution of GDP and inflation in Slovenia compared with the euro zone average between 1996 and 2009

Source: Own simulation based on the IMF (<http://www.imfstatistics.org/imf/>) and ECB (<http://sdw.ecb.europa.eu/>) data

We must stress out from the beginning that the macroeconomic evolution of these countries had suffered as a result of the financial turbulences that have started in the fall of 2007 [4]. Also because of the relative short period of time since their ascension to the European Union our analysis had to rely on a relatively short period of time. Also, we must take into consideration the fact that most of these countries have set specific dates for the adoption of the euro currency while others have had

adopted already (like Slovenia in 2007, Malta and Cyprus in 2008 or Slovakia in 2009) and this had also a direct impact on the integration of their banking sectors.

2. Characteristics of the banking sectors from the new member states

In the process of transition from a centralised economy to a free market economy and afterward to the integration in the European Union common market, these countries have undertaken a series of reforms and adjustments that had a direct impact on the structure and the development of the new member states banking sector [8].

A decisive factor for a banking system is represented by the supervision and regulation authorities that exist. In all the new member state as a result of the transition to the market economy and also the ascension to the European Union the banking system is in general regulated and supervised by a dedicated authority, usually the Central Bank of that state. This structural component of the banking system is in concordance with the European Union guide lines on the matter and proves the lining of the banking systems structure of the new member states to the one of the EU-15. This development strengthen by a reform of the legislative framework regarding financial and banking service in line with the *acquis comunitare* has provided the base for the development and the integration of the banking sectors from the new member states [3].

The next big event that will have a direct impact on the integration of the banking sector from these countries will be represented, as mentioned earlier by the adoption of the European single currency. All new member state must adopt the euro within 7 years of their ascension to the Union; the enlargement of the euro zone should take place in different waves until 2015[10].

Table 1. The dates on which the new European Union member states will adopt/ have adopted the single currency

Country	Date
 Bulgaria	1 January 2014
 Romania	1 January 2015
 Slovenia	1 January 2007
 Slovakia	1 January 2009

Country	Date
 Malta	1 January 2008
 Cyprus	1 January 2008
 Czech Republic	1 January 2015
 Poland	1 January 2015
 Estonia	1 January 2011
 Lithuania	1 January 2014
 Latvia	1 January 2014
 Hungary	1 January 2014

Source: ECB and authors update

Taking in to consideration the fact that these countries had a relatively similar development in the last decade (see [1]), dominated by the reforms needed in order to be able to become full time members of the European Union we can acknowledge the fact that de development of the banking sectors in these countries is relatively in the same stage. Even if the banking activity has developed very fast in this period, it still remains in terms of quality but also quantity well below the EU-15 average. The economic activity is mainly financed through the banking system, which in general terms is the same also in the EU-15 [8, p.3].

The banking systems from these countries are dominated by commercial banks, which account for almost 90% of the total banking assets of the new member states [4]. In several new member states there are specialised banking institutions that operate alongside commercial banks like cooperative banks, specialised financial institutions (mortgage bans, construction banks) and also foreign branches of other EU member states. All these financial institutions are having a determined role of the actual banking system of each new member state.

Table 2. Percentage of total banking assets owned by other EU member states banks (branches and subsidiaries)

Country	Percentage of total banking assets
 Bulgaria	81,24%
 Romania	79,43%
 Slovenia	30,78%
 Slovakia	92,80%
 Malta	36,54%
 Cyprus	33,43%
 Czech Republic	90,80%
 Poland	63,49%

Country	Percentage of total banking assets
 Estonia	97,27%
 Lithuania	84,84%
 Latvia	61,86%
 Hungary	57,55%

Source: Own simulation based on ECB (<http://sdw.ecb.europa.eu/>) data

The presence of the European banking corporations in the new member states is manifested either through branches or subsidiaries. At the end of 2009 the foreign banks operating in the new member states had 84,37% of the total assets of the banking systems. On the other hand the banks from the new member states have a limited presence abroad, mainly through participation in the banking corporation from which they are part of (e.g. *Raiffeisen Bank Romania has a participation in Raiffeisen Bank Zentral Bank A.G.*).

We can note that at least until the start of the international financial turmoil in the late 2007 early 2008 the banking systems from the new member states have developed sharply because of the favourable economic environment and the structural changes imposed as part of the integration process in the European Union.

3. The impact of European financial integration process

Once the enlargement of the European Union from 15 to 27 members has taken place the need to analyse the impact of EU ascension on the banking sector from the new member states has become evident. As noted earlier the economic boom that these countries have felt since the year 2000 doubled by the structural changes in their banking architecture has provided the necessary background for their banking system development.

If it were to take in to account the structure of the banking systems in the new member states since their EU ascension we can note that there were no fundamental changes, mainly because all the mergers and acquisitions that had a direct impact on it took place before their integration mainly at end of the '90 and early 2000 [3].

These mergers and acquisitions have led to the diminishing of the number of banks with

dominant domestic capital in the new member states. This has led to the increasing of the systemic risk in the case of the new member states banking system, as it has become more dependent on the economies of the EU-15 states especially more than these economies have become exposed to risk associated with the banking enterprises that the western banking corporations have undertaken. This is mainly because of the way in which the European banking corporation have extended their businesses in the new member states. Rather than taking advantage of the banking passport that will allow them to set up a branch under the home rules of supervision and regulation, their approach was more corporate orientated, opening subsidiaries either through mergers and acquisitions or by simply developing it from scratch (see [5]; [2] and [7]).

If by any chance one or more markets from the new member states should find themselves in trouble, the banking western banking corporation can easily isolate the "damage" and intervening directly by reducing its size or selling it. On the other hand if the banking corporation is experiencing problems in the home country it could call back its credit line to its subsidiaries from the new countries in order to ensure its liquidity. Thus in turn will reduce the overall liquidity in that country banking system transmitting or enhancing the crisis in that state. This is a perverse effect of the European banking integration process a good example of this being Slovenia where only in 2009 the foreign banks subsidiaries and branches have repaid approximately 3.3 billion euro to their home corporations, as a effect of the recalling of credit lines [4].

In such a case the most affected banking sectors are the corporate and the mortgage one. In the case of corporate banking the credit lines granted to large clients tend to be the first that are resized and downsized. Mortgage lending has also to suffer because of the long time exposure that a bank has to these types of credit operations. The fact that securitisation is a very underdeveloped in the new member states also plays an important role in the diminishing of mortgage lending squeezing in case of a financial crisis. Also, investment crediting is becoming more selective making the economic slump deeper.

One reason why the credit market has developed so quickly in the new member states was the ability of the banks operating on these markets to get access to cheap credit line from

EU-15 banks and investor as these countries changed their banking structure and legislation to fit the requirement for EU ascension. Also a side effect of this process was the economical and especially financial stability which was gained as a result of the reform which encourage foreign lenders to invest in these countries via their banking systems.

The rise in mortgage lending and corporate crediting has began well before the integration in to the European union and had a upward trend until the international financial turmoil hit Europe in late 2007 and early 2008. The access to foreign lender has allowed banks to take a short cut in the deposit-credit relationship, having an excess of liquidity their only worry was getting credits in to the market as quickly as possible. The highest degree of credit rising was on the mortgage sector followed by the corporate credit and consumer credit.

Graphic 2. The development of mortgage credits and corporate credits in the new member states between 2002 and 2008 (percentage, yearly based)

Source: Own simulation based on the IMF (<http://www.imfstatistics.org/imf/>) and ECB (<http://sdw.ecb.europa.eu/>) data

This quickly development of credits in the new member states has raised the question about the sustainability of these credits by the banking sector, which put deposits development as their second priority to credit operations. The limits of this scheme have been proven as the 2007 financial crisis unfolded.

4. The “law of one price” in the banking sector from the new member states

The law of one price is a good test in order to underline the impact that the integration of these countries in the European Union had on their banking systems. In order for the banking sectors from these countries to be integrated, the interest rates from them should converge, in other word, the dispersion between the interest rates from the new member states should get smaller (for methodological considerations see: [12], [13] and [14]). We will analyse the

convergence of the interest rates on the corporate sector.

Graphic 3. The evolution of the convergence of the interest rates for corporate credits in the new member states between 2002 and 2009

Source: Own simulation based on the ECB (<http://sdw.ecb.europa.eu/>) and Bankscope - Bureau van Dijk data

Graphic 4. The evolution of the convergence of the interest rates for corporate deposits in the new member states between 2002 and 2009

Source: Own simulation based on the ECB (<http://sdw.ecb.europa.eu/>) and Bankscope - Bureau van Dijk data

We can note that in the light of European integration the dispersion of interest rates between the new member’s states, both for credits and deposits, has shrunken having a descending trend. This proves that the Integration in the European Union had a direct impact on the integration of the banking sector from the new member states. Despite different monetary policies strategies employed by their central bank the decreasing of the dispersion regarding the interest rates of the banking sector proves the fact that the banking sector in these countries has become more integrated.

5. Conclusion

Following the analysis undertaken in this paper on the integration of the banking sectors from the new member states we can argue that:

- These banking systems have gone and are going through an accelerated process of European integration, the results of the application of the law of one price on the new member states underling that. It is rather hard do to determine the exact degree that these banking sectors have achieved as there is no sure

methodological approach to the subject;

- Even if there are oscillations in the evolution of the interest rate dispersion both in the case of credits and in the case of deposits, these can be attributed to local economical factors and the impact of the global financial crises, rather than on a fundamental change in the integration process of these sectors.

In closing we can note that the banking sector from the new member states known a deepening in the European integration process since these countries have become members of the European Union especially because of a better structural and legislative environment and also because of the heavy presence of foreign banks especially from EU-15. But this process still remains a long term endeavour, full of challenges and opportunities.

The Movement of Persons and Employment in EU States

Abstract

From ancient time, in the name of an primer instinct became a reason of being, the man travel, conquered the spaces from the need of relationship and progress. Alexander Macedonian, Napoleon Bonaparte are leaders of the crowds which carried the expansion in the name of "vital space" through the extreme.

The dismissal of the conventional barriers including of the borders, defeating the preconceptions, the dialog for the ethno-religious compatibility represent the solution for the creation of an free zones, of some spaces without visas like the European Schengen, of some districts like China-town in New York in which the cohabitation, the human relationships are non-antagonistic.

The free movement of person it's particularize between other human rights through that the exertion and the full achievement of this one involve the relationship between the states, the harmonization of those position regarding of this right, fact that influence in a positive way the international atmosphere.

Key words: free movement, Single market, liberalization

JEL classification: F15

The free movement of persons on a certain territory was the subject of numerous international documents, which according to the sphere of the regulated legal relations, have recognized the principle of free movement as being crucial in protecting one's rights and freedoms.

The labor freedom is one of the basic principles of the EU internal market. Thus, citizens of the member states can sign on in any member country without needing a special permit and on the same principles as the nationals.

The freedom of movement is the fundamental freedom of the internal market and of the EU policies at the European Union level. It may refer to persons, goods, services and capital.

A key aspect of the legislation is the free movement of persons, this principle representing a more sensitive issue for the Member States than the free movement of goods, due to the implications related to national security or to social security.

The free movement of persons is intended, economically to create, first, a single labor market, and politically, to achieve a greater cohesion of peoples that comprise the European Union by removing the barriers of migration.

The essence of this freedom consists in the elimination of discrimination between the nationals of the Member State on whose territory they are located or working, and the citizens of the other Member States who are staying or working in that state. Such discrimination may relate to travel, work, employment or earnings. By providing such a non-discriminatory regime the free movement of persons within the Community is achieved.

The first consecration at the global level of the free movement of person it's achieved through the article 13 from the Universal Declaration of Human Rights from December 10, 1948: "every person has the right to travel free and to choose the residence inside of any state. Every person has the right to leave any country, including his own, and to return in it's own country".

On the European ground this right was included in the Roma's Treaty from 1957 which put the bases of the European Economic Community. Among the objectives of C.E.E. was held "the elimination, between the members states, of the obstacles in the way of the free movement of persons, services and capital".

The essence of the free movement of persons is consist in the elimination of the discrimination between the citizens of the member states on which territory they unfold their activities and the citizens of the other member states who live or work on the territory of that state. The discriminations could refer to the entry conditions, removal, work, engagement or remuneration.[7]

Although, the Roma's Treaty assert the duty of the Communities to ensure the free movement of persons, until the middle of the '80's the efforts depose in this way manage to settle only partial the aspects related of the free movement of the certain categories of persons: the workers and their families, the services suppliers and the economics agents. The European Court of Justice play an extreme important role in the consolidation of this process, also through the alert and elimination of the vagueness, and through the alert of the legislatives gaps. [7]

In the course of the 80's years, had place the European debates about the significances of the notion of "free movement of the persons". For the certain member states, this right has to be apply only to the European citizens from the member states, which imply the maintain of the control to the borders for to distinguish the European citizens from the nationals of the third states. Others countries, on the contrary, wish the settlement of the free movement for all, and consequently, the retrenchment of the control at the borders. In the face of the impossibilities to found an agreement in the frame of the European Community Treaty, the France, Germany, Belgium, Holland and Luxembourg has sign at June 14, 1985 in the Belgium locality Schengen "The gradually reduction of the common borders controls Agree". The objective of this agree was the progressive retrenchment of the common borders controls and the establishment of an free movement regime for all the persons – nationals of the signatory states, of the others member states of the Community or the thirds states. On this agree it's add The Unique European Act, entry in vigor at July 1, 1987, the document which had remove the last barriers in the way of the achievement of the unique market and had lead to the acceleration of the extension process of the right of the free movement on the some new categories of persons: students, persons that doesn't depose economics activities, but has enough resources of living. [5]

The free movement of the persons is define by the Unique European Act like been one of those four fundamentally liberties which form the Intern Market alongside the goods movement liberty, of the services and the capitals. Through the Intern Market it's understand an space without the interns frontiers which had to operate in the same conditions like a national market: the staffs, the persons, the services and the capitals had to be circulate within without no borders control between the member states. [8]

For to reconcile the liberty with the intern security, the consecration *in fact* of the free movement of the persons was join by the "compensatory" measures. That way the states had agree to action in order to improve the coordination between the police services, the custom and justice, and to take the necessary measures for the combat the terrorism and the organized criminality.

The Maastricht Treaty, enter in vigor in 1993, had introduce the concept of "the European citizen" through which it's give the right of free movement and the free residence inside of the Union to all citizens of the member states of the European Union. Beside, the Treaty has place in the common interest domain of the member state also the political refer to the asylum, the issue of the external borders pass and the political refer to immigration (Title IV – the cooperation in the justice domain and the internal affairs, named also like The Third Pillar of U.E.). [8]

The Amsterdam Treaty from 1997 and the Nisa Treaty, had consecrate, at their turn, the achievement of the internal market and the important position which had the Four fundamentally liberties in the process of the European integration.

An important document for the free movement of the persons it's constitute The Fundamental Rights Charter sign at the Nisa's European Council from December 2000. The article 45 from the Charter it's stipulate that: 1. "Any citizen of the European Union has the right to move and to establish the residence in a free way on the territory of the member states". 2. "The movement liberty and staying could be award conforming with the European Community Treaty, to the citizens of the third states which legal reside on the territory of the member state".

The retrospect of the papers which consecrate the free movement of the persons in the community law shown the evolution of the

sense of this right. Therefore, if initial the primer stipulations consider the peior person just like an economic agent – like an employee or services provider, further the concept it's extend to include the aspects related by the notion of the citizen of the Union, whatever by any economic dimension or the differences related by the nationality. [7]

The movement liberty it's particularize between other rights of the human been through that the exertion and the full achievement of this involve the relationship between the states, the harmonization of those position regarding of this right, fact that influence in a positive way the international atmosphere. Also, through the exertion of the free movement right it's produce the effects both in the macro plan and micro-social, fulfilling the role of the progress factor both for the collectivities and also for the human personality (especially), enriching it's knowledge and developing it's feelings. [4]

Through it's political, The European Union envisage creation of an free European area, of the security and justice in which has no need by the persons control at the internal borders, the European citizens benefiting by the fundamental right to move and to set anywhere they wish.

An important area of the community acquis on free movement of persons is the movement of labor, the community legislation containing provisions on the necessary conditions for circulation and residence of workers and their families within the EU.

The free movement of the workers is settle by the article 48-49 from the Roma's Treaty. In this treaty the free movement of the workers is define through the right to reply at the offers regarding the work places, to move in this scope on the territory of the member states, to stay on the territory of the member states to unfold an activity, inclusive to remain on the territory of one of this country after a person unfold an activity (art. 48, par. 3). Therefore, the free movement of the workers suppose that the worker which it's displace answer to an effective offer made regarding to a place of work, not being about an absolute right of the worker to move freely on the territory of the member states for looking a place of work.

By this right benefit only the workers from the member states. The term of the "worker" embrace the persons engage in the host country, those which there is in the searching of an place of work, the unemployed workers capable of work and which were hired previous (CEJ, the

case Hoekstra, Nr. 75/63),the incapable work persons thanks to an illness or an accident suffer during the engagement in the host country (art. 7(1) of the Directive no. 68/360), the persons that reach the normal age of retirement during to unfold of an activity in the host country.

The member states are obliged to remove any internal administrative restrictions which could to stumble the exertion of this right.

The stipulations of the institutive treaties regarding the free movement of the workers was initial develop through the Council Regulation no. 1612/68 which dispose in it's preamble that "the mobility of the work hand in the Community must to constitute for the workers one of the means which to guaranty the possibility to improve the life and work condition and to facilitate the social promotion". This regulation was initial modify and improve by the Regulation no. 2434/92 by July 27, 1992.

The base principle is that of the equality treatment, each citizen of an member state having the possibility to exertion an remunerate function in another member state in the conditions applicable to the nations of this state behind. Conforming the Regulation no. 1612/68 (art. 10 and 11) the beneficiary of this right is both the worker and the family members which had an derivative right from the person right which exertion the free movement right. In the notion of family are include the wife and the descending until 21 years, the relatives in the ascending line of the worker or the husband and depending of that.

Through the Decision of the Council from May, 7 2002 it's create an consultative Committee for the free movement of the persons which are the fate to propose the improvement measures and by the utilizations of the legislation in the movement work force domain in the community space. [7]

The specialized administrative services from each member states had the obligation institute by the Regulation no. 1612/68, to periodic send to the specialized services from other member states and also to The European Office of coordination in the information domain regarding:

- The jobs offers susceptible to be engaged by the nationals of the other member states;
- The jobs offers addressed the member states;

➤ The requests for the jobs depend by the persons which declare in the formal way that they want to work in the another member state;

➤ The information, on the activity district and branch, regarding the applicants for the jobs which they declared in the effective way willing to occupy an work place in the another state.

Any job offer addressed to the occupancy services of an member state must to be communicated and analyzed by the responsible occupancy services in the case of the member states (art. 16 from the Regulation no. 2434/92.).

Workers from a Member State enjoy the same tax advantages, all the rights regarding housing including home ownership and the same social advantages as national workers.

Maastricht Treaty established by the 8th art. the principle of non-discrimination based on nationality, between the workers of the Member States, regarding the employment, remuneration and other conditions related to the activity.

After Romania's EU accession, many countries in this community were dissatisfied with the Romanian citizens and their attitude towards the laws of the state.

The Member States can invoke, though, the subject of public policy, health and public safety, thus removing the application of the principle of non-discrimination. The simple breach by a citizen of a Member State, of the formalities regarding the entry, the movement and the stay of foreigners it is not itself a conduct that threatens public order and security.

The European Union called upon all the Member States, including Romania, a transitional period of 2 to 7 years after accession. Thus, the Member States will continue to apply national measures for a period of 2 years after the accession, regarding the right to work of the citizens belonging to the new Member State. This period may be extended by 3 years, according to a prior assessment and continue with another 2 more years in case of serious disturbances in the labor market of the new Member State. Meanwhile, any Member State may introduce, under the national law, a greater freedom of movement of workers than at the present, including full freedom of movement.

In another train of thoughts, there are Member States that have imposed transitional measures for Romanian workers such as:

- Austria, to work in this country Romanian workers need a work permit;

- Belgium, as Romanian workers who want to work in Belgium will not receive the principle of free movement of workers, being obliged to obtain a work permit;

- Denmark, to work legally in this country, Romanian citizens need a residence permit and a work permit;

- France, allows the employees of the 2 Member States which acceded in 2007 (Romania and Bulgaria), to work only in seven industries, where there is a poor number of staff;

- Germany, Romanian workers still need an approval to exercise an activity in this country;

- Ireland, to exercise an activity in this country a work permit is needed;

- United Kingdom, to work in this country, Romanian workers need permission from the country's Ministry of the Interior;

- Portugal, has imposed restrictions regarding the access to labor market of the Romanian workers.

The freedom of movement for workers, from and between the Member States which joined the EU on May 1, 2004 (Czech Republic, Estonia, Cyprus, Latvia, Lithuania, Hungary, Malta, Poland, Slovenia, Slovakia) and on January 1, 2007 (Bulgaria, Romania) may be restricted for a transitional period not exceeding 7 years after the accession.

Conclusions

Every EU citizen has the right to work and reside in another Member State without being discriminated on grounds of nationality.

Since January 2007, Romania is a member of the European Union, to which the transitional arrangements are applied to. By these measures every Member State may continue to apply the national provisions or the provisions resulted from two-side conventions and these measures can be maintained at the latest by 2014.

Aspects Regarding the Financing of Higher Education Institutions

IPATE Dragoș Mihai
PÂRVU Iuliana
“Spiru Haret” University of Constanta
dragosmihaiipate@yahoo.com
iulia.parvu@yahoo.com

Abstract

In spite of its universally recognized importance, the literature reveals that higher education in most countries (and Romania is not an exception) is suffering from increasing austerity traced to some combination of rising costs and stagnating and even diminishing revenues. So it is obviously that we need some changes in the financing systems of higher education, systems that not to affect the quality of the educational services, moreover to be a support for them. This paper presents an analytical view of the other countries' experience in the matter of financing higher education institutions from the cost sharing perspective, in order to offer solutions for Romanian higher education managers. Our work offers a new perspective and a point of discussions over the changes which must to be made in financing of public higher education system. The paper also reveals the advantages and limits of some of the methods used worldwide and, most of all, affirms the necessity of the implication of all stake-holders in financing higher education.

Key words: higher education, public funding, fees

JEL classification: H52

1. Introduction

Since 1950, in developed countries and later in developing countries, the demand for educational services virtually “exploded”. As regards higher education, there have been recorded unprecedented developments. Basically, it appears that higher education was transformed from an elitist and restricted to a small minority phenomenon in a

mass phenomenon. With these developments, the issue of financing higher education has become extremely pressing. [4]

Until 1980, except some minor cases, the higher education in Europe was free or almost free of charge. In recent years, however, under pressure from budgetary constraints, the economic analysis showed that higher education supported wholly by the State is neither efficient nor fair and therefore the idea of introducing tuition fees in higher education was accepted. In the last decade, international organizations, government officials and economists have recommended the partial privatization of higher education, the general sense being that increased privatization of higher education through tuition fees must be accompanied by a substantial expansion of student support schemes. Under this approach, with general basis of reforming the financing of public sector and of restructuring based on efficiency criteria of higher education institutions, the existing trends in university education policies focus on rebalancing the funding of university education by supporting it with private funds. Thus, the burden of carrying the higher education costs will be shared between the general taxpayer and beneficiary students or their parents, emphasizing the role of the latter. This action must be complemented by building, in parallel, of a scheme of financial assistance to ensure accessibility, in order to equalize opportunities for access to higher education.

The European countries have reacted differently in terms of this financial problem, trying to find different ways of providing sources for funding of academic activity, as follows:

2. Public funding

Regardless of the size of these funds, it is clear that they can influence the functioning of an institution of higher education. For this reason, for public authorities should become a matter of great interest to find the most appropriate way of granting the funds so as to generate an increasing quality of educational services. To this end there have been proposed and used several methods:

Financing based on volume of activity - is a widely used method that takes into account for funds allocation the volume of educational activity (number of enrolled students, personnel, material basis).

Financing based on results - the Netherlands and Denmark are countries that have introduced this system in determining financing funds.

Financing based on strategic projects – the most eloquent example is France that have introduced the requirement of elaboration, at each university level, of multi-annual strategic projects on which to negotiate the public amounts to be allocated. [1]

3. Tuition fees

In this area it seems that European countries will be obliged to follow the U.S. model (private funds in U.S. higher education represent 50% and in Canada 35%). In the U.S. the trend is to have universities based on the market model (“market-model university”, a term used by professors James Engells and Anthony Dangerfield, from Harvard University). This term means that the U.S. federal government contributes relatively little to the maintenance of universities and other institutions of higher education, leaving in general the problem of financing institutions at the discretion and competence of the institutions themselves. In general, public higher education institutions are funded partly by taxes paid by citizens of that state, the rest of needs being covered from fees payable by students. Some private higher education institutions receive some financial support from the state administrative bodies, but most income is made from student fees, private donations, funds provided by foundations and

companies, federal grants, etc.. Basically, the model of U.S. higher education financing is based on the idea that public expenditure should be minimized, and, in parallel, at the society level, must be realized a “philosophy of costs sharing”. What means this philosophy? Starting from the idea that a higher education of quality is also an expensive one, tuition fees charged are very high. The idea is that from education received from people benefit both that people and the society on the whole, but also the company where he/she will be employed later. Therefore, all these beneficiaries must financially support the training within the university. The advantage is that training provided by universities is proportional to these charges, and the system works so well that for getting a job in the United States is more important what university you graduated than what you have studied there.

This exclusive orientation towards the market has its disadvantages, examples in this respect being the following:

* Joan Obra *et al.* (2001) note the situation of Stephen Hall University in Berkeley, California, where the African Studies Center occupies two rooms with cracked walls and floors covered with linoleum, while within the same university the Middle East Studies Center occupies sumptuous offices as a result of a 5 million dollars donation made by a foundation from Saudi Arabia;

* some departments within U.S. universities have sometimes controversial relationships with companies. For instance, Novartis, a pharmaceutical company, won 2 of the 5 seats of the Committee for Research at the University of Berkeley, after making a donation of 25 million dollars;

* also, in an article from 2001, Ibrahim Warde notes that academic integrity has become a merchandise, giving the example the Nike company decision to withdraw donations of millions of dollars for Universities of Michigan, Oregon and for Brown University, because their students dared to criticize working conditions within the company. [2]

Until now, the issue of tuition fees has been approached in most European countries in various ways, beginning with charging high fees, as happens in Britain, the consequence being that the access to higher education has been limited, achieving instead a system of

high level of quality, not observing however the principle of fairness (Lincoln and Walker, 1993). Other European countries such as France, Italy, Spain, have adopted the egalitarian policy of open doors to all young people who want to study, with the risk of endangering the quality of higher education system due to lack of financial resources needed. There is a third version, adopted in Norway, Finland, Netherlands, countries which reached an equilibrium, because of their generous public financing of higher education.

Many countries have introduced tuition fees, if they did not exist before, or have increased the fees if they already existed. Thus, in countries like Spain, Holland, Belgium they were introduced in early 80s, in Portugal, Italy, United Kingdom in 1990, in Austria in 2000, and also in Central and Eastern European countries the tax system has been introduced everywhere. Taking into account the levels of university fees to be paid by students, Western European countries can be divided into three groups, as follows:

- countries where university education is almost free: Denmark, Finland, Austria, Greece, Norway, Sweden, Germany (in a study from 2001, Karl-Heinz Heinmann shows that in Germany even foreign students receive free education in university).
- countries where university fees are low: France (approx. \$ 200);
- countries where taxes are high: Belgium (approx. \$ 800), Spain (between \$ 450 and \$ 800), Ireland (between \$ 1,000 and \$ 4,000), Italy (between \$ 450 and \$ 800 mandatory fee plus a fee up to \$ 600 to the faculty choice), Netherlands (approx. \$ 1,500), Portugal (approx. \$ 800), Switzerland (between \$ 500 and \$ 2,000).

A version of the tuition fees taken in some countries is *selective study fees* according to the category of students whom it is addressed. Some are designed to stimulate students, as happens, for example, in Baden-Württemberg in Germany where, since 1997, there have been introduced tuition fees for students exceeding the normal duration of studies. Similarly, those taxes apply to foreign students enrolled in certain programs of study or over the number of places allocated and supported by public funds. The Russian Federation, the Government being unable to cover all costs of higher education, allows the

universities to admit the fees payer students up to 25% of the total number, but the lack of effective control of the state in this area leads to that percentage increase.[3]

At the level of Central and Eastern European countries have started to be introduced reform programs related to financial relationships between universities and state and to institutional financial management. The changes resulting from these reforms can be summarized as follows:

- relative decentralization of financial competences, relative reduction of general constraints, decentralization of financial control;
- diversification of financing sources, increase of self-financing and by this means, reducing dependence of universities on state, although the public budget remains the main source of financing for higher education and fundamental scientific research;
- sharing of costs for higher education between state, local communities, beneficiaries (including the introduction of tuition fees);
- increased institutional and financial responsibility of financial managers and their incipient professionalization;
- introduction of transparent and partly competitive mechanisms for allocation of public funds. [8]

4. Consumer subsidization: the voucher system

A strategic market instrument, often considered by reforms of higher education but rarely widely implemented is the use of vouchers. Together with university fees, the voucher is an instrument whose application in higher education contributes in influencing the structure of university market by creating competitive behaviors. The voucher is a special form of government subsidies oriented to consumers' university-products (students) and not to university institutions.

Office of Economic Opportunity is one of the organizations that developed one of the first such experiments in 1973 in Alum Rock, California. In 1990, Milwaukee (Wisconsin) became the first U.S. city to implement a program of school choice based on vouchers. In Cleveland, Ohio, is running a similar program,

and in 1998 the voucher system was approved also in Pennsylvania. The voucher system in Colombia has grown substantially over the past 5 years. The enrolments included 100,000 students from disadvantaged families, leading to an improvement in educational opportunities among the poor people.

One of the most alleged advantages of the use of vouchers in higher education consists in revealing much better the consumers' preferences for the value of university programs. The running of this system in higher education creates the link between producer and consumer, offering to the consumer the possibility to pay through the voucher the university that can best ensure the accomplishing of its preferences. [3]

5. Granting loans for students

Once it is understood that investment in education should be viewed like any other investment, it was stated the idea that there is no reason why the society should be required to pay all educational expenses for an individual. Given the fact that higher education graduates are better paid in the employment market than those without higher education, they can afford to allocate some of their additional income to pay the loans used to finance their studies.

Practice shows that there are three main types of loans:

- *Commercial loans* - works like any normal bank loan. Interest rates are evolving considering the market conditions, while repayment periods are fixed. The main disadvantage of this method is that it is very risky for both those who grants the loan and for those who take it. Firstly, the student can not specify when he/she will be able to repay the loan as long as he/she depends on a future conjuncture of the labor market, and secondly we do not know for sure if the student will be able to finish the university. As a result of these issues, in general, the banks hardly grant such loans if they are not guaranteed by the government, and when they do so, they have high interest rates. Another version practiced is to grant loans for relatively short periods of time, which are returned at the end of each period.

- *Public programs for education loans* – the public intervention in granting the loans

may take the form of subsidies, which allow lenders to charge reduced interest rates and to have grace periods, or may take the form of guaranteeing the loan by the state.

- *Loans with repayment based on income* - the uncertainty regarding future income obtained in the labor market causes that some potential students to give up to school. To prevent this situation there have been developed certain types of insurance against the risk of not achieving a level of income able to make education a profitable investment. Such insurance may be purchased under a loan scheme whereby the credit return is based on the debtor's current income. Thus, amounts paid in the account of the loan granted and the time period in which the loan is returned may increase or decrease depending on income earned by the person who has taken the loan. There are two major disadvantages: one is called "moral hazard" and refers to the fact that the return of loan is based on debtor's conscience - they are likely to accept low incomes or not employment, and this leads to recording of losses following to be paid from public money, the other disadvantage is called „opposite selection” and refers to the fact that those students who expect higher incomes will prefer to obtain loans from banks or will be supported by their families, and this way of loan will be chosen only by those who do not expect to obtain higher incomes, which will generate another source of losses to be supported from the budget. [7]

The model introduced in Australia in 1989, called the *Higher Education Contribution Scheme* has attracted the attention of the academic world. That consists in the fact that fees charged are relatively high, but payments can be delayed by students who can not support that fees after graduation. Thus, the former student starts to pay the fees when his/her income reaches at least the average income level in the given economy. Students who do not want to postpone paying the fees can pay them at the beginning of each academic year, enjoying a 25% discount. So far, the model has been successful and, contrary to all forecasts, did not result in fewer students.

This model has been adopted since 2001 also in Scotland, where the Parliament has decided to separate the higher education, in terms of its financing, from the rest of the UK. [6]

6. Services offered by universities

This method provides an increasing part of resources needed by institutions of higher education. In North American universities 20% of revenues is coming this way, whether public or private universities. Also in Europe began to take shape clearer and clearer the entrepreneurship in universities, encouraging the diversification of financing sources and reducing the dependence on public funds. There have been created new entities, professionally conducted, operating on a commercial logic similar to that of corporations with which they come into contact. These entities are designed to exploit the results of research taking place at the university and to offer a wide range of training courses to those interested.

Another way to obtain financial resources is the export of educational programs. Thus, many U.S. universities, or from UK and Australia, are opening branches in Asia and Central and Eastern Europe.

7. Financing coming from business environment

It is a way in which companies can participate in financial supporting for higher education. In this respect the law should be constructed so as to encourage the donors offering them various advantages. An interesting example in this respect is France where the state can waive the fee for education of 5% which must be paid by all companies if they donate the same amount of money to freely chosen educational institutions and from which they can get various services in return.

[5]

8. Donations, sponsorships

Individual or corporate philanthropy flourishes only in an appropriate environment created by a favorable tax system and a national tradition in terms of local solidarity. Without these coordinates even the best organized campaigns to raise funds for education will.

The Role of EU funds for Agriculture and Rural Development in the Global Economic Crisis

ISTUDOR Nicolae

MANOLE Victor

IRIMESCU Achim

Academy of Economic Studies, Bucharest

Abstract

With the current global economic crisis, European preaccession and structural funds allocated by the European Union (which were and are quite consistent for Romania) may represent significant financial support for the acceding countries and those that joined in 2004 and 2007 to provide resources in order to support investments aimed at contributing to raising living standards in rural areas.

However very importantly is that these funds to be accessed at a high rate because the history proves that few countries could fully access the pre-accession funds (Czech Republic is a good example) and structural funds (Spain and Portugal are positive examples).

An important factor in accessing European funds is the operation of advisory structures (public and private) to advise the potential beneficiaries of such funds, both in preparing investment projects and implementation.

Key words: access, users, consulting, economic crisis, rural development, European funds, investment projects

JEL classification: F15, O1

1. Introduction

On the food products market, the inflationary pressures are rising based on the global agricultural problems since some years ago, including drought and population growth have added new pressures on prices. Consequently, the inflationary trend is likely to continue indefinitely in the market for these products. Companies that produce agro-food products have faced in recent years increases the cost of raw materials, and that these increases will not affect their earnings were

transferred to these increases to customers through selling price increases.

The inflation of agro-food prices is a constant concern worldwide that affects all segments of the population. Consumers and producers around the world are facing higher prices for basic foods. Moreover, food is the most important component of a basket of consumer spending and an important part of family farms.

At the same time, inflation generally creates a very volatile and difficult environment, but an environment where there are opportunities for investors. A solution for an investor would approach if „you can not beat them then you should join them”. If agro-food prices had an upward trend of increasing commodity prices, why not invest in the issuing of these products? Economic organizations profile should invest in equipment and thus to benefit from agro-food price increases.

Moreover, global food demand has increased for vegetables, dairy products, fruits and high value meat. It is difficult for a small or medium size firm to benefit from this trend. However, given the emergence of food price inflation and the current financial crisis we expect a steep banks reluctant to finance such investments, which will have negative consequences for farmers and food companies, which will be difficult advantageous to access credit.

A good result can be achieved only when entrepreneurs are faced with budget constraints that limit their performance. To increase production, in terms of quantity and quality, agro-food producers must renew existing facilities, introduce new technologies, all encompassing, but substantial investment.

However, businesses must allocate financial resources for obtaining information, purchasing inputs and marketing products. On the other hand, improved technology will improve farmers' access to raw materials and

will help to improve productivity and quality of finished products. It should be noted that private investment would be made not only in agriculture but also in warehouses, processing industry and retail.

2. Accessing EU funds - solution for crisis

A viable solution to address problems facing Romanian agriculture, deepened further in the context of the current situation in financial markets can be mutual funds for financing agriculture and rural development.

As such, particular attention should be paid to promoting a balanced rural development program to all regions of our country in a rural development concept which refers to economic and social integration of Romanian villages, while ensuring a favorable environment for attracting foreign capital favorable terms, to support investment and development programs to agricultural production. Special attention should be paid to the implementation of community programs, projects undertaken by the World Bank and other foreign-funded programs.

Moreover, through the European Agricultural Fund for Rural Development (EAFRD), Romania has allocated 8.022 billion Euro, which adds about 2 billion Euro national cofinancing, provided the state budget. For 2007-2013, through the National Rural Development Programme (NRDP) appropriate measures are undertaken priorities grouped into four:

- *Increased competitiveness of agriculture and forestry (Axis 1)* - total funds allocated for 2007-2013 - Euro 3,967,311,581, of which 3,173,849,264 EAFRD contribution in the amount of Euro

- *Improving the environment and the countryside (Axis 2)* - total funds allocated for 2007-2013 - Euro 2,293,413,375, of which EAFRD contribution in the amount of 1,880,598,967 euros

- *Quality of life in rural areas and diversify the rural economy (Axis 3)* - total funds allocated for 2007-2013 - EAFRD contribution of EUR 2,473,739,880 - 1,978,991,904 Euro

- *LEADER Axis (Axis 4)* - total funds allocated for 2007-2013 - 235,074,871 euros, of which EAFRD contribution in the amount of 188,059,896 euros.

The program includes significant funding for invest in farms, processing units and processing agricultural products, investment in non-agricultural activities, tourism and the establishment of microenterprises. To be eligible for an investment made by the EAFRD should be located in Romania, which can be carried out in compliance with the law, economic activities within the following areas: crop production and / or animal health and forestry, processing industrial agricultural and forestry products.

However, although the National Rural Development Program is intended as a continuation of the program SAPARD pre-accession instrument to address the modernization and restructuring the agrifood sector, compared with it, NRDP is a program that provides increased opportunities. First, the rural development sector allocations are more generous forms of support are more diversified and there are several categories of beneficiaries. In the same direction is expanded eligible investment, the degree of flexibility is increased, and implementation procedures are much simplified.

3. The stage of accessing the European funds for rural development

Until April 30, 2010, for measures launched nationally 21 185 projects were submitted in accordance with a published value of approximately 10 billion, which represents the entire amount allocated for rural development Romania, 2007-2013.

Several sessions were organized for the launched measures, which included a total of 12,405 projects worth about 2 billion. Since they have contracted a total of 9267 public projects worth about 1.8 billion euros, which represents approximately 32.7% of net amount allocated for measures in the implementation period and about 18% of the total amount spent on whole programming period (data is centralized in Table. 1).

At first glance it seems that Romania is somehow in trouble in terms of accessing European funds for agriculture and rural development, since more than two years after accession and starting (theoretical) implementation of sectoral operational programs, country Our failed to access than 3% of the amount allocated by the EU (as shown in Table No data. 2).

* Proiecte aprobate de către AM

** Contracte/decizii de finantare cu beneficiarii, ca urmare a aprobării de către AM/OI

However we should notice the large number of projects submitted for the National Program for Rural Development that ensures a good rate of projects accessed till now (almost all the amount allocated) that stands over the level of the SAPARD Programme (preaccession programme) and the other operational programmes.

It noted that progress in accessing European funds for agriculture and rural development is due on one hand, pursuit, in good condition, a pre-program (SAPARD), and, on the other hand, firms experience advice of our country in developing and implementing projects with European funding. The same can be said of other operational programs that have great difficulties in accessing these funds, levels of access are located at less than 5% of the amounts.

If Romania is maintaining its constant rhythm in accessing the European funds for agriculture and rural development we can say that will not have problems in accessing European funds for agriculture and rural development funds and will contribute to balanced sustainable development of rural.

4. Conclusions

In conclusion, we can say that Romania is benefiting of a quite generous financial scenario for Agriculture and Rural Development (and beyond), the amounts allocated are over 10 billion euros, representing approximately 33% of the total EU funds allocated our country for 2007-2013 (these falling to around 30 billion euros). But it is very important to follow the allocation and effective utilization of these funds to ensure balanced and sustainable development of rural Romanian.

For this, we need awareness and involvement of all leaders and participants from/to the management of EU funds, both

public authorities to coordinate operational programs and consulting firms, that the recipients of such funds.

In this respect, public authorities responsible for managing European funds are designed to ensure equitable distribution of these funds, to contribute to balanced development of rural and track the effectiveness of their use in order to achieve impact indicators listed in the programming document.

The consulting firms with responsibility to base investment projects to help enhance their success and project beneficiaries (investors in rural areas) to scrupulously examine whether any investment that contributes to economic efficiency and to raise rural living.

Also, consulting firms must be involved throughout the whole project implementation, until receipt by the beneficiary of the final installment of funds from the paying agencies, including consultancy targeting beneficiaries for obtaining funds necessary for the cofinancing.

The Sustainability of the European Model of Development Facing the Challenges of the New Era

KARDOS Mihaela

„Petru Maior” University of Targu Mures

mihaela_kardos@yahoo.com

Abstract

During its existence, EU has developed a socio-economic model defined in terms of responsibility, regulation and redistribution, aiming to provide for all member states both economic growth and social cohesion.

Although we could identify more types of models within member states in accordance to the European diversity, there is one European model of development defined through certain common characteristics such as: specific institutions and decision-making processes, sectoral common policies, a single market, the four fundamental freedoms and a focus on the issues imposed by the knowledge based society.

EU experience has demonstrated that its socio-economic model brings more benefits in terms of market opportunities, work force and technology transfer, but currently, due to the problems brought by the global economic crisis and the challenges of the new type of society we are heading to, many questions raise regarding the sustainability of this model and its capacity to continue to be a source of growth and prosperity for all member states, many of them following it as a way to overpass their underdevelopment issues.

At present, EU is still looking for the proper instruments to provide its competitiveness, fully supporting the principle of solidarity.

Key words: European model, fundamental freedoms, economic integration

JEL classification: F15

1. The specificity of the European model

Although the European Union is diverse in many respects, globally, we can speak about the existence of socio-economic model applicable to all Member States, a model

describing the European experience, in its attempt to simultaneously promote economic growth and social cohesion.

The fundamental idea of the model is that economic and social progress must go "hand in hand." In a vast literature, the model is presented as one incorporating certain characteristics (institutions, values) inherent in the Member States that are perceived as a way of regulating society and economy.

One of the latest approaches sees it as a European society model or, otherwise expressed, an economic and social model, as long as models and reforms are related not only to social issues, but also to regulatory incentives and the innovation system.

Pragmatically, we can define the European model in terms of responsibility, regulation and redistribution: [1]

- Responsibility: for the individual welfare, protection against poverty, support in case of sickness, disability, unemployment or old age, while promoting and ensuring an efficient system of education and health;
- Regulations: institutionalized labour relations, economic environment governed by social partners, market regulation;
- Redistribution: through financial support and social services for all groups.

These three characteristics reflect the fact that the European model is more than a social model in strict sense, because it affects production, employment and productivity and therefore growth and competitiveness, as well as all other economic policy objectives.

Furthermore, the European model influences social relations, behaviours, learning, knowledge creation and its diffusion. Thus we speak about a social-economic model. [2]

The European model has evolved from a spontaneous market to a regulated one, focusing on the need to solve development issues by reporting equally to both economic efficiency and social equity. The European model of integration is the countries' reaction

to globalization, following the failure of national policies during global crisis. In this respect, it is interesting to watch how the European model is able to minimize for member countries, the negative effects of the present economic and financial crisis.

This model promoting a sustainable society is based on creating a knowledge society, on reaching the completion of internal market and promoting competition, on creating a labour market responsive to economic change, and also on matching economic policies with the natural environment.

Although within the European model framework, social systems differ relatively, we can talk about the coexistence of four distinct groups of countries with relatively similar social practices, which justify the presence in economic literature of the following European models of society: [3]

- The Scandinavian model, often called the Nordic model, characterized by a system of monitoring labour market, in order to keep unemployment at a reasonable rate, a very well developed and financed social protection system;
- The Anglo-Saxon or the liberal model, characterized by increased market competition and modest social protection, in a changing labour market;
- The Continental model characterized by massive involvement of banking system in financing medium and long term projects, a more stable labour market and a greater focus given to the social protection system;
- The Mediterranean model, characterized by an effective system of monitoring and controlling unemployment, but also a defective social security system.

More recently, to all these could be added the so-called model of "catching-up", specific to new member states.

According to this typology, the European Union has no wish to have a single model of development, considering that their diversity does not lead to lower integration benefits, but rather enhances them.

However, we can speak of a European model as there is a common vision of how society should be organized. European Union has brought for half a century not only peace, but also economic and social progress.

2. Defining elements of the European model

A market-oriented vision does not mean abandoning what is specific to European values, but rather using market forces to preserve the values, by encouraging innovation and creating wealth to provide financing for equality, health, social cohesion and common security. [4]

To manage the global and regional challenges, to manage space and time and to minimize the democratic deficit, European Union should have modern, responsive, transparent and credible institutions, effective sectoral policies and appropriate responses to society stimuli and strategic vision.

Being an advanced form of integration, European Union shows that institutional harmonization becomes insufficient, requiring the necessity of transferring decision-making abilities from national institutions to the Union's.

EU beneficially uses a specific hierarchy in cooperation policies, such as information, consulting, coordination, unification and harmonization.

Complex objectives are achieved with greater benefits than costs. Benefits arise from a better allocation of production factors, from stabilization policies of economic growth and equitable redistribution of income. In this context, the European specialized institutions have a special role, directly contributing to favourable effects of activity in various economic and social areas.

The EU governance system has seen many developments in various plans. European Union has become an actor with a high degree of complexity, as the increasing impact of its policies has attracted more and more governmental and non-governmental participants in the process of policy formulation. Also, EU has become a multi-faceted process, as a growing number of responsibilities were established and this portfolio is impossible to be accomplished without decision-making procedures, within the framework of a flexibility principle.

The limit of policies, topics or themes addressed is broader than ever. National policies and European policies are intrinsically linked. National political actors operate at European level and European policies and procedures have a direct impact on national political scenes.

The four fundamental freedoms (of goods, persons, services and capital) are today the focal point of EU policies. European agenda is dominated by the continuation of the institutional reform and by the reducing the so-called democratic deficit, introducing the euro, the common agricultural policy reform, defining EU's global role, including the impact of enlargement, transatlantic dialogue, relations with neighbouring countries. The current situation has added a new task, which seems to be the first priority, namely finding successful solutions to overcome the problems of economic crisis.

That EU has become a global player, with clear political expression of identity, interests and capabilities, is already a reality that can be proven through its impact on contemporary developments in European and international political and economic scene.

At the basement of the whole European construction is found the willingness to work together for common interests. These led to the belief that in some areas better results may be obtained at European level than at national level, generating common policies developed and adopted by the Community institutions, applicable throughout the Union.

Often, these policies respond to one of the fundamental principles of European construction, that of solidarity and cohesion. The existence of common policies confers a unique feature for EU because it demonstrates the acceptance to surrender a part of Member States' sovereignty to European institutions.

Common policies support both political and economic integration, the deepening of the integration process. Gradually, passing through the customs union, single market and the Economic and Monetary Union, the deepening of the integration process opens member states' economies to trade and international competition.

In 1957, the EEC Treaty was limited to establishing three joint policies: agricultural policy, transport policy and trade policy. Thirty years later, the Single Act has added five new areas: monetary, social, environmental, economic and social cohesion and research and development policies. The Maastricht Treaty brought new competences, increasing to 25 the number of intervention areas.

Within European policies, a special role has the regional development policy, basically an element of the European model of

development. Regional development policy seeks to achieve a certain inter-regional equity, by eliminating some unwanted side effects of development.

The traditional objective of the regional development policy is to reduce regional disparities and achieve a relative balance between economic and social development of various areas.

Currently, it is considered that another important objective is to facilitate structural and regional adjustments. Globalization, rapid technological progress and profound geopolitical changes are factors involving the disappearance of whole sectors of economic activity. This kind of effect may affect negatively some regions.

Studies state that times when economic growth went by itself and when regional policy had only to steer this growth are now obsolete. Economic policy is called to promote economic growth by promoting competitiveness and regional capacity of self-development.

EU also brings benefits by integrating national labour and capital markets, leading to significant welfare gains for participating countries. Integration of national markets energises considerable intra-industry trade by exploiting economies of scale, diversifying consumption patterns and a gradual adaptation of EU standards, encouraging uniform community industrial practices.

Single market mechanisms of goods, services and production factors favour the reducing of costs in both private and public sectors, increase the overall efficiency by sectoral restructuring and ensuring a more competitive economic and organizational environment.

EU facilitates for firms increased opportunities for collaboration with partners from other countries in scientific research, technological development and introduction of technical progress. In this respect, management skills are enhanced, know-how transfer is emphasized, as well as a qualified workforce.

3. New challenges for the European model

Today, after the progress recorded in the '90s - a return to price stability and fiscal consolidation - Europe is still struggling in the trap of slow growth and high expenses.

Moreover, a sharp economic recession has been recorded in all countries, whether well or poorly developed, as a consequence of the global economic crisis.

Therefore, the European model is forced to find as quickly as possible the answers to the most important problems that threaten the Community economy and to face the challenges of globalization, which expose Member States to structural adjustment process in their economies.

Not all Member States are in an optimal position, while the current crisis raises new problems, besides those regarding the evolution to knowledge society, sustainable development, global integration processes, aging of population, slow economic growth and high unemployment, technological transformation and structural economic changes. [5]

Member States (both old and new) aim to redefine and implement a European social model, while retaining elements of social protection, but in a new modernized approach, adapted to the new economic requirements.

Until recently, the strategic goal was to make EU the most competitive and dynamic knowledge based economy, capable of sustainable economic growth, with increased opportunities to create more and better jobs and greater social cohesion. This objective continues to be a concern for European decision-makers, although on short term, EU seeks to mobilize forces to overcome crisis problems.

A major element is to make the economy-environment relationship a positive one. The key is to create a new technological basis by improving natural productivity of products, longer life products, recycling and improved technological processes.[6]

This new technology will generate, in addition to substantially improved environmental benefits, secondary effects for EU: regarding competitiveness, improvement of economic power through optimum use of resources and regarding strategic terms, decreasing EU dependence on the rest of the world due to the decrease in imports of raw materials. The second key element relates to the implementation of market research results into market innovations.

From social perspective, the model faces the challenges of demographic changes in the meaning of population aging, supplemented by extensive changes in the cultural, social,

relational nature of the family and work organization.

Solutions aim education for all, lifelong learning and even the proper management of migration issues. Labour market situation of young people is another challenge as they are among the most vulnerable groups on labour market. Key issues refer to the need to improve levels of education and training (qualification), to adopt a new attitude towards training, in the meaning of lifelong learning, security reform and social inclusion.

The first issues are related to human capital and are clearly oriented to labour market supply. Regarding social protection, the emphasis is on sustainability of pension and labour payment, as well as on social inclusion. It actually insists on individual ability to meet the challenges and survive in a competitive economy, a risk that was some time ago a social one, but today has become an individual one.

The existence of a reduced rate of growth in the EU (on average 2-3%), until the installation of the global financial crisis effects, which marked the inflection point to a downward trend, shows that economic prosperity can not have as fundamental source income redistribution between citizens, but rather providing the emergence of a competitive environment to ensure appropriate incentives in the process of saving and favourable conditions for entrepreneurship.

The key is to determine companies to anticipate changes, rather than to determine them to manage the consequences, which must be based on synergies of policy, legal, contractual and financial instruments.

Last, but not least, the question regarding the balance between security and flexibility is important, in the sense of finding a socially acceptable balance between the needs of businesses and long-term goal of human and social development.

The European institutional model is currently under extensive pressure to change the welfare system, with that of private property order and economic prosperity. It is increasingly recognized that maintaining the current arrangement of the welfare state becomes increasingly more expensive for European economies budgets.

These specific items suggest the need for configuring a new European model that combines welfare and sustainability, on one

hand and efficiency and economic incentives on the other hand.

The reformed European model supposes promoting mobility and supporting in finding employment, incentives for returning to work, creating jobs in new companies, services, flexibility as a strategy for firms and as a right for employees, but also focus on new technologies, fiscal prudence, fundamentals such as research and education, strengthened competition.

When it comes to modernizing the model we should bear in mind that individual's chances of post-industrial economy depend on knowledge-intensive learning skills and human capital accumulation. Thus, social policy is about to become a productive resource to determine people to succeed in the market. But, in the same time we must not forget about the demand and support an active macroeconomic policy as a third pillar of the economic and social model. [7]

Currently, however, EU is facing an unprecedented situation of economic crisis, which marked the strongest economic slowdown in recent history. Recovery is now the watchword at European level, which meant accelerating expenses in 2009 and 2010, to support the economy. For EU to withstand crisis pressures, cohesion must be maintained internally. This is not very easy, especially as long as, besides the uncertain political situation dramatic economic and financial problems appear. Still, issues raised by the Lisbon Treaty remain on the agenda.

The problem is to find the formula in which the 27 Member States are able to join forces,

so EU is able to exert a lasting influence in defining new rules for financial markets and economy. Expectations are even higher, since leaving the situation is uncertain. EU decided to allocate large sums to most affected states, to avoid weakening their economic capacity.

Solidarity, no matter how expensive, remains the best solution. Global crisis has changed Europe and European Union can not succeed unless carries out its economic, social and political problems. It is today still looking for levers to keep a balance.

Community Legislation and the Incrimination of Acts

LĂMĂȘANU Daniela Iuliana
"Stefan cel Mare" University of Suceava,
lamasanud@yahoo.com

Abstract

Since Romania joined the European Union, the courts are faced with the application of the Community law to the cases to be deduced by the judgement. If in civil and commercial fields the situations are somewhat clarified in terms of the priority application of the Community law, in criminal cases arise difficult situations because in the incrimination field the EU Member States retained their sovereignty.

Key words: criminal law, European integration, Court of Justice, criminal reform.

JEL classification: K14

1. Introduction

The European Union established an independent legal order, which was regarded as an expression of a great sense of values, impregnated by an European law community.[1,2,3,] The unity of the European law and the diversity of national contexts involves the application of the Community law in the Member States conditioned by the compliance with the features of each national legal system, although the EU rules tend to be made nationally with an identical content and with equal effectiveness. It would seem, at a first glance, that the treaty of Rome by which was founded the European Community (EC) does not contain dispositions with criminal implications for the Member States. On the contrary, the treaty shows that the Member States do not to abdicate from their sovereignty by it in any form, as regards the incrimination and the punishment of acts which they consider as dangerous for their national law. On this line of thinking also lie the decisions of the Community Court of Justice that underline that, in principle, the criminal law and the criminal procedure remain a matter for the Member states. Such a conclusion is natural if we consider the main economic objectives the achievement of which

is aimed by establishing the European Community, namely to achieve a common market, an economic and monetary union to facilitate a harmonious and balanced development of economic activities, of their sustainable non-inflationary growth, of achieving a high level of employment and social protection, all these in order to increase the living standards and the quality of life, the economic and social cohesion and the solidarity of European countries.

These tasks entrusted to the Community are carried out by the work of EU institutions, namely the European Parliament, the Council, Commission, Court of Justice and Court of Auditors.

After Romania joined the European Union, the transfer of sovereignty of national legal order to the Community legal order, of rights and corresponding obligations of the Treaty, results in limiting the sovereign rights of Romania and the integration of the Romanian legal system in the Community legal order which becomes a complement and at the same time, a measure of national law. According to article 148, second paragraph, of the Constitution of Romania, as a result of the accession to the European Union, the provisions of treaties constituting the European Union and other binding community regulations shall take precedence over contrary provisions of domestic laws, in compliance with the Act of Accession.

In view of the Treaty, the European Community would not be entitled to intervene in the internal activity of the Member States only if and insofar as the designed objectives could not be achieved by these countries in a satisfactory manner and, conversely, could be better achieved at the Community level due to the dimensions or effects of designed actions (subsidiarity principle). In the latter case, the European Union normatively acts by the adopting by Community institutions of regulations and directives, decisions, recommendations or approvals. The regulation has general application; it is binding in all its

elements and directly applicable in all Member States. The directive is mandatory for each Member State as regards the result to be achieved, the national authorities keeping full freedom of choice of form and means necessary to achieve the result. The decision is binding, but only for those whom it is addressed. Recommendations and opinions are not binding.

Therefore, the Community rules aim in particular an economic problem, that is the areas likely to meet the guidelines of the Community, namely: the establishment of stable prices, the development of healthy public finances and monetary conditions and a stable balance of payments. A second conclusion is that the Community legislation, within its intervention limits, is compulsory (except recommendations and opinions) for the Member States, it takes precedence over national law of Member States of the Community.

2. Incrimination in the internal law of community prohibitions

1. The European Community was not granted, by the Treaty, the attribute to develop normative acts of criminal nature, that is to incriminate the acts that would undermine the EU's economic system and provide the possibility of penalties for such acts. This does not mean, of course, that in certain respects, the community legislation has no contact with the criminal law. For instance, referring to Article 64 of the Treaty of Rome, we note that the text includes some requirements that the Romanian law enshrines too. Thus, it is provided that in the scope of the Treaty all discriminations based on nationality are prohibited. The same idea also appears in article 46 second paragraph of the Treaty which provides for the abolition, between workers of the Member States, of all discriminations based on nationality as regards employment, remuneration and other conditions of work. On the same line are also located certain provisions of Romanian legislation. We would firstly note the Romanian Constitution which enshrines in the article 16 the principle of equal rights for citizens and the elimination of any privileges and discriminations. The same principle is expressed in article 4 and 6 of the Constitution. The Romanian criminal law (art. 247 of the Criminal Code) also incriminates

the civil servant's act who in the performance of his official duties restricts the rights of a person on grounds of nationality, race, sex, religion. Elsewhere (article 317 of the Criminal Code) is sanctioned the chauvinistic nationalist propaganda, the stirring of racial or national hatred. The mentioned texts protect the citizens' equality before the law in relation to all fields, implicitly in the field of labour relations.

2. But the implications of the community legislation on domestic criminal law could not be assessed only with reference to the general constitutional framework and to the framework contained in the internal criminal law, framework capable, as shown, to allow satisfying the principle of European Community. The problem is how the current system of criminality and punishment prescribed in the national law will be able to meet more specific requirements of Community law, and possibly in what direction we should proceed to refine it in relation to these requirements.

3. Extra-criminal community provisions with impact on criminal prohibition

The Treaty of Rome, though, as we noted, considers the criminal legislation as the attribute of sovereign Member States, this does not exclude the fact that the Treaty, allowing a certain amount of freedoms, both in terms of movement of people and goods, to prohibit, by implication, any measures which would have the effect of restricting these freedoms. Therefore, whenever the liberties established by the Community legislation are in contrast to some prohibitions under domestic criminal law, for example in the regulation of economic or customs relations or the trade of products or goods, the last shall be cancelled, giving priority to Community law and identifying ways and solutions by which the criminal law does not oppose the freedoms enshrined in the Treaty.

How is justified, in relation to the internal law, this priority of the Community law? In this respect, the experience of French law is interesting. Faced with situations where the domestic criminal law should give way to Community regulations, the Criminal Chamber of the French Court of Cassation established the principle that the Community law takes precedence over the criminal law, citing in support of this conclusion of principle

article 55 of the French Constitution according to which the treaties have a higher authority than rules of internal law.

Although there were some reserves [4], the French Court of Cassation has maintained its position of principle. Moreover, in the Western criminal doctrine became major the opinion according to which whenever the community legislation would allow for certain activities to be conducted on the territory of member states, although, by definition, on the territory of some of them this act would be impermissible and prosecuted by law, the Community law, under its priority over the national law, will eliminate the existence of the incrimination rule under national law. In this respect, the EC Court of Justice, by a decision of March 9, 1978 (Simmenthal case) decided that the judge is obliged to apply the Community regulations, eventually dropping to apply the domestic law if it contradicts the EU law, even without waiting, through legislation, to repeal the rule which opposes to the Community norm. It was accepted that can be retained the guilt for those who do not comply with the norms of the Rome Treaty on the competition, even if there is no provision in the domestic law.

In this regard, they stressed that as far as the community legislation is interfering with the criminal law in the way of description of the act prohibited by law, the rule of Community law assumes the role of technical norm, helping to clarify the content of such incrimination. For instance, the dispositions of Article 85 and the following of the Treaty, relating to competition, will serve, inevitably, as technical rules to clarify the concept of unfair competition, even if the national criminal law would not refer explicitly to the provisions of the Treaty. Also, it was accepted that the exercise of a right recognized by the Community law may be a cause for removing the existence of the infringement provided in the domestic law.[5,6] In such cases, the problem arises from the verification by the judicial body, in every criminal case which refers to situations also covered in the Community legislation, if the national law does not contradict the EU law, case in which it will be given priority to the Community law despite the provisions of the national law and even before its repeal. In this regard, in the practice of French courts rising an issue if the judge can rule to determine whether the criminal law is not contrary to a provision of the Community law, it was decided

affirmatively, in that the judge may make such an assessment and he does not apply the internal standard if it is incompatible with the Community law. If the judge does not refer to this incompatibility, the Court of Justice of European communities will intervene. This appeal to the Court of Justice is optional when the issue arises in the first instance and is mandatory when raised before the Court of Cassation. The referral to the Court of Justice is not necessary if it has already answered the same questions, or if the national law was unlawful in relation to the international law.[4,5,6] It is also very interesting another case handled by the French courts: some people sent food to Serbia and Montenegro despite the international embargoes decided by the United Nations Security Council and endorsed by a decision of the Council. As a result, the transport of food to these countries being suspended, any operation carried out in breach of these rules became illegal, constituting an infringement of smuggling. However, the Lyon Court of Appeal acquitted the offenders, holding that the prosecution against them is not legally supported. The customs administration, interested in maintaining the legal classification for confiscating the goods which made the object of the contraband, disputed the solution of the Court of Appeal, arguing that the acts constitute the crime of smuggling because they violate the embargo and the suspension of transport to the listed countries.

The French Court of Cassation, by the decision of 18 May 1998, did not endorse this point of view. In its view, the Community rules restricting the trade relations with Serbia and Montenegro were not followed by internal criminal law provisions prohibiting the operations above. As such, the effectuated transports can not be considered unlawful and classified as contraband. There could not exist, says the Court, an infringement in this case, without taking into account the nature and character of the suspension measure ordered by the previously established embargo. According to the Court, it would have to be a national provision providing for the effects of this embargo. The provisions of EU Council, although superior to the internal rules, can not substitute the domestic legislation in the above listed situations.[7]

1. In what directions could be identified some implications of the community law on the national criminal legislation? In the French

doctrine was made the finding that although the community legislation may not actually include criminality, such competence only being of national law, there are recent incriminations that were introduced as a result of the community directives. That would be the case of Law of July 13, 1983 on the professional equality between men and women developed as a result of Directive 76/207 of 14 February 1976 on the equal treatment between men and women as regards the access to employment, to vocational training, promotion and working conditions (law provides criminal penalties for violations). Also as a result of the EU directives (the 4th directive of the European Community Council on annual accounts of companies from July 25, 1979) were adopted new incriminations on the compliance of accounting rules by the law of April 30, 1983 and the Decree of 30 November 1983.

Some other time, the Community legislation is considered applicable in the internal law without the need for the existence of a certain law or decree for their introduction in the national legislation. Such an application is made either by attributing through the national law a criminal penalty to the Community regulation, either by replacing the community regulation to the text of the domestic criminal law which provided a criminal penalty. In this regard is cited the decision of October 22, 1970 of the Court which made the application of the Community legislation no. 24 instead of the national provisions. Likewise, by the decision of June, 23, 1977 and January 4, 1982 was made the application of Community rules in place of internal rules concerning the wine. Also, in relation to drivers' working time and sea fishing, the Community regulations have been criminally punished through the internal texts which they replaced.[4 p. 13] Moreover, the French Court of Cassation refers frequently to the Community texts, even if they were introduced, in the above listed ways, in the internal law, after the acts alleged to the offender, or they were never formally introduced. We believe that these regulations are not subject to the rule of retroactivity of criminal law only if it is more favourable, but they are anytime retroactive, whether favourable or not, just as the interpretative criminal laws. No less shocking is that in these cases, the criminal law applied by the court was not that which would result from a national legal text, but from a rule of

Community law which was not always presented to the citizens through publication in the Official Gazette. In this regard, the French authors wonder if we can speak of a presumption of knowledge of criminal law.

2. If from the examples above results, undoubtedly, a direct influence of the Community legislation on the domestic criminal provisions, the French authors also emphasized a possible indirect influence which this legislation exerts, in that the EU principles may make ineffective the national criminal rules where the latter are incompatible with the Community law.

Such an influence was obvious, especially in two directions, namely the freedom of competition and the freedom to exercise a profession. Under the first part, the Community rules are likely to paralyze any measure restricting the quantity of import products, and other measures with equivalent effect (such measures violating the freedom of competition). For instance, following an interpretative decision of the Court of Justice of the European communities, in that food for calves should enjoy free movement between Member States, just as dairy products, price bottlenecks which were preventing the circulation of these products have been removed.[4 p. 13] Similarly, the European Court of Justice of the European communities held the French law on advertising alcoholic drinks as being contrary to the free movement of goods.

Drawing some conclusions from these Community rules for the criminal justice activity, the Criminal Chamber of the French Court of Cassation, by a decision of 16 June 1983 asked the judges to determine whether the provisions of national criminal law include discriminations in terms of marketing drinks compared with competing products from other countries with comparable features. As a result, the Court of Cassation rejected those repressive measures ordered by the lower courts in this respect, even if there was no danger of a discrimination, as reprisal, on the exported French national products.

According to article 36 of the Treaty of Rome, the Member States may provide restrictive regulations if they are justified on grounds of public morality, protection of health and life of humans or animals or for needs to protect the vegetation, protection of national heritage, or for protection of industrial property and trade, provided that such

restrictions do not affect intra-Community trade. Applying these provisions, the French Court of Cassation justified some restrictions introduced in the French law. Thus, by a decision of 17 February 1988, it justified the prohibition of trading tools designed to detect some devices used by the police or the gendarmerie, arguing that such restrictions are imposed by public order and they do not favour the selling of French products of this kind. Similarly, the prohibition to work on Sunday (Art. 221-5 of the Labour Code); it had been motivated that it may not constitute a quantitative restriction on imports, because that rule is established in the interest of workers and does not affect in any way the exchange between the Member states. All by a similar reasoning, because the measure does not affect the inter-European exchanges, it was disposed the maintaining of the conviction of a restaurant owner for lack of respect for the French language in the name of dishes and drinks offered to the clients.

The second part of the indirect influence of the community law on the domestic law concerns the right to exercise a certain profession likely to affect the free movement of goods. In this regard, the French Court of Cassation, by a decision of February 22, 1990, decided that the national provisions on the obligation of doctors to use certain devices do not oppose the community law and do not hinder the free movement of goods, for article 52 of the Rome Treaty allows each Member State to determine for its own citizens the conditions for the exercise of self-employment or for setting up a business. A similar solution was adopted on October 23, 1990 on the business of hairdressing.

3. It is also interesting to follow the influence of the Community law over criminal penalties of the national law. In this regard, in the French doctrine are cited the cases in which, following the decision in principle of the Court of Justice of the European communities, the French court was directed to amend the interpretation and application of domestic criminal law in customs offences.

Under the Treaty of Rome, goods from a third country, after the customs duties have been paid, are free to circulate in a member state, being assimilated to the goods originating from a Member State. In the case in which we talked about the importation to France of such goods on which duties were collected by another Member State of the

Community, the French authorities, noting that the import was based on misrepresentations of origin of goods, ordered the criminal accountability and a severe punishment of the importer. The Court of Justice of the European community, by the decision of 15 December 1976, criticized this solution indicating that Member States could not claim to the importer than a declaration of origin of the product, as he knows it or he may know it. Any omissions or inaccuracies in such a declaration, even if objectionable, could not be punished so severely, as the French courts did, applying a disproportionate punishment compared to the nature of the offence and its character of violation of administrative nature. Such arguments were repeated by the Court of Justice (Rivoira Business, March 28, 1979), which led to the establishment of a settled jurisprudence within the meaning of coercing the national courts to give priority to the provisions of "community legislation and to bring amendments to the legal classification of facts or to reduce the applied criminal penalties".[4 p.18] Being placed on this position, the French Court of Cassation (decision of December 5, 1983) dismissed the appeal of the customs administration and maintained the solution of the acquit of the importer who has made an inaccurate declaration of the origin of goods, also stating that the penalty with applied fine for an import of goods without customs declaration is not disproportionate to the more administrative nature of the infringement. By another decision, the Court of Cassation decided that the above solutions will not work in case of imports of goods based on fraud or prohibited goods. It is interesting to note that under the influence of the community legislation the French legislator repealed the provisions of Article 369-2 of the Customs Code, repealing interpreted by the Court of Cassation as having the significance of a change in the probation in this matter, being possible a simple evidence of good faith. By such a proof is removed the criminal liability of the importer working just as a justificatory fact; in this way, the bad faith became, by default, a constituent of the infringement.[4 p.19]

Regarding the influence of legislation on criminal sanctions is also held the repeated appeal of the Court of Justice of European communities for applying economically proportional sanctions.[8 p.149] This appeal was followed by the French courts, which, in

cases of import of goods under a false declaration of origin, considered there can be applied only a fine according to art. 410 of the Customs Code. This rule does not apply to illicit drug trafficking, a matter in which, motivates the French Court of Cassation, even the Court of Justice of the European communities decided that appropriate sanctions should be applied to the serious threat that have such acts. Following these indications of moderation in applying criminal penalties in economic and customs matters, the French legislator replaced the fixed fine penalty with relatively determined penalties (Law of December 21, 1977) and later (Act of July 8, 1987) has limited the fine to the amount of 2 times the value of imported goods in case of contraband or import or export without a declaration of origin. Also, by another law was stressed that the size of the penalty in these areas must be compared to the gravity of committed violations (Law of September 20, 1986).

Financial Interests of the European Union and their Criminal Protection

LĂMĂȘANU Daniela Iuliana
"Stefan cel Mare" University of Suceava,
lamananud@yahoo.com

Abstract

The EU constitution with broad objectives in the economic, social, justice and home affairs fields involved a considerable effort of the member states in financial, legislative and institutional terms. To these is added a categorical imperative, namely, to defend the EU financial interests against the frauds that can be committed at the institutional level to the detriment of the budget. In such conditions, the member states should create an appropriate legal and institutional framework to protect EU budget against possible frauds.

Key words: European Union, EU financial interests, criminal protection of EU financial interests

JEL classification: K14

1. Introduction

A serious problem the EU is facing is that of frauds committed to the detriment of the Union budget, which is defined by experts as the practical expression of the common heritage of citizens of the Union and as the decisive instrument of European policy.

The acts by which the Union budget is hijacked are particularly dangerous, not only by the amount of damages, but also by the impressive degree of organization of such acts. Many investigations carried out in this regard have shown that the EU budget is hijacked, both at the level of incomes and expenditures, which reflects the fact that this budget is supplied with amounts which are smaller than those normally expected to enter, and the expenditure shows that some amounts awarded as grants and aids by the community bodies often come to take other routes than those consistent with the purposes for which they were granted and the Union's interests.

The activity to combat and prevent such acts is extremely cumbersome and difficult

due to the limited powers of judicial bodies, to the reduced power at national borders and to the differences in legal regulation of acts by which the EU budget is hijacked.

As the Common Market is in expansion (that is the achievement of free movement of goods, persons and services) favourable conditions are created for the perpetration of fraud, breaches of the law. In such case, we found that the persistence of legal borders, that is of obstacles in an unitary super-state repression is disastrous, creating very favourable conditions to offenders (for whom are created real havens for immunity) and very dangerous for the Community legal order.

2. Internal legislative measures taken to combat frauds

It is known that at the European level was also tried the development of common rules to punish fraud against EU budget. A very important step in this regard was the development by experts from the European Union of a body of rules (*Corpus Juris*) with criminal nature, which would be approved by the European Parliament and applied in all member states of the Union.[1,2,3,4] The prevention and punishment of corruption acts, as well as of the acts affecting the financial interests of European organizations is a constant concern of them, contained in numerous documents, such as *the Criminal Law Convention on Corruption*, Council of Europe, ratified by Romania by Law no. 27/2001 or *the Convention on the Protection of the European Communities' financial interests* and its additional Protocols, established pursuant to Article K.3 of the Treaty on European Union. This concern is determined both by the need to improve the criminal law on preventing and combating corruption and by the proliferation of corruption, a phenomenon which occurs in Romania too.

The modification and completion of Law no. 78/2000 for preventing, discovering and sanctioning the corruption acts followed, on one hand, the completion of the legal framework in the field with new incriminations and, on the other hand, the widening of the sphere of the active subject of criminal corruption in some categories of persons referred to in the Criminal Law Convention on Corruption and in the Convention on the protection of EU financial interests and its additional Protocols. In the section "Crimes against the EU's financial interests" are incriminated acts such as: the use or production of false, inaccurate or incomplete documents or declarations, resulting in falsely obtaining funding from the general budget of the European Union or from budgets managed by them or on their behalf or that results in the illegal diminution of resources in these budgets. It is also incriminated the failure, with science, to provide data required by law to obtain funds from the general budget of the European Union or from budgets managed by them or on their behalf, if the act results in unfairly obtaining such funds or the illegal diminution of resources of those budgets, as well as the change, without observing the legal provisions, of the destination of funds from the general budget of the European Union or budgets managed by them or on their behalf.

However, by the newly introduced Section of Law No.78/2000 is incriminated the negligence in service of the leaders of economic agents resulting in an offence against the EU's financial interests or an offence of corruption or money laundered by people who are their subordinates and act on behalf of economic agents.

As regards the protection of the financial interests of EU, the legislation has been enhanced by the Government Ordinance no. 79/2003 concerning the control and recovery of Community funds and related misused co-financing funds, but also by Law no. 161/2003, which amended Law no. 78/2000.

Law no. 177/2003 for ensuring the funds necessary to discount the costs incurred by developing feasibility studies for the SAPARD Programme, Law no. 179/2003 regarding the co-finance of the non-refundable financial assistance allocated to Romania by the EU through the Instrument for Structural Policies of pre-adhesion for environmental projects, the Emergency Ordinance no. 26/2003 to ratify

the Annual Financing Agreement of 2002 between the Government of Romania and the European Commission on the Special Accession Programme for Agriculture and Rural Development, are all normative acts in support of more efficient running of the funds.

3. Measures adopted at EU level

To prevent the commission of frauds, each Member State shall take the necessary measures to prevent persons with leading positions in economic agents or any other person with decision-making or control power within them to be declared legally criminally responsible in accordance with the principles of its domestic law, when committed frauds against EU financial interests.

Any Member State shall take the necessary measures to establish its jurisdiction over such acts of misconduct incriminated by national laws. Also, any Member State which, under its laws, does not extradite its citizens, must take the necessary measures to comply with the Convention on the protection of EU financial interests, to establish its jurisdiction in matters of incriminated acts. If a fraud is a crime and concerns at least two Member States, they will cooperate effectively for inquiry, prosecution and penalty provision, with the aid of the legal assistance, extradition, transfer of criminal pursuers, the enforcement of judgments rendered in another Member State.

The European Court of Justice has jurisdiction for all the disputes between the Member States concerning the interpretation or application of the Convention. The Commission for preventing the frauds may refer the Court in some cases.

The frauds against the EU's financial interests are a considerable risk, being required an effective protection of them. The Commission proposes a directive on the criminal protection of the Communities' financial interests which aims to harmonize the national criminal laws. The Community institutions, as well as the Member States recognize the importance of an effective protection of EU financial interests.

To more effectively combat frauds and other illegal activities affecting these interests, the Member States, as referred to, have signed a *Convention on the protection of the European Communities' financial interests* of 26 July 1995, with a number of additional protocols, which provide measures which aim,

in particular, to harmonize the national criminal laws. As these legal instruments were not always ratified by the Member States, the Commission presented a proposal for a directive based on the new Article 20 of the EU Treaty introduced by the Amsterdam Treaty, a proposal which sets much of the provisions of those instruments.

The frauds affecting the EU financial interests are reflected both in terms of costs and profits.

According to the EU rules, is considered to be a fraud any international act or omission on:

- the use and presentation of false, incorrect or incomplete statements or documents
- the non-transmission of an information by violation of a specific obligation
- the diversion of legally acquired funds for other purposes than they were granted for.

The protection of the European Union's financial interests is also made by introducing legislation and administrative laws. In order to protect the financial interests of the European Union was adopted a provision on administrative measures and penalties for infringements of Community law.

It constitutes a disorder of administrative law any breach of a provision of Community law resulting from an act or omission of an economic operator which causes or will cause an injury in the general budget of the European Union or in the budgets managed by it, or by reducing or even suppressing the profits from its own resources collected directly on behalf of Communities, or by unlawful expenditures. The operators are natural or legal persons and

other entities for which the national law recognizes the legal capacity and which have committed irregularities.

The fight against frauds at the EU level is supported by the existence of action plans. Such an action plan may involve:

- a global legislative anti-fraud policy: the evolution of the regulatory device towards efficiency and consistency
- a new conception of cooperation: participation and understanding the national and community authorities
- an inter-institutional approach to prevent and combat corruption
- an improvement of the criminal-judicial dimension: adapting the legal and judicial framework for protection of EU financial interests.

Abstract

Elaborated in the, and in agreement with Priorities National Strategic Framework, the Sector context of national Developing Plan 2007-2013 Operational Program of Human Resources Development (SOP HRD) is an important instrument to sustain the economic development and the cultural structural changes.

Moreover, investments in human capital will complete and will confer support for work productivity growth on long term.

A qualified labor force, with a high quality level, having the capacity to adapt to new technologies and to needs of market changes is essential for a competitive and dynamic economy.

Romania will promote active policies on labor market for the augmentation of the adaptability and flexible security of the workforce.

The achievement of a higher participation level is predicted on the labor market as the basis of an economy funded on knowledge. In this context the project manager role achieves new values and dimensions, making the project leadership and leading of man art and science towards perfection. culture becomes an important component and resource of organizational culture.

Key words: relevance, durable development, equality of chances, value added

JEL classification: F15

1. Introduction

Social European Fund (SEF – set up in 1958) is the fundamental instrument through which the European Union finances the strategic objectives of the occupation policy. For 50 years SEF has invested in programs dedicated to increase the degree of employment in the states members of the EU.

SEF intervention in Romania will support the achievement of the overall objective and of the specific objectives in the human resources development field, bringing its genuine contribution to the implementation of the European Employment and Integration Strategy.

In this respect, the main objective of SOP HRD is human capital development and the competitiveness increase through correlation of education and teaching along life with the labor market and providing improved opportunities for future participation in a modern, flexible labor market to include 1650000 persons [6].

Limiting to such type of framework, the main objective of Priority Axis 3 project, “Increasing adaptability of employees and enterprises”, consists in creating new entrepreneurial experiences through the development of competences and abilities needed to assure people’s adaptability from target groups (entrepreneurs, people who wish to start an independent activity) to labor market and creating a permanent balance between work and family.

The specific objective, identified from the specific objectives SOP HRD, consists in developing personal and professional competences (adaptability, private initiative,

communication, team work, entrepreneurial abilities, competitive spirit) through initiation, counseling, assistance and continuous training in business management and organizational culture. This type of project, through the objectives announced, through the support given to target groups, brings its contribution to the main specific objectives of Priority Axis 3 “Increasing adaptability of employees and enterprises” through: promotion of entrepreneurial culture and social responsibility, increase of social adaptability, of professional skills, organizational culture development and perfecting methods of work organization.

2. Materials and Methods

In the context in which Romania adhered to EU in 2007, the Romanian development national policy will get closer and closer to the community's policies, objectives, principles and regulations in this field in order to assure a social-economic development “European” type and a reduction, as fast as possible, of significant differences to the European Union [1].

The implementation and development of some projects in human resources development field imply consideration to certain criteria widely available and adaptation to the national and European legislation.

To meet the relevance criterion, the project must be built taking into consideration Community's law provisions in the field.

Therefore, the project has to bring its contribution to the achievement of Lisbon Strategy objective, because it will include as objective, full employment, reintegration on labor market of inactive population, of the unemployed and particularly of unemployed young people.

Professional continuous training is a prerequisite for the development of future human capital performance. The project will meet the European Employment Strategy, integrated in the Lisbon Strategy, whereas it aims increase of employment degree through development of new business or independent activities improving quality of human resources [10], [11].

This type of project must meet terms of Integrated Guidelines for Economic Growth and Employment.

Thus, directions for such a project consist in promoting employees and enterprises adaptability, increasing investment in human capital through training, adapted to labor market requirements [5].

Project must meet Community Strategic Orientations regarding Cohesion 2007-2013 because it will bring its contribution through development of new business, to economic growth, wealth and more and better jobs [9].

The project will be compiled taking in consideration the development objectives established by national programming documents and plans of action in the human resources development field.

The project will be consonant with National Strategic Reference Framework 2007-2013 NSRF and simultaneously with OFP DHR because through the activities performed this type of project will support the training system to improve people's quality through the increase of this system adaptability in order to provide the knowledge and the skills needed for a modern economy in development [4].

The engine of such economy is the investment in human capital too.

Priority Axis 3 “Increase of employees and enterprises adaptability” contributes to the achievement of strategic objectives of NSRF, meaning superior skills and management capacity improved.

The project will meet the National Reform requests meaning that through the project priorities are established for reforms and improvement of quality and management, achieving a flexible labor market, improving enterprises and employees' adaptability, managing natural resources, preserving biodiversity and reducing pollution [7].

European Social Fund is an important financing source for activities destined for development of employment capacity and human resources, inside an inclusive society, non-discriminatory, that promotes equal chances.

Balanced participation of women and men in all life's social, political and economic spheres is more than necessary to obtain durable competitiveness and development and to obtain and consolidate a genuine democracy.

For real equality to be a *fait accompli*, it is necessary not only an improvement of legislation meaning the integration of equality principle, but especially a change of attitudes and behaviors, of life styles and social

structures that stop women to freely develop their personality and their active participation in all life's economic-social and political spheres.

Beginning from these objectives, the project will seek identifying, informing and attracting entrepreneurs and persons who wish to initiate an independent activity, in the professional and personal training program by promoting un-discrimination principle and offering big chances to social inclusion.

This type of project must respect the gender equality principle, promoting equal treatment for men and women without making any difference, exclusion, restriction or preference, regardless of race, nationality, ethnicity, language, religion, social status, belief, gender, sexual orientation, age, handicap, not contagious chronic illness, HIV Infection, belonging to disadvantaged categories [6].

The project must offer the same opportunities and chances for both young people, experienced entrepreneurs and unemployed looking for jobs, who are free to develop personal skills, for both men and women.

As strategy, integrating approach, is used and gives decisive factors an important role for project's implementation, especially to promote equal relationships between women and men for values given to "women's work" and "men's work" to be the same.

An important objective is to merge the family and professional lives, which is a difficult thing in practice.

3. Results and discussions

Participation to the achievement of some projects needs an interdisciplinary collaboration inside a management system.

As a result, managers' possibilities in response to extern environment evolutions are limited by its intern capacities which at their turn, depend on scientific and cultural accumulations of the subdivisions that form it.

Managerial culture important component and resource of organizational culture will be strongly oriented to achievement of project's objectives, acting as a modeling mechanism of the influences of exogenous and endogenous variables that affects the organization.

In fact, managerial culture will follow in these projects beside scientific strictness, the integration of staff decisions and actions

according to the estimated objectives, creating and developing models of organizational behavior, promoting certain managerial styles and practicing some type of leadership.

The content and the methods of manifestation of managerial culture are strongly marked by managers' personality, actually being a custom culture.

In developing a project that pictures the increase of employees and enterprises adaptability, completion, synergy and deep connection to economic documents and national policies, strategies, plans are sought, including:

a. National Research, Development and Innovation Strategy 2007 -2013 (RDI).

One of strategic objectives consists in the increase of Romanian economic competitiveness through innovation with impact to economic agents and knowledge transfer to economic practice [8].

In this way, you can achieve specific objectives of the strategy: to double the share of innovative companies, the increase of private expenses with research, stimulating private involvement to RDI, including increased capacity for innovation, technology development and assimilation of technologic research results into production, development of public-private partnership, simplified access for innovative companies to financing schemes RDI.

Through continuous training and assistance and assistance and counseling program of existing entrepreneurs and those who wish initiate a business, facilitation of partnerships between business environment and the research one is stimulated, in order to spread expertise in eco-innovative technologies and the transfer of good practice in energy and environment field to improve quality of life.

b. National Developing Plan for 2007-2013 (NDP) which is a reflection of development needs in Romania, to reduce as fast as possible, existing disparities to EU [1].

NDP Strategy 2007-2013 is based on both community strategic orientations regarding cohesion, and on priorities of Lisbon Agenda and on objectives from Goteborg, especially increase of competitiveness improvement and more efficient use of local human capital (full employment) and durable environmental protection.

National development priorities include reducing development disparities between

regions of the country which is achieved through the development of partnership, collaborations in entrepreneurial culture field.

Regional development policy is one of the most important policies and most complex of the European Union status arising from the fact that, through its objective of reducing economic and social existing disparities between different regions in Europe, acting on some significant fields for development, like economic growth and SME sector, transport, agriculture, urban development, environment protection, employment and professional training, education, gender equality etc.

Conceived as a policy of solidarity at European regional policy is mainly based on financial solidarity, meaning on redistribution of one part of community budget achieved through contribution Member States to regions and groups less prosper.

In Romania, the regional development policy began to take shape once with the operation of Phare in 1996.

Regional development *acquis* does not define how to create specific structures for the implementation of Community requirements just mentions these and leaves this in charge of Romania.

Thus, although the Community *acquis* should not be translated, Romania must create an appropriate legislative framework to enable implementation of provisions specific to the field [2];

c. National Strategic Reference Framework 2007-2013 is a strategic document that establishes intervention priorities of Structural and Cohesion Funds, representing simultaneously global strategy of their use and different Operational Programs symbolize the instruments used for the achievement of different provisions of NSRF.

Among these priorities there is the development and more efficient use of human capital, increase of competitiveness of Romanian economy on long term.

The project will be designed such a way to help achieve these priorities.

d. Strategy to strengthen excellence in scientific research -strategic objective is the development and promotion of scientific research, so in 2013 to classify the top places of the country in the internal hierarchies (classification NURC) and the top 500 places in the world (Shanghai classification) [8].

In line with research priorities formulated in the European Framework Programs FP6 and 7,

in full accordance with established research priority fields in the country, taking into account human possibilities, the following priority areas can be proposed: technologies of information society, durable development: economic, social and ecological; governance in a society of knowledge; quality of life; values and social-human behaviors; social cohesion; fields involving small and middle enterprises.

From scientific research objectives we mention: durable development and quality of education and employment.

Project will develop and complete projects under SOP HRD by: special training programs to achieve entrepreneurial abilities of existing entrepreneurs and of persons who wish to start an independent activity, special programs of business training, assistance and counseling programs for categories mentioned.

Romania has recently developed entrepreneurship and therefore there are still lot of things to do to expand and to stimulate private sector.

Implementation projects for operational programs seek development of entrepreneurial spirit to improve managerial skills in business activities.

Training will be provided to companies so that they could more efficiently manage change, economic restructuring, development of trade to diminish social expenses and to facilitate adaptation.

Both senior and middle managers will benefit of trainings in areas such: marketing methods, intensive staff training to achieve entrepreneurial knowledge, diversification of production, the use of ICT in productive processes, the new quality management system and the promotion of innovation, training for EU legislation regarding health and safety at work, organizational management and restructuring.

Operations financed by ESF will also support innovative forms of work organization, including health and safety at work and diversification of contractual relations and work relations to improve quality and work productivity.

However, within this priority Axis, specific professional training will be provided, seeking to improve specialists' skills in specific fields that use advanced technology.

Development of partnerships will be beneficial for promotion of new methods and

models that lead to change of organization and present and traditional attitudes.

In an era of globalization, science and art of leading will unite for development and progress, both nationally and internationally.

4. Conclusions

Human resources development will focus on investment increase in education and training, integration and maintenance on labor market of more employees, increasing job offer, adaptability improvement of workers and entrepreneurs, promotion of social inclusion and vulnerable groups.

Solid actions which will be promoted will target the development of new professions and professional standards in education, promotion of entrepreneurial culture, consolidation of partnerships with social partners, promotion of continuous professional training, promotion of active measures of employment, fight with hidden unemployment.

Participation of long term unemployed people will intensify on labor market and will be supported by durable communities through promotion of social economy.

EU Budget – An Economic Integration Support

ORAC Madalina
MIHAI Constantin
BUJDOVEANU Aurica

The Academy of Economic Sciences, Bucharest

Abstract

It is very difficult to calculate net financial benefits that a state derives from its membership of the EU, because other important advantages related to the domestic market (economies of scale, increased competition), the development of external relations development funds, security and justice are not considered. It should also be taken into consideration the redistributive function of the Community budget, which is based on the principle of EU solidarity.

International crisis cut Romania's high economic growth in recent years. It has highlighted major weaknesses of the local economy, which were reflected by large structural budget deficits (over 5% of GDP during 2006-2008) and external imbalances by two digits (remember that structural imbalance is obscured by an economic growth above potential, which brings only temporary additional budgetary receipts).

Key words: European budget, resources, member states, European Commission

JEL classification: H61, H69

1. Introduction

EU budget reflect the current EU priorities and policies of each year. It is the act that authorizes the funding of all Community activities and their related operations.

The resources related to finance these budgets come from each Member States contributions. European Council had an important role in ensuring the budget management.

In accordance with Financial Regulations in 2002, the budget can be defined as "the instrument that, for each financial year in part, forecasts and allows all revenue and expenditure considered necessary for the EU".

The EU budget allows observation of every year community priorities and policy guidelines.

Its evolution over time reflects the successive transformations of European construction. In 1970, the Community budget was 3.6 billion ECU (from January 1, 1999, 1 ECU = 1 euro) and consisted almost entirely of funds for expenses related to the CAP (Common Agricultural Policy).

Today, the EU budget is approximately 100 billion and is covering all Community policies: the common agricultural policy, regional development policy, policies on research, education, and training, international cooperation actions.

Since 1998, the Union's annual budget is set in accordance with a medium term financial plan, which defines the annual limits of the Community expenditure.

In 1999, during the negotiations of "Agenda 2000", related to the future EU priorities, there were established and adopted guidelines of budgetary policy for a period of 7 years, between 2000 and 2006. This budget outlook over several years is taken both by the EU Council and European Parliament.

The financial perspectives for the 2000 – 2006 periods have included credits for the enlargement of the Union.

The EU Budget also has an important redistributive function, by transferring funds from rich to poor regions in order to achieve convergence (structural policy).

Figure 1: Evolution budget U.E. (billion €)

The UE Budget is often misunderstood. Important as absolute value (over 100 billion per year), this is reduced when expressed as a percentage of total EU public expenditure (under 2,5%).

The budget has provoked periodic political crises, but also functioned as a catalyst for development of the EU. During this period, the budget increased in real terms, but its size relative to GDP has declined, despite the enlargement of the Union and the assumed new political responsibilities.

The own EU resources were introduced in 1970, in order to finance the joint costs, to ensure the independence and identity of the EU to the Member States.

The own EU resources are defined as "income taxes irrevocably earmarked to Community to fund its budget and automatically balance it, without the necessity of any other decision from the national authorities" (European Commission, 2001).

The total EU income must be equal to total expenditures and to meet legal limits agreed, which is currently 1.31% of GNI (gross national income) for commitment and 1.24% of EU GNI for payment.

The main source of financing the EU budget is a resource based on gross national product of Member States. It has come to exceed other sources, like customs duties and agricultural levies ("traditional own resources") and a resource based on the value added tax.

In 2013, the GNI resource will represent 74% of EU funding, compared with 13% coming from customs and agricultural duties and 12% from the VAT-based resource.

The EU budget funding sources and mechanisms should provide a more adequate funding of EU policies. These should be assessed on the basis of agreed principles, such as economic efficiency, equity, stability, visibility and simplicity, effectiveness of administrative costs, financial autonomy and sufficiency.

Therefore, Member States often tend to judge European policies and initiatives in terms of profit in relation to national contributions, instead of first assess the total value of carrying out certain policies at European level. General composition of the own resources system will be an important factor to be considered during the review.

Corrections on income levels, including the UK correction - which is, in particular, the

repayment of a proportion of 66% of the difference between contributions based on GNI and VAT paid by the United Kingdom on the state budget and revenue - lump sums paid to Netherlands and Sweden, reduced VAT rates for the Netherlands, Sweden, Germany and Austria, and a flat rate of 25% retention of traditional own resources for the State that collects them.

Budgetary funds are used to finance all EU policies in the respective budget year.

The EU Budget reflected the key stages of European integration. Developments such as the single market, enlargement, developing a global vision on Europe, have required each time, changing the pattern of EU expenditure.

The EU expenditure profile has changed considerably over time: traditionally, most of the EU budget was concentrated on a relatively small number of policy areas.

However, both within and outside these areas, spending priorities and policy objectives pursued have evolved.

Budget structure and its size have met a continuous modifying trend:

- at the beginning of the integration process, each of the three European Communities had a specific budget. The first budget of the European Economic Community (EEC) was very small, covering only administrative costs;

- in 1965, payments for the Common Agricultural Policy (CAP) absorbed 35.7% of the budget and increased to 70.8% in 1985. In the first financial year of the 1988-1992, CAP expenditure represented 60.7% of the budget. By 2013, the share of traditional CAP spending (excluding rural development) will decrease to half (32%), following a reduction in real terms occurred in the current funding period;

- only 6% of the EU budget was spent on cohesion policy in 1965, a share which has seen only a mild increase in the 1980s (10.8% in 1985).

Single European Act put an emphasis on economic and social cohesion and was followed by a significant increase in expenditure on cohesion. The amount devoted to structural measures already risen to 17.2% in 1988 and will represent 35.7% of EU budget in 2013, with at least two-thirds for competitiveness, growth and jobs;

- funding for other policies (in particular, competitiveness, external actions and rural development) was initially very limited. In the

first financial framework, only 7.3% of the budget was restricted to those areas. However, the new emphasis on development and competitiveness will lead to an increased share of these policies by 26% in 2013, of which 10.2% for competitiveness, 6.3% for external actions and 7.3% for rural development. Spending policies for the period 2007-2013 have new priority objectives for growth and jobs, and new policy directions such as freedom, security and justice. Meanwhile, the decision to conduct a review confirmed the necessity of a more fundamental assessment, able to provide a long term proposal for the next financial framework and the future beyond.

2. The EU Budget for the 2007-2013 Horizon

Financial perspectives for 2007-2013 have been reduced from eight to five chapters. This makes the system more rigid and allows a more efficient use of available resources.

During 2007-2013, the budget revenues will be 1025 billion Euros and will cover the following objectives:

- sustainable growth: this heading includes structural funds, research and education, with a budget of 382 billion Euros for 7 years. It aims to two components: efficiency and cohesion, linked to economic growth and employment use factor;
- conservation and managing of natural resources: it is financing the common agricultural policy and environmental policy, with a budget of 371 billion Euros;
- citizenship, freedom, security and justice: 10.7 billion Euros are intended for activities related to justice and internal affairs. This amount will cover programs that encourage European citizenship, such as exchanges between young people, town twinning and European dimension of media and culture;
- The EU, as a global actor: 49.5 billion Euros will be allocated for different actions in favor of developing countries, promoting human rights, foreign policy and security policy and support for developing of neighboring countries;
- administration (including translation services) will receive 49.8 billion Euros, that is 5.75% of the total budget.

The breakdown by years of the 2007-2013 financial perspective is presented in Table 1.

In recent years the EU has accelerated the pace of change, while developing a policy agenda toward the future, which will determine the main priorities of the Union for the next decade and beyond in the future.

It is possible to outline the new policy challenges that could have a significant impact on the direction in which the Union shall conduct work in the future.

- the competition for resources and markets became more intense. The economic balance of power changes. The opening of new markets creates enormous opportunities for many Europeans, but will test at the same time, Europe's capacity to adapt to the structural change and manage their social consequences;
- the globalization is stimulating scientific and technological development, which gives the European dimension a greater importance in promoting awareness, mobility, competitiveness and innovation. The EU can help harness the benefits offered by its continental size to promote excellence and convert it into growth;
- the transformation into a knowledge economy and services is as profound as the earlier shift from agriculture to industry. This is changing the nature of work. Information technology and personal skills are particularly sought. Too many young people - one in six - give up too early in school, while even more do not have the basic skills necessary for the knowledge economy;
- current levels of birth rates will change the structure and balance of our societies, raising important issues both in terms of economic efficiency and intergenerational equity;
- Europe's solidarity and commitment to social justice is an important dimension of the European way of life in a globalized world;
- the impact of climate change on environment and European society has become a central element of the European agenda, forcing policy makers to reflect on the most appropriate response to use policy instruments available to EU;
- globalization has led to the need for Europe to have an effective presence in the world in order to spread its interests and values successfully.

3. Conclusions

Both the budget and in other respects, European action should provide clear additional benefits compared with action by individual Member States in order to develop policies that promote the common European interest.

The 2007-2013 financial perspective was adopted in December 2005. The budgetary procedures remained, however, still difficult. This is the reason why the European

Commission asked an independent panel of experts to find simplifying solutions. The Expert Group recommended "a radical restructuring of the EU budget in order to cover the development agenda under the Lisbon objectives. The simplifying of the budgetary procedures would represent a significant contribution to the EU operation in a crucial moment of its evolution.

Abstract

Although the concept of CSR is gaining ground in European businesses, there are big differences among countries members of European Union. These differences refer to the approach regarding CSR and its implementation in companies. Central and Eastern Europe has a legacy of institutional and economic development different from that in Western Europe. For some countries, like Romania, CSR is a new problem.

Although CSR is present in Romanian business society, it has been imposed rather as a fashion, than as a result of a real need of Romanian society. In this context we can say that only the multinational corporations really posse the necessary abilities.

Key words: corporate social responsibility, globalization

JEL classification: F02

1. Introduction

In the context of globalization, the expansion of multinational companies on developing country markets have witnessed a shift of center of gravity of the economy and society from state to private sector particularly multinational corporations. But their power has become huge but in the same time it increased its impact on society. In these circumstances the range of responsibilities that a multinational company has, have diversified and expanded.

Accelerated social and economic transformations at the global level subject companies to permanent necessity to change their business model, the mode of thinking, attitudes, and patterns of interaction with stakeholders. The time when companies built their business solely around the needs and expectations of consumers has gone. Today,

companies are challenged to answer through performance that reflects the values, interests and expectations of society. Social responsibility has become a vital part of healthy development strategy, for long term, of any organization.

Theme of corporate social responsibility has become true size only to the early 90s, with a significant acceleration to 2000. The debate on corporate social responsibility concept integrates the global debate on the future of the planet (regarding aspects such as economic, social and environment) around the concept of "sustainable development" formalized the 1992 UN Summit in Rio. The theme of sustainable development was started in 1970 along with the publication of the first Club of Rome report entitled "The Limits of Growth". In Brundtland report (1987), sustainable development is defined as: "the current generation capacity to meet the needs of the present without compromising the ability of future generations to meet their own needs".

The CRS represents the microeconomic dimension of the macroeconomic concept of sustainable development. In another interpretation, CRS can be perceived as an integral part of the sustainable development concept, a contribution to the business environment in achieving sustainable development objectives. World Congress on Sustainable Development defines corporate responsibility as "the company's commitment to contribute to sustainable economic development, participated together with employees, their families, local community and society at large to improve quality of life."

2. Literature review of the "Corporate Social Responsibility" concept

Internationally, corporate social responsibility (CSR) has become the topic of research since the 1940s, then evolved as a consequence of movement for rights (the '60s)

and expanded as a result of the general crisis of the welfare state, also shown more visible since the first "oil shock" (1973-1974). With the entry of companies in the post-industrial era, Western governments are pressed to reduce involvement in social welfare activities and to re-define its philosophy of providing it.

The term CSR has a long history. The notion first emerged in one form or another in writings dating back to the 1950s, mainly emanating from the USA [3]. The first academic debates on corporate social responsibility took place at the beginning of the 50's. Initially under the term of "social responsibility" it was referring at the expectations of the society from the business environment and at the ethical obligations of the company towards the society. Howard Bower, the "father" of CSR defined Corporate Social Responsibility as "the obligations of businessman to follow those policies, to take those decisions or to follow those directions that are agreed in terms of values and objectives by our society" [2].

During the decades that have followed there has been a significant increase in the efforts to formalize and conceptualize the idea. Early definitions emphasized the importance of relating business 'responsibility' to 'power'. Later, in the 1970s, a 'stakeholder approach' emerged that highlights the importance of balancing the multiplicity of interests represented by internal and external constituent groups and individuals. In the 70's the line of scientific research has moved towards the capacity of the companies to answer to environment requirements. With the name of "social responsibility of the company" it was stated the issue of the way in which and with what consequences the companies should or can adapt to the needs of society. In the same time the concept of "social performance of a company" has developed.

During the 1980s the focus shifted from developing new and revised definitions to further research on CSR, resulting in a splintering of writings and the emergence of a range of alternative concepts and themes. Clearly the use of the term CSR has not diminished but its core concerns have been recast into alternative theories, concepts models, and themes [20].

In the 80' and 90's the stakeholder theory brought an important contribution regarding the speech of CSR. It changed Friedman's (1970) stakeholder paradigm that considered

maximization of financial results towards shareholders is the greater social responsibility of a company. The company citizenship ([12], [8]) is related to the theory of the social contract ([14], [6]) through which a company belongs rather to the community in which activates than to some persons, so it becomes an extension of it, it becomes a "citizen" of the community and in this sense it has some rights and obligations towards the society in general, and that community specially.

Although the concept has been developed since the early 1970s, there is no single, commonly accepted definition of "Corporate Social Responsibility" (CSR). There are different perceptions of the concept among the private sector, governments and civil society organizations. Depending on the perspective, CSR may cover [19]:

- a) A company running its business responsibly in relation to internal stakeholders (shareholders, employees, customers and suppliers);
- b) The role of business in relationship to the state, locally and nationally, as well as to inter-state institutions or standards;
- c) Business performance as a responsible member of the society in which it operates and the global community.

According to the mentioned authors the first perspective includes ensuring good corporate governance, product responsibility, employment conditions, workers rights, training and education. The second includes corporate compliance with relevant legislation, and the company's responsibility as a taxpayer, ensuring that the state can function effectively. The third perspective is multilayered and may involve the company's relations with the people and environment in the communities in which it operates, and those to which it exports. All the concerns and problems that are associated with the CSR concept, as it has been stated before, have a global dimension. In fact, an increasing number of European companies, and not only, develops their activities in several other countries, obtaining profits as a result of these markets openings.

3. Corporate Social Responsibility in Romania

In this study we try to analyze how CSR is evolving in national context, starting from the

imperative of Europeanization, the compatibility between modern development models and national contexts, such as an explanation of corporate social responsibility in post-communist Romania. The question is, indeed, companies in Romania assume voluntarily, responsibilities towards the community, beyond what is covered by law, as happens in countries with economies strengthened and functional democracy. In the CSR approach we start from the premise that it appears in a society with a proper way of modernization [17].

CSR is a reality in the Romanian business society, only that it was imported from the U.S. and Europe and it has imposed more as a fashion than as a result of awareness of the need for CSR. In Romania and in other countries of Central and Eastern Europe, CSR is still in stage of imitating the Western model of CSR. It can be a powerful tool for social development only if it answers to needs of social groups in these countries [17].

Unlike the U.S. and Western Europe, CSR, CSR in Romania is at the crossroads of Europeanization and modernity. That multidimensional process of Europeanization contributes to the emergence of new understandings, the original explanation of key domestic social issues such as for example analysis of the impact of European action on domestic contexts [13].

CSR Europeanization in Romania takes place by adapting CSR programs adopted by the European Commission. They are focused on providing social, economic and environmental benefits. If in Western countries CSR aims actions without no state involvement in Romania CSR falls, often in the State actions, particularly in operations for supporting the disadvantaged social groups, groups neglected by the multinationals because of low income (they aren't their customers). It is important that European institutions to understand that the Europeanization of Romanian society can be beneficial for both Romanian and for all Europeans only if they meet real needs of Romanians.

In the process of Europeanization an important role is attributed to multinational companies, owners of industry and natural resources of Romania ([15], [17]). Regarding corporate social responsibility in combination with Europeanization some authors stress the idea that there is an inconsistency between

Europeanization and domestic circumstances, which has as a result the pressure from the European Union on the Romanian society to adapt the European norms. The difference between the model of Europeanization through innovation and model of Europeanization through imitation [18] is found in the application of CSR. Aligning CSR to the internal needs and requirements depends on the Europeanization degree of society, manifested in the compatibility between the interests of multinational corporations and Romanian social and institutional Europeanized structures [17].

CSR comes in Romania from a mature capitalist economy, developed organically over several centuries, and applies to a society seeking to resume the thread progress towards a capitalist economy, existing before 1948, the year of nationalization, from time to philanthropic initiatives of Romanian capitalists. CSR operations reflect the type of capitalism introduced in post-communist Romania. Capitalism is considered one of the drivers of change of modern type. Consequently, modernity and capitalism have been accepted as a way of evolution of Romanian society.

Romanian economy is in an ongoing transformation process starting with 1990. This involves changes of legislation, institutions, human perceptions of economic activity and productivity in order to fulfill the challenges of the: (i) transition period, during 1990-2003; (ii) emerging market, during 2004-2006, and emerging country, since 2007. Also, transformation process have gained another status in the context of the evolution of relationships between Romania and European Union (EU) from a candidate country, in 1997, to an acceding country, in December 2004, and a EU member state, in January 2007. This new status in 2007 indicates that Romania fulfills political, economic and institutional criteria and implements the acquis. As a result, Romanian has an administrative capacity to transpose European Community legislation into national legislation, to implement it and to effectively enforce it through appropriate administrative and judicial structures. Therefore, Romanian economy must face new challenges imposed by the EU member state status.

In Romania, the concept of CSR has been imposed since 1990 when there appeared NGOs, especially those focused on

humanitarian goals with assistance from international public and private institutions [11], conclusion that brings in relief the specificity of CSR in Romania, because it did not appear as an action resulting from the Romanian context, but as an initiative taken and adapted from abroad, multinationals interested in promoting their strategies in all countries where they have extended their activities.

Most Romanian ministries have special departments to introduce measures CSR and promoting initiatives to change laws according to the principles of social responsibility [11]. The question is whether this large number of institutions has the material and human resources to organize activities for the implementation of corporate social responsibility. Ministry of Labour, Social Solidarity and Family, Ministry of Economy, Ministry of Agriculture, Forestry and Rural Development, Ministry of Health, Ministry of Environment have such kind of departments but taking into consideration the particular features of Romanian society, they are more bureaucratic forms without an appropriate background. Their establishment has been under pressure from the European Union, as happened with many of the new institutions emerged after 1990.

In the process of modernizing, the Romanian society, as we mentioned above, has known the phenomenon of form without substance caused by transplantation of capitalist institutions in a traditional and patriarchal national context. Most Romanian sociological doctrines argued Romania's modernization directly related and necessary to capitalist development [10].

Like other new practices introduced after 1990, CSR applies more due to the need of synchronization with the spirit of time than as real necessity derived from cultural and historical contexts of the local society. Only 5% of companies in Romania have an annual budget for donations and 25% of them are trying to have a charity scheme (Source: Am Cham - The American Chamber of Commerce in Romania [11]).

In Romania have begun to appear more and more companies of corporate social responsibility. One of the main reasons for these changes could be the appearance on the Romanian market of the multinational companies with a tradition in social responsibility. The appearance in Romania of

the concept of CSR has as main cause the economic development and the appearance of some multinational companies that exercised some pressures even on the local ones to create a corporate reputation and image.

The companies with the major involvement in projects of social responsibility remain the international companies; those with Romanian capital haven't got yet this preoccupation. One of the elements regarding CSR that is missing in Romania is the informations from the market regarding the impact of CSR on the consumers and on the society. One of the reasons for this is the fact that for the Romanian public CSR is a relatively new subject.

CSR initially emerged in the Romanian business environment through the multinational companies, such as Lafarge, Coca-Cola, Holcim, Carpatcement, Zentiva, Orange, Vodafone, Petrom-OMV, which are still its main promoters at the national level. As previously declared, like any other imported concept, subject to a need of accelerated assimilation, CSR in Romania was initially imposed more as a fashion rather than the result of the full awareness of all the stakeholders' needs [5].

The most important categories of CSR projects carried out by companies in Romania in 2007-2008 period refer to the following social implication areas [1]: *Environmental protection; Social issues; Civic behavior; Human rights; Health; Education; Art and culture; Sport.*

Recent studies regarding Romania (V. Chisu INCSMPS 2008) revealed that corporate social responsibility (CRS) does not only mean fulfilling a duty towards the society, but on the contrary, it is a new style of doing business, integrated into the company's culture at all of its levels. The above mentioned study shows that only 17% of companies in Romania, with more than ten employees have a clear strategy for future development of CSR activities. According to the study 12% of companies have drawn up a report on the activities and programs of CRS domain and 7% out of these have drawn up an annually report and only 5% occasionally.

There appear two directions Romanian CSR. First is the option to get involved, because this is your company's vision, is a cause in which the organization believes, the second would be that a company has no credibility as long as it is pure marketing and it

gets involved in social causes to earn at the chapter "image".

CSR in Romania could be reduced to some coherent initiatives, attempting to earn an extra image capital of the company through social involvement, and a lack of awareness and involvement from civil society, that doesn't notify itself, that is not capable, yet to sanction companies' foul actions.

Corporate social responsibility can make a decisive contribution to social inclusion and integration of labor markets, poverty reduction and the achievement of any other objectives. Also it needs to be stressed the importance that social responsibility can have in terms of Romania's EU integration. Thus, CSR may be for Romania more than a solid base for implementation of the Lisbon strategy.

4. Conclusions

The CSR initiatives once present only in Western Europe are now part of the day by day activities of the companies also acting in the Romanian business environment. Companies in EU are supported in their socially responsible activities by the national public policies; meanwhile this type of support is rather insignificant in Romania. The good part is that also the companies in Romania begin to realize the great strategic potential of developing social actions.

Corporate social responsibility is today part of the strategic approach of the companies that are acting in the Romanian business environment. CSR policies were first launched in Romania in early '90, rather as a fashionable corporate behavior or as an extent of the European policies. Later on they became part of the companies' strategies. From the early beginning, CSR was seen not as mandated by law or imposed by external forces, but undertaken by the companies "in a manner that meets or exceeds the ethical, legal, commercial, and public expectations that society has of business". Although CSR is an area still at the beginning of the road in Romania, this concept is increasingly present among the national business environment.

In Romania, the challenge is to encourage people to realize that social responsibility is not only an image building instrument, but an essential element of success in the long term, which is directly related to the social and environment performance of the community.

CSR will become an organic reality in Romania only if the shares of companies, especially the multinationals will adapt to the requirements of the Romanians in their approaches by freely assuming these actions and not only for publicity. In other words, multinationals will apply the same moral criteria as support of CSR as in their countries of origin. This will be realized when the Europeanization of Romanian society will enter into the depths of all its components [17].

Abstract

About 12 years ago, some expert argue that the euro is the last big mistake of the European political class. The benefits are smaller than disadvantages. Free movement of people, goods and services is perfectly possible in a market without a single currency unit. Currency risk must be accepted as acceptable are the differences in productivity, efficiency, but also the mentality or culture. We are not all alike. Accepting diversity does not mean impossible coexistence, but just being realistic.

Key words: economic crisis, economic and monetary union, economic model

JEL classification: F15

1. Introduction

History of Greek past five decades is the most eventful in Europe, no other country on the continent has experienced so much political instability, military governments, expulsions on political, refugees and triumphant return in a short time.

Papandreu political dynasties and Karamanlis made the law of 50 years in Greece, a country that was born thousands of years ago the word democracy. Papandreu and Karamanlis are Greek names for Kennedy resonance for Americans or for Peron Argentina.

Greek governments over the past 50 years: 1955 - 1963 Constantinos Karamanlis (right policy); 1963 - 1965 George Papandreu (political center); 1965 - 1967 political instability; 1967 - 1974 military dictatorship; 1974 - 1980 Constantinos Karamanlis (right policy); 1980 - 1981 George Rallis (political right); 1981 - 1989 Andreas Papandreu (left politics); 1990 - 1993 Constantinos Mitsotakis (political right); 1993 - 1996 Andreas

Papandreu (left politics); 1996 - 2004 Constantinos Simitis (left politics); 2004 - 2009 Costas Karamalins (political right); 2009 George Papandreu (left politics).

The current crisis in Greece is different from the worst financial crises that have occurred in recent decades, such as in Argentina (2001), Russia (1998) and Mexico (1994) and Asia (1997), given that Hellenes part of a system that lets them provide few levers with which to recover and the situation.

The most important difference is that "Greece could not use tools to adjust the imbalance as part of the Economic and Monetary Union (EMU). The state can not use that as monetary policy or exchange rate. Moreover, the crisis is not only Greece and EMU proves weakness," said Daniel Daianu, professor of economics and former finance minister. "Steps for building the European Monetary Union have been taken wrongly from the outset, given that one needs money and a central bank, but also a cash shortage of the euro area," said U.S. investor Hungarian origin George Soros in an editorial published in the Financial Times business daily.

Treasury is required to constantly collect taxes from taxpayers, but to be used in times of crisis.

When the financial system is in danger of collapse, the central bank can provide liquidity, but only one can handle cash solvency issues," said American billionaire, became famous in the early 90s when he won one billion dollars betting on the collapse of sterling.

Soros quotes on the editorial Otmar Issing, former chief economist of the European Central Bank (ECB), which said the eurozone was originally desired to become a monetary union, and not a policy.

Issing, one of the fathers of the euro, admits he was among those who believed that "the foundations for a stable and monetary

union without political consensus is that like putting cart before the horse."

The 2008 economic turmoil highlighted errors made by European authorities regarding the creation of the euro after euro zone members were forced to save their own banking sectors. Greek debt crisis brought the situation to a climax, however, that if countries that use the common currency fail to pass, the euro could become just a memory.

Greece, Spain and other countries in the euro area have lost, with entry into monetary union and the possibility to devalue the national currency, one of the most important instruments through which could reduce the mountains of debt in that struggle. In this situation, these countries currently face difficulties in trying to pay their rising debt, burdening them.

Most vulnerable countries in Europe are Greece - whose debt is estimated by the European Commission to almost 120% of GDP this year - Ireland and Portugal. In Spain, when the crisis began debt-GDP ratio was below 40%. For 2010 the situation is expected to get worse, and debt to rise to 66% of GDP, and in 2011 the ratio to be 74%.

In terms of share of interest expenses to revenue, Greece lies the worst problem compared with other states in Europe. Thus, 15.1% of 2010 budget revenues will go to interest payments, up from 10.3% in 2006.

2. The significance of greek crises and the future of european state

With a record budget deficit, which exceeds more than four times the target imposed by the EU, the second largest public debt as a ratio of GDP in Europe, with false statistics and soda picture scandal hiding debts by banks Wall Street Greek situation worsens from day to day.

I think it is clear that Greece has not done your homework. If you look at solidarity, we have rules in Europe are very clear. We usually 3% and the Treaty and the Stability and Growth Pact has been interpreted so that if not fulfilled, you must do your homework to return to a position of public finances sustainable. If not do that, there is no exit clause, so nobody has to pay for the sins of others. It's like the Greeks would have it all to a party in the last 10 years, while the Dutch and Germans took a sober support. You can now ask the Dutch and Germans to pay for

that party which lasted 10 years. Sure, there must be solidarity. This is what happened. We ECB and everybody says: 'Yes, we'll help', but it is moral and just and should be. You said, standing on a chair, '3% must be respected. " Nobody has respected that percentage. Countries like Spain, which met 3%, are also now in hard situations. Obviously, these rules are not sufficient to have an economic coordination within the EU. Of course, Germany it goes well, but Germany has a well with deflation of wages and benefits of internal markets. One of the objectives of the Stability Pact was to ensure some convergence between the economies of the region. We can not have a single currency and economy very divergent.

What I saw and observed is that the first 10 years of euro area ended with a more divergent in the eurozone economies. So the Stability and Growth Pact has not borne fruit. All eyes are glued on Greece, and not just because of the difficult economic situation, but also because new scandal involving the Greek State. Earlier this year, authorities in Brussels have launched charges that Greece has forged over many years of statistical data. The European Commission announced that both the budget deficit figures, and those relating to public debt situation presented in a better light than in reality. European authorities announced they will launch an investigation in this regard to clarify the situation.

Before the waters calm down, but a new storm broke. Greece emerged that use derivatives to hide the real value of budget deficit. "Shortly after joining the eurozone Greek State appealed to Goldman Sachs to get \$ 1 billion through a debt swap of 10 billion dollars," said Christoforos Sardelis, head of the Public Debt Management Agency to time.

The main problem is that most of these products are and are sold and transferred by U.S. investment banks, which have been extremely proactive in ensuring that there is no real market vision and with compensation within the EU. And now one of our states pays for it. It is unfair that Greece, the Greek people, the effort to ask him his government and Goldman Sachs to continue to sell CDS Europe.

3. The radiography of Greek economy

Increasing taxes on fuel will contribute significantly to revenues chapter within a few weeks. This year the measure is expected to bring additional revenue of 1 billion euros, 0.4% of GDP.

Improve mechanism for collecting taxes, which last year was on the brink of collapse.

Reducing the total amount of public sector wages by 10%. Freezing salaries for those working in government agencies and reducing allocations.

Amid uncertainties surrounding the way in which Greece and the EU will provide support, the euro continued to depreciate. The Athens government must act against time to thank and European partners and to demonstrate that you can control the reins of their economies. But given that Greece's problems come from the very basic structure of the economy, which is one of the most closed in Europe, with one of the lowest levels of FDI per capita on the continent, which the government has announced so far will have effect only in the short term. However, to get rid of debt in May, the Greek cabinet decided to sell part of stakes it owns in various companies, but excluded the possible sale of the islands home.

The state hopes to raise around 2.5 billion euros, or 1% of gross domestic product, selling of the shares of the company OPAP betting, but also some Airbus A430 before it holds air operator Olympic Airlines be privatized.

Even if the amount would be close is an infinitesimal fraction of Greece's 300 billion debt, the approach could convince financial markets that Athens made serious efforts in the direction of balancing public finances.

Privatisation Plan sounds great in theory. If they sold all the assets of state, maybe the Acropolis, is likely to meet targets agreed by Government," said Constantine Michalos., president of the Chamber of Commerce and Industry of Athens.

"However, considering current market developments, the government will be forced to sell cheap. Because we must acknowledge not only Greece is facing recession, but worldwide," according to Michalos. Using financial institutions under the control of Germany and France would allow states to bypass the regulations that prohibit

governments hold debt securities issued by other states, according to close sources. In Germany, the KfW banking group could be one of the institutions used to buy bonds issued by Greece. Such a sale could be completed with the efforts by Greece and the European Union which aim to reduce the budget deficit.

Value of debt securities that could be sold by Greece, under the new plan, could amount to 20-30 billion euros, the sum required by Greece to pay debt in spring. Reuters columnist: "Greece should be allowed to go bankrupt, to be an example."

"Europe should stretch a helping hand to avoid widespread problems of Greece to other countries and especially to the banking system," warned Josef Ackermann, chief executive of Germany's biggest lender Deutsche Bank. "We must help the country to avoid the effects of contagion. In conclusion, should put out small flames before they spread," said Ackermann. German lenders risk losing billions of euros if Greece enter default, which is why any support is imperative. "If we can not stabilize the situation, then the next problem we face will be at banks," the banker from Deutsche Bank. German banks were to September 30 last year in Greece exposure of 43.2 billion dollars (31.3 billion).

The solution is, politically impossible to put into practice at present, because Germany does not want to become "deep pocket" in which partner problems in the euro area to call every time. We have to find another way through that Greece receives emergency aid, but Spain, Italy, Portugal and Ireland, countries that represent a very large portion of the euro area to be supported like this, will remain an urgent issue for European authorities .

Most Germans believe that Greece should be removed from the euro area if necessary, over two thirds opposing the idea that the German government to get involved in supporting the Greek economy by providing loans billion. According to Emnid poll conducted for the German publication Bild am Sonntag, 53% of Germans surveyed believe that, if necessary, Greece should be removed from the euro area.

"We didn't ask for money from the Germans, French, Italian or other contributors. What we want is political support but to end speculation and slander

against Greece," Papandreou said at a cabinet meeting that he leads.

He added that Greece needs time to implement programs that could regain credibility within creditors. Greek prime minister's comments trying to calm everyone down after public opinion in Germany, but also from other Northern European countries showed reluctance in terms of financial support to Greece.

According to a survey of journal Dutch De Telegraaf, 92% of Dutch want Greece to leave the monetary union.

4. Greece fears UE gifts

Germany, the State initially opposed the idea of helping Greece, with the largest European economies, France, Spain and Italy are countries that will contribute with the largest amount in loans given to Greece. Western European states have their own interests that make them jump in aid to Greece and help to pay their debts on time, and among them is included the strong exposure to banks from countries like France and Germany.

Combined exposure of banks in Germany and France only in Greece is 119 billion dollars (86.6 billion euros), but if you analyze the situation in Greece and all other euro area countries vulnerable - such as Portugal, Spain and Ireland - increased exposure to over 900 billion dollars.

Together, the banking sectors in France and Germany, (the strongest European economy) "lead burden" which represents half of the total exposure of European banks in these countries

European countries and the IMF agreed to provide Greece, a financial package worth 45 billion euros, money given to an interest rate below the market, but over the IMF. This trial aims to help state and restore confidence in the euro.

If Greece decides to access these funds, the largest amount would come from Germany, followed by France, Spain and Italy. Each member of the euro area is offering money to Greece according to the share that National Bank of each country participated in the capital of the European Central Bank.

5. Conclusions

Earlier this year, all Europe looked to Greece with some envy. Worst case scenario

of the European Commission stated that Greece will be this year growth 0.3% forecast that excludes the possibility of recession.

Weapon with which Greece has fought against crisis meanwhile returned against her, for which today's European Union is looking with concern at the country's economy. Known for its highly developed economy, Greece has benefited from the advantage of a business environment quite animated, which led to unemployment at a reduced rate.

Crisis in Greece deepens every day, despite rescue plans. The IMF specialists painstakingly worked in collaboration with local authorities. Greece believes now only in tears (to remember part of the title of the movie), especially after investors demand higher yields for bonds issued throughout the State. How should Greece pay so much money? Their debt is 330 billion. In May have a maturity of 20 billion. In autumn, tens of billions. An alternative: to leave the Eurozone and take back their drachma. Then pay the debt in drachma and make their monetary policy as they want. That would be a slap on everything that is called the EU construction.

Today we must accept the reality that European monetary union is precarious as long as there are differences in mentality, culture, economic behavior, level of development of each member of it. Europe must show it can not find a solution for Greece but for herself. Otherwise failure of either country will happen one way or another. Same contagion. Today we must accept the reality that European monetary union is precarious as long as there are differences in mentality, culture, economic behavior, level of development of each member of it.

Europe must show it can not find a solution for Greece but for herself. Otherwise failure of either country will happen one way or another. The least bad solution for Greece is declared insolvency, reducing its debt to creditors in more than one third of the current, accompanied by exit from the euro area. So Greece could expect a decent growth in mid-2011. Although I think the solution of dependency on a foreign currency by virtue of forcing governments powerless to restructure costs, however, became acute in this case, it does not work.

For the moment it is Greece who is caught in the middle, but Spain, Portugal, Italy are

not far at all so...all of these countries could
become a new Greece.

Considerations Regarding the Coordination of Pension Funds of the Member States of EU

RISTI Lucia,
CUC Lavinia,
PANTEA Mioara
University „Aurel Vlaicu” of Arad
lucia_risti@yahoo.com

Abstract

The compulsory contributions for social security represent the group of revenues with the highest weight in the GDP of EU and determined the accentuation of fiscal pressure in the last decades. The relative level of contributions differs from a member state to another because of the conceptions and different historical traditions regarding the social security policies and funding sources.

The factors that determined the general increase of the weight of contributions for social security are the tendency of increasing the weight of old age population, increasing the expenses with the health care, the policies of insurances of pensions that do not correspond any more to the new demographic and economic realities.

The systems of insurances of pensions based on the support by the active generation by the payment of contributions, pensions for the inactive generation that cannot be supported any more, because the ratio between the number of population payer of contributions and the number of population beneficiary of pensions has worsened. The solution is to go to pension funds fully funded, a generation creates its own pension fund during its active life.

Key words: social security contributions, pension pillars, fiscal coordination

JEL classification: H30

1. Introduction

The compulsory contributions for the social security systems, pensions, unemployment, persons with disability, and other forms of social security have 15,1% of GDP of EU (2007, by European Tax Handbook), more

than the weight of direct or indirect taxes and even with a tendency of growth in the last years.

Just like direct and indirect taxes, between the member states there are great differences from this point of view: 19,2% of GDP in France, 18,9% in Netherlands and Germany, 1,7% in Denmark, 4,6% in Ireland and 6,7% in Great Britain, in 2007, according to European Tax Handbook.

On average, 55% of the compulsory social contributions are paid by employers, 33% by employees and 12% by freelancers.

From this perspective too, the differences are great, so the biggest contributions paid by employers are in Sweden (80%) and the lowest are in Denmark (24%), and the highest contributions paid by the employees are in Netherlands (61%) and the lowest are in Spain and Sweden (17%), according to the same source.

The differences mentioned above are caused by the different conceptions of governments to approach social issues and some relate to the historical traditions of the states.

2. Theoretical Fundaments

The increase of the weight of contributions for social security in the GDP of the member states is determined by:

- a) The increase of the weight of the average age of population of EU states (over 65 years old);
- b) Increase of expenses with the health care following medical technologies and new medication;
- c) Social security policies, especially in the field of insurances of pensions;

The tendency manifested in EU is of growth of weight of populated aged 65 and over, from 23% in 1995 to 40% in 2025, due to the extension of the average life duration and

reduction of birth in member states, so the active population compared to the retired persons will be reduced from 4:1 to 2:1 or even 1:1 in some states.

The increase of expenses for health are determined by the increase of medical technologies, expenses for new medication, and due to diseases that require longer treatments and the increase of the weight of old age population that requires costly medical care.

The social security policies in EU are more generous than in United States of America and Japan and the retirement of categories of persons before the limit of age, determined by the restructuring of some economic sectors.

The pressure for the growth of contributions for social security comes from the field of insurances of pensions where the current systems do not correspond to the demographic and economic realities.

The evolution of insurances for old age had the following stages:

- In preindustrial society, the family with many children and the charity actions were the support of old age people;

- In the period of industrialization social security systems were created by the contributions of employers and employees, called „Pay-as-you-go” (PAYG), respectively: the active generation supports the pensions for the inactive generation. In this period the ratio between the active population and the inactive population was favourable to active population so the level of social contributions was relatively low.

3. Method and Results

In these conditions, the answer to the increasing cost of the present system of pensions is the passage to the system that each generation creates its own pension fund by one's own financial contributions done during one's life. Such systems are already developed in Great Britain, United States and some countries of Europe.

Such systems in the beginning period, determine high costs because the contribution must insure the retired persons and assure one's own fund for future years when the active employee retires.

The present system PAYG cannot be fully replaced because it must assure a minimal social security for the old age persons who did

not have the possibility to participate but to this pension system (PAYG).

Now the states of EU assured a pension system based on three pillars:

- Pillar 1 – the public pension system that is compulsory for all the employees or the resident population (PAYG). The system assures a minimal protection by maximal ceiling at the revenue for which contributions are calculated and for pensions.

- Pillar 2 – private pension systems fully funded, established between an employer and an employee or as a result of an individual or collective contract between an employer and an employee. The participation of employees to the private pension fund is compulsory. These funds fructify the contributions of employers and employees by investments in financial assets observing the rules of financial prudence, etc. These pensions complete the pension of the public pension system.

- Pillar 3 – individual pension plans (supplementary) that take the form of contracts concluded voluntarily by persons with life insurance companies and other financial institutions.

In EU states, the second pillar of the pension systems – private pension funds – reached in 1999, 2000 billion euro, 25% of GDP of EU and will be 5000 billion euro in 2010 and it is estimated that 25% of the active population of EU is integrated in this system.

But the system is differently developed in the EU states. Denmark, Ireland, and Great Britain have a much better development of this system. For example, in Great Britain, the private pension funds represented 95% of GDP in 1999, while in France and Spain, which are at the beginning of this system, it represents only 5% of GDP in France and 2% in Spain.

In Romania, although the conception was elaborated for the passage to the pension systems on the three pillars, now, the pillars 2 and 3 are blocked and only the public pension system functions.

4. Discussions

If regarding the first pension pillar, the public pillar, there are no special problems, the social contributions of pensions are deductible fiscally at national employees and the employees who have their origin in another state, in the private pension system there are serious fiscal obstacles in the transborder activity of these funds and in the free

circulation of the workforce. The same unfavourable aspects are valid for the supplementary pension funds.

The most obvious fiscal obstacles in transborder activity of private pension funds refer to the taxation of contributions to pension funds, revenues from capital realized by the pension funds by the investments done (interests, dividends, gain of capital) and the pensions paid by the pension funds by :

- Non-acceptance of deduction from the taxable personal income of contributions to the pension funds that are in other states;
- Does not exonerate from taxation the revenues from capital realized by the investment funds from other member states.

These obstacles have the following consequences:

- Prevent the European citizens from continuing participation (by contributions) to the pension fund from the member state of origin, from the moment he moves to another state;
- The person cannot transfer the cumulated pension fund from a member state to the pension fund from another member state;
- A person from a member state does not have the right to participate to a pension fund from any other member state;
- The transnational companies are obliged to create pension funds in each member state in which they have employees;
- The decisions of the pension funds to invest the financial resources in other member states are distorted by the different fiscal regimes applied to the revenues from capital;
- There is the risk of double taxation of pension and the risk of total non-taxation because of different fiscal regimes of the pension funds, for example:

*11 states apply a fiscal regime of the type E.E.I., the exemption from taxation of contributions to the pension funds, the exemption from taxation of revenues from capital realized by pension funds and taxation of pensions;

*3 states - Denmark, Italy and Sweden practice a fiscal system type E.T.T., the exemption from taxation of contributions and the taxation of revenues from capital and pensions;

*Germany and Luxemburg have a fiscal regime type T.E.E., by taxation of contributions and exemption from taxation of revenues from capital and pensions.

The situation is more complicated for some states that give exemptions from taxation to contributions, establish ceilings for these deductions, etc.

European Commission was informed of these obstacles and in February 2001 adopted a strategy that provides for the following years the following:

- If a member state accepts the deduction from the taxable revenues of contributions to the resident pension funds, it must accept the deduction of contributions to pension funds from other member states;
- The employees of a multinational company should have the possibility to participate to only one pension fund founded by the company, irrespective of the member state in which they carry out their activity. The pension received by an employee who retires will be subject to the fiscal regime from the state of residence of the retired;
- The judicial regime E.E.T., already practiced in 11 states should be extended to all EU states, which reduces the revenues from taxes in exchange of higher taxes in the future from pensions. The Commission of EU does not have the intention to harmonize the fiscal regimes regarding the pension fund, so the EU states have the possibility by bilateral agreements to avoid the situations of double taxation or non-taxation;
- The coordination at EU level of rules of prudence and financial supervision of financial investments from the pension funds so that they function in conditions of maximal security.

5. Conclusions

- In the member states, pension systems function, based on three pillars: pillar 1 – public pension system in which participate obligatorily all employees (or residents); pillar 2 – private pension funds, fully funded, created by companies for their own employees, based on obligatory contributions; pillar 3 – funds for supplementary pensions with voluntary participation;
- The functionality of the unique market for transborder activities of private pension funds is not full, because of the fiscal obstacles and therefore, the free circulation of the workforce in EU is affected;
- The fiscal obstacles refer to different regimes of taxation of contributions to the private pension funds, revenues from capital

(interests, dividends, gains of capital) realized by these funds and to paid pensions, depending on the place where the fund is created in the resident state or in another member state;

- The solutions for the elimination of these fiscal obstacles aim at: each member state should give an equal fiscal treatment for the contributions and revenues from capital, irrespective of the place in which is the residence of a private pension fund; giving the right to each person to participate in any private pension fund in EU; the possibility that transnational companies create a single private pension fund for their employees anywhere in the member states; on long term, the passage of the member states to the fiscal regime that is dominant at the moment, based on non-taxation of contributions and revenues from capital of the pension funds and the taxation of pensions;

- Reduction of the risk of tax evasion and system errors in the management of these

funds can be done by mutual exchange of information between the member states and by adopting common standards at the level of EU, of prudence and financial supervision.

Controversies Regarding the Necessity of an Integrated Supervision for the EU-27 Financial Markets

SARGU Alina Camelia

„Alexandru Ioan Cuza” University of Iași, Doctoral School of Economics

s_alina_camelia@yahoo.com

Abstract

As the European financial markets suffered substantial structural changes in the least decades, under the influence of the financial innovation process, the question regarding the efficiency of an integrated supervision model rather than a specialised one becomes more challenging. The aim of this paper is to provide an overview of the different models used by each European Union member states, underlining in this way the current state of the supervision integration in the EU-27 and the controversies regarding the necessity of an integrated supervision system for the national financial markets. Thus, the paper compares the pros and cons arguments regarding the adoption of an integrated model for financial supervision. Overall the study highlights that although, in general, a specific model for financial supervision is adopted taking into consideration the political, historical and structural aspects of the financial systems, in recent years a trend for integration has become very visible.

Key words: Integrated financial supervision model, specialised financial supervision model, European financial markets

JEL classification: F36 - Financial Aspects of Economic Integration

1. Introduction

The processes of integration, globalization, liberalisation and deregulation represent the main factors that have accelerated the structural changes of the financial markets in the last years. As a natural consequence of these processes the products and services offered on these markets have been developed in an accelerated way, exceeding

geographical and sector boundaries. Thus, new way of financial investment have appeared, the number of non-banking financial intermediaries has risen and the products offered have become more sophisticated, which has lead to the creation of large financial conglomerates – institutions that are offering financial services from at least two different categories: like banking, investment and/or insurances. As a result of this, *the supervision and regulatory models used had to adapt to the fast paced development and the complexity that financial innovation has brought to these markets* [3], *in order to ensure the stability of the national financial systems, taking into consideration the fact that cross-border transactions and intermediation had enhanced the risk for contagion* [4], *as the sub-prime lending crisis had confirmed in the recent events that have unfolded.* Therefore, the current economies and the modern society that is served by them need regulations, as free markets are not the synonym for non-regulated markets. Thus, solid and efficient regulations must exist in order to prevent free markets abuses to cause high prejudices, directly or indirectly, to the economy or to the society in general.

2. The necessity for the creation of an efficient financial supervision structure at EU level

In the last decade, the quest for the development of an adequate financial regulatory and supervision structure at EU level which will handle the European financial markets has been an increasingly important issue, a proof in this way being the large number of academic studies on this field. There are many studies which have focused on the prudential supervision and the role of the central banks in this matter (see [9], [17], [13], [18], [16]). Other studies have focused on the analysis of capital markets supervision and its centralisation - as centralised structures are considered in this case more transparent than local ones – either at national or European level, taking into consideration the development of a European SEC (see [15], [1], [11],

[8], [6]). Nevertheless, many studies have focused on the analysis of the changes that have occurred at national level, underling the process of transition from specialised supervision and regulatory systems to a partially or even fully integrated model that covers the entire financial market (see [4], [2], [10], [12]).

Therefore, *as a result of the enhancement in the degree of European financial market integration* (which has accelerated as a result of the adoption by several countries of the single European currency) *and the raise in number and importance of financial institutions which are active in more than one European state* (the development of financial conglomerates), in addition to *the continuous development of supervision and regulatory institutions*, both at national and European level, the problem of an efficient regulatory and supervision system in the European Union has become a very important issue.

In the 21st century, there are two trends that must be taken into account when it comes to the devising of the European financial supervision structure.

The first trend is represented by the internationalisation and especially the integration of the European financial market as a whole. In the European Union there are a growing number of financial institutions that have fully integrated cross-border activities which include single products or even common trading platforms. According to the European Central Bank there are 46 groups that hold approximately 68% of the total European banking assets [5]. From these, 16 have at least 25% of their assets in other European Union countries and are present in at least six European banking markets (see the figure below). As a response to the market-led developments, the European Union political commitment on the matter and the European directives that regulate the financial sector, the financial institutions have reorganised their business and operational set-up.

Figure 1. Total assets of foreign branches and subsidisers in EU-27 countries

Source: Own simulation based on data provided by ECB (<http://sdw.ecb.europa.eu/>)

As a result of these transformations some of the business functions of the pan-European financial institutions have been centralised, such as the risk, liquidity or capital management functions, regardless of the legal statue of the group's components (branches or subsidiaries). The direct consequence for the prudential supervision process is the diminishing of its relevance when it takes into consideration only local, isolated components of a pan-European financial group. *A more efficient approach would be represented by an integrated prudential supervision model which would take into consideration the whole group rather than its individual components.*

Beside these aspects it should be noted that the pan-European financial market infrastructure is becoming more integrated: the clearing and settlement systems as well as the stock exchanges have developed an integrated European business model. Also European payment infrastructure is expanding in size and coverage, especially with the implementation of the SEPA project. All these changes suggest the fact that the pan-European financial institutions will have a determine effect on the stability of the European financial market and as such, their activity must be supervised and regulated in accordance with their status.

The second trend is represented by the convergence of the financial market segments. Because of the financial innovation process the differences between the financial market segments have become blurred. As a result of this, the necessities for a single financial rulebook have become more stringent than ever. In general if the different segments of the financial market provide different services and products, then a specialised

form of supervision and regulation does not affect the stability of the system. The development of “allfinanz” or “bancassurance” conglomerates does not necessarily imply the necessity of a unitary supervision and regulatory entity, but in a market dominated by these types of financial institutions such a matter is more than obvious. Thus, the argument in favour for a unitary, integrated supervision and regulatory entity for the financial market lies in the fact that the segments of the financial markets are converging, offering similar content.

In this context, it has become necessary the development of specialised structures at European level for the prevention and also for the management of crisis. Both types of structures, especially the one dedicated to the management of the crisis, need the full backing and collaboration of institutions like central banks and the institutions delegated with the supervision and regulation of capital markets and assurance companies at European level.

3. The advantages and disadvantages of integrated versus specialized supervision

With regard to the two methods of supervision used for the financial markets, *the integrated model* and *the specialized model*, there are numerous controversies regarding their usage, in both cases existing pro and con arguments.

The most important *advantages that the integrated model of supervision and regulation brings* are: *better adaptation to the current structure of the financial systems* - the old financial systems were created in certain historical periods, in which the general architecture of the financial sector was more simple, while now, because of the globalisation process and the integration of the financial markets, the financial conglomerates are under the supervision of several institutions as they provide multiple services and products, thus, being necessary a more integrated approach in order for the process to be efficient [19]; *competitive neutrality* - as the supervision and regulatory systems become integrated will prevent the risk that a financial conglomerate will move its services and products to areas where they

feel the supervision process is less strict in order to commit frauds or to gain unjustified competitive advantages. Moreover, an integrated supervision may prevent regulatory arbitrage and ensure a level playing field; *the covering of the “gray areas”* - as supervisions and regulations become centralised the loopholes that permit the appearances of non-regulated areas will stop, especially in the case where the legislation is not explicit about the way a certain financial product or service should be supervised.

There are also several *drawbacks regarding an integrated model of supervision and regulation* of the European financial markets: *unclear objectives* - if the objectives are not clearly specified the integrated model for supervision could prove to be more ineffective than the specialised supervision approach, mainly because the adoption of a wide range of objectives (that may vary from the stability of the banking sector to the protection of the clients of the insurance companies or pension funds) could facilitate the development of divergent paths between them [20]; *limited synergies* - the much anticipated synergies may not appear if the regulations regarding the banking sector, the insurance sector and the one for the capital markets are not harmonised before they are integrated into one structure, making their coordination more difficult and leading even to *diseconomies of scale*.

4. Comparative overview of the existing supervisory schemes at the European level

The countries from the European Union have chosen different models for their financial supervision depending on their own necessities. Thus, after 1990, *most of the developed countries have adopted an integrated model for the supervision and regulation* of their financial sector, *this trend becoming more obvious in the present*. This decision has been taken as a result of the development of very sophisticated financial systems, where the number of supervising entities was large and their connection in order to assure a balanced economic system have been proven to be too difficult.

Table 1. Models of supervision in Banking, Securities and Insurance sectors in EU-15

Source: our elaboration based on information’s from documents and websites of the main supervisory authorities.

In the case of the EU-15 countries the fact that some of them haven’t adopted the integrated supervision and regulatory approach do not emphasise the existence of a lesser developed financial sector, but *the existence of a more traditional and rigid financial system.*

This un-uniform structure of the supervision systems appears also in *the case of the new member states* (see table below).

Table 2. Models of supervision in Banking, Securities and Insurance sectors in EU New Member States

Country	Banking sec	Securities sec	Insurance sec	Model

Legend: U- Unified supervision for all sectors; SA-B – Supervision authority for the banking sector; SA-S – Supervision authority for the securities sector; SA-I - Supervision authority for the insurance sector; CB – Central bank; Integ. – Integrated model; Spec. – Specialised model

Source: our elaboration based on information’s from documents and websites of the main supervisory authorities.

As we can note from the table there are yet several new member states that still use the sector supervision model, one of which is Romania. This is mainly because the financial systems from these states are not

that complex, some of their financial sub-systems being not that evolved and having a low level of credibility. Thus, we can conclude that *the supervision model is chosen also based on the financial system architecture from each state, besides political, historical and path dependence factors.*

Another remarkable aspect is represented by the fact that almost half of the European Union members have a fully integrated or semi-integrated supervision system (a single entity supervises two market segments e.g. in Finland and Luxemburg the same entity is supervising both the banking and the capital market, while in Bulgaria the assurance and the capital market have a sole supervisor), *the major trend being, as we can see, toward an integrated supervision system.*

5. Conclusions

In conclusion, *the tendency to integrate the supervision and regulatory powers regarding the financial market in a single entity at national level must not necessary imply that there must be a single supervision and regulatory entity at European level.*

The minimal conditions which must be fulfilled in order to optimize the European cross-border financial flows supervision refers to the existence of a single European rulebook and a unified supervision of the financial groups – two key elements for the creation of the common European financial market. On the one side, *a single European rulebook* would allow companies to compete on the basis of the same rules in all the 27 member countries of the European Union and reduce compliance costs and moreover would diminish the possibility of regulatory arbitrage. On the other side, the creation of *one integrated EU supervisory framework*, can provide a strong supervision of the cross-border financial institutions and also facilitate access to information’s needed in an effective supervisory activity. In order to achieve all this, the creation of a supra-national entity at European level which would ensure the supervision and the regulation of the financial sector, is not an obvious necessity. A more “soft approach” can be used, like the creation of a network of supervisors, which will be engaged both in micro and macro prudential supervision, like the one suggested by the De Larosiere report.

Conclusively, if the European financial market would be successfully regulated through the Lamfalussy procedure (European Commission, 2001), then *the necessity for an integrated*

supervision system will be obvious, or, in the case of the countries with a specialised model, *a tightening of the collaboration between the different authorities* (supervision entities for the assurance, capital and banking market) will become evident.

European Statistics and Globalization. Romania's case

SECAREANU Constantin
Romanian-American University of Bucharest
constantin.secareanu@yahoo.com

Abstract

In the paper, major tendencies are identified, presently influencing official statistics, as well as concepts, methods and instruments used within the Global Statistical System for the analysis and status forecast and evolution of any statistical agency, at different levels: international, European and national.

The development methods of the National Statistical System are highlighted (in an European and international context), in such a way that it meets the requirements of actual challenges and perspective.

Key words: Statistical System, Centralization, decentralisation, deconcentration

JEL Classification: E02, K2

1. Preliminary considerations

Presently, official statistics is recognised as having a fundamental role in society, at a national level, as well as at a community and international level. Statistical information has become a true public product, through the exponential growth of the number of users of data generated by the statistical system (from the deciders to the entire public opinion), contributing to the creation and spread of informational capacity in society.

At a community and national level, statistics has become, in a measure, greater, an instrument of fundamenting, analysis and evaluation of economic and social politics, of constant monitoring coherent and correlated, of strategic objectives.

In the conditions of an increased diversification from the economic, social, cultural, ethnic, etc point of view, statistics must create a common language for all the entities, through providing information produced, developed and published based on some clear standards of a harmonised metadata

and of a common set of principles, criteria and norms that govern all statistical activity.

Although, a lot of countries – with enough expertise in the field - are making individual efforts to resolve actual problems in the field of statistics, the accomplishment of previous goals requires a much larger dedication, both at the community and national international level.

The accomplishment of these objectives require a concentrated effort of all national statistics, in a much wider frame created by the existence of the European Statistical System and the Global Statistical System.

2. The Global Statistical System

The Global Statistical System (GSS) is built based on an official infrastructure, consolidated on three levels: international, community and national.

A. At an international level, the Statistics Committee of the United Nations is recognized as the supreme entity in the GSS, with a leading role in managing and developing policies and practices in international statistics. The committee is the “engine” that makes the global system work, ensuring the implementation and development of international statistical standards for creating solutions to the pressing matters existing for national offices of statistics.

Still on the international level, as a direct reaction to the requests of specific statistics, a series of specialized organizations have become a part of the GSS: The Organization of Economic Cooperation and Development, the Global Bank, the International Monetary Fund, the International Office of Work, etc.

Also, the solutions of great problems have necessitated the creation of partnerships such as PARIS 21, the “Partnership in Statistics for Development in the 21st century”, where the United Nations, the European Committee, the Organization for Economic Cooperation and Development, the International Monetary Fund and the Global Bank are globalised. The objective of PARIS 21 is the implementation and development of a culture of elaboration of policies in statistics that serve to

improve the governing efficiency in hopes to reduce poverty and accomplishing the Objectives of Development of the Millennium.

Surely, the creation of this structure is a reaction to the fact that the remarkable successes in economic statistics development have been accompanied by slow progress and less spectacular in the field of standards for social statistics.

B. At the community's level, supranational structures (organizations) have been created, with attributes in the field of statistics. firstly, there's EUROSTAT (The Office of Statistics of European Communities), that ensure – on one hand – the solving of problems common to all the members of the community (through assistance programs) and – on the other hand – the complementary regulation in the field, in two directions:

- harmonising statistical standards of the European Union with international ones;
- harmonising national statistical standards with the European Union's ones.

As a result, for the good governing of the European Union in the field of statistics, a part of the responsibilities have been transferred from the Member States to Eurostat.

C. At the state's level, we meet all the national offices of statistics, the base components of the GSS, of which the quality, promptitude and efficiency of all statistics finally depend on.

The functioning of the Global Statistical System at all three levels is conditioned by at least two factors:

-on one hand, the cooperation and connexions between international and national structures, based on a common terminology of methodologies and instruments developed, to permit the exchange of information;

- on the other hand, the constant hardening of the National Statistics Systems and their dedication to the international problems in the field.

Finally, the Global Statistical System is made whole through the inclusion, along the structures of practical statistics, of academic communities and of research represented by the National Institute of Statistics.

3. The actual internal and international context

The official Romanian statistics had to recover, after 1989, at least two essential handicaps: independence and credibility, both

severely shaken in the 80's. The statisticsman's task was more difficult, as the economic, political and social environment in those years were unfavorable: economic downfall, social movements, syndical withdrawals and political disputes. With all the inherent difficulties, the actions were aimed toward change, for promoting the modern methods of statistical research, for processing and dissemination.

A new legal frame was adopted, where the fundamental principles of the workings of statistics would be found, wholly copied from the Governmental Ordinance nr. 9/1992 and became the value set for the National Institute of Statistics (NIS), through which regaining the respect of different categories of suppliers were sought, as well as benefitting from statistical information and data of the public opinion.

The objectives, measures and actions enterprise were conjugated, concentrated and covered all these aspects:

- the change of concepts, instrument inventory and statistical research methods;
- the professional forming of statistical personnel and the management of human resources;
- the equipment of high performance and the administration of information technology;
- internal and international cooperation.

As a result, we're assisting to – presently – to the creation of a new image of official statistics, a slow, very difficult and sometimes contradictory process, through which statistical information is published through media and is accessible to all users, whatever their revealed tendencies.

Romanian statistics has engaged itself in the process of readapting to the European standards, through the harmonization and progressive integration in the European Statistics System (ESS). Thus, since January 1st, 2007, the National Institute of Statistics (NIS) in Romania is the beneficiary of ESS membership, actively participating in the European legislative process and statistics management.

In June 2009, the Parliament approved a new Law of statistics that regulates the organization and function of official statistics in Romania, the creation, development and coordination of the Statistical National System, the current approach of the relationship between producers – dealers – users of statistical data, in conformity to the fundamental principles of official statistics.

In the last decades, theoretical research and managerial practice have intensified and permitted the crystallization of some concepts, methods and

new instruments for analysis and prediction of the status and evolution of a national statistical system.

The starting point, in the present case, is the outlining of the three *major tendencies* identified for every public entity, but that much more for a statistical agency.

A. *The first tendency* consists of shifting from focussing managerial preoccupations almost exclusively on the internal situation of the agency, to subordinating the majority of activities to a considerable opening to the exterior, to the environmental factors with important impact.

In our crosshairs we have at least two elements that, presently, can become both opportunities and threats:

1. On one hand, *the satisfaction of the users' necessities* for statistical information (The government, ministries, local authorities, the academic environment and scientific research, the business environment, the press, the overall public, national institutions); their necessities must be identified and studied differentially, for each category separately, then the types of future demands must be anticipated, and the observations made be included in the formulation of priorities in the plans of action; From this point of view, Romanian statistics has to act in more directions:

- satisfaction with the priority of European demands, in the context of a simultaneous increase of the satisfaction degree of statistics data needs of the internal users;
- the implementation of the statistics System of regional development in unison with the adopted administrative, territorial and statistics structures;
- the development of a high quality integrated simultaneous dissemination System, comparative to the best systems;
- the implementation of an opinion surveillance System, of positive or negative comments addressed to the statistic, through research about the opinion and trust that data users invoke in rapport with a series of statistics indicators;
- contracting one of the acute risks, that of the apparition of imbalances between research and new statistical data (more and more numerous) and human and financial resources available, through prioritizing activities in statistics and the optimal allocation of resources.

Within a world of continuous globalization, the public opinion represents a major interest

for national statistics and for the international comparisons. In these conditions, the visibility of statistics and statisticians has risen greatly, simultaneous with the growth of some risks (vulnerabilities), specifically tied to the authority and credibility of statistics, especially regarding the quality if provided information that stands at the base of the decision making process.

2. On the other hand, *the policy toward respondent targets* avoiding the useless delay of data suppliers, through the reduction of "the burden of statistical reports"; Not excluded, should be the possibility that, in the near future, *primary data collection will become the primary threat, if it hasn't become already*. The more and more frequently met phenomenon of the growth of the non-response rate, especially in the case of small enterprises and of the populations' farms, it must be contracted through the improvement and diversification of data sources, through identification and attraction in the international circuit, in greater measure, of administrative complementary data sources.

In this context, of reducing the primary data answering load of dealers and, implicitly, the rise in operativity and quality in statistics at a community level, references to the European approach on statistics are often made. So, the fields where national data are not absolutely necessary, the sampling will be possible at the European Union's level (but not at a national level).

B. *The second tendency* identified is derived from the characteristics of the period we live in, when continuity records inflexion points, discontinuities, movements more numerous and accelerated, of changes that know amplitudes and depths previously unreached (from an economic, political and social standpoint). From here results the obligation to raise the decisional reaction time, simultaneously with increasing the flexibility of actions, indispensable in case of unforeseen changes. The reactions of a national statistics system can be very different. The successful passing through a sometimes "turbulent" environment, most of the times "changing" and rarely "stable" are decisively influenced by the general characteristics of the statistic system: Coherence and force, or, oppositely, frailty and continuous pressure.

Counteracting the possible negative effects is done *by creating and actualizing a unified and uncontradictory systematic legal frame* of organization and function of a national statistical system that clarifies a series of problems and permits the overtaking of some dissfunctionalities and the elimination of voids:

1. The subordination/autonomy of the institution demands the existence of an independent statistical leadership (at a central and local level), uninfluenced by political groups.

2. The duration of an agency leadership mandate should not be similar to that of the executive.

Thus, in some EU member states and in the USA, a limited (a number of years time) mandate is practiced, that can be renewed, not affecting the continuity of statistical programs.

3. The national statistical system components, the mechanisms and functional relationships between the primary actors of the system, as well as its slope of coordination and communication between different structures (interinstitutional committees and collaboration conventions); Thus appears the necessity of creating statistical compartments within public institutions' administrations, central and local, as well as other public authorities.

The adoption of a new statistics law, in concordance with the actual state of Romania as a Member State of the European Union consequentially appears as justified, with standards, mission, vision and functions that Romanian statistics proposes to exercise in the context of full integration in the European Statistical System.

As well, in this cadre, statistics will succeed in offering the adequate answers to challenges and ample changes present and in society's perspective, in the context of the economic and financial crisis, globalization, the competitively growing in intensity, the affirmation and development of international society.

C. Finally, *the third identified tendency* is that of *institutionalizing innovation*, finalized through the realization of new statistical research, as well as perfecting the existent research.

This tendency must be encouraged through custom (specific) coordination instruments such as: methodologies, classifications and nomenclatures, statistical registries, information technology, the recruitment and professional personnel training. The crucial instrument for the increase of the innovation capacity is the budget of the agency (including the external unrefundable funds).

In this context we mention the quantification efforts through statistical indicators of problems regarding durable development, rural development, globalization, regional development, competitively, the

interaction of economic development – social development, the environment, etc.

The infusion of technical support, methodological and operational, has given Romanian statistics the possibility of making significant progress and touching, in more domains, the quality and comparability of the solicited data, compatible with that of the other EU member states, data aligned to the international standards.

In the future, actions must be made in the direction of totally implementing the European Code of Good Practice in Statistics and of all the elements of the Management of Total Quality.

4. The centralization and decentralization within national statistical systems

There's a diversity of statistical systems in the world.

At one extremity there's the *centralized system*, where a single institution (usually an *autonomous* governmental agency) is responsible to the majority of official statistics (Australia, Canada, Mexico); even in this situation, the collection of some statistics lies within the responsibility of other institutions (the agricultural statistics, work statistics, environmental statistics, financial statistics, etc.);

At the other extremity we meet the *decentralized system*, in which numerous statistical agencies are annexed on certain domains (USA). This is *institutional decentralization*, that demands the existence other profiled institutions, outside the agency, for example: demography and population counts, social statistics, external commercial statistics, price statistics, education and health statistics, etc., distinct institutions, that usually don't need the existence of a coordinating authority.

There is, as well, a *territorial (regional) decentralization*, that needs coordination and control from the central statistical agency.

Regarding the role of regional offices, more possible functioning choices:

1. *decentralization*, that presumes a total subordination toward the central agency, the regional office taking on routine duties in the aspect of collecting primary data and eventually disseminating results;

2. *deconcentration*, which is met in at least two situations:

- in the conditions of a risen autonomy of regional offices, a case where *national centers (poles)* can be created, that tend to processing and dissemination of statistics regarding a certain domain, taking on the responsibilities of coordination and control of the central agency.

- in the conditions that the regional offices are in the *subordination of local authorities*; this situation must be avoided, the double subordination not being recommended; domains of local interest can be developed based on partnerships between regional offices of statistics, the local authorities and the economic agents.

5. Conclusions

1. No country in the world contains a single institution responsible for collecting and disseminating all official statistics.

2. Usually, national statistical systems aren't entirely centralized or decentralized, mixed statistical systems being often met, with asymmetry toward one or the other extreme alternatives.

3. There is no unique recipe, the final objective being the growth of a complete national statistical system, tight and coherent, comparable with similar systems in the countries of the European Union (with the exception of those in federal government systems).

4. A series of statistical system modifications are presently imposed on the national statistical system, based on a coherent strategy, with clear objectives on a medium and long term, targeting the total integration of Romanian statistics under methodological and quality aspect in the European Statistical System. The massive transfer of good practice in statistics will lead to the creation of a modern statistical system, organized on scientific bases and capable of offering efficiency, quality, promptitude and transparency to the official statistic.

Single Currency of the European Union

popaionela80@yahoo.com

Abstract

The euro is the single currency shared by (currently) 16 of the European Union's Member States, which together make up the euro area.

Around 329 million EU citizens now use it as their currency and enjoy its benefits, which will spread even more widely as other EU countries adopt the euro.

The process of economic and monetary integration in the EU parallels the history of the Union itself. When the EU was founded in 1957, the Member States concentrated on building a “common market”. However, over time it became clear that closer economic and monetary co-operation was desirable for the internal market to develop and flourish further. But the goal of achieving full EMU and a single currency was not enshrined until the 1992 Maastricht Treaty, which set out the ground rules for its introduction. These say what the objectives of EMU are, who is responsible for what, and what conditions Member States must meet in order to adopt the euro. These conditions are known as the “convergence criteria” and include low and stable inflation, exchange rate stability and sound public finances.

In a radical report, the UN Conference on Trade and Development (UNCTAD) has said the system of currencies and capital rules which binds the world economy is not working properly, and was largely responsible for the financial and economic crises.

Although a number of countries, including China and Russia, have suggested replacing the dollar as the world's reserve currency.

Key words: economic and monetary union, single currency, common market

JEL classification: F15

1. Introduction

For the first time since the fall of the Roman Empire most of Europe has a single, common currency. The US dollar faces the first challenge to its hegemony since it displaced the British pound sterling as the world's most important currency after the First World War. However, if the Euro is to assume a wider role it will have to flourish in its own continent and survive challenges to the stability of European economies first.

The European Union was brought into existence by putting the cart before the horse: setting limited but politically attainable targets and timetables, knowing full well that they would not be sufficient and require further steps in due course. But for various reasons the process gradually ground to a halt. The EU is now largely frozen in its present shape.

The same applies to the euro. The crash of 2008 revealed the flaw in its construction when members had to rescue their banking systems independently. The Greek debt crisis brought matters to a climax. If member countries cannot take the next steps forward, the euro may fall apart.

The recent global financial turmoil brought the world to the brink of monetary collapse, and reminded us yet again that the current multicurrency system has excessive risks and costs. The only long term alternative is to deliberately move to a single global currency, managed by a global central bank within a global monetary union, and the time to begin planning is now.

2. Euro - project reality

European Economic and Monetary Union (EMU) is an agreement between participating European nations to share a single currency,

the euro, and a single economic policy with a set of conditions of fiscal responsibility.

Currently, there are 27 member states with varying levels of integration in the EMU. Sixteen Member States have adopted the euro: Austria, Belgium, Cyprus, Finland, France, Germany, Greece, Ireland, Italy, Luxembourg, Malta, Netherlands, Portugal, Slovenia, Slovakia and Spain. Three other Member States, Britain, Denmark and Sweden, they weigh on euro adoption plan. Eight Member States, Latvia, Lithuania, Estonia, Poland, Czech Republic, Hungary, Romania and Bulgaria, are in various stages of adopting the euro and most likely will join the euro area over the next ten years[1].

At the outbreak of World War II, most currencies in the industrialized countries were closely similar to U.S. dollars under what was called "gold standard" in the Bretton Woods system. De facto supremacy of the dollar and European currency devaluations has led some European politicians to search for a redress of this unbalance through economic integration between European nations.

Plans for a single European currency began to be outlined since Barre's 1969 report, prepared by the then six member states of the European Economic Community (EEC). This was followed later that year a meeting of heads of state and government in The Hague to plan the creation of economic and monetary union. The process was delayed by the collapse of the Bretton Woods System in 1971 after President Nixon's unilateral decision making inconvertible dollar after gold and oil crisis of 1972. Meanwhile, the EEC has grown now including, as noted above, sixteen states, many of them are reluctant to give up their national currencies.

Currently, European countries participating in the three phases can be integrated economic, historical phases of development corresponding to EMU.

Each state has adopted the new currency on 1 January 2002 must meet "convergence criteria" set out in the Maastricht Treaty. ***The criteria included five requirements:***

- Currencies must stay within the parameters set by the ERM for at least 2 years;
- Long-term interest rates could be higher than 2% of the three best Member States in terms of performance;
- Inflation to be below the reference value (within three years prices may be higher by 1.5% than the best performer);

- State debt should be below 60% of GDP (or be close to this target);
- Budget deficits to below 3%.

The third phase of development may be linked to an EMU member state, which once joined the ERM-II and maintained the convergence criteria for at least two years, and joined the Euro zone.

Name of the euro was formally adopted on December 16, 1995, and entered currency on international markets itself on January 1, 1999, replacing the so-called European currency unit (ECU), and then, on January 1, 2002 was brought into service, replacing the Finally the national currencies of the euro area.

Currently Member States participating in the euro are Austria, Belgium, Cyprus, Finland, France, Germany, Greece, Ireland, Italy, Luxembourg, Malta, Netherlands, Portugal, Slovakia, Slovenia and Spain. These countries are often called "Euro zone" and "Euro land".

Andorra, Monaco, San Marino and Vatican City also use the euro, although not formally members of the euro, even EU members. Of these, Monaco, San Marino and the Vatican have created their own currency, its own national symbols on the back. Andorra used the French and Spanish coins, since they used the French franc and Spanish peseta as its currency. These countries use the euro due to agreements with EU Member States (Italy where the principality of San Marino and Vatican City, France if Monaco), approved by the EU Council.

Montenegro and Kosovo, who used Mark as their currency, have also adopted the euro, although, unlike the above three countries have not entered into any legal agreement with the EU explicitly enabling this work.

Other places that use the euro are French Overseas Territories: French Guiana, Réunion, Saint Pierre and Miquelon, Guadeloupe, Martinique, Saint Bartholomew, Saint Martin, Mayotte, and Clipperton islands nelocuitele and French Southern and Antarctic Territories, autonomous regions Portuguese Azores and Madeira and the Canary Islands.

From February 2, 2002, the litas (LTL) entered the ERM II exchange rate's being fixed against the euro instead of dollar.

Denmark and the UK have obtained an exemption is not required to adopt the euro and with the so-called clause "opt-out. Sweden has no exception in this regard, but nevertheless decided in 1997 not to join the

euro zone, so it has not made any effort to meet the criteria necessary to have a stable exchange rate. Sweden has been a referendum on the European single currency on 14 September 2003, participants voting against adopting the euro, with 56.1% votes against and 41.8% votes. This decision was taken for a minimum of five years.

In Denmark a referendum on joining the euro took place on September 28, 2000, resulting in a rate of 53.2% against membership.

Making the euro required years of plans and preparations to strike a balance between aesthetics, practical dimensions and security features. From this process emerged seven banknote and eight coins that were put into circulation in January 2002.

All coins have a common (1, 2 and 5 cents: Europe in the World, 10, 20 and 50 cents: Europe as an alliance of states, 1 and 2 euro: Europe without borders) and a specific country to which it is issued by currency (even for Monaco, San Marino and the Vatican have made their own coins). All notes are made after a joint model for the entire euro area. Obviously, all currencies are used in all member countries, such as a coin has the portrait of Juan Carlos circulation not only in Spain but also in Finland, Ireland, etc..

The final date of validity of currencies varies from state to state. The first coin was gone Deutsche Mark (German mark), on December 31, 2001 in a minute, the last coins disappeared on February 28, 2002, once all the coins would have to stop in the respective legal amount. However central banks of the euro area countries will continue to accept old currency notes and coins (e.g. 2012 in France for banknotes).

European currency symbol, €, comes from the initial European continent, and the 2 parallel bars represent stability and security.

Also, each state is entitled to issue an annual € 2 coin, commemorative purpose, but ordinary legal tender.

3. Benefits and costs of transition to single currency

Euro benefits[2] are diverse and are felt at different levels, from individuals and businesses and reaching the whole economy.

These include:

- More choice and stable prices for consumers and citizens

- Increased security and more opportunities for businesses and markets
- Stability and Growth
- More integrated financial markets
- A stronger EU presence in the global economy
- Presence of a tangible sign of European identity

The single currency brings a new force and new opportunities arising from integration and economic dimensions of the euro zone single market becomes thus more effective.

The single currency and the euro area mean new opportunities in the global economy. Prudence in managing its business, making the euro an attractive reserve currency for the euro zone countries and ensure a stronger position in the global economy.

Also gives size and prudent management of euro area economic stability, which resists thus better the so-called "shock" external economic, or sudden economic changes that may occur outside the euro area and affect national economies, and price increases oil or the emergence of turbulence on international currency markets. Due to its size and strength, the euro area can also better absorb external shocks without losing jobs and without reducing growth.

Euro status as world currency, plus size and economic strength of the euro area, determined more and more international economic organizations such as the IMF and the G8 to consider the euro area economy an independent entity. This ensures that the European Union a stronger global position.

To benefit from this strong position to contribute effectively to international financial stability, the euro area is expressed increasingly more often as a single voice in important economic forums. This is the result of close coordination between Member States of the euro area and the cooperation between the European Central Bank and European Commission during the international meeting on economic issues.

Disadvantages (costs)[3] transition to the single currency could be summarized as follows:

- reduction and elimination of arrears could lead to closure of production capacity whose viability is not possible, which would mean rising unemployment and public spending on the redundant (however lower than maintaining the activity of the viable artificial);

- waiving lever to promote exports through currency depreciation will cause difficulties (reduced price competitiveness) of exporters, especially those that supply, with domestic priority;

- classical and specific channels used for macro underdeveloped countries, economic growth and enhance external competitiveness will not be used (national currency depreciation, increasing budget deficit and public debt, inflation and high interest rates) which will create economic difficulties coping Community rigors unusual;

- up to full monetary and economic stabilization is possible the entry of speculative capital that adversely affect the country's foreign exchange resources;

- the first stage of accession after the prices and rates could increase (especially in public utilities and agro-food products).

Despite the general pessimism on euro costs and risks, it would seem that the question whether the euro benefits exceed its disadvantages, in terms of importance, is a firm yes. This response is primarily due to simple fact that the euro has been introduced. He is no longer a theoretical symbol of unity, a symbol which exists only in the minds of some ambitious politicians.

4. Euro zone crisis and the future enlargement of Euro land

The crisis that began in Greece culminated in a crisis across the euro area. To answer the question how it came to this impasse is necessary to differentiate the three players who had played an important role in the development of this crisis, namely: Greece, and financial market authorities in Euro land.[4] Greece's role could be summarized in few sentences. Mismanagement and a sense of disappointment emanating from the authorities have made this crisis possible. The Greek government is currently struggling with a huge problem of lack of credibility, making the exit from the crisis is becoming more difficult, because nobody trusts them (government). Any announcement made by Greek government officials about their intentions to redress the budgetary situation will be received with a large dose of skepticism for years to come.

Credit rating agencies have been central to the destabilizing role of financial markets. A stuff you can say about these agencies would

be that they have failed to see near crisis. And even after its emergence, they react in a systematic way too many, so contribute to intensify the crisis. This happened even two years ago, when rating agencies were caught completely unawares by the credit crunch. Repeat that scenario even now in the last few months. Sovereign debt crisis began in Dubai. Fail in a way so shameful as to predict a crisis of sovereign debt, agencies began to seek such frantic and possible seizures. They focused on Greece's target was a natural course. But not limited to Greece only searches. This led to a significant decrease in government bond rates in the countries concerned.

An explosion source level of government debt is unsustainable levels of private debt in the financial crisis. During the boom years, private sector has accumulated many debts. Then came the recession and governments had to collect the shards. They did this in two ways. First, while the economy was dragged into recession decreased revenues and increased government social spending. Secondly, since the part of private debt was guaranteed by the government, he was forced to save his debt to private institutions.

Present due to fear excessive government debt may trigger so-called "Fisher's paradox." As governments are forced by rating agencies to reduce debt levels, future redemption of private debt becomes impossible. The private sector can reduce its debt unless the government is willing to increase their debt. Now forcing the government to reduce debt while the private sector also seeks to reduce its own debt, leading to a dynamic self-defeat, the neither the government nor the private sector and fail to reduce debt. This dynamic also pull the economy down by deflation. This dynamic has been examined by Irving Fischer in 1930 seems to be part of the intellectual tools kit rating agencies. The event was permitted hesitation crisis that came from both the governments of the Euro zone and the European Central Bank (ECB).

Greek debt crisis turned into a setback to the prospects of enlargement of the euro area, highlighting the difficulties of managing an area with a single currency. Politicians will not say so, but only little Estonia is likely to join Euro zone the next 5 years, although "the euro convergence" will remain the central policy anchor for all new East European members of

the European Union. Germany and European Central Bank is determined not to let another into the Euro zone Greece. Polish politicians have understood this and changed their attitude in this regard, saying that Poland will adopt the euro no earlier than 2015.

Analysts expect both the European Commission and European Central Bank is ever stricter application of membership criteria and insists that the first candidate to achieve real and sustainable convergence with the Euro zone. This means to take into account more indicators such as neglected in the past, current account balance and broader measures of competitiveness. When eight Central and Eastern European countries joined in May 2004, along with Cyprus and Malta, a Reuters poll conducted on the 33 economists of Banking, has revealed that they expected that all these states to join Euro zone this year. Their accession treaties obliging them to adopt the euro once they meet criteria on debt, deficit, inflation, interest rate and exchange rate stability. However, only Cyprus, Malta, Slovenia and Slovakia joined the Euro zone which is now 16 members. Lithuania has seen its document application rejected in 2007 after nearly missed both the inflation target.

Estonia has strong chances to gain access to Euro land next year, EU officials said, but the main central European economies is more likely that they will not join before the middle of the decade and possibly well beyond. Iceland comes and knocks at the door looking for news Euro zone rescue its banks after they fell in October 2008, but were told he must first make application to join the European Union. Czech and Polish governments have shown a distant horizon when they approved the euro convergence plans that seem to delay the adoption of the second half of the decade. Poland, which suffered embarrassment last year when he had to jump over an over-optimistic forecast that said it would adopt the euro in 2012, has set a new date, while the Czech Republic now aims for the years 2016 or 2017. Both have floating currencies that have depreciated during the financial crisis, helping them to avoid deep recession that hit the country with the euro exchange rate as reported in Latvia. Poland was one of the EU economy has enjoyed growth in 2009. Public opinion in the former socialist countries has become more sensitive in terms of early adoption of the euro, after an initial enthusiasm in this regard, after the financial

crisis hit. Greece deflation spectrum including sacrifices in wages and pensions and unemployment rates than the euro area do not seem so attractive in this region.

The crisis in Greece has intensified rumors that the EU countries as Romania and Bulgaria, two countries with big problems regarding corruption and organized crime were admitted into this organization too early integrationist.

5. Constant struggle between Euro and Dollar

About this struggle that gives the world between the euro and dollar, which analysts have different opinions that they are divided into two camps: those who favor the rule of the Euro and so fervently believe and those who are of the old dollar? If we do an analysis of the euro share in global foreign exchange reserves for 2009, then surely we tend to believe that the supremacy of the dollar is about to end.

Single European currency continues to increase its attractiveness as a reserve currency to the detriment of the dollar, its share in global foreign exchange reserves climb to 27.5% in mid 2009 from 25.9% in March, showed a report of the International Monetary Fund (IMF), quoted by Bloomberg. Share of U.S. dollar in world currency reserves dropped to 62.5% at the end of June, from 65% to end the first quarter. In contrast, the Sterling rate increased slightly from 4% to 4.3%, as well as share yen, which reached 3.1% from 2.9% in March.

For U.S. currency is the lowest rate as world reserve currency to the euro, in 1999, while the European currency is the highest share after its appearance, informs Tuesday.

World Bank President Robert Zoellick, the United States warned Tuesday not to consider that the dominant role of the dollar as reserve currency is guaranteed forever.

Value of global foreign exchange reserves rose in the second quarter of 2009 to 6.800 billion from 6.500 billion at the end of the first quarter. However, data on the weight of each currency is based on extrapolation of figures available for part of the reserve - about 4000 billion dollars - the conditions under which central banks have no data on the structure of foreign reserves.

But as said, there are voices that are safe that almighty U.S. dollar will not end his

career as an international currency and euro support.

History shows that will not happen, despite the fact that the dollar is vulnerable. Financial supremacy of America in this century resembles the position that Britain occupied a century ago in international finance. Before World War I in August 1914, sterling was the favorite currency in international transactions, as the dollar today, and those who borrowed money at international visitors from London's City to raise capital. At the outbreak of the Great War, Great Britain retained the pound sterling convertibility into gold in order to maintain the credibility of international tender.

Dollar could not beat the British pound for the role of international exchange currency without being on a par with her in the reputation. And the events of August 1914 gave him the chance. Payment habits are changing financial world in the rate at which a glacier melts.

Making Britain - from international creditors in international debtor during the Second World War - gave the dollar a second victory in his fight with pound sterling.

Experience since 1914 shows that a credible alternative can replace a coin long recognized as the international medium of exchange, especially after being weakened by a trade imbalance. Today, the euro - a currency without a country - has a long history behind its credibility. There are sixteen EU countries using the euro as their currency. But these independent political entities committed to the euro can not match the history of American commitment to the dollar.

European Central Bank, founded in 1998, new money manager, has a mandate to maintain price stability so. But the ECB needs time to create a reputable institution that fights inflation. Can not take the shortcut, as did the United States a century ago. So the euro must

earn its reputation crisis by crisis to confront the dominance of the dollar as the favorite currency in international transactions. In short, it is clear that the euro made its place in this period of U.S. trade deficit, but this reflects a decline in the dollar rule pertaining to its development and not a revolutionary change of regime.

What could trigger a deadly assault on the dollar on international markets? While a massive and steep sales dollars by major holders of the currency - for example China - is unlikely, a cataclysmic event, like First World War in 1914, could cause the search for new currency as a means of international exchange. In the modern era of automated payment systems, such twists may come from a terrorist attack that could undermine bank transfer to computer systems in the world system of banks. A catastrophic loss of computer files would surely destroy the credibility of the dollar as the international means of payment.

But what could replace the dollar in such a situation remains to be learned. After all, a loss of electronic files would make the euro as suspicious. Perhaps gold, a depository of value can not be distorted by such maneuvers, will return as the standard currency evaluation. Of course, we can only hope that such a scenario will remain purely speculative.

The Quality of the Commercial Services

STANCIU Anca

CONDREA Elena

„Ovidius” University of Constanta

castan22us@yahoo.com

elenacondrea2003@yahoo.com

Abstract

The implementation of a quality assurance system (SAQ) in a firm represents at the moment a necessity of the actual development context.

Commercial services represent one of the main important components of the quality management systems in the retail activities. The services offered by all types of commerciants in their activities must themselves represent objectives of a quality approach, taking into consideration the customers exigency nowadays. The range of commercial services enregistered an explosive development in the last few years, being permanently adapted to the market demand.

A special attention must be given in this respect to the human resources management involved in the quality assurance (AQ) activities, the human vector representing a major important item due to the activities specificity.

Key words: quality management system, commercial services, human resources

JEL classification: M59

1. Introduction

Businesses have like main resources: capital, physical, and human ones. Companies in global competitor's countries have been forced to develop their competitive edge primarily through the human resource, essential for retail activities. The human resources is the only one that competitors cannot copy, the only one that can synergize, that produce output whose value is greater than the sum of its parts. The objective of big retailers is to serve customers and their own employees. They are learning every day that to satisfy customers, they must first satisfy employees. The role of human beings at work has changed as business and labour have

changed over the years. Skilled craft people prior to the industrialization had a major stake in the quality of their products because their families' lively hoods depended on the sale of the products. They were motivated by pride in their work as well as the need for survival.

Recently, managers have begun to realize that these human resource practices no longer work very well. The new thinking is that:

- people design and improve the process;
- workers who run the process must control it;
- managers must obtain the commitment of people to design, control, and improve processes so that they can remain productive;

Thus, human resource management has shifted from a "control philosophy" to a "commitment philosophy". Studies have shown that such a shift results in higher quality, lower costs, less waste, better utilization, increased capacity, reduced turnover and absenteeism, faster implementation of change, greater human skill development, and better individual self-esteem. However, managers are faced with such new responsibilities as investing extra effort, developing new skills and relationships, coping with higher levels of ambiguity and uncertainty as well as obsolete skills and careers that are casualties of change. Workers also face discomfort caused by changing attitudes and skill requirements and increased responsibility.

Selling is a key element in the retail process. Some retail establishments such as jewellery stores, clothing stores, and hardware stores require a more personalized selling effort than others. A sales force equipped with the necessary selling skills and under competent management is an asset to any store.

2. Configuration of retail selling

Retail selling can be divided into two major categories: order-taking and order-getting.

Each of these has a different set of responsibilities and may be suitable for different types of stores.

Order-Taker – certain retail outlets require very little in-store personal selling of their products. However, they do require salespeople to take orders from customers. Examples of these include fast-food outlets, catalogue showrooms, gas stations, and grocery stores. The primary function of the order-taker is to take the order and serve the customer with the minimum possible delay. There may also be some opportunities for creative selling. Here, the order-taker can give the customer some guidance.

The order-taker should be courteous and efficient, and have a thorough understanding of store policies and procedures. Other characteristics the order-taker should have are knowledge of the product, tact, and a neat personal appearance.

Order-Getter – the order-getter is the salesperson that may need to convince customers to buy. This person is responsible for appraising and greeting the customer, determining the customer's needs, presenting the product, meeting objections and sales resistance, and, finally, closing the sale.

3. Requirements for the Effective Retail Salesperson

The requirements for good salespeople include the following categories: personal traits such as judgment, tact, a pleasant personality, a positive attitude, a pleasant appearance, and good personal hygiene, and knowledge of the merchandise, the store's policies and procedures, the competition's products and policies, and consumer behaviour.

- *Personal Traits*
- *Tact*
- *Personality and Attitude*
- *Appearance and Personal Hygiene*
- *Knowledge: Merchandise Knowledge; Store Knowledge; Competitor Knowledge; consumer Knowledge.*

4. Performance appraisal

Performance appraisal is an exceedingly difficult HRM (Human Resources Management) activity. Organizations typically

use performance appraisals for a number of reasons:

- Appraisals provide feedback to employees who can then recognize and build on their strengths and work on their weaknesses;
- Appraisals are used to determine salary increases;
- Appraisals identify people for promotion;
- Appraisals are used to deal with human resource legalities. As such, they can provide a paper trail to fight wrongful-discharge suits and act as a formal warning system to marginal employees.

Conventional appraisal processes typically involve a manager or supervisor evaluating the work of a subordinate for a given time period. Steps and characteristics of these processes may include some or all of the following:

- Objectives for a certain period of time are set unilaterally or jointly by the manager with his or her subordinate.
- At the end of the review period, the manager sits down with the subordinate and reviews accomplishments, strengths and weaknesses, and/or personal characteristics of the subordinate related to the job.
- Frequently, the form used for performance rating has 10 to 15 tangible and intangible categories, such as quantity of work, quality of work, works well with others, takes initiative, to be rated on a five-or seven-point scale from "excellent" to "unsatisfactory" or "poor".
- Usually, the manager appraises employees according to ratings distribution, based on company policies, such as "no more than 10 percent of any departments employees, may be rated as excellent" or "merit raises or bonuses will only be paid to employees who are rated as excellent or very good".

• The standard form generally asks the rater to evaluate the rate's capacity to handle greater responsibility and/or readiness for promotion.

• Often, the performance appraisal interview is accompanied by announcements of raises, bonuses, and/or promotions.

Dissatisfaction with conventional performance appraisal systems is common among both managers, who are the appraisers, and workers, who are the appraisees. Many managers are inclined to give higher ratings because of potential negative impacts. Numerous research studies over the past

several decades have pointed out the problems and pitfalls of performance appraisals.

TQM assumes that people want to do better, and will if they are properly motivated and are given the opportunity to participate, along with adequate training and tools. From a shared vision of quality that goes beyond one's own workplace emerges a team concept in which trust, effective communication, and cooperation are necessary to achieve success. Performance appraisals are most effective when they are based on the objectives of the work teams that support the organization. In this respect, they act as a diagnostic tool and review process for individual, team, and organizational development and achievement. The performance appraisal can also be a motivator when it is developed and used by the work team itself. Team efforts are harnessed when team members are empowered to monitor their own workplace activities.

In a TQM culture, quality improvement is one of the major dimensions on which employees are evaluated.

In the spirit of Deming, many companies are replacing performance evaluation altogether with personal planning and development systems.

5. Training and education

Training is one of the largest initial costs in a total quality initiative, and not surprisingly, one in which many companies are reluctant to invest.

Quality and related training and education provide and/or enhance the knowledge and skills employees need to do their jobs effectively and efficiently. Training includes quality awareness, leadership, project management, communications, teamwork, problem solving, interpreting and using data, meeting customer requirements, process analysis, process simplification, waste reduction, cycle time reduction, error-proofing, and other educational issues that affect employee effectiveness, efficiency, and safety. In many cases education also provides job enrichment skills and job rotation that enhance employees' career opportunities. Sometimes, training in basic skills such as reading, writing, language, and basic mathematics is needed for quality and operational performance improvement.

Companies should assess the specific

training needs of different employees. All employees need basic skills and quality orientation. However, advanced topics differ among employee categories and functions.

The leaders in quality (Deming, Juran, Crosby etc.) actively promoted quality training and education. Two of Deming's 14 Points, for example, are devoted to these issues.

The approaches of quality leaders are not based on sophisticated statistics or new technologies. Rather, they are focused on the philosophical importance of quality and simple tools and techniques that are easily applied and understood. Once the basics are in place, more advanced statistical methods can be taught and applied.

Companies committed to TQM invest heavily in training.

Specific approaches vary by company. Most large companies have in-house training staffs with state-of-the-art facilities.

Smaller companies often use outside consultants. The content should be customized to the company's needs; "packaged" seminars are often a waste of time.

Continual reinforcement of lessons learned in training programs is essential. Many companies send employees to courses, but then allow the knowledge to slip away. New knowledge can be reinforced in several ways.

Finally, companies need an approach for evaluating training effectiveness.

6. Recognition and reward

The topic rewards has already been introduced in the context of performance appraisal. Motivation, leadership, performance review, training, and development all ultimately lead to the question of "What's in it for me?" for each individual in every organization. Without willing, sustained individual effort, coordinated team efforts, and the sum total of the individual efforts that meet organizational goals, TQM is an impossible dream. Recognition and rewards should reinforce quality relative to short-term financial considerations. They can be monetary or non-monetary, formal or informal, individual or group. Employees should contribute to the company's performance and recognition approaches. Awards provide a visible means of promoting quality efforts and tell employees that the

organization values their efforts, increasing their motivation to improve. Most importantly, rewards should lead to behaviours that increase customer satisfaction.

Extrinsic and intrinsic rewards are the key to sustained individual efforts. A well-designed pay and benefit system, which is discussed in the next section, can provide excellent extrinsic motivation. Other reward systems are non-monetary.

Certain key practices lead to effective employee recognition and rewards:

- Giving both individual and team awards;
- Involving everyone;
- Tying rewards to quality based on measurable objectives;
- Allowing peers and customers to nominate and recognize superior performance;
- Publicizing extensively;
- Making recognition fun.

7. Compensation

Compensation is always a sticky issue and ties closely to subject of motivation. Money is a motivator when people are at the bottom of Maslow's hierarchy. Pay for performance can diminish intrinsic motivation. It causes most employees to believe they are being treated unfairly, and forces managers to deliver negative messages. Eventually, it creates win/lose situations. The objectives of a good compensation system should be to attract, retain, and not demotivate employees. Other objectives include reducing unexplainable variation in pay (think about Deming's principles) and encouraging internal cooperation rather than competition.

Many TQM-focused companies now base compensation on the market rate for an individual with proven capabilities, and then make adjustments as capabilities are increased, along with enhanced responsibilities, seniority, and business result.

One method often used to separate individual compensation from performance appraisal is gain sharing, an approach in which all employees share savings equally.

Finally, in system development and organizational improvement, HRM managers must encourage individual development activities that support and enhance the systems.

8. Customer Services

Customer service is one way to keep customers satisfied and have them return to the store. Customer service includes all features, acts, and information that augment the customer's ability to realize the potential value of a core product or service.

A major factor that determines whether customers will return is the level of services provided by the retailer.

While there may be several reasons for this, many retailers are recognizing the need to improve their level of customer services. Others are opting to increase the self-service component of their operations because of increased labor and operation costs.

Retail services can be divided into four categories: courtesies, sales service, support services, and revenue services.

Courtesies include the relationship the customer has with the retail sales clerk. Such things as smiling and saying "thank you" seem obvious but are often neglected by retail employees. A recent survey scored retail clerk courtesy the lowest of the types of retail services. Retailers can improve this aspect of their operations by screening employees, monitoring performance, and by providing incentives to extend courtesies to customers.

Sales services include such things as the quickness with which transactions are completed, sales clerk knowledge, suggestion selling, and the willingness you accept phone orders. These types of services can be provided effectively through increased efforts in the training of employees.

There are also services that can be offered to customers at a minimal charge. Examples are equipment leasing, some financial services, restaurants, alterations, repairs, and government services such as postal services. These are called revenue services. In each case the retailer should assess the extra service on a cost-benefit basis before its implementation. Occasionally customers may expect some of these services to be provided free of charge. Therefore, the retailer needs to be aware of such expectations regarding these extra services.

Support services refer to things the retailer does after the purchase has been made. Examples of support services are extending credit, providing merchandise delivery,

wrapping gifts, and providing a liberal returns policy. Of particular importance to the retailer are the costs of providing these services and the increase in retail patronage those results.

9. Conclusions

Motivation and human behaviour are major elements of Deming's Profound Knowledge.

Quality depends on employee commitment at every level of the organization. If employees are not provided with the proper motivating climate to align their efforts to meet organizational goals, the result can be conflict, poor performance, and low quality levels, first of all in case of "first line" human resources, the case of commercial services.

Managers must understand that there is no such thing as an unmotivated employee. The system within which employees work can seriously affect intrinsic motivation.

Although thousands of studies have been performed over the years on human and

animal subjects in attempts to define and refine the concept of motivation, it remains an extremely complex phenomenon that still is not fully understood. This section briefly reviews the major theories, models, and approaches, and their implications to TQM.

European Integration Process between Divergent and Convergent Points of View

STANCIU Miltiade
STOICA Ana Maria

„Spiru Haret” University, Faculty of Marketing and International Business
miltiade_stanciu@yahoo.com
anasta84@yahoo.com

Abstract

The current complexity of life, carrying with it direct interdependencies, but also uncertainties of interpretation or misinterpretations, marked the process of European integration. The European Union is currently in an unprecedented stage. The twenty-seven states have generated a specific problem in this game of integration. The disparities between Member States, the fact that the entry into EU structures did not bring about the expected welfare, especially for the former communist countries and the lack of giving hope perspective are all concerns of the European future, of all livings.

On the other hand, the European Union, through the institutional framework created by itself, is to help with developing by respecting diversity in the new European world. Without respect for this diversity, integration may become a form without substance largely negating the meaning of life of individuals. Therefore, the sustainability of European construction must be based on spiritual assimilation of integration values, where people, as Europeans, should believe, think, act, live and hope.

Key words: convergence, integration process, institutional framework

JEL classification: F15

1. Introduction

The integration process involves the development of simultaneous action on two fronts: the increasing interdependence of national economic systems components and the establishment of a set of specific relations between states so that all constituent parts may function consistently and with mutual benefits.

One of the most advanced forms of international economic integration, through the process of its creation, the aimed objectives, the specific mechanisms used, but also through the results that have been achieved so far, is the European Union[1].

However, because of the current complexity of life carrying with it direct interdependencies and uncertainties of both divergence and convergence, the European Union is currently facing up a completely odd phase. The twenty-seven states have resulted in a specific problem in this game of integration. The disparities between Member States, the fact that the entry into EU structures did not bring about the expected welfare, especially for the former communist countries and the lack of giving hope perspective are all concerns of the European future, as a whole.

2. Divergent and convergent points of view in terms of EU integration

Meanwhile, the European Union consisting of a human community of states, free peoples and minorities, organized institutionally to mark the spirit of its citizens' life ideals, should aim to control risks arising from natural and social evolution of our microcosm. Among the potential risks arising from integration, John Mc Cormick identifies a seven[2]:

- The loss of sovereignty and national independence.
- The loss of national identity as laws, norms and standards are harmonized.
- The reduced powers for national governments.
- The creation of a new level of impersonal „big government”, situated at Bruxelles, determining a new level of laws and norms.

- Increased competitiveness and loss of jobs because of the elimination of market protection.

- Intense traffic of drogues, crime and illegal immigration due to the elimination of the custom controls.

- Problems regarding controversial situations, such as Common Agricultural Politics.

However, he also mentions certain advantages of integration that, in his opinion, enumerates the following strong points[3]:

- Cooperation reduces the possibility of having wars and conflicts.

- The unique market offers to the European businesses an extended area of consumers.

- Mergers and overtake create European corporations important at the international level supporting The European Union when competing on the world market.

- There is greater liberty regarding the transversal circulation within the European Union.

- The unification of economic and social resources of many member states.

- The member states that work together enjoy new powers and international influences.

- The poorer member states try to „reach” standards at which the more developed states are situated.

- Funds and investments create new opportunities in poorer areas of the European Union.

- Democracy and capitalism are promoted in poorer member states.

Certainly, from the point of view of an analyst who comes from a developed state, the advantages of the EU integration mentioned above may be real. But if the analysis is done by an analyst who comes from the newly integrated countries, ex-communist, the benefits do not seem so obvious. Thus:

- The more developed states do not maintain themselves at the same standards, but evolve, in most cases positive, to the same standards, whereas the poorer countries find it increasingly difficult to keep up with the former one, not to mention reaching their level. (see the last cohesion reports within the European Union). This would require a sustained economic, financial and political effort meant to support the poorest nations in their economic development and actions meant to eliminate all the gaps existing between the

rich states and the poor ones. It is difficult to do it, but not impossible.

- The way of reasoning of the member states enjoy working with new power and global influence can work in two cases: when two rich states are associated or when the association is between a rich state and a poor one. In both cases, the locomotive is a rich country / one of the richest countries. For example, cooperation between Romania and Bulgaria does not equal cooperation between Germany and France.

- Given the changes occurring in the former communist countries but also the crisis generated by one of the most democratic systems in the world, the United States of America, we do not believe that any simple translation (in the duplication of mot a mot) of a system from a developed country to other ex-communist country leads necessarily to favorable results, unless the specific of the particular country is ignored.

- The results of unification are quite often supportive only for certain countries, usually the strongest ones that are the biggest resource consumers. Takeovers and mergers make the less developed countries dispose of their own business that, with the others similar to the former ones underpin the economic success of the country.

- Unfortunately, in military terms, the EU has not acted until now as an united force, see the different responses of the Member States to the conflicts in Iraq or Afghanistan, which generated hilarious and strange situations both within the Union and in relations with third parties. Moreover, the ex-Yugoslav crisis has shown the need for a corps and political institutions that should respond rapidly to regional crises and counter mediation[4].

- There is a significant big gap between the rich countries led by the locomotive pole-Germany, and the poor countries, mostly ex-communist countries, which unfortunately, increases slowly, but continuously.

If we consider the words of Zbigniew Brzezinski, a prominent U.S. political analyst, former advisor to President Carter, which formed the Ten Commandments on the EU developments and investments [5], we can sketch the EU evolution of divergence and convergence:

- For most Europeans, „Europe” is not an object of personal affection. It is more a convenience that a conviction.

- On the global scene, the European Union will not be as America, but more an extended Switzerland.

- Most of Europeans do not react against Americanism as an impulse of unity.

- Integration is essentially a bureaucratic process and it does not mean unification.

- The EU extension is essentially an antagonism from demographic and economic point of views.

- The European Union needs to extend from demographic and economic point of views.

- From the political point of view, it is not functional to have an internal federal center of the states that do external policy in a European Union consisting of more than 21 states.

- It is more likely that a slow extension on the one hand, and a bureaucratic integration, on the other hand, may generate a Europe united from the economic point of view, but only confederated one, from the political point of view.

- The European Union is unlikely to acquire a autonomous military capacity.

- The European Union will be, thus, a new type of organization of global influence, firstly economic and financial.

Without doubt, there are situations generating hopes for the future European Union such as the dimension of the social assistant that characterizes the European model and differentiates it from the dominant ones existing in the USA, Japon, India and China. At the same time, Europeans have a common vision on world organization, significantly different from the solitary way of making decisions within the Yellow Oval Room and prefer a collective decision within certain international institutions. The way in which Europe managed to overpass its historical past full of wars through supranational forms of cooperation strengthened the Europeans' belief that, at the international level, it is necessary to accept mutually a limit of state sovereignty in terms of making use of force.

Regarding the common commercial politics of the EU, the USA and certain representatives of the American corporations accused the former one to be the Europe fortress because of its refusal to reduce the subventions for agriculture. For example, at a negotiation meeting of the World Trade Organization that started in 2001, in Doha, Qatar and finished

in 2003, at Cancun, Mexico, the European representatives were accused by the poor countries that the former ones protect farmers by export subventions provided in accordance with the Common Agricultural Policy, subventions that made them more productive and more competitive, as well as the dumping of cheap products existing on the markets of the poor countries which undermined the efforts and the chances of the local farmers. A year later, in 2004, at Geneva, The European Union and the United States of America agreed on diminishing the subventions in exchange of some facilitations of the penetration on the less developed countries, which had been requested by the EU for a long time. A month before the conclusions of negotiations, some representatives of the EU and the USA met to set up their positions.

3. Instead of conclusions

Thus, Europe is still in need of significant quantity of labour at the institutional level to assure the irreversibility of its effective integration from the economic point of view. At the inferior level, as unique market, the integration is probably irreversible. But this thing is not still possible in case of the development of a unique extended economic space [6].

After 18 years of working in one of the European institutions, the European Parliament, Steven McGiffen asserts that the integrationist project is only serving the interests of multinational corporations, the hegemony of which is extending at all levels threatening all that people from developed countries have managed to build up in the past two centuries: democratic rights and freedoms, economic security, the chance to lead a dignified and productive life meant to make them feel satisfied [7].

Among the causes that generated this reality, I mention: a cultural conservatism derived in partly from the continuous influence of Christianity (various types) on the European social life, the ruling elite's understanding of the fact that this ecological crisis is not some myth imagined by environmental activists exalted beyond measure[8]. The negative effects of the European Union do not end at its borders. In relations with the rest of the world, the Union demonstrated a purely rhetorical knowledge of the imbalance of power between North and South and the disasters grazing both

regions. In fact, it acts without restraint, for short-term interests of European capital owners and their highly selective commitment to free trade and protectionism that protects industries and agriculture of the Member States, has contributed to the underdevelopment against which many of its trading partners poorer in the last three decades fought.

The fact that we need an international approach to the problems which humanity in this century has been facing up, does not mean that the only or the best available forms of international cooperation are this international approach, this European Union, a single currency based on monetary principles discredited or extreme, a political system that seems almost designed to maximize the rich elite corruption and hegemony or a Constitution which is in fact a neoliberal political program [9].

To conclude, The European Union, through the institutional framework that it created, has to contribute to development by respecting the diversities existing in this new European world. Without respecting this diversity the process of integration becomes a form without content annulling considerably individuals' lives meaning. The strength of the European construction has to be founded on the spiritual assimilation of the integration values in which people, as European citizens, have to believe,

think of, and act in their spirit and hope. If the results of integration are not concretized gradually and are not resented in each country immediately, the degree of confidence in the process of integration is more and more diminished, which is totally opposed to what the founders intended to create.

The Schengen Agreement and the Free Movement within the European Union

BRASOVEANU Florica

floriordache@yahoo.com

Abstract

Among the main aims of the European Union there are targets such as the achievement of a high level of employment or obtaining a permanent economic growth and raising the living standard. Achieving such objectives requires the necessity of establishing a common market that represents a single economic space composed of the following elements: the customs union, the four freedoms, free competition, and common policies in the domains of agriculture, transportation and trade. The core of this common market can not be anything else than the domestic market with the free movement of goods, persons, services and capital

The free movement of goods, persons, services and capital within the EU common internal market is ensured by a set of provisions of the Community law which, together, constitute the four fundamental freedoms. Although the activities of the European Union can not be easily summarized in brief, we can say about the four freedoms that they represent the free flow of the economic factors towards gaining prosperity both for Member States and their citizens.

Key words: Schengen agreement, four freedoms, custom union, common policies

JEL classification: F15

Since the Union citizenship should be the fundamental status of the nationals of Member States when they exercise their right to free movement and residence, it has been considered that it is necessary to codify and revise the existing Community instruments which separately envisioned workers, self-employed persons, students and other inactive persons, in order to simplify and strengthen the

right to free movement and residence of all Union citizens

To the extent necessary for the proper functioning of the common market, participating countries have phased out, from their relationships, the restrictions on the movement of capital belonging to the residents of Member States, as well as the discriminatory treatment based on citizenship, or on nationality or on residence or on the registered office of the parties or on the location of capital placement. On the EU territory, the capital can be transferred in any quantity from one state to another, and all transfers in Euros within the EU is considered a domestic payment and thus it supports the appropriate internal transfer rates. These provisions apply to all EU Member States, whether or not in the Euro area, as long as it is the transaction currency.

Concerning the right to the free movement of persons, EU citizens enjoy the opportunity to travel, for whatever reason, from one region of the Union to another, only on the basis of an identity document or valid passport. This possibility was reiterated and the Court of Justice of European Communities stated that Member States can not apply, for the admission to their territory, other formality than the mere presentation of an identity card or a valid passport

The free movement of workers is fenced only in two situations, strictly defined, which can be exceptions. Firstly, Article 39 of TEC will not apply when it comes to the employment in public services. In this way, there are eliminated several jobs that directly or indirectly involve the participation in the exercise of the powers conferred by public law. The European Court of Justice stated that such positions presume in fact from those who occupy them the existence of a special loyalty connection to the State and the reciprocity of rights and duties which form the basis of the

nationality obligation. Secondly, the free movement of workers may be limited, fenced, for reasons of security, order and public health.

In practice, the main obstacle to the free movement is the control of borders, and their dissolution is a prerequisite in order to facilitate the imposition of free movement.

The Schengen Agreement is a treaty signed on June 14th, 1985, by the representatives of five countries (Belgium, France, Germany, Luxembourg and Netherlands) of the 10 States that were the members of the European Community at that time. The name of the Agreement comes from the name of the village Schengen of Luxembourg, near which the Treaty was signed, located near the border of Luxembourg with France and Germany. The actual signing of the agreement took place on board of a boat located in the middle of the river Moselle, which forms the boundary line between Luxembourg and Germany.

We can say that since the establishment of the European Economic Community in Rome in 1957, major changes occurred on the old continent, both at political and legal levels. The will of States to cooperate resulted during these years not only in strengthening and in establishing community integration but also in fulfilling and ultimately achieving the largest part of the objectives established of not only by the Treaty of Rome but also by other important acts, such as the Single European Act, the Maastricht Treaty or the Treaty of Amsterdam. The creation and the expansive evolution of the free movement of persons within the Union area is probably one of the most eloquent examples of the success of this appropriate cooperative environment.

Considering that the abolition of internal borders in 1995 was enforced by only seven Member States, it is noted that the Schengen space was and is constantly in a process of enlargement. Although the new states joining the Schengen cooperation need some time to actually and practically implement the regulations, each of them is expected to eventually succeed in participating and fully benefitting from this cooperation.

The preparations for the accession to the Schengen area is a complex of measures that should be adopted and implemented in a coordinated, unified and planned way by the institutions and structures with responsibilities in the field. This approach may materialize only through an inter-institutional effort to express the capacity of all persons involved in

order to coherently manage this complex process. In addition, the preparation for the accession to the Schengen area must have such a quality as to allow a positive evolution of Romania during the Schengen evaluation process and the adoption of the European Union Council decision on the abolition of internal border controls.

Of course, we can not deny that the will to cooperation of the European states did not have the same number of ups and downs. If there had been a constant and undisturbed cooperation, we could not have reached the situation in which the Schengen Agreement was signed by a group of countries outside the EU understandings. But even in this situation, there is the possibility to interpret the Schengen phenomenon as rather an engine that has accelerated the too slow pace of the development of the European Community at that time, but as a sign of the disparity of views of partner countries. Concerning the further progress of the Convention of implementation and its poaching in the Community acquis, the clear conclusion is that the five countries that have forged the agreement, initially outside the Community, have not been drawn away from the other partner states, but rather have taken a step forward, which was followed in the coming years by nother twenty states, failing to count those that are currently in the process of accession to the Schengen space (such as Cyprus, Romania, Bulgaria and Liechtenstein).

Apart from this, the Schengen Agreements have been considered as a "laboratory" of intergovernmental cooperation before being incorporated into the European Union, and if we consider the achievement of transforming the free movement into a fundamental right and a benefit automatically guaranteed with the integration with the EU, we can say without delay that it is a categorical success.

But the question that will remain unanswered is to what extent the Schengen successful recipe can be applied to other intergovernmental approaches. We know that there is already at least one New Convention, the one of Plum, which tries to follow its footsteps. It was concluded outside the EU policy by seven EU member states, to which other four states have announced their intention to join (Finland, Italy, Portugal and Slovenia) and it aims at the regulation of cooperation on the movement of persons. It is certain that, unlike the Schengen Agreements, the Plum Convention has been vehemently

criticized so far, especially by the European Data Protection Association, which sees in its provisions serious threats to privacy breach. Given these conditions, only time is able to pronounce itself on the success or failure of the “Schengen III Agreement”.

The Free Movement of Goods, Persons, Services and Capital

BRASOVEANU Florica
PETRU Alexandru
BREZEANU Lisievici
Ovidius” University Constanta
floriordache@yahoo.com

Abstract

The issue that we tried to analyse in this paper is related to how we could keep what Jean Monnet proposed and realized in the last 50 years, whereas the current economic and political situation requires it.

The European Union is the lab of successful experiences regarding unification. We started from the collaboration between two competing countries and nowadays we are talking about 27 accessions and many others in the near future.

Jean Monnet himself concluded that after an economic union, states will also want a political one.

What could be more interesting in the European Union than knowing our rights and freedoms and, why not, positively taking advantage of these prerogatives?

Key words: free movement of goods, persons, services and capital

JEL classification: F15

Being European is not a random attribute; the credit belongs to the parents of Europe, who faced reality more than fifty years ago.

Talking about the quality of being European includes a reminder of the Treaties of Paris, Rome, and Maastricht – treaties which testify the free movement within the Community space.

A comprehensive concept, *the freedom* in the history of Europe challenges us to answer questions such as: “What is Europe?” What will its future be like?”

It is true that the premises of the ideas of European unity have their origin since Antiquity, but we can not dispute that Europe was reborn under the probative imprint of the intellectuals of the time.

The genesis of “Europeanism” reveals the importance of the study of this article because speaking of the free movement means also balancing the origin of this right.

The free movement, which is naturally given, has been imprinted in the quotidian by us, the contemporary Europeans, and it has been acquired through joint and real efforts by yesterday Europeans.

It is not enough to thank to the parents of Europe for the freedoms that we enjoy; at least, we have to respect and not to prejudice these fundamental values that we benefit from, as European citizens.

Analyzed both from a historical perspective and a contemporary one, but also from the multidisciplinary perspective, this paper comes to show once again the actuality of this theme anchored within the contemporary.

This approach is not possible without a serious foray into how to define the essential elements of the free movement of goods, persons, services and capital, achieved at international level.

Also, the rules within the domain were regarded as immutable ones, seeking all the time, during their treatment, to give them the current interpretation by which to achieve their implementation, but also the design of *proposed regulations* that reflect the present general interests.

Although this study is addressed to specialists in the field, we aimed at achieving a standard of accessibility for all persons who want to make an investigation into this matter, without allotting an excessive space to the analysis of purely theoretical issues.

Among the Community sources of the Union, which have guided us in the

development of this research, we consulted treaties, directives, regulations published in the Official Journal of the European Union.

We approached the idea of the European Union in terms of the free movement, as it is perceived by respondents, and the conclusions of the study give it a touch of originality. The comparative studies between the different European Union legislations are also very interesting.

Given that human existence is undoubtedly related to the free movement, we can not dissociate it from its specific correlative exceptions.

The actuality of the theme influences the knowledge of the Community field because, in a single material, it gathers useful and certified data and it simplifies the research activity concerning the information which is the object of this study.

The evolution from 6 to 27 states, the institutional improvement and the development of the ideas on the major stages establishing the process of the European Communities construction have not been overlooked. The European construction is even nowadays in full process of development, as long as there are states who want to join the great European family. It is certain that the EU will maintain itself as a force in a world that is moving more rapidly towards globalization.

In order to better understand the mechanics of the free movement, which also forms the core of the study, the emphasis is on the overview of the liberalization of the movement of goods, persons, services and capital.

The study leans the balance more towards the practical aspects imposed by the freedoms and restrictions of this right of the free movement, but it is also based on theoretical viewpoints.

Regarding the policy within the domain on the free movement of goods, we find that it is a permissive one, based on the democratic principles of the free trade.

The European Union is a free space, without borders, where the free movement of goods, persons, services and capital take place without restrictions.

However, the liberalization of movement prones to criminal behavior and that is why it is necessary to impose preventive measures and

the integration of new technologies for border control.

The free movement allows criminals the access to various EU countries and bodies such as Frontex, Europol, which acts as a European FBI.

Terrorist threats, human trafficking - organized crime - in general, are issues related to citizen security and, therefore, their analysis can not be avoided.

We found that the European Union should not be confused with the Schengen area, also because for Romania it has become the first target on the priority list.

Although Romania has fully liberalized the labor market, some EU states are still reluctant to do so.

But is Romania ready to face the wave of foreigners?

Can Community institutions adapt to this remarkable change? The current institutional organization is the result of significant transformations, both through the regular revisions of Treaties, and by the daily practice and cumulated experience.

The advantages and disadvantages of the employment on a single market are given by the following factor: the recognition of professional qualification.

Although, theoretically, we are speaking about the principle of non-discrimination, the practice challenges the values of freedom and the equality of chances. The age, gender and qualification criteria are some of the requirements imposed indirectly on job candidates. Official documents and statistics are proofs that highlight examples of discrimination in this regard, and the employers are not discouraged by legal sanctions.

On the list of the approached topics there are also situations on unemployment, illegal work and, from the chapter on goods liberalization, the measures of European standardization and of ecologic labeling are of great interest. In this study we will learn that not all goods can move freely in the Union, but only those which meet the criteria imposed by European standards and, in addition, we will define and specify the prohibited goods on the single market.

The restrictions on the free movement of goods and those on any charges or measures having equivalent effect on them are

prohibited. Useful examples gathered from the Community jurisprudence will contribute to the systematization of theoretical notions.

Starting from the great magnitude of the phenomenon of the freedom of movement, from its advantages and disadvantages, we consider that the research and the conclusions which will be drawn from this study will contribute to the knowledge of the rules in the field, both under its theoretical and practical aspects.

The date of January 1st, 2007 remains in history as the date of Romania's EU integration. In connection with this last statement, some precisions are still required, because we believe that Romania belongs to Europe through its history, geography, traditions and culture.

Romania is politically integrated in the new Euro-world structure, belonging to the club of the most select countries.

It remains to be seen how the regional, political and economic map of Europe will look like in the near future, how we will fill in the gaps between large and the small countries, how powerful and weak states will merge in order to achieve a common goal.

The answer will be decided by us, on the infallible realm of contemporary Europe.

The importance of free movement within the EU is still a natural given, enshrined in rules, but, in order to maintain this right, we must fight.

The violation of European legislative meanings is equivalent to the restriction of free movement, proportionally with the violated rule.

Writing about Europe and the European Union from its origins and until today, about the viability of several institutions that handle all the strings of an international theater is *an entertainment* that requires information, inspiration, analysis and objectivity.

The climax is given by the free circulation within the Union and the outcome is an open one, with the possibility of shaping our own opinions.

The conclusions to which we stopped are few because the subject challenges new debates and reflection topics so that we conclude with the following questions which worth to be treated in the future: Where can we travel? What papers do we need at the border? What

services can we provide in the Union? Can we set up a trading company in another European country?

Considering the content recorded in the study and the above conclusions, we came up with the following recommendations (*lex ferenda*): the clarification of the concept of free movement not only in rules, but also by implementing this concept to the apprehension of citizens; the development of a strategy for the benefit of the European citizen, in the sense of making him aware of his rights and freedoms in a more practical and easy manner, such the information by the media.

It is true that treaties, conventions and many other normative acts treat and regulate the freedoms available to the citizens of Europe, but there are many people who, although are generally acquainted with them, do not know how to apply them. It is a vast range of people who either have no access to media or are uninterested.

And this will happen to the extent that *contemporary kings* will facilitate the access to information also in deprived areas, because, in fact, the situation is worrisome. The lack of information, on the other hand, leads to criminal conduct, but this can not be opposed by the incognizance of law.

Informing the public on the free movement, in particular, is not only sufficient but also necessary in a democratic society. *Do you want to know the European Union?* This remains an invitation to all who want to move freely, in the European spirit.

The Treaty on the European Union has made from the free movement and residence one of the essential rights attached to the European citizenship. Between the European citizenship and the free movement of persons there have been established many links.

Thus, article 12 of European Community Treaty restricts the right to non-discrimination based on nationality to the citizens of Member States. Article 39 on the free movement of workers refers only to the citizens of Member States, although this is not explicitly stated, it must, however, be deduced from the practice of Courts.

Romania vs Global Crisis

IONESCU Romeo

“Dunarea de Jos” University of Galati
ionescu_v_romeo@yahoo.com

Abstract

The paper deals with the impact of the present global crisis on the Romanian economy.

As a result, the analysis is focused on 2008-2010 time period and support the idea that Romania is not in the best position to face this crisis.

The analysis covers social, economic and financial pertinent indicators and uses the latest statistic database.

Even that the Romanian government adopted the Updated Convergence Program 2009-2012, the forecasts are not too optimistic for the economy.

The main conclusion of the paper is that to adopt radical measures, starting by the top of macroeconomic management and politicians, not by the bottom.

Key words: global crisis, globalization, foreign financing

JEL classification: F01

Despite an abrupt decrease, in the last quarter of the year, the GDP growth accelerated by 7.1% in 2008, regard 6.2% in 2007.

The internal demand for consumption and investments grew by double-digit in the first three quarters of 2008. It was supported by the wages growth and the rapid extension of the credits.

The net exports continued to have a negative contribution to the GDP growth.

The great FDI fluxes in Romania stopped dramatically in the fourth quarter of 2008, as a result of a significant contraction of the foreign capital inputs, growth of the investors risk aversion, vulnerability of the Romanian economy and decrease of the disposable income.

As a result, the internal demand decreased by 2%, in the fourth quarter of 2008, regards an average 14.5% growth in the first three quarters.

The contribution of the net exports became positive in the forth quarter of 2008, even that the internal demand decreased significantly.

The need of foreign financing decreased slowly, but it was high (12.8% of GDP) in 2008. In 2007, the same indicator was 12.8% of GDP.

The FDI influxes grew in 2008. They covered 56% of the total foreign financing need, regard 47% in 2007.

The great internal and external disequilibrium and the effects of the world financial turbulences concerned the economic and financial situation from Romania.

As a result, in March 2009, the Romanian authorities addressed to the European Commission in order to support the cash flow equilibrium.

The EU financial assistance is conditioned by the implementation of a major economic policy program, which has to cover fiscal, structural and financial reform measures.

In 2009, the GDP growth was negative, by -4%. The decrease of the households' disposable income growth rate and the harder credit terms decreased the domestic consumption.

On the other hand, the government expenditures tightened as a result of a significant fiscal adjustment.

The expected powerful contraction of the gross capital formation will be attenuated by a growth of the public investments and EU investments, as well.

The GDP growth rate in Romania will be 0% in 2010.

The net exports will have a positive contribution to the economic growth, even that the Eurozone demand will be weak.

As a result, the net foreign loans decreased, from 11.8% of GDP, in 2008, to 6.5% in 2009 and 5% in 2010. This macroeconomic scenario was based on the EU medium period program for financial assistance in Romania.

As a result of the economic activity decrease, the unemployment rate grew, from 5%, in 2008, to 8% or more in 2009 and 2010.

The inflationist pressures decreased from the second quarter of 2008, as a result of the decrease of the rare materials prices on the international markets. At the beginning of 2009, the inflation rate grew again as a result of the national currency depreciation.

During 2009-2010, the inflation rate will decrease. This is the result of the lower growth of the wages and low goods prices on the international markets. At the end of 2009, the inflation rate in Romania achieved the National Bank target by 3.5% +/- 1%.

The depreciation of the exchange rate and the lowest pressure of the wages growth will support the improvement of the international efficiency of the Romanian goods.

In 2008, the budget deficit was 5.4% of GDP, regard 2.5% in 2007. This evolution was supported by the higher growth of the expenditures, especially those connected to the public sector wages and the social transfers.

Moreover, the too optimistic forecasts of the budgetary revenues in 2008 didn't realised. In the latest two months of 2008, it was an abrupt decrease of the budgetary revenues, as a result of the slowed down economic growth.

On the other hand, the budgetary deficit decreased by 5.1% of GDP in 2009. The 2009 budget contained some specific measures to decrease the deficit, including blockage and decrease of the salary increases in the public sector, decrease of the goods and services expenditures and subventions. The same measures covered the growth pension's limitation to the inflation rate value, the growth of the pension fund contribution by 3.5% and the excises growth, as well.

The Romanian government supporting economy program adapted the supplementary fiscal measures, decreased the wages fund of the public sector, the goods and services expenditures, some specific capital expenditures and subventions.

The governmental measures connected to the budgetary revenues were focused on the elimination of some specific tax deductions and allowances, especially to cars service and the depreciation of the re-evaluated assets.

On the other hand, the government achieved a substantial growth of the public investments in 2009 regard 2008. These measures were reflected in the approved budgetary rectification from April 2009. The budgetary deficit will achieve 5.5% of GDP in 2010.

But the Romanian authorities engaged to continue the financial adjustments during 2010,

in order to obtain a deficit less than 3% of GDP in 2011.

The great deficits and the significant growth of the paid interests for public debt will support the growth of the public debt ratio in GDP, from 15.25% in 2008, to 22.75% in 2010. On the other hand, Romania ranked 48th position in the world welfare top ([1]).

It was better placed than Turkey (rank 69), Ukraine (rank 61) and Russia (rank 69), but worst than Bulgaria (rank 46), Czech Republic (rank 25) and Poland (rank 29).

Romania ranked 52nd position at economic fundamentals, 42nd position at entrepreneurship and innovation. The best position was at democratic institutions (33rd) and the worst at social capital (102nd).

*Table 1. Romania macroeconomic indicators
(% annual change)*

	2008	2009	2010
GDP (prices from the previous year)	7.1	-4.0	0.0
Private consumption	9.1	-3.7	-0.3
Public consumption	3.2	-11.0	0.1
Gross fixed capital formation	19.3	-6.5	-0.5
whereby equipments	19.0	-7.0	-1.0
Exports	19.4	-16.9	0.6
Imports	17.5	-17.3	-0.5
Labour	0.3	-2.2	0.6
Unemployment rate	5.8	8.0	7.7
Average labour cost	14.3	10.5	8.1
Households saving rate	-	-	-
Consumption prices index	7.9	5.8	3.5
Trade balance	-13.3	-9.1	-8.0
Gross public debt (% of GDP)	13.6	18.2	22.7

Source: [2].

On March 2010, the Romanian government approved the Updated Convergence Program 2009-2012, according to the latest evolutions of the internal and international economic environment.

The program was based on the present legislation and the budgetary capitols for 2010.

The Convergence Program sustains the engagement to adopt Euro at the 1st of January 2015 and forecasts an economic growth by

1.3% in 2010 and 3.7% in 2012, the inflation decrease and the employment improvement, as well.

The program covers a medium period economic strategy, which is focused on the following objectives:

- taking again the economic growth process and creation of new jobs, adjustment of the public deficit and current account deficit until values which are able to support their financing, deflation and population protection;
- improvement of the fiscal policy medium term predictability and performances;
- efficient use of the European funds;
- sustainability of the long term public finances;
- restructuration and a better efficiency of the public administration;
- implementation of the assumed commitments regard IMF, European Commission and World Bank.

The Romanian government wants to introduce Euro on 1st of January 2015, but it understands that our national currency will not be able to achieve the 2nd exchange rate mechanism (ERM II) until 2012.

On the other hand, the government supports a larger economic recovery, according to a future consolidation of the financial system or a greater growth of the world demand.

As a result, the Romanian government consider that the GDP growth rate will achieve 1.3% in 2010, 2.4% in 2011 and 3.7% in 2012.

The budgetary deficit will decrease below 3% of GDP until 2012, regard to 7.4% in 2009.

The domestic demand will grow by 1.4% in 2010. It will be supported by the private consumption, which will grow by 3.8% in the same year, as a result of the governmental measures which were focused on the economic recovery, the propensity to consume and better credit terms.

The greater external demand and the growth of the domestic economic activity will support the recovery of the Romanian foreign trade.

The goods exports and imports will grow moderated and the net export will have a little negative influence (-0.2%) on GDP growth.

Moreover, the GDP growth rate will grow during the next two years. It will be supported by the intensification of the foreign trade and the growth of the domestic economic activity.

The Romanian government considers that the economic recession will stop in 2010, in Romania.

As a result, the goods exports will grow by 3.5% and the goods imports will grow by 4.2% in 2010. The trade deficit will be 5.7% of GDP, as great as in 2009.

On the other hand, the current account deficit of the balance of payments will maintain into sustainable limits in 2010. It will be 5.1% of GDP and will be 76% covered by FDI.

On the other hand, the world economy will grow after it will be able to defeat the economic and financial crisis. As a result, the Romanian government forecast the growth of Romanian exports by 4.6% in 2011 and 6.7% in 2012.

The domestic economic activity will accelerate and it will need supplementary imports (4.9% in 2011 and 8.3% in 2012). This is why the trade deficit ratio of GDP will increase and will achieve 5.9% in 2012.

The current account deficit will not deteriorate and it will achieve 5.2% of GDP in 2011 and 5% in 2012.

The current balance transfers exceeding will compensate the negative impact of the trade balance and revenues balance deficits.

The employment will decrease by 0.9% in 2010 and the employment rate will achieve 58%. The good news is that the employment growth rates will be 1% in 2011 and 2012.

The unemployment rate will decrease, by 7.5% in 2011, to 7% in 2012.

The Romanian government decided to implement austerity measures for the next period, which will be able to decrease the budgetary deficit by 1.7% of GDP in 2010, 1.9% in 2011 and 1.4% in 2012. This means a cumulated adjustment of 5% during 2009-2012.

2010 Budgetary program is focused on the deficit decrease by 5.9% of GDP (6.3% according to the European methodology).

The measures for 2010 maintain the unique tax percentage and VAT and are focused on the decrease of the wages, employment from public sector, replacement of one from seven labours and the decrease of the supplementary paid and bonuses.

A distinct problem is that connected to the sickness pensions, which grew very much. As a result, the annual pension's expenditures would grow by 2 billion lei.

The Romanian government wants to sell Rompetrol bonds by 2.4 billion lei in 2010, in order to retrieve Rompetrol debts to the budget.

On the other hand, Rompetrol faces to a lack of cash and the received amount would decrease to 1.2 billion lei (0.2% of GDP) in 2010.

At the same time, the public bonds achieved the repayment period and the payments from the budget for these bonds will decrease, by 0.07% of GDP in 2010, to 0.03% of GDP in 2012.

The medium term impact of the governmental reforms will support the social security budget savings by 0.6%-1.5% of GDP.

In 2060, for example, the deficit of the public pension system will decrease by 4%.

The member states from Eurozone implement stability programs and the other Member States implement convergence programs every year.

These programs are evaluated by the European Commission. The objective of these evaluations is to improve the budgetary discipline using budgetary policies monitoring and coordination inside Eurozone and EU27.

The government eliminate some fiscal deductions and allowances, especially to the job cars and revaluated actives depreciation.

On the other hand, the government grew the public investments in 2009 regard 2008. These measures were found in the budget rectification in April 2009. Even that the budgetary deficit will achieve 5.5% of GDP in 2010, the Romanian government will continue the fiscal adjustments in order to obtain a deficit of only 3% of GDP in 2011 ([3]).

The great deficits and the growth of the interest paid for the public duty will support the growth of the public debt, from 15.25% of GDP, in 2008, to 22.65% in 2010. These evolutions will affect the welfare in Romania.

In 2009, Romania ranked position 48 in the world welfare top. It was below Bulgaria (rank 46), Czech Republic (25) and Poland (29). Romania ranks were 40 for entrepreneurship and 52 for its economy. This is not a positive perspective. The Romania model of powerful economic growth, low taxes and great poverty implemented until 2008 was not a democratic and efficient way to a European sustainable socio-economic model.

What can we do? Maybe it's time to adopt radical measures. But these measures have to start by the top of macroeconomic management and politicians, not by the bottom.

Trading Partners are in Conflict. Mediation, Arbitration, Court – the Current Settlement Possibilities

MARIN Marilena
“Ovidius” University of Constanta
marilenamarin@yahoo.com

Abstract

Integration issues in the contemporary world are a current concern of anyone who tends to the evolution of social, professional and beyond. As our business, Romans followed with interest the European integration and integration in the contemporary world, but from different perspectives, depending on various factors.

Acts and deeds of trade are subject written or unwritten rules and pursue counterparties each first meeting his rights. This sometimes generates violating the rights of others and/ or failure of the legal obligations assumed made with the commercial legal relationship.

A dispute and restore legality are possible so amicably and by resorting to a competent authority. Such authority may be the court or court of arbitration.

By regulation of the mediator, has become a new authority in resolving a conflict competence including commercial. Mediation procedure seems to be a fast, less expensive and elegance of a dispute between partners.

We consider the efficiency comparison in this paper the possibilities for settlement of conflicts between partners.

The novelty of this work lies in the fact that until now have never been studied versus all three ways of solving disputes.

Key words: mediation, arbitration, trial, commercial conflicts, European integration,

JEL classification: F15, K29

1. Commercial activity from the perspective of European integration

When we talk about European integration must remember something about the appearance of this phenomenon, but also about the factors behind this integration.

Between newly emerging phenomena, which concern economic growth and development at national, European and global consequences of the phenomenon of economic integration requires political, social and military.

Articles expert talking about interstate economic integration. This was one of the essential features of the world economy since the post-war period. It resulted in the formation of new centres of power, which exerts a growing influence on the ratio of forces in the contemporary world. Thus, economic integration after World War II occurs in the context of Western Europe on grounds that originally started the economic situation in this period. Western European integration was one of the ways the economic recovery of countries that feel the negative effects of war.

The economic literature finds the notion of economic integration has many meanings. Starting from the definition of economic integration will find directions and views on economic integration. Economic integration means a complex process of development of world economy in contemporary conditions, based on a qualitatively new stage, upper interdependencies between economies of specialization and different countries, and is determined by a combination of factors, among which it has an essential role technical revolution contemporary scientific.

Initially, the notion of integration was used for the first time in economic science in relation to industrial organizations. This notion is the result of expression of a set of agreements between firms to form cartels, corporations, trusts or merger, a vertical direction, in terms of implementation in relation to suppliers with users, and a horizontal direction with regard to agreements between firms' competitors.

Currently, some believe that the notion of integration is the most comprehensive, leading

to notions of national integration, regional integration and global integration.

Most specialists and economic literature has brought a new outlook on economic integration, which is considering more degrees of depth and speed of expansion. Thus, it is estimated that above all there is a first-degree integration in production and trade structures are ordered by a form more or less spontaneous, driven by competitive market law.

The second level of integration is the situation in which intergovernmental and supranational authorities play a major role in the development and trade orientation. The third level is the ultimate stage of integration, the final stage; he must be regarded as an ideal sphere of human value.

In terms of commercial activity with respect to European integration, remember that in mid-century began to establish the first international economic organizations that protected the various economic sectors. Within these bodies have an important economic trade relations are governed by a legislative text or by the contracting parties.

Either way, regulators, co-contractors are bound by contractual terms, rights and liabilities recorded in the respective conventions. If any law is violated or if any of the obligations is not respected, one who is guilty of this breach of law will be held responsible and also will try establishing state of legality.

The problem that interests us in terms of this work and for solve this potential authority competent to deal with disputes arising between merchants, the contracting parties.

2. Court, the most widely used method of solving conflicts in commercial matters

Usually, when traders come to litigation, the first step they should have it done to restore legality should be discussed directly to the representatives, trying to solve problems amicably. However, counterparties impulse is to act through the court. Perhaps this happens because of the entire individual, whether commercial or not, has more confidence in the court in the dispute settlement procedures, even though they are sometimes costly and burdensome.

In cases where it is considered injured by their partners attitude contract by failure or

improper fulfilment of contract terms, dealers have to reach via direct court having as "claims". The reason will be judged by the court, both on the merits, and to review and after a final and irrevocable decision that will invest the formula will be enforceable and enforced.

The claimant is obliged to pay a stamp duty related claims required, depending on the stage to proceed to case, which is judged and its *locus standi*. Sometimes, when appropriate, if the trial court agrees specialized technical expertise, expert fees is supported, usually all by the complainant. All it will pay the fee and a lawyer, you hire legal services, and executor's fee, if forced to choose to implement the decision obtained.

Disadvantage is that if at the time of enforcement of the decision of the debtor is insolvent; the creditor can not obtain satisfaction in the claims pursued to promote action.

If one partner has a foreign nationality other than the Romanian, the dispute shall be verified by applicable law.

Another possibility that the lender has an obligation to hand is declaring a state of insolvency of the debtor or which is a dealer. Creditor in this situation can be so individual, but also a legal person (trader).

In this situation the lender is not likely to recover damages, but spend less this procedural step up and get the kind of so-called moral satisfaction. In doing so it may affect the debtor, or not.

There are legal, including the possibility that the debtor himself to declare his state of insolvency request to prevent any steps shown above and which are easier or creditor.

In all cases proceeding before the court is a public, not the judge in secret session.

3. Court of Arbitration, another method of solving conflicts in commercial matters

It is known that in countries with well-developed market economy, most business processes resulting from the execution of a contract is usually settled by arbitration. Consider calling the trial a commercial process to ordinary courts would take years because of cumbersome procedures and multiple levels of jurisdiction.

Arbitration is a preferred way of settling disputes and dealing with rapidity because of

confidentiality. The latter is usually imposed as a fundamental characteristic opposite trial publicity.

In Romania, commercial arbitration is a form of private justice.

As a general rule, according to Code of Civil Procedure, persons who have full legal capacity may agree to settle by arbitration of economic disputes when the law does not allow them to make the transaction.

Arbitration may be assigned by the arbitration agreement, one or more persons, and parties or vested under that convention to hear disputes and to give a final and binding upon them. The parties may agree to arbitration to be held by a permanent arbitration institution or a third person, the parties have a choice between arbitration and occasional (ad hoc) and institutional arbitration.

Arbitration occasional (ad hoc) occurs when the parties have complete freedom to organize and to establish a procedure under the agreement between them. Institutional arbitrage occurs when parties have entrusted the task of organizing a specialized arbitration, the dispute is solved by the rules set by that institution.

Arbitration shall be organized and conducted under the arbitration agreement which is mutual agreement between the parties to submit the dispute between them arbitral tribunal trial.

Arbitration Convention appears as a bilateral contract, consensual and commutative, it is a disposal, because, first, the parties waive specific guarantees of state and justice, on the other hand is required to execute an arbitration award, which may require payment of money or transfer of ownership of property.

Arbitrary convention can be concluded either as an arbitration clause, included in the main contract or as a stand-alone agreements, called compromise. The form chosen depends on the moment when the agreement will - before or after birth dispute.

The arbitration clause the parties agree that disputes will arise from the contract that is inserted or connected with it should be settled by arbitration, showing the names of the arbitrators or the manner of their appointment.

The compromise the parties agree that a dispute between them be settled through arbitration, showing it, on pain of invalidity of the subject and names of the arbitrators or the manner of their appointment. Compromise the essence is there a dispute to a dispute between the parties is irrelevant whether the state court at the time the convention was asked or not.

Effects of the arbitration agreement are contractual, and procedural. Arbitration, whether combining form of compromise or compromise clause whether the one ad hoc or institutional arbitration, the same effect.

The arbitral tribunal have their own jurisdiction to resolve the dispute and decides in this regard by a closure can be broken only by annulment of the arbitration award.

Typically, the defendant, to remove the main effect of the arbitration, the arbitration agreement invoking the exception of nullity, validity or invoking disputing them that it has shortcomings. Exception solution presents a special interest, competence or incompetence as determined before the court or tribunal complainant.

The referee may be any person who, according to its national law, has full legal capacity. The law does not provide special conditions for appointment of arbitrators, but nothing precludes the parties provide for arbitration in certain skills or experience requirements.

Arbitration procedure to ensure the parties, failing which the arbitration award invalid, equal treatment and respect for the rights of defence, and is determined by the parties to arbitration.

Arbitration procedure to ensure the parties, failing which the arbitration award invalid, equal treatment and respect for the rights of defence, and is determined by the parties to arbitration.

Although Code of Civil Procedure makes no statement on whether public or secret discussions, is generally accepted that the principle of publicity is not applicable in this matter.

Sentence gives the arbitral tribunal unless the parties have agreed otherwise, within five months of its establishment. Expiry of the sunset is not a reason to arbitration, unless one party notifies the other party and the arbitral tribunal by the first term that will invoke the arbitration inoperative.

Abolition of the award may be obtained by an action for annulment may be brought within one month from the date of sentence, and it is for the next higher court that would have been competent if no agreement could be concluded arbitration. Decision of the court on cancellation action may be challenged only on appeal.

4. Mediation and scope of commercial activities in which it can solve

Number of disputes could be resolved through mediation could grow to tens of thousands until the end, because judges are required, starting yesterday, to inform the court that addresses this process of existence (Claudiu Ignat, vice-president Mediators National Union of Romania).

The emergence of mediation law in 2006, the number of disputes were resolved through mediation was less than 500 annually, Ignat said. "It is a procedure that not only advantageous for the parties are in litigation, because it shortens the period of several months to resolve it - how long in court - a few hours, but the judges are overcrowded."

Until yesterday, the judges were not required to inform parties involved in litigation that may appeal to mediation, which has the possibility to resort to this procedure without judicial deadlines to be delayed so that judges do incur this information.

Mediation is a mechanism for an amicable settlement of a dispute in the commercial, civil, consumer protection, employment or other areas of law, without recourse to a judge in May of "state", but a judge "private. In commercial matters, litigation frequently refers to non contract terms.

In commercial matters, litigation frequently refers to non contract terms. In 2009, due to late payments and lack of liquidity in the economy, over 20,000 firms became insolvent.

Profession of mediator is a recently opened in Romania and to qualify in this profession must pass a training course accredited by the Mediation Board, after completion of higher education in any field and three years of work experience.

A mediator may request a fee in euro for mediation. Currently, this new profession grew; more people are interested to know the conditions what are which must meet to get a mediator.

Considering all legal options available to those who consider the damage, it remains to appeal to them most effective of the methods to be liable to one who created the damage.

5. Conclusions

It is possible that during the development of a contract to interfere with some disputes between the contracting parties. As noted, these disputes can be resolved in several ways: amicably, through mediation, arbitration or by the court.

How to solve a conflict depends on intent of parties involved and their seriousness of the conflict situation and applicable law and persons.

Undoubtedly, solving a conflict, a dispute amicably or through negotiation and mediation, even through arbitration, is an elegant option and proof of social and professional maturity of all persons involved.

However, there are times when one or both parties fail to overcome some ambition, pride or hold erroneous data on commercial activity they are involved. This may cause enmity towards negotiated transactions, mediation, arbitration and appeal to court to solve the conflict they see well.

Alike, there are situations in which parties are not sufficiently well informed, and another path than the court does not find it safe, do not think it offers a satisfaction guarantee obtaining fair.

In relation to the ways of solving conflicts in commercial matters, the opinion for a complete analysis of conflict situations as objective and only then released to choose settlement procedure.

Abstract

Starting from some relevant theories regarding the interdependence between the public and private sector, the reality shows that these sectors are connected one with each other, even more by daily activities.

Three main key market segments (manufacturing, construction and automotive industries) benefit from the support of both European Commission and the private sector, by Public- Private Partnerships, in order to stimulate the economic recovery after the crisis period.

Nowadays, to obtain a strong relationship between the public and private sector the investment should be focused on human resources and mutual technology.

Ways of interaction between the two sectors are included in this paper. Among them it can be mentioned government assistance, legislation, joint projects, industrial and community development.

The interaction between the two actors could become a regional development tool as long as the state of a developing country, especially, is determined to come up with proactive activities that bring economic transformation and further on, a position in the global economy. These could be achieved by promoting public-private alliances, according to local conditions.

The cooperation between the state and businesses, by regulations, is of real impact on services. The access of individuals to basic services like primary education, health, water resources, energy represents an important mean in order to eradicate poverty and register progress of the community.

Key words: regional development, public sector, European Commission

JEL classification: H41, R10

1. Introduction

Taken as a whole, the interdependence between the public sector and business community in services area is based on theories of *natural monopoly and contestable market*. The meaning of the interdependence concept consists of inter-linked and *mutual conditioning* between things, events, processes and others. [1] Is there a natural monopoly when the production cost of a certain enterprise is lower than the cost amount of several enterprises, between which that specific quantity is allocated, no matter the distribution. But, in the 80's it was found that firms in monopolistic or oligopolistic situations had excessively high costs, thus the encouraging of competition by the state generated the rate (tariff) diminish and the demand growth. Regarding the theory of contestable markets, this implies the freedom of an economic agent to enter and exit a market, this aspect being achieved by government intervention that restrict the practice of unfair prices in order to encourage investment, but with the existence of some typical uncontested situations. The improvement of this theory involved finding solutions even in such uncontested cases, by setting the concession to some activities that could be taken by firms through auction.

The paper highlights another opinion of a researchers group [11] which states that in order to analyze the interdependence between government and business community to be used the psychological theory of cooperation and competition. Their research refers to government officials and businessmen from Shanghai, China, but may be drawn some several directions applicable also to the European Union. The study examines the collaboration between private industry and government agencies and its effects on business development. In addition, the

researchers' intention is to seek when and how managers and government officials openly discuss their ideas and constructively integrate their perspectives. The contributions of this study argue that private industry and government agencies are in a greater extent interdependent, a fact which is also supported by the interdependence theories of social psychology that can be applied in order to understand the dynamics of public and private relationship (cooperation and competition theory, the concept of open discussion for mutual benefits- solving the problems, strengthen relationships and industry development). Similar to China is presented also the European Union situation, when on one hand, the government aims to increase the number of persons employed, the consumption and social stability and on the other hand, the business persons who stress the need of an environment where to feel confident that they can expand their investment, enhance the employment force and income. The incompatibilities between goals and views between the private and public sector interfere in contracts of employment, employment practices, security and concerns about environmental and legislative issues. Government assistance, regulations, common projects (30%), community development and industrial development are the categories of incidence between public and private sector, which emerged from the quantitative analysis conducted by the researchers mentioned above.

According to a specification from the Development strategy of public sector [12, p.2], between public sector reform and private sector development there is a very close interconnection. The private sector role toward the public sector and vice versa should be a complementary one, although there is no typology generally valid to establish an equilibrated balance on the occupied roles by the public or private sector.

The paper is structured as follows: after the introduction is presented the necessity of the public- private cooperation in services, then some elements that determine the public support for the business community, reaching regional development by public- private collaboration and in the end, more particular aspects of public- private interdependence in the specific case of services and conclusions.

2. The necessity of public- private cooperation in services

Regarding the need for interaction between public and private sector are taken into account factors such as quality of service, rates, depreciation of fixed funds and corruption. Regarding the quality of services, especially in emerging countries, it can be argued that providing people with different types of services such as utilities (water and sewer, gas, heat and electricity), like other services (public transport, telecommunications services) is unsatisfactory and there is often no continuity in their delivery, furthermore their quality does not meet the consumer needs because of outdated technologies, mismanagement and others. Therefore, the consumer is not satisfied with the way of providing these services. A second element that encourages the introduction of ways for cooperation between private and public consists of the rates established by the persons that activate in public service, and which tends to be continuously increased. For example the methodology of composing the rates (in water supply and sanitation, gas, hot water, electricity, the heating, postal services, urban telephony and other services) provides the establishing of rates according to the cost of services, but without having as result also the increase of quality services. A third element that determines the need for collaboration between the public and business community is the depreciation of fixed assets, which is seen as low budgetary sources of state with the intention of investing in public services. One last important element that marks the need for public-private collaboration is corruption, which in this way can be reduced.

Public sector, through the state is the one that establishes the appropriate framework for the private sector development by proper application of trade policies, maintaining competition, regulation of utilities, commercial legal systems, taxation, labor codes and environmental management. The moderator role of the state is manifested through the establishment of balance between the competitive requirements of the private sector, on the resources, and the maintaining of stability. A powerful state that holds economic competences can develop "common interests", by encouraging the forming of alliances with the private sector. *Maintaining economic stability is achieved through the collaboration*

between the two sectors, with means consisting of modern technologies acquisition and the funds investment in productive activities. A strong state can support a company also beyond its borders, or on the contrary a weak state may risk being overwhelmed by the commercial interests of economic agents. In addition, the lack of economic competences of a state may cause not seeing the development benefits generated by the collaboration with the private sector. Those states that realize how important the collaboration with the private sector is, by *combining the expertise of both sectors*, those have to benefit in the way of obtaining a sustainable development of that specific community. [4]

At the European level, the European Commission in collaboration with the private sector aims to stimulate the economic recovery by injecting funds (about 268 million euros) in three key market segments. It seeks to develop new technologies in the manufacturing, construction and automotive industries, through public-private partnerships, aiming to promote convergence between public and sector interest, considering the research area. This *collaboration between the European Commission and private sector* for "smart" investments in strategic sectors generates long-term benefits, which consist of constructing unpolluted technologies, creating new jobs and sustainable development. The funding for these partnerships comes half from the business sector and half from the European Commission, through the Seventh Framework Programme for research and development. In the European context, between 2010 and 2013, the emphasis will be placed on factories for future, energy efficient building and environmentally friendly cars. Increase of knowledge level and utilization of future technologies, promotion of ecological technologies and creation of energy-efficient systems and materials for European building sector, development of renewable and unpolluted energy sources and increase of safety and traffic flow of cars are targets established by the European Commission in cooperation with the private sector. These targets will be put into practice by public-private partnerships for which funds of 3.2 billion Euros are allocated. [13] Although in a market economy the achievement of high levels of competitiveness is, primarily, the responsibility of companies, public authorities can assist this process by providing a favorable

economic environment. This became possible in the European Union when the Single Market was established, particularly through the trade policy with Non-EU countries and the competition policy.

By the Single European Act 1992 the programme of the single market was approved, when twelve separate national markets have been transformed into a single market. A summary of business benefits include access to new markets, proportionally restructuring the production to the population of the single market area, contracts with transnational partners and others. Over the years plans, analysis, communication regarding the single market were developed, but in this paper is presented the recently recorded situation. In 2007 was elaborated a resolution on the Single Market Review, prepared by the European Parliament, which proposes the "fighting against the barriers and inefficiencies through a better transposition and application of existing rules" [9, p.404], followed by the Communication 724 / 2007 "A single market for the Europe of XXI century" which seeks to reposition the single market, focusing on services of general interest and the market of domestic goods.

3. Public sector support toward business

Summing up the ways by which the state supports business, represented by companies, includes direct and indirect forms of intervention. [14] The direct forms of intervention are represented by grants, which refer to transfers of money from the state budget amounts to businesses, non-refundable and without any basis; investments granted by the state to develop the public sector or others; subsidized loans granted to public or private enterprises which have temporary financial difficulties, financial aid which is given from the budget for the dissemination of information, marketing studies, organization of exhibitions; and repayable loans. The indirect forms of business support consist of tax benefits, which constitutes the facilities and tax relief that reduces the tax burden of the recipient companies; and the state guarantees to bank loans incurred by enterprises, with the state ownership of the fact that when the debtor becomes insolvent, to secure repayment of the loan.

In addition to the traditional idea that public sector provides financial support, policy,

information and technical support and also negotiates with the private sector environmental issues, are born strong relationships between public and private which may consist of investment in human resources and mutual technology. [10] The interaction between the public and business community can be done in several ways, such as government assistance, involving financial support and technical information for the public to the private sector, legislation that can become a barrier or support for representatives of businesses, joint projects involving the pooling of resources to meet a clearly defined purpose, industrial development by supporting innovative initiatives and community development, through private sector involvement in policy making aimed taxes, building construction and legislation.

4. Reaching regional development by public- private cooperation

Considerations on the directions of public-private collaboration are captured and supported by the European Commission through the Regional Development Policy. Among the principles of this policy it can be identified the *Partnership and cooperation* between the Commission, Member States and other authorities or bodies, including economic and social partners.

Collaborative governance is a term used to describe a new form of public sector work, involving cooperation with private sector stakeholders to develop and implement policies. The identification of variables influencing or not the governance way is a challenge for researchers wishing to develop a model of successful public-private collaboration. According to the authors [2], the variables that define the collaboration can be found within the history of conflict or cooperation, incentives for stakeholders to collaborate, imbalance between power and resources, leadership and institutional aspect. Also were identified by the authors, also a number of factors that are relevant to the collaborative process itself, among them being face to face dialogue, confidence gained and the development of commitment and shared understanding. The collaboration discussion forums, developed in collaboration tend to develop trust, commitment and understanding

for the other part, so as to form a cycle together.

Globalization may create conflict between public and private interests, but it is necessary to identify key elements of public policies that both economists and business leaders agree with them and in this way is obtained a positive interdependence relation. [6]

Proactive actions of the state in case of a developing country, aiming to achieve economic transformation and a role in the global economy, are matters which reduces differences in comparison with a developed country. To recover this difference, the state must implement a medium and long term strategy and to obtain support from public-private alliances, according to local conditions. Public-private alliances are a supporter of regional development and thus less developed countries manage to achieve a process of convergence with developed countries. [5] The implementation of European integrated socio-economic system proves its usefulness to implement policies of social cohesion, because of the connections which are established between the European administrative unit, national government and business. [7]

To eradicate poverty and register progress is essential for individuals to have access to basic services like primary education, health, water resources, energy, etc. These basic services are actually public goods, of which the public sector is in charge. But it is considered the main supplier, but not the only one, because it may be involved also the business community, by establishing partnerships between the two entities.

5. More particular aspects regarding public- private interdependence in services

The tertiary sectors interacts with the other economic sectors toward which develops many interdependence relations, because of the fact that services can be associated with the production of goods, intermediate consumption and final consumption in order to meet people's needs. The complementarities between goods-services generate more interdependent relations, compared with the single action of services, and the services relations in the economy and society are developing on several levels. The services area is in interdependent relationships with the

scientific-technical revolution, population and production needs, the global values circulation and environment. [8, p. 60] These plans develop mutual relationships with the services area, and also between them interdependence is reflected, for example, people's needs are influenced and influence in return, on one hand the scientific-technical revolution and on the other hand, the environment. If the focus would be on the relationship between the service sector and the environment there are noticed two different directions: the first consists of services that act so destructive on the environment through pollution, destruction, for example transport, tourism, and the second concerns the care for environment, by developing scientific research services, sanitation services, information services and others.

Services are those economic activities subject to a well structured government intervention way, applicable by tax system, subsidies, system of rules and regulations. The volume and structure of service control is done indirectly by the state and directly through state companies and policies that encourage competition. [3]

Various forms of cooperation are developed between the state and businesses, and the most significant impact on services and implicitly on included activities, are present regulations. The regulations that aimed primarily services can be found under the form of technical regulations which refer to those persons involved in providing services (some specific requirements that have to be met: diplomas, some coaching), products or business (compliance with rules security, customer protection). The role of these regulations is reflected by regulating flows of companies on market entry. Administrative regulations are the second category of ways in which the state acts on the business community in services, in order to limit access to that area (it can set a defined number of firms in a market, so that it can be assigned a monopoly within a specific territory to a certain economic agent, or only to some of them thus forming the oligopoly). Specific to the services are the regulations aiming the administrative control of prices (tariffs), the state control on the increasing of prices, more explicitly on the size of the commercial margin rates. In addition, the tax rules also result in changes at the business community level, through the tax system that

can stimulate or not the service sector activity. [8, p. 109-110]

The system works by the following route: citizens pay taxes to the state, the latter, as a direct supplier, directs funds to provide basic services and infrastructure that supports providing these services (administration, emergency services, medical systems, transportation, water supply, etc.). Instead, the state may change its position in two ways: by transforming it into a supervisor of services offered by business community representatives and by assuming the role of purchasing services/ infrastructure from the private sector.

Managing a public service can be made either by a public entity (state institutions), or by a private individual (or entity). The management of a public service by a public entity can be made either for its own or through a specialized institution. Individuals have different ways of providing a public service, under an administrative contract, location contract, the authority given by the local government and concession. In the national or international scientific literature are found several main ways of managing public services, where the interaction between public and private sector is the mainstay and manifests differently from one type to another, such as public service concession, the service made by its own, public services in franchise system, joint ventures, purchase of goods and services, privatization of public services and public-private partnership.

6. Conclusions

Finally, the collaboration between the public and business community introduce a new approach in assuring the social welfare and it is a mean for achieving multiple purposes: savings in public expenditure, improving the quality of public services, streamlining the operations from public administration and improving the efficiency opportunities of chosen and implemented policies. The interdependence between public and private foster political control, managerial freedom and activity transparency of the public administration bodies, which must create a actually cheaper governance, with high quality services and more effective programs. Future research on this topic will imply the analysis of some particular cases in services, under the form of Public- Private Partnerships.

Abstract

The current study is part of a CNCSIS project, focusing on Gorj county; its previous phases consisted in identification of secondary growth poles and the way in which foreign and local investments can stimulate their development. The complex methodology used allowed for the identification of a main growth pole, the city of Târgu-Jiu, and nine secondary growth poles, mainly urban settlements (Motru, Tismana, Novaci, Bumbe ti-Jiu, icleni, Târgu Cărbune ti). A little-developed and not polarized area was also identified in the south-eastern part.

This article reviews in depth the main features of SMEs (concerning size, number of employees, sectors of activity) in Gorj county, as well as their geographical distribution across the territory; it analyzes the part they play in creation and consolidation of secondary growth poles.

The distribution of SMEs in Gorj county highlights that the highest concentration is found in Târgu-Jiu and secondary growth poles (with the exception of Urdari), while the non-polarized area in the south-eastern part of the county features some of the lowest values. At the same time, one can notice the companies tend to concentrate in the central and northern part of the county, a situation favored by the presence of natural resources, but especially by the polarization capability of the city of Târgu-Jiu.

SMEs classification in terms of size highlights that microenterprises are predominant; in terms of sectors of activity, a predominance of tertiary-sector companies can be noticed.

Keywords: *small and medium-sized enterprises, Gorj county, secondary growth poles, territorial disparities*

JEL Classification: *I30, M13, M21, O10*

1. Territorial differentiations in levels of development in Gorj county

The process of development across a region depends on a set of organic factors, which cause significant differences in the emergence of economic producers – in terms of quantity and quality – difference in the structure of fields of trade and distribution of economic activities, and in social terms. These differences lead to some human settlements standing out, and to permanent competition between settlements, which results in the emergence of growth poles and of an area comprising several competitors, which is the polarized area.

The overall evolution of the economic and social life, as well as the pre-1990 industrialization policy led to the emergence of imbalanced development in the territory [10]. The region under analysis features major imbalances caused by the drop in the capacity of diffusion of “development” of numerous hubs, a situation that caused a chain reaction of imbalances in subordinated areas, going beyond the critical threshold in numerous situations.

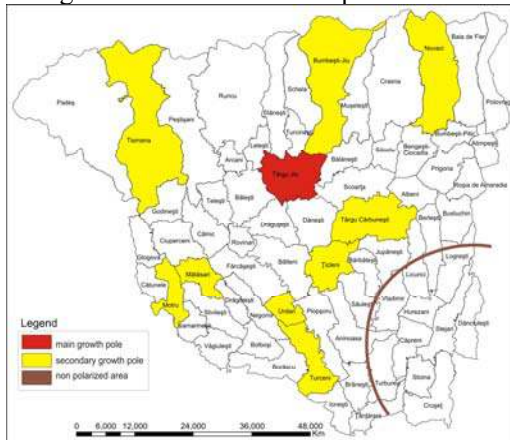

Grounded in this situation, one of the national policies for economic and social recovery consisted in identifying and declaring disadvantaged areas. The Government labeled three disadvantaged areas in Gorj County in 1999: Albeni - by Government Decision 191/1999, Schela - by Government Decision

192/1999 and Motru-Rovinari - by Government Decision 193/1999.

According to law 351 /2001, Gorj County has two second-rank cities (Târgu-Jiu and Motru) and seven third-rank cities. According to traditional classifications, the county seat is a middle-sized city, at the higher end of the 100,000-inhabitant category, Motru is also a middle-sized city at the lower end of the 20,000 inhabitant category, while all other seven cities are included in the category of small-size cities with less than 20,000 inhabitants [5].

Using analyses carried out at the level of administrative subdivisions by collating a set of indicators that describe demographic matters, economic development level and living standards, the secondary growth poles were identified, whose geographical distribution is relatively even across the county, with the exception of the south-east where polarization stands at a relatively low level [1]. Using the respective methodology one main growth pole was represented - Târgu-Jiu – and nine secondary growth poles, mainly urban settlements (Motru, Tismana, Novaci, Bumbe ti-Jiu, icleni, Târgu Cărbune ti)(figure 1).

Figure 1 The main areas of polarization

Diversification of the economy of the region is a priority in the present context, because the region is a mono-industrial one and in addition mining operations falls short of the regular parameters (production can no longer reach the rates that, up to 1990, contributed to the development of the region). The entrepreneurial sector is the fastest-growing sector in the region; its development offers cohesion to the region, thanks to its capacity to selectively capitalize on resources and to its impact on the strength of the ties between the other components of the system.

Considering this economic framework, plagued by numerous setbacks, one could conclude that opportunities for new activities and jobs can be created by means of innovation. In this context, starting from the premises that SMEs enhance the dynamism of local economy, their main characteristics were analyzed, with the goal of identifying the part they play in the emergence and consolidation of growth poles.

2. Particularities of small and medium-sized enterprises

The European view is that SMEs have had a key part in reorganization of the centralized economies in Central and South-Eastern European countries and in preserving economic dynamism [4]. They are able to create a significant number of new jobs, to improve industrial relations and to provide a superior working environment for employees, to create a diversified and flexible industrial base by creating a pool of entrepreneurs willing and able to take risks, to stimulate competition for small and large firms alike, leading to an energetic enterprise culture, to stimulate innovation [4].

At the same time, SMEs are, everywhere in the world, the engine of growth (being the largest provider of employment in most countries and a major source of technological innovation and new products), essential for a competitive and efficient market (playing a major role in removing regional and sector imbalances in the economy and creating competitive market pressure), critical for poverty reduction (tending to employ poor and low income workers) and play a particularly important role in developing countries [9].

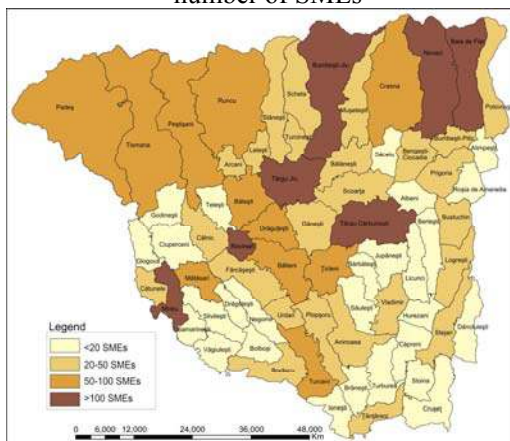

For big companies, SMEs represent the world where they have come and where their concurrence of tomorrow will appear. For individuals, SMEs often represent a first place to work, a first step of career. They are also a first step towards entrepreneur's world [8]. They can also contribute to the preservation and development of local customs, thanks to the opportunity of operating at lower costs than large enterprises [6].

At the regional level, the development of SMEs is determine by a set of local factors, that emphasize the importance of this sector, offering clues that lead to certain courses of action that can be taken into account when

creating strategies or programs for development [7].

Territorial distribution of SMEs in Gorj county turns out to be uneven and indicates disparities between urban and rural areas and the northern and southern regions (figure 2). 2007 data indicate that the biggest number of SMEs is concentrated in urban areas (75.3%), especially in Târgu-Jiu (54.8%). A high number of units are also to be found in the urban settlements of Motru (6.1%), Rovinari, Bumbe ti-Jiu, Târgu Cărbunesti and Novaci. In rural areas, more than 100 SMEs are found in Baia de Fier only, with somewhat high numbers also registered in Bălesti, Bălteni and Drăgutești. There is also the reverse situation, where there are townships with less than 10 active companies, mainly involved in retail: Godinesti, Jupănesti and Glogova.

Figure 2 Territorial distribution of the number of SMEs

Source: The National Trade Register Office; processed data

This situation is also explained by the fact that the first small and medium-sized enterprises to emerge in post-1989 Romania were grouped in the large urban centers, the place where the concentration of population and the income earned in the first year of transition – in addition to the clear deficit in commercial activity – allowed small retail enterprises to develop. From the large urban centers activity expanded – gradually pervaded – to medium-sized and small towns, then later or simultaneously – to rural communities in the vicinity and eventually to isolated settlements, difficult to reach [2].

As far as **SMEs size** is concerned, one notices that microenterprises (0-9 employees and an average net turnover or total assets of less than EUR 2 million) are predominant in all townships; in 27.1% of them they are the

sole type of economic agents. The communes of Logresti, Dănciulești, Stejari and Stoina, located in the non-polarized area in the south-eastern part of the county, are included in this category.

Overall, in the area under analysis, 91.4% of all SMEs are microenterprises, a ratio slightly higher than the national average (88.4%) [12], but lower than the European one (93%) [11].

The high number of SMEs is due to the fact that on the one hand this is the first step most businessmen take in business, but on the other hand it is the result of important factors of an institutional, legislative and, not least, fiscal policy nature [12].

Small enterprises (10-49 employees and an annual net turnover or total assets of less than EUR 10 million), account for 7.7% of all SMEs, which indicates a lower ratio than the national average, in the same period of reference (9.6%). Small enterprises account for more than 10% of all SMEs in a mere 14.3% of all administrative units in Gorj county. The highest ratio is registered in the commune of Pades (34.4%), followed by Albeni (17.6%) and Pe ti ani (15.7%).

Medium-sized enterprises (with 50-249 employees and an average annual net turnover of up to EUR 50 million, or total assets of up to EUR 43 million), are located in several units, most of them concentrated in Tîrgu Jiu (63.1%), but also in the secondary growth poles (Motru, Târgu Cărbune ti, Tismana). Overall, they are less represented (0.9%), as compared with the national average value (2%).

The distribution of SMEs in terms of size and sectors of activity highlights the fact that in both the primary sector and in the secondary sector medium-sized enterprises are best represented, while microenterprises feature a clear dominance of the tertiary sector (table 1).

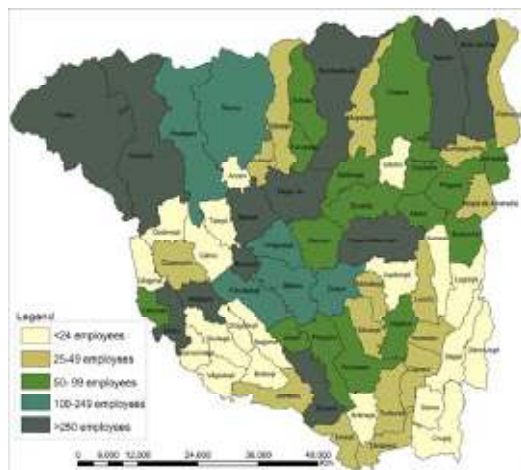

Table 1 Distribution of SMEs in terms of size and sectors of activity (%)

Fields of trade	Micro-enterprises	Small enterprises	Medium-sized enterprises
Primary sector	2.5	3.2	7.7
Secondary sector	6.4	14.4	23.1
Tertiary sector	91.1	82.4	69.2

Source: The National Trade Register Office; processed data

An assessment of the *workforce* employed in SMEs indicates that the majority is located in the city of Târgu-Jiu (58.4%); alongside other urban settlements, it accounts for more than 84% of the total, which contributes to enhancing their attractiveness in the region. In rural areas, higher ratios are found in the communes of Padeș, Mătășari, Baia de Fier, Bălești, Bălteni and Runcu (figure 3).

Figure 3 Territorial distribution of the number of SMEs employees

.Source: The National Trade Register Office; processed data.

The reverse situation is found in the communes where less than 25 people are employed in SMEs – two sizeable areas in the south-eastern part of the county, which partly overlap with the non-polarized area, and in the south-western part of the county.

SMEs division in terms of *sectors of activity* highlights the fact that tertiary sector companies are predominant (90%) in the administrative units of Gorj county (figure 4).

Moreover, in some localities, all companies operate in the tertiary sector – for instance in Bolboșii, Dănciulești, Dănești, Godinești, Jupânești, Negomir, Samarinești; a large part of them are companies involved in retail.

Figure 4 Distribution of SMEs in terms of sectors of activity

Source: The National Trade Register Office; processed data

The explanation would be that involvement in such an activity involves several incentives, such as low initial investments, the existence of low risks, rapid depreciation of investments and the fact that this activity does not require either lots of experience or high levels of professional training [3].

The predominance of the tertiary sector is also typical of urban settlements, such as Târgu-Jiu (95%), Rovinari (90.7%), Motru (86%) and others, but one can notice that in their case tertiary sector activities are much more complex, as they include higher tertiary sector (such as universities and specialized medical assistance).

3. Outlooks for development

Starting from the premises that development of secondary growth poles can induce development of surrounding areas and therefore allow a polarization of the biggest part of the county (also bearing in mind their geographical distribution), the following courses of action are suggested:

- identifying and promoting the strengths of the secondary growth poles as part of existing county development programs;

- the need for establishment of SMEs by local and foreign investors that would capitalize on local resources, so that they would become competitive on the European market and attractive for banking institutions, supply jobs and lead to the emergence of a prosperous middle class;

- the creation of a partnership between secondary growth poles and neighbor administrative units, with the purpose of encouraging entrepreneurial initiatives, but also in order to implement infrastructure development projects, also by means of tapping into development funds;

- establishing of collaboration ties between the county seat (Târgu-Jiu), as the main growth pole, and the secondary poles, matching the revaluation of urban-rural and urban-urban ties.

4. Conclusions

Matching the main areas of polarization against the geographical distribution of SMEs in the region indicates differences among secondary growth poles, but also certain similarities:

- the concentration of companies in the central and northern part of the county, a situation favored by the presence of natural resources and especially by the polarization force of the city of Târgu-Jiu;

- the total number of companies, on commune, varies in a range from less than 10 to more than 3,700, with the highest numbers found in Târgu-Jiu and in secondary growth poles (with the exception of Urdari), and in communes in the central-northern part of the county, some of them located inside the polarization scope of the urban settlements;

- as far as both the distribution of SMEs and the number of employees are concerned, the non-polarized area in the county's south-features some of the lowest values;

- a feature shared by all administrative units in the county, secondary growth poles included, is the predominance of microenterprises; in terms of structure, the dominance of the tertiary sector is visible;

To conclude, the analysis of SMEs in Gorj county highlights the existence of SMEs concentration in secondary growth poles, which influences the attractiveness of settlements with such functions and contributes to accelerating the dynamics of local economy.

Irrigation in Dobrudja's agriculture retrospective and historical perspective

CHRILĂ Constantin, LUP Aurel
Chamber of Deputies
Ovidius University
constantin.chirila@cdep.ro
lupaurel@yahoo.com

Abstract

The paper presents the development and agricultural exploitation of the land reclamations in Dobroudja's since '50 years until these days. The main aspects analyzed were the followings: equipped area and investments, organisation and exploitation, influence on yield per hectare, cost price of the main crops, economic efficiency of the irrigation in farms and social water cost.

Finally, the author proposes some ideas about the future of the land reclamations in Dobroudja's, especially in the irrigation field.

Key words: irrigation, land reclamation, efficiency.

JEL Classification: Q15

1. Introduction

According to some relatively recent studies, Dobrudja's quality in agricultural land is affected by what the FAO language calls the *danger of desertification* determined mainly by two factors, the vulnerability of the land by the phenomenon mentioned above and anthropogenic activities (including grazing). In terms of climate, the areas where the report precipitation/potential evapotranspiration (Penmann) is less than 0.75 are considered vulnerable.

For Northern Dobrudja the phenomenon was highlighted on the lower and middle rungs of relief in the Jurilovca, Cerna, Babadag, Tulcea, Macin, Topolog (strong-moderate vulnerability in the steppe and weak-moderate before steppe (Munteanu, 1988).

In southern Dobrudja, the sterility phenomenon was also found on the lower and middle rungs of relief at more than 70 km from

the coastline (Mihailescu and Paul, 1993). As a remedy, irrigation and reforestation were proposed.

2. Materials and methods

The main data source is the techno-economic statistics of the ANIF branches and the beneficiaries. Financial reports for the period before 1990 are extracted from the book "Irrigation in Romanian agriculture" (A. Lup).

For the period 1990-2010, the data was extracted from the rehabilitation studies of irrigation systems and the Report on irrigation Parliamentary Commission of Inquiry.

The chosen method was that of the specific economic research, data collection and analysis, processing and synthesis.

3. Results and discussions

3.1. Irrigation development in Dobrudja

In only two decades: 1969-1989, over half a million hectares have been equipped, the largest area, over 200 thousand ha, was equip in a five-year period, 1970-1975. In the end of the 1989, over 581.5 thousand hectares or 82% out of the arable area Constantza county and about 55% out of the arable area Tulcea county were equipped.

The rhythm of the arrangements and the shortage of funds of the recent years have

Year	Dobrudja		Constantza county		Tulcea county	
	Agri-cultural	Ara-ble	Agri-cultural	Ara-ble	Agri-cultural	Ara-ble
1965	15.0	13.1	9.1	7.3	5.9	5.8
1970	76.7	69.6	62.7	58.0	14.0	11.6
1975	289.9	263.4	204.5	187.7	78.4	75.7
1980	452.0	434.3	339.5	326.3	112.5	108.0
1985	532.0	512.6	390.7	376.5	141.3	136.1
1989	581.5	552.7	422.3	398.8	159.2	153.9

damaged the quality of accommodation, so the essential elements such as sealing channels,

drainage systems and water supply remained unfinished.

Another characteristic of the irrigation systems in Dobrudja, and Constantza in particular, is that it is the largest water pumping, it heights over 80 m, compared with 40-45 m in the Romanian Plain, for example.

This feature entailed excessive power consumptions over 1500 kwh/1000 m³ of water in Constantza county, and 1200 kmw/1000 m³ water in Tulcea county, compared to an average of 723 kwh/1000 m³ water throughout the irrigation systems in Romania. The location of the irrigation systems in Dobrudja as it was at the end of 1989, is presented in fig. 1.

Fig.1.Irrigation systems in Dobrogea (1989)

The large arranged areas and the structural characteristics at the time had a significant impact on the level of capitalization and energy equipment.

In 1985, for example, hydro facilities were 38.8% out of the capital's technical units of the agricultural equipment and 33.8% out of the power equipment of the vegetal sector in Constantza county.

3.2. Operation of irrigation systems before the year 1990 in Dobrogea

The two decades of building, the irrigation system and especially the decade 1980-1989, were characterized by a deepening of the financial crisis resulting in shortages of the most diverse such as electricity, spare parts, fuel, fertilizers and pesticides, and above all a continuous further arrangement of new areas.

According to a recent program launched in 1983, the arable area of Constantza county, for example, ought to be fully equipped for irrigation by 1989.

The cumulative effect of these objectives historical facts, never recognized by the decision factors of that time, were reflected in the improper operation developed for the irrigated perimeters and finally in the technical and economic results achieved.

The most affected was the hydro operating system: delayed watering, reduced rates for irrigation, big water losses. The result was that the yields per unit practically were half of the one projected, much more for the small hoes and technical crops (tab.2).

Table 1
Irrigation development in the period
1965-1989 in Dobrudja
Source: Statistical yearbook of Romania

Culture	County Constantza	County Tulcea
Wheat	3521	2524
Maize	3051	2130
Sunflower	1444	1096
Soybeans	748	711
Potatoes	11567	8743
Sugar	21048	11847

Table 2
Yield (kg/ha) for the main crops average production
for the period 1986-1989, the counties of Constanta
and Tulcea

Source: A. Lup, Agricultural Dobrudja, 2003.

We mention that during the referenced period 1986-1989, the operated land under irrigation was over 80% out of arable land in the county of Constantza and about 40% out of Tulcea county and technical crops such as soybeans, potatoes, sugar beet, were located exclusively in the exploited land under irrigation.

Naturally, under such circumstances, satisfactory economic results could not be achieved. Moreover, the supplier of water – the State - recorded water loss rates at prices representing only 25-30% out of the actual adduction cost of water distribution to beneficiaries and farmers.

A performed calculation on actual data from Constantza agricultural county proves the social economic inefficiency of the agricultural system under irrigation throughout the economical plan, including last year when over 80% out of the arable county was exploited

technology in the irrigation system (table 3 and fig 2).

Table 3
Economic efficiency of agricultural crops at the level of aggregate expenditure by the difference covered by the water supplier

Specification	At the level of agricultural	Cumulative ag agricultural units and water provider (state)
Wheat		
Production value	6367	6367

Net income	-517	-1419
Potato		
Production value	19237	19237
Production costs	35420	38578
of which: irrigations	3330	6488
Net income	-16183	-19341

Source: A.Lup, Romania irrigation in agriculture

Fig. 2. Crop production value obtained by agricultural enterprises Constantza country, state spending compared with its volume and the water supplier (not covered rates) during 1985-1989

Of course the main cause of the economic inefficiency was the very low yields per unit (tab.2) and the result of the improper operation of surface facilities.

Another cause of failure of the economical parameters was the overcome of the technological costs provided by technical and economic studies carried out by designers.

3.3. Irrigation in Dobrudja during 1990-2010. Areas operated under irrigation.

According to the data from the water provider (IELIF, then RAIF, SNIF, ANIF) in 1989 were irrigated in Dobrudja 520 thousand ha, of which 389 thousand ha in the county of Constantza and 131 thousand ha in Tulcea county, figures which did not concur with the yields obtained: wheat - 3773 kg/ha in the county of Constantza and 2828 kg/ha in Tulcea county, maize - 2307 kg/ha and Constantza county of 2055 kg/ha in Tulcea, or soybean - 600 kg/ha and Constantza county of 495 kg/ha in Tulcea county .

In 1990, the persistence of old structures operating (IAS and CAP) and of free irrigation water, 382 thousand hectares were irrigated - 264 thousand ha in the county of Constantza and 110 thousand ha in Tulcea county

In 1991, starts the dismantling of the agricultural cooperatives (Law 18/1991) and irrigation is practiced only on 54.5 thousand hectares, out of which 45.1 thousand hectares in the county of Constantza and 9.4 thousand ha in Tulcea county. In the following years the irrigated areas were 4281 ha in 2006 and 124 thousand in 2003, one of the driest years of Dobrudja.

In 2007, the year with a similar rainfall regime as 2003, only 26.8 thousand hectares, will be irrigated - 9.3 thousand hectares in the county of Constantza and 17.5 thousand ha Tulcea county.

Among the objective reasons which led to a gradual reduction of irrigated areas we find:

- Abolition of the operating structures of the large agricultural cooperatives and then that of the state agricultural enterprises whose territory was organized in accordance with the network of the water collection and distribution to the plant.
- The degradation of the water collection and distribution infrastructure through removal, physical and moral wear basic components;
- The gradual introduction of differentiated pricing according to the height of water pumping and delivery point;

- Radical changes to agricultural markets both in structure and in the price system as a result of their liberalization, but also of the restrictions imposed by the European integration.

Romanian market has been invaded by imported products: vegetables, potatoes, soya, and specific irrigated agriculture products. The area planted with sugar beet was limited to 50 thousand hectares, while over 95% of sugar consumed is imported. The prices of the agricultural input increased of an alarming rate, while prices of the agricultural products stagnate or even declined in the years with better harvests.

Responding to the market challenge, the Romanian agriculture expanded, the range of species has diminished being dominated by cereal grains and oilseeds, even in the most favorable areas for the intensive agricultural system of the irrigation system.

3.4. Organizational structures and management of irrigation systems in Romania.

Over the years, land improvement and especially irrigation were the subject of organizational and management structure governed by laws issued by policy makers.

Before 1990, the latest organizational structure and management of land improvements was the General Economic Directorate of Land Development and Agricultural Construction - DGEIFCA the Ministry of Agriculture and Food Industry. According to the establishing act - State Decree no. 210-1983, DGEIFCA was responsible for implementing state policy in the field, research, design, construction and mining, and of course managing the financial resources.

After 1989, in 1990, units of the territory, former IEELIF (Business of Execution and Operation of Land Improvements) existing in each county have been transformed - to match new concepts of economic exchange - in Companies of Operations of the Works of Land Improvements - SCCELIF.

According to the same principles of the market economy from SCCELIF different compartments were separated with specific activities: design, construction, industrial production, which in turn turned into commercial companies. Reducing irrigation activity and other specific works justifies in a

certain measure the diversification of the work areas which meant using a powerful material basis, especially human resources usage which could not be passed to *conservation*.

1994 will bring a new restructuring. GD nr.686/1994 and then nr.50/1994 Law shall establish the Autonomous Land Improvements - RAIF with branches in every county, all in the background of further specific land reclamation activities.

In 2000, the GD nr.23/2000, RAIF turns SNIF - National Society of territorial land improvement with the same structure but with a smaller number of hydro systems, due to the reduction of the irrigation activities.

Finally, Law no. 138/2004, SNIF, the unitary form of organization is split into:

- ANIF -National Administration of Land Improvements, Romanian legal person of national interest in the land improvement, with specific activities (Article 3);
- SNIF - National Company for Land Development which is proposed for privatization and the first two years of its establishment is required to provide specific services for ANIF.

Territorially Law 138/2004, compresses the administrative structures of only 13 to 41 branches each including two or more counties. In Dobrudja there is a single branch, Constantza, with three management units: Constantza South, Constantza North and Tulcea.

Nr.138/2004 Act, also stipulates the establishment of organizations and federations of private organizations (legal or natural persons) for the exploitation of land and facilities covered by formal transfer of pressure stations and water supply infrastructure in plants.

Currently, the Law 138/2004, is criticized both by specialists and by the decision factors specially for the provision from which the SNIF, the service has been separated from ANIF, depriving it of its material base necessary for the maintenance of the irrigation infrastructure, pumping, collection and transportation of water.

3.5. Rehabilitation irrigation programs

Early studies of rehabilitation were initiated in 1990, a total of three hydro complexes, including Carasu irrigation complex.

The studies conducted over a period of three years (1990-1992) by a Romanian-French team have achieved a certain level of economic efficiency under certain conditions of the pattern of crops of yields and operating costs.

A second study of irrigation and drainage in Romania, was carried out by an English-Romanian consortium during 1992-1994. They analyzed 100 major irrigation systems in Romania.

They concluded that only 1, 2 - 1, 4 of 3 million hectares could be arranged to be economically efficient, Dobrudja is practically excluded because of the high pumping and high energy costs that are exaggerated.

In 2001, the ministry launched The Strategic Development of Agriculture, Food and Forestry in Romania. Under its rehabilitation, the areas with irrigation systems would reach 2000 thousands ha in 2004 and 2600 thousands ha in 2010.

Table 4
Economic viability of irrigation in Dobrudja
- thousand hectares -

County	Prezent situation			Situation perspective (after rehabilitation)		
	viable	margin of viable	non viable	viable	margin of viable	non viable
Constantza	0	15.9	403.4	0	106.2	313.0
Tulcea	2.9	15.8	129.6	5.9	24.5	118.0
Dobrudja	2.9	31.7	533.0	5.9	130.7	431.0

Source: DHV Netherlands and INCDIF-ISPIF Bucharest

Finally in 2007-2008, a consortium of DHV Netherlands and INCDIF-ISPIF Bucharest, have developed an economic analysis of the irrigation sector component of The Rehabilitation and Reform Project of Irrigation in Romania, financed by the World Bank.

They analyzed 375 irrigation systems in terms of economic viability. For Dobrudja the situation is shown in the opposite table.

4. The Perspective of irrigation in Dobrudja

In the summer of 2009, the Chamber of Deputies of the Romanian Parliament set up an Inquiry Committee for the state irrigation and other sectors of land reclamation.

The authors of this material have participated in the Committee, assessing especially the situation in Dobrudja, where the

cost of irrigation water in the area is one of the highest, and also taking into account the climate of Dobrudja.

Dobrudja is expected to have soils with a high production potential which can not be realized due to the arid climate, Dobrudja is even prone to become tropical zone

In another train of thoughts, the elimination of subsidies for irrigation since 2010 makes the irrigation uneconomical, leading to the lower interest of beneficiaries for this type of farming.

This year, for example, the farmers have indicated their intention to irrigate - based on firm contracts - only for about 10 thousand hectares in the county of Constantza and less than 5 ha in Tulcea county.

5. Conclusions

1. To combat the effects of drought in Dobrudja, over 581 thousand hectares were designed for irrigation during 1965-1989.
1. Improper operation of irrigation systems and technological difficulties in the farm, led to the failure of economic parameters and design techniques.
2. After 1990, some studies have been conducted to rehabilitate the irrigation systems, which were partially transferred to water users for irrigation.
3. Although the current irrigable potential is around 100 thousand hectares, we irrigate less, the main cause is the insufficient funds and even the stopping of their subsidies from 2010.
4. In perspective we search for solutions of indirect subsidy of irrigation by framing Dobrudja in the disadvantaged areas under the climate issue.

Migration and Density – Major Problems for the Economic Future of Emerging Economies

Abstract

The world is changing. Civilization has moved from discovery and populating their territories through colonization to the next level. Those who recently tried to win a piece of land to settle are now driven by economically developed areas to survive and lead a better life. We therefore return to the abandoned areas in uninhabited areas.

Steps to work the developed world now repeat emerging states. Populations we are talking about now migrate to areas that are economically developed but hundreds of millions. And yet migration is not "free" (see the case of China).

Keywords: economic development, living standards, migration

JEL Classification: J61, O15, F22

Cities evolving people becoming more mobile and products becoming more specialized, are all part of the development. Such changes were visible in North America, Western Europe or North and East Asia. But the countries of Eastern and Southern Asia and Eastern Europe now face similar changes in scope and speed. World Development Report 2009 - "Reshaping Economic Geography"[3] considers that such transformations will remain essential to future economic success in developing and emerging countries should be encouraged.

These changes bring prosperity but do not occur without risk and sacrifice. Evidence are examples of three of the most prosperous places in the world:

The first is Tokyo, the largest city in the

world with 35 million people, one fourth of Japan's population, living in less than 4 percent of its territory.

The second is the United States, the largest economy in the world and is also the most mobile, where approximately 35 million people change their residence each year.

The third proof is the Western Europe, the continent most connected in today's world, where countries trade out of about 35 percent of gross domestic product (GDP), more than half of them being accomplished between neighbors.

Man's habitat at the outset was dominated by the need to find food, and hunting and foraging were rural pursuits. Not until the end of the last ice age, around 11,000 years ago, did he start building anything that might be called a village, and by that time man had been around for about 120,000 years. It took another six millennia, to the days of classical antiquity, for cities of more than 100,000 people to develop. Even in 1800 only 3% of the world's population lived in cities. Sometime in the next few months, though, that proportion will pass the 50% mark, if it has not done so already. Wisely or not, Homo sapiens has become Homo urbanus.[6]

Visitors can see the people crushed in Tokyo trains. Millions of people voluntarily subject to the possibility of suffering such accidents. A density map shows that Japan's economic. Tokyo generate much of the wealth in Japan and to get some of this people choose to live near it.

In the United States each year, days before the Thanksgiving holiday, some 35 million people trying to return to their families and their friends. It is early winter in some

parts of the country, so many times, flights are canceled. But Americans accept the pain of leaving friends and family, because economic activity is concentrated in some parts of the country. To get some of that wealth has to be close to her. This is why the 8 million Americans each year change their state of residence, migrating to reduce the gap to economic opportunities.

Over the Atlantic, Western Europe, another massive movement takes place every day but this time not of people but of the products. An example is Airbus, which manufactures aircraft components and assembles them in France, Germany, Spain and the United Kingdom and other countries. Large sections of aircraft are loaded on ships and planes to special places in different parts assemble and produce them at scale. Countries in a region that was shared not long ago now they trade with former enemies to become an increasingly integrated European Union. As this integration has increased the economic disparities have decreased, making possible the specialization and economies of scale.

What is the reward for all this trouble? A map of economic geography, which resizes areas to reflect the country's GDP each show benefits of big cities, people's mobility and integration of economies. United States, Western Europe and Japan dominate the world economy.

Big cities, migration and trade were key catalysts of progress in the developed world in the last two centuries. History is repeated now in the most dynamic developing economies. Mumbai is the largest city in the world but is the most densely populated and the population continues to grow. China is the largest economy in the world, but is the fastest growing and could be among the most mobile. Southeast Asia may not have formed a political union like Europe, but trade in goods between states are similar to the EU region.

- Half of world production would fit into a smaller area than Algeria?
- Cairo metropolitan area generates more than half of Egypt's production using 0.5 percent of the country's area?
- In the U.S., 96 percent of the innovations taking place in metropolitan areas?

Increasing population density, rather than boosts in human brain power, appears to

have catalysed the emergence of modern human behaviour, according to a new study by UCL (University College London) scientists published in the journal *Science*. [1]

High population density leads to greater exchange of ideas and skills and prevents the loss of new innovations. It is this skill maintenance, combined with a greater probability of useful innovations, that led to modern human behaviour appearing at different times in different parts of the world.

- 200 million Chinese immigrants traveling to his native place to spend New Year?
- Despite lower transport costs in the last century, countries are selling even more neighbors than with more distant?
- In 2006, Singapore, with 700 square km area of export of the same value (U.S. \$ 300 billion) as the Russian Federation, which has more than 16 million kilometers square?
- People take risks just to take advantage of special economic density. Despite the loss of lives among commuters and those due to living in slums like Dharavi, Mumbai population has doubled since 1970. Starting in 1990, millions of Chinese workers have migrated to closer economic opportunity concentrated along the coast. Just as Americans traveling for Thanksgiving, so more than 200 million Chinese travel to China during Chinese New Year.

Regional production networks in East Asia are much more common than in Western Europe's Airbus. East Asian countries may not sell airplane parts, but nations that were once enemies, are now trading in auto parts or computers, the same frequency and speed as in European countries. And the reward? We recognize the new forms of China, India and the countries of South-Eastern Asia on the map of world economic geography. These forms contrast with the African continent, which seems a peninsula deleted.

WDR2009 report claims that the situation in some regions is good to have promoted changes in the three dimensions of economic geography:

higher density, as seen in the growth of cities.

Distances shorter, so that workers and companies migrate closer to the density.

Borders fewer, as countries weaken their economic borders to enter global markets and to reap the benefits of specialization and economies of scale.

United States and Japan have reshaped the economic geography on the basis of past trends. China reshape its economic geography now. This shows that there will be changes that will help developing nations in other parts of the world, especially Africa, to follow the path of developed countries.[4]

Over half of world population live in miserable conditions. Whether from our poorest African or emerging, they are the greatest challenges of current economic development. Seemingly disparate, they share one key feature: at different distances, they are the most visible manifestation of the importance of economic geography of development.

Precisely because of this breakdown is required to follow a more balanced growth space. It is necessary to develop controlled growth of cities, a reduction of urban-rural disparities and should be required to implement development programs that create jobs for people who live far from economic density.[5]

Bridging could be achieved by measures to protect companies from the developing world until they are able to compete on the world market.

But economic growth is rarely

balanced. Efforts to obtain it at all costs may sometimes endanger economic progress.

Two centuries of economic development shows that differences in income and production are inevitable. Results of scientific research confirms that there is no reason to expect economic growth to be spread smoothly in space.

Developers of successful experience shows that production becomes more concentrated spatially. Success Nations established policies that standardize living standards. Economic production is concentrated, while living standards are converging.

In conclusion, any economic benefits would bring the density required to follow a balanced growth as the region.

Abstract

In the past decades, the number of sources of pollution has increased and their consequences on the lives of humans, plants, and animals are ever more alarming. Numerous personalities in the entire world draw the attention on the present unprecedented aggression against the environment.

Romania, which, from January 1st, 2007 is a member of the European Union, faces serious environmental problems. The promises related to investments for fighting pollution and for protecting the environment have not been kept, on the contrary, the projects suggested by the various investors present the risk of polluting the air, the water, and the soil, endangering human life and health.

One of these projects is Roșia Montană, which, through its objectives, its special scope, as well as through its potentially negative impact on the environment, contravenes to the national, communitarian, and international principles and regulations that govern environmental law.

Moreover, the type of organization adopted by the Roșia Montană Gold Corporation implies significant risks, providing insubstantial financial guarantees. This joint-stock company, created in 1995, has as its main activity objective the implementation of a single project with an uncertain purpose: the extraction and process of the auriferous and argentiferous minerals of the Western Carpathians. Since it will not initiate any other activities, this society has little credibility on its specific market and does not comply with the international practices in the field of environmental law.

Although this project also includes a series of positive aspects, knowledge of the severe consequences on the environment has determined numerous protests against the Roșia Montană Gold Corporation project. In this sense, the following institutions have presented their opinions, together with scientific arguments: The Romanian Academy, The Holy Synod of the Romanian Orthodox Church, The Ecological university of Bucharest, as well as a number of scientific and cultural associations and organizations.

This way, a consensus was formed of all the personalities and institutions that understand the importance of a healthy natural environment for the preservation of life on earth in defining the project as disastrous and catastrophic, not only for Roșia Montană, but also for its surroundings.

Key words: Roșia Montană, sustainable development, environmental quality, rational usage of the resources

JEL Classification: K22, K23

1. Introduction

The Roșia Montană Project is located in the neighborhood of the Roșia Montană commune in the county of Alba, approximately 80 km away from the county seat Alba Iulia, in the Center-West of Romania. The Project area is located in a region called The Auriferous Quadrangle, in the metalliferous Mountains – framed at a regional level by the Apuseni

Mountains of Transylvania¹. The area around Roșia Montană, known in the Roman antiquity as Alburnus Major, has represented, for over 2000 years, the most productive auriferous region in Europe.

In 1999, Romania's Government granted an exploitation license, for a surface of approximately 4282 ha, to Minvest S.A., as contract assignee, and Roșia Montană Gold Corporation (RMGC), affiliate. This relation between the two companies reversed in October 2000. At this moment, the license was transferred from Minvest S.A. to Roșia Montană Gold Corporation, who became the assignee, and Minvest S.A. became the affiliate. This license transfer has important implications in the decision-making system regarding the completion of the Roșia Montană Project.

The project's initiating company is composed of: Gabriel Resources Ltd. of Canada, holding a percentage of 80%, Minvest S.A., the company of the Romanian State – former Copper Direction of Deva – with 19.3%, and other Romanian shareholders, with 0.7%.

The deposit of Roșia Montană has been estimated at a value of about 3 billion dollars. The exploitation process will take place on the surface, and 36,000 tons of minerals will be excavated per day, which will mean approximately 13 million tons of minerals per year. Roșia Montană Gold Corporation will process the exploitation of the 10.6 million ounces of gold and 52.3 million ounces of silver in four massifs: Cetate, Carnic, Orlea, and Jig-Vlădoaia.

During the entire period of exploitation, the extraction technology used will be cyanidation, which will represent a danger for the health and life of humans and of the rare plants and animals in the Apuseni Mountains. The cyaniding process – during the exploitation of gold and silver – will generate gangue and technological waste, which will deposit in a sedimentation pool with a stocking capacity of 250 million tons. The pool will cover a surface of 400 ha, and the dam height will reach 185 meters². The Roșia Montană Project “is conceived so as to support the revival of the economy of the region, by ensuring local,

regional, and national development, through the creation of jobs and through the income generated by taxes in the private sector” and includes a summary of the benefits that may be brought to the Romanian State – elimination of the ecological damages caused by the previous mining activity, introduction of the best available techniques, economic benefits, alignment to internationally acknowledged standards, training and acquisition of new skills, protection of the cultural heritage, and direct foreign investments.

Through Decision no. 8 of March 27, 2003, a Parliamentary Commission was created, made up of 13 members who, after visiting the premises and talking to all the interested parties, reached the conclusion that the implementation of this project will severely affect “all the elements of the environment (air, water, soil) and all the forms of life” during a period difficult to estimate.³ The Commission report evokes the complaints to the Project, according to which the exploitation method suggested for Roșia Montană “contravenes to the concept of sustainable development and usage”. At the same time, the Parliamentary Commission mentions that “relocation, no matter how correctly and legally it takes place, presupposes the appearance of human problems that can have major individual consequences”⁴.

With a potentially negative impact on the environment,⁵ the Roșia Montană Project infringes the provisions of the Community and the international conventions regarding environmental protection.

2. Objectives of the European Union regarding environmental law, translated into the Romanian legislation

The first objective of the environmental policy of the European Union is expressed in the concept of “preservation of the quality of the environment”. Environmental protection includes measures for preserving its statu quo. Since art. 174 of the EC Treaty establishes a

¹ Presentation report of the Roșia Montană Project, pp. 1-10.

² Idem, pp. 21-23.

³ The Report of the Parliamentary Commission regarding the Roșia Montană Project, April 2004.

⁴ Ibidem.

⁵ D. Mazilu, “Dreptul comunitar al mediului”, Lumina Lex Publishing House, Bucharest, 2009, pp. 228.

high level of protection concerning the environment, the Community must also stop those initiatives that have not yet shown to have any negative effect on the environment, but may threaten environmental integrity. According to art. 174, par. 3 of the EC Treaty, risk evaluation should rely on the available technical and scientific data. Therefore, the current state of the environment can be preserved through the implementation of preventive environmental protection; it cannot be preserved solely by adopting the measures required for eliminated the damage that has already been caused⁶.

Specialized literature and communitarian jurisprudence consider that people should not be considered the main factor that threatens the integrity of the environment.⁷ In fact, the policy of the European Union should also refer to the threats that will become real in the future (for example, changes in the state of the underground water or earthquakes). Based on this interpretation of art. 174 of the EC Treaty, threats to the environment that have not been caused by people should also be included in the environmental policy and legislation of the European Community. Moreover, through this agreement, the difficulties encountered in proving the threats to the environment should be eliminated, since the polluter or the causes of pollution cannot be always be verified.

The second objective of the environmental policy of the Community included in art. 174 of the EC Treaty is “to improve the quality of the environment”. According to art. 2 of the EC Treaty, this objective should aim at a high level of protection, thus facilitating the adoption of measures that would improve the current environmental standards. The high level does not indicate a state of perfection, but only serves as a starting point. In order to actually improve the statu quo, the Community should first introduce environmental standards that are ever more difficult to achieve⁸.

The third objective of the environmental policy of the Union is defined as “protecting human health”. The aim to insure high protection for human health is already mentioned in art. 152, par.1 (Title XIII) of the EC Treaty. In order to complete to some extent this clause, Art. 174, par. 1, point 2 of the EC Treaty repeats the objective of obiectivul protecting human health” in Title XIX (Environment), thus stressing the importance given o the protection of health in the environmental legislation of the European Community. In this respect, the term “health” encompasses all physical and mental processes. Therefore, in the context of a final competence norm, this objective must be understood as an addition to the objective of “protecting the environment”, although certain measures of environmental protection, such as the preservation of nature, have little to do with health. However, the protection of human health has its independent importance within environmental policy and the present European legislation⁹.

The fourth objective, “the careful and rational usage of natural resources”, refers both to natural environments (for example, air, soil, water, as well as plants), and to mineral resources. Since the European Community does not have the competence to develop a common legislation concerning energy, a conflict may occur between this objective and national policies. First, such a conflict should be diminished by the fact that this regulation represents a simple objective and, as such, it is not included in the category of the directly applicable legislation of the European Union. However, if this objective is materialized in the future in a legal act of the secondary legislation of the EC, this act will either have to be implemented (in case it is a directive), or to have a direct effect in a vertical direction. In case a directive is implemented, it is generally compulsory and directly applicable as soon as it is approved or comes into effect.¹⁰

The Chart of Fundamental Rights of the European Union states in art. 37 – “Environmental Protection”: “The Union acknowledges and obeys the right to the access to services of general interest, as stated in

⁶ “Compatibilitatea proiectului minier Roşia Montană cu principiile şi normele legislaţiei UE şi CE”- an opinion expressed by experts Peter Fischer, PhD Professor, and Alina Lengauer, PhD Assistant, LL.M, The Institute of European Law, Vienna University, Austria, 2002, pp. 8- 9.

⁷ E.Lupan, *Tratat de dreptul protecţiei mediului*, C.H. Beck Publishing House, Bucharest, 2009, pp125.

⁸ “Compatibilitatea proiectului minier Roşia Montană cu principiile şi normele legislaţiei UE şi CE”, pp.9.

⁹ Idem, pp. 9- 10.

¹⁰ M. Duţu, *Dreptul mediului*, 2nd edition, C.H. Beck Publishing House, Bucharest, 2008, pp.114.

national legislations and practices, in agreement with treaties, aiming to promote the social and territorial cohesion of the Union". The precautionary principle and the principle according to which preventive action should be taken into consideration represent an important component of the concept of preventive environmental protection,¹¹ providing the Community with the ability to adopt legal measures and, as a result, to go further than the repressive environmental legislation. These principles of environmental policy give the Community the ability to guarantee environmental protection through legal acts of the secondary legislation of the EC.

In agreement with European regulations, the Emergency Ordinance no. 195/2005 concerning environmental protection (approved by law no. 265/2006) includes a series of strategic principles and elements that will be implemented, in the view of meeting the engagements that Romania took in the process of European integration.

The following principles are included: the principle of integrating environmental requirements into the other regional policies (art. 3, let. a); the principle of precaution in decision making (art. 3, let. b); the principle of preventive action (art. 3, let. c); the principle of keeping pollutants at their source (art. 3, let. d); the principle according to which the polluter pays (art. 3, let. e); the principle of the preservation of biodiversity and of the ecosystems specific to the natural geographical frame (art. 3, let. f).

The following strategic elements are taken into account and consecrated: the sustainable usage of natural resources (art. 3, let. g); the information and participation of the public to the decision-making process, as well as access to justice in environmental issues (art. 3, let. h); development of the international collaboration for environmental protection (art. 3, let. i).

Reported to international as well as internal provisions, the exploitation suggested by the Roşia Montană Project will shortly exhaust all the natural resources and will compromise the

sustainable development of the area for a long period of time.

3. The EIA and SEA directives

The normative acts of the secondary legislation of the EC, relevant for establishing an evaluation procedure for the impact on the environment, include Directive no. 85/337/CEE referring to evaluating the effects of certain public and private projects on the environment (or the Environmental Impact Assessment Directive – the EIA Directive), as well as Directive no. 2001/42/CE regarding the evaluation of certain plans and projects on the environment (or the Strategic Environmental Assessment Directive de – the SEA Directive).¹²

Romania has translated Directive nr. 85/337/CEE in its internal legislation through Law no. 137/1995, abolished by O.U.G. no. 195/2005 regarding environmental protection, which draws the regulating directions in the field of environmental protection. An important feature of the EIA Directive is the provision of a legal procedure for establishing an assessment of the impact on the environment. This procedure is based on certain fundamental principles and will help the correct identification, description, and evaluation of the adverse effects on the environment, as soon as possible.

The EIA Directive does not stipulate that the projects believed to have negative effects on the environment should not be authorized under any circumstances. Actually, the effects of these projects on the environment should be included in the "development agreement" (the decision to authorize the project). If necessary, special conditions will be imposed on the "project entrepreneur" (the person who requests project authorization).

In art. 1, the EIA Directive states that public and private projects that may have a significant effect on the environment should be subject to a compulsory assessment of the impact on the environment. In the context of this directive, the term "project" refers to a large range of activities. According to art. 1, par. 2 of the EIA Directive, a "project" means performing construction works or any other installations or activities, as well as other interventions on the

¹¹ D.Marinescu, *Tratat de dreptul mediului*, ediția a III-a, Ed. Universul Juridic, București, 2008, pp.58.

¹² "Compatibilitatea proiectului minier Roşia Montană cu principiile și normele legislației UE și CE", pp.16.

natural surroundings and on the landscape, including the extraction of mineral resources. Since the definition of the scope of applicability includes all construction works and all the interventions for the extraction of natural resources, any extension of the already existing installations should also be seen as a possible scope of this directive.

The installations corresponding to the definition of a “project” of art. 1, par. 2 of the Directive should be subject to an environmental impact assessment. Art. 3 of the Directive states that: “the assessment of the environmental impact will appropriately identify, describe, and evaluate, in the light of each individual case and according to articles 4 – 11, the direct and indirect effects of a project, based on the following factors: 1) human beings, flora, and fauna; 2) the soil, water, air, climate, and landscape; 3) the interaction between the factors mentioned in the first and second point; 4) material assets and cultural heritage.

According to art. 4, par. 1 of the EIA Directive, “the installations for obtaining the non-ferrous metals from minerals, concentrates, or secondary raw materials, through metallurgic, chemical, or electrolytic processes” (Annex 1, par. 4, point 2) will have to be evaluated according to art. 5 – 10.

Art. 5, par. 3 of the EIA Directive stipulates that the information that will be provided by the entrepreneur should include at least a description of the project with on-the-scene details, the actual project and its dimensions, a description of the measures envisaged in order to avoid, reduce, and, if possible, repairing the significant negative effects, the data necessary for the identification and evaluation of the main effects that the project may have on the environment, a description of the main alternatives studied by the entrepreneur and an indication of the reasons for its selection, considering the environmental impact. Moreover, a non-technical abstract of the information above is required in order for the public to acknowledge and understand this information. This regulation includes two requirements that the member states must comply with when requesting the development agreement: the collected information should be available to the public within a reasonable delay; besides, “the public concerned by this problem”

should be given the opportunity to “express their opinion”.

“The public concerned by this problem” includes a smaller group of people than the general public. According to its permanent jurisdiction, The European Court of Justice gives individuals the right to exert their rights established through a legal act in the environmental legislation if the purpose of the legal act in question supports the protection of the rights considered crucial for the people.

Analyzing the Roşia Montană Project, we can notice that the requirements of the EIA procedure have not been met. The information required by art. 5 of the Directive are not available. It seems that no hearing of the opinions expressed by the affected people has been held. The request of the opinion of the “community” or the use of opinion surveys do not represent means that comply with the requirements of a correct procedure established by law and in conformity with the EIA Directive.

The objective of the EIA Directive is to provide a high degree of protection for the environment and to contribute to the integration of environmental considerations in the preparation and adopting of specific plans and programs. This directive includes all the projects believed to have a similar impact on the environment.

Although the SEA Directive basically contains similar regulations to those in the EIA Directive, in its case, “the public concerned by this problem” includes both that part of the public that is or will be affected by the decision-making process of the Directive, and the non-governmental organizations that place a particular accent on the activities connected to the object of the Directive.

Therefore, the group of people included in the SEA Directive is larger than that included in the EIA Directive. According to the data owned by experts, this extended group of people has not been heard by the responsible authorities, nor have they been given information concerning the project. This represents an infringement not only of the EIA Directive, but also of the SEA Directive. Although the requirements of these directives have been included in national legislation, it is still necessary to establish a concrete method for their effective implementation and compliance.

4. Conclusion

The socio-economic and environmental costs of the Roșia Montană Project, determined by the changes in the professional structures, the usage of cyanide, and the irreversible deterioration of the environment are considerable and contravene to the fundamental objective of sustainable development and to the principle of precaution.¹³ They also ignore the obligation of the present generation to leave behind a proper ecological and cultural heritage.

Romania's Constitution stipulates in art. 134, par. 2, let. d) the obligation of the State to ensure "the exploitation of natural resources in conformity with the national interest". But the exploitation to the exhaustion of the gold resources in the Apuseni Mountains, under the circumstances in which the Roșia Montană Gold Corporation Project will concretely develop, does not meet this constitutional requirement.

Because of the mining project of Roșia Montană, thousands of people will be relocated, which can only be justified if this action is of "public interest", that is, aims at improving "the country's wealth", in proportion to the disadvantages caused for the affected individuals. The RMGC mining company is owned in a proportion of 80% by the Canadian company Gabriel Resources Ltd. and in a proportion of only 20% by the Romanian State. This type of minority shareholding for the country owning the resources is quite unusual in the international mining industry. In what concerns the lease of exploitation, the Rosia Montana Project does not indicate a formula for splitting the profit. Usually, mining leases include such a formula in favor of the producing country. But this Project mentions rights over only 2% of the total production that the lease owner should annually pay to the Romanian Government. This means that the justifying criterion "the public interest aimed at the country's wealth", mentioned in art. 8 of CEDO, has not been fulfilled by the mining project of Roșia Montană. However, even if Romania, as

the country owning the resources, is not granted a correct share of the Project's profits based on a series of UN resolutions, both the significant involvement in the lives of thousands of people that live in this mining area and the irrecoverable damage caused on the environment by this method of extracting gold using cyanide, which is forbidden, are not proportional to the possible economic benefits that Romania may gain as a producing country.

A lunar landscape, with a precarious stability, takes contour on the horizon. If applied, the Roșia Montană Gold Corporation project will transform Roșia Montană and its surroundings into a lifeless area; most species of rare plants and animals will become extinct. Such a catastrophic evolution should sensitize all those aware of the importance of a healthy natural environment for the perpetuation of life on earth.

Questioning EU Regional Cohesion Policy in Romania

GRAMA Izabella Gilda
PATACHE Laura
„Spiru Haret” University Constantza
izabella.grama@spiruharet.ro
iacob_laura@yahoo.co

Abstract

The main objective of this paper is to analyse the territorial impact of the European Cohesion Policy in Romania. Since the inception of this policy and the first programming period (1989 - 1993) the key problem: 'to reduce the disparities between the levels of development of the different regions' has usually been measured in terms of GDP per head (relative to the EU average). In the future, will be recommended, that GDP per head in PPS being complement with other measures of welfare and standards of living. The cohesion policy in the current financial crisis is concentrated in investing in priority infrastructure, productive capacities of businesses and in human capital potential, in this way it could play an important role in restoring confidence in real economy.

Keywords: cohesion policy, convergence, operational programme

JEL Classification: R58

1. Introductory remarks

One of the most important objectives of the European Union (EU) is defined in Article 3 of the Treaty establishing EU cohesion should contribute to “promote economic, social and territorial cohesion, and solidarity among Member States.” This implies that the people should not be disadvantaged by wherever they happen to live or work in the EU. In the highlight of this reason in the draft Constitution was mentioned the concept of territorial cohesion (Article 3) alongside "economic and social" cohesion. The importance of this concept is also acknowledged in Article 14 (old Art.16) (Principles) in the Treaty, which stipulates that the citizens should have access to the essential

services, basic infrastructure and knowledge, underlining the significance of services of general economic interest for promotion social and territorial cohesion. Article 174 (old Art.158) at Title XVII: Economic and Social Cohesion adds “in particular, the Community aims to reduce the disparities between the levels of development of the different regions and the backwardness of the least favoured regions or islands, including rural areas”. (We mention that since December 1, 2009 Old Treaty establishing the European Community - Amsterdam 1997 – has been replaced by the European Union Treaty - Treaty of Lisbon; for more information on New numbering of the Treaty on European Union see the address <http://eur-lex.europa.eu/LexUriServ/LexUriServ.do?uri=OJ:C:2007:306:0202:0229:EN:PDF>) [1]

The EU's economic and social cohesion policy is a policy of financial solidarity, based on redistribution of the Community budget obtained by the member states contributions (one of the third part) to the least developed EU's regions, for promoting a higher level of competitiveness and employment.

The European regional policy has the following objectives: convergence (for countries with less than 75% of GDP per capita EU's average, among these is Romania too), regional competitiveness and employment (for the regions excluded from convergence objective), European territorial cooperation (regions, counties and transnational areas). All these are sustained by European regional development fund (ERDF).

The ERDF finances:

- ✓ Direct aid to investments in companies (in particular small and medium enterprises) to create sustainable jobs;
- ✓ Infrastructures linked notably to research and innovation, telecommunications, environment, energy and transport;
- ✓ Financial instruments (capital risk funds, local development funds etc.) to support

regional and local development and to foster cooperation between towns and regions;

✓ Technical assistance measures.

There are a number of aspects of territorial balance in the EU, which threaten the harmonious development of the Union economy in future years [2]:

- at *EU level*, a high concentration of economic activity and population in the central area or pentagon (which stretches between North Yorkshire in England, Franche-Comté in France, Hamburg in northern Germany and Milan in the north of Italy), which was identified in the second Cohesion Report and which covers 18% of the EU15 land area while accounting for 41% of population, 48% of GDP and 75% of expenditure on R&D. Enlargement will only increase this degree of concentration by adding to the EU land area and population but increasing GDP relatively little;
- at *national level*, a persistence of pronounced imbalances between the main metropolitan areas and the rest of the country in terms of economic development, which is a particular feature of the accession countries;
- at *regional level*, a widening or, at least, the persistence of a number of territorial disparities beyond those measured by GDP or unemployment. In particular, economic development is accompanied by growing congestion and pollution and the persistence of social exclusion in the main conurbations whereas a number of rural areas are suffering from inadequate economic links with neighbouring small and medium-sized towns and their economies are often weakening as a result. Large urban areas are tending to sprawl outwards encroaching into the surrounding countryside as economic activity and their population increase, creating what have become known as „rurban” areas, while rural areas where there are no towns of any size are experiencing falling population and a decline in the availability of basic services;
- *within regions and cities*, the development of pockets of poverty and social exclusion in areas with often only limited availability of essential services;
- in a number of *specific areas* constrained by their geographical features (islands, sparsely populated areas in the far north,

and certain mountain areas), population is declining and ageing, while accessibility continues to be a problem and the environment remains fragile, threatened, for example, by regular fires, droughts and floods;

- in *outermost areas*, with an accumulation of natural and geographical handicaps (as recognised in Article 344.2, old Art.299.2, of the EU Treaty), the continuation of severe social and economic problems which are difficult to tackle because of their remoteness, isolation, topological features, climate, small size of market and dependence on a small number of products.

The territorial cohesion concept exceeds the economic and social cohesion ones, it's intensified and completed by the last one. In policies terms, the aim is to achieve a balanced development by diminishing of the existent territorial disparities, by preventing the territorial discrepancies and by contributing to the coherence of the sectorals policies with territorial impact and to the regional policy. In this highlight should be working on the direction for improvement of the territorial integration and sustains regional cooperation.

The path of so-called European regional policy - or, in modern terms, the European Regional Cohesion Policy (RCP) – has been long and slow. A varied set of factors (named the vectors of change) were generated changes in RCP's structure: the theoretical concept of growth and its territorial impact; the political concept of EU's role; the development of the integration process in the EU; the successive enlargements in the EU; and, finally, the evolution of the business cycle in the EU. [3]

Presently, EU has 27 member states which represent a community and an internal market of 493 millions of citizens, with higher possibilities of economic and social disparities between them and between 271 regions of them. Besides, one region of four has a GDP per head under 75% of EU-27's average.

2. Measuring convergence on the dimension of GDP per head

Despite the cohesion refers at economical aspects and social and territorial issues too, most frequently, analysis are based on relatively aggregated measures, such as for instance the standard deviation or the coefficient of variation of regional GDP per

head at purchasing power parity (EU's average). [4]

GDP per head at PPP calculation can differ by one year or one organization (International Monetary Fund, World Bank etc.) to other. The measuring of convergence on the dimension of GDP per head was realized by successive forecasts in different countries and regions in PPP standards for adjustment of differences between goods and services bought with one GDP unit. This adjustment is an annual process.

Despite GDP per head is the only criterion used in cohesion policy for regions disparities' evaluation, the others indicators of Report of Cohesion might help to manage better the structural interventions in the territory (e.g. sectoral GDP, the employment rate, the unemployment rate, total research and development expenses s.o.)

The GDP per head in 2006 it ranges from 25 % of the EU-27 average (5,800 PPP) per inhabitant in North-East (Romania) to 336 % (79,400 PPP) in the UK capital region of Inner London. With the exception of three other regions (Mazowieckie in Poland, Malta and Bucharest - Ilfov in Romania), all the other regions of the new Member States, Croatia and the former Yugoslav Republic of Macedonia have a per inhabitant GDP in PPP of less than 75% of the EU-27 average. (Eurostat 2009)

For measuring the convergence at national level – named in specific literature sigma-convergence (Barro, Sala-i-Martin, 1995; Sala-i-Martin, 1996) – on the dimension of GDP per head in PPP we determined the coefficient of variation (national average) during 2000 -2007. (See Figure1)

We may appreciate the fact that the disparities between development regions were grown. The coefficient of variation value is during entire period higher than 0.35 this means that the variation is high, the average is not significant and hided a heterogenic structure of the collectively, which higher it becomes points out a worse situation.

Figure1. Coefficient of variation: GDP per head in PPP

Source: National Institute for Statistics (NIS), Romania Book Years, editions 2000-2008, www.insse.ro, www.bnro.ro

In conformity with Eurostat dates, Romania has the most dramatically evolution comparable with others EU's new member states (which extended EU-15 at EU-27), the coefficient of variation increasing to 0.15 in 1995 at 0.43 in 2007. [5]

By the same source, in 2006, from 15's the most undeveloped regions of the EU six are in our country: North East Region with 25% by EU's GDP per head average, South West Region – Oltenia (with 30%), South Region – Muntenia (with 32%), South East Region (with 32%), North West Region (with 35%) and Middle of the country (with 38%). The only Romanian region which are not find it in The most poorest Europe's arias Top is Bucharest-Ilfov with 83% by EU's average.

The noncapital region with the strongest growth in the new Member States was Vest (Romania), where per inhabitant GDP (in PPP) increased by 15.3 percentage points between 2001 and 2006, from 29.4 % to 44.7 % of the EU-27 average.

In the table below, the regional disparities indexes (data are calculated as a proportion between the gross domestic product per capita at the regional level and the national average) reveal important differences between the 8 Romanian development regions, the forecasts for 2008 and 2010 estimate and improvement, but the expectations are not so significant.

Table 1. Regional disparities Indexes

Development regions	2004	2006	2008	2010
North – East Region	0.692	0.675	0.675	0.679
South – East Region	0.907	0.845	0.841	0.872
South - Muntenia Region	0.834	0.822	0.821	0.820
South - West - Oltenia Region	0.833	0.843	0.839	0.832
West Region	1.147	1.149	1.143	1.141
North – West Region	0.972	0.920	0.917	0.951
Middle Region	1.042	1.087	1.085	1.054
Bucharest - Ilfov Region	1.915	2.044	2.063	2.007

Source: 2004 and 2006 – NIS; 2008 and 2010 forecasts National Prognoses Commission

3. Future challenges for regional development policy

Fourth Report on Economic and Social Cohesion was identified problems such as: globalisation, demographical changes and social tensions, climate change and the increasing of energy price. [6]

Despite of the general consent concerning the fact that cohesion policy should debate these problems too, cohesion policy should not be the only one and the key instrument for intervention highlight's the majority of contributions.

Some contributions appreciates that these difficulties are already been debated by Lisbon Agenda and Goteborg Agenda too. Others mentioned the fact that the debate of these problems shouldn't affects the Treaty's objectives for cohesion policy. [7]

From the total amount of 19.7 million Euro, destined for Romania for the period 2007-2013, 19.2 milliards are for the Convergence objective and 455 million Euro for the third objective – European territorial cooperation.

According to Romania Government Programme of Convergence 2008-2011, the most important condition to accomplish the fundamental objective of it – that to promote a sustainable development growth, in competitiveness, directed to accomplish the nominal and real EU's convergence – is the implementation of an appropriate combinations of macroeconomic policies, which should

provide *the disinflation process continuation and the maintenance of external sustainment.* [8]

Trough the National Development Plan (NDP) and the National Strategically Frame for Reference (NSFR) prepared during 2007-2013, Romania promote a regional policy which has as general objective balancing territorial development of the country and disparities reduction of the social - economic development between Romania and EU's member states, by the improvement of the regions' competitiveness and by achieving of a supplementary economic growth for 15% of GDP until 2015, an European funds absorption's consequence.

For the consolidation of the territorial cohesion's component part, in 2007, was elaborated The strategically concept for territorial development of Romania 2007-2030, which highlight, by integrate territorial's perspective, the modalities of national potential evaluation, for catching up and for stimulation of the Romania balanced development. Are in course to be elaborated the 8 Plans for the territorial arrangement of area/region added to the measures concerning economic, social and territorial cohesion, as well as the projects for various sources of financing and is in course of preparing the modification of local and territorial planning legislation, so for the territorial arrangement, than for execution of the constructions working authorization, too.

The priorities established in Regional Operational Programme (ROP) 2007-2013 – support for cities sustainable development – potentials growing poles, improvement of the regional and local infrastructure for transportation, improvement of social infrastructure, consolidation of local and regional business environment, sustainable development and tourism promoting – should be contribute to the accomplishment of the ROP strategically objective. By ROP's objectives should be support the economic, social and sustainable development of the Romania regions. Some of these objectives are: concentration to the urban growing poles, improvement of the infrastructure and business environment's conditions and diminishment of the Romania regional disparities.

By putting into practice these programs which were elaborate in the framework of the cohesion policy, one aims at developing the basic infrastructure according to the European standards, the growth of the competitiveness on a long term, the development and the

efficient use of the human capital, the development of the managerial capacity, the promotion of the balanced territorial development. It is estimated a growth of the GDP with 15-20% up to 2015, the growth of the employment rate from 57.45 to 64% and the accomplishment of 1400 km of new or rehabilitated roads. [9]

Even if, according to recent studies, the year 2007 was a year of strong performance, we must not forget that effects of the global financial crisis will make the Lisbon targets even more difficult to achieve, since labour markets are deteriorating, and all countries economies, too.

Tourism Impact of European Cultural Capital Programs – Sibiu 2007 Preliminary Findings of a Follow up Approach

GREG Richards
ILIE Rotariu
*Tilburg University – Holland
„Lucian Blaga” University of
Sibiu – Romani
ilie.rotariu@ulbsibiu.ro
Greg@tram-research.com*

Abstract

The Sibiu 2007 European Cultural Capital was monitorized in order to highlight the follow up. Preliminary findings concerning the impact on tourism are prezented based on field research carried out for the City Hall of Sibiu. In spite of a lower tourist circulation the encrease of daylly spending of tourists have compensate partially the impact of the economic crises comparing with other cities of Romania.

Key words: tourism, travel, statistic tourism

JEL classification: P25, L85

1. Introduction

This study of the impact of the European Cultural Capital in Sibiu in 2007 is part of an ongoing programme of research initiated by the European Association for Tourism and Leisure Education (ATLAS) in 1999. This programme of research aims to examine the implementation and effects of this increasingly popular event throughout Europe. To date, ATLAS members have been involved in assessments of the impacts of the ECOCs held in Helsinki (2000), Rotterdam (2001), Porto (2001) and Salamanca (2002).

This study of the ECOC in Sibiu is the first such study to have been completed in an Eastern European country, and therefore provides an interesting contrast to the previous research. This study also benefits from the long association of the Lucian Blaga

University in Sibiu with the ATLAS network. The university has been collecting data on cultural consumption in the city for number years as part of the ATLAS Cultural Tourism Project. This will eventually enable us to monitor longer terms in cultural consumption in Sibiu and therefore to provide a longitudinal assessment of the event.

2. Tourism Impact of ECOC in Sibiu

An important aspect of the ECOC is the economic impact that it can have on the host city. The bulk of the economic impact of the ECOC usually comes from visitor spending, because visitors inject new money into the local economy. In 2007 we estimated that the total economic impact directly attributable to staying visitors to the ECOC was €19.35 million. It is difficult to compare this figure directly with other years, because the ECOC as a direct visit motivation is no longer there.

However, the figures on average visitor spending show that spend levels have increased since 2007. The average visitor to Sibiu now spends almost twice as much as the average visitor before 2007. Again, this underlines the structural change in the nature of the tourist market.

Average total visitor spend 2001-2009

Total average visitor expenditure increased very little between 2007 and 2009. This is basically because the ECOC attracted a relatively high number of foreign tourists and other high spending guests. However, the average daily spend has increased significantly since 2007, largely as a result of a shift in spending patterns (see below).

Average spend per day (euro) 2007 and 2009

Not surprisingly the average daily spend of foreign tourists is significantly higher than that of Romanian tourists. However, the difference in daily spend between tourists from other parts of Romania and from abroad is perhaps lower than might be expected, probably because these visitors are more likely to be using commercial tourism accommodation.

Average spend per day (euro) by visitor origin 2009

In 2009 relatively more was spent on shopping and admissions, and less on travel (reflecting the higher level of domestic tourism).

If we exclude travel expenditure, however, the spending by visitors in the city of Sibiu itself was significantly higher in 2009.

Visitor spend by category 2007 (excludes Sibiu residents)

Visitor spend by category 2009 (excludes Sibiu residents)

Spend in Sibiu (excluding travel costs)

	Total
2007	303,06
2009	406,58

Expenditure was particularly high for hotel guests, who tended to spend almost twice as much as other visitors.

Spend by hotel guests in euro

	2007	2009
Travel spend	212,14	157,69
Admissions	21,53	62,44
Food and drink	126,24	145,27
Shopping	87,89	277,18
Accommodation	250,19	269,39

Not surprisingly, the highest spend was made by visitors from abroad, who tend to have much higher travel and accommodation costs than Romanian visitors. However, the economic impact of foreign visitors on the local economy is not as great as the total expenditure suggests, because a large proportion of the total is spent on transportation to reach Sibiu. Even if travel costs are excluded, however, spending by foreign visitors in the city is still much greater than for domestic tourists.

Spend by visitor origin in euro

	1	2	3	4
Travel spend	36,79	66,11	300,5	77,82
Admission	26,22	35,84	152,5	49,22
Food and drink	65,37	108,9	186,1	99,58
Shopping	95,74	140,6	281,6	136,9
Accommodation	150,3	159,6	314,2	178,9

1. = Elsewhere in Transylvania
2. = Elsewhere in Romania
3. = Abroad
4. = Total

For the local economy, the most important data relates to those tourists actually staying in the Sibiu region, because these visitors spend money on accommodation in the region, and therefore have a greater economic impact. Visitors staying in Sibiu spent considerably more than visitors staying in the region around Sibiu, mainly because they spent far less on shopping. The accommodation spend in the Sibiu region was however higher than for visitors staying in other parts of Romania, a sign that the accommodation facilities in the region have been upgraded in recent years.

Spend by visitor origin in euro for tourists staying in Sibiu city

	1	2	3
Travel spend	41,33	30,22	33,36
Admission	3,00	40,00	22,50
Food and drink	20,33	60,24	76,54
Shopping	50,00	130,67	120,50
Accommodation	160,00	132,00	103,75
Total	132,33	226,09	255,50

1. = Elsewhere in Transylvania
2. = Elsewhere in Romania
3. = Abroad

3. Total tourism expenditure trends

Although the ECOC is no longer a specific motivation for tourists to visit Sibiu, we can still calculate the total tourism spend in the city for the period before, during and after the ECOC to see if spend levels have increased.

Tourist arrivals and bednights in Sibiu 2006-2009

	Arrivals	Bednights
2006	150,000	235,000
2007	178,532	280,993
2008	147,000	204,005
2009	120,373	164,281

The data for 2008 and 2009 show a sharp decline in tourist arrivals and overnights, which is probably related in 2008 to post-ECOC decline and in 2009 to the economic crisis. It is clear that the decline in arrivals and expenditure follows national and regional trends. Compared to other cities in Transylvania, for example, the decline in arrivals in 2009 has been lower in Sibiu than in any other city except those of Mures County. Nationally, the first 11 months of 2009 saw a decline in tourist overnights of more than 16%, which indicates that Transylvania as a whole has been hit by the decline in tourism worse than the country as a whole. However, evidence from the interviews (see below) also indicates that many individual businesses in Sibiu have seen an increase in tourism, in spite of the general economic climate.

The other important point to note about the trends in arrivals is that recent data indicate a significant shift away from officially

registered accommodation into unregistered accommodation or staying with friends and relatives. In Sibiu County, for example, over 30% of accommodation capacity inventoried is not classified according to the standards of the Ministry of Tourism. This may tend to exaggerate the extent of the decline in tourism arrivals and expenditure.

In estimating total expenditure we have used the official tourism statistics on the number of bednights spent in hotels and other registered forms of accommodation, This excludes people staying with friends and family, which in 2009 for example might have increased the total expenditure in Sibiu by around 20% (see Appendix 4).

Total spending by visitors staying in Sibiu according to official statistics, 2007-2009

	overnights	spend per night	Total spend (million euro)
2007	280,993	91	25.6
2008	204,005	85	17.3
2009	164,281	130	21.4

On the basis of the tourists staying in registered accommodation in Sibiu city alone, total tourism spend was around €26 million in 2007, the ECOC year. Most of this impact was due to visitors coming for the ECOC, as these visitors tended to spend far more on average than other tourists, particularly as the event attracted many foreign tourists. It is not surprising, therefore, that the economic impact of tourism declined in 2008. But the higher average spends in 2009 has maintained the overall economic impact at a higher level than in 2008. It seems that the increased number of high spending tourists attracted by the cultural image and new attractions of the city has to some extent mitigated the effects of the decline in tourism as a result of the crisis.

If we add the impact of visitors staying with friends and relatives, then the indications are that total tourism spending has been maintained at around the same level as in 2007, in spite of the economic crisis. This is partly due to the increased spending by hotel guests, many of whom are now staying in higher quality hotels accommodation thanks to the development of the hotel stock for the ECOC, and partly due to the growth in VFR travel. The surveys also indicate that many of the visitors coming to Sibiu in 2009

had visited previously in 2007. This seems to suggest that the ECOC had a direct impact on repeat visitation, with many of those returning now staying with friends and relatives instead of in commercial accommodation.

Total visitor spending including VFR tourists

	1	2	3	4
2007	25.6	26	8.5	34.1
2008	17.3	15	6.4	23.7
2009	21.4	31	13.7	35.1

- 1 = Total spend by tourists in official accommodation (million euro)
- 2 = % VFR visitors
- 3 = Total spend by VFR tourists (million euro)
- 4 = Total spend by all tourists (million euro)

4. Conclusion

To summer up, according to preliminary findings, the follow up impact of Sibiu 2007 European Cultural Capital on local tourism was strong enough not only in 2007 but also on long term, as to balance the effects of the economic crises, by report of other similar cities of Romania

Abstract

The educational system's modernization implies the transfer of responsibilities regarding the multiplication of financing resources and expense coordination to the level of the institution's management (the school director) and the direct participation of the local community and of the administrative authorities- mayors and town counselors- to the effort of ensuring the well-going of the training and educational process through school. It means, in the same time, creating a system designed to distribute equitably and rationally public money between educational units, and careful control of its expenditure. The educational system's modernization also implies raising the control and intervention capacity of the decision factors on local and central levels as well as the correction of some errors or the removal of dysfunctionalities in budgetary planning and execution. Our study was founded on a survey type of scientific research, made on 50 preuniversity educational institutions from Sibiu. The essential aims are ensuring the fund distribution based on standard costs and a real transfer towards the school of the attributions regarding the calculus of material and human resources and the accomplishment of a stimulant and efficient budgetary execution. Based on the facts presented by this paper, we notice the fact that the financing system based on standard costs and differential coefficients is not

difficult to apply on the conditions of knowing it and the informational data collecting and processing to function normally.

Key words: standard costs, public funds, preuniversity educational institutions, differential coefficients, budget.

JEL Classification: I 22

1. Introduction

The state financing system for the preuniversity educational institutions comprises the principles and the institutions involved in budget planning, distribution and use of financing resources, as well as indicators of the founding and allocation of the funds necessary to a good functioning of the preuniversity educational institutions. The unit's funds, no matter their origin (state budget, local budget or own sources), are distributed to the following destinations: *basic financing*, proportional to the number of preschoolers/ students and *complementary financing*. The allocation of budgetary funds to educational units for the basic financing is made using a formula which refers to the number of preschoolers/students of the kindergarten/school and the standard costs per preschooler/student, corrected by differential coefficients according to the environment (rural/urban), level and the educational branch, socio-economical conditions of the region material basis' specific conditions.

2. Methodology

The methodology of the basic financial distribution considers the application of quality standards for the preuniversity education, the normative acts that control the teaching and non-teaching personnel's remuneration, regulations regarding the volume and structure of the teaching- auxiliary personnel and non-teaching. The distribution of the budgetary allowance for the basic financing of the preuniversity education per entities (schools) is made based on general information (the total amount allocated) and on specific information (the number and structure of students). This information is collected from the school units at a date considered to be representative for the system (the beginning of the school year). Therefore, the distribution methodology takes into account the number of physical students (for different educational levels, educational environments, branch, profile, teaching language and differential coefficients of costs per student-calculated for every educational level, based on standard costs), which determines the number of equivalent students and other quality indicators associated to the level of qualification of the teaching personnel.

The "equivalent student" notion has been introduced in order to express mathematically the fact that the process of training a physical student requires different costs, according to the level of education he is registered to, branch, profile, teaching language, etc.

The number of equivalent students is determined by balancing the physical number of students registered to different teaching forms, with differential coefficients of standard costs per teaching levels and other additional coefficients (for minorities, class dimension, etc).

3. Results and discussions

Ensuring the necessary funds for the Romanian school implies creating the instruments for budgetary planning and fund allocation. For the basis financing is used the standard cost/ student, which is the budgetary planning instrument; it is determined for a standard school unit.

In view of the differentiation of school units' budgets there has been made a field survey on 35 school units in Sibiu, about 50% of the number of school units existing in this town.

Starting from the notion of "equivalent student", the data has been processed in order to identify a typological group. With this purpose in view, we have used the STATISTICA calculus software, with the variable quantities *school cycle*, *school unit's profile*, *student/teacher indicator*.

Our first goal consists in knowing the differential coefficients of standard costs per educational level. The information is listed in table 1.

Educational form (level of preuniv. education)	X	Y	Z
Preschool (normal schedule)	0	1892	0.663
Preschool (long schedule)	0	3473	1.216
Primary (normal)	0.2	2179	0.763
Primary (vocational)	0.2	2555	0.894
Secondary (normal)	0.143	2856	1
Secondary (vocational)	0.143	3196	1.119
Secondary (low attendance)	0.143	1158	0.405
High school theoretical	0.133	2712	0.949
High school (technological, sports, teacher training, military, theological)	0.133	2952	1.033
High school (art and music)	0.133	3271	1.145
High school (low attendance)	0.133	1114	0.390
Industrial schools and supplementary years	0.1	3129	1.095
Post High school	0.1	3129	1.095

Table 1

Where:

X= Supplementary coefficient of adjustment for students learning in a minority language

Y= Standard cost/student (per educational levels and environments)

Z= Differential coefficients of standard cost (per educational levels and environments).

We mention that the notion of *standard educational cost per student* is the main component of the normative cost representing the expenses with the teaching personnel (standard education cost per student) and it represents the annual average gross salary expenses for a teacher, divided by the average student number per teacher.

$$school_cost_{student} = \frac{gross_salary_cost_{teacher}}{students_number_{teacher}}$$

Where:

- The gross salary means the basic salary (including weightings and allowances), plus the employer's contributions
- The student- teacher ratio results from dividing the average number of students per class with average teaching rate to the average number of classes of a student per week.

The information collected after the research regarding the teacher's classes, number of students per class and number of standard students/teacher is given in table 2.

Educational form (level of preuniversitary education)	A	B	C			D	E
Preschool (normal schedule)	25	25	10	15	20	20	20
Preschool (long schedule)	25	50	10	15	20	20	10
Primary (normal)	16	20	10	20	25	22	17.6
Primary (vocational)	16	24	10	20	25	22	14.7
Secondary (normal)	18	30	15	25	30	25	15
Secondary (vocational)	18	34	15	25	30	20	13.2
Secondary (low attendance)	18	10	15	30	45	25	45
High school theoretical	18	30	15	25	30	28	16.8
High school (technological, sports teaching, military, theological)	18	37	15	25	30	28	13,6
High school (art and music)	18	10	15	30	45	28	50.4
High school (low attendance)	18	32	15	25	30	24	13,5
Industrial schools	18	36	15	25	30	29.2	14.6
Post High school	18						

Table 2

Where:

- A= Teacher classes/week
- B= Student classes/week
- C= Students/class (specified by the law in force)
- D= Standard number of students/class
- E= Standard number of students/teacher

After the field research, we can notice differences between the real costs and the standard costs (in 2010), listed in Table 3. These differences are not objectively related to the quality of the managerial activity or policy and they cannot be eliminated at short notice. However, they can be minimized by using mid- and long-term policies regarding the school network, concentration and modernization of school buildings, development of the administrative- territorial unit's infrastructure.

4. Conclusions

The results of our studies and analysis and the dialogue held with the specialists and institutions we referred to in this paper lead to an obvious conclusion. Regarding the school financing formula- meaning the whole relational system referring to the fund allocation strategy and the decentralization of the decisions regarding the volume and the effective budgetary execution-, our studies reveal that we are barely at the beginning. The following steps should ensure a real fund distribution based on standard costs, and, moreover, a real transfer of the attributions regarding the calculus of human and material resources needs and the application of an incentive and efficient budgetary execution toward the school. This process requires a long period of time, while the following must be provided:

- The improvement of the law system regarding the personnel's norming and remuneration, the school units' and their management's right of using the budgetary economies regardless their source, the local councils' and town halls' right of participating and decision in the school units' development programs and their personnel policies.
- Collaboration between the county school authorities, local councils and town halls, in order to control the managerial achievements of school directors.

- An intensive preparation of school principals in the area of financial and administrative management.
- Creating a coherent informational electronic system, which, according to the given data and parameters, to ensure the acknowledgement of the realities in all school units and the right decision-making process.

• Time is required in order to remove the excess and reticence generated by the responsibility transfer regarding the personnel and remuneration policy from the center towards the schools, local councils and town halls.

We are well aware of the fact that this last challenge, as well as the law modifications required by the decision decentralization is the toughest objectives to achieve. This is why we propose the process to be made gradually, through consecutive laws, well funded and sustained by a professional and moral preparation of all those involved in this process.

School unit	Payments 2009	Requests 2010	Standard cost calculus
Kindergarten no. 14	646,47	873,00	619,01
Kindergarten no. 18	597,19	625,00	625,32

Abstract

Although regional policy is implemented in the EU Member States, the need of a common regional policy arising from the need for greater resources for implementing effective regional policies, resources have not all EU member states the financial argument is a fairly correct. Greece, for example, had to spend in the period '80 - '90, a much larger part of its GDP on state aid than the EU together

Key words: European Union, allocation, regional policy, resources

JEL Classification: R1, E6

The need to implement a regional policy in the EU arguments is based on social, political and economic facts. These arguments can be summarized as:

- inefficient spatial distribution of income: there is an inverse connection between growth and inequality in income distribution. However, improving interpersonal income distribution may lead to a less efficient allocation of resources affecting the welfare level. For this reason, the argument of equity in income distribution is more a social than an economic connotation;
- much easier to adapt economic structures to major changes or macroeconomic shocks: issues related to EU enlargement Thus, a state candidate may face more serious

problems after its accession to the EU, such as unemployment. Therefore, Member States may grant aid to overcome these problems by joining the new state;

- optimize the allocation of work and mitigation factor unemployment: in areas where economic activity is insufficiently developed, unemployment is high. Regional policy can contribute to economic development and employment reintegration factor underused, whilst ensuring its high mobility and lower operating costs benefits obtained activation from this reintegration.

On the other hand, Greece and Ireland have given a much smaller part of their GDP on infrastructure and research and development compared with other Member States;

- recital that the settlement of regional problems in a state is also good for other Member States. This consideration is related to the fact that any EU Member State shall enjoy the same welfare benefits;

- benefits of integration within U.E. require an equitable distribution, which may be provided by regional policy;

- to provide for compensation for– some Member States, which have suffered from implementation of other EU policies such as CAP, transport policy and policy research-development. This argument is often linked to the need for regional transfers within the EU, especially the peripheral regions, which have suffered most.

Regional Policy of U.E. is implemented based on allocations from the Community budget and only in designated areas within Member States. This implementation should be monitored at EU level since:

- donors of funds for regional policy net wish to ensure that these funds will be used to increase the economic potential of regions lagging behind. It is intended as temporary support regions which have a lower competitive level;

- regional authorities in many EU Member States are not be safe to apply the most effective measures for the development of their countries. As a result, the European body becomes viable to solve this inconvenience;

- as regional policy measures in a Member State have an impact on other Member States is necessary to coordinate regional policies at Community level;¹

- regional policy approach at national level can only lead to the emergence of a race between different locations to obtain as large subsidies.

Initial elements of common regional policies related to European Social Fund - aimed, inter alia, increasing employment and occupation factor geographic and occupational mobility within the EU, and by the European Agricultural Guidance and Guarantee Fund. Oil shock in 1973 and the first EU enlargement have increased the importance of Community regional policy. Therefore, regulation 724/75 U.E. led to the establishment of the European Regional Development Fund. Basic objective of the fund was helping to mitigate the main regional imbalances within the EU, mainly due to imbalance of industrial reconversion and industrial decline. Initially, the resources allocated to the European Regional Development Fund shall consist of contributions - the default rate - the Member States. Member States U.E. co financed projects F.E.D.R. national public funds, in accordance with the principle of additionally. Almost 85% of regional projects undertaken by the ERDF in the period '70 - '80 included infrastructure improvements.² Extensions U.E. years 1981 and 1986 led to increased regional disparities and the need to compensate some states, like Greece, France and Italy, for losses incurred as a result of enlargement to the south. Therefore, integration programs were conducted Mediterranean, which proved to be the pioneers of European regional policy reform in the late '80s. The main stimulus for development of EU regional policy was the formation of the European Single Market. Single Market required the financial assistance of EU Member States to

help them increase their economic competitiveness. To this end, the European Commission's powers were increased and were dropped from the system of fixed quotas for participation in ERDF.³

Maastricht Treaty, in Article 2, spoke of objective economic and social cohesion, which could not be achieved without a proper European regional policy. The Maastricht Treaty led to the change of regional policy instruments. The Cohesion Fund was created and the European Investment Bank, European Investment Bank related. Cohesion Fund was established under the provisions of Article 161 (2) of the Maastricht Treaty, to ensure funds for the development of infrastructure and environmental projects in Member States whose GDP / capita was less than 90% of the EU. European Investment Fund was intended to facilitate funding of projects in peripheral areas of the EU, involving acceptance of a risk of higher than standard bank loans to operate the European Investment Bank. Another change was the establishment of the Committee of Regions (in accordance with Articles 263-265 of the Treaty), which act as a consultant for the European institutions involved in implementation of regional policy. European regional policy today is based on the following principles:

- concentration;
- programming;
- additionally;
- partnership.

EU regional policy reform, which took place in 1988, was based on its focus on those parts of EU who were most in need of development support. As a result, areas covered by national support and automatically became an object of European Structural Funds allocation.

EU regional policy objectives have evolved over time. For the period 1994-1999, these objectives were targeted:

1. development and structural change in the less advanced regions of the EU;
2. conversion of regions or areas that were heavily affected by industrial decline;

¹ Weise C., *EU-Politik zur Steigerung regionaler Wettbewerbsfähigkeit*, Vierteljahreshefte zur Wirtschaftsforschung, vol. 64, no.2, 1995.

² Tsoukalis L., *The New European Community: The Politics and Economics of Integration*, Oxford University Press, Oxford, 1997.

³ Bianchi G., *The IMPs: A Missed Opportunity*, Frank Cass, London, 1993.

3. combating long-term unemployment and improving the integration of youth employment;
4. facilitate structural changes;
5. a. accelerate structural adjustment in agriculture and fishing cases;
b. supporting the development and structural adjustment of rural areas;
6. support areas with a very low population density (northern regions).

For the period 2000-2006, EU regional policy objectives were:

1. combination of objectives 1, 5a and 6 in the period 1994-1999;
2. combination of objectives 2 and 5b of the period 1994-1999 and supplement them with specific problems of urban areas, those dependent on the fishing industry and the services sector is under reform;
3. supporting the adaptation and modernization of education, training session and policies aimed at employment factor, and follow further the objectives 3 and 4 of the period 1994-1999.

EU regional policy objectives can be divided into regional goals and objectives themselves horizontal.

For the period 2000-2006, Objectives 1 and 2 were considered regional and horizontal objective 3. In addition, quantitative criteria have been established to allow the lay out of European regions. For regions covered by Objective 1, was considered as the criterion for outs Regional GDP per inhabitant. So were departed those regions whose regional GDP per inhabitant is less than 75% of GDP / capita of EU the past 3 years, before starting the calculation. Moreover, traditional areas located under Objective 1, are: French overseas departments, Azores, Madeira, the Canary Islands and sparsely populated regions of northern EU According to the principle of concentration, the regions covered by Objective 1 are the type of NUTS-II, not less.

Designation of regions covered by Objective 2 is somewhat more complex. This is because, in 2000-2006, these regions were limited to 18% of the population, of which 10% covers the industrial and service areas, 5% rural areas, urban areas and 2% 1% areas dependent

on fishing industry. For delineation of these areas, European Commission uses a set of economic indicators, social and demographic considering proposals under which Member States of the region can be considered under Objective 2. The lists of Member States' proposals are reviewed by the European Commission, after consultation with Member States, completes the final list of areas that will fall under Objective 2.

However, the limit of EU regional policy was considered, since 1988, as Objectives 1 and 2 to cover areas in which to live up to 40% of the population. Part of the funds U.E. for regional policy is for Community Initiatives. These initiatives are aimed at helping different types of regions that are declining due to causes such as their location on the outskirts of the EU In 2000-2006, Community Initiatives have been grouped into four broad categories:

- border and interregional cooperation (INTERREG);
- convert socioeconomic urban areas (URBAN);
- rural development (LEADER +);
- transnational cooperation in the fight against discrimination and inequalities in the labor market (EQUAL).

The Community initiative in 2000-2006 represents 5.35% of total SF, vs. 9% in the period 1994-1999. Regional policy objectives for 2007-2013 are:

- O1 - Promoting convergence and economic development and job creation in the least developed Member States.
- O2 - Promoting regional competitiveness and employment by preparing work to attend and meet the labor market changes.
- O3 - Promoting regional cooperation at European level.

Programming is that principle that the forms of implementation of regional policy in a given area must be included in the development plan of that area. The basic idea was to ensure consistency between regional policy measures of individual, regional, national and EU levels. In 2007-2013, EU regional policy programming algorithm requires completion following steps:

- adoption by the European Commission guidelines– outlining common priorities for all three objectives of regional policy.

These priorities were reflected in all regional development programs and have focused, among others: increasing competitiveness, increasing employment of factor employment, equal opportunities for men and women;

First, these plans may differ in terms of classification regions in Objective 1 and 2. In addition, there are major national and regional differences between the size of the areas covered by the same objective and the tools that some Member States prefer to implement their regional policies. On the basis of national or regional plans, the European Commission, together with national and regional framework created to help the Community, which provides specific information on regional development plans. For Objective 1, the information is structured into the following categories: supporting productive investment, human capital formation and infrastructure. Support productive investment concern: industry, services, rural development, fisheries, tourism and agriculture.

Human capital formation covers education and training of research-development, while infrastructure refers to:

- transportation, communications, energy, but also to water, environment and health;
- preparing detailed operational programs: is done— only at the national and regional authorities in each Member State. During the implementation of such plans held numerous consultations with the European authorities of these authorities.

The current algorithm implementation of European Regional Policy, presented the three steps in its drive to increase the role of the European Commission, together with increased decentralization of management of regional development programs.

Additionally refers to the obligation of each member state to support public expenditure in each subject at least the same level as the previous programming period. Monitoring compliance with the principle of additionally is a complex process that can lead to disputes between the European Commission and Member States.

The partnership aims to close cooperation between the European, national and sub-national, in order to effectively implement

regional policies. This partnership takes three basic forms:

- coordination between the different Structural— Funds and other EU financial instruments;
- coordination between EU structural policies— and national policies of Member States;
- Coordination between the European Commission and— national authorities of Member States.

Increase budget allocations related to EU regional policy highlights the importance given to structural measures in the EU Financial resources have been concentrated in the period 2000-2006 nearly 70% in regions covered by Objective 1 and those in transition. The remaining third was divided regions were placed in Objectives 2 and 3. Already in 1993, four countries (Ireland, Spain, Portugal and Greece) have benefited from cohesion funds for financing of transport infrastructure and environmental projects.

In absolute terms, Spain was the largest recipient of Structural Funds in 2000-2006, followed by Germany, Italy, Greece, Portugal and the UK. Community allocations per capita in the period 2000-2006, ranged from 220 € / person (in Greece and Portugal), from 140 € / person (in Spain) and 100 € / person (in Ireland). The EU developed countries, these benefits are only 20 € / person (in the Netherlands, Belgium and Luxembourg) or 50 € / person (in Italy). European Union began providing financial support applicant countries in Central and Eastern Europe in 1989, through the Phare program.

The level of financial assistance U.E. by these countries increased significantly after 2000, by implementing two new programs, SAPARD and I.S.P.A. Until 2004, the 12 EU candidates received financial assistance of 3 billion Euros. Last 12 states that joined the U.E. in 2004 and 2007 became eligible for financing under the Structural and Cohesion Funds. From May 1, 2004 to the end of 2006, these countries have received 21.7 billion Euros. Nearly 2/3 of the funds from the Structural Funds, while 1 / 3 of the Cohesion Fund (European Commission, 2003). Low level of GDP per inhabitant, several regions of the 12 EU Member States in November covered by Objective 1. Research on

the dynamics of regional policy instruments allows us to achieve one of their out classical instruments and contemporary instruments.

The issues addressed in regional policy instruments, can be viewed from several angles, and are differentiated in the following categories:

- policy instruments used in– micro-regional level in order to influence the allocation of labor and capital factor between different industries and inter-regionally;
- macroeconomic policy– instruments used at the regional level, whose area of action is focused on revenue and expenditure changes made at the regional level;
- government policy instruments– used at regional level to achieve policy coherence between national and regional policy;
- EU regional policy instruments– used to achieve economic and social cohesion (between Member States) and in achieving a high economic and social development similar to the average level registered in the EU (if candidate states).

Abstract

In recent years environmental issues are an integral part of the strategy of organizations around the world. Each economic unit seeks to achieve and demonstrate along with economic growth and a level of performance of environmental protection to meet the environmental legislation. The paper analysed the objectives and relation among EMAS and ISO 14000, analyses is also extended to new EMAS adopted on 2009.

Keywords: sustainable development, environmental management, environmental audit, business

JEL classification: Q56

1. INTRODUCTION

Environmental management systems are designed to help companies to improve their environmental performance including the life cycle performance of their products, activities and services. They allow organisations to have a clear picture of their environmental impacts, help them to target the significant ones and manage them well

The environmental rules mention the necessity for introduction of environmental management system at the organization level. In this way, is answering to a concept more a more use in the environmental protection field: the pollution stops of its sources or act at source of pollution and not only to its effect on the environment.

2. COMPETITIVENESS AND ENVIRONMENTAL MANAGEMENT

Competitive position of partners depends of ensuring "clean products, which meet both consumer demands, as well as the rules applied by their trading partners. A sustainable profit can be obtained only through an effective management of these changes in order to cope with new coordinates (table 1).

TABLE 1. Pressures, changes, business technology .

Pressures	Changes	Business opportunities
Development of environmental legislation	Draft of new products	New product with green level
Increasing of pressure behalf of beneficiary	Using of new materials	Cleaning technology
Competitive increasing	New technology	Division of environmental market
Cost increasing	Increasing of environmental monitoring and control	Reducing of waste generation
Investments decision	New system of environmental management	Application of the best practices
Pressure of environmental groups	Increasing of environmental preoccupation	Improvement of organization images

Source: Rojanschi, V., Duduman, S., Grigore, F., "Sisteme de Management Integrat pentru Agentii Economici", Tribuna Economica Publishing, Bucharest, 2007.

2. REQUIREMENTS OF ENVIRONMENTAL MANAGEMENT SYSTEMS

Planning consist in identification of significant environmental aspects and legal requirements, including procedures for integrating anticipated changes to the facility's requirements or commitments into the EMS. Measurable objectives and targets to meet policy commitments and legal requirements, to reduce the facility's significant environmental impacts, and to meet the performance commitments made as part of the facility's participation in the program

Implementation and operation
Established roles and responsibilities for meeting objectives and targets of the overall EMS and compliance with legal requirements, including a top management representative with authority and responsibility for the EMS.

Checking and corrective action means an active program for assessing performance and preventing and detecting nonconformance with legal and other requirements of the EMS, including an established compliance audit program and an EMS audit program.

Management Review of performance against the established objectives and targets and the effectiveness of the EMS in meeting policy commitments.

One of the request addressed to the company that implement environemntal management system , is defining an *environmental policy*, management shall ensure that its policy is:

- Appropriate to the nature, scale and environmental impacts
- Commitment to continual environmental improvement.
- Commitment to prevention of pollution
- Comply with relevant environmental legislation pollution, and regulations
- Comply with other requirements
- Framework for setting and reviewing environmental objectives and targets.
- Ensure that its policy is documented.
- Ensure that its policy is implemented and maintained.

- Communicated to all employees

- Available to the public

From the view of evolution of environmental management system standard one of the most important are EMAS at the level of European Union and ISO 14000 at the international level. A relation among these environmental management systems is presented below:

TABLE 2. EMAS – ISO Relation

EMAS	ISO
European Union reglementation	International standard
Applicable only in EU	Applicable at international level
Restricted to sites specific for industrial activity	Applicable for activities of products, services including industrial activities
Require initial assessment of environmental impact assessment	Initial assessment is not required being suggest in appendix 4.2.1. of standard
Continuous improving of environmental performance at the level of the best available technology	Continuous improving reflected by increasing environmental performance
Require an environmental public declaration to allow access to environmental program and policy	Suggest an external communication but depends of each company to decide content of information. Require public access only to environmental policy
Frequency of environmental audit at 3 years	Not specific the frequency of environmental audit
EMS require existence of an register of environmental effect	Is not required

Source: Rojanschi, V., Bran, F., Grigore, F., Ioan, I., "Cuantificarea dezvoltarii durabile", Economica Publishing, Bucharest, 2006.

3. EMAS 2009

In the follows we are focus on presentation of EMAS at the level of European Union. The scheme has been available for participation by companies since 1995 and was originally restricted to companies in industrial sectors. Since 2001 EMAS has been open to all economic sectors including public and private services. In addition, EMAS was strengthened by the integration of EN/ISO 14001 as the environmental management system required by EMAS.

The **new EMAS adopted on 2009** cover not only the industry sector but all sectors and concern not just the environmental impacts of economic activities, but also of their products and services. EMAS II. Key revisions include an extension of the scope of EMAS to all economic sectors, including local authorities. In addition, a visible and recognizable EMAS logo was adopted to allow registered organizations to publicise their participation in the EMAS more efficiently.

With regards to EMAS requirements, the involvement of employees in the implementation process was increased, and the role of the environmental statement was strengthened with the aim of improving communication between registered organizations and the public.

An EMS is defined in EMAS II as “the part of the overall management system that includes the organizational structure, planning activities, responsibilities, practices, procedures, processes and resources for developing, implementing, achieving, reviewing and maintaining the environmental policy”

The **objective of EMAS**, is to promote continuous improvements in the environmental performance of organizations by the establishment and implementation of environmental management systems by organizations, the systematic, objective and periodic evaluation of the performance of such systems, the provision of information on environmental performance, an open dialogue with the public and other interested parties and the active involvement of employees in organizations and appropriate training.

Acoording to an study published in 2009 by European Comission organizations were asked what their three most important reasons for seeking EMAS registration were.

The reasons most frequently selected are highlighted in Figure 3 below.

They include the wish to improve resource and production efficiency (19%), internal management approach/culture (18%) and improved reputation (15%) as the most popular reasons identified. The desire to improve transparency with stakeholders and legislative compliance were also significant for some organizations.

Source: EC, 2009

Fig.1 Reasons for Seeking EMAS Registration

Organizations were also asked to indicate which of a list of impacts of EMAS had been the most positive for them. The most positive impact, identified by 29% of respondents as having a score of 1 and 18% as 2, was energy/resource saving.

4. CONCLUSIONS

Implementation of environmental management system can be useful tool for organizations to improve their environmental performance, and enhance their business efficiency on the other hand compliance with environmental laws and regulations is strongly well-established. Finally, acomplished the reqest adresses to the company that implement the environemental managemnt system the competitive position to manage with the challenge of international market is ensured.

Networking a basic instrument for regional development

IONESCU Claudia
Universitatea Hyperion
adrbinvest@yahoo.com

Abstract

A successful regional development is support by an efficient communication. A modern and very useful tool for dissemination of information is the network. Romania benefits from Operational Programmes for 2007-2013, a lot of money that we need to spend wisely and to get development of local and regional areas. In the paper I present one instrument of regional development the Regional Operational Programme – Regio and its the communication network and demonstrate its usefulness for the successful of Regio implementation. I used strategic documents available on the European, National and regional institutions website and my personal experience achieved by working at the development of the Bucharest Ilfov Region, since 1999.

Keywords: communication networks, Regional Operational Programme, Managing Authorities

JEL Classification: D85, R58

1. Introduction

The Operational Programme Monitoring Committee (OP MC) has a primary role in the monitoring of operations of the OP. The OP Managing Authority submits annually to the European Commission, an Annual Implementation Report by the 30th June in each year until 2015.

The Regional OP (ROP) is one of the Romanian Operational Programmes agreed with the EU, and an important tool for implementing the national strategy and policies for Regional Development. It applies to all 8 Romanian Regions [1].

The global objective of ROP is “to support and promote a sustainable balanced economic and social development of the

Romanian Regions, by improving business environment and infrastructure for economic growth”. This means that the ROP aims to diminish the gaps in economic and social development between more and less developed regions of the Country.

The ROP in Romania is funded through one of the Structural Funds - The European Regional Development Fund. This fund is supporting EU Regions where GDP is under 75% of the EU average. The total budget of ROP is approximately 4,4 Billion Euro for the first seven years (i.e. 2007-2013). EU funding represents approximately 84% of the ROP budget. The remaining is coming from national funds, public (14%) and private (2%). ROP is broken down in a number of Priority axes. Each priority axis is endowed with a specific budget and incorporates a number of key areas of intervention targeting specific development goals.

During the period 2007-2013 period, Romania will receive € 19,667 Million from EU Structural Funds. Approximately 98% of this amount will be allocated in seven Operational Programmes with the objective of “Convergence” (i.e. diminishing the economic and social development disparities among EU regions). The remaining 2% will be allocated in six Operational Programs with the objective of “Territorial cooperation” with neighbouring countries.

2. The system of regional development in Romania

The Managing Authority has the overall responsibility for the management and implementation of the ROP, in accordance with EC Regulations and the principles of sound financial management. Some of the most important tasks of the MA in relation to the potential beneficiaries are the elaboration of the project selection criteria, appraisal and evaluation methodology, and the

signature of contracts with the selected applicants. There is only one MA for the ROP and has been established within the Ministry of Regional Development & Tourism.

The Intermediary Bodies (IB) of ROP are implementation entities at regional level that have been delegated specific tasks of the MA, by means of a written Agreement. The IBs are the direct "contact" of ROP with the applicants. Among others, the IBs assist applicants in project development, launch the calls for proposals, receive and register the applications, support the evaluation process, notify the results of the evaluation process to applicants and follow up the implementation of projects.

There are nine (9) IBs: eight within the Regional Development Agencies (RDAs) and one within the Ministry of Regional Development and Tourism. Other Bodies making part of the implementation mechanism of ROP are : Certifying & Paying Authority (Ministry of Economy and Finance), and Audit Authority (Romanian Court of Accounts).

The ROP Intermediary Bodies are implementation entities at regional level and they organised a communication network to accelerate the dissemination of Regio information for local areas. They undertake certain tasks of the MA, on the basis of a written agreement, and are the main bodies that hold the contact with the applicants. There tasks are indicatively summarised below: Assist applicants in project development; Contribute to the delivery of the ROP Communications Plan at a regional level including local publicity, information and training events; Participate in the preparation of calls for proposals; Launch the calls for proposals, according to the schedule established by the ROP Managing Authority; Receive and register applications according to the relevant procedure; Check the administrative compliance and the eligibility of the applications submitted, in conformity with the criteria established by the ROP Managing Authority and approved by the ROP Monitoring Committee; Send to the Managing Authority reports on a monthly basis with regard to the applications that were submitted and their acceptance or return after their eligibility check; Organize the technical and financial evaluation sessions, with the support of the independent evaluators; Send to the

Managing Authority the technical and financial evaluation reports of the applications that received the positive endorsement from the Regional Committee for Strategic Assessment, including the list of projects proposed for financing and of those that were rejected, together with the rejections reasons; Notify the applicants with regard to the results of the evaluation process of their application and informs the RCSA with regard to the projects that were proposed for financing and those that were rejected; Carry out on-the-spot checks of projects; Take action as agreed with the MA in the case of fraud irregularities, and financial corrections; Ensure that all the documents and procedures for the establishment of an audit are in place, in accordance with the relevant procedures etc.

3. Communication networks

The term "network" can refer to any interconnected group or system. Networks connect everyone to everyone, contrary to hierarchies, which do not; rather they create formal channels of communication and authority. Networks operate informally with few rules, they depend on trust.

They are formed because people need one another to reach common goals. Mutual help, assistance, and reciprocity are common to all functioning networks, which are not only self organizing but also self-regulating. Networking is the most powerful way to build professional relationships, actively foster contacts and disseminate information. Networks can actively contribute to strengthening the communication power on the territory and thus helping to close the gap between EU Institutions and the people by improving the communications flow among the different bodies.

The European Commission encourages the creation of networks at different levels. The new Communication puts forward a set of future actions to foster a general and permanent debate on the future of the EU among people from all walks of life, at both national and EU level. It will, among other initiatives launch on-line networks which will bring together European, national and regional parliamentarians, journalists and other European opinion-makers to share information, knowledge and ideas on the EU.

INFORM network is open to EU communication officers who want to *inform* others about their experiences with the *information* on the ERDF, Cohesion Fund and EU Cohesion Policy, who want to be *informed* about inspiring ideas and communication projects developed in other Member States or regions, who want to meet other communication officers and learn from each other in formal and *informal* ways. It is coordinated by the Information and Communication unit of the European Commission's Directorate General for Regional Policy.

The network aims to foster the exchange of good ideas, learning from the experiences of others and creating common tools, where needed. Its composition is two-fold: the core group comprises one representative per Member State, usually from the central body responsible for coordinating ERDF/Cohesion Policy. The core group's key tasks involve conveying information about publicity and communication activities in the Member States as well as sharing the latest communication tools and exchanging information gathered from meetings held with the national networks of communication officers in each country. The general group includes communication officers from the ERDF and Cohesion Fund programmes, who want to participate in the network on the voluntary basis.

INFORM wants to grow to include all communication officers from the ERDF and Cohesion Fund programmes, who are responsible for developing and implementing communication plans and interested in sharing their experiences.

A. National Networks

Every country has one or more managing authorities or organisations that are responsible for distributing information on activities within the various EU programmes. The information officers in these organisations are easy to identify, and they have a clear remit and access to central information and communications from the EU.

There are other communicators on the fringes of these groups, who in their various positions are also responsible for providing information on the EU-funded programmes.

They can be communicators at local authorities or organisations, whose jobs are related to the Structural Funds in some way, but without giving them access to all sources of information.

Creating a national communicators network is therefore an important stage in providing integrated and consistent information about the Structural Funds and the EU. Such a network can, for example, consist of representatives from all the Operational Programmes within one country during a programming period.

The aims of the network can be to:

ensure an exchange of experiences and good practice, coordinate communication work, create synergy effects, share information about experience of the EU's communicator network INFORM. Some examples of what this might involve include distributing the results from various activities in the communication plan, sharing experiences and good practice, holding discussions around how the various regulations are to be interpreted and adapted to local circumstances, etc.

The network should meet regularly, e.g. the Bucharest Ilfov Regio Communication Network meet four times by year. The meetings are focus on the experience sharing, presenting various information products, discussing practical issues at the thematic workshops. External speakers, e.g. from the respective County Council from Ilfov and/or Bucharest offices and media experts are invited to enrich and contribute to the discussions.

B. Networks with beneficiaries

Information is the heart of Structural Funds programming. Applicants and beneficiaries need guidance in order to submit good quality projects and to implement their projects in line with the regulatory obligations. The dissemination of information and the transparency of programmes is a vital element of an Operational Programme activity. As a result, the contractual partnership between managing authorities and beneficiaries is a close-knit relationship as it affects the very success of the programme. Two-way communication here is a strong priority: beneficiaries need to understand what can and cannot be done with the Structural Funds co-financing and programme managers require

information on the programme's progress to make strategic decisions.

Effective networking with beneficiaries is crucial and should be combined with tools which support interactive, personal communication (i.e. events, seminars, workshops and one-to one meetings together with documentary sources of information such as programming documents, guidance, toolkits, newsletters and websites). We must always bear in mind that information regarding structural funds programming is often complex and versatile and that beneficiaries vary in terms of their degree of knowledge, experience and know-how in dealing with Structural Funds.

To be effective, communication must be centred around the beneficiaries' needs, taking into account their degree of familiarity with regional policy jargon and procedures. Good communication is not about giving out information blindly, but making sure that it is receiving has the desired results. The main objective is to avoid that applicants and potential beneficiaries abandon their projects under the false impression that applying for Structural Funds is too difficult.

C. Enhance the publicity and communication capacities of beneficiaries

It is widely acknowledged that beneficiaries and project implementers often ignore their information and publicity obligations and lack the necessary resources, skills and experience to design and implement their publicity measures. Since beneficiaries have a binding obligation to publish the Structural Fund contribution to their activities, it is essential for Managing Authorities. One effective way of doing this is by developing a network relationship between the appointed Managing Authority Information Officer and the information officers of the beneficiaries. With the establishment of an effective channel for dialogue and interaction, a Managing Authority can ultimately ensure compliance and consistent communication by beneficiaries. A consistent networking initiative produces new dynamism and additional motivation.

4. A systematic dialogue and transparency of the Region

Cohesion Policy touches **all regions** in the EU. This has created a new communication opportunity, to present Cohesion Policy as a policy for all regions as well as being the main vehicle for the growth and jobs agenda. Over this financial period we are responsible for the biggest part of the Union's budget and for the main instrument that directly serves the citizens. For those reasons our policy is perfectly suited to explain the European added value and the real benefits brought by the common participation in the European Union. Hundreds of thousands of projects already developed across Europe and those still planned give the best testimony and the practical face to the European Union.

In this context it is imperative that the positive role that is being played by the European Union which ultimately benefits all European Union citizens is fully understood and communicated to all citizens. The responsibility for delivering this message depends on the successful communication and delivery of information and publicity measures by individual Member States and regions. In other words responsibility lies with Member States and regions to get the message across and to develop and deliver a positive image of EU activities.

The EU brand should be something that is sought, admired/followed and understood by private individuals as a stamp of quality, integrity and recognised as the standard bearer when it comes to delivering a public good to the people of Europe. Information and publicity measures are key to marketing this brand. Article 69 of the Council Regulation 1083/2006 obliges Member States and managing authorities to provide information on the respective operational programmes and publicise co-financed operations. European Union citizens and beneficiaries are the main target groups of those information and publicity actions, whose aim is to highlight the role of the Community and to make sure that assistance from the Funds is transparent.

The detailed requirements have been addressed by Articles 2 to 10 of the Commission Regulation 1828/2006. These articles encompass the spirit of the Legislation which is to inform the public, create a positive

identity and ultimately to make them aware of activities and keep them up to date on the policies of the European Union.

Transparency should be the cornerstone of any EU activity as it is imperative for the successful use of the funds. Therefore it is obligatory to publish the list of beneficiaries. By doing so this removes any veil of mystery about the destination of funding and makes it clear to all citizens that the EU can deliver positively to their locality be it in the form of a new motorway or additional childcare places.

Beneficiaries also have a special role to play in this process. They can and should show through their projects, developed with the cohesion policy assistance, that the European Union is indeed present around us and supports the regions' economic development and improves people's lives. By fulfilling their responsibilities as laid out in these articles, the Managing Authorities and other responsible bodies can go a long way in ensuring that the success of EU structural funds is properly communicated in their respective regions.

Ad hoc contacts exist already between the Commission and the local and regional authorities, both directly and through their associations. In response to the commitment given in the White Paper on European Governance, the Commission wishes to make this dialogue systematic. The following principles justify the need to involve the regional and local authorities in the formulation of European policies:

Openness improved information and ownership of the Community's policy position are needed. Since they are democratically elected and close to the ground, the regional and local authorities are well placed to provide the citizen with information.

Participation - The White Paper on governance affirms the need for the European and national associations of regional and local authorities to be involved with due regard for the institutional architecture of the Union and the Member States' internal organisation.

Coherence - The Commission acknowledges the need for better assessment of the impact at

regional and local level of Community policies in areas such as transport, energy and the environment. Analysing the impact of measures proposed at Community level will contribute to inform the different actors of the effects of these measures and guide them in their implementation tasks.

Effectiveness - Some Community policies are implemented and/or have the greatest effect at regional and local level. Local government authorities are ideally placed therefore to assess the coherence and effectiveness of Community policies.

5. Conclusions

The purpose of national / regional aid is to support investment and job creation and encourage firms to set up new establishments in Europe's most disadvantaged regions. In order to support economic development in these regions during the period 2007-2013, the guidelines introduce criteria to assess the compatibility of national regional aid with the internal market.

The Romanian Regio Communication network could insert the information deep into local level, to involve local authorities to understand the EU financing principles. Also the network can present how Romanian institutions can help local administration to use the financial allocation for the local development.

If we don't communicate, if we don't involve we don't exist!

i_onescu@yahoo.com

codreanudia@yahoo.com

Abstract

When Romania's EU integration has brought joy to be apart became EU members and the responsibility to rise to the level of other EU countries. Fundamental challenge is for Romania, operating capacity of regional policy of arbitrary independent axes and influence the political dimension.

Regional development policy is a set of measures planned and promoted by local and central public administration authorities, in partnership with different actors (private, public, volunteers) to ensure economic growth, dynamic and sustainable by building effective regional potential and local, to improve living conditions.

Economy of a country, region or group of countries and the whole world, develops cyclically. This means that in certain periods of time, one country (a group of countries, etc..) Is characterized by a growing economy, followed by a limitation of extension, then a decrease, that stopping it.

A stronger integration at both regional and world countries and population following the widespread introduction of information innovations that have led to significant reductions in transport and communication costs, eliminate artificial barriers that hinder the movement of goods, services, capital, knowledge and people between countries is that globalization is called a complex phenomenon.

Keywords: regional development, financial instruments, Regional Operational Programme

JEL Classification: R50, R58

The Treaty of Rome (1956), there were no express provisions relating to a joint regional development policy, as in 1974

created the European Regional Development Fund (ERDF), to support Italy and Britain.

Single European Act of 1986 raises the question of economic and social cohesion, representing the beginning of regional development policy. In February 1988 the European Council to extend the operation Brussels solidarity funds represented by the European Social Fund (ESF), European Agricultural Guidance and Guarantee (EAGGF), European Regional Development Fund (ERDF) now called Structural Instruments - namely to increase significantly their allocations from the Community budget. It is recognized and officially declared the importance of these instruments to reduce regional disparities

Regional policy was defined first in the Maastricht Treaty in 1992.

EU regional policy to reduce economic and social development disparities between regions of Europe, to encourage harmonious development throughout the whole EU and promoting equality. In 2009 adopted a new strategy EU sustainable development that is directed towards achieving long-term targets implementation of environmental actions, actions to counter the phenomenon of global poverty and begin preparation for inclusion [1].

EU regional development policy is based on financial solidarity and is supported by contributions from Member States to the Community budget, funded by Structural Instruments developed multi-regional development programs along with other regions, Member States and the Commission proposed by the Commission for all EU.

There are large differences in development between the Member States and between regions within them. These differences in development have widened with the accession of ten countries in 2004,

Romania and Bulgaria in 2007. Thus one of the most prosperous regions of Europe (London) has a GDP per capita of nine times higher than in the poorest regions of Romania.

The European Union took advantage of the accession of 12 new members to reorganize and regional policy for 2007-2013 has three main objectives: convergence, competitiveness and cooperation. This new approach was called Cohesion Policy[2].

When Romania's EU integration has brought joy to be apart became EU members and the responsibility to rise to the level of other EU countries. Fundamental challenge is for Romania, operating capacity of regional policy of arbitrary independent axes and influence the political dimension.

Regional development policy is a set of measures planned and promoted by local and central public administration authorities, in partnership with different actors (private, public, volunteers) to ensure economic growth, dynamic and sustainable by building effective regional potential and local, to improve living conditions.

Regional policy in February , to achieve its objectives, has provided more financial instruments - the Structural Funds and Cohesion Fund - which for 2007-2013 were allocated 348 billion from the Community budget.

For 2007-2013, three instruments will finance regional programs:

European Regional Development Fund (ERDF) - to finance infrastructure projects generated, innovation and investment.

European Social Fund (ESF) - finances projects for training and other assistance programs to employment.

Cohesion Fund (CF) - finance large infrastructure projects, environmental and transport in new Member States, Spain and Portugal (living standards are below 90% of EU average).

In addition to these tools is used complementary action undertaken by the European Fund for Agriculture and Rural Development (EAFRD) and European Fisheries Fund (EFF).

The Romanian Operational Programmes agreed between the European Union is the Regional Operational Program (ROP) [3] , which is a very important tool for implementing the national strategy and regional development policies. Is applicable to all the 8 development regions of Romania.

The overall objective of the ROP is to "support and promote local sustainable development, both economically and socially in their regions of Romania, by improving conditions for infrastructure and business environment, supporting economic growth. This program aims to reduce economic and social development disparities between the more developed regions and less developed.

Romania Regional Operational Programme is funded by one of the EU Structural Funds - European Regional Development Fund (ERDF). It supports EU regions have a GDP per capita below 75% of EU average.

The total budget allocated to this program is about EUR 4.4 billion in the first seven years after accession (2007-2013). EU funding represents approximately 84% of the Regional Operational Programme, the rest comes from national funding, public financing (14%) and private financing (2%).

Distribution of funds is done on the priority axes of the Regional Operational Programme. Each priority has allocated a budget and includes a number of key areas of intervention in pursuit of development objectives. Regional Operational Programme priority axes are presented below 4 :

Priority Axis 1: Support sustainable development of cities - urban growth poles (30% of the budget ROP). It aims to support urban development to enhance quality of life and creating new jobs.

Priority Axis 2: Improvement of regional and local transportation (20.35% of budget ROP). Aimed at rehabilitation and modernization of county roads, urban streets, including ring roads.

Priority Axis 3: Improvement of social infrastructure (15% of the ROP).

Its purpose is to improve social services infrastructure, health and public safety in emergencies; educational modernization.

Priority Axis 4: Strengthening regional and local businesses (17% of the budget ROP). The aim is finance for business development support structures, rehabilitation of disused industrial sites, supporting micro-enterprises.

Priority 5: Sustainable development and tourism (15% of the budget ROP). The objective of this axis is to help restore cultural and historical heritage, upgrading the tourist infrastructure, improving infrastructure quality natural areas that could attract tourists.

Priority Axis 6: Technical assistance (2.65% of the budget ROP). Provides support

for transparent and effective implementation of the Regional Operational Programme.

Proposed priority axes and areas of intervention included in the ROP are in line with the Lisbon objectives, the EU Cohesion Policy and the Community Strategic Guidelines. The program also is consistent with the principles of Structural Funds Convergence objective.

Regional Operational Programme 2007-2013 is a program that implements key elements of the National Regional Development Strategy of NDP, contributing, along with other sectoral programs to achieve the overall objective of the National Strategy - Regional, namely reducing disparities between regions of Romania. Regional Programme will be funded during 2007 - 2013 European Regional Development Fund, in proportion to 85% of the total eligible project cost and financing of national resources (state budget and local budgets or private contribution).

Comparative analysis highlights the Development Regions, after 1990, a growth process of economic and social development disparities between regions. Differences in development between the developed regions (Bucharest - Ilfov) and the least developed countries (North-East), in terms of GDP per capita increased almost threefold. At the same time, there is growing disparities between regions located in the western half of the country (Northwest, Central and West), with positive economic developments and increasing levels of numerous economic and social development indicators, and those in eastern half of the country (Nord-Est, Southeast, South and South-West), less developed.

As I said the main objective of the Regional Operational Programme is to help regions lagging behind in terms of development and the somewhat more prosperous regions, less developed areas, by exploiting their specific resources, hitherto underused to accelerate growth of these areas.

Identified the main route for achieving this goal is the allocation of funds regionally differentiated according to the general degree of development of Regions ie, inversely proportional to the size of GDP per capita, less developed regions so as to benefit proportionately from a financial allocation higher. These funds will be used to fund projects with major impact on regional and local development: the rehabilitation and upgrading transport infrastructure, educational,

social, health and public safety, improving the business environment through developing business support structures (industrial parks , technology, logistics, business, etc.) and private enterprises to support initiatives, tourism and cultural potential of developing tourism infrastructure and supporting business initiatives in this area, supporting the development of urban centers with growth potential, in order to create conditions to act as engines of regional and local development.

Calls for proposals will be released regularly in each of the key areas of intervention. When a call for proposals was launched, eligible projects that receive funding only key area of intervention.

Economy of a country, region or group of countries and the whole world, develops cyclically. This means that in certain periods of time, one country (a group of countries, etc..) Is characterized by a growing economy, followed by a limitation of extension, then a decrease, that a halt to its five[4] .

In the intellectual world is about to produce a blockage of understanding, because they say and write so much about globalization in June , the visible sign of this truth is just to manage the crisis, from any perspective, the globalization project.

A stronger integration at both regional and world countries and the population as a result of widespread introduction of information innovations that have led to significant reductions in transport and communication costs, eliminate artificial barriers that hinder the movement of goods, services , capital, knowledge and people between countries is that globalization is a complex phenomenon called July .

Globalization has become the expression of a system that integrates the highest level and always remain open to integration because their intentions of running increasingly obvious. The exclusion the system is an exceptional opportunity and entry is liberalized, as the whole is designed to absorb changes in extremes, including failures, even if it is a party[6].

Globalization is shown as a new world order, one that is multidimensional in nature and corollary [7] .

Given human development, globalization is not only trade markets, capital and financial, but everything that is fundamental to people, all things surrounding life: technology, environment, culture etc..

As a strategy, globalization is the direct expression, verifiable and substantiated the rationality and reason.

Globalization is definitely an ideal to meet the truth with freedom and justice, amid general prosperity production undertaken individually, not the best world, a world only possible long-prepared human nation.

Global ideas, global markets, global technology, global solidarity can IMB Ogata lives anywhere, but they can and poverty simultaneously. The key defining characteristics of globalization is the contraction of space and time, the disappearance of borders and the emergence of new markets, new rules, new players and new media. Promoting globalization of human perspective is to ensure that its benefits are shared equitably and that the growing interdependencies between countries working for people, not for profit.

Globalization has made communication easier or more regions of the world, it connected him to the economic reality - Social western countries.

Benefits of globalization are felt in all areas and numerous world and in all fields, with major influence not only in poor countries in the de veloped or developing countries but also in developed countries.

But as any phenomenon in addition to positive effects, globalization has brought a number of adverse effects. Today, as a result of the development of ties of interdependence, it becomes increasingly obvious that the world is gradually in one societal system, which affects us on all of us.

Looming global system is not only an environment where there are private companies that evoluează distinct systems. He is, by social ties, economic and political, through institutionalized forms common to communications systems and across boundaries between states, a new system, which tends to limit substantially subsequent action systems by providing a decisive fate of those living in each.

Also looming on the common consciousness globality, the planet on which we live and can not, the planetary system, the world's problems are going to find. With this phenomenon of globalization, we have found that people who live on the planet is one. Now we can only say that we are one human family and that we must overcome all national boundaries, linguistic, cultural, racial and religious. Globalization is by nature a human

dimension, regarded as the world as a whole, as humanity requires, besides the involvement of society, involving the destiny of the individual, the human species as a whole. It reduces the feeling of loneliness, isolation or exclusion.

Costs of this world view, globalization transcends appearances, it concerns all global, based on essences, on substance, in effect, means and purpose, seeking answers to the challenges posed to us design our common future.

Switching from bi-and tri lateral treaties to regional and global treaties, the laws and legal institutions, jurisprudence and doctrine Regional / globalization, the regional network to the Constitution - and "tomorrow" in a global - is also a major challenge alter the concepts, mentalities and structures. Thus, gradually, the new government will reach a common, global, which, in a given national governments will determine the (national), applying the principle of subsidiarity in a position of increasingly large in various fields .

Globalization, the process involves continuous motion as a source of progress and development, and a dual national and individual identity (citizenship). It requires an education beyond the requirements of the specific national education that values take into account relevant social validated regionally and globally such as cultural pluralism and intercultural learning, freedom, equality, solidarity, democracy and rule of law, alteralitatea market free, etc..

Globalization is a process that expands the determinant of social change in the world as a whole. It is an integrative process, thought many sides of knowledge attained, at the same time is syncretic, has a unitary (unity through diversity). Thus, while social change was first addressed in local and national context, globalization has increased the concern for interest in explaining the relationship between territorial units and the world as a whole, wearing discussions on problems relating to local report - Global and multilevel analysis.

Our planet is in fact a variety of a whole, an identity system consisting of different subsystems in September .

Potential, where we approach the world as a whole will be found in each subsystem and at the same time, each subsystem, locality, region or nation-state will be found anywhere in strengthening reg. Each component is dezindividualizează, is becoming more and more as whole, while the entire

manifest ever more the components and local conflicts are global social problems.

Globalization has often been what is called "book world" where mankind can write the most interesting episode in her life. It is therefore among the most important social changes facing the world today. Many of today's fundamental issues, such as organic, to avoid a military confrontation or global fight against terrorism are of global importance.

The study of globalization has assumed the character of fundamental research as a comprehensive investigation, multidisciplinary nature and human society, aiming to solve global issues vital to the conservation and sustainable development of our appliances.

Starting from the fact that globalization is stateless, it borders the designers get to our planet or its synthetic components - regional - managing the process of globalization is in fact our entire planet heritage management. It is therefore necessary to adopt coercive measures gradually, starting with protecting natural resources to establish the rules of economic and financial policy in the military field, research cosmos, etc..

Globalization and the introduction of market economy countries in the process of transition from a command economy to an invisible hand regulating the economic and social activity on the principle of efficiency has not produced the expected results. We believe that a rapid transition to market economy standard of living and prosperity will grow rapidly. Instead of the expected growth, poverty has increased - for many people the market economy creates greater restrictions than the command economy. This was possible to transition process by using shock-type therapies, which have forced a number of developing countries to open trade barriers, while developed countries have maintained for certain categories of goods and services could compete - thus preventing the former socialist states able to export agricultural products, depriving them thus the income of which were desperately needed.

To go beyond the old order, globalization is a tendency to reorder the world [8].

Currently, exploitation of natural resources is an important component of globalization, and in some respects failures in developing countries rich in resources are

representative of the failures of globalization [9]. West depends heavily on natural resources that it receives from developing countries and their motivations do not always coincide with the welfare of developing countries. However, for globalization to deliver good results long term, developing countries and their citizens should receive more favorable conditions.

If the benefits of globalization in many instances were small, Price Is I paid was much higher social costs are, in some cases, huge, natural environment, pollute, and too fast pace of change has not allowed countries to adapt to new system values.

But fortunately, there are successes that entitle us to be optimistic about the functioning of globalization.

The Analysis of Labour Regional Imbalance in Romania

NEGOTEI Ioana-Alina

BALABAN Georgiana

The Bucharest Academy of Economic Studies

gina.balaban@gmail.com

ioanaalinanegotei@gmail.com

Abstract

The paper analyses the directions of inter-regional migration in Romania in the years 2000-2007, taking into account the influence of economic factors on migration flows as gross wage, GDP per capita and regional unemployment rates. The influence of these factors can be justified in such a way that migrants move from poorer regions to richer ones, in search of better living conditions. Econometric model developed in this paper show that getting a higher salary was in the analysed period a significant factor for migration inflow. Following the results we conclude that regional imbalances in the Romanian labour market leads to a deepening of regional disparities.

Keywords: inter-regional migration, labour market, regional imbalances.

JEL Classification: J61, J68

1. Introducere

Migration is not a recent phenomenon, but is a permanent one, that has occurred all over the history of mankind, most countries of the world are increasingly affected by international migration: either as senders of emigrants, receivers of immigrants, or in many cases as both.

The most studies on international migration focus on the national level, while impact assessments at local or regional scales are rather rare, an overview in Gorter (1998); and more recently Nathan (2008) on the local impacts in the UK; and Partridge (2008) and Chappell(2009) on outcomes in rural America and rural UK). The predominantly national focus is intriguing as most problems –but also opportunities-associated with international

migration are experienced at local or regional level.

To migrate or not, is determined by a number of factors, that can be different, from economical aspects to personal or even political aspects. One's decision to migrate or not is due to the difference which can be viewed as the result of gains or costs that migration involve. While the gains are usually more easily to work out, the costs contain some elements that are hard to quantify, having a high subjectivity element.

In order to take the decision of migrating or not, one should take into account the next elements: direct costs (for instance the cost related to transport), the lost gains and the psychological costs (usually related to the loss of friends and loneliness). The family concept can be important in taking a decision because migration costs for a whole family is faraway more expensive than those for a single person (McConnell& Brue1995).

An important factor in taking or not this decision is represented by the person preparation level. Specialist showed that there is a strong connection between one's preparation level and the migration probability. This result is due to the fact that the persons with a high preparation level are more efficient in identifying the alternatives on the labour market, in this way the migration costs being reduced.

Internal migration means people moving between various places in the same country, which leads to permanent or longlasting changes in their place of residence (Holzer, 1994), a significant element of internal migration is inter-regional migration, which consists in people moving from one region to other. One important aspect of migration is labour force migration for occupational reasons, people aim at getting better access to the labour market, higher wages or better conditions for starting up their own businesses

compared with their previous regions of residence.

The purpose of the analyses undertaken in this paper is to determine the directions of inter-regional migration in Romania in the years 2000-2007, pointing the major factors that cause her, and to observe how inter-regional migration can influence regional imbalances.

Analysing the determinants of inter-regional migration I take into consideration macroeconomic variables as: relative gross wage, relative per capital GDP and regional unemployment rates.

E. Kwiatkowski, L. Kucharski, T. Tokarski (2004) consider that, the influence of these factors can be justified in such a way that migrants move from poorer regions to richer ones, in search of better living conditions. The variation of regional unemployment rates can affect inter-regional migration in a similar way, because some migration are dependent upon the situation on the labour market. In the regions whose unemployment rates are high, the migration outflows should also be comparatively high. This happens because, after losing hope of finding a job in their resident region, some jobseekers start to look for a job in other region, which should translate itself into streams of inter-regional migration.

2. Model

Studying the influence of economic factors on migration flow, according to the study of Tomasz Tokarski, we have estimated the parameters of equation using fixed effects method estimation:

$$mn_{i,t} = k_0 + k_1 \frac{y_{i,t}}{\bar{y}_t} + k_2 (u_{i,t} - \bar{u}_t)$$

where:

$mn_{i,t}$ = $mi_{i,t} - mo_{i,t}$, - net migration inflow into region i in year t. $mi_{i,t}$ - gross migration inflow into region i (i=1,2,..8) in year t (t= 2000,2001,...,2007) per 1.000 inhabitants of region i;

$mo_{i,t}$ - gross migration outflow from region i in year t per habitants of region i;

$\frac{y_{i,t}}{\bar{y}_t}$ - ratio of variable y in region i in year t over the average value of variable y in year t. Variable y is respectively gross wage or GDP per capita.

$(u_{i,t} - \bar{u}_t)$ -difference between the unemployment rate of the i region and the average unemployment rate of Romania in year t.

$en_{i,t}$ -error terms assumed to be white noise
 k_0 -intercept devoid of direct economic interpretation.

k_1 - show the extent to which net migration change due to the changed variable y from de average value

k_2 - show the extent to which net migration change due to an increase in the difference between the unemployment rate in a given region and the national average.

2.1. Data

The data for our empirical analysis is obtained from the National Institute of Statistics and has annual frequency, it is used series that are both time series and cross-sections type series; analyzed period time is 2000-2007, cross sections refers to the eight development regions in which our country is divided.

2.2. Empirical results

Applied the unit root test for the time series used in model estimation, we found that time series are non-stationary; data series become stationary ones by applying first order module differences, so we test the relationship between the intensity processes. The results are:

If GDP per capita plays the role of y variable we have:

$$N_NE = -1.1612 - 3.3371 + 19.4888 * P_NE - 0.1554 * S_NE$$

$$N_SE = -1.3861 - 3.3371 + 19.4888 * P_SE - 0.1554 * S_SE$$

$$N_SM = -0.9009 - 3.3371 + 19.4888 * P_SM - 0.1554 * S_SM$$

$$N_SV = -1.3733 - 3.3371 + 19.4888 * P_SV - 0.1554 * S_SV$$

$$N_VE = -1.8186 - 3.3371 + 19.4888 * P_VE - 0.1554 * S_VE$$

$$N_NV = -0.9327 - 3.3371 + 19.4888 * P_NV - 0.1554 * S_NV$$

$$N_CE = 8.1042 - 3.3371 + 19.4888 * P_CE - 0.1554 * S_CE$$

$$N_{BI} = -0.5311 - 3.3371 + 19.4888 * P_{BI} - 0.1554 * S_{BI}$$

Akaike info criterion = 6.87

Schwarz criterion = 6.97

F-statistic = 11.25

Durbin-Watson = 2.28

Taking into consideration the influence of the gross wage we obtain:

$$N_{NE} = -1.8148 - 4.1153 + 24.1366 * V_{NE} - 0.1556 * S_{NE}$$

$$N_{SE} = -1.1358 - 4.1153 + 24.1366 * V_{SE} - 0.1556 * S_{SE}$$

$$N_{SM} = -0.8998 - 4.1153 + 24.1366 * V_{SM} - 0.1556 * S_{SM}$$

$$N_{SV} = -1.3090 - 4.1153 + 24.1366 * V_{SV} - 0.1556 * S_{SV}$$

$$N_{VE} = -1.4727 - 4.1153 + 24.1366 * V_{VE} - 0.1556 * S_{VE}$$

$$N_{NV} = -0.9776 - 4.1153 + 24.1366 * V_{NV} - 0.1556 * S_{NV}$$

$$N_{CE} = 7.8907 - 4.1153 + 24.1366 * V_{CE} - 0.1556 * S_{CE}$$

$$N_{BI} = -0.2807 - 4.1153 + 24.1366 * V_{BI} - 0.1556 * S_{BI}$$

Akaike info criterion = 6.84

Schwarz criterion = 6.93

F-statistic = 13.46

Durbin-Watson = 2.24

Positive relationship between $Y_{i,t}$ represented by the gross wage ($k_1 = 24.13$) or GDP per capita ($k_1 = 19.48$) and net migration flow show that as the value of y (gross wage or GDP per capita) in the region „ i ” is close to the average of the year, the entire flow will increase.

Concerning the influence of unemployment rate, the value of k_2 close to 0 value ($k_2 = -0.15$) shows that unemployment rate has no significant influence, negative value can denote the fact that, the more unemployment was higher than average unemployment rate the more outflow will increase, population tending to migrate to regions with a smaller unemployment rate;

Result of the econometric analysis shows that gross wage has a greater influence on net migration than GDP per capita. Labour force migrate from one region to another due to

difference of earning, getting a higher salary was a significant motivational factor.

For both type of models F-statistic and T-statistics shows that parameters are significant. We notice that R^2 have small value which means that we face labour market rigidity.

The labor market is characterized by the fact that labor demand does not change equally with nominal wage changes, and any supply of employment does not evolve in relation to price and cost. The labor market in Romania is characterized by limited relevance of education to labor market requirements, few jobs, which is looking and well paid, and a large number of occupations with excess supply, a monopoly market consolidation of economic agents, high labor taxation, high administrative and legal barriers affecting the firms activity and thus the creating of new jobs.

Given that development region of Romania are large size, we can say that migration is a phenomenon that occurs especially intra-regional that inter-regional.

3.The effect of migration on convergence process

According to neoclassical models, wage and unemployment differentials are the driving forces for labour mobility. The liberalization of labour mobility between regions will trigger a reallocation of production factors among regions marked by disparities in labor market conditions. Labor will move from low-wage regions to high-wage areas. The reallocation of production factor leads to declining disparities in factor remuneration. According to traditional neoclassical approaches, there will be a migration equilibrium if no more wage disparities exist between any regions.

The opposite neoclassical framework literature suggests that migratory behavior and the migrant's characteristics are important in the convergence process. The exit of labor from poorer economies lowers gross fixed capital formation in such region.

Peter Nijkamp (2009) support that are two major impact of labour market: the scale (size) and the composition effect. Migrants with higher human capital endowments are expected to search for job-opportunities over wider geographical areas and are clearly more mobile. Labour flow influence the human capital endowments. Flow of skilled labour can lead to an upward shift in the production of the recipient region. The skills of the migrants

determine what happens to the economic opportunities in a source region when a selected subsample of its population moves elsewhere.

The removal of regional disparities through migration and local labour market adjustment takes a long time that relying exclusively on this adjustment mechanism may lead to underutilization of resource in depressed region (Pissarides and McMaster, 1990).

Barro, and Sala-i-Martin (2004) suggest that the effect of migration on convergence between region is very small. Cardenas and Ponton (1995) reported a negligible impact of migration on income convergence in Colombia (1960-1980). Similarly, Gezici and Hewings (2004) find similar no effect of migration in reducing regional disparities in Turkey (1987-1997), but in contrast, Kirdar and Saracoglu (2008) detect a strong impact of migration on regional growth rates and on the speed of convergence in Turkey (1975-2000).

Figure 1. Net inter-regional migration in Romania 2000-2007

Own calculations using data from National Institute of Statistics.

We can notice that in the period 2000-2007, the region with highest net migration flow are develop region, characterized by a high GDP per capita and implicitly high level of wage, we refer to the region like Buchareast-Ilfov, West as we can observe from the figure 1., while the region with low net migration flow are less developed regions typified by large shares of the employed in agriculture (North-East, South-West)

Migration inflow was from poor and agricol regions to industrial ones, so we can say that migration process leads to deepening regional imbalances, because this lack of human resources will affect economic activity.

Figure 2. External migration (2004-2007) Deviation from average

Own calculation using data from National Institute of Statistics

In terms of external migration, regions with the largest negative deviation from the average outflow were North East and Centre regions also faced with strong intra-regional migration.

At national level, migration of people like researchers, doctors, engineers and other qualified persons are a significant problem, because there is a major loss for the country, regarding the potential intellectually, scientifically and economically it represents them, and the loss on investment in their education.

4. Conclusions

The result of study shows that getting a higher salary was a significant motivational factor for migration inflow, according to neoclassical models, labor force follow the direction of moving from low-wage regions to high-wage areas, people leaved poor region like North-East, South-East, South-West, that was characterized by a large shared of employment in agriculture and went to the develop regions as Buchareast-Ilfov and West, which have a large shared of employment in trade, construction, industry (see appendix table 1) or migrate to other countries

During the analyzed period, migration process leads to deepening regional imbalances, because migration flows went to developed regions, especially in the capital of Romania which has become a polarizing zone, focusing the benefits; the less develop regions recorded losses due to the fact that the outflow of labour from poor economies

lowers gross fix capital formation in such regions.

Portuguese Regional Unemployment Patterns: A k-Means Cluster Analysis Approach

NUNES Alcina

BARROS Elisa

Instituto Politécnico de Bragança

alcina@ipb.pt

ebarros@ipb.pt

Abstract

The k-means cluster analysis technique is an important ally in the study of economic patterns in a multivariate framework. Aware of its analytical importance this paper adopts such method of study to identify groups of Portuguese administrative regions that share similar patterns regarding the characteristics of unemployed registered individuals. The regional distribution of the unemployed individual characteristics is of core importance for the development of public policies directed to fight the unemployment phenomenon, especially in times of crisis. Preliminary results show a clear division of the territory into four regions – north and south and urban and rural areas - that stresses the importance of designing well-directed public labour policies.

Keywords: regional unemployment, labour market, regional dissimilarities.

JEL Classification: J64

1. Introduction

A study of the regional dissimilarities in a labour market can not be limited by a simple descriptive analysis of the associated phenomena. It should establish standards for spatial comparison of the territories subject to analysis in order to develop public policies of both central and regional scope. These policies should be the most appropriate to fight the associated unemployment problems. The generation of employment public policies, used to fight the persistent phenomenon of unemployment, have deserved a particular attention in the Portuguese economy over the last decades, however, little is known about the profile of the registered unemployed individuals along the national administrative

regions. That knowledge is of crucial importance to develop public labour market policies specifically targeted to the regional unemployment profiles.

This type of analysis begins to be developed in some economies since it is believed to be of core importance for understanding the phenomenon of unemployment at the aggregate level. Moreover, according to authors like Marelli [4] economies that observe substantial changes in its GDP (a fast growth of the GDP levels, for example) do it at the expense of some regions over others. The consequence is the promotion of the observed regional disparities that could be observed, namely, throughout different profiles of regional unemployment. The so-called European Union enlargement countries had experienced this phenomenon which led to the production of various studies on the phenomenon of regional unemployment [1, 2 and 5].

In this research work, it will be aimed to bound regions of the country - using the district as the territorial unit - according to a specific profile of registered unemployment. So, it will be applied a classification analysis where the territorial units are grouped into classes, according to their similarities observed through the set of explanatory variables presented. The aim is to detect the presence of homogeneity among different districts based on a multivariate statistical method – the k-means clusters analysis methodology – for the year 2009. To reach the mentioned goal it will be taken into account a set of variables made public by the institution that administrates the registers of unemployed individuals in the Portuguese economy – the *Instituto de Emprego e Formação Profissional (IEFP)*.

The article is presented as follows. The next section presents a description of the registered unemployment rate in Portugal taking into

account a set of characteristics that describe the unemployed individuals registered in the national employment services. In Section 3, it is explained, briefly, the methodology selected for the empirical analysis presented in Section 4. This section presents and describes the results obtained there. Section 5 presents the average cluster unemployment profiles and section 6 concludes.

2. Registered unemployment data

The unemployed individuals registered in the Portuguese public employment services of the *IEFP* present a given set of distinctive characteristics that make each of them different from the others. Such features are related with the gender, age, formal education, unemployment spell and relation to a first or new employment. The data concerning these characteristics are openly available in a monthly period base. The data concerning the month of December collects information about the stock of registered unemployed individuals at the end of the respective year.

Table 1. Description of the registered unemployed individuals in Portugal

Characteristics		2009
Gender	Male	236.791
	Female	267.984
Age	<25 years	64.116
	25-34 years	119.441
	35-54 years	229.054
	>=55 years	92.164
Education	Less than 1° CB	27.408
	1° CB	142.665
	2° CB	96.529
	3° CB	99.976
	Secondary	94.442
Position relating labour market	Superior	43.755
	First Employment	37.556
Unemployment duration	New Employment	467.219
	Less than 1 year	329.358
	More than 1 year	175.417
Total		504.775

The registered values, here applied, were collected in December of each one of the referred years and represent the stock of register unemployed individuals in the public employment services during the year that did not found a formal employment or other solution to their lack of job problem.

3. Brief introduction to k-means cluster analysis

The seminal work of Tryon [7] introduced the cluster analysis. Such methodology is composed by a set of multivariate statistical methods that include different classification and optimization algorithms which intend to organize information concerning multiple variables and shape homogeneous groups.

In other words the *cluster* analysis develops tools and methods that, given a data matrix containing multivariate measurements on a large number of individuals (or objects), aim to build up some natural groups. The groups or *clusters* should be as homogeneous as possible and the differences among the various groups as large as possible. The *cluster* analysis does not make conjectures about the number of groups or its structures - the groups are based on the similarities among the groups characterized by different ways of calculating the "distance".

Being the adopted variables quantitative variables, the application of the Euclidian Distance method is advised [3]. The distance is defined as the square root of the sum of the squared differences between the values of i and j for all the selected variables ($v = 1, 2, \dots, p$):

$$d_{ij} = \sqrt{\sum_{v=1}^p (X_{iv} - X_{jv})^2}$$

Besides the settlement of the distance among observations, computation method is still necessary to settle the computational method to calculate the distance among groups. Non-hierarchical methods choose in advance the k number of groups which will comprise all the observations. Then all the observations could be divided by the predefined k groups and the best partition of the n observations will be the one that optimizes the chosen criteria. One of the processes that could be applied is the k-means interactive partition method. The method follows the next steps: starts by dividing an initial partition of individuals by the number of clusters previously defined; computes for each cluster the respective centroid and the distances between each individual and the centroid of the various groups; transfers each individual to the cluster relatively to which presents the minor distance; re-computes the centroids of each cluster and repeats the previous steps until the moment each

individual belongs to a stable cluster and, therefore, it is not possible to carry out more individual transfers among cluster. The method presents the disadvantage of limiting the search for an optimal partition of individuals since it restricts the number of predefined clusters. Still, it has the advantage of defining the regions belonging to each cluster as well as the distance of each group.

4. Empirical Application

The empirical application of the cluster analysis present in this research work follows the methodological steps suggested in the cluster analysis literature.

First of all the observations in analysis where selected. Considering the availability of the number of register unemployment individuals by municipalities, and its characterization throughout a range of distinct variables, was possible to aggregate the municipality observations by district - the object of study in this research work. Such geographical option is explained by administrative reasons concerning the political and social cohesion of these geographical areas.

In a second step was made the selection of variables that offer the required information for the districts clustering. The selected variables comprise individual and labour characteristics. Regarding the individual characteristics is available information related to gender, age and education of the register unemployed individuals. Regarding labour characteristics is known the duration of the unemployment register period and the unemployed individual experience concerning the labour market (looking for a first employment *versus* looking for a new employment). Since the variables are defined in different measurement scales it was important to transform them in such a way that they could appear with the same standard measurement scale. This transformation avoids that some of the measures of similarity/distance reflect the weight of the variables with bigger absolute values and dispersion. In particular the standardization applied measures the relative weight of each variable in the total of the unemployed individuals register in the public employment offices, by district. This is, was computed the ratio of registered unemployed, by variable, regarding the total number of registered unemployed individuals.

This k-means algorithm assumes that the

number of groups (clusters) is previously known. However such assumption is rather unrealistic for most analysis problems since, normally, the data properties are not known. Thus the estimation of the number k of clusters is a frequent problem not only when applying the k-means algorithm but also other methods of clusters generation. In Stata, two testing methods for the optimum number of clusters were consider. Both Calinski-Harabasz pseudo F-test and Duda-Hart pseudo test point out for 5, 7 or more clusters. Following a parsimony rule, to avoid excessive information lost, the option was to divide the districts in 5 clusters.

The results for the 5-means methodology are presented in Figure 1.

Figure 1. Spatial distribution of districts by cluster

The analysis of the Portuguese territory allows concluding that exist a clear distinction between the north and south districts and between littoral (more urban) and inland (more rural) districts.

The visual results do not clarify, however, which is the mean profile of a registered unemployed individual. This mean profile was obtained through the estimation, in each cluster, of the mean values for the variables. The aim is to understand which variables better characterized the unemployed individual register in the public employment services of

each district.

The mean profiles of the registered unemployed individuals, for each cluster, are described in Table 2.

Table 2. Average proportion of each variable, by cluster (%)

Cluster		1	2	3	4	5
Gender	Male	48,6	47,0	43,2	47,4	44,7
	Female	51,4	53,0	56,8	52,6	55,3
Age	<25 years	16,4	15,7	15,2	13,1	13,4
	25-34 years	26,3	23,5	24,5	25,3	21,6
	35-54 years	41,8	43,9	41,9	43,7	45,2
	>=55 years	15,6	16,9	18,4	17,9	19,8
Education	Less than 1° CB	8,1	6,7	9,0	5,0	5,6
	1° CB	24,4	32,5	27,4	25,2	32,9
	2° CB	18,7	19,1	20,4	18,8	18,4
	3° CB	20,5	16,8	17,2	21,2	19,1
	Secondary	21,0	16,3	15,4	20,1	15,5
Superior		7,3	8,7	10,6	9,6	8,5
	First Employment	9,1	16,9	17,6	7,9	9,4
Position in the labour market	New Employment	90,9	83,1	82,4	92,1	90,6
	Unemployment duration					
Unemployment duration	Less than 1 year	76,0	62,9	69,3	69,6	61,4
	More than 1 year	24,0	37,1	30,7	30,4	38,6

5. Cluster unemployment profiles

Cluster 1: *Beja, Évora, Faro and Portalegre*. This cluster is characterized by the fact that it is the one with the biggest proportion of unemployed men and young individuals with an age inferior to 34 years. Maybe due to the youth of its registered unemployed individuals it is the cluster with higher levels of formal education and lower duration spells. The national increase of the number of registered unemployed individuals should have had as consequence the increase of proportion of individuals looking for a new employment

after losing their ties with the formal labour market.

Cluster 2: *Vila Real*. The cluster presents specificities that transform the region in a particular one. It is the district with the bigger proportion of unemployed individuals with age between 25 and 34 years and the bigger proportion of unemployed individuals with the first basic schooling cycle. It is also one of the regions with the bigger proportion of individuals looking for a first employment but with unemployment spells bigger than 1 year.

Cluster 3: *Bragança*. Like the district of *Vila Real*, *Bragança* appears in 2009 with special features. The rise in the broad registered unemployment stressed the proportional number of unemployed women with age superior to 35 years. It is the region in which the proportion of those without any formal education is higher but it is also the region where it is possible to find the bigger proportion of registered individuals with an university formal education. In 2009 it is also possible to notice that *Bragança* becomes the district with the bigger proportion of individuals looking for a first employment most of them with unemployment duration spell lower than 1 year.

Cluster 4: *Coimbra, Leiria, Lisboa, Santarém, Setúbal, Viana do Castelo and Viseu*. This group includes the districts with the lower proportion of unemployed young individuals (those aged less than 25 years). With a close relation to the previous fact, it should be noticed that it is the cluster with the bigger proportion of unemployed individuals looking for a new employment. The cluster aggregates regions close to the littoral and in the centre of the country suggesting that the changes in the number of registered unemployed had similar consequences in the unemployment profile of this contiguous geographical region.

Cluster 5: *Aveiro, Braga, Castelo Branco, Guarda and Porto*. Even if the cluster geographical dispersion is large, the five districts share among themselves the following characteristics. In 2009 they lose, for the benefit of *Bragança*, the bigger proportion of unemployed women even if the difference between male and female unemployment is the biggest in the whole country. It is the cluster with the bigger proportion of registered individuals aged more than 55 years and also the one with lower levels of schooling among the unemployed population. Due to the previous characteristics it is not strange to

observe that this is the group of districts with the higher proportion of long duration unemployed individuals (individuals with unemployment spell longer than 1 year).

6. Final Remarks

From the results analysis the main conclusion to withdraw is that there is a clear distinction among different regions of the country. This is particularly true when we analyse the littoral and the inland regions and the north and the south of the country. It is possible to identify different unemployment regional profiles according to the geographical areas. Other studies, applying the same methodology here adopted, had reached the conclusion that the littoral regions present development features different from the ones that could be found in inland areas. Those studies have alerted that any regional development policy should pay attention to this reality [6]. The previous mentioned authors advise to the particular fact that any regional development policy should prevent the youth migration from the inland (rural areas) to the littoral (urban areas) throughout the creation of employment opportunities in the less development areas of the country. This research work stresses that conclusion and highlights this fact.

The second conclusion to withdraw is that there is a window of opportunities to implement different labour market public policies in the Portuguese territory. It was possible to find regions where the youth unemployment, the long-term unemployment

or the female unemployment are concentrated. There are also regions characterised by a registered unemployed population with low levels of formal education, without any previous connection to the labour market or, in opposition, with previous links to labour market experiences.

A Cost Benefit Analysis on Developments in the EU Regional Policy

ORAC Madalina
STEFANICA Virginia
DAMASARU Costin
Academy of Economic Studies

Abstract

The measurement of the effects of regional policy basically means to compare costs with the results of these policies. The most often used indicator for this purpose is the number of jobs created on the basis of costs incurred in this respect, at regional level.

The cost of implementing a specific regional policy is already known by the government and can be easily quantified. Where regional policy expenditures are reflected in the classification of the work factor and in the substitution of companies' location, number of jobs directly created is also easy to estimate.

But reality shows that the effects of regional policies are more complex than those related to the number of new jobs created. Moreover, the initial costs of regional policy can have positive multiplying effects more difficult to quantify.

Key words: cost benefit analysis, regional policy, European Union

JEL classification: O18, R1

1. Introduction

The requisite to implement a regional policy in the EU arguments is based on social, political and economic points of view. These arguments can be summarized as [1]:

- the inefficient spatial distribution of the income: there is an inverse connection between economic growth and inequality in income distribution. However, improving interpersonal income distribution may lead to a less efficient allocation of resources affecting the welfare level. For this reason, the argument of equity in income distribution has more a social than an economic connotation;

- the more easily adjustment of the economic structures to major changes or to

macroeconomic shocks: issues related to EU enlargement. Thus, a candidate state may face more serious problems after its accession to the EU, such as the increase of unemployment. Therefore, Member States may grant aid to the state that has just joined the Union to overcome these problems;

- the optimization of the allocation of the work factor and mitigation of unemployment: in areas where economic activity is insufficiently developed, the unemployment rate is high. Regional policy may contribute to economic development and to the reintegration of the employment factor underused, whilst ensuring its high mobility and activation costs lower than the benefits obtained from this reintegration.

Although regional policy is implemented at the EU Member States level, the need of a common regional policy is arising from:

- the need of greater resources for implementing an effective regional policy, resources that not all EU member states have. The financial argument is fairly correct. Greece, for example, had to spend in the '80 - '90 period, a much larger part of its GDP on state aid than the whole EU.

On the other hand, Greece and Ireland have allocated a much smaller part of their GDP on infrastructure and research - development compared to the other Member States [2].

- the reason that the settlement of regional problems in a state is also good for other Member States. This consideration is related to the fact that any EU Member State shall enjoy the same welfare benefits;

- the benefits of integration within U.E. requires an equitable distribution, which may be provided by the regional policy;

- the necessity to provide compensation for some Member States, which have suffered from implementation of other EU policies such as CAP, transport policy and research - development policy. This argument

is often linked to the need for regional transfers within the EU, especially towards the peripheral regions, which have suffered most.

Regional Policy U.E. is implemented based on the allocations from the Community budget and only in the designated areas within Member States. This implementation should be monitored at EU level since:

- the net funds donors for regional policy are seeking to ensure that these funds will be used to increase the economic potential of regions lagging behind. It is intended as a temporary support for the regions which have a lower competitive level;
- regional authorities of several EU Member States cannot be sure of the application of the most effective measures for the development of their countries. As a result, the European Commission becomes viable to solve this inconvenience;
- as regional policy measures in a Member State have an impact on other Member States, it is necessary to coordinate regional policies at the Community level;
- regional policy approach only at national level can lead to the emergence of a race between different locations to obtain subsidies as large as possible.

The main challenges which the European Union currently has to face refer to:

- globalization;
- economic restructuring;
- trade liberalization;
- technological revolution;
- population ageing;
- labor migration;
- slow pace of economic growth;
- rise of unemployment in the global crisis context.

2. Cost – Benefit Analysis

Cost – benefit analysis at the regional policy level was introduced by Armstrong and Taylor [4], as highlighted in Table 1.

The first benefit (B1) is the result of regional expenditure policy. These costs have two categories of effects: the direct ones, linked to the level of economic activity in developed regions and, secondary, indirect, which takes the form of a benefic multiplying influence at regional level. Regional economic multiplier value is crucial in determining the actual costs of expenditure policies. The

greater the value of the multiplier will be the greater will be the overall positive effect of regional expenditure policy. If the regional expenditure policy is successful, it will have the effect of reducing interregional differences related to employment opportunities and income levels.

As a consequence, the benefits B2 and B3 will also be achieved due to the reduction of interregional migration. Where employment opportunities and incomes are higher, more and more immigrants will arrive from less developed regions. Migration imposes costs for both immigrant (private costs of migrants) and society (social costs of migration). A decrease of interregional migration flows will result in a reduction of migration costs at private and social level. Private costs are the financial ones (related to moving the house) and those related to leaving social environment (family and friends). Social costs of migration concerns the construction of more housing, schools, hospitals in a given region.

The following benefit (B4) of the regional policy arises from a spatial distribution of the negative externalities, e.g. pollution. If pollution is considered to have a cumulative effect on the environment, then it will be pursued the reduction of the concentration of polluting firms in a given area.

The B5 benefit refers to the fact that regional policy reduces the expansion of the differences in income and of its distribution. Concentration of revenue from the economic activities in a spatial subsection of economy is not fair. Therefore, the presence of policies such as progressive income taxes will have a benefic effect on mitigating inter-regional differences.

But inter-regional differences in income levels may reveal other sources of spatial inequality such as differences in regional access to better paid jobs, education or health care.

Finally, an active regional policy also allows the achievement of political benefits (B6). Interregional differences lead to a political cohesion of the whole nation. Thus, in Italy, Northern Areas have politically allied in the early '90s, as a result of higher fees they are required to pay to support the development of southern regions.

Table 1: The main costs and social benefits of regional policies

Benefits (B)		Costs (C)	
B1	The degree of employment factor, production and additional income achieved from increased economic activities;	C1	Loss of production, income and labor factor due to the diversification of conventional resources that are now used;
B2	Decreased number of migrants, which leads to reduced costs in public sector for services and infrastructure implementation;	C2	Infrastructure costs resulting from the effects of regional policy on development of economic activities;
B3	Decreased number of migrants, which leads to reduced private costs of migration;	C3	The costs of moving the production capacities to a new location;
B4	Decreased externalities;	C4	Increased externalities (e.g.: environmental protection);
B5	Fair benefits;	C5	Administrative costs;
B6	Political benefits.	C6	Political costs.

Therefore, national economic unit will contribute to a political unit. Thus, regional politics will get political benefits, as well as economic and social ones.

Often, regional policies lead to the employment of resources that, until then, were never used. In such cases, additional economic activity that will occur will not be independent from political intervention. Creating these additional economic activities leads to the achievement of some economic and social benefits with very low costs.

If the resources are drawn from an economic activity to another, regional policy will invoke a certain opportunity cost (C1). Political benefit will appear as the net benefit due to the increased economic activity, as a result of redirecting the resources from less productive activities to the most productive ones.

When regional policy is aimed at transferring resources from productive

activities to the least productive, the society will bear a net cost that will exceed the benefits obtained.

The second category of costs identified in the table (C2), are those associated to infrastructure elements. Thus, in predominantly rural areas infrastructure elements such as proper roads, are not sufficient, while, in industrial areas, raise the question of the road relocation to optimize access. The relocation involves additional items of expenditure. These costs include labor factor moving costs in the new locations of production capacity (C3) and not in all cases they are covered by governmental funds. In addition, there are costs related to the attraction of labor force necessary to replace workers who do not want to change their jobs, and expenditure on construction of new buildings and modernization of related. All the relocation costs are associated with a regional policy.

The fourth category of costs (C4) draw attention to the potential impact of regional policy on the environment for the benefit of the region analyzed. These costs should be reduced where relocation causes extensive retooling of existing industrial capabilities.

Cost category (C5) are those related to administrative costs associated with implementing regional policies. The absence of these policies implies the lack of such costs.

Finally there appear the political costs (C6) related to active regional policies, as in regions of northern Italy, previously analyzed. In general, regional political costs may be attractive to those who vote (voters) in areas covered by these policy measures.

All these elements show that regional policy is not implemented at low cost. It is therefore important to create additional economic activity instead of diversifying the existing ones, and money spent should allow the maximization of the benefits available to the region concerned.

3. Conclusions

A first conclusion that should be drawn concerns the increasing interregional disparities that will be generated by lower living standards in disadvantaged areas, and the tilt of balance of regional effectiveness towards the more developed areas.

The present paper aims to address various aspects of the regional disparities

issues and how to implement regional policy in the EU.

The implementation process of regional policy is based on cost benefit analysis as a key element for achieving sustainable economic development.

The Importance of Intangible Resources in Regional Developing: human capital, social capital

POPA Florina
Institutul de Economie Națională
florinacarina@yahoo.com

Abstract

A region's competitiveness is the product of its creative, attractive and maintenance activities which may increase its influence, assuming that for a sustainable economic development there are needed both the existence of resources and the implementation of some policies conducive to growth, employment and stability.

The study focuses on the importance of intangible resources highlighting – human capital, social capital, the relationships they create within the region and the influence they have on whole region's development.

The human capital constitutes a central element of the development's endogenous resources; the functioning of human resources is a basic element of performance to any organization. Skill level is part of the competition between firms, so human resources become a central factor in achieving competitiveness, also taking into account the new opportunities offered by technology.

The social capital - also a key factor in the development of the region, represents the relations of authority, trust and norms of reciprocity which develops in the organizational, institutional and social framework, within the individuals do their activities. The term of social capital can be understood as a product of the interaction between institutions (formal or informal) and labor processes in a society that can be exogenously or endogenously determined.

Key words: regional development, competitiveness, intangible resources, human capital, social capital.

JEL Classification: R – R0; R1 – R11; R5 – R58

1.1. Introduction

Competitiveness depends on achieving the most valuable and distinctive goods, requiring the initiative and strenuous efforts of the participants, their representation in the modern economy being given by knowledge, skill and creativity, values which ensures priority in competition (as opposed to traditional factors - land and natural resources) .

Within a region, competitiveness expresses the product of its creative, attractive and maintenance activities, which may increase its influence. For a sustainable regional development, policies are needed to create national favorable conditions and to lead to growth, occupation and stability. A region can be considered competitive if it has resources and it has useful features for the business which should motivate its location and investment decisions.

Among the conditions of interest for localization of companies and thus, important for successful regions are also the intangible factors of competitiveness. These include the ability of regional economy to generate and use knowledge and to give priority to innovation, to encourage entrepreneurship and creation of cooperation networks. These are factors to be integrated within the area development strategy; each one has to find an appropriate policy, according to its own economic, social, cultural and institutional characteristics.

Theories of endogenous economic growth stress the importance of intangible resources for competitiveness: human capital, technological capacity and innovation, social capital (networks, relationships between firms, between firms and institutions, between individuals and firms).

The economic performance assessment of a region takes into account the dynamic

development of its resources, the pace at which they develop and combine to produce competitive advantages, taking into account the economic, social and territorial characteristics.

Intangible assets such as human capital, social capital are in the interaction, allowing for development in a mutual way.

1.2. The Human Capital

It constitutes a central element of the development's endogenous resources; the human resources cause the economic growth and are also a result of this.

The functioning of human resources is a basic element of performance to any organization and the human resources management must be an integral part of corporate strategy and not merely a functional strategy. Skill level is part of the competition between firms, so human resources become a central factor in achieving competitiveness, also taking into account the new opportunities offered by technology.

The correlation of human capital with technology development is motivated by the fact that both are formed through education and based upon the investments made in research. The concentration of associate enterprises in an urban environment confers them the advantage of using a well-qualified workforce and access to experts' services.

The difficulty of verifying the relationship between human capital and development lies both in the mobility of human resources in the local systems and the impossibility of a statistical measurement of human capital and regional comparisons.

While tangible assets dynamics can be quantified more easily, the time change of the capital being expressed by quantitative additions, the intangible aspect of the assets is more complex, and measurement is more difficult.

As for human capital, the assessment of intellectual capacity or the ability to adapt to changes has drawbacks; the human dexterity, intelligence and culture through which human capital manifests develops over time and the measurement of the processes is more difficult, development being not constant. Intangible human capital stock assessment involves analysis of local history and of the cultural and social framework. On the one hand, human

resources have a high mobility from one region to another, due to the salary opportunities and, on the other hand, they are related to the development degree of the region: the workers' knowledge and skill level depend on local conditions which were created, on investments in education (conditioned by the level of development), the renewal capacity of local entrepreneurial resources, economic relations between local actors, also influenced by current social model.

The attempt to assess human capital considers a number of its measurable issues that shape some characteristics which may have implications upon the socio-economic system and it can represent resources or constraints, depending on the area.

● **Education.** Human capital represented by a higher level of formal education can be a competitive advantage in urban centers, but in other areas formal education does not have the same consequences and may even be a constraint. A greater welfare level can provide more advanced studies and it is associated with a higher level of employment. In areas where small production firms prevail, average education level is lower, the training is informal (at workplace), the employment level being based on this criterion.

At national level, such an intangible asset may be an economic advantage for a country or a disadvantage to another, depending on the conditions of each country. Thus, the knowledge of a particular technology can become a competitive advantage if it is useful for the existing production system and there are skilled human resources, or it may be a constraint, if the new technology does not correspond to the productive system or to the local traditions. As such, economic performance and competitiveness of a country depend on tangible and intangible assets it possesses and which enable its adaptation to changes. In assessing the level of human capital according to the education level, it should also be noted that not all the basic knowledge acquired through the education system becomes resources for growth and development, but only part of it is an advantage to companies and regions.

● **Family relationships** are correlated with the level of employment in an area. Extended families, with strong links, represent a main input channel on the labor market, without

being a determinant factor of the employment level.

- **Entrepreneurial ability** has a significant role, being in a directly proportional relationship to the employment level, especially in industry and not in services.

- **Organization of production - social capital** has importance in areas with a high level of specialization and density of relations between firms, having higher employment levels and a higher gross domestic product. Larger cities are open economic systems, developing relations with the rest of the region and beyond. Networks are more extensive than small business systems, which may constitute a guarantee for continuity in their performance over time.

1.3. Social Capital

The organizational, institutional and social context, in which individuals operate, condition and determine their choices in developing relationships that serve their interests. These relations of authority, trust and norms of reciprocity represent the social capital - also a key factor in the development of the region.

Viewed from the angle of individual, the social capital is "the set of relational resources which, in part, an individual inherits and largely builds them by himself within the family and other social circles".¹ From the collective perspective, it is a set of "structural and regulatory features of a given social system: organizations, rules, institutions, etc."²

The term of social capital can be understood as a product of the interaction between institutions and labor processes in a society that can be exogenously or endogenously determined. Institutions can be formal, such as the government and the legal system, regarded as having an exogenous origin, or informal, such as rules of conduct, related to culture, essential for social interaction within the community.

¹ Lorenzo Bacci, in "The Intangible Determinants of Competitiveness and their Measurement: The Case of Regional Analysis", WP3 Unit PRISM Project, 2003, www.en.intangibles.net, he quotes Picelli, 1991.

² Idem 1.

The qualification of the workers, the ability to learn and adapt their knowledge to new information, formal and informal set of relationships that contribute to regional economic performance, also represent the social capital of the region.

As such, the human capital, as endogenous resource, it is considered within the context of relations between elements of the system, which can increase or diminish its potential in the region.

The main influence factors involved in the development of social capital are networks and creativity.

- **The networks** include links which are created among businesses, government, universities, research institutions, development agencies, telecommunications and other technological networks, inter- and intra-company networks, various forms of community networks regarding individual citizens. As a result of trust and effective communication, the networks allow individuals and organizations to reduce the cost of transactions. The network effects are felt by increasing benefits for its members, as a consequence of increased network size. Thus, generating increased revenue, networks help to stimulate endogenous processes that lead to social capital formation. Negative consequences may occur, as a result of practices that impede innovation or change.

- **Creativity** includes both appearance of new ideas, projects, inventions, discoveries and ongoing adaptation or application of ideas and technologies in new ways. This leads to development of social capital provided that it involves a cooperative or complementary effort.

Creativity can thrive in an open, tolerant environment, where creative tension is manifested, as well as contrasting ideas that are submitted to a continuous attention. Manifested in various areas, creativity helps to contribute to the stimulation of cities' economic development, and to the economic success of nations.

Networks and creativity generates endogenous effects by the means of new ideas and higher incomes, increasing the social capital, which also means innovation growth.

The innovative environment expresses a distinctive feature on regional level and it refers to the ability of a community to generate ideas or to apply the existing ones. Since

innovation is related to the work process, knowledge and experience have significant importance in the context. Spreading of knowledge through networking and cooperation, promotes the emergence of a creative environment, which contributes to strengthening of the link among networks, creativity, social capital and innovation.

The social capital dependant innovative environment contributes to the competitiveness of the region, if it develops a good location for innovation and it has a positive reputation in this respect.

Depending on the size of the urban area and business diversity, specialization opportunities arise, as well as establishment of contacts between companies, encouragement of personal relationships and information sharing, all these factors being favorable for diffusion of innovations. A highly qualified staff is an important resource for companies and their location in an area where opportunities for good employment are combined with a high living standard represents an asset to that area.

Innovation represents a priority, regional competitiveness being dependant upon productivity and market availability, on the skill level of labor force and institutional factors, namely, social capital endowment by the means of entrepreneurial culture that encourages cooperation and initiative. There should be an emphasis on high-tech research development, increased investment in research and development and on intellectual property rights.

The formation of reputation, crucial for the competitiveness of the region, is necessary for achieving benefits within the innovative environment, and as it has been commented, the latter one is consolidated by social capital.

It is characteristic that the establishment of good reputation requires long time, it builds itself on past achievements, which are reflected in its current status and it consolidates on continuous success; there is a chain of dependencies in which a sequence of present events is based on particular past elements. For example, a region whose reputation has been affected by a damaging legacy of the past, it hardly leaves this condition, even if new contradictory evidence appears. Therefore, in order to have an increased regional competitiveness, building of a reputation is complementary to creating innovation.

Thus, we can say that networks and creativity can accelerate the appearance of the social capital which, in turn, creates an endogenous change that leads to innovation, reputation and regional competitiveness, according to the diagram below:

Figure 1. The relationships among networks, creativity and social capital.

Source: Andrew Harrison, “Social Capital as a Determinant of Regional Competitiveness”, www.3ekftuke.sk

In conclusion, the analysis of the influence which the intangible resources have in regional development takes into account some observations such as:

The common element of the intangible resources is knowledge created by human mind, and as such, directly related to human capital; the knowledge communication occurs through interactions between individuals, so innovation occurs only if human capital and social capital are present (relationships, trust, behavioral norms and rules which guide the interactions among individuals). The consequence is that intangible resources are complementary.

The intangible assets can be resources for some areas, or constraints for others, caused by socio-economic characteristics of the local system.

Abstract

In a global economy, the energetic strategy of a country is realized taken into account every change or evolution in the world. Countries, as China or India, or countries with economies in transition put a higher pressure on the supplied quantity of energy, due to their economic growth and/or economic structure change. In fact, between 1994-2004, these countries doubled their request for oil, and in 2006, their request was over 20 mil. Barils per day, which is about 40% of the global oil production.

The forecast shows that in 2030, it is quite possible that they will double again their oil needs, which will be over the actual, know oil reserves of the Planet.

In this situation it is a must to reorient the energy policy of all countries, in such a way that they will take into consideration the renewable energy sources and improve their energy efficiency. Romania has made its first step by entering in the green certificates programme in 2005 and has as objective to reach at a level of green energy production of 38% of gross internal consumption.

Keywords: green certificates, electricity market, renewable resources

JEL Classification: Q27, Q28, Q40, Q43

1. Introduction

In a global economy, the energetic strategy of a country is realized taken into account every change or evolution in the world. Countries, as China or India, or countries with economies in transition put a higher pressure on the supplied quantity of energy, due to their economic

growth and/or economic structure change. In fact, between 1994-2004, these countries doubled their request for oil, and in 2006, their request was over 20 mil. Barils per day, which is about 40% of the global oil production.

The forecast shows that in 2030, it is quite possible that they will double again their oil needs, which will be over the actual, know oil reserves of the Planet. In this situation it is a must to reorient the energy policy of all countries, in such a way that they will take into consideration the renewable energy sources and improve their energy efficiency.

2. Green Certificates System

The main objective of a system of tradable green certificates is to stimulate the penetration of green electricity into the electricity market and to promote renewable generation. In a green certificate system, certification serves two purposes. It functions as an accounting system to verify whether the obligations have been met and it facilitates trade in electricity from renewable energy sources. Thus, through the establishment of a green certificate system a separate market for renewable electricity will originate besides the market for conventionally produced electricity.

Green certificates are created by the producers of electricity. Producers receive a certificate for each pre-defined unit of electricity produced from renewable energy sources that is put on the grid. Consumers of electricity are allotted with targets for the consumption or sale of electricity from renewable sources. In order to show that they meet their targets, these consumers have to hand over certificates at a given point in time. Penalties are set if they are not able to fulfill their obligations. Therefore, consumers have an incentive to buy certificates from the

producers and the certificates become valuable. It is expected that competition between producers and increasing supply of green certificates will lead to a decline in the price of electricity from renewable sources. In this respect, the green certificate system is considered as a cost effective way to meet the renewable energy target.

Consumers will pay a price for the certificates in order to meet their target. The price will depend on the market, i.e. on demand (that is fixed by the target) and supply. With low supply of green certificates, price will be high, which will be an incentive for new producers to provide renewable electricity. Moreover, in theory renewable energy will be provided in an efficient way because those producers who can provide renewable electricity at the lowest price will be able to sell their labels.

It is expected that both a spot market and a forward market will develop for green certificates. On the spot market, consumers or supply companies will trade green certificates that have been issued in the past. This market will be used to buy certificates to fulfill their obligation. On the forward market consumers or supply companies can negotiate about long-term contracts i.e. they trade in green certificates that will be issued in the future. The forward market will be used to hedge for price risks, therefore securing investments into renewable electricity projects.

3. Green Certificate System in Romania

Romania got involved in promoting the use of renewable resources for the electrical energy supply and its first step in this way was to adapt the provisions of the EU Directive 77/2001 regarding the promotion of production of electricity from renewable energy sources on the internal market to the internal specific conditions. It also establishes the promotion system for the electricity produced from renewable energy sources.

Currently Romanian produces energy from renewable sources as follow:

- 25 - 30 % of generation is from hydro sources, depending on the hydrological factors;
- about 95 % of hydro generation is in large hydro power plants and only 5 % in small hydro;
- wind generation is under 1 % of total production.

Romania uses a green certificate system with mandatory quotas for suppliers. In this system, a green certificate is a document proving that 1 MWh electricity is produced from RES and supplied into the grid.

This type of system has advantages and disadvantages. The main advantages are:

- good control of the share of green electricity in final consumption;
- equitable share of promotion costs between captive and eligible customers;
- possible future integration in a European wide Green Certificates Market;
- and the disadvantages:
- not very attractive for investors;
- complicate penalizing system.

The RES-E producers may sell the green certificate within bilateral contracts to electricity suppliers at negotiated prices or monthly, on the centralized market of green certificates organized and administrated by the Green Certificates Market Operator (OPCOM SA).

The prices are to be comprised between the minimum and maximum values. Minimum and maximum price levels on the market established by the regulator are:

- minimum value 24 Euro/MWh, for the period 2005-2012 and 27 Euro/MWh, after 2012
- maximum value 42 Euro MWh, for the period 2005-2012 and 52 Euro/MWh, after 2012

If the annual offer of green certificates is lower than the annual demand, in the following year the E-RES producers will receive from the Transport and System Operator (TSO) the minimum price set by the National Energy Regulatory Authority (ANRE) for each unsold green certificate.

But who can get these green certificates? The answer may be quite simple: the producers of green energy, but only from:

- wind;
- biomass;
- solar;
- hydro in power plants with less than 10 MW installed power.

Producers receive a green certificate for each MWh of produced energy, issued by Transport and System Operator (TSO). No producer who imports the energy or exports the green energy is qualifying to obtain these

certificates.

Supplier's mandatory quotas, obligation to buy Green certificates according to total annual electricity selling to final customers are:

- 2005 - 0, 7%
- 2006 - 1, 4%
- 2007 - 3, 74%
- 2008 - 5, 26%
- 2009 - 6, 78%
- 2010 - 8, 3%

The regulator can modify, in certain circumstances, these quotas established by Government Decision.

Also, a penalizing mechanism is applied for non-compliance, but it is also true that the extra certificates can be used in the next year.

Expected income for promoted green electricity, taking into consideration a market price for green certificates between 24-42 Euro/MWh and a market price for electricity of 36 Euro/MWh is of 60-78 Euro/MWh, which is an encouraging price for the potential investors.

4. Conclusion

Liberalization is being implemented on a fast pace, while fulfilling environmental targets is at the top of the energy agenda. Renewable energy generation is at the heart of both issues, and policy on the subject is shaped and implemented as of this moment. Currently, three distinctive incentive schemes for renewable energy generation exist in Europe: fixed feed-in tariffs for produced electricity, a competitive bidding system for renewable energy generation capacity has been implemented and a green certificate system. Being a market-oriented incentive scheme instead of a subsidy based scheme it attracts international attention.

Romania has a significant potential of renewable energy sources, its potential being practically unused, excepting for the hydro potential for ESRE, which is around 50% and biomass for individual heating. The existing promotion system for E-SRE through green certificates start showing its attractiveness for new investments, even if this system is highly contested by investors, which leads us to the

idea that the existing promotion system for E-SRE is going to be improved. It is a must to develop promotion mechanisms also for heat production from renewables.

Review of environmental issues in sustainable strategic development of România and analysis of the connection between ethics and sustainable development

ROF Letitia Maria

Universitatea „1 Decembrie 1918” Alba Iulia
letitiamariorof@yahoo.com

Abstract

With no intention to exhaust the limits of the subject, I chose as the topic for my scientific approach the connection between ethics, sustainable development and economic interests, the desire to gradually emphasize the implications of this connection in our country.

Therefore, I started from the key issues dealt with in specialised literature on the influence of environmental component in sustainable development and translating this influence in the environmental accounting. In the first part of my scientific approach, I proposed to put the concept of sustainable development within non-financial concepts, to review the main conceptual boundaries of sustainable development and to formulate a series of critical ideas focused on this issue. In the second part of the paper, I gradually analysed the implications of the National Strategy for Sustainable Development of Romania in our country and I proposed a business model based on ethical principles for enterprises in our country.

Keywords: ethics, sustainable development, economic interests.

JEL: Q 01

1. Introduction

Protection of the environment is one of the current concerns of modern societies. Ecology means living wisely, living harmoniously with nature, partnership between human society and natural environment, economical growth in terms of proper environmental management, management that must become priority and responsibility.

Any economic activity is like a human intervention in natural environment, but this intervention should not be an aggressive one, leading to degradation of natural environment, but on the contrary. Starting from this, the relationship between economical growth and natural environment was designed in different ways, synthesizing itself into three distinct approaches: geocentric biocentric and anthropocentric.

Sustainable development approach is a factor of innovation, of launching new products and services involving a societal or environmental added value. In management, care to achieve long-term profits could mean using only the quantities of resources that can regenerate naturally. The interest to stabilize the income source would be compatible with the objective of sustainable development. Applying a homogeneous environment and international accounting, based on works of the UN, would not be regarded as a source of cost, but rather as a means to better use of resources in an economically sustainable future.

2. Framing the concept of sustainable development within non-financial concepts

Sustainable development and other approaches based on similar themes: corporate social responsibility, business ethics and socially responsible investment occurred in late 80s and early 90s, growing lately.

Determining the value of a business is based 35% on non-financial elements. In this perspective, in the consequences of a commitment to sustainable development in the profitability, risk and competitive

advantage there are factors that have an impact on profitability. Among such factors, there are:

- *sustainable development* with its three aspects: economic (which concerns growth and economic efficiency), social (with a goal of equity and social cohesion) and environmental (which takes into account valuation, improving the environment and preserving natural resources for future). These three requirements correspond to a triple bottom line or the 3Ps (planet, people, profit) of Anglo-Saxon society;
- *business Ethics*, literary translation of the expression “*business ethics*” involves analyzing the implementing measures of moral norms of individuals to specific decisions taken by the enterprise;
- *corporate social responsibility* is the enterprises’ response to sustainable development concerns. The societal term used here designates the responsibilities of enterprises to multiple business partners (stakeholders) strictly professional relationship employers/employees, according to a usage which designates the term social responsibility;
- *socially responsible investment* involves integrating into the analysis of investment the social, philosophical, cultural or environmental values, which are not considered directly in financial analysis. Basically, these socially responsible funds are elements of the application of the concept of sustainable development.

Environmental performance evaluation (EPM) – ISO 14031 is based on “what can be measured can be managed”. This type of evaluation is seen globally in all sectors to improve environmental performance, for providing information for settling the “best practices” through Performance Benchmarking to demonstrate compliance and operational efficiency.¹

EPM is a relatively new concept, used to describe the measuring process, analysis and communication of environmental performance of the company.

3. Brief overview of the conceptual boundaries within sustainable development and environmental accounting

Human society today resembles less and less with the previous one, even at an interval of 100 years. In the last 100 years, world population has tripled, global economy has increased 20 times, fossil fuel consumption by over 30 times, and industrial production over 50 times.

Stockholm Conference on Human Environment, organized by the United Nations in 1972, decided to create the United Nations Environment Programme, considered a significant moment in the history of planet saving. Called eco-development, in Stockholm Declaration, then translated by the Anglo-Saxon through the term *Sustainable Development*, this concept is known today as sustainable development.

Brundtland Report of the World Commission on Environment and Development, proposed by the General Assembly of UN, in 1987, identifies the main environmental problems, defines sustainable development as “a development that meets the needs of the present without compromising the ability of future generations to meet these requirements.”

Sustainable development, through the economic literature, “*is defined by a natural dimension - meaning that there is only as long as man-made environment is compatible with the natural environment - an economic dimension based on competitive competitiveness, a social-human dimension - meaning that all exits from man-made environment must respond directly to the needs and interests of present and future generations which coexist and succeed – a national-state dimension, regional and global – meaning the compatibility of optimization criteria both nationally and at regional or global level.*”²

This concept involves a new set of values to be achieved within a general process of transition towards a sustainable society. It is

¹ Tabără Neculai, Horomnea Emil, Mircea Mirela Cristina, *International Accounting*, Tipo Moldova Publishing House, Iași, 2009, p. 539

² Angelescu Coralia and staff, *Economics*, Seventh Edition, Economic Publishing House, Bucharest, 2005, p.231

an economic growth strategy designed to reconcile economic and social progress without jeopardizing the natural balance of the planet.

There are several elements that define sustainable development, including:

- permanent and safe compatibility of the man-made environment with the natural environment;
- *equal opportunities* of succeeding generations which coexist in time and space;
- interpretation of present in terms of future, admitting *natural and human security* as a purpose of sustainable development, instead of maximizing monetary profit;
- *introducing compatibility of national development strategies* as a result of increasingly strong interdependencies on geo-economic and environmental level;
- *moving the centre of gravity* in the general welfare, from the quantity and intensity of economic growth to its quality;
- *environmental (natural) capital* is interdependent and it integrates organically with the man-made capital, human (cultural) capital within a global category;
- *transition to a new strategy with natural and human nature*, in which the economic and social development objectives to expand the horizon in time and space, called sustainable development;

One of the major consequences of increasing pressure on the natural environment was the change in atmospheric chemistry component and increasing the concentration of carbon dioxide and reducing the ozone layer. Increasing atmospheric CO₂ concentration has had negative consequences on the world by increasing temperature. Research has shown that a real threat to mankind would be to increase the concentration level at twice the level of pre-historic period, which would cause drastic climate changes with irreversible consequences. According to Professor Niță Dobrotă, sustainable development *"implies economic growth (not zero growth or negative growth) in accordance with the requirements of ecological balance (not simply preserving nature), but with all human development, which means that there are regarded all aspects of progress within and for human - culture, science, civilization,*

*equality and equity among people, ethnicities, nations, peoples."*³

The relationship between economic growth and natural environment, seen in the light of the three concepts raised, respectively geocentric conception, biocentric and anthropocentric conception, is as follows:

- **geocentric conception** regards as priority in human activity unreserved land protection, for *"nature to remain untouched in its purity."* Of course, the excessive conservatism of this concept is questionable, having in mind that sometimes human intervention is absolutely necessary to prevent the disasters that can be caused even by nature;
- **biocentric conception** aims to protect especially living organisms which usually can not defend themselves against human aggression, the man having to intervene in species' life only to ensure their preservation;
- **anthropocentric conception** is based on the idea that everything must be sacrificed for the satisfaction of growing and diversified needs of people. And this objective seems to be absurd and irrational as immediate interests are clearly in conflict with those of perspective.⁴

Sustainable development *"is a strategy by which communities seek economic development paths, benefiting also by the local environment or which will benefit the quality of life."*⁵ Many communities have concluded that the interpretation of traditional planning and development, creates rather than solves environmental or social problems.

The three areas of sustainable development referred to in the literature take into account economic, environmental and cultural resources. A widely accepted view of sustainable development assigns it the interaction of four systems: **economic,**

³ Niță Dobrotă, *Political Economy*, Economic Publishing House, Bucharest, 1997, p.335

⁴ Taking over after, Burja Vasile, *Economy II*, Department of Distance Learning, Alba Iulia, 2009, p. 33, 34

⁵ Rojanschi V., Grigore F., etc., *Quantifying Sustainable Development*, Economic Publishing House, Bucharest, 2006, p.15

human (social), **environmental** (or ecological) and **technological**.

Developing economic and environmental accounts provides synthesized information to makers, regarding the natural assets of the environment, being necessary to determine environmental costs and to their consequences on production, income, economy.

4. Continuous improvement of quality of life seen through the light of the National Strategy for Sustainable Development of Romania (2008)

National Strategy for Sustainable Development of Romania is a national document that complies with EU sustainable development strategy. Its main objective is continuous improvement of quality of life, creating sustainable communities, able to capitalize on the environmental and social innovation potential of the economy, to manage and use resources effectively, to ensure prosperity, environmental protection and social cohesion.

In November 12, 2008, was approved by the Romanian Government the National Strategy for Sustainable Development in the horizon years 2013-2020-2030. The document is a joint project of the Romanian Government through the Ministry of Environment and Sustainable Development, and United Nations Development Programme, through the National Centre for Sustainable Development.

Starting from this strategy, within a reasonable time, Romania should move to a new development model, characteristic of EU, namely that of sustainable development generating high value added and focused on continuous improvement of people's lives and their relationships, on the interest in knowledge and innovation.

The strategy proposes a vision of Romania's development in light of the following two decades, with goals that transcend electoral cycles and circumstantial policy preferences.

Horizon 2013: Organic incorporation of principles and practices of sustainable development in all programs and policies of Romania, as EU member state;

Horizon 2020: Achieving the current average level of EU countries to the main indicators of sustainable development;

Horizon 2030: Significant approach of Romania to the average level in that year of EU countries in terms of sustainable development indicators;

Achieving these objectives will ensure our country a substantial reduction in economic and social disparities, compared with other EU Member States, and hence a high economic growth. The main directions of action, detailed by sectors and time horizons are:

- rational correlation of development goals, including investment programs in inter-sectors and regional profile, with potential and capacity to support natural capital;
- accelerated modernization of education and training, public health and social services, taking into account demographic trends and their impact on labour market;
- widespread use of best available technologies in investment decisions; firm introduction of criteria for eco-efficiency in all production and service activities;
- predicting the climate change effects and early development of action plans for crisis situations caused by natural or anthropogenic phenomena;
- assurance of safety and food security by exploiting comparative advantages of Romania, without compromising the requirements for maintaining soil fertility, biodiversity conservation and environmental protection;
- identifying additional funding sources for completion of major projects and programs, particularly in infrastructure, energy, environmental protection, food security, education, health and social services;
- protection and enhancement of the cultural and natural national heritage; connection to European norms and standards on quality of life.

For accomplishing the objectives and measures set out in the Strategy, there are established mechanisms for implementation, monitoring and reporting to the government and to the civil society and citizens' consultation throughout the entire process. Since 2009 will begin the process of

comprehensive review of programmatic documents, strategies and national programs, sector and regional policies to bring them into line with the principles and practices of sustainable development and the dynamic development of EU regulations.

5. The connection between ethics, sustainable development and economic interests. The business model suggested to enterprises that engage in sustainable development action

First and foremost, the concept of sustainable development lead to the emergence and proliferation of the issues related to destructive activity of the company. Without the existence of a permanent control of the state, it is difficult to understand that it may have responsibility for environmental problems. If the damage caused by an entity to the environment is automatically passed on humans, then the entity may become morally responsible. This argument is based on the ethical principle not to harm future generations. The concept of economic ethics aims to define, promote and disseminate the economic life of rules, principles and ethical norms universally acceptable, which can support on a medium-term the economic reconciliation of social, cultural and eco-friendly, and, on a long-term, assuring co-determination in matters of globalization, based on the principle of the inalienable right of every human being to life and liberty (Garabanghi N., *Présentation. In l'éthique économique: une contrainte méthodologique et une condition d'effectivité des droites humanis.* Economie Ethique, no5., France, UNESCO, 2003).

A close coordination between the entity, state and UN allows:

- on one hand, awareness of governments, entities, shareholders and consumers in general, on their ability to destroy the habitat by unfortunate use of resources and excessive consumption;
- on the other hand, facilitating the generalization of an environmental accounting, as it currently happens in EU, in order to ensure continuity of the entities referred to;

Environmental accounting expresses the emergence of a new ethic which responds to citizens' concerns, regarding the becoming of the

Earth. Therefore, the principles of sustainable development, through these records, meet these anxieties refocusing environmental concerns of states and firms. An OECD report in 2004 states that, after the conference in Rio de Janeiro in 1992, environmental accounting is considered an instrument of sustainable development. However, its implementation cannot be similar from country to country. In underdeveloped countries it is used quite hesitantly, while in others it is already applied to incorporate environmental principles of sustainable development (Germany, Scandinavia).

After presenting the Brundtland Report, the mentality of various entities that engage in an action for sustainable development was influenced. The principles of sustainable development made by the report set a number of ethical rules and take into account the interests of all partners, communicating in a transparent manner, without forgetting their economic role.

At the Rio Conference in 1992, WBCSD has published an argument for sustainable development based on examples of achievements of its members who support the credibility of the approach. This appeals to previous outlook, in which industry appears in ecological sphere, especially through its impact on pollution. WBCSD opinion is that sustainable research is a trend that tends to generalize. Now it is more preferable and more profitable to anticipate. The first to do these things will be able to create special advantages. Currently, many entities have developed new technologies and industrial processes to reduce pollution and other negative impacts. Now we talk about clean production, about organic farming. There were established environmental protection services. There were published directives and codes concerning product safety, plant operation, business practices, technology transfer and international cooperation. The results were different, and successes were achieved mainly in the industrialized countries. Worldwide, there were formed four types of behaviour that allow delineation of large trends adopted by enterprises on the concept of sustainable development:

- proscriptive behaviour (without any environmental measure);

- reactive behaviour (compliance with regulations set);
- prescriptive behaviour (application of environmental policies with a legal vision);
- proactive behaviour (prediction and prevention of concerns for sustainable development).

The enterprise is moving slowly towards a logic of responsibility. Implementing an *ecological and responsible model of business* takes into account criteria such as: establishing an environmental policy that respects the vision and mission of the entity, allocation amounts for environmental management, HR involvement in process, using various tools.

A successful assimilation of the concept of sustainable development will result in options that change the business model of the enterprise, in a spirit of long-term vision and a mission of sustainability.

6. Conclusions

The concept of sustainable development expresses the emergence of an optimistic new model of development, which records and keeps in mind all this moving around the environment, responding to increasing regulations, to some political issues but also to some natural maturity. Planet is an ecosystem composed largely of natural resources which are not renewable. This fact, long recognized by the work of the Club of Rome, leads to understanding the need for extensive management of resources and global approaches.

The real stakes of future are not related to the action value and environmental performance, but especially to the big issues that climate change is a reality, access to water resources, inadequate funding, energy depletion, increased CO2 concentration. All these problems are also felt in our country. Sustainable development is a framework, and not a possible way of usage, allowing a rational development which will prevent degradation of eco-Earth system.

To avoid this degradation it is necessary to use an ethics of management both at our state and multinational level, compliance must be established and a connection between environmental protection and socio-economic situation of countries. The nature of capitalist system that emphasizes competition without boundaries, often irrational, maximizing profits

and reducing costs drastically, constitute a fundamental structural barrier in adopting ethical practices.

In conclusion, meeting the present needs, without compromising the ability of future generations to meet their own needs, is a priority objective of the next century, but not one easily to be achieved. Even if at a conceptual level, sustainable development has been accepted and supported worldwide, this objective being taken from a report to the United Nations Conference in Rio de Janeiro (1992), achieving an optimal correlation between the four systems, economic, human, environmental and technological has encountered and still encounters difficulties.

Resources and Priorities in Maramureş County

SABOU Simona

ZIMA Liliana Adela

HAHN Rada Florina

Universitatea de Nord Baia Mare

simona.sabou@gmail.com

lili_zima@yahoo.com

hahn_florina@yahoo.com

Abstract

Maramureş County is quite endowed with natural resources. Together with quantity, the quality of resources must also be considered. The SWOT analysis helps identify other resources that, together with the natural ones, can support development in the county.

Keywords: natural resources, SWOT, development strategy

JEL Classification: R10

1. Introduction

In Maramureş County underground resources are not available in large quantities, fact that imposes the existence of well-developed commercial flows with other regions, to support economic activity. The least available ones are energy resources – coal, oil and natural gas – intensely needed by the economy and existing in quantities far from satisfying the need. However, following are some of the resources that are well represented:

- complex and gold-silver ores (in the Oaş-Gutâi-Țibleş-Rodna zones), found in the same quantities only in the South-West Region;
- salt (in the Maramureş Basin).

Together with quantity, quality of resources, mining technological conditions and profitability must be considered. The effects of decision-making in resource exploitation, at a local, regional or national level, can seriously influence the economic and socio-human aspects and the environmental impact.

Regarding agriculture, the share of cereal crops is high (48.59%) even if the required

climate and soil conditions are not met. In 2007 the total cultivated surface was 74524 hectares, from which 36957 hectares were cultivated with cereals [6]. As a result, one of the lowest average yields per hectare was reached in Maramureş County (compared to the figures from the rest of the country) for wheat, rye, barley, oats and corn (measures should be taken to optimize cultures based on the existing climate and soil).

Fruit tree growing occupies 6012 hectares (1.935% of the total surface of the County) which represents an advantage over the other counties, with lesser figures. As the climate and soil are favorable for this branch of agriculture, this advantage should be further exploited.

Another important advantage of the county is wood – as raw material and also for the activities linked to it. On the other hand, there is the risk of over-exploitation that can, because of the lack of forestry management, lead to de-forestation.

Areas with the greatest turnover and investment are manufacturing, wholesale and retail trade, repairing of motor vehicles and personal and household goods, as can be seen in Table 1 [4] [5].

Table 1. Turnover and investment amounts for active local enterprises from industry, constructions, commerce and services fields, categorized by national economy branches, in 2007

Maramureş County	Turn-over (million RON)	Gross Investments (billion RON)
Total	10102	1390
Extraction industry	36	24
Processing industry	3840	517
Electric and thermal energy, natural gas and water	166	38
Constructions	916	139
Wholesale and retail trade, repairing of motor vehicles and personal and household goods	3941	355
Hotels and restaurants	118	37
Transport, storage and communications	650	173
Real estate transactions, rental and services mainly targeted towards enterprises	326	93
Education	2	1
Health and social security	16	3
Other activities of collective and personal services	91	10

2. The specificities and fields of excellence of Maramureş County

The development strategy for Maramureş County is prioritized towards increasing competitiveness and economic development, with the following identified strategic objectives:

- providing the infrastructure needed for the investor's activities;
- supporting small and medium enterprises as a local development engine, creation and development of original products;
- promoting research and innovation activities in the technology field;

- promoting imports that carry technological value, with the ultimate result of accumulating technological know-how;
- eliminating the raw material exports and supporting exports that carry technological value;
- eliminating the lohn cases and enhancing creativity and innovation for own creations.

Through a SWOT analysis, the strong and weak points, the opportunities and threats concerning the development of Maramureş County were identified. The contributing factors can be categorized in factors that are common with the whole country and factors that are specific to the county. Following is an enumeration of these factors, categorized by fields of development [1].

Strong points in human resources:

- common with the rest of the country:
 - cheap qualified labor, generally well trained;
 - existing industrial tradition;
- specific to the county:
 - north-western mentality;
 - will to work and succeed;
 - existing entrepreneurship tradition;
 - multi-lingual population.

Strong points in the institutional field:

- specific to the county:
 - art school in Baia Mare specialized in painting;
 - Universitatea de Nord Baia Mare.

Strong points in natural resources:

- specific to the county:
 - favorable position close to Central Europe and Ukraine;
 - developed forestry field;
 - mineral water natural springs;
 - underground resources (ores, kaolin, marble, rocks);
 - soil and geologic conditions favorable for orchards;
 - developed animal husbandry field.

Strong points in infrastructure:

- common with the rest of the country:
 - existing airport.

Strong points in the institutional field:

- specific to the county:
 - balanced industrial development.

Weak points in human resources:

- common with the rest of the country:
 - weak work discipline;

- low productivity;
- limited use of managerial initiative;
- limited market and management experience;
- limited information for planning/financing;
- low level of consumer knowledge.

Weak points in the institutional field:

- common with the rest of the country:
 - education system still not adapted to the market demands;
 - weak economic coordination/planning according to the rules of market economy;
 - limited local authorities autonomy (concerning taxes, spending, etc.);
 - weak government policy regarding industry and agriculture;
- specific to the county:
 - weak institutional ties to other countries;
 - weak services in the business field.

Weak points in natural resources:

- specific to the county:
 - weak positioning relative to the internal market;
 - weak ties to the rest of the country;
 - soil that is less fit for agriculture;
 - polluted environment.

Weak points in infrastructure:

- specific to the county:
 - weakly developed infrastructure (in transports, communications, utilitarian networks);
 - too few points for crossing the border;
 - the absence of international flights;
 - weak railway links (excepting those with Bucharest and Cluj).

Weak points in the general economic development field:

- common with the rest of the country:
 - insufficient funding;
 - weak coverage against economic shocks and system changes;
 - relatively weak product quality;
- specific to the county:
 - low export level;
 - weak economic ties to the rest of the country.

Opportunities:

- common with the rest of the country:

- low competitiveness level on the internal market;
- the possibility of learning from the market leaders (especially from the West);
- increasing incomes in Eastern countries;
- export in the EU;
- reinstatement of historic ties (economic, educational, cultural, touristic, etc.) with Austria, Germany, Hungary, Italy, etc.;
- promoting local specialties (plum brandy, berries, mushrooms, etc.);
- the possibility of promoting the county's image.

Threats:

- specific to the county:
 - competition with Hungary, Turkey, the Far East;
 - restricted access on the unified European market;
 - political instability;
 - exhaustion of mineral resources;
 - increasing social tensions because of the restructuring of heavy industry;
 - competition from other regions of the country (Arad – industry, Braşov – tourism, etc.).

Many opportunities that can be exploited and that can stimulate economic development exist. For a number of food products demand is not satisfied. There also is great potential for wood product exports – either raw, semi-manufactured and finished. Touristic potential is continuously expanding.

The fact that Baia Mare and surrounding areas are seriously affected by pollution (as a result of the long period in which the enterprises processing ores were active), fact that has a negative health impact, has to be mentioned. The responsibility for the future was ignored. This can influence the way the county is perceived from the outside, slowing the development process, as, for example, buyers can avoid purchasing food products originating from the county.

Unfortunately, Maramureş County is unfavorably positioned relative to the internal market – as it is quite isolated, in the North-West of the country. There are several territories that it competes with that are more favorably positioned, like Braşov, Sibiu, Cluj, Timişoara.

3. Conclusions

Maramureş County is characterized by an extreme specialization in mining and processing non-ferrous metals; the production units, with large numbers of employees, suffered massive layoffs as a result of the termination of mining activity in the area; massive restructuring took place in the machinery manufacturing industry (Baia Mare) and lumber industry (Sighetu Marmăţiei); in Maramureş County the ecologic balance has been heavily affected, with negative international impact, by residues leaking from mining enterprises' tanks, leading to the pollution of several rivers (Tisa, Săsar); in Baia Mare there is high air and soil pollution, caused by non-ferrous ore processing activities.

Maramureş County has development potential in the following fields:

- traditional handicrafts – metal, wood and wool processing;
- tourism – it has a rich ethnographic heritage that can attract tourists;
- education – the existence of “Universitatea de Nord Baia Mare” and other universities ensures superior professional qualification of the workforce (Cluj, which is another education center, is close by).

The Speleological Tourism Developing Strategy in the West Development Region

SAVA Cipriana
"Dimitrie Cantemir" Christian University
cipriana.sava@gmail.com

Abstract

The development of a region according to the durability principles may be accomplished both on a general and a sector level with the help of well researched strategies. Tourism is an activity based on environmental issues and the sustainable development is the only solution for its protection and for the protection of tourist resources. The exploitation of the speleological potential in order to develop the speleological tourism in the West Development Region could be a possible variant which needs the planning and the set up of an adequate strategy.

Key words: speleological tourism, sustainable spatial development strategy, environment

JEL Classification: L83

1. Introduction

The economical development is continuous and therefore the strategies should be changed so that they fit the ecological limits offered by the environment and by the resources of the planet.

The sustainable development is considered a new way of development which is able to support the human progress for the entire planet and for a long period of time.

This type of development is a response to the current problems and tries to act as an intermediary between the socio-economical development and the restrictions imposed in order to protect the environment. At present, researchers in this field focus on the spatial coordinate (territorial and regional).

The set up of a sustainable spatial development strategy requires the existence, besides those explicit criteria of environmental protection, of some fundamental criteria such as:

1. exterior circumstances which refer to:
 - the demographic evolution, the migration of the population, all the changes related to workforce and quality of life;
 - the developmental phase at a macroeconomic level, the international evolutions and the balance of forces, alliances;
2. spatial arrangement, more precisely:
 - changes occurred within the degree of concentration and spatial diversification of economical activities;
 - changes appeared within the complex patterns situated in the urban areas, suburban and peripheral;
3. mobility patterns which concern:
 - the attitude of the population regarding commuting, recreation, the frequency of movements;
 - the appearance of qualitative changes in the distribution of the merchandise
4. technological transformations which regard:
 - technological achievements in automotive industry;
 - the improvement of the general infrastructure network;
 - the introduction of data communications for the naval transport management
5. the transport system scale which regards:
 - the existence of longer national and local roads
 - the transeuropean transport network
6. transport-related intervention politics regarding:
 - prices and current fiscal reglementations

- organizational and institutional rules for the transport system.¹

The concept of sustainable development requires economical and social achievements. As far as tourism is concerned, these ones could be:

- the increasing of the level of resource exploitation and capitalization, without altering their value;
- the preservation of trades;
- the access of population to tourist facilities;
- the extension of the life expectancy;
- the improvement of people's health;
- the avoidance of the environmental deterioration;
- the decrease of the withdrawal of land from the agricultural circuit.

The protection of the environment and of the tourist potential is necessary for both the tourist areas already included in a circuit and for those which aren't yet exploited so that they can attract more tourists.

The accomplishment of a perfect combination between tourism and environment supposes certain planning devices from the part of the tourism organisers, the inhabitants of those areas and environmentalists.

2. The Speleological tourism in the West Development Region

Even if there is sufficient potential, tourism is not the best represented economical activity in the West Development Region, which includes the Arad, Caraş-Severin, Hunedoara and Timiș counties.

This region is characterized by the diversity of its natural tourist resources. Studying this type of resources reveals the fact that the natural elements within this region represent an attractive tourist potential, which can be

developed in different forms by organizing tourist activities from the simplest to the most complex ones.

The value of the tourist entropic potential of the region is conferred, to a decisive extent, by the existence of several urban and rural establishments that include significant historical, architectural or cultural vestiges.

The development of the sustainable tourism in the region may take several directions, one of them being the niche tourism such as the rural, religious or speleological tourism.

Speleological tourism supposes visiting all types of caves together with a specialized guide.

This type of tourism may take several forms:

- collective;
- ecological;
- specialized;
- for adventure;
- scientific;
- speleological therapy.

Caves are classified, depending on their chronological appearance, in primary (in volcanic rocks and in limestone) which developed at the same time with the rock evolution and secondary, developed in time, after the rock evolution and caused by the movement of the rocks, by erosion or dissolution.

Taking into account their degree of difficulty, there are caves that:

1. may be arranged for tourist purposes;
2. do not need any special equipment for visiting;
3. need special equipment for visiting;
4. may be active;
5. partially or totally flooded.

Depending on their importance caves may be classified in the following categories:

1. A. - caves that display an exceptional value which, through their scientific interest and the uniqueness of their resources, are representatives for the national and international speleological patrimony;

2. B. - caves that have a national importance and they are remarkable due to their size, scarce resources and tourist potential; they are perceived as natural monuments or natural reservations;

3. C. - caves that present local importance and are protected by their geological, hydrological and historical significance or by their sizes; they may be the object of speleological exploits, scientific research,

¹ Nijkamp, P., Baggen, J., Van der Knaap, B., SpaSpatial Sustainability and the Tyranny of Transport: a Causal Path Scenario Analysis, the 34th European Congress of the Regional Science Association, Groningen, the Netherlands, August, 1994 și Masser, I., Wegener, M., Sviden, O., The Geography of Europe's Future, Belhaven, London, 1992, și Constantin, Luminița, Economia regională, Ed. Oscar Print, București, 1998, p.197

tourist development or of other means of exploitation;

4. D. – caves that do not meet all the conditions to be included in A, B and C class.

The West Development Region offers the place for activities on behalf of associations and gatherings of speleologists who, besides their current practice, design projects in the view of protecting the caves and the karst environment and familiarize people with these issues. We mention Speowest Arad, Speo-Caraş from Oraviţa, Explorers from Reşiţa, Clubul Sporturilor Montane Hunedoara, Speotimiş, SpeleoTeam and Prusik from Timișoara.

The existence of such caves and associations in the region offers a range of possibilities for the tourist speleological development.

In the Arad county there are caves and swallow holes (103 identified groups) placed in its mountainous region. Three of the caves of this county are protected areas: Valea Morii belonging to the Moneasa village, Duțu and Sinesie, belonging to Săvârșin village.

The Caraș- Severin county has a mountainous landscape where there are numerous attractive caves (approximately 1500 caves and swallow holes). Within the category of natural and protected areas there are included the Comarnic cave and the Popovăț cave in the Carașova village, Buhui, belonging to Anina town, Bârzoiu on the territory of the villages Cornereva and Mehadia.

With an important mountainous area, the Hunedoara county possesses caves and swallow holes. Some of them have already been declared protected areas such as the Coral Cave and the Zeicului Cave near the village Câmpul lui Neag, the cave assembly Ponorici – Cioclovina near the Boșorod village, Șura Mare which belongs to the Pui village, Tecuri near Baru Mare village, Cizmei and Podul natural from Grohot situated on the territory of Bulzeștii de Sus village, Dealul and Cetatea Bolii from the Bănița village.

In the Timiș county the number of these natural attractions is more limited because of the predominant plane landscape. We may only mention the caves from Românești, Albastră, Cioaca Birtului situated in the Poiana Ruscă mountains but which are not considered natural protected areas.

Even if there is a significant number of caves on the territory of the analysed region,

none of them is organised or exploited from a tourist point of view and at international standards.

However, besides the members of the above mentioned associations which explore this phenomena, there are also some tourists eager to discover the beautiful underground landscapes and reach the less accessible caves.

We can identify a popular cave for tourist in each county of this region.

The Comarnic cave, within the management of the National Park Semenic, is unelectrified and unequipped for practising sustainable tourism. Due to the forest exploitation, the access to the cave is possible only by means of off-road vehicles and the guide is available only for the summer period. According to the data offered by its keeper, the number of tourists between 2005 and 2009 was very low (picture 1)

Picture 1 The evolution of number of tourists who visited the Comarnic cave, the Caraș-Severin county.

According to these data we may say that few tourists come and see the beauty of this place because reaching this place is difficult and there is no signalling.

The Românești cave, situated near the monastery with the same name in the Timiș county, may be easily reached, but does not present any special characteristics. Annually (beginning from 1984), a symphonic concert takes place in October due to the extraordinary acoustics of this place. This event gathers more than 3000 tourists every year. During the rest of the year those who want to visit it (pilgrims at the Românești monastery, tourists who come to the Liman's Valley) have a marked track.

The most visited cave in Hunedoara county is considered to be Cetatea Bolii which has two

access ways and is situated at only 6,5 km from the town of Petrosani.

A part of the tourists arrived at the Moneasa spa resort. Try to visit the cave from Bai, situated in the centre of this resort which, however, offers a modest view.

A first step towards the surpassing of the current phase of exploitation of these natural resources is the planning of a tourist strategy for the development of the speleological tourism.

The main motivation to accomplish this task would be the increase of the number of caves in the region.

Some objectives of this strategy may be:

- the diversification of the regional tourist offer;
- the attraction of a higher number of tourists of different ages and social categories;
- an appropriate and sustainable exploitation of the caves;
- the compliance to international standards of caves' development;
- the organisation of courses for the specialization of tourist guides for these caves;
- the planning of some impact studies on environmental issues;
- the consolidation of the infrastructure development regarding accommodation and public food services;
- the planning of some tourist activities;
- some activities aiming the promotion of these caves: leaflet publishing, brochures;
- the publishing of materials for the tourists' information and education;
- the attraction of tourism agencies for the sale of tourist programmes

The responsibility of the tourist speleological development is attributed to the speleological associations, guardians or cave administrators, to City Halls and Prefect's Offices of the

designated area. Moreover, the volunteers and the inhabitants also play an important part in the strategy setting up.

The planning and the setting up of such a strategy would have the following effects:

- the diversification of the tourist offer;
- the increase of the number of visitors;
- the development of the general infrastructure and of the specific tourist infrastructure in these areas;
- the economic growth;
- raising awareness about the protected areas among the local population and tourists;
- drawing attention upon the importance of these caves and upon the other tourist objectives from the appointed areas.

The development of speleological tourism may contribute to the environment protection and to the development of the West Development Region.

The impact of cultural diversity on ecotourism – an opportunity for regional development

SOIMU Oxana,
TROFIMOV Victoria
Deusto University, Spain, Bilbao
Academy of Sciences of Moldova, Chisinau

Abstract

In Culture matter time, space, location, possibilities, needs, scarcity of goods, technologies, destination and the scope.

By this article, authors begin from the hypothesis: how culture is linked to environment and ecology? As a result, key-point ideas of the work suppose that this link (Ecotourism) defines a contribution to mutual understanding and respect between peoples and societies, a vehicle for individual and collective fulfillment, a user of the cultural heritage of mankind and contributor to its enhancement, a beneficial activity for host countries and communities obligations of stakeholders in tourism development.

Likewise, “The International Ecotourism Society” states that Ecotourism activities imply the fulfillment of the following principles, to name some:

- *Minimize environmental negative impact, protecting the regional culture and environment.*
- *Provide positive experience to visitors and hotel owners.*
- *Economically benefit local inhabitants by enhancing their self-esteem.*
- *Support human rights and labor agreements.*

Finally, main expectation from work are some proposals as matter to promote heritage conservation and environmental sustainability, to create an intellectually challenging and stimulating environment and provide educational benefits to local community. Such aim addresses to Republic of Moldova too. Also, authors notice that ecotourism development in Moldova is possible and would promote its easier and better integration in Euro-zones.

Keywords: cultural diversity, ecotourism, regional development

JEL Classification: L83, R58

1.Introduction

Tourism is a relatively new social activity that has recently emerged as a global phenomenon. Long before tourists began traipsing all over the world, social interactions involving different cultures usually occurred in the context of commercial trading, wars or migrations. As a result, cultural exchanges were relatively restricted, occurring in specific geographical regions or within the expanding limits of political and military empires.

However, with the advent of technological advances in communications and transportation came a shift in people's attitudes towards travel. People (namely westerners) began to travel for the sake of traveling, which launched a process of cultural globalization. This process has accelerated in recent decades as a result of further technological breakthroughs in the airplane and information industries.

According to the “World Commission on Environment and Development a sustainable development implies **“meeting the needs of the present without compromising the ability of future generations to meet their own needs”**. Eco tourism can have many definitions and we can apply this one: *Ideally, ecotourism satisfies several general criteria, including the conservation of biological diversity and cultural diversity through ecosystem protection, promotion of sustainable use of biodiversity, share of socio-economic benefits with local communities through informed consent and participation, increase in environmental and cultural knowledge, affordability and reduced waste, and minimization of its own environmental impact. In such ways, it contributes to the long term benefits to both the environment and local communities.”*

Actually Eco tourism creates a triangle of criteria:

1. conservation - conserve biological (and cultural) diversity, by strengthening protected area management systems (public or private) and increasing the value of sound ecosystems;
2. sustainability - promote the sustainable use of biodiversity, by generating income, jobs and business opportunities in ecotourism and related business networks
3. biological diversity - share the benefits of ecotourism developments equitably with local communities and indigenous people, by obtaining their informed consent and full participation in planning and management of ecotourism businesses.¹

2. Mobility and cultural diversity

Agenda 21 of Culture (“We, cities and local governments of the world, committed to human rights, cultural diversity, sustainability, participatory democracy and the creation of the conditions for peace, assembled in Barcelona on 7 and 8 May 2004, at the IV Porto Alegre Forum of Local Authorities for Social Inclusion, in the framework of the Universal Forum of Cultures – Barcelona 2004, agree on this Agenda 21 for Culture as a guiding document for our public cultural policies and as a contribution to the cultural development of humanity.”) with its principles 1 and 2 is a real reflection on cultural diversity though mobility issue and its relationship with environment.

Second principle of Agenda (Clear political analogies exist between cultural and ecological questions, as both culture and the environment are common assets of all humanity. The current economic development models, which prey excessively on natural resources and common goods of humanity, are the cause of increasing concern for the environment. Rio de Janeiro 1992, Aalborg 1994, and Johannesburg 2002, have been the milestones in a process of answering one of the most important challenges facing humanity: environmental sustainability. The current situation also provides sufficient evidence that

cultural diversity in the world is in danger due to a globalization that standardizes and excludes. UNESCO says: “A source of exchange, innovation and creativity, cultural diversity is as necessary for humankind as biodiversity is for nature” (UNESCO Universal Declaration on Cultural Diversity, article 1)) reflects the relation between culture and environment. And it is very important to note that even this issue should be seen through anthropological point of view, where it stars and which the limitations are. Maybe, environment is not always seen as determining factor for culture but rather as limiting factor. Environment influences the social and cultural process and determine individuals to act in such manner to be satisfied, to confront, or to change given environment.

For instance a real example could be Mark Q. Sutton and Eugene Newton Anderson work: *Introduction to Cultural Ecology* with its relevant ideas that the culture is that one that could make a choice of which of possibilities to employ and not environment. An example could be building a house. Culture chooses materials like wood, iron, stone and other materials and it has a direct impact on the ecology.

So, if we talk about choice then we already mean the relation between culture and possibilism and technology. So culture is not accidental, but is subject of choice. The best choice implies best environment, best ecology. But these choices are available in the environment that can be limited by the capabilities of culture.

Or, environment is the nature; the increasing level of pollution directly is connected to the used technology. Technology is a result and same time a promoter of cultural diversity.

As a result the interplay between environment and culture increase the mobility, technical process and diversity of economic patterns.

Now let's think why do we need cultural diversity for human being as biodiversity for living? First, we could say that the level of ecology is related to multi-linear evolution of culture. This evolution is the result of mobility. Meantime, mobility is the result of technology expression as universal, creativity, specialty and diversity. Technology as it was said before is an expression of miniaturization and portability, people increasingly interacts and form communities: real and virtual. So, culture

¹

<http://www.travelwebdir.com/travelarticles/Ecotourism---The-Must-be-Principles-1015.html>

becomes more and more sophisticated and we already have virtual issue despite of performing arts (selective idea from: *Mobilities, immobilities and moorings*, by Kevin Hannam, Mimi Sheller and John Urry).

This performance of mobility and technology, increase the opportunity cost of cultural diversity and its multi-linear evolution, that directly or indirect has an impact upon environment and its state. Of course cultural development is linked to economic patterns and the risk increase in a very modern pattern, but also is very discussed as a possibilism of materials chose to less affect the environment.

Even human body is considered as material culture. Demonstrative point could be the passage from *Introduction to Cultural Ecology* by Mark Q. Sutton and Eugene Newton Anderson: “Biological evolution and natural selection are the forces that shape organism. Beginning sometime in the distant past, culture began to influence human development, changing the relationship of humans to their environment from one of strict biology to a mixture of biology and culture.” Continuing with same idea, in *Visions of Culture*, by Jerry D. Moore, Bronislaw Malinowski comes to conclusion that “culture is utilitarian, and functionally integrated”, it means that culture is that determines which set of solutions will be utilized. In addition to meet biological needs, culture impose other needs, thus increase the search, the look for and the most important the mobility towards satisfaction from consumption. An instrument is technologies which impact upon environment in a positive or negative manner. So, practically human being is forced by his needs to perform technologies to be satisfied. And here we are again confronting the parallelism among cultural diversity, performing technologies, environment and our needs.

To conclude directly with the second principle and its meaning about how culture is linked to environment and ecology we could mention a very important result of this relationship that aims world high level of ecology – ECOTOURISM, which is linked also to mobility. Finally, the Global Code of Ethics for Tourism enacted by the World Tourism Organization (WTO) defines the concept of Ecotourism (Ecological Tourism) as follows:

- A contribution to mutual understanding and respect between peoples and societies
- A vehicle for individual and collective fulfillment
- A user of the cultural heritage of mankind and contributor to its enhancement
- A beneficial activity for host countries and communities obligations of stakeholders in tourism development.

3.Sustainable Tourism Strategies

For these reasons, the development of a sustainable approach to tourism must be based on strategies that protect and strengthen both natural and cultural diversities. It should avoid the clash of conservation-versus-people — which has become particularly common in Africa. It needs to integrate the rights of local communities to use and manage natural resources. And it should ensure that any profits from tourism are used by the local populations as well as for the conservation of natural resources.

Ecotourism has the potential to help preserve and enrich local indigenous cultures not only in the short term, but also from a transgenerational long-term perspective. Indeed, the development of a sustainable tourism model could play a valuable role in the development of more sustainable societies worldwide. There are, however, significant risks involved in any tourism or ecotourism initiative. When developing an ecotourism strategy, the vulnerability of the natural or cultural resource being promoted must be carefully assessed to ensure that any planned activities do not threaten or undermine it. Furthermore, it is absolutely critical that local communities, in their struggle for sustainable livelihoods, be involved in integrating ecotourism activities into self-reliance projects that benefit both the community and the natural environment.

“The participants to the World Ecotourism Summit from August-September, 2002 in Johannesburg, aware of the limitations of this consultative process to incorporate the input of the large variety of ecotourism stakeholders, particularly non-governmental organizations and local and indigenous communities:

- Acknowledge that tourism has significant and complex social, economic and environmental implications;
- Consider the growing interest of people in traveling to natural areas;
- Emphasize that ecotourism should contribute to make the overall tourism industry more sustainable, by increasing economic benefits for host communities, actively contributing to the conservation of natural resources and the cultural integrity of host

communities, and by increasing awareness of travelers towards the conservation of natural and cultural heritage;

- Recognize the cultural diversity associated with natural areas, particularly because of the historical presence of local communities, of which some have maintained their traditional knowledge, uses and practices many of which have proven to be sustainable over the centuries;

- Reiterate that funding for the conservation and management of biodiverse and culturally rich protected areas has been documented to be inadequate worldwide;

- Recognize further that many of these areas are home to rural peoples often living in poverty, who frequently lack adequate healthcare, education facilities, communications systems, and other infrastructure required for genuine development opportunity;

- Affirm that different forms of tourism, especially ecotourism, if managed in a sustainable manner can represent a valuable economic opportunity for local populations and their cultures and for the conservation and sustainable use of nature for future generations;

- Emphasize that at the same time, wherever and wherever tourism in natural and rural areas is not properly planned, developed and managed, it contributes to the deterioration of natural landscapes, threats to wildlife and biodiversity, poor water quality, poverty, displacement of indigenous and local communities, and the erosion of cultural traditions;

- Acknowledge that ecotourism must recognize and respect the land rights of indigenous and local communities, including their protected, sensitive and sacred sites;

- Stress that to achieve equitable social, economic and environmental benefits from ecotourism and other forms of tourism in natural areas, and to minimize or avoid potential negative impacts, participative planning mechanisms are needed that allow local and indigenous communities, in a transparent way, to define and regulate the use their areas at the local level, including the right to opt out of tourism development;

- Note that small and micro business seeking to meet social and environmental objectives are often operating in a development climate that does not provide suitable financial and

marketing support for this specialized new market, and that to achieve this goal farther understanding for the ecotourism market will be required through market research at the destination level, specialized credit instruments for tourism businesses, grants for external costs, incentives for the use of sustainable energy and innovative technical solutions, and an emphasis on developing skills not only in business but within government and those seeking to support business solutions.”²

4. Some benefits of tourism' development in Moldova

All the above are true for Moldova also, because the tourism industry is not fully recovered. Especially, it is necessary in conditions where in our country lack natural resources on the one hand, but on the other hand, it has a very important resource - both favorable natural environment and its human potential. Unfortunately, ecotourism is still little practiced in our country. But already are developing other types of tourism - rural tourism, cultural tourism, historical, etc., that promote important values, including environmental conservation. On the base of these types of tourism already in place, there may be special programs that would specifically protect certain areas, such as, natural reserves. Notorious advantage of such tourism is the fact that it can be done in specific natural environment, contributing to its sustainable development.

Another important advantage is that ecotourism is focused mainly in rural areas, traditionally disadvantaged in Moldova, where the standard of living of the population is substantially lower and, moreover, holds about 60 percent of national habitat. But the massive exodus of population from the country's large majority occurs on account of the rural population (which, according to assessments, tend to figure about 1 million people).

Also important is the impact and cultural exchange offered by tourism for a country like our, which has set as its primary objective - the European Union integration. And the exchange of tourists leads to the imminent intensification of interpersonal communication and in the longer time

² FENNELL, David A. “Ecotourism”, Third edition, 2007, 282 pages

perspective between peoples. As a result, it is achieved a complex process of system of values' homogenization, perceptions of the reality between local people and outsiders. And finally, it is logical to expect homogenization of mentality, influenced in particular and quite inadequate by the former economic system (central planned and command system) and, why not ideological.

Nowadays, types of tourism that allows the environment support and contribute to rural areal development, become those alternative avocations that allow diversifying the rural habitat, to retain young people in the area and provide opportunities to the native self-assertion. Important fact it is especially in times of crisis, when it is among the few susceptible areas likely to support the economy through the importation of foreign currency and eventual occupation that they can provide to labor resources in the country.

5. Conclusion

It is from this perspective that one can begin to comprehend the cultural impact of international tourism. When tourists arrive at their destination, they bring with them different beliefs and behaviors, which to some extent influence the host culture. At the same time, tourists are changed by their experiences. In short, tourism is an interactive phenomenon, affecting both the hosts and the visitors.

But this effect is lopsided. The influence of tourists on the societies they visit is generally more pronounced than vice versa. The majority of global tourists come from a few affluent countries (dominant cultures), which are relatively unaffected by visitors from smaller local cultures. On the other hand, tourism increases the risk of irreversible cultural and eco-systemic disruptions in smaller societies.

Generally, the formulation of ecotourism implies by itself the problem of cultural interaction, as well of cultural impact and vice versa. Sometimes this impact could be positive, because it enhances the role of ecotourism, its meaning and development. On

the other hand its impact could be negative, because it could create the situation when meanings and values are misunderstood.

With regard to Republic of Moldova we would like to mention that a substantial contribution for solving problems on ecotourism development can bring financial and information opportunities that it offers the Euro-region creation, which have the potential to lead to the widening tourism sphere development, including those ecological in Republic of Moldova. But for this aim, the respectively field needs to become a state priority, which will elaborate concrete economic policies and mechanisms to support it (creating a favorable economic environment through incentive tax, preferential credit, proper training of personnel to be involved, advertising, etc.).

Abstract

Romanian rural areas are a sector that, in the context of transition from socialist economy to market economy, has accumulated numerous dysfunctions, whose resolution requires the identification of viable solutions that are compatible with local potential and at the same time preserve traditional features.

In this context SMEs play an active part and are very important because they allow the absorption of a percentage of the population laid off in the wake of economic reorganization that plagued post-1989 Romanian society, as well as the rapid diffusion of innovation in the territory. They can be considered local sources of discontinuity, which serve to enhance and propagate economic growth in the territory, implicitly bringing about a rise in living standards.

After 1989, the rural sub-Carpathian area between Buzău and Slănic valleys was characterized by changes in economic structure, with a strong impact on the population and on the organization of rural communities. In this context, the features of SMEs during 1994-2006 were analyzed, which highlighted their increase in numbers, more than threefold, during the respective period.

Key words: *rural area, small and medium - sized enterprises, development strategies*

JEL Classification: *I30, M13, M21, O1, R00*

1. Romanian rural areas – features and outlooks

Up to 1989, rural areas were viewed in Romania as merely a source of manpower and a raw material supply [1], a situation that, for certain reasons, continued after 1989, and, although on a smaller scale, has endured through into the present.

As a residue of the communist era in the mindset of a large part of Romanian population, urban areas are considered the standards in development and wealth, where living standards and therefore access to services is much higher. For all purposes, after decades of socialist economy, when the bulk of the young and adult population wanted to migrate to cities, after 1989 the rural areas had lost their bearings; the population could no longer head for the cities, where available jobs dropped in numbers (because of economic reorganization) and where potential migrants' access was much more difficult than in the previous period. In this context, solutions must be found in rural areas in order to raise living standards and improve the conditions of rural population.

Unfortunately, the bulk of the population in rural areas is not aware of the resources available in the village where they live, nor is it able to identify ways to capitalize on those resources [2]. Development of rural areas should be tackled while bearing in mind the resources of those areas and preservation of traditional customs and local rural nature, so as to preserve their identity. Actually, no single universal approach can be found to solve the existing dysfunctions and drawbacks in that

type of area; the plans for development must offer viable solutions that match the specific features of each particular rural region [6].

2. The role and part of SMEs as vectors of local and regional development

Rural development policy is closely linked to two concepts: diversity (multi-functionality) and sustainability, as achieving optimal diversity at community level is a key in the rural development problem [5]. Rural development programs therefore have to consider a multifunctional approach that would encompass the competitiveness of the agrifood sector, rural infrastructure, alternative sources of income (others than agriculture) and measures to raise mobility of manpower [2].

Opportunities for multifunctional development are grounded in generating many-sided activities, with a view to generating alternative incomes [3].

Diversification of activities in rural areas will result in creating new jobs for the population, which might lead to a drop in emigration and to stabilizing the population in those areas, because one of the main problems faced by rural areas is that most of those who left have not returned to their birthplaces but preferred to settle in towns.

An important part in the development of rural areas can be played by SMEs, which can act as vectors of rural development. They can be deemed drivers (local sources of discontinuities), which can be converted into vectors of innovation and economic growth.

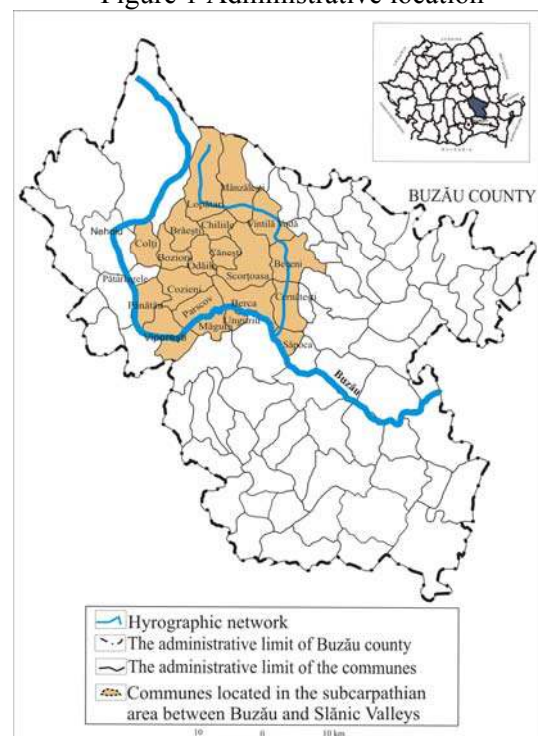

After 1989, increasingly more attention has been paid to SMEs in Romania, and the Romanian Government alongside various partners, usually European institutions has taken a series of measures to encourage and support the development of SMEs. However, SMEs are found in rural communities in small numbers in general, the reasons being that rural areas lack basic infrastructure (roads, water and sewers), the rural population's generalized shortage of money, and the archaic rural mindset [2].

3. Characteristics of the Subcarpathian rural area between Buzău and Slănic valleys

The subcarpathian rural area between Buzău and Slănic Valleys is located in Buzău Subcarpathians, which are included in Curvature Subcarpathians.

From administrative point of view this is located in the north central area of Buzău county (figure 1).

Figure 1 Administrative location

Thus, in this area there are located 9 villages, but there are going to be studied other 11 administrative units that are only partially located in the analyzed area, which approach this area through the economic activities developed there. In this area, small and medium rural establishments prevail, being an obvious difference regarding the development level of the villages located in Buzău and Slănic valleys and those located in the tributary streams' valleys, which are less developed, even marginalised. In the most cases, living standard and accessibility degree are diminishing proportional to the distance between the two polarizing axes [4].

On the whole, in these villages, as the entire subcarpathian rural area, there are serious problems which have influence on the rural life quality and there should be found some viable

solutions that are fit for a territorial balance from both economic and social points of view.

Thus, one of the main disfunctionalities is the high level of the population ageing in 11 villages out of the 20 localities, the population share of 60 years being over 30 %. In 17 localities, the age class between 15 and 59 prevail; this aspect related to the low natality demonstrates that the employment will decrease more and more in the future.

On the whole, the living standard is low and even very low, as well as the education level, especially in the localities located within the analyzed area, in this way being partially explained the low initiative level; in the most localities not even one type of European funds being accessed by the natural persons.

Agriculture, in the economic sectors, represents the greatest share, the only exception being Berca locality, where the industrial activities prevail, within those, the oil and natural gas extraction having the greatest share. The practical agriculture is one of subsistence, in small areas, especially by traditional means, being only associations for the land owned in the plain area. At the same time, another problem is the absence of local outlets that should permit a proper capitalization of the products obtained.

Non-agricultural activities are slightly represented, the most part of the existent companies being oriented to retail, due to the fact that is an activity implying a low risk by comparison with other economic sectors, an initial low investment rate and minimal economic knowledge being needed.

4.Changes in the economic structure of the rural areas between Buzău and Slănic valleys

The economic structure of the area analyzed underwent several changes starting 1994 and through 2006, some of them of special importance because they triggered radical changes.

As far as the number of active companies is concerned, it rose more than three times over during the period analyzed, which caused many-sided modifications in the structure of the region, in the context of the economic reorganization that brought about the bankruptcy or downsizing of some of the

companies set up during the communist period; in many instances there was a conversion of companies to new trades, or the emergence of new ones, especially in services.

Economically speaking, Berca is the most developed commune, with more than 20% of all companies, most of them active on the premises of Berca, which polarizes a significant percentage of the active population in - not exclusively - neighbouring communes. Berca has permanently been a center of attraction for inhabitants of the Central-Northern part of Buzău county, and it was a destination for migrants even as early as the communist period.

While in the case of the above-mentioned administrative unit, the companies' ratio of the total in the two reference years was roughly the same, in the case of Pârscov (the second commune in importance, in terms of total ratio), a 3% plus increase is registered, as a result of the inclusion of several companies in the trade registry, plus certain companies involved in processing timber.

By 1994 the two settlements accounted for more than 30% of all small and medium-sized enterprises in the region (table 1), between them, and they were centers that polarized the population in neighbour rural areas, a state of things that continued throughout 2006 (33% of all SMEs), a trend enhanced by infrastructure and ease of access, much better than the other townships'. In these two instances, commune seats are the drivers of economic growth, and they are much better developed as compared to the surrounding region, a situation that has persisted since the communist period; the two settlements have been nominated for elevation to the status of towns.

In most communes SMEs are involved in retail, but there are some exceptions, such as the Lopătari commune, where, in addition to retail-specialized companies there is strong economic activity based on exploiting and processing timber; there are more than 30 saw mills in the commune. This is a traditional field of work in the area, favoured by the commune's geographical location, as the piedmont border with the mountains features vast forest areas, supplying the raw material needed for such an operation.

Total	350	1114	6	3	2	2

Source: 2006: Buzău Trade Registry; 1994: the National Trade Register Office; processed data

The lowest number of SMEs is located in the communes of Bozioru and Chiliile, which are more isolated and suffer from deficient infrastructure. By the beginning of the time period analyzed, each of the two communes had a single company, active in services and retail, respectively; in the long run, more companies involved in retail trade were set up. Cănești and Odăile were in the same situation; by 1994 they had 1 and respectively 3 companies involved in retail. Nowadays most companies continue to work in retail.

Economic activity in the area analyzed consists in microenterprises and small enterprises (0-49 employees and average annual net turnover or total assets of no more than EUR 2 million in the case of microenterprises and no more than EUR 10 million in the case of small enterprises); by 1994 they accounted for more than 95% of all

SMEs. At the moment there are only 3 medium-sized institutions (with 50-249 employees and an average annual net turnover of up to EUR 50 million, or total assets worth less than EUR 43 million); their number dropped to half as compared to 1994's, because of economic hardships, which brought about their privatization and subsequent bankruptcy, or their subdivision into smaller units, which meant their inclusion in the lower tier of small and medium enterprises.

The 2 large companies in service by the onset of the period analyzed endured; they operate in industry; however, the number of employees dropped, in the context of the reorganization that encompassed all of Romanian economy. They are located in Berca, and specialize in crude oil drilling and the construction material industry, respectively.

As far as *turnover* is concerned (table 2), one can notice several variations from one reference year to the second, in the sense that if by 1994, 99.7 % of companies registered turnovers below RON 500,000, by 2006 their number had dropped to 89.9%, which proves increased profit for companies active in that field. Only 0.3% of the companies posted RON 500,000 to 1 million in 1994; by 2006 their number had risen to include 5.9% of companies.

4.2% of all companies posted turnovers bigger than RON 1 million, as compared to not a single company in this category in the previous time period.

Among communes, Berca and Pârscov stand out; they have the highest number of SMEs with turnovers bigger than RON 500,000; the other companies fall way short of the figures that would include them among large enterprises (with the exception of the two companies in Berca, which qualify as large enterprises thanks to their number of employees). In 40% of the communes all companies posted turnovers lower than RON 500,000, due to the fact that microenterprises are predominant on the premises, which mainly focus on retail commerce [4].

Table 2 Companies' turnover (1994, 2006)

Comuna	<500 000 RON		500 000 - 1 000 000 RON		>1 000 000 RON

Total	357	1006	1	66	0	47

Source: 2006: Buzău Trade Registry, 1994: the National Trade Register Office, processed data

Analyzing the ratio in terms of *sectors of activity* for each of the 20 settlements in the region analyzed, one can notice significant changes in the two reference years:

-the steep rise in the number of companies involved in retail was first of all due to the need for such units that would supply the population; their development was also stimulated by the large degree of isolation that characterizes a big part of the rural settlements in this area. A great inflow of such units was noticed right after 1990, when the purchasing power was great, and the rapid success of some owners launched an upward trend, also emphasized by the fact that the initial

investment was small and it could be relatively easy recuperated. In the longer run, some of them stopped being self-sufficient so they were either closed down or they reoriented towards other fields of trade: services, transport or the timber industry. This was easy especially for those companies that had had several fields of activity listed upon their setting up;

-In industry, the number of companies rose by around 30%; the growth occurred in the context where many were closed down (for instance, Berca-based "Rubinul", active in the glassware sector), but many endured and other new ones were launched, especially in the timber processing industry;

-In agriculture, the ratio rose by 0.1%, which was due to the fact that several farms were post-1990, especially in the land close to the plains region, which have survived through to the present time;

-A significant ratio - 5.2% - consists in construction companies, typically specializing in building construction and civil engineering. This sector of the economy is a clear example of economic diversification, considering that by 1994 there was no company of this type in the area analyzed;

-A process to implement new subdomains also occurs in the service sector, as new companies were created to offer business and management consultancy, ambulatory medical assistance, veterinary activities and others;

-The number of companies involved in transportation doubled in the 12-year time span analyzed, mainly due to the fact that long-distance travel to other counties was previously handled by a single, state-owned company, and several companies have been set up in the past few years, which handle the transport of both people and commodities;

-Hotels and restaurants are in a special situation; by 1994 they consisted in a few restaurants, plus a single accommodation facility in the Fișici resort (the Bozioru commune), now no longer in service, with the central building in an advanced stage of decay left as a sign of past activity. By 2006, in addition to bars and restaurants, several pensions had opened, rated one or two flowers, with one exception – a four-flower pension in the village of Berca. Pensions partly capitalize on the existing tourist potential; resources compatible with touristic usage that stand out include some special ones such as the Mud Volcanoes, the Meledic plateau, the cave

dwellings in Aluniș, Nucu, Fișici, and the 16th-17th-century wooden churches in Bozioru, the Amber Museum in Colți and the karst complex in Meledic among others.

5. Conclusions

Although transition from centralized economy to free market economy opened the way for the development of a wide range of non-agricultural activities suited to rural areas, involvement in such activities has been – and still is – limited by social, economic and technical factors.

SMEs are present in the area under analysis, but they are able to only partially absorb the existing workforce in the area; it is necessary to identify viable strategies for development that match local specific features and the strengths of the region. One of the drawbacks is the population's mindset, grounded in rural tradition; it finds it very hard to think of a way of life where agriculture would not play an important part. This is the challenge for local decision-makers: economic development of this type of space by finding those solutions that would allow improvement of living standards by a gradual transformation, so as not to harm rural identity.

The bottom line is that SMEs can act as vectors of multifunctional sustained development, able to propagate innovation in the region and bring about an uptrend in living standards.

Considerations Concerning the Economic Regional Situation on the Verge Of Global Crisis-the Maramures Area County

TOHATAN Ana Maria
Western University "Vasile Goldis" Arad
anatohatan@yahoo.com

Abstract

Studying the economic environment of the region is a necessary condition for emphasizing certain specific characteristics. Analysis involves drawing conclusions normally by reporting to some references. In terms of economy the results obtained through careful analysis cannot be reported only to references whose meanings are, most often, debatable, despite of the improvement of the statistical information content.

Keywords: *economic crisis, economic analysis, statistic-economic indicators.*

JEL Classification: R 10;

Today, at the height of the economic crisis, as we look "in the mirror", that is to statistic-economic situation, we wonder:

Could one have foreseen the decline of the economy in 2009, and at the same time diminished somehow the effects of the global economic crisis?

What we are trying to highlight here is precisely the following: the abilities of predicting the future through the global results as obtained from economic analysis.

Studying the economic environment of a region is a necessary condition for emphasizing certain specific features of that precise area.

The importance of analyzing regional economy makes itself a necessary condition through the very way in which economy is structured in micro, mezo, macro and mondoeconomy.

Thus, mezoconomy studies the economic processes and phenomena on the economic level, territorial-administrative, etc.

Economic processes and phenomena are a complex phenomena generated by many main and secondary reasons, essential or non-essential, all these being in terms of mutual conditioning.

The various forms of connections between these phenomena are being established by a comprehensive qualitative analysis.

Regional economy state of things is analyzed in terms of the economic movement, which reflects in relation to space and time factors, the way in which the economy exists and functions, as a whole and at the same time at each and every particular level. Thus the economic movement emphasizes changes in terms of quantity, quality and structure of the economy.

The very source of the economic movement is mainly the interaction of the economic processes and phenomena, whereas its impulse is being given by the multitude of necessities, interests, desires and goals of the economic agents.

Taking a step back in time, we could say that the regional economic analysis meant what we can translate from *oikonomia* mainly the way in which a house or a community is being managed-with specific references in this case to how the territorial administrative region is being managed.

The economic analysis is the complex activity as it is done on the economic-administrative level of a certain region and has its main goal reflecting-through syntetic indicators-the state of the economy.

The statistic indicator is the numerical expression of an objective-qualitative measurements-as it is obtained by carefully examining the economic situation and related to a certain,specific time,space and management conditions.

Being a result of the research, the indicator has a real content, a determined goal, its own calculation formula and the specific form of expression. It characterizes an economic or social phenomenon which repeats itself regularly. It expresses numerically a certain economic category.

Expressing in numbers certain economic categories involves using several indicators, each emphasizing different essential aspects of it, such as primary (absolute) indicators and derivatives; relative indicators.[8]

Analysis through indicators is based on techniques used for evaluating economic position of the results obtained and the changes in economic position.

The Maramures County, as a separate administrative-territorial economic entity, is characterized by the following economic issues:

- Lies in the north of Romania
- Its total surface is: 6304,4 square km, representing 2,6% of the country's territory, ranking the 15th among the country's counties in terms of size.
- The capital city of the county is Baia Mare
- There are 76 administrative/territorial units in Maramures, of which 2 cities, 13 towns, 61 communes and 225 villages.[13]

In 2008, a year on the verge of the economic global crisis, in the local economic environment 3404 firms were supposed to successfully function, economically speaking. It is to be mentioned that these data subjected to analysis refers to comparative results between 2007-2008 as retroactive statistic-economic data.

Their situation is synthetically shown in the summary table nr.1. and graphic nr.1.[12]

Through analysis of the results and economic performances of the firms subject to research, we can see the following aspects:

- The industrial production in 2008 was 6,5% higher in absolute volume as compared to 2007, and 6,3% under comparable conditions from the point of view of working days;
- The total turnover (the total turnover originates both from the primary activity and the secondary activities of the companies within the industrial field) of the companies mainly active in industry in 2008 was 2,7% higher as compared to 2007;
- Investments in 2008 increased with 21,5% as compared to 2007;
- Exports and imports of goods between 1 January 2008 and 31 October 2008 grew with 19,9% and 10,6% respectively as compared to the same period in 2007;
- The turnover from market services directed towards the population grew with 8,6% in 2008 as compared to 2007;
- The possibility to offer accommodation in tourism-specialised facilities in 2008 was 10,8% higher tourism as compared to 2007;
- The average national nominal gross salary in December 2008 grew with 9,7% while the average nominal net salary grew with 9,4% as compared to November 2008. The ratio between the index of the average nominal net salary and the index of consumption expenditure in December 2008 was 110.6% as compared to the same month in 2007;

Graphic nr.1 – Numbers of Companies according to CAEN Divisions conforming to 2008 Balance sheet

- The inflation rate, determined on the basis of the increase in the population consumption expenditures, as 6,3% in December 2008, as compared to December 2007, which corresponds to a monthly average of 0,5% (0,5% in the previous year);

- The numbers of unemployed people at the end of December 2008 was 7577 people, 357 people less than in the previous month, but 509 more than in December 2007. The unemployment rate in December 2008 was 3,75 (3,9% in November 2008 and 3,4% in December 2007). For women the unemployment rate in December 2008 was 3,5% (3,6% in November 2008 and 2,9% in December 2007);

- The number of business with foreign capital (data supplied by the National Trade

Register) registered in 2008 was 173 with an invested capital of 42.196 Euros. [12]

Conclusions

As it results from the evolution of the main statistic-economic indicators of the economical state of Maramures region, at the end of 2008 no economic downturn could have been foreseen. And this is because the indicators of economic and financial performances are retroactively calculated, reflecting the situation as shown through the financial activities from a past point of view.

Drawing conclusions through analysis usually means reporting to some kind of references. In economy results obtained through analysis can be reported only to references whose significance is often questionable, despite of the improvement of the statistical information content.

Changing the idea, Gheorghe Băilașteanu used to say that “no indicator or economic category can reflect everything, the complexity of real phenomena or economic process”.

And this is in fact our own conclusion as drawn through this research.

We would conclude paraphrasing Leucip, by saying that “*nothing happens without a reason but happens as necessity imposes itself*”.

Purging Wastewater – a Priority for Romania

VOICU Ioana-Iulica
ANTONESCU Eugenia
Constantin Brâncoveanu University from Pitesti
ii_voicucb@yahoo.com
eugenia_antonescu@yahoo.com

Abstract

Considering the global diminishing of water resources, treating and purging the waters represents a desideratum for all of us, as water quality is affected most of all by the spill of wastewater.

Water is essential to life and the lack of it or drinking polluted water generates negative consequences for a person and his health. That is why EU lays emphasis on creating performing purging stations according to the latest quality standards.

Of the 2,605 cities in Romania, only 505 are equipped with sewage systems, out of which only 18 are in concordance with the requirements of the European norm in this field. The percentage of connections to the sewage network was, in 2008, of 49.46% and by the end of 2010 it has to reach 60.8% - in order meet the terms of the EU agreement. Out of the already mentioned total number of cities, only 390 are served by 337 purging stations – only 14 of them are in concordance with the European norms and have the secondary level of purging.

The year 2010 is the first deadline at which Romania has to report about the progress made with the implementation of the European Norm concerning the purge of wastewater. The public eye has to convince itself about the gravity of the current situation. The mass of the polluting substances we spill in waters grows each day and if no measures are to be taken in order to prevent this danger, the pollution today will be insignificant in comparison with the one from tomorrow.

Keywords: wastewater, European norms, resources

JEL Classification: Q27, Q28, Q40, Q43

1. Conceptual approaches – historic, evolution, regulations

Considering the global diminishing of water resources, treating and purging the waters represents a goal/ desideratum for all of us, as water quality is affected most of all by the spill of wastewater.

Apparently *the first sewers* were built 5000 years ago in Mohenjo-Daro, on the Indus valley, and the roman canals are still in use nowadays, technically being an excellent execution. *The first purging stations* however appeared in England in the 19th century, and in 1984 in the USA there were 15438 purging stations serving to 73.1% of the population[1]. Technically speaking, the first step in the purging process is collecting, through the sewage systems, the wastewater, also known as used water or sewer water. For the industrial polluters these systems are simpler, but for the sewage of a locality, they are vast and complicated. Practically water purging is the process of removing from potable, industrial, canal waters the substances that make them inappropriate for certain uses.

The principle of building a purging station for wastewater is based on a close building scheme, although they differ in dimensions and the applied technology. As a rule they consist of: a primary level, mechanical; a secondary level, biological; and for some stations a third level, biological, mechanical or chemical. There are also vertical purging stations, tour-like, but most of them are horizontal. They occupy a relatively big surface, but part of the plumbing can be done under-ground, with green-spaces on the ground.

Purging wastewater is a technical discipline, in which the sciences of engineering, physics, biology and chemistry collaborate. There is a big amount of specialized literature on how to

operate purging stations, based on detailed legal and technical regulations.

The main normative specific act is H.G. Nr 188 / 28th February 2002 for the approval of norms concerning the conditions of discharging wastewater in the aquatic environment, published in *Monitorul oficial*, 1st part nr. 187 of March 20th 2002.

According to the Adhering Treaty, Romania has to assume the compulsivity of the approximation of the national legal frame and the EU legislation in the field of water as well, this meaning 18 directives (17 plus the 91/271/EEC).

Moreover, in the context of European integration the rational use of both knowledge and technology transfer is imposed, as well as promoting the standards and the existing norms at an European level.[2]

2. Water, an universal substance.

Water is essential to life it is the most common substance on Earth. She fulfills several functions in the organism and basically, without water, all biological reactions become impossible. The lack of water or the consumption of polluted water has multiple negative consequences on persons and their health.[3]

Moreover, the human body is two thirds water and needs, in order to be healthy, 2.5 liters of water a day. In western societies about 250 liters of water are used daily for body hygiene and domestic consumption to which the industrial and agricultural consumption are added. In order to grow the wheat necessary for a white loaf of bread 400 liters of water are needed and 279 tons of water are required for the production of a ton of steel. Naturally, water appears in three different forms: solid (frozen or as ice), liquid (water) and gaseous (vapors of water in the air). It can dissolve more substances than any other liquid.

The sea level is raising, the glaciers are melting and the Earth is under the threat of a possible flood until the end of the century. The irony is that the planet is now confronting a scarcity of water that may become a serious crisis in the near future.

Water, universal substance, covers 70% of Earth's surface, that is over 1.4 billion Km³, but only a small part of it is used by man. Sea water represents approximately 97% of world water supplies and it contains up to 35 kilos of mineral salts dissolved in every 1000 liters of

water. This is up to eight times saltier and it cannot be used for consumption or irrigations. Fresh water only represents 3% of world water supplies and 97% is sea water. 77% is blocked in ice caps or mountain glaciers, 22% is underground waters and the remaining per cents represent 0.05% vapors of water, 0.2% soil humidity, 0.35% lakes and rivers, 0.4% salty water rivers and inner seas.[4]

While UN requires a minimum consumption of 50 liters of water daily for drinking, cooking, washing and sanitary use, billions of people worldwide don't even have access to sources of fresh water of safe water for minimum sanitary use. If the world population continues to grow in the same rhythm as it is now doing, the water consumption will be in 2030 of about 40%. In this case between 2 and 7 billion people worldwide will suffer the consequences of the irrational use of water up until the middle of the century.[5] Moreover, nowadays even the most pure water sources have become inappropriate to be used because of the pollution and of the contamination that resulted from human activities and from industrial wastewaters. The industrial progress of the last decades has led to the increase of the amount of polluting substances that are hard to be detained using classical technologies. Industrial and domestic wastewater that have been insufficiently well purged, or not purged at all, affect the quality of water resources.[4]

3. The particularities of purging wastewater in Romania – somber realities.

Studies have shown that, at a national level, the sewage network measured almost 17,000 km in 2004. In five years, the network has increased with only 3000 km, serving localities comprising 51% of Romania's population. For the almost 20,000 km of pipes still necessary, we would need 29 more years. Two decades later than the commitment Romania took in front of the EU.

The total sum required to finalize the sewage network and the purging stations in Romania has been estimated by the National Administration of Romanian Waters (ANAR) to 9.5 billion euros. At the end of 2008, according to ANAR data, in Braila County only 2.6% of the population were connected to

the purging stations, in Mehedinti only 2.7%, in Caras Severin 2.8% and in Galati 5.9%. The wastewaters in these regions go unfiltered in the Danube and then in the Black Sea, affecting the environment on a long-term.

The Danube is polluted and according to the data from the Ministry of the Environment, the biggest polluting factor is Bucharest. Only in 2008 in Dambovita have been discharged over 370.000 m³ of wastewater, containing over 25,000 tons of phosphates, 500 tons of detergents, a ton of cyanide and the quantities of nitrogen, ammoniac, urea or phosphorus were 30-40 times over the imposed norms.

The pollution of the Dambovita leads to the pollution of the Danube and currently the people of Calarasi have severe problems with the quality of the potable water in the town. In this vicious circle an important part is played by the Purging Station of Bucharest which normally should filter the wastewater of the capital city before they reach Dambovita.

Although investment has been made at the Purging Station of Bucharest of 2003 by using European funds, the complete modernization of the filters of the purging station will take place in 2013. According to the Monitoring Report of the National Administration of Romanian Waters (ANAR) for 2008, the volume of wastewater discharged from Bucharest and the localities adjacent to it was of 354.3 million m³ a year, representing all the wastewater discharged directly in the Dambovita, after passing through a mechanical stage, which has a powerful impact on the quality of the waters of Dambovita and Arges, the parts of the rivers that are affected being represented by strongly degraded waters.

According to their equipment and to the complexity of the technological scheme, the purging stations can produce: potable water, water of different quality categories for industrial use, water for zootechnic compounds or water for irrigation.[5].

The European norms in the field of waters imply, especially for the big cities, the creation of purging stations with a third purging stage, in order to achieve a good waters' state respectively class two of quality. In Bucharest, after finishing line I, the works on line II must also be ready by 2012.

The maximum volume of wastewater discharged in Bucharest is of 18 m³ a second. The purging line I makes possible the purging of a maximum quantity of 10 m³ a second and after the completion of line II the maximum

purged volume of water will be of 18 m³ a second.

According to the data from the ANAR monitoring report, in 2008 the wastewaters were filled with nutrients, the high values of nitrogen, an annual average of 27.037 milligrams a liter, and of phosphorus – 3.99 milligrams a liter, requiring an advanced purging of wastewater.

From the 2,605 cities in Romania, only 505 have sewage systems. Out of these, only 18 are in concordance with the requirements of the European norm in this field. The degree of connection to the sewage system has been, in 2008, of 49.46%, and by the end of 2010 it has to reach 60.8%, consistent with the agreement with EU.

Out of the same number of cities, only 390 are served by 337 purging stations, and only 14 of them respect the European demands and have the secondary stage of purging.

The big cities however do not have purging stations congruent with the European norms. 2010 is, as stated by ANAR, the first deadline to which Romania has to project its progress in connection to the implementation of the European norm about wastewater purging. By the end of 2010 “*part of the big urban agglomerations that have more than 100.000 inhabitants, among which: Bucharest, Cluj, Iasi, Buzau, Piatra Neamt, Satu Mare, Constanta, Galati, Targu Mures, Ploiesti or Timisoara, have to report the completion of the works at the purging stations with a third stage and, implicitly, the connection of their inhabitants to them.*” At present Romania has no purging station with a third stage capable to clean the wastewater of the content of nutrients, total phosphorus and total nitrogen.

The wastewater with a high content of heat generates multiple effects, and the increase of temperature stimulates the phenomenon of eutrophication.[6]

Moreover, the effects of polluting water resources are complex and varied, according to the nature and the concentration of the contaminating substances. Solving the problems raised by water pollution is a matter of the treating and purging process through which the necessary conditions for consumption are fulfilled.

On the one hand it is required to lay emphasis on human resources and on the institutional development of the internal environment system, and on the other hand on promoting international relations, especially regional,

aimed at improving the efficiency of the actions locally.[7]

The entire Romanian society has to participate in administrating water resources and this activity must be fulfilled in a very conscious way.[8]

The public eye must convince itself of the gravity of the current situation. The mass of the polluting substances we spill in waters increases daily and if no measures are to be taken to stop this danger, the pollution today will be nothing compared with the one from the future.

Proposals concerning project management for local communities development

BRAGARU Constantin
Asist. Univ. Drd "Ovidius" University
costin_bragaru@yahoo.com

Abstract

In the last years local development has become undeniably one of the dominant elements for productivity growth strategy employment, human welfare, entrepreneurship promotion, obtaining human capital and income increase. Assuring sustainable development for a specific region is a complex process in the measure in which this process is subjected to some factors which cannot be controlled by a local, regional, or national administration. The entire post-revolution and post-accession experience, cumulated with good policy making transferred by Romania to European Union, proves that the private public partnership is a viable solution for successfully solving some communitarian problems, public interests starting with social services and complex social-economic development projects including infrastructure projects. The experience of some different governments and international organizations cumulated in more than 20 years demonstrates that PPP are a solution for solving social economic problems.

Key words: local community, economic development, strategies, European funds

JEL Classification: E61, H83

Introduction

The long term impact of globalization, associated with demographic growth and the advanced aging of population, technology evolution and climate change have enlarged the action of local economy in condition of a registered success in regional, national or multinational structure level. Although it has become more and more clear that the only national politics which haven't been confronted with major difficulties in repairing economic disparities between regions and towns are part of EOCED (Economic Organization from Cooperation and Development) states for which sustainable development is vital. The difficulty

in the local development process consists in identification of the solutions in order to attract and involve in the "game" all necessary factors, a balanced utilization of resources so that these can be improved in the next 30-50 years. The knowledge economy has gained new valences and has more importance ahead industrial economy. This type of investment is definitely profitable but a great number of towns don't have the necessary financial resources. Local communities must fulfill necessary competences in order to stipulate the occasion to realize a new investment, share the risks and costs through realizing public private partnerships. The investments are in fact the fuel of local development that's why local communities are trying more and more to attract this type of action with the purpose of increasing entrepreneurship, innovation, human capital, exchange of good politics, creating new workplaces. Public and private sectors loose their efficiency if used separately, because they are two interdependent realities deriving one from another and permanently sustaining each other.

In the actual context of economic crisis, the fact that project management for local communities' development is based on European financing like a certain financial source for sustaining the process of implementation of sustainable development strategies formulated at national, regional, county level. The results for finalized projects or those of projects in implementation will positively affect the life quality of county communities contributing to developing some areas set as priority: tourism, transport, infrastructures, water, waste management, social assistance. The implementation of project using pre-accession funds have been a point of departure in the process of economic and social development and in managing projects financed from uncallable funds. Thereby public authorities involved directly like beneficiaries of financing, or through partnerships, have gained

necessary expertise in domain with a real advantage in accessing European structural and cohesion funds through the Operational Programs. The private sector must be nearby local authorities in scanning this road of challenges of economic and social developments of a region to European standards. It's not necessary for towns and villages to have preferment infrastructure if there are no people to valuing them, initiate and maintain business creating new work places, turning advantage from local peculiar and building a proper space for economic and social development. The local development strategies have been sensitively modified in the last two decades. Nowadays the economic development of cities and regions is less oriented towards roads, bridges and factories and more towards communication, industrial reconversion, spaces assigned to high class concerns, mutual actions of promoting and local development. It stands for these elements to attract tangibles contractual partners and production taxes for reinvested capital. Local powers must be reorganized for attracting investments. Because at this time beside budget regions imposed public administrations must face globalization that is why the solution cannot came only from public financing because local development has been successfully "crowned" and has proved itself viable on long term therefore private sector must bring contribution. This last one has often manifested the interest for local development , but in order to attract them and use them efficiently local administration must have the necessary financial resources. Local development has chances of succeeding if it's the fruit of a private public partnership in collaboration with international financial institution. Within this partnership two major roles are hold by public sector: assuring the improvement of public services, mostly in what regards education, development projects, infrastructure and favoring the collaboration between public and private actors with the purpose of realize development projects in a professional manner. A great number of local economic strategies are never taken to a good end because those who have conceived it haven't identified at first the necessary resources for the feedback investments and haven't regarded the involving of private sector as a rule. The progress key in financing local economy development consists in reorganization of relations with the private sector. This last one supports collectivities in

obtaining financial resources. There are several devices which allow to public and private sectors to share risks and costs related to local development projects because PPP, credits and private financing mechanisms are sustaining local efforts made by public sector. Important changing is exposed in financing local development financing. The perspectives offered by globalisation to cities and other towns have launched a dynamic development through new financial investments. All these evolutions are more and more indurate by realizing the fact that facilitation of local and regional investments doesn't depend only by the volume of absorbed funds. Local sustainable development depends entirely of the investment quality, a good management and the efficiency that can be offered by local and private paymasters. Therefore the key principles that must be followed in elaboration of a financing strategy for local communities development are:

1. Smart financing for towns and regions through improvement of budgetary relations with superior administration levels.
2. Encouraging private sector by involving it in financing investments al local level.
3. Financing with the purpose of metropolitan area development through sharing costs and advantages.
4. The exploitation of economic growth advantages at local level.
5. Forming PPP.
6. The approach of a new vision in what implies public management at local level with the purpose of finance fluidization.
7. Encouraging entrepreneurship in private and public sectors at local level.
8. Encouraging private sector towards market investments which lead to long term results.
9. Laying emphasis on the quality of local investments projects and not financing offers.
10. Skilled officials in local and superior administration.

However PPP is not a wonder solution for solving the problem of necessity of great investments. In Romania the most often problem in public and private area is deficient legislation who doesn't officially sustain the arguing of PPP. Another fundamental proposal in what regards local development aims the establishment of an interior management at local level.

In the organization and function of all Institution that leads to good preparation activity and local development implementation projects. Most of the times projects are blocked in their way of organizing as financing application leading to limit situation like: a heavy analysis of documentation to send for note, transmitting in useful time some essential information. In conclusion we can synthesize two directions for development local communities. The first one is writing financing European and national projects and the second is creating necessary important elements like: local development strategies well elaborated, structured and prioritized, qualified staff for writing project implementation and elaborating development strategies.

Sustainable Municipal Waste Management Process – Environmental Protection and Profitable Public Investments

STATE Florina
Doctoral School of Economics ASE Bucurest
florinastate@yahoo.com

Abstract

Both the present waste management process in Romania, which does not involve any selective municipal waste collecting activities or adequate storage facilities and EU requirements in what concerns waste management (a significant reduction of stored municipal waste and an increase of recycling strategies and action plans) represented the main reasons for choosing to debate a series of strategic approaches towards the abovementioned subject herein. We focused both on the social and economic impact a sustainable waste management process may have trying to be as clear as possible about the costs and the benefits of implementing a national strategic action plan in the area.

Keywords: biodiversity, degradation, environment, sustainable, waste management.

JEL Classification: Q 53

1. Introduction

Our approach is not about words, these being mainly a political job, but about facts, about possible strategies that can “cure” the “waste plague” which has been one of the major problems in Romania for the last 20 (twenty) years. The following pages are concerned with a couple of strategic approaches we think might solve the problem, each of them being analyzed both in what concerns its strengths and weaknesses.

2. The “waste plague” and possible solutions to “cure” it

The first strategic approach concerned with achieving a sustainable waste management process in Romania provides the background for splitting the waste management services market into different “slices of the pie”, the operational activities being outsourced to different companies, each of them being responsible for implementing the policy within their own area of responsibility. The benefits implied by such a way of solving the problem are obvious: a part of the services associated to waste management is easier to deal with in comparison to all of them and the existence of more than one service providers imply a certain degree of economic competition which eventually will lead to an increase in the quality of services provided to the stakeholders and better value for money. When the public authorities develop their own operational waste management system, they have to invest both in the development of the collecting infrastructure (transporting vehicles, containers etc) and in the human resources who are supposed to deliver the activities implied by the strategic delivery plan.

The collecting, transport and processing costs are also paid by the responsible public authority. The main advantage of such an approach is the fact that they practically have the entire control over the delivery process. The main disadvantage is the fact that, in the case of smaller communities, the insufficient economic development of the area may generate poor return rates for the service provider, the huge initial investment the authority needs to make being economically inefficient. The solution of splitting the

market into smaller, easier to deal with, shares has the advantage that each of the companies will focus on their own area, not interfering with each-other, the citizens being the only beneficiaries of this improved implementation of the strategic action plan. Another advantage which should be taken into consideration in this particular case is the fact that, once the services have been outsourced, the public designated authorities will have more time and resources to design better sustainable waste management strategies, not having to be concerned with the delivery of the strategic action plan anymore.

The overall costs of the operational aspects involved would also be smaller, due to the competition between the legally established companies delivering waste management services.

A few aspects should also be mentioned in what concerns the disadvantages of the outsourcing solution discussed herein. At the moment, due to the recession period we are experiencing, finding adequate operators to compete for the delivering aspects implied by the sustainable waste management strategy might be a very difficult thing to achieve. The risks associated to the establishment of a long term agreement such as this one are very high, the winners of the procurement process being likely to fail their share of meeting the agreed provisions enforced by means of the agreement discussed herein.

Another problem would be that, once the services are outsourced, the prices might rise for the private investors need to have good return rates to achieve value to money.

A direct consequence of the higher prices on the market would be higher taxes which need to be paid by the stakeholders, a tremendous loss of social and political capital being experienced by the decision makers. In what concerns the economic impact, by attracting private investments which need to produce high return rates in order to generate profit, the prices paid by the stakeholders for the municipal waste collecting services is expected to rise by at least 100%, this being a challenging expense for their already shrank recession budgets.

On the other hand, by creating jobs and new sources of revenue for the local budget, the investments would prove to be a medium term economic hit. The implementation of this strategy would positively impact on all sustainable environmental issues. The municipal

waste management strategy is not delivered properly at the time, one of the consequence being the pollution of the environment (water, air, soil) associated with a series of landscaping problems. The delivery of a sustainable waste management action plan performed by the more than one selected companies would assure environment protection and sustainable development for the cities of Romania.

At the same time, an adequate waste management system is necessary in order to assure quality to life for the stakeholders, the quality of the environment being linked to the health of everyone inhabiting it.

By processing all municipal waste in such a way as to achieve value to money, a sustainable market for renewable resources is created, the overall carbon footprint being positively influenced.

Another approach suggested herein focuses mainly in encouraging companies to use all the resources that can be identified at the level of municipal waste in Romania, the focus being both on material and energy generating waste usage.

An integrated strategy which promotes sustainable municipal waste processing impacts both on the quantity of raw material that is being used to produce goods and on the price of the recycled end products, the latter being cheaper due to the inferior costs of the material used to produce them.

The proposed strategy aims to promote a sustainable municipal waste recycling action plan, the processes of selection and separation of different waste types being performed only after they have been collected and brought to a central processing facility.

Municipal waste separation and selection processes can be performed both automatically and manually as long as secure working conditions are provided to all employees.

Image 1. The Romanian plague

The effectiveness of the two abovementioned processes, performed after the waste has been collected, can be reasonable in the case of some resources like metal, wood, plastic, these materials being suitable to enter a process of composting and packaging shortly after they have been separated. Nevertheless, this is not the case of other materials like glass, which can be very fragmented, or paper, which can be polluted with other substances or other types of municipal waste.

The economic value of these materials would never justify such an investment in their processing. One of the main advantages of this strategic approach is the fact that, in comparison to on field municipal waste separation, there is no need for special collecting containers or any other facilities, the initial public expenditure being, in this case, reasonable. In what concerns the economic impact, this strategy involves high return rates for the investments made during the first stages of the process. The revenues, being further reinvested, can help the community and regenerate the obsolete existing municipal waste collecting infrastructure.

The recycling process also facilitates a further reduction of operational costs by providing a solution to cheap municipal waste storage. On the other hand, if we are to take into consideration the recession period experienced by the contemporary society, the prices paid for raw materials are more affordable nowadays, the recycling businesses being on the verge of collapsing for it cannot compete in these new open market conditions. The implementation of the strategy herein would definitely have a positive impact on the environment, the

recycling process offering a lot of eco-friendly solutions.

The joint efforts of the Romanian designated authorities and the vast majority of the stakeholders are needed in order to achieve a sustainable municipal waste management process. Selective municipal waste collecting is an affordable solution and implies waste storage in special designated facilities in order to assure a cost effective recycling, this being another solution we propose. The forecasts predict an increase of 0,8% a year in the case of the municipal waste produced, the waste stored within special designated facilities increasing correspondingly. The latter aspect could be improved by means of developing a special selective collecting infrastructure which could lead to a better processing of municipal waste and to an increase of the recycled goods entering the market. The implementation of a strategic action plan associated to the strategy under discussion implies an initial investment in the development of a selective collecting infrastructure which requires special facilities (special containers and bags). According to the provisions of Regulation 1121/2006 the specific designated colors used to identify the containers which are supposed to store different types of waste are: White – white glass; Green – colored glass; Blue – paper and carton; Yellow – metal and plastic; Red – dangerous waste; Brown – biodegradable/compostable waste; Black – waste which is impossible to process/recycle. In order for this approach to be a success, the initial infrastructural investment should be associated to a publicity campaign, the latter aiming to inform the stakeholders about the initiative, the process and all the specific information in relation to the strategy. In order for the stakeholders to be receptive to the strategy presented herein, certain financial benefits, like tax reductions, could be provided.

Image 2. Selective collecting containers

This strategy generates a positive environmental impact, the quality of life increasing correspondently. As an EU member state, Romania has to reduce the quantity of municipal waste stored in inadequate facilities, and this selective collecting waste management strategy is an efficient solution to the problem. The result of its implementation depends, as we have already mentioned before, on the mutual partnership established between the local authorities and the stakeholders.

3. Conclusions

In conclusion, the benefits implied by making the best of these strategies are: environmental protection (by selectively collecting the municipal waste, reducing the improperly stored waste and processing all renewable resources), an increased level of community cohesion, all stakeholders being active agents in the process of implementing the strategy and developing qualitative waste management infrastructure and services (adequate containers, means of transportation, deposit and processing facilities).

Important quantities of energy (a television set may function for three hours and a bulb up to 20 hours only by using the energy obtained by recycling a single aluminum can), water and raw materials will also be saved by developing a specific recycled products market and the municipal waste storage facilities will cover less surfaces of polluted land.

Aspects Regarding the Constantza Harbour Traffic Seasonality

Aivaz Kamer-Ainur

Mirea Marioara

“Ovidius” University of Constanta

kamer_aivaz@yahoo.com

mm_mirea@yahoo.com

Abstract

Having in view the distinct importance of the harbor traffic and directly and indirectly induced impact, the paper fulfills a study of modifications in a certain period, identifying harbor traffic influence factors. The seasonality analyse have in view the monthly evolution (development) of the merchandise traffic in the period 2004-2008 and will be focused on the main merchandise groups

Key words: harbour traffic, seasonality analyse

JEL Classification: C01, C25, L91

1. Introduction

The harbor activity is defined like a regional economic activity with the goal of a regional economic activity with the goal of passengers and merchandise maritime transport achievement. This definition involves activities on board, in the harbor terminal and during the passengers and merchandise transport. The harbor activity directly connected to the maritime transport activity involves a series of activities and services necessary to move merchandise on water, concretized by expenditure made by the respective firms to accomplish their duties. Analyzing the relations generated by the harbor activities, it has been observed the 94,7% dependence on the total merchandise traffic and 6,3% on other factors.

This reality could be explained first of all by the fact that in Constanta, Midia and Mangalia harbors, activities are limited especially to the merchandise operation, the shops building being quite weak represented. Having in view the distinct importance of the harbor traffic and directly and indirectly induced impact, the paper fulfills a study of modifications in a certain period, identifying harbor traffic influence factors. The seasonality analyse have in view the monthly evolution (development) of

the merchandise traffic in the period 2004-2008 and will be focused on the main merchandise groups: cereals; potatoes, other fresh and frozen fruits and vegetables; living animals; sugar but; wood and cork; solid mineral fuels; crude oil; oil products; iron ores; iron and steel offal's furnace slag; non-ferrous ores and offal's; metal products; cement, quick lime, prefab materials for buildings; rough or processed minerals; fertilizers (natural or chemicals); chemical products derived from coal and tar.

2. Experimental

The specification of the time model structure could be made using several methods, as: the graph method and the variation analysis method. In what follows the used method will be detailed for the first product group, CEREALS, for the other groups the study results only will be specified. The graph method consists in the chronogram of the analyzed period series.

Because the analyzed phenomenon chronogram shows an oscillatory evolution, that leading to the acceptance of a model structured on three components, as follows:

$$y_t = f(t) + s(t) + u_t$$

where:

y_t = time series values;

$s(t)$ = seasonal component, result of the essential factors influence, representing the evolution trend of the long term analyzed phenomenon, trend that based on the graph, could be described using a linear function;

$f(t)$ = trend component, the general long-term movement in the time series values over extended period of years;

u_t = residual component, the erratic variation from trend that cannot be ascribed to the cyclical or seasonal influences.

Variation analysis method

The use of this method in order to specify the adjustment model is founded on the relation:

$$\sum_{i=1}^n \sum_{j=1}^m (y_{ij} - \bar{y}_0)^2 = \sum_{i=1}^n \sum_{j=1}^m (y_i - \bar{y}_0)^2 + \sum_{i=1}^n \sum_{j=1}^m (y_j - \bar{y}_0)^2 + \sum_{i=1}^n \sum_{j=1}^m (y_{ij} - \bar{y}_i - \bar{y}_j + \bar{y}_0)^2$$

$$y_{ij} = y_t, \text{ where } t = j + m \cdot (i - 1);$$

$$\bar{y}_i = \text{annual means } (i = \overline{1, n}; n = 5);$$

$$\bar{y}_j = \text{monthly means } (j = \overline{1, m}; m = 12)$$

$$\bar{y}_0 = \text{general mean};$$

$$\bar{y}_i = \frac{\sum_{j=1}^m y_{ij}}{m} = \frac{\sum_{j=1}^5 y_{ij}}{5};$$

$$\bar{y}_j = \frac{\sum_{i=1}^n y_{ij}}{n} = \frac{\sum_{i=1}^4 y_{ij}}{5};$$

$$\bar{y}_0 = \frac{\sum_{i=1}^n \bar{y}_i}{n} = \frac{\sum_{j=1}^m \bar{y}_j}{m} = \frac{\sum_{i=1}^n \sum_{j=1}^m y_{ij}}{n \cdot m} = 385062,4167$$

$$\Delta_{y/t}^2 = \sum_i \sum_j (y_{ij} - \bar{y}_0)^2 =$$

1257759803966,58 (total variation);

$$\Delta_{y/t}^2 = \sum_i \sum_j (\bar{y}_i - \bar{y}_0)^2 =$$

339884671177,17 (the variation of y explained by the trend, that is the effect of action of the main factors; represents 27,02% of the total variation).

$$\Delta_{y/s}^2 = \sum_i \sum_j (\bar{y}_j - \bar{y}_0)^2 =$$

307100318662,58 (the variation of y explained by the seasonality, that is the effect of the seasonal factors; represents 24,41% of the total variation).

$$\Delta_{y/u}^2 = \sum_i \sum_j (y_{ij} - \bar{y}_i - \bar{y}_j + \bar{y}_0)^2 =$$

610774814126,83 (the variation of y caused by the action of the accidentally factors (residual component); represents 48,56% of the total variation).

Because the time series base to follow the econometric description of the phenomenon nature of the law evolution represents just a segment just a part of the long term evolution, it could be assimilated to a test the check of

the calculation on analyzed the period time indicators must be necessary.

The test of the obtained results significance could be made using the „F” – test Fisher – Snedecor, knowing that:

$$F_{cal}^1 = \frac{\Delta_{y/t}^2}{n-1} : \frac{\Delta_{y/u}^2}{(n-1) \cdot (m-1)} = 6,12$$

$$F_{cal}^2 = \frac{\Delta_{y/s}^2}{m-1} : \frac{\Delta_{y/u}^2}{(n-1) \cdot (m-1)} = 2,59$$

From the Fisher – Snedecor distribution table is taken the corresponding theoretical value of the two calculated values, F_{cal}^1 and

$$F_{cal}^2 : F_{0,05;4;44} = 2,58.$$

Because:

$$F_{cal}^1 = 6,12 > F_{0,05;3;9} = 2,58$$

$$F_{cal}^2 = 5,53 > F_{0,05;3;9} = 2,58,$$

It could be accepted the model $y_y = f(t) + s(t) + u_i$, with a 5% significance limit (a probability of 0,95), the trend component having a 27,02% weigh from the total variation of the y phenomenon, the seasonal component 24,41% and the aleatory factors 48,56%.

The seasonal component could be expressed even by relative form – the seasonal coefficients, k_j , even the absolute form, s_j .

Like general rule, the seasonal component is calculated related to the trend (the trend component). Depending on the trend modalities of expression seasonality could be determinate using several procedures, as: the arithmetical average procedure, the mobile average procedure, the analytical trend procedure.

This study used the first one, the arithmetical average. The arithmetical average procedure consists in the comparison of the empirically values y_{ij} with the annual averages \bar{y}_i and the arithmetical averages calculation of these values on the annual under periods.

Thus:

- Seasonality in absolute values s_j

results from the relation:

$$s_j = \frac{\sum_{i=1}^n (y_{ij} - \bar{y}_i)}{n} = \frac{\sum_{i=1}^n y_{ij}}{n} - \frac{\sum_{i=1}^n \bar{y}_i}{n} = \bar{y}_j - \bar{y}_0$$

$$\sum_{j=1}^m s_j = \sum_{j=1}^m \bar{y}_j - m \cdot \bar{y}_0 = m \cdot \bar{y}_0 - m \cdot \bar{y}_0 = 0$$

$$\sum y_i = \sum f(t)$$

$$\sum u_i = 0$$

- Seasonality in relative values

$$k_j = \frac{\sum_{i=1}^n \frac{y_{ij}}{y_i}}{n} = \frac{1}{n} \cdot \sum_{i=1}^n \frac{y_{ij}}{y_i}$$

$$\sum_{j=1}^m k_j = \frac{1}{n} \cdot \sum_{i=1}^n \sum_{j=1}^m \frac{y_{ij}}{y_i} = \frac{1}{n} \cdot \sum_{i=1}^n \frac{1}{y_i} \cdot \sum_{j=1}^m y_{ij} =$$

$$\frac{1}{n} \cdot \sum_{i=1}^n \frac{1}{\sum_{j=1}^m y_{ij}} \cdot \sum_{j=1}^m y_{ij} = \frac{m}{n} \cdot n = m$$

Where:

$$k_{ij} = \frac{y_{ij}}{y_i}; \quad k_j = \frac{1}{n} \cdot \sum k_{ij}$$

Observation: more each value from this series removed from zero, more the seasonal factors are present inside the respective under period. This procedure to express the seasonality is used only to evidence the seasonality intensity because of the restrictive hypothesis there are based on.

3. Results and Discussions

Applying the methods used before for the main merchandise groups we obtain these results:

a. Potatoes, other fresh and frozen fruits and vegetables:

$$\Delta_y^2 = \sum_i \sum_j (y_{ij} - \bar{y}_0)^2 =$$

1040427776,85;

$$\Delta_{y/t}^2 = \sum_i \sum_j (\bar{y}_i - \bar{y}_0)^2 = 758330214 \text{ (the}$$

variation of y explained by the trend, that is the effect of action of the main factors; represents 72,88% of the total variation).

$$\Delta_{y/s}^2 = \sum_i \sum_j (\bar{y}_j - \bar{y}_0)^2 = 123808086,05 \text{ (the}$$

variation of y explained by the seasonality, that is the effect of the seasonal factors; represents 11,89% of the total variation).

$$\Delta_{y/u}^2 = \sum_i \sum_j (y_{ij} - \bar{y}_i - \bar{y}_j + \bar{y}_0)^2 =$$

158289476,53 (the variation of y caused by the action of the accidentally factors (residual component); represents 15,21% of the total variation).

b. living animals

$$\Delta_y^2 = \sum_i \sum_j (y_{ij} - \bar{y}_0)^2 = 754547750,58;$$

$$\Delta_{y/t}^2 = \sum_i \sum_j (\bar{y}_i - \bar{y}_0)^2 = 23574322,54 \text{ (the}$$

variation of y explained by the trend, that is the effect of action of the main factors; represents 37,49% of the total variation).

$$\Delta_{y/s}^2 = \sum_i \sum_j (\bar{y}_j - \bar{y}_0)^2 = 29871874,28 \text{ (the}$$

variation of y explained by the seasonality, that is the effect of the seasonal factors; represents 19,79% of the total variation)

$$\Delta_{y/u}^2 = \sum_i \sum_j (y_{ij} - \bar{y}_i - \bar{y}_j + \bar{y}_0)^2 =$$

322296508,7 (the variation of y caused by the action of the accidentally factors (residual component); represents 42,71% of the total variation).

c. wood and cork

$$\Delta_y^2 = \sum_i \sum_j (y_{ij} - \bar{y}_0)^2 = 27545283919,25$$

$$\Delta_{y/t}^2 = \sum_i \sum_j (\bar{y}_i - \bar{y}_0)^2 = 13409011909 \text{ (the}$$

variation of y explained by the trend, that is the effect of action of the main factors; represents 58,42% of the total variation).

$$\Delta_{y/s}^2 = \sum_i \sum_j (\bar{y}_j - \bar{y}_0)^2 = 925075621,9 \text{ (the}$$

variation of y explained by the seasonality, that is the effect of the seasonal factors; represents 16,79% of the total variation).

$$\Delta_{y/u}^2 = \sum_i \sum_j (y_{ij} - \bar{y}_i - \bar{y}_j + \bar{y}_0)^2 =$$

6829091531,1 (the variation of y caused by the action of the accidentally factors (residual component); represents 24,79% of the total variation).

d. solid mineral fuels

$$\Delta_y^2 = \sum_i \sum_j (y_{ij} - \bar{y}_0)^2 = 1101740132667$$

$$\Delta_{y/t}^2 = \sum_i \sum_j (\bar{y}_i - \bar{y}_0)^2 = 398520322172,27$$

(the variation of y explained by the trend, that is the effect of action of the main factors; represents 36,17% of the total variation).

$$\Delta_{y/s}^2 = \sum_i \sum_j (\bar{y}_j - \bar{y}_0)^2 = 175110878398,4$$

(the variation of y explained by the seasonality, that is the effect of the seasonal factors; represents 15,89% of the total variation).

$$\Delta_{y/u}^2 = \sum_i \sum_j (y_{ij} - \bar{y}_i - \bar{y}_j + \bar{y}_0)^2 =$$

528108932096,93 (the variation of y caused by the action of the accidentally factors (residual component); represents 47,93% of the total variation).

e. crude oil

$$\Delta_y^2 = \sum_i \sum_j (y_{ij} - \bar{y}_0)^2 = 1909672798803$$

$$\Delta_{y/t}^2 = \sum_i \sum_j (\bar{y}_i - \bar{y}_0)^2 = 691808225153,9$$

(the variation of y explained by the trend, that is the effect of action of the main factors; represents 36,23% of the total variation).

$$\Delta_{y/s}^2 = \sum_i \sum_j (\bar{y}_j - \bar{y}_0)^2 = 421171181968,2$$

(the variation of y explained by the seasonality, that is the effect of the seasonal factors; represents 22,05% of the total variation).

$$\Delta_{y/u}^2 = \sum_i \sum_j (y_{ij} - \bar{y}_i - \bar{y}_j + \bar{y}_0)^2 =$$

796693391681,3(the variation of y caused by the action of the accidentally factors (residual component); represents 41,72% of the total variation).

f. oil products

$$\Delta_y^2 = \sum_i \sum_j (y_{ij} - \bar{y}_0)^2 = 733748466559,93$$

$$\Delta_{y/t}^2 = \sum_i \sum_j (\bar{y}_i - \bar{y}_0)^2 = 61018784643$$
 (the

variation of y explained by the trend, that is the effect of action of the main factors; represents 8,32% of the total variation).

$$\Delta_{y/s}^2 = \sum_i \sum_j (\bar{y}_j - \bar{y}_0)^2 = 294224301387,93$$

(the variation of y explained by the seasonality, that is the effect of the seasonal factors; represents 40,1% of the total variation).

$$\Delta_{y/u}^2 = \sum_i \sum_j (y_{ij} - \bar{y}_i - \bar{y}_j + \bar{y}_0)^2 =$$

378505380528,73 (the variation of y caused by the action of the accidentally factors (residual component); represents 51,59% of the total variation).

g. iron ores

$$\Delta_y^2 = \sum_i \sum_j (y_{ij} - \bar{y}_0)^2 = 5242963699863,93$$

$$\Delta_{y/t}^2 = \sum_i \sum_j (\bar{y}_i - \bar{y}_0)^2 = 2098725986425,10$$

(the variation of y explained by the trend, that is the effect of action of the main factors; represents 40,03% of the total variation).

$$\Delta_{y/s}^2 = \sum_i \sum_j (\bar{y}_j - \bar{y}_0)^2 = 780120345628,33$$

(the variation of y explained by the seasonality, that is the effect of the seasonal factors; represents 14,88% of the total variation).

$$\Delta_{y/u}^2 = \sum_i \sum_j (y_{ij} - \bar{y}_i - \bar{y}_j + \bar{y}_0)^2 =$$

2364117367810,50 (the variation of y caused by the action of the accidentally factors

(residual component); represents 45,09% of the total variation).

h. metal products

$$\Delta_y^2 = \sum_i \sum_j (y_{ij} - \bar{y}_0)^2 = 614114892640,98$$

$$\Delta_{y/t}^2 = \sum_i \sum_j (\bar{y}_i - \bar{y}_0)^2 = 113690710198,23$$

(the variation of y explained by the trend, that is the effect of action of the main factors; represents 18,51% of the total variation).

$$\Delta_{y/s}^2 = \sum_i \sum_j (\bar{y}_j - \bar{y}_0)^2 = 134811588454,54$$

(the variation of y explained by the seasonality, that is the effect of the seasonal factors; represents 21,95% of the total variation).

$$\Delta_{y/u}^2 = \sum_i \sum_j (y_{ij} - \bar{y}_i - \bar{y}_j + \bar{y}_0)^2 =$$

365612593988,17(the variation of y caused by the action of the accidentally factors (residual component); represents 59,53% of the total variation).

4. Conclusions

Results of this economic study addresses to a very large audience, formed by:

1. representatives of the local administration and other local and regional decision factors;
2. public opinion, especially the local communities
3. governmental decision factors
4. the harbor industry and the harbor services users.

Conclusions will provided to the harbor industry members a general view and a better understanding of the economic effects associated to operations developed in the local communities and other economic areas. Such an assembly view will underline the importance and positive role in the economy of Constanta Region of the economic relationship created and maintained following the existence of this harbor platform.

Intellectual Capital Evaluation Models

Agoston Simona
Puia Ramona Ștefania
Orzea Ivona

ramonapuia@gmail.com
ivona.orzea@gmail.com

Abstract

The evaluation and measurement of intellectual capital is an issue of increasing importance for companies because of the staleness of the traditional accounting systems which do not provide relevant information regarding the value of a company. Thus, specialists are working to identify a model for assessing intellectual capital that can be easily implemented and used. The large number of proposed models but also the major differences between them emphasizes the fact that the specialists are still far from having reached a consensus. Still, there is no model accepted by most of the companies. The article aims to achieve a brief description of some of the most important models in intellectual capital.

Key words: intellectual capital, evaluation model, market value, cost

JEL classification: D29, E16

1. Introduction

Ever since the beginning we must point out the difference between assessment and measurement: evaluation involves a standard reporting, while measuring doesn't. For example, suppose that during the evaluation process of teachers in a university, done by students, appears the question: How do you rate the difficulty of the course / seminar? The answer possibilities: very difficult, difficult, moderately, easy, very easy. Students will choose one of these options and will calculate an average. Consider that it is "easy". Is this a positive evaluation or not? This answer has no relevance to teacher

evaluation, if there is no standard of value such as: the optimal indicator is "difficult." In most of the models to be presented we speak about measurement and not assessment. Evaluation is usually done by comparing the values of indicators obtained in a company over several years.

2. Market to book value

This indicator is simple and frequently used by stakeholders. Based on major differences emerged between market value and the value of a company's accounting records. A study compared market value to book value for 3,500 U.S. companies for over 20 years. In the 80 'the two were about equal: 95% of book value represented the market value. Over 20 years, the gap has increased considerably: book value is only 28% of market value. Robert Howell, a well-known American financial expert stated suggestively: the records are as useful as a road map of Los Angeles 80 years ago [1]. The difference is even higher in organizations where intangible assets are predominant, such as universities, consulting firms, design, etc.

Market to book value indicator is calculated as the difference between a company's market value (the value of shares traded multiplied by the number of shares), and the book value of the respective companies. This difference represents the value of intellectual capital, of intangible assets.

Intellectual capital = market value – book value.

This indicator has the advantage that it can be easily calculated, allowing comparison with other competitors while tracing the

evolution of the company. On the other hand has the disadvantage that it may lose accuracy because the stock share price can often be influenced by many external speculative factors that can not be controlled by the management of the organisation. Another challenge is represented by accounting regulations that determine the book value differently, uneven from a country to another [2].

3. Tobin's Q ratio

It was introduced by James Tobin, Nobel laureate for his contribution in the field of analysis of financial markets. Tobin initially developed this indicator to know the elements that affect investment decisions. The indicator was subsequently taken over by the community of intellectual capital.

This indicator compares the market value of an asset with the value of replacement cost for that asset [3]. The market value is the price obtained for an asset in a competitive market that meets the conditions of a fair sale. Replacement cost represents the cost needed in the organization to recreate the utility of such a good.

$$\text{Tobin's } Q = \text{Market value} / \text{Replacement cost}$$

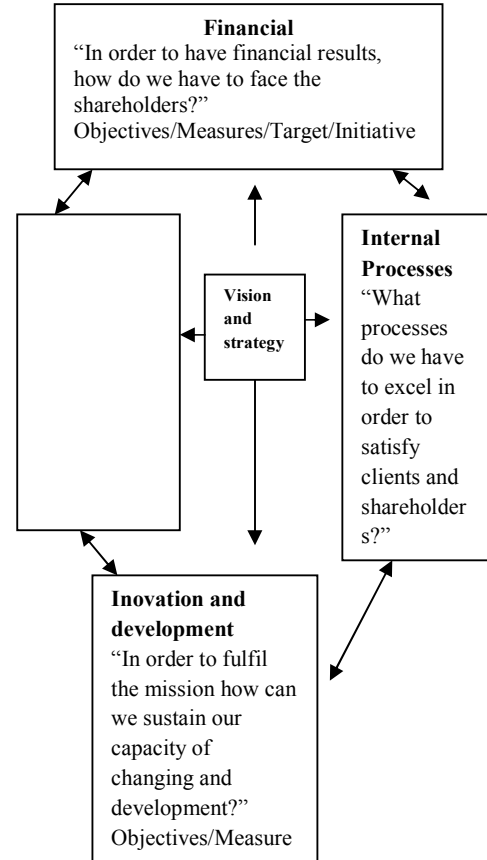

Thus, Tobin Q can be used both for the entire company and for each activity. In the second case managers receive valuable information on the degree to which an asset creates value-added for the company. The higher Tobin's Q ratio, the more an asset incorporates more knowledge / intangible assets and has contributed more to the process of creating added value. If the indicator has a value greater than 1 means that the organization has something more than competitors who may hold the same assets. The respective assets involve something unique: people, systems, clients, etc. For example, if this rate has the value of 3, that means that an asset worth 3 times the cost of replacement and the company benefits greatly from these activities.

Alan Greenspan from the U.S. Central Bank observed that higher values of this rate are related to investments in human capital and technology. This indicator does not differ essentially of market to book value, but has the advantage to remove the difficulties

imposed by different national accounting systems.

4. Balanced Scorecard

Figure 1. Balance Scorecard

Source: Kaplan and Norton, 1996

This model was developed by Kaplan and Norton in the United States and includes a set of indicators that allow the measurement of a company performance from a wider perspective than financial. The model has its origins in the French concept of "Tableau de bord" that measured physical performance by various indices of production statistics. Balanced Scorecard seeks to measure the core competencies of a company that brings competitive advantage, which are usually intangible. Thus, Kaplan and Norton (1996) describes this model: Balanced Scorecard maintain traditional financial indicators. But these financial indicators reflect past events, and are appropriate tools for companies in industries where investments in long-term capabilities and customer relationships are

not critical for success. However these financial indicators are inadequate for guiding and evaluating the "trip" the knowledge-based companies have to go through to create value through investment in customers, suppliers, employees, processes, technology and innovation. Balanced Scorecard expresses an organization's mission and strategy into a set of performance indicators that allow the performance measurement and provides a strategic framework for the practice of strategic management. Explained in a concise way, Balanced Scorecard includes financial indicators that reflect past results, and link these indicators with indicators from the field of customers, internal processes, innovation and learning that lead to future financial performance.

Balance Scorecard analyses a company from four different points of view:

1. The clients perspective that answer at the question: How are our clients looking at us? This perspective includes different indices like: clients satisfaction, the number of new clients, profitability/client, market share, the clients loyalty, etc.

2. The internal perspective: In what field do we have to stand out, to excel? This perspective includes different indices like: production duration cycle, costs/product, quality indicators, the number of value adding activities, etc.

3. The perspective of continuous learning and innovating: How can we continue the process of increasing and creating value? This perspective contain different indices like: team performances, the number of suggestions/employee, promotions, the time necessary to develop a new generation of products, new products/new competing products, the percent of new products sales in total sales, etc.

4. Financial perspective: What financial results can we offer to shareholders? This perspective contain classic performance indices like: profit, profit rate, the increase of turnover/region, etc. [4]

Sears Company, a major American retailer, offers a good example of the relations between the four dimensions mentioned above: they measured the fact that the improvement of employee with 5 % leads to an increase of 1.3% of customer satisfaction, which in turn leads to increased revenue by 0.5% [1].

Balanced Scorecard was introduced in many companies with very good results. In their book, Kaplan and Norton (1996) illustrates the concept for five organizations they have closely analysed and followed: Rockwater - underwater construction company, Metro Bank – a commercial bank, Pioneer Petroleum - oil company, National Insurance - insurance company and Kenyon Stores - clothing retailer.

Another important concept introduced by Kaplan and Norton refer to a company's strategic map. This map describes a cause-effect chain underlying a company's strategy. The strategic map of every company is unique in content, but has the same structure: the base is made by intangible assets that make possible organizational and customer service activities. In the second layer we can find internal processes that transform the first layer assets into value for customers. The customer value is the third layer, from which is developing the fourth layer, the financial results.

The main criticism brought to this model is that it fails to measure a company's intangible value, and only expresses some hypotheses about cause-effect relationships, linking financial and non-financial indicators.

But these assumptions have not been empirically tested and proven. Andriessen (2004) shows how the vocabulary used by Kaplan and Norton migrate from the area of strategic management in the area of intellectual capital.

Forstenlechner et al. (2009) adapted Kaplan and Norton's concept of knowledge management, creating KM Balanced Scorecard. They imagine a map of the factors (predictors) that influence the success and establish the relations between them. Later this model is empirically tested and applied in a multinational law firm [6].

5. Intellectual capital index

Intellectual capital index is a method of measuring intellectual capital developed by Roos in 1997 and calculated as an aggregate index for intellectual capital. Roos et al. (2007) defines intellectual capital of an organization as "the amount of knowledge of its members and their translation into brands, trademarks, and processes." They divide intellectual capital into human capital and

structural capital. In turn, human capital is divided into competencies, attitudes and intellectual agility.

Structural capital includes the relationships with the stakeholders, the organizational infrastructure and the capacity of development and innovation. In the first phase, Roos [7] creates a list of non-financial indicators, then he makes their ranking according to their importance and each gets a share, according to the importance in the value creation process. In a next phase these indicators are consolidated into an aggregate index. The main problem is that this index can not be compared with a desired value / standard. It can be analyzed only in its dynamics from one year to another.

A novelty of this model is the attempt to link it with the market value: thus, changing the index of intellectual capital should reflect a market value adjustment. If this does not happen, there are errors in its method of calculation.

6. Conclusions

We all agree that our society is becoming more and more knowledge-based, and thus only those organizations will succeed in the global information society and business environment that can identify, value, create and evolve their knowledge assets [8]

Following the desideratum of Roos, one of the most prestigious authors in the field of intellectual capital, who states -What you can measure, you can manage, and what you want to manage, you have to measure - [7], many specialists from academia and business consulting tried to develop a model in order to properly ascertain the intellectual capital of a company and implicitly its real value.

Therefore, the assessment of the intellectual capital of a company plays a crucial role in evaluating the companies' competitive capability, as well as in evaluating their innovative potential in the context of the new knowledge based economy. This led to an explosion of the research and papers in the field. Some of the most important models were critically analyzed in the current paper. The great number of models and the differences among them reflect their increasing importance and the difficulties faced by specialist in finding a proper one.

The main limitations of the models for the assessment of intellectual capital presented before refer mainly to the fact that the results obtained allow just in certain cases comparisons between companies/ departments and even in fewer cases they can be ascribed to an "ideal" standard value. The comparisons are difficult to be achieved due to the fact that the indicators/ratios vary significantly from one company to another.

Besides the most well known models of measuring intellectual capital presented before, other models were developed, like: Intellectual Capital Benchmarking System, Intellectual Capital Dynamic Value, The Model developed by Konrad Group, Value Chain Scoreboard, Technology Factor and others. Andriessen (2004) also made a synthesis of 25 intellectual capital models in his book „Making sense of Intellectual Capital- designing a method for the valuation of intangibles” (2004) and developed a methodology/tools to develop ways of evaluating intellectual capital that can be applied in any organisation.

The evaluation of the intellectual assets offers the managers new perspectives on the current state of the company and its development opportunities. It aims at improving the knowledge management system in order to achieve sustainable competitive advantage.

This article is a result of the project „Doctoral Program and PhD Students in the education research and innovation triangle”. This project is co-funded by the European Social Fund through the Sectorial Operational Programme for Human Resources Development 2007-2013, coordinated by the Bucharest Academy of Economic Studies.

Human Resources Development (HRD) of Public Entities in the Globalization Era

PhD. Stusent Bejan Marius

Abstract

Human Resource Development (HRD) is the frameworks for helping employees develop their personal and organizational skills and knowledge. Human Resource Development includes such opportunities as employee training, employee career development, performance management, coaching, mentoring, succession planning, key employee identification and definition, assistance in training, and at the same time organization development. The link between human resources development and managerial practice, as a whole, is vital for management success. Humans are the most important category of resources that an organization can use. No organization can exist without the human resources component.

Key words: basic skills, performance, career management, organizational development, promotion policies, challenging requirements.

JEL classification: H00

1. Introduction

Human Resources Development (HRD) has derived its conceptual basis from three broad areas of organizational, economic and psychological theory. [1] The psychological perspective promotes motivation, learning and ownership issues [2]. It approaches the issue of a psychological contract that seeks to conceptualize the working relationship

using the concepts of expectations, perceptions and requirements.

Organizational theory focuses on learning and changing processes. It also refers to the establishment of learning organizations. The economic dimension emphasizes investment in human capital and focuses on resource-based theories. [3]

2. The Role of HRD

Human Resources Development (HRD) plays a vital role in meeting the challenging requirements of high qualification and human skills due to the globalization process. Abundant financial and material resources alone can not facilitate growth and development of a state without human resource component which converts natural resources into productive ones.

Human resources **development function** involves professional development [4] which is customized for each and every individual by [5] improvement, career management and organizational development.

•**Improvement** – based on planned training – aims at identifying, assessing and facilitating the development of key skills that allow individuals to perform organizational tasks related to current or future positions. The problem is to recognize the type of training that employees need. All training decisions must take into account the motivation of the employee who undergoes training. There are a number of training techniques and elements necessary for a training program to be efficient.

•**Career management** - is aimed at ensuring long-term relations between employees' career development needs and career challenges within the organization. Employees' desire to advance within the organization underlines this approach. Depending on the development level, we identify several stages in the lifecycle of a career, as according to the graphical representation in Figure no. 1.

3. Organizational development

- aims to ensure proper relationships between intra- and inter-groups and to facilitate groups anticipate, initiate and lead change. Organizational development implies the existence of a normative strategy that is re-educational and likely to affect systems of values, attitudes, and involves the company's formal reorganization in order to cope with the accelerated changes.

In this context, we believe that Human Resources Development (HRD) is conducive to helping the employees develop personal and organizational knowledge and skills. HRD aims at training opportunities for employees, employee career development, performance management, coaching, mentoring, succession planning, key employee identification and definition, assistance in training, and at the same time organization development.

4. The link between human resources development and management practice

The link between human resources and managerial practice as a whole is vital for management success. Humans are the most important category of resources that an organization can use. No organization can exist without the human resources

component. From another perspective, people are also the only category of resources that can act *against* the organization's goals. Only through collaborative efforts, people can contribute to the achievement of organization's objectives through an outlet of their latent energy and creativity. [6]

Within public structures, in tight connection with Human Resources Development, a study [7] examined how officials perceive **the importance given to the promotion policy** based on the following criteria: skill level, performance, experience, personal relationships and attention paid to the manager/leader.

Respondents were asked to evaluate all the criteria mentioned, using a scale of 1 to 10. Depending on the awarded score, there has been calculated a score's average value for each feature. There has been tested the significance of statistical differences between average values of the recorded score in order to establish the benefits.

Benefits hierarchy was determined by using SPSS test results, and are evidenced in chart no. 1. [8] After applying the test for characteristics, the values calculated for the **"qualification level"** and **"workplace performance"** were $t = 1.1016$ ($\alpha = 0.310$), therefore it has been accepted the hypothesis of equal score. Values obtained by other characteristics indicate a significant difference between them, corresponding to a significance level of at least 0.01

As highlighted in the above presented

chart, the values calculated for **"qualification level"** and **"workplace performance"** had an almost equal score (8.01 and 7.98), which leads us to the conclusion that the **professional qualification level** is directly proportional to the **professional performances level**. Closely related are also the **professional experience** (with a score of 7.5), the

personal relationships and the **attention paid to the leader** taking considerable distance (6.5 and 4.9) against the first criteria.

Professional promotion policies play a strategic role in the applicability of principle regarding the right to career and its stability.

The right to work is considered one of the main motivation elements for both civil and national servants. The conditioning of staff satisfaction in relation with outcomes creates positive or negative motivation.

Positive motivation is reflected in *moral* and *material* incentives, as follows [9]:

Material Motivation	Moral Motivation
<ul style="list-style-type: none"> Monthly salaries based on qualifications and performance 	<ul style="list-style-type: none"> Highlighting the complexity of positions and professional skills of their occupants
<ul style="list-style-type: none"> 13th salary 	<ul style="list-style-type: none"> Receiving diploma and gradations for participating in training programs
<ul style="list-style-type: none"> Additional reward for employees with great performances if the organization as a whole has notable results. 	<ul style="list-style-type: none"> Receiving tasks involving a high degree of confidence from the management
<ul style="list-style-type: none"> Rest tickets 	<ul style="list-style-type: none"> Advancement opportunities on a hierarchical scale
<ul style="list-style-type: none"> Increments, bonuses for celebrations etc. 	<ul style="list-style-type: none"> Safety climate at organizational level

In the absence of positive incentives or due to positive incentives diminution, negative incentives develop without too much effort. *Negative incentive* may rather seem at first glance a de-motivation. It however depends on the entrepreneur/manager's ability that the penalty, for example (more or less dramatic depending on the situation), be a springboard for a positive leap. Therefore, it will be often appealed in a diplomatic

way to the principles of responsibility and exemplarity that should exist within the framework of every team in consistence with the principles and strategies of the Human Resources Development. [10]

5. Organizational Theories

Among the most important organizational theories, one of the most recent and with direct impact on our theme is that of knowledge-based organization. This originates from the theory of resource based entities – according to which the organizational structure stands for a collection of productive, tangible or intangible resources, the organization's development and performances being ensured by their use [11]. The theory of knowledge-based organization is based on the following assumptions [12]:

- The resource of knowledge tends to have a leading role in public institution;
- Knowledge is acquired by the organization's components, who also become its keeper – where implicit knowledge;
- Components of the public entity must specialize in the acquisition and utilization of knowledge;
- Performance results are obtained by using various types of knowledge;
- The competitive advantage is the result of combination and utilization of certain knowledge.

Knowledge-based organization theory naturally connects with the context of knowledge economy, the term resulting from recognition of the decisive role of knowledge and technology in the administrative, social and economic sustainable growth. In a knowledge-based economy, knowledge-holders become the price value of an organization [12].

Therefore, we consider that within the organizational development process, planning or career management has the key role. The main tools for career development, factors contributing to the motivation of civil servants, are identified by:

- Promotion policies;
- Policies on mobility and development of an attractive career for senior civil servants.

6. Attractive promotion policies

Regarding the attractive promotion policies approach, we refer to the fact that promotion should depend as much as it could on individual skills and performances estimates by means of annual assessments. Promotion should be applied to opportunities of rapid career promotion to ensure recruitment and retention of young and ambitious civil servants. It is imperative to apply alternative motivation methods to compensate reduced promotion possibilities due to financial constraints and thus, there should be used proactive policies regarding mobility.

Proactive policies on mobility are part of a coherent strategy for career planning. There should exist flexible and efficient tools (legal and practical; for example, open competitions between departments or transfer rules acceptable to both the administration and the civil servants). Mobility should be directly proportional to performance assessment and facilitated by a proactive approach to human resource management (for example: job coaching, vocational guidance).

Management systems of senior civil servants should be characterized by:

- Regular assessment and support for staff development;
- A close link between performance and promotion;
- Existence and accessing of special education programs.

Public sector jobs and especially the civil servants system, should meet the requirements of both the organization and the employees. While the interests of the organization obviously relates mainly to performance, efficiency and results, UE employee preferences have changed in recent decades due to changes in attitudes and values, as well as economic changes and technology development.

While the staff used to orientate towards stability and protection regarding the job, nowadays, expectations include, if not exclusively, at least partially, a modern workplace which offers attractive positions and is able to satisfy employees' expectations. Due to the global economic crisis, there are tendencies to return to job stability and protection.

Polls show that among civil servants, the formal barriers to promotion (for example, the waiting period, the age) and the limited development opportunities (the lack of a clear picture of career development, inadequate information on vacancies) have a negative impact on the degree of motivation and commitment at work, which of course adversely affect service quality. In Romania, instability and deficiency in civil servants remuneration add to these factors.

In an interesting survey (2000) conducted among civil servants in New Zealand, which is famous for its reforms, half of the civil servants have held the promotion possibilities as "poor", while only 13% appreciated them as "good."

A survey in Ireland (1999) on career development opportunities in civil service system, presents the following factors influencing the civil servants' commitment to the system:

- earnings and career development;
- job responsibility;
- recognition and reward;
- job security;
- training/development.

Development and training are also approached in a survey of Denmark (2000) on the degree of motivation in the public and private sector as follows: content function, development and training, salary, payments and specific conditions, work schedule, work environment, leadership, company's organizational culture and image.

7. Conclusions

Human Resources Development (HRD) plays a vital role in meeting the challenging requirements of high qualification resources and human skills, due to globalization.

Expert opinions leads us to conclude that after years of accelerated reforms in the public administration, the perceptions and values of civil servants reflect some positive effects in the modernization process which turn into measures against traditional practices in this area that continue to exist.

The Impact of the Global Crisis on the Labour Market in Romania

Bălănescu Mădălina

“Constantin Brâncoveanu” University of Pitești
madabalanescu@yahoo.com

Abstract

In recent times people have been speaking more often about the global economic and financial crisis and the effects it has on the economies of the world's states. Countries with strong economies such as the USA, Japan or the developed countries in Europe have suffered from the global crisis, its implications being also great both economically and socially. The global crisis had a strong impact on the Romanian economy as well. For this reason, in this paper I have presented the situation of unemployment in Romania since the setting up of the crisis until February 2010 so that one could understand the gravity of the situation on the labour market in Romania. According to the data presented in the paper, during the period considered the number of unemployed people in Romania has doubled, because of closing down many companies with domestic or foreign capital. An analysis of unemployment is made in this paper in terms of: the level of training of the people made redundant, the gender distribution of the unemployed, but also of the way different development regions of the country and the corresponding counties are affected by unemployment. Job insecurity overlaps with salary uncertainty (during the crisis the salaries remain frozen at the previous level or record reductions) lead to reducing the demand, both within the country and for export, the effects being felt directly by the producing companies, but also by population as labour force and consumers.

Key words: financial crisis, global and national economies, labour market, unemployment

JEL Classification: E32, G01, J40, J60, J68, O11

1. Introduction

The year 2008 represented for Romania the end of economic growth which began in 2000, as well as the year when the effects of the global financial and economic crisis started to be felt in Romania, with the multiple economic and social implications.

It is interesting to analyze the direct impact of the global crisis on the labour market in Romania, given that many companies have reduced their work or went into bankruptcy, making massive layoffs. The figures are eloquent in this respect, but they do not fully reflect the psychological impact, the financial impact (the reduction in income and hence the reduction of consumption) and the insecurity of the persons directly or indirectly affected by unemployment.

The crisis in which is the world economy began as a financial crisis in the summer of 2007, in the United States. Gradually, the financial crisis turned into an economic one and acquired global scale.

2. Who has the global crisis affected

Romania feels increasingly powerful the effects of this crisis, which overlaps with the domestic crisis, caused by the existence of a national economy based on over-consumption and excessive money lending. Thus, the loss of important segments of the foreign market, the reduction of investments and the withdrawal of investors, bankruptcies from the private sector affect the Romanian economy and the multiple consequences of the global crisis are fully felt by the population. The entire structure of the Romanian economy has been shaken by the economic crisis. The most affected were the fields of industry, agriculture and constructions, branches in which many businesses were temporarily or permanently closed. The exporting firms are also strongly affected by the expansion of the crisis, Romania's main business partners (the USA

and the EU states) reducing their demand and their funding capacity. In these circumstances, the reduction of the production and the shutting-down of investments caused staff reductions in many Romanian companies. From the beginning of the crisis in Romania and up to the present about 250,000 people have lost their jobs and it is expected that the number of unemployed will further increase.

The question "*When did the global crisis begin to affect Romania's economy?*" was asked many times. The answer was not found with exactness either by specialists, analysts, economists or politicians; they feel that it was a period of several months, probably August-September 2008. Their opinion is confirmed regarding the labour market in Romania, directly addressing the economic crisis by increasing the number of unemployed people.

The labour market is perhaps the most sensitive market, receiving impulses from all other existing markets in an economy. The labour market and thus the labour force intensely fell the vicious cycle of the crisis.

In Romania, the labour market was seriously affected by the current economic and financial crisis worldwide, which overlaps with the economic and political crisis set up in Romania in recent years. The crisis has affected sectors such as: car industry, textile industry, wood processing industry, constructions and the property sector.

The global crisis primarily affected the exporters who, because of reducing the consumption in the Western Europe countries, were forced to reduce the production volume and thus to reduce the number of jobs.

The global crisis hit in full and the auto industry. Companies such as Dacia-Renault and Ford have been affected by the dramatic fall in sales so they finally ceased operations (in certain production departments) or temporarily, moving some of the employees in technical unemployment. The local firms have also suffered, being located upstream or downstream the production activity of large car companies (companies that produced component parts for the car industry), many of them falling into bankruptcy.

Many immovable projects were delayed, with effects that spread in other economic sectors of economy, such as constructions or transports.

In these circumstances, many international companies which carried out production activities in Romania reduced the production or permanently ceased work, having effects on the Romanian economy in general and on the labour market in particular. In this regard, some examples are conclusive:

- More companies from the industry of the auto component parts in Romania have made layoffs since the beginning of the crisis until present. These include: Valeo, Lisa Draxlmaier, Yazaki, Subansamble Auto Pitești which made layoffs in the units from Pitești, Craiova, Câmpulung Muscel and Curtea de Argeș, Leoni Wiring Systems Romania, SEWS Romania. Also, Michelin factory in Zalau closed in December 2008;
- In the food industry, Kraft Jacobs Suchard closed the company in Brașov, while Coca Cola Romania has limited its activity to the five production units in Bucharest, Ploiești, Timișoara, Oradea and Vatra Dornei, and the factory from Iași was closed in 2009, following to be moved in the Republic of Moldova;
- In the chemical industry, the Oltchim Râmnicu-Vâlcea plant reduced its production by 20% during the crisis. Interagro company in 2009 made layoffs as a consequence of the cessation of the activity in the chemistry companies that the group holds in Romania;
- In the steel and metallurgic area, the company S.C. Laminorul S.A. Brăila stopped work in 2008-2009 and Alro Slatina decreased production by 25%. The ArcelorMittal company, the world's largest steel producer, in 2009 made redundant the employees in the production departments of Galați, Roman, Hunedoara and Iași, in Romania;
- In the IT sector many layoffs have been made, companies like Nokia and Romtelecom sending many workers in technical unemployment;
- Major layoffs were made and the S.C. Petrom S.A. company. These were partly determined by other factors (even to a greater extent than the crisis), the reduction of the number of employees occurring as a result of a post-privatization restructuring plan of the Petrom company;
- The American company Colgate Palmolive, which produced toothpaste and after shave in Romania, finally closed down

in 2009 the factory in Braşov, the production following to be moved to Poland;

- The big companies owned by the state have also made numerous layoffs, the most important being the ones at S.C. Electrica, at the National Society of Lignite Oltenia and at the National Coal Company.

The crisis has affected not only the big companies and the subsidiaries of the multinational companies (which usually pass more easily over the difficult times caused by the crisis), but also the small and medium enterprises from Romania. Thus, the economic and financial crisis has affected more or less than 90% of the small and medium-sized enterprises operating in Romania. Because of the depreciation of the national currency, of the reduction in crediting demands addressed to the banks, of the decrease of the domestic consumption and export, many companies in Romania have been thrown into bankruptcy. Also, some of the companies that have contracted investment loans (for the purchase of machinery, equipment, and production plants) or loans to finance the current activities (payments of salaries, of debts to the state or to suppliers) are unable to return these loans, concomitantly with hindering the suppliers' paying opportunities.

In the Romanian economy there are also **sectors less affected by the global economic and financial crisis**. These are in particular the sectors which produce goods that can not be replaced (i.e. the food or pharmaceutical industry) and the sectors that benefit from the public investments (health care services or utilities).

The food and beverage industry has recorded growth of the sales in 2008-2009, being able to absorb some of the labour force made redundant from the other areas of activity.

Although the crisis, the major retail chains (operators of hypermarkets and bricolage store networks) have recorded increasing turnovers. For example, the German company Real Hypermarket opened five stores in Romania in 2009, which led to the creation of over 1,500 jobs. Also BauMax, the Australian bricolage network has expanded with five new stores and created over 500 new jobs.

The companies on the healthcare services market have also recorded increasing

turnovers, given the type of activity carried out (the demand and the consumption of medical services that can not be postponed for the moment when Romania comes out of the crisis). Unfortunately, in this area it is unlikely to attract the labour force made redundant in the other areas because of the strong specialization of the medical field. Only the administrative, auxiliary departments can take personnel from other industries, but these acquisitions will not have a noticeable effect on the labour market.

3. The analysis of unemployment in Romania, during the crisis

Following the above-mentioned situation it is not difficult to understand why during the period of September 2008-February 2010 the number of unemployed people registered in Romania doubled, because of the reduction of the employees' number and of the reduction of the gross and net average earning per month.

During 2005-2008, due to the growth of the economic growth registered in Romania, unemployment has a downward trend, so that if in January 2005 the registered number of unemployed persons was of 562,748, in January 2008 it decreased to 383,989 people. The number of the unemployed oscillated in 2005-2008, with an undulating trend, according to the specific of the activities that create jobs. In general, in the period from March to September the number of the unemployed had a reduction tendency, a consequence of carrying out supplementary activities in agriculture, constructions and tourism, while in the months from October to February the number of the unemployed registered an upward trend. This demonstrates that the Romanian economy is affected by seasonal unemployment, the other sectors of the national economy not being able to absorb the labour force temporarily made redundant from the seasonal activities.

Since August 2008 unemployment in Romania recorded a continuous growth trend. In the period August 2008-February 2010 the number of the unemployed has doubled, rising from 345,510 unemployed people in August 2008 to 762,375 unemployed people in February 2010. The situation is worrisome if we consider the dramatic increase in the

number of the unemployed in 2009, so that since the beginning and to the end of the year their number grew with 264,476 unemployed persons.

Although many economists consider that 2010 will be a year of economic growth, the labour market shows no sign that this year Romania will come out of the crisis. It is too early to anticipate this, but in the first two months of 2010 the registered number of the unemployed increased by 52,992 persons.

It is interesting to notice that if until early 2008 the number of the unemployed men was almost equal to the number of the unemployed women, once with the crisis the proportion is amended. **The number of unemployed men increased** during January 2008 - January 2010 by 103%, which represents an increase of 220.4 thousand persons, while the number of unemployed women increased by 80.2% (with 136.6 thousand persons). **The ratio of all unemployed women decreased** in the analyzed period, so that if in January 2008 they accounted for 44.4% of the total number of the unemployed, in January 2010, women represented 41.4% of the total number of the unemployed. Simultaneously, there is an increase in the ratio of men in the total number of the unemployed.

The explanation is that the effects of the crisis were felt, at least so far, in the directly productive areas where male workers are employed predominantly, and less in the areas where women work. According to the National Agency for Employment, the areas that have experienced the highest number of paid unemployed at the end of February 2010 are: unskilled workers in manufacturing (32,258 persons), manufacturers and fitters of metal structures (29,137 persons), sales assistants (18,340 persons), workers in grinding machines, grinding and sharpening (14,941 persons), unskilled workers in the construction of dwellings (11,437 persons), etc. It is to be noted the relatively low training of the registered unemployed persons, which impedes their integration on the labour market.

Regarding **the structure of unemployment by the educational level**, the unemployed with an elementary, secondary and vocational level of education represent 72.5% of the total number of people who address to county employment agencies in order to find a job. The

unemployed with high school level and post-secondary education represent 21.1% of the total number of the unemployed, and those with university education only 6.4%.

If we consider **the structure of unemployment by duration**, by the end of February 2010 it was noted that the largest share (i.e. 56.1% of the total number of registered unemployed persons) is held by the unemployed without a job for more than 6 months (427,568 persons), followed by the category of unemployed without work from 6 to 12 months, 225,146 persons (29.5% of total number of the unemployed), and that of the unemployed without work for over 12 months, respectively 109,661 persons (14.4% of total number of the unemployed).

At territorial level, in February 2010, the number of unemployed workers increased in 35 counties and in Bucharest, **the most significant increases** occurring in the following counties: Constanța (2025 persons), Dolj (1,944 persons), Neamț (1,801 persons), Iași (1,676 persons). **The decrease in the number of the unemployed** is recorded in the following counties: Alba (743 persons), Gorj (252 persons), Hunedoara (189 persons), Caraș-Severin (148 persons). The decrease in the number of the unemployed in these counties is determined in particular by reducing the number of unpaid unemployed as a consequence of the expiry of the validity period of the requests of the people seeking employment and at the same time of reducing the number of applicants for certificates according to Law 416/2001. The most affected counties in terms of decrease of investments, and hence the reduction of jobs, are those in which have prospered lately on account of privatization and implantation of subsidiaries of the big companies. Thus, counties such as Timiș and Cluj, where more foreign investments have concentrated in recent years, are found among the top counties with severe risk of not being able to cope with the crisis. There will also be problems for the counties dependent on one major investor, such as Galați, where ArcelorMittal activates and Argeș, where Dacia Renault is based. The counties where most investors have as main activity the manufacturing of car component parts intended largely for export, do not do too well either.

The less vulnerable counties are in the south and east of the country, being

predominantly agricultural and maintaining the traditional economic relations. These include Dâmbovița, Giurgiu, Suceava, Bacău and Ialomița. Also, the areas based on less vulnerable segments to the crisis, such as the dairy production, the wood industry or bottling soft drinks, will suffer its effects more easily.

Regarding **the unemployment rate**, since the beginning of the economic crisis in Romania, it has steadily increased. Thus, if the September 2008 the unemployment rate was equal to that one recorded in September 2007 (3.9 percentage points), starting with December 2008, the unemployment rate has greatly increased. In 2009 the unemployment rate has grown continuously, and did not record the reduction trend recorded during the summer, as recorded in the previous years. In February 2010 the unemployment rate reaches the maximum level of 8.3 percentage points, being the highest unemployment rate recorded in March 2003 (8.6%) and so far. Throughout the entire analyzed period, the unemployment rate recorded among men was 2-3 percentage point higher to the unemployment rate recorded among women.

If we look at the effects of the economic crisis on the labour market on counties, it can notice that there are some counties that have experienced an unemployment rate above the national average. **The highest levels of the unemployment rate** have been achieved by the counties of Mehedinți (14.6%) and Vaslui (14.2%), Teleorman (13.0%), Alba (12.7%), Dolj (12.9%). The minimum level of the unemployment rate in February was recorded in Bucharest, being of 2.4%.

On developing regions, the highest unemployment rates were recorded in the South-West region (11.5%), the Centre and South regions (10.1%), the North-east Region (9.3%) and the South-east region (9.2%) these also being regions in which the rural activities are predominant. The Bucharest-Ilfov region recorded the lowest unemployment rate.

An unforeseen situation which unbalanced the labour market in the sense of increasing the labour force represented a return to the country of thousands of Romanian emigrants, who were left without a job when many Western countries (Italy, Spain, the United Kingdom, Germany) began to drastically reduce the number of employees.

Concomitantly with the increase of the number of the unemployed, the number of employees from the economy has decreased as well, so that in late January 2010 there were 4333.8 thousand employed workers, compared with 4765.2 thousand employees in end January 2008 (which represents a decrease by 9.05 percentage points of the number of employees in the national economy).

On sectors of activity it is to be noted that **agriculture** is the only area in which, during the crisis the number of the employees grows. Thus, during the period September 2008 - February 2009 the number of employees in agriculture is reduced, so that from March 2009 until June 2009 the number of people employed in agriculture to record an upward trend. The increase of the number of employees in agriculture is determined by the fact that this sector is the only one able to absorb the labour force made redundant from the other sectors. The unemployed, who have lots of farmland, found in agriculture a means of survival, increasing the number of persons working in agriculture (which was already quite numerous). Since August 2009, the number of employees in agriculture recorded a trend to lower again.

In **industry**, in January 2008 - January 2010 the number of employees decreased by over 300 thousand persons (from 1560.8 employees in late January 2008, to 1261.1 employees in late January 2010). The constructions activity was strongly affected by the global financial and economic crisis, the number of employees in this field falling from the beginning of the crisis in Romania and by January 2010 by 25.6% (from 422.9 employees in September 2008 to 314.7 employees in late January 2010).

The services sector, as we presented in the beginning of this paper, was less affected by the global crisis, in this sector the number of the employees being reduced during September 2008 - January 2010 by approximately 2%.

4. Conclusions

The global crisis has affected the entire Romanian economy. The most affected areas were the auto industry, the chemical industry, steel and metallurgy, areas that produced especially for export as well as constructions

field and the financial-banking sector. All these imbalances in the Romanian economy caused many layoffs and therefore an increase of the number of unemployed persons and of the unemployment rate in all the counties of the country, being made redundant primarily the male persons and those with a medium or low education level. To overcome the crisis requires a policy and a strategy that can create new jobs, simultaneously with investment in infrastructure and with support for the small and medium enterprises. While maintaining a high rate of unemployment and shutting down firms, there can be no economic growth in 2010. It is also necessary to have a coherent anti-crisis program and take resolute measures in the economic and social area, to support the economic recovery.

The Knowledge Economy – a Chance for a Lasting Economical Growth After the Crisis

Belostecinic Grigore
Academy of Economic Studies of Moldova
anticamera@ase.md

Abstract

The financial and economic global system was changed due to the world economic financial crisis that affected most of the countries. Crisis is a process of transformation where the old system can no longer be maintained. Therefore, the cause of a crisis is the need for change. A solution for the actual financial crisis can be the knowledge economy. But knowledge has no resilience. If we fear for the security of the supply chains for food and energy, how much more should we be nervous about our knowledge? Not only is it floating free of any relationship with the real world, it is also stored on highly transient media. The research- development-innovation activity could bring a solution for the ending of the crisis and developing the knowledge economy that will save the economy.

Key words: research, development, innovation, knowledge, education, competitiveness.

JEL Classification: B52, G01, O39, Q01

1. Introduction

The economic and financial crisis that started in the second half of 2008 affected most of the world's states, except the poorest ones and generated processes able to change the economic and financial global system.

Thus, according to the World Bank, the world PGB decreased in 2009 by 2,2%, the world trade volume by 14,4%. According to United Nations Trade and Development Commission the direct foreign investments decreased in 2009 by 38,7%, comparing with

2008, from 1,69 to US \$ 1,04 bil.

The fall was most pronounced in countries with developed economy, by 41.2% , in countries with the emergent economy, by 35% and countries with economies in transition, by 39%.

Those listed above have made the World Economic Forum in Davos this year to discuss about the need for tougher controls and extensive state interventions in the economic processes of post-crisis, about the impossibility of a fast recovery of the economic growth rhythms from pre-crisis and that straightened out the economy will be a long, slow and difficult process.

In the situation, acquires special importance to find new solutions for insure the economic growth lastingness and, certainly, they will be found by production and assimilation of new knowledge.

2. Solutions to ensure sustainability of economic growth

Remember the fact that economic competitiveness, social inclusion and environmental protection were identified as pillars of the Lisbon Strategy, which proved that the sustainable development should form the foundation of all European policies. Even tough some of the settled objectives at Lisbon proved to be too ambitious, even for the states with a developed economy, it's obvious that promoting the research-development-innovation and the foundations of an information-based society, together with education remains a prerequisite for all world states, including the Republic Moldavia.

To note that science, technology, innovation, use of knowledge, so far over time, have played an important role and have made their contribution to social and economic development, supported the general economic progress.

Meanwhile, the contemporary society becomes more and more based on knowledge and information, a society of global civilization, the information becoming, in fact, a strategic and fundamental resource, alike the capital for the industrial society and with a total impact on developing and with a decisive impact on the development and prosperity of any nation. In most economically developed societies, intensive use of knowledge is recognized as the main factor of progress.

The Japanese were the first to have understood this, nationwide. Toshivo Doko, considered a “king of Japanese success”, declared since the late 60s: “We have no natural resources or military power. We have only one resource: our brains capacity for invention. It is unlimited and we must show it. We need to educate, to specialize, to equip. This power of the mind through the power of things will become, in the near future, the most precious common good, the most creator of all mankind” [1].

With the launch of the Lisbon Strategy, it became obvious the desire to clarify the content and these objectives, including from the scientific point of view, the research - development – innovation studies were intensified.

However, so far it hasn't been developed and completed a theory of this process, and there are several names of this phenomenon, such as post-industrial society, post-capitalist society, information society, digital economy, new economy, society based on knowledge and information, knowledge based economy, etc.

3. Old economy and new economy

There are different ways through its tried to identify those changes that happened and continue to occur worldwide in the context of scientific and technical progress, globalization, innovation, sustainable development, etc.

In these conditions, together with traditional factors, knowledge is necessary as a factor with a major role in economic progress and the ability of a country to benefit from the gained knowledge is crucial

to the success of that state economy.

The transition from the industrial society to the next phase of economic development does not mean that after the age of industry, there will be no industry. Old economy and new economy coexist side by side.

Nobel laureate in economics Joseph E. Stiglitz estimates that the new “digital” economy has, yet less than 10% of the U.S. economy. New industry becomes an automatized one, robotic, cybernetized and computerized [2].

4. Competitiveness of an economy

Speaking about the main features of the knowledge economy in the context of developing the competitiveness, usually the following are mentioned:

- there is a movement from homogeneity to extreme heterogeneity of products in order to meet the specific needs of some market niches;
- an enterprise from the knowledge economy is largely determined by its ability to acquire, disseminate and exploit knowledge and information;
- the role of creative labor and employment flexibility in the employment field increases;
- the importance of the economy on scale and the high economic value of „small scale” decrease as a competitive advantage;
- the importance of decentralization of decision-making, creativity and flexibility in business increases;
- need for greater processing capacity information and better coordination of business systems;
- continuous exchange of information to promote business partnerships;
- the importance of time (speed) as a factor of competitiveness increases, given that competition between firms increasingly rely on time and speed of reaction;

Whether they're big or small, strong or weak, countries are equal in front of the new rules of the international economic exchanges game. We must recognize, in this context that the theory of competitiveness and of the competitive advantages were developed on the basis of the experience of large economies (states) and on quite different economic situations.

Economic globalization, open economies, strong foreign competition has made the traditional sources of benefits like uptake of existing technologies, mass production of scale generating economy, domination of large enterprises in the industry, stable sales markets to lose their seasonableness and efficiency. This offers new opportunities and small economies, as it is the Republic of Moldavia.

I must admit here, that most of our economy continues to rely on extensive use of production factors. New technologies are mainly assimilated by imports and foreign investments.

There is a part of the economy can be considered as belonging to an investments based economy, and appears the emergence of the economy based on innovation, especially in information and communications technologies, an area with high competitive potential.

In this context, the Republic of Moldavia continues to present serious gaps in competitiveness compared with the absolute majority of European countries, at the level of all elements that determine the competitive ability and the largest gap occurs in the first place, in terms of innovation and research - development, the information society field.

In this context, to be competitive, an economy must be based on educated and skilled population, a developed information infrastructure an innovative and effective economic and institutional system that could support what was indicated above.

Hence, in a situation of increasing the economic competitiveness is a priority the goal of developing an innovative economy must be also a priority.

More so, as the investigation and analysis that we conducted showed a real correlation between the degree of innovation of economy and gross domestic product per capita or national productivity, in the sense that the value of these indicators increases with the appreciating of the innovation degree of the economy.

The states with a higher share of R & D expenditure in GDP have also a better position in global competitiveness rankings, which determines the need for greater investment in this area.

We must admit here that during the last years the expenses for research and development have been and continue

growing in the Republic of Moldavia, both in absolute terms and in relation to GDP. And this is to appreciate.

And even though for this chapter, we have to recover significant differences compared with developed European countries, the big problem for the Republic of Moldavia is that the largest share in research & development expenditure (the personnel involved in research & development) continues to go to budgetary resources (public sector), a very light involvement of the private sector in this area was recorded, absolutely contrary to the one established trend in Europe and worldwide.

The lack of private research (in enterprises) stops development of demand in the research market, that there is no need for assimilation of the research results.

Increasing involvement of private sector in the research- development-innovation activity can be achieved through state support, including by grants, subsidies or tax credits.

Let us remember that the European Union makes efforts to catch the large advance over the United States and Japan, beginning with research and development field.

Lisbon strategy review in 2005 confirmed the target settled at Barcelona of giving 3% of GDP for R & D by 2010, but from it: 1% must go to public expenses and other 2% for public sector.

5. Instruments used in the innovation field

There are more important instruments that can be used by EU in the innovation field, instruments that can be also useful for the Republic of Moldavia:

- Creating the European Institute of Technology, its first projects aimed the measures meeting climate changes and development of EU energy policy.
- Creating clusters, including the fact that economic performance is influenced by the ability to cooperate in innovative activity. Although clusters are usually economic agglomerations formed spontaneously in a well defined geographical area, the state can encourage their forming, especially when they are organized around knowledge centers (universities or research institutes).

- The proposals for initiatives are preparing to develop areas with high potential for economic development and social value. (For the Republic of Moldavia these could be Balti town, which has a well developed infrastructure, partially preserved industrial potential, qualified workforce, Ungheni town - near the borders of the European Union and the city of Iași; Cahul town - Galati proximity and Giurgiulesti port).
- It seeks to promote innovation not only in the productive industry but also in services field, following the creation of the first innovative incubators in the services domain.
- Actions are taken to improve the European System of Standardization.
- The promotion of public-private partnership increases on issues such as green industry and eco-innovation, cluster policy, innovation services, and for sure innovative SMEs.

It can be mentioned that knowledge production can be considered as a new activity field, or, as the result of human activities, research and innovation, and having a market value, knowledge, like any economic good can and must be sold in the market.

As buyers can be both private companies and the state, as representative of the interests and social needs. Obviously this will approach the issue of free access to knowledge and will require the development of new economic theories, new research funding schemes, new problems related to the accounting of intangible assets, etc.

Knowing not means only the production of goods that includes a large amount of science and technology, but also improving the existing products, the ability to obtain in real time information about markets, distribution channels, consumer preferences, finding new groups of customers or entrance on new markets, the importance of trademarks - are new tasks in the science of marketing, not to mention the fact that even the research-development-innovation must be organized on customer's needs.

This imposes the need to promote collaborations and partnerships between economy and science; irrespective of funding source and implement marketing function involves just research orientation towards the needs of potential customers, adapting the

activity of research institutions to market needs.

6. Knowledge economy

Knowledge - based economy implies a greater role of universities in society.

First, universities must review their mission, which, in addition to providing learning and personnel, consider activation of research and commercial activities of product research to become more active in transferring knowledge and technology.

Similarly, universities must recognize that the XXI century student is different from the student of previous generations.

He requires partnerships with teachers, interactive training methods, and online student-teacher communication systems.

He must build the ability to understand and accept cultural differences, think critically, to approach problems from a global perspective, to work in cooperation, to be able to change their lifestyle and consumer habits and to ensure also the environment protection etc.

Universities need to recognize the fact that education has no borders. It becomes transnational.

That is why it is necessary and universities need to promote global innovative universities that need two things: more autonomy and more money, meaning a better financing.

7. Concluding remarks

In conclusion, we can mention:

- Building the society based on knowledge has become a reasonable goal for all world states, including the Republic of Moldavia. This is now the only way to competitiveness and economic prosperity.
- The Republic of Moldavia needs to establish a favorable business environment for innovation and a clear and realistic approach, which could start from stimulating the activities of research-development-innovation.
- It requires a systemic approach to innovation in the context of relations and interests of all actors participating to this process: universities, research institutions, donors and, not least the state.
- Like, maybe, in a short while, for the Republic of Moldavia is more important the

acquisition of technology in relation to the creation of technology, in terms of accelerated growth of productivity.

In this context, it becomes important promoting scientific and technological cooperation with large transnational companies (domestic and foreign), which would provide access to advanced research and high technology.

Innovation process in the Republic of Moldavia will be successful only if new knowledge will be used in economy and will be assimilated by the enterprises.

From this perspective, the reason to support research-development-innovation must be the economic effect established on the basis of efficiency and cost analysis.

Talking about the effective integration of

our research in the European research area, becomes important to find our place and role in European scientific research, our niche European market of research-development-innovation.

In this context, it is necessary to identify priority areas where research should be focused on research-development-innovation, which could provide a competitive advantage on the European market research.

The Analysis of the Main Factors of the Macro-medium Influencing the Dynamics of Public Services in Romania

Bicăjanu Vasile,
Ionciță Maria,
Academy of Economic Studies, Bucharest
maria.ioncica@com.ase.ro

Abstract

The current study presents the PESTE analysis, as well as the analysis of the evolution of the main factors of the macro-medium influencing the dynamics of public services, namely: the political and legal environment, the economic environment, the socio-cultural environment, the technological environment and the ecological (natural) environment.

Currently, from a political point of view, we can say that in Romania the climate is relatively stable and favorable for change. On the other hand, the legislative system is rather unpredictable, influencing in a negative manner the course of business in the economy, hence public services.

Economic factors influence to the highest degree the development of public services, the level and dynamics of the main indicators of economic development determining their level and quality.

In the last part of the paper, we shall present a SWOT analysis of the social and economic situation of Romania after 1990, which had a decisive influence on the dynamics of public services.

Keywords: PESTE analysis, macromedium, public services, economic development

JEL Classification: E61, E69, H40, H59, O29

1. Introduction

The dynamics of public services is in close correlation to the evolution of the economic and social milieu in which they develop. Public services are influenced in their activity by factors in the macro-medium, such as: the

factors in the political and legal environment, in the economic environment, in the socio-cultural and the technological environment. Lately, the ecological (natural) factor was added to these factors, as a result of the growing importance of the problems in the environment.

In this context, the current study analyzes the evolution of the main factors in the macro-medium, impacting the evolution of public services.

2. Public services – contents and typology

The existence of people in society requires, as an objective necessity, the production of public goods alongside private goods. The former are defined as ‘goods that benefit the entire public or population’ [1].

By object of activity and means of financing, public services are categorized in:

A. commercial public services

B. public services financed by the state budget, which can be in turn: administrative public services, collective public services, customized public services [2].

Commercial public services have as object industrial and commercial activities (railroad transport, the common transport system, mail and telecommunications, water, gas and electricity distribution, etc.). Although these services are largely paid for by the population, the state intervention through the competent authorities resides in the imposition of conditions for supplying the services, organizing and developing auctions for leasing them to private companies, subsidizing, approving and controlling the increase in tariffs, etc.

Administrative public services can be only supplied by the state through its

institutions, these including the legislative public service, the executive public service and the judicial public service.

Collective public services are financed by the state budget, have a collective destination and satisfy needs with a pronounced social character, such as defense, public order and national safety, locative and public development, and protection of the environment.

Customized public services comprise social and cultural activities meant to ensure public health, to raise the level of professional and cultural development, create conditions for leisure and recreation.

The level of public services depends on the evolution of factors in the macro-medium: the political and legal environment, the economic environment, the socio-cultural environment, the technological environment and the ecological (natural) environment, evolution which will be analyzed in the following.

3. The analysis of the factors in the macro-medium in Romania influencing public services

The factors in the macro-medium, which are in a continuous change, have a strong influence on the volume and structure of public services. The analysis of these factors is known as a PESTE analysis.

3.1. The political and legal environment

Political factors are specific to each country, and represent mainly the structures of society, social classes, political forces, the degree of involvement of the state in the economy, the degree of stability of the political climate. The political objectives of the government in power at a given moment have a strong impact on economic policies, influencing in a direct or indirect manner the evolution of the economy in its entirety, and public services in particular [3].

Currently, it is considered that in Romania, from a political point of view, the climate is relatively stable and favorable for change, with all the disputes between the actors on the political stage, inherent in any democratic society.

The legislative environment is formed of the ensemble of laws and norms regulating

the functioning of the economy. There are general laws and norms valid for all domains of activity, as well as laws specific to the various branches of public services (education, healthcare, public administration, etc.). The legal provisions, as well as their stable or unstable character, influence in a decisive manner the development of public services.

Due to the instability caused by the passing from a socialist economy to a market economy, regulations in our country have recorded two tendencies, namely, on the one hand, *the increase in their number*, and, on the other hand, *changing some of them at small intervals*.

This unpredictable legislative system represents a major barrier in the stimulation of investments in general, and investments in the public services field, in particular, as they do not allow for the elaboration of development plans and do not offer the safety necessary for their implementation on the long term.

3.2. The economic environment

Among the components of the environment, the economic environment has the greatest impact on the development of public services, as the level and dynamic of the main indicators of economic development condition the level and quality of public services.

The main economic factors influencing the development of public services are: *economic growth* (the rhythm in which the economy evolves (for better or worse) in a period of time); *final consumption expenditures of the population*, influenced in turn by real income, the tendency towards saving, the taxes and subsidies from the budget, etc.; *investment spending*; *consumption spending of public or private administration*; *exchange rates*, *interest rates*, *inflation and unemployment rates*, a.s.o.

The evolution of macro-economic indicators in Romania shows the fact that economic activity in our country was characterized, after 1990, by a sinuous evolution, the measures of economic reform applied being sometimes less than adequate.

The dynamics of Romanian economy after 1990 exhibits evidence of economic growth and decrease cycles (see the data in **Table 1**).

Table 1. The main economic indicators in the 1990-2008 period

Years	1990	1995	2000	2001	2008
Indicators					
GDP growth rate (previous year= 100) %	-5.6	7.1	2.4	5.7	7.3
Annual inflation rate (previous year=100) %	5.1	27.8	40.7	30.3	7.9
The exchange rate RON/euro (average annual values)			1.99	2.60	3.68
The real salary gain index (1990=100) %	100	66.5	59.4	62.4	130
The unemployment rate % (cf. AAFP)*		9.5	10.5	8.8	4.4

Source: The National Strategy for Economic Development in Romania on a Medium Term, March, 2000; Social Trends, INS, Bucharest, 2004,2008; The Statistic Yearbook, INS, Bucharest, 2009

* AAFP = Agenția de Ocupare și Formare Profesională (The Agency for Employment and Professional Development)

After 2000 and until 2008, most economic indicators had a positive development, as we can notice from the figures presented in Table 1, which influenced the dynamics of commercial public services and publicly financed services.

After 2008, the influence of the global economic crisis was felt in our country as well.

Thus, the rate of economic growth was negative in 2009 (approx. -7%), the unemployment rate also rose (reaching approx. 7%), to give just two significant examples referring to the decline of Romanian economy under the influence of the economic crisis.

3.3. The socio-cultural environment

The socio-cultural environment is formed of the complex of elements defining a society (institutions, factors, etc.) giving the society its own system of values, traditions and norms leading to a certain behavior of its members. Among the most important changes lately, with an impact on the development of public services, we can mention:

- the phenomenon of ageing of population, with the increase in the average lifespan, involving the increased need for healthcare services, social assistance, etc.

- the spectacular increase in the mobility of population, in the conditions of the globalization of the economy, and of the progress in the evolution of transports, increasing purchasing power and need of recreation and information.

- the growth in the role of women in economic life, leading to the need for development of childcare and education services. The employment of women and the untraditional structure of some families in developed countries (single, same sex couples, groups) are two separate factors, but which lead to mutations in consumption expenditures, hence demand [4].

3.4. The technological environment

The technological environment presents both opportunities and threats for the development of services.

The main aspects through which the technological environment influences the development of services refer to [5]: the degree of development of information systems; the development of communications; the development of soft; the volume of research and development expenses.

Related to all these aspects, Romania has an extremely valuable human potential, but, to a large extent, the financial resources for technological progress are missing, thus leading to a gap compared to developed countries.

3.5. The natural environment

The natural environment is made up of geographical, biological, hydrologic, climatic components [6].

Natural factors have both a positive influence, by becoming sometimes essential strategic resources, as well as restrictive, through the limits imposed by the necessity of protecting the natural environment.

The need for restructuring economic activities and shifting the weight towards intangibles activities is highlighted in the current context by growing concerns of how to promote sustainable economic development [7].

In an attempt to characterize the economic situation of Romania after 1990, and till the present moment, a brief **SWOT analysis** shows:

Strengths

- Romania has a series of natural advantages, insufficiently exploited at the moment, which, if well managed, can contribute significantly to economic growth and influence in a positive manner the development of public services.

- The labor force has, on the average, a *high level of education*, which represents an important opportunity for the development of knowledge-intensive branches (informatics, healthcare, research, etc.)

- The *reduced cost of labor* represents an opportunity, being an incentive for foreign investors, and a possibility for relatively lower prices for Romanian entrepreneurs.

Weaknesses

- Infrastructure* (transport, communications, public utilities) is insufficiently developed, outdated and does not act as catalyst for investments. It is, alongside other factors, responsible for the insufficient inflow of foreign direct investments in Romania.

- The slow rhythm of restructuring of public companies* has made some of these into real 'black holes', consuming a large volume of subsidies, and at the same time, accumulating huge debts to the state budget. Moreover, low labor productivity has generated economic difficulties, related to the high level of production costs, as well as social problems (reduced salaries, and even the impossibility to pay them).

- The important share of *activities with a low added value*, characterized by the

absence of innovation or a low level of innovation, has determined a low competitiveness of Romanian products on the domestic, and especially on the international, markets.

- The environmental management systems* (waste, residual water, drinking water) are still extremely underdeveloped, and sometimes they do not even exist.

Opportunities

The most important opportunities for Romania are:

- EU accession*, and, related to this, the decrease in the importance of trade barriers and of obstacles in the development of the economy.

- The opportunities provided by the *information society*, considering the fact that Romania has extremely valuable human potential for developing services with a high added value (informatics, telecommunication, etc.).

Threats

The main threats to Romania's economic development are:

- Other competitors from Central and Eastern Europe, capable of increasing their competitive advantage, with the help EU Structural Funds.

- Competition from China and South-East Asia, in the sectors with low production costs.

- Shocks in the labor market, related to the restructuring of state companies.

- The overseas migration of the labor force, especially highly qualified employees.

As a natural consequence of the evolution of the factors in the macro-medium in Romanian economy, most public services have recorded a decline in the 1990-2000 period. Afterwards, a period of recovery followed, due to economic expansion, and after 2008 public services, as well as the entire economy, were affected by the global economic crisis.

4. Conclusions

Considering the interdependence of public services to the other sectors of the economy, and the evolution of the whole economy, the economic policy measures should aim at ensuring a positive trend especially for economic factors, but for the other factors of

the macro-medium analyzed previously as well.

Thus, we refer, mainly, to the stimulation of economic branches, with high development opportunities for Romania, such as: agriculture, informatics, tourism, etc. The re-launching of Romanian exports is also crucial, as well as regaining traditional markets lost in recent years, and taking advantage of the opportunities created by the accession to the EU.

Developing infrastructure, transports, telecommunications, education, research and development services, with EU support inclusively, represent important directions for improving public services, as well as the economy as a whole.

The Shadow Economy and Corruption in Romania

Bocean Claudiu George
University of Craiova
boceanclaudiu@hotmail.com

Abstract

Shadow economic activities constitute a large and growing part of all economic activity throughout the world. Because all individuals engaged in these activities wish not to be identified it is very difficult to get accurate information about the relationship between corruption and shadow economy activities. The paper highlights the interaction between the underground economy and corruption using comparative analysis. It discusses the theoretical approach to shadow economic activities and focuses on the determinants of the Romanian economy concluding that Romania record a high incidence of corruption and a large shadow economy.

Key words: shadow economy, corruption, legal and illegal activities, dual economy sectors

JEL Classification: C83, D73, D78, E 26, K42, O17

1. Introduction

The analysis of dimensions, spread, and consequences of shadow economy phenomenon in Romania is under intensive public policy debate. Most authors trying to evaluate the shadow economy face the difficulty of how to define it and its complexity.

Smith (1994, p. 18) defines it as „market-based production of goods and services, whether legal or illegal that escapes detection in the official estimates of GDP.“ Del’Anno (2003) considers that shadow economy consists in ”those economic activities and the income derived from them that circumvent or other wise government regulation, taxation or observation”

Economic theory also identifies increasing in tax and social security

burdens as one of the mainly important causes of the increase of the shadow economies worldwide. This effect is explained by a switch of labor supply to the shadow or informal economy (considered as an untaxed sector) driven by the enlarging difference between the total labor cost and after-tax earnings in the official economy (Schneider & Enste, 2000). Studies of shadow economies for the period of early transition have found some evidence for the assertion that the success of market reforms is related to lower levels of the shadow economy (Eilat & Zinnes, 2002).

The shadow economy includes all market-based legal production of goods and services that are deliberately concealed from public authorities for the following reasons (Schneider, 2006):

- to avoid payment of income, value added or other taxes,
- to avoid payment of social security contributions,
- to avoid having to meet certain legal labor market standards, such as minimum wages, maximum working hours, safety standards, etc.,
- to avoid complying with certain administrative procedures, such as completing
- statistical questionnaires or other administrative forms.

As I supposed before the tax evasion is typically assumed as a major motive for shifting the activities “in the shadow”. The main reason for this is the tax burden level. I believe that if all the due taxes have to be paid, assuming that the other companies succeed to avoid it, the firms which pay taxes will lose its competitive position in the economy.

From Table 1, it becomes obvious that a broad definition of the shadow economy includes unreported income from the production of legal goods and services,

either from monetary or barter transactions - and so includes all economic activities that would generally be taxable were they reported to the state (tax) authorities.

Table 1 Type of Underground Economic Activities

Type of Activity	Monetary Transactions		Non Monetary Transactions	
Illegal Activities	Trade with stolen goods; drug dealing and manufacturing; prostitution; gambling; smuggling; fraud; etc.		Barter of drugs, stolen goods, smuggling etc. Produce or growing drugs for own use. Theft for own use.	
	Tax Evasion	Tax Avoidance	Tax Evasion	Tax Avoidance
Legal Activities	Unreported income from self-employment; Wages, salaries and assets from unreported work related to legal services and goods	Employee discounts, fringe benefits	Barter of legal services and goods	All do-it-yourself work and neighbor help

Source: Lippert and Walker (1997), with additional remarks from Schneider (2006)

The separation of the economy (Dual economy) into an official (First economy) and an unofficial sector (Second economy; informal economic activities) offers an initial guide towards a categorization of the shadow economy (Figure 1).

Figure 1 Dual economy sectors

National economy (Dual economy)			
Official sector (Formal sector, first economy)		Underground economy (informal economy activity, second economy)	
Public sector (Public institutions and public companies)	Private sector (private households and companies)	Shadow economy (Market transactions)	Household sector (Self-sufficient economy)

Source: Schneider and Enste (2002)

Fields (2005) sees the informal sector as composed of two tiers. According to this view, the upper tier contains the competitive part, i.e. those who voluntarily choose to be informal, and the lower tier those who are there because they do not have other alternatives. It becomes clear that if the informal sector is indeed a two-tier one, then appropriate attention has to be paid to the differences between these two segments in terms of the reasons and

motivations of informality as well as the consequences of informal employment. Policies should be designed accordingly to take into account the specificities of these two main parts of the informal sector.

2. Shadow economy in Romania

In Romania, immediately after the fall of communist regime, the informal sector was based largely on flow of smuggled goods from public companies, and then sold on the black market, domestic or foreign. With time, shadow economy channels have diversified. Specialized pathways have appeared on the black market currency, in drug trafficking, etc. Many people were employed in companies without legal requirements.

Continuing some practice before 1990 (corruption, favoritism, bribery), addressing new forms of expression, the shadow economy, which has proliferated since 1990, was provoked by several factors, which enabled development of many of the specific practices:

- legal uncertainties that have accompanied economic changes;
- development of tax legislation characterized by gaps, inconsistencies and ambiguity;
- decentralization of power has increased the number of individuals that may be corrupt;
- adjustment and economic restructuring have led to small enterprises creating, which are important generators of the shadow economy;
- economic restructuring have led to small enterprises, which are important generators of the underground economy;
- tolerant attitude of both the authorities and population, to breach the rules and some reluctance to discipline characteristic generally Latin peoples;
- underground economy inherited from the old regime.

The main cause of the shadow economy is still high level of taxation. Meanwhile, corruption is practiced at all levels of society.

Figure 2 shows the evolution of Romanian shadow economy after 1990.

Figure 2 Shadow economy in Romania (share in GDP)

Source: RCEP (2001) and Kearney (2009)

3. Shadow economy - corruption correlation

It is usually agreed by economic policy analysts that shadow business activities and corruption practices are interlinked phenomenon. A lower level of corruption in the public sector should restrict the shadow economy widen, and contrary - with restrained “shadow operations” (providing “black account” funds for bribery purposes) corruption would be substantially slowed down.

Figure 3 shows some causes and effects of the shadow economy and corruption, and their correlation.

Figure 3 Links, causes and effects of the shadow economy and corruption

Business Regulations	+	Shadow Economy	-	GDP Growth
Unemployment Rate	+/-		+/-	Labor Force Participation
Transfers and Subsidies	+		+	Tax evasion
Government Consumption	+			
		+/-		
Government Effectiveness	-	Corruption	-	Real GDP per Capita
Fiscal Freedom	-		+	Bribes
Bureaucracy Costs	+		-	Judicial Independence
Rule of Law	-			

Source: Buehn and Schneider (2009)

A large shadow economy is linked to high levels of corruption. In countries with large shadow economies, firms and

individuals often rely to a large extent on shadow economic activities. In order to avoid detection, taxation, and punishment, they bribe bureaucrats. Moreover, low tax revenues reduce the quality of public services and infrastructure. This in turn reduces the incentives to remain in the official economy. Weaker legal systems and unstable conditions for economic activity increase corruption.

Figure 4 shows the evolution of Corruption Perceptions Index in Romanian economy.

Figure 4 Corruption Perceptions Index in Romania

Source: www.transparency.org.ro

Although according to the Corruption Perceptions Index situation in Romania has improved, shadow economy remains at high levels, which proves the relationship in both directions.

4. Conclusions

Extend of shadow economy, tax evasion, and corruption is still a problem in Romania as a new EU member state with not only domestic but also international repercussions. The existence of the shadow economy is a challenge for public authorities. In an attempt to limit or taking it in the formal economy, these authorities should take into account both negative and positive effects. Favorable critiques argue that underground activities provide flexibility and adaptability of the formal economy which it lacks, compensating fields which it covers, providing jobs and acting as a remedy for unemployment in periods of recession. Should, however, do not skip the fact that that when accepting a dual society, consisting of a formal sector and informal sector, taxation and regulation will push even more on formal sector. Any tax unpaid by one or more taxpayers

involves the assumption or increase public spending, increased taxes paid by others.

Shadow economy is a complex phenomenon, present in all type of economies (developing, developed and highly developed). People engage in shadow economic activity for a variety of reasons, among most important are government actions, avoiding taxation and regulation. A government aiming to decrease shadow economic activities has to asses the complex relationships between the corruption and shadow economy.

Labour Taxation in EU Countries. Comparative Analysis

Boglea Vanina Adoriana
Iacob Mihaela Ioana
„Aurel Vlaicu” University of Arad
vanina.boglea@yahoo.com
mihaiacob1976@yahoo.com

Abstract

The problems of high labor taxation, has been the topic of numerous debates, in which there has been shown that the taxes on income from employee are significant, especially in Europe. Despite the existence of some countries that have a reduced level of taxation, the labor taxation, is on an average, much higher in the EU than in other main industrialized economies.

Key words: labour, taxation, European Union

JEL Classification: H2

1. Introduction

In the European System of Accounts classification, keeping in mind the distinction between employed and non-employed, taxes on labour can be identified as the following categories:

- taxes on employed labour - comprise all taxes, directly linked to wages and mostly withheld at source, paid by employers and employees, including actual compulsory social contributions. They include compulsory actual employers' social contributions and payroll taxes, compulsory social contributions paid by employees and the part of personal income tax that is related to earned income. The personal income tax is typically levied on different sources of income: labour income, but also social benefits, including pensions, dividend and interest income and self-employment income.

- taxes on non-employed labour - comprise all taxes and compulsory social contributions raised on transfer income of non-employed persons, where these could

be identified. This transfer income includes social transfers that are paid by the state (invalidity and health care benefits) and benefits from old-age pension schemes (both state and occupational pension schemes). Most of these benefits paid to non-employed persons are in some way or the other linked to employment; contributions for current unemployment and state pension benefits are, for example, for the most part, paid by the active labour force, while occupational pension schemes are mostly funded while being employed.

2. Labour taxation in EU27

We have to point out that the weight of takings from the labor taxation is far more superior than the UE27 average (45,2%) in 16 countries: Sweden (58,6%), Austria (55,2%), Germany (54,6%), Belgium (52,2%), Finland (52%), France (51,8%), Slovenia (51,5%), Denmark (51%), Estonia (50,8%), Holland (50,4%), Hungary (50,1%), Italy (49%), Lithuania (48,9%), Czech Republic (48,3%), Latvia (48%) and Spain (45,6%).

Under the UE27 average we find 11 countries, namely: Portugal (42,9%), Greece and Luxembourg (41,8%), Romania (41,1%), Slovakia (39,5%), Great Britain and Poland (38,6%), Ireland (34,2%), Bulgaria (31,6%), Malta (27%) and Cyprus (26,4%).

If we take into account the distinction between the employed and the non-employed and we refer here to the two main components, we can observe that in all the state members of the European Union, the taxes on income from labour employed are the highest.

Graph 1: Taxes of labour as % of total taxation

Source: Eurostat, *Taxation Trend in the EU, 2009*

The taxes on income from non-employed labor are more significant (more than 5%) in countries such as Denmark, Sweden, Germany, Holland, Austria, Finland, Italy and Spain.

The problems of high labor taxation, has been the topic of numerous debates, in which there has been shown that: “the taxes on income from employee are significant, especially in Europe. This happens, maybe

because this sort of taxation is more convenient to implement from the political point of view – they are at the charge of an anonymous administration, not at the charge

of the prime minister nor the president’s. Furthermore, the employees are not aware of these income taxations, because the taxes are paid, on their behalf, by the employer. Some of these taxes cover the unemployment compensation, the national health insurance, the allowances for pensioners, the accident insurances, “the solidarity funds”, having different objectives, from houses with moderate rent, till special requalification programmes, and so on. All these taxes lead to a raise of costs of the labor manpower for the companies, except for the cases in which the employees agree to reduce the value of the wages after they have been paid off [1].

Starting with the 90^s many states, members of the European Union, have introduced measurements for reducing the fiscal weight upon labor, especially through reducing the wage taxation, and granting some facilities for the labor.

A solution for reducing the fiscal pressure upon labor has been considered by numerous states members as being “the removal of the fiscal weight from labor”, meaning the use of other taxes in order to gain fiscal resources. Thus, the removal of the fiscal weight from labor has been directed towards capital or towards a larger taxation basis. From 1999, the French government has removed the labor taxation towards taxation of the local businesses, a process that has been finalized at the end of 2003. In Italy, between 1997-1998 some compulsory health contributions of the employees have been removed and a new tax on expenses has been introduced.

Taxes have also been orientated towards polluting activities, and as a result many countries have introduced or raised some taxes on energy or the so called “green tax” in order to finance, at least partially, the decreases from labor taxation. In Germany, in April 1999, new taxes on the consumption of energy, having the aim of reducing the taxation on pensions, have been introduced. Italy has launched in 1999

a “green fiscal reform”, which meant a step by step implementation of excise which are higher and close related to the carbon dioxide produced by each fuel, until 2005. The rise of the fiscal incomes will determine a diminution of the labor taxation. In Great Britain, in 2001, a new change regarding the tax perception from the companies that use methane, coal or electricity, has come into effect. In Holland, the reduction of the personal income tax has been covered by a VAT and “green taxes” increase.

Another possibility of diminishing the labor taxation was the diminishing of the indirect taxes upon the working at home activities. In 1999 there has been adopted a norm that guarantees the option of those countries that want to reduce the VAT for the working at home labor, during 2000 and 2002. The objective was the rise of demand for such services and of the jobs as well as for legalizing that part of the unofficial economy: bike mending, shoe and leather products repairing, dressmaking and weaving; restoration and mending the private houses, cleaning and maintaining cleanliness in the private houses; medical care at home and hairstyling. Countries such as Belgium, Greece, Spain, France, Italy, Luxembourg, Holland, Portugal and Great Britain took advantage of this opportunity.

3. Implicit tax rate on labour

One of the indicators that were mostly used to express the real fiscal pressure or direct effective or indirect imposed on different types of economic incomes or possible taxation activities by the state members is represented by the implicit tax rate.

The implicit tax rate on labor is a relevant indicator of the fiscal weight upon labor and is being calculated through reference of all direct and indirect income taxes, of the compulsory social contribution and imposed on the labor income, related to the income that is actually being taxed.

The implicit tax rate on labor is being calculated only for the employee labor, avoiding this way to burden the taxation

upon the social transfers, including the pensions.

The implicit tax rate on labor estimates the average fiscal burden upon the labor income in economy. The tax proportion can hide important variations in real/effective tax contributions from one house to another or from one wage to another.

For example, reducing the taxes or the social contributions which aim the workers that are badly paid and badly trained or the families that have children can have a minor impact over this indicator, but at the same time can be efficient in rising the real wage for beneficiaries. The evolution of the implicit tax rate on labor, during 1995-2007 is shown in the graph 2 below.

Graph 2: Evolution of the implicit tax rate on labour, 1995-2007 (%)

Source: Eurostat, Taxation Trend in the EU, 2009

The implicit tax rate on labor, in 2006 and 2007, has gone up to 34,8%, in comparison with the 34,7% level in 2005. The descendant trend of this rate, stating with 2000, has ended in 2005, in spite of a large agreement regarding the wish of reducing the labor taxation. However, the fiscal burden is still low in comparison with its maximum of 36,1%, maximum that has been reached in 1999.

As for the state members, in 2007, the values of this rate varied between a minimum of 20,1% in Malta and a maximum of 44% registered in Italy. Also, the implicit tax rate on labor registers reduced values in Cyprus (24%), Ireland (25,7%), Great Britain (26,1%) and Bulgaria (29,9%) and higher values in Italy

(44%), Sweden (43,1%) and Belgium (42,3%).

Despite the existence of some countries that have a reduced level of taxation, the labor taxation, is on an average, much higher in the EU than in other main industrialized economies.

Electronic Commerce Versus Traditional Commerce: Trends, Similarities, Differences

Boldureanu Gabriela
„Petre Andrei” University of Iasi
E-mail: gabrivaleanu@yahoo.com

Abstract

The unprecedented development of information technologies in recent decades has revolutionized global trade, wholesale and retail, redefining, from a radical way of organizing and operating system business, requiring a new way to trade, to enter relationship and partnership with consumers connect. Thus, this paper presents the main developments in trade, from classic to electronic commerce trade, concluding that, in fact, widespread Internet and information technology contribute to the development of traditional trade.

Keywords: classical trade, commerce, information technology, goods, suppliers.

JEL Classification: Q33, N70.

1. Introduction

Research in the field of trade developments have revealed a number of milestones, from the appearance of large stores, development of branch emergence popular shops, placing of self-serving, development centers, the introduction and widespread deployment of electronic commerce. In the context of the new economy [2], information technology, the Internet boom led to new opportunities for humanity, creating an unprecedented development of electronic commerce. Global electronic commerce is not a simple activity that focuses only businesses but their efforts became a major component of economic development policies of governments of developed countries.

2. From classical to electronic commerce trade

During over 150 years, trade has seen a number of structural mutations which facilitates understanding review its current stage of development, namely [5]:

- Development of large stores in the mid-nineteenth century were the main mutations choice of products, highlighting a greater extent the characteristics of goods, can direct consultation of the goods displayed;

- Development of branches. His originality consisted in concentrating purchases made by a commercial firm, leading to a number of advantages such as flexibility and proximity to business customers from small chain stores.

- The third revolution, which started between the two wars, has led to popular store emphasis on a narrow range of non-food goods but high rotational speed;

- Creating the dominant food supermarkets have led to self-serving;

- In the early '60s that focused hypermarkets occurred under the same roof in a shopping center independently, several independent traders or companies specializing in the provision of services;

- The sixth revolution, initiated in the early '60s was the mainstream: maximizing servicing by each trader;

- A seventh revolution that we can consider the introduction and widespread deployment of electronic commerce.

Thus, electronic commerce dates from the decade eight of the twentieth century. Since 1968 the standard was developed first EDI (Electronic Data Interchange) structured messaging transport industry in

the U.S.. In the decade closed 9 develops networks of commercial transactions, hence the emergence of electronic mail. In 1990 occurs the Internet revolution products. By that time „culture” of the Internet has encouraged and rewarded people who brought information and tried to discourage the use of Internet for profitable activities or who is committed to making a profit.

Be said that there is no universally accepted definition of the term „electronic commerce” or e-commerce. However, e-commerce means „distribution, marketing, sale or delivery of goods and services by electronic means”.

After Kalakota and Whinston electronic commerce is „a modern business approach, which addresses the needs of companies, markets and customers to reduce costs while improving product quality and services and increase the speed of delivery or performance. Electronic commerce can be treated without regard to computer networks, useful in searching and finding information needed to support various decisions taken by companies and by consumers” [3].

The Buyer's Guide to Electronic Commerce, published the following definition: Electronic commerce is to "use information technology to improve relations between business partners” [9].

For Dennis P. Geller, electronic commerce is the „collection of tools and practices that involve the use of Internet technologies that allow companies to create, maintain and optimize business relationships with other companies and individual consumers” [6].

For some companies, electronic commerce means any financial transaction using information technology. For others, the notion of electronic commerce covers full cycle sales - including marketing and selling itself. Many people consider e-commerce as any commercial transactions conducted electronically for the purchase of products such as books, CDs, tickets and more. But electronic commerce has, in general, a more profound impact on business development and includes, in fact, not new purchases only commercial but also all activities that support marketing

objectives of a company and may include, for example, advertising, sales, payments, after-sales activities, customer service, etc.

Thus, its wide range of services to support and assist this new area of business: Internet providers, security systems and electronic signatures, online transactions or store chains and general services such as consulting, website design, development sites, etc.

This development has a major impact on the economy [7], the creation of new enterprises, diversification of existing ones and, in particular, the potential labor market and the employability of its future. Because of this diversity of market conditions that include a large number of service providers and is in constant change, it must as a necessity available to enterprises, especially small and medium enterprises, a „source” where to find adequate support for implementation of e-commerce solutions in their own activity.

E-commerce industry is generally a distinction between transactions *Business-to-Business (B-2-B or BTB)* transactions and *Business-to-Consumer (B-2-C or BTC)*:

- *B-2-B* contains all transactions are made between two or more business partners. These transactions are usually based on an extranet system, which means that our business partners acting on the Internet using names and passwords for their Web pages.

- *B-2-C* refers to the relationship between dealer and end consumer retail e-commerce is considered.

A new option in e-commerce transaction is the *Business-to-Employee (B-2-E)*, which refers to transactions within a firm, the firm conducted for staff through its intranet.

Momentum and rapid growth of electronic commerce, especially the emergence of electronic market needs has been given by international alliances of purchasers in different industrial sectors such as automotive, retail, aerospace, chemistry and agriculture [1]. According to forecasts, in virtually every sector will appear as electronic markets, as expected, are most likely to turn into global electronic business environments.

Momentum and rapid growth of electronic commerce, especially the emergence of electronic market needs has been given by international alliances of purchasers in different industrial sectors such as automotive, retail, aerospace, chemistry and agriculture. According to forecasts, in virtually every sector will appear as electronic markets, as expected, are most likely to turn into global electronic business environments.

With the development of electronic commerce and started on the future trade disputes traditionally done by traditional means. Thus [10], in France, Dia-Mart - specializes in research and advice in distribution, in „E-Commerce: cannibal strategy, analyzed the risk of “cannibalization” [4] and the internal contradiction between the sites Internet and a company's own stores.

Researchers involved in this study analyzed the potential of the Internet taking issue two criteria: "marketability" virtual store and "value added" products offered by this.

The research results reveal following: while the products category for computer supplies, trips or other consulting services prove strong products "marketability", able to benefit from added value from the Internet, footwear, clothing and furniture items are presented as weak "merchantability" unlikely to assume the added value of Internet.

In fact, electronic commerce should be a mix of online interaction and the interaction between buyer and seller in shop class. Both are required for a commercial enterprise to be successful.

In fact, there is no question there is a risk of cannibalization of physical store (Classic) by electronic commerce. Because of the need for personal contact with the products online unsaleable remains delicate logistics problem. The problem of supply distribution system (comet wholesale and / or retailers) by producer-suppliers fall within Business to Business transactions to file and continue to the trend in terms of organizing logistics flow using electronic data exchanges. As regards the distance over the Internet, the problem of transport

for goods bought at home buyer is still in a phase of building effective solutions for both partners: the seller and buyer.

In an attempt to minimize unpleasant surprises that may occur in transactions Business to Consumer, scientists underlines the need solutions and answer the main difficulties arise from the distance, such as packaging, marking and transportation asset management diverted / defects, storage, inventory management, management of unsold goods, database organization, customers and increase loyalty.

3. Classic trade and commerce: a short comparative analysis

Comparative analysis of the priority issues of classic trade / commerce are [8] : location, interior and exterior design, layout, display of goods, technology, internal and external commercial transportation, packaging technology, technology supply, storage, sale and services, technology earnings, payments, settlements.

1. Location

Study area characteristics, considering whether a particular location in the shopping center, evaluation of potential sites are priority elements in classical trade through stores, while e-commerce site has a minor role;

2. Design

Trade traditional styling is part of the identity point of sale, the focus is on aesthetics and functionality of physical attributes. If electronic commerce, interior design is important, not necessary related analysis awnings, signage, windows and exterior lighting system, the focus on specific design elements and rules designed pages and size of characters used, site map the use of empty spaces, animated images, the color.

3. Technology of display

Identifying the criteria and best display technologies and presentation of goods inside the shop windows, merchandising

activity, are important when talking about classic trade, while the display of goods for commerce requires a specific technology implementation of shopping cart technology (base data communication to ensure a perfect seller-buyer).

Shopping Cart System offer information on the following: the nature and characteristics of products sold (technical details, prices, images of products), how to choose the type and quantity of goods to be purchased, verifying and recording data, calculating and showing the total value of purchases including transport charges.

4. Commercial Equipment

The classic case of trade, commercial furniture and equipment are differentiated profile and vary from store gondolas linear with single and double exposure, pillars, racks, shelves, tonete, presentation tables and refrigerated showcases different kinds of machines for processing. E-commerce dominate machinery, and computers, laptops, modems, own server / host, etc.

5. Supply, storage and sale

Regarding trade classic supply process includes: application of supply, determining needs, finding and choosing suppliers and preparing orders, negotiating, contracting, storage, sale itself through outlets. Instead of making an electronic ordering interface need exists for the order to have the following characteristics: a cover page of the store where products are presented, a form of customer data, a form with information on payment and delivery , an order confirmation form.

6. Payments, collection and settlement

The classic trade, payment is made directly to the seller, in cash or by credit card while in the case of electronic commerce, payment is made by debit / credit cybercash, electronic wallet, smart card sites or micro-payments systems and NetBill, or MiliCent CyberCoin.

4. Conclusions

In conclusion, all these elements of comparative analysis reveals that the Internet, information technology is revolutionizing the business, redefining the system of organization and operation of businesses, requiring a new way to enter into relationship with suppliers and customers.

In this context, electronic commerce should be a combination of online interaction and the interaction between buyer and seller to trade classic. Both are required for a commercial enterprise to be successful.

Assessments Regarding the Economic Development from Ecological Perspective

Borza Mioara
Mardiros Daniela-Neonila,
University „Alexandru Ioan Cuza” of Iasi
mioara@uaic.ro
mardirosdaniela@yahoo.com

Abstract

The modern Eco-Economy concept makes reference to a new type of economy, which will develop without damaging the environment that is support of economic development. The financial crisis is a today reality facing almost all world countries and is seeking solutions to overcome.

The aim of this paper is to identify and analyze some ways which can get out of financial crisis, by reorienting the economic development to a new type of economy. This approach is based on studies that claim the world economy must to be reinvented and the financial crisis is a best opportunity to ensure a sustainable development.

One of the most appropriate solutions is orientation towards green business. In terms of the Dow Jones Sustainability Index, in the current financial crisis, the green enterprises registered better results. Another solution is forthcoming in the fiscal economic reform, which will guide the market economy to environmental objectives.

In new eco-economic culture, the growth and development have different meanings, allowing the zero growth theory reconsideration, which can provide practical solutions for getting out of financial crisis.

Keywords: eco-economy, economic development, financial crisis, zero growth theory

JEL Classification: G01, Q01, Q56

1. Introduction

A reality that interests all world economies is that the actual world economy is in a strong reorientation process, in terms of decisions for future directions and development perspectives.

The main reasons leading to this orientation are: the economic crisis which covered almost all world states and strong environmental damage from the planet. Although the emergence and manifestation of environmental problems have been observed since the '80, their effects are felt today in many directions such as depletion and alteration of vital resources to ensure economic development, affecting human health, climate change, pollution excessive etc.

Since the early '90, the world-renowned experts have raised an issue, apparently purely theoretical, aimed to find the effective solutions to the global problems of mankind: the greening of the economy.

Today, it is creating the idea that it represents a removal from the states of the world crisis, especially those in developing countries. The systemic approach of environment and economy permit to identify a strong interdependence relationship between the both, impossible to be redirected towards independence.

By economical specific literature, we know that from all times, the economy represents a subsystem of environment. In the circle of this process operation, all inputs into economy come from the environment and, finally, all of wastes produced it is return to the environment. In February 2009, the head of the European Central Bank said „we live in non-linear

times: the classic economic models and theories cannot be applied, and future development cannot be foreseen” [8].

2. The relevance of eco-economy concept in the current economy

Our economic today world is based on immediate and permanent development requirements, in the context of emergence of new and modern economic concepts, such as of environmental economy that should impose the combination of economic lines development, with issues related to ensuring the sustainability. The concept of eco-economics, modern and very topical, shows that the eco-economy or ecological economics is refers to a new kind of economy that will be able to develop without harming the environment which is, essentially, the support of economic development. [3].

The economic development in accordance with the requirements of environmental protection has become a necessity which disseminate gradually to the level of countries and regions, becoming a topical issue for entrepreneurial sphere, too. Approach, in organic manner, of economic development needs, is directly connected to ensuring the sustainable development based on ecological economics support. A chaotic economic development, in a rhythm which is not well connected with the rhythm of ecological reconstruction, will lead to a progressive decline of the future generations.

Restructuring the global economy will require that ecologists and economists work together with aim to identify the directions that must be followed to ensure the sustainable world development. Building an eco-economy is the biggest investment opportunity in history. The companies that have a new economic vision and include the environmental issues in activities planning will be successful [3].

In our opinion is useful to give more attention to a new sphere of inters regarding the possibilities to start and develop some business which are friendly with environment. To determine the perspectives of a green economy

sustaining, we believe that very important is the identification of units for quantifying its performance. So, the overall sustainability benchmarks for measuring the statistics are the status of sustainability parameters. The most important agencies from world provide all necessary time for sustainability governance. They are just one form of data used for sustainability accounting and are valuable for assessing trends and measuring progress.

Table 1 Variables for EPI 2008

Objective	Policy categories	Indicators
Environmental health	<i>Environmental Burden of Disease</i>	Environmental Burden of Disease
	<i>Water</i> (effects on humans)	Adequate Sanitation
		Drinking Water
	<i>Air Pollution</i> (effects on humans)	Indoor Air Pollution
		Urban Particulates
		Local Ozone
Ecosystem vitality	<i>Air Pollution</i> (effects on ecosystems)	Regional Ozone
		Sulfur Dioxide Emissions
	<i>Water</i>	Water Quality Index
		Water Stress
	<i>Biodiversity and Habitat</i>	Conservation Risk Index
		Effective Conservation
		Critical Habitat Protection
		Marine Protected Areas
	<i>Productive Natural Resources</i>	
	Forestry	Growing Stock
		Fisheries
	Agriculture	Trawling Intensity
		Irrigation Stress
		Agricultural Subsidies
		Intensive Cropland
Burnt Land Area		
Pesticide Regulation		
Emissions per electricity generated		
Industrial carbon intensity		

Source: EPI - Environmental Performance Index; <http://epi.yale.edu/> [2008]

On 23 January 2008, Yale University and Columbia University released the 2008

Environmental Performance Index at the World Economic Forum ranking 149 countries. The environmental experts from both universities concluded that “analysis of the drivers underlying the 2008 rankings suggests that wealth is a major determinant of environmental success”. On top of 50 countries, the first 10 are: Switzerland, (95.5), Austria (89.4), Norway (93.1), New Zealand (88.9), Sweden (93.1), Latvia (88.8), Finland (91.4), Colombia (88.3), Costa Rica (90.5), France (87.8).

3. The need to *greening* the actual economy

The world population is using all natural resources faster than they can be regenerated and producing wastes faster than they can be assimilated. Nowadays, the result is the degradation of natural capital and a really ecological crisis characterized by: climate changes, biodiversity loss, deforestation and a lot of other global environmental problems.

Another problem that is a result of bad connection between the environmental protection and the current growth and development level is reflected into ecological footprint. Today the averages of ecological footprint are 2.7 ha./person, with 30% higher than the available bio- capacity of planet (2.1 ha./person).

The debates on environmental issues were connected, as a turning point, with economic reconstruction, and their synthesis has resulted in an essential question: “Can a green business revolution to get us out of recession?”. The unanimous opinions have subscribed to the idea of European Commissioner for the Environment that “economic development in line with ecological principles will underpin many business models, is a priority of many governments” [6]. Recently, in 2009, A. T. Kearney said that, in the context of financial crisis that resulted in great loss of economic and business environment, “green winners are companies focusing on sustainable performance”. The 2007 study realized by management consulting firms on financial and economic results of companies

specialized in business with ecological character, is result that “green businesses” scored higher compared to other categories of firms in the current financial crisis. The synthesis of studies concluded that “companies that focus more on sustainability will exit from the current crisis stronger than ever”. The study authors were analyzed the performance of 99 companies on the list of green companies of Goldman Sachs, in terms of the Dow Jones Sustainability Index. In 16 of the 18 industries, included in the study, focusing on sustainability businesses have performed better than others in the field for periods of 3 to 6 months and are “better protected from erosion value”. The most representative example of the study is given on a packaging company that has started to work towards sustainability 10 years ago. The company has increased production by 76% from 1998 and reduced the emissions of greenhouse gases (-16%), water consumption (-28%) and energy (-3%), according to a report in 2007. In 2007, thanks to these measures, the company has saved 30 million dollars. The study confirmed that more and more companies are endeavoring to reduce the water consumption and emissions and producing goods with less environmental impact. As a recommendation, it is proposed that the companies reviewing the sustainable practices, because a strong sustainability strategy is more effective than measures to improve the corporate image, by green washing type. Since that the economic downturn may cause losses or even bankruptcies among enterprises, but can also open new areas of investment, untapped until now, it is appropriate to examine the possibilities to develop areas of economic development in conditions of crisis, so was not triggered a possible ecological crisis, too.

The food industry, pharmaceutical, organic agriculture, but also the sale of second hand, reconditioned furniture, and waste recovery are just some of the sectors with minimum risk. In exploring of these opportunities we should based on the fact that 75% of the resources that industry needs are not found in the ground, but on

its surface in the waste form. Most suffer the construction and real estate agent brokering and trade with construction materials. The consultancy financial and fiscal services, the advice firms for opening a new business, for ensure the profitability of existing firms, but the psychological consulting practices are another's domain where will exist permanent clients.

The effort to save and manage the environmental resources is a direct benefit for businesses green reorientation, with favorable consequences in direction of reduced consumption of resources. A combined effort of several countries around the world is being felt globally as a benefit for environment. The examples are outlined in reducing of energy consumption, water, wood, etc.

4. The specific situation in Romania

Our country is one with extremely high potential of going about business opportunities in ecological area. Moreover, the economic crisis is felt strongly at level of more enterprises, an immediate consequence of that being the increasing number of unemployed. Thus, we identify some opportunities that may help initiate sustainable business:

- dismissal due to financial crisis determines the "new" unemployed to focus on directions of activity with stable horizon;

- moreover, in Romania the level of waste recycling is one located right in stage debut, so the niche such business is extremely permissive orientation;

- there are several sectors that have not been so strongly affected by financial crisis and not enough exploited before the onset. One this is the ecological products that represent an untapped sector and which finds its adherents, even in times more difficult;

- food industry is a sector very inflexible when it comes to modification of market conditions and in times of crisis, the consumers will give up long-use goods or the luxury goods, that ensure their expensive needs and not necessarily vital,

but will not drop so much the demand for food;

- restaurants, catering services and retail sectors will remain in Romanian the sectors that will be successful in periods of instability, too.

Of opportunities and chances to reorientation to green business, previously listed, we consider that the organic production sector presents the greatest potential of the current period characterized by the negative effects of financial crisis. Developing the ecological products could be the competitive advantage of Romania's economy, because exist a high potential. For now, the ecological products consumption remains at low level in Romania, compared with other member states of the European Union. The flexible business, that is easily adapted to the market specific, is those which resist in difficult periods.

5. Conclusion

The solution to the actual economic and ecologic crisis is for wealthy countries to change their goal from growth to stability and to begin the transition towards a steady state economy. A steady state economy is an economy where population and per capita consumption remain roughly constant over time, at a level that the environment can support.

One dimension of the way ahead that is being pushed strongly is the rapidly developing concept of the green economy, defined as an economic system that preserves and restores ecosystems, the backbones of economic and social well-being and essential for poverty reduction, while simultaneously creating new industries and employment. Environmental industries using clean and efficient technologies, and sustainable agriculture, serve as major engines of wealth and job creation and poverty reduction. The priorities in green economic sectors are: efficiency technologies, renewable energy technologies, biodiversity-based businesses (agriculture, forestry, marine, nature-based tourism), ecological infrastructure (nature reserves, protected areas, watersheds),

chemicals and waste management (waste reduction, recycling and reuse), low carbon cities, buildings and transport. [10]

The economic collapse has underlined the need for a systems approach integrating all the issues. Science and technology have united the world in information flow, finance, trade, migration and environmental impact. Each part affects the others, so they must be understood together in all their complexity. The Global Agenda Council on Climate Change called for an unprecedented multi-stakeholder collaboration to link the climate and economic agendas, and highlighted the diplomatic opportunity represented by “the shared desire to deliver climate security, energy, food and water security, economic security, equity between rich and poor through enhanced capital and technology flows, all through the creation of a package that promotes economic growth by decarbonising the world economy”[9]. Global action requires global public support, which will only come if the solutions are seen as equitable.

This means simultaneously addressing the issues of poverty, as defined, for instance, in the Millennium Development Goals. As long as there are such extreme differences between and within countries in wealth and level of development, it is necessary to apply the approach of common but differentiated responsibilities, with each country adopting its own implementation strategy within the larger framework. However all must respond to the required fundamental transformation in the dominant economic paradigm and its consumer lifestyles. How to organize the transition, and cushion its negative impacts, is a major challenge, in which diplomacy must play an important role. In addressing climate change, for example, the adoption of deep emission cuts in the north, or the principle of equal per capita emission

rights, will produce significant transfers of investments from north to south.

The combined crises have shown the importance of a sound ethical foundation for human society, including justice for all planetary inhabitants, equitable solutions, trust and confidence in the mechanisms, moderation in material development, an altruistic cooperative economy, effective wealth redistribution, and adequate employment creation. Agreement on these will greatly facilitate the negotiation of solutions at other levels.

Efficiency of Capital Investments in the Context of Time Factor

Botezatu Mihai

Academy of Economic Studies, Bucharest

mihaibo2006@yahoo.com

Abstract

The correct evaluation of the economic efficiency of a capital investment is a purpose any investor must accomplish, if he wishes to make a correct and efficient investment decision.

In such a context, it results that, beside the investment efforts and effects, there must also be considered another factor: TIME.

Any calculation of the economic efficiency, generally, of the capital investment, particularly, which takes place beyond the reminded influence cannot lead to a correct investment decision.

The influence of time in calculating the evaluation of the efficiency of a capital investment may confirm, but also may infirm the decision which could have been made only based on the static calculations, except for the reminded influence.

Below, we shall present a few more relevant aspects of the implications of time in the calculation of the economic efficiency of the capital investment, which, eventually, would lead to making an efficient investment decision, with full knowledge of the facts.

Key words: economic efficiency, time calculation, investment decision

JEL classification: O16

1. Introduction

The economic efficiency, generally, the capital investment efficiency, particularly, is one of the most complex economic categories. Due to its complex character, this one cannot be measured using only one indicator.

In other words, in order to evaluate the efficiency of a capital investment, using an indicator, such as the yearly profit, the production capacity or the effort of invested

capital, cannot create a relevant image, in order to make a correct investment decision.

A big yearly profit would seem, at first sight, to show a convenient efficiency of the respective investment; in reality, though, the respective profit must be correlated with the effort of invested capital which, if very big, could not justify the reminded profit.

In such a context, we might consider that, in order to evaluate more exactly the economic efficiency of the capital investment, it is not enough to use only one indicator; in other words, in order to measure the efficiency relevantly, we must use a system of indicators.

On their turn, the indicators from the reminded system must be chosen in such a manner so that to be suggestive, relevant and to characterize loyally the respective efficiency.

In such a conception, each indicator of the reminded system would characterize one side or another side of the respective efficiency, so that, finally, after analyzing the whole system of indicators, an investment decision might be made, with full knowledge of the facts.[10,5]

On the other side, a series of static indicators of efficiency of the capital investment, though they have a certain degree of relevance, their calculation is not enough to be able to pronounce firmly and competently on a capital investment, from the point of view of its efficiency.

In order to have a more loyal image of the respective efficiency, it is necessary for the static indicators, respectively: period of recovery of the capital investment, the economic output of the respective investment, the total profit etc., should be calculated in their updated, dynamic form.

This dynamic calculation mentioned above is intended to emphasize, beside the investment efforts and effects, the influence of time factor.

This paper is trying to present briefly, in this small space, and to emphasize on few of the more important effects of the time factor on the economic efficiency of the capital investments.

2. Capital Investment and Its Main Stages

Any capital investment, since its birth and until it is closed down, goes along several stages and moments.

These stages, which involve in fact the time factor, should be known by any investor and taken into account when evaluating the economic efficiency of the respective capital investment.[2,5]

Therefore, a first moment from the life of an investment is the one of making the investment decision.

Obviously, such a moment has behind it a series of calculations and studies, in order to fundament the respective efficiency, subsequent to which, the investor, respectively the capital owner, would make the respective decision.

Once the investment decision is made, the next more important moment from the live of an investment is the moment of beginning the investment works, followed by another more important moment, the one of commissioning the respective investment.

Between these two moments mentioned above, the moment of beginning the execution of the investment works and the one of commissioning the objective, the stage, respectively the period of achieving the respective investment lies.

Once commissioned, the respective investment passes through another important moment, on the scale of time, the moment of returning the credits for investments, and, at the end of the period of functioning of the respective investment, we shall meet another moment, the one of closing down the achieved investment objective.

Below, we shall try to mark, briefly, on the scheme of the investment process, the

reminded moments [7,8]:

Figure 1. Scheme of the investment process

On this scheme, we may read the main moments and stages, as follows:

g = moment of making the investment decision

s = moment of beginning the investment works

t = moment of commissioning the investment objective

d = period of achieving the investment

T = period of recovery of the investment

u = moment of beginning the return of the credits for investment

v = moment of closing down the investment objective

CA = yearly turnover

C = yearly production cost

On the above scheme, both the turnover and the yearly production cost are considered constant in time, in form of an average.

On the same scheme of the investment process, we may deduct easily a series of criteria of economic efficiency in the context of time factor, which any investor should take into account.

Therefore, once the decision of making an investment is made and once the moment of starting it is fixed, what interests specifically is that, in certain given conditions, the period of achieving the investment should be the shortest possible[9, 4].

The calculations of economic efficiency reflect this thing on several plans, however the “average value of the capital immobilization” and the “effect of invested capital immobilization” as indicators of economic efficiency are suggestive in this

regard.[1]

The two indicators mentioned above are calculated as follows:

- YEARLY AVERAGE VALUE OF THE INVESTED CAPITAL

$$M = \frac{\sum_{h=1}^d I_h (d-h+1)}{d}$$

Where:

M = yearly average value of the invested capital

I_h = investment in the year "h"

d = period of achieving the investment

- EFFECT OF INVESTED CAPITAL IMMOBILIZATION

$$I_t = aMd$$

Where:

I_t = effect of invested capital immobilization

M = yearly average value of the invested capital

d = period of achieving the investment

These two indicators presented above, in a form or another, by their manner of calculation, take into account the implications of time factor.

It is obvious that both the average value of the capital immobilization and the effect of invested capital immobilization, in case of some concrete calculations will reflect a situation as favorable as their level will be smaller and the other way round.

That is why, when we analyze two or more capital investments, when we reach at the calculation of these indicators, we shall prefer the investment variant where the level of the respective indicators is the smaller.

On the other side, another significant indicator in the calculations of economic efficiency of the capital investments is the recovery term of a capital investment.

In the first value, the respective indicator is calculated by reporting the invested capital at the yearly profit earned.

$$T = \frac{KI}{P_{Rh}}$$

Where:

T = period of recovery of the invested capital

KI = invested capital

P_{Rh} = yearly profit

The result of the respective equation above expresses the number of years during which the capital investment is recovered.

In reality, things are different, as we shall try to present in the next chapter.

3. Implications of Time on Some Indicators of Economic Efficiency of the Capital Investments

As mentioned above, the calculations of evaluating the economic efficiency of the capital investments is based on an adequate system of indicators.[4]

On their turn, these indicators of evaluating the economic efficiency of the capital investments have as basis, in a way or another, correlations of the investment effects and efforts.

On the other side, to take into account only the investment effects and efforts in evaluating the economic efficiency of the capital investments, without taking into account the implications of time in this process will not create a loyal and real image of the respective economic efficiency which stands at the basis of a correct investment decision.

Therefore, the basic idea which is emphasized is related to the fact that no calculation of evaluating the economic efficiency of the capital investments must be made without considering the influence of time.

Below we shall try and focus on some aspects regarding the reasoning enounced before.

For example, let's consider that the achievement of a manufacturing capacity in the industry of construction materials presents the following characteristics:

- value of the investment = 700 mil. RON
 - yearly profit = 175 mil. RON
 - period of achieving = 4 years
- The investment expenses will be distributed per achievement period.

Table 1

	Mil. RON				
Years	1 st	2 nd	3 rd	4 th	Total
Values invested	100	150	200	250	700
← d=4 years →					

In the context of the above data, it is necessary to calculate the period of recovery of the respective capital investment.

In order to answer at this question we shall first use the static calculation relation of the respective indicator:

$$T = \frac{KI}{P_{Rh}} = \frac{700}{175} = 4 \text{ years}$$

Therefore, the static calculation of the recovery period of this investment is of 4 years.

This figure was calculated as mentioned in the above relation, without taking into account the implications of the time on the respective indicator.

A first question which is brought into discussion in this context is related to the fact that a correct calculation of the economic efficiency cannot take into account the influence of time next to the investment efforts and effects, as shown above.

Referring at the above example, the calculation of the recovery term of the respective capital investment must take into account the effect of the capital immobilization during the period of achieving the respective investment.

In other words, during the 4 year-period, which is the period of achieving the investment, the respective capital would have produced a certain interest in a bank deposit (for example, 10% per annum).

This does not happen in our case, because the immobilized capital does not produce anything during 4 years.

In these conditions, a correct calculation of the economic efficiency must start from the increase of the investment effort with this

reminded effect of capital immobilization, which should be recovered.

In our case, based on the reminded relations:

$$M = \frac{\sum_{h=1}^d I_h (d-h+1)}{d} = \frac{3950}{4} = 987.5 \text{ mil. RON}$$

And:

$$I_t = aMd = 0.10 \times 987.5 \times 4 = 395 \text{ mil. RON}$$

In these conditions, the capital to be recovered from the profit is not of 700 mil. RON, but of $700 + 395 = 1095$ mil. RON

The period of recovery of the invested capital in the new situation will be:

$$T = \frac{KI + I_t}{P_{Rh}} = \frac{1095}{175} = 6.2 \text{ years}$$

Therefore, the initial period of recovery of the capital investment is of 4 years, and in the new conditions, the level of the indicator shows a 6.2 year-period, which is different.

This was only an effect that I wanted to mention about the influence of time on some indicators of economic efficiency of the capital investments.

At the same time, because we refer at this indicator, the period of recovery of the capital investment, we must mention that it has two calculation form, respectively a static calculation form (the one mentioned previously) and a dynamic, updated form, of the same indicator.

In the second calculation form, the influence of time is also taken into account, by updating the investment efforts and effects at a certain moment.

If, [1,3] on the scheme of the investment process, we choose "s" moment as updating moment, being the moment of recovery of the investment works, the dynamic (updated) recovery period will result from the following relation:

$$\sum_{h=1}^d \frac{I_h}{(1+a)^h} = P_{Rh} \frac{(1+a)^{T'} - 1}{a(1+a)^{d+T'}}$$

The respective relation starts from the equality which should exist between the investment efforts and effects (profit) at the "T'" moment, which is in fact the updated

recovery term.

In this above equation, all the elements are known, less T' , which will lead to solving finally an exponential equation, having the unknown T' .

But, let's presume that, for achieving a production capacity in the electronic industry, we know the following data for two investment variants:

Table 2

Indicators	U/M	V1	V2
Value of the investment	Mil.	2000	3000
Period of achieving	Years	2	3
Distributing the investments per years of the achievement period			
1 st year	Mil.	1000	1000
2 nd year	Mil.	1000	1000
3 rd year	Mil.	-	1000
Yearly profit	Mil.	400	625

It is necessary to determine the most efficient variant of investments from the point of view of the period of recovery of the capital investments.

- a) static calculation of the recovery period of the capital investment

$$V_1 \rightarrow T_1 = \frac{KI_1}{P_{Rh1}} = \frac{2000}{400} = 5 \text{ years}$$

$$V_2 \rightarrow T_2 = \frac{KI_2}{P_{Rh2}} = \frac{3000}{625} = 4.8 \text{ years}$$

We see that the second investment variant is better, even if the difference is small.

- b) dynamic (updated) calculation of the recovery period of the capital investment

For this calculation, we shall use the updating relation mentioned above, for an updating coefficient of 0.15, the other data being taken from the Table 2.

$$V_1 \rightarrow \frac{1000}{1+0.15} + \frac{1000}{(1+0.15)^2} = 400 \cdot \frac{(1+0.15)^{T_1'} - 1}{0.15(1+0.15)^{d+T_1'}}$$

Solving this equation, it results $T_1' = 12.1$ years

$$V_2 \rightarrow \frac{1000}{1+0.15} + \frac{1000}{(1+0.15)^2} + \frac{1000}{(1+0.15)^3} = 625 \cdot \frac{(1+0.15)^{T_2'} - 1}{0.15(1+0.15)^{d+T_2'}}$$

Solving this equation, it results $T_2' = 13.2$ years.

Synthesizing the static and dynamic results of the recovery term for those two variants, the situation is the following:

Table 3

Indicators	U/M	V ₁	V ₂
Static recovery term	Years	5	4.8
Dynamic (updated) recovery term	Years	12.5	13.2

Therefore, we may see that, from the point of view of the static recovery term, we would have preferred the second variant, but the first dynamic, updated variant is more convenient.

Obviously that in the situation of such results, the priority in making the decision belongs to the dynamic calculations.
