Almost any organization can extemporaneously plan, schedule, and monitor a complex project – even though that project may comprise numerous tasks for which little or no experience has been accumulated – so long as budget overruns are of no concern. If the budget is of concern, however, it is important to use project management techniques to streamline this difficult process. The two most popular tools of project management – the critical path method (C.P.M.) and the program review technique (P.E.R.T.) – are, essentially, identical in concept.

The Importance of Quality Information In Continuing Education Throughout Life

Mitu Cristina-Dana
Ovidius University
Modern languages department
Univesitatii Street, Constanta
Romania
mitu.cristina_dana@yahoo.com

Abstract

In this paper we present important aspects of quality information in the continuing education and training or professional reconversion in today's economic and social environment affected by global economic crisis. Here we have integrated current results on the characteristics of the activity of institutions with responsibilities in continuing training which we have filtered through personal experience in the area of education.

Key words: information, quality, continuing education, economic and social environment

JEL classification: M19

1. Introduction

Approaching economic development issues we always consider the local, regional, national aspect of it. Characteristics exist for each level regarding the nature of information, its quality, its present interest and usefulness in the field of study and of the decision act that we prepare. For a better response to existing conditions in the economic, social or political environment we have to refer to standardized information existing at that time.

Using standard indicators, according to EU methodology was particularly necessary for Romania. This not only involves a transfer or automatic translation of EU indicators, but an experimental effort, change and training.

This involved an action in two directions:

- identification system of indicators used in EU countries and their comparability analysis of existing indicators in the national system

- harmonization of evaluation indicators in accordance with EU methodology

For this purpose has been made a National System of Education Ratios. For example, this is a tool for all those involved in the design, implementation and evaluation of educational policies. It is compatible with international systems of indicators, mainly the European Statistical System built by Eurostat (Statistical Office of European Communities), in which Romania participates through the National Statistics Institute.

2. Useful indicators

Indicators are numeric expressions which are characterized by social and economic phenomena (such as structure, growth, etc.). Indicators are built on quantitative data or qualitative information. This information is based on statistical data, but also on qualitative information, such as those referring to attitudes, features or behaviors.

The use of indicators is favored by these circumstances:

- need for public liability, based on specific criteria for measuring progress;
- need for comparability, using common references in the context of globalization and regional integration;
- interest in decentralization and quality assurance, which has as a consequence the use of precise criteria for assessing and reference to common indicators;
- education approach in an integrated vision, which considers education with vocational training and social cohesion;
- including lifelong learning as a basic principle of educational policy.

Indicators are not significant in itself, detached from context and used as mere

statistical benchmarks. Definition and use of indicators is only part of a cycle that includes these sequences: primary data collection; construction of the indicators; indicators reporting on various criteria analysis; evaluation of educational policies in relation to such criteria; decision taking.

There are some important functions of the indicators, among which we mention: distance measurement against objectives; identification of problematic situations or of those unacceptable; argument concerns and options underlying educational policies.

3. The importance of professional training in human resources development

“Competitiveness of an economy depends on the wisdom of its decisions, the ability to make decisions necessary to reform and skills to follow the tasks they involve this kind of investment”. With a remarkable premonition, author Edgar Faure stressed that the international competitiveness next 20 years will depend largely on investment in youth and lifelong vocational training.

Under the current circumstances of globalization of economies, of the new knowledge society, education and training throughout life become a vector of sustainable economic development of the global balance, of creating a zone of concentration of economic and social performance with a set of economic values, cultural, ethical and appropriate human models of various cultural patterns, of the need to preserve national identity.

The skills acquired through training, workplace training, training courses, distance learning either formal public and private institutions, or in non-formal and informal, all have positive effects on economic and social development of society, and the human personality.

Effective training system depends on several factors:

- Balance between the different sources of financing (domestic and foreign sources, public and private sources, funds coming from some international financial bodies like the World Bank, IBRD, EU;
- Increased demands in terms of continuous training;

- Accelerated speed of change, improvement and perfection of human capital stock;

- Emphasized processes of demographic aging assets. Changes in coming decades will be significant and particularly in countries with rapid aging population. This causes pressure on opening the range of free movement of labor on a reformat and large labor market.

Advantages of investment in human resource in modern society we look at it as a great opportunity for individual, family, enterprise and society; the assess of the education's effect and training can be explained by its two coordinates:

- Quantitative aspect of education and training gained in years of study on different levels of training (measured by education or stock in the form of indicators that reflect the level achieved in the implementation of educational policies and strategies);

- Qualitative aspect (measured by internationally comparable scores).

The improvement of the education and training act is very closely interlinked with the value and quality of the information used. To do this, we consider all sources of information with local, regional, national or international nature to exploit existing experience in this area.

It is necessary to use a partner the civil society by non-governmental organizations with activities in our study where from the institutional point of view the information is not complete or relevant. Mostly, the effects of such activities are centralized in the county, regional or national statistics.

Research activities in the field of statistics shall be undertaken to ensure collection, processing, analysis, dissemination and official statistical data sets up the necessary evaluation of education policies, informing public opinion development of scientific surveys, forecasts and development strategies, transmission of statistics to international bodies and for other internal and external users. The main objective in statistical research in Romania is to build systems of indicators harmonized indicators at European level and internationally through the use of research methods to ensure comparability of data on European and international level. Harmonization of statistical system in Romania with the

European statistical system is achieved by putting together the concepts, definitions and classifications used in statistical research methods of data collection and application of common law rules for data transmission to European and international official bodies.

Research methods used in all fields of statistics can be exhaustive statistical research methods (censuses, statistical reports) and statistical survey methods (sample surveys). These methods are the statistical data which, together with administrative data sources, provides the necessary statistical information for constructing indicator systems in all fields of statistics.

4. Statistical research methods used in continuing training and education

To ensure data and information required all users of statistical data, National Institute of Statistics draws up annual programs of national statistical research on development regions, counties and other regional structures. Statistical research in education is achieved annual or other periodicity depending on information needs, the nature of indicators and possibilities for organizing and conducting; periodicities are correlated as much as possible with European and international statistical practice. Official statistical services are authorized to request and obtain free information and statistical information from natural or legal person whatever the form of ownership of the institutions of central or local public administration, NGOs and other organizations. The research of social phenomena and processes is performed by these types of statistical research: exhaustive statistical research, statistical sample surveys (other surveys).

For expanding the volume of data required and reducing the application of statistical subjects, National Institute of Statistics has access to financial data that Finance Ministry holds regarding public institutions with the principle of confidentiality of data and statistical information.

These data sources are part of the administrative sources, representing collections of data at the aggregate level of public institutions for training needs. Administrative sources are used mainly to complete the statistical information system with additional data, to verify the estimates

obtained based on statistical sample surveys (sample survey).

In general, administrative data are recorded in tabular form and disseminated directly to National Institute of Statistics.

The advantages lie in the following:

- Supply is made without charge by administrative agencies responsible for their collection;
- There is no additional charge response of individuals or units to which they relate;
- Modern technology allows National Institute of Statistics to quickly access and process large sets of administrative data.

The disadvantages lie in the following:

- Data are collected for administrative purposes rather than for statistical purposes;
- Potential users of administrative data statistics are not considered unimportant when the administrative program is organized so that the National Institute of Statistics has limited control or no control over coverage, content, accuracy or timing.

Currently, the demand for data is growing, there are serious budget constraints and concerns regarding response rates and the burden is on the rise, so the use of data represents an attractive alternative and / or complementary to direct data collection. National Institute of Statistics' policy is to use administrative data when it presents an alternative that involves lower costs or supplement to direct data collection.

The use of an administrative data sources should follow a process of assessment data regarding coverage, content, concepts and definitions, frequency, punctuality, quality assurance procedures, as well as the establish of administrative program in time and the costs involved in obtaining and processing data. Using administrative data may give rise to privacy concerns and, usually, they are carefully controlled. Also, combining data from an administrative source with those from another source is not easy in the absence of a common identification system covering both sources. Necessary in such cases are interconnections of registers. When using data from administrative sources, the first explores:

- Administrative context in which the organization has created the administrative program (eg. legislation, objectives, needs, coverage, content concepts, definitions, frequency, punctuality, quality and setting time);

- There may be administrative data and surveys as non-responses or partial responses;

- Continuous and periodic assessment of quality of data received from administrative sources, especially because the National Institute of Statistics does not control the data collection process.

Statistical sources are the research methods used in education statistics and can be *specialized* or *unspecialized*.

Unspecialized statistical data used in statistical education are:

- Demographic statistics (data are obtained based on birth certificates, death certificates, marriage certificates or from registers of civil status offices);

- Censuses;

- Surveys that include modules or specific questions specific to education, on education level of population (Adult Education Survey).

Quality of statistical data sources provided by non-specialized statistical sources do not reach the quality of data supplied by other data sources in education, but their advantage is that they can make correlations between education and other indicators of socio-economic field (economic activity, employment status, occupation, income), correlations that may explain better the education level of respondents. This investigation, as well as many others, are performed by the National Institute of

Statistics and have become an important tool in evaluating important tool in evaluating the quality of life in general and the level of education, especially.

Specialized statistical sources are classified into two categories:

- Statistical sample data sources (investigation of education through the interview);

- Comprehensive specialized statistical data (statistical reports).

One of the specialized statistical research that provides a wide range of information about the population's education level is Adult Education Survey (AES).

Tendencies for development in Tourist Air Transport Services in Romania in order to meet modern customers' demands

Andreea Moraru

Ovidius University of Constanta, Faculty of Economic Sciences

amoraru@univ-ovidius.ro

Mariana Juganaru

Ovidius University of Constanta, Faculty of Economic Sciences

mjuganaru@univ-ovidius.ro

Abstract

At the moment, tourist transport is a complex phenomenon, and choosing one or another of the transport forms is subject to the influence of a series of factors regarding consumer behavior. Among different forms of transportation air transport has distinct and obvious advantages – short duration of transport for long distances, relative safety, comfort and prestige, high quality services on board and at terminal level, incentives, and accessibility to relatively isolated areas. As disadvantages one may mention the high costs, the mandatory early arrival at airport, at least two hours in advance, the necessity to travel to airports which are usually outside cities, its dependence on meteorological conditions and threat of terrorism. At world level it accounts for 47% of international traffic, while at European Union level it represents 25%. As far as Romania is concerned air transport accounts for only 17-19%, below the European average both for foreign tourists arrival in Romania and for Romanian tourists travels abroad, but a growth tendency during the past few years is obvious.

Keywords: travel, air transport services, tourism, competition, progress.

JEL classification: L89

1. Introduction

At the moment, tourist transport is a complex phenomenon, and choosing one or another of the transport forms is subject to the influence of a series of factors regarding consumer behavior. To general variables that concern the characteristics of the journey – distance, duration of transport and holiday, comfort, accessibility, safety, price others may be added – the arrival and departure schedule, possible bonuses, facilities concerning infrastructure, status, prestige, possibility to savor the trip, and even to turn it into an attraction per se, destination and origin geographic position.

These variables lead to strong competition among different forms of transport. But, at the same time, due to the unprecedented development of tourism, the experience modern tourists have, their needs and desires in permanent transformation, a tendency to associate two or more modes of transport in the same tourism package is present.

Bearing in mind these variables one may accomplish a competitive analysis of the transport modes both at world level and particularly for Romania.

Among different forms of transportation air transport has distinct and obvious advantages – short duration of transport for long distances, relative safety, comfort and prestige, high quality services on board and at terminal level, incentives, and accessibility to relatively isolated areas.

As disadvantages one may mention the high costs, the mandatory early arrival at airport, at least two hours in advance, the necessity to travel to airports which are usually outside cities, its dependence on

meteorological conditions and threat of terrorism.

At world level it accounts for 47% of international traffic, while at European Union level it represents 25%.

As far as Romania is concerned air transport accounts for only 17-19%, below the European average both for foreign tourists arrival in Romania and for Romanian tourists travels abroad. This situation may be explained by several hypotheses – high costs; an important part of tourism traffic is done with neighboring countries road transport being preferred in this case, and the preponderant use of only one major international airport, in Bucharest.

But an ascendant tendency during the past few years is obvious (table 1).

Table 1 Foreign visitors arrivals in Romania (thousands and %)

Foreign visitors arrivals		
	Total	Air
2004	6600	705
%	100	10.68
2005	5839	919
%	100	15.73
2006	6037	1122
%	100	18.58
2007	7722	1460
%	100	18.90
2008	8862	1462

2. Development and perspectives

Air transport services have known the most dynamic evolution compared to other transport forms used in tourism, ranking first at world level.

It is preferred for long distance travel (between 1000 and 4000 km) and used almost exclusively for distances above 4000 km. It is also preferred or even used exclusively in geographically isolated areas.

The development of air transport is closely linked to the evolution of tourism as a phenomenon and it has lead to the discovery and development of new destinations and the unprecedented dimension of tourism industry.

The technological progress, the innovations in air industry, and the development of specific infrastructure have lead to a rapid development of air transport, placing it on top of tourists' preferences. The growing demand for air transport services has made possible the decrease of tariffs and offered premises for stimulation of regular flights growth.

The deregulation of air transport has lead to competitiveness growth in air transport companies and allowed relatively low tariffs, together with new routes introduction. The related infrastructure also developed at high rate in order to respond to a growing demand for air transport.

Although air transport has obvious advantages - rapidity, comfort, safety, there is also a series of disadvantages that influence the development of the sector: its dependence on natural conditions, relatively high costs, fixed schedule, and terrorism.

The air transport services usually make up three categories:

- Regular services
- Charters
- Air taxi. [2]

In Romania the situation of air transport does not follow the international rule, only below 20% of foreigners visiting Romania use air transport and even less Romanians that travel abroad use it. But the statistic data show a growth tendency both for arrivals and especially for departures, registering a growth of 250% in 2008 compared to 2004.

At internal level, air transport connects Bucharest to major urban centers in the country, but for domestic tourism purposes the other forms of transport are preferred.

The growing competition in air transport market has determined the companies to adopt consumer orientated strategies, meant to raise the quality of services. Air companies in order to maximize profits diversified the service classes: from those with the highest level of quality First Class and Business Class to those with few provided services, Economy, Budget, Tourist.

During the past years consumers have become price sensitive, looking for minimum services.

Airlines were therefore forced to reduce operating costs in order to survive competition and at the same time to manage consumer needs by increased complexity and awareness of marketing.

Companies also looked for ways to increase efficiency: yield management, CRS etc.

Yield management allows maximization of income by suggesting maximum prices that may be charged for each place in the plane; yield management was defined as income maximization through competitive price strategies, loss control and demand forecast.[1]

CRS is used for seat and flights program control for efficient distribution and profit maximization and allowed the development of techniques for competitiveness growth such as yield management and frequently flights programs, becoming a competitive advantage.[1]

Competition in air transport market has grown due to the large number of low cost operators in the market, which by the nature of services provided respond to two demands: they meet the needs of less pretentious and price focused consumers and they charge low prices that allowed them to acquire important market share.

Therefore the development and diversification of local air transport services took a turn when low costs companies entered the market. The first low cost company that entered the Romanian market was My Air, in 2001 (in July 2009 its license was suspended). Subsequently Blue Air the first Romanian low cost company entered the market in 2004. Sky Europe (2005, and ended the activity in 2009), Wizz Air (2006, low cost leader in 2009), Wind Jet (2006), GermanWings (2007), Easy Jet (2007), Click Air (2007), OnAir, Alpi Eagles, Baboo (2008) and the largest low cost operator in Europe, Ryanair (2008) followed.

These companies offer plane tickets at reasonable prices for numerous destinations in Europe, turning air transport in an accessible service for those with low income. Their activity prospered in the short period they operated in Romania, recording continuous annual growth; in 2008 they transported 15.7% more passengers than in 2007.[3]

In Romania, during the past years numerous air taxi companies entered the market due to the growing demand for this type of transport services related to the development of business segment, but also in order to satisfy an increasingly sophisticated entertainment demand.

In 2007 NetJets, the largest private plane operator in Europe and Atlantis USA, noticing the opportunities decided to enter the Romanian market.

Technology made possible the unprecedented development of air transport and also tourism at world level and also in Romania.

On one hand the airplanes became safer and faster and were adapted to the needs and requirements of modern passengers.

On the other hand, the frequency of flights raised as did the number of routes and airlines.

Today flights are operated from different airports by a multitude of airlines and one must notice the impact of low cost companies on air transport services. These facilitated the access of low income population to air transport, determined the development of attractive tourist packages and gave impulse to regular flights airlines to revise their offer. Moreover during the past years the air taxi services also developed, at present a large number of such companies operating the market.

The same tendency of development and diversification of tourist services includes combined transportation arrangement such as „Fly and Drive” that involves travel by plane to destination and by car at destination or „Fly and Bed” arrangements that include flights and accommodation.

It is necessary to take measures that allow the development of air traffic on local airports. At the moment most of the air traffic is concentrated on Henri Coanda Airport, followed by Aurel Vlaicu. Although

there are several airports that may serve tourist areas, they do not function at full capacity, such as Mihail Kogălniceanu International Airport in the seaside area with only 80000 passengers transported in 2008.

The development and diversification of air transport services may be accomplished by implementing the following measures:

- development of services at airport level, minimization of waiting time and formalities;
- proper maintenance and renewal of aircrafts;
- serving new air routes and destinations;
- development of local airports especially during tourist seasons;
- development and diversification by marketing mix strategies (quality awareness, simplification of reservation and distribution systems, diversification of price categories, intensive promotion, use of Internet as means for promotion and selling);
- development of hubs in order to facilitate transfers;
- „fly and drive” and „fly and bed” arrangements.

3. Conclusion

The development of air transport is closely linked to the evolution of tourism as a phenomenon and it has led to the discovery and development of new destinations and the unprecedented dimension of tourism industry.

The technological progress, the innovations in air industry, and the development of specific infrastructure have led to a rapid development

of air transport, placing it on top of tourists' preferences. The growing demand for air transport services has made possible the decrease of tariffs and offered premises for stimulation of regular flights growth.

The deregulation of air transport has led to competitiveness growth in air transport companies and allowed relatively low tariffs, together with new routes introduction. The related infrastructure also developed at high rate in order to respond to a growing demand for air transport.

In Romania the situation of air transport does not follow the international rule, only below 20% of foreigners visiting Romania use air transport and even less Romanians that travel abroad use it. But the data for the last few years show a growth tendency both for arrivals and especially for departures. The further growth of the sector may be achieved by development and diversification of air transport services in order to better satisfy the customer needs.

Head Hunting – Innovative Method of Recruiting

Moraru Camelia
Constandache Mihaela
„Dimitrie Cantemir” Christian University
Faculty of Touristic and Commercial Management Constanta
E-mail: cami.moraru@yahoo.com, micky_eve68@yahoo.com

Abstract

Classic recruitment for top management positions began to be replaced by head hunting, which, although requires a greater financial effort from the client, is an investment with quick payback. If at the beginning, this head-hunting, was practiced mostly by big corporations, who knew that the company's success are the employees with valuable experience, smaller firms now seem to resort to this kind of selection of personnel. Method called "head hunting" is more than a process, is the art to highlight existing opportunities and put them in direct relationship to experience, work of some persons concerned, so they may decide in favor of changing job, in most cases to a rival company.

Keywords: employees, recruitment, headhunting, human resources.

JEL classification: M12

1. Introduction

Companies engaged in recruitment offers a variety of services (recruitment, training, consulting) and some specialized exclusively on one particular type of project (activity of executive search companies or head-hunting).

In Romania, firms which offers headhunting services, are at the beginning compared with those in Europe or the United States and struggle to convince potential customers of the benefits of such services [4]. Headhunting market evolution

is not influenced only by the quality of services, but also of human resources trends in Romania.

In recent years, top management positions in foreign companies are occupied by Romanian managers. This trend is due to both increased volume of the foreign investments in Romania and professional skills of local managers.

2. Head-hunting process

More and more companies resort head-hunting services firms. If a traditional recruitment process involves mostly, open job announcement in the press or on a job portal and sometimes networking, followed by receipt of CVs and selecting the best candidate, in the case of head-hunting situation is slightly different [8]. One can say that classic recruitment is a reactive method of employment, meaning that the employer seeks candidates who respond to an ad. Head hunting, on the other hand, is a recruitment method which aims to hunt the best and convinced them to change their work, reserved in most cases, for middle and top management positions. So, head hunting recruitment method can be defined as a proactive approach, because such a method can attract good candidates who are not normally looking for a job.

Head hunting process seems simple at first sight, head-hunter's task is to address to

the person desired by the company and to present the offer, but in reality things are not so simple as they seem and head hunting process can last for long periods, requiring patience and tact [1].

The first step made by a head hunting company in a recruitment process is a very precise understanding of the profile search, then follows the definition of which companies will be searching and contacting people who are considered potential candidates [5]. Until there is no direct discussion with these people can not make an assessment of the closeness of the ideal profile.

Usually, head hunting firms are those who approach the candidates and not vice versa, this is precisely the difference between head hunting and recruitment and selection. As foreign headhunting firms, the Romanian ones resort to all possible means to identify the ideal candidate. Although the own list of contacts (resulting from the research process developed for previous projects) is always the most valuable, they also use the communication paths provided by the customer when he wants a certain candidate.

Head hunters use only one method: that of direct research [3]. Head hunter sets the potential targets and then, with customer approval, begin to address directly the people they consider valuable for that project. The initiative belongs throughout the project to the executive search agency, which often consult with the client organization about intermediate results. There is another version of this activity, which can be said to represent a purely head hunting activity. In this case the client has set the goal of "hunting" in the person of one or two candidates already known. Consultant's role is to arrange relocation of that person successfully to the client company. Person's belief that it is best to leave the company is the hardest part of the whole process.

In the initial phase of the process are chosen 100-150 possible candidates, so for the final stage of selection, on the short list, to remain under 10 people. The latter pass through at least two interviews with head-hunting firm, followed by two or three interviews with employers' representatives, interviews that last between 30-120 minutes, depending on the stage of development and the project purpose.

There are some things that employers are looking at candidates for key positions: confidence, ability to adapt working in an

existing team, experience, market and competitors knowledge. Also, candidates who are on the short list, should be able to understand what the organization wants to engage in the next 3-5 years [2].

Every recruitment is customized and guided by preferences and scope of the client, such a project can be handle by more human resources consultant at the same time. An executive-search process may take, depending on the complexity of positions to be occupied, between 3 weeks and 6-12 months.

Until September 2008, the most dynamic areas were represented by: the financial market, the investment funds, retail market, marketing, industrial area, IT&C market. Banking market has been a „hot” area, because 2008 was considered the best year in banking, in terms of profitability. Most wanted features are the general manager, sales manager, CFO and directors of human resources.

3. Who are the head hunters?

Head-hunting technique involves, in essence, stealing people's best competition [6]. For this there are people specially trained, people who are not in employment office and they are called "head hunters".

A person who is head hunter shall sum a range of qualities esentiale. A head hunter has to be a best seller, to be persuasive, persevering, diplomatic, honest, possess outstanding communication skills, have a great opening to others, experience in the field, minimum 5 years (starting point). Equally important are access to information and market knowlegde [8]. If a head hunter knows what is happening in the market, people who can give information, knows what is "hiding" behind significant business, then positive results are fairly predictable.

Besides communication, a head hunter must strictly respect the principle of confidentiality, without which the placement process can break even after the first meeting between the parties [7]. The principle of confidentiality is essential, because the process involves the recruitment of key positions. Usually, head hunter, disclose the company name only in the final stage of the process, but to compensate, the manager

gives relevant information about the client it serves.

A head hunter has to be productive from the first day that is set to do this job. Generally, large head hunting companies consultants work with seniors consultants, never with juniors in training. Most times, the head hunters are former managers from different areas, which had a strong career and to the final they "retire" to counseling.

In the big companies from abroad, the average age of a head hunter is 40 years. From the first day they move to an executive search firm, a manager can take head hunting mission, as it did before in other competitor's companies. Therefore, investment in a head hunter, is or should be zero.

Head hunters are among the highest paid employees in the economy, their profits rivaling those of executives which they place. Depending on the position that hires, head hunters can get to win 25% -30% of annual gross salary of the applicant [1].

4. Pricing system

Each head hunting agency has established several criteria required on the charging system. They accept assignments for which head hunting firm has exclusivity, and payment is made only if suitable candidate is found and ends with a job. They do not define themselves simply as "service providers", they also try to establish long-term partnerships with client organizations. Therefore, consultants head hunting firms devote significant time to know and understand better organizational culture, the place occupied by leaders in the company's business strategy and all its particular aspects.

Both in Romania and in foreign companies, most head hunting firms choose pricing system in 3 stages: 1/3 at the contract signing, 1/3 the presentation short list, 1/3 after signing the contract of employment. Minimum limit charges head hunting firms in Romania is considered to be 10.000 euro, in Western countries is slightly higher. Prices for top positions, also start from 15.000 euros and can reach up to 100.000 euros [1].

For some time, the executive search market has started a new way of paying head hunter based on success fee. Pricing based on successful means that the recruitment firm receive money from the customer only when the

candidate becomes employee of the client. This pricing method shows a high degree of risk, because the employer, who requested the services of a firm working on success fee, may decide to promote someone from inside, to close the open position or to work with other recruiters.

Any head hunting agency offers clients a warranty of 6 to 12 months. If it is proved that the new employee is not good enough, as thought and is fired, then executive search firm makes a new recruit, without having to be paid [8]. There are situations in which this warranty does not apply. When the split between employee and customer is not related to quality of the head hunter's services, such as failure of the employer promises, reorganizations take place within the company or the employee received a better offer and the customer failed to detain him (it considered to be the sole responsibility of the employer for maintaining and motivating new employee), the executive search agency no longer take any responsibility.

5. Conclusions

In Romania, not all firms have come to understand what multinationals already knew, namely that people particularly employees through a head hunter, are those who make large profits.

Public institutions in the West know the head hunting benefits and do not exclude this method to increase their efficiency. In our country, things are exactly the opposite, the state sector is inaccessible due to restrictive legislation, which requires a competition. Although the method is good, apparently, that is based on the idea of "best win", it can not be applied at any level and especially at the highest level since the really good professionals, do not care to submit to test, examine and evaluate by persons trained weaker than its preparation. It is clear that the mentality and laws must change and adjust to market demands, where the hierarchy of areas of interest change with changes in the economy.

Among the head-hunting's benefits include privacy, security, obtain references, targeted and efficient search. Matter and ideas coming from a consultant about the

sources of recruitment and candidates from other industries, which could have the required skills for the position.

We could say, that the main advantage is the fact that this method is going directly to potential candidates for open positions. Access to difficult resources directly to addressed by the company and guarantee offered by a head-hunting firm for candidates placed, are other advantages. During the warranty period, some head-hunting companies offer coaching sessions for those recruited and access to professional self-assessment tools.

The main drawback that companies associate it with head-hunting is the high cost of this process, but employers who realize the benefits of head hunting, are willing to pulsate considerably when it comes to identifying and hiring the best people.

Head-hunting appearance should make the companies to lift a little the guard, to think to

better motivate employees to remain in their company, to reward them at their true value, to listen not be in the position of losing them.

Abstract

The tourism activity is marked by a strong competition and frequently environmental changes, thus tourism organizations must be permanently preoccupied on the process of innovation and new products creation. In tourism marketing this process can be more risky because, generally, the budgets are higher, the users are heterogeneous, and the market is unstable. The goal of this paper is to show some important aspects concerning the process of the new products' development in tourism.

Keywords: tourism, products, development, customer.

JEL classification: L83

1. Introduction

For many organizations, a better answer on consumers' needs and on environments' evolution, means to concentrate efforts on the direction of new product development.

The process of new products' development is very important for the tourism organizations, because the business innovation is vital for very competitive markets.

If, for the large people, the product means a tangible object that a customer buys, in tourism marketing, the product is an assembly of several elements, that includes:

tangible components, that means the base of tourism attraction (natural, cultural, historical, artistically or other types of tourism resources, generally infrastructure of a country or tourism areas and the tourism equipments, such as accommodations places, restaurants, coffee-shops etc.), intangible elements, that means all tourism services assembly (basic and supplementary), and psychological elements (comfort, animation, environment etc.), communications about product (for example, realized through advertising, force sales, fair and exhibitions etc.) and the image of product, that means what tourists think and believe about the product [1].

Is very important to mention that, from tourism marketing point of view, the process of new products' development can be realized going from a new destination, un new type of entertainment service, a new type or place of accommodation, a new modality of transportation etc.

The generic product is the core idea of a product, but, when buy a product, customers are going from an expected product. In many cases, the suppliers tries to offer a product that is more than customers' expectations, and this is the augmented product [2].

Thus, it is necessary to think of products in all their complexity, when it's talking about the conception, development, and introduction of products.

A new product may look and work exactly like an old product, for example, but have a

completely different set of associated services and be distributed in a different manner [3].

In tourism activity, the new product can be obtained modifying some of its specific characteristics: is an „assembled” product, the result of a strong cooperation between many services suppliers (including another new service can be obtained a new product), includes natural attractions or some evidences of human activities (and that’s why, when tour-operators include another tourism attraction, can obtain a new product), must have some quality characteristics, as to assure tourists’ satisfaction (increasing or decreasing the quality level of tourism resources, infrastructure, personal etc., can obtain another tourism product) etc. [4].

2. New Tourism Product Success Factors

In marketing literature is generally considered that are some important factors which differentiate success at a strategic level, such as the following: linking new product development (NPD) to corporate strategy, directing a clear new product policy which specifies the level of innovativeness sought, the amount of acceptable risk, the amount of synergy with existing operations that is desired, and so on, supportive top management which sets goals and allocates resources, accepts risks and encourage flexibility and a multi disciplinary approach, and finally, an organizational structure which fosters an organic approach [5].

The same author consider, also, that those factors at the task level which differentiate success from failure include: completion of all stages in the NPD process with particular proficiency in technological and marketing activities, attention to customers’ needs throughout the development cycles, eschewing a stage-by-department approach which reinforces functional distinction between phases of development and lengthens the process, inter-functional integration and direct lines of communication between those carrying out the project and top management.

Those aspects are more important in tourism activity, because are involved many actors (tour-operators, tourism services suppliers, local or central authorities, different categories of public), in many cases the tourism resources are public properties, the local customs are various etc, is difficult to take decisions that concerns the new product development.

3. Aspects considering the novelty of a tourism product

The novelty can be perceived under two ways: as new technology or as the complexity of products’ modifications or improvements.

The marketing specialists consider that analyzing the products’ characteristics, the tourists’ needs and the particularities of target market, the novelty of a tourism product can be judged going by three aspects:

- New product for a tourism firm, for example a tour-operator which creates a new product going for new tourism attractions and with the support of different tourism services suppliers
- New-product for a certain market, for example, when a hotel chain inaugurates a new hotel in a new geographic area where this chain was not presented until this event
- Absolute new product, for example the first „Disney Land”

4. The New Product Development Process

The process of new product development involves the several stages, that can be grouped as the following [6], [7], [8]:

- 1) Strategic planning for new products
- 2) Generating, screening and evaluating ideas, based on technical, economical and marketing criteria
- 3) Developing and testing the concept, business analyze
- 4) Commercialization
- 5) Test launch

1) American Professor Philip Kotler considers that new products’ strategy has four important goals [2]:

- Concentrate the efforts on team level
- Integrates the functional efforts
- Delegates team members’ competences
- Fundaments initiative and not reactive management

Managers must coordinate the initiatives concerning the innovation opportunities

(product, market, technology), realistic goals and appropriate tactics referring to product's nature and innovation.

2) Generating, screening and evaluating ideas, based on technical, economical and marketing criteria.

In the opinion of Philip Kotler, the new ideas can proceed from internal sources (almost 50%), from customers (~28%), from competitors (~30%), from distributors, suppliers etc.

In tourism activity, the new ideas can be inspired by tour-operators, services suppliers, travel agencies, competitors, tourists etc

3) Developing and testing the concept

In marketing approach, new product development process must consider the situation where demand for existing products requires to be evaluated against new opportunities and competitive threats, taking account also of suppliers and their forward plans.

In this stage, the idea turned into a recognizable product concept, with attributes and market position identified.

The information needed for the stage concern explicit assessment of customer needs to appraise market potential and explicit assessment of technical requirements [9].

Generally, the creation process in marketing may concerns other important elements, such as: package (that has a modest position in tourism marketing), name, brand, services assembly, price that must be correlate with product's characteristics and other similar products [5], [6], [7].

The technical and economical specification must correspond to customers' needs.

So, in this stage are identified the key attributes that need to be incorporated in the product, major technical costs, target markets and potential markets.

In tourism marketing, the product can be tested by virtual tests, for example projecting different versions of one hotel or the images of different tourism attractions etc.

The business analyzes demands information about detailed market analysis, technical feasibility and costs, production implication and corporate objectives.

In this stage, companies that initiate new product's development must take major go/not go decision.

Generally, greater the degree of newness, it's

greater the risk. Production facilities, because of the huge investment they require, and marketing activities, because of their importance to user's organizations and consumer' satisfaction, are two important keys to analyze in terms of risk.

The test can be realized:

- in a complete manner (global)
- through parts of product (different elements that compose the product)

Generally, the market test of goods can be realized such in following manners [2]:

- testing the way of product's utilization, by a small group of potential buyers organizations, which agreed to use the product among a certain time period. The technical personnel from seller organization oversee the way of product use, gets information and can train the clients' personnel
- on marketing events, like fairs and exhibitions
- through standard and controlled tests, that allow the measurement of new products potential

The organization has a limited offer presented by sales force on different geographic areas, and, in the same time, unfold a strong promotional campaign.

This way of testing allows testing the product and the marketing programs in real market environment. In tourism activity, fairs have a great importance in testing process.

4) Launching and commercialization of the new product

After the market test is finished, and the new product has been successfully tested, the product is ready for commercialization or full-scale production and distribution to the target-market.

This process is realized on several stages, such as:

- determining the period when the new product is introduced on the market, going from product's nature and the specific of its consumption. Generally, it must be considered a certain time period as to be sufficient for a good promotion and distribution of the tourism product (before the beginning of tourism season). In tourism marketing, the new products are usually launched on trade fairs or

- special events
- selecting the place or the geographic area, considering the distribution strategy, on local, national or international zones. The tour-operators or the services suppliers must take in to consideration the tourists' characteristics and the level of product's adoption by the markets. Generally, powerful organizations launch the new product on national or international market, and the small firms choose an attractive significant town
 - selecting the distribution channels, which means to choose between a direct and an indirect distribution. Marketing specialist recommend to orientate the product distribution to the best categories of potential clients, knew even from the studying and market testing stages. The product must be direct to the opinion leaders, or to frequent users, because they have a great influence over the other buyers
 - informing the market, by marketing promotion and communication. The goal of this stage is to inform the consumers. In tourism marketing, a great importance have the meeting between specialists, advertising, public relations or selling promotions
 - selecting the appropriate modalities of tourism product commercialization and training the sale forces
 - selecting and preparing the personnel that is involved in this process.

5) Controlling the launch process of the new product.

In this stage organization must gets quantitative and qualitative information about the level of acceptance of the new product and its success (or failure) on the market.

In marketing are used certain statistics concerning different important aspects, such as:

- the number and type of effective clients (until the moment of research), and the dimension of orders
- the potential clients and the evaluation of the level of market penetration on key-sectors
- the length of sales cycle, beginning with first client who launched the order until the moment of evaluation
- the efficiency of sales activity, expressed through several ways

5. Conclusions

The process of new product development is very complex. The vitality of the product development function is directly related to the vitality of the whole company.

The important goal of this process is to assure clients' satisfaction when the product is used, and based on that, is important to assure a good business relationship between seller and buyer organization.

In the same time, the product strategy must be assembled with the marketing policy, and correlated with the general strategy of the tourism firm, in such a way as to realize the principal goals: increasing tourists' satisfaction, and increasing profit level, market share, sales level or other qualitative marketing goals, such as realizing a good image of tourism firm or its products.

In tourism marketing literature, specialists recommend to formulate the product strategy going from the seasonality of tourism demand.

In this approach, is necessary to differentiate the product strategy going from tourism seasons.

In the tourism product assembly, the elements of tourism attractions must be correlated with tourism services, considering the every period of tourism season.

In the same time, the strategy of tourism product must be correlated with the other elements of marketing-mix: price, distribution or promotional policy.

Conflicts in the Distribution Circuits

Silvia MUHCINA

Abstract

The objectives of the trade partners in distribution field are not always the same. Some – manufacturers, wholesalers or retailers – aim primarily at profit, others seek to increase their market share or to develop sales, others wish for success, while others want to reduce their economic risks. Even if two economic agents pursue the same objective, there may be a tension between them.

Key words: conflict, distribution, price, profit.

JEL classification: M31

1. Introduction

According to professor Philip Kotler, conflict in the distribution channel would be: 'Disagreement between marketing channel members about their roles, objectives and what to do each and receive the rewards. "

Under the same author conflicts fall into two categories:

- Horizontal conflict that takes place between firms at the same level
- Vertical conflict that occurs between different levels

of the same channel, very common situation.

More conflicts in the distribution channel is a characteristic of healthy competition. Without this competition, the channel is passive and lifeless and innovation. In some cases, channel conflict can be harmful and does not happen to this conflict must be managed very well since the beginning of each channel member's role should be clearly specified. [1]

According to American Marketing Association, the distribution represents, the movement and

handling of goods at the place at which products are consumed or used "[2]

„Distribution channel is a combination of utilities and functions provided by the companies that constitute route trips (distribution channels) of goods from production to consumption”[3]

„Nowadays, manufacturers lose more and more from their prerogatives in terms of their product features, being forced to take account of the distributors' will, who own a significant share of their products sale.

The rivalry between manufacturers and distributors occurs especially in the brand and price policies. Major retailers have created their own distribution brands and so they sell more than half of marketed products. For a retailer, the distribution brand strengthens the company's image, because adds itself to the store logo as a mean of identification by consumers. Furthermore, it is a factor of differentiation for the assortments of goods. Such a monopol element allows the distributor to closely control the prices and the margins. Therefore, the big retailer no more depends so much on his suppliers, because he strengthens his sovereignty by his own brand. This trend of the distributor entails strong denials from the manufacturers to abandon their own brand, since they can no longer benefit from the profitable exploitation of trademarks.”

There are situations in which the conflict source between manufacturers and distributors is in distributor's price policy. This tries to sell the products at very low retail prices in order to enlarge his market and at the same time they put pressure on manufacturers when they negotiate the sales prices” [4]

Schematically, the succeeding of the conflict in a distribution circuit after Rosenberg's model (L.A. Rosenberg, A new Approach to Distribution Conflict Management, Business

Horizons, octobre, 1974, p. 64-74) is presented in Fig. 1.

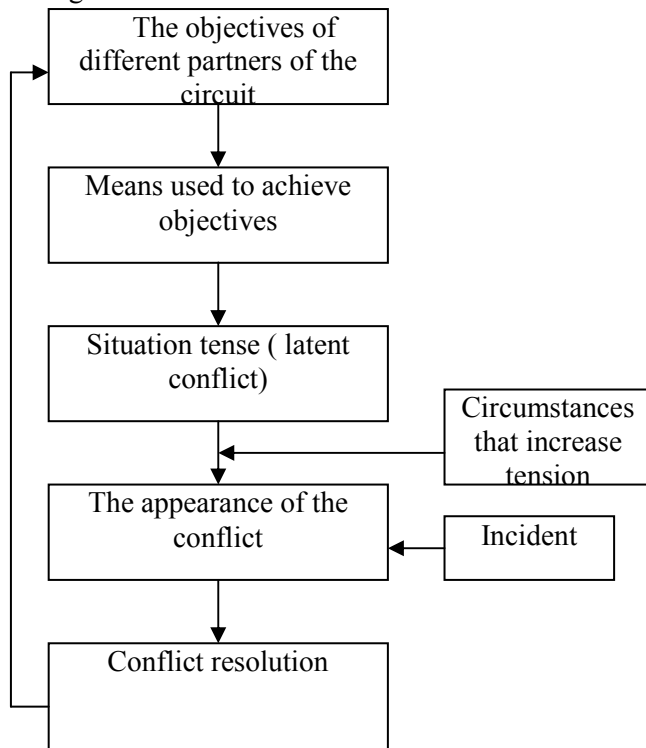

Fig. 1. The succeeding of the conflict in a distribution circuit.

According to the above mentioned author, there is a hidden antagonism inside every distribution circuit. The conflict erupts when the external circumstances (sharpening competition, consumers' pressure, legal regulations, technological changes) or internal ones (installation of a new leadership in one of the firms, the results of a market research) make the tension increase at an unbearable level for one or another company.

Depending on the attitude of the conflicting parties and on the importance of the stake, the conflict will lead either to severance of trade relations or to further transactions. [5]

„The antagonists can adopt several attitudes: ignorance, accomodation, dominance, compromise and cooperation.

If the stake is minimum or, on the contrary, too expensive for one or another, in case of separation, the two parties simply adopt the attitude of ignoring the conflict.

When the cause of rivalry ist minor and with negligible consequences for one of the

companies, its leader can adopt a concession stand.

The attitude of domination is adopted by a strong company, capable of solving the conflict with weaker firms, imposing its demands.

If each party accepts to diminish its demands up to a mutually acceptable level, we say that an attitude of compromise was adopted.

The attitude of cooperation expresses itself by a common search of a solution, satisfactory for each party. Because it goes animosity and often encourages progress, this can be considered the best attitude.

The outcome may consist either of a sudden break of the relations between the partners of the circuit, when their interests become too different, or of an ongoing business relationship in a climate of distrust and suspicion, this being the most common case.

Sometimes, the way out of the conflict can be eased by the appearance of some legal regulations, which allievate the tensions between partners.

Until recently, manufacturers were limited to production tasks and let the brokers and retailers the main distribution functions: transportation, fractionation, range, storage, information. Nowadays, more often, the leaders of big production companies want to guide and control the distribution of the goods they produce, especially of the own branded goods. Besides this, for the manufacturer, the distribution channel is a kind of screen which is interposed between him and the final consumer.”[4] Philip Kotler regarded as an object of physical distribution,, and bringing the products at the right time, with the lowest cost”. [6]

It is clearly understood the will of manufacturer to alleviate the opacity of this obstacle, isolating or even supressing it.

Anyway, conflicts burst when different participants' objectives (manufacturers, wholesalers and retailers) become less compatible with each other.

To avoid or alleviate the adverse consequences of this situation, the manufacturer can take over part of the distribution, when possible. He organizes a nett of active sale, creates warehouses, he must be fitted to ensure delivery and even participates at retail operations (sales promotion, merchandising etc).

„Restrictions that limit the possibilities of choosing solutions by the manufacturers can be financial, legal, related to customer or to the nature of the products.

Moreover, it is prohibited the practice of discriminatory conditions imposed on sales and prices depending on customer. Finally, for some goods, by law, certain circuits are required (pharmaceuticals, meat and meat products , chemicals etc).

Restrictions related to customer occur when buyers are widely dispersed and working with wholesalers becomes inevitable. On the contrary, when there are few customers, the sellers of the manufacturer can negotiate directly with retailers, without intermediaries.

Restrictions related to the nature of the products influence the choice of distribution as it follows:

- Perishable products require the selection of those channels through which the movement of goods is done as quick as possible;
- High-tech goods are sold preferably direct, because there are few competent intermediaries in this field and most of them prove themselves unable to provide the services expected by customers;
- The product or brand image, when it's decisive, conditions the choice of a circuit adapted to the followed image;
- If the manufacturer wants to follow his product to the consumer, he must accomplish a certain number of functions, each containing a group of specific activities (conditioning, storage, delivery). So the problem for the manufacturers is the cost calculation for the distribution operations that he will do.

Schematically, one can present the different phases of the logical approach, resulting a first choice of the distribution channel.

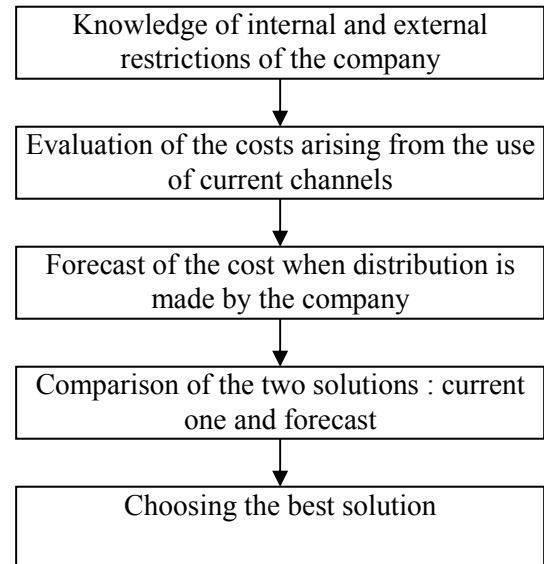

Fig. 2. Selection by manufacturer of a distribution channel

The selection of a distribution channel by the manufacturer is caused by several circumstances, such as: launching a new product, creation of a subsidiary, monitoring a competitor, willingness to reduce costs, sales saturation in a traditional channel, a new stage of life cycle of the product, new forms of trade etc'' [4]

2. Conclusions

Until recently, manufacturers were limited to production tasks and let the brokers and retailers the main distribution functions: transportation, fractionation, range, storage, information. Nowadays, more often, the leaders of big production companies want to guide and control the distribution of the goods they produce, especially of the own branded goods. Besides this, for the manufacturer, the distribution channel is a kind of screen which is interposed between him and the final consumer.[4]

Image of the Public Institutions – Historic, Evolution, Trends

Lecturer Ph.D. Marilena-Oana Nedelea
Associate Professor Ph.D. Alexandru Nedelea
Stefan cel Mare University of Suceava
E-mail: oanad@seap.usv.ro

Abstract

The aim of this paper is to underline that there is a preoccupation of the institutions to apply strategies aiming the creation of a positive climate, marked by credibility and trust, the creation of a distinctive image in the relevant social environment and in the interest areas, the determination and motivation of the opinion leaders regarding the main issues and the role of the public institution, the attraction of the citizens' attention, good will and trust.

Keywords: strategy, environment, public institution, image.

JEL classification: P37

1. Introduction

Last years have been and still are under the sign of globalization, but also of the economic crises which, corroborated, lead to unbalance, tensions and threats in the social and political life.

We are looking for solutions in order to overcome the economic obstacles but also ways to prevent such consequences with negative effect at global level.

The citizen's trust in the state's politics, the positive image of the public institutions, the promotion of the efficient public services contribute to the ease application of strategies oriented to find solution to the problems caused by the negative economic elements.

The promotion of the public services has as objective the real and operative information of citizens – potential clients and also the creation and maintenance of long term relationships with these ones. The specificity of the public services leaves its hall-mark upon the promotion politics, both concerning the content of the activities and also the ways used for promotion. The content of

the performed activities refers to the „substance” of communications, the way of realizing them, the relation with the consumers' segment.[5]

The image of the public institutions plays the role of mediator between people and organizations, between citizens and institutions, between organizations and institutions. The force of images resides in the fact that they impose themselves within the communication process, orienting the people's opinions, attitudes, convictions, faiths, conduct and actions within the social and unsocial environment.[1]

Nevertheless we must mention that the premises of the above mentioned factors are also the aspects existing in the Romanian legislation starting the *inter-war period*.

In the content of the *Law for administrative unification no.95/ 13.06.1925* there is mentioned the fact that the notary – the agent of the central authority in the rural community – has among his attributions the publication of laws, regulations and instructions using posters and by „reading in public”.

The law no. 167 from 1929 for organizing the local administration mentions the fact that the village mayor has also the responsibility to publish the government's laws, regulations, orders and instructions in the village.

The image and transparency of the public institutions during the inter-war period can be studied through the perspective of the fact that in art.84 there is mentioned „The ascendants and descendants, brothers and the same degree affinities and also the third degree relatives cannot be members in the same council, at the same time”. On the same coordinates there must be mentioned that the public character is a condition for the progress of the communal council sessions.

A plus of image and trust in the public institutions' representatives was also given by

the fact that the mandate of a county councillor could not be reattributed – art.219.

Meanwhile there must be mentioned the role of the county secretary who was responsible with the display and communication in conformity with the law of the county council's decisions.

Among the provisions of the *Administrative law no.569 from 1936* there is the one saying that the mayor and the prefect represented the commune, respectively the county at the official ceremonies, having as distinctive sign a belt with the national colours.

Usually the mayor and the prefect were wearing a badge according to the model elaborated by the Ministry of Interior.

In order to ensure the quality of the public servants' training, the prefect is obliged to call in educative conferences all the servants belonging to the city hall and to the prefecture from the county's capital at least once a month. These conferences had as objective the enrichment of the professional knowledge of the administrative servants, the information regarding new laws and also the guidance for the way of exercising their attributions.

The prefect called all the council's members in conference at the residence of each small rural district at least once a year.

The praetor, mayors, notaries and other servants from that small rural district and also the bank and cooperative federals' presidents were invited at these conferences.

Different issues of local interest were discussed in these conferences, the principles concerning the laws, regulations and ordinances' application were debated and the purpose of that was to take measures in order to develop the administrative, economic, sanitary and cultural situation of that administrative-territorial unit.

The reputation of the public institution was improved by the fact that the mayor appointed in the communes declared balneal or climate resorts must have had an academic title.

We could also mention that from the actions to promote the image of the public institution there was an element related to the public relations field, namely the fact that attached to all the local administrations, as in the Ministry of Interior, there was a *special service for the reception of the inhabitants' claims*. This one had the role to send to the petitioner, at his residence, the solution of the respective authority

within at maximum 30 days since the registration of the request.

In the rural communes this service was carried on by the notary who was obliged not only to receive, but also to edit the villagers' claims.

The administrative law from 14th of August 1938 regulated the education conditions for a series of representatives from the public institutions. Thus the legal resident had to be „a university graduate or a general officer” – art.57, the prefect was a carrier servant and he held a university diploma and a diploma issued by the Administrative professional technical training centre, the praetor should have been a bachelor of law and also graduate of the Administrative professional technical training centre.

The quality of the public services performed within these institutions had to be carried on only by administrative public servants having an administrative and professional technical training.

Meanwhile there are enumerated the incompatibilities of the legal resident with any other public position, thus promoting an administrative system based on the principles of decisions' transparency and efficiency. The legal resident was not entitled to be administrator, censor or officer in civil or trade companies, cooperatives or popular banks and he could not „exercise any freelance profession” – art.58. The prefect, the praetor and the notary were applied the same rules.

Analyzing the evolution of the Romanian public institutions there can be identified the preoccupations of the public authorities to improve their image among the citizens.

2. Promotion of the public services

The promotion is mainly realized through communications. The internal ones are oriented towards citizens on the scene and towards different categories of personnel (public servants) and the external ones towards those target-collectivities the administrative institution wants to inform and influence.

The promotion strategy in the public administration includes actions centred, at present, on the external communication theme. That corresponds to some recent evolutions, as for a long time the public sector considered this communication of administrative order. For

instance, we remind the case of the „Official journal” („Journal Officiel”) from France which represents both an advertising and information body. And, as every one must respect the law, the public institutions don't consider having the mission to develop communication.[4]

The internal and external communication cannot be rigidly isolated or separated one from another. From the occidental experience it results that the personnel is often more sensitive to the external communication than citizens.[11] It creates an affiliation feeling among the public servants, especially in situations when through external communication there are mentions regarding the personnel's qualities and role within the performance process and the success of the institution in satisfying the citizens' demands.

Promotion of a positive image (desirable) represents an essential element for the affirmation of the public administration institution, an important objective of the organization's marketing strategy.

In the case of public administration, it is normal that the public has knowledge about the actions carried on within the state institution, reason for which *the so-called promotion campaign must be a correct information action* for the large public related to:

- the public institutions' objective and responsibilities;
- their attributions conferred by law;
- the methods used in applying the law;
- the success and, eventually, the more special cases ended with the citizens' help;
- difficulties in carrying out the work.

The promotion / information activity must be performed on regular bases, respecting a certain schedule or periodically, within some distinctive emissions, appealing to the mass information means having the greatest audience.

Using the promotion actions the image of the public administration institution is configured, the transmitted messages having to include the most faithful image of reality. The authenticity of the messages issued by the public institutions is imposed in their relations with citizens, relations that are normally based on trust and mutual respect. The excessive use of *publicity techniques* and the orientation of the public promotion towards certain particular electoral interests would have as consequence the deformation of the presented reality with

negative effects upon the image of the institution and the efficiency of the taken actions.

The public promotion / communication oriented towards reality or truth will lose any authenticity, increasing the population's mistrust in administration.

In order to disclose the existence of the public services, to determine their use by citizens, the public institutions use different promotion techniques, paying special attention to the messages' content, the type of the used language, the way of carrying on the promotion actions, the chosen means to transmit the message. The efficiency of a promotion action supposes the determination of a clear, specific objective, according to the group of citizens aimed by the respective action.

It must not be ignored the fact that the promotion actions of the local public services have an important role in obtaining financing sources and in attracting economic investors, creators of workplaces and local taxes payers.

3. The image of the public institution

By image we understand the representation which forms as a sum of beliefs, requests, attitudes, opinions, mentalities, prejudices, experiences, suppositions (expectations) in a group of people or within the public opinion, upon a person (for instance the public servant) or an institution (for instance the city hall, the prefecture).

True or false, positive or negative, the images lead to the support, modification or rejection of an idea and they have a strong influence upon the human conduct.

It exists, as the above mentioned definition suggests, several categories of images: the image of the public administration institution, the image of the public services, the image of an official (mayor, prefect, president, minister, president of the county council etc.), the image of a service within the administrative institution etc.

Concerning the general image of the public services, this is in an endless and rapid change, more and more oriented towards citizens, the marketing ideas and techniques being especially useful to a public service manager.[7]

Marketing has as objective the creation and management of the public administration institution image. The image of the public

institution is determined by the representation it generates related to the other organizations from the public sector or with the institutional partners. Several factors compete for the creation of this image, having in view the assembly of the transmitted messages, the supplied information, the way of functioning and organizing the public institutions (central and local).

Several actions can contribute to the improvement of the image of the public administration institutions, such as: the renewal and fitting out of their locations in order to avoid queues (or to make them more bearable), there can be searched solutions so that the discussions between servants and citizens to be more convivial, personalized, meantime modifying the schedules of the public services according to the local particularities, putting at the citizens' disposal copy machines, vignette or stamp automatic machines, by opening offices, points, reception centres for orienting or solving the requests on the spot.[13]

The creation of images is not isolated, but a continuous activity. It is necessary for the representatives of the public administration institution to communicate at any moment and to take care of its image so that the public opinion to have a positive and trustful perception upon the public administration.

As „patrimony object”, the image is managed in the same manner as any other patrimony good of the public administration institution. A good image has a special influence upon its success and perception on the large public. On the other hand, a negative image sometimes affects, in an incredible manner, the institution success. In order to be efficient, the image must evoke something, it must say something, it must invite, in essence, to a possible and permanent dialogue. In an image as such there will be included several messages, having in view the basic principle saying that it is hard to keep the attention for a long time, and once you got it you must transmit the maximum of information.

The institutional image supposes the respect of certain requirements which lead to coherence and authenticity. The image must be *coherent*, meaning it must realize a global presentation of a certain public institution, of its tasks and attributions and of the way of organizing and functioning, so that the ones who apprehend it to be able to easily identify its role and specificity. In plus, the image must be *authentic*, meaning it

must confirm to the identity of the public institution, to correspond to the existing reality within it, to reflect in an objective manner the way that respective institution fulfils its specific objective. The disrespect of this requirement leads to the affirmation of an institutional image which does not correspond to reality, being concerned only by the creation of a simple appearance. When the institutional image does not correspond to the authenticity principle, even though it could have certain favourable short term consequences, while reality contradicts the created appearance, the obtained negative effect will consist in increasing the mistrust of the citizens in the institutional framework. [2]

The institutional image is mainly related to the citizen's trust in the public authorities. For instance, concerning the governmental administration, the trust in it is determined only in proportion of 15,5% by the satisfaction related to the government's performance concerning the standard of living, the public order, workplaces, privatization, agriculture, health, education, houses, industry, the corruption reduction. On the other hand it must be considered that fact that the attitudes towards government are greatly influenced by the political bias. In plus, some of the citizens are direct clients, others not, just some of them know the government's activity in different fields, which makes the appreciation unequal.[9]

We deduct from here that the way the public authorities promote their actions plays an important role in creating a positive institutional image. The mass-media role in reflecting the public administration activity is essential in this respect.

In order to illustrate the special importance of the image of the state's institutions among citizens, we remind the crisis situation created by the Katrina hurricane on the USA territory in September 2005. Even though the state authorities asked the population to evacuate the New Orleans area, a part of the citizens refused to leave it, some of them being motivated by the lack of trust in the state's institutions.

The reputation concept of an institution, organization, service is also used as an image substitute.

Reputation is the most important reference criterion of an institution in its relations with the public. Reputation represents in fact what the

others think about you; in other words, your public image.

The institutions, regardless their type or level they function on (local, regional, central), don't assert themselves only by their specific features, but also by their social image of viable and credible partners related to other organizations and institutions. In this situation, the image created in the collective mind, to the image characterized by continuity and steadiness is an essential role. The institutional components, their services must respond to the expectations of citizens and organizations it cooperates and relates to. That is why the public administration institution must carry on a dialogue and communicate with all its partners, as component parts of the institutional management, to make possible the preventive actions which should put back or decrease the danger for the public institutions to generate situations that could induce images impeding the fulfilment of its own interests or the co-operation with other institutions and organizations, or determining the mass-media reserved or hostile attitude.

The image of the public institutions with national vocation is very important for the functioning within the society. This thing is more required in the case of national safety and defence institutions whose social situation confers to their public image a high level of relevance.

For instance, the national safety and defence institutions cannot efficiently function in society unless enjoying a large social support mainly determined by the population's trust in these institutions, trust conditioned, at its turn, by the way the respective organizations are seen in society. In this situation, only two realistic alternatives can be identified: the organizations are seen as viable, trustful social partners who efficiently manage the society's resources and produce national safety and security or they are seen as unviable social partners who waste the society's resources, without substantial results for it.

It exists a preoccupation of the institutions to apply strategies aiming the creation of a positive climate, marked by credibility and trust, the creation of a distinctive image in the relevant social environment and in the interest areas, the determination and motivation of the opinion leaders regarding the main issues and the role of

the public institution, the attraction of the citizens' attention, good will and trust.

The formation of an image strategy must take into account strategic factors defining the general condition of the public institution, the favourable situations which can be used by these ones and the social elements against it. The most popular strategic factors with major implications upon the institution's image are its strong and weak points, its opportunities and threats. These are in fact the factors considered in a SWOT analysis of a public institution.

When presenting the promotion steps of the public institutions and services and the strictness they submit to, we referred especially to the concept of **image**. Besides it, in the theory and practice of the field there is also met the concept of **identity** (that we will develop below). Both need to be „clarified” and transmitted by all the possible / available information means.[10] We will not detail again these means or factors and the demands they operate on; instead we must underline that, generally, they contribute both to the crystallization of the image and of the administrative institutions' identity, to their consolidation. In fact, the **identity** refers to the modalities the public institution wants to identify itself and the **image** represents the way by which the large public perceive the respective organization. The institution creates its own identity in order to draft the image of the large public about itself, image that is determined by a series of factors for each citizen.

The identity and the image will be successful by the messages having distinctive personality and well defined recipient transmitted by the written and audio-visual means by also by the created events, ambiance, public space (architecture, design, climate), visit cards of the institution or its logo etc.

4. Conclusions

The public administration wants to inform about the existence of public services the citizens have at their hand, to produce the adhesion of the social body to the interest actions generally carried on.

An image deficit or an unfavourable image generates question marks regarding the viability and credibility of the initial actions and activities performed by the public institution on local and global level.

A new image of the public administration institution can be created by an attentively conceived publicity, repeated and broadcasted by as much information mass-media as possible.

Abstract

In managing a business online, it was given crucial importance to research business and increase the visibility of offered products or services, through online social media. Promotional expenses compared to the online business model to those of a traditional business model, decreased significantly. Visibility, as equal opportunity, given the size of a business and lift them in time. A contemporary Romanian online business success is based even so on visibility and social environments on the Internet: Facebook, Twitter, blogging, messaging, YouTube, forum sites. The research on several web sites that have well exceeded the maximum phase of economic depression, is particularly interesting to draw conclusions on how it can be treated a business model.

Key words: online business models, the visibility of the products and services, activity on the internet, contemporary romanian business, economic crisis, internet social media.

JEL classification: L86

1. Introduction

The internet and the World Wide Web are, in some measure, items that have both physical features and some items without spatial boundaries. Therefore, their definition in the classic way is difficult to understand, because they represent only a small proportion in tangible structures.

Although different structures, the internet and the www interact to form a perfect system; the www could not function without the Internet and would not make sense without it. With the advent and the explosion of Internet, appears the businesses so that have the Internet as the medium of life. The process was imperceptible at first, but grows exponentially as it moves.

The human being is made to communicate. Into the new society, the type of information society, the communication, the transfer and the exchange of information takes place through technical systems.

When we talk about information society and about the e-business it has to be, above all, an unlimited number of computers connected through telecommunications networks, for transmission of the huge information. Having unlimited access to information posted on the Internet, the consumer of products and services search, find, compare, make decisions more easily than in traditional trade.

Hence the conclusion that the new information society brings with it a series of the great opportunities: spatial and temporal constraints (borders and time) in communications have been greatly reduced, the information can be processed, stored and transferred rapidly, the prices of services, related to the information transfer, are steadily decreasing.

2. Characteristics of an online business model

General economic crisis which started timidly in 2005, but took a huge scale worldwide in 2007, has affected all sectors of the global economy. From here until the bankruptcy of many businesses both chain and, even, national economies, there was only one

step. A step that has revolutionized almost everything in a negative sense means business, precisely because of the interdependencies between regional and inter regional economy which is manifested in the world.

Due to lower degree of interdependence of the Romanian economy with the global economy (the degree of interdependence due to poor performance of the Romanian economy), the "Tsunami's" economic crisis in Romania reached about a year later, but the return will be much later than the performing economies. Whatever type of business, its size and complexity, degree of intermingling with other businesses, everything has been affected. Even if, through of the intrinsic nature, the online business seems somewhat immune from the economic cyclical (due to take extraordinary boom of the Internet environment and the penetration thereof), and decreases the medium took place so, sometimes dramatics, of the business itself.

Starting from a definition (Onete Bogdan, „Information Systems - design, aesthetics and promote websites, edition III-rd), saying that „the Internet is a large community that embraces the world, beyond the physical and political limits so. It is a collective society as a braided wire, the understanding between managers and users to a group of independent computers connected to servers.”, it can be stated as true, the conclusion of a seminar held in Russia under the auspices of the WTO (World Tourism Organization), which says that no other technology, except television, has had a so great impact on the passengers, as the Internet. And that statement can be extrapolated to all online business models.

3. Aspects of information used in electronic commerce

A research regarding the information, that are searchable online trade, which was conducted on a group of Danish visitors, it has surprised the following issues:

50.2% sought detailed information on the product

37.1% wanted price comparison

12.7% considered very important the details about the vendor

These data indicate a lower interest in actually buying the product - only 12.7% wanted detailed information about the vendor, attention is focused more on individual products and prices described. Winning the

trust depends of many factors, the researches, conducted by the Studio archetype / Sapien and Cheskin Research, leading to the recognition of six very important factors, namely:

- logo of the confidence corporate sites that allow transactions on that website (eg., Visa Card)
- the brand
- the simply navigation
- the complete instructions regarding of how to conduct the transaction and the details information of the compensation of any dissatisfied customers
- the presentation or design that gives the company a professional image, and a high quality to the products
- the technology

Research shows that most products bought directly through e-commerce are books and CD ROMs, followed by electronic products and tourism services. However, the preferences for the products purchased online differ from region to region. For example, among the products ordered online by U.S. customers generally include clothes; other way, in countries like France and Italy, these products are sourced from conventional stores. The research on electronic commerce, conducted by Forrester Research (www.forrester.com), shows that in the U.S. in 2004, the number of those who bought online increased by 11 million the previous year, it estimated about 38 billion revenues from electronic distribution of the products and services. Also, the estimates made by Boston Consulting Group shows an increase in online shopping, but estimates are much higher - 61 billion U.S. dollars.

In Romania, an environmental research online business during economic crisis, revealed so 6 factors for the consumer confidence-building.

Thus, the first in Romania, for the information you are looking for to trade online, the price ranges of products or services, and in second place are situated the mark or brand of the product or service offered, and the third place - the ease with which the buyer takes possession of the product or service ordered and its quality.

„Figure 1. Incentives leading Romanian internet users to buy on the Internet”

The data illustrated in "Figure 1. Incentives leading Romanian internet users to buy on the Internet ", made by Gemius Research, shows that Romanians are primarily sensitive to price or rate a product / service ordered online, but also to an wider range of products which have a choice or to a quality of becoming their best.

Especially, the curve of decreasing their financial status is apparent that, with the advancement of economic crisis, Romanian buyers increasingly prefer more shopping online. Thus, regardless of income level that the buyers get, they are turning to e-commerce. At the first glance seems a financial unconscious, but a more careful analysis it is normal – to the same level of income (even decreasing), online shopping is preferred over traditional shopping because of lower prices.

This information can be easily used by online companies, adapting their prices policies to the changing online market. However, due to specifics of the online market itself, the prices are lower compared to the same type of product, than traditional business environment, as a reflection of lower costs in the online environment compared to the traditional business environment.

Moreover, almost 30% of online shoppers said they are willing to buy through social networking, and 27% said that the display of the comments relating to products for sale, would encourage them to buy, according to a Harris Interactive poll.

The poll show that the internet users are increasingly willing to resort to the social networks to seek recommendations on online purchases, and they are open to make purchases via the web sites that are usable and effective security systems.

The inclusion of the companies from the online business environment, on social networks (Facebook, Twitter, blogging, messenger, forum discussions, etc.). makes itself closer business by the preferences, ideals or desires buyers.

Extracting from the Harris Interactive study, result that 48% of online shoppers say that an e commerce website should be first user-friendly and attractive, 92% say that a brand is what draws them to a specific online shopping site. The innovative site design is another factor considered by internet users willing to buy online, 88% of them considering that the website layout endorses's credibility and may lead to purchase. 32% of Internet users say they would buy online if e-commerce web sites should be easier usable, and 24% - if the verification procedures would be simpler.

The differentiation offers for online and offline would make 50% of Internet users to purchase products via the Internet, according to the same study.

In addition to airworthiness ease, the consumers want that the purchases online will be integrated into communications platforms through which they have dialogues with colleagues and friends, making the preferences known in social networks and giving to retail officers the opportunity to develop a closer relationship with online bidders.

The report also shows that the recession was another step in electronic commerce, with sales rising in Europe, the United States and China, while traditional stores faced a decline in the number of consumers.

"The economic crisis has provided to the online trade a growth, after consumers have sought ways to reduce costs through buying items online", OECD announced, adding that the reductions can be substantial.

These costs reductions were transferred to lower prices, was based on the lower costs of online business then traditional business. The study shows that users in the UK, Germany and France can save up to 17% by purchasing electronics, DVD's and clothing from online platforms than traditional stores. OECD cites a study by research company Forrester, which expects that the western Europeans users will spend 123.1 billion euros for goods online until 2014, with an annual growth rate of 9.6%.

Also, the OECD warned that the future of electronic commerce is not entirely sure, since it depends largely on the trust consumers have in online stores.

In 2009, 33% of EU consumers bought goods online, but only 7% have purchased items from another country, the report said.

In Romania, in 2009, Internet penetration rate was 36% and about 50% of internet users used the Web site at least once to order online, more than 22% over 2006, according a study by specialised online research polish company, Gemius Research.

„Figure 2. Online shopping developments in Romania”

According to "Figure 2. Online shopping developments in Romania", is easily seen a good rate of growth in online shopping, in Romania, in the economic crisis.

Contrary to all hostile economic realities, even in 2009, the increase was significant, which further demonstrates the market potential for products or services online. According to that study, 96% of Romanian Internet users are aware of the possibility to buy online, and only 3% of them would not make Internet purchases.

4. Conclusions

After various studies and research, several major conclusions may be drawn [1]. The economic crisis has affected the field of online sales, but not so great an extent as traditional business. Even under conditions of economic crisis, but respecting the trend of online media, online business trend to increase. As consumers look for cheaper products, but as an online store has the advantage of lower costs compared to a traditional store which is reflected in lower prices for the same type of product or service.

Reviewing all adverse effects of economic crisis in general, but looking much less adverse effects (even beneficial) to the online business sector, is apparent that this sector of online business was the least affected, conversely, the consolidation and growth even registered.

“Respecting” international trend of consumer behavior of goods or services online, romanian consumers can give, by their own behaviors, real momentum and beneficial e-business sector. But even if there are positive expectations from this segment of business, and even if the percentage of those who never buy on the Internet is less than 5%, positive evolution of e-business largely depends on the degree of trust and that you give business to consumer online.

Bypassing the negative effects of economic crisis for a business online, is made by associating consumers or potential consumers in social networks like Facebook, Twitter, blogging, forums.

To meet consumer demands, including social networks, should represent an end in itself, a goal of business online.

Constanta, mirela_secara@yahoo.com.*

Abstract

The tourist's circulation manifested in the county of Mures during 2005 – 2009 has registered light fluctuations from year to year. Thus, after an increase of 24,85 % in the number of tourists arrived in 2007 comparatively to 2005, this indicator has registered a decrease of 20,96% during 2007 – 2009. this decrease has been determined, mainly, by the low quality of the tourist's services, by the insufficient capitalization of the existent tourist's potential and the lack of investments in the modernization of the reception tourist's structures, with housing functions, existing in the tourist's resorts and balneal spas.

Keywords: tourist, investment, demand, indicators.

JEL L89

1. Introduction

The analysis of the tourist's circulation manifested in the county of Mures expresses the evolutions or involutions of the flows of tourists which have oriented towards this county, as a tourist's destination, during the specified period. The analysis of the specific indicators is especially important because it reflects the realities of the tourism in this area

The decrease, in the last two years, of the number of tourists who choose this county as a tourist's destination, has for causes the low quality of the tourist's services traded in the resorts in this county, the lack of investments in the modernization of the treatment units from the balneal spas, the weak capitalization of the

existent tourist's potential and the lack of training of the workers in the area.

2. Indicators of tourism demand

In 2008, comparatively to 2005, has been registered an increase of the number of the reception tourist's structures with housing functions of 16,34%.

The largest percentage, in the total of the reception tourist's structures with housing functions is that of the rural and urban board and lodgings, followed by the tourist's vilas and hotels.

Fig. 1 The number of tourist's structures with housing functions in the county of Mures, during 2005-2008

Source: Processing after data taken from the Mures County Department of Statistics, *the 2008 Mureş County Statistic Yearbook, Monthly statistic bulletin, or.12/ 2009.*

Fig. 2 Housing capacity (number of places) existent at the level of Mures County, during 2005 – 2008

Source: Processing after data taken from the Mures County Department of Statistics, *the 2008 Mures County Statistic Yearbook, Monthly statistic bulletin, or.12/ 2009.*

The indicator of the variation in time of the total housing capacity (I) = (no. of housing places during the year n / no. housing places year n-1) x 100

$I = (\text{no. of housing places during the year 2006} / \text{no. of housing places during the year 2005}) \times 100$

$I = 6044 / 6201 \times 100 = 97,47\%$
 $97,47\% - 100\% = -2,53\%$

At the level of the year 2006 has been registered a decrease of the number of housing places with 2,35 % comparatively to the previous year.

$I = (\text{no. of housing places during the year 2007} / \text{no. of housing places during the year 2006}) \times 100$

$I = 6138 / 6044 \times 100 = 101,55\%$
 $101,55\% - 100\% = 1,55\%$

At the level of the year 2007 has been registered an increase of the number of housing places with 1,55% comparatively to the previous year.

$I = (\text{no. of housing places during the year 2008} / \text{no. of housing places during the year 2007}) \times 100$

$I = 6385 / 6138 \times 100 = 104,02\%$
 $104,02\% - 100\% = 4,02\%$

At the level of the year 2008 has been registered an increase of the number of housing places with 4,02 % comparatively to the previous year.

3. Indicators of tourist

Fig. 3 Number of tourists arriving in Mures County, between 2005 - 2009

Source: Processing after data taken from the Mures County Department of Statistics, *the 2008 Mures County Statistic Yearbook, Monthly statistic bulletin, or.12/ 2009.*

The indicator of the variation in time of the tourist's demand (Ivc) = (the number of the tourists arrived in the year n / the number of the tourists arrived in the year n-1) x 100

$Ivc\ 2006/2005 = (238.147\ \text{tourists} / 202.994\ \text{tourists}) \times 100 = 117,31\%$
 $117,31\% - 100\% = 17,31\%$

In the year 2006, the number of the tourists who oriented towards the county of Mures, as a tourist's destination, increased with 17,31% comparatively to 2005.

$Ivc\ 2007/2006 = (253.454\ \text{tourists} / 238.147\ \text{tourists}) \times 100 = 106,42\%$
 $106,42\% - 100\% = 6,42\%$

In the year 2007, the number of the tourists who oriented towards the county of Mures, as a tourist's destination, increased with 6,42% comparatively to 2006.

$Ivc\ 2008/2007 = (231.500\ \text{tourists} / 253.454\ \text{tourists}) \times 100 = 91,33\%$
 $91,33\% - 100\% = -8,66\%$

In the year 2008, the number of the tourists who oriented towards the county of Mures, as a tourist's destination, decreased with 8,66% comparatively to 2007.

$Ivc\ 2009/2008 = (200.312\ \text{tourists} / 231.500\ \text{tourists}) \times 100 = 86,52\%$
 $86,52\% - 100\% = -13,47\%$

In the year 2009, the number of the tourists who oriented towards the county of Mures, as a tourist's destination, decreased with 13,47% comparatively to 2008.

Fig. 4 The number of overnight stays realised by the tourists arrived in the county of Mures during 2005 – 2009

Source: Processing after data taken from the Mures County Department of Statistics, *the 2008 Mures County Statistic Yearbook, Monthly statistic bulletin, or.12/ 2009.*

During the analyzed period, the highest level of overnight stays realized by the arrived tourists has been registered at the level of 2007. After this year, this indicator registered slight decreases (with 9,80 % in 2008 comparatively to 2007 and 5,95% in 2009 comparatively to the previous year).

4. Average stay

$S = \text{no. of overnight stays} / \text{no. of tourists}$

The average stay realized in 2005:

$S = 516.100 / 202.994 = 2,54 \text{ days /tourist;}$

The average stay realized in 2006:

$S = 589.900 / 238.147 = 2,47 \text{ days / tourist;}$

The average stay realized in 2007:

$S = 635.300 / 253.454 = 2,50 \text{ days /tourist;}$

The average stay realized in 2008:

$S = 573.000 / 231.500 = 2,47 \text{ days / tourist;}$

The average stay realized in 2009:

$S = 538.870 / 200.312 = 2,69 \text{ days / tourist;}$

Fig. 5 The average stay realized by the tourists arrived in the county of Mures during 2005 – 2009

Source: Processing after data taken from the Mures County Department of Statistics, *the 2008 Mures County Statistic Yearbook, Monthly statistic bulletin, or.12/ 2009.*

During 2005-2009, the highest average stay was registered at the level of 2009. The reduced value of the average stay registered in the analyzed period can also be a cause of practicing, in the recent years, of the week-end tourism in the detriment of the weekly and average stays.

In the analyzed period, the Romanian tourists have a percentage of over 70% of the total of tourists who choose this county, as a tourist's destination, the rest being foreign tourists.

Fig. 6 The indicator for usage of the working housing capacity during 2005 - 2008

Source: Processing after data taken from the Mures County Department of Statistics, *the 2008 Mures County Statistic Yearbook, Monthly statistic bulletin, or.12/ 2009.*

During 2005 – 2008, the highest occupation degree of the working housing capacity was registered at the level of 2007.

5. Density tourist

The tourist's density – population ratio = no. arrived tourists / the county's population

The tourist's density – surface ratio = no. arrived tourists / the county's surface

The tourist's density of the county of Mures, in 2005

The tourist's density – population ratio
 $\Delta t = 202.994 \text{ tourists} / 580.851 \text{ inhabitants} = 0,35 \text{ tourists} / \text{inhabitant}$

The tourist's density – surface ratio
 $\Delta t = 202.994 \text{ tourists} / 6696 \text{ km}^2 = 30,31 \text{ tourists} / \text{km}^2$

The tourist's density of the county of Mures, in 2006

$\Delta t = 238.147 \text{ tourists} / 579.000 = 0,41 \text{ tourists} / \text{inhabitant}$

$\Delta t = 238.147 \text{ tourists} / 6696 \text{ km}^2 = 35,56 \text{ tourists} / \text{km}^2$

The tourist's density of the county of Mures, in 2007

$\Delta t = 253.454 \text{ tourists} / 579.000 = 0,44 \text{ tourists} / \text{inhabitant}$

$\Delta t = 253.454 \text{ tourists} / 6696 \text{ km}^2 = 37,85 \text{ tourists} / \text{km}^2$

The tourist's density of the county of Mures, in 2008

$\Delta t = 231.500 \text{ tourists} / 579.000 = 0,40 \text{ tourists} / \text{inhabitant}$

$\Delta t = 231.500 \text{ tourists} / 6696 \text{ km}^2 = 34,57 \text{ tourists} / \text{km}^2$

The tourist's density of the county of Mures, in 2009

The tourist's density – population ratio
 $\Delta t = 200.312 \text{ tourists} / 579.000 = 0,34 \text{ tourists} / \text{inhabitant}$

The tourist's density – surface ratio
 $\Delta t = 200.312 \text{ tourists} / 6696 \text{ km}^2 = 29,92 \text{ tourists} / \text{km}^2$

Fig.7 The tourist's density - population ratio during 2005 - 2009

Source: Processing after data taken from the Mures County Department of Statistics, *the 2008 Mureş County Statistic Yearbook, Monthly statistic bulletin, or.12/ 2009.*

During 2005 – 2009 the highest value of the tourist's density – population ratio was registered at the level of 2007 (0,44 tourists / inhabitant).

Fig.8 Tourism in relation to surface density, between 2005 - 2009

Source: Processing after data taken from the Mures County Department of Statistics, *the 2008 Mureş County Statistic Yearbook, Monthly statistic bulletin, or.12/ 2009.*

During 2005 – 2009, the highest value of the tourist's density – surface ratio was registered at the level of 2007.

6. Conclusions

In order to stop this tendency of diminishing of the number of arrived tourists, manifested in this county in the last years and in order to revive the balneal spas in this area on the internal market, the tourism's entrepreneurs should permanently adapt the tourist's products and services offer at the exigencies manifested onto the tourist's market and to adopt an aggressive promotional marketing in order to promote their offer.

Some of the weak points this county's tourism are represented by the low quality of the tourist's services and the lack of training in this sector. As

a result of this, the passing of a strategy of increasing the quality of products and services, as well as strategies of attraction, motivation and loyalty for the workers in this area should be enforced.

Conceptual operationally of Business Intelligence – an epistemological view

Abstract

Business Intelligence although seems one of the newest discipline integrated in the big family of MANAGEMENT, actually has its roots in the antique military strategies. BI evolved a lot in the last years (mainly since 1994, when it received the first time its name in France), until it became a tool unlikely to be neglected by theorists as well as by practitioners. With all these, often it is mistaken for other new discipline, or they are used with interchangeable meanings. So the declared purpose of the present paper is to try to realize a conceptual frame of BI, and to try to connect it with other discipline/concepts used, such as – Knowledge Management, Benchmarkingul and Competitive Intelligence.

Keywords: business intelligence, information, knowledge management.

JEL classification: M19

1. Instead of introduction – choice’ motivation

The transition from the industrial society in which the immateriality becomes an important source of goods realization, puts nowadays the issue of nature, its importance and its role in the firm’s strategy. The decisional processes present nowadays treats today of 100 times more information than 30 years ago, and in the last 10 years the information managed in an organization, institution or firm, knows a growth rate of over 10% per year. Obviously, this growth rhythm of the managed information volume differs from a country to another, but has to be underlined the fact that in the countries with a consensus ruling, the information plays a role of source of competitiveness, as well as a source of social cohesion [2].

The present economic issues became too

complex that only a person can manage them in all its aspects. The time where a strategist within an enterprise had the capacity to inform and to understand the enterprise environment without being framed in a team passed. The enterprise has to organize its activity into a more global manner. It needs the observation capacity and of reflexion of its employees. On the other side, the business became worldly.

Business Intelligence and competitive intelligence represent an old practice, and its historical examples are many. M. Lehman, the Director of Research of Saint – Gobain, achieved to maintain its domination more than two centuries thanks to a remarkable intelligence system using networking (having a network of ambassadors from all Europe amongst other types of people) [7].

2. Business Intelligence – a new spirit status and a new work frame

The Business Intelligence’ experiments highlighted its multidimensional character. Business Intelligence fits in the newest manners of organization and the newest managing means of information’s distinguishing the necessity of changing the present way of thinking and of action. This new manner of thinking and of action will be the expression of *a new spirit status* and of *a new work frame*.

Business Intelligence as a new spirit status depends on a few fundamental considerations such as:

- *the information has value*, such as: the value that helps to make known what it can be spread in exterior; the value of the missing information to take a decision; the financial cost that it is paid for obtaining the information, etc.;

- *the information has to develop within a collective culture* through: sharing the means between the internal and the external

environment, etc.;

- *the information is a rough material*, which means that: the added value results only through its exploitation and can be measured only when a firm exists request; requests a continuous process of perfecting (refine) with each technological phase, etc.;

- *the information is an action mean to:* influence in the interior of the firm, especially, upon motivations; the improvement, in exterior, of factor's influence that condition the firm's functioning (the customers, the suppliers, the competitors, the administration and even the citizens), etc.;

- *the information enforces the usage of a analysis grating* with its help achieving : through using the game theory of the economic agents, it can be identify the threats and the opportunities caused by the different force rapport; it is analyzed comparative the cultures, each information is given to its context, etc.;

- *the change in any firm has to be assured through a management* that: polarize the people around the individual and collective information network; organizes functional structures of Business Intelligence to collecting, treating and spreading information's, etc.;

- *the change in any firm has to be started through conceiving and implementing an informatics system* based on individual modern means (work places) and on collective means, such as, informatics networks, assuring thus the gathering , the processing and the spreading of information's according to the users' requests (ergonomics, rapidity, security, capacity, etc.), etc. [1];

Regarding the new work frame, in this uncertain epoch, Business Intelligence became a necessity for more and more enterprises:

- for the strong enterprises (so called dinosaurs) because the environment changes so the firms have to adapt. A bad example happened a few years ago with IBM and Philips, that lead to loosing 100 thousands employees;

- for the „weak” enterprises (so called squirrel) which survives with niches and are frequently threat by competitors and predators. For example, a small firm who produces software always has to supervise its supplier (such as Microsoft) and also its customers (which can go to its competitors – that can be at the same time its supplier, induced by a reduced price);

- for the medium enterprises (bear cubs)

that have the ambition to become strong, and so it have to learn from the best [7].

3. Conceptual operationally of Business Intelligence

The concept Business Intelligence appeared in France in 1994, in the rapport of Martre Commission (the XI Plan): „Business Intelligence (in french is used the term intelligence économique that means actually economic intelligence) and enterprise's strategy”. Analogous to the americans „Business Intelligence”, the french intelligence économique is an extension of the strategic surveillance (the ensemble technologic and competitive surveillance) for an offensive usage of information.

In the Rapport Martre it is stated the following: „*Business Intelligence can be defined as the ensemble of the researching, collecting, treatment and spreading actions so that the economic agents exploit the useful information*”.

Business Intelligence is focused on an organization at a national level and not only on organization, such was the case many years ago concerning the old technological surveillance [4].

Different publications on Business Intelligence shows the variety of possible approaches, and also the methods and the tools to really implement it into practice. Another tendency of various publication on the subject, unfortunately, are driven by the present „fashion”, use the concept of BI and old technological surveillance as being synonyms; and other publications just refer at BI as being a simple transfer of documentation.

The concept „intelligence” was chosen because it has more passive connotations than the terms „surveillance” or „oversee”. The intelligence is only the intellectual aptitude and is defined as being the capacity of adapting at the existing environment. The intelligence, in the British literature is called the „Service Intelligence” (the service of British intelligence) and it means the aptitude of informing and of understanding its environment.

The above definition, where each word is often intense debated and evaluated, contains the major ideas of this issue:

- the concept of action forms an ensemble coherent, that produces information;
- the concept of the entire cycle of treating the information: gathering, treatment, spreading;
- the concept of useful information is pertinent.

The general Guyaux goes longer in defining the useful information, and does it like being the information that the person that is making the decision needs at the desired form and on the desired time. All these imply:

- it has to be identified the person that is taken the decision, and it's not a simple task especially in the diversified big groups;
- it has to be identified the needs (expressed and latent);
- it has to put the information into the right form (to know to communicate it);
- it has to be delivered into the right moment, this means that if the information is delivered to the right person, this one has to use it according to the enterprise' rhythm [7].

3.1. Business Intelligence and Knowledge Management

The specialists in knowledge management speak frequently about various concepts that are trying to define and to manage, such as: knowledge management, data mining, data warehouse, groupware, work-flow, knowledge base, know-how.

One of the first attempts of defining the concept of Knowledge Management it can be found into an article – The ABC's of KM in CIO Magazine in 2001, that states the following: „KM is the process through which organizations generate value from their intellectual and knowledge – based assets”. The authors Santosus M. and J. Surmacz continue in the article by seeing: ”Unfortunately, there's no universal definition of KM, just as there's no agreement as to what constitutes knowledge in the first place” [8].

Adding to the above definition for a better understanding of it, we specify the following:

- KM is not a concept based on the information's technologies, but *a process adapted to the enterprise commercial activities*;
- results that KM cannot be separated by the enterprise's strategic objectives;
- the decisions of KM has to be based on WHO (the actors), WHAT (the knowledge,

the abilities), and WHY (the enterprise's objectives), HOW (the used technologies).

The central point, the cornerstone of the entire BI'system is the network of experts and the person who will beneficiate on the knowledge management techniques, starting with the exploitation of internal information's, continuing with their correspondent's contacts, because the issues that may appear in an enterprise' activity can be related to the internal as well as external information's.

The groupware will be useful for the contacts existing between different correspondents and the leader of the experts group:

- the documentarists of the observers network, that are interested in the public information;
- the „other observers”, who are related to their group and they are interested on the nonformal information's, gathered from their customers, their providers, and from their competitors;
- the experts that are in their group that must be consulted for obtaining the information's validation and the preparation of the periodical groups reunions;
- the other experts of the enterprise, such as other responsible of the expert's and of the specialist's groups can be asked for advices;
- the directors (the person who takes the decision) who are directed the BI's information's issues [3].

3.2. Business Intelligence and Benchmarking-ul

Benchmarkingul is a standardized competition method in the economic competition and it is a known consideration for the BI' specialists to consider essential to own the basis elements [3].

Well understood the benchmarkingul can be applied in various functions and actions, such as:

- R&D;
- production;
- finances;
- logistics;
- administration of stocks [4].

The „bench-marks”, the term derived from

the american litterature, are the guiding points used by inspectors for efectuating, the mentioned, topographic indications.

Through extension we call benchmarking the method of localization, of standardization of competitor societies. Nowdayw, the concept benchmarking is also used by informaticiens: to them the concept „bench testing” and „mark” means a level of references and at the same time a comparison basis and a target [1] .

In the french litterature benchmarkingul as „competitional standardization” or perhaps „comparative standardization” has the sense of: a process of performance evaluation of products, of services, of functions, of methods and of practices of the rapport of the best worldly societies.

In conclusion, we can state that the benchmarkingul and BI are mutual necessary to each other baccuse, in BI, if each enterprise needs a specific system, while it is elaborated and implamented, it is recomended to use:

- to study the recommendations and the prescriptions of the specialized organisms;
- to be inspire by the experiences realized by the best enterprises [3].

3.3. Business Intelligence and Competitive Intelligence

In „Competitor Intelligence: How to get it – How tu use it” (1985), Fuld L. Introduced and vedeloped the concept „Competitor Intelligence” that rapidly converted in Competitive Intelligence [5]. In 1985, as well as in 1988, in „Monitoring the Competition”, Fuld. L., who became one of the known americans specialists, didn’t menntioned anymore the concept „competitive intelligence” that suddenly largely propagated with the apparition of Society of Competitive Intelligence Professionnals (SCIP) [6]. Other american specialist – Stanat R., used for the first time the concept competitive intellgence in „The Intelligent Corporation” (1990), where she stated:”This is the impetus for competitive intelligence and the systematic monitoring of the competition”, and also a phrase that nowadays is more actual then evere:”There are various forms of competitive information or intelligence that are valuable in today’s environment” [9].

The american litterature, as well as the british one used in the same manner the concept BI. For both, the concept competitive intelligence is

practical synonymous with the concept business intelligence, in the present acception of the term, without having any connection with espionage.

Making a brief history to show that the french concept „intelligence economique” was oficialized in 1994, is subsequent to the apparition of the american concept „competitive intelligence”. The american concept was used official after 24 june 1992, the date of the french Society of Competitive Intelligence Professionnals apparition. It is rather difficult to differentiate the concepts american and french, it is unanimous accepted that it has the same meaning. For supporting the above statement it is usefull to give the definition of competitive intelligence according ti the American Productivity and Quality Center (APQC) in 1999: „Competitive intelligence is a systematic program for gathering and analyzing information about your competitor’s activities and general business trends to further your own company’s goal” [3]

4. Conclusions

Although the present paper can’t be considered an exhaustive approach to the conceptual operationally of Business Intelligence, does treat three concept related with BI, such as: knowledge management, benchmarking and competitive intelligence.

The Knowledge Management, as well as Business Intelligence are considered as one of the latest disciplines welcomed in the general discipline, generic called – MANAGEMENT. KM and BI are different meanings and diferent approaches, but is important to remember that certaines present techniques of KM present interest for BI, for its implementation but also for its optimal usage. The BI have an ofensive usage of informations, whereas the KM represents the optimum knowledge administration. The specialists in BI are conscious that they have to keep in mind the exterior information (to know what the other are doing) and they have to incite at the offensive usage of this kind of information for obtaining a strategic objective. But they are in the same measure conscious that the expertise of the enterprise’s specialists is indispensable for:

- to transform the raw collected information into an elaborates one, represents an helping tool for making decisions;

- to know the resources specific of the enterprise, its forces, its own competences.

As we already mentioned, BI resulted from an external evolution of the old surveillance (or as we find it in the frenc litterature „veille concurrentielle”) who integrated the national interest, so the benchmarkingul is the logique sequel, internally, of the old surveillance of a given entreprise.Thus, determing its competitors to observe a certain quality, a superiority . All these made legitimate to expand BI in grafting the competitionnal benchmarking as the generic benchmarking.

The last concept debated – the Competitive Intelligence, we saw that between it and Business Intelligence is a diference of form, and not a significant one – of substance.

Abstract

This article analyses the main methods and techniques of organizational development, from the point of view of changes that these produce, at the level of the organization as a whole. The organizational changing process is analysed in the way that presumes the gearing of a whole system of organizational forces, in the direction of the expression of the whole potential of the organization. There are taken into consideration the training laboratories for sensibilisation, the team building or the built of the teams, the investigations for the obtain of feedback and quality circles.

Key words: methods, techniques, organizational development, process

JEL classification: M21

1. Introduction

The organizational development (O.D. - *organizational development*) represents „a long time effort to enhance the organizational vision, to grow the organization's force, to develop learning processes and to solve problems, through managerial support (including top management), to ameliorate the organizational culture, with the help and collaboration with a facilitator consultant and the theory and the behaviour science technology including the research of participative actions” (French, Bell, 1995).

As the name indicates, O.D. means change, and even more: it presumes change plus positive growth/ development, o conjugation of

numerous efforts, different, through normative, reeducational strategies, for the modification of the „philosophy” of the organization, of the values, systems, behaviours.

We will next stop over some of the most often met *methods and techniques* in this process.

2. The training laboratories for the sensibilisation (T-group training)

The training laboratories for the sensibilisation (*sensitivity training laboratories - STL*) represent one of the traditional techniques of organization development, that remains in the present one of those who have results both in the area of personal development, as in the level of work group and in global organizational level. The STL process, according to K.Benne, L. Bradford, R. Lippit, can accomplish the following objectives:

1. The increase at the participants of the awareness and sensibilisation towards their own emotional reactions and those of the ones around them.

2. The development of the participant's ability to perceive and learn from the consequences of their own actions, giving attention to their own feelings and those of the others.

3. The stimulation of the clarification and self value improvement and of the consonant purposes with the scientific approaches of the problems regarding the decisions and personal and social actions.

4. The development of some concepts

and theoretical insights that will serve as instruments for the relationship of the values, purposes and intentions for actions, consistent with the interiorisation of the individual, and with the requirements of the situation;

5. The reunion of the behaviour efficiency accomplishments with the life environment of the participants" (*apud* Luthans, 1985, p. 629).

Therefore, through the achievement of the reminded purposes it can get to a larger sensibilisation of the employees towards the group life; this can be accomplished without the overlook of the individual advantages that appear at the intercommunication and helping level, with effects over the individual positive tonus.

The STL practice pursuets therefore, in the first place, the elimination of a „common cause of frictions that appear in the organization, envolving the absence of a correct perception." (Baron, 1983, p. 541).

STL takes place under the form of some group meetings with aproximately 12-15 members and a discussion intermediary. Luthans talks about the laboratories with strangers, with „relatives" or family" (1985, p. 631). These are metaphorical exprimations, for the work groups, of participants from different organisations, from different departments, or the same departement.

Of course, the fastest, most direct and profound effects are those from the last categy. R. Baron (1983, p.543), arguing for the use of this method starts from 3 central ideas:

- a) in normal conditions, the individuals aren't very opened and honest with each other.
- b) the opening lack blocks the important *insights* about themselves of the others.
- c) these *insights* can be encouraged if the individuals are placed in a communicational environment that has a rule the opening, the direct communication.

STL is a technique meant to develop in an open manner the memeber's interaction, starting from simple to complex, from unstructured to structured, from the lack of empathy to empathy. Even if initially it exists „the lack of a working agenda, focused on „here and now"" (Altman, Valenzi, Hodgetts, 1985, p. 651),

A first step of the STL should be an initial diagnostic of the situation, to identify the main problems and their area of action.

The second step follows the effective technique and includes the indirect work laboratories, without a structure everyday order.

The meetings can be leaded by a trainer, but can also be made by the effective members of the group, they choosing in the first phase their leader.

The third step, according to Luthans (1985, p. 631), presumes from the trainer „opening, non-difensive attitude, the empathy manifestation and the exprimation of their own feelings in an non-evaluation manner".

Here is an extra argument for the STL to work with an expert/consultant and not with a group leader person from the coworkers or managers from those in the group, that could perceive evaluations even in the situation in which they don't exist (not to be omitted the fact that there may be the situation in which the manager will act evaluatively)

The *fourth step* proposed takes into consideration the effective development of the inter-personal relations. There are opened the bases for colaborative type behaviours and the stimulation of the team spirit. It is the step that has to be on the most meetings for this type of behaviour not only has to be awared but also accustomed.

In the end, quoting George Odiorne, Luthans (1985, p. 631) we consider that we must find the „exploatation of the relevance of experience in the terms of the situations and problems from the workplace".

A special attention must be given to the role that the trainer has in the activity of this type. The *trainer* can be, as we said before, a person specialised in STL or can be chosen from the persons in the group.

At least in the first phase, the role of this person is to encourage the free talk, regardless of the theme chosen. It is essential that this „doesn't act as a leader and neither as therapist" " (Baron, 1983, p. 543).

His role must be that of intermediary of the talk, between all the members of the group. Problems can come from two directions:

- a) the vulnerability of the persons that will reveal
- b) the lack of a correspondent feedback given in the first situation

A few words now about the possitive and negative effects of the STL. The positive effects of the method appear especially in „the consciousness of the group normes, the

experience of a belonging feeling, the accomplishment of a role flexibility” (Altman, Valenzi, Hodgetts, 1985, p. 652).

It seems a bigger chance is given to the „structured STL (structure that allows the specific learning of of all that can be transfered into work situations)” (Luthans, 1985, p. 632).

On the other hand, there can appear negative results from the „confrontation and the disclosure of feelings and personal values” (Altman, Valenzi, Hodgetts, 1985, p. 652), things that tend to reflect negatively, without a direction and a close control from the facilitator. For this reason, the technique isn’t always recommended by the profesionist. Either way, if it is applied adequately, the success in the clarification of the feelings and in the improvement of the social relations has positive effects over the entire organisational life.

STL can have immediate effects over the integration of the new employee thanks to the flexible and open manner of practiced discussion, through this, there can be gathered many informations about coworkers and the working environment in general. Finding out about the values that appreciated by the work group individuals, about the desired behaviours or just because they are expressed, a quick and important step into the society is made.

3. Team building-ul or building teams

The built of teams represents a deziderate of the efficient activitiy. Besides, the contruction methods of the teams have started from this conclusion: of the employee is intergrated in the work collective and finds its „place” in the mechanism that this represents, many advantages appear, implicitly: the productivity is growing, the motivation is at high shares, it decreases the probability of the leave of the organisation etc.

Since this method has been largely treated in the chapter about the motivation, we will limit now to notice that in the whole of this concept, multiple variations and options can be found; therefore, besides some relative evolution stages and for some criteria and analysis indicators, the way to build the team are very variable.

That is why we will talk here about the efficiency of a methodological structures, and not a simple method. For example, a necessary „ingredient” for a *team-building* programme is represented by the (*ice-breaking*) exercises

whose role is to make easier the interaction area of the behaviours and to extend these borders in the interior of the working collectives.

Here is how *team-building* starts to be seen, more and more often as a developed philosophy in the interior or the human resources management and a methodological, dinamical and flexible whole, at the basis remaining the bond between the cohesion of the group and the assurance of performance. As for this connection, the specialty literature consents the corelations between the two criterias without being able to establish a direct determination relation; more precisely, there isn’t just one answer to the question „*What comes first: cohesion or performance?*”.

In this way, for example, te increase of the cohesion can be the cause for which the team members will work more, as a result an increase of the performance, but non concomitent, and the obtain of performance can be because of the increase of the inter-relational level between the team members, so that the „cohesion influences the performance, and the accumulation of performance influences therefore the cohesion” (Forsyth, 1983, p. 450). From these considerations, *team-building* remains a pretious instrument for the organisational development.

4. Investigations for obtaining feedback

Represents a tehnique that can produce, at its turn ameliorative effects at the level of interrelations between the employees of an organisation through the realy valuable information that we can gather after it is applied.

Most of the times, *survey feedback* presumes two distinct steps. The first step, according to a series of authors (Baron; Altman, Valenzi and Hodgetts; Luthans) is designed to gather information about the state of the organisation/department; for this purpose, a questionnaire is applied.

Sometimes it is used a standard questionnaire, otherwise it is used a questionnaire especially created for the gathering of those informations. In the case of the standard questionnaire, Luthans (1985,

p. 635), quoting C. Taylor and D. Bowers proposed the next areas of research:

Table 1. Investigation areas of the organisation reality

Categorii	Elemente investigate
Leadership	<ul style="list-style-type: none"> - managerial support - the direction towards the means and their accentuation by the managers - the facilitation of the work by managers - the facilitation of the management interaction - the support of the „equals” - the direction towards the means and their accentuation by the equals - the facilitation of the work by equals - the facilitation of the equals interaction
Organizational Climat	<ul style="list-style-type: none"> - communication with the company - motivation - decision making - control inside the company - coordination between departments - management at a general level
Satisfactions	<ul style="list-style-type: none"> - satisfaction of belonging to the company - work satisfaction thanks to the supervisor - satisfaction in the work done - pay satisfaction - satisfaction about the activity in the department in which it’s included

In the second case, this first step is preceded by the information gathering about the problem situation, finding out through mini- questionnaires, interviews or focus groups, that is the problematic area, at a general level.

The method has the advantage that more information can be gathered; in the step of the application of the questionnaire is very important to assure the data confidentiality, so there can be gathered real data, correct, that can be used in a manner that would draw the amelioration of the identified negative aspects.

The correct interpretation of the data is also important. In the situations in which the data is insufficient (for example, in the small departments, where there are few respondents and can't be made a valid generalisation) is important that the interpretation to be based on other data gathered through other methods.

The utilisation degree of the data is another element that raises problems, being necessary that the management to want to use the data in the direction of the improvement of different seized aspects.

The second part presumes the delivery of the taken and interpreted data. In order for the dates to be valued and for the effects to be positive, this second step must accomplish with professionalism, „making the summary and the interpretation in a clear manner, that would extract also the reactions of the employees at the gathered information” (Baron, 1983, p. 548).

The same author draws attention over the presentation of the results „in a constructive manner and not threatening” (ibidem). It must be explained to the employees that the method is being used exclusively in ameliorating purposes at the level of the organisational life.

In the view of the successful utilisation of the investigations in order to obtain feedback in the organisations, Floyd Mann recommends:

1. „the top manager” to actively participate at the preliminary planning;
2. the dates to be collected from all the organisation members.
3. the dates to be communicated from the beginning to the *top-management* and after that down the hierarchy;

4. each manager to have meetings with his subordinates to interpret together the information, planning constructive changes and the introduction of information at the lower levels;

5. the feedback meetings should include a consultant that would prepare the manager for the meeting and to play the „resource-person” part (*apud* Altman, Valenzi, Hodgetts, 1985, pp. 661-662).

The studies made show that the positive impact method over the employees, with a significant score of enhancing the productivity (but with less significant effects over the abstention or demission from the organisation). Anyway, the use with success on a large scale of the method in organisations is proven by valid statistical studies, quoted by Altman, Valenzi, Hodgetts (1985, p. 663), who attributed the success of this method, a series of three factors: virtually, all members have been included in the research; the technique has stimulated the „defrost” of the wanted components; the employees perceived the data recollection process with a direct relevance over the problems they have.

A different way to apply the feedback in the O.D. is through the use of key-questionnaires este the 360° feedback. To the 360° feedback technique we have given a *supra* special interest, in the analysis of the performance evaluation in an organisation, We wish to remark that such an investigation completes the information board that we will use in the construction of an organisational development programme.

5. The quality circles

Method of Japanese origin, it is proudly used to enhance the organisation's efficiency, drawing implicitly a development of that another aspect that is worth mentioned is that through the development manner, *the quality circles* have positive effects on the climate.

The method used to enhance the working style or the amelioration of the solving way of some problems, gathering through volunteer work in the team some persons that act in the area of the problem. There are obtained both strictly professional objectives-quality results- and results at the level of the

interaction through team-work, the learning of a way of positive interaction, the increase of self-confidence and team confidence as well.

The discussions from the „quality circles” are made periodically (weekly, in one hour meetings), in a flexible, open manner. There can be integrated in the groups persons that don't belong to the problem area and that can offer objective solutions.

The discussions have as a main purpose aspects about the decrease of consumes, the minimization of the error number, the amelioration of the productive flow, the resource identification underused or not used at all etc.

In order to maximise the contributions of the method to the organisational life, support is needed that is why it's recommended that before of the use of quality circles, a series of „facilitation methods” to be applied:

- the making of an analysis questionnaire of the current state;

- discussions with the *top-management* over the results;

- the realisation of special programmes for the top management and the middle one;

- instruction with the „professionists” of the problem;

- awareness programme for the method with all the organisation's employees;

- the registration of those who participate in the programme and their coordination;

- the formation of quality circles and the instruction of the members.

R. Baron (1983, p. 558) develops the following succession of phases about the method use:

- in the discussion groups there are identified the key-problems, that interfere with the efficiency or quality;

- there is accomplished a close analysis of those and it is tried the identification of specific solutions;

- the recommendations are sent to a managerial team in order for them to analyse.

- if accepted, the solutions are implemented, if not, there are sent to the group the objections according to what the solutions can't be implemented.

- in the case of the solution implementation, the success of the implemented solutions is analysed.

The problems can be subdivided into the

next categories:

-type 1 problems- that presume the minimum implication from the other departments.

-type 2 problems- the implication of the other departments is a necessity.

-type 3 problems- support, sanctions and involvement from the management are required to implement the solution”.

It is recommended the use of as many working methods for the reach of results: *brainstorming*, the collection of all necessary data, graphic analysis methods and result presentation, cause-effect diagrams etc. Also, it is important to be actioned so that the cohesion of the team is kept, to be involved all the discussion participants and to maintain the task focus.

According to Baron (1985, p.558), the method seems to „awake the feeling of pride towards their work at the employers and tends to increase the quality and efficiency on the total”. The organisational integrity is made easier through the method, thanks to open and flexible talks, thanks to the feeling of belonging to the group which is very possible to appear, given the favourable conditions.

As it can be noticed, all these methods and techniques can be used in a large sphere of processes from the human resources management. Their situation in correlation with the phenomenon of organisational development is based on the including that these can register.

We were characterising at the start of this section, the organisational development through the light of change; we were also reminding that the O.D. overcomes and embraces the change, giving it other significations and higher implications. Therefore, the organisational development is supported on the idea of *learning through change*.

The successful organisations are the organisations that learn (*learning organizations*), defined through the „ability to create, purchase and transfer knowledges or modify behaviours to reflect new knowledges” (apud Holden, Salskov, in Cooper, Cartwright, Earley, 2001).

Indeed, in the context of an accelerated progress and of a flexible and unpredictable concurrent market, *the learning*

organisations are the only ones who have chances to succeed on the long term. Some authors extend even more the O.D. analysis.

This is how Ramon Flecha and Lidia Puigvert (in Aspin, Chapman, Hatton, Sawano, 2001, p. 251) appreciate that the impact and organisational influence continue in the family and even more, in the community. For those, the authors extend the learning organisation to *learning communities*.

6. Conclusions

Even if, after the organisation development, it is foreseen the change of the system as a whole, the applied techniques are addressing, especially to the persons as individualities or groups – through these following the concretisation of an amelioration at the organisation level as a whole.

The training laboratories for the sensibilisation represent one of the traditional techniques of organisational development with results in the personal development area, as the level of the work-group and at a global-organisational level. Team building can be considered a methodological structure, and not a simple method. Investigations for feedback gathering produce ameliorative effects at the level of inter-relations between an organisation’s employees through the truly valuable information that can be gathered. The quality circles are predilectly used to enhance the organisation’s efficiency, drawing, implicitly a development of that.

Abstract

The Romanian organization has a particular reality in comparison to the western organization. This specific feature is determined by the fact that it neither succeeded in separating itself for good from the socialist "enterprise", nor to make many steps towards the western organizations. The Romanian organizational climate has great access to information, but manages only with great difficulty to adjust itself to this information, to the Romanian reality, and this adaptation, where it appears, means more of a folding of this information on the pre-existent reality than an adaptation to the possible organizational changes.

Keywords: organization culture, competition, values, strategy.

JEL classification: M14

1. Introduction

The results (good or bad), the success or failure of an individual, of an organization, are an expression of the level of Culture held because: any results and the result of the conduct, behavior, are a function of people's heads, their mentality, their culture and culture of the context in which they operate. Culture is the Software and the rest is hardware or, if you prefer, culture it is the soul and the rest is the body, no system could function well without appropriate software.

It is difficult for the organizational development specialists to process the information gained in their academic

environment and to actually apply it in accordance to the actual reality of the organizational climate. But through a conjugate effort of the working team, based on sincere collaboration, it is possible an understanding of the company and to find ways to improve the working conditions, the climate and the employees satisfaction also.

For Corporate culture means what that determines individual behavior, namely a set of identities, values, evidence, and expertise possessed, both generally and individually. The Culture of an Organization is expressed in how you will work, how decisions are made, are people managed, you are confronted with competition, you try to generate value.

The Culture of an Organization it is the result of three factors: the nature of its activities, the mentality, the personality, the culture of its leaders, especially those who have played a crucial historical continuity with a significant presence, the adopted system of government.

2. Winning culture and its possible content

At all levels, from individual to entire territories it is necessary to define those aspects of culture considered the winner facing the challenges of this era. These are issues that should arise a series of behaviors to achieve their best goals in the best possible way.

Culture is not something abstract, just philosophical. Nothing is the most important practically, to define the distinctive features of culture you want. Once defined, to be handled with extreme efficiency and effectiveness. Individuals, organizations, territories are really specific, as they have their specific goals and

their strategies. There is therefore, recipes for the aspects of a winning culture.

We should provide some idea of the cultural aspects that, in this era that we live, appear of particular significance and, therefore, of interest to the business world:

a) The Result / merit (to the effort / elderly). Into practice, we must never confuse efforts with results. Efforts may be laudable but the results are not going anywhere.

b) The solution / proposal (versus problem / protest). Are here with the solution or there are also part of the problem? It is appropriate, indeed essential, to explain the problems, as is legitimate in many circumstances, to do protest, if do not have problems and protests you should never differentiated by the suggestion of solutions and proposals.

c) From client / function usage (versus service or product the middle). It is important to know the function of use of the customer, that is why it requires a service or a product. The exclusive focus on service / product is equivalent to focus on "medium", forgetting the "end", the purpose. The purpose of the customer does not acquire products and services, but providing the optimum function of use. There is no specific guidance to the customer without attachment to its function of use.

d) From Proactive / timing (versus reactive). During acceleration era, or the gradual reduction in the time available, the player who has the ability to manage the timing right. Being early is, sometimes, equally problematic than being late. Not always the "big" beats the "small" always on "fast" beats the "slow".

e) To competition (versus orientation to themselves). Is not enough to confront their own goals, their budget, or their performance last year.

f) The open system (versus closed system). Protectionism and anarchy have always created backwardness and decay

g) Of the international perspective (versus provincial). With globalization, the opportunities are everywhere, but also there are threats. Even when working locally, you must

do so with the knowledge of what happen relevant in the world.

h) Flexibility / change / innovation (versus exclusive defense of the past or just improving). Today more than ever, flexibility means intelligence and intelligence means flexibility. The only objective limits of flexibility are the values we have chosen as a reference. Improving protect which it means that already exists, innovate it to make it obsolete. With the acceleration, everything and subject to its cycle of life, without innovation and doomed to decline. Innovation is a culture, not a directive or a manual.

i) Of the long-term goals / vision and strategic management (versus only management / operational management, live for the day). It is an overriding reason in an the age of discontinuity (the possibility that the future will replicate the past).

j) Resolving (versus running). If you need to prepare a room for a meeting is not enough to prepare only your pens. Who needs to drive a vehicle should know well to do it in advance, in order to study the best route and possible solutions to any problems may appear.

k) The Auto responsibility/ update learning (versus guaranty / arrogance). There is no field of activity, exposed to the dynamism, in which a generation of knowledge and skills longer than five years and this period is declining. Those who have responsibility for other people, namely the ruling class, have a dual responsibility: to be aware and make aware. Nobody but not some other secure their future. Explodes the individual auto-responsibility. At stake is no longer "lifetime employment" but "employability" for life, where the difference lies in the ability to systematically remove their knowledge and skills that appear to date and useful in practice.

l) From Integration / cohesion / teamwork (versus individualism). In the game of football you need a team to win the game. It is sufficient that one of the players to give an own goal for the game to be lost.. The purpose of teamwork can usefully be summarized as follows: to achieve the common goal in most effective and efficient way. There can be a team if its members do not know the organization's objectives and strategies.

m) From ant/ institution (versus people). The facts and results count far more than statements and rumors. It communicates to the organization not to individuals.

n) From work as a profession (versus employment / punishment). Work must not exist without professional dignity. If the work is conceived as a profession, the systematic updating and the relevant sales fall in people's heads concerned. Work is an important expression of self-fulfillment.

3. Actual cultural anomalies in the romanian multinational company

Cultural anomalies, compared to the needs of this age are very numerous. We are studies a Romanian company with foreign majority capital in an attempt to adapt itself to the western experience with the study of the employees' organizational behavior. The above mentioned Romanian company, generically called "Alfa", is a middle sized company (approx. 250 employees), operating in various but interconnected fields of activity. The services provided to the UE clients are of an outsourcing type.

The link between culture and the values of an organization are very strong. Identify what is important for an organization in terms of values, determine the strategic guidelines of the organization with a direct impact on the objectives of each individual member of the organization. Below, some anomalies registered in the "Alfa" Company:

a) Ambiguity respect to economic success. On the one hand, all or almost all private property are enjoying the good life, yet there is a widespread mentality that the rich are guilty, even if they had accumulated his property in full compliance with the rules and demonstrating social awareness. There is a tendency to oppose solidarity and economic success, leaving unanswered the question: whether the employer had not happened and, anyway, if not accumulated sufficient wealth, where you find the resources for solidarity?

b) Culture of belonging rather than of competence.

c) Poor concrete sense of the country. All the other things that go beyond the self-interest

and of his family and often seen as something to be suspicious or to exploit.

d) Poor ethical rigor. Widespread privileges, clientele, complicity, opportunities and, sometimes, corruption.

e) Imbalance between rights and duties. Even in the public debate are much more frequent references to the rights, or any additional rights, much less duties.

f) Emphasis on luck rather than on the merits. In this age of self empowerment, great emphasis is given daily, even from public television, the lottery, horoscope etc.

g) Culture of distrust instead of trust and good faith, particularly in the relationship between state and citizen. This is being declared, for example, tax is not believed. Even those who pay taxes regularly and in full is requested to comply with the conditions of amnesty applicants "because otherwise ...". Alongside continuing unacceptable levels of evasion, sometimes finding relatively easy. Any company would fail quickly if operated on the basis of mistrust.

h) Culture and chatter and intentions, rather than facts and results. There are also many witness almost daily media.

i) Contempt for some trades. It is used habitually threaten to send their children to do the factory worker, if not ensure adequate performance of the study. As if to make the worker was a punishment. Then we wonder that we do not find workers.

j) Rebound of responsibility rather than statements of responsibility. Are common, even by major institutions, habit, denouncing what others should do or have done instead to account for their actions, of what and not been done and why, what we are committed to do, how and when, limiting references to others as instrumental responsibilities.

k) Management culture rather than strategic. Resulting in an age of globalization optical reductive and discontinuity.

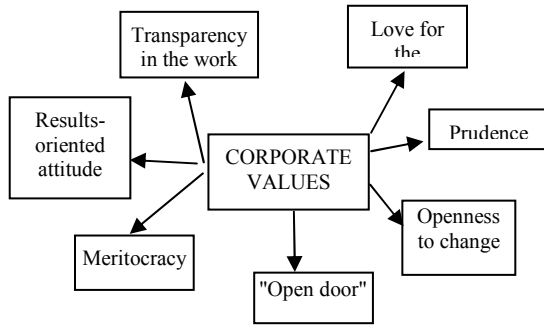

4. Principles and cultural values

Consistent organizational culture in order to survive in the current context of strong economic and financial crisis and indispensable to any organization-wide financial and banking

will be promoted to a series of principles that guide the conduct of business to make it a success: principles and corporate values, individual values (energy).

The main principles and corporate values that must be promoted with vigor and energy are:

Figure n. 1 – Corporate Values

a) "Love" for the customer. The customer is the precondition for the existence of a company. Each activity should be oriented towards satisfying the needs and demands of the customer with care, attention and decision, in a word with "love". "Love" must be understood as love for others, sympathy, affection, pleasure of making a product and service, to do something with love, do it well.

b) Transparency in the work. Proper functioning of a company and related to knowledge of the real trend of the variables that govern it. A good human resources management, technical and financial transparency should be based on the results, well the economy is, on any mistakes made, the levels of service.

c) Prudence. Customer trust depends on the reputation, which is a consequence of the results obtained with a more consistent and conduct of particular prudence in risk management and investment.

d) Openness to change. The only thing permanent is change said Heraclitus 2000 years ago. Every successful company must correct its course when the business market, customers, times require it, anticipating the market and drawing from it a competitive advantage. Openness to change and innovation are a prerequisite for long-term maintenance and success.

e) "Open door". This principle means that everyone has the opportunity / duty to express their ideas, illustrating them in any hierarchical level and bring its contribution to the growth of the company besides their own.

f) Meritocracy. Responsibilities, recognition should be awarded to those who deserve it, to whom are capable. Evaluation of results should be made on the basis of objective, measurable and documented.

g) Results-oriented attitude. Commitment and results are not synonymous, our destiny is determined by results rather than just commitment. While these technologies is often a prerequisite for the result, which must always be recognized, the results are always rewarded. The aim of all must therefore always be to continue the results more objective and quantifiable.

5. Conclusion

Globalization, innovation, value creation, quality, teamwork, customer orientation, new powerful technologies, competitiveness, development, and excellent results are a possibility. Culture is the reality, often with deep roots. In this era of an increasing level of complexity and an equally growing need for expertise and professionalism is not difficult to infer that win and will win more and more organizations and territories with the best popular culture at the level of critical mass.

The Ethical Consumer in the Context of Globalisation

Oboroceanu (cas. Popa) Ioana Anda,
Manea Ioana
Al. I. Cuza University,
a_oboroceanu@yahoo.com;
ioanna02manea@yahoo.com

Abstract

This paper introduces the concept of shopping ethically. It includes a bit about the philosophy behind what we do and some background to the main issues that made it so important. It also gives us some guidance on getting started as an ethical consumer and explains the different ways that we can make a difference when we go shopping.

Expenditure on ethical goods and services has grown almost threefold in the past 10 years. Ethical Consumerism means adopting a different perspective on our disposable income. It's not just the links between the product and its impact that ethical consumers need to consider, but the activities of the company behind the brand. A less number of multinational companies own a large proportion of our favorite brands.

As consumers, we have a great deal of power in our pockets and we've already experienced change.

Key words: globalization, ethical goods, ethical consumption

JEL classification: F0, D10

1. What is ethical globalisation?

Today's globalization is one of stark contrasts. There are many connections - markets, people and ideas linked as never before. At the same time, there are more divisions - between North and South, between rich and poor, between the powerful and powerless.

These divides can be seen in statistics. At a time of unparalleled prosperity for some, 54 countries are poorer now than they were a decade ago.

In 14 countries, more children are dying before their fifth birthday. In 21 countries, more people are going hungry. In 34 countries, life expectancy has fallen.

Worldwide, the number of people living in absolute poverty and daily insecurity has not changed for more than ten years, with women and children suffering disproportionately.

No one will deny any longer that turmoil in one region can spread rapidly to others, through terrorism, armed conflict, environmental degradation or disease as demonstrated by the rapid spread of AIDS around the globe in a single generation.

While the connections are obvious, we seem further apart in finding ways to tackle global problems in a coordinated way where the burdens and responsibilities are shared.

Globalization has not only become one of the most fashionable words for politicians, businessmen, union leaders and economists alike, but the word also became the scapegoat for everything that goes wrong in the world. In the minds of many politicians and citizens from the developing countries, globalization is to blame for the financial crises and negative influence, because the capital invested in the savings potential is abruptly withdrew at the first sign of weakness or economic policy. For many unions and political parties in the developed world, globalization is blamed for job destruction and growing of income inequality as international competition brings with it social dumping from countries with low wages and unhuman working conditions. Many governments blame globalization for the rapid loss of national sovereignty, because they realize that states and governments have to diminish the power and authority in front of unchecked growth and influence of multinational corporations and financial markets.

First - globalization involves a greater economic efficiency and an increased productivity and also economic growth by coordinating with the latest wave of technological innovation. On the other hand - globalization causes a fragmentation in production processes, labor markets, political entities and even societies. It combines the benefits of innovation and dynamism with the negative impact of financial crisis or other kinds of economic shocks. Globalization is not an unlimited source of benefits for humanity, as some say, but it is not guilty of all evils which is held responsible. In the economy - nothing is absolutely and everything is relative.

It is a fact that globalization of markets and companies lead to a greater expansion than governments. This is a positive development after many decades in which opposite situation prevailed.

Both markets, and governments are needed and also tend to have failures when they lead, but markets are sure to correct them faster and better than governments.

This change of management generates contradictions which we have to struggle to. One of this is that market is developing through a complex process of individual decisions, while democracy is the product of collective decision, approved by majority. Another is that markets are better developed where there is less government intervention.

However, the society is looking for a greater economic security and a social stability. Globalization is based on rules that prevent social disintegration, and elect governments to ensure cohesion and social protection.

Ethical globalization requires greater recognition of the responsibility of the international community to help people who have been denied their fundamental rights. This requires taking human rights beyond their more traditional political and legal realms and applying them to other fields.

2. What is ethical and fair trade?

"Ethical consumer approach ethical issues with a mind-boggling thoroughness and integrity that makes everyone else look like a charlatan." [4].

There is not an universal definition of „ethical“, but broadly speaking when we talk about an ethical product, we mean something which has not harmed or exploited humans, animals or environment. Sometimes, we would go further and say that an ethical product or company is one that actively benefits humans, animals or the environment.

The origins of the most inspiring examples of ethical actions by consumers lie in 1970's, when the first fair trade initiatives started. Ethical banking made an appearance with the first social banks starting up in the USA and Europe. Early ethical investors stumped up money to put into worker co-operatives. And alternative technology was born.

These pioneers were engaged in a timeless struggle to run ahead of their own era, and to create new possibilities.

The simplicity of their idea – not that you can do everything through what you buy, but that you can do something – was educative. Even so, mainstream business was slow to adapt to the opportunities of ethical consumers and leadership came from the margins – the ethical minnows – the small firms and social enterprises connected to the consumers communities that sustained them.

Ten years later, the first products with “fair trade” labels began to appear on the shelves. The marks guaranteed that what you buy is produced by people in decent conditions, and that they get a fair share of what you pay.

From these beginnings, there are many markets in which ethical consumers have had a significant effect – from animals testing and lead in petrol through to organics and animal welfare in farming. Ethical consumerism has grown to be a force to reckon with.[27]

Whatmore [24] tried to define ethical trade as a “relational” based on the networked relations of consumers, producers, commodities, and productive nature. Goodman [10] has described this relational ethic as forging links of eco-social “right action” that is qualitatively different from the concerns of food safety that inhabit the meanings of organic and/or local foods.

As its structure and the use of the byline of “trade not aid” suggests, ethical trade is not just an emotional caring response on the part of consumers to the plight of poor coffee farmers. Indeed, embedded in these networks

is what Whatmore & Thorne [24] described as a sense of “enterprise”: the practicalities of commodity production, marketing, and expansion. Mediating each other then, are the business of development built on a particular expanding niche value-added market and a non-market morality populated by reflexive consumers “... different from that of the cost-minimizing, self-interested individual of neoclassical economic theory” [24]. It is here that K. Soper [23] statement rings true that “... many of the changes in the moral economy originate more in the sphere of cultural and personal politics than the formal economy”. Situated thus, the ethical “praxis” of fair trade is born out of the choice of the consumer who feels a committed responsibility to the producers growing fair trade commodities. Not surprisingly, this moral praxis is fraught with continual tension between the proclivity for both enterprise and ethics.

At the very least, ethic trade means not losing the politicized consumer-education component of fair trade behind the façade of the fetishized brand names that are quickly taking over many products and markets.

It’s not just the links between the product and its impact that ethical consumers need to consider, but the activities of the company behind the brand. A small number of multinational companies own a large proportion of our favorite brands. Many of

these companies are involved in a range of unethical activities.

These days, it seems that everyone has jumped on the bandwagon. This isn’t necessarily a bad thing. It’s encouraging that the big companies are making ethical products and investing in ethical brands.

Broadly, fair trade networks work through the recognition that the poorest farmers and cooperatives deserve more help than others. Philosophically, this type of moral economy conforms to an “ethics of partiality” that holds that some deserve more care than others.

3. Ethical consumption

Ethical consumption represents a distinctive strategy for connecting the politics of consumption with the practices of being a discerning, choosey consumer.

Ethical consumption is also distinct from the related and growing area of ethical investment [5]. It seeks to embed altruistic, humanitarian, solidarity and environmental commitments into the rhythms and routines of everyday life – from drinking coffee, to buying clothes, to making the kids’ packed lunch.

Ethical consumption seems to fall under the description of what C. Pattie call “individualistic activism”[22], as distinct from both contact activism and collective activism. It involves relatively anonymous individual acts, as distinct from acts which aim to contact people in authority or those which involve participating alongside other people. But there is no need to see different modes of civic engagement as mutually exclusive. People who engage in individualistic activism such as ethical consumption “are no more or less likely to engage in collective activities or to contact the authorities than those who are not “individualistic activists”[22]. Ethical consumption actually combines elements of all three of these ideal-types of civic engagement. It might therefore be better characterized in terms of what Micheletti [18] calls “individualized collective action”: “citizen-prompted, citizen-created action involving people taking charge of matters that they themselves deem important in a variety of arenas”; which it distinguishes from various political engagements “involving taking part in structured behavior already in existence and oriented towards the political system per se” [18]. The emergence of individualized collective action is, however, dependent on the activities of various intermediary actors – non-governmental organizations, advocacy groups, social movement organizations. These facilitate innovative forms of civic and political participation which are appropriate to situations where “citizens must juggle their lives in situations of unintended consequences, incomplete knowledge, multiple choices and risk-taking” [18]. Considering these elements, we analyze ethical consumption as part of an emergent politics of choice distinct from a longer established politics of loyalty based on parties and elections. P. Norris [21] argues that this new style of politics is distinctive for

two reasons. Firstly, it is associated with particular repertoires used for political expression (e.g. buying or boycotting products, petitioning, demonstrating). Norris calls these “cause-oriented” repertoires. And secondly, this new politics of choice is associated with particular agencies that serve as the mediators of engagement and participation. These tend to be issue-based organizations, depend on relatively high levels of expertise, and focus on the production, exchange and distribution of knowledge and information. They are certainly distinct from political parties and are also more like advocacy groups than the activist-based organizations often taken to exemplify so-called “new social movements” [6] and [13].

Ethical consumption discourses also contain elements of deontological understandings of moral obligations. They often invoke highly universalized arguments about people’s responsibilities to care for others – whether this is other people, other creatures, the environment, or future generations.

The preceding discussion of the pitfalls of moralizing in discuss of ethical consumption suggests that it might be useful to distinguish between two senses in which ethics and consumption can be related. On the one hand, there is a set of debates concerning the “ethics of consumption” [27], where what is at stake is a judgment concerning the morality of a whole system of provisioning, that of capitalist commodity production [26]. Perhaps this is the dominant sense in discussions of environmental problems, debates about sustainable consumption, and in movements such as voluntary simplicity and the slow food movement. Here, it is “consumption” itself that is the object of moral evaluation. The aim of these projects is the reduction of levels of aggregate consumption.

On the other hand ethical consumption also refers to a set of debates and strategies in which consumption is not so much the object of moral evaluation, but more a medium for moral and political action. This is the dominant sense in the case of consumer boycotts, ethical audits, corporate social responsibility initiatives, and fair trade campaigns. Commodity consumption as a

mode of provisioning is taken as given – assumed to be open to some transformation certainly- but not taken as the object of moral evaluation as such.

These two senses of ethics and consumption [27] are not completely separate. Lots of ethical consumption campaigns are geared towards reducing overall levels of consumption. Others also play upon the standard desires and motivations of consumer behavior, deploying the strategies of advertising, marketing, branding and so on. But distinction is important to keep in mind for two reasons. First, it raises questions about how these two distinct concerns – consumption as the object and medium of moral action – are connected in different contexts. Second, it raises the question of just what are the moral and political issues most at stake in discussions of ethical consumption.

4. Globalisation responsibility and empowerment

In ethical consumption, globalization is presented as simultaneously providing people with opportunities for innovative engagements as consumers just as it also implicates them in an ever expanding range of consequential entanglements.

“Globalization means that people concerned about social or environmental issues can no longer, in many cases, just lobby their own government for regulatory solutions.[8] “Globalization has brought about a huge increase in product choice which has significantly increased the power of consumers in modern markets” [8].

And in turn, this is used to explain the growth of consumer-oriented campaigning across a diverse range of causes and issues:

“We are fast approaching the situation now where it is unusual to find a pressure group without some kind of “consumer awareness” campaign aimed at influencing corporate behavior” [8].

The metaphor which is most frequently used to describe this new form of consumer power is that of “voting”:

“We don't have to feel powerless about the world's problems. Our till receipts are like voting slips – they can easily be used constructively [...]. If you care at all, it's

really simple to do something about these difficult issues, just by making good choices while you're out shopping"[9].

It is just at this point, when the classically "political" function of voting seems to have transmuted into an essentially "economic" function of exercising consumer choice [7], that the wider articulations of this sort of consumer-oriented activism become visible.

The sorts of "global feeling" that are mobilized by ethical consumption campaigns aim to sustain collective participation in networks of national and local politics:

"Ethical buying is not a substitute for other forms of political action. Nor is it necessarily just concerned with individual consumers. Ethical purchasing is, for example, already being organized by societies, campaign groups, private companies, local authorities and national governments" [8].

There are two dimensions involved in this re-inscription of globalization. Firstly, it involves a claim that people are now implicated in much more extensive spatial networks of exchange, exploitation and advantage, so that this narrative ascribes to people a much broader range of responsibilities: to the environment, to workers in distant sweatshops and so on. But secondly, this ascription of responsibility by virtue of implication in the global market turns out also to provide the medium through which people are told that they are empowered to act on these new responsibilities: as consumer-activists, or perhaps shareholder activists. Understood as one vector of a distinctive strategy which provides "new ways for people to be" [11], the organizations involved in ethical consumption simultaneously make it possible for people to recognize themselves as consuming subjects and as responsible subjects.

Many authors characterize globalization by juxtaposing capital mobility and reactive governments:

"Large corporations have a significant advantage over governments. They are able to cross borders much more easily. The transnational corporations with their massive stocks of private capital are much more influential on the global stage than any government or even intergovernmental agency can be"[25]. In terms of the criteria

noted above, this type of rhetoric clearly reproduces rather than contests a well-established discourse of globalization as a clear-cut shift from state-regulation to market-regulation of economic affairs. In these examples, the empowerment of "the consumer" as an ethical actor is placed firmly within what one might call a "neoliberal" frame which takes for granted the natural operations of markets, price signaling and the aggregation of preferences. These sorts of accounts seem, then, to confirm the argument of J. Litter [15] argument concerning the lack of reflexivity in much of what she characterizes as the "anti-consumerism" movement.

Other organizations adopt a stance in which the individual and collective dimensions of "ethical" action are not seen as substitutes for one another but are aligned as part of a broad movement of mobilization in markets, public spheres and formal political arenas.

5. Conclusions

Ethical consumption seeks to connect the activities of everyday, domestic social reproduction – shopping, doing the laundry, preparing dinner – to a range of "big" public issues such as human rights abuses, labor rights, environmental sustainability or global trade justice. This blurring of the public/private distinction [19] is in turn of responsibilities addressed to the potential subjects of ethical consumption campaigns. The targets of claim making by ethical consumption campaigns are, however, not restricted to national governments. More often than not, they directly address business corporations or international regulatory institutions.

One key question for the critical analysis of ethical consumption is whether this mobilization of the figure of the empowered consumer is made in ways that connect with forms of collective, participatory engagement, or whether it wittingly or unwittingly reproduces a marketised discourse of privatized, anonymous choices. This is an important tension within the broad movement of consumerised activism of which ethical consumption is a part [16].

A great deal of ethical consumption campaigning takes the rhetoric of the “hollowing out” of the nation-state and turns it into an empowering address to consumers to realize their new-found influence. There is a two-step move which is involved here: first, it is asserted that all effective power is now concentrated in the hands of global economic actors, whether businesses or international regulatory institutions; on the other hand, the response to the implied crisis in accountability that follows from this redistribution is already at hand, generated by the very same forces that give rise to the initial problem – people are now empowered as consumers.

Abstract

This study aims to highlight the factors which determine the employability of higher education graduates in the knowledge-based economy. We analyzing the employability issues from the perspective of higher education institutions, which are increasingly seen as the principal provider of the knowledge workers, as well as the main culprit for the eventually unemployment of their graduates. In our paper we do a review of the employability literature in order to reveal the whole range of factors which make some graduates more employable than others. Our goal is to sustain by evidences that providing qualified workforce is as important as creating conditions to manifest it in order to create a competitive economy, and this assume the implication of universities, individuals, employers, as well as the national level management for education.

Key words: higher education, knowledge-based economy, employability

JEL classification: M12

1. Introduction

Nowadays, higher education is producing a mass market of potential knowledge workers and they intersect with the shift towards a so-called knowledge-driven or post-industrial economy. Widening participation in higher education has become a global policy 'education-to-work' transition of new graduates and the extent to which they are readily 'employable'. Universities are subsequently under growing pressure to equip

objective, with considerable quantitative success. Student enrolment worldwide increased from 13 million in 1960 to 82 million in 1995 and to 132 million in 2004 (UNESCO, 1998, 2006), and this is a positive aspect as long as economic performance is increasingly associated with a skilled workforce.

But, in the same time, as more graduates enter the labor market the value of academic credentials as screening devices is reduced. While Smith et al. [6] found that a 'good' degree performance substantially reduces the probability of unemployment and inactivity, there is an increasing view that qualifications, despite signifying a general level of ability, do not necessarily equip individuals with skills necessary for particular occupations [5]. The 'scientific-technological revolution of our time' is transforming the nature of managerial and professional work, leading to mass proletarianisation and mass unemployment and only a small occupational elite is able to preserve their personal autonomy and fulfillment through their work. Graduates have to find new ways of gaining distinction in a world where educational qualifications are no longer sufficient in themselves to guarantee success. It seems that no one and nothing can guarantee employment in a competitive global environment. [4]

The expansion of higher education participation in many OECD countries in recent decades has led to increasing interest by researchers and policy-makers in the

ever greater proportions of the population with the higher-order skills which can be used productively and substantial resources have been invested in efforts to develop students'

employability skills while they are at university. [7]

Without denying the importance of the skills and aptitudes gained by graduates during university, we argued in the present paper that even when people are 'employable' they may fail to find suitable jobs because of different causes as: market congestion, social background or individual characteristics and perceptions of the work environment. Based on the literature viewing employability of university graduates we discussed about differentiating factors between equally well-qualified individuals on the labor market. We also considered the aspects regarding the graduates' skills as determinant factor for their employment. We also stated that, in this article the idea of a knowledge-driven economy is restricted to the labor market for those with graduate qualifications who represent an increasingly large proportion of labor market entrants. These are purported to be the 'knowledge workers' of the future and are expected to command high levels of general and specialist knowledge.

2. Employability skills as determining factor of the graduates' employment

The knowledge-driven economy requires individuals with the types of knowledge, skill and creative potential who can meet the challenges of a global economy characterized by rapid change. Employers want recruits who are going to be effective in a changing world. They want people who can deal with change and thrive on it. They want intelligent, flexible, adaptable employees who are quick to learn. In a world of uncertainty, employers want people who are able to work on a range of tasks simultaneously. They do not need people who are resistant to new approaches or slow to respond to cues

The importance of employability skills is well documented in an era which demands a value-added approach. The educational literature offers a large number of expectations in this matter, so the number can be as high as 80. However this could be reduced by categorizing them into: *personal qualities* (e.g. independent learning, willingness to learn); *core skills* (e.g. communication, numeracy, working with others, problem solving); *process skills*.

Another classification divides employability skills in *hard skills* (e.g. analysis of business problems; formulation of long term plans, interpretation of meaning from numerical data) and *soft skills* (e.g. motivation for life – long learning, communication, and effective time management). Van der Heidjen (2006) identifies four general categories of competences: (1) *anticipation and optimization* – refers to the skills that make a potential employee proactive by creating the future himself instead of merely performing fixed tasks, (2) *personal flexibility* – relates to the capacity of smooth transitions between jobs and between organizations, (3) *corporate sense* – means that employees have to participate more as members of an integrated team, identify with corporate goals and accept collective responsibility for the decision-making process and (4) *balance* – it is about compromising between opposing employers' interests as well as one's own opposing work, career and private interests and between employers' and employees' interests. [9]

Studying the literature one can also observe that there is a general need among employers for graduates to possess and demonstrate skills that are relevant and applicable to working in their organizations, but this need is not being met. There is a gap between the skills graduates present to their employers on career entry and the skills employers expect from these graduates.

To resolve these problems, higher education institutions are the most important in order to enhance the employability of their students. There are four broad areas of activity that higher education institutions are engaged in to help develop student employability:

a. Embedded attribute development in the program of study, often as the result of modifications to curricula to make attribute explicit or to accommodate employers' expectations;

b. Enhanced or revised central support for undergraduates or graduates in their search for work;

c. Innovative provision of work experience opportunities within, or external to, programs of study;

d. Enabled reflection on and recording of experience, attribute development and achievements alongside academic abilities, thorough development of "progress files" and "career management programs".

But even if that all these actions work perfectly and universities will provide just employable graduates (according with the employers' expectations) will still remain graduates that will not have a job according with their specialization. Various studies have suggested that recruitment and progression in employment continue to be dogged by bias and inequitable treatment. This means that there are some other factors that affect the employment, and they will be presented below. [2]

3. Labor market conditions as determining factor of the graduates' employment

Brown et al. argue that employability is primarily determined by the labor market rather than the capabilities of individuals. They believe that it is a form of victim blaming of those people who are unable to secure employment. Considering the individuals are solely responsible for their situation on the labor market it is another example of personalizing, individualizing or socially decontextualising broader employment issues. Employability varies according to economic conditions.

An individual's employability will be influenced by how employers view and value the credentials, knowledge, skills, attitudes and attributes, as well as the skill demands of the labor market. Organizational culture and structured support also play a crucial part in making new employees effective. Employability cannot, therefore, be defined solely in terms of individual characteristics. This is because employability exists in two dimensions—the relative and the absolute. Virtually all policy statements on employability fail to grasp the *duality of employability*.

Policy debates have concentrated on the issue of whether students have the appropriate skills, knowledge, commitment or business acumen to do the job in question. This *absolute* dimension of employability is not inconsequential. It relates to what Gellner termed the production of 'viable human beings'. The increasing policy emphasis on graduate employability, in part, reflects the increasing importance of knowledge, skills and commitment of employees as a source of efficiency, innovation and productivity. The

personal is productive. However, employability is also a *relative* concept that depends on the laws of supply and demand within the market for jobs. [1]

4. Social background as determining factor of the graduates' employment

The literature shows that many graduates are not utilizing their knowledge and skills from their higher education, that not all are able to 'cash in' on their investment in higher education, and that there are still 'positional' differences between graduates on the basis of social class, gender and ethnicity. The graduate premium or exchange rate of qualifications in the labor market differs according to the social identity of the graduate. More, Purcell et al. found that social background appears to be strongly correlated with employment outcomes, even among graduates. For those from disadvantaged backgrounds attempts of finding decent jobs are largely futile as the best jobs are often assigned to social elites with the appropriate cultural capital. Decades of research have shown that when one shares the same cultural literacy as teachers and employers, it does not guarantee one's success but it greatly increases the probability of achieving it. When employers reject candidates as unsuitable it could be argued that they are being rejected for lacking 'cultural' capital. There is absolutely no doubt that this happens when people are seen to have the wrong accent, dress inappropriately at an interview, or do not know the rules of the game when candidates are invited to a formal dinner to meet company employees.

Another factor which affects employability and is not necessarily connected with the skills of graduates is the reputation of the university graduate. The causal relationships between socio-economic background and employment are complex as social class tends also to be correlated with the type of university attended and course completed, rather than solely with recruitment practices. Brown and Scase's (1994) empirical study shows how employer perceptions about the 'quality' of graduates from certain universities and departments continue to influence transitions into employment. In the context in which higher education institutions have to face the

economic competition, we have to admit that is hard to believe there are institutions which do not, within certain limits, quit acting just to survive in a competitive market. So it's time to see the reputation of certain universities with more discernment. [10]

Social closure is another factor that affects the meritocratic selection of graduates. It is recognized so all over the world but we appreciate Romania is even a special case. Social closure theorists sustain that social elites were no longer able to rely on social ascription and 'proof of ancestry' (aristocratic breeding) as a way of directly transmitting social advantage to their children. Today, the process of obtaining a "good job" has to be based on a declaration of formal equality before the law, where entry into elite groups is ostensibly open to all through a competition for credentials, jobs and property. In practice this formal equality obscured the ability of elites to rig the competition for jobs by restricting access to the supply of credentials.[1]

5. Individual characteristics and perceptions of the work environment as determining factor of the graduates' employment

Individual characteristics and perceptions of the work environment might affect employability orientation. Despite the popularity of the concepts of employability and organizational flexibility, employees' attitudes toward employability development have received little research attention.

Although a review of the literature suggested that individual characteristics and perceptions of the work situation are important antecedents of employees' attitudes toward career changes and development activities. Employability orientation may vary with certain individual characteristics as types of dispositions, attitudes and identities they develop around their future work and employability. Research has shown a relationship between personality traits and several career variables Two personality traits were considered important antecedents of employability orientation: openness and initiative.

Openness refers to being open to new ideas and changes. Meta-analyses have demonstrated that openness is a valid predictor of training success. Measures of this

personality dimension have also been found to correlate positively with beliefs about the importance of improving oneself, and negatively with the belief that a structured work environment is important.

Initiative refers to an autonomous posture and behavior that is self-started and proactive in contrast to being reactive and following orders. Research has revealed positive relationships between initiative and several career related variables, such as career planning, innovation, career initiative, employability, and entrepreneurial activities.

Unfortunately there is still a tendency to view students in 'universalistic' terms; that is, as rational investors in education who approach the labor market in uniformed and stereotypical ways (Rees *et al.*, 1997). Such assumptions typically negate the different orientations and work-related identities learners develop in relation to their future labor market activities.

The work of Holmes (2001) has been important in highlighting this issue and argues that employability should be conceptualized as a form of identity; it is relational, emergent and influenced largely by graduates' 'lived experience' of the labor market. Individuals' experiences of work are subjective, and this is likely to influence their actual labor market outcomes and further shape their propensity for employment. Employability in this sense may be seen to be value- and identity driven, relating to graduates' own dispositions and biographies. Work is not purely a technical matter which individuals undertake: it is a personal matter which involves the location of self and identity in an ongoing social process of engagement with the labor process within which they operate.

Theories of self and identity have taken an increasingly important role in sociological endeavor. The work of Giddens (1991) and Beck *et al.* (1994), in particular, have highlighted the important role identity has in the way individuals position themselves within the social and economic world. Giddens argues that identities have a reflexive and self-monitoring character: individuals are continually engaged in a reflexive process around issues of who they are and how they should go about managing their 'projects' of the self. Crucially, individuals draw upon various knowledge resources, both formally and informally

channeled, which they use to negotiate social and economic structures.

A qualitative study of 53 final-year undergraduates in a university in the UK, revealed students now no longer anticipate a clear link between their merit in education and its reward in the labor market. Many students, particularly those whose future aspirations are strongly geared around their future employment, now perceive the need to develop more proactive and aggressive labour market strategies. This goes far beyond what they achieve in the formal education setting. [8]

6. Conclusions

The evidence clearly demonstrates that many graduates are marginalized from high-paid, fast-track employment, and that existing patterns of inequality are likely to continue well into the future unless employers find appropriate ways of managing the large bulk of talent entering the labor market. Universities may in fact be limited in their capacity to enhance the employability of their students, even though policy-makers consistently argue that they have a pivotal role. Teaching and learning policies around graduate employability may only have a minimal impact in aiding the labor market trajectories of graduates. At best, they may merely be a compensation for effective and equitable employer strategies for organizing graduate talent.

However, the way students, graduates and employers make sense of and attempt to manage the problem of graduate employability, as well as their aspirations and expectations, presents some serious challenges for higher education in the new economy. We do not intend to deny the important role of the universities in making graduates employable, but we appreciate that the employment of graduates is a very sensitive performance indicator in quality audits of the higher education institutions. Harvey [2] for example, criticizes current methods for measuring employability outcomes based on the proportion of graduates who achieve a full-time job within a certain period of time for assessing employability as an institutional achievement rather than that of the individual. Other authors, including Knight [3], have argued that the relationship between employability

and employment is, in any case, heavily mediated by unequal access to employment opportunities and labor market preferences. Morley [4] supports this view: she argues that employability has become a performance indicator within higher education, which overlooks 'how social structures such as gender, race, social class and disability interact with labor market opportunities'.

This is intended to highlight the fact that graduate employability is primarily about the relative chances of finding and maintaining jobs as knowledge workers (lawyers, doctors, journalist, middle or senior management). It also erroneously assumes that the competition for education and jobs is based on a meritocratic contest that negates class, gender and racial inequalities.

Department of Chemistry and Industrial Commodity Science,

Gdynia Maritime University, Poland

E-mail: krysie@am.gdynia.pl

Abstract

In this paper the kinetic analysis of quality and utility based on the average market prices of 10 selected used cars, produced in years 1997-2005, were conducted. Price changes of all examined cars were described as a convex downward-sloping curve over time. On the basis of the price change kinetic functions, the orders of processes, the velocity rates, the acceleration rates, the resistance rate, as well as the attractiveness rates have been calculated. The price change velocity denotes marginal changes of second-hand car price during the time. The price change acceleration denotes the consumer downward pressure on the used car price, whereas the resistance rate represents supplier's upward pressure on price. Attractiveness rate describe perceived quality and utility of a product. In that investigation the data attractiveness rate increase when dynamic indicator grew up. For each car model, the decrease in price caused increase in velocity rate and acceleration rate.

Acceleration rate and resistance rate were presented in this paper as a new dynamic approach of measuring the pressures on price in supply/demand analysis.

Key words: quality, utility, price changes, second-hand cars, kinetic analysis

JEL classification: C81;

1. Introduction

To get around easily in today's cities in Poland, especially in their sparsely populated suburbs, access to a private motor vehicle is not only very convenient but sometimes absolutely essential. The widespread use of automobiles in recent years by Polish residents instead of using public transit is a major factor that led to the rapid increase in demand for passenger cars, and especially for cheap second-hand passenger cars, brought from abroad, mainly from other European Union countries. For many years in the motor vehicle market in Poland it is observed the significant dynamic growth.

The large demand for used cars in Poland caused that in the market appeared new ideas to satisfy customers' needs. The global car makers in Poland began to participate actively also in the second-hand car market, seeing potential economic benefits for themselves. They invented and launched the innovative program of selling used cars of all brands and models in their outlets in the whole country.

Most of this increase in demand for passenger cars was attributed to serious social, economic and political changes in Poland, connected directly or indirectly with the accession of Poland to the European Union. Over the recent years the quantity of the second-hand cars imported is average three times greater than the quantity of new ones sold in the primary car market.

All the mentioned factors are product characteristics, which describe how much attractive a car is to a potential customer. A

product attractiveness level is a very important market variable, because it effects on the potential demand and generates revenues and profits for a company or a dealer.

In this article, we focus on the relationship between the second-hand passenger car price changes and the quality and utility of the cars. Changes of quality and utility of the cars during the definite period are presented by their market price changes. Prices of used cars depend mainly on their age in calendar year. Those prices bear a close relation to the expected discounted value of the flow of future utility that a car can provide to its owner during the remainder of the car's lifetime. As a car grows older, it's expected remaining lifetime decreases. Thus, older motor cars fetch lower prices on the used car market. At the same time, we are interested in identifying the characteristics of the market forces, that effect the attractiveness level of a product [5].

2. Methods

This article is based on the data collected by the 2006 Eurotax publications and other Internet-based second-hand car average market prices [1]. The base of investigation were average prices of 10 selected used cars models, produced in years 1997-2005 and sold in the Polish car market in 2006.

There are following passenger car brands under examination: Citroen (1 model), Ford (6 models), Lancia (2 models) and Nissan (1 model).

In this paper, the used car price changes were described by kinetic models rates. Using kinetic functions, the n orders, the velocity rates $V(M)$, the acceleration rates $A(M)$, the resistance rates $R(M)$, and the attractiveness rate $F(M)$ of all the processes have been calculated. The price change velocity denotes marginal change of second-hand car price during the time. The price change acceleration denotes the consumer downward pressure on the used car price, whereas the resistance rate represents supplier's upward pressure on price. The attractiveness rate describes perceived value (quality and utility) of a product. In addition to those calculations, all the value changes indexes were estimated [2÷8].

Symbols used in this paper:

t – time
 M_0 – initial price of a used car,
 M_K – final price of a used car,
 M_t – price of a used car during time t ,
 \hat{M}_t – price of a used car during time t , estimated theoretically,
 $V(M)$ – price change velocity rate,
 $\hat{V}(M)$ – price change velocity rate, estimated theoretically,
 $A(M)$ – price change acceleration rate,
 $\hat{A}(M)$ – price change acceleration rate, estimated theoretically,
 $R(M)$ – price change resistance rate,
 $\hat{R}(M)$ – price change acceleration rate, estimated theoretically
 $F(M)$ – price change attractiveness rate,
 $\hat{F}(M)$ – price change attractiveness rate, estimated theoretically,
 P_K – value change index,
 n – dynamics indicator, n order,
 w_n – velocity constant rate, velocity rate indicator,
 a_n – acceleration constant rate, acceleration rate indicator,
 as – downward-sloping convex model.

Price changes of all examined second-hand passenger cars were described as a convex downward-sloping curves over the age of a car. Hence, the curves show the relationship between the prices of used cars and the processing time. All the curves analyzed in the paper have a model form of as . Model as represent an inverse relationship between the second-hand car price and the age of the car and also are characterized by the decrease of prices with increasing velocity rate during time t . The curves can be described with high accuracy by downward-sloping convex models as , with special importance of the n order of the description of the process function. The n order is understood as an indicator of the mechanism, or of the process course, as well as the rate constant of the n^{th} order of w_n being an indicator of the change velocity rate. Hence the n order is an indicator of the process dynamics [4; 7].

The values for the price change velocity rates $V(M)$ were found in accordance with the following formula [2 ÷7]:

$$V(M) = w_n \cdot M_t^{-n} = -\frac{dM_t}{dt}, w_n > 0, n \geq 0 \quad (1)$$

The price change velocity rate denotes marginal change of second-hand passenger car price during the processing time.

The values for the price change acceleration rate $A(M)$ have been calculated using following equation [2]:

$$A(M) = a_n \cdot M_t^{-n-1} = -\frac{d^2M_t}{dt^2}, a_n > 0 \quad (2)$$

The price change acceleration function is the second derivative of the price function and denotes the level of consumer's pressure on used car price to fall.

The resistance function $R(M)$, refers to the level of suppliers upward pressure on a used car price. All the series have been calculated using following formula [2]; [4]:

$$R(M) = \frac{1}{A(M)} \quad (3)$$

The force of the product attractiveness $F(M)$, called the attractiveness rate, have been calculated using equation [5; 6]:

$$F(M) = M_t \cdot A(M) \quad (4)$$

The force of attractiveness describes the attractiveness level of the second-hand passenger car. The function of the attractiveness shows the power of the effects of the quality and utility of the used car on decision making of the consumers as well as the suppliers.

All the calculations in this work were done with the estimated (theoretical) values of M_t (price) – \hat{M}_t and further $\hat{V}(M)$, $\hat{A}(M)$, $\hat{R}(M)$ and $\hat{F}(M)$ values were applied. The average deviation accuracy of empirical values and estimated (theoretical) values – e_m [%] of curves description was also calculated.

In addition, the values of changes between initial values and final values P_K , were calculated. Index P_K denotes the percentage change of the final value of the measure in relation to the initial value of that measure,

expressed in the relative scale. The values of P_K indexes have been calculated using the following formula [2÷7]:

$$P_K = \frac{X_K \cdot 100}{X_P} \quad [\%] \quad (6)$$

where:

X_P – initial value of a measure,

X_K – final value of measure.

All the calculated P_K indexes in this paper were named: velocity index, acceleration index, resistance index and attractiveness index.

3. Results and discussion

In this paper only a part of the wider research on the second-hand passenger car market in Poland was presented [5; 6]. The kinetic analysis of quality and utility using the average market prices of 10 selected used passenger cars were conducted. All the examined car models were collected in Table 1. and arranged in order of the increasing dynamics, represented by dynamics indicator n .

Table 1. Results of dynamics estimation of 10 examined second-hand car models

Car model	n (as)	$V(M)$ index [%]	$A(M)$ index [%]	$R(M)$ index [%]	$F(M)$ index [%]
Ford-Focus 1.6 Comfort	1,2	150,2	210,6	47,5	150,1
Nissan-Maxima QX 3.0 SE	1,42	169,1	244,8	40,8	169,1
Citroen-C3 1.1 SX	1,48	152,2	202,1	49,5	152,2
Ford-Focus 1.8 TDCi Ghia Kombi	1,52	167,3	234,8	42,6	167,3
Lancia-Lybra 2.0 Emblema Kombi	1,53	149,8	195,1	51,2	149,8
Ford-Focus 1.8 Comfort	1,65	175,1	246,1	40,6	175,1
Ford-Focus 1.6 Comfort Kombi	1,71	177,9	249,2	40,1	177,9
Lancia-Lybra 1.6 LS Kombi	2,2	156,8	192,4	52,0	156,8
Ford-Focus 2.0 Ghia	2,42	141,2	162,9	61,4	141,2
Ford-Focus 1.8 TDDi Ambiente	3,08	156,7	181,3	55,1	156,7

The price changes of all examined passenger car models were described as convex downward-sloping curves over time t , and called as models. All the cases have orders of processes n between $1as$ and $3,08as$. Rising n value of an as model shows increasing change dynamics. Parameter n is the main dynamics indicator in this paper. The most dynamic price decreases were observed at Ford-Focus 1.8 TDDi Ambiente ($n = 3,08as$) and the less dynamic falls at Ford-Focus 1.6 Comfort ($n = 1,2as$), as presented in Table 1.

Each second-hand passenger car model is characterized with the rapid decrease of its market price. The changes of prices of used cars are shown by the increase of the velocity rates $V(M)$, average to 159,63% and more rapid increase of the acceleration rates $A(M)$ of the processes, average to 215,93%. The resistance rates $R(M)$ decreased significantly, average to 48,08%. The attractiveness rates of all examined car models went up, average to 159%. It is shown by the values of changes between initial and final values – P_K indexes in the Table 1, Figure 1, Figure 2 and Figure 3.

As the acceleration rate $A(M)$ represents the market pressure on second-hand car price to fall, the increase of $A(M)$ rate is attributable to relative high performance of perceived quality and utility. The acceleration rate $A(M)$ in quantitative and dynamic way measures the downward pressure on price in supply/demand analysis. In the same way, the resistance rate measures the upward pressure on price in supply/demand analysis, whereas the attractiveness rate measures the quality and utility of a product.

Very high accuracy of curves description as the average deviation of empirical values and estimated (theoretical) values was found (average $e_m = 0,3\%$).

In spite of the fact that all changes in prices over time are described as the downward-sloping convex models, those changes are not always the same. It's shown by the price change velocity and acceleration indexes (Table 1, Figure 1).

The price change velocity rate as the first derivative of the price function represents marginal changes of second-hand passenger car prices during time.

Price change acceleration rate is the second derivative of the price function.

Figure 1. Velocity and acceleration indexes of 10 examined second-hand car models

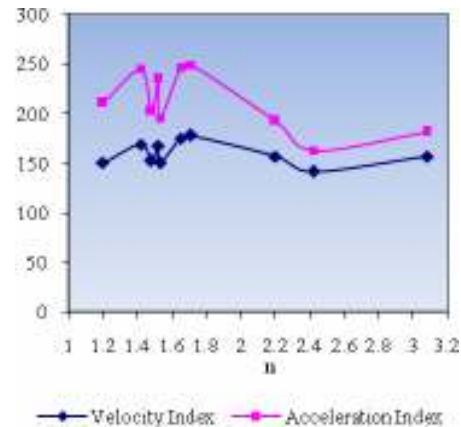

Figure 2. Acceleration and resistance indexes of 10 examined second-hand car models

Figure 3. Price and attractiveness indexes of 10 examined second-hand car models

It describes the market downward pressure on used car price. Hence the consumer's pressure was relatively high in all cases, because acceleration index was greater than 100%, whereas the supplier's pressure was at relative low level, as shown by resistance index, which was less than 100% for each model (Table 1, Figure 1, Figure 2).

In this group of car models, the greater decrease of the car price (described by the price index), the higher level of the car attractiveness (described by the attractiveness index), as shown in Figure 3. The attractiveness rate $F(M)$ and further the attractiveness index describe the attractiveness level of the second-hand car in the market. The most attractive car model in this group was Ford-Focus 1.6 Comfort Kombi with its attractiveness index of 177,9%, whereas the less attractive was Lancia-Lybra 2.0 Emblema Kombi (the attractiveness index equals 149,8%). The most interesting thing is that each car model is characterized with relative high level of the attractiveness index (greater than 100%). It denotes that in spite of a car price decline, its market attractiveness increases. A significant proportion of the increase in $F(M)$ rate was attributed to the excess demand – quantity of cheap passenger cars demanded was greater than quantity supplied.

The relationship between the passenger car price change and its age is a key point in this paper, because the price as well as the age is very important determinants of a car attractiveness and utility. The market price is also a very important determinant of a commodity quality.

4. Conclusion

Price changes of all examined second-hand passenger car models were described as convex downward-sloping curves over time.

For each car model, the decrease in price caused increase in velocity rate and acceleration rate.

Acceleration rate and resistance rate were presented in this paper as a new dynamic approach of measuring the pressures on price in supply/demand analysis.

The attractiveness rates of all examined car models increased, what denotes, that the perceived level of quality and utility of those products were relatively high.

Abstract

The paper concerns kinetic estimation of second-hand passenger cars attractiveness. The analysis is based on the average market prices of 10 selected used car models, produced in years 1997-2005. Price changes of all examined cars were described as a concave downward-sloping curves over time. On the basis of the price change kinetic functions, the orders of processes, the velocity rates, the acceleration rates, the resistance rates, as well as the attractiveness rates have been calculated. The price change velocity denotes marginal changes of second-hand car price during the time. The price change acceleration describes the consumer's downward pressure on the used car price, whereas the resistance rate represents suppliers upward pressure on price. And finally, attractiveness rate describe perceived value of a product.

Key words: estimation, second-hand cars, average market prices;

JEL classification: C81;

1. Introduction

In this article, we focus on the relationship between the second-hand passenger car price changes and the car attractiveness in the Polish automobile market. Changes of quality and utility of the cars during the definite period are presented by their market price changes. The level of the used car market price generally depends on their age in calendar year. Those prices bear a close relation to the expected discounted value of the flow of future utility that a car can provide to its owner during the remainder of the car's lifetime. As a car grows

older, its expected remaining lifetime decreases. Older passenger cars fetch lower prices on the second-hand car market. At the same time, we are interested in identifying the characteristics of the market forces, that effect the attractiveness level of a product [3].

One of the market variables, that effect the second-hand car attractiveness in Poland is still increasing demand for such products. Most of this increase in demand for passenger cars was attributed to serious social, economic and political changes in Poland, connected directly or indirectly with the accession of Poland to the European Union in 2004. Over the recent years the quantity of the second-hand cars imported is average three times greater than the quantity of new ones sold in the primary car market.

All socio-economic factors and product characteristics describe how much attractive the car is to a potential consumer. A product attractiveness level is a very important market variable, because it effects on the demand and generates benefits for second-hand cars suppliers.

2. Methods

This article is based on the data collected by the 2006 Eurotax publications and other Internet-based second-hand car average market prices [1; 7]. The base of investigation were average prices of 10 selected used cars models, produced in years 1997-2005 and sold in the Polish car market in 2006.

There are following passenger car brands under examination: Citroen (1 model), Ford (2 models), Hyundai (2 models), Lancia (1 model) and Nissan (1 model), Mitsubishi (1

model), Renault (1 model), Volkswagen (1 model).

All the car price changes were described by kinetic models. Using kinetic functions, the n orders, the velocity rates $V(M)$, the acceleration rates $A(M)$, the resistance rates $R(M)$, and the attractiveness rates $F(M)$ of all the processes have been calculated. The price change velocity rate represents marginal changes of second-hand car price during the time and mathematically it is the first derivative of the car price change function. The price change acceleration rate is the second derivative of the price change function and denotes the consumers' downward pressure on the second-hand car price, whereas the resistance rate represents suppliers' upward pressure on price. They describe demand and supply in dynamic way. Finally, the attractiveness rate describes perceived value of a product. In addition to those calculations, all the value changes indexes were estimated.

Symbols used in this paper:

- t – time
- M_0 – initial price of a used car,
- M_K – final price of a used car,
- M_t – price of a used car during time t ,
- \hat{M}_t – price of a used car during time t , estimated theoretically,
- $V(M)$ – price change velocity rate,
- $\hat{V}(M)$ – price change velocity rate, estimated theoretically,
- $A(M)$ – price change acceleration rate,
- $\hat{A}(M)$ – price change acceleration rate, estimated theoretically,
- $R(M)$ – price change resistance rate,
- $\hat{R}(M)$ – price change acceleration rate, estimated theoretically
- $F(M)$ – price change attractiveness rate,
- $\hat{F}(M)$ – price change attractiveness rate, estimated theoretically,
- P_K – value change index,
- n – dynamics indicator,
- w_n – velocity constant rate, velocity rate indicator,
- a_n – acceleration constant rate, acceleration rate indicator,
- ds – downward-sloping concave model.

Price changes of all examined second-hand passenger cars were described as a concave downward-sloping curves over the time. All

the curves analyzed in the paper have a model form called ds . Model ds represent an inverse relationship between the second-hand car price and the age of the car and also are characterized by the price decrease with decreasing velocity rate during time t . The curves were described with high accuracy with special importance of the n order of the process function description. The n order is understood as an indicator of the mechanism, or of the process course, as well as the rate constant of the n^{th} order of w_n being an indicator of the change velocity rate. Hence the n order is an indicator of the process dynamics [4; 7].

The values for the price change velocity rates $V(M)$ were found in accordance with the following formula [2]; [4]:

$$V(M) = w_n \cdot M_t^n = -\frac{dM_t}{dt}, w_n > 0, n \geq 0(1)$$

The price change velocity rate denotes marginal change of second-hand passenger car price during the processing time.

The values for the price change acceleration rate $A(M)$ have been calculated using following equation [2; 4; 5]:

$$A(M) = a_n \cdot M_t^{n-1} = -\frac{d^2M_t}{dt^2}, a_n > 0 \quad (2)$$

The price change acceleration function is the second derivative of the price function and denotes the level of consumers pressure on used car price to fall.

The resistance function $R(M)$, refers to the level of suppliers upward pressure on a used car price. All the series have been calculated using following formula [2÷8]:

$$R(M) = \frac{1}{A(M)} \quad (3)$$

The force of the product attractiveness $F(M)$, called the attractiveness rate, have been calculated using equation [5]:

$$F(M) = M_t \cdot A(M) \quad (4)$$

The force of attractiveness describes the attractiveness level of the second-hand passenger car. The function of the attractiveness shows the power of the effects of

the quality and utility of the used car on decision making of the consumers as well as the suppliers.

All the calculations in this work were done with the estimated (theoretical) values of M_t (price) – \hat{M}_t and further $\hat{V}(M)$, $\hat{A}(M)$, $\hat{R}(M)$ and $\hat{F}(M)$ values were applied. The average deviation accuracy of empirical values and estimated (theoretical) values – e_m [%] of curves description was also calculated [2; 4÷8].

In addition, the values of changes between initial values and final values P_K , were calculated. Index P_K denotes the percentage change of the final value of the measure in relation to the initial value of that measure, expressed in the relative scale.

The values of P_K indexes have been calculated using the following formula [2; 4÷8]:

$$P_K = \frac{X_K \cdot 100}{X_P} \text{ [%]} \quad (5)$$

where:

X_P – initial value of a measure,

X_K – final value of a measure.

All the calculated P_K indexes in this paper were named: price index, velocity index ($V(M)$ index), acceleration index ($A(M)$ index), resistance index ($R(M)$ index) and attractiveness index ($F(M)$ index).

3. Results and discussion

In this paper only a part of the wider research on the second-hand passenger car market in Poland was presented. The kinetic analysis of attractiveness level using the average market prices of 10 selected used passenger cars was conducted. All the examined car models were collected in Table 1. and arranged in order of the increasing dynamics, represented by dynamics indicator n .

The price changes of all examined passenger car models were described as concave

Table 1. Results of dynamics estimation of 10 examined second-hand car models

Car model	n (ds)	$V(M)$ index [%]	$A(M)$ index [%]	$R(M)$ index [%]	$F(M)$ index [%]
Citroen-Xsara II 1.6i SX	3,05	17,8	31,3	319	17,8
Renault-Megane II 1.6 Pack Expression	3,14	20,5	34	294,1	20,5
Hyundai-XG 2.5	3,48	17,4	28,8	347	17,4
Lancia-Lybra 1.8 LX	3,94	21,8	32	311,9	21,8
Ford-Mondeo 2.0 TDDi Ambiente	4,03	51,4	60,6	165,1	51,4
Mitsubishi-Space Star 1.3 Family	4,74	46	54,2	184,5	46
Volkswagen-Golf IV 1.6 Comfortline	5,8	27,7	34,5	289,8	27,7
Hyundai-Accent 1.5 L (air)	6,86	7,9	11,5	871,4	7,9
Nissan-Micra 1.0 Comfort Plus	6,95	26,7	32,3	309,3	26,7
Ford-Galaxy 2.3 16V Ghia	7,15	7,6	10,9	921,7	7,6

downward-sloping curves over time t , and called ds models.

All the cases have orders of processes n greater than $3ds$. Rising n value of the ds models shows decreasing change dynamics. Parameter n is the main dynamics indicator in this paper. The most dynamic price decreases were observed at Citroen-Xsara II 1.6i SX ($n = 3,05ds$) and the less dynamic at Ford-Galaxy 2.3 16V Ghia ($n = 7,15ds$), as presented in Table 1.

Each second-hand passenger car model is characterized with the rapid decrease of its market price. The changes of prices of used cars are shown by the rapid decrease of the velocity rates $V(M)$, average to 24,48% and decrease of the acceleration rates $A(M)$ of the processes, average to 33,01%. The resistance rates $R(M)$ increased significantly, average to 401,38%. The attractiveness rates of all examined car models went down, average to 24% (Table 1, Figure 1, Figure 2 and Figure 3).

Very high accuracy of curves description as the average deviation of empirical values and estimated (theoretical) values was found (average $e_m = 0,79\%$). As the acceleration rate $A(M)$ represents the market pressure on second-hand car price to fall, the decrease of $A(M)$ rate is attributable to relative low performance of perceived product value.

Figure 1. Velocity and acceleration indexes of 10 examined second-hand car models

Figure 2. Acceleration and resistance indexes of 10 examined second-hand car models

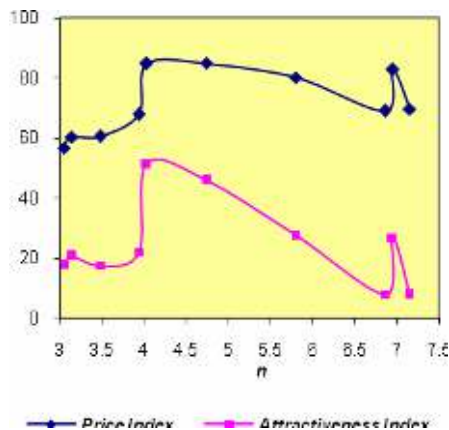

Figure 3. Price and attractiveness indexes of 10 examined second-hand car models

The acceleration rate $A(M)$ in quantitative and dynamic way measures the downward pressure on price in supply/demand analysis. In the same way, the resistance rate measures the upward pressure on price in supply/demand analysis, whereas the attractiveness rate measures the quality and utility of a product.

In this group of car models, the greater decrease of the car price (described by the price index), the lower level of the car attractiveness (described by the attractiveness index), as shown in Figure 3. The attractiveness rate $F(M)$ and further the attractiveness index describe the attractiveness level of the second-hand car in the market. The most attractive car models in this group were Ford-Mondeo 2.0 TDDi Ambiente with its attractiveness index of 51,4%, and Mitsubishi-Space Star 1.3 Family with its attractiveness index of 46%, whereas the less attractive were Ford-Galaxy 2.3 16V Ghia (the attractiveness index equals 7,6%) and Hyundai-Accent 1.5 L (the attractiveness index equals 7,9%). Each car model is characterized with relative low level of the attractiveness index (less than 100%). With a car price decline, its market attractiveness decreases. The decrease in $F(M)$ rate was attributed to the excess demand – quantity of cheap passenger cars demanded was greater than quantity supplied.

The relationship between the second-hand car price change and its attractiveness is a key point in this paper, because the price as well as the age is very important determinants of a second-hand car marginal utility and attractiveness.

4. Conclusion

Price changes of all examined second-hand car models were described as concave downward-sloping curves over time.

For each car model, the decrease in price caused decrease in velocity rate and acceleration rate.

Acceleration rate and resistance rate were presented in this paper as a dynamic approach of measuring the pressures on price in supply/demand analysis.

The attractiveness rates of all examined car models decreased, what denotes, that the perceived level of market value of those products were relatively low comparing to

other second-hand passenger cars in the Polish market.

Studying the Factors Which Influence Consumer Behavior on the Insurance Market

Petrescu Eva-Cristina,
Ionciã Diana,
Petrescu Marian,
The Academy of Economic Studies – Bucharest
eva_petrescu@yahoo.com

Abstract

For understanding insurance services' consumer behavior, it is necessary to study the influence of different endogenous and exogenous factors on the insurance services' consumer behavior. The researchers must analyze the decision-making processes from those that precede the purchase of insurance to the final experience of using it and the various factors that influence the processes and the insurance services' consumer. The paper aims to present some methodological aspects related to the qualitative study of the influence of endogenous and exogenous factors on the insurance consumer behavior.

This work was supported by CNCSIS – UEFISCSU, project number 915 / 2009 PNII – IDEI 1773/2008

Key words: influence, insurance market, consumer behavior

JEL classification: M30

1. Introduction

In order to be successful an insurance company must understand the needs of consumers and to satisfy these needs better than the competition. The insurance services' consumer behavior is determined by the influence of a series of factors, which can be divided, function of their nature, in endogenous and exogenous factors.

The qualitative researches are designed to generate new ideas, to provide insights about the consumer behavior. The ideas resulted from qualitative studies must be tested using quantitative researches. The qualitative researches are making possible the understanding of consumer behavior and the

quantitative researches are making possible the prediction of the consumer behavior [1]. The main characteristics of the qualitative researches are presented in Table 1.

Table 1 Particularities of the qualitative research

	Qualitative research
Study purpose	Researches are designed to provide new ideas. The qualitative researches are often used in exploratory research to refine the objectives of quantitative studies.
Methods of research	<ul style="list-style-type: none"> - depth interview, - semi-guided interviews, - focus group, - collage research - projective techniques
Sampling Methods	Small, nonprobability samples
Representative results	The results are generally not representative of the universe under study and cannot be generalized to larger populations; the findings tend to be somewhat subjective.
Types of questions	Open ended, unstructured questions. The projective techniques include disguised questions.
Data Analysis	The analysis is subjective and reflects the judgment of the researchers.

Adapted from [2]

The main qualitative research methods are depth interview, semi-guided interviews, focus group, metaphor analysis, collage research and projective techniques.

The semi-guided interviews are the most frequently used methods of qualitative research [3].

Due to the nature of the insurance services' consumer behavior research we consider that for

the study of the influence of different endogenous and exogenous factors on the insurance services' consumer behavior the most appropriate is the use of semi-guided interviews. This qualitative research must be conducted by exploiting primary sources of information.

The organization and implementation of the qualitative marketing research using semi-guided interviews implies:

- designing marketing research,
- implementing marketing research
- the analysis and interpretation of information,
- drawing up conclusion and presenting the final rapport.

Designing marketing research is a difficult task from which depends the success of the entire research. In this stage the researchers must establish the objectives of the research, they must establish the population segment studied, the sampling method and they have to design the tools of the research: the recruitment (selection) questionnaire and the conversation guide.

In this case there are two main objectives of the research: (1) studying the influence of endogenous factors and (2) studying the influence of exogenous factors.

The studied population must be made up of Romanian owners of insurance contracts aged over 18, from urban and rural areas. The choice of the subjects interviewed must be made by using selection questionnaires

The number of semi-guided interviews to be taken is relatively limited and the sample cannot be considered as representative.

The sample of subjects interviewed must reflect the structure of the population studied, even if the sample cannot be considered as representative.

In the conversation guide the questions are open ended, unstructured. In the qualitative research the subjects are asked to freely respond to stimuli as words or pictures.

The implementation of qualitative marketing research supposes to select the participants based on the recruitment questionnaire, to interview each subject by using the conversation guide and to record the interviews.

In the case of the qualitative research usually the data collected are analyzed by researchers with experience in the behavioral sciences.

The results obtained from such a study cannot be generalized, and the conclusions following are not to be extended to the whole insured

population. Even if they are not necessarily valid for all the Romanian insurance services' consumers, the ideas resulted from the research can be valuable when used in an exploratory way.

2. The endogenous and exogenous factors influencing insurance services' consumer behavior

The insurance services' consumer behavior covers the decision-making processes from those that precede the purchase of insurance to the final experience of using it and the various factors that influence the processes and the consumer. The researchers must analyze the consumer buying process and the various factors that influence the consumer and the buying decision. Insurance services' consumer behavior involves many different actors: insurance purchasers, insurance beneficiary, influencers, organizations or groups of insured.

The insurance services' consumer behavior is influenced by two categories of factors: one category acting from inside: the endogenous factors, and category acting from outside: the exogenous factors.

The endogenous factors are the inner workings, the processes taking place in the mind of the consumer which influences his behavior.

The main endogenous factors to be analyzed and studied when we want to understand insurance services' consumer behavior are: **perception, learning, attitude, motivation and personality.**

Perception is an extremely complex phenomenon, comprising the mental activity of observing, understanding and discerning between stimuli, achieved through the system of sensory receptors [4].

Consumers are extremely selective regarding the things to which they pay attention, reacting only to a small part of the stimuli they are exposed to. Thus, a process of perceptual selection takes place.

The way in which insurance services and insurance companies are perceived by consumers can be studied, by using tests and techniques specific to qualitative research:

- free word association (for instance: ‘Which is the first word that comes to mind when you hear of insurance services ...’),
- the sentence completion test (for example: ‘Please complete the following sentences: The most attractive insurance services on the Romanian market are:.....’, ‘During a crisis, insurance services are:’),
- the Chinese portrait technique (‘Please tell us what you think about the insurance company or companies with which you currently have insurance contracts. ...Which animal would you associate its image with? ...’).

Learning refers to a relatively permanent change in behavior which comes with experience and the experience does not have to affect the learner directly: we can learn by observing events that affect others [5]. For the researcher important questions related to the learning process are the following: “Is acquiring insurance a stressful or pleasant experience?”, “How does the insured learned about the insurance products and insurance companies existing on the market?”.

Attitudes are learned predispositions [6]. The attitudes relevant to insurance purchase behavior are formed as the result of insured direct experience or of information acquired from others (family, friends, colleagues, insurance agents etc.) or of exposure to mass-media, Internet, marketing activity. Attitudes and interests strongly affect the consumer behavior. Attitudes are relatively consistent with the behavior they reflect, but they are not permanent, they can change. For the researcher an important question is “How are consumers attitudes towards product formed and/or changed?”.

One of the main endogenous factors to be analyzed and studied when we want to understand insurance services’ consumer behavior is motivation.

Motivation is considered to be an inner state which drives an organism towards a goal [7].

In the case of insurance services, motivation comprises the totality of motives and reasons, conscious or not, which determine someone to purchase insurance. People contract insurance as cover against various risks, but also from the desire to save or invest.

Someone can be determined to purchase an insurance policy either for a series of reasons with positive connotations (for instance, I want

to make sure I have the money to pay for my child’s education, so I purchase an education insurance policy), or so as to avoid a negative situation.

So as to understand the motivations in insurance purchase, the subjects interviewed must be asked about the appearance of the need for insurance and the reasons which lead to closing the insurance contract, the motives for satisfaction / dissatisfaction towards insurance companies and their policies, the reasons conducive to customer loyalty, the incentives to buy new insurance policies.

So as to understand the barriers to insurance purchase, the subjects interviewed can be asked to answer open-ended questions (for example: ‘Which are, in your opinion, the main reasons not to purchase in the case of insurance?’, ‘Which are, in your opinion, the factors that would determine you to renounce at closing an insurance contract?’, etc.) and to complete sentences (for example: ‘When I think of insurance, I am most scared of’).

Personality is the distinctive and enduring patterns of thoughts, emotions and behaviors that characterize individual’s adaptation to the situations of his or her life [8].

Nowadays consumers are trying to build an identity through various consumption activities and consequently a consumer will choose the product / service / company brand that has an image in accordance with the ideas he holds about himself – the choice being indicative of the type of image the consumer desires [9]. The motivations to purchase a product or a service can be related to self-expression: expressing the consumer personality. So it is important for the researcher to know what type of personality insured have.

The exogenous factors can be directly observable factors (for example the marketing stimuli) or factors that have to be deduced by the researcher (for example the stimuli of a social nature).

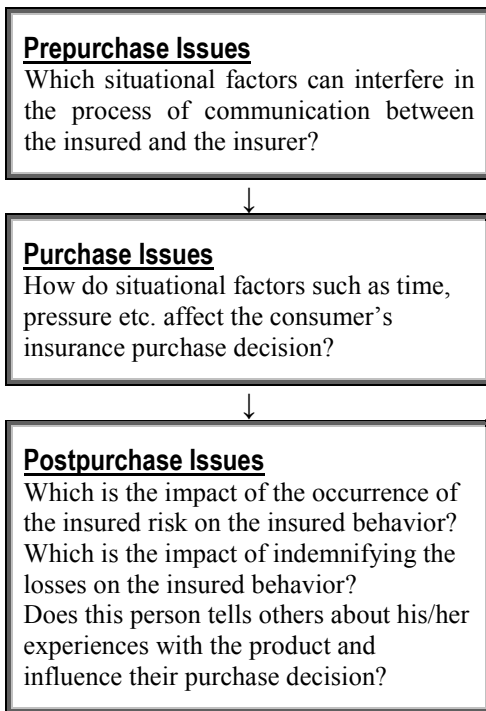

The principal categories of external stimuli are: marketing stimuli, situational factors, stimuli belonging to the macro-medium and stimuli of a social nature.

The factors related to the marketing mix of insurance companies are important stimuli for insurance services’ consumer behavior. The elements pertaining to the insurance company’s offer, the insurance premiums, the means of

distribution, the process of communication and the personnel of insurance companies can determine the acts of the consumer and the insurance company can modify those elements so as to obtain the best responses from the insurance services' consumer. So it is important to know consumer's expectation regarding the marketing mix of insurance companies

Situational factors are related to the moment before the sale of the insurance policy, the moment of purchase of the insurance policy, and the moment of use of insurance services – see Figure 2.

Figure 2. Questions concerning the situational factors related to the consumption process stages

The factors from the external macro-medium which can influence insurance services' consumer behavior are demographical, economic, political, technological, factors from the natural environment etc.

The role of the insurance is to protect the insured against different risks, but also to create benefic effects for the entire society. The marketing activity in insurance has important causes and effects in the social, ethical and legal environment.

The evolution of the insurance market is closely related to economic, social and political changes, and in the context of financial crisis the

insurance services' consumer behavior is clearly affected by those factors. The researchers must study the effects of the financial crisis on the insurance services' consumer behavior.

From a sociological perspective the study of consumer behavior suppose the investigation of the demographic characteristics of consumers, the large-scale social structures and their influence on consumer behavior, the small-scale social structures such as groups and their influence on consumer behavior, the role of relationship and their influence on consumer behavior, the social influence and the way in which communications modifies consumer behavior. So, in order to find the influence of **sociological factors** we have to study the role of family, belonging and reference groups, social class, subculture and culture in the decision making process in the Romanian insurance market.

It is important for any study of consumer behavior to know the **factors related to personal characteristics of the consumer**, such as age and the stage in the life cycle, occupation, economic situation, etc. In the case of insurance services' consumer behavior the age, the stage in the life cycle, the occupation, the economic situation are crucial elements that influence the decision of acquiring an insurance.

3. Conclusions

In conclusion, for understanding insurance services' consumer behavior, it is necessary to study in detail a great variety of endogenous and exogenous factors.

eva_petrescu@yahoo.com*

Abstract

The insurance services' consumer behavior is influenced by a series of factors, which can be divided, function of their nature, in endogenous and exogenous factors. The potential insurance client's behavior is influenced by the following main categories of exogenous factors: situational factors – related to the moment before the sale of the insurance policy (connected, for instance, to the process of communication between the insured and the insurer), the moment of purchase of the insurance policy, and the moment of use of insurance services; the factors related to the marketing mix of insurance companies – elements pertaining to the personnel of insurance companies, their offer, the insurance premiums, the means of distribution and the process of communication; factors from the external macro-medium – demographical, economic, political, technological, factors from the natural environment etc.; factors related to the sociological particularities of the insurance services' consumer – among which we would like to mention culture, subculture, social class, reference group, family. In the current paper, we shall present the main factors which influence from the exterior the behavior of the insurance services' consumer.

This work was supported by CNCIS – UEFISCSU, project number 915 / 2009 PNII – IDEI 1773/2008

Key words: exogenous factors, consumer behavior, insurance market

JEL classification: M30

1. Introduction

So as to understand the insurance services' consumer behavior, it is necessary to find the answer to a multitude of questions: *Who is insured? Who purchases insurance? For whom is the policy purchased? How is the decision to close an insurance contract made? Why? What are the reasons which determine someone to purchase insurance? When do people get insurance? Where do they get it from? What are the preferred insurance types? What are the factors influencing the insurance services' consumer behavior? etc.*

„Figure 1. Correlated questions concerning consumer behaviour”

In order to have a clear image of the insurance services' consumer behavior, the answers to these questions must not be taken separately, but in correlation.

The analysis of the insurance services' consumer behavior implies a multidisciplinary approach. The way in which a person behaves from an economic point of view, besides reflecting the insured's needs, is also the result of accumulated experience [1].

The insurance services' consumer behavior is influenced by a series of factors, which can be divided, function of their nature, in **endogenous** and **exogenous factors**. A series of external stimuli influence the insurance client. These are both marketing stimuli (product, price, distribution, communication, personnel), stimuli belonging to the macro-medium (economic, demographical, economic, political, technological, natural factors, etc.), stimuli of a social nature, as well as other factors specific to the situation of the consumer.

The inner workings, the processes taking place in the mind of the potential insurance services consumer, are among endogenous factors. The main endogenous factors to be analyzed and studied when we want to understand consumer behavior are: perception, learning, attitude, motivation and personality.

The behavior of the potential insurance client is influenced by the following main categories of **exogenous factors**:

- A. situational factors** – related to the moment before the sale of the insurance policy (connected, for instance, to the process of communication between the insured and the insurer), the moment of purchase of the insurance policy, and the moment of use of insurance services.
- B. the factors related to the marketing mix of insurance companies** – elements pertaining to the personnel of insurance companies, their offer, the insurance premiums, the means of distribution and the process of communication.
- C. factors from the external macro-medium** – demographical, economic, political, technological, factors from the natural environment etc.
- D. factors related to the sociological particularities of the insurance services' consumer** – among which we would like to mention culture, subculture, social class, reference group, family.

2. Situational factors

Specialists consider that **situational influences** can be related to three distinct moments: the moment of the marketing communication, the moment of purchase and the moment of consumption [2]. In the case of insurance, we can distinguish three important

situations when determining factors for the purchase of an insurance policy may intervene:

- *the moment before the sale of the insurance policy* – at this moment, we can list among the most important factors those related to the process of communication between the insured and the insurer,

- *the moment of purchase of the insurance policy* – it is important to know whether the person purchases for himself/herself or so as to insure another person (for instance, in the case of policies parents purchase for their children – for studies, etc.). Moreover, at the moment of purchase, factors related to the state the consumer is in may count, the factors connected to the atmosphere in which the transaction is closed, factors related to the urgency of the acquisition, factors linked to the occurrence of unexpected events at the moment of purchase, such as changes in contractual terms, or in the insurance premium, factors related to the presence of 'influencers', prescriptors, the presence of other persons who may influence or even determine the purchase decision.

- *the moment of use of insurance services* – at this moment, among the most important factors, we can mention those related to the occurrence of the insured risk and the covering of losses through indemnity. The way in which insurance companies act at this moment has a determining role in influencing the subsequent behavior of the insured.

3. Factors related to the marketing mix of insurance companies

The marketing stimuli are factors which can be controlled – to a great extent – by the insurance company. The latter can control its product, price, distribution, communication and personnel policy.

The product policy is reflected in the supply of the insurance company. By means of its offer, the company should try to attract and keep customers. So as to be purchased, insurance products should firstly be known, and their necessity must be accepted by the target consumers. The services offered by the insurance company must meet the needs of the target market. Among the *factors* influencing the relation insured-insurer we can list: *the atmosphere* (the organizational conditions in which the contact with the client is made), *the*

material elements of the performance (the means by which the results of the performance are communicated, etc.), and, not lastly, *the quality of the insurance services provided*. The services offered by the insurance company are intangible, so it is quite difficult for consumers to evaluate *their quality*. *This is when other elements come into place – such as the level of trust held by the brand*.

A person will choose a brand (of a product, service or company) which has an image in accordance with the ideas the person holds about himself/herself. In the case of insurance, the brand of the insurance company counts more than the product brand. Moreover, the choice is made function of the brand notoriety and of the reputation of the insurance company.

The price paid for insurance, the insurance premium, is an extremely important criterion for the choice made by the insurance consumer.

In the case of the mandatory motor insurance, RCA, the premium is the decisive factor in the insured's choice. An important element which must be studied is the perception of insurance services consumers on the relation 'price paid/utility'. It is important to study the degree of price sensitivity for various insurance types. A significant element to analyze is the correlation between the prices accepted by the insured and their incomes, thus identifying the target 'segments' for the various types of insurance.

The longer the period of time in which the purchase of insurance has consequences on a person's budget (for instance, in the case of life insurance), the more difficult the process of choosing an insurance company for a certain insurance type.

Distribution is a key element, ensuring the clients' access to the services supplied. A proper distribution network can influence favorably consumers' attitude towards the insurance company. So as to study the influence of the distribution method, one must know and analyze purchase behavior for each insurance type, and identify the points of sale preferred by consumers; furthermore, one should see if there is a preference for traditional or for modern acquisition methods, like the internet, and how this is manifested (for instance, at the current moment, an important development related to RCA policies on the Romanian market is their electronic issue), the frequency of purchase, the criteria related to distribution which influence

choice (where the point of sale is located, proximity, etc.)

The communications of the insurance company are another factor which can influence the insurance services' consumer behavior. Communications have as main objectives: to draw the attention of potential consumers towards the insurance company and its services; to inform potential clients about the offer of the insurance company and convince them of the necessity to purchase its services; to persuade them to become loyal to the insurance company; to determine a certain behavior on the part of the insured.

A fundamental premise of consumer behavior is that people purchase products and services not only for what they do, but also for what they represent. Subjective factors, such as the symbolism used in the brand name, can influence the choice of the product of an insurance company, instead of that of another. The wrong promotional policy may have a major impact not only on the activity of an insurance company, but on the entire market.

In relation to the promotional policy of insurance companies, one must study the degree of impact of different commercials, the way in which the message transmitted is understood by the insured, the way in which the promotional activity is perceived by consumers.

The personnel has an extremely important role, given the fact that the closing of an insurance contract often depends on the abilities of the insurance agent.

4. Factors from the external macro-medium

Factors from the external macro-medium are stimuli which cannot be controlled by the insurance company. This category includes demographical, economic, political, technological stimuli, factors from the natural environment, factors of a socio-cultural nature, etc. For instance, when we are in a crisis period (like the current one), it is important to study consumer priorities, as well as the necessity of insurance as perceived by consumers, and the insurance company must adapt its offer to the conditions specific to the crisis. Furthermore, the messages of the insurance company must not ignore the situation, since it is essential for the consumer to be informed and receive proper

explanations on the implications the phenomenon might have on his/her situation.

5. Sociological factors

The decision to close an insurance contract might be influenced by a series of socio-cultural factors, such as: culture, socio-cultural affiliation, belonging to a social class.

Culture. It is made up of everything a human being acquires – behavior, knowledge, techniques, traditions – as a social entity [3]. Cultural differences should be respected and taken into consideration, since culture is a factor which determines the way people manifest themselves, hence their insurance related behavior.

Due to cultural differences, the way risk is perceived differs from country to country, thus influencing the attitude for or against insurance. Moreover, purchasing behavior varies function of the common values specific to each culture. As members of the same society, people have a common system of values, and strong shared convictions. The common values determine the existence of common fears. For instance, if in the US unknown risks quickly become a matter of national importance, in Norway they are considered insignificant and negligible. [4]

In Romania – except for mandatory policies – the interest in insurance purchase is relatively low, probably because of a cultural deficiency in this domain shared by the majority of population.

Sub-cultures are smaller groups within a culture, such as ethnic groups, persons from different regions of the country, etc. The members of *subcultures* share specific values. In a society, there are cultural groups which can be divided in 4 categories: *races* (white, black, oriental, etc.), *regional groups* (in Romania there are several regional groups: inhabitants of Oltenia, Moldavia, Transylvania, etc.), *national groups* (Romanian, Hungarian, Turkish etc.), *religious groups* (orthodox, catholic, protestant, etc.). Each subculture in the various categories has its own system of values, therefore a specific way of manifesting buying behavior.

Multicultural marketing grew out of careful marketing research, which revealed that different ethnic niches did not always respond favorably to mass-market actions. Companies have capitalized on multicultural marketing strategies

to recent years. For instance, many banks and life insurance are focusing on Hispanic Americans because although their income level is rising, the 40 million Hispanic Americans living in the United States have not yet become big consumers of financial services. [5]

Insurance companies must study carefully the features of sub-groups, since the perception of risk is different from one group to another and therefore there is a specific way of manifesting for each group.

Social class. Human society is based on a social stratification system. A social class is an ensemble of persons grouped by economic, historical and sociological criteria. Social classes are relatively permanent and homogenous groups, whose members have the same system of values, a similar way of life, similar interests and a behavior with common characteristics. Persons belonging to the same social class are approximately equal in terms of income and social status, share the same ideas and values and tend to have similar preferences.

The decision to purchase insurance is also influenced by interpersonal relations. Consequently, one should study how the insured is influenced by the relations to the people around him/her, the relations to reference groups and to the family.

Primary **reference groups** are one's family, neighbors, friends, colleagues, while secondary groups are clubs, associations, etc. An individual can follow, or, on the contrary, dissociate himself/herself from the behavior of the group, function of his/her attitude towards the latter.

In theory, reference groups should offer an individual behavioral model. They influence the person's attitude towards insurance, as well as the image he/she forms about various insurance products. Reference groups exert pressure on the consumer, determining the direction in which his/her behavior evolves.

Insurance companies must notice the influences exercised by reference groups, and try to attract the group's opinion leaders. To this end, the personal characteristics of opinion leaders should be studied, as well as their habits, and promotional messages that would reach the respective leaders must be elaborated.

The convictions of opinion leaders are important in the case of insurance, as a significant part of product information, as well as recommendations to purchase insurance from

a certain company, are gathered from conversations with the people around, rather than from magazines or advertisements.

Family is the most important factor that should be studied, as in most cases a person's attitude towards insurance is influenced by his/her family. This is where an individual is formed, and where he/she shapes most of the opinions.

There are several types of family: nuclear family (formed by a husband, a wife and one or more children), extended family (the nuclear family together with at least one grandparent), and single - parent family (one parent and at least one child). The type of family that is most typical can vary considerably from culture to culture [6]. In an individualistic society the nuclear family is most common (for example in Canada), in a kinship culture predominant are extended families (with a head of household, married adult children and grandchildren).

In studying the influence of family on the insurance services' consumer behavior, the researcher should analyze: Who initiates the decisional process of insurance purchase? Who assesses alternatives? Who makes the decision regarding the premium to be paid for insurance? Who makes the final decision of purchase? Who purchases insurance? Who is the beneficiary?

Purchase decisions are influenced by an individual's stage in the family life cycle.

Function of his/her stage in the life cycle, the attitudes, and the individual's system of values change. Therefore, the individual's purchase behavior will change accordingly.

The offer of insurance companies must meet the needs, wishes and aspirations of each consumer segment.

The operation of the elements influencing the behavior of the insurance services consumer should be studied both for each factor taken separately, and in interdependence. The consumer responds to different stimuli through his/her behavior: choosing a type of insurance, a brand, a place where the insurance contract will be closed, a moment, and the sum paid for the chosen product. So as to determine as precisely as possible the way in which consumers will react, it is necessary to know and understand them, and to be able to foresee the effects of the various causative factors. For these reasons, it is crucial to study the exogenous factors influencing the insurance services' consumer behavior.

The Corporations' Social Responsibility – A New Attitude on the Working Force Market

Pivodă Roxana Mihaela
Spiru Haret University
roxana_pivoda@yahoo.com

Abstract

At first, the responsibility of every company was the obtaining of a most substantial profit by its owners, without taking into account the fact that all the employees have contributed to this success, beginning with the manager and ending with the doorman; the clients, in their consumer quality of the goods and services produced by these companies and why not even the society itself, which facilitates the functioning of the company under different aspects.

Key words: corporate social responsibility, competitive market system, society, working force market

JEL classification: M14

1. Evolution of the concept

Today, the object of some companies, or better said, their responsibility as a competitive market system is not only the enterprising profit and the maintaining of a certain market position, but also the satisfaction of the consumers' social needs in better conditions, including not only the consuming needs, but also the need and maintaining of a job and some living ways, the need of living in an unpolluted environment or the need of some public vital services, as education, health, law etc.

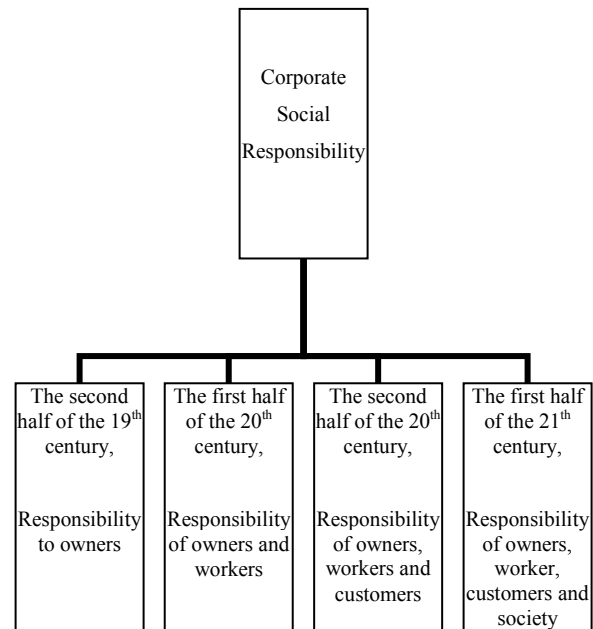

Also in Romania, we hear more and more talking about the notion of the corporations' social responsibility, even though this concept has appeared from the second half of the 19th century, being known under the acronym of C.S.R. in foreign literature, after the English denomination Corporate Social Responsibility.

At the moment, this notion refers to the obligations every company has in carrying on its actions regarding the economic activity towards

all the parts involved in this process, wishing in the same time as being a priority no matter the dimension and the type of the company's activity, connotation that has not had the same meaning at the beginning of its existence.

Overall, until now, developing the concept of corporate social responsibility different meanings experienced during the four stages of evolution, which are summarized in the chart no.

Chart no. 1 - New meanings of the concept of corporate social responsibility

With the emergence of this concept, in the second half of the nineteenth century, the only responsibility of a company was as substantial a profit by producing goods and services required by society through the market, work was considered a commodity that is sold and buy it like any other commodity market relations.

Later in the first half of the twentieth century, the company begins to show responsibility and

to employees. Their work is more than a commodity and no longer considered just one element of the capital, but also workers have certain rights in the company, which are supported by unions and recognized by employers.

Social responsibility of companies is expanding in the second half of the twentieth century, the quality of goods and services and attention they produce to meet consumer demands.

Now the century XXI, a corporate social responsibility, acquire new values, meaning that in addition to the responsibilities mentioned, the company is responsible to society in general, protecting the environment by providing equal opportunities for all members of society, promoting social justice.

The need of promoting this concept derives from the fact that, through their actions, the companies give birth to some social problems and because of this they have also the social responsibility of resolving them. For example, through technological innovations and efficiency growth, the companies lead to some jobs' disappearance and to the unemployment growth, work force migration, depopulation of some areas affected by structural recession and the overpopulation of economic boom areas; some companies pollute the environment, others exploit the non-renewable resources etc. It is not morally correct that every time others take the consequences of these phenomena, from which the companies are always winners. Other example shows that a company, this time a multinational one, that has accumulated an enormous capital through the employees' work and creativity, having in the same time the support of the state for a long period of time, does not act correctly when, following to maximize its profits, delocalizes itself, moving its activities in the Third World countries, where the salaries are much smaller and the settlements of the environment protection are less severe, without carrying about the fact that the native employees lose their jobs.

Finally a company's actions, a social impact, either by products or services offered or the jobs they provide, or indirectly through the effects they generate to other companies. Therefore, companies can not avoid liability under such an

action creates, whether positive, negative or neutral.

The issue is particularly acute in the Romanian economy, since the transition to a functioning market economy and a competitive imperative advertisement economic efficiency and productivity, which condemn to extinction a number of sectors underperforming and outdated, and massive staff redundancies. On the other hand, conversion of redundant labor is with great deliberation, leaving no hope roads and a large number of employees. Most countries have fought the law in different ways, the phenomenon of unemployment. Although governments are responsible for solving this problem, they have increasingly less able to influence the proportions of vacant jobs as long as policy decisions regarding employment, relocation or dismissal of workers are taken by companies.

The globalization facilitates the relocation and offers the companies the possibility of attracting the governments into a real "trip to the abyss"; the companies have the tendency to relocate towards regions where the work force price is very low, the legislation regarding work conditions and environment protection is very permissive or applies in a discontinuous and discriminatory way, and the taxes are insignificant.

Given these issues, it is desirable to remove these negative effects caused by the actions of companies and promote their new attitude by changing attitudes regarding the responsibility that these companies have yet to a social environment.

Like any corporate social responsibility concept and wished to be explained in the context of such definitions:

Sims, wrote that in 1999 Watts and Holmes were defining the corporations' social responsibility as being "the business continuous commitment of behaving ethically and contributing to the economic development, improving work force life quality and the one of the community"[1].

Kotler and Lee, were considering that corporations' social responsibility is "a commitment that contributes to the well of the community through its own business ways and through the contribution of the company's resources"[2].

European Commission defines corporate social responsibility as “a concept whereby companies voluntarily give attention to social and environmental aspects of their actions and interactions with stakeholders. SMEs that have adopted the concept of CSR behave ethically and contribute to economic development, improving both quality of life of employees and their families and the local community and society in general”.

Therefore, the concept of corporate social responsibility concerns involving multifaceted responsibilities of companies not only to the owners but also to employees, suppliers, customers, local communities, environmental protection, because ultimately these companies are willing to become good citizens.

Having analyzed the concept, finally there is a question about the actual social responsibilities of a company regarding the relationships on the writing force market?

It is known that stimulation of employment has become an important concern for all companies, both nationally and locally. Private initiative allows people entering the labor market of the community, thereby contributing to its development and of the action resulting from the social responsibilities of companies towards society and community in which he operates. Developing local employment policies and private initiatives were important tools to reduce unemployment, intractiunii beneficial effects of the local community and private initiatives are well known environment.

Corporate social responsibility on the labor market is likely to contribute at the same time as promoting the creation of new jobs, improve working conditions for employees, equal opportunities at work, health and safety, insurance programs training and retraining of personnel, fair and responsible employee remuneration, providing more flexible labor market, social inclusion, and labor market integration of disadvantaged people, but also the promotion and business development.

Meanwhile, one must not overlook the fact that, where talking about the social responsibility of the employer, which already shows this responsibility in creating jobs for a certain number of people, jobs that are very important to employees guaranteed without any conditions. Employers can already be considered socially

responsible enough when they think about the needs of the society in its all and they try the best they can to efficiently assign the resources in order to come forward this needs with the most appropriate goods and services. In essence, the society does not exist for enterprisers to take advantage of it, but contrary, any activity must satisfy the social needs.

2. Examples in Romania

The social responsibility of companies in Romania is specific to such actions, through which companies showed their responsibility in a way or another depending on the field in which the companies worked or depending on the Romanian society.

Regarding employment, the responsibility of companies has resulted in actions to facilitate access to employment of certain categories of disadvantaged or marginalized youth with educational level or low skilled, long-term unemployed, women wishing to enter the labor market after an absence of long or short, young people in institutions at risk of social exclusion, but also the promotion and development of young people value.

For instance,

“Autoitalia, in partnership with Call Service Association started a project called “Intervention for recovering and professional education for children and young that are socially educated”. The Project aims, with the help of some classes of social orientation and professional education, to help 20 institutionalized young to get a job. Thus, they try to solve one of their biggest problems, social reintegration. Autoitalia supports this project with €10600.

Young people who will require training institutions in this project will work with an advisor to the Call Service Association. Together, they evaluate the potential of young professional and will prepare a career plan for it. They will also work on developing communication skills necessary for a discussion with a potential employer.

Necessary funds for training courses, wages and counseling materials used in the preparation from AutoItalia contribution.

Depending on the choices made by beneficiaries of the program, participants will be enrolled in training. At their graduation, they

will call service firms mediated collaborative relationship for employment.

The expected results at the end of this action are: 10 young men registered in different courses of professional education and 10 young hired in actual jobs" [3].

Another company,

"UniCredit Romania supports the "Call" Program for education and professional integration for young disadvantaged (especially women). The project is under way in Bucharest and Timisoara, in collaboration with the Parada Foundation/Call Service that also involved public institutions in this project.

Getting a job is a difficult issue for young people and especially women from foster care or institutions for protection. Despite the potential they have, many of these disadvantaged youth are denied the opportunity of training and professional integration.

Therefore, the Romanian society has felt the need to create an instrument of mediation between supply and demand of jobs for these youth.

UniCredit Romania, decided to support those seeking to reduce unemployment and social exclusion through education and training plans of young people in difficult situations.

Choosing the setting of this project was a difficult problem to help exactly those individuals that need help the most, it was considered that big cities offer the best condition, with the cases of social polarization. More, these centers needed an important influence on their economic development at a national level. Initially, the program only got underway in Bucharest and it extended in Timisoara with the help of UniCredit.

The objective of the program was the integration on the working force market of youth with ages between 15 and 29 who had a difficult social situation and who presented the danger of social marginalization.

The program got the support of some non-governmental organizations and also of the specialized, public institutions. Some of these partnerships provided useful data about the young with difficult situations.

Direct beneficiaries of the activities were: information about labor market dynamics (searchable jobs, vacancies, labor), professional advice to determine individual (potential

evaluation, training, job search - resume, cover letter, interview - improve communication skills, analyze the employee), financial support for attending training programs in trades and labor required at the option and ability of young, disadvantaged youth and facilitate networking between employers (accompanying the Job, monitoring of initial employment opportunities to practice in firms).

The budget provided for a term of two years was approx. 152,000 euros to support the 120 disadvantaged youth in Bucharest and Timisoara.

The "Call" program and the informing services helped 185 young people, 130 of which being advised, 28 took professional education courses for jobs such as cook, pastry, chef, decorator, florist, waiter, etc., and for 46 there have been offered mediation services on the working force market"[4].

Social responsibility shown to society in general, but with effects on the workings force market made it possible that

"In 2005, Allianz-Tiriac helped open a professional skills work shop within the Technical Food Industry College in Sibiu. 12 young people, with a disadvantaged social background were trained in this workshop. 11 of them graduated the bakery courses and were involved for a year in a session of professional integration. The youth selection was done with the help of the General Department for Social Assistance and Child Protection from Sibiu.

With the completion of training, there was a period of vocational integration, which included socio-professional integration activities, information about future jobs, advice on relationship with the employer, free time and income management, documentation activities, visits the units and bakery units trading bakers, social integration activities, participation in cultural events, excursions, meetings with other workers in the field bakery, etc.. Activities aimed at increasing confidence in young people's own forces, to counter the phenomenon of social exclusion, which, due to bad family situations, all the children were exposed.

From the 11 graduates of the courses, 6 were hired (3 of them in bakeries, 2 in some enterprises other than bakeries and one of them was hired as a janitor).

Social responsibility oriented towards promoting young people made it possible that

RBS Romania developed for 3 years the "European Values" program, meant to help preparing future specialists for the Romanian banking system. The program is under way with the help of the Bucharest Academy of Economical Studies.

This demand was identified by RBS Romania and solved in its own field of activity. The program enjoys the support of the Bucharest Academy of Economical Studies.

The company initiated the "European values" to support efforts by higher education institutions to prepare future professionals in the banking sector.

The program takes place over an academic semester, year 4 of study addresses and includes lectures, seminars and workshops. The courses were invited guest-speaker and bank representatives and other specialists in the field. The first 3 editions of the 'European values' have trained 165 students. The first edition was awarded 55 students, and the second 26. Currently, third edition takes place.

Initially thought as an optional course, the program became a full course, with credits, just like any other university courses. Some of the students who graduated the course were hired by RBS"[5].

But, inside the working force market, a company can be socially responsible towards its own employees also. This supposes the equal treatment and granting equal chances to all employees, based on the principle that the success of a company is due to the contribution of all employees, and the human resource is the most important asset of a company.

Responsibility of companies towards their employees is evident by providing a work environment based on health and safety at work, providing opportunities for professional development and personal achievement of a permanent dialogue to understanding the needs, expectations and satisfaction workers.

In this regard, for example:

"The Romanian research company SC Icemenerg SA assigns 5% of its business figure to some measures that must improve the working conditions of employees, such as: investments for a safe work, trainings, social events, creating a recreation center or a gym"[6].

And another company,

"To come forward for its own employees, it initiated in 2007 a program of donations called"1 ron for your co-worker. This program was generated by the help demands of the co-workers that found themselves in difficult situations, but also by the employer's desire to help them. Such a program allows an immediate reaction to someone's needs and it consists in the voluntary contribution of every employee, of a minimum amount of 1 ron, to a special fund for helping other co-workers which are experiencing extremely difficult moments. The sponsorship demands are analyzed by a representative comity of A&D Pharma, taking into consideration certain eligibility criteria, and the amount raised by the donations of the employees is doubled by the company"[7].

Responsibility towards own employees made it possible that

"Inside Tuborg Romania, training team-building programs, and professional education are a priority for the human resources. This, is proved by The Codecs award, received in 2005-"Best Investor in People". The amount invested every year in training programs is more than € 550 per employee, this amount not including the MBA programs and the organized team-buildings. Each employee, not matter what level he works on, takes advantage of a team-building and training every year"[8].

And the examples could go on.

3. Opinion

From the aspects above, that represent concrete facts of the responsibility that takes place in Romania by some companies, towards society in general but that are coming towards the working force market, we can notice the results and the positive aspects that these attitudes generate. Consequently, without any doubt, it can be said that the social responsibility of some companies, positively influences the relationships inside the working force market, at a larger or a smaller scale, depending on how big is the activity of these companies, reasons for which promoting these attitudes at a larger scale is desired.

Employment Strategies. Objectives and Achievements

Pivodă Roxana Mihaela
Spiru Haret University
roxana_pivoda@yahoo.com

Abstract

Work market, compared to other economy specific markets, has a pronounced national character which has to be matched to the community or global one. This implies the defining of a certain occupation existing model in a country within the European Union or the world.

In the present circumstances the occupation problem becomes stringent not only at international level, but also in Romania.

Key words: employment strategy, development, national policy

JEL classification: M12

1. Objectives

Increasing employment work is a matter of general interest to the European Union and for the development and implementation of this objective should encourage cooperation between Member States. Employment issues on the European labor market and reducing unemployment and has presented a careful concern because the European Union is a topic of major importance with important implications on macroeconomic and fiscal policy.

To meet an increased unemployment, which generates negative economic effects, correlated with a reduction in employment, European Union, introduced a series of regulations in the labor market, taking into account the concrete conditions of each Member State regulations that have evolved and developed over time.

Because of this, in November 1997, it was thrown off by the Luxemburg Work Force Occupation Council, the European Employment Strategy (EES), which represents the first important step towards work problems and human resources approach, and also of work and

functioning conditions of work markets from all the European Union state members. The charge of work force European Employment Strategy was the injection of a dynamism into the work markets, as well as the sustaining of the state members and social partners, and also guiding national policies of work force occupation in a coordinated manner, having the purpose of reducing the unemployment and stimulating work force occupation rate. The Luxemburg meeting was followed by a long series of reunions, where there have been settled other objectives of the European Employment Strategy.

Strategy launched in Luxembourg in March 2000 was marked by the Heads of State and Government meeting in Lisbon, which adopted the Lisbon Strategy, known as the Lisbon Agenda or Lisbon Process.

European Employment Strategy European Union wanted to become the most competitive and dynamic knowledge-based economy by 2010, able to deliver sustainable economic growth with more jobs and better and greater social cohesion.

This was to coordinate the objectives and priorities related to employment in Europe. The strategy was meant to find the most appropriate solutions that can support full employment as employment, new jobs, based on social dialogue, joint discussions, exchange of information between all EU countries.

The strategy was based on full employment of labor to reduce unemployment and low interdependence of downtime, achieved by increasing labor supply and demand, to achieve economic development and enhance social cohesion.

Regarding achievement objective of a fully occupation the strategy elaborated 10 years ago, took account of policies not only for the quantitative growth of the occupation level, but also for the quality growth. From a quantitative

point of view, it was established that at the European level, until 2010, the general occupation rate will be 70%; women occupation rate being 60%; and the occupation rate of the persons with ages between 55 and 64 being 50%, having as an intermediary object the achievement of a general occupation rate of 67% and a women occupation rate of 57% until 2005.

From a qualitative point of view the strategy aimed to the growth of the jobs' quality, health and security; promoting human capital investments; the assurance of work market flexibility; promoting equal opportunities and the elimination of any kind of discrimination forms.

Now, in 2010, the evaluation of the results, actions and taken policies has come, and all these regard the achievement of the suggested answers.

Chart no. 1 - E.E.S. Objectives and Achievements

If we strictly refer to the occupation level, as it can be noticed in the Chart no. 1, [1] the European Employment Strategy has not reached its proposed target ten years ago, that being the reaching of a 70% occupation rate, wishing that in 2010, Europe became the most competitive economy.

The strategy arose as a response to worsening relative competitiveness of the European Union against the U.S., Japan, in a time of rapid economic ascent of China and other Asian economies. When launching this strategy, the EU employment rate stood at a distance of -13.4 percent against the U.S., compared with -8.2 percent recorded employment in Japan and at a distance of 9.3 percent over the 70% proposed in

the strategy. Whether, given the financial and economic crisis or because the policies implemented, the EU failed to reach its target. Although no figures shown in the chart no. 1, is intragrate values at the end of 2008, is hard to believe that the difference of 4.1 percentage points was recovered during 2009, taking into account the existing social and economic situation.

Now, when the period for which the strategy has been proposed expired and after observing the results, when the entire European Union and not only is in a transformation process, as a consequence of the fact that the economic crisis effects have contributed to the involution of the economic and social progress, in March 2010 the 2020 Europe Strategy has been launched, which is actually replacing the 2000 Lisbon Strategy, that has not succeeded to transform the European Union into the most competitive economy.

Like the previous strategy, Europe in 2020, provides more objective, achieving a 75% occupancy level is one of them. Remains to be seen whether more than ten years, both the EU and each of them will manage to reach this target.

Therefore, employment policies employment plays a critical role in the European Union, demonstrating a high degree of importance for Europe to develop the entire region into Europe. Implementation of active employment policies employment, people are safeguards in matters relating to unemployment, poverty, labor dumping, social exclusion.

The final objective of the national and international occupation strategies, either connected or convergent, is finding an economy based on scientific knowledge, in which work resources occupation is full and efficient for the person and the social community.

2. Employment strategy results recorded in Romania

Even from 2001, there have been developed certain preoccupations regarding the adjustment of Romanian legislative system to the European acquis in the domain, putting into practice the European Employment Strategy objectives, Romania's work force occupation being considered one of the priority objectives, even though these objectives are not obligatory, and at

the time Romania was not part of the European Union.

In this respect, they have taken steps to develop a new Labor Code and some modification and adaptation of legislation on labor protection requirements of the new strategy. Composition was changed to National Action Plans for Employment which are concerns of increased national employment level, in close accord with the objectives of the European Employment Strategy, efforts were undertaken to develop a new employment law work, which emphasized the role of stimulating active measures to reduce unemployment and increase employment level, thus elaborându Law 76/2002, whose presentation was made in the previous subsection.

Along this decade, the Romania`s hopes and efforts for the realization of a most fully occupation and for the reaching of the third 2005 established targets, within the Lisbon Strategy have taken shape into the results presented in no. 2 [2] and 3 [3] chart.

Chart no. 2 – E.E.S. results, shown in Romania during 2000-2005

Female employment rate of persons

The undertaken measures regarding the implementation of the occupation policies till 2005, have not answered to the Lisbon Strategy established objectives. So, the general occupation rate which had the objective of realizing a 67% occupation level for 2005, didn't have the expected result; from a difference of -3,4 rate points in 2000, Romania had at the end of 2004 a difference of -9,1 rate points. The women occupation rate in 2005, established within the Lisbon Strategy, which had to achieve a 57% level, has also registered a descendent evolution, although, even from 2000, Romania records at this mark, a lead of 0,8 percentage points, level that not only does not maintain itself, but also drops after 2001, reaching at the end of 2004 a level of 4,9 percentage points.

Regarding the employment rate of the population with ages between 55 and 64, the Lisbon Strategy decrees a value of 50% that must be reached by 2010, level that Romania established even from the year 2000.

The rate of the employment for people aged between 55 and 64 follows a descendant pattern, as can be observed in chart no. 3, pattern that can be noticed more frequently after the year 2001 and until 2004, when the situation reestablishes itself. In 2009, at the end of the fourth trimester, Romania has a -8,7 percentage points compared to the level settled by the strategy, even though in the year 2000 it has a starting point that a positive margin of 0,1 percentage points.

Chart no.3 - The employment rate for people aged between 55 and 65 years, registered in Romania in comparison with EES objectives

The fact that Romania failed to reach any of the targets of the Lisbon Strategy, in employment, proposed for the first half of this interval is an indication that the structural reform process and in particular, enterprise restructuring and achieving a competitive economic environment leading to job creation has not yet been finalized.

For the second half of the interval, the results Romania recorded concerning the employment of the working force, results that were based on the stipulations established by the Lisbon Strategy for the year 2010, are shown clearly in the chart no. 4 [4].

In the first interval of the period in discussion, the employment rate recorded a constant fall, fact that did not happen in the second interval also. Despite this, after 2005, the employment rate of the Romanian working force records a continuous rise until 2008, when reaches a value of 59 percentage points, during the first trimester of 2009 the numbers fall significantly by 1,6%. The next trimesters of 2009 are characterized by an important rise of the employment rate that manages to regain the lost percentage at the end of the third trimester of 2009, thus recording a rise of 1,4% compared to the highest values of the five years period. But

success does not last for long, as the world economy crisis hits also the working force market causing a drop of the rate, during the fourth trimester of 2009, by 3%.

Chart no. 4 – EES results, shown in Romania during 2005-2010

Female employment rate of persons

Overall occupancy rate range lost 0.3 percentage points, in 2005, occupancy is based on a difference of -12.3 percent against objectives in the Lisbon Strategy, as the end of 2009, rate occupancy to 57.4%, which means a difference of 12.6 percentage points.

The employment rate of the female population in this interval follows the same descending trend. The chart no. 4 shows 2 points of contraction of the employment rate of almost identical values, one recorded in the year 2006

and another in the third trimester of 2009, and also a point of boosting recorded in the first trimester of 2009. At the end of 2009, Romania recorded a difference of 9,2% compared to the 60% level imposed by the strategy.

Table no. 1 shows a summary of the values presented so far.

Table No. 1 - Realization by Romania, the targets set in the European Employment Strategy

	Indicator	Overall employment rate	Employment rate for women	The employment rate for people aged between 55 and 64 years
2000-2004	Proposed level of EES	67	57	50
	Level reached in Romania	57,9	52,1	36,9
	Level achieved difference to the level proposed	-9,1	-4,9	-13,1
2005-2009	Proposed level of EES	70	60	50
	Level reached in Romania	57,4	50,8	41,3
	Level achieved difference to the level proposed	-12,6	-9,2	-8,7

Source: table constructed using data from chart no. 2, 3, 4

Romania failed to reach all the recommendations of the European Union established by the European Employment Strategy; the overall employment rate recorded at the end of the evaluation period showed the most significant difference.

Towards the EU, the employment in Romania, was lower by 6.9 percent, although this indicator in 2000 was higher by 2.9%.

3. Opinion

Economic crisis which led to massive layoffs in all sectors, aggregate employment policies and reforms that had adapted to the new demands of the domestic labor market, due to the fact that there is a general formula valid for all states, but they should take into account the concrete realities that exist in the country have made in this period, the employment of Romania to decrease by 4.6 percent compared with the EU, which increased by 5.2 percent. In other news we have to consider that in comparison with other EU countries, with a long experience in market economy, Romania has much covered.

In order to reach a level of employment of 75%, established by the Europe Strategy 2020, Romania must recover during this decade a deficit of 17,6%, starting at January 1st 2010 from an employment rate of 57,4%. The goals established by the Lisbon Strategy, as well as those of the Europe Strategy 2020, never were, nor are mandatory, meaning that not reaching them will not have bad consequences on the evolution of the Romanian economy. Although ignoring these objectives could lead to an important risk factor in a medium or long term, regarding the proper evolution of Romania inside the European Union.

The final goal of both national and international strategies is to strengthen an economy based on scientific knowledge, in which the employment of the working force is both total and efficient not only for the individual, but also for the entire social community.

Market Strategies Regarding the Integration and Confrontation of Small and Medium Enterprises with the Exigency of the Competitive Market

Pîndiche Elena

Ioniță Roxana

*„Dimitrie Cantemir” Christian University-Faculty of
Tourism and Commercial Management-Constanta, Romania
pindichielena@yahoo.com
ionita_roxana2000@yahoo.com*

Abstract

The elaboration of market strategies is a complex process, which needs to be performed by all enterprises, without consideration of size or field of activity. The elaboration of strategy under auspicious circumstances presupposes careful research of the environment within which the enterprise performs its activity, as well as of its resources.

Key words: market strategies, SME, influence factors

JEL classification: M31

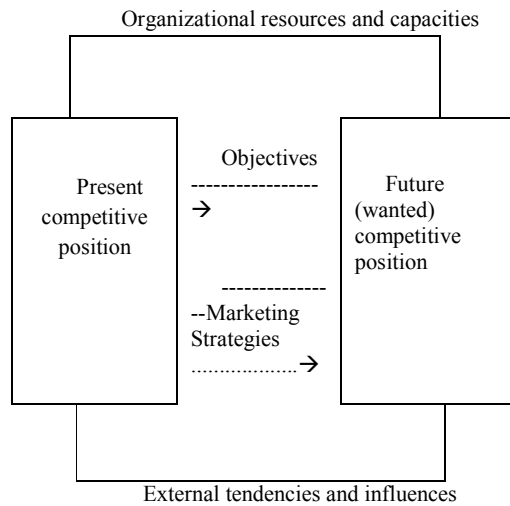

Most specialists consider that *“out of all the components of marketing policy, the market strategy represents the most important element, taking into account the fact that only by means of dynamic adaptation to the socio-economic environment is the correct substantiation of the other components possible”*[1]. A more complex definition of this concept is the following: *“market strategy is a component of marketing policy, within which is concentrated the whole ensemble of actions regarding enterprise management. Within marketing policy, strategy plays two roles: on the one hand, it ensures the general orientation of the enterprise activity, while on the other hand it establishes the basic tasks needed to achieve the objectives set for each stage and the possibilities to adapt enterprise activity to the dynamics of the market.”*

In principle, the formulation of these strategies constitutes an important part of the enterprise strategic management, which comprises three basic dimensions: defining the field of activity for the enterprise; setting the performance indicators; elaborating development strategies. Defining the field of activity consists of establishing the role and setting of the enterprise, its nature and finality. It must be noted that, starting from the 1960s, important authors in the field of management emphasized the fact that *“neglecting any of these elements probably represents the most important cause of economic failure.”* The second dimension consists of setting the goals of the enterprise, *“which express in operative terms the anticipated performances, mirror the degree of efficiency of the enterprise conversion process.”* Finally, the third dimension represents the course to be followed in order to achieve the set goals, and it is called strategy. A definition of an effective marketing strategy might be the following: *“an adequate market strategy is that according to which the enterprise performs a correct selection of the segments towards which to focus its marketing efforts, which it addresses with the adequate product, which it provides in the most adequate setting, for the adequate price and accompanied by appropriate promotion, so as to achieve the goals set for a certain period.”*

Malcolm McDonald [4] describes such a process as one of planning change, the development of the present enterprise competitive position towards a future position, by means of setting goals and elaborating strategies. However, the process

is also determined by the resources and managerial skills within the enterprise, as well as by the external tendencies and influences. Therefore, one can talk about “the process by which long-term goals and strategies are formulated for the entire company or for the strategic unit of activity, by connecting resources with the existent opportunities.”

Fig.1 Repositioning strategies

In Kotler's[3] opinion, positioning is crucial for the success of a product. He defines the concept as follows: “Positioning is the action of conceiving the offer and image of the company, so that it takes a distinct place in the mind of the target market audience.” At the same time, he mentions cynically, taking over from those who coined the term, that “Positioning starts with a product. A commodity, a service, an institution, even a person...But positioning does not refer to what you do with the product, but to what you do with the mind of the potential buyer. In other words, you position the product in the buyer's mind.”

This course from the present position to the future one is defined by an ensemble of elements comprising four strategic components: the product and market sphere, the growth vector, the differential (competitive) advantage and the enterprise synergy. The first three form the triptych by means of which one can characterize the course of the enterprise towards the environment in order to achieve the set goals. The fourth represents “the process of concerted action of more factors, process which generates a total effect greater than the sum of the

individual effects of each factor considered independently”[5].

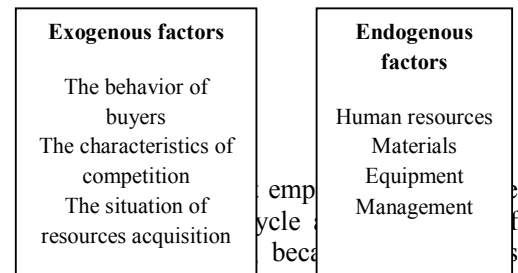

Fig. 2 Strategic components

We will come back to the differential advantage, whose correct detection is, according to Kotler, the key to the success of market strategy. Moreover, “Marketing is the field where, by excellence, the synergetic effects have special amplitude, where the effect of any controllable variable depends very much on the way in which it is integrated next to the other variables, by means of which the enterprise acts upon the environment.”

The elaboration of market strategies is a complex process, which needs to be performed by all enterprises, without consideration of size or field of activity. The elaboration of strategy under auspicious circumstances presupposes careful research of the environment within which the enterprise performs its activity, as well as of its resources. Therefore, these strategies are influenced by factors from outside the enterprise (exogenous) and from the inside (endogenous factors).

Fig. 3 Market strategy determination factors

that there are major differences in the marketing approach for a product at a launch stage, growth stage, maturing stage or decline. Besides the life cycle stage, the used strategies are also influenced by the prestige the enterprise enjoys within the market.

We conclude that the multitude of factors to influence the strategies adopted by enterprises inevitably lead to a multitude of strategies which can be chosen. Theoreticians show that there are five approaches which can differentiate market strategies.

First of all, starting from the fact that market strategy is nothing but a reaction of the enterprise towards the environment where it performs its activity, strategies can be distinguished into two categories which, in turn, can have different intensities and forms[2]. Strategic relations are different when the enterprise intends to modify its relations with the market (the launching of new products, for example) then when the reactions refer only to internal modifications, with indirect effects upon the market (technology modification).

Secondly, the stages of demand determine different types of market strategy. Starting in 1973, Kotler [3] has tried to synthesize the following types:

Fig. 4 Varieties of market strategies depending on the demand situation

Demand situation	Marketing role	Strategy title
Negative demand	Demand "demystification"	Conversion
Lack of demand	Creation of demand	Stimulation
Latent demand	Demand development	Development
Declining demand	Demand "revitalization"	Remarketing
Fluctuating demand	Regularization	Synchromarketing
Complete demand	Maintaining demand	Maintenance
Excessive demand	Curtailling demand	Demarketing
Undesirable demand	Demand "destruction"	Antimarketing

Depending on dynamic of the environment, market strategies may embrace passive behavior (they adapt their strategy to environment changes without influencing it), anticipating behavior (the strategy is corrected in time, based on the correct anticipation of environment change) or active

behavior (the enterprise imposes the environment change, based on opportunity detection and environment savvy).

Depending on the interaction between strategy and market segmentation, enterprises can choose an undifferentiated strategy, a differentiated one or a concentrated one. Finally, depending on its development alternatives, the enterprise can choose the market strategy most suitable for achieving its own goals. Starting from the main elements of the growth vector, the situation can be concentrated within a table:

Fig. 5 Versions of market strategies depending on the growth vector

	Present Markets	New Markets
Present Products	Market penetration	Market development
Improved products	Reformulation	Market extension
New assortments of a product	Replacement	Product differentiation and segmentation
New product lines	Production line extension	Concentric diversification
New products, by new technologies	Horizontal diversification	Lateral diversification

Marketing strategy is a component of marketing policy, within which is concentrated the whole ensemble of actions regarding enterprise marketing.

Purchasing Decision Process in the Context of the Economic Crisis in Romania

Magdalena Platis

University of Bucharest,

magdalena.iordache-platis@drept.unibuc.ro

Abstract

In the market place, the consumer behavior has always been an attractive area for the purpose of better defining the marketing strategies and alternative options for companies. In addition, the decision-making process has been a starting point for understanding the consumer behavior and identifying the positioning and segmentation variables for the company. In the context of the contemporary international economic crisis, many changes affect the consumers. We assist to new rules in the daily consumer behavior as well as raw tendencies in the purchasing decision process.

Therefore, the purpose of this paper is to reveal the features of the Romanian consumer and purchasing decision in the context of the contemporary international economic crisis. The main objectives of the paper are:

- To understand the consumer behavior and the factors that influence the purchasing decision for a typical consumer;
- To identify the new features of the purchasing decision before and after the international crisis for the Romanian consumer;
- To analyze the impact of the consumer decision on the market place.

Key words: consumer behavior, purchasing decision process, change, marketing strategy

JEL classification: M31

1. Introduction: The Typical Consumer Behavior and Purchasing Decision Process

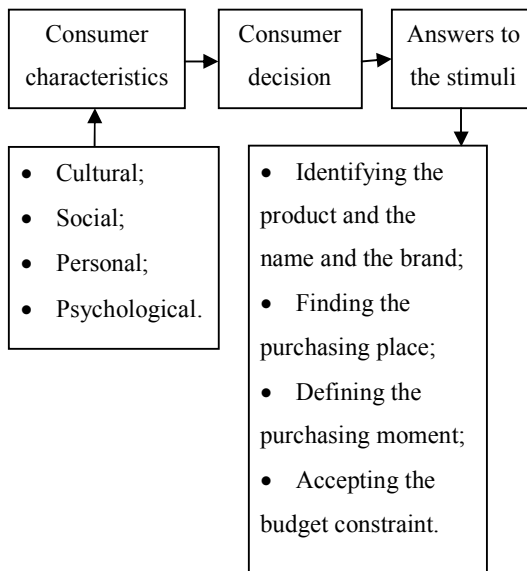

The consumer behavior is considered as the total decision actions made at an individual or group level that regard the buying process in order to satisfy the current and future needs by consuming or using foods and services.

In the context of globalization and knowledge society some new tendencies characterize the consumer behavior such as:

- Many of the consumer preferences become common or convergent, since so many identical products can be found indifferent countries through expert and franchising.
- A fundamental premise of the consumer behavior is the perception of buying goods or services not only for what they are used to, but mainly for what they represent; in other words, consumers create their own identity through the product, brand, name etc which is accepted.
- In different moments and locations different external stimuli influence the consumer behavior – marketing stimuli which include the features of the marketing-mix components and the external environment stimuli which refer to economic, technological, political, social, cultural, informational and legislative factors.

The consumer reacts to these stimuli and decides about the purchasing consumer (see figure no. 1).

Figure no. 1. Consumer Reaction to Stimuli

The classical decision process in the purchasing situation takes into consideration the following phases:

- Identifying the problem;
- Searching the information;
- Evaluation;
- Decision;
- Defining the purchasing behavior.

At the same time, the main factors that influence the purchasing behavior are included in different groups:

- Social-cultural factors: culture, subculture, social class;
- Social factors: reference group, family, social status;
- Personal factors: occupation, economic wealth, life style, personality;
- Psychological factors: perception, learning, believes, attitudes, motivations.

Therefore, the purchasing decision is made under the pressure of the external factors and the internal ones, the latter being individual factor such as: age, income, education, position, personality, status, authority etc.

2. Purchasing Decision Process in Romania

Romanian Consumer has always loved to buy, but the budget and price constrains modified the needs and the decisions with this respect.

In the process of purchasing goods and services, the evaluation of the alternatives take

an important role for the decision making. Therefore, some possible rules may be applied in order to identify the product that best corresponds to the consumer needs:

- Compensation rule → every alternative is evaluate and the less satisfied results according to certain criteria (attributes) are compensated by higher results of other features; example: the consumer may prefer a product even if it has a higher price if this disadvantage is compensated by a better feature such lowest energy consumption.
- Eliminating rule → the characteristics of a product are evaluated according to a minimum standard defined by the consumer, who therefore eliminate the product which does not correspond to this level; example: if the guaranty time is less than one year, the product is eliminated from the alternative test.
- Selection rule → the consumer identifies some minimum standards, but only for some criteria (features) considered dominant, the other being considered of less importance and ignored. Therefore, the consumer accepts the alternative which exceeds the minimum standards; example: a product bought from impulse.
- Hierarchic rule → the consumers set a hierarchy in the list of criteria according to their importance. The products are compared feature by feature, but the most important criteria are decisive; example: the purchasing of a product being the cheapest one.

The Romanian Consumer decides to purchase according to some specific rules:

- Imitation rule → the consumer admires the product already bought or used by somebody else and decide to buy it for him or herself;
- Exaggerating rule → the consumer wants to be considered who he/she is not and decide to buy things only to generate the wanted impression among colleagues, neighbors, relatives, and friends.
- Giving-up rule → the consumer create a real scenario to explain his/her purchasing decision for a low price product looking for different arguments in order to hide the low level of financial resources and that he or she cannot afford something else.

The Romanian Consumer and decision process have been different in periods which can be expressed:

- Before Revolution in 1989 and after,
- Before Integration in the European Union and after,

– Before economic crisis and after.

Consumer Behavior is a very complex set of attitudes and actions that are observed on the market through the interaction between the supply and demand.

Marketing view and orientations take into consideration the huge importance of the client and his/her behavior in defining the functions themselves:

1. Researching the consumer needs;
2. Dynamic connection of the organization to the economic environment;
3. Increasing the clients satisfactions;
4. Profit maximizing.

Nowadays, people in Romania behave totally different than before 1990, as consumers. Many things have changed in the market place and new market rules have developed.

Before Revolution

- in spite of a considerable agriculture potential, many product markets were characterized by scarcity and lack of supply; an unforgettable experience was in **1946** when because of a dryness, a profound crisis came out in alimentation;
- at the beginning of **60's** the Romanian agriculture (the economy was agriculture-based) started to be nationalized, exception being only the private properties in the high mountain areas;
- the communist agriculture units were called Agriculture Production Cooperative started to function late 60's so that the period 1965-1971 were even considered as a small liberal period of the Romanian Communism;
- **the 70's** were years of relative prosperity, an average salary being of 1200 Lei in 1971 while the official exchange rate consisted of 18 Lei/1\$, which meant an average salary of 66,66\$/month;
- an average family of three members used to spend around 800 Lei/month for food and the Romanians even had the possibility of consuming products of imports, especially from the socialist countries (Romania was a member of the CAER-Council for Mutual Economic Help) and from other countries, undeveloped countries which produced citric fruits or bananas;
- at the Romanian littoral, some foreign tourist started to come for vacation and some western drinks like Pepsi Cola started to be produced in Romania;
- **the 80's** are now considered as an alimentary tragedy, because too many credits had been concluded by the state at

the end of 70's for the communist industry to be technologically improved;

- in 1978 and 1979 the edible oil (oil for food) and the sugar were rationalized, beginning with the small cities, but later on, the rationalized consumption affected even the Capital: 1 liter of oil/person/month plus 1 kilo of sugar/person/month, 20 liter gasoline/month;
- many products became very scarce for the Romanians, like milk and meat and could be bought under unforeseen situations (without any rule) after waiting in line for hours, no matter what the season were;
- the private cars could be driven during weekends only once at two week-ends, which meant two times per month, depending on the number: even or odd numbers;
- Romanians developed a specific humor; for instance the pig legs sold as meat were called "addidas" shoes;
- the retired persons were going to the food stores very early in the morning with little pliable chairs in order to wait for something, no matter what it would be provided, either milk or meat or napkins;
- Romanians could buy a good book of a famous author only if they had known the seller from the bookstore and accepted to buy other 1-2 books which were not wanted;
- many times you could buy fresh vegetables under the condition of buying at the same time some of the expired vegetables;
- TV emissions could be seen only few hours a day and with the same socialist content;
- nobody died for hunger and Romanians started to behave like a huge family, sharing the same needs and unsatisfactions;
- many adults of today were children in the communist times, but they did not face too much of the scarcity due to their parents, the old people of today, because above everything Romanians were and are wonderful parents.

After Revolution

- obviously, prices started to increase year by year, under economic explanations like price liberalization or domestic price correlation to the external prices;
- too much variety on the market made the Romanians confused in making consumption decisions;
- too much flexibility in price changes made the access to products different from one person to another; Romanians had not accepted the situation according to which a

product were sold in a location at one price and to another location at a higher or a lower price, for many years;

- Romanian consumers are now looking for Romanian products, even the market is full of imported ones, due to the belief of a better quality for the Romanian products;
 - Romanians are now facing a reverse situation:
 - from a market of scarcity and lack of products => to a market of variety of products and prices;
 - from a status of dominated consumer => to a state of free consumer;
 - from a situation of contradiction between “having money and not having what to buy” => to a contradiction between “having what to buy but not having enough money”;
 - from a childhood of no regret because of not knowing some products (chocolate, fruits etc) => to one of much regret because parents do not afford to buy some of their children’s wanted products;
 - from a “hidden” unemployment when people used to pretend to work => to a visible unemployment;
 - from a one single job position => to multiple work places as if Romanians have become totally dependent of work;
 - from a relative equilibrium between working time and free time => to a completely disequilibrium toward working time;
 - Romanians have become protected as consumers by special agencies and they started to know and to feel better;
 - Romanians have started to consume for the sake of consuming with or without a need and therefore, to spend too much time and money for products, some products having low utility for them;
 - Romanians have divided into two parts: rich and poor, but being rational or less rational consumers:
 - rich and rational;
 - rich and irrational;
 - poor and rational;
 - poor and irrational;
 - Romanians are still loving to celebrate different went together with the family or friend and they cook a lot, invite a lot to restaurants, are well known for hospitality.
- The subject behaviors in the Romanian economy have changed during the transition process and in the UE integrating context. The

principal characteristics can be summarized as following:

Visible elements of the subjects behaviors	
Before EU integration	After EU integration
<ul style="list-style-type: none"> • Individuals were tempted by international tourism and understood the abroad access as a special event, being proud of it; 	<ul style="list-style-type: none"> • Individuals have started to travel abroad more easily and even to look at this as being a natural thing;
<ul style="list-style-type: none"> • Consuming behavior were kept and respected; 	<ul style="list-style-type: none"> • Consuming behavior have been expanded by borrowing from West;
<ul style="list-style-type: none"> • Individuals with deficitary social status had no access in developed countries; 	<ul style="list-style-type: none"> • Free access of all subjects has generated the travelling abroad of some uncorrect and unrepresentative behaviors;
<ul style="list-style-type: none"> • Regulations on the market processes were not followed many times; 	<ul style="list-style-type: none"> • Regulations on market mechanisms have expanded and become more firm;

Of course, many of the current features of the individual and organizational behaviors can be explained through the European influences. Most of the times, there are noticed negative influences on consuming which have been expanded in the Romanian economy: drugs traffic and their consumption, trading artificial and even harmful products in spite of rules, less decent manifestations in the daily life for individuals and exaggerated and absolutely decisions in the business relations, even of long-lasting for organizations.

The same phenomenon is havening in a reverse sense: the visible behaviors of the Romanians out of country are the negative ones: steeling, violence, frauds etc.

Why these negative aspects tend to generalize to the entire nation and to be considered representative for the entire Romanian society? Why the Romanian achievements in science, technique are ignored? Why the Romanian Olympics on different areas of science and sport does not count anymore? Why also positive elements are not seen in a manner, which should consider the negative

aspects only as exceptions and isolated situations?

Perhaps the people through the institutions they represent of or where they work in are tempted to exaggerate and promote actions that are negative.

Therefore, an education in a positive sense must be done especially at individual level because institutions are represented and are active by the action of their people as individuals. Thus, the negative elements from the social life could be shown as a pointing start for change toward a positive behavior and positive elements otherwise many of them should become a permanent subject for information and not an exception.

In 2008, the Romanian Consumer was considered adaptable, curious, proud, sensitive, critical etc. In the current context of the international crisis, new behavioral rules influence the decision process:

- Low price rule → the consumer decides according to the lowest price, but if the product is visible very poor at other characteristics, the Romanian Consumer is still too proud to buy it; therefore, it would be preferred a product with a low price (not the lowest) but with better other attributes.
- Changing rule → the consumer accepts the changing situation in the decision process, therefore he or she postpone some investments, give up to some products or re-evaluate other options.
- Priority rule → the consumer learns to identify priority at priorities and to follow the direction to satisfy the needs according to the best priority; most of the time, the priority regards the children and their needs.

3. Conclusions

In Romania, there is no model for the consumer behavior. People act differently under different conditions and stimuli.

The economic principle of maximizing the consumer satisfaction according to the equilibrium between the rapport of marginal utility and price among different goods: $Um(A)/P(A) = Um(B)/P(B) = \dots$ is correct.

People started to behave like a “king” in the market-place, in a consumption society.

Unfortunately some “bad” behaviors are easily borrowed (fast-food etc).

At present, it is a time for thinking of how to stop the trend:

from a consuming life that destroyed health	=> to =>	a spending toward health
---	----------	--------------------------

In other words, it is time for respiritualization and sustainable education toward health of the:

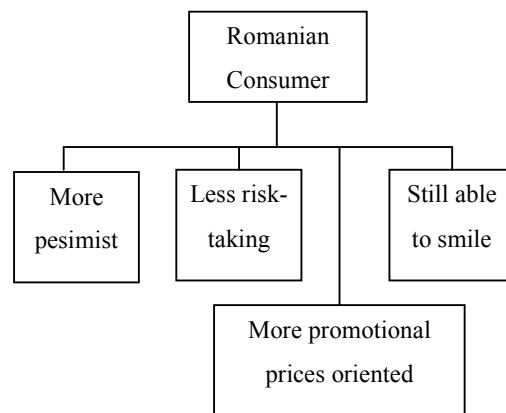

- individuals and families;
- organizations;
- societies.

The Romanian Consumer has definitely become more informed since the integration in the European Union. The Consumer has understood that:

- There are many rights for the individuals in the market place;
- People must understand the product: who created it, what components does it include etc.
- There must be correct information in the communication process.
- There are special agencies for the consumer protection.

The features of the Romanian Consumer in the context of the international crisis can be easily observed (see figure no. 2).

Figure no. 2. Romanian Consumer

To conclude, the Romanian Consumer has borrowed many international features but has remained with a strong propensity of buying. Understanding the consumer needs, companies find a potential way to profitability. Therefore, sometimes consumers are abused by so many questions and questionnaires. Some of them like to answer, but most of them refuse being already to stressed in the real life and at the working place.

Understanding the current situation and the consumer behavior, the most important aspect to be studied should regard the education

consumption, since education itself is considered a special product. What kind of education Romanians like? When do they buy such a product? How much do the Romanians want to sacrifice in order to get education? Many other questions and answers to them may be of real contribution to further understanding of the general consumer behavior in Romania.

The Role of Change in Higher Education an Empirical Research

Popescu Maria-Lavinia
"Babeş-Bolyai" University, Cluj-Napoca
lavinicamaria@yahoo.fr

Abstract

The deep changes which happen in today society impose of educational institutions new exigencies for qualifications of the young generation. Taking her the former responsibilities of people, those see obliged all the time to adjust oneself by new curricular projects at quick economical and social change which influence decisive the conception what regarding the role of education system. They majors objectives are determinate by the necessity of development resources by the measure of increases complexity of life conditions and aspirations.

The study it is based by primary quantitative research method by conclusive-descriptive nature based by the divided plans or transversal research how this is know in specialty literature. The dates collect method has been "face to face" investigation and the research instrument the questionnaire. The quantitative dates processed using SPSS. This paper achieved on the basis of punctual investigation represents a photography for the time being of students at master opinions referring to the perceptions which they coached by the different aspects vis-à-vis by the education institutions where they are entered in.

Key words: educational consumer, educational institutions, marketing investigation

JEL classification: M31

1. Introduction

The education consumer has a certain behaviour defined as the totality of acts and decisions regarding to turn to account of opportunities with the view to obtain and to use the educative goods and services. For this has with view to following actions succession: stimulus perception, representing information's process of mind received by the surrounding, in

this case the consumers are aware to educational needs, the inform regarding the educational goods and services which are on market, their contents, the utility, the diversity, the accessibility, the axiological level etc. The attitude creation, mint bent for the consumers to "buy" these goods and services, the motivation, which represents the state of mind stress which lead the fellow at purchase, satisfying his needs and expectations.

The after consumption behaviour is considered through the estimation of satisfaction index. That is, the graduates of one school are in measure to make valuations if their expectations have been satisfied in the course of studies years and what doesn't correspond with these expectations.

Educational marketing policy must be drawled up through the motivations study and of symbolic representations of consumers, through the fundamentals options defined of groups and fellows.

The paper includes in section 2 the theoretical fundaments, in section 3 the dates analyze which shape the students opinions register within framework of FSEGA at masters for one year of study, regarding the changes while they would agree with for improvement of economic university quality education corresponding to that of big world universities (that which are included in all the important tops of universities), and the section 4 the conclusions remarks.

2. Theoretical fundaments

The plan of marketing research consist in mention the methods what will be used from collecting and analyzing the necessary dates with purpose to identify and to reaction in face of one problem or opportunity, so that the difference between the cost of obtain of different exacted levels and the expected

value of information associated with each exacted level to be maximum. The investigation represents the most acquaintance method of obtain primary dates necessities from the fundament of marketing decisions and not only. I resort to using a quantitative research realized in base investigation, what is a method of primaries dates collect through addressing questions included in a questioner at one representative pattern (100 students) by the mother population (students register in 2008-2009 of FSEGA-UBB, masters – one year , daily classes). Thus in study I use a structured investigation which supposes using one questioner with questions which was established to begin with and was arranged in a certain order which must respect. In same times the investigation was one not dissimulate, the fellow being informer about the purpose of research and he could identify him with rapidity in the base of questions of questioner. Much, I used the classic personal investigation which supposes a discussion face to face between the interview operator and fellow asked, which permit obtaining the necessities information's for research.

With the view to realize the research I extracted a pattern with 100 persons by population. Total population (investigate universe) have 1400 subjects. I used the proportionally stratification investigation in function with the students percent in mother population and in same times in rapport with repartitions of section.

3. Students opinions of FSEGA

The education consumer has a certain behavior defined as the totality of acts and decisions regarding to turn to account of opportunities with the view to obtain and to use the educative goods and services. Creating attitude, mental bent of consumers for “purchase” those goods and services, the motivation which represents the mind state by tension which lead the fellow at purchase action, satisfying his needs and expectations are very important. Consumer preferences for different superior educational institutions would depend from to anticipate learned situations. Observes the fact that students within the framework of FSEGA consider that the selection realizes in base of entrance examination, how it acts in the big universities of world, would be more

efficient, 93% between the persons asked being in agreement with this affirmation.

Education posing in agrees with the new requirements and for the other part, with the dates offer by the new researches undertaken in psychology and in educational sciences, behaves tasks more pretentious than for past. The tendencies and the directions established by curricular reform by which was supposed the education in our country illustrate the efforts of renewing destined to assure a superior quality in people qualification. Through the new profile of former it gives a special role of competences and attitudes development. Education becomes, in this manner an authentic formative process, and his moderator impact it is appreciate though formed and developed skills and abilities.

The adaptation efforts at news situations thanks to changes of social environment, leaded at profound mutations in educational area. It was acted at a curricular diminution which to come in meeting of complexes economical-social changes. In this context, the diminution of educational process in all his spheres and joints is centered for accentuation formative aspect, therefore the education subjects being prepared to offer proof by functionally competences, adaptability, responsibility, initiative and creativity, essentials characteristics considered in the development they personality. The students asked are aware of fact that the system used in the biggest universities which involves the suggestion an one vast palette of optional disciplines between which the consumer of educational services can choose those which represents him better and to give a diploma corresponding to the profile obtained in base of disciplines basket studied is more efficient, 88% between they declaring this thing.

An attitude is a behavior propensity learnt which is consistent in a favorable or non favorable direction in connection with an object given.

The attitudes represent an expression of internal feelings which reflect if a person is favorable or not favorable with a bent at certain “objects”, as would be a service, a brand, a product. The materials delivery necessities with the view of carry on the course at begin is considered a good method by all the participants at study. The attitudes

are perceived by ones specialists that representing a general evaluation. This evaluation would go from positive extreme at negative extreme. Then, is very important to observe how the persons asked perceive the university preparation received, having in view the fact that the attitudes vary in intensity and favorability. Then, the students asked if would dispose by course support with less at week before begin this, the reason from which the most would going at course would be there for to obtain more information's with regard at studied subject (64%). A quarter between the population studied would use the course support for search before the information, in this manner can have active participation of course carry on. A percent quite reduced (11%) would profit by this event for do not going to course.

Figure 1. Dispose one week before by the material of course

Dispose with one week before by the material of cours

Table no. 1 Master section is: * If you dispose with a week before by the material which will be the course support then:

Master section:	If you dispose with a week before by the material which will be the course support then:			Total
	would go for at course	would not go supplementary information	quest before information for active participation	
% of Total

Total %	11	64	25	100

6 between the answered students follow the MDA section (business development management) and said that if they dispose with a week before by the material which will be the future course support, then they go not at school, while as 22 students of same section would go with the view of obtaining the supplementary information and 5 between they would profit from inform before with the view of active participation. 100% between the students asked by FCA (corporative finance assurances-1 person, therefore 1% by population studied) would use the course to begin with received for inform them and for active participation. With the view of link identification which can come into sight between that two variables analyzed I resorted to coach the hypothesis:

$$H_0: \chi^2 = 0 \text{ (link not exist)}$$

$$H_1: \chi^2 \neq 0$$

Table no. 2 Chi-Square Tests

	Value	df	Asymp.Sig. (2-sided)
Pearson Chi-Square	46	38	0.17
Likelihood Ratio	45.4	38	0.19
Linear-by-Linear Association	2.34	1	0.13
N of Valid Cases	100		
a	56 cells (93.3%) have expected count less than 5. The minimum expected count is 11		

It can say with 95% probability that between this two variables link not exist, because Sig.=0.17, therefore is much more then 0.05.

Table no. 3 Symmetric Measures

		Value	Approx. Sig.
Nominal by Nominal	Contingency Coefficient	0.56	0.17
N of Valid Cases		100	
a	Not assuming the null hypothesis.		
b	Using the asymptotic standard error assuming the null hypothesis.		

The value of contingency coefficient is equal with 0.56 being significant different by zero, therefore the link between variables is by big intensity.

4. Conclusions

The idea of fellows preparation in agreement with the society requirements in which they live lead at initiation the instructive-educative ways capable to respond of formative exigencies for the moment, but in the same time and for perspective. The educational institution has moreover the responsibility to form ablest citizens to build all the time the new society, a task more difficult: that to reform/to restrict in such manners so that they majors objectives to realize more rapid as the changes of societal paradigm. Studying the population direct implicated in process of professionally formed within the framework of university center of Cluj-Napoca with economic profile emerge the following conclusions: Then the consumers are free to action that they want foretell that they actions will be consistent with the attitudes. Often, though the circumstances change.

Is necessary to consider too the influence of conjectural situation over the attitudes and behavior consumer. The marketing – through her traditionalises functions of consumer research and of increase of adaptability entity at environment in which this work – will play a determined role in the assurance of success on market. At his place, the marketing will constitute the subject of some important changes in the years which will come, changes which will intervene on all this landings: marketing research, communications with potentials clients and current clients, sales, services addressed of clients etc. Absence using marketing view within the framework of educational system it is similarly with the disagreement educational institutions access at the ensemble valuables tools which can eliminate the status quo problem present within the framework of this.

Ways to Improve Competitiveness and Crew Personnel Strategy

Norina Popovici

“Ovidius” University, Constanta
norinapopovici@yahoo.com

Cristina Nistor

Constanta Maritime University, Constanta
nistor.cristina@gmail.com

Abstract:

In maritime transport, a well-structured crew personnel strategy impacts on every facet of the ship's operation and is an issue that must not be ignored. Competitiveness of seafarers can be acquired by appropriate training. Seafarers have to pass specific training programs when they study in university time and afterwards, when the graduate they have to enrol in different courses in order to improve their knowledge and capabilities and to promote in function. This paper presents the importance and the effects of training of seafarers on crew personnel and competitiveness.

Key Words: human resources, strategy, competitiveness.

JEL classification: M51

1. Introduction

When considering the overall picture of maritime business, personnel's training is considered by shipping companies a top priority on the list of matters that influence competitiveness in operating cargo and vessel.

Taking into account results of a study developed for a PhD research on maritime human resources management, we can establish a definition of competitiveness of seafarers from the behaviour point of view. The results of the study are based on interviews delivered to Romanian and foreign representatives of 3 national and international crewing companies with subsidiary in Constanta, on 45 questionnaires applied to Romanian seafarers

and ratings (seafarers without Certificate of competency) and on 55 questionnaires completed by undergraduate students in maritime domain.

2. Definition of competitiveness in maritime transport

Based on the results of the study mentioned before, competitiveness in maritime domain is a comparative concept of the ability and performance a seafarer who follows the legal norms of seafaring stated by the International Maritime Organisation and other international and national institutions, related to safety, efficiency and efficacy issues. A complete definition of competitiveness would integrate the pecuniary aspect like the lower level of wage that a competitive seafarer will demand and accept, compared with other seafarers, from the point of view of a shipping company's costs.

A feasible method of developing competitiveness is through training and long-life learning. Training is delivered for undergraduates (future seafarers) in maritime schools and universities and after graduation in maritime training centres and in the employing company. A particular attention must be given to transmission of adequate knowledge for gaining competences and abilities and not only theoretical insights.

There have been made increasing efforts to gain an awareness of human element issues. The traditional view that human error is the major cause of all accidents is being challenged by some who consider human error to be a symptom of deeper problems with the system. Nevertheless, human errors are a sign of lack of competitiveness and poor professionalism. Errors can be induced through bad design, poor training or poor/inadequate management

systems. Some specialists argue that modern technology has reached a point where improved safety can only be achieved on the basis of a better understanding of human element within the system.

Ship operations in maritime business is a commercial enterprise similar in many regards to any other profit-making organization. It has shareholders interested to make a return on their capital and stakeholders. [1]

The board of directors have the duty to deliver that return while at the same time ensure that this is achieved in a professional, responsible, safe, qualitative and timely manner.

A competitive maritime company is the one that clearly states a mission reflecting a serious commitment to international transport activities and has the ability to identify and adjust rapidly to client's needs and opportunities providing high-quality, competitive navigation services. The following elements are determinants for a firm's international competitiveness: specific assets and core competences that can be exploited to their competitive advantage, reputation, continuous innovation in ship building, ship design or ship services, shown in particular in passenger cruises, a firm's architecture which describes the culture of the company.

2. Importance of Training for Seafarers Competitiveness

Traditionally, the purpose of training and development has been to ensure that seafarers can accomplish their jobs efficiently. Today, during the financial world crisis, the business environment has changed, with intense pressure on organizations to stay ahead of the competition through innovation and reinvention. Strategic positioning of training and development directly promotes organizational business goals and objectives.

Current trends emphasize the importance of training and intellectual capital, a critical factor for competitive advantage. The development of partnerships for knowledge sharing (e.g., consultants and/or academic partners as subject matter experts) has increased. To develop specialized training programs in corporate university settings, training departments often work closely with academic partners to prepare high-potential seafarers for leadership roles.

When strategically applied, continuous learning fosters knowledge and skills acquisition to help the maritime company achieve its goals. Human resources department role is to establish and implement a high-level roadmap for strategic training and development. The starting point is an in-depth understanding of the business environment, knowledge of the organization's goals and insight regarding training and development options. HR must then develop strategic learning imperatives (high-level, learning-related actions that an organization takes to be competitive) that align with business goals. Differences in industry, business goals, human capital skills and resources influence the selection of learning imperatives [2].

In maritime business, competitive firms are the ones that provide qualitative transport services at a competitive price [3]. Business excellence and competitiveness can be achieved at the early stage of selecting personnel. For selection of crew members, maritime companies make a psychometric profiling, interviews, aptitude tests and portfolio determination. Entry level solutions are pre-sea courses for cadets, counselling, distance learning, STCW courses and system training. Professional competence is acquired after passing competency courses, simulation training. For professional competence, an important tools are assessment and on board mentoring. Enhancement is provided by using advanced simulation training, leadership and teambuilding programs, customized training based on the needs of the team. A constant analysis of productivity is also recommended for up to date results. The training system that a competitive company must take in consideration is not only limited to shipboard training. Shore based training implies external courses like STCW 95 mandatory courses, competence and soft skills enhancement courses. In house shore based courses are related to company's system and policies, safety, productivity and loss control. The objectives of structured shipboard training are acquiring theoretical knowledge, familiarization and drills, mentoring and next rank training.

Many maritime companies are registered in tax-free fiscal paradise countries because of advantageous tonnage tax regimes. In many cases, this does not encourage companies to train crew and master to a higher level, but rather attracts those who wish for commercial

advantage with the minimum amount of training required by the international regulations like IMO Convention on Standards of Training, Certification and Watchkeeping for Seafarers (STCW)[4]. Such companies should take into consideration that business excellence is acquired by those that take into consideration the level of non-mandatory training, apart from those regulated by International Maritime Organization in order to establish the quality level of the crew and to ensure a supply of high calibre officers needed for the high-tech vessels of tomorrow. This issue has a major impact on a vessel's earning potential.

In order to be legally acceptable, maritime companies must comply with operational rules issued by International Maritime Organization (IMO), employment condition issued by International Labour Organization, National Flag legislation and local country legislation and condition imposed by International Transport Workers Federation (ITF) imposed or agreed with the relevant unions.

IMO's Standards of Training, Certification and Watch keeping (STCW) Convention were drafted in 1978. In its first version, it had the scope to formalize a system nearly identical to the US marine system, around the world. In 1995 when the US Coast Guard approached the International Maritime Organization and asked them to amend the convention, significant changes were made. The STCW 95 amendments did not have to be ratified like the original convention because it was an amendment to an existing convention. The amendments, however, completely re-wrote enforcement related to the Convention, and more importantly created an STCW Code that set stringent standards for mariners to meet. Unlike the original 1978 Convention, the 1995 Amendments required a separate piece of paper to certify that the mariner met the requirements - a STCW Certificate.

The traditional way of studying human performance in the maritime work domain is through the analysis of accident reports or even better through the analysis of accidents. 80% of maritime accidents are caused by human factors or human error. Experts who make accident reports evaluate in the first stage the human performance in the particular case against the performance standard you could expect from the crew in the given situation [5]. According to international regulations, after any incident

needing the involvement of authorities, the first thing an inspector of Marine Investigation Branch does on boarding the vessel is to check the competence and training of the seafarers on board.

Good quality training is a prerequisite to ensuring a vessel maintains a high standard of operation. Training in all its forms adds to the value and safety culture on a vessel. From the legally imposed training certificates of competence to the cadet programs of practice at the board of the ship, it is essential to understand the strategic importance of operating a vessel to the highest levels.

For crew members aspiring to higher ranks, statutory training is carried out as they seek for promotion, but a good ship operator will have their own in-house training program that will help reinforce the company's culture and safety.

Undertaking responsibility ashore means learning many new skills. Skilled officers make excellent managers but the knowledge prescribed to prove competence at sea leaves gaps in a number of disciplines required in an effective competitive ship management company.

A great number of companies today have human resource sections instead of „personnel department” that were used in the past. This is the part of the company that is responsible to the CEO, the board of director and shareholders for ensuring that the operational matters of crew deployment are carried out successfully.

A well-trained seafarer is the most valuable asset an owner has on board. Companies must meet the requirements for which they are directly responsible. Having well-trained seafarers is essential to any maritime company who wishes to demonstrate that responsibility, while at the same time be seen by the community as having quality and competitive operation.

Competitiveness means professionalism and high productivity. At the level of maritime company, it means cost efficiency and cost effectiveness. But competitive companies don't cut costs with training systems for seafarers and invest in sending employees to international conferences and seminars on safety issues and safety management.

3. Ways to improve the crew personnel strategy

Improving the personnel strategy includes a general evaluation of the company focusing on a good business plan, analysis of the human resources by establishing the portfolio of human resources and the efficient manning pool and the analyze of the existing situation, of the distributed tasks and of the motivational system.

A favourable external medium for the maritime company is set by creating interesting jobs and developing strategies for attracting valuable personnel. The decision factors must notice the aspects which influence the personnel fluctuation and must find solutions for solving them. The causes which increase the emigration of personnel might be lack of material motivation for the specialists or politics for keeping the personnel with low qualification. The company should implement periodical brainstorming meetings at shore and at the board of the ship for collecting good ideas and motivating the personnel. Ways of increasing the number of employees with superior qualification are reducing the ratings and personnel with medium studies and increasing the number of personnel with proper qualifications.

In Romania, competitive maritime companies are the ones that hire seafarers after they passed a technical computer exam in English and a very well structured interview. Competitiveness is acquired when seafarers act as professionals in every action they make at the board of the ship or on land. Employment conditions for seafarers should be at least comparable with those found in other industries – particularly in view of the obvious impact that the quality of the shipping industry's workforce has on safety at sea and protection of the marine environment. Applying a professional way of thinking, not only in their job, but in life in general, brings satisfaction.

Maritime companies can assure the adequate resources for the continuous professional training by internal and external financing of professional training [6].

Finally but not exhaustively, the company should believe in investing in its people for its success, supporting employee development to grow talent from within by using a Performance Management Plan. This is a strategic performance tool which support strategic plan and goal attainment of the organisation. The

objectives of a Performance Management Plan is to compensate related decisions, promote the crew's potential, establish efficient rewards and recognition systems, helping objective or equitable decision making. By using a Performance Management Plan, the management can identify proper training needs. This tool is also used to document and analyze performance and to promote a high-performance culture.

4. Conclusions

To maintain success in today crisis period, investment and innovation in recruitment and training programs must continue in order to achieve a competitive status. Used on a large scale, seafarers' recruitment training programmes can give a competitive edge. Their aim is to select and equip new entrants to the maritime industry with the skills and knowledge to pursue a career at sea and to perform their jobs better. The training programmes are also essential to gain new set of skills and knowledge for seafarers' career transition. In order to acquire competitiveness and business excellence in this business, the management of the maritime company should state a clear vision so that the crew members can understand the expectations of management. A solution for establishing derived strategies, in specific areas of the personnel activities, in consonance with the concrete conditions of the international environment is to develop partnerships for elaboration and implementation the strategies in continuous professional training.

Abstract:

Climate changes, energy security, population ageing and other contemporary world challenges necessitate an international cooperation in order to take advantage of the resources and to coordinate all the countries' investments for a long-lasting development. In this context, the European Commission launched the Framework Programme, which is the principal instrument of the European Union, used for research funding. The international scientific and technological cooperation has always been part of the European Union research policy, from the moment when the first Framework Programme was launched in 1983. An open access approach to the international cooperation was implemented once the sixth Framework Programme was launched between 2002 and 2006. This approach has been consolidated, in accordance with the seventh Framework Programme (2007-2013), by new instruments designed in accordance with each specific programme (“Cooperation,” “Capacities,” “People,” “Ideas”) in order to promote international cooperation. The purpose of this article is to provide an analysis of the application and of the access to these programmes.

Key Words: Framework Programme, research, cooperation.

JEL classification: O32

1. International Research and Development within the Framework Programmes

In January 2000, the EC identified the necessity to consolidate the international research inside and outside Europe. The European research needs to align with the citizens' major preoccupations, by approaching common problems such as energy, environment and health, together with partners outside Europe. In 2007, the Green Charter confirmed this objective as an opening of ERA towards the world as well as the European engagement to deal with the global preoccupations, together with Europe's international partners, by means of multilateral cooperation. The Green Charter declared that in the global world of science and technology, the European countries need to develop a coherent approach for international cooperation in order to ensure themselves that science and technology efficiently contribute to the stability, security and prosperity in the world.

Approximately 75% (figure 1) of the world research has been done outside Europe. The global changing research and development environment is marked by the activities which are becoming more and more internationalized in each country. In most of the industrialized countries, the research and development process has performed abroad in foreign subsidiaries, approximately 16% of the total research and development expenses in many European states, and even in other parts of the world.

The community Framework Programmes extended their capacity to cooperate at an international level during 1998-2007. International scientific and technological cooperation has always been part of the European Union research policy from the

moment when the first Framework Programme was launched in 1983. It is about the Framework Programme FP5. In November 2002, in Brussels,

the European Commission launched the sixth research Framework Programme in the European Union, for the period 2002-2006.

Fig. 1: The Percentage of Research and Development Researchers and Expenses

(source: Science, Technology and Competitiveness key figures report 2008/2009)

Eventually, the investments and funds for the exploitation of the research results are more and more fungible and the research production itself in the multinational companies is structured in global value chains.¹

While the ex-Framework Programme focused almost exclusively on the Eastern and Central European developing countries, the sixth Framework Programme was opened for the third category countries in all thematic domains.

FP6 proposes to contribute to the creation of a true research space, a new vision on research in Europe, a new internal science and technology market. The economic growth depends more and more on research and many present and future challenges cannot be solved only by national actions.

The participation rate in FP5 and FP6 during the last years is presented in figure 2.

Most of the third category countries, which participated in the FP5 and FP6, came from the Russian Federation, the USA and China. The five countries which are considered emerging economies lead the ten participating countries in FP5 and FP6: the Russian Federation is in first place, followed by China, India, Brazil and the South Africa. The USA is the first in the industrialized countries top, followed by Canada and Australia. Eventually, Morocco leads the developing countries top, followed by Tunis, Ukraine and Argentine. The leading countries, which participate in both programmes, have

increased their participation rate, in absolute terms, between FP5 and FP6. Nevertheless, in general, the participation rate of the third category countries is still very low, at 5,5%. The Russian Federation, the USA and China represent 32% of the third category countries participation rate.

In 2007, the seventh Framework Programme was launched (2007-2013) for funding the research in priority domains in order to meet the needs of the modern economy.

The provisory data regarding the participating countries in FP7, the cooperation and the capacity of the programmes in 2007 or the first call for proposals shows that the three leading countries, the Russian Federation, China and the USA, remain the same: the Russian Federation is in the first place with 697 participations, China in the second place with 548 participations and the United States, which occupies the third position with 492 participations. India is in the fourth place, with 422 participations (figure 3).

Regarding the financing proposals, those which involve the industrialized countries have, in general, a higher success rate than those which involve other countries: 22% in case of the USA and 29% for Australia, while the emerging economies vary between, for example, Brazil with 9%, China and the Russian Federation with 14% and 16%, respectively, and the South Africa with 24%.

¹ Remi Barre, Bastiaan de Laat, Jacques Theys, Management de la recherche, Ed. De Boeck, Paris, 2007, pg. 43.

Fig. 2: The Participation of Different Countries in FP5 and FP6.

(source: Science, Technology and Competitiveness key figures report 2008/2009)

All the third category countries have seen the collaboration relationships with the EU member states multiplied by more times between FP5 and FP6. In general, Germany, France, Italy and the Great Britain are the largest research countries of Europe and they have more extended cooperation relationships than other member states of the EU. A typical example is the cooperation with the Russian Federation and China: Germany is the leader, followed by the United Kingdom, France and Italy. Nevertheless, other countries such as Holland, Sweden, Belgium, Finland, Greece, Hungary, Poland and Austria have strong connections with the Russian Federation and China. The cooperation relationships with Brasil are the best for the

United Kingdom, followed by Germany, France and Spain. Smaller countries such as Holland, Belgium and Denmark also play an important role in establishing collaboration relationships at the global level (see table 1).

At the community level, the framework programmes have extended their application domain during the last 10 years. Although it innitally focused on the developing countries, Europe framework programme extended to the industrialized countries, as well. Most of the third category countries participants come from the Russian Federation, the USA and China.

Fig. 3: Participations and Funding within FP7.

(source: Science, Technology and Competitiveness key figures report 2008/2009)

Although the largest research countries from Europe - Germany, France, Great Britain and Italy - have the most collaboration relationships with the third category countries researchers, more small member states used Europe framework programme in order to extend substantially the collaboration relationships.

2. The framework programme for funding the research and development in Romania

By implementing the National Strategy CDI, Romania ensures the alignment to the CDI policies orientations within the European space and participates actively in the consolidation process of the European Research Area.

From the statistical data, presented by European Commission, which refer to the calls launched during 2007-2008, a number of 187,532 entities applied the Framework Programme FP of the EU during 2007-2013 (FP7) and FP7 Euratom, from which 23,160 participations were from Romania.

Tab. 1: Collaborations within FP5 and FP6.

(source: Science, Technology and Competitiveness key figures report 2008/2009)

As a result of the evaluation, 21,497 entities have been selected for funding, from which a number of 230 from Romania. Those 230 entities from Romania participate in 181 contracts funded by the European Commission, 18 of them as collaborators.²

The total value of the European Commission for these contracts is of 640,419,434 euro, from which 30,041,281 euro for the Romanian entities (a percentage of 4,69 %). The distribution of the

number of contracts in which Romania is involved) regarding the programmes and thematic, as well as the value of EC contribution looks as follows:

- COOPERATION: 114 contracts, EC contribution =21,409, 200 euro, namely 71.26%,
- HUMAN RESOURCES : 14 contracts, EC contribution =2, 236, 407 euro, namely 7.44%,
- CAPACITIES : 47 contracts, EC contribution =5, 829, 279 euro, namely 19.4%,

² Ion Plumb, et. al., Managementul cercetarii si inovarii, Ed. ASE, Bucuresti, 2007, pg. 157.

- EURATOM : 5 contracts, EC contribution =432, 050 euro, namely 1.44%.

We mention, in particular, Romania's participation in projects based on a solid transnational cooperation, supported by PC 6 and PC7, in the following way:

- Romania is directly involved in the coordination process, at a European level, of the national research programmes, through the participation of 16 projects of the type ERA NET. We can mention the projects in which ANCS is a direct partner, namely EUROPOLAR (polar research), HY CO (energy), NEURON ERA NET (health), SEE ERA.NET (bilateral cooperation).
- Romania is continuously supporting the development of the new forms of public-private research partnership, represented by the technological platforms as well as by the common technological initiatives. During 2007-2008, Romania enrolled as a member in 4 from the six approved common technological initiatives: ARTEMIS (integrated computer systems), ENIAC (nanotechnologies), IMI (innovative medicines) and CLEAN SKY (aeronautics).
- In the 34 European platforms, Romania participates with 31 national mirror platforms, from which we can mention in the Nano-domain - the platforms MANUfuture Romania, MINAM - Microand NanoManufacturing, NANOMED - (the Collaboration Platform in Nanomedicine).

Concerning the funds on domains, the priority ICT from COOPERATION detains the first place both as a percentage (23.66%) and as the sum paid to the participants from Romania (7,108,467 EUR). After ICT the domains with the highest success rate are transports (18.51% from the total and 5,561,365 EUR), nano-scientific and nano-material (9.5% from the total and 2.855.224 EUR) and the environment (4.36% from the total and 1,310,218 EUR).

If we look at the participation of the IMMs, 48 of the 230 participants come from these enterprises; this fact represents 20.87% of the total Romanian organizations, which benefit from the European funds from PC7, contributing to the research and technological transfer activities.

The contribution of the European Commission for IMMs represents 18,24% of the total 30, 041, 281 EUR, from which the Romanian scientific community has benefitted till now.

The share of the funds accessed by Romania on programmes and domains at PC7 (2007-2008) can be visualized in figure 4.

4. Conclusions

Europe needs to strengthen the coherence of the research strategies, to increase the production potential, to use knowledge to become more competitive. The increase in the research and development investments must arrive at 3% from the GNP in the EU, in 2010.

More than 100 countries from the whole world are involved in the EU research programmes. These activities will continue within the cooperation programme of PC7. The international research will lead to the decrease of the differences, which exist between the countries of the world.

The international cooperation in the research and development domain will integrate the EU into the international community and will support the evolution of research and technology in those countries which are building their own knowledge capacity.

The Lisbon Strategy has the main purpose to make Europe become in 2010 the most competitive and dynamic economy, based on world knowledge, capable of sustained economic growth, with more workplaces and an extraordinary social cohesion.

The Bearers of Information in Healthcare and their Dynamics

Ileana G. Răducanu,

National Institute of Gerontology and Geriatrics "Ana Aslan" Bucharest
ileanaghraducanu@yahoo.com

Abstract

The need of correct and in short time information to do management and marketing decisions it is a priority and a necessity in any area of human activity today. In healthcare area the information is necessary not only to strategic decision but provide healthcare service too. The information in healthcare system is generated at local level inside healthcare organizations but it is usually inaccessible to marketers. For this reason, the identification of bearers of information, increased capacity to collect data, analysis and statistic interpretation with their transforming into information make the difference between success and failure for marketing initiative and better outcomes in healthcare system. The bearers of information in healthcare domain are: general population, insured people and healthcare providers. The collected data from them are used to strategic decisions. The analysis of health information result to the dynamics of bearers of information show some major change in population structure and health needs. So, the population's aging change the number of aged person with increased healthcare needs; the disease structure change with increased chronic diseases; the increased health costs because of development of new technologies and medical procedures; the geographical distribution of health staff is a high problem; the inequality access to health for rural or isolate areas and disadvantaged communion is a real issue. The marketing tools applied to the specific of healthcare domain serve to adjustments of healthcare system. The Integrate Unique Information System creates by National Health Insurance House can solve partial these issues.

Key words: information, healthcare system, organizations

JEL classification: I11

1. Introduction

The need of correct and in short time information to do management and marketing decisions it is a priority and a necessity in any area of human activity today. Doubtless the healthcare must no more be peer as a distinct and independent area that it is separate from the rest of economic and social activities. Today, in the economic context the principle and criteria of efficiency must to govern any activity with the view to acquire maxim of outcomes using the existent resources. For this reason, the information becomes an absolutely necessary resource. So, the identification of the bearers of information, the collection of information is a priority to know the customers' real needs; it is create not only an informational flow important to adjust the patients' supply to the demand and need but it is prevent the inutile consumption of resources with a higher performance of healthcare system.

Moreover, the information is an important part at health services provided. The healthcare service does not be provided without a previous evaluation of patient's healthcare need. This evaluation can not be performed by the patient because of lack of expertise. The healthcare supplier is the one who evaluates for each patient their healthcare need based on information. The healthcare services entail close relationship between healthcare supplier (the physician as a rule) and customer (patient) with an increased level of patient participation to healthcare service and a high degree of personalization. Some studies show that 60-80% of requisite information to put a diagnosis is acquired by anamnesis (the interview with the patient) [1]. At their turn, the patient must to receive all information to be able to do their own decision which the physician must respect it, if this is an informed decision even their disapprove it.

So the patient information is their right and the information must be correct, completed, accessible and related to the patient's understanding level.

The information in healthcare system is generated at local level, inside healthcare organizations and the data are accessing with difficulty and they are not usually utilized in extensive research based on which are made strategic decisions. So inside healthcare system is generated many information but they are inaccessible to marketers [2]. Increasing the capacity of collection data, analysis and statistic interpretation with their transforming into information make the difference between success and failure for marketing initiative and better outcomes. The projection, development and usage of marketing information system at healthcare system level become a necessity for strategic decisions and planning of specific activities.

2. The bearers of information in healthcare system and their particularities

The selection of sources, the choice of methods for data collection, the collection and processing data into information are made inside the information system. The flow of information is the basis of strategic decisions. Depending of required information the bearers of information are selected:

1. General information on people's static and dynamic; these kinds of information are collected from:

- National information system for personal data. These information are collect from official papers emit by Register of births, marriages and deaths from birth, marriage, death or divorce certificates. There are five types of statistic papers that content personal data and are transmitted to National Institute of Statistic for analysis. Here are analyzed data concerning the intern migration, collected by workers of Ministry of Internal Affairs as statistic paper for changing residence.

- Demographic survey on general population (census) or on representative sample. The personal data are collect too.

The bearers of information are all people and the main information refers at number of people, natality, mortality, sex age and territorial distribution. Because of personal data collected they have a special regime and

the confidentiality and identity protection must be insured [3].

2. Consumer's information (patient information); these information are collected from medical papers and now are transferred to District and National Health Insurance Houses by the Integrate Unique Information System. This is a secure network for collection and processing data at local level and then they are aggregated and managed at national level. The data collected refers at personal data, medical general data, primary care or specialist care (consultation, treatment and prescribed drugs), hospitalizations, medical investigations (lab tests, radiological procedures, and functional tests), medical expertise.

The bearers of information are any insured person who need and receive healthcare.

3. Information on medical procedures; these information are collected by healthcare providers. In Romania there are over 26 000 providers (medical or pharmaceutical providers) [4]. The data are registered in medical papers at contact with the patient (medical registers, medical papers, medical certificates, receipts, other papers).

In this situation the bearers of information are the healthcare providers.

The particularities of bearers of information in healthcare area refer at confidentiality of information and professional secret. The confidentiality is a form to protect patient's personal life and it is guaranteed by healthcare provider obligation to keep professional secret. These restriction are stipulated into The Deontological Code and Law no 306/2004 concerning medical profession as well as the organization and working of Romanian Physician College at national level, and The Charter on Medical Professionalism made by the European Federation of Internal Medicine, The American Board of Internal Medicine Foundation and The American College of Physicians–American Society of Internal Medicine Foundation at international level. The professional secret has not a temporal limit, there is even after the end of treatment or patient death and medical evidences must be kept as professional secret papers.

In concordance with these principles and to protect them, all projects and activities concerning to informational systems must be coordinate by physicians. Moreover it is forbidden to use them if these principles can not be abided. The responsibility to any error in this area is assigned to the physician and can not be attributed to the information system

even the error is only technical. These are the reason for the restrictive access on healthcare information for other people behind medical personal. So, the medical personal must learn techniques and methods used in marketing researches to provide qualitative information [5, 6, and 7].

3. The change leads by the dynamics of bearers of information on health organization and working of healthcare system

The main functions of marketing are: the market, consumer needs investigation; the dynamic connection of organization at its environment; the satisfaction in superior conditions of consumer needs; the maximization of economic efficiency [8]. These functions are important in healthcare area as in any other activity and the information is an important part to accomplish them. The analysis of health information result to the dynamics of bearers of information show some major change in population structure and health needs. These tendencies are underline not only at national level but at international level too. For these reason the national healthcare system must be adjust as the supply too because the demand and need change. The main tendencies are:

1. The population's aging by increased of life expectance because of mortality decreased and natality reduction. This phenomena change the structure of healthcare services with an increased number of people who need permanent hospitalization or who need home healthcare.

2. The disease structure change too, with many chronic diseases and few acute diseases. So the percentage of diseases as dementia, osteoporosis, diabetes mellitus, and hypertension are increased. Even the infant mortality decreased, the child health is no better because many diseases are diagnosed: obesity, asthma, behavior change with violence, depression. This is the paradox of the modernity.

3. The increased costs because of development of new technologies and medical procedures: prosthesis, diagnosis procedures and interventional therapy, special radiological technologies.

4. The health personnel's necessary and their geographical repartition are a important problem to be solved, a medical staff's deficit

especial with high qualification in a rural or isolate areas and disadvantaged communion.

5. The inequality access to health services with inequities especially for disadvantaged communion (as gypsy communion) is a challenge for the health system that must provide health services for all people.

4. Conclusions

1. The need of correct and information and in short time information to do management and marketing decisions it is a priority and a necessity in any area of human activity today.

2. Inside healthcare system is generated many information but most of them are inaccessible to marketers.

3. The information in healthcare system is generated at local level, inside healthcare organizations and the data are accessing with difficulty.

4. The Integrate Unique Information System creates by National Health Insurance House can solve partial these problems.

5. The main barriers to obtain and disseminate this information are tie to objective causes: the confidentiality of information, the professional secret and the restriction that the collection and management of data to be made only by medical personal.

6. The selection of bearers of information, the collection and analysis of data to know the real need of patient become a priority to adjust the patients' supply to the demand and need and prevent the inutile consumption of resources with a higher performance of healthcare system.

7. The dynamics of bearers of information in healthcare show many change (the aging of population, the change of disease distribution, the existence of disadvantaged group, the deficit of medical personal) that draw the continuous adjustment of healthcare system.

Communication Networks in Business Settings

Raluca – Nicoleta Rogoveanu
Ovidius University of Constanta
ralu_ionita@yahoo.com

Abstract

Communication is an integral part of business settings since each functional area of a business organization depends on communication. Although such independent functions as marketing, production, finance, receive indications and instructions from corporate ideals as transposed into objectives, communication offers the necessary “cohesive element” that enables departments to function harmoniously and successfully. Employees at all levels need to be skillful communicators in order for a company to be effective by twenty-first century standards. Effective communication is a prerequisite for the good management of organizational strategies and behavior. Ineffective communication is detrimental for organizations since it can lead to poor performance, unsuitable interpersonal relations and high levels of stress.

Key words: communication networks, communication channel, sender, receiver, upward/downward/horizontal communication,

JEL classification: L22, M54

1. Theoretical framework

On a day to day basis, one is constantly faced with communication challenges. They may occur in a variety of forms such as: interacting with others face-to-face, transacting business on the telephone, inputting and accessing messages via the computer, dealing with regular snail mail for incoming and outgoing correspondence. Communication is therefore a vital link in achieving personal and career success. Without

strong communication skills, today’s employees and employers alike cannot expect to build successful relationships.

To be a successful communicator, a business person needs to select a communication medium appropriate for each particular message. Taking the right decision and communicating it in the most professional and polite manner usually ensures good interpersonal relations and increased goodwill and cooperation among people. For instance, it is difficult to establish whether a congratulatory message should be conveyed through a letter, a phone call or orally, in a public /private meeting. It may be twice as hard to determine if a layoff announcement should be made in a memo or at an organization-wide meeting. Nevertheless, these issues are routine issues business people need to tackle on a regular basis.

When choosing a communication medium for message, people need to consider three factors. The first and most important is the level of “information richness” that the message needs to convey. Information richness is the amount of information that a communication medium can carry and the extent to which the medium enables the sender and receiver to reach a common understanding (see Sims 14). The time span necessary for communication is the second factor that one needs to take into account when selecting a communication medium. The third factor that affects the choice of a communication medium is the need for a paper/electronic trail or some kind of written documentation to attest to the message being sent.

Most of the time devoted to communication is spent during one-on-one, face-to-face interactions. Face-to-face communication provides immediate feedback and is the richest information medium as it can convey a variety of details and nuances through voice, eye contact,

posture, blush, and body language. It is the best medium for delegating tasks, disciplining, instructing, sharing information, asking/answering questions, developing and maintaining interpersonal relations. Telephone or spoken communication electronically transmitted lacks the “hic et nunc” and provides only the cue of voice inflection. The telephone is the suitable medium for short and quick exchanges of information but is highly inappropriate for personal matters. Interpersonal written communications (memorandums, for instance) are the lowest in richness, are not focused on a single receiver, use limited information cues, and do not permit feedback.

Media selection should be based on the type of message one wishes to communicate. If the message is likely to be misunderstood or is rather ambiguous, then a rich channel with immediate feedback gives one the possibility to send information rapidly until a common understanding is reached. For many managers, meetings are the most common communication medium used in their regular interaction. The quick, informal get-together with two or more employees is also a common form of meeting, especially appropriate for instructing/coordinating employee activities, delegating a task to a group, and providing feedback on the success of the activity performed

Before sending a message inside or outside the organization, one needs to consider a variety of details pertaining to the information to be exchanged: the nature of the message, the most appropriate medium for accepting the message, the potential relevance and impact which the medium will have, the available sources of information, the people to engage in the process of communication, and the consequences of the message.

2. Communication Networks

Although various communication media are used, organizational communication falls into more or less recurrent patterns. The pathways along which information flow in groups, teams and throughout an organization are called *communication networks*. The type of communication network occurring within a group depends on the nature of the group’s goals and the extent to which group members are willing to communicate with each other in order

to fulfill corporate goals. There are three types of “Official” communication channels: downward, upward, and horizontal.

By means of *downward communication* one transmits instructions, directions, and orders—that is, messages telling direct reports what they are expected to do. This type of communication can be used by a manager announcing/instructing/explaining to his/ her reports what tasks they should fulfill. Especially in the case of oral communication, the further the information goes from the sender to receivers, the more likely it is to get distorted. “Going through channels”, from a superior organizational level to the subordinate one, formal information loses something from its original accuracy and precision. To eliminate such problems, many organizations have introduced programs in which they communicate formal information to large numbers of people at different levels at one time.

Upward communication starts at low levels and moves to higher ones within an organization. Such messages from direct reports to their supervisors are known as upward communication. They usually involve information commissioned by managers from reports, those data required to complete projects and help in the decision making process. This may include suggestions for improvement, status reports, reactions to work-related issues, and new ideas.

At first sight, one may feel inclined to consider that downward communication is the logical opposite of upward communication. However, there are many other important differences between the two, differences which become evident once one realizes the status of the people acting as senders and receivers respectively. For example, it has been established that upward communication occurs far less frequently than downward communication. This is only natural if we consider that the amount of instructing and orders that we receive from higher levels exceeds the amount of ideas we can suggest and propose to our superiors. And, when people do communicate upward, their conversations tend to be shorter than the ones they have with others at their own level. In many instances, upward communication can convey inaccurate information, as negative information is often overlooked or ignored. For instance, a request

for a salary rise will be “accompanied” by the attempt to highlight one’s accomplishments and to downplay his/her mistakes.

Within organizations, messages flow up and down the organization chart but sideways as well. *Horizontal communication* is the term used to identify messages that flow laterally, at the same organizational level. Such messages are indications of the fact that people at a certain level of company/organization hierarchy are willing to work together and exchange ideas. Unlike vertical communication, in which the parties are at different organizational levels, horizontal communication involves people at the same level. Therefore, it develops more easily, it is more casual in tone and occurs more frequently due to the fact that there are fewer “status barriers” between the parties. Yet, despite a certain degree of familiarity which people working at the same level may have, there are many hindrances in communication that such employees are likely to experience. The misunderstood concept of competition may determine people in different departments to feel that they are competing against each other for the resources of the organization. This may lead to emerging resentment toward one another and this antagonistic, excessively competitive orientation may prove detrimental to the overall cooperation among people.

3. Managers as Senders of Communication

There are various kinds of barriers to effective communication in organizations and some may have their origins in senders. When messages are unclear, incomplete, ambiguous or difficult to process, when they are sent over an inappropriate medium, or when no provision for feedback is made, communication becomes imperfect. In other communication circumstances, the guilt lies with receivers. When receivers pay little or no attention to a message or when they make no definite effort to grasp the meaning of a message, communication also suffers.

To cope with communication situations successfully, managers (as well as other organization members) must possess, acquire or develop certain skills. Some of these abilities are particularly helpful in sending messages while others are of utmost importance when receiving messages. These skills help ensure that managers

will be able to share information, will have the information they need for the decision making process, and will be able to reach a common understanding with others.

Organizational effectiveness depends on employees being able to effectively send messages to people both inside and outside an organization. One usually associates effective speaking with properly understood message and a smooth transmission phase. Consequently, a person intent on communicating effectively needs to make sure that they are able to:

Send clear and complete messages. Managers need to learn how to send a message that is both clear and complete. A message is clear when it is easy for the receiver to comprehend and process, and it is complete when it comprises all the data that the sender and receiver need to reach a common understanding. In their attempt to send messages that are both clear and complete, corporate workers must learn to anticipate how receivers will decode their messages and adjust them to eliminate possible causes of misunderstanding or ambiguity.

Encode messages in symbols which the receiver understands. People need to understand the fact that when they encode messages, they use symbols / language that the receiver understands. When sending messages in English to receivers whose native language is not English, for example, it is important to use basic vocabulary and to avoid using clichés that, when translated, may add little or no clarification to the main idea, sometimes being comical or insulting. Jargon—specialized terminology that members of a group, or organization develop to facilitate communication among themselves—should never be used when communicating with people outside the occupation, group, or organization. Meaningful utterances to people engaged in certain areas of production mastering a certain vocabulary may seem utterly incomprehensible and frustrating to the people outside the domain. When choosing among various media, managers need to take into account the level of information richness required, time limit, and the need for a paper/electronic trail. A primary concern in choosing an appropriate medium is also the nature of the message (personal, important, non-routine and likely to be misunderstood).

Select a medium that the receiver can easily access. Another factor that managers need to consider when selecting a communication medium is whether the medium is one that the receiver monitors. Many managers simply select the communication medium which they are most comfortable with, without paying definite attention to the fact that their reports might be less comfortable or at ease when using it. Managers who dislike telephone conversations and too many face-to-face interactions may prefer to use e-mail, send many e-mail messages per day, and check their own e-mail every few hours. Managers who prefer to communicate with people in person or over the telephone may have e-mail addresses but use them less frequently.

Avoid information distortion. Filtering occurs when a sender obliterates part of a message because he/she wrongly considers that the receiver does not require the information or finds it useless. For example, managers should avoid mistakenly filtering the information they give their direct reports, especially when that detail is of a definite importance to them. Filtering is likely to occur at all levels in an organization, in both vertical and horizontal communication. Many employees may filter messages they send to managers, managers may filter messages to middle managers, and middle managers may filter messages to top managers. Such filtering usually takes place when messages contain bad news or problems that direct reports fear that they will be held responsible for. Information distortion originates in the process of passing the message through a series of senders and receivers. Some information distortion is unintentional due to faulty encoding and decoding. Other information distortion is intentional and takes place when senders change messages to receive preferential terms and conditions. Managers should make a definite effort to avoid filtering and distorting information but this can only be achieved if they strive to eliminate the communication barriers between the members of an organization.

Include a feedback source in messages. As feedback is vital to effective, high quality communication, managers should consider a built-in feedback mechanism into the messages they send. This can be done either by including a

request for feedback or by mentioning when and how receivers will follow up on the message. When managers write letters and memos or send faxes, they can request that the receiver should respond with comments and suggestions in a letter, memo, or fax, schedule a meeting to discuss the issue or follow up with a phone call.

4. Managers as Receivers of Communication

Since managers receive as many messages as they send, they must possess or develop communication skills that allow them to be thorough /effective receivers. It is important for them to pay attention, be a good listener, and be empathetic.

Paying attention. When faced with enormous workloads, managers are often forced to consider several tasks at once. In cases of multi-tasking, they sometimes fail to pay enough or adequate attention to the messages they receive.

Being a good and empathic listener. In order to be good listeners, communicators should refrain from interrupting senders in the middle of a message. This way, senders do not lose their stream of thought and managers do not reach wrong conclusions based on incomplete information. They should also consider asking questions so as to clarify points of obliterated meaning or confusion. Receivers are empathetic when they strive to understand the sender's feelings and interpret the message from the other's perspective, rather than view the message from their own standpoint.

According to Manning, Curtis, and McMillan, an effective listener will observe the following principles:

1. Follow closely the speaker's reasoning, weigh evidence and read between lines
2. Listen for central or overall ideas
3. Assess content by listening to entire message before making judgments
4. Withhold judgment until comprehension is complete
5. Give the speaker full attention
6. Fight distractions and concentrates on the speaker

7. Listen to both favorable and unfavorable information
8. Treat complex presentations as exercise for the mind

5. Conclusion

When all members of a team, company or organization are able to communicate effectively with each other and with people outside their department/ organization, they are much more likely to perform professionally and successfully. When the members of the organization are ineffective communicators, organizational performance is seriously impaired in many cases, poor communication sometimes can be a frustrating experience for all the people involved in the message sending and receiving process. Better communication results in increased morale, a more cohesive work climate, better interpersonal relations, and higher productivity. It also reduces errors and misunderstandings, while enhancing accuracy and understanding.

In the transition from interpersonal communication situations to mass audience settings, the process of communication becomes increasingly sophisticated, both strategically and tactically. The person taking on the task of a public presentation is confronted not with one or two message recipients, a straightforward and relatively simple communication process, but with an audience made up of a large group of members, each with his specific interests, different media exposure patterns, and unique interpersonal networks that ultimately influence the impact of mass media messages (see Selnow and Crano 47) The public communicator/presenter must consider the various characteristics of the media that convey the message. Since media time and space are expensive, choosing appropriate media channels is essential to achieve the greatest possible effect with the least possible expense. Choosing the wrong media combination involves unnecessary waste of money and reduced communication impact.

People with high media exposure (in business or politics for instance) acknowledge that they need to ensure the maximum possible effectiveness of their public communication plans. So it becomes increasingly necessary for them to master the art /science of

communication studies. The decisions concerning the approaches and the selection of the elements in a public communication campaign are most logically predicated on tested principles that have yielded success under diverse conditions and circumstances. To achieve success, the public communicator must rely on increasingly complex strategies to affect audiences and promote the success of a campaign.

The Motivational Dominants of Communication in Crisis Situations

Lecturer Rus Mihaela, PhD
Professor Ana Rodica Stăiculescu, PhD
The Faculty of Law and Administrative Sciences
Ovidius University Constanta
psiholog_m@yahoo.com

Abstract

The attitude of the staff involved in public relations, communication methods, the personal specificity are important elements in the interaction with clients or beneficiaries. The satisfaction or dissatisfaction of a beneficiary sometimes depends largely on how he/she perceives such a relationship. Obviously, in this case, the staff plays an essential role; its style - manner of behavior, social attitudes, in general the overall structure of personality. Therefore, what motivates the employees has an important connection to how it relates to duties, to how it communicates and to how it relates to customers.

Keywords: motivate, customers, employees, communication.

JEL classification: J53

1. Introduction

The main problem that involves the study of communication is that of determining the content and means through which it is sent. Regarding content, it is extremely varied. Communication convey images, concepts, ideas - has informational content - it facilitates the expression of emotional behaviors, produces psychological dissonance or consonance effects of acceptance or refusal, match or mismatch (which is the affective-emotional content), is transmitted by communication needs, aspirations, impulses to action - motivational content - is initiated, the trigger or halt activities, there is resistance to efforts - volatile content. In conclusion "our mental life is specifically involved in human communication, it is differentiated by its contents expanded one held at intrauman. In

general, three types of information communicated:

1. Cognitive - sign language content;
2. indiceale - focusing on population in order to define and control role during communication;

3. injunction or conative - exchanged between interlocutors to advance communication to achieve a goal. To characterize and analyze any real crisis is needed employment in a typology. Synthesizing typologies made by several authors recognized, Cristina Coman four classification obtain crisis following criteria:

- 1) as causes (due to internal or external factors);

- 2) after run-time (sudden or slow);
- 3) scale (superficial or deep);

- 4) the level at which place (Operational - affecting normal operations, strategic - affects strategies, identity - affects the identity of the organization);

- 5) effects (affecting employees customers, partner organizations, part of the public etc.).

Proposing criteria, Newsom et al¹. obtain two main categories of seizures, violent and nonviolent, each category having three subdivision respectively

- Products of crisis;
- Crisis produced by intentional human action;
- Seizures caused by unintentional human action;

Finally, running relatively the same idea of human action and using two axes classification (internal-external and non-

¹ Newsom, Doug, Scott, Alan, Turk, VanSlike Judy – *This is PR*, Belmont Wadsworth Publ. Comp., 1993, pp. 538-539

intentional), Coombs² six obtained four types of crises:

Accidents - internal, unintentional (seizures due to technical problems);

- errors - unintended actions of its members that an external agent seeks to turn into a crisis (doubt, hesitation, professional misconduct - for example, operated a medical mistake to affect hospital that has a post of responsibility);

- transgressions - intentional action committed by organizations that knowingly violate the rules of behavior previously assumed (bankruptcy banks or diplomas fake license);

- Terrorism - intentional actions performed by external actors in order to affect a given organization is directly or indirectly (attacks);

All these classification schemes can be used both as a tool to analyze real crisis, as well as support element in generating alternative plans crisis.

2. Crisis management

A recommended policy for resolving the crisis successfully is the first step in trying to avoid as much as possible. In a careful analysis of several situations public relations crisis in history has been found that even when production was unpredictable, the event itself was predictable (for example, when the shuttle Challenger were reported six months before the reactor technical problems). Politics avoid crises require identifying and tracking items that can change negative study of weak links of the organization. Fink³ identifies several stages of a crisis:

a) preparation of financial crisis is the stage where it is possible to anticipate and avoid crisis

b) acute crisis: the trigger time, which can be overcome only if there is a crisis communication plan can be implemented;

c) Crisis chronic phase: a phase reaction occurring in government

investigations and public debate, and the organization is trying to restore balance and public image;

d) The end of financial crisis if it fails to keep the crisis under control (through sound management of the first two phases) then it is possible for the organization to achieve a shorter period of crisis that finally opens the road to the normality reintoacerea;

In his opinion Cutlip et al.⁴ three elements are retained in connection with Information Center. First, it must be conceived as an information center public and therefore should not be superimposed nor the space nor the powers over press center. Secondly, the authors believe that there should be two teams working in this center, one to manage communication and another that coordinate and update information, taking in touch with the organization's leadership team. Ultimately such a center must have before triggering the crisis, the status of a source of reliable information, adequate circulation information yet to be achieved during routine organizational activities.

In within the organization, employees should be informed about this center and be encouraged to either provide information or to request information if needed.

Basically, the emergency communication will take place on several areas: the internal and external audiences, the actors and the media crisis. This last component is one of the most important. Experience has shown that most of the times organizations are concerned with emergency and support less work Documentation journalists. In this case, journalists are resorting to rumors or take a position from the organization, which contributes more to damage the image of it. Experts in public relations, in such cases to take the role permanently contact journalists to achieve the correct operational information transmission, accompanied by the organization's position in relation to ongoing events

3. Research Methodology

3.1. Scope of the study

This paper investigates elements of changing attitudes in the current context of a constantly changing economically and socially, how motivation may influence attitudes to work, where attitudes toward work involves customer service attitude.

3.2. Participants in the study

Lot of subjects, was selected by stratified randomization of subjects all existing employees of different professions, employees in those organizations, in positions involving public relations so obtained is representative group specificities of the two organizations. Selected sample contains a total of 230 subjects, of which 120 in the state sector (50.8% representing 61 men and 59 women representing 49.2% and 110 private (50 men representing 45.5% and 60 women representing 65.5%).

Comparative study in terms of training shows that the state sector have a higher percentage of highly educated people on the private sector is the greater percentage of persons with secondary education.

Depending on such subjects, where private institutions have a uni-modal distribution (module = 45 years) with mean age of 40.5 years, median 41.5 years and standard deviation of 8.65 years. The amplitude of this distribution is 39 years from a minimum age of 22 years and a maximum age of 61 years.

State institutions have a bimodal distribution (module = 48 to 50 years), left asymmetric with higher prevalence of age, with mean age 44.06 years, median 45 and standard deviation of 9.12 years. Amplitude distribution is 36 years, between a minimum of 24 years and a maximum of 60 years.

3.3. Objectives and research issues

This study seeks to establish a correlation between the dominant values and motivational orientation.

3.3.1. Assuption

1. It is assumed that there is a link between the dominant motivational orientation and values;
2. Suppose that there are significant differences between men and women in the motivation and the value-orientation;
3. Type of institution and study motivation and orientation influence values

3.3.2. Tools

The tools used are:

1. OV questionnaire for measuring orientation values.

It comprises 32 items, each having a rating scale response from 1-7. Items are divided into three dimensions as follows:

Scale 1 - personal. This dimension focuses primarily on human values, to improve the system's reasoning and communication employees.

Scale 2 - yield. With this increased size is placed primarily on the values of productivity / efficiency, which means collective performance improvement.

Scale 3 – conservatism

2. DM for dominance motivational questionnaire.

It comprises 32 items, each having a rating scale response from 1-7. Items are divided into four dimensions as follows:

Scale 1 - management (lack of power) - this being understood as a desire to influence those around them to mobilize its success or manipulating his personal interest;

Scale 2 - expertise (need for achievement) expressing this tendency or desire to excel in the activities they undertake, to be considered an expert, or be a professional man, the shadow' that influence decisions (expert professional)

Scale 3 - networking (need for affiliation) - which expresses the wish that the individual feels to establish and to demonstrate relations of friendship with others.

Scale 4 - Subsistence (lack of existence) - the concerns of the person for basic needs of existence such as rest, stability, money, food security.

3.3.2. Data analysis and interpretation

Checking assumptions

The first assumption assumes that there is a link between work motivation and value orientation. To check it we used a correlational plan through which to establish the correlation between scores obtained by subjects in value-orientation and motivation score obtained at work. Since one variable is normally distributed, we used the correlation coefficient of Rank "rho" Spearman.

Between values and dominant motivational orientation there is a significant, positive and weak ($\rho = 0.37, p < 0.01$). This shows that as motivation to obtain the high rate increases and the move towards true values of the company.

Figure 1 - Correlation between dominant value orientation and motivational

But we do not know which part of that motivational dominance orientation value subcomponents correlate each other dimensions. This will make correlations between each component of a total score of other sizes and dimensions.

Analysis we see that value orientation correlated significantly with all components positive and weakly dominant motivational orientation values as significantly correlated positively with the size and weak leadership ($\rho = 0.30, p < 0.01$) with expertise dimension, ($\rho = 0.38, p < 0.01$), the size relationship ($\rho = 0.28, p < 0.01$) and subsistence size ($\rho = 0.26, p < 0.01$).

Table 1 - Correlation between dominant motivational orientation and component values

Correlations			Total dominante motivationale
Spearman's rh	Total dominante motivationale	Correlation Coefficient Sig. (2-tailed)	1,000
		N	230
	Dimensiunea personala	Correlation Coefficient Sig. (2-tailed)	,472
		N	230
	Dimensiunea randamentului	Correlation Coefficient Sig. (2-tailed)	,402
		N	230
	Dimensiunea conservatorismului	Correlation Coefficient Sig. (2-tailed)	,531
		N	230

Figure 2 - Correlation between dominant motivation and attitude to change components

Studying other dominant motivational note that overall score correlated significantly with positive and low staff size ($\rho = 0.47, p < 0.01$), yield size ($\rho = 0.40, p < 0.01$) and size conservatism ($\rho = 0.53, p < 0.01$).

The first assumption is fully confirmed, there is a significant link between work motivation and value orientation, and weak positive relation.

What the second assumption assumes a significant difference between men and women regarding work motivation and value

orientation.

The first variable orientation values are normally distributed and we use to verify the existence of differences, the test "t" Student of the significant differences between averages of two independent samples.

Table 2 - The difference between men and women in terms of orientation values

Independent Samples Test						
	Levene de egalitate a varianțelor	t de egalitate a mediilor				Sig. (2-tailed)
		F	Sig.	t	df	
Total orientare	1,447	,230	,517	228	,605	
Varianțe egale			,516	24,365	,606	
Varianțe inegale						

The data obtained do not show any difference between men and women in terms of orientation values, views of the two populations are homogeneous in this respect. Since the second variable is normally distributed, the test "t" Student of significant differences between the average will not be relevant. I preferred using a nonparametric test and Mann-Whitney test the difference between ranks. Note the existence of significant differences between men and women in terms of motivation at work ($Z = 2.59$, $p < 0.05$) in the sense that the motivation of men is significantly higher compared to women's motivation.

To see which components of motivation differs between men and women have repeated the procedure for dominant motivational dimensions. Note the existence of significant differences between men and women in terms of motivation at work ($Z = 2.59$, $p < 0.05$) in the sense that the motivation of men is significantly higher compared to women's motivation. To see which components of motivation differs between men and women have repeated the procedure for dominant motivational dimensions.

Table 3 - The difference between men and women in terms of dominant motivational

	Test Statistic			
	Dimensiunea conducere	Dimensiunea expertiza	Dimensiunea relationare	Dimensiunea subzistenta
Mann-Whitney U	4650,000	5988,000	6327,000	5894,000
Wilcoxon W	11790,000	13128,000	13467,000	13034,000
Z	-3,879	-1,226	-,552	-1,410
Asymp. Sig. (2-tailed)	,000	,220	,581	,158

a. Grouping Variable: Gen

Note that only one component differs between men and women in this respect. It's about leadership dimension where men are significantly more motivated in terms of leadership in relation to women ($Z = 3.87$, $p < 0.01$). In other words, opportunities for leadership is a strong incentive motivational significantly more important for men compared with women.

The second assumption is partially confirmed. I found that there are significant differences between men and women only in the variable "dominant motivation" where men are significantly more motivated compared with women. The dominant motivational components have shown that only component that distinguishes between men and women is the driving dimension.

The third assumption, that type of work and study motivation influences may be demonstrated by studying the effect that carries two independent variables, type of institution and study the dependent variable orientation on the dependent variable values and motivation at work.

Variable "type of organization" has two degrees of intensity: State institution and private institution and the variable "education" has three intensity levels: primary, high school and university.

For dependent variable "value-orientation" does not observe any significant effect caused by the existence of independent variables. There are differences of views in terms of studies or type of institution in terms of value orientation, which is observed in the figure below.

Figure 3 - Analysis of variance for value-orientation

Analyzing the dependent variable "dominant motivation" we find there is a main effect of variable studies ($F(2.229) = 5.26, p < 0.01$)

Table 4 - Analysis of variance for dominant motivational.

Tests of Between-Subjects Effects

Dependent Variable: Total dominante motivationale

Sursa	Suma patratelor tip II	df	Media patratelor	F	Sig.
Model corectat	11952,350 ^a	5	2390,470	4,559	,001
Interceptari institut	857964,492	1	857964,492	636,164	,000
studii	47,593	1	47,593	,091	,763
institut * studii	5516,706	2	2758,353	5,260	,006
Eroare	1927,467	2	963,734	1,838	,162

Total corectat	534686,000	230			
Total corectat	129412,522	229			

a. R Squared = ,092 (Adjusted R Squared = ,072)

The variable "study" thus influence the dependent variable "dominant motivation. To see what is the meaning of this influence we used a test post hoc Bonferroni test. Is a similar test test test Bonferroni "t" in the study there significant differences in the environments of the three groups determined by the independent variable.

Table 5 - Effect of studies carried out by the dominant motivation.

Multiple Comparisons

Dependent Variable: Total dominante motivationale

Bonferroni

(I) Nivel de stuc	(J) Nivel de stuc	Mean Difference (I-J)	Std. Error	Sig.
Primare	Liceu	14,84	11,658	,613
	Univ	4,00	11,644	1,000
Liceu	Primare	-14,84	11,658	,613
	Univ	-10,84*	3,048	,001
Univ	Primare	-4,00	11,644	1,000
	Liceu	10,84*	3,048	,001

Based on observed means.

*. The mean difference is significant at the ,05 level.

From the table above we see that the effect is caused by significant difference between those subjects with university and high school education (Bonferroni = 10.84, $p < 0.01$) in the sense that those with university education have a significantly higher level of motivation compared with those who only graduated high school, something reflected in the figure below.

Figure 4 - Analysis of variance for dominant motivational

4. Conclusions

In a special organizational dynamics, with profound changes in the state institutions and private companies, the question is, first, the rapidly changing attitudes. A special role in this direction has motivation as a factor influencing the attitude toward work. Moreover, we tried to separate and define the role and importance of motivational factors in influencing attitudes towards work in general. We chose a large sample to allow, on the one hand, comparative study for different categorical variables and secondly to ensure representativeness.

The purpose of this study is to identify the relationship between orientation to certain values and motivation at work. For this I left a number of assumptions that I assumed that gender differences in the motivation and value orientation, but that type of institution and level of education influences work motivation and value orientation. Following correlational studies have shown the existence of positive correlations between value orientation and motivational dominant. But correlation is not strong, only 13.6% of variation in how the two variables is explained by this correlation (.37 x0, 37). A high motivational level determined favorably values and vice versa, at low rates motivation involves an attitude characterized by values generally ignored.

While moving towards certain values significantly correlated with dominance motivation components, although the correlation, is positive, is also weak. Stronger motivation to work correlated with components of value orientation, although overall we are not dealing with a strong correlation.

Second assumption can be studied by inferential method. There were no significant differences between men and women in terms of orientation values, but these differences appear when we analyze and observe that the dominant motivation motivational men is significantly higher compared with women. Moreover, one motivational dimension that made the difference is related to driving. It seems that it meets the most part men compared with women. For the third case we found the existence of a single main effect, that exercised by the dominant motivation for studies. Under this effect, subjects with university education have a significantly higher level of motivation compared to subjects with high school

Data Equivalence in International Marketing Research

Rusu Sabina Mihaela
Doctoral School of Economics
„Al. I. Cuza” University, Iasi
mhl_sbn@yahoo.com

Abstract

The field of international marketing research is a challenging one through its proportion and complexity. The model construct submitted for testing in an international research is more complex and difficult to manage as more factors and variables are interfering and the simple identification of all of them can be a real challenge. As the international environment is considered to be formed from a large number of diverse environments, the research design must prove its validity for any of these environments and also for the entirety, or for the international one as a whole. Also choosing a representative sample is usually confronted with limited resources and the samples used in international marketing research are often associated with research limits. The sampling encounters difficulties as much in sample size as in sample structure, due to the amplitude of international phenomena and to the large sample frame to which the research results must be extended. The research in the field of international marketing demands a higher degree of refinement as both global and local aspects, as well as the interactions between them, must be comprised in the analysis. But in spite of all of these impediments, the international research is gaining importance among the researchers, as more companies and institutions are targeting a bigger market. The paper covers the topic of international data equivalence by providing a conceptual base for international marketing research and emphasizes the importance and the specificity of this area.

Key words: international marketing research, data collection, data equivalence

JEL classification: M31

1. Introduction

Conducting a research on an international market is not the same with conducting a research on a domestic market. Although the research objectives are mostly the same, regarding the way to manipulate the marketing mix variables and whatever to enter or not on a market, the research environment is different and this affects the entire research perspective. The complexity of international marketing research is sustained not only by the different factors that must be managed in an international environment, but also by their increasing number [1, p.161; 2, p.135]. Following the same steps of the domestic research process, the international marketing research also has to consider for each of these steps the political, economical, legal, social and cultural differences across countries, being responsible at the same time for managing the research results comparability [9, p.113]. The researcher who attempts to analyze the international market has to be gifted with cultural sensitivity in order to comprise in his study all the relevant differences as well as all the relevant similarities. He has to have the ability to face up his “lack of familiarity with costumers, competitors and the market environment” [2, p.135].

As the “international research almost inevitably crosses cultural boundaries”, the data equivalence is a major issue of international marketing research [7, p.391]. \

Problems of data equivalence are accompanying the international research process from the first stages of defining the research problem and of secondary data collection to the final ones of primary results interpretation. In order to improve the international research accuracy and validity, the use of both secondary and primary data as well as the triangulation of quantitative with qualitative research methods is

recommended [2, p.145]. Unlike the domestic marketing research, the international one sets data equivalence utilizing different methods, instruments and techniques on different samples for the same purpose, depending on the cultural specificity of the sample.

But before exploring the subject of data equivalence, it is necessary to understand how international studies are being approached.

Sampling methods		
Sample type	%	Median sample size
Sample based on lists supplied by others	33,7	203
Judgment	15,1	135
Convenience sample	14,6	174

Government data	7,0	154
Others	5,4	-
Census	1,9	351
Newspaper articles	1,6	186
Unspecified	3,7	-
TOTAL	100	-

2. How is the international marketing research approached?

The studies regarding the use of international marketing research are few, but the concern for this issue is increasing as more companies and institutions are becoming aware of the fact that this type of research is vital for accessing the global market (defined as the whole or the worldwide market, but not with the connotation of the homogeneous one) or for accessing the international one (defined as a set of multi-domestic markets). A complex study that examined this aspect is the one conducted by Yang Z. et al., who analyzed 1.296 empirical studies that were published between 1992 and 2003. The studies were extracted from six top international business journals (JIBS: Journal of International Business Studies; MIR: Management International Review; JWB: Journal of World Business; IMR: International Marketing Review; JIM: Journal of International Marketing, and IBR: International Business Review) and the content analysis has been applied. The results of the study are the syntheses in tables 1, 2 and 3.

The research results indicated that the data collection techniques mostly used are the survey

by mail questionnaires, followed by secondary data analysis and the survey using administrated questionnaires.

Table 1. Review of data collection methods
Source: after Yang Z. et al. (2006)

Data collection methods		
Type of study	%	Response rate
Survey	60,3	-
Mail survey	37,6	27,4
Administered questionnaire	11,9	51,2
Personal interview	9,9	36,6

country sample [8, p.612].

Table 3. Review of sampling methods used
Source: after Yang Z. et al. (2006)

Another study conducted by Nakata C. & Y. Huang that analyzed 487 articles published in nine leading marketing and international business journals between 1990 and 2000, revealed a progress of international marketing research reflected in the diversification of topics and “the rise of analytical sophistication in quantitative studies”. But the authors also pointed out the factors that inhibit the development of international marketing research: the predominance of US researchers in the detriment of multi-cultural research teams, “the heavy reliance on analog frameworks, the simplest form of conceptualization” and the increased use of surveys that favor a lack of qualitative research and of multi-method approach to the international market [6, p.306]. The practical approach of international marketing research is evolving as the international businesses evolve themselves. The necessity of conducting international research cannot be denied any more, but the confrontation generated by time and financial resources, as well as by the need of researcher specialization in the international aspects, demanded in such a research, will still dominate a long time the practical way of approaching the international market.

3. Research hypotheses – the issue of equivalence at the basic stage of the research

The equivalence of the research hypotheses refers to the full understanding of the research problem by all the researchers implied and also by the beneficiary of the results (the person or the institution that ordered the study), especially in the case in which the subjects are geographically separated and when they belong to different cultures. At this stage the equivalence is threatened both by the self-reference criterion (SRC) and by the lack of familiarity with the foreign environment that has to be investigated [1, p.164]. The SRC is represented by the people’s tendency to see all the situations in terms of their own background and to assume that a foreign environment can be interpreted in the same way as their local one. A four step procedure has been suggested in order to remove the SRC [4, p.66; 1, p.70]: 1) defining the problem considering the researcher’s own

cultural context; 2) defining the problem in the context of the foreign or international market that has to be investigated; 3) isolating the SRC, and 4) redefining the problem without the SRC.

The lack of familiarity with the foreign environment “can lead to false assumption and poorly defined research problems”[1, p.164]. Also, the lack of familiarity can favor the influence of cultural stereotypes in the research problem definition. The cultural stereotypes are general pictures that we have in mind about other cultures based on informal sources like movies one has seen, friends’ opinion and things that one often hears about a culture, short experiences like a trip in a country or an individual one once met that belonged to a certain culture. All of these can create false images in our minds as the means for a scientific validation of this information is missing. In order to define the research problem in a foreign context a foreigner or secondary data results may be used.

An example of a poor problem definition in international marketing research that had lead to false results is the study conducted by Reader’s Digest regarding the spaghetti consumption. They defined the spaghetti consumption as a measurement of packaged spaghetti sales and concluded that West Germans eat more spaghetti than Italians do. They obtained a false result because they didn’t consider the differences in buying habits when defining the problem: while West Germans buy packaged spaghetti, Italians buy much of their spaghetti fresh and in bulk, from local pasta shops. The conclusion is that preliminary information about the market such as consumption patterns, decision makers, business habits and others, are needed before starting the research and defining the problem [5, p.274].

4. Research design equivalence

The research design equivalence comprises construct equivalence, measurement equivalence, scale equivalence and sampling equivalence.

Construct equivalence means that the researcher and the subjects understand a concept or a phenomenon in the same way. If they have a different perspective on the issue, this can have an impact on the functional equivalence, the conceptual equivalence, the definitional

equivalence, the temporal equivalence and the market structure equivalence. The functional equivalence refers to the functions associated with an action. For example shopping can be a servant duty like in some Asian countries or can express the function of a social activity like in some European countries. The conceptual equivalence means that a concept has to have the same meaning across countries. One of the reasons why the meaning may differ is the customer experience with a product. Reliable is a concept that can mean different things to a car owner in Germany, where sales of Mercedes and BMW are high, compared to a car owner in India used to a local brand of cars. The definitional equivalence relates to the categories used in order to group data, categories that usually differ across countries. For example family means parents and children in USA, while in others countries the concept includes also grandparents and other members of the extended family. A businessman has a high status in Europe, but this may not be the same in countries where status is based on education or caste. The temporal equivalence is affected by the reverse seasons between the southern and the northern hemisphere and by the fact that gift-giving seasons differ across countries. The perceived value of time also differs across countries depending on the time perception of each culture. The market structure equivalence is related to the infrastructure of the countries and the stage of development of the market [1, p.165].

The measurement equivalence has to take into account the calibration equivalence and the translation equivalence. The translation equivalence can be assured using translation and back-translation of bilingual translators, but as the meaning is more important than verbatim translation, the items must be included in pre-tests with respondents in the countries under investigation [5, p.296-297]. The calibration equivalence, also called the gradation equivalence, refers to the equivalence of units of measurement, procedures, safety standards, perceptual cues and all the other aspects that vary from one country to another. The translation equivalence can be analyzed in such aspects as lexical equivalence (whether the translations in dictionaries match precisely), idiomatic equivalence (linguistic usage natural to a native speaker), grammatical Equivalence (the

construction of sentences and word ordering), experiential equivalence (words have to relate to the subjects' experience; for example, in hot countries there is a larger number of words that express the degree of heat than the colder countries have) and character equivalence (for example the meaning conveyed by ideographs is highly contextual, while the meaning conveyed by words is less contextual) [1, p.166-167]. A special issue of measurement equivalence is the one regarding the unit of analysis. For example household definition and size vary greatly from one country to another [3, p.333].

The scale equivalence means not only the use of the same scale, but it also assures that the respondents attach the same meaning to each point in the scale. For example, Italians like the extremes, while Germans are more restrained. As a consequence Italians will mark toward the extremes of the scale and Germans the middle points of the scale, fact that has to be considered in the results comparability [5, p.295]. Another example is the Likert scale which has versions with 5 or 7 points in countries like UK, while other countries like Germany may use a version of 10 points. Also, there are substantial differences in the way in which the respondents use the scales. Some cultures favor the firm answers, while others prefer to be more equivocal. To reduce the differences in the measurement of terms interpretation, the use of pictorial scales in international research is recommended [1, p.167-168]. The type of scale used in international marketing research also has to be adapted to the respondents' level of education and to their experience with the product. For developing countries and for respondents not familiar with the product ordinal scales are recommended, or even the dichotomous scales (the simplest type of ordinal scale) in order to improve the response rate and the response accuracy [3, p.270]. In international marketing research the use of pan-cultural scales is recommended, the ones that are free of cultural biases. An alternative to such scales are the ones whose respondents are asked to set the anchors (the verbal descriptors for the extreme scale categories) before responding the question, in this way assuring the cultural equivalence of scale descriptors. Scale numbering must also be avoided as far as possible, due to the different association of numbers across cultures [3, p.299]. The use of

unstructured or open-ended questions is necessary when the researcher does not understand all the alternatives that may be associated with an answer in a different culture [3, p.334; 2, p.150]. Also, the questions have to be “culturally acceptable”, and the researcher has to take into account that questions that can be asked directly in some cultures must be asked in an indirect manner in others [2, p.150].

Sampling equivalence is difficult to be assured in an international context, and the problems appear from the first stage of defining the population. If the population is defined using external criteria like for example income classification, the samples risk being incomparable across countries because the same income group may have different lifestyles in different countries. Instead, the internal definition may include in the sample people with high interest for the product in some countries and people with low interest for the product in other countries. For assuring the sample comparability, the sample representativeness may also be sacrificed. It is more likely to achieve the comparability of samples across countries by using different sampling procedures, than by using the same ones.[3, p.366]. The equivalence of samples can be assured by making them broad enough to cover all the subcultures influences or by drawing specific samples representing the same subculture in each country, if a specific subculture is specific to the phenomenon under investigation (for example Bolivia nurses and Argentine nurses) [5, p.297]. Sample size depends on population variance which usually is unavailable. For achieving sample size comparability, the relative homogeneity or heterogeneity of markets can be compared. Often, markets that are familiar with a product are presenting more homogeneous consumer preferences than the markets in which a product has been newly introduced [3, p.390].

5. Data collection and research results equivalence

In the international marketing research, data collection has to adapt to each specific market. As a consequence the questionnaires must be designed to adapt to a variety of administrative methods. In primary research, using local field workers may be an advantage, as they are

familiar with the local customs, but they must be trained in order to understand the research purpose and supervision is also necessary [3, p.440]. In collecting data it is more important to use techniques with similar reliability rates than to use the same technique but with high reliability differences across countries [2, p.154]. Surveys may need to be administrated in different ways, using telephone interviews, mail questionnaires, face-to-face questionnaires or on-line questionnaires depending on each specific market.

The interpretation of international research results can be affected by the selective perception of the researcher due to cultural biases. The Anglo-American researchers are in disadvantage in recognizing the cultural biases due to their lack of familiarity with other languages, fact that limits their cultural understanding. The correct interpretation of the data can be improved if at least one person from the team is familiar with the culture and business customs of that region [5, p.303]. The results equivalence may also mean preparing the final report in different languages and using different styles if the persons interested in the research results belong to more than one culture.

6. Conclusions

The research in the international environment requires a completely new approach. Each step of domestic market research has its own particularities and more than that, rules that work well in the domestic market lose their validity in the international one. In order to manage the variety of the markets implied in the study, assuring their comparability is essential. Most of the international marketing research peculiarities rise exactly from this continuous effort to maintain data equivalence. Comparing samples different in size and sometimes different also in structure, considering different techniques of data collecting as similar in results and using the subjective concept of “culture” as a base of the research, with almost a different meaning in each different research, are just a few of them. But, as the market globalizes and as more businesses internationalize a full understanding of international marketing research becomes more than necessary.

Abstract

The increasing attention paid to Romanian tourism revival asks for a more precise evaluation of the incoming cash obtained in this field of activity in order to underline the real contribution that it brings to our national economy. Tourism is considered, and verified as the main source of foreign currency incoming cash that can positively contribute to better balance external due payments, as it has already been the situation for countries with a tradition in tourism.

Key words: tourism, statistic data, Tourism Satellite Account (TSA)

JEL classification: L83

1. Introduction

Given the wide diversity of touristic services, the seasonal feature of tourism, various forms of tourism, as well as the range of quotes and tariffs that differentiate according to comfort level, forms of tourism and economic agents, the activity in this field is not to be characterized statistically by means of a single indicator, but by a system of indicators.

The increasing attention paid to Romanian tourism revival asks for a more precise evaluation of the incoming cash obtained in this field of activity in order to underline the real contribution that it brings to our national economy.

The natural and anthropic touristic potential available in our country justifies fully the present government's preoccupation to raise the bid of tourism both on the internal and especially on the international market. Tourism is

considered, and verified as the main source of foreign currency incoming cash that can positively

contribute to better balance external due payments, as it has already been the situation for countries with a tradition in tourism.

Firstly, a series of other priorities meant to contribute to the increase of Romanian tourism competitiveness are added to the national projects as follows: modernization and increase of comfort level of present accommodation structures and their expansion to areas and towns with touristic potential, yet lacking a certain level of comfort, the improvement of service quality and their diversification, expansion of the range of leisure activities for all touristic destinations, development of skiing areas that are not yet part of touring circuit, renewal of technical facilities of treatment bases and so on.

The result arising from these efforts constitutes the very economic achievements obtained that can be a stimulant to more native and international investors in a field of activity that proves its profitability.

Within systemic approach, tourism can be considered as one cybernetic system that is included in the national economic system and it is formed of a series of interconnected subsystems, whose state of functioning has been permanently obvious[1].

In order to propose, fundament and choose the optimum decisions, the management has to acquire continuously information on the status of the system, that is to gather data, systematize them, process and present them in the shape of indicators.

This system of indicators forms the main part of the statistic informational system in the field

of tourism and represents a component, a subsystem of indicators system of our national economy.

2. Organization and operation of the informational statistic system in tourism

Touristic activity, as integrant part of the national social economical system, can be quantified and analyzed by using the entire statistic methodology, but it has to be particularized according to specific conditions and features of the touristic sector.

Statistic research of the touristic phenomenon requires developing certain stages as: statistic observation, that consists in gathering touristic information by using unitary methodology for all units of the researched collectivity regarding characteristics included in the research schedule; statistic procession, that consists in systematization of individual data gathered, calculation of statistic indicators, presentation of data under the shape of tables, series and statistic graphics; statistics analysis and interpretation that consist in data confrontation and comparison, hypotheses verification, draw of conclusions on the research and prognosis calculation[3].

In order to achieve an accurate statistic research in tourism, it is necessary to organize an informational statistic system to provide on a daily basis or whenever necessary, appropriate data to disclose to public opinion, state authorities, as well as to international institutions in the field of tourism that our country is affiliated to.

The above require that the entire activity of touristic statistics is developed with a systemic approach and is materialized in an open and dynamic system of indicators, as part of the national statistic informational system[2].

The informational statistic system of tourism comprises a system of indicators of the touristic activities that can be determined as: absolute indicators (global and medium) and relative (according to their intensity, structure, indexes etc.) These indicators are: indicators of the economic (supply indicators – technical material basis and the indicators of the work force); indicators of the economic results (indicators of tourism incoming cash, indicators of tourism expenses, indicators of economic efficiency);

indicators of touristic circulation; indicators of the quality of touristic activity[2].

These indicators can be expressed in natural units, natural-conventional units and units of account.

The importance of elaboration of appropriate methodology, meant to provide statistic indicators with unitary content to the touring industry, that are comparable on the national level in their dynamics, is an intense preoccupation of the national and international touring organisms.

All of the above interests target to synthesize a broad system of statistic indicators in tourism, based on a rational database of gathered information and data that are necessary to adopt optimum decision regarding the future of the economical-organizational activity, linked to the future development of touristic industry[1].

As any other economic sector, touristic activity is evinced by the contemporary researcher as a large cybernetic system, whether it is a mere touring agency or the entire field of tourism as a branch of national economy. Economic units that are active in tourism develop their activity considering decisions of their economic management[2]. These decisions have to take into account the activity of economic prognosis elaborated according to analysis of recorded data of the so-called database.

Determination of economic effects resulted from touring circulation require access to detailed information concerning tourists' income, the currency they use, their manner of financing voyages (current income, savings, credits, rate payments). These data have to be compared to the touristic supply (material basis, level of quality, structure of services), divided on characteristic periods of touristic activity (top season, out of season), and this shall lead to more elaborate analyses and a more precise determination of the social-economic parameters that characterize touristic circulation[2].

In its entirety, the touring database is constructed as a vast recipient where all information and available data on touring activity gathered systematically, permanently and rationally accumulate. The more the information, the better the decision to be considered. Information record shall not be random, but according to wisely selected criteria

that are situated at the same level with the activity of each touring company involved.

Given the set of requirements, a comprehensive system of the national touring statistics can fulfill the following main functions as: an estimation, according to demand, of the volume and dimensions of the international and intern tourism. The basic information to achieve a connection between these two forms of tourism is provided by the number of visitors and days/nights of accommodation, the country of residence, duration of vacation, purpose of visit, transportation and accommodation choice, as well as individual expenses of tourists; information provided on the accommodation supply and on the other touristic services, analyzed according to geographic areas and resorts: capacity of accommodation, level of occupation, supply of services, available personnel and other aspects of touring companies; evaluation of the international tourism influence (incoming and outgoing) on the external cash balance and on the economy at large and including the effects of touring expenses on the income, the effectiveness and on the employment level in various sectors of production and services and on the profit obtained by the touring companies[2].

By analyzing aspects of the manner of obtaining touring information, it is important to have a certain quality of information interpretation, according to actual conditions of touristic activity, considering the following essential characteristics: content and form of touristic information; age of information; frequency of touristic information.

As concerns the content and type of information, it is important that all data reflect precisely the evinced touristic phenomena. The accuracy of touristic information is a function of the quantitative and qualitative expression of the analyzed phenomena, taking into consideration the possibility of verification of information source. Within the touring activity, because of its large scale performance, the possibility of control decrease with the large volume of data, and this requires a certain reliability, which is a higher probability of the gathered information.

The age of touristic information is measured by the period between the record time and the time of data use. The concept of touristic information use is relative enough since it comprises both the immediate use of data and

their adequate storage, with the purpose of their later use for various comparative analyses and tourism dynamic trends.

Within tourism, because of the seasonal feature of the activity and the fact that the medium vacation of tourists has a relatively short duration, the gathered information depreciates, at large, very rapidly. This fact implies a lot of reticent approach of the stored data and intensifies preoccupation to continuously update the database.

The frequency of touristic information refers to the rhythm this information complies with the conditions of interaction of the elements of rational organizational structure: operative touristic system (economic developing processes), the informational system (data procession and transmission) and the management system (information capitalization with a view to optimize solutions and elaborate decisions in touristic activity).

The above-mentioned interdependence leads to the fact that the frequency of information has to be organically fit with a well-established logic, in which the action – information – decision are useful parts to develop management activities in every touring company. As in the case of the information age, the decisive factor that confers usability to data is the processing method.

A special importance is given to the Tourism Satellite Account (TSA), which is a statistic method to pursue the estimation of tourism economic impact, by a direct comparison of the dimension of touristic sector with the other sectors of the economy, the result being the measurable degree of its influence. TSA has been created to provide a methodological unit in defining, gathering, analysis and interpretation of data at the national level.

Tourism Satellite Account shall provide aggregated macroeconomic indicators in order to describe the size and economic importance of tourism, as for example, the Added Value in tourism and how much is tourism contribution to GDP (other than national GDP), according to similar aggregate indicators for the national economy: detailed data on tourism consumption and the manner this consumption meets the internal supply, basic information necessary to develop patterns of tourism economic impact, to prepare analyses of touristic market, the connection between economic data and other

non-monetary information regarding tourism, as: the number of trips, duration of vacation, transportation.

Tourism Satellite Account (TSA) represents the most important statistic element to measure economic impact of tourism. Tourism is different of other economic activities by the fact that it does not comprise a single branch of activity within the National Accounts System. Consequently, there is a larger difficulty in the quantification of touristic sector within the national economy, and the TSA meets this challenge.

3. Conclusions

In conclusion, the informational statistic system in the field of tourism is formed of the following:

statistics obtained of reports addressing to visitors/tourists such as The Report of the Touristic Demand of Romanian Residents; statistics obtained from the touring companies: level of frequency of the accommodation structures; capacity of touristic accommodation existing as of 31st of July; touristic activities organized by the touring agencies; market research programs regarding the quantitative and qualitative analysis of touristic demand, economic

results and labor force in the accommodation units in Romania; statistics obtained from administrative sources – Romanian International Tourism; statistic syntheses; balance of payments; national accounts; other data providing sources.

Consequently, a more precise evaluation of the efficiency of touristic development is an objective necessity, a fact that requires a more accurate follow-up and record of the obtained results, especially of the foreign currency incoming flow obtained by economic operators in the field as: direct service providers, touring agencies etc.

Gaining Customers` Trust In Online Stores

Anamaria Severin-Humelnicu, PhD. Student
Transilvania University of Braşov
anamaria.humelnicu@unitbv.ro

Abstract

Trust is very important in running businesses on the Internet. It plays a significant role in the actions a consumer undertakes in the online purchase process. An online store will never reach the desired level of sales until it gains the trust of its consumers. Building confidence is the key of succes in electronic commerce. Therefore, any online retailer should strive to achieve this goal.

Keywords: consumer, electronic commerce, confidence, products.

JEL M31

1. Literature review

Online shopping is different from shopping in traditional stores. The main difference is the uncertainty that appears in the purchase process. Therefore, trust is an important factor that facilitates online transactions. Most studies have shown that confidence plays a significant role in the actions a consumer undertakes in the online purchase process. Gaining customers trust equals with increases customer confidence intention to buy a product from an online store.

In the literature, the concept of trust in the offline and online medium has been extensively discussed. According to Srinivasan (2004), two major factors contribute to the success of electronic business: the trust people place in the online businesses and how secure they feel when doing business on the Internet. [14]

Martínez-López and Montoro-Ríos define trust in Internet shopping as the consumer's perceptions regarding the credibility or reliability of shopping over the Internet. Building strong customer relationships is the key to a successful marketing strategy. [10]

Prasarnphanich shows that when customers build their trust in a retailer, they are more likely to see value in the relationship with the retailer, they want to maintain the relationship, and commit to that retailer. [12]

Credibility and trust are very important for success and although intangible, essential to any online transaction. Credibility comes before trust and is part of building trust. Claxton stated that credibility is a major issue that a company has to overcome before it can do business on the Internet, because online visitors can't look you in the eye or gauge your handshake to determine your trustworthiness. [2]

Srinivasan (2004) stresses the importance of gainig consumers` trust in order to be highly successful. [14]

A lot of researchers view consumer trust as the most critical factor in a consumer's selection of an online store. If a consumer perceives trust in an online vendor, its overall satisfaction will be greater.

Researches like Chow S. and Holden R. have found strong relationships between trust and customer loyalty. [1]. Daemen concludes that in general, customer satisfaction is shown to positively relate to consumers' overall trust in a business. [4]

The study of Connolly R. and Bannister F. provides evidence that consumers' trust in Internet shopping is the result of specific factors, the first of which relates to the vendor's perceived integrity (social antecedents of trust), and the second of which relates to the vendor's perceived competence (the technical antecedents of trust). Both of these factors are within the control of the online vendor. An online vendor can convey a perception of integrity by providing clearly defined terms and conditions regarding transactions and by providing customers with guarantees that their rights are protected. By providing a

web interface that is easy to use, reliable and secure, it is possible for the online vendor to convey a perception of competence. [3]

A research conducted by Hoffman, D., Novak T., Peralta M. reveals that this lack of trust that consumer feel, arises from perceived lack of control over the access others have to their personal information during the online purchasing process. [6]

In a research conducted by Mukherjee and Nath (2003) perceive trust as a driver of customer relationship commitment. They demonstrate that trust has a significant positive influence on relationship commitment. [11]

It is very difficult to convince the online visitors that the online store is trustworthy and assure them that that the online entrepreneur has good intentions. It takes a long period to build credibility and trust, but unfortunately just a few seconds to destroy it. Hoffman et. all concluded in their paper that consumers simply do not trust most web providers enough to engage in "relationship exchanges" involving money and personal information with them. [5]

2. The role of trust in online business

The virtual market changes the power structure of the participants. Online market allows customers to compare products and prices without any big effort. Online stores should provide high quality products at lower prices than in offline stores. Customer can by just one click to move to the competition. Often the reason for not buying online is not the price of the products, but the lack of services for the customer. Because of the lack of communication between client and vendor, the confidence in electronic commerce is still low.

Srinivasan (2004) identified several factors that significantly contribute for enhancing transaction trust for consumers. This factors are: easy access to description of products and services; ease of placing orders; order confirmation; order tracking and post-sales service. All of these factors are centralized around overall customer satisfaction when dealing with an e-business [14].

Consumer behavior in the virtual environment is not completely different from the behavior of the physical environment. The virtual medium has a disadvantage which online stores managers must know how to face it. In general, customers need confidence to buy, but to gain consumer

confidence online is more difficult than offline, because electronic commerce means having no contact with the store staff and not touching the products which a customer wants to buy. Therefore, customers want to know as much as possible about a product and about its features. Detailed product descriptions and images posted on the stores` website will help customers buying online. By offering this information, customers level of trust in the online store will grow. Rowley (2000) also recognized the need for online companies to generate trust so that consumers may develop purchasing processes on the websites. [13]

The online store`s reputation contributes directly to gaining customer confidence. A well-known store will be more successful in obtaining the trust of new customers. New, unknown stores can poorly convince visitors, because people often doubt that the online shop is a trustworthy one. People are influenced by what they hear. If they hear repeatedly about the unfair business practices conducted on the Internet, their perception of electronic commerce will be strongly influenced.

Customers are searching on the internet for certain products, but often they interrupt the process of purchasing online because they do not find the product they are looking for, whether the price is too high. However, the main reason for deciding not to continue a purchase is the lack of confidence.

Generally, because of the lack of trust in online stores, customers prefer to pay only when the goods are delivered. This payment method offers him the certitude that he gets the products he has ordered. Not everyone wants to pay online by card, because they fear fraud. The vast majority of Romanian online shops accept cash payment. This is a secure method for buyers. They fear that the personal data they provide may be transferred to others or that their products will not be delivered and the money will not be returned.

Late deliveries, extra delivery costs which are not listed on the site, or untrue information about products affect the trust consumers have in online shops.

It should be noted that most buyers react to opinions of other shoppers. A dissatisfied customer who has encountered a problem

when buying online will tell at least ten other people, which also will inform further persons.

It is worthy of mention that for trusting an online store, a person must have confidence in the technology itself and generally in the virtual environment. A study conducted by Martínez-López and Montoro-Ríos aimed to demonstrate that consumer trust in the Internet as a shopping medium is affected by the overall opinion that consumers have about this medium in general. [10] Lee and Turban (2001) also note that trust in shopping through the Internet is a bidimensional construct formed by trust in the online businesses and trust in the Internet as a purchasing medium. [8]

3. Managerial implications

Especially when doing business on the Internet, customer confidence is very important. An online store must succeed in convincing consumers that is trustworthy, reliable and safe. Traditional mechanisms of building trust and eye contact disappear online. According to Koufaris, trust in the company is an important determinant of customer retention and intention to buy. [7]

One method by which online stores can gain the trust of its customers is posting on the website the real price of their marketed products. They should clearly indicate whether the price listed there is the final price, or if the price will be increased due to delivery charges or other fees. If other charges should occur, the total amount must be indicated precisely.

Trust depends also on how much do managers invest in promoting their online store. There are a lot of ways to promote a website. The most used is submitting the website to search engines. Lack of confidence is due also to lack of promotion of electronic commerce.

When creating their website, online entrepreneurs should remember that they have to create customer confidence and a positive impression at first sight. A visitor takes some seconds to decide about the seriousness of the store when browsing the website. Customers feel whether they can trust or not the company that manages that website. The quality of a website is determined by the degree of usability of the site. Thus, a high quality website means for consumers to find easily information they seek. Consumers are also demanding for a simple ordering process. A good website means an attractive web design, functional pages, but also

minimizing loading times of pages. The website is a reflection of all store activities. Therefore, all site content must be updated regularly. Koufaris stated that if customers find a company's web site easy to use and useful, they will perceive the company as being more trustworthy. The effect is significant even after the first customer visit to the web site. Lohse and Spiller (1998) suggest that improving the browsing and navigation capabilities of stores and especially product lists can generate significantly higher traffic and sales per store. Larger stores attract more traffic, but this traffic does not necessarily mean higher sales. One reason for this outcome is that consumers may not find the products they are looking for in larger stores. [9]

Customers feel attracted to an online store and gain confidence when they have the feeling of purchasing online superior quality products. The consumer can not see and touch the product he wants to buy before it gets delivered, and therefore the fear exists, that the product is not like he desires. A large description of the product, including pictures, or even descriptive videos will always help deciding to make the purchase.

A website which contains clear information about products may be similar to a traditional store, where the visitor can be advised by the responsible person. Visitors can be advised also in an online store, using telephone, e-mail or chat. When a online store offers the possibility to use chat, the visitors know that their queries will be answered immediately by the one responsible for the customer support. If a customer needs additional information about products or he wants to place an order using e-mail, the response he receives must be prompt and conclusive. If a customer requests a response to a question, it must come within 24 hours. Placed orders must be confirmed immediately. The speed of the reply will be seen as an indicator of how important the individual customer is for the company.

Confidentiality is very important in running their businesses on the Internet. Information that vendors receive from customers has to be kept confidential and protected from unauthorized access. Online

shoppers care a lot about their privacy. To reduce suspicion and to be closer to the customer, every online store should inform the shoppers on site that the company respects their personal data. If the online store collects confidential information from its customers, then an SSL Certificate (secure sockets layer) is vital. The information is transmitted through an encrypted link so that the data cannot be stolen. When building a website, the company's Terms of Sale and Return Policies should not be forgotten. Lohse and Spiller (1998) believe that stores having a „Frequently Asked Question – section“ generate more visits per month, compared to those stores without this section. [9] In addition, some online shops provide a statement of ethics. It is very important that a company provides contact information (company name, e-mail address, telephone number).

Gaining customer confidence means to induce a feeling of safety to online visitors. Companies that are able to obtain customer confidence will have nothing to lose, they will only benefit. Managers must take appropriate measures for building trust and to change negative point of views about online stores. They should strive to transform potential customers into actual customers.

An online store will never reach the desired level of sales until it gains the trust of its consumers. Building confidence is the key of succes in electronic commerce. Therefore, any online retailer should strive to achieve this goal.

georgiasima@yahoo.com

Barsan Simona-Clara
Research Institute for Analytical Instrumentation Cluj-Napoca
simonaclara_barsan@yahoo.com

Abstract

The article deals with the analysis of the main variables that significantly influence the competitive positioning of the companies and their evolution, emphasizing the strong connections among management, environment and performances.

This analysis is based on a research carried out on 614 Romanian SMEs, within one of the authors' doctoral program and is targeting to offer new perspectives over the factors that affect the enterprises behaviour and what are some of the options that the present managers can apply in a more and more dynamic environment in order to meet appropriately the stakeholders expectations.

Key words: SME, management system, crisis

JEL classification: M10

1. Introduction

SMEs are important for Europe. These enterprises account for a significant amount of European work experience and economic activity. Furthermore, SMEs make an important contribution to the dynamism and innovative performance of an economy, thus enhancing economic growth especially in the medium and long term.

Romanian government should confer great importance to SMEs, since they represent the base for developing a dynamic economy at a competitive level. European Union (EU) experience shows that SMEs have an important contribution to GDP growth, increasing employment opportunities and boost exports. SMEs have the ability to respond in a very flexible manner to market challenges, adapt quickly to cyclical and structural changes of the

global economy.

The SME sector can thus enhance the well-developed macro-economic stability and growth.

2. General overview

The EU economy counts over 20 million enterprises, over 99% of which are SMEs. Within the SME sector, the vast majority (92%) are micro enterprises, having less than 10 occupied persons. The typical European firm is a micro firm. With the exception of Liechtenstein, the situation is the same for all EU partner countries [1].

In Romania the number of SMEs situates a little over a half a million which is below EU average. In terms of weight and proportions, the figures vary is not importantly significant: 90.38% are micro enterprises, 7.71% are small, 1.59% are medium sized and only 1931, respectively 0.31% are large companies.

In February 2009, there were 600 000 SMEs in Romania, but 100 000 SMEs went bankrupt in the first half, most businesses facing sales decrease between 21% and 50%. In Romania, 90 000 firms appear each year, while 40 000 go bankrupt. Currently, the difficult economic situation has increased the number of bankruptcies (30-40%) and for 2010 is forecast at a rate of 15-20% compared to 2009. Among the measures companies have taken to reduce the impact of economic crisis: 36% have reduced administrative costs, 19% have reduced the number of employees and 9% lowered the income of their employees.

Underdeveloped entrepreneurial base is a serious problem for the country's economic development, especially within the underdeveloped areas. Many SMEs end their

economic activity in the first year of its establishment, particularly because the lack of financial support, business support services, entrepreneurial skills and limited work experience and lack of information on market demands.

SMEs have a lower productivity than large enterprises, as follows from the fact that SMEs contribute a lower share to value added (58%) than to employment (67%). Productivity is lowest in micro enterprises. They (micro enterprises in particular), also present lower profitability and smaller employee compensation than large enterprises.

At the same time, micro enterprises appear to have a propensity to invest that is significantly above the average of the economy (23 % versus 18 % for large firms in terms of value added). This phenomenon is not yet clearly understood (data on this became available only recently) and should be further investigated. However, it could point at a high knowledge intensity of micro firms accompanied by a high level of investments, a higher tendency to absorb uncertainties in the market through new investments, a rejuvenation of business affecting the production function of industry in the way of "creative reconstruction". All these explanations suggest a significant contribution of micro-enterprises in the dynamic EU economy.

As SMEs are more dependent on external sources of funding, it is clear that the current financial crisis has a strong impact on them. Traders face greater problems than in previous years: difficulties in obtaining credit and a large number of taxes. Analysis made on the needs of SMEs have showed there are huge difficulties in accessing credit from commercial banks and repayment, since those are reluctant to according loans to start-ups that present high associated risk, very stringent warranties being requested.

In a globalizing economy, where large incumbent firms are able to outsource and offshore production and employment to lower cost locations, SMEs are an important source of employment.

At the macroeconomic level, there has been noted the need for the industry to re-become the heart of European recovery, highlighting the role of SMEs. On what kind of scenarios will this "New Deal" industry be based on? First, on a regulatory framework and incentives to encourage innovation, simplifying the access to financial resources and developing the "Key

Enabling Economy." Innovation requires reordering and improvement, understood as a growth of government efficiency. The fight and sensitivity of Europe with regard to late payments of loans that SMEs claim to the government are well known. It also required a new policy to promote trade with foreign partners (China for example), so that European companies will be able to export know-how rather than passively suffer the reverse process. To restart the economy, tourism needs to be also restarted, so that it becomes a handy tool for providing income. Location is also fundamental to industrial economic system development.

In addition, SMEs serve as a key mechanism facilitating knowledge spill-over from the organization where knowledge is created to the organization where it is actually implemented and commercialized. The contribution of SMEs to facilitating spill-over is confirmed by a wide set of studies finding an empirical link between various measures reflecting entrepreneurial activity and economic growth.

Globalization forces Europe to focus on finding a way to create better opportunities for companies to establish new collaborative environments including the competitors, having as objective building strategies for environmental security, social responsibility and marketing strategies connected to and for the consumer, led by strong technological integration, using ICT tools and the approach focusing on individual progress, in order to respond to the intensive progress of countries like China, India or Brazil. Collaborative environments that use ICT tools [3], but are focused on individuals, will allow better use of opportunities offered by global markets. Furthermore, instead of considering the global powers as a threat, European companies should take advantage of them and create innovative products or services.

With the development of innovative inter-firm collaboration, Research and Development activities imply the process of attracting innovative SMEs, universities, public administration and so on. Promoting innovation is a priority of the new Regional Development Programs of the European Union. Framework Program 7 (FP7) contains the incentives for innovation and has as one of the objective and that in 2020,

collaborative work environments will offer ubiquitous hardware and software infrastructure made out of resources providing a new range of oriented activities, software flexible services depending on the context, supporting models of human interaction, human robot interaction and the collaborative devices, which all interact in a dynamic and proactive [3].

Promoting entrepreneurship, quality assurance and quality management in the SME sector, represent areas that especially require the development and implementation of evaluation systems and procedures, management and quality assurance business activities, as well as the professionalization of management.

3. Management system analysis

Business activity takes place in a strong uncertainty and risk. This means that companies no longer can be programmed to work in conditions of certainty for the activity is influenced by many unmanageable factors. The solution is to pertain to *planning* as a compromise between the needs and knowledge possibilities and should always be supported and completed by research and studies. Crisis Management acquires new dimensions to the strategic and operational level. In what *forecasting* function is concerned, processing priorities or successions, regardless of field, become essential. They have superior value to plans specific timeframes or activity program. Transition, from strategic planning to strategic vision is compulsory. Thus, strategic planning is based on a realistic assessment of what can be done within the organization and on detailed planning of strategy implementation. In this respect, the strategy contains many details, as a guarantee of achieving it. Hierarchical strategy undermines competitiveness and leads to demobilization of a large number of employees who no longer recognize their goals within those of the organization. They no longer actively, consistently involve themselves in achieving those objectives. Strategic vision, in exchange, requires management to set a number of goals for the organization and create networks to build necessary competencies, but leaves the decision on how to actually achieve/obtain those to the various organizational levels within the organization.

It can be seen that strategic vision transfers management goals to operational levels, using

the most appropriate ways and not through successive derivation.

In what the *global strategies* [8] are concerned, only 70% of businesses actually have global strategy formulated, but not necessarily in a scientific way. In what process components, as well as at organizational level, partial strategies are formulated (30%). Regarding the *objectives* set, most of the companies aim to maintaining their present level and as specific objective, the first place is occupied by increasing sales volume (77%).

In what the *methodological system* is concerned, even though partially, companies use methods and management techniques. Far more important is the fact that those are used in a very small professional manner. Available resources should be harmonized with the objectives, so as to achieve maximum possible business efficiency. Delegation should be promoted and the "descent" of managerial actions and all functions at the level of operational centers and direct executants. In summary, decentralization is recommended as a way of strengthening the top management.

In what *organization function* is concerned, it is necessary to define and redistribute tasks at all levels. The old hierarchical organizational structure, with a large number of levels, is flattening. In multilevel hierarchical structures, problems are solved sequentially; top-level decisions pass through all management levels, to reach to the subject of decision. Management with many hierarchical levels does not ensure effective control by the top management regarding the circumstances in which changes are happening at the bottom levels. The time in which orders are transmitted and reports on their implementing effect are received is relatively long, in the same way as the length of change is larger than the responses to change.

In what *research and development*

function is concerned, design activities, as well as those of management organization, labor and production, are poorly covered by procedures. *Marketing activity* is conducted largely empirical; however it contributes to deliver superior results in 38% of the cases. *Supply and distribution*, respectively the calculation of raw materials needs and signed contracts for selling the finished production, are mostly based on orders rather than on forecasts of potential contracts signed without preliminary order. *Production* is only 37.5% fully regulated by procedures and its cost is determined by expenditure and revenue (43.4%), the existence of a profit (23.8%), norms of production (8%), market dynamics (7%) or the nature of the product (17.8%). *Financial function* shows that: 67% of the companies had hand over their balance in 2009 and intends to do the same in 2010, taxes are determined in accordance with tax laws in 34% of cases, security of assets is provided at a rate of 56 %, the system of financial records is mostly electronic and data are communicated to managers under the form of reports and briefings.

Coordination imposes the strengthening of horizontal linkages among departments of same type or those with convergent goals. The preparation of management decisions should be initiated at the lower levels, since decisions' quality is determined by the degree of vertical coordination.

Involving and motivation, as management function is carried out based on priorities set by forecasting function. Long-term forecasts, regarding strategies and policies, usually on shorter periods of 2-3 years are less formalized, their establishment involving fewer people. In developing annual forecasts it is observed a broadening circle of decision, including employees. Motivation is essential and requires the use of leverage and adequate means of stimulating the personnel. Factors that have proved to be most effective are: attribution of responsibility, delegation of authority, salary, supporting employee to developing a career, ambition, allowing employees to build a reputation, the degree of safety ensures by the company, company policy framework, rewards, adapting working programs to employees' interests, rational use of geographical factors.

At control function level, management processes are under the impact of TQM methodology [2]. Total quality is a goal, an

objective which must mobilize all elements of the unit. Total quality is an organization approach, an effective propinquity to professionalism and success. It refers not only to a product or certain products, but to the entire activity of an organization, to what it can or should do to crucially influence not only clients' opinion, intermediaries or end beneficiaries, but also its entire reputation.

As regards to *information system*, it is necessary to facilitate the movement of information from and to hierarchical interested levels so as they function effectively, the implementation a system able to remove interference from the communication channels, avoiding overcrowding persons with some unnecessary information, information that does nothing else but occupy their time and to diminish work efficiency. Furthermore, the computerized system within enterprises should be encouraged, so that it can ensure communication and storage of essential items.

SMEs *human resources* development must be sustained (managerial and operational) in order to adapt them to structural changes within the labor market and Romania's strategic priorities to achieve progressively the medium level of development from EU Member States, with stress on managerial skills development, quality management, human resources and assistance on human resources development (development of human resources strategies, training needs evaluation, training plans, exchange of best practices in human resource development).

4. Conclusions

Within the economic crisis context it is necessary to rethink the management process and in particular the introduction of changes in managerial functions. At the basis of all the steps lies the innovation process. Edmund Phelps [6] stated that "innovation is one of the things we can do to reactivate economic activity level. Confidence in innovation and change is also suggestive expressed by famous scientist Albert Einstein [9] who says: "do not pretend that things would change if we do the same thing

all the time."

Within this paper we have presented a global perspective of the strengths and weaknesses from a large part of companies from Romania, information that could represent the starting point in designing clear strategies, able to offer the necessary answers for the challenges that the managers have to cope with during the crisis period.

Abstract

In the context of the knowledge based economy, more and more organizations discover again the unexhausted force of human resources as the active, creative and innovational factor of modern society. The powerful development of the information and communication technology has favored and imposed some substantial modification in the nature and contents of work process, new professions and qualifications emerging because of it, which have as their most essential attribute the process of thinking and creation, the knowledge and intelligence. At the same time, the new mutations manifested on the labor/work market under the impact of markets' globalization and activities' internationalization, of continuous and rapid changes taking places in all domains of activity generate profound transformations in the professional carriers, accentuating the necessity of an efficient management of this essential component of human resources management. Consequently, many organizations are preoccupied to develop attractive carrier plans that will contribute to bring into relief the entire professional potential of a person, concomitantly with achievement of each individual's desires and aspirations in the domain of carrier.

Key words: career, knowledge based economy, motivation

JEL classification: D 83

1. Career – an important aspect of human life

Though at first hand, the term *career* seems simple and understandable to everyone, but it is actually a complex concept in which many famous human resources management specialists were interested. This derives from the fact it is oriented on the human being, the organization's most dynamic and valuable resource.

If, from a person's point of view, the career consists of an accumulation of opportunities or better jobs that are better remunerated, from the managerial perspective it represents a succession of functions, in the ascending order of prestige, the employee occupies successively, following a predictable rule [1]. Being an important part of a human's life, the carrier signifies in fact the evolution of a man from social an professional points of view, including an assembly of professional activities and positions, attitudes, knowledge, specific competences accumulated and developed in time.

Evolution, the movement in time of a person along the road of his professional career, is approached from two perspectives:

- As an objective succession of positions in a hierarchy together with the associated functions, which targets the personal development and the promotion opportunities, signifying in fact the *objective aspect of career*;

- As a dynamic framework in which an individual perceives his life as a whole and is able to interpret the signification of his different personal qualities, actions and things that happened to him, representing the *subjective aspect of career*.

The career is a permanent fight of a human for achievement of his personal objectives, who is developing and evolving by the close interaction between existent knowledge and aptitudes, on one hand, and the person's desire to improve himself, on the other hand. Since career is manifested only within organizations, it is a consequence of the interaction happening between individual and organizational factors, existent aptitudes, desire for professional success and the work experience gained in the organization.

2. A person's attitude towards career

In general, each person has his own career plans, and the organizations must supply various alternatives and opportunities for the achievement of those, as well as the most appropriate ways to bring into relief his professional potential, to stimulate permanently his creative/ innovative ability, in strong concordance with his individual desires and aspirations. It is obvious the employees' attitude towards career influence, in a considerable degree, their attitude towards the organization. The efficient organizations are, actually, the cumulus of a number of individual successful careers.

A person's attitude versus his career follows three aspects [2]:

- Motivation of career;
- Involvement in career;
- Orientation in career.

Motivation of the career is meant to explain many of the human beings' behaviors in the domain of career: choosing a domain of activity and an organization, searching and accepting a profession, deciding to stay in a certain organization, updating the career plans and the individual efforts made for the achievement of the personal goals etc.

The motivation of career is a resultant of three dimensions, more explicitly: *the career's identity, discernment and elasticity*.

The identity explains the relation between a career and a person and includes two important components:

- The manner in which individuals perceive their life in report with the time, solving by themselves the problems they are confronted with in the present, as a natural consequence of the experiences accumulate in the past;

- In what measures the employees are aware of the future perspectives and act in order to achieve their own interests, aspirations and systems of value.

The discernment (judgment) expresses the degree of realism of the perception individuals have in regard to the career choice they had made. Thus, the persons having a positive perception and attitude regarding their career are, in general, well integrated in the organization, get involve 100% in the activities and tasks specific for the position occupied, they attain superior performances in the activity developed by them and this fact, obviously, generates positive effects on the organization's efficiency.

The elasticity of career is an urgent necessity in present times, when change is the dominant characteristic of all socio-economic systems and professions constantly disappear and other new ones appear that require knowledge, skills and qualifications compatible with the technological improvements brought to work's nature and inner structure. In regard to this aspect, M. Armstrong [3] points out the dominant of career management, of the career's perspectives is given by the stress put on promoting flexible career, by the reduction of the intermediary, bureaucratic structures, by the construction of multifunctional structures, enriching in this way the employees' experience and improving at the same time their aptitudes, competences, knowledge, and abilities corresponding to the new demands. As a consequence a new, modern concept has appeared– „portfolio of careers”; this expresses exactly the professional and occupational mobility and flexibility and replaces the term „life career”.

To have an elastic means being able to anticipate problems, to overpass failures and

to find always the resources necessary for ascent in the career.

Involvement in the career is manifested by the involvement shown at work, the premise being that only the attainment of high performances guarantees the managers' positive appreciation, the respect of other colleagues, collaborators and subordinates, in not so many words the professional success. The degree of involvement of these persons increases considerably when their expectations are met by favorable answers on behalf of the organization, and they succeed to achieve the aspirations and objectives in the plan of career.

Specific orientation means „the tendency to monitor a progress in career by means that are not based on performance”[4]. It is characteristic especially for the youngsters, who take more easily the decisions concerning mobility and change of employer/organization, due to their desire to gain higher wages and to have more chances to be promoted.

Orientation in career is a scheme, a model or pattern of talents, values, attitudes, activities, occupational behaviors projected by an individual within a professional activity [5]. It implies the existence of the next elements:

- *The individual's intrinsic characteristics:* talents, capacities, needs, values, motivation, attitudes, preferences etc.;

- *The professional environment:* responsibilities, rewards, exigencies, opportunities, constraints etc.;

- *The individual's behaviors and attitudes:* performance and adaptability, competence, satisfaction, interest manifested for the work station and the organization, decision to stay and to be promoted in an organization etc.

Therefore, the career orientation is a conscious and complex process of research, documentation and gathering information for using optimally the personal potential and abilities. The person in case must, permanently, evaluate himself from the perspective of at least three aspects: *Who is he? Where is he? and Where he wants to arrive?*. Those are questions that must guide a person's career, since success is directly proportional with personal abilities and the capitalization on the professional skills and potential.

By knowing the elements that influence a person's attitude towards career, the

organizations must identify the most adequate ways to increase the employees' fidelity and to avoid the departure of the valuable employees, who must be motivated and stimulated along their professional ascent.

3. The career in the knowledge based economy

Within the society based on knowledge and information, the human resources become more and more important and complex, and a person's life and his evolution is based now on intelligence and knowledge. Man is the organizations' major asset in the present, their main competitive advantage, and investment in human capital clearly becomes a necessity and a condition for survival and lasting development in the new competitive context. Referring to this, Tick Chan appreciates that “the new competitive advantage and the new barrier for the 21st century's organizations is represented by the human resources' knowledge and information”[6].

Modern society generates deep transformations of structure and contents in the human existence, in the work's nature and structure, in the personal and interpersonal relationships, in the intra și inter-organizational relations. At organizational level, changes of the work stations appear and they are materialized in such aspects [7]:

- Creativity, innovation and knowledge represent the essence of the work processes at all organizational levels;

- Work teams are the defining element of all work processes;

- New types of work emerge on the market (telework, munca la domiciliu etc);

- The increasing role of partnership and dialogue, which determines the jobs' preconditions in the organizational environment.

So, the individual must develop his capacity to deal with the new challenges generated by the changes occurred, because they determine significant changes in the occupational structures, by gaining and

developing some superior abilities, corresponding to the new forms of work. These facts bring in transformations and modifications in the essence of careers, since they represent a „route” of human knowledge, behaviors and actions along his existence, and this is the natural consequence of the development of mankind.

The impact of the knowledge based economy on career is manifested specifically by:

- *The emergence of new conditions in which the organizations function*, leading to: an increase of competitiveness and competition and of the degree of adaptability to the new realities; a new manner of organizing work and employees; the reduction of the number of employees, departments and hierarchic levels, concomitantly with the simplification of the organizational relation; the promoting of cooperation relations, detrimental to those based on authority and subordination; a growth in the management’s transparency and flexibility; the exhaustion of the personnel, especially the managers etc.;

- *The externalization of some activities*, which generates various and contradictory reactions from the employees or those making them;

- *The adoption of new employment criteria*, such as: a person’s competences and values in report with the organization, his loyalty to the organization, his performance etc. those criteria must be in close concordance with the new forms of organizing work: work at home, work network, multifunctional operative teams, part-time jobs etc.

- *The new attitudes and behaviors of the employees* towards some negative events that occurred in the life of the organization, especially after massive layoffs, which provoke feelings of regret or rebellion, noninvolvement, lack of interest, but also a decrease of creativity and innovative spirit etc.

The influences exerted by the information and knowledge based society impose the necessity to *approach professional career in a new manner*, which has the following main characteristics:

- a) *Replacing stability and continuity of professional careers with their mobility, dynamic and flexibility* [8]. The stability of a job is already a past aspect. Nowadays, individuals must be „employable”, meaning they have to have the knowledge, abilities and professional

reputation requires at a certain time;

- b) *The increased presence of a complex and variable career trajectory*, detrimental to the ascending organizational line;

- c) *The enhanced preoccupations related to the perspective of a career*, to its evolutionary analysis, making necessary the permanent analysis and evaluation of career in the present days.

- d) The transition from the pattern of a career management administrated by the organization to the *model of a flexible and dynamic career, built through the direct involvement of each individual*, which concretely means the transfer of the career management from the organization to the employee, the later one taking on the commitment to develop his career.

- e) *The interdependency of career*, which signifies making simultaneous actions, specific for the double or no limits career, that offer to the individual multiple possibilities to optimally capitalize on the skills, abilities and experiences accumulated. It is a phenomenon characteristic to the present period, when the stress is put on finding the most adequate means for increasing the creativity of the personnel.

The complex processes characterizing modern society, under the impact of knowledge and information based society, have a direct impact on professional career, thus the persons must be more and more preoccupied to achieve multidisciplinary and multi-professional education.

4. Conclusions

These days, when knowledge and information rules the human existence, when the world undergoes a continuous process of change, a modern vision on the career is necessary, in consensus with the exigencies imposed by the new conditions in which the organizations function. The progresses registered in the domain of science and techniques, applying on large scale the technology of information and communication, and the emergence of the intelligent organizations based on knowledge have determined structural modifications of

the business environment, in the work's structure and styles of work, generating a unprecedented dynamism of the contemporary professions and occupations.

Both at the level of the organizations and at global, national or world level, the human resources' creativity, abilities and spirit of commitment represent the essential element of the competitiveness. Within the global competition of computerized economy, the quality and inventiveness of the human resources will be the only ones able to differentiate each society's contribution in the context of global knowledge based economy [9].

All those provoke the career's upgrading, its permanent adaptation to the new transformations and the adaptation of strategies that can anticipate new situations, but also the affirmation of possible professions and their dynamic, able to keep under control the eventual mutations, twists and turning points in career, being promoted the flexible careers on large scale.

In the conditions in which the work market is confused by the effects of the global economic crisis, each individual has to consider his professional future as a patrimony and, in consequence, has to be concerned with an efficient career management.

The Swot Analysis Of The Rural Tourism In The South- Eastern Romania

Spătariu Elena Cerasela , Trandafir Raluca Andreea, Lazar Cristina Mihaela
Ovidius University, Constantza
cgrozea@yahoo.com

Abstract

The rural tourism is characterized by a slow, but sure development, being a keeper of the traditions, customs, natural landscape and folklore. The basis of this form of tourism is represented by the existence and maintenance of the rural areas' functionality, the preservation of the traditional life-style, of the specific cultural identity and of the rural infrastructure.

This paper focuses on the specific aspects of this form of tourism in the south-east region of our country, eventually making a SWOT analysis on it.

Key words: rural tourism, analysis, region

JEL classification: P25

1. Introduction

Tourism, along with other sectors of the economy can become an important component of the national economy, which may lead to important changes in the territorial area and may be a main factor in the creation of the regional identity.

Studying the aspects regarding the rural tourism on areas of interest, with their potential, leads to the increase of knowledge of the regions and contributes to the creation of an image about their development possibilities.

The tourism field may become a main driver for achieving the intra- and interregional convergence, by increasing the incomes of the less favoured communities and areas, due to the high valuing of the specific potential of these areas (historical, cultural and natural objectives, romanian traditions and customs, a specific life-style, etc). That is why the rural tourism may

represent an alternative element for the national tourism forms.

The experience of certain countries such as Spain, Portugal, Greece and Ireland prove the contribution of the rural tourism to the development of the poor countries and the prosperity insurance of of the less favoured communities. It is true that the concern of the central and local authorities for preserving, developing and exploiting the opportunities offered by this type of touristic activities, has contributed to the attraction of a growing number of tourists in these countries annually and, therefore, to the development of the adjacent services of the field. The latest estimations of the WTO reveal an annually tendency to increase of the tourists' interest for the alternative forms of tourism, which would bring them closer to nature, to discovering the authentic cultural values, to a more relaxed and healthy lifestyle.

Specifically for the european economies, tourism delivers an essential contribution to the integration process. The intensity of the mutual touristic flows stimulates the mutual knowledge, creates the sense of belonging to a common values area, contributes to the development of the european identity and, through all these elements, it contributes to the shaping of the european citizenship. Through the high degree of internationalizing the production, tourism contributes to the amplification of the changes between communities and to the integration of the european markets. Therefore, the EU efforts to promote tourism on external markets maintain the image of a unit of cultural heritage, as a key element of the European unity.

In this context, Romania benefits from certain comparative and competitive advantages in relation to the countries near it. These advantages are being offered by the variety of

the landforms, but also by the number of archeological, historical, cultural touristic objectives and by the number of traditions and customs, which are well preserved, especially in the rural area.

The intensity of the rural tourism, as a mass phenomenon, has increased in the last years and is considered to be a true alternative of spending the spare time. The reason for the rural tourism development is represented by the farmers' awareness for the necessity of diversification of the activities within the farm, but also outside it, through their engagement in forestry, tourism, or by using certain activities determined in time, within the local economy.

A number of official documents released by international organizations- the most representative being *Romania Tourism Report*, published by World Travel Organization in 2006, highlighted the huge potential which tourism has in Romania, particularly in fields less exploited internationally (rural, cultural, hunting tourism).

At the end of 2007, launched the Romanian National Tourism Master Plan for 2007-2026. This document reproduces some of the conclusions from the report published by the WTO and outlines a development strategy of the products and of the touristic understructure for the next 20 years.

The various regions of the country, together with a large, geographical framework: mountains, hills, planes, lakes, the Danube Delta, the Black Sea, etc, focus real treasures of culture, sometimes of universal interest and represent all the motivations for tourism.

The cultural heritage of our country is an invaluable resource for the sustainable cultural, economical and social development, especially through an innovative approach to the rural tourism, in the spirit of the International Cultural Tourism **Charta** (ICOMOS, 1999).

2. The Characterization of the south- east region of Romania

This paper aims to undertake a brief analysis of the characteristics of the rural tourism in the south- eastern Romania.

The rural tourism is based on three coordinates:

- Space, which represents the support for coexistence ;

- People, who represent the activities' motor ;
- Products, which represent the object of the toutistic consumption .

The rural residents must be the ones to be engaged in this type of tourism, but it is necessary that the traditional hospitality of the peasant to be doubled by specific knowledge regarding the tourism activity. Rural tourism involves staying in the village and spending time in the countryside and to various touristic attractions.

The rural tourism can not be separated from the place where it is practiced, that is the touristic village, which must accomplish certain conditions: the natural landscape with reduced pollution, the presence of human objectives, cultural and folk traditions , traditional habits, access understructure, accomodation, food and entertainment services. By valuing certain resources of high touristic attraction, we can create a specific typology of the touristic villages: historical, fishing, viticultural and fruit-growing villages.

For the development of the rural tourism, a strong relationship must exist between the hosts and the local and central administrations, in order to insure the success of this form of tourism.

The South- Easter region is the second largest of the eight Romanian Regions, comprising 15% of the total area of 35.762 km² and with a population of 2.846.379 residents, representing 13,1 % of the country's population, from which 55,5% of them live in the urban area and the rest of 44,5 %, in the rural area. It is bounded on the North by the North- East Region, on the West by the central Region, on the South- West by the Regions of South Muntenia and Bucharest- Ilfov, on the South by Bulgaria and on the East by the Republic of Moldavia, Ukraine and the Black Sea.

On this region, there are places almost all the landforms: the Danube flood plain, the Baragan plain, the Dobrudja Plateau with the Macin Mountains, on the North- West area there is a part of the Carpathians and of the Curvature Sub- Carpathians, it is drained by the Danube, including the Danube Delta and it is bordered on the East by the Black Sea.

The presence of the various landforms make this area attractive for the tourism.

The various ethnic structure in the region may be considered a key- point for the development of the rural tourism and may be presented as follows:

- from ethny (1,7 %);
- the lipovan russian community (0,9%) – concentrated in Tulcea county, representing 16.350 persons from 25.464 persons in the region;
- the greek community (0,1%);
- the turkish community (1%) – concentrated in Constantza county, representing 27.914 persons in this county from 32.098 persons in the region;
- the tatar community, quite large, concentrated in Constantza county, where there are registered 23.230 persons of 23.935 persons in the country.

The tourism products require the existence of objectives of human, cultural and folk traditions, traditional habits, accommodation and food services specific to this region.

At the region's level, there have been identifies several areas that represent different elements of attractiveness to potential customers in rural tourism, as follows:

- Baragan plain area is characterized by the presence of climatic resorts that are situated near lakes with curative properties (the Salt Lake, Amara Lake) near numerous recreational resources (hunting and fishing), in the Smalland Large Island of Braila.
- The Northern Dobrudja area, which includes the Danube Delta reservation and the National Park-Macinului Mountains, where rare species of flora and fauna can be met. The predominant economic activities are focused on the exploitation of natural resources and the tourism; the attractiveness elements being given by the forestry potential, by the diversity and unique biotypes, the historical and religious monuments (monasteries: Celic-Dere, Cocos-Niculitel, Saon and the paleo-christian Basilica situated in the

village of Niculitel, Italian- roman fortresses, and byzantine fortresses: Troesmis, Arrubium, Dinogetia, Novio donum, Halmyris, Arganum, Enisala)

- The Dobrudja South- East area is characterized by the Romanian Black Sea coast which gives it a high degree of touristic attraction, a special spa background (Techirgiol Lake, Eforie North)
- The mountain area in Vrancea and Buzau presents touristic interest through Soveja and Lepsa resorts, and unique tourism areas in the country, such as Mud Vucanoes, Bozioru caves, The Living Fires.

3. The SWOT analysis of the rural tourism in the South East region

To determine the development potential of the rural tourism in the region we have made an analysis that highlights strengths, weaknesses, opportunities and threats as follows:

1. Strengths:

- The variety of landforms with typical continental;
- sludge treatment (Sărata Monteoru ,Lacul Sărat, Techirgiol);
- the existence of reservations and national parks (the Danube Delta Byosphere Reserve and Măcinului Mountains);
- the number of the touristic villages ;
- the diversity of the flora and fauna;
- the existence of the romanian Black Sea Coast ;
- the diversity of heritage objectives – monasteries, fortresses,
- rural settlements where the traditional lifestyle can be experimented;
- museums and archaeological sites;
- a various ethnic structure with specific traditions and customs;
- the preservation of the traditional crafts;
- a wide range of traditions and folklore festivals;
- culinary traditions of the region;
- the presence of Pan -European transport corridors;
- the presence of the harbours and the airport of an international level capacity ;
- well-developed communication networks- telephone, radio, GSM, satellite;

- available human resources;
- population with language skills, offering a potential human resources in tourism;
- welcoming people with traditional hospitality;
- many qualified and experienced travel agents;

2. Weaknesses

- the environmental and utility understructure is underdeveloped in the rural areas (sewer, gas, waste management) ;
- Rural areas with a high number share of population employes in agriculture and a low profitability of the agricultural activities ;
- The inadequate medical equipment and the small number of doctors in the rural area;
- A poor implementation of the environmental legislation;
- The lack of investments in the development and promotion of the cultural objectives – museums, monuments;
- The lack of a data base regarding festivals and cultural events, which can allow an efficient promotion for the tourists;
- The lack of parking places and sanitary facilities in a great number of touristic objectives;
- The lack of target indicators for the touristic objectives and points of attraction;
- The lack of a tourists information centres network;
- The lack of stimulents and support mechanisms for the investors;
- The failure in the legal problems concerning the lands ownership and the real estate properties, which limit the development;
- The poor use of the computer and internet for information, marketing and reservation;
- The lack of information and of touristic maps;

3. Opportunities

- The financing of the rural tourism development by structural funds within the Social and Economical Cohesion Programme;
- The increasing of the customers' demands for organic products;

- Romania's state, being a member of the European Union;
- The relatively simple and with minimal investments of the rural motels;
- The existence of certain funds for the development of small households;
- The possibility to attract foreign tourists due to the touristic products offered and to small rates;

4. Threats

- The lack of responsiveness of the administrative bodies concerning the rural tourism development in the region;
- The touristic products offered are not being internationally competitive;
- The competition showed by the neighbouring countries within the rural tourism ;
- The environmental quality in certain areas has a negative effect in the rural tourism development ;

The impact of the rural tourism development must be analyzed on three coordinates: the economical impact, the social impact and the environmental impact. Speaking from the experience of the developed countries, in Europe and also in other areas of the world, the development of the touristic activities, no matter which, leads to positive economical effects at the local communities level through the main understructures development, of other adjacent activities and to the complementation of the touristic industry also through creating additional jobs.

The valuing of the rural tourism participates to the regional development wether directly, through the total of the incomes from the touristic consume, due to the growing number of tourists (accomodation, food services, taxes, shopping), or indirectly through the local, bilateral cultural contact and influences, the knowledge of the local economical values and of the eventual business opportunities, the labour employment in the services, the creation of a favourable image, the civilization of the involved userstructure.

From the standpoint of the environmental impact, it is known that the rural tourism activities doesn't raise any particular problems concerning the environment, it even contributes to optimizing the relationship human- nature.

The measures of development on specific tourism forms will lead to the increasing regional tourism competitiveness to the national and international one, and at intra-regional level, tourism can serve as a means of reducing the regional disparities between unequally developed areas.

THE ENTREPRENEUR, THE MARKET CONTEXT, AND THE VENTURE

Authors: Prof. Stoyanova M., MSc, mstoyanova1505@gmail.com
Prof. Stanciulescu G., PhD, gabriela.stanciulescu@com.ase.ro

Abstract

The blending of entrepreneurship, psychology, and marketing research may be beneficial to all disciplines and can assist in comprehending the real essence of doing business. Psychology clearly has a valuable impact on marketing and can have the same effect on understanding entrepreneurial behaviors. Likewise, entrepreneurship can provide an applied test for many psychological and marketing theories, such as in the study of small group behaviors, new product introduction and attention retaining. The unique perspective that entrepreneurship provides is that of highly unstable and unstructured groups in rapidly changing markets whose development is also hard to predict or model in exact numbers. This dynamic environment is an excellent counterpoint to the static and artificial conditions all too frequently encountered in traditional psychological and market research.

Key words: creative opportunism, entrepreneurial networks

JEL classification: M10

1. The Importance of Context

Although it has become increasingly apparent that no simple definition of entrepreneurship is satisfactory [11], it remains clear that the creation of a new venture is a social phenomenon that exists in a market desiring the output of that venture. In fact, it is nearly impossible to define any *entrepreneurial behavior* without at least an indirect reference to the market or social context in which it occurs. Entrepreneurial behaviors are often viewed as most prevalent in unstable socioeconomic environments, where organizations and society are adapting to rapid change [10].

This concept can be traced back to [27] portrayal of the entrepreneur as an agent of "creative destruction" within the market context.

Schumpeter, perhaps the best known twentieth-century student of entrepreneurship, stressed the role of innovation as the distinguishing factor for entrepreneurs. He believed that both managers and entrepreneurs experience risk and held that their challenge is to find and use new ideas. The range of possible alternatives as expressions of these ideas include:

1. Developing new products or services
2. Developing new methods of production
3. Identifying new markets
4. Discovering new sources of supply
5. Developing new organizational forms.

Schumpeter's position was supported later by [19], who felt that the identification of market opportunities is the fundamental function of the entrepreneur. Similar "rule-violating" behaviour of the entrepreneur is also claimed by [18] as a prerequisite for the existence of the entrepreneur and their ventures because otherwise both buyers and sellers play the role of non-decision makers who simply follow the set rules for conducting their daily purchasing/producing activities.

Research writers at the end of 20th century have abandoned the struggle of defining "the entrepreneur." This is because definitions have tended to change as business concepts have evolved and ownership forms have changed which was a very dynamic, transitional process, especially in Eastern Europe, at the turn of the new century. Long [21] argued that the universal aspects of entrepreneurship involve uncertainty and risk, complementary managerial competence, and creative opportunism. Other writers have characterized entrepreneurial behavior as the

pursuit of opportunities for value creation in resource-poor situations. Some propose that entrepreneurial behaviors occur within organizational and market contexts that are resource-tense or strained ([13]; [11]). Still others have emphasized that entrepreneurial behaviors are elicited most frequently when and wherever the socioeconomic and market environments are most congenial [32]. Yet each of these conceptualizations demonstrates that the entrepreneur exists within a complex matrix of social interactions within an even larger context of community, society, and culture [10].

1.1. A contextual model

The image of the highly individualistic entrepreneur fascinates even former communists, as [7] noted in his description of several myths about entrepreneurs and their businesses. In reality, however, even the myth of the individual requires a market environment as the context in which the individual's actions occur. This market context is the "ground" against which the entrepreneur's actions are the "figure." Neither is interpretable without the other and neither exists without the other. A detailed analysis of the social construct/context within which entrepreneurs appear and flourish is available in [26] that focuses on the economic approaches to entrepreneurship from a historical and philosophical perspective.

This social psychological perspective allows access to a rich research literature while providing theoretical linkages among psychology, entrepreneurship, and marketing. Given the perspective of a market context, a simple model of entrepreneurial action has three basic components:

1. The entrepreneur's social context
2. The market context
3. The entrepreneurial process.

Although a number of personality and cognitive variables have at one time or another been implicated in entrepreneurial activity [7], the contextual model focuses on the entrepreneur's external world as a driving force behind the entrepreneurial process. Examples of the entrepreneur's relationships include prescribed roles, role sets, and social

networks.

1.2. Role Theory and the Entrepreneur

Knowledge and enactment of appropriate roles is important for entrepreneurial success as well as understanding consumer behavior in marketing. Roles act as social scripts that dictate how one should act within a given situation or market context [33]. In assuming the role of entrepreneur, people must be able to exhibit behaviors that are associated with this role. The more the entrepreneur fulfills role expectations, the more likely the individual will be to succeed in that venture ([29]; [1]). However, there are also authors who challenge the perception of pre-defined entrepreneur's role and behaviour in given circumstances. As [28] suggests, the "role of the entrepreneur is to create new circumstances rather than to be alert to new opportunities in existing circumstances" and such flexibility is especially important within the new market regulations and relations.

As the markets change, or the venture matures, the *role set* also shifts in order to reflect as fully as possible the shifting positions. To continue successfully, the entrepreneur must adjust to the emerging managerial role by learning new behaviors, such as the delegation of authority, adopting attitudes consistent with the changing role such as becoming a mature, expanding business. Unfortunately, entrepreneurial behaviors that once were adaptive may now interfere with the changed expectations because the changes on the market and the position of the company might happen faster than the evolution of the entrepreneur him/herself. The resulting conflict may contribute even to the downfall of the business venture. On the other hand, successful adaptation to the new role expectations can offer new benefits. One benefit is access to multiple segments of society. These different segments may offer distinct network assets that include access to additional resources, monetary (prestige) rewards, and contributions to personal growth and development. In this regard, social networks will grow to become value-added contacts which will provide a customer-base of loyal consumers.

In their review of a social psychological

perspective of entrepreneurial behaviors, [10] propose that the social context of entrepreneurial behaviors includes specified *role sets*. These are components of larger social relationships to which the entrepreneur belongs by virtue of a particular status within the social network of the local community. For example, the entrepreneur's role set may include family members, venture capitalists, bankers, investors, partners, distributors, and customers. The entrepreneur's behavior is significantly influenced by the social fabric, or market-oriented network of contacts for both reassurance and for economic motives.

The complexity of this matrix is most obvious when members of the role set have conflicting expectations for the entrepreneur who simultaneously might be expected to fulfill a great number of roles. For example, a partner may expect an entrepreneur to work 12 hours a day, seven days a week, during the venture's early development; this expectation is likely to conflict with the role expectations of the entrepreneur's children, wife, and friends, even if they are involved in the venture.

Alternatively, a positive factor in entrepreneurial behaviors is the "density" of the contacts or social linkages in which the entrepreneur is enmeshed. These social contacts include not only direct, first-level relationships but also other contacts to which these first-level individuals belong. The resulting phenomenon is best described as the "strength of weak ties." As [2] have noted, within a framework of complex relationships, entrepreneurial behaviors are facilitated or constrained by linkages. These linkages are connections between the entrepreneur, resources, and market opportunities. Such linkages are continuing social relationships with ever-changing dimensions and valences. The more extensive and complex the relationships, the greater the access to resources and market opportunities. The less dense the framework of relationships, the less the probability of encountering necessary resources and opportunities. Thus, networks can best be defined as relationships of varying added value as their intensity directly affects the availability and access to resources and market chances.

From such diverse, indirect contacts, the entrepreneur is able to gather the necessary

means and information to ensure the successful development and growth of a new venture within a changing market and market relations. The developmental and growth activities would include such things as finding product/service ideas, gaining access to new technology, transferring existing technology, locating capital, collecting current market data, and appraising competition. The direct contacts and far more extensive indirect contacts can significantly contribute to the development and success of the new ventures by actually providing customers for the products and services, both new and established ones.

As recent experience in Eastern Europe so dramatically indicates, the creation of new ventures is heavily influenced by the cultural and political context in which that entrepreneurial behavior occurs. All managerial problems are inherently social, economic and also political in nature, and the same is true for entrepreneurial activity. There must be political support for innovation, reliable energy supplies, free flow of information, telecommunication infrastructure, and an acceptable medium of monetary or wealth exchange for the creation of new ventures to flourish. This background is to a market system what air is to a human being. However, it is only noticed in its fatal absence.

Other more noticeable aspects of the day-to-day operation of the market system also contribute to entrepreneurial activity. Population ecologists have noted the importance of a market segment's carrying capacity and degree of differentiation. Students of the labor market have argued that underemployment or unemployment can provide the "push" leading to entrepreneurial activity [30]. Finally, on an individual level, dissatisfaction with an existing job may result in reduction of an entrepreneur's willingness to consider the possibility of failure [7]. Specifically, as many as 60 percent of entrepreneurs decide to start a business before they know what business they will undertake [6]. For many of these people, job dissatisfaction changes the perceived market for entrepreneurial activity and their perceived intentions for undertaking the entrepreneurial roles [20].

2. The Entrepreneurial process

2.1. Maintaining an Image

Part of the entrepreneur's challenge is to convince the external market to believe in his or her vision. For example, one factor that makes it difficult to obtain capital (not fully secured by collateral) is the perception by the potential providers of these funds that the business will not be successful. Justification for this reluctance can be seen in past studies of discontinuances, which show failure rates to range from 35 percent to more than 70 percent within the first five years [31].

Entrepreneurs, nevertheless, tend to be quite optimistic about their own prospects for success. In a study of almost 3,000 entrepreneurs, [13] found that 81 percent of the respondents perceived that the odds of achieving success for their particular businesses were seven out of 10 or better. For other businesses similar to theirs, however, only 40 percent perceived the odds to be that good. The attribution of success is a very personal one where the individual entrepreneur's image and confidence are critical.

The keys to selling anything are image, confidence and value-trust. For the entrepreneur, these may be even more critical with respect to selling herself or himself to significant others such as bankers, investors, and employees. Impression management focuses on the public presentation to others in the environment and involves the internal representation of this public self. In everyday social interaction this self presentation can serve the person's strategic goals [15]. Tactics such as ingratiation and supplication are especially useful for people who find themselves confronting more powerful others. These normal social tactics may be even more highly developed among entrepreneurs, who depend on others not only for social acceptance but also for access to and use of scarce resources.

An original study by [22] argues that when it comes to creating a new product and an appropriate new image for it, despite numerous, well-structured diagrams and formulas showing key components and stages to venture success, very often creative teams

realise that "what *should* happen is not what *does* happen and that the difference comes from the "aha moments" on the way" [22]. The article describes how a team of academic entrepreneurs decided to start a new EMBA without any previous experience of how to do so. In their unique "adventure" to start it up, the final success was preceded by seven "aha moments" where particular solutions resulted from serendipity and originality and not exactly manual follow-up.

2.2. Entrepreneurial Exchange

The issue then arises as to how the entrepreneur develops and maintains the image required by the market place. As noted early in the study of self-presentation, the maintenance of face requires both a performer and an audience [14]. For the entrepreneur, however, the audience is more than a collection of dispassionate observers and very often is even invisible for the entrepreneur as it exists only behind the screen of the computer. If an entrepreneur's venture fails, his or her bankers, employees, and family also suffer. So the success of the entrepreneur's image has economic consequences as well as social consequences. In other words, the entrepreneur and his or her network are *interdependent* in the fashion described by social exchange theory ([16]; [17]).

Each party to the interaction seeks to maximize outcomes, whether these are social, economic or political. But no participant has complete control over the reward system, so each must accommodate the other's expectations. The result, if the interaction is to continue in a balanced way, must be a correspondence of outcomes. The situation has to be "win-win," and the rewards achieved by the entrepreneur and the members of his or her network must exceed a psychological threshold, as well as an economic one, for the relationship to remain stable. Very important aspects for maintaining a stable relationship are also the personality traits of the entrepreneurs themselves as they are the very hearts of the venture itself. According to [25] who conducted a large scale survey of 208 American and Irish participants, various personal characteristics, namely achievement motivation, tolerance for

ambiguity and personal efficacy, affected the way business was initiated and run afterwards and those characteristics of the entrepreneur influenced the development of social, economic and political networks. The most interesting finding, however, was that cultural factors played an extremely important role in how persuasive the message of the entrepreneurship would be, and how this message would influence its auditoria in terms of appropriateness, self-consistency and effectiveness.

2.3. Managing the Networks

As is the case with the entrepreneur's mobilization of resources, the market's influence on new venture development is often transmitted by social contacts, or linkages. The exact effect of these linkages is not always easily identified. For example, in asking entrepreneurs to recount their successes and failures, it is not uncommon for them to emphasize the "know-how" aspects of starting or running a business rather than the "know who" [24]. And indeed some new ventures may not uniformly rely on networks. Carsrud, et al. [11] found networks to be unrelated to the success of the initiation process, but potentially very important to success in the growth phase of the venture.

Notwithstanding these exceptions, entrepreneurial networks increasingly have been associated with success. Entrepreneurs count on such connections to cut corners, to pave the way for acceptance, and to enhance image and credibility. Contacts also provide information and support, help avoid costly errors and time-consuming research, help locate resources, and serve as major sources of information about the market. Consequently, entrepreneurs constantly maintain these relationships, so that they are available when needed to provide information and assistance [5]. On the background of more and more complex market relations, it is becoming also popular to form "entrepreneurial cooperatives", uniting various ventures to provide the services needed for the running of a company, which result from the skills brokerage business model [3]. The model greatly elaborated by [23] in the so called "Triple-Helix Approach" according to which by developing rapport at

various levels – encounter, exploring affinities, identifying communality, establishing congruencies, and discovering potential, different companies are able to share their social capital and develop enlarged and more efficient entrepreneurial networks.

However, when it comes to "personal" networks, opposite to the Triple Helix model described above, [24] propose a "silent strength" explanation for the tendency of entrepreneurs to avoid talking about their personal networks in terms of their successes and failures. The entrepreneur may wish for these contacts to remain confidential, because if they were revealed, the strength of the network might be weakened or others might have access. It is also possible that entrepreneurs do not emphasize the importance of their networks because the individual wants to receive personal credit for the success of the enterprise, thus maintaining his or her personal attribution of success.

3. Marketing-entrepreneurship research interface

Given the importance of the external market in the entrepreneur's social context, the influences of market factors on entrepreneurial activity, and the dynamic exchange between the entrepreneur and representatives from this external community, it is surprising that so little research has yet been done at the interface between entrepreneurship and marketing. This last section builds on the preceding analysis to suggest possible directions for marketing and entrepreneurship research in the future. For example, using social context to describe the marketing—entrepreneurship interface raises a number of interesting research questions:

1. How do effective entrepreneurs recognize and balance the contending, and potentially conflicting, demands of the various constituencies?
2. How does the unique social context of Eastern Europe and the former Soviet Union influence the reactions of entrepreneur to the ever changing market opportunities there? How do these reactions differ from those of entrepreneurs in the West wishing to enter these markets

but not having the same social context?

3. Are the skills involved in maintaining an image the same as, or different from, those involved in managing a network? Are entrepreneurs who are highly successful in maintaining their images and managing their networks better able to *shape* the market context in which then-products or services will compete?

Although our analysis suggests that such questions could be fruitful, it also clearly indicates that cause and effect in the market environment of the entrepreneur involves complex relationships. It is possible that simplistically modeled, casual relationships are apt to be misinterpreted. Researchers, the entrepreneurial community, and government policy makers need models that can begin to handle the complexity of this important socioeconomic phenomenon.

The challenge is increased by the fact that researchers and policy makers all too frequently speak different languages. For example, [8] analyzed entrepreneurial and small business research appearing in the major entrepreneurship journals and conferences in 1986 and compared their topics to the 60 recommendations of delegates to the 1986 White House Conference on Small Business. Only six articles or papers from the 268 examined converged on the central core of concerns of the delegates. Thus, marketing-entrepreneurship research in the future should be more practice-oriented rather than primarily theoretical.

Finally, the potential for interaction among key variables must be recognized. For example, the specific market context may alter the effectiveness of the various entrepreneurial behaviors or governmental policies. What compounds the analysis problem is that every entrepreneur has a unique set of personal constituents and micro-market environments. Such market facts help to explain why entrepreneurial ventures are perceived as being chaotic and disorderly. They also help to explain the seeming inconsistency in the influence of various factors over time. Despite the formidable risks involved in cross-disciplinary endeavors, the market context provides a promising light with which to further illuminate entrepreneurial behavior.

Last but not least, the cultural implications on enterprises start-up,

development, maintenance and growth should be perceived as an inseparable element in the overall functioning of the entity. Such cultural considerations hold vital especially with the enlargement of the European Union market, where, as [4] righteously states, regulating business activities within a common market frame presents both freeing and restricting business opportunities and cultural differences more or less affect understanding and application of European common policies. The issues are further complicated on a global scale where European markets compete with any other.

Ethical Consumerism in the 21st Century

Ștefura Gabriela

Universitatea Alexandru Ioan Cuza Iași

gabi.stefura@gmail.com

Abstract

In a world where the global economy has suffered a great deal of changes and has encountered many obstacles, consumers and companies seem less concerned about ethics in their behaviour.

Ethical consumerism regards issues as environmental friendly consumerism, fair-trade, morality and honesty. The paper presents a theoretical background of ethical behaviour from two perspectives, followed by factors of influence, typologies of consumers and causes of unethical behaviour, offering an up-to-date starting point for more thoroughgoing studies and some possible directions for further research.

Key words: ethical consumerism, unethical behaviour, environment, morality

JEL classification: M39

1. Introduction

An issue of great importance for the economic behaviour has been and still is the study of ethical consumption. In the speciality literature there are not many studies concerning this subject, but the interest increased in the last 10 to 15 years.

In order to be able to understand better the nature of this subject, it is important to start with the description of the concept and what are its meanings.

Firstly, “ethics” as a general term refers to a branch of philosophy which seeks to address questions about morality. It has been for centuries in the interest of philosophers the discussion regarding what is right and

what is wrong and how we can live doing the right thing.

Secondly, a more general definition of ethical consumerism describes it as an intentional purchase of products and services that the consumer considers to be made ethically. Ethical consumerism can be practiced through “positive buying”.

Last but not least, among specialists there have been discrepancies regarding the meanings of “ethical consumption” and “ethics of consumption” [9]. The ethics of consumption mainly depicts a set of judgements over the morality of the entire provision system; the consumption is seen as the object of moral evaluation. In the case of ethical consumption, the consumption is now a medium for political and moral action. Although it may seem so, the meanings of the two concepts are not completely separate.

This paper’s main purpose is to build a theoretical frame of ethical behaviour among consumers, providing the description of its different meanings and, also, some directions for further research.

As the last couple of years have been a challenge from an economic perspective, ethical behaviour has begun to be more and more a problem which needs to be properly studied.

In the second part of this paper, the different views of ethical behaviour will be presented, along with the factors which influence this type of behaviour. The third part brings into discussion the typologies which can be found related to this behaviour and the main causes that determine an unethical behaviour (or simply being indifferent to it). Finally, the paper ends with conclusions and some further research directions.

2. Ethical behaviour perceptions. Factors of influence

The concept of ethical behaviour has been approached in the speciality literature from two perspectives.

The first one refers to ethical behaviour from an environmental approach. In many studies referrals to “green consumerism” are being made [4; 12]. A green consumer is the one who avoids using products which pollute or is against animal cruelty, he/she purchases eco-friendly products, recycles etc. [apud 4, p.401]. Shaw and Shiu [12] emphasize on the difference that must be made between green consumers and ethical consumers. The second category is obviously much more complex and includes the first one.

Ethical consumption has also been referred to as a behaviour which incorporates the principles of environmental friendly consumption and addresses issues regarding conscience and morality [4, p. 401]).

In the opinion of Callen-Marchione and Ownbey [2] ethical behaviour includes the purchase of eco products, the attitude towards counterfeited goods, how consumers react to companies which approach an unethical behaviour, honesty etc.

The second approach on ethical behaviour regards piracy, petty theft, shoplifting, unethical behaviour of employees etc. In this case, the morality and the honesty of individuals are put into question.

Shoham, Ruvio and Davidow [13] emphasize on the matter of piracy (DVD's, music, software) and describe the phenomenon in three forms, as found in other researches:

- the assessment of software piracy, in the context of the innovation diffusion, accentuating the outcomes of piracy
- the overall issue of purchasing counterfeited products
- the identification of the ethical/moral issues which support the consumers' decision of buying counterfeited goods

Coyle et. ali [5] discuss about piracy in music. They think that the ability to distribute digitized music, the perception of an unfair treatment as long with the misunderstood expectations of buyers/sellers of music have created a favourable environment for music piracy.

Regarding the factors which influence the ethical behaviour or the attitude towards ethical consumption, previous researches have approached demographic, cultural and situational factors.

Babakus et. ali [1] consider that a better comprehension of variations among consumers, regarding their beliefs on unethical behaviour, at a global level, could help in business development, but also in the propagation of public policies.

Many of the researchers think that age could influence the ethical behaviour. Babakus et. ali found out in their study that younger people are more tolerant when it comes to unethical behaviour.

Carrigan, Szmiging and Wright [4] also sustain the idea that age is very important factor. The authors came to the conclusion that older people (50 and more) have higher morale and are more ethical when it comes to consumption. They think that the over 45 age segment is often underestimated, especially regarding subjects as novelty, technological innovation.

Older people are more predisposed to boycotting companies/brands which develop an unethical behaviour, but only in certain conditions. Carrigan, Szmiging and Wright conclude with the idea that their study cannot be generalised and that it can be approached only from an idiographic perspective.

Women were found to have a more positive attitude towards ethical behaviour [1; 14], but other authors think that the sex factor does not have an influence on ethical behaviour [3].

Income and education are positively correlated with ethical consumption [14].

Coyle et. ali [5], in order to illustrate the way how people decide to purchase or pirate music, take in consideration three influencing constructs: attitudinal factors, demographic factors and purchasing/pirating behaviour. They came to the conclusion that younger men with lower incomes have more the tendency to pirate music. Also, they found that the legal/ethical factor has a great significance in describing the past behaviour and predicting the future one.

Starr [14] found through her study that individuals who are influenced by politics, are more likely to have an ethical consumption behaviour, this suggesting a general influence of

pro-active attitudes in the socio-political participation.

Ford, Nonis and Hudson [7] affirm that values influence attitudes, attitudes influence behaviour, and behaviour has effects on culture, forming in this way a circular phenomenon. They think that the most frequent mistake made by marketers is that they fail to understand cultural differences. In their study, they measure six types of basic attitudes, with the help of six scales:

- theoretic
- economic
- aesthetic
- social
- politic
- religious

The authors found a significant difference between the US and middle-eastern culture. The political dimension has the highest result in the case of the US culture, regarding ethical consumption. This dimension also influences the middle-eastern culture, along with the “social” attribute. The middle-eastern are seen as keen on social welfare and interaction between individuals.

Babakus et. ali [1] also emphasize on cultural differences, trying to expand the research on the role of individual background variables, as determinants of unethical consumer perception. They underline the power of one nation to be different from others.

Egan and Taylor [6] analyse the general personality traits that predict the attitude towards shoplifting and unethical behaviour. Predictors for this type of behaviour, according to their study, are lower IQ’s and lower incomes, especially at young males. Their study also shows that between personality and unethical behaviour exists a significant relationship.

3. Behavioural typology. Causes for unethical consumption

Shaw and Shiu bring into discussion the fact that some researchers in ethical consumerism rely on the Theory of Reasoned Action/Theory of Planned Behaviour [12, p. 1487]. This theory is described, from a general perspective, in the next figure:

Fig. 1: Theory of Reasoned Action

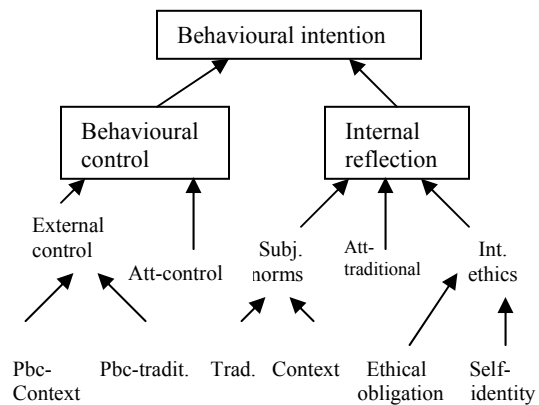

Source: Foxall R.G, Goldsmith E.R. and Brown S. [8]

Attitude and subjective norms (the individual’s beliefs about what other people think related to his actions) determine the genesis of the behavioural intention and, in the end, the actual behaviour.

The authors offer an adapted, more complex model relying on the traditional theory, in order to explain behavioural intention:

Fig. 2: Influences of behavioural intention

Source: Shaw D. and Shiu E. [12]

Explanations:

- Att-control represents the attitude of the individual towards difficulties
- Att-traditional relates to the attitude towards fair-trade
- Subjective norms-traditional reflect the normative others from the traditional theory
- Subjective norms-context refers to groups associated to fair-trade
- Pbc-context and pbc-traditional derive from “perceived behavioural control”

Shaw and Shiu tried to demonstrate that the behavioural intention of the individual has behind it a complex structure of influences.

Rawwas took in account Hofstede's classification of the dimensions which make societies different [apud 11, p. 189]: power distance, uncertainty avoidance, individualism and masculinity.

The author also uses in his study Hofstede's typology to categorize the different types of nationalities and their culture [apud 11, p. 192-193]:

- Functionalists (Nordics, Anglo-Saxons): people with high common-sense, with a well-developed sense of perceived risk; they have the tendency to be individualistic;
- Deferents (Latin nations, Mediterranean and Japan): the opposite of functionalists; are hard-working and obedient;
- Survivors (German): they weigh all possibilities and then they choose the one which can help them achieve their goal;
- Enthusiasts (Asian and African people): they listen to their superiors and are risk-tolerant.

He offers another typology, in order to complete the first one:

- Achievers (American business men, Anglo and some of the Asian): are aggressive and very competitive; their morality is variable;
- Absolutists (Latin Americans and Asian): are cooperant and are encouraged to take group decisions- collectivists;
- Situationists (some of the Latin, German and Japan): they accept a condition only if it brings safety and benefits;
- Conservationists (Indonesia, few of the Nordics and Africans): are preoccupied with society and environment.

The conclusions of Rawwas's study are that functionalists have a tendency of being more pragmatic, deferents have more stringent ethical values, absolutists can be idealistic and achievers more relativistic.

Babakus et. ali [1, p.260], regarding the attitude towards unethical behaviour, have made a classification of the consumers, giving five different categories:

- Puritans
- Realists
- Indifferent
- Tolerant
- Cynics

The extremities are puritans and cynics and show the most clear segmentation. Puritans mostly young people (57%), mostly female (57%) and Anglo-Saxons. Cynics, although have a small overall percentage, include young people (89%), male (53%), the majority form the UK (73%).

In a study regarding similarities between the opinions towards ethical behaviour of countries from the North and South of the European Union, Polonsky et. ali [10, p. 119] remind about four categories of questionable behaviour:

- people who actively benefit on the behalf of the retailer;
- people who passively benefit on the behalf of the retailer;
- deceitful practices;
- no harm/no foul.

The first category is related to consumers who initiate this type of actions and who perceive the action as being illegal. In the second, the situations are determined by the seller's mistakes and the consumers don't do anything to correct them. The third category regards situations which are initiated by consumers who do not see the act as being illegal. Finally, the last category describes the situations in which consumers think that no harm is done to the seller.

Regarding possible causes that determine people to engage or tolerate unethical behaviour, Carrigan and Attalla [3] have identified the following:

- poor quality of information; in order to maintain an ethical behaviour, people must be constantly informed;
- there are too little constraints for companies to behave in an ethical manner;
- the gap between attitude and behaviour;
- the lack of personal impact.

Callen-Marchione and Ownbey [2] make a very interesting point by sustaining the idea that an unethical behaviour can determine supplementary costs for the consumers, as sellers increase prices to cover losses, an adverse shopping environment and many restrictive policies in stores.

4. Conclusions. Further research

Although ethical behaviour is presented from different views in the marketing literature, its importance remains the same. Ethical

behaviour includes both consumers and companies behaviour and attitudes towards morality, honesty and environmental protection.

Ethical behaviour is seen from the environmental perspective (eco-buying, recycling, boycotting companies which have an unethical behaviour) and from the moral perspective (shoplifting, counterfeiting products, buying/selling pirated music, films and software).

This type of behaviour could not exist without the influence of such factors as: demographic factors (age, sex, education), cultural (the differences between nationalities) and situational factors.

Adopting a behaviour or simply having an opinion are not the only important elements. People are extremely diverse, but through some similar characteristics, different typologies have been conceived by specialists, in order to help international commerce and marketing.

Even though the causes that lead to unethical behaviour seem changeable, consumers along with companies put very little effort in making an importance change.

An interesting subject for further researches would be how countries from Europe differentiate from one another regarding ethical behaviour. For example, a study regarding the ethics in countries from Eastern Europe, especially in the economic crisis context, can be taken in account for the following researches.

Ethical Behaviour in Business - Premise for Obtaining Performance under Crisis Conditions

Iuliana Talmaciu

iuliana_talmaciu@yahoo.com
mihaela.maracine@yahoo.com

Abstract

In the current context of globalization of the economic, social and even spiritual life, the people's need for morality is increasingly becoming stronger. The accelerated economic progress and the global expansion of technologies led to the reaffirmation of the ethical considerations. Undoubtedly, the current financial crisis, doubled by the moral one, represents an obstacle in the development of companies that are forced to treat ethics as an issue that can no longer and should not be ignored anymore.

Key words: ethics, morality, ethical behaviour, crisis conditions

JEL classification: M14

1. Introduction

To begin with, we can consider *ethics* as being the science of the ethos (of morality), of good/evil (Socrates, Plato, Cicero), of happiness, of virtue (Aristotle), of pleasure (Aristip), of the social ideal. Ethics has emerged as a distinct branch of knowledge due to Socrates. As a scientific subject it has existed since the time of Aristotle, who raised ethics to the level of "the dignity of science." The role of ethics is to help people and institutions to decide what is best to do, on what criteria to choose, and which their moral obligations are in their actions. Ethics is a rational approach to morality. Some of the ethical norms are rooted in our past. Some ideas about what we should and should not do come from our parents, teachers or friends. The people who influence us give us ideas about what is right and what is wrong.

Ethics is also determined by the community where you live. The schools, the businesses and all the types of organizations have standards and they expect people to follow them. But our "ethics" also comes from our culture and traditions. We are surrounded by culture and traditions every day. Culture characterizes the group with which we identify ourselves (sometimes it is our generation). Sometimes it is the community in which we live. It may be our nation or our colleagues. But in every culture and even in every social group there are the behaviour's own peculiarities that concern: the way of shaking hands, the ability to look the interlocutor into the eyes during an important discussion, the speaking style, the obligation to fulfil big and small promises. [1]

The ethical sense represents a person's faculty to distinguish between right and wrong and to respect the moral order.

2. The perspectives of the business – ethics relationship

By their nature, businesses are competitive, but economic competition has its bases in the cooperation between shareholders, managers, employees, customers, suppliers and even between competitors. In other words, good and healthy businesses are governed by rules meant to ensure benefits for all partners. Some of these rules are the legal norms that most business people consider mandatory for everyone. But the law can not provide clear and indisputable solutions in all situations, sometimes very complex, which may occur in the commercial relationships.

Where the law has nothing to say, morality is the only guide that we can rely to make the best decisions. In theory and in practice business people must meet certain moral standards.

Which are the strongest, the most just and most effective moral rules that a successful business person should take into account? The answer to that question is not simple at all and widely accepted. Different people's concept on the moral and social responsibilities that a business person must take on decisively depends on how to understand and define the concept of business itself.

The business person only seeks to earn as much as possible on the long term; it is his/her "duty" as a business person. If it had been it in his interest to do so, within the limitations of the law, without caring for anybody else, everything would be perfect. Unfortunately, every business depends in its various activities on many other groups of people, each having their own interests. Ignoring or disregarding these interests of the different categories may sometimes be profitable in the short term, but in the long term it would prove disastrous. For this reason – and for this reason alone – a judicious business person, who knows and serves well and efficiently his own interest, has to take into account the interests of those who depend on his business as well. Businesses may be affected not only by the owners' reactions, but also by the reactions of the employees and of the customers, suppliers or creditors. Their tastes and preferences, including the moral preferences will influence their willingness to do business with a particular firm, and that is why they should be considered in estimating the owners' long-term value. It is important to have an ethical behaviour both towards the suppliers and towards the shareholders, in dealing with the employees or with the customers. Fairness must be mutual between employers and employees, between producers and consumers or between creditors and debtors. That is why the basic idea of ethics in business is confirmed with theoretical arguments: "good ethics is good business" while "bad ethics is bad business".

Ethics in business is merely an application of the general moral rules in the specific field of business. The businessperson's duty is to maximize profits, as Aristotle would have said, it is one's "virtue" and eminently characteristic of a good businessperson. But this is not a robot, programmed not to pursue anything else, but he is primarily a human being like everyone else and, as such, he is subject to the universal moral values and standards, which must have priority

over the limited purpose of his professional activity. Whenever the businessperson's interest conflicts with the moral values and norms as such, the latter have priority, even if their compliance may be temporarily detrimental to his business.

From the theoretical point of view, we can talk about three perspectives regarding the relationship between ethics and business:

- the incompatibility between ethics and business (affairs have nothing to do with ethics);
- the compatibility between ethics and business;
- the primacy of ethics over business (in some cases, the business interests of companies should be subject to ethical considerations).

The three perspectives of the relationship between ethics and business materialize in the four distinct theories:

1. *The theory of incompatibility between the business and ethics* starts from the premise that ethics and business have nothing in common; there are no ethical responsibilities in business; there is no ethics in business. Albert Carr supports the idea that ethics belongs to the personal lives of individuals, and it should not be confused with the rules that business people follow in their professional field: "*When you are at work, do business, and when you are home, reflect upon the issue of loyalty towards friends or other ethical issues.*" [2]

Obviously, most people perceive the business environment in a less noble, ruthless manner, since it is related to profit. Besides the vices which, undoubtedly, some business people have, the typical arguments against the ethics-business combination are, essentially, *the following myths*:

- *Ethics in business is more a religion than a managerial science;*
- *Ethics in business is a good study subject for philosophers, scholars and theologians;*
- *Our employees have an ethical behaviour, so we do not need ethics in business;*
- *Our organization does not have trouble with the law, so it is ethical;*
- *Managerial ethics has little practical relevance.*

Such myths are not confirmed by reality because during the last two decades, the business world has become an academic subject; in the West superior schools have been set up in which

business ethics is a subject that enjoys great success, and businesspeople started to be respected for their honourable occupation. The continuous development of the needs and consumption has prompted the need for ethical regulations in business, the subject no longer being restricted to some negative connotations such as immorality of business on the grounds given by the fact that money is the common denominator of business.

2. *The theory of compatibility between business and ethics or the theory of single social responsibility of businesses to make profits.* This view is based on the minimalist approach expounded by Milton Friedman, one of the fervent defenders of the free market, including the ethical constraints that go beyond their own rules of business and especially the essential purpose: profit. Any involvement in charitable actions, in social projects which do not lead to the increase of the profit represents a theft from the shareholders' pocket because the corporate managers do not have to and neither do they have the power to initiate public policies. The government should protect the interests of the firms and to relieve them of "additional" obligations to society; profitable businesses serve society by creating jobs, by improving the living standards of the owners and employees, on the one hand, and on the other hand, companies pay taxes which support the social actions of the government.

Although it claims that the only purpose of businesses is to make profit, the theory justifies by *moral reasons* this one-dimensional nature of the businesses. Only the profitable (good) businesses are useful to society, they are ethical businesses that on long-term meet ethical fulfil moral and social objectives.

3. *The "stakeholders" theory* assumes that any business organization has a social responsibility and a moral duty towards all the groups that influence and are influenced by its economic and commercial activity, not only towards the owners (shareholders). Any business must fulfil a social role and the purpose of a business is not to make money for its owners, but to provide customers high quality goods and services at affordable prices, to create jobs for its employees, to protect the environment, to financially support sports, arts and technology advances, etc., finally obtaining a reasonable profit for its owners, as deserved reward for their services for the community. [3]

The businessperson is not a strategist concerned with the progress of the entire society and by the eradication of all evils from the world; his job is to run his business as well as possible, namely to obtain considerable profits, which requires compliance with the law and supply of products and services sought and valued by consumers. Before being a "businessperson", the capitalist is a person like any other, with his limits and moral aspirations of general human nature. There are business people with a high moral conscience, which determines them to act in business with maximum seriousness as well; there are also business people with a precarious moral conscience, which makes them act with fewer scruples in their professional activity. Furthermore, all business people must, by their very status, to make decisions that are profitable, which obliges them all to do some calculations and to act according to certain rules.

The important fact is that, regardless of motivation, one reaches the same practical conclusions: pursuing the long-term profit excludes a rapacious and irresponsible behaviour towards customers, employees, suppliers, creditors, competitors, etc. On the contrary, a good business person – that is to say one who earns well from what he/she does – is the one who never forgets, not for a moment, the interests of the many categories of stakeholders, striving to meet their requirements.

4. *The theory of corporate social responsibility* is the approach which assumes most of ethics in business, given that a corporation's obligations extend to the level of the entire community (regardless the reasons), not only to the level of the groups that contribute to the company's profits. The theory claims that the primary responsibility in business of firms is to make profit, but there are ethical limits or constraints on what can be done effectively in business; in other words, in terms of ethics, the right to obtain a profit is not unlimited.

A motivational factor of the companies' involvement in social activities (excluding the one strictly aimed at the economic performance and obtaining further gains from the advertising due to "charity" actions) is promoting what is called *value-based management*. In this case, managers act to promote shared values in the organization, including the moral ones, aiming mainly at two effects: improving the company's

image by associating the idea of worthiness to the one of performance; and creating and strengthening the team spirit within the company. [4]

At first glance, it is easy to understand that “ethics in business” is an area that seeks to clarify the moral issues which currently arise in the economic agents’ activities from a capitalist society. Business ethics is essential for the long-term success of the business.

Our moral standards relating, for example, to correctness, righteousness, justice, differ from one individual to another, because of the difference of values to which they relate. Therefore, nobody can say with certainty that a certain moral standard is either good or bad, but it may be shown if it expresses an obligation towards the others and not only a benefit towards ourselves.

Most times it is very difficult, even in the simplest cases, to distinguish between ourselves and the others, between benefits and obligations and, especially it is hard to make these distinctions in business, where a benefit to some may represent damage (or an unpleasant obligation) to others.

In solving ethical issues, the key questions are:

- Who would win and how much?
- Who will lose and how much?
- Is what we are doing legal?
- Who benefits from and who bears the consequences?
- Would we trade places with the customer who expects us to meet a particular need?

Peter Drucker states that the owner, the business person, managers must “consciously take on responsibility for the common good and to curb their own interest and authority when their carrying out harms them and the individual freedom” [5], a conservative, demanding vision, sprung from the idea of a social order based on a moral purpose in which accepting the responsibilities, the duties and the obligations justifies claiming the rights.

3. Ethics in the Romanian companies

In Romania, there are currently two views on ethics in business. On the one hand, there are several supporters of the idea that Romanians, eager to emulate the Western model, have begun to study and to teach business ethics, even if the

national economic system is not yet one compatible with the market economy from the developed capitalist countries; thus it is considered that Romania, unnecessarily and ridiculously, is trying to incorporate modern features of the Western culture in a social reality weakly developed and outdated. On the other hand, the followers of the other position, more numerous and more logical in their arguments, believe that business ethics is a necessity in Romania, since the penetration and expansion on a wide scale and at high levels of corruption in the Romanian society is one of the main inhibitors in the way of attaining a functioning market economy, efficient and internationally competitive [2].

Ethics and ethical behaviour are very important for all business people. Unfortunately, many do not consider that an ethical code and a moral behaviour have such a great impact on the results they want to achieve as entrepreneurs or investors. Very few Romanian companies are interested in ethics and compliance. According to Smart Solutions & Support [6], Romanian companies leave, for the most part, the ethical issues into the hands of some departments poorly prepared to deal with them, such as the human resources departments. Thus, in almost two thirds of these cases, these issues remain unresolved. Companies and their employees could use more and more corruption and anti-ethics practices in the current period, in the attempt to survive the global economic crisis. Business people will focus less on the issues of corporate responsibility and integrity, in the context in which their companies are making efforts to themselves keep afloat and are faced with pressing problems, such as staff reductions.

A report from December of Transparency International shows that among the big exporting countries, the companies from Russia and China are the most prone to bribe when doing business abroad. No other country, however, is immune to the dubious practices. On the other hand, some companies might unintentionally encourage the corrupt practices among their employees through a wrong policy of bonuses. In such a climate, it is more important than it was before that companies ensure that their anticorruption systems are effective and that employees are aware of the standards.

The companies operating on the less regulated markets, from the emerging market economies,

where corruption is more widespread, must not use the local conditions as an excuse, and senior management must take on a firm conduct. According to Transparency International organization it is expected that as the financial crisis continues to expose fraud in the large corporations, such as the Madoff case or Satyam Computer Services from India, and to become clear that the corrupted activities are not only a consequence of the crisis, but have also played a role in its onset. [7]

Most issues of the Romanian business environment are born from the intersection area between politics and business: corruption, interest conflicts, ambiguities left in problems such as the control of assets, lobbying, and sponsorship of political parties. One can identify three major sources of ethical problems in the Romanian business environment:

- (1) state interventions on the market, consisting of facilities granted to certain economic agents (subsidies, debt relief and rescheduling), legal uncertainty, interventions on the financial market and on the price policies for utilities and some commodities;
- (2) in the producers-consumers relationship, disloyal corporate practices and to the limit of legality, quasi-monopolistic practices of some of the big companies and of the distributors of public utilities;
- (3) the practices from the employer-employee relationships (black market labour, wages below the minimum income, discrimination or other forms of abuse of employees).

To understand the nature of problems that entrepreneurs have to face, the Analysis and Surveys Department of the National Council of Private Small and Medium Enterprises (SMEs) from Romania (CNIPMMR) conducted a study on a sample of 1,399 SMEs considered representative nationwide. The study shows that 44.64% of the respondents considered that the economic environment is unfavourable for business development, while only 25.50% think that it is favourable to entrepreneurs.

Furthermore, the main obstacles in the activity of SMEs are generated by the state institutions which interact with the market. The survey reveals that three main factors that negatively affect this sector are excessive bureaucracy, the evolution of the legal framework and corruption. Entrepreneurs must

understand the importance of ethical codes, to know that their compliance determines the creation of long-term business relationships, as well as the increase of the companies' credibility.

4. Conclusions

Currently, taking into consideration the globalization of the economic life and the growing demands of the society, ethics in business presents a practical interest to the business people who can use various tools and methods to enhance the moral component of the organizations they are working for and to enhance, thus the company's profits, also contributing to the general welfare of the society. Undoubtedly, an ethical, responsible and cooperating is advantageous and mutually beneficial for the partners of a long-term business relationship.

The Informational Component in Teaching the Language for Economics through an Authentic Material

Tamaş Cristina

Ovidius University of Constanta

The Department of Foreign Languages for the Non-Philological Faculties

cristina_tamas2003@yahoo.com

Abstract

Informatics, especially the Internet, represents a new approach for the teacher interested in new methods of teaching foreign languages. More and more attracted to the Internet, the students will combine what is necessary with what is pleasant in learning rapidly a language for special purposes. In this paper I have presented the objectives of teaching French language for the Economics starting from an authentic material on the Internet: Lafarge Group which is a multinational enterprise and a world leader in building materials, with a branch in Romania, Constanta County, Medgidia town.

Key words: internet, learning, enterprise, branch, communication.

JEL classification: D83

Information is an inevitable stake for the maintaining and developing control by the actors in the economic field. Without it, the management and the renewal of products and markets, the organization of their distribution and consumption worldwide would not be possible. The importance of information is essential in the economic field, since the great merit of unquestionable accomplishments rests with it. Economy is based on information in almost all its forms: techno-scientific, geographical and media. At the same time, information supremacy has succeeded in creating specialized fields from the viewpoint of the necessary language for understanding the main global problems. Morin states that: "Under the economic pressure, the tissue was cut into small pieces; hard to recompose the whole. Economy for the economists, demography for the demographers".

According to the requirements of today's society, there is a great necessity for the integration of the economic vocabulary into a

larger community, that of the university, on the one hand, and of the business environment, on the other hand. Thus, economy and its specific language, at the human being's service, should lead us towards the civilization of a modern society, able to favour the understanding of the specialized economic language as well as the mechanisms that influence it.

The informational component in economy is a social achievement. It sets up rules for the individual, taxes which ensure the control of the company, and regulations which prevent tax evasion.

Or, the new stakes of a global informational economy should deliver to the students who major in economics all those specialized terms belonging to the economic mechanisms. From a practical point of view, the students in economic sciences should take into account not only their qualities as individuals, but also their role of social actors who will have to face a multitude of communicative situations in their future workplace, and the accomplishment of the consequent requirements. In order to manage them well, the individuals make use of a series of skills which they already dispose of, and, acquire new ones permanently.

The defining of the communicative objectives imposes, as we have already seen, the taking into consideration of the target group's needs. Sophie Moirand conceives a functional scheme whose outcomes make the difference between the contextual and the communicative objectives – the movement of the contextual objectives towards the communicative ones will be made through the identification of various factors and their relationship with verbal and non-verbal elements of communication, as well as the analysis of verbal elements (or speech elements) produced in similar circumstances.

Among the general objectives, the teacher will focus on the following ones:

1. to initiate depending on the social, job relationships in an enterprise;

2. to train with a view to understanding the written and oral documents stipulating job relationships;

3. to help with the drafting of materials for experimenting FOS on the Internet, s/he must meet with the students' views to answer, in the best possible way, the question: what should learners know, and, above all, know what to do in order to manage the activities of communication found on a site. So, they will have to get accustomed to the different tasks among which:

a) knowing the communicational and job relationships within the enterprise;

b) controlling the discourse, that is knowing how to cope with one situation of communication: specific vocabulary, syntactic constructions, strategic aspects, patterns of behaviour;

c) having the ability of a good negotiator, capable of entertaining a business meeting.

4. to have an in-depth knowledge of the enterprise's business contents;

5. how will the assessment of these communication activities be made and according to what criteria?

The main *thematic objective* will be dictated to the students and this will make up for the framework within which the teacher will include the other objectives and speech acts. In our case, the thematic objective will be: an awareness of the various means of written and oral communication used in a multinational company which has its own site and wants to make a correct publicity for its normal run of things.

Regarding the *discursive objectives*, the teacher identifies the definitions and explains the difference between the written and the oral communication means (s/he will tell the students about the promotional movie that they will listen to several times).

Since we are in the situation in which the Internet becomes a partner for the student, the linguistic objectives will be identified together with the speech acts.

Therefore, in the assessment or self-assessment, students will be asked to identify sentence types in enterprise communication (affirmative, negative, passive, impersonal).

The teacher's explanation is necessary for such tasks: *When and in what context have we expressed obligation (interdiction, permission and so on)?*

Our students usually correspond to the level *BI+*, they succeed in understanding and using a number of words concerning the exchanged

quantity of information. They are able to explain a difficulty, provide the accurate information demanded for a business encounter, however with a limited precision; give their opinion on an article, a presentation, or a discussion; answer supplementary questions or summarize them; conclude a prepared encounter by checking and confirming information even if sometimes the interlocutor has to repeat it when his answer is too long or rapidly uttered; describe how certain things should be done and give detailed instructions; exchange with a great certainty a large quantity of factual information on questions from his domain. So, one can access the Internet address <http://www.france-entreprise.fr/> where one can find *the yearbook of the French enterprises on the Internet*. There, one can choose between *Alimentation et boissons*, *Antiquités* or *Économie* (Foreign trade exchanges, Consulting, Business Correspondence, Human Resources, Economic data and R&D, Services, Financial Services...). The yearbook improves the students' intercultural competence and offers an overall picture of the criteria on which enterprises can be classified. Thanks to this site one can view the list of the most important French enterprises quoted on exchange with the ratio Stoxx50.

The teacher presents the history of the *Lafarge* enterprise with a branch in Romania, Constanta County, Medgidia town. *Lafarge* Group is a multinational enterprise and a world leader in building materials followed by Holcim. It has three main activities: concrete and granules, cement, gypsum, and subsidiaries in 79 countries. In 2008, its turnover amounted to €19,033 bn., from which 57% in cement, 35% in concrete and granules, and 8% in gypsum. The group hires around 84,000 employees all over the world in 2,187 production areas. The Cement Company Lafarge has been developing special cement well-known for its quality. Lafarge is a world leader in building materials. The activity of the concreter Lafarge started in Ardèche, 1833, after the takeover of a family business launched in 1749 by the founder Léon Pavin, and whose factory exploits a stone pit in the mountain Saint-Victor dominating the river Rhône situated between Le Teil and Viviers. Since 1864 the pit has been supplying 11,000 tons of chalk for the Suez Channel; it is the first large-scale construction site of the enterprise. In 1919, the activity changed into a joint-limited company under the name *Société*

anonyme des chaux et ciments de Lafarge et du Teil, and since 1939 Lafarge has become the first French concrete company and one of the world leaders. In 1980, the merger with the Belgian company Coppée gave birth to Groupe Lafarge Coppée and, in 1997, it took over the British Redland which allowed Lafarge to enter the market of tiles. On 12th July 2001, the takeover of the British Group Blue Circle Industries Plc (BCI) allowed Lafarge to become the first global cement manufacturer before the Swiss Holcim. To fund this acquisition Lafarge resells under the form LBO its main branch of specialized building materials, renamed Materis. On 29th June 2004, Lafarge decided to double the capacity of its cement site from Dujiangyan, in China, to register 2,4 million tons, and signed a partnership agreement with Shui On Construction Materials Limited (SOCAM), a Chinese concrete company quoted on Hong-Kong exchange. In 2007, Lafarge SA announced the repurchase of the cement division from the Egyptian Group Orascom, Orascom Cement for € 8,8 bn., but, in the same year, it was sentenced together with Vicat enterprise for illegal agreement and abuse of dominant position on the wholesale market for cement supply in Corse.

On 2nd July 2008, *Lafarge Couverture* becomes Monier after the cessation of Toiture activity at PAI partners, and on 19th August 2008, on the occasion of cement nationalisation suggested by the Venezuelan president Hugo Chavez, Lafarge signed up a contract of transferring its Venezuelan branches.

On 28th July 2009, within the global framework of the Group's disinvestments, Lafarge announced the demise of its assets Cement and Granules & Concrete in Chile (Lafarge Chile SA and Immobiliaria San Patricio as well as the cement site La Calera) to the Peruvian Group Brescia for the amount of US \$ 555m.

The Group, which contains more than 1,240 enterprises holding the majority of shares and around 230 enterprises having a share of the benefit, is extremely decentralised. It is structured on three branches:

- cements, the headquarters and the French technical services are situated at Saint-Cloud, whereas the international technical services are located at L'Isle-d'Abeau.
- granules and concrete,
- gypsum.

Each branch regroups the total number of units from its field of activities all over the world. These units have a limited competence on a geographic area, generally a country, for a given activity. The head office of the group situated in Paris includes the headquarters, the executive board and the assembly of the functional directions.

If we click on Lafarge Enterprise, we will find the whole necessary vocabulary for the presentation and promotion of a company: the agenda, the stock list, lasting development, Research and Innovation, Clients and Activities, Shareholders and Investors, Journalists, Candidates etc.

For instance, in the 2010 news releases, we are likely to find out that *Lafarge* (world leader in building materials, which occupies a leading position in each of its activities: cement, granules & concrete and gypsum), exceeds its objectives to reduce CO2 emissions in the natural environment. In order to keep its promises, Lafarge invests considerable sums of money in durability: more than € 800 m have been invested in the last five years in industrial environmental imprint of the Group's cement sites.

Ethique et gouvernance offers the students the opportunity to watch the management strategies which are an integral part of the criteria for durable development. Lafarge *gouvernance* is characterised by strong ethical principles.

One can distinguish three aspects:

- the success of teamworking: the Group's main objective is to help everyone to succeed;
- the constant improvement in performance: Lafarge carefully supervises the optimization of its products and services.
- the <<multilocal>> organization: Lafarge activities are local, but they fit into a global logic.

The fact of listening to such a presentation can be considered as a very important oral comprehension factor in professional communication, and can be used as a supplementary material.

From the economic viewpoint, after the listening of the discourse, one should insist on the term *gouvernance* which the students can write down. Enterprise *gouvernance* is made up of the totality of orientational, control and evaluation mechanisms. More precisely, this term can equally refer to the executive board's functioning rules.

We can also indicate the *glossary* of the site http://www.lafarge.fr/wps/portal/2_6Glossaire

where the students can find words and phrases specific to the activity of the enterprise (bauxite, photovoltaic cell, loose ash, co-incineration), as well as economic terms for the multinational group (The International Organization of Travel (IOT), The United Nations Programme for the Environment UNPE). However, it would be useful that the information offered by the site be enlarged upon through consolidation exercises grouped in a database. Evaluation is, in fact, based on a process designed as an open spiral where the teacher is always active and ready to adjust, readjust and rephrase the suggested activities. The student can learn to communicate with the group presenting the profile of Lafarge and its strategy.

The teacher, in his turn, can intervene by asking open questions about the student's future career prospects: *Would you be happy to work in a multinational like Lafarge? Why?* Teaching the students how to use the Internet site effectively both in the classroom and in their individual study is the first step towards their autonomy.

Nevertheless, the Projects <<Langues Vivantes>> under the aegis of the European Council have included in their fundamental objectives the research on the concept of autonomy and the methodological strategies liable to contribute to its application in the teaching and learning systems of the European languages.

Abstract

Attempts to quantify the human assets of an organization happened the first time in the US in 1960, when it was tried to end it in their balance sheet. This idea of quantification started to analyze the differences in value between similarities or changes made in time by the same organization and the premises had the decisive contribution of human activities. The practical consequences of the current research on human activities were not eloquent. In recent years the problems of quantification has been resumed by the focus on intangible elements of the organization, without accounting field to find a satisfactory solution to all parties. Construction of the strategic balanced scorecard refit problem in assessing the human factor concerns of managements' instrumentalization.

Key words: Human assets, human resources management, social pilotage.

JEL classification: M12, M40, M 41

1. Introduction

The combination of the three terms, accounting, assets, human have seemed until recently at least un-operational. The first term usually evokes techniques to evaluate transactions on products, materials; the third has a sacred character. The second term has several meanings, so it is not known whether to be understood as a group of people in work or as a set of constituent elements of a heritage. Ambiguous combination of

these terms increases the scope of investigation. In the broader sense it can be understood as a set of concerns, which aims to provide a balance-sheet translation in human resources evaluation in the organization and any initiative that aims to express the collective assessment on individuals in a situation of work.

Originally, human asset accounting aimed at entering a value in the balance sheets, a concern which reappears today with the intangible assets evaluation problem. Then, integrated to costs accounting, the evaluation of the human factor is performed in the center of construction for strategic board panels.

In the 1970s, in the US, an important current of research into assessment of human resources has been developed. The main idea is to give formal recognition to the importance to the human value of businesses' assets, including human resource asset in the balance sheet. In the face of many difficulties and criticisms, applications have remained relatively limited. Reflections related to the current accounting intangible assets provide the force of this current.

Human asset accounting issues underwent a fast period, on the conceptual plan in the 1970s, by the emergence of theoretical works, experimental applications in organizations, research on the impact of decisions and unexpected geographic distribution. In 1960, the US recorded a strong pressure for firms to improve the information system both for shareholders and to support internal decision. Researchers in accounting identify in this requirement a source of social legitimacy, which, for twenty years, fueled important current proposals aimed to take account

of “social performance” or socially responsible behavior of companies or to quantify the benefits of social achievements. Attempts which were booked to value human assets are increasingly being felt in this movement, causing the appearance of two theoretical currents:

- The human capital theme, developed at the initiative of economists Schultz (1971) and Becker (1964), according to whom human being is regarded as an asset that has a monetary value characterized by all its attitudes, knowledge and experience; as any capital, it must be the subject of investment and maintenance of costs, which brings benefits to enterprises that is engaged;
- Human relations school, animated by psychologists and specialized in the analysis of labor and psychologists, such as Rensis Likert (1967); for them, the arrangements for evaluating performance based exclusively on gains in the short term can cause the apparition of some management styles that are likely to alter relations human and ultimately be detrimental to profitability and long-term profitability of the organization.

The first method of accounting for human resources have been the object of an evaluation of human resource costs and, secondly, evaluation of human resource value. To assess human resource costs were proposed three ways: historical cost, replacement cost and opportunity cost.

Historical cost method, developed initially by Flamholtz and Main (1999) and Pyle, recognize and record the costs of staff as an investment, it is recruiting costs, with the selection, integration, with training. In the condition in which they are calculated, recorded and conveniently attached to an accounting year, they may be amortized over the useful life of human active. This term is derived from the age of retirement, the maturity of employment.

Replacement cost method was presented by Flamholtz and Main (1999) as an alternative or supplement to the previous method. Founded on the principle of historical cost upgrade, it is intended to record the expenses that should be employed to reconstruct the same human potential at its disposal at any time given.

Opportunity cost is defined as the use of human resources in the most favorable alternative. Hekimian and Jones (1967) have suggested a competitive auction in the company, where those

responsible for the division play the role of “buyers of personal”. In principle, the auction should allow to determine a situation of equilibrium that represents the “price” group of persons, assimilated to the incorporable economic value of business assets.

Attempts to measure the value of human resources were at their origin, exclusively monetary, but some models have integrated the economic variables and behavioral variables. Monetary approach of Hermanson (1986) proposes two techniques:

- The “goodwill” latent method, which takes into account a forecast of future earnings and human resources assigned any greater than normally expected earnings in a given sector;
- The method of updated value of labor flows, weighted by a factor measuring the relative effectiveness of human resources of an enterprise; Models combining non-monetary approach, behavioral with another monetary are based on Likert's (1967) work. Framholtz and Main (1999) defines an approach to the value of work product, offering an updated model of the future prices of services or, in other words, the human resource is the flow of revenue brought by the staff.

Publication of the financial statements which are elements of human asset accounting has been a first application of these tests, but it remained very limited. RG Barry Corp Company debuted in 1966 by applying the historical cost method, but no further than a few years experience.

Applicability of methods has been restricted to organizations or organizational sectors in which gray matter, competence and experience are determined for the product or service market.

These ideas were published until the 1980s by the accounting and financial success, but have not done it in human resource management magazines, where penetration has been slow and limited, marking specialists skeptical in regard to their usefulness. Criticisms made in these methods were many and various:

- The very specific nature of “human activity” raises the question of legitimacy of its accounting for the immobilization; the accounting model with patrimonial dominancy considers an asset that is not owned by the organization
- Various proposals of evaluation methods fowl difficulties of calculation making use of subjective estimates
- The concept of value is retained only in terms of cost to business or income for individuals, but not

in terms of advantages for the organization; the economic value of human resources appears particularly through their capabilities and skills, rather than cost

- The complexity of the models and its' application cost have also been a brake on their development
- The scientific validity of the models was considered unsafe, because of the concepts considered unclear or confusing
- Researches, based on a hypothesis of a simple addition, remained very focused on the intrinsic value of individuals, ignoring the collective and organizational context in which they operate and the synergy effects resulting from their cooperation

The accounting rules, both national and international, have not taken into account the concerns of human asset accounting.

The importance of activities that convey information, dematerialization of business activities and growing of intangible assets have re-launched the accounting debate carrying on their evaluation.

An increasing number of authors draw attention to the fact that in the post industrial age, firms depend on knowledge and information. Therefore, they should pay particular attention to developing human and intellectual capital. Even for economy companies called "traditional", exchange value is at least twice the book value of assets, which tends to show that there is an immaterial value "hidden", consisting of essential human knowledge, Bounfour (1998).

Researchers in accounting are now in favor of making active partial or total costs of certain human resource management, as recruitment and training, Martory and Pierrat (1996). After several years, the OECD has become an active supporter of these ideas.

The integration of these concerns in accounting approaches has not occurred because of conceptual difficulties (purpose of accounting information, the definition of asset) and practical (method of evaluation and quantification of problems).

In practice, human asset accounting would involve a reconsideration of the general objectives of accounting and taking into account economic activity as a source of jobs and income for employees or, more generally, the social responsibility of the company, which is not included in any of the existing conceptual frameworks.

Taking into account the human resources as assets refits design problem assets and what distinguishes it from an expense. French design, which privileges an optical property, do not record, in principle, as active rather than items that are owned enterprise, which means that they are identifiable and separable and may be subject to disposal authorities. This prohibits any possibility of active human resources costs. Anglo-Saxon conception and IASC believes that values human assets that may cause future revenue, offering the possibility of activation. In practice, the assessment methods in historical costs prohibit almost all of the registration of securities which have not been the subject of transactions, which considerably limits the field of human resources operations. Evaluation by the cost of replacement faces the low possibility of an intangible asset to be reproduced identically. Evaluation by future revenue involve identifying and quantifying specific revenue it generates, which is a hypothesis often difficult to sustain in the case of human resources and it is difficult to distinguish between what is apparent from the collective organization and which reveals individual contributions.

The only case in which activation may be admitted involves training expenses.

2. Social pilotage and organizational management

The importance given to the evaluation of human capital has gradually dimmed in favor of research on "human cost". This interest overlaps growing attention from the organization lower costs, to search for new increases in productivity and increased staff training. Management focused on cost-oriented analysis / results, allowing decisions on improving human resources, taking into account the hidden costs generated by such measures. As a result, management has sought instrumentalization methods, allowing the articulation of strategic management and human resources.

After several years of research, interventions were concentrated on the socio-economic domain. Savall H. and ISEOR of Lyon (1979) developed the concept of "hidden cost/performance" in order to assess the costs of the organizations benefits of measures to improve social (staff turnover and quality).

In the US, the same type of approach has been put into practice by Spencer and Cascio in costs and behavior at work in the field of costs and selection procedures benefits, training programs and helping employees. In Sweden, companies like Ericsson and Telia have developed calculation methods that allow assessment of the cost of sickness leave and staff rotation.

Methods in supporting the decision making process are related to the management accounting and organizational control. They are often put into the methodology of management control and auditing business in areas like employment policy, the policy of recruitment and human resources development, organizational management type of work, evaluation of a profit training program.

At the level of global management, accounting methods can bring these original classifications for investment policies: integrating social costs among the criteria and calculations of investment choice, taking into account the human conditions of use in the examination of various possibilities of equipment. The construction of new tools for management control of employees favors, thus, the functions of organizational management and human resources.

A new approach has been made known for several years and it tends to link the operational performance of the strategy. The research of Kaplan and Norton (1998), "on the prospective balanced scorecard" allowed a better measuring of this procedure, which has been experienced for over 15 years. Linking strategic indicators and indicators of results, this model is special because it addresses the following four axes: customer, process and innovation, organizational experience and financial expertise.

3. Conclusion

Attempts in human assets accounting were multiple, but they had difficulty in accounting methodology, which is not compatible or prepared in this regard.

There is a favorable current, accepted by accounting researchers, to include in the asset some costs for human resources management, such as recruitment and training, with a partisan in OECD.

Management did not remember the results of previous research, thus it oriented towards "cost-

results" analysis, with immediate implications in the decision making process.

Quantify human assets strategic vision was promoted by the emergence of concepts of social control and social piloting, with the balanced scorecard and social balance.

This approach provides more information on human resources and their performance, on organizational behavior.

Quantifying human assets is still a goal that depends, among other things, on the accounting paradigm change.

Abstract

Dynamics of organizational forms manifests to the enterprise level, and to its subsystems. Human resources function is subject of optical and content changes that are exacerbated by the emergence of NTIC. To be able to promote change, human resource function should adopt a structure best suited to strategic alignment requirements. The article highlights the need for consistency between enterprise organization and human resources function, which must be experiencing the strategic changes within the organization and NTIC influence and promote within the assembly. The issue of organizational resource function can be considered as the main vector in the reception and promoting the change and NTIC. Subject and object of change, the human resources function should be the managements' main partner in the process of change, being the first organization that consists also the structure of human resources functions, which greatly perceived NTIC influences. All these studies lead to the idea that human specific new organizational forms. The evolution of enterprise organization influenced according to company strategy. It must tend to an adocratic type structure, which should apply an important reference mark with those of Ford, Porter and Mintzberg and continuing with the

structure was the object of numerous studies as principles of value channel to its own activities. In this regard, emphasis should focus on the activity of knowledge management, cultural and organizational change, leadership, motivation and personnel achievement, and other activities to be only supervised.

Key words: New organizational forms, e-management, new techniques of information and communication, compatibility, human resources function.

JEL classification: M10, M12, M20, M21

1. Introduction

The degree of compatibility and correspondence between the internal characteristics of the organization, way of operation and type of environment the organization faces allow a configuration of a specific manner. This combination will inevitably influence the choices of the organization in matter of management, as previously interested several researchers in organizational design (Perrow, 1961) -a rational perspective; (Woodward, 1965; Burns and Stalker, 1961; Galbraith, 1973, Weick, 1979, Lawrence and Lorsch, 1989 -contingency

perspective; (Mintzberg, 1982; Lawrence and Lorsch, 1989; Giddens, 1979; Pettigrew, 1987;

Nizet and Pichault, 2000) with the political perspective).

In most cases, the types exposed by the researchers are found only partially in reality, they represent marks according to which the organization is placed, according to the models issued by different participants. It is important that they allow managers to be positioned thanks to these models proposed by different authors. However, these models of configuration described do not stand for long and then they should be updated.

The definition of organizational configuration given by Paillot emphasizes the need for enterprises to take account of multiple internal and external elements in their approach to effectively structure; it also states the fact that existing typologies are found only partially in reality, because they are only the main features of that reality.

The operational design of enterprise depends on two important restrictions:

- Internal constraints, developed by Mintzberg (2004), who wants to answer the question of how to organize enterprises.
- External constraints highlighted by Porter and Millar (1985), related to how enterprises are positioned.

Mintzberg (2004) undertakes the largest and most important synthesis ever made in scientific literature on the organizational phenomenon. As a result of intense research and synthesis, Mintzberg (2004) identifies various organizational configurations that can coexist with dynamic and its' transformations, configurations that organizations are facing along their evolution, such as the simple structure, mechanistic bureaucracy, professional bureaucracy, divisional structure and adhocracy. For Mintzberg (2004), the organization's structures may be included in one of the five basic categories listed above. He admits there are two types of adhocracy: Operational adhocracy (one unit of creation that evolves in a competitive market, such as an advertising agency or a producer of software) and administrative adhocracy (where work can be directed toward research, for example NASA).

Regarding their evolution, Mintzberg (1993) mentions that the models of simple structure and mechanistic bureaucracy correspond to the past;

professional bureaucracy and divisional structure are specific for today, while adhocracy represents the structure of tomorrow.

Aware of continuous change context in which organizations evolves, Mintzberg (1993) does not eliminate the perspective of further development of the structure according to different influences, already announcing two structural configurations: The missionary structure and political structure.

The two types occur after a thorough analysis of one of the contingency factors, respectively the power.

The above thematic approach allows the release of a central thesis, highlighting that any organization can be analyzed as a form more or less precise for these different poles, in other words and any concrete organizational form would necessarily be situated within these configurations. Political organization is characterized by the development of "illegitimate" power. When the enterprise is not able to install a stable system of authority, without a prevailing characteristic, conflicts evolve and get out of control, reaching the form of political enterprise, where each pursues its own interests. Some enterprises are just temporary policy, especially in difficult periods of transformation; others remain like this for long periods of time. The missionary organization is characterized by the harmony of veils and the beliefs of its members, which pays attention not only to internal powers, but also to common interests.

Each person can have a degree of latitude in the organization to which it belongs, indicating an almost pure form of decentralization.

To understand the manner in which enterprises formulate their strategy, Mintzberg (1993) is, thus, highly interested and he studies:

- The manner in which the enterprise is structured, as the structure is the basis for numerous organizational problems
- Factors of contingency, goals and authority system

Depending on the crucial variables-the conception of the structure, factors of contingency, goals and authority, the author defines five configurations. Each enterprise represents such a structure or a combination of them, being hybrid from this regard. During his research, Mintzberg

(1993) calls the rationalist theory, contingency and policy theory.

Actors build organizational context and then these structures are, in turn, restrictions on their action.

The second restriction in terms of structural configuration was developed by M. Porter (1998), who transferred discussions about enterprises' strategy to the marketplace, moving away from the idea of a theoretical concept that applies to different functions of organizations.

He also identifies the five factors that govern the competition and which are very useful to managers who try to analyze the conventional situation of their company:

- Rivalry between enterprises
- Threatening of new market entrants
- The threat of substitute products and services
- The bargaining power of suppliers
- The bargaining power of customers

These factors should be identified as clear, in order to define the best strategy to be adopted and, where possible, monitored their evolution. Based on these benchmarks, Porter and Millar (1985) defines five generic types of enterprise or structural environments: Dispersed, to come, maturity, decline and international scale. In terms of competitive advantage, the author considers that a company can have two types, through cost or differentiation. To estimate competitive position, Porter uses the method "value channel", which explores all the activities and their interactions, reveals the origin and influence costs, existing and potential sources of differentiation.

Channel value theory provides a framework for strategic analysis of the enterprises' activities and the cost evaluation for each of them and allows knowing the use of a possible differentiation among various activities. The profit of a company corresponds to the gap between the value of its activities and their cost, while the notion of value channel allows rigorous analysis of what is valuable for the buyer and makes him agree to pay a higher price than normal or even abandon a product or service in favor of another.

“Table 1: The specific characteristics of new organizational forms”

Groups of characteristics

General attributes

Globalization
Hyper-flexibility, adaptability
Continuous improvement, innovation,
Orientation toward "stakeholders"
Tolerance to uncertainty

Structural features

Payment structure
The absence of internal borders
Indistinctive external borders
Compatibility between the structure and work process

Decentralization
Network
Self-organization
Permeable borders

Processing of information

Integration of technology for telecommunications
Organization "electronics"

Conception of jobs

Empowering individuals and work groups (auto-control, entrepreneurship)
Continuous learning
Interoperable work, on team

Management

Leadership without control: Less directive and evaluation, more facilitation, communication, work network
Tolerance to ambiguity, trust in individuals

An enterprise strategy corresponds to a consistent configuration of its activities, which will allow a differentiation over competitors. Porter and Millar (1985) shows how the concept of valuable channel can serve as a privileged instrument to diagnose the competitive advantage. He describes the manner to decompose the enterprises' activities that are prior for this advantage and identifies the connections between them.

Porter and Millar (1985) suggest a valuable channel that takes into account New Techniques of Information and Communication (NTIC), which also make Roux and Soulier (1997). The introduction and development of NTIC contribute to the changing of the value creation process, to reduce restrictions regarding the location,

geographic position and transformation of the relationships with customers and suppliers.

Traditional forms of organization are based on a distribution of tasks and objectives, generating the notion of hierarchy and a report type of activity designed to ensure the systems' balance. This distribution may be more or less rigid and concerns an ideal and a high efficiency. Classical models of organization have a striking hierarchy feature, with defined roles and rigid compartment.

Currently, unchanging structure represented by organizations is not adapted to new requirements enterprises must fulfill. Butera highlights that this type of structure "remains essential for border demarcation between market and hierarchy, to maintain balance between strategy and structure to reallocate resources, but loses importance when it comes to defining the tasks and the manner of their address.

The review of the organization, reordering of roles and enrichment of missions of its component causes restructuring in order to get better efficacy. Today, from various reasons, many moves to restructure and change the organization can be seen, from which we can individualize the new organizational forms. Desreumaux (1996); Louart (1996); Miles and Snon (1992) have dealt with the concept NFO, highlighting specific characteristics (Table 1).

Comet mentions all aspects of organizational changes over time, which allows supporting the transition from standing bureaucratic organization to a procedural organization. She made several tables that illustrate the changes that have occurred in the division of labor, coordination mechanisms; change the systems of influence, the goals and values, environmental changes. To achieve the changes required by information and communication technologies, companies have adopted a vision through the process. Growing interest of companies for modeling processes may be referred by developing ERPs' and PGI's (collaborative activity programs). Technological developments arising from the occurrences of Intranet, Internet determine enterprises to have a profound reconfiguration, often identified as a reconfiguration through the process or BPR.

Use of Intranet in the company trains changes in depth, both in the manner of work (rhythm and content of work) and organization. For example,

management of "virtual" companies is allowed by the development of these technologies. New technologies of information and communication allow the radical organization and (put in question) phasing result in functional organization, which seems misfit to economic environment and technological developments. Hammer and Champy suggest replacing the cut function in the activities around an aggregation processes occurring in the enterprise. The vision of the enterprise, where it is considered an aggregation of processes enables an effective and efficient change of organization in relation to its internal and external environments. With the support of NTIC, a specific form of virtual enterprise is developed. A new form of organization is now the network. Kiosur considers virtual organization as "an entity composed of members who perform the same work and communicate exclusively through electronics which suppress almost entirely physical meetings". Other authors refine their views, claiming that the organization may not be entirely virtual, this quality can be manifested at various levels: Local, organizational or inter-organizational. Scouarec and Yanat distinguish two cases of establishment of network organizations:

- The cross crews consisted to achieve a specific mission in an organization
- Grouping of separate entities to perform a certain task. This form of organization is opposed to functional enterprise, characterized by stiffness, especially in terms of reference of time and space. It shares mobile borders, is based and provides the appearance of new skills

These changes do not remain without consequences on management models, because, besides the change the structure, organization-network cannot operate independently of a review of management powers.

As enterprises are subjected to extensive changes, due to factors that influence their strategy and structure, their subsystems also, go through the same transformation. Since the 1980s, the human resources function has known a dynamic evolution, tending to decentralize, to reduce the vertical structure and to outsource tasks both inside and outside the enterprise. Literature study reveals some consistency between the configuration and policies of human resources management. Organizations with their structural configurations

are complex entities, various and multiform, such as their relationships with human resource management are manifold.

In terms of developments that have known human resource management from the beginning of the XXth century, Pichault (1996) offers a short, but interesting, history allowing specialists to form an overview of these changes, grouped into three stages:

- Human resources management focused on personal activities, defined by Belanger and Petit (1998) as "all activities of attraction, development and conservation of human resources, aiming to provide to working structures a productive labor, stable and satisfied"
- Systemic management of human resources, integrated gradually as a system in the enterprise. Human resources function interacts with other organizational variables to answer enterprise objectives and combine economic success with technical success and the social engineering
- Strategic management of human resources, through which function integrates to enterprise strategies and approaches to management

This presentation captures well the transition from a human resource management which manages its own activities independent of any other variable (Phase I), then, secondly, the emerging needs to integrate this function with other organizational components to make the overall process more efficient. The integration process lasts long enough, because only in the 1980s the function has its place in the establishment, while the prerogative in enterprises was to restore performance and competitiveness objectives.

“Table 2: Correlations between structural configurations, the dominant actors and models of human resource management”

Structural configuration	Dominant actors
Entrepreneurial management	Strategy Arbitrary
Bureaucratic techno-structure	Specialists from Objective

It also responds to managers who want to know their effects in improving human resources performance in enterprise and the effectiveness of

Emerging of strategy notion inside the function and the fact that with the organizational strategy, an important role is also held by the strategies of the organization' players, train human resources management to a political management.

Activities and practices of the function are widely redesigned under the influence of two phenomena:

- The development of new forms of organization, such as virtual enterprises and now network
- A significant increase of use the New Techniques of Information and Communication (NTIC) by enterprise staff

The first cause of deep changes that faced and are facing human resource function is the organizational change of the enterprise, started by NTIC. Huault (1998) considers that new forms of organization lead to a redefinition of roles and functions within the enterprise, reducing the level and power of hierarchy but also the emergence of new setting and a profound evolution of human resources function.

The second cause of mutations that occurred in the functions of human resources is an increasing use of NTIC within the enterprise activities. Function must deal with complex mechanisms and have an immediate responsiveness to management earnings, forecast of the effectives and skills, in management of work time.

From this point of view, NTIC participate and support services of human resources and make the necessary changes in anticipation of structuring and proper functioning of the office. Study of Matmata, regarding the place of human resources function towards these changes, answer to the will of understanding and analyzing the impact that NTIC has on it.

Professional operators	Qualified Conventionalist
Missionary officially designated actor	Without an Valuable
Adhocratic operators	Models of human resources management
individual/hierarchical line	Qualified Based on an

human resources function in its performance for operational structures.

Several research studies, but also the reality of today reveal that information technology will have

a strong impact on the activities, location and direction of human resources, because it amends individual and collective work situations, but also operational processes of the channel. This way, significant changes in the channel value of enterprise take place. The academic thinking ranks human resources function mutations at the evolution of the work structures level, its missions that can be decentralized, outsourced or kept in the same service, but also to the level of each roles in reaching the specific objectives.

Henriet (1999) considers that human resources function has gained new features which may be formulated as follows:

- A new configuration, characterized by decentralization and reduction of hierarchy, mainly to increase its reactivity
- A new strategic dimension, taken to obtain a competitive advantage by refocusing on the issue of competencies and outsourcing of activities not covered in this new feature of function
- New powers in the human resources function

Human resources function is in full transformation, characterized by processes of dispersal and delegation. The first process involved a large movement of decentralization and reduction of central services, simultaneously with research responsibility of actors closer to the field.

The second process was possible because of NTICs' influences, which authorized the emergence of an initial redistribution of the function, increasingly decentralized at the operational level, sometimes even relocated outside the organization borders.

Today enterprises are refocused on their base occupation and outsource some of the functional and administrative areas considered non-strategic. This follows a redeployment of forces and their professional resources to new roles, with lower costs and with high added value. As outsourced activities we can mention payment, selection of candidates (recruiting) and training.

New organizational forms that have appeared in the enterprise do not remain without consequences in terms of issues facing human resource management specialists in their role and mission, but also the structure and position functions as such. These developments do not have a radical character, since this is more than a change

in the context of action faced to the organizational changes. Many researchers urge caution regarding the influence of organizational structure movements on human resources management, considering the differences between what is said and what is actually done in the enterprises. It remains essential that between the organizational structure and human resource management there must be a compatibility, to provide the good functioning of the enterprise.

Interesting, are from this viewpoint, the proposals of Nizet and Pichault (1996) which based on the five structural configurations of Mintzberg (2004), identify five basic models of human resource management: arbitrary, objective, individualized, conventionalist and valuable. These models are, according to two researchers, dependent variables from structural configurations (Table 2).

The study of compatibility between organizational structures and human resource management was the object of several debates in the trade journals. Henriet (1999) tries to provide an answer concerning the implications that organizational transformations have on human resource management policies, but also on how human resources policies participate in making these changes. Human resources policies play a key role in facilitating the development of new cultures and successful launch of the new technologies of information and communication, being active elements in the process of change. Interactions between organizational changes and introduction of NTIC, in which human resource policies are active elements of change, are induced in the Figure 1.

“Figure. 1 Interactions between organizational changes and introduction of NTIC”

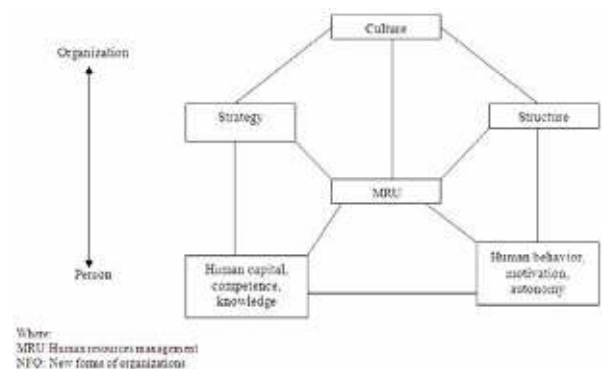

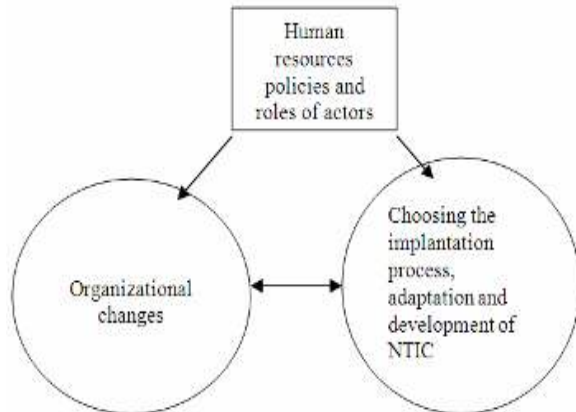

Figure. 2. The place of human resources management in the NFO”

Because of their role and position, human resources and organization actors are in the center of change, especially those caused by NTIC. From another perspective, it is possible that some changes motivated by different factors to claim NTICs' development. The role of human resources is fundamental here, considering the choices they must make in accordance with the organizations' objectives.

Louart (1995) considers that besides the impact of NTIC, human resource management depends on many factors:

Organizational contexts, especially the internal structures and their environments

The actors point out in the company, with their influences of power that they own;

Uncertainties about the desire that these actors work together

It is clear that human resource management changes depending on organizational developments, being consequential in the heart of change, but also their catalyst. The same is sustained by Chambrier, who noted that under the influence of organizational developments human resource management changes and realize change. "The relationship between human resource management (MRU) and organization in the New Organizational Forms (NFO), figure.2, are placed to the exigency level of a direct participation of human resources in new practices of work...passing from the logic of minimizing the influence of human variables on systems performance to a logics that seeks to integrate human variables to relentlessly improve enterprise performances".

Regarding the involvement of human resources function in technological changing, its organizational structure is most appropriate in assessing the interaction between technology and work organization. It is able to provide organizational and human constraints to support the introduction of new technologies, to judge organizational changes to be made to make suitable structures to facilitate optimal use of NTIC. Human resources direction is also the one who should construct appropriate training programs and foster a culture of continuous learning, Jacob and Ducharme (1998) conclude that the essential of such approach is to adapt to the context of single organizations and function and that there is no other form of success.

Regarding the position that the human resource function will have to take in the technological change, the two authors mention that the treasurer should adopt in this case the anthropocentric paradigm, because the development and use of knowledge are applicable to each individual.

2. Conclusion

Organizational changes required by enterprise strategy should have a direct and immediate correspondence with the structure of human resources function.

The paper points out that change in the organization and those of human resource functions overlap interact with each other, hence the need for compatibility between the two assemblies. Human resources function must be the first component subject/object of organizational change required by the environmental strategy and by NTICs' influences. It has to experience these changes and to extend them to the organization level. To truly be a promoter of change, the human resources function should use the "value channel" model, and focus on those activities that enhance its contribution to creating value for the enterprise, such as, knowledge management, culture and organizational change, leadership, motivation and involvement, etc., leaving others only in supervision state.

Privileged position and its new content gives to the function of human resources the potential to achieve the first an adocratic structure.

Evaluating Online Destination Image by Analyzing Pictures Used in Presenting Romania on Websites

Oana Catalina VICOL
Sinziana SPIRIDON

Doctoral School of Economics, "Al. I. Cuza" University, Iasi, Romania
oana.vicol@rembrand.ro
sinziana.spiridon@rembrand.ro

Abstract

The purpose of the present paper is to evaluate the main elements transmitted through pictures used in developing Romania's image as a touristic destination with application in developing a more coherent and unitary strategy of online promotion. We evaluated a sample of 667 pictures collected from 15 Romanian and foreign websites. Results show a high percentage of what we call commercial elements as hotel exterior and interior images and a lack in promoting Romanian cultural and natural treasures.

Key words: Romania, tourist destination, Internet, website

JEL classification: L83, M39

1. Introduction

Starting from the more simple consideration of the tourist destination as a product, studies in this field have reached today to a much higher level of complexity. The analysis of tourist destination is presently approached from four different perspectives: economy geography-oriented, costumer-oriented, marketing management - oriented, and cultural [10].

Regarding the image literature, there are three ways accepted to think about it. The first one approaches image as a composite construct that means that the image is based on the attributes/perceptions/ associations/ impressions that an individual have on a tourist destination. The first definition accepted by researchers it has been given by Crompton in 1979 and defines the

tourist destination as "sum of beliefs, ideas and impressions held by people about the destination" [13]. The second is the attitudinal construct introduced by [4]. They consider the main part is the cognition, the physical traits, and affect [2], the emotional response. In the third concept - the societal concept- the focus is on the socially constructed consensus of reality.

Gartner (1993) classifies the sources of information received as base of the process of destination image formation is based in organic and/or induced sources. The organic sources include to news, movies books, school, movies, etc.– materials that don't have the objective of advertising a specific destination; the induced sources include videos, brochures, advertisements, posters, the Internet and other marketing and communication instruments used to promote a destination.

2. Internet influence on destination image formation

It is well known that the internet occupies today a major part of our lives. This way the internet has become an important channel of communication in the tourism field. Expressed in a marketing language we can say that the internet is a perfect channel for the tourism industry because of its intangibility, high perceived risk and high price.

Regarding the demand of touristic information on the internet, statistics show that an increased number of individuals are using the internet for information about the destination they want to visit. Here they find almost any information they need about a city, country, village or something else. The challenge is on

the offer-side to create and promote using the internet destinations that are on the top of the list of their potential clients [7].

3. Destination image online

In [12] there are compared materials regarding the presentation of Russia as a touristic destination existing on the Russian and US websites with the purpose of identifying the main differences between the most frequently mentioned places from Russia and the description of Russia as a travel destination. They analyzed the text of 212 US and Russian tour operators, official sources, and travel guides.

[11] analyzed the image representations of Macau on the Internet by using both qualitative (text mining and expert judgment) and quantitative approaches (correspondence analysis).

Among the studies dealing with content analysis of textual and/or pictorial materials are also [3], [5].

4. Content analyses of destination image

In the literature, the destination image is most approached as a three-dimensional continuum of destination image; functional-psychological, attributes-holistic and common-unique [4], [5], or composed by three components cognitive, affective and conative hierarchically interrelated [6].

In both situations, the measurement should contain unstructured and structured methodologies. A major part of the constructs used to analyze the destination image are using multivariate or bivariate structured techniques.

The combination of both quantitative and qualitative methods of collecting data has been recognized by the majority of researchers. The qualitative method is the preferred way to discover the holistic and psychological levels, that can't not be an easy approach by using the quantitative methods [4].

Qualitative content analysis includes manifest content and latent content [1]. The manifest content can be identified through the process of naming and translation, while analyzing images at a latent level involves the subjective

interpretation of “the structure and set of rules – the codes – that transform a picture’s compositional appearance into a shared and meaningful message” [1].

With the increasingly rich and readily available text data on the web, qualitative assessments such as content analysis of image formation and other tourism phenomena is gaining in popularity. [8] proposed that while visitor-determined images reflect individual differences in information processing and interpretation, destination determined images mirror the actuality of the destination. Therefore, it is important to test whether the images presented in promotional materials correspond to those held by visitors. Although image is formed through the subjective evaluation of external stimuli [6], it may be as important to discern what stimuli are delivered by destination marketers. The examination of the effects of projected images through various information channels could become an integral part of image formation research. Some previous studies have investigated the pictorial or verbal contents of promotional materials from the perspectives of the research subjects after exposure to the messages [8]. [9] argued that content analysis of written information, such as guidebooks and travel brochures, could provide a great deal of information about the images projected by a tourism destination. They conducted an exploratory study on the contents of Ireland’s promotional materials distributed in the French market and developed a master list of attributes measuring French residents’ perceptions of Ireland as a destination.

However, this study only examined the printed promotional materials provided by the Irish national tourism organization. Online information and other commercial information sources were not analyzed. Further, the destination attributes identified were based on the researchers’ subjective judgments. [12], however, examined the online content of tour operator websites about Russia. They found that within the 212 websites analyzed the US and Russian sites were portraying different images of Russia as a tourism destination.

5. Methodology

Using Google AdWords Keywords tool we generated 3187 keywords starting with a first seeding keyword “Romania tourism” and using at each step new seeding words from the list generated by the previous keyword until the new generated list had very few or no new relevant keywords.

This method of identifying websites from which to select images to analyze has been chosen due to the fact that the present paper has as purpose to evaluate the image transmitted by Internet not just created and posted on the Internet. We therefore chose to use a method of selecting the websites with the most exposure to Internet users.

In a second stage, from the 3187 keywords obtained we have selected 115 keywords on the following criteria: to contain the word “Romania” or “Romanian” and one or more of the following terms: “travel”, “tour”, “tourism”, “tourists”, “touristic attraction”, “travel agency”, “travel guide”, “touristic guide” – indicating an interest in the touristic aspects of our country.

Using these 115 keywords in Google search engine we generated a number of 2186 websites from which we have selected for analysis a number of 17 websites each of them representing more than one percent of the links offered by Google in the first two pages of results. We had eliminated 2 from these websites because of the lack of an English version of the site, analyzing therefore a final set of 15 websites:

Tabel 1 – List of websites from which the pictures have been collected

Website	Freq.	%
www.romaniatourism.com	98	4,5
www.wordtravels.com	48	2,2
www.deltatravel.ro	42	1,9
www.rotravel.com	39	1,8
www.infohub.com	38	1,7
wikitravel.org/	33	1,5
www.virtualtourist.com	30	1,4
www.lonelyplanet.com	29	1,3
www.romaniatravelcentre.com	28	1,3
www.goromaniatours.com	27	1,2
en.wikipedia.org	26	1,2
www.worldtravelguide.net	26	1,2
www.visittransilvania.ro	24	1,1
www.tripadvisor.com	23	1,1
romania-on-line.net	22	1,0

For the collection of pictures we used Extreme Picture Finder downloading pictures from pages within a 3 links depth in the website and more than 10 kilobytes in size (Govers, Go - 2005).

We analysed 667 pictures registering three main elements: objects or appearances in pictures, context and geographical localization of places represented in the pictures. We have defined 117 initial object or appearance categories.

6. Findings

The results show a high presence of pictures representing hotels. 24,7% of all pictures include exterior view of a hotel and 4,9% the interior view of a hotel.

The natural beauties of Romania are present in a lower percentage: mountains are the most present element of nature being included in 9,3% of the pictures, lakes in 1,6%, Black Sea in 1,2% Danube Delta in 0,8% and various rivers in 0,4% of the pictures.

Figure 1 – Presence of natural elements in pictures

Various monuments are present in 9,1% of the pictures. Buildings are the most frequently present element starting with monasteries present in 4% of the pictures, and continuing with ordinary buildings, in 2,6% of the pictures, churches, in 2,6% of the pictures, castles and fortresses in 2,1% and respectively 1,9% of the pictures.

The religious symbols presented in pictures representing our country's image represent a total of 11,7% of all the elements encountered in the analyzed pictures representing monasteries, churches, cathedrals, synagogues and sisters.

Figure 2 – Percentage of elements with religious significance in total elements

Castles, fortresses and palaces have been observed in 4,7% of the pictures representing 7% of the elements.

Traditional elements as old wooden houses, traditional clothing, painted eggs and other elements are referred to in 3,5% of the analyzed pictures.

Symbols of culture as museums, opera, the Ateneu are present in only 0,9% of the analyzed pictures.

Transportation elements as boats, ships, cars and vans are included in a percentage of 2,4% of pictures.

7. Conclusions, limits and further research

The results indicate a stronger orientation towards the strictly commercial aspect of Romania destination image through the significantly higher percentage of hotels views in the pictures analyzed. We must mention that this direction is sustained only by the hotel element, because any other elements associated with the touristic infrastructure: air ports, cars, entertainment places are not included in a significant percentage.

The promotion direction to follow as suggested by the obtained results should pay more attention to our cultural and natural riches.

The main limits of the present research are determined by the small number of websites analyzed and their typology. From the current sample are missing blogs and forums, sources of information with particular characteristics that might influence significantly the image of Romania.

The second limit taken into consideration is the fact that in the generation and identification of the websites we only chose general keywords as "Romania travel" or "Romania travel agency". The initial set of 3187 keywords obtained contain very various keywords referring to certain geographical area of Romania, main attractions and monuments, famous Romanians and so on. For our next project we propose to classify the complete set of keywords on relevant categories and to use a larger and more various set for generating the websites for pictures collections. We think that this approach might reveal more focused websites (oriented on presenting only one area of our country and not all of it) and more distinctive in structure and approach.

We also have in mind combining the analysis of image destination in pictures with content analysis of the text.

Enhancement of Collectivities' Autonomy from Administrative-Territorial Units in the Management of Local Public Administration

Petronela Zaharia
Irina Bilouseac

“Stefan cel Mare” University of Suceava
petronelaz@seap.usv.ro
irinab@seap.usv.ro

Abstract

With a distinct status in relation to the state administration, the collectivities in the local territorial-administrative units can manage themselves without the intervention of any other structures. Having local autonomy, the authorities of the local public administration have initiative and full responsibility in the administration, management and resolution of common affairs, towns, cities and counties, the latter being regarded as parts of the where autonomy is exploited.

In the light of the matters presented in our scientific approach, we can certainly support the idea that local autonomy, an essential factor in the organization and functioning of public administration in territorial-administrative units, is one of the most effective forms of self-administrative economy, allowing the rapid satisfaction of local interests.

Key words: public administration, local autonomy in administrative-territorial units

H83

1. Introduction

Under the condition of promoting local interests, we cannot ignore the principle of local autonomy, which is crucial to the functioning of local administrative-territorial units. In this regard, in the pages of this paper we are going to debate all the requirements whose existence guarantees the achievement and enhancement of local autonomy, in terms of its primary role in meeting the needs that arise in the village, town, municipality or county, constituent parts of the state.

Undoubtedly, we are in the presence of a genuine and strong governance structure when a structure does not retain complete jurisdiction and power to itself, but gives it to the governing bodies of administrative-territorial units, holders of local autonomy, which have the right to exercise that autonomy on behalf of citizens and for citizens.

2.Regulations and legal determinations in the current legal administrative context

Both the Romanian Constitution and the Local Public Administration Law no. 215/2001 regulates the basic principles of organization and functioning of public administration in territorial-administrative units, among which local autonomy is a part, which all other principles are subordinated to, that being regarded as a crucial element which should not be ignored in encouraging and strengthening local democracy.

According to the dispositions of article 120 paragraph 1 of the Fundamental Law, “public administration in territorial-administrative units is based on the principles of decentralization, *local autonomy*, and deconcentration of public services”. Therefore, local autonomy is a principle of constitutional status, governing local public administration and the activities of its authorities.

Besides the Constitution, Law no. 215/2001 places local autonomy in the organization and functioning of local government. Thus, according to article 2, paragraph 1, “public administration in territorial-administrative units is organized and operates under the principles of

decentralization, *local autonomy*, deconcentration of public services, the eligibility of local authorities, legality and consultation of citizens in solving local problems of special interest”.

As for the etymological meaning of the term 'autonomy', it is derived from Greek, in which the prefix 'auto' is translated by one, by itself, independent and 'nomos' means law. Thus, the concept of autonomy can be understood as the right or freedom to govern by own laws. Given the position of the various communities located within the state, they are autonomous only insofar as their power of self-management is recognized, in terms of independence from central government authority.

Article 3, paragraph 1 of Law no. 215/2001 defines local autonomy as “*the right and effective capacity of local authorities to resolve and manage, on behalf and interest of the local collectivities they represent, public affairs, under the law*”.

In a similar way that text can be found in the European Charter of Local Self-Government [5], which fundamentals the principles of democracy and decentralization of power, as the defining elements of local autonomy, assuming the existence of local government authorities endowed with decision-making bodies, established in a democratic manner and benefiting from an extended autonomy in terms of skills, how to exercise them and means to fulfill their mission [4]. Thus, following the creation of an administration, both effective and closer to citizens, the Charter recognizes the existence of local authorities, entrusted with actual responsibilities.

According to article, 3 section 1 of the Charter, “local autonomy means the right and effective capacity of local authorities to resolve and manage within the law on their behalf and in the interest of the local population, an important part of public affairs”.

We cannot overlook the fact that while the Local Government Law defines local autonomy as *the resolution and management of public affairs* and refers to all public affairs, the Charter refers only to *a substantial part* of them. *Resolution and management* entrusted to the local administrative authorities do not refer to all the needs of administrative-territorial units, but only to a part of them, respectively the *important part* of public affairs. Governing the scope of activity and competence of local authorities, the

law is the one which exhaustively states that part of public affairs.

In our case, local autonomy statute confers a distinct status to communities and local authorities in relation to state administration, representing *the recognized ability and freedom of local government to decide alone on how to address and meet their own problems and interests*.

Thus, authorities operating in territorial-administrative units remain responsible for managing local affairs, as distinct communities that should enjoy local power, i.e. local autonomy [3].

3. Conditions that guarantee the achievement and enhancement of local autonomy in administrative-territorial units

To be in the presence of local autonomy, certain conditions have to be met whose existence would guarantee the legitimacy of this principle.

3.1. The first such requirement relates to *the existence of a local authority within an administrative-territorial entity*, i.e. a group of people in need and concern, distinct from national need and desire.

Exercise of local autonomy by public authorities, respectively local councils and mayors as well as county councils and their chairmen (article 3, paragraph 2 of Law no. 215/2001), is administered only in conjunction with local communities in the area of administrative-territorial units of the state. According to paragraph 3 and paragraph 4 of the Local Government Law, “local community means all residents of an administrative-territorial unit”.

Although local, city, municipal, or county collectivities viewed as separate components of the state and form an integral are part of the great social community, they raise specific issues and show their needs related to the local matters, such as water supply, construction, maintenance and upgrading of bridges, street lighting, etc. In such framework, local autonomy is based on the idea that people themselves in villages, towns, municipalities, counties are in the best position to observe the detailed requirements occurred in administrative-territorial entity

and therefore all these are the most interested and also the most entitled to act in order to meet them. Seen as a key factor in ensuring the smooth functioning of local government, local autonomy claims self-operative advertising decisions by the competent authorities to resolve and manage public affairs, decisions tailored to local circumstances and with full knowledge of the needs of the inhabitants in the administrative-territorial units under discussion.

3.2. Another requirement to be met in order to achieve local autonomy regards *the existence of appropriate means, material and financial, available to the local community, whose management is carried out under the responsibility of the collectivity* [1].

As local interest issues must be resolved by administrative authorities of municipalities, towns, cities and counties, so the latter must have material and financial resources that will be used for self-management. Specific needs of local management are regulated by Law no. 215/2001 on local public administration which states, according to article 4, paragraph 2, that the local autonomy equally regards “the management of the resources that belong to the village, city, municipality or county as appropriate”.

So, without being a simple theoretical principle, local autonomy is manifested in terms of management in the activity of social collectivities at the local level. Villages, towns, cities, counties have their own heritage and revenue which they use to solve their village, town, municipal and county problems. The material support of self-government is represented by the public property of administrative-territorial units, namely land, material resources, social institutions and cultural buildings, etc. as well as the revenue from local budgets, and non-budgetary revenues.

The management of affairs of the territorial-administrative units is the responsibility of local authorities which acts on behalf and in the interests of local communities they represent. In other words, the management of values and cash of administrative-territorial units is the job of local authorities who are concerned to obtain what is useful, favorable and necessary for the collectivities on whose behalf they act, seeking, thereby to promote their interests. But for local bodies to decide for the community, they must have the resources necessary and sufficient to ensure implementation of operational and practical courses of action and ways of achieving

them. We can talk about self-management only if the administrative-territorial units have enough revenue from the local budgets in order to cover the costs of achieving efficient management of local issues and good governance [3]. Moreover, increasing financial autonomy of territorial administrative units and their local budgets incomes makes up a separate section of the current government, thus being aimed at taking control of certain categories of income by the local authorities. (According to Chapter 19 - Public Administration Reform within the 2009-2012 government Program, the measures meant to increase financial autonomy of territorial administrative units and their local budget revenues are: granting local authorities the right to change the local taxes according to local needs and level of supportability of the population, calculating the taxable value of buildings and land in built-up settlements by reference to their market value, reviewing the income tax rates broken down according to the new powers transferred to local authorities in the decentralization process, and full allocation to the local budgets of the amounts collected from fines from legal persons, just as those fines received from physical persons.) Of course such measures are welcome, in the context of a specific self-government which meets the demands of local communities, viewed as beneficiaries of local autonomy, but only if based on financial support to be managed by local government.

3.3. An essential factor in ensuring local autonomy is *the eligibility of the management organs of administrative-territorial units*.

Intending to emphasize this requirement which highlights local autonomy, Local Public Administration Law expressly provides the eligibility principle of local authorities (article 2, paragraph 1), along with other principles which have already been mentioned earlier in this study. Community members should have the right to elect local government bodies, as representatives of territorial entities and not as representatives of the executive power at local level. In other words, to be in the presence of local autonomy it is necessary to hold local elections for the designation of specific governing bodies of the local power.

The fact that the voting population that resides in the territorial-administrative unit designates itself without the intervention of other structures, the authorities who should represent their interests highlights their autonomous nature.

An authority is autonomous only when elected, the elective system allowing the residents of the administrative-territorial units to self-manage through their own organs, thus having the opportunity to solve problems that concern them directly.

Local public administration authorities which local autonomy is manifested through are elected by universal, equal, direct, secret and freely expressed vote, in accordance with the Law for the Election of Local Public Authorities (article 1). The wording of paragraph 2, article 3 of Law no. 215/2001 results that authorities that have local autonomy are: local councils and mayors - at county level, county councils and their presidents - at county level. Deliberative authorities of public administration in territorial-administrative units, local councils and the county ones act for the benefit of communities and make decisions for better management of municipal, town and county respectively. Mayors and presidents of county councils, local executive authorities, bring out the decisions of deliberative bodies, having the mission to manage the affairs of administrative-territorial units in which were chosen, for the benefit of those who appointed them.

As an justification of local autonomy, among public bodies that manage local affairs there is no hierarchical relationship of obedience to some over others, situation which results without doubt from article 6, paragraph 2 of Law no. 215/2001, according to which "in the relations between local government authorities and county council, on the one hand, and between local council and mayor, on the other hand, there is no subordination".

By their election by community members, these bodies appear as expression of the will [2] of the local electorate, central state authorities taking part in no way in the elective process. These bodies are empowered by their very electors to act for a good administration of the community, and not by the central government.

But if the population residing in the administrative-territorial unit elect their governing bodies, the latter are likely to follow the achievement of their own personal interests. Often, the local elected representatives are

surrounded by suspicions regarding the honesty with which they fulfill their mission to ensure good governance of the community.

3.4. Another requirement which is of great importance in achieving local self-government regards *the independence for the exercise of the public authorities' powers in administrative-territorial units*.

To ensure a genuine local autonomy and to resolve issues of local interest it is necessary for autonomous local government bodies to enjoy the power to give them the right to self-government bodies in relation to the public administration central bodies.

Moreover, as we already stated above, local autonomy is based on the idea that those who best know their needs are the very local collectivities, the latter being therefore the most interested in satisfying their needs. The Public Administration Law provides in article 5, paragraph 2 that "local autonomy gives local authorities the right, within the law, to take initiatives in all areas except those which are expressly given in the jurisdiction of other public authorities".

Therefore, important in guaranteeing the independence of local authorities is a clear delineation of their powers. The functioning of public administration in territorial-administrative units is based on the plenitude of power country in solving problems of local interest.

The administrative-territorial units in which local authorities work enjoy legal personality distinct from that of the state, being parts of the state structure, therefore being recognized the autonomous situation of local self-government bodies in relation to central bodies. But the autonomy of these local authorities is not without limits, meaning that all their powers is established by the state, and their entire activity must be recognized by it. Thus, we should not consider this independence as isolation of the local public administration bodies from the governmental structures.

3.5. *Consultation with local people in addressing important local problems* gives substance to local autonomy, that principle ensuring the balance of governance [3] and also guaranteeing the cooperation between rulers and ruled to identify the best solutions to meet the needs of the latter.

The involvement of citizens in resolving issues of local interest appears as an element that we cannot dispense of in ensuring local autonomy, since in this way to give local communities the opportunity to participate in finding solutions to problems that arise locally.

Consultation is binding, since the legislature raised it to the level of principle, being stated both by Law no. 215/2001 and Law no. 3/2000 on the organization and holding of a referendum, which in article 14 provides that issues subject to local referendum are determined by local or county councils, as appropriate, at mayor's proposal, respectively at the county council president's proposal. We may interpret that those who have the right to decide which issues can be the object of a referendum are the local council and county councils. Therefore, local authorities have the right to assess the problems which citizens are called upon to decide and that decision to be adopted by local authorities must take into account citizens' views and comply with their needs.

The priorities are fixed by common agreement, through consultation, in this way citizens being able to intervene in the administration of community interests. Only asking citizens about matters that affect them closely, will identify their real needs and will be established the ways to act in order to ensure efficiency and effectiveness in serving local priorities arising at local level.

3.6. Local authorities have autonomous character, but their autonomy is not total independence, so authorities of villages, towns, counties are under a degree of *control exercised over them by the central power* or even by the local representatives of central power.

This control, named administrative trusteeship, is an indispensable element in ensuring local autonomy based on which central government authority and its local representatives have the right to control public administration authorities' activity in territorial-administrative units.

As mentioned above, local authority holders, democratically designated by the inhabitants of administrative-territorial units, have full responsibility in resolving local affairs, so they can issue administrative acts, but only after these measures have been approved by the central authority mentioned by law. The administrative trusteeship is nothing else but the right of tutelary authorities to approve, cancel or suspend

certain acts of the autonomous authority, for legality reasons.

Administrative supervision problem arises only in the case of those administrative authorities that do not have hierarchical subordination, between a subject within the executive power and one from outside. The tutelary control is exercised either by the central bodies of executive power, government or ministries over county councils, or the prefect on mayor's, municipal or county council's acts. So we cannot speak of administrative trusteeship between the central bodies of executive power – the Government, ministries – and those that exercise this power locally or at county level – the prefect and the decentralized services of ministries.

Absolutely necessary in autonomous administrative activity, tutelary control allows central authorities to ensure guardianship so that local interests shouldn't be achieved at the expense of central interests. Also, seeking to preserve state unity, the central authority must ensure, through this control, setting limits on recovery of local autonomy.

4. Conclusions

Based on the matters dealt with in the present study, we can conclude that only by giving recognition to the autonomy of local collectivities within territorial-administrative units will improve the economical situation of the members of the community and will also lead to efficient use of their resources to address the local public affairs in an accelerated way. Investigating the conditions which bring value and by reference to which local autonomy is shaped allows us to underline its prominent role in building an autonomous administration, effective and democratic.

Real Option Techniques in Project Management

Mihaela Mateescu

Gabriela Suba

CEIS, Romanian Academy

E-mail: mateescuadina@yahoo.com

E-mail: gabisuba@yahoo.com

Abstract

The paper deals with elements concerning the application of the new “real options” approach system in project management of small and medium sized companies. The real option approach has the advantage of a great flexibility when a high degree of uncertainty is present. Also, it suggests to estimate the maximal profit obtained by investing a certain amount of capital using: updated monetary flow methodology, Monte Carlo simulation method and other stochastic optimization techniques like those using minimum and imposed risk problems. Generally, this new approach was used in the project management of large companies.

Keywords: project management, real option, technologies, risk.

JEL O16

1. Basic elements concerning real options concept

The new real option system regards the strategic management and decision taking process as a process aiming at the same time, at the reduction of risks and enhancing of favourable opportunities. Real option approach takes into account the investment financial system (particularly shares) and also other fields concerning decision making in risk circumstances (e.g. project assessment in a market input-output organization restructuring and reintegration, taking over new technologies concerning climate change decision making, organization reintegration, biodiversity, etc).[2]

This approach is used in various activity fields of modern companies: market covering and developing finance, human resources management, technology and knowledge management, etc.[4] It represents an important change in strategic management but it is relatively almost unknown, despite the fact that it was adopted by many large trusts like: Airbus, HP, Intel, Toshiba, etc. At a macroeconomic

level financial system efficiency is based on a thorough assessment of risks and a good project management. Real options approach is a crucial analytical instrument for this assessment and is also the connection between the financial system and the project management sector for actual investments.[8]

2. Financial options connection – real options

Real option approach is based on financial options working systems on Futures stock exchange. A financial share gives the owner the right but not the obligation to buy (or to sell) a given amount of shares in the future at a predetermined cost. The share owner will execute the option only if it is profitable. That is the cost on the market is high; otherwise the option is not executed and the bonus (the amount paid for the right of exercising the options) is lost (Fig.1).

In time it was found that some actual investments are correlated with financial options.[1],[11]

Let's consider the example of a plane ticket. A fixed date plane ticket is cheaper but the loss in case the owner is ill represents the whole cost of the ticket. In exchange of an additional bonus the ticket may be returned or another departure date may be chosen. In this case, if the flight is not possible the ticket can be returned and so the loss is limited to the additional bonus.

Similar options can be found for planning strategies in project management or in project financing.[7] So, project managers can forecast the possibilities of some reactions to various risks occurring during the ongoing project so that when costs are similar to option bonuses the losses are limited to this cost, the manager being able to choose another way or to give up the project when it becomes unprofitable.

Figure 1 Nonlinear Payment Function

3. Risk categories

The risk is regarded as an exposure to uncertainty for which most of the investors show some aversion, because investors are interested in obtaining maximum profit from a share, respectively from an invested capital. On this basis were defined a set of models dealing with risk and gain. In this models the risk is divided into two components:

- Systematic risk affecting all investments on the market;
- Specific risk affecting only specific investments.

According to some of these models the expected gain is proportional with the systematic risk associated to the investment. As the investments are practically different in a certain field, only the specific risk shows the benefits are proportional with the exposure to the systematic risk.[6]

Risk level can significantly change in various phases of the project (development, research, marketing).[3]

4. Assessment binomial model

Ordinarily every option is connected to the value of a share. So, the future value of the option directly depends of the future value of the share. For this reason the current cost of the share and its future development is most important information for the assessment of the share which can be considered as representing a part of the assets of the company.

The actual cost of a share S – represents the market value. After a given time interval the value of the share can evolve to two possible

limits. Let highest value be S^+ and the lowest be S^- . The fraction S^+/S is called growth factor u and the fraction S^-/S is called reduction factor d . Actually the cost of a share can take an infinity of values after a certain time and taking into account several intervals one can obtain a most realistic distribution of the cost of a share.

Volatility σ is a measure of the total risk of the share and is used as a magnitude of the uncertainty concerning the cost variations of the share. For the binomial model a combination of factors u and d may be calculated as below:

$$u = e^{\sigma} \text{ and } d = \frac{1}{u} \Rightarrow S = \begin{cases} S^+ = u \cdot S \\ S^- = d \cdot S \end{cases}$$

At the end of the interval the net gain is given by the cost of the share minus the X fracture value. If the value of the net gain is negative the option is not executed and its value is zero. The future values will be noted C^+ , C^- and the actual value C .

$$C = \begin{cases} C^+ = \max(S^+ - X, 0) \\ C^- = \max(S^- - X, 0) \end{cases}$$

Eventually, the binomial model shows a computed equivalent of the real option similar to that of the model computed using the formula Black and Scholes for financial options.[10]

Table 1 Elements for the assessment of the options

S	Actual value of the share (of the investment)
(S^+, S^-) or (u, d) or σ	Assessment values for the future development of the investment
X	Fracture cost
r	Interest rate for zero risk (the interest rate for state bonds)

The actual value (S) of a share can be observed in the market. The fracture cost X may be deliberately chosen so it may be known. The interest rate at zero risk is the interest rate for state bonds. So, the historical data may give enough information on volatility making possible the assessment of the share cost development from the beginning until the end of the considered time interval.

5. The similarity between financial option assessment

The assessment techniques of financial options can as well be used to the assessment of real options. While the financial options are based on the evolutions of some shares on the market, the real options are based on the evolution of some investment values on the market. The first example of real options is found when the value of some investments is very close to the market value. The financial shares are traded meaning that on the market appears a momentary cost called market cost.[2]

The financial markets prove that information concerning the future development of the share cost of is reflected in the market cost. Actual investments that have many common parts with financial investments are presented in the following examples:

- The right of drilling for crude oil (correlated with the future cost of the crude oil) and assets of the company. The crude oil is traded on the market so there is a cost called spot cost and also some information concerning the volatility of this cost. The cost of a company may be also transacted at a cost fixed by the market. The information concerning the future cost is included in the spot cost. The approach of cost evolution of an investment to the option system is obvious. In these circumstances the value of the optional investment can no more be calculated using the traditional system of the analysis of the updated value of DCF (discounted cash flow) in project management.[5],[8]
- The option to launch a new product is based on the market volume; if the demand is high, the product is launched, if the volume is not large that is the demand is low the product will not be made and launched on the market. Starting from such examples a new theory of actual options is developing based on ideas such as a new technology leads to the option to develop a new product. The new product leads to the option of trading it or not when the market is favourable or not. For a right modelling of the market updated value assessment of volume and volatility are necessary which sometimes are very difficult to obtain because it is not about elements transacted on the market.

6. Techniques used to assess volatility

- The **Correlation Technique** makes the correlation between a nontransactionable investment value and a similar transactionable share. It is about the rule of shares strongly correlated with the nature of the investment value. These shares are frequently called tracing shares because they trace the market volatility aimed at. As an example many western pharmaceutical companies use the shares of medical companies transacted on options market to compute updated values for projects concerning the launching of new products. Many other business opportunities especially projects based on new technologies are unique, so that finding new shares in similar areas is difficult and we can use the following technique.
 - The **Assessment technique** based on the assessment of the market potential for the respective product and then on the attempt to assess this potential and to use the assessment as a basis. The expected value of the investment may be found in the computing methodology for the updated monetary a flow computations made in traditional analyses found in investment projects, hence maximal and minimal estimated values may be determined using risk maximal and minimal values taken into account. In more complex cases the estimation may be performed using the Monte Carlo method for simulation by which the probabilistic distribution function of the gains generated by project completion is synthesized.[5] Then an evaluation of the interest rate on the market is necessary for a right determination of the risk, more exactly of its systematic component. Computing the updated net value, the values of S (and X) may be determined when using a right interest rate.[9]
- Maximal profit estimation for a certain amount of invested capital may be carried out using also stochastic optimization techniques. This may be approached in two different ways:
- Minimizing the risk of not obtaining for the objective function of the profit a value smaller than a given one (these are called minimal risk problems).

- The risk we take can be chosen and the decision resulting in the highest value of the profit function can be determined.

7. Conclusions

The use of real options is difficult and requires substantial know – how to perform the quantitative analysis. The difficulties in performing the quantitative analysis are a true barrier in the development and dissemination of that methodology. Another major difficulty is the access to confidential and protected data resulting from previous researches. This seems to be the hardest problem knowing that small and medium sized companies depend on the way they protect their research and technological information.

Global Economical Strategy and the Romanian Reality

Madalina Matei (Nitoiu)
PhD, The Academy of Economic Studies, Bucharest
madalina_nitoiu@yahoo.com

Abstract

Building a coherent country branding program at international level requires a strong coordination between the government, the business sector, the decision makers from educational and cultural sector, the civil society and, the mass media representatives in any country. The paper presents the main efforts Romania has done to build a country image with a significant impact at international level. It focuses on the main policies and programs applied by Romania in the specific field of the national branding, offering a good analysis on the institutional framework and experience in promoting the country's image internationally. Corporate Social Responsibility (CSR) in Romania, as it is today, is the result of two distinct, yet converging, historical series. The first one is the emergence, in the late 90s, of the CSR as an important force for global multinational corporations based in the western world. The second one is the fall of the communism in 1989 and the opening of East European (including Romania) markets to the world. The result was that global multinational companies entering the Romanian market have brought their global CSR strategies to Romania. However, given the Romanian local realities (corruption, ineffective law enforcement and regulating agencies, an economy left in ruins) global CSR strategies have failed to address local needs.

Keywords: strategy, perspectives, behavior, environment.

JEL O11

1. Introduction

Corporate Social Responsibility in Romania is a new and diverse phenomenon. Multinational corporations entering the Romanian market, starting with early 90s, have bought with them

diverse forms of CSR. This, in conjunction with the specific Romanian conditions gave birth to specific CSR forms.

In this paper I analyze the emergence of a specific CSR in Romania and the two historical series that led to its current shape. In order to document this process and the current state of the Romanian CSR an empirical study, based on case studies was conducted.

2. CSR in Romania: Global and Local Perspectives

The collapse of the communism was the beginning of rapid and profound transformations in the Romanian society and its economy. The progressive opening of the Romanian market in the 90s has meant an increasing amount of foreign direct investment. The foreign investment was made, almost entirely, by western based multinational corporations. These global companies opened subsidiaries in Romania or bought out former state owned companies. These companies have introduced CSR to Romania. As a result, the actual CSR in Romania has emerged at the intersection between an evolving CSR definition and local Romanian realities.

In the late 90s the CSR was just emerging as mainstream concern for MNCs and they did not bring to Romania a single version of CSR, but instead various forms of it. The CSR has come not just in various forms but also as in a "work in progress" state. The meaning of the term was in a redefinition process. Various forces were shaping the meaning itself of the CSR. These forces included: increased environmental consciousness, increased NGO activity, government regulation and the beginning to use CSR as a marketing and differentiation tool.

However, as a result, in the last three decades CSR has become a more and more important concern for global multinational corporations.

Citing Boli [1] and Hartsuiker states that "by the end of 1990s, close to 90% of Fortune 500 firms embraced CSR as an essential element in their organizational goal, and actively promoted their CSR activities in annual reports. For comparison

in 1977, “less than half of the Fortune 500 firms even mentioned CSR in their annual reports” [5]. The 90s were the years when CSR became mainstream for the global multinational corporations.

In the 90s Romania was trying to emerge from communism and rebuild its institutions and economy. The Romanian reality means an emerging economy, with a great desire to grow, ineffective institutions and law enforcement agencies, corrupt officials, a public that is still not very aware of environmental problems, old production facilities left from communist times with very poor environmental records, a large rural population and an agriculture left in ruins, one of the highest emigration rates in the region which is beginning to have negative consequences on the economy.

From January 1st 2007 Romania is a full member of the European Union. One of the key economic accession conditions was the transformation of Romanian economy in a functional “market economy”. For this to be achieved, the transfer of big state companies to private investors had to be accomplished. As a consequence, the majority of state companies were sold to foreign based multinationals, a big chunk of these companies being based in EU. The privatization of the Romanian state owned companies began in the early 90s. Various methods were used, including the transfer of the company ownership to its employees. The process was not smooth and was marred by corruption scandals and the selling of state owned assets to connected individuals, often with the help of corrupt officials. In parallel former state companies began to be taken over by foreign multinationals, either directly from the state or from the new private owners of the companies.

This is way (and when) the two independent historical series have met on the Romanian soil. The result was that the global CSR policies did not work in the Romanian context. By definition, a global policy has to have a high degree of generality. It has to cover a plethora of situations and local realities. But being so general, a CSR policy cannot be effective. It has to be adapted to local realities and Romanian subsidiaries have to interpret these global policies according to local realities.

At the beginning, the local subsidiaries tried to apply the global CSR strategies by the book. However, with the time passing by they began to slightly modify the global CSR strategies to better answer local Romanian needs. In the next section I analyze the differences between global

and local CSR strategies and how the local strategies are actually implemented.

3. Corporate Social Responsibility in Romania: The OMV Case

Research Methodology

In this section I will analyze the global and local strategies of OMV multinational corporation.

Global and local CSR strategies of the company were analyzed from official, global and local, company websites. Using websites for analyzing CSR strategies is an effective research methodology. The four main reasons for using official websites in CSR research are:

1) it provides an official viewpoint on the matter and also offers a standardized image, since various stakeholders within the company itself;

2) the website it is a company narrative and from it one can evaluate the role and importance of various subjects to the company;

3) using surveys or in depth interviews may result in biased responses since ethical subjects are sensitive and

4) it is better to use secondary data analysis when researching ethical subjects. In fact, the official website of a company is not just a company narrative that allows the researcher to assess the importance of various subjects present on the site. [2].

It is also the place to promote a sort of “corporate ideology”. It is the place to project a company image that is in line with global company strategy. Social relations are, in a sense, power relations and various social actors are promoting their particular interests in the social public space. Following this line of reasoning the official website is a tool for promoting the interests of the company in the public space. The company websites were accessed in February – May 2009. Global sales of the corporations are cited from company annual reports. Sales and market values for Romanian subsidiaries are cited from Ziarul Financiar, *Top 100. Most valuable Romanian Companies* [9].

OMV/Petrom

OMV is one of the leading oil and gas groups in Central Europe. The company is based in Vienna and had sales of over \$31,000m in

2007. OMV entered the Romanian market in 2004 by taking over Petrom, the former Romanian state oil and gas company. Petrom is now, according to Ziarul Financiar, the most valuable Romanian company with a market value of around \$13,000m (Ziarul Financiar, 2008) and sales in excess of \$5000m.

OMV states on its global corporate website that “the elements of CSR are enshrined in OMV’s strategy and balanced scorecard”. For OMV the global CSR strategy is constructed along the three responsibility “pillars”. These three pillars/dimensions are seen by OMV in terms of the “three dimensions of the triple bottom line – economic, environmental and social aspects”. As a consequence, OMV stresses out that these three pillars are incorporated into OMV’s business operations.

It is significant to note that OMV is making public, on its website, its objectives in adopting CSR. The aims of OMV’s CSR strategy are: “to gain competitive advantages, to promote innovation, to enhance our reputation and minimize risk, to strengthen corporate identity and culture and to mitigate the company’s impact”.

Petrom, the Romanian subsidiary of OMV, has put its entire CSR strategy under a unique umbrella: “Respect for the future”. Petrom emphasizes that this means it acts, in all its business operations having an eye to the future. As Petrom puts it “*Respect for the future*” [12] is a complex platform developed by Petrom through which we respond to the needs of the society and environment. The platform also includes internal campaigns for responsible behaviour, high ethical standards in business, health, work safety”. What exactly this means is not further explained. However, several specific CSR programs are presented on the site. One of these specific programs is the TV show “Respect for the future”.

The show was broadcasted by Realitatea TV. The show had 12 editions. In each edition two social projects were presented to the public and the public could vote for one or more of the 24 projects. The first two projects, ranked by the public votes will be financed by Petrom.

4. Implications

We saw which the CSR agendas of global multinational corporations are globally and locally, in the Romanian market. We saw that the global and local CSR and development agendas of the large multinational corporations are fairly similar, even if some differences

might be discerned. Nonetheless some differences exist and they have the potential to grow in the future.

Let’s now turn to the CSR agenda of the Romanian society and see if they are overlapping with the MNCs’s agenda.

Several studies, cited by Peter Gross [4] have shown that in 1990 and the following years the main concerns for the Romanian public were: 1) prices and inflation; 2) unemployment and job safety; 3) agriculture and the aid for the rural population; 4) corruption; 5) social benefits for senior citizens; 6) youth and its problems.

It can be seen that the environment is not on the Romanians agenda. This was also confirmed by subsequent studies. For example, the early 2008 wave of the *Eurobarometer 3* [8] has shown that Romanians are less concerned about environmental problems than the European mean. For example, just 19% of the respondents were concerned by the running out natural resources, comparatively to the 26 European mean. The 2007 *Eurobarometer* [8] has shown that the Romanian public agenda is virtually unchanged from the early 90s, with the major concerns being:

- 1) Economy, 45%;
- 2) national health system, 25%;
- 3) prices and inflation 30%;
- 4) unemployment;
- 5) crime rate, 23%;
- 6) social benefits for senior citizens.

The environment is a concern for just 2% of the respondents. As the three analyzed cases have the MNCs are undertaking action in the CSR field.

Comparing the CSR strategies and programs of the three multinational corporations that were analyzed with the Romanian public agenda we can see that they do not overlap.

In the Romanian case it seems that the theory of CSR as risk management strategy is confirmed. James K. Rowe [7] has offered a modern and complete view of this subject.

The OMV company have global strategies which are slightly adapted to the Romanian market. I have to clarify a point here. I already said that the local CSR strategies are beginning to adapt to local Romanian conditions. This is true, but for the wrong reasons.

They are adapting to Romanian conditions not in the sense that they are trying to better respond to Romanian concerns. They are adapting their strategies to better handle the risks associated with operating in Romania and to better pursue the marketing and

differentiation strategies of their respective companies.

OMV was involved, since taking over Petrom in 2004, in various scandals. Allegations were made regarding the secret appendices to the contract that is prejudicing the Romanian state. Various bribery and corruption allegations involving OMV and high ranking government officials were made. These allegations even unproved are negatively affecting OMV's image. They are promoting a hypocritical image if OMV since the company is communicating a responsible image of itself while using alleged bribes to pursue its commercial and financial interests.

5. Conclusion

The paper presents also the results of a research conducted with different local authorities (based on personal interviews) involved in the construction and promotion of a national brand abroad. The findings of the study provide opinions on the implications of the role of Romania's country image in the European Integration process. A SWOT analysis on the Romania's policy for building a European country brand completes the conclusions and the perspective on this particular issue considered to be important for a European Union integrating country. Finally, the paper makes proposals for creating a positive country image for Romania, a country that is in the process of redefining its position and its image at international level. Romania's image will be considered from the perspective of the four dimensions defining a country image (tourism, exports, foreign direct investments and foreign policy), as well as from the perspective of building an integrated image abroad.

Without a clear understanding of the local conditions, the CSR strategies of large MNCs are likely to fail in the Romanian context. Often, the global CSR strategies are not sensitive to local conditions and the local strategies are merely just translations of the global ones. When they are not just the Romanian translations of the global CSR strategies, they are conceived as risk management strategies, or marketing and differentiation strategies.

Under these circumstances, multinational corporations with a real concern in respect to CSR, have to develop particular CSR policies that are adapted to local realities. In order to have a lasting and beneficial effect on

Romanian society and on the companies themselves, these CSR policies have to address local concerns and needs. The local CSR strategies of the global MNCs have to be anchored in the Romanian reality and not to blindly follow the global strategy. MNCs have to follow the Romanian public's agenda.

This is not yet the case as this paper tries to document. The CSR narrative of these companies is the expression of a corporate ideology that emphasizes CSR just as a response to social pressure.

If the MNCs do not connect their global CSR strategies to local realities they are likely to fail in creating value for the society as a whole and not just for some stakeholders on the expense of the others. If the CSR strategies of the global MNCs are to have a meaningful effect on the Romanian society they have to take into account the local realities and conditions.

Abstract

Till the last years, the product specialist or the marketing responsible could be glad of the classical analysis of their markets. Today, it becomes much more difficult to limit to this type of analysis. As a consequence, the markets become more tight, the competition acts more rapid, the potential clients are more and more exigent and their wishes more and more precisely. This paper analyzes several methods of segmentation, taking as an example the case of Elpreco Company.

Key words: segmentation strategy, Elpreco Company,

JEL Classification: M31;

1. Introduction

Wendel Smith [1], in the article published in 1956, describes the market segmentation as being the strategy with the accent on the precision with which the products of a company can satisfy the demands of one or more distinctive markets. He thus supposed that the market wasn't an anonymous and uniform mass, and that's why it was possible to find different consumers groups from the point of view of their compartment, needs and wishes.

Eight years later, Daniel Jankelovitch [2] extended this definition to "a systematical approach which allows the selection of the most important market segments from a strategically

point of view and the creation, around this brand segments, of products, packages and strategies of communication and marketing. This considerably simplifies the objective's fixation."

2. The segmentation depending on the client's importance/ the commercial relationship difficulty

The matrix of client's importance/ the commercial relationship difficulty can traverse two coordinates such as the client's strategic importance and the degree of easiness of the business relationship. It reveals four main types of clients [3]:

- *Difficult clients*: important clients for an enterprise (size, potential, strategic interest). But the relationship is not easy due to various factors: the long and complex buying process, the number of speakers to be convinced, important negotiation power etc.
- *Easy clients' accounts*: the type of dreamed client! It is important for a company whose relationship is simple.
- *Other easy accounts*: even if the relationship is easy, the strategic interest is reduced. The common sense indicates the attitude to be adopted: "While the relationship is simple, we have to continue that way."
- *Other difficult accounts*: a client type that the relationship is not at all easy and

offers less strategic interest for a company. For this type of client it is better not to insist, but with a detailed analysis, we can shade our strategies offering a diversity of alternatives.

How can it be used?

The first stage will consist in choosing the importance criterion of the client's and the difficulty of the business relationship:

Table 1. Types of important/ difficult criteria

The clients' importance	The commercial relationship's difficulty
The monthly and annual orders volume	The product's type: simple and complex
Potential turnover	The competition type (occasional or systemic)
The orders frequency	The needs and buying motivations
The client's position on the market	The buying process
The strategic attractiveness	The selling channels type
Current or potential profitability	The distance or geographical proximity
	The client demands the payment to a great number of days
	The client is a bad payer (sometimes)

Source: Smadja A., 1988 [4]

Sometimes a single criterion is not relevant enough to qualify the client's importance. It is recommended two or three examples: the annual volume of orders + potential sells + current client's profitability. Similarly, regarding the commercial difficulty evaluation, for instance, we can take the following examples: the product type (simple or complex) + the buying process + competition.

The second stage will consist in the assignment of a goal for every client following these criteria. If you chose to combine two or three criteria, it is recommended to make an average evaluation for all.

Example

Take the case of your customer. A. If you assign a note from 1 to 5 for every criterion, 1 being considered the least important, 5 very important, and 3 the average for all the clients, you will obtain:

Client A: the annual order volume 2, potential turnovers 4.5, current profitability 2. The Client A receives an average of 2.83 for the importance.

To evaluate the commercial difficulty, if you assigned a note from 1 to 5, 1 being considered easy, 5 very difficult and 3 as the average of all your clients, you can obtain for the client A: product type 4, buying process 4, competition 1. The Client A receives a relationship average of 3.

The third stage will consist in the positioning of all the clients. You can consider "weak" all the notes from 1 to 2.99 and "high" all the notes from 3 to 5. Thus, your client is included within the category of "other difficult clients' accounts".

What do we recommend?

It is understood that within the situation of the "easy client accounts", the accent will be to conserve and maintain your position as privileged provider. The following questions will be put:

- What strategies and loyalty actions we have to put in practice for this client?
- This type of client received signs that indicate our society's engagement?
- We have identified the strong points of our products and services by reporting to the needs and motivations of this type of client?

For the "difficult client accounts", your orientation will follow the direction of keeping, because it represents a key account, important for your business. The questions that will appear within this matter are the following:

- Has the difficulty of your relationship an effect over your profitability? How can

you exceed this situation (do you orient your client towards the commercial channels less expensive, if it is possible, within a relationship type of winner-winner?)?

- The relationship difficulty is within the last instance “remunerated”? In what manner can you make easier some aspects of this relationship (process, duration, preferred services)?
- Is the commercial administration and commercialization working in teams, so as to facilitate this relationship (knowledge exchange, marketing research, documentation etc.)?

For “other easy clients’ accounts”, your objective is to keep the most profitable clients. For this aspect, you will have to make use of the profitability segmentation matrix or to determine a single acceptable profitability level for your business:

- Have your clients a less score than 2?
- If yes, what are the solutions you propose for its improvement (selling channels and relationships, buying process ...)?

For other “difficult clients’ accounts”, the strategy would be more nuanced. You will need to define a typology, of many cases, following the average scores according to the criteria. Indeed, taking our client A: his importance note is 2.83, as a result, closer to the average of 3; his difficulty note is 3, so it doesn’t matter if it takes part within this account or within the “other easy accounts”. As a result, you will have to take into consideration:

- The average score for the clients: You can decide to assign a special attention to the clients from the accounts with importance notes of 2 or higher than 2,5 and less in difficulty than 3,5 or 4. You will determine the notes’ limits depending on the number of affected clients so as from the following criteria.
- The client’s profitability: in the case when the cost is too small (1 - 2, for instance) you should ask yourselves “can we improve this client’s profitability”?
- The client’s potential: taking our client A that you have assigned a potential of 4,5, it is not to be neglected and it is in his favor.
- The criteria that tend towards an easy relationship: your client doesn’t put you regularly in competition, but more within his favor.

We can observe that this matrix of client’s analysis is very interesting as we can combine several criteria and establish stages for our minimal and maximal scores. This is a directly operational application: it remains only to define the action ways due to its orientations

3. Profitability segmentation

In a powerful economical crisis situation, the client’s profitability concept trends to impose itself in the first plan of client’s analysis. In this way, the real/ potential profitability matrix is precious: it permits to take into consideration the current and potential profitability and, also to establish the objectives to reach the profitability, specific strategies and methods. [5]

Due to a single axis of profitability, there could be a more nuanced analysis for the “undesirable” clients.

How it can be used?

The first stage is to determinate the profitability criterion chosen by the company for the clients.

This matrix needs a client’s profitability analysis and all the companies are very well with this matter. If your company doesn’t have the possibility to precisely measure the profitability for each client, you have to use methods such as:

- The number of ordering lines;
- Grouped or displayed buying;
- The selling channel choice (on line selling is the less expensive, the face-to-face selling is the most expensive);
- Business type relationship;
- Reductions rate, rebates rate etc.;
- Type of acquired products.

The criteria you chose have to be relevant for your business, easy to be identified and easy to be measured for the client.

The second stage, in the case of a detailed analysis of the profitability for every client consists in establishing a grid in “profitability”/ “unprofitability”. To make such a thing, you can establish as objective to reach the profitability, for instance, a profitability rate higher than 0, or a profitability rate higher than 3, 5 or 10,

depending on the variables from your activity sector.

In the case in which this profitability analysis for every client is not already made within your company, assign a note to the clients based on one or more of the cited criteria. The clients' positioning within the matrix allows the view of four groups of clients and the action priorities considered for each one. Our example fits the client A, within the group of "unexplored clients" and the client B within the group of "wanted clients".

What do we recommend?

The considered priority action order within the first analysis of this segmentation for marketing and sales is as follows: A, B, C, D.

The unexploited clients from the frame A: They were forgotten, because their profitability was weak, but the potential margin was not taken into consideration. Here there is the highest profitability potential.

The wanted clients from the frame B: are those that already allow to the company to generate good return while they still have a possibility to develop themselves. The profitability potential is probably not as strong as the anterior frame, but not at all to be neglected.

The cold clients from the frame C: the company can not generate supplementary costs. They have to be made loyal.

The undesirable clients from the frame D: they are unwanted in terms of profitability. They are the clients for whom a profound analysis is needed to refine this profit based process, depending on the answer to the following questions: What is their strategic importance? What is their turnover potential? What is their accessibility? What is their trading history? Are they loyal? What is their activity sector growth?

This matrix is interesting to be used especially in periods of economical crisis, where there is competitive aggression, sudden lost of the activity. This allows the refocus on the profitability notion and taking into consideration of a new profit source.

4. The Penetration/ Potential Matrix

This analysis instrument of the clients' portfolio offers an important criterion, consisting in the penetration rate. We are referring to the

turnover share generated by the society in relation to the turnover's potential offered by the client. This calculation supposes the knowledge of your clients' turnover. [6]

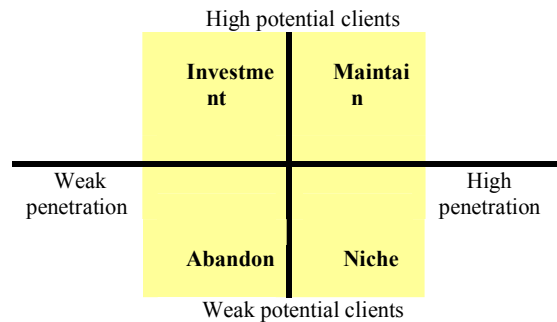

Figure 1. Penetration/ potential matrix

How it can be used?

The first stage is that to identify or evaluate the potential clients. If you didn't do that, there are several solutions. Depending on your activity sector, you can choose among:

- The employees number;
- The dimension of the vehicle fleet;
- The number of telephone lines;
- The observed average buying basket; etc.

The second stage: the defining of a potential limit after which you qualify your weak or strong potential. Generally, you choose the sector's average potential. In general, if your company has a higher potential than the average on the whole market, the reference potential will be the average potential of the target market or segment.

The third stage: the evaluation of the penetration degree within its clients. The penetration rate represent the percentage from the turnover within the total potential of the client. We can consider a penetration rate of 80%. A client can make a reservation from another provider for reasons regarding the security, the failure or regulation of the sector. There are several modalities to determinate the penetration average:

- The simplest modality is to establish an average of 50%. The disadvantage is that there is not the firm's representative average. Thus, this is not the recommended standard. Its advantage

consists in the fact that it offers a reasonable average, that can be used when the firm has no precise measure of the penetration degree.

- The most relevant is to take the global average of the penetration degree within the clients. Its advantage is that it permits a real benchmark, leaving from the enterprise's real position and its capacity. We start the comparison beginning from the real position of the company.

Finally, *the fourth* stage is to position within the matrix the clients depending on their potential and the company's penetration degree.

What do we recommend?

The question that we put is: what strategies we define for each frame?

- Maintain: Maintain the relationship and trust. Propose options to those clients that base on you and you, on their acquisitions.
- Investment: these clients' acquisitions bring development to your company. Analyze closely their expectations and their motivations and study the history of your relationship. You will avoid to develop "pro-competition" clients and you will found action ways for the clients that are ready to buy more.
- The niche strategy: profitability. But, pay attention to these clients' relationship conservation, that entrusts you with almost all their buying potential. This is a proof of trust and an important loyalty factor. We have to watch their profitability during time with RADAR matrix
- Abandon. It is always delicate to give up to a client.

5. The RADAR Strategic Matrix

This matrix was created in 2003 by Nathalie Van Laethem to respond the growing needs of the enterprises and marketing directions, anxious to find new alternatives within crisis periods and, moreover to have a strategic vision of the relationship with the client. There are many companies that use it, either in B to B or B to C. It proposes a durable approach of the marketing client, being on one hand, a method to establish the relationship objectives throughout the target

segments and also an aid in decision taking regarding these target segments. [7]

A method to establish relational objectives

The goal of this method is to list the target markets and the marketing efforts within the dynamics of the clients' lifecycle throughout the establishment of target objectives relational to every target and very phase of the client's lifecycle:

- The reactivation of the ancient clients.
- The conquer of new clients and prospects.
- The development of the average turnover basket of the existing clients.
- Make the clients loyal throughout specific programs.
- Retain the great value targets or decrease the observed wear rate.

Its interest is to be an analysis method and preliminary formalization of the operational marketing plan: it reveals the objectives of the individualized clients' relationships throughout target segments where it can be discovered with precision the adapted actions and ways.

How it can be used?

The first step is to define the relational objectives, every moment of the client's relationship for the identified targets. The second step is to take into consideration these objectives and adequate marketing and commercial action types. The third stage represents the correlation in any other stage of the relationship of the most relevant offer, regarding every target.

Table 2. Example of correspondence between the related objectives, targets, marketing actions and offers

Related objectives	Targets	Marketing actions	Offers
Reactivation	Ancient clients that didn't contact us for at least three years Clients that diminished the buying volume	Mailing or e-mailing Sending of catalogues Telephonic marketing	Promotional offers of re-buying Promotional offers from important quantities
Conquer	Prospects on the target segment	Publicity Mailing or e-mailing Commercial visits	Trying offers for some products and services
Development Buying	Clients whose alimentati on rate is between 20 and 75% With the highest potential Possible targets Loyal clients for several years	Commercial visits Mailing or e-mailing Catalog, invitations	Offers such as cross or up-selling Associated services Products or compleme ntary services

Loyalty	The that clients have to be made loyal are: The common clients The usual clients The clients with a powerful potential	Commercial visits Loyalty programs Club One-to-one actions	Global individuali zed offers Personaliz ed services ranges
Don't forget	The clients with a real value for the enterprise are: The prescribers clients Strategic clients Profitable clients	The following of the client's turnover Telephonic marketing	Specific and selective offers

What do we recommend?

Make sure that your offers are according to the marketing and selling directions and, are directed to the segment or the clients' type. If it is necessary, rethink the clients' segmentation within the clients' satisfaction logic and an important coherence of your offers.

6. Conclusion

The diversity of methods and application data of the market segmentation is, one hand, dangerous and, on the other hand, very desirable. A segmentation strategy will have important consequences on the enterprise

at the level of the results and also at the level of the commercial administration, research and production sector. So, the company's results will be affected by all the supplementary costs. The justification of these costs bases on the hope of a better profitability.

Abstract

The globalization of business and the global economic crisis, companies are forced to face changes in their action. Solutions crisis lies in new ways of enhancement of human potential at individual, organizational and societal. People are creative beings by their very existence in the organizational and social context. So the difference between success and failure is determined by how companies and individuals develop their ability to generate new and used creativity in work.

Regardless of what perspective is discussed and defined, creativity is a key determinant of business success. Of course, creativity should be rewarded at the organizational level to ensure long-term success. How organizational success comes from successful individuals who compose that organization, business success is achieved by educating individual's ability to capitalize on the talents and skills of existing capital at the organizational level.

Keywords: creativity, success, business, crisis, Globalization

JEL Classification: M29

1. Introduction

Entry in the Age of the Internet and e-business, knowledge-based economy has *produced fundamental changes in terms of socio-economic structures, creating new models of organization and economic activity.* Known is that *ideas and knowledge-based economy* is an economy in which communications technology **creates global competition**, in which **rapid change is a constant**, in which innovation is more important than mass production, the investor buys new concepts or new means to create

them than he bought cars, prosperity of firms arising from the innovation, not from optimization.

The global economic crisis is a necessity to find new ways of enhancement of all human potential. This is because the global economic crisis is a challenge for every individual. Moreover, as one of mega-tendencies evolution of the economy is moving the focus from job creation, by creating your own job, it is necessary accountability for their presence in the labor market, which means improvement and individual development. Individual success is ensured on the organization, so it must be each individual's creative development, organizational membership.

2. Creativity and business success

2.1. Creativity - conceptual issues

Known is that mental and social process involving the generation of ideas or concepts, or new associations of the creative mind between existing ideas or concepts is called creativity. Creativity is a difficult concept to define. No doubt the concept of creativity is something indeterminate in itself. When studied is essential a determination of and / or investigate what the content is. Otherwise, the issue remains vague, undefined concept. Everyone can understand what creativity wants. Besides, creativity is a multidimensional concept, which can appear in different areas. Therefore, the concept of creativity has been addressed, defined and developed from the perspective of several disciplines: sociology, psychology, economics, linguistics, management,

cognitive science, philosophy etc. So there are many definitions of creativity, without being there a generally accepted definition. Some definitions are contradictory and subjective; others are caused by the need for creative research.

About creativity Allport [4] said that "psychological substratum of creation is irreducible to a general provision requires skills and personality to the new organization of mental processes in the system personality." Creativity can be approached from the perspective of product created from the perspective of the creative process and creative person perspective. Atmosphere and the influence of environmental / socio-cultural system linked to the situation, can determine the level and frequency of creative behavior. Creative approach in terms of product made of particular importance as it constitutes the basis of any evaluation of performance and creativity in the real world could pave the way other aspects of creativity. The most common method used to measure product creativity ratings of experts in the field, *consensual assessment* technique (CAT) is an example of this approach.

Whatever is raised, creativity in organization is a cultural creativity, if only because any creative person is carrying culture. Also, the product created is a cultural creation of the organization.

However, the difficulty in defining creativity lies in the concept of private associations with the arts, the complex nature of creativity and variety of theories have been developed to explain it listed.

A simple definition of creativity is "action to combine previously unbundled elements" [6].

Thus, there are several theories on creativity [1], some in relation to technical developments (technical design, sociological theory, technicism theory, structuralism theory), and others in relation to the influence of psychological factors (associantist theory, configuration's theory, behavioral theory, features and factors, psychoanalytic theory).

According to technical design, creation is providing technical developments. Sociologic creativity theory focuses not on individual but on the socio-cultural context in which the individual creates. Technicism theory interested in technical structures in the

creation of new structures and structuralism theory focuses on the relationship between structure and intent, the creative process of each individual.

In associantist theory creativity lies in finding new combinations related items. In contrast, behavioral theory considers creativity as a result of stimulus and response is possible at any individual, and behavioral manifested.

Theory features and factors analyzed in terms of creativity traits, skills and creative thinking factors.

Naming psychoanalysts, creativity has its origins in the subconscious elements, and a supportive environment may lead to its manifestation. Creativity refers to the individual's ability to generate new, the "opportunity to reveal unknown aspects and relations of events to determine their own ways of solving problems"[4].

A particular problem is the creative process to stimulate creativity. There are many odes to stimulate creativity met individuals and communities[2], including: logical methods (Functional analysis, morphological analysis, and graphical analysis), heuristic methods (matrix finds, morphological, etc.) and imaginative methods (brainstorming, synectics, collective book, etc.).

Morphological analysis involves decomposition of a product into its existing form and seeking solutions. Use it to explore ways of human thinking allows morphological innovative ways to investigate possible solutions to a given problem. Analyses of morphological type are useful in future research possibilities of social organization, the achievement of technical performance and economic research *cultural creativity manifested in the form of technical creations, technological and social*.

Human activities, the nature of technological, economic, political or social are placed in order to achieve a goal. These activities are only effective if it is determined the types of operations and their execution order. Allow graphical analysis and policy research operations in time, starting with the ultimate goal, to achieve objectives. Operations and time moments are

represented by a graph which should see the sequence of operations. *For example*, the launch of new organizational rules can be ensured by a certain order of operations, specifying the number of days required for each operation.

Regulatory approach has wide applicability in the socio-political and economic. It is often used in business planning when a company seeks to change the philosophy and mission. Applying techniques and methods of regulations permits in an orderly manner addressing problems through creative and innovative development companies. They thought running disciplined without affecting the creative potential of individuals. Existence of bifurcations is a strong incentive to engage human creativity.

Groups known as creativity, the most common are brainstorming sessions and synectics[3]. Brainstorming sessions are a small group activity to stimulate individual creativity in the formulation of innovative solutions for the problem under discussion.

Major condition for ensuring success is to ensure a climate free of rigidity, enabling a free exchange of ideas. Proposed solutions are recorded, and the resulting list is subject to a rapid assessment by the group. Fostering creativity and offering limited group synectics training involves divergent participants who contribute to enhancing the ability to see the same problem from different angles. In practice synectics noted an important role, along with intuition, analogies and metaphors which, in turn, can trigger unexpected ideas.

2.2. Business success in the context of crisis

Success seems to be rather a natural consequence of what someone is only a result of what makes that person or how we act. They say that business success is achieved by individuals who have natural resources, materials, information, etc. But explained that many people have seen success without resources? In fact, success is achieving steady all planned objectives are important for individual and organization. Individual and organizational success is not measured by success compared with other individuals or other organizations, but true success is the

exploitation of their potential, develop and enrich their personalities.

Is important to define the organization's mission, vision, goal and objective system and the way forward and effort throughout the "journey." Business success is achieved by educating individuals' ability to capitalize on the talents and skills of existing capital at the organizational level. It is unusually good conduct routine activities.

Authentic success is linked to the goals of each man. However, it is not achieving these goals, despite the general opinion that seeks to impose on us, but in striving to attain them. In the words of Oliver Wendell Holmes[5] important is not where we are, but where we are going. Success is over, the road trip, and has its source in attitudes and skills learned during this effort. He is determined not so unusual talents do not know why, but to educate our ability to harness the talents and skills capital. It is not unusual to do so, how do ordinary things exceptionally well. Once achieved objectives, individuals and organizations must aim to achieve more ambitious goals. Also, success means tackling new areas, territories, development models, actions, etc.

Reporting individuals and business organizations to the concept of success requires both a clear definition of success and its sources. Understanding of context of self is the first step in proving successful. So companies and individuals must understand the mechanisms of economic crisis and its effects, so that threats and opportunities arise. Success is given by overcoming conditionality and creating an enabling environment at individual and organizational. Companies need proactive strategies that lead them to success in the crisis, whether that means changing direction or guidance. In general, harsh conditions stimulate imagination and creativity, so firms that want to cope will be those who will try to identify hidden opportunities behind the crisis. But it is necessary to develop a strong personality, which is based on fundamental principles of life, behavior and positive attitude.

The secret of success is to use your intuitive mind and the rational part of her team together, and not against each other. People are able to achieve this harmonious complementarily.

3. Creativity in business success in the crisis

The global crisis has caused changes in the environment of action of companies, which led to the need to change their personality, because organizational and personal success or failure depends on how companies consider obstacles as steps to success and their attitude towards changes. In this context, socio-economic individuals and companies based on creativity and innovation is a safe alternative. The company develops innovative technologies based on knowledge, essential changes in all fields, which causes a major trend focus on concrete results.

Moreover, in 2009, the actantial had to be creative to survive, leading to the stimulation of personal, social and organizational. Obviously, creativity and innovation are key factors for success in all fields, not only in business, why not by accident of 2009 was declared the European Year of Creativity and inventiveness, as in periods of crisis and conflicts that creativity is make the difference between success and failure. Moreover, experts believe that the Romanian economy is now the vanguard of creativity [7].

In fact, creativity is an essential component of any business, without it leading bankruptcy firm. In their effort to find solutions to social and economic problems, people become creative.

Successful businesses are both creative relationship with customers, suppliers and partners (state institutions, banking and financial institutions, outside, etc.), and the relationship with their employees. Successful companies hires creative people and innovative, constantly developing their creative spirit, as the products and services offered competitive market are the result of creative organizational members. Literature indicates that not all people must be creative in the organization, that some people feel better carrying out a routine activity. However, success is defined by creative individuals throughout their existence. At the

organizational level is not performing to classified employees in creative, less creative and lacked of creative spirit or to boost the creative side only to employees who have (of course, by hiring evaluation). Employees identified as being created must be positioned in key business and creativity, regardless of what occurs at the organizational level should be rewarded. And other individuals must be helped to develop their intuitive side, not only the rational. This is because the business world, and beyond, people are becoming increasingly aware of the major role in providing high performance that it plays an individual endowed with fine intuition and observation. In this respect it is interesting to note that steadily increased the number of female employees, because precisely these qualities: a sense of intuition and observation. Studies showing that the fair sex have more developed intuitive side. And can therefore be expected to grow in the next period the number of women in key positions in various companies.

The crisis is auto-limiting business through sales policies, pricing and product they practice trying to cope. They forget that many problems we have to overcome can be solved by ideas and concepts. People are in crisis solutions. Their talents and skills are in place through creativity.

4. Conclusions

Success habit could be learned, as we learn to be creative, to communicate and develop our personal and professional. Old models, negative habits and conditioning can be overcome if given a chance to creativity. Of course, as long as individual and organizational objectives are achievable, stimulating, accessible but challenging. In fact, firms are established to make a profit, which is the default operating successfully in the market, and not to go bankrupt, regardless of the context in which it occurs.

Abstract

At present, the action mentioned in CE documents for promoting the quality are considered priorities able to offer visibility and equilibrium. They are not enough also for development of the European economical competence, as they should be accompanied all the time by complementary activities concerning development of: innovation, research, education and instruction in quality management. Any type of politics that concerns the development of the European economical competence must be accompanied also by a revision of the legislative activities of institutions belonging to the countries members of the community, which must allow the permanent adjustment of legislation to the actual requests of the European Union market. The permanent changing and the necessity to assure the management of this changing based on a continuous improvement, generates the need that industry and public authority should make continuously adequate researches in the field of quality management methods, with the aim to gain and maintain the competitive advantage.

Through innovation and design, one can assure the competence of an alimentary product, both of them must be taken into consideration in elaboration of politics in the field of quality and for which is necessary the development of the collaboration relations between University of Agricultural Sciences and Veterinary Medicine from Iasi and production unit SC AVI-TOP SA Razboieni, and another production unities with the aim to create the synergy and of some communication real channels among activities, whose results depend one of another. This way it will be possible the solving of one major problem, the rapid transfer of the results obtained

as a consequence of the scientific research towards production current activities.

Key words: poultry products, quality management, correlations

JEL classification: L66, Q13

1. Introduction

Quality of the alimentary products represents an used modality in a certain scope, through which a company or a firm exists on the market and it can maintain itself competitive, in a continuous way, although it evolves in an environment found itself in a permanent changing [1]. The specific activity of the European Community, oriented towards promoting of quality is developed towards implementation of New approach and on consolidation of quality infrastructures, which are necessary in the context of final achievement of Integrated Market. Scientific research represents the filed in which quality has a major role, at which principles, techniques and the methods of the management quality must be applied. In the plan program no. 4 of E.C. for scientific research, technological development and demonstrative projects in EEC are foreseen specific programs for development of the standardized measures and of tests, with the aim of encouraging of research and of new methods of production management and also of measuring and inspection of products. Besides scientific research, innovation program contains a series of projects concerning promotion of innovative techniques of management, which needs also an integrated approach which should be adapted to the general strategy of organization. [11]

2. Material and method

Rational alimentation is now a problem of peoples' education. USA put into practice the nutritional education of persons in schools, in universities by holding up special nutritional courses and the state finance training campaigns for populations from a nutritional point of view. In this context, it is very important the nature of the nutritive components, of vegetal origin or of animal origin, according to their provenience, assuring also quicker or slower digestibility of those components. Thus, man prefers aliments that are able to insure the nourishing stage for a longer period of time, a fact that influences in a negative way the digestion process and also the metabolism of the nutritive substances, in generally, causing some affections such as: diabetes, obesity, hyper blood pressure, cancer.

As a consequence, the present research, has as its aim to find out a method in order to experiment alimentary products obtained from poultry meat which may become functional aliments, and reduce the risk of appearance of some affections, those aliments having a certain direction, such as: optimization of metabolism by controlling the obesity and diabetes, promoting of defending the organism against oxidative stress, promoting of healthy cardio-vascular system, on gastro- intestinal tract and of mental performance. Inside to the standardization stage of agro-alimentary products, respectively, of the semi-manufactured poultry products, it will be established the parameters of the product and production parameters, in order to achieve an efficient qualitative control of the developed activity.

A modern approach of the production process asks for development of specifications inside the company, which leads in fact, at personalization of poultry products that are to be obtained, generates their quality and assures the success of the finite products. Specifications of the company have to do with specifications of the raw materials, of the manufacturing processes, and of finite products. Conceiving of those specifications refers to: defining of quality of the products characteristics which must be measured and controlled, identification of the critical characteristics in order to accept the finite product, determination of methods through which critical characteristics can be measured, a fact that asks for correlation of the results of the

tests made with the help of laboratory equipment with the sensorial characteristics of the finite product, improvement and simplification of testing and researching methods, so that, these methods should increase their precision, verification of the efficiency of the measuring equipments used to obtain the desired information concerning the quality of the product. After repeated making of tests, there are developed the own specifications of the company. Specifications concerning raw materials used in order to obtain poultry products with added nutritive elements.

Thus, from a chemical point of view, presents an interest: acidity, solubility, fat content of the animal origin products, humidity, residual content and pesticide at cereals, fruits, vegetables, toxins and pathogenic bacterium, ashes content in cereals, fruits and vegetables, nitrogen content at meat products, elements that determines also the sensorial characteristics of finite products.

Human nutrition must satisfy more requests of the human body:[8] energetic request, the request of the tissues increasing and renewing, and also the one for insurance of the substances necessary to adjust the vital processes. Thus, from a biochemical and biological point of view raw materials have the most important nutritive elements, respectively: glucides that are to be found in fruits, vegetables, cereals, milk, and milk products, lipids that are to be found in sun flower oil, soya, rape, butter, peanuts, cocoa butter, proteins that are to be found in meat, meat products, milk products, cereals and vegetal oils, vitamins (fruits, vegetables, meat, cereals), mineral salts (milk, milk products, vegetables and fruits) and alimentary fibre (cereals, wheat seeds, vegetables and fruits). The last three categories of nutritive substances become today essential for an optimal nutrition of the man.[5]

Calculus of the qualitative depreciations of products stored by freezing.

The evolution of the depreciative qualities of the frozen products is stopped during all the storage period, owing to the decreased temperature. Still, the degradation is worthless, that is why frozen products may

be frozen only for a limited period of time.[14]

The researches establishes the following correlations, which may be used in calculus of the depreciative qualities:

-frozen products lose during storage some of their qualities, every day, according to the storage temperature;

-during keeping of frozen products, effects of temperature and time of storage are cumulative, the total decreasing of quality does not depend on the order of the temperature succession along time;

-the needed time for producing minimal losses of quality increases exponentially, according to temperature.

-keeping of some frozen products at temperature of - 4°C ...+1°C, for a day, has the same effect on degradation as storage at temperature of - 18°C for a year.[11]

The period in which the frozen products does not present any significant qualitative difference comparing with packed products, called “time of high quality”, after which the product may be consumed even after a time of 3-6 times higher.

$T = 1 / T \times D \times 100$, in which:

D – is the number of days in which the products are stored at this temperature;

In order to make the transformations which the frozen products suffer during storage it was drawn the curve of the variable quality according to the time and known temperature[...]:

$\Delta C_1, \dots, \Delta C_n$ - represents the partial losses in quality in each stage of the technological process, or:

$$\Delta C_{tot} = \sum \Delta C_1 + \Delta C_2 + \Delta C_3 + \dots + \Delta C_n$$

in which :

$\Delta C_1, \dots, \Delta C_n$ represent the partial quantity losses for each fases of technological process or :

$$\Delta C_{tot} = (1/\tau_1 \times t_1 + 1/\tau_2 \times t_2 + 1/\tau_3 \times t_3 + 1/\tau_4 \times t_4 + 1/\tau_5 \times t_5 + 1/\tau_6 \times t_6 + 1/\tau_7 \times t_7)$$

- $\tau_1, \tau_2, \tau_3, \tau_4, \tau_5, \tau_6, \tau_7, t_n$ – time in which the acceptability limit is reached at the indicated temperature. In order to have a acceptable product from a qualitative point of view is necessary that, from a qualitative point of view, the losses should be smaller than 100%. Owing to this value a non-corresponding technological process is indicated.

Fig. 1 – Curves of the tolerant relation of time – temperature

3. Results and discussions

Using the same relation the qualitative losses that are registered in a certain stage of the technological process may be calculated:

We considered that semi-manufactured poultry products were kept in the following conditions during the frozen process(15):

- frigorific warehouse: -20°C, for three months;
- transport to the small gross storehouse: - 15°C, two days;
- transport for sale network: - 12°C;
- storage in store: -12°C, two days;

With the help of curves time tolerance – temperature, the length in days, in which the acceptable quality of the product is maintained and the partial losses in quality.

The qualitative losses of semi-manufactured frozen poultry products according to the storage conditions

Table no. 1

Fases	Tempe rature °C	Value of Ca, days	Time, days	Qualita Tive losses, ΔC
Frigorific warehouse	- 20	105	90	$1/105 \times 90 = 0,857$
Transport	- 15	46	2	$1/46 \times 2 = 0,043$
Storage	- 18	90	30	$1/90 \times 30 =$

				0,33
Transport	- 12	40	1	1/40x1= 0,025
Delivery	- 12	40	2	1/40x 2= 0,050
			ΔC_{tot}	1,305

$$\Delta C_{tot} = (\Delta C_1 + \Delta C_2 + \Delta C_3 + \Delta C_4 + \Delta C_5) \times 100 = 130,5 \%$$

4. Conclusions

We noticed that in mentioned conditions of storage and manipulation of semi-manufactured poultry, the acceptable qualitative losses are surpassed, and as a consequence the product will not be accepted by the customer.

That is why, is necessary the decreasing of qualitative losses on their way, of storehouse. The storage period in storehouse must be reduced at maximum 60 days. This fact means that every manufacturer must assure a qualitative reserve, taking into consideration the transformations that take place at keeping of the product at customer.

Scientific argumentation of proteins consumption associated with other nutritive elements, which completes the nutritive value of poultry products.

Assurance of alimentary safety for the new types of poultry meat by: equilibrated usage of nutritive components, severe identification of raw materials and added materials from a nutritive point of view, which may be associated with poultry meat.

Abstract

The research method used for obtaining some functional poultry aliments will be made of: identification of sources for raw materials and additional, which can offer the quality of functional aliments for finite poultry products, determination of sensorial, physics and chemistry, micro-biological and nutritive characteristics, making of new technological recipes which should contain nutritive elements with a determinative role in controlling the human metabolism, testing the new products on variable periods of time, at refrigeration and frozen temperatures, in order to be stored and kept in proper conditions, testing the recipes from a sensorial point of view by comparing with the qualitative standards valid for the presented qualitative characteristics and watching of qualitative losses according to the storage conditions of products stored by freezing, analyze and their interpretation. In order to measure and evaluate the qualitative characteristics of raw materials and of finite products we will develop our own processes of testing in research activity.

Key words: poultry products, quality, nutritive addition

JEL: L66, Q13

1. Introduction

The study tries to find out a method in order to experience some semi-manufactured poultry products functioning as functional aliments, which has to assure an optimal equilibrium from a nutritive point of view, easy digestion, and decrease the risk of appearance of some diseases, those aliments having a special target

point such as: the optimization of metabolism by controlling the obesity and diabetes, promoting the protection of body against the oxidative stress, promoting the health of cardio-vascular system, of gastro-intestinal tract, and of mental health.

2. Material and method

During the standardized stage of the semi-manufactured poultry products production parameters will be established so as to realize an efficient quality control of the activity carried on.[6]

The finished product specifications refer to the way the raw materials have been included in that product, to the consumers' requirements and the requirements of the existing laws/regulations. Some of the qualitative specifications of the finished product are: the sensorial characteristics (appearance, shape, color, texture, flaws, fragrance, smell, taste), the physico-chemical characteristics of quality, the use of the food additives, microbiological characteristics of quality,[15]strange bodies, the wrapping/package integrity, label aspect, product lifespan.[1]

The methods used to measure the quality characteristics can fall into two categories: measuring methods for physical characteristics, which are definite and refer to color, taste, texture and viscosity;[9]measuring methods for the "hidden" characteristics which cannot be seen or felt; they can be measured only by chemical and microbiological standard procedures (nutritive substances, dyestuff/coloring agents, additives, pesticides, toxicsubstances).[13]

So that, the methods used to measure the contents of mineral nutrients of poultry meat as the initial sample and semi-manufactured poultry products which are obtaining with the recipes proposes was calcined with calciner systems and the finally results was monitoring with the atomic spectroscopy.[4]

The recipes proposes for the research are the following: 1. MEAT POULTRY WITH - Poultry meat 400 g, onion 50 g, orange juice 30 ml, apricot 60 g, raisins 50 g, curry 5 g, oil 20 ml, salt 20 g, pepper 5 g and 2. MEAT POULTRY ROLES WITH VEGETABLES – Flour 500 g, water 300 ml, salt 3g, eggs 300 g which formed pancakes added minced meat poultry 200 g, peppers 50 g, onion 20 g, brocoly 50 g, cheese 100 g, mushrooms 100 g 3.MEAT POULTRY WITH RAISINS – Poultry meat 500 g, sugar 5 g, starch 10 g, raisins 250 g, flour 10 g, rusk 20 g, savory 5 g, 4. POULTRY MEAT WITH GREEN BEANS poultry meat fine paste 300 g, parmesan 100g, garlic 5 g, savory 5 g, white wine 10 ml, green beans 100g, eggs 100 g, vegetable marrow 300g. Analyzing the elements of recipes into the external factor such as: the cooling conditions we are established that the mineral nutrients especially, have an important increasing.[16]

3. Results and discussions

Increasing of temperature at refrigeration inducts losses of mineral nutrients for any semi-manufactured poultry products. Though, it is to observe that the amplitude of the losses (variation) is higher when the refrigeration is made around the values of 0-2°C. Even if, at the value level, the losses are more important around the refrigeration temperature of 8°C at this level of refrigeration, the amplitude of losses (variation) is lower. These aspects indicate a linear correlation with lack of intensity between the series of experimental data (temperature – losses of mineral salts). In this direction, the cubic function was used, $y = b_0 + b_1x + b_2x^2 + b_3x^3$ which, for the field of studied definition, (0-2°C), follows closely the studied phenomenon.

Losses quantity of mineral nutrients in refrigeration of the semi-manufactured poultry products for a day

Table no. 1

losses of mineral nutrients	poultry meat,	semi-manufactured	semi-manufactured	semi-manufactured	semi-manufactured

	mg	1, mg	2,mg	3, mg	4, mg
mineral nutrients	445	970,419	323, 206	427,693	1026,81
losses of mineral nutrients at 0°C	4,45	31,05	6,46	11,33	39,53
losses of mineral nutrients at 2°C	4,97	31,56	6,87	11,57	40,23
losses of mineral nutrients at 4°C	5,07	32,30	7,68	11,98	40,63
losses of mineral nutrients at 6°C	5,13	32,54	7,94	12,36	40,97
losses of mineral nutrients 8°C	5,16	32,86	8,04	12,57	41,03

Coefficients of regressive cubic function $y = b_0 + b_1x + b_2x^2 + b_3x^3$ (losses quantity - temperature)

Table no. 2

	r ²	Sig f	bo	b1	b2	b4
Poultry meat	0,994	0,09	4,45	0,36	-0,06	0,004
Sp1	0,989	0,13	31,03	0,30	0,003	-0,0016
Sp2	0,987	0,14	6,44	0,17	0,04	-0,0058
Sp3	1	0,009	11,32	0,05	0,04	-0,0035
Sp4	0,998	0,05	39,53	0,38	-0,02	-0,0002

Fig 1 – The quantity of mineral nutrients at the fresh products – poultry meat and semi-manufactured poultry products

Fig. 2 – The dynamic of losses quantity of mineral nutrients at the poultry meat between of 0 - 10°C

The losses of quantity of mineral nutrients monitoring through the refrigeration at the poultry meat without vegetables or fruits was increasing between 4,45 mg at the 5,16 mg / 100 g of product, (0,07%) means a decreasing of quantity of mineral salts just at 1,1% (table 1).

Fig. 3 – The dynamic of losses quantity of mineral nutrients at the semi- manufactured poultry product (SP1) between of 0 - 10°C

The decreasing of mineral nutrients registered of the refrigeration of semi-manufactured poultry products with added of vegetables of fruits variety after the following conditions :

-At the semi-manufactured poultry products SP1 from 31,5 mg of 0°C at 32,86 mg of 8°C(0,18% comparative with 0°C and 3,38 % comparative with fresh product).

-At the semi-manufactured poultry products SP2 from 6,46 mg of 0°C at 8,04 mg of 8°C(0,15% comparative with 0°C and 2,48 % comparative with fresh product).

Fig. 4 – The dynamic of losses quantity of mineral nutrients at the semi- manufactured poultry product (SP2) between of 0 - 10°C

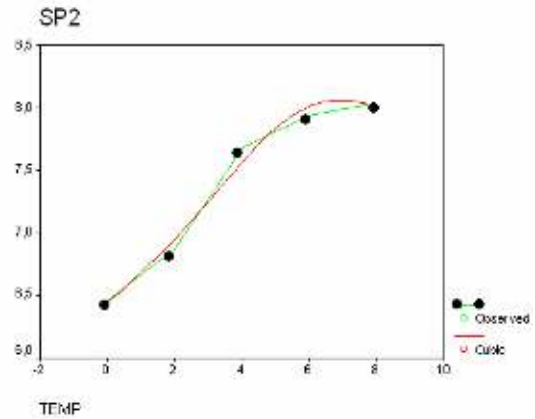

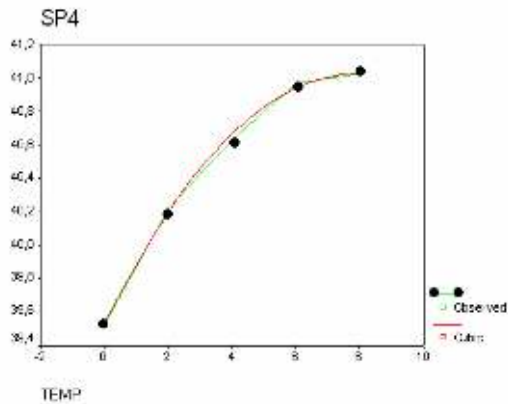

Fig. 5 – The dynamic of losses quantity of mineral nutrients at the semi- manufactured poultry product (SP3) between of 0 - 10°C

-At the semi-manufactured poultry products SP3 from 11,33 mg of 0°C at 12,57 mg of 8°C(0,11% comparative with 0°C and 2,94 % comparative with fresh product).

-At the semi-manufactured poultry products SP4 from 39,53 mg of 0°C at 41,03 mg of 8°C(0,15% comparative with 0°C and 3,99 % comparative with fresh product).

Fig. 6 – The dynamic of losses quantity of mineral nutrients at the semi- manufactured poultry product (SP4) between of 0 - 10°C

4. Conclusions

The values of the correlation coefficients (losses quantity of mineral nutrients - temperature) for each semi-manufactured product are situated around the superior value, thus indicating a superior correlation between the two series, so the increasing of the temperature at which the refrigeration is made implies a variation of losses following the model described above.

For each case in particular it was calculated also the risk limit (*sig. f*) which has generally lower values, indicating so a higher level of trust in the obtained results.

Analyzing the elements of recipes into the external factor such as the cooling conditions we are established that the mineral nutrients especially, have an decreasing, but that don't influenced the mineral nutrients quantity of semi-manufactured poultry products because the level of them are important increased using the vegetable and fruits (figure 1 – by the 445 mg at the meat poultry at the 970, 419 mg at the semi-manufactured poultry product (SP 1), 323, 206 mg at the semi-manufactured poultry product (SP 2), 427,693 mg at the semi-manufactured poultry product (SP 3) and 1026, 813 mg at the semi-manufactured poultry product (SP 4).

So that, the decreasing of mineral nutrients at the refrigeration was between 0,07 % and 0,18%, decreases which couldn't paste about the increasing of level nutrients which became

54,14% - 56,66 % more largest then the meat poultry without vegetables or fruits.

Abstract

The strategy conceived for a certain type of business takes shape in the form of the business plan. The business plan represents a complex system based on interdependence and which reflects in an accessible manner the idea of business and the evolution of this one in the time. This is a work tool used for the beginning and the development of a business that needs material, financial and human resources. By the instrumentality of the business plan are improved the experience and the realizations of the past with the intention to project the future through the most appropriate methods of estimation and approximation. It serves as an element of convincing in the process of negotiation of some credits and of attraction of some potential paymasters. A business plan can be compared with a road map: it shows where we are and where we want to arrive. It contains points of mark and other helping elements for the orientation in the economical environment, preparing at the same time the traders for the more or less predictable modifications of the “crossing”. A good based business plan should be capable to determinate the necessity of additional capital and the moment to realize the infusion of this one, convincing on the capacity of the inquirer to manage the business. The paymasters want to be sure that it was made a responsible analysis of the strong and weak points of the business, of the rescues and the associate opportunities. They also must be convinced that a lot of rescues indissoluble related to that businesses were identified and some methods of decreasing of these ones were found on acceptable levels.

Key words: the bank financing; the capital investment; the alliance; the relations with the clients and with the distributors; external sources of financing.

JEL classification: M13, G21

1. Introduction

The business plan – an indispensable tool of the entrepreneurs which builds a business or seeking partners, of the managers proposing new projects to other persons or financing institutions, of the institutions of financing, of the institutions which administrate the funds for the investment projects, of the administrators of projects in the background of the so appointed “hatchery of business” etc.[1]

The business plan reflects the projects of investment from all the branches of activity, projects which are tending to become today more and more important and complex, many times being of international stature. The projects of international investment must advance the information in a system and language accessible to all the aimed parts. From this point of view, the most sensible part is in fact the translation of the financial previsions of the Romanian system in the Anglo-Saxon system.

The business plan is not represented by a form to be completed at the demand of a credit inspector, a bureaucratic element to be realized in order to obtain a certain sum from a paymaster, but a complex system based on interdependence and which reflects in an accessible manner the idea of business and its evolution in the time.

2. The Business Plan – A Tool of Attraction of the Sources of Financing.”

Its role is not only to demonstrate that the business worth to be financed, but also to guide the entrepreneur beginning with the first year of operation of the business. Its deployment means control and adaptation in function of the real evolution. This control exerted aboard the rollback of the business will aim at all the critical elements of the economic entity, elements concerning the strategy of the prices, of the distribution, of the sales, of the competitive strategies, etc.[2]

The business plan is this way a written document that describes the nature of the business, the point market, and the advantages, which the business will have on the competitors, as well as the resources, and the aptitudes that are disposing the owners of the business.

In order to draw up the plan it is necessary to analyze with attention the products/the services offered, the competition, the necessary financial resources and other operational details.

At the same time, the business plan is a work tool used to begin and develop a business that needs material, financial and human resources. By the instrumentality of the business plan are improved the experience and the realizations of the past with the intention to project the future through the most appropriate methods of estimation and approximation. In the speciality literature it is attempted a definition of the business plan as follows: “The business plan is a tool of the present, elaborated through successive approximations, using the experience and the past realizations of the enterprise in order to project in a realistically the way to the future. It has as purpose the most advantageous and realizable compromise between what the enterprise want and what it can do”[3].

The preparation of a business plan is a dynamic phenomenon, emerged in a permanent improvement, some potential sources of financing wish to see improvements of the plan, new ideas or letter day figures – in the case the enterprise already has business. Any business plan supposes a certain sequence of operations. For the drawing up of this one we need to scan the following three points:

- The collection of the necessary information (prices, competitors, contractors, technical data, juridical data etc.);
- The effective planning of the respective activity – the choice of the adequate strategy and the find of the path to reach the established objectives;
- The editing of the plan (the stage of choice of the optimal form of presentation to the addressee of the result of the foregoing stage).

At the basis of the planning of the business and of the realization of the business plan is an entire process, made of five stages (A, B, C, D, E), and systematized this way:

A. The fixation of the objectives, which supposes to establish the following points:

- Where do you want to arrive
- The efficiency of the investment
- Products/Markets
- Productivity
- Expansion/Consolidation

B. The Diagnostic of the actual situation:

- Where you are situated
- Products/Markets
- Production
- Resources: human, material and financial
- Organization
- Results

C. Analysis of the economical medium of evolution:

- The demand of the market
- The clients
- The competitors
- The existent technologies
- The work force
- Other influences

D. The SWOT analysis:

- Strong points
- Weak points
- Opportunities

E. The establishment of the strategy concerning the choice of the best way to come to (B) The diagnosis of the present situation to (A) The fixation of the objectives considering (C) The analysis of the economical medium of evolution and (D) The SWOT analysis: strategies; necessary resources; responsibilities of implementation and motivation.

The concept of a business represents an intangible idea, and when the business takes shape in a written business plan, the ideas, the concepts, the forecasts and the researches become tangible, they can be seen and examined.

The business plan approaches the idea of business to the reality – a fact which represents a very big psychological advantage. That's why the business plan has four functions:

a. The function to realize a retrospective evaluation of the real performances of a business through the time – it supposes the identification of the causes, of the directions and the amplitude of the digressions from the plan, as well as the modalities of action of the company in the future. The entrepreneurs will ameliorate their professional experience and the knowledge, they will be less exposed to the unexpected dangers, they will oversee and control the performances of the company and they will be able to take corrective measures in a good time when the realization of the objectives is menaced.

b. The function of crystallization and development of the ideas regarding the manner to manage the business supposes that the business plan defines clearly the purposes and the objectives of the business, to establish the methods to reach these ones and to identify the rescues involved. This way, the allocation of the resources will be done after criteria of maximization of the efficiency, the strategies are chiselled, the business is examined from all the points of view (marketing, production, financial sustentation) and the mistakes are done rather on the documents as in the reality.

c. The function of prospective evaluation of the business – it derives from the capacity of the plan of business to analyze, to evaluate, to compare and to classify the projects of business. At the same time, this tool of work gives confidence in the own capacities, can compensate the failure of the capital and the experience in the case you have other advantages.

d. The function of generator of financing - the most creditors and paymasters will finance the business only after they will have studied the business plan, they will see the ability of the plan to generate necessary collections for the daily operations, for the payment of the debts

and the generation of the profit. The sources of the capital (credits, investment or grants) would like to know how much money is necessary, when it would be necessary and how it will be spent, if and when could be require the allocation of some funds. The paymasters could appreciate this way the capacity of the management to diagnose the current situation, to mark the future objectives and to choose the best strategy to obtain these facts.

The development of the business will be easier if it will be elaborate a business plan and the financing will be more accessible if through this document we convince the paymaster on the soundness of the business. When an entrepreneur presents an idea to a commercial paymaster, to a bank or to a potential paymaster without a business plan, they will demand to the paymaster to have one and then to come again. The necessity to obtain a financing constrains every company, which have already begun its activity to realize a competitive business plan, a stringent planning. The elaboration and the editing of the business plan will give competitive advantages in at least three areas:

- Marketing – it could be identified the clients, their necessities and expectations, the politics of prices, the techniques used in order to conquer the market area they wanted;
- Personal – it could be defined the rights and the attributions of the management and of the employees, the politics of hiring and lay-off, the daily operational process, etc;
- Financial (the pile of sustentation of the whole business) – the learning of preparing and the utilization of the cash-flow projection, of the account of settlement, of the analysis of critical points etc.

Therefore, the conceiving of a business plan is an excellent way to obtain credibility and to show that a success is very important for an entrepreneur. There is no unique prescription to elaborate a business plan, this is, in the long run, the expression of the competence, of the experience of the business man, but it cannot digress neither from the logic of the points it supposes the development of a business, nor from the necessity to contain indispensable information, for the one who realizes the

business plan, as well as for the people who develop the business.

3. The financial Objectives of the Business Plan.

Every business plan has well defined financial objectives. In the speciality literature, there are identified as financial objectives of the business plan: the reduction of the financial risks; the resolution of the unexpected situations; the procurement of external sources of financing.

a. The reduction of the financial risks – is realized through the anticipation of these ones and the establishment at time of the best measures to be taken in case of necessity. Between the most important risks can arrive we can mention the establishment of the following points:

- The default of liquidities
- Supersized credits
- Undersized credits

b. The resolution of the unexpected situations – of the unplanned, unexpected events (fortunate or unfortunate) consistent on the economic situation of the company. Some situations can be really unexpected. Here are some examples of unplanned situations:

- The interruption of the production
- The introduction of a superior product from a competitor
- The disappearance of a competitor.

c. The reduction of the costs of financing – the financing supposes a succession of costs, which set on the second place the entry of the cash, irrespective of the source of this one. In function of the nature of the paymaster and of his wishes, will come out a few categories of costs of the financing:

- The rates, or the cost of the taken capital, containing the rate of the debts of refinancing and the prime of risk (collected by the paymaster for the respective business and in interrelation with the proportion of the advanced sum);
- The dividends – the cost of the subscribed capital and incarnates in the payment of the dividends (with an effect on the flow of the cash).

d. The procurement of external sources of financing – the most attentively chased objective of the planner. The financial plan is in fact the “heavy artillery”[4] of the business plan, because to this component is oriented the biggest part of the financial interest of the examiner

4. The Utilization of the Business Plan in the Relations with the External and Internal Environment of the Company.

Because the number of the demands and offers of financing or other type of support from outside enlarges, the business plan becomes an indispensable instrument to every company in order to benefit of support from outside of the company.

The bank financing – The banks hadn't the tradition to demand business plans from the solicitors of credits, finding their confidence on the foregoing and actual reports regarding the economic-financial activity of the solicitors of credits. But the problems interceded through the collapse of some economic projects made the banks to become cautious and not willing to continue the politics of the credits according to the traditional procedures. A written business plan can help a medium company, setting it in a fortunate position in the endeavour to obtain the financing, in the conditions of the intensification of the competition, in the fight to obtain loans and credits.

The banks are demanding information not only on the dimension of the wished credit and for what purpose, but they demand also certainty on the reimbursement and on the debts, therefore when and how it will be made the reimbursement of the loaning.

The capital investment – the particular paymasters of capital and other – same companies will not considerate the adjustment of the financial support to a company, which not represent a written, and credible business plan. To the difference with the banks, which are interested especially in the re-entry at the date of payment in the possession of the borrowed capital and its debts, the paymasters want to be demonstrated the high benefits of the investment project purposed, which can admit the recuperation of the investment in an

accelerated rate. Extra, they want to know how they can recuperate the money they invested through the sale of the company and on other ways, in order to know about the probability of a corresponding benefit; the investors analyze very attentively the following facts:

- The records registered by the soliciting company, its outlet market, the persons who manage the business and their performances;
- The feasibility of the accomplishment of the foresights;
- The uniqueness of the product and its technology;
- The quality of the management.

When the banks are interested in the existence of some actions capable to be guarantees for not to lose the sum they borrowed and that the debt could be paid cash, the paymasters are very interested in the quality of the people who manages the company and in the durable profits of this one.

The alliance – Such engagements, which may refer to the common applicative scientific research on the problems of development of the product and of the marketing, generally and typically between big corporations and young companies, but in development, became more and more usual in the last years.

For the companies in development, the arrangement often includes a combination of financial assistance and access to the channels of distribution well stabilized. The common effort may subsist three years or more. The big companies, in a variable way, would like to examine the plan of business of a company of medium level before it engages in a long time engagement.

The coalesces – a company of a medium level searches more and more the way of the coalesce which can constitute a tool of expansion and that's because it needs more and more the business plan. A company of a medium level in the situation to take over another company or to find a company interested to take it over in a fusion needs always a business plan.

The relations with the clients and with the distributors – for the companies with a medium level, the gaining in quality of clients of a big company or an engagement from an important distributor can be events of equal importance.

The big and well-known organizations are always reticent to make engagements with companies of medium level, because they are not well known[5]. A good business plan can abolish the disbelief and the doubts.

In point of the utilization of the business plan in the relations with the internal medium of the company, we must say that the business plan is an important tool for the management. It gives the possibility to the management to plan the development of the company and to anticipate its structure changes.

The administration of the medium level enterprises argues sometimes that this is pointless to write a business plan because the situation of the market changes quickly and the plan play out.

It is obviously really that the changes are a layout but the process of the preparation for the realization of the business plan is at least such important as the real business plan. It constrains the management to think about the business in its details and to establish the objectives in which accomplishment to be piloted the activity of the company.

The most important thing is maybe that the business plan mobilizes and coerces the whole management in the accomplishment of the same desideratum.

The process of the elaboration of the objectives of the plan forces invariably the executive management to reconsider the opinions on the situation of the company and on the directions it is managed. This process may be painful but the realization of the common purpose is important for the company.

A written business plan can be an internal important document also for companies with multiple centres and activities. The

management can lead the elaboration of the business plan in order to certify the contiguity, on a long period of the purposes of the company concerning the market and the financial results.

Common points and particularities between financial audit and internal audit

Alexandru Georgiana

Abstract

This paper has as objective marking of a line between internal and financial auditing, in order to a better understanding of these two concepts. Giving the fact that we find ourselves in a world trapped in a continuous movement, it is well known that world communities tend to globalization. Our desires and always growing needs, along with the need of life improvement, bring the necessity of developing international directions, regarding various themes, including the auditing activity. Auditing activity is known as an activity which brings plus value, an activity with a short history, borned from our need of a high level of performance regarding all the activities developed in a company, especially in now-a-days economy when the word quality gains a much higher value. So, the auditing activity takes her well-earned place on the market, were we meet two concepts of auditing, such as internal auditing and financial (external) auditing.

Key words: audit, internal auditing, financial (external) auditing, financial statements.

JEL classification: M4; M42

1. Audit - brief history

The audit, the activity itself is a relatively new function, having a short known history, with not an existing record fine determined along time, being assigned for the first time early in the XVIIIth century, but not specified the exact date or geographical location in a state.

Etymologically, the word *audit* has his origins in the Latin sound *audire*, which means *to listen*. However, the *expression audit* has been mentioned for the first time in French language and means *accounts listening*.

Broadly, the audit until the XVIIIth century had as purpose thieves' punishment for fraud and prevention of such acts in order to protect their own heritage, entities being represented then by the state, church, and court. Since the XVIIIth century and continuing with half of the Nineteenth Century, the audit function has become an end to fraud, to those who were producing fraud, and last but not least, tried to find solutions on the preservation of heritage integrity. End of the Nineteenth Century brings a new era in the history of auditing, a relationship between auditors and the entity taking shape, auditors who until now were elected from the priests and best accountants, now will be represented by professional accountants. Thus, the *basic objective of the audit becomes the certification of the reality of the financial statements, in order to avoid errors and fraud*.

The XXth century represents a top period in audit activity; in this century specialized organizations are developing, such as the International Institute of Internal Auditors (IIA - Institute of Internal Auditors) in the United States in the year 1941 and the French Institute of Auditors and Internal Consultants (IFACI), in the year 1965. With the emergence of these organizations, for approximately two decades (1970-1990) objectives are targeted to internal control certification, compliance with the conceptual

framework of accounting and auditing rules. Since then, standards and rules have been drawn up, to bring the audit work to an advanced form, a form that would confer an added value to the business of accounting.

Considering changes and the galloper rhythm that these changes take place all over the world, it is not a surprise that every type of activity is affected, the globalization tendency putting a profound mark on everything that means economical and financial life.

It's understandable that *audit does not mean an exception as it regards development and changeability*, keeping a close check in meeting necessities and demands, making a purpose from *work upgrade*, taking the auditing activity to a higher level, without the risk of a non perceptible or incomprehensible work.

2. The concept of internal and financial auditing

The audit, in accordance with international rules of audit, but also in opinion of many authors, can be defined, in a simple form, as an examination of the situations, whose purpose is expressing a responsible and independent opinion, an opinion that means that the financial statements have been prepared according to the accounting identified references, named quality criteria.

According to ISO 8402, the audit can be defined as a methodic examination conducted to determine whether the activities and results relative to the subject are considered to satisfy the provisions of default and whether these provisions are put into opera in an apt and effective manner, in order to achieve the entity's objectives.

Concisely, we can say that the audit is used to evaluate the *difference between the actual situation and the default one*.

Auditing architecture is composed mainly by internal and external (financial) audit. International standards, guidelines, the recommendations issued by specialized organisms such as IFACI, are coming to help us

give auditing activity a definition, giving us a hand in understanding audit.

The audit is a universal function. Although, its best known face regards the financial function, the auditing activity spreads its arms among all functions retrievable in an entity, through internal audit, which covers all functions which contribute to a result determination. A limitation of audit activity to a single compartment, as accountancy, is not recommendable in the context of a globalized society, being preferable a complete verification and certification of the entity's activities.

Therefore, *internal auditing represents a function integrated in the company*, when the *external auditing represents an independent function* whose mission is to certify the accuracy of the accounts, results and financial situations, and more precisely to certify the sincerity and a truthful image of the financial situation and (if we retain the definition of the authorized accountants) to certify the regularization, ingenuity and fair picture of accounts and financial situation. The two types of auditing are now-a-days, net differentiated, their definition, especially the external audit one being universally accepted.

A deeper presentation of those two concepts of audit can be done, but we must mention an essential thing, the fact that those two functions do not compete, on the contrary we can affirm that they are complementary.

3. Differences between internal and external auditing

The differences between the two concepts are presented in the next table.

Table 1
Differences between internal and external auditing

Compared elements	Internal auditing	External (financial) auditing
Statute	Being an integrated function, dependent by the company, results that the internal auditor is an employee of the firm.	As an independent activity, the external auditor is represented by an authorized independent auditor or by a company which offers this kind of services.
Beneficiary	Through the perspective of his characteristics, internal auditing give information to the company's responsible, as managers and auditing committee.	External auditing works to obtain information in benefit of a large range of users, like shareholders, bankers, authorities, clients, suppliers.
Objectives	Internal auditing has as objective appreciation of an efficient development of the activities developed by the entity and recommendation of some directions regarding detected problems.	External auditing takes a look at the entity from outside, though it has as objective the certification of the honesty and a correct and fiddle representation of the results and the financial situation of the entity.
Application field	Internal audit it's applicable in all departments of the entity.	External audit is limited to observations and investigations regarding accountancy.
Fraud preventing	Internal audit approaches fraud referring to personal folders.	External audit is interested to any fraud that might affect the financial situation of the entity.
Independence	Internal auditor is an auditor employee of the entity, without juridical and statute independence.	External auditor, as we mentioned before, is an independent auditor, which pleads for a free profession.
Periodicity	Internal audit has a permanent character, being continuously present, solicited in permanence with the same intensity, any time of the year.	External audit has a temporary character, being solicited in some specific periods, in order to certify accounts.
Procedure	Internal audit has a specific and original method.	External auditors accomplish their work based on specific methods, like analyses, inventories.

4. Common points between internal and external audit

As similarities between internal and external audit, we mention the following:

- Both are effectuated by specialists;
- Both functions help to a consolidated position of the entity on the market, assuring trust and respect from the
 - entity's partners, meaning clients, suppliers, investors, state and other institutions;
 - They both respect deontological principles;
 - In both cases, the annual financial statements are open to an audit work in a obligatorily;
 - The auditors are responsible with the

elaboration of the audit report, which will have to be signed by the auditor on each page;

- Objectivity, internal and external auditors must maintain their objectivity, so that they can give a correct and fiddle representation of the entity's situation;
- The auditors' responsibility is limited to the situation's control, they are not responsible for the preparation of financial statements;
- In their sphere of control accountancy is included, both functions appealing to the information given by accountancy through her support, like registries, documents, cd, dvd, programs;
- They are functions that overtake information, in order to analyze them and so be able to give, at their turn, new information to the beneficiary;
- Co-treatment, defined by IFACI as a constituent of a common team between internal auditors and external consultants, in order to complete a determined mission;
- External services, defined by IFACI as a punctual assistance of external specialized companies. In this point, it can appeal to multi-disciplinary specialists like technicians, computer-experts, jurists;
- Interdiction of any auditor's intervention in the management activity;
- Utilization of identical ways, even though there is a different methodology.

Although, there are some major differences, the main one consisting in their statute, we can take a conclusion from their similarities: that internal and external audit are not competitive functions, on the contrary they are complementary.

So, the internal audit is a complement of the external one because where is internal audit function, the external audit must appreciate in a different way the qualities of honesty and fiddle representation of the accounts. This aspect is mentioned in Direction 550-02: "access to the programs and work files of internal auditor must be

given to the external auditor, so that the last one can take as support internal auditor's work".

In the same time, external audit is a complement of the internal audit, an element of evaluating business.

These being said, we can affirm that internal and external audit must collaborate, as Direction 550 mentions:

- coordination of the work whose responsibility is the director of internal audit, and in this respect, avoid any duplication of assignments;
- the possibility left to the internal audit to perform work for external auditors, subject with the condition of respecting IIA rules;
- in consideration of what preceded it: the possibility of internal audit director to have an appreciation of the work of external auditors;
- reciprocal access to programs and files;
- mutual understanding techniques, methods and terminology. And this issue should not be missed in the formation of external auditors;
- the transmission of external audit reports to internal auditors and each other, of course under cover of confidentiality to those two functions;
- establishing joint plan interventions to minimize difficulties caused by audit

Collaboration may go even further and it is desirable to go to achieve internal and external audit in the same service at the same time, each with its questions and methods to its objectives, with periodic exchanges of information along mission.

- regular working meetings once or twice a year, each possessing its investigations, its findings and feedback which compares the two parties. It is often an opportunity to find faced convergences.

5. Advantages and disadvantages of internal and external audit

Internal audits are part of a whole, represented by patrimonial entity, which has the power to assist the enterprise, assisting members to exercise effective management

of their responsibilities by providing analysis, feedback, comments and recommendations on relevant activities examined, presents certain advantages, resulting in precisely the status of this work.

Among these advantages are included:

- knowledge of the environment, an internal auditor will understand better the internal control through a permanence contact with the entity;
- a permanent action, internal audit is not a temporary action, exercising his functions throughout the existence of the entity;
- in-depth analysis, internal audit having regard to all its components, not only the accounts;
- can give the best answers to issues of privacy through the first advantage: a detailed knowledge of the environment in which they operate;
- internal audit brings a plus value, materialized in a general improvement of the entity's activity;
- internal audit contributes through its methods to loss stop.

Internal audit presents disadvantages too, namely:

- environment influence, an inconvenience which has its origins in the same advantage as environmental awareness, namely to be kept within the entity, having the risk to influence audit work;
- term routine.

External audit, aimed in expressing a motivated opinion on the regularity, honesty of the financial statement, being capable in giving a reliable picture of annual accounts which are submitted to its present, have, just as internal audit, both advantages and disadvantages.

The advantages of external audit include:

- expert competence;
- procedures experience;
- total independence;
- a new and neutral vision;

The inconvenience of external audit brings into question the following aspects:

- A punctual intercessory (mission);
- General recommendations are often superficial.

6. A personal approach of internal and external auditing

Some basic principles governance the internal and internal auditors work, those principles can be found in both internal and external audit standards, like Internal Audit Directions and the Ethic code of professional accountants.

To this purpose we are giving the following opinions:

- 1) An auditor must be proficient, must have an adequate qualification required to an efficient audit work;
- 2) The auditor should have in plan, constantly, a permanent training, he will have to be up-to-date with all directions, standards, a professional stagnation not being allowed to an expert in any field of activity;
- 3) The auditor must maintain and respect confidentiality regarding information they have access to, as a result of the audit work;
- 4) The auditor should not let any circumstances/emergencies to influence him, he should have an objective point of view, not a subjective one, regarding audit work, in the purpose of exercising a competent and professional work worthy of trust in front of the beneficiary;
- 5) An auditor must be impartial, right and honest in all his professional and business relations;
- 6) An auditor has the responsibility of an action according to mission requirements, with meticulousity and paying attention;
- 7) An auditor has the obligation to respect laws, directions, avoiding any kind of action that could be a reason of profession disparagement.

All these principles do not eliminate each other, they become complementary; from a principle derivates another and so long.

The auditor cannot decline any of these principles, the work of audit and his acknowledge being done through those principles.

It can be observed that the 7th principles

mentioned above can be structured by their appurtenance in a category (figure 1).

From figure no.1 it can be observed that objectivity, integrity, confidentiality and consciousness fit into the personal characteristics category. These principles should be present in every field of activity, with a great importance in an expertise activity.

Competence, continuous improvement and professional attitude are principles that are included in the professional category features. As well as other principles included in the category of personal characteristics,

these principles should make the formation of any worker.

Both external and internal auditors must take in consideration some common basic directions, as it follows:

- auditors will respect principles and rules, regarding internal and external audit, by case;
- auditors must respect information confidentiality and will have to consider an open-eyed position with the possibility of information leaking;

Figure 1
 Principles appurtenance

- auditors will not use information obtained in their work of audit, as a result of professional or business relations, in their personal interest or in the interest of a third part;
- auditors must have knowledge, skills and other capabilities in order to complete their work of audit;
- auditors must have sufficient and relevant knowledge in order to identify fraud, but not meaning that they will have the competence of a person whose main responsibility is identifying and fraud investigation;
- auditors must develop their skills and proficiency, appealing to a continuous training, so that they could keep up with society's dynamism. A proficient service requires a permanent consciousness

and an understanding of relevant evolutions on professional plan. A continuous training develops and maintains abilities that allows auditor to do a work done competently;

- auditors must have a neutral and non-prejudgment attitude;
- auditors must avoid conflict of interests;
- auditors must avoid auditing some special operations that they were responsible of. An auditor's objectivity is considered affected when they accomplish an assuring mission for an activity they were responsible of.

All audit missions must be accomplished with maximum of consciousness and competence, including the responsibility to

action in conformity with the mission's requirements, with maximum of attentions and meticulousity, at the right time.

In an acceptance of free markets and a society in continuous development, audit gains values increasingly popular and higher, a certification that the activity of a company is in accordance with international standards, thus always an added value, representing an ace of the company. This will bring notoriety, will confer confidence and stability, notifying that the entity is an important player on the market and can face market demands.

Abstract

It is argued that the current accounting and risk assessment methods have played an important role in developing financial panic. Mark-to-market models and fair value accounting seem to stand as the basis a market failure and should be replaced by more conservative accounting methods. In this paper we reject this idea, emphasizing the weaknesses of historical cost accounting and mark-to-model financial model. We put the debate in a larger perspective, pointing to the relation between accounting methods and entrepreneurial economic calculation. Also, we criticize the association between fair-value accounting and the current crisis, arguing that the latter is more likely the result of risk regulation that determined herd behavior.

Key words: financial assets, business cycle, entrepreneurial economic calculation, herd behavior

JEL classification: M4; M41

1. Introduction

Since the beginning of the financial crisis an important debate emerged on whether accounting principles should be reform in order to prevent market upswings and downturns. Many economists and officials expressed concerns that fair-value accounting method and resulting financial statements may unduly exacerbate profits during the growth phase of the business cycle and contribute to the spiraling

down of investments and profits during the recession.

This paper is structured as follows. The next section presents the case against market value accounting. Section 3 shows the disadvantages of historical cost accounting, arguing that it does not prevent economic distortions, especially in time of inflation. Section 4 extends the argument, approaching the issue historical cost-accounting/mark-to-model versus fair value/mark-to-market from the perspective of entrepreneurial economic calculation. Section 5 shows that it is not necessarily market value accounting which induce firms to invest in overvalued assets, but the regulation of risk.

2. The case against fair value accounting

As authors of one of the many papers on the subject explain, "The use of fair value seriously reduced the ability of the financial institutions to resist risk. When the market is active, financial products which are measured by the so-called fair value are always lucrative and managers usually tend to be unrealistically optimistic. Once the market shows a weaker tendency, the value of financial assets will be undervalued. According to IAS, financial institutions have to accrue to impairment according to the measurement attributes of the assets or reduce the owner's equity, which will affect the profitability of the corporate and the level of capital adequacy ratio. At this time, in order to evade the adverse effect, a large number of financial institutions will sell assets, causing a further decline in the value of the assets. So the

vicious circle won't stop until the bank is bankrupt.” [1]

It is argued that the current accounting and risk assessment methods have played an important role in developing financial panic. Many economists believe that using the market value of financial assets in investment risk assessment and, further, the minimum level of capital that a bank should possess, is likely to generate herd behavior and a vicious spiral, which lead to market collapse.

The reasoning is this: if the price of financial securities drops, the assets of institutional investors (who recorded the present value of financial instruments in their portfolio) is reduced as this fact pushes banks and investment funds to liquidate some assets - to quit assets which are depreciating, in turn, lowers the securities' quotations, consequently, worsening their accounts. The more the market falls, the market participants sell more, leading to market collapse. The procedure of recording the market value of assets (so-called *mark-to-market*) seems to stand as the basis a market failure and should be eliminated.

New accounting clarifications issued by the International Accounting Standards Board and the supervisors of capital markets (such as the U.S. Securities and Exchange Commission) approve the replacement of market price-based values with models-based values (*mark-to-model*), where the cost of assets - the price at which they were acquired - plays a larger role.

Figure 1. Mark-to-market model and market downturn

2. Historical cost accounting disadvantages

However, historical cost accounting has a number of severe weaknesses, and even if one appreciates the arguments against fair value accounting, it does not automatically result that past cost accounting would be better.

First of all, historical costs do not provide relevant information for the management or shareholders, because it ignores price signals. Past transaction prices are a poor guide to what is the current value of assets, and so accounting values are disrupted from economic realities. This lack of correlation between accounting values and actual business conditions induces inefficient decisions because the measurement regime does not reflect properly the effects of past decisions. “Under the historical cost regime, shortsighted firms find it optimal to sell assets that have recently appreciated in value, since booking them at historical cost understates their worth. Despite a possible discount in the secondary market, the inertia in accounting values gives these short horizon firms the incentives to sell. Thus, when asset values have appreciated, the historical cost regime leads to inefficient sales.” [2]

Second, the historical accounting method has been criticized mainly for its fault to address the problem of inflation. Leaving aside the issue of market change, the relevance of historic accounting is lost when the currency is devalued, that is when prices are strongly affected by monetary factors. Thus, inflation makes business to become over-optimistic about their profits, as past costs are compared to present inflated prices. For example, it encourages borrowing since with inflation the debtor gains at the expense of the lender as, in real terms, the value of the loan has decreased; the opposite is true in time of deflation. Inflation inflates accounting profits because as the value of the monetary unit shrinks depreciation will become lower and lower in real terms, so that asset consumption is not properly taken into account in financial statements.

Third, since inflation is mainly a form of taxation (redistribution), its effects are unequally spread across the market and historical cost accounting does no longer

provide relevant information for comparing corporate performance.

Fourth, although it is true that, at times, observed market prices deviate from fundamentals nobody knows exactly what these fundamentals are. Historical costs do not reflect the fundamental value of an asset just because they are historical. Past costs are still market costs, albeit past, so they may be infected too with the virus of overvaluation or undervaluation; what happens when past not present prices depart from the fundamentals?

Last, there is no empirical evidence that investors would be calmer if they use historical cost accounting. Nothing prevents investors to anticipate and recognize the imbalances on the market despite the situation resulting from the official financial statements. This anticipation is only more difficult, as companies lack the important instrument of accounting to evaluate investment's performance. Moreover, even if it were true that investors would react more calmly under historical cost accounting, this is irrelevant when it comes to judge the relative performance of accounting standards; investors may be more calmly, but they may be so in realizing the malinvestment – overvaluation of certain assets. Thus, “to make a case against fair value accounting, it is important to consider not only the costs of it, but also the costs of the alternative(s), including their incentive effects during normal or boom times. Otherwise, we fall victim to an accounting version of the Nirvana fallacy”. [3]

3. Historical cost accounting and entrepreneurial economic calculation problem

The debate between supporters of both risk assessment procedures recalls the theory of economic calculation and similar dispute between advocates of socialism and its critics. Theory of economic calculation, developed by Ludwig von Mises¹ states that the allocation of resources is based on economic calculation. [4] The possibility of economic calculation, i.e comparing profitability of different investments, is an essential instrument for entrepreneurs who need to allocate resources efficiently. Economic calculation cannot proceed without money prices that allow bringing to a common denominator

both anticipated costs and revenues associated with each investment alternatives. Discussing the importance of economic calculation, Mises said that socialism is impossible, meaning that without monetary prices to disclose consumers' needs and scarcity intensity factors of production, socialist planners can not reasonably determine which direction to focus resources. They may, for example, if urgent (from the perspective of end users) that iron is used to produce or to manufacture cars rails, have no means of discovering which of the two methods of transport, rail car and is more profitable. In such case, the scheduler is forced to "groping" in an attempt to produce the goods in such quantity and quality demanded by consumers.

Money prices arising naturally on the market allows us to calculate and to discover which businesses are profitable and which are not. From a broader perspective, free prices accomplish the role of coordinating economic activities because the system gains / losses "says" where market participants to focus.

Impossibility of economic calculation under socialism definitively discredited this ideology. Some economists' attempts to revitalize this economic doctrine by proposing a calculation of prices based on complicated mathematical models or market game mimicking the directors of state factories have only demonstrated the meaningless of socialism. But as we said, this debate, forgotten by more than half a century ago, becomes very relevant in our days.

Now, there is no doubt that reduced interest for a financial title in a certain way causes loss for the people who continue to hold in their portfolio. But as well, a reduced demand for pretzels is causing losses of those who hold stocks of pretzels. Nobody came up with the idea to save the bankrupt producers of pretzels because, allegedly, pretzels price does not represent its real value. But there are many economists arguing that the price of bonds backed by mortgages do not express their real value.

Market price indicates the intensity of preferences of purchasers. It offers a signal not only to purchasers but also to producers. A price increase shows that it is effective for society to dedicate a larger share of inputs to the booming industry. On this basis of a whole chain of

producers and subcontractors decide to increase production. Conversely, a lower price shows that it is better to quit and seek alternative business, more important for consumers.

To ignore this is to deny the importance of economic calculation for efficient resource allocation. There are many criteria by which goods produced in society can be allocated: the basis of race, color, political affiliation, sex, nationality, the subjective preferences of political authority, the lottery or, why not, by developing mathematical models based on quantitative relationships between various elements determined arbitrarily selected. We can employ wizards to tell us which way to invest. But one criterion only can tell us how to allocate resources to enhance the general welfare - economic calculation based on market prices.

4. Accounting standards, the regulation of risk and herd behavior

It is true, of course, that the accounting of assets using market prices creates problems once quotations fall down. However, the collapse of financial markets has its foundation not in the use of market prices themselves, but in the herd behavior determined by the decisions of regulatory authorities.

It is wrong to blame for the crisis the ignorance of market participants, to consider asymmetric information as a fundamental weakness of the financial system. Only those cut off from reality can live with the impression that they have a better knowledge of the situation than those actually involved in that situation. Chair economists have no incentives to acquire this knowledge. Players from companies (and investors in general) are eminently interested in obtaining information necessary for accurate prediction of economic development, because their money is at stake.

The problem is to understand why there is such a large fluctuation on the market. What causes market participants to act at once, what factors are responsible for herd behavior in financial markets before? The answer needs to consider the effects of regulatory policy. As Avinash Persaud (one of the old market participants) confesses, "risk management systems and increase transparency in fact

determined markets to be less stable, increasing the chance of occurrence of a crisis." [5]

A host of regulations issued by the national and international agreements such as Basel I and II, have constrained banks to abandon their independent policies and adopt standard models of quantitative risk assessment. A century ago, banks were run in entrepreneurship (in the economic sense). They were concerned to identify profitable investment projects, and provide them with necessary funding. Since the economic environment is uncertain and the crowd of possible investments highly heterogeneous, analysis of each funding proposals has a strong entrepreneurial feature, is speculative. Banks tried to discover, how to use their own and attracted capital so as to achieve the highest profit possible. Their mission was, from this perspective, different from any other entrepreneurial mission, knowing that only by identifying business opportunities still untapped, by innovation, they can survive in the market. At the present, as a direct consequence of regulatory policy risk, entrepreneurial dimension of banking is replaced more and more, with typical bureaucratic work. Investment opportunities (assets) are divided by the public authority on risk categories and risk will be calculated according to models and methodologies approved by the regulators. Uncertainty is excluded from mathematical models. Banks are strongly encouraged (read forced) to comply with technical standards issued by the banking supervisory authority. Is increasingly less room for the exercise of entrepreneurial ability, because financial institutions can no longer run their businesses after their entrepreneurial talent, but as the regulators dictate. Banking is less speculative and more bureaucratic. The uncertainty disappears. Everything is done on the basis of calculations in predetermined patterns.

Now, if a number of students have to solve an equation, they will reach the same solution. There is another option. Ex post, students are featuring herd behavior because they all have traveled along similar reasoning to reach the equation's solution. The same is happening with financial institutions, which facing market data and the requirement for prudential capital must calculate the optimal portfolio. We cannot expect that from these

calculations will result very different portfolios. On the contrary. If so, then it is reasonable to expect market participants to follow similar paths as dictated by the calculations.

Homogenization of risk assessment leads to a homogenization of portfolios and, further, to similar trading acts, so the herd behavior. The cause of herd behavior is not stupidity, ignorance, informational asymmetry, imitation or other factors, but that the resulting "identical knowledge" – the fact that all market participants assess the risk of various investments similarly, because of the legislation.

Herd behavior is reinforced by regulations that increase transparency. From a traditional perspective, each competitor is interested in maintaining his business confidential, because the danger of being imitated reduces his/her potential profit. Just like each chocolate manufacturer competes for public money, constantly striving to offer original varieties and scrupulously keeping secret their manufacture, so every investor is motivated to keep secret his "recipe for money." Removal of secrecy, disclosure of business virtually abolishes competition strategies. Why would anyone strive to find new profit opportunities, if his strategy will become visible to all? A good bank is investing in a project that its competitors have overlooked. If banking secrecy and "opacity" of various investment (much reviled today) are dismantled, how can we have good banks and bad banks? We'll have just ... banks - straight state agencies charged with lending, whose bureaucratic operation cannot be evaluated from a market perspective.

We are tempted to believe that the case for transparency has been fueled, incidentally, by the natural interest of taxpayers to know how the state distributes public funds. In the public sector, transparency is justified, because citizens are entitled to know how their money is being spent. But in the private sector, transparency - understood as public dissemination of what a company undertakes - is not justified. The company must give account only the owners (shareholders). To the extent that disclosure is imposed upon it, the ownership rights of the shareholders suffer. Thus, transparency is not a value in itself but only in relation to ownership right of businessmen.

Prudential regulation is inconsistent from another perspective. In order to discover this weakness we need to remember what is the reason cited for introducing regulations – "market failure". This failure is expressed essentially by the inability of prices to provide relevant information for acting agents. But the risk modeling procedure that financial institutions are obliged to follow is based precisely on market prices. According to public authorities, market is malfunctioning and can transform today's boom in a crisis tomorrow, current prices of financial assets are meaningless because there are "multiple equilibria" etc. But then, if the legislation aims to do away with market failure, it should not be based on prices but on other criteria. For example, the state could demand banks not to lend to people 1.70 m and taller. It would be an aberrant measure, probably inefficient, but clear. Instead, the imposition of risk assessment methodologies using market data in order to correct the market values is inconsistent. As Persaud concludes, "any system in which market participants have the same preferences (to reduce risk and the capital) and use the same information (descriptions provided by rating agencies, pricing, pricing model) will lead banks to adopt a similar behavior, entering and exiting the market at once, eventually causing the system to collapse. "

Basically, regulatory policy, far from saving us from an alleged market failure, put the economy into a trap. The elimination of prudential regulations would mark an important step towards eliminating panic episodes that occurred in recent decades in the financial markets, to avoid situations in which asset prices are tumbling to the stupefaction of many qualified observers who cannot understand why at a level so low, nobody buys. So in past and present crises, some market analysts have noted that risk assessment models to dictate "to go with the herd" and continued to sell, while anticipating entrepreneurial economic assessment based on the value of various assets would justify the investment. Thus, we come to another paradox of intervention by: while the speculators who bet on lower quotations (*short-selling*) are accused for the market collapse and many of the institutions of market surveillance

would like to know disappear, we notice how regulations destroy the incentive to invest.

Abstract

This paper looks back at two decades of monetary policy in Romania focusing upon the analytical framework (the so called strategy or regime of monetary policy), which helped to order, analyse and interpret monetary policy relevant data and present and announce policy decisions made by the National Bank of Romania (NBR) to the outside world.

In theory as in practice there is an ongoing debate concerning the optimal monetary policy strategy. As we look into the past decades we draw a line and conclude that inflation targeting (IT) eventually emerged as the preferred solution to the complex economical, political and social issues regarding present times for many industrial countries and emerging markets alike.

Romania is not an exception. The policy framework has changed throughout the transition period, from broad money targeting (from 1990 till 1996) to high-powered money targeting (from 1997 till 2005), and then to inflation targeting (starting August 2005).

The purpose of this paper is to make a critical analysis of the past monetary policy regimes in Romania and highlight what went wrong. Also, the paper reviews some distinguishing features of Romania's IT monetary policy framework identifying possible challenges that the future holds, including the perspective of joining the Exchange Rate Mechanism (ERM II).

Key words: strategies, monetary policy, National Bank, transition period, high-inflation

JEL classification:G3, G38

1. Introduction

After the failure of money targeting in the mid-1980's and the collapse of fixed exchange-rate-pegs in the early 1990's a new monetary policy framework was needed. Monetary targeting regimes have been abandoned, primarily due to the inability of central banks to reach targets set for money stock growth. In this context, inflation targeting (IT) with floating exchange rates emerged as the new monetary regime of choice for many countries.

According to the Bank of England report from January 2010 [8], at this moment there is a number of 27 central banks considered fully fledged inflation targeters, and many others in the process of establishing a full IT.

In Romania, the monetary policy framework has changed throughout the transition period, from broad money targeting (1990–1996) to high-powered money targeting (1997–2005), and then to IT (2005).

Since 1990's (when the transition process to a market-driven system started) Romanian's monetary policy had to carry the burden of too slow a restructuring of the economy. Price stability, considered to be the prime aim of monetary policy, was frequently sacrificed, thus causing Romania to build up an image as a high-inflation country. In order to lower the inflation rate, and thus "putting the country back on a path of sustainable economic growth" [7, p.7], the NBR adopted monetary anchors. These monetary policy frameworks "preserve the independence of the monetary policy and are suitable for an economy facing both money demand shocks and external competitiveness difficulties" [12, 1998, p. 257].

The Romanian high-powered money targeting regime (1997–2005) failed to provide monetary authorities with a predictable control of either the intermediary target or prices, thus presenting to NBR the necessary arguments to shift its framework from monetary targeting to IT.

The NBR introduced IT as a monetary policy strategy in August 2005. This regime was taken into consideration because it brings a series of benefits for a central bank, including a clear *policy focus on inflation*. More than that, in the context of a disinflation process in which Romania is engaged since 2000, IT came as a mean to unburden NBR's monetary policy to achieve further descending inflation rates.

The paper is organized as follows. The first part of the paper consists in a survey of the literature regarding the monetary policy strategy. In Part 2, the paper summarizes the main distinguishing features of the four distinct subperiods of Romania's monetary policy framework since the 1990's. Part 3 examines the current status of IT in Romania and possible mutations that might appear in the near future. Conclusions highlight the most important aspects of the paper and some lessons to be learned.

2. General overview regarding the main monetary policy strategies

According to the European Central Bank [4], in order to build up *reputation capital* and *credibility*, elements which are necessary for implementing monetary policy effectively and successfully, a monetary policy strategy has to satisfy a number of additional criteria:

- a strategy must be *understandable* from the viewpoint of the public at large and financial market participants in particular.
- a strategy must be *transparent*, thus the public must be presented *ex ante* with information about how monetary policy decisions are being made by the central bank and the economic rationale on which they are based.
- a strategy is typically formulated with the view of providing the central bank with some *discretion (escape clause)*. This is necessary because delivering low inflation can be achieved over the medium-term.

- a strategy must be consistent with the independent status granted to monetary policy and should support it as far as possible.
- a strategy must ensure that the central bank decision makers are accountable both for policy actions and the performance in achieving the policy goal.

There are four basic types of monetary policy strategies adopted by modern central banks and that comply with the above criteria, each of which uses a different nominal anchor: 1) exchange-rate targeting, 2) monetary targeting, 3) inflation targeting and 4) interest rate targeting.

Exchange-rate targeting

Targeting the exchange-rate is a monetary policy regime with a long history. It can take the form of fixing the value of the domestic currency to a commodity such as gold. More recently, fixed exchange-rate regimes have involved fixing the value of the domestic currency to that of a large, low-inflation country like the United States or Germany (called the anchor-country). Another alternative is to adopt a crawling target or peg, in which a currency is allowed to depreciate at a steady rate so that the inflation rate in the pegging country can be higher than that of the anchor country.

As a strategy for the conduct of monetary policy exchange-rate targeting has several advantages [11]: 1) directly ties down inflation of internationally traded goods; 2) automatic rule for conduct of monetary policy; 3) simplicity and clarity of target. However it does have some disadvantages too: 1) loss of independent monetary policy; 2) open to speculative attacks; 3) loss of exchange-rate signal.

Monetary targeting

In the 1970's, monetary targeting was adopted by several countries, notably Switzerland, Germany, Canada, the United Kingdom, and Japan, as well as in the United States. This strategy involves using monetary aggregates as an intermediate target to achieve an ultimate goal such as *price stability*. Associated with an interpretation of inflation as a consequence of excess aggregate demand, monetary targeting theories developed within the monetarist tradition rely on the assumption that inflation is a demand phenomenon, with the demand pressures

yielding from excessive money stock expansion [5].

Monetary targeting has two main advantages [11]: 1) it enables a central bank to adjust its monetary policy to cope with domestic considerations, and 2) information on whether the central bank is achieving its target is known almost immediately. On the other hand, this strategy suffers from the disadvantage that it works well only if there is a reliable relationship between the monetary aggregate and the goal variable, inflation, a relationship that has often not held in different countries.

Inflation targeting

In broad terms, according to Setterfield [16] the IT framework involves “the public announcement of inflation targets, coupled with a credible and accountable commitment on the part of government policy authorities to the achievement of these targets”. To other authors [1] IT normally involves delegation of responsibility for medium term control over inflation to an independent central bank using interest rates as its primary instrument to influence inflationary pressure.

As a strategy for the conduct of monetary policy IT has several advantages [11]: 1) enables monetary policy to focus on domestic considerations; 2) stability in the relationship between money and inflation is not critical to its success; 3) it is readily understood by the public and is highly transparent; 4) it increases accountability of the central bank; and 5) it appears to ameliorate the effects of inflationary shocks. However it does have some disadvantages too: 1) inflation is not easily controlled by the monetary authorities, so that an IT is unable to send immediate signals to both the public and markets; 2) it might impose a rigid rule on policymakers, although this has not been the case in practice; and 3) a sole focus on inflation may lead to larger output fluctuations, although this has also not been the case in practice.

Interest rate targeting

Under an interest rate targeting regime, a central bank would set the real (short-term) interest rate at the neutral level, at which inflation is low and stable, and output is equal to potential [10]. Over the medium- to long term, it can be assumed that a successful monetary

policy sets the real interest rate close to the natural rate. In the short-term, however, a lack of knowledge on the part of policy makers about the exact level of the neutral interest rate may cause unfavourable policy results in terms of deviations of actual inflation and output from their desired levels [2].

Some disadvantages that this monetary policy framework present are: 1) the possibility of blockage of the transmission process; 2) the volatility of the interest rate and 3) the incompatibility of the objectives.

Much of the existing financial literature as well as the experience of policy makers lead towards the idea that IT is the new orthodoxy of mainstream macroeconomic thought. According to the Bank of England report from January 2010 [8], at this moment there is a number of 27 central banks considered fully fledged inflation targeters, and many others in the process of establishing a full IT. The spread of inflation targeting has often been spurred by exchange rate crises. Figure 1a and 1b shows exchange rate pegs of various kinds accounted for two-thirds of monetary policy regimes in industrial countries in 1989. Among the crises the most important is considered to be the ERM crisis in 1992 which served as a major spur to the adoption of IT in Europe

Figure 1b. *Evolution of Monetary Policy Regimes in Non-industrial Countries, 1989-2008*

Source: Roger, 2009

As we can see in Figure 1, after the failure of money targeting in the mid-1980's and the collapse of fixed exchange-rate-pegs in the early 1990's IT with floating exchange rates emerged as the new monetary regime of choice.

3. Historical review of Romania's monetary policy strategies

In Romania, the monetary policy regime has changed throughout the transition period, from broad money targeting to high-powered money targeting, and then to IT.

The various assessment of the shifts in macroeconomic policy stance in the transition period in Romania allows the identification of four distinct sub-periods [6]. Although the main focus has been inflation stabilisation, policy practice differed markedly throughout these four periods. The four distinct sub-periods are:

- *The period 1990-1993.* In this period the NBR adopted a policy of targeting the broad money stock taking into consideration that the high and variable inflation rates in Romania are due to excessive liquidity in the system. The strategy implied a tight monetary policy by means of setting contractionary targets for both broad money stock growth and domestic credit. Also, a floating exchange rate regime was adopted [9]. Despite all the efforts made by the NBR the anti-inflationary policies were by no means successful. The economy was characterised by: consumer and producer prices hovering around 150%-200%, GDP fell by an average annual of 6.45% while current account deficits expanded.

- *The period 1994-1996.* The NBR changed the policy stance to targeting the nominal exchange rate, kipping M2 as the official intermediate target. The macroeconomic situation of the economy improved patently, with an average annual GDP growth rate of 5% and inflation rates slowing down to 50%. Nevertheless, by the end of this sub-period, current account imbalances started pressuring again the NBR's foreign reserves position.
- *The period 1997-2005.* The difficult situation in which the Romanian economy was in this period led to signing a new IMF shock therapy in early 1997. The new stabilisation programme included a shift in the monetary policy stance to targeting the cash base of the system, a strategy move complemented however with a strongly managed float. In the OECD report its stated that "Officially, the NBR targets money base growth, but continues to be seen by the market as having an implicit exchange rate target" [14]. Thereby targeting implies smoothing short-term fluctuations with a view of the exchange rate as a nominal anchor in the anti-inflationary policy.
- *The period 2005 – present days.* In August 2005 the NBR officially adopted IT, with a short-term interest rate policy rule. According to the new policy strategy, monetary authorities abandoned direct interventions on the foreign exchange (forex) market starting with the last quarter of 2005. In spite of this fact, the official discourse attaches the word *flexible* to IT, by which the monetary authorities allow exchange rate considerations into the policy process [13].

4. Challenges for Romania's current monetary policy framework

According to Gabor [6], although the NBR shifted the monetary policy framework from monetary targeting to inflation targeting, in a policy environment where the trade-off between inflation and the external position retains its relevance, the new policy regime "has so far failed to strengthen the link between policy and money market rates". In this case, repeated attempts at modifying the structural conditions in

the money market have been constrained by and finally failed because of the dependency on foreign capital inflows and the inflationary consequences of depreciations. Thereby, it looks like partial sterilisations of liquidity through deposit-taking operations remain the main vehicle for policy interventions.

Another important aspect highlighted by the same author consists in the possibility that NBR is confronted with a policy *cul-de-sac*. She places the roots of the problem at the moment the new policy regime was adopted, i.e. in the context of the April 2005 phase in the capital account liberalisation. Initially monetary authorities' withdrawal from the forex market was designed to offset the inflationary implications of reducing the interest rate differential through real appreciations. The current policy regime has restricted the array of policy options available for moderating the impact of massive speculative inflows to cuts in the policy rate. This policy stance, constructed as expansionary in the inflation targeting conceptualisation of inflationary pressures (and despite the little predictability of the transmission mechanism) could potentially undermine the consolidation of the new policy regime by confusing market expectations and affecting policy credibility. To escape the policy *cul-de-sac*, the NBR should aim in a first instance at exploring innovative policy strategies and ultimately at designing an integrated approach to economic policy that takes into account the structural nature of the current account deficit and the desirability of imposing low inflation rates.

Another important challenge for the current IT regime is the adaptation, in the near future, of the euro.

In January 2007 Romania became a Member State of the European Union. In order to achieve its objective of full participation in the European Monetary Union (the adoption of the euro) it must set its monetary institutions and policy in line with the euro area; in other words, a set of nominal and real convergence criteria must be achieved. A criterion implies that Romania must spend at least two years in the Exchange Rate Mechanism (ERM II), keeping its exchange rate towards the euro stable, inside a band of $\pm 15\%$. What does this mean for the NBR? It must find

the proper instruments to assure a smooth transition from its current exchange rate regime to the irrevocable fixity of exchange rate against other Euro Area currencies. That is why NBR's attention will shift back from price stability to the exchange rate anchor, implying that the current form of IT will be maintained at least until the ERM II. Although IT, as the current national monetary policy, and an explicit exchange rate objective are not inconsistent, since in the medium run the international value of the currency can be stable only if its internal value is stable, the co-existence of these two goals could be quite problematic.

Several authors [3] argue that a *soft version* of inflation-targeting is feasible under the circumstances. This "soft" monetary framework would focus on inflation but, initially, it would consider shorter horizons (a period of two to four quarters) than the medium term, would not neglect exchange rate completely, would work closely with the government on budget policy and would further delay the full opening of capital account.

5. Conclusions

The paper shows as that over the last decades, in spite of the fact that there are various monetary policy strategies, many central banks moved towards IT and others are in the process of establishing a full IT or have moved towards regimes that have many of the attributes of IT. Thereby, both the existing financial literature as well as the experience of policy makers lead towards the idea that IT is the new orthodoxy of mainstream macroeconomic thought.

Romania is not an exception. The policy framework has changed throughout the transition period, from broad money targeting (from 1990 till 1996) to high-powered money targeting (from 1997 till 2005), and then to IT (starting August 2005). Despite various adjustments in the policy framework, base money targeting failed to provide monetary authorities with a predictable control of either the intermediary target or prices.

Nevertheless, the new policy framework carries on the tension between theorising and practice of monetary policy. On the one hand, the monetary authorities fail to overcome the

policy trade-offs of the monetary targeting years, whereas, on the other hand the same authorities are unable to alter the money markets' structural features in order to consolidate the relevance of the policy rate for spending decisions, as the new regime requires.

Regarding what the future holds for the IT strategy in the context of full participation of Romania in the EMU, IT as current monetary policy strategy is to be maintained at least until the ERM II entry. The paper shows that a soft version of inflation-targeting is more appropriate under the given circumstances.

Considerations of Performances in Tourism

Asaloş Nicoleta, Georgescu Cristina Elena, Trandafir Raluca Andreea
 “Ovidius” University of Constanta, Faculty of Economic Sciences
nicoleta_asalos@yahoo.com

Abstract

Performance represent an economic category by which quality of the economic activity is appreciated by companies with indexes such as : turnover, added value ,profitability , labor productivity , gross and net profit, etc .The profit may not represent aim of the company but it is necessary in order to reach the targets . Generally the most powerful competitors :create value ;obtain competitive advantages and distribute optimally the created value ;improve the ratio efforts/effects .

Key words: performances, profitability, tourism

JEL Classification: M21, M41

Introduction

Beginning with the exigencies of economic processes and phenomena we appreciate that measurement of the expenses and returns of the company firstly implies true settlement of basic principles. Mainly this is referring to : consideration of the integral effort in all stages of the economic structure –it is a necessity generated by the fact that performance of every social -economic activity involves allotment, use and consumption of resources, reflection of effects complexity ; efforts and effects delimitation in time and space as well as their comparison , conversion of all efforts in economic effects ; compatibility of indexes that express the efforts and the effects ; consideration of a standard for profitability level appreciation , veracity of information regarding the costs and returns of the economic activity .

Within carrying on an economic activity, reflection of the integral effort as principle of efficiency measurement has to consider the primary elements of any economic deed : labor, natural resources, capital .

Efforts and effects are differentiated not only according to their nature and mode of transformation from allotted resources in consumed resources ,respectively according to content and express mode but according to the space and manifestation time ,too, thus appearing the necessity of delimitation of efforts and effects in time ad space and delimitation of the efforts from effects .

Basing on this delimitation of the effects and efforts in time and space there may be guaranteed the premises of comparison of the indexes that dimension these . Homogeneity aims to guarantee comparison of received and/or utilized resources with consumed ones this being determined by different categories of resources that have different functions in the economic activity ,by the different modality of transformation of received resources in used resources and by the mode they participate in formation of the integral effort.

Aspects of performances

In order to compare the economic returns with done efforts at the level of economy, branches, economic units as well as of the correlation settled in time and space between effect and effort there are used some value categories : price, profit, credit ,interest these leading to producers’ stimulation for the achievement of maxim returns .

Profitability is a problem that concerns every economic company as the target of her activity is that of obtaining profit and carry out a profitable activity.

Process of the economic activity aiming to obtain a profit as high as possible has to be based on a coherent economic theory that has the task of orienting the material ,human and financial efforts of the company within the competition environment .

Obtainment of a growing profit may be guaranteed by reduction of uncertainty and risk assumed in the economic activity. If uncertainty should not exist all elements that lead to profit achievement are known, the economic companies will have the certainty that incomes are higher than expenses and it will be registered the offer increase in comparison with the demand, thus assuring an equilibrium between incomes and costs and profit will be null.

In reality the uncertainty generates profits and risk existence and they do not become null due to competition. As in a world without uncertainty profits and losses would not exist we may consider that profit or loss are a consequence of uncertainty.

Therefore profit is not a payment that has to be done in order to obtain a resource but it is a rest remained after total costs are covered from incomes, it is the result of future forecasting done with higher accuracy than the other competitors did. It is an unwitting income and not a forfeited one, this determining every economic company to achieve a better anticipation of the circumstances of her activity.

In conclusion it results from those above presented that the requirements of economic efficiency are regarding maximization of returns concomitantly with expenses' minimization as well as optimization of labor, material and money resources' use. In fact criteria of economic efficiency should govern any field of the human activity including the social one, too. On the other hand profitability represents activity efficiency at the microeconomic level by comparing the financial returns-the profit-with the expenses effectuated in order to obtain the returns. Economic efficiency has a more complex content, it reflects how much an activity produces positive economic effects per effort unit, achieved in the market by the ratio between demand-offer.

The profitability synthesizes the action of all production process factors, being a first-plan indicator in the indicators system of economic efficiency at micro-economic level, thing that conduces to the conclusion that what defines the result of activity from economy, *economic efficiency*, can be only the supplementary value remained over the spent one, plus product, comparatively with invested resources for the

realization of this value. *The profitability* is an economic category connected to the existence of goods production and monetary relations. In order to be profitability an economic unity, it must cover all the expenditures of production and circulation from personal incomes and to realize a profit. *The profitability represents the capacity of economic unities of obtaining profit, of which to dispose them and the society concerning the economic development.* It shows the efficiency with which are used the material and human resources in the sphere of material production, it is an organic component of economic efficiency that cannot be identified.

The profitability is a demanding of economic development. The obtaining of plus product is an objective necessity, a condition for the assurance of a sustained economic growth.

In order to research if an enterprise is viable is imposed the measuring of the profitability rate. Also, in this sense, it is used the profit rate, between these two indicators not being any essential differences, only nuances that not change the general conclusion, but offer more closed information of some certain enterpriser possibilities to use the capital in risk conditions.

In the conditions of concurential market, the maximizing of profit rate is the essential criterium of enterprises decisions to spend with the development, the maintaining or the restriction of some economic activities. Thus, the economic agent has the possibility to action in first place, over the production volume, in order to find those dimensions of economic goods quantity to maximize the total cashings, minimizing, in the same time, the total costs.

The profitability can be determined at product level, economic unity or branches level. At all these levels, it can be expressed in absolute size, but also in relative size with the help of profitability rates.

The importance of profitability rates is very special, because:

- it favours the orientation of production structure on products, branches, and sub-branches, in order to found to ones that assure the biggest advantage. The economic waves redirectionate permanently, putting on the economic activities an unequal

development because the economic agents will restrict or abandon the low profit activities in the favour of the ones with bigger profit;

- stimulates the administration through the rational utilization of resources;
- contributes to the strength of enterpriser's interest for the difference of the products, having in his centre the modernization of quality concept;
- it favourizes the market segmentation and the differentiation of concurential strategies.

Performance is qualitative appreciation of a company being measured by economic-financial indexes of liquidity, creditworthiness, activity(labor productivity, efficiency of assets use ,etc), profitability (rate of profit , relative and absolute profitability).

Profitability may be defined as ‘ a state of competitiveness of the company reached by a level of efficacy and productivity that guarantee a durable presence in the market ‘.

Thus according to the definition above mentioned performance claims simultaneous and complementary presence of the two ‘ingredients’ but separately approached these are necessary but not sufficient conditions of performance .This is an important aspect as a global vision upon performance is possible only by correlation of the dynamic of the two indexes.

Efficacy defines the extent according to which the returns obtained by a company correspond to wanted performances. Therefore is measured by the comparison of the returns effectively obtained with the proposed returns.

Economic efficacy is referring to the level or degree of fulfillment of economic targets settled for a period of time in order to be achieved by the company . In case that the target was 100% reached it is about maxim efficacy and on the contrary when it is partially reached we may speak about partial degrees of efficacy .

In conclusion efficacy is a ratio between the effective effects and those proposed this showing the aptitude of a company to achieve successfully the proposed targets .

Productivity is the capacity of a production element of contributing to goods and services elaboration under the terms of

maintaining a constant perfection level of the others production elements . The basic form of productivity recognized by economic literature is labor productivity but productivity does not refer only to live labor . Michael Didier affirmed in his work “Economie.Les regles du jeu /Economy .Rule of the game “ that labor productivity is an important index but it is a partial one ‘.

Productivity is the result of the ensemble of the production elements and their combination and it is not only the result of labor. Considering this the global productivity that expresses “ the ensemble performance or global efficacy of the production elements” is determined at the microeconomic level as well as at macroeconomic level.

It may be asserted that a company characterized by performance is productive, too these being effects(results) .In the same time efficacy and productivity are causes that determine performance . If efficacy is intelligible by the level of satisfying the external exigencies –customers, state, suppliers, employees (on labor motivation and safety increase basis) ,shareholders-, productivity is measurable by accomplishment of the expectations of the companies’ internal environment .The tight connection between the internal environment and the external one justifies this double approach and invokes the following technical aspect : coherent judgment of an index that may be quantified (productivity) and quantification of the other one that is subjectively too (customers satisfaction degree) .

Data sources necessary for the analysis of the results and performances of a company are : business plan , incomes and expenses budget, commercial statistics, synthetic and analytical accounting , other operative records data . There are equally useful some external information that have as sources statistical year books ,laws and other normative documents , international statistics , market studies , etc.

In order to characterize the dimensions of the activity of the company ,to appreciate the returns and measure her commercial performances there are followed the above mentioned indexes and any evaluation begins with complex investigation of these indexes in dynamic and in comparison with settled targets , in total and for diverse specific structures . A

pertinent judgment capable to point out the real situation requires correlation of above mentioned indexes and especially of the turnover with three essential elements of a market economy : inflation rate , position of the company in the market , prices and tariffs policy .

Conclusions

Performance of the company involves knowledge of :

a) targets, strategies and current policies of the company ;

b) fulfillment degree of economic targets established for a period of time in order to be achieved by the company this meaning the reached degree of economic efficacy ;

c) productivity level of production elements ,especially of labor productivity ;

d) obtained performances reflected in the main economic-financial indexes: profitability, liquidity, creditworthiness , profit/share , investments redeem , owned market share ,etc.

Obtainment of a superior performance claims fulfillment of all three conditions previously mentioned as it is possible that a company to carry out an efficient activity without obtaining any competitive advantage or

certain goods/services to have a certain competitive advantage even if they belong to and are produced by inefficient companies. Wording differently it means that a company may be efficient but not competitive in the market and in this case we can not mention the performance at a global level or we can state that it is competitiveness at the level of the company but not efficient this leading again to the absence of performance .

Assigning Strategic Objectives and Managing Profitability Ratios

Ph D Professor Aslau Titus

laviniacuc@yahoo.com

Abstract

Most often, profitability is attached to the performance concept, which, on an organizational level, is evaluated in connection with the reaching of strategic objectives and gaining expected results. That is why, assignment of strategic objectives and management of economic performance find themselves in a unitary structure based on common features of the complex process of supplying the decision taking factors with the information needed for the diagnosis and amelioration of profitability terms. Equally, the result, means, physical or quality indicators represent the support for the management instruments which come in hand to managers, by means of which they run the profitability influence ratios. This study starts from the fact that each decisional level may use as management control instrument, a board table comprising performance indicators and strategic objectives assigned to units or to sub-units invested with responsibilities arising from the contribution they have in reaching the expected results. The tendency to commission decision taking, more and more aimed at the persons responsible for hierarchic echelons, situated at the grounds of the managerial pyramid, is imposed by a series of complexities, but without neglecting the relevance of the department and global strategy coherence. Thus, the assignment-management tandem will be able to better fulfill its role in the process of assessment and analysis of enterprises' global performance and implicitly, of profitability. Moreover, this relationship represents an important moment

in distinguishing through strategy between enterprises within similar activity domains.

Key words: management, strategic objectives, performance, profitability

JEL Classification: M1; M21

The study has been made on the grounds of researches conducted in several enterprises that have recorded remarkable results in applying concepts regarding strategy and performance, using adequate Romanian and foreign bibliography, treatises relevant for the investigated field. The research has also had in view the comparison with data and information reported by other organizational entities within the same field of activity and it has taken into consideration the perspective of the evolution of indicators that define performance. Current crisis economic and financial situation has been viewed from the study's perspective, as a plus for enterprises in the difficult step of attempts to control the evolution of the external context. Although considered a cyclic phenomenon, the crisis disorientated in many cases the profitability indicators of enterprises. Some of those, even very renowned and with remarkable contribution to the gross internal product have sunken or were forced to function on a minimum capacity. The turbulences have interrupted the evolution thought to be constant of enterprises' processes, being forced to adopt behavioral changes and re-evaluate their strategy.

If we have in mind these reasons, a short reference to the management issue is most

welcome. The management system of an enterprise allows its permanent adjustment with its environment and the clear hyphening of its management ability. The system, part of the organizational component having the purpose to ensure the allotment of resources for the fulfillment of the strategy, comprises management regulations that must be observed by all persons in charge, in order to be applied. Otherwise the strategy might fail. For this reason, the strategy management becomes a requirement that not only accompanies success, but it is also a condition for it to be guaranteed and amplified.

The management strategy implies that, on one hand, it is formalized by taking into account the expectations regarding profitability, capital output, perspectives on evolution, identification and cultivation of success key factors, finding the adequate managing formula, and on the other hand the strategy shall then be applied. But the application of the strategy is preceded, as shown before, by the prior formalization (Molho and Fernandez-Poisson, 2009).

Before pointing out some of the aspects in debate, it is proper to mention that these are not recently created concepts, but they are, one way or another, adjusted or shaped depending on the evolution of the economic context in which the enterprises function. It is relevant to enumerate among the dramatic changes in the economic and business environment, that took place in the latest years, those regarding the unprecedented rise of competition, the new options and attitudes of consumers, and, as a consequence, the organization's focus on the performance of internal processes and raised efficiency. Anticipation and reaction ability thus become high importance preoccupations in the management control area. The use of new instruments such as *balanced scorecard* or *cost calculation on activities method*, communication systems adapted to each enterprise's culture, responsibility commissioning or a more precise demarcation and grouping of indicators, brings closer the analysis frame to the operation realities.

Fast modifications and sometimes spectacular of the external environment

determines adequate reaction from enterprises. Reactivity exigency to changes also implies interventions in the assignment of strategic objectives of the enterprise, those having to be clearly defined in order to create the premises of a management that orientates and maintains the course of the enterprise towards profitability.

The management of profitability ratios, as a fundamental condition for the success of the strategy, implies permanent updating of the enterprise's strategic plan in its global dimension, but also in what concerns the revisions on whose levels they were assigned responsibilities. Thus, in order to ensure this coherence, in general this step aims at:

- Channeling actions towards acquaintanceship with clients, rising the quality of services supplied to them, a good control over costs and profitability of the enterprise's commercial function, synchronized with the consolidation of accountability to results;

- Identifying opportunities and sensitivities of the external context, improving the organization's image regarding technical abilities and the capacity to offer to the clients professional services;

- Filling in the objectives in the established strategic areas with new services, depending on the requirements of the business partners, in order to keep them in the active portfolio;

- Establishing a correct portfolio regarding the performance level of internal processes, that takes into account the technological update level, the need to invest, operation cost reduction in order to achieve competitiveness on the competition market, using a management formula observant enough to details that define profitability, including of the points on which the management control relies, that is means, actions, attitudes and procedures (Aslău, 2001);

- Pointing out success key factors on the grounds of recommendations and conclusion drawn from the diagnosis and the strategic orientations.

Certainly, depending on the characteristics of each organization, of the field of activity it belongs to, the shaping of strategic plans may vary and comprise adequate objectives. But the above

references, without being considered exhaustive, present a great importance for the strategic management option that the organization adopts.

Once the formalization process concluded, the strategy is put into practice and it has to aim at and find an answer to a series of issues that concern (Molho and Fernandez-Poisson, 2009):

- The allocation of resources according to the evolution of the strategic objectives;
- Managing profitability ratios;
- Increase of value for the clients;
- The contribution of operational and support processes at the competitive benefit;
- Developing professional and organizational proficiencies.

It may be noticed that the re-grouping of this issues corresponds to the *balanced scorecard* concept which places a board table in the equilibrium of four distinct axes or processes in the enterprise's activity: financial, internal, clients and formation, development, innovation.

It is not our goal to totally approach the issue in debate in such a short space. But, we will try to synthesize a few relevant aspects for the relation between the strategic objectives and the management of the profitability ratios.

As example, we have focused our attention in this study, on the assignment of strategic objectives at the Agro-Industrial compound CAI Arad - Curtici, an enterprise which for more than two decades ensures its raw material need for industrialization, relying on its private agricultural resources, obtained from cereal, technical, vegetable plant cultivation and the zootechnic sector. The industrialization activity consists of butchery activity, meat products fabrication and milk processing. The entire production achieved in the meat and dairy products factories is sold on the internal market through its own retail network, which at the end of the first trimester of 2010, consisted of 21 specialized stores, in Arad and Timis.

Some of the major strategic objectives of the compound regarding industrial production for the following 3-4 years are:

- Cost reduction for obtaining in-house primary resources that enter the industrial processing, also taking into account the efforts made on a regional level, respectively in Central-Eastern Europe, to obtain profits comparable to those in Western Europe;
- Increasing automation level and using new manufacturing technology, together with reducing the range of diversity for meat products for 55-60 products at the most, a limit which is considered to be on the optimum profitability level, adequate resources being allocated for investments in this sense in the future;
- Increasing profit margins through a better controlling of distribution costs;
- Improvement of manufacturing networks, encouraging collaboration with high education institutions in order to develop research and innovation, especially in the genetics field in order to reach quality requirements of European regulations, regarding pork stratification.

These strategic objectives have been defined and transposed in terms of performances on processes specific to industrialization, which are grouped into *operational* and *support*:

The first category comprises:

- Research – development – innovation;
- Marketing;
- Raw material entries from the integrated sector of animal and agricultural production;
- Exterior acquisitions;
- Sales;
- Expedition.

The support processes consist of:

- Accounting and treasury of the industrial sector;
- Management control;
- Supervision of storage rooms of the industrial production and of the retail network;
- Management of human resources.

In the following step, the strategic objectives have been turned into performance goals on each of the identified processes. Here are some of them:

- ✓ Reducing industrial production costs for meat products processing with 10%;
- ✓ Achieving a profitability plus between 3 and 4,5% based on the application of results to exciting innovation-research systems, which also lead to a time cut for products homologation and licensing;
- ✓ Re-orientation and flexibility of marketing policies, completion of the brand with the new products and increase of sales through acknowledged hypermarket networks, so that the profitability ratio is at least 1,7%;
- ✓ Increase of contribution to profitability with 1% of support functions through amortizing their organizational component.

A first observation may be pretty well notices. The management systems are visibly in full expansion, especially lately. Passing with the performances' analysis over the classical taking into consideration of a single product or of a small range of products, implies the introduction in the management equation of profitability of the elements that define the efficiency of the specialized processes, complying with the regulatory frame of those activities, emergent regional development, the unstoppable ascension of technologies and last but not least, increase of proficiencies.

Secondly, these exigencies are void of meaning if they do not have the ability to create value both for the client and for the enterprise. Defining operational and support objectives represents the grounds for success conditions and it creates the premises for answering the questions about what represents the value for the client, what does the enterprise have to do in this direction or which are the relational consequences and others.

Without drawing a conclusion, it is still necessary to point out that due to resource limitation, their profitable allocation must take into account a proper risk assessment, strategic options for each field, operational means, future development focused on clients' requirements and creating a facility that keeps a close look on the changes of the external environment.

The Impact of the Economic and Financial Global Crisis on Public Indebtedness in Developed Economies

Bilan Irina

„Al. I. Cuza” University of Iași
irina.bilan@uaic.ro

Abstract

In this paper we intend to briefly analyze the evolution of public debt in developed countries, on the background of the global economic and financial crisis, also highlighting the specific factors leading to its accumulation and the solutions possible to apply in order to reduce its level.

We find that developed countries' public debt, already very high before the crisis, has substantially increased over the past two years, mainly due to the sharp increase in budget deficits, both as a consequence of cyclical revenue and expenditure increases and of anti-cyclical budgetary policy measures, threatening to evolve into an unsustainable level. Although several strategies could be conceived to reduce public debt to a sound level, the most appropriate consists in adjusting budget balances so as to have a structural budget surplus on the medium-term.

Key words: public debt, policy, crisis, global economic, budget deficit

JEL Classification: G3, G32, G01

1. Introduction

The global crisis that erupted in September 2008 has made a deep impression on the economies of countries all over the world. As signs of economic recovery are already being felt, it seems the worse is yet to come as new challenges appear on the horizon.

On the background of increasing budget deficits and public debts, debt sustainability is once again coming to the forefront of policy agenda in many countries, developed as well as developing, including from European Union. Although this problem is not specific to developed countries, it is of special importance

and urgency here because of the large budget deficits and public debts that they already faced in the period before the crisis, by comparison with developing countries.

2. The dynamics of public debt in developed economies in the context of the crisis

As some studies reveal, there is a direct link between financial crashes and the unsustainable increase in public indebtedness. Analysing data for seventy countries from all over the world, covering over two centuries, C.M. Reinhart and K.S. Rogoff [12] find that banking crises (both domestic ones and those emanating from international financial centers) often precede or accompany sovereign debt crisis. Some reasons for this temporal sequence may be that governments take on massive debts from private banks, the depreciation of the national currency (when the banking crises are followed by currency crashes and a large share of public debt is denominated in foreign-currency) or the collapse of revenues.

The above mentioned authors conclude in their paper that there is little evidence that „*debt cycles and their connection with economic crises have changed appreciably over time*” [12]. In consensus with these findings, the connection seems to reassert itself in the context of the current economic and financial crisis.

As the economies of some developed countries already show signs of recovery, a new issue comes to the forefront of public authorities concerns, namely the increase of public debt. Table 1 summarizes the evolution of gross public debt in some developed countries, comparing its pre-crisis and anticipated post-crisis level.

Table 1. General government gross public debt in selected developed economies

* preliminary data for 2009 and provisional for 2010-2011

Source: OECD Economic Outlook no. 86 database

As shown in table 1, between 2007 and 2011 public debt is expected to substantially increase in all developed countries, in some cases (as in Iceland, Ireland, Luxembourg or United Kingdom) reaching twice the size of its pre-crisis level. According to OECD estimates, public debt will grow in developed countries, on average, by approximately 30% of GDP, with an above average level registered in Ireland, Iceland, Japan, United Kingdom and United States.

This trend is not unusual in times of crisis, similar situations were encountered in the history of developed economies. However, the scale of the problem is unprecedented in times of peace, due to already very high pre-crisis public debt levels.

IMF's reports indicate similar findings. Under IMF's current projections [7], public debt in the advanced economies will rise, on average, by about 35% of GDP between 2007 and 2014, from 73% at end-2007 to 109% at end-2014, with most increase up front. By 2014, public

debt to GDP ratio will be close to or exceed 85% in all G-7 economies.

In this respect, there is a general concern that the public debt to GDP ratios projected over the next years will raise to an unsustainable level in developed economies.

However, there are exceptions to this situation. Some developed countries, although few in number (such as Australia, Korea or Luxembourg), with low public indebtedness and healthy budget balances in the pre-crisis period, could cope with the crisis without causing an unsustainable growth of their public debt.

An excessively high, unsustainable level of public debt could jeopardise the economy on the long run, as it leads to higher real interest rates and affects GDP growth rate and employment (thus resulting in possible worse economic crises and unemployment in the future). It would also reduce the ability of budgetary policy to respond to future imbalances. For the euro area member states, the problem is particularly important as the high debt level registered by one country would also be particularly damaging for other member states.

Therefore, numerous studies conducted by international institutions or organizations such as IMF or OCDE highlight the urgency of designing strategies aimed at ensuring the reduction and stabilization of government indebtedness at prudent levels. This is also a central preoccupation at European level, considering the importance of public finance soundness for the achievement of European goals. At its meeting of March 2010, the European Council underlined the importance of restoring macroeconomic stability and returning public finances on a sustainable path, as prerequisites for growth and jobs.

3. Factors contributing to public debt accumulation in developed economies in the context of the crisis

According to IMF's estimates [7], the contribution of financial support operations to public debt growth, in developed countries, could account for about 3% of DGP (of the total 35% projected increase in average public debt ratios by 2014). Therefore, the increase in public debt ratios in developed countries is considered to mainly result from the sharp increase in budget deficits.

* (+) indicates a surplus and (-) a deficit

** preliminary data for 2009 and provisional for 2010-2011

Source: OECD Economic Outlook no. 86 database

As shown in Table 2, the budget balances of all developed countries severely deteriorated between 2007 and 2009, sometimes by more than 11% of the nominal GDP (as in Ireland, Iceland or Spain). The average budget deficit increase for the selected developed economies was of about 7% of GDP.

Prospects are not very good for 2010 as budget deficits are expected to further deteriorate in some developed countries, although at a slower pace than before. Improvements are expected in a few countries (such as Australia, Belgium, Greece, Italy, Korea, Spain or United States), but they only rarely are substantial.

The consequences of the crisis on government balances and, consequently, on public debts, have proved harder to bear by those countries that have experienced significant budget deficits in the period before the crisis (deriving mainly from pro-cyclical budgetary policies), such as France, Greece, Japan, United Kingdom or United States. For some countries with significant budget surpluses and lower public

debt (such as Korea, Australia, Luxembourg or Denmark), the effects proved to be bearable and public debts are unlikely to evolve into an unsustainable level.

Two major factors have contributed to the increase in developed countries' budget deficits in the context of the crisis.

First, as economic theory stipulates, the budget balance varies with the progression of the economic cycle, due to the operation of automatic stabilisers. In an economic downturn, revenues tend to be lower and social welfare payments higher than when the economy is operating at full capacity and, thus, budget deficits rise. The impact of this factor is, however, temporary and is expected to reverse as the cycle picks up.

Secondly, budget deficits increase can result of the discretionary budgetary policy measures adopted by national authorities in order to stimulate economic recovery. Unless these actions are conceived on a temporary basis, the influence of this factor on budget deficit and, thus, on public debt, is permanent and will continue in the absence of specific policy adjustments.

In order to support the recovery of the economy, public authorities from developed countries have adopted comprehensive budgetary support packages (estimated at about 1,6% of GDP in 2010 [8]). Although their size and composition varied across countries, they generally included [10]: increases in government final consumption expenses; new public infrastructure projects; cuts in direct taxes; measures that have helped to boost or bring forward private demand through car scrappage incentive schemes, direct lump-sum income payments to households and temporary reductions in indirect taxes and housing tax credits.

As an example, for the EU Member States, the European Commission presented, in November 2008, and the European Council approved in December 2008, a comprehensive plan of recovery from the economic crisis, comprising short-term measures to boost demand and purchasing power and to protect jobs as well as "smart investment" to yield higher growth and sustainable prosperity in the longer-term. The overall value of the budgetary stimulus agreed for in the European Economic Recovery Plan was of around 200 billion EUR

or 1.5% of EU GDP, out of which around 170 billion EUR or 1.2% of GDP (equivalent to 85% of the total) supported from national budgets [6].

4. Possible solutions and their applicability

The literature indicates several mechanisms that public authorities can use in order to reduce public debt to GDP ratio, when the risk to increase over the level considered sustainable appears: *use inflation to alleviate public debt burden, sell public assets, default on some public debt obligations, GDP growth or generate budget surpluses and redeem debt.* However, not all these mechanisms are fully applicable in the current conditions.

If inflation rises, it erodes the real value of the debt held by creditors and thus reduces the effective public debt ratio to GDP. As suggested by J. Aizenman and N. Marion [1], an inflation of 6% over four years could reduce the public debt to GDP ratio in United States by a significant 20%.

However, inflating the debt away is not an option when a large share of a country's public debt is indexed, either directly or indirectly, to inflation or when floating rate debt instruments are employed, as is the case in many developed countries. If such a strategy is adopted, there is also an important risk of inflation getting out of control.

The sale of assets, especially those acquired during the crisis, could be a solution. However, this would only give a relatively modest contribution to reducing public debt ratios in the years ahead (of about 3% of GDP, as seen above).

The government can always choose to default on some of its debt obligations as a last solution, but this is a very costly alternative. As E. Borensztein and U. Panizza [2] show, there are several types of costs that may result from an international sovereign default: reputational costs, international trade exclusion costs, costs to the domestic economy through the financial system and political costs.

If GDP grows rapidly enough, surpassing the growth rhythm of public debt expressed in absolute figures, public debt could decrease as a share of GDP. However, this solution requires a robust economic recovery from the financial

crisis, and growth perspectives for developed countries are still weak and uncertain.

Achieving and maintaining prudent public debt levels therefore requires a budgetary balance adjustment, as a last resort solution, resulting in lower budget deficits or even budget surpluses on the medium-term. This could be accomplished either by increasing revenues from taxes, either by reducing public expenditure (especially final consumption ones) and budgetary resources would be made available to redeem public debt.

Required consolidation efforts are substantial. According to IMF estimates [7], for the advanced economies, attaining a public debt ratio of 60% of GDP by 2030 would require the structural primary balance to improve by 8% of GDP, on average, during 2011-2020 and to remain constant for the following decade.

Important budget consolidation could also create some space for developed economies to address some other major challenges in the years to come, such as the growth of age-related expenses, and would allow them to be better prepared when confronted with future crisis.

4. Conclusions

Our findings show that, on the background of the crisis, public debt has substantially increased in all developed countries, threatening to evolve into an unsustainable level, particularly in countries where pre-crisis public debt to GDP ratios and budget deficits were already very high. This situation is mainly due to a sharp increase in budget deficits, both as a consequence of cyclical revenue and expenditure increases and of anti-cyclical budgetary policy measures adopted in order to alleviate the effects of the crisis on the economy.

It is imperative that public authorities from developed economies act appropriately and timely to correct the situation and reduce public debt to a prudent level, thereby preventing the emergence of a new public debt crisis, which could have even more disastrous effects than the current one. Two reasons would justify this.

First, such a crisis could prove to be more severe than a crisis with private sector origins, because no one would be available to bail out the public sector.

Secondly, the incurrence of a public debt crisis in developed countries could also have

important negative effects for emerging and developing economies, although their public debt to GDP ratio is substantially lower. The current crisis has proved that a loss of confidence in the advanced economies could spill over to other, less developed countries, with weaker fundamentals.

Public debt reduction strategies should mainly be based on a substantial reduction of budget deficits and even a return to budget surpluses on the medium-term. Thus, not only financial resources from taxes will be made available for public debt redemption, but favorable conditions will be created for the developed countries to be better prepared, in the future, when confronted with similar situations.

Abstract

The European Union is currently affected by the financial crisis that spread internationally. The member states face difficulties such as price volatility, uncertainties, liquidity issues, cases of bankruptcy, increased unemployment rate, and decreasing GDP. The present paper analyses the challenges faced under these new circumstances by the European companies and their stakeholders. By taking into consideration the threats and weaknesses faced by firms and other interested parties, we emphasize the importance that transparency and communication between companies and their stakeholder have in overcoming financial difficulties.

Key words: GDP, financial difficulties, stakeholders, creditors.

JEL Classification: G3, G31, G38

1. Introduction

The present paper covers aspects related to the current situation of the European Union and the causes of the economic crisis that affected the member states. The authors analyzed not only the effects, but also the chain of events that lead to the current crisis.

The break-out of the world economic crisis, initially started with a financial crisis, caused by

unprecedented increases in credits that were stimulated by a long period of moderate financial and economic conditions. As a consequence, this crisis is opening the road to changes affecting European companies, stakeholders and the relationships between them, as well as to changes at the level of the whole society. What are these changes and what possible directions of actions should be adopted are the main questions this paper tries to answer. As a result of their analysis, the authors emphasize the role and importance of communication in times of financial crisis, as main survival factor and even exit from the crisis.

2. Current Economic Situation of the European Union and Causes of the Financial Crisis

The fifth anniversary of the largest recent enlargement of the European Union is marked by financial difficulties faced by the member states. Risk adversity, reduced liquidity, price volatility, uncertainty regarding the future of financial institutions, doubts related to the quality of the structured credit products and uncertainty about the macroeconomic perspective now characterize the EU economic environment.

The current turmoil was preceded by a period of benign financial and economic conditions,

with low real interest rates and no liquidity problems. The consequence was an exceptional growth of credit, since investors and intermediaries were willing to take on higher risks. In conjunction with this, a sophisticated and apparently stable system was established, which consisted in originating extremely complex financial instruments that allowed banks to offload risks (especially in the United States of America). These financial instruments were then distributed and bought – mostly in Europe, without paying proper attention to the underlying assets and the real economic fundament of these instruments [1]. This excessive distribution of credit, the use of complex financial instruments, the underestimation of risks and even the lack of economic cooperation between major countries within the European Union and globally have led to the current financial crisis.

However, the report of the Economic and Financial Affairs Council (ECOFIN) called “Five years of an enlarged EU: Economic achievements and challenges” states in an optimistic tone that “the recent EU enlargement was not only a historic step in unifying a long-divided Europe but also a success from an economic point of view resulting in a win-win situation for the whole EU” [2]. The objective of the European Union structures currently refers to using the created synergies in order to diminish the negative effects of the financial crisis in the member states. The European Council in 2008 agreed on a European Economic Recovery Plan, based on a proposal of the Commission. Moreover, the Council of the European Union has recently drafted country-specific recommendations that have in view the particular economic situation in each member state [3].

3. Corporate Governance. The Impact of the Current Financial Crisis on the Main Stakeholders and Accounting Professionals

In theory it is considered that the concept of enterprise refers to a single entity which operates harmoniously and whose main goal is to

maximize value and shareholder wealth. Due to the appearance of new elements and complex needs, other views on the enterprise have been developed. Thus, the definition of the enterprise could be based on the concept of social interest, with the purpose of generating wealth as a result of the participant’s collaboration in the company’s life (shareholders, managers, creditors, employees, customers, suppliers, public power). Thus, the objectives of a company are of social nature, but also relate to maximizing profits [4]. The definition developed under the first theory leads to financial information directed towards investors, while the second definition is oriented to satisfy the financial needs of all users [5].

One of the key factors that influence the efficient use of resources, the increase of the confidence shareholders have in the enterprise managers, the success in achieving the company’s objectives and the economic efficiency is the corporate governance system by which a company is controlled. This system promotes fairness and transparency at company level, and consists in a set of rules of conduct that aims the welfare of the society as a whole, but mostly the welfare of the shareholders and other stakeholders: managers, creditors, employees, customers, suppliers, public power, etc. [6]

Across the European Union, there are several corporate governance models which have distinct characteristics: the Anglo-Saxon corporate governance system (specific for Great Britain) and the German system (specific for Germany and for Continental Europe countries). The Anglo-Saxon model has a “shareholder orientation, with the expectation that other stakeholders will indirectly benefit from the active pursuit of shareholder interests”. The German system “is more orientated towards a stakeholder approach, in the sense that employees are also included in the internal governance process” [7]. Although, the corporate governance systems may differ, the managers, investors and other stakeholders have different behaviors in relation to changes of the economic environment that recently stroked over Europe.

3.1. Managers, Investors and Auditors

There are several challenges that European managers, investors and auditors face under the current financial crisis, which highlighted certain weaknesses in the related management, investment and auditing processes. It is a known fact that managers and investors have contrasting interests and different views on the success of a company. Whereas for investors, who took financial risks, success means, in most of the cases, financial performance, namely profit, managers are often tempted to follow their own interest, at the expense of the investors. However, under the current economic situation, it may happen that the objectives of the managers and those of the investors are the same, since both are interested in survival and exit from the crisis. Therefore, a challenge for investors and managers would be to cooperate better towards improving their risk management systems and bringing their company financial success.

Since investors do not always have the benefit of direct contact to the responsible managers, the ones that act instead of them and protect their interests are the financial auditors. Their interest is to obtain a reasonable insurance that the financial statements provide a true and fair view. Under financial crisis, the role of the external auditors has an increased importance, and banks and supervisors rely more and more on the expertise and judgment of external auditors as independent and upright experts [8]. Auditors in the European Union also face new challenges, since political, social and economic pressures on them are now higher than ever.

Currently, two widely used sets of auditing standards exist side by side, i.e. International Standards on Auditing (ISAs) and the US standards adopted by the Public Company Accounting Oversight Board (PCAOB). Europe should adopt ISA's as soon as possible to reduce uncertainty and promote convergence, and should call for convergence between ISA's and PCAOB standards [9]. Moreover, the quality of the audit work is more and more important, and

independence rules are essential in this matter. However, countries currently apply different independence rules, particularly those on scope of services restrictions. Europe should seek to adopt or converge to the independence standards of the International Federation of Accountants (IFAC) as soon as possible [10].

3.2. Creditors

The current financial crisis has underlined some major weakness of European and international financial institutions. In fact, the now intensively publicized world's economic crisis started with a boom on the market of credits and financial instruments. The long period of moderate economic conditions in the European member states and the positive evolution of new member states stimulated this credit expansion and the failure in correctly assessing investment risks. Other factors for the credit boom at international level and for lowering the underwriting standards were: increased competitiveness among financial institutions, low interest rates, rising house prices, and weak government oversight.

As a natural reaction, in times of financial crisis, the attention of bank creditors grows significantly. While in normal conditions, prudence should be a fundamental principle, during financial crisis, lenders focus on excessive prudence, on business continuity of companies, on their ability to maintain profits, on the degree of liquidity, but also on the human factor, especially on managers, on their behavior, the measures taken to survive, and also to exit the crisis. The refusal of bank creditors to fund a company can lead to a liquidity crisis.

The permanent communication between creditors and managers, the fair description of the company's situation, the flexibility, the transparency and the fairness are key factors for establishing a viable relationship between creditors and companies. In crisis conditions, survival is the main objective of the companies and funds are primary. However, if loans are not efficiently used, it can lead to bankruptcy.

3.3. Other Stakeholders – Employees, Customers, Suppliers

Survival remains the biggest challenge in times of financial crisis. However, survival is understood in different ways by the managers and the employees of a company. If managers believe that survival means reducing the number of staff, for sure, the employees will think exactly the opposite, because the disposal would affect their welfare, as the unemployment period may be longer than normal. On the other hand, accepting a number of employees too large in comparison with the necessities of survival or continuation of activity can lead to inefficiency and even bankruptcy. In crisis conditions, the employees are interested not to lose their job, and to maintain the same financial and other benefits. Therefore, the permanent communication with their managers, the active participation in the business of the company, or on the contrary, the more or less violent confrontations between managers and employees are some of the possible effects related to the reaction of employees during these difficult conditions.

Trading partners demonstrate more prudence when there are going concern issues. Customers are mainly interested in the company's going concern assumption, but they also have in mind the possibility of negotiating prices easier. On the other hand, the suppliers are interested and analyze more strictly the profitability of the companies and their ability to pay the financial liabilities. However, the monitoring of debits and deadlines is the main objective of suppliers in times of financial crisis.

The improvement of the relationships between the trading partners and the companies can be achieved through communication and informational transparency. The financial crisis leads to significant changes in the behavior of stakeholders. The reactions differ depending on the role of the participants in the company's life. To avoid bankruptcy and conflicts of interest, managers should adopt a flexible attitude, adapt to the demands of the stakeholders involved and not at last, insure permanent communication between company and interested parties.

4. Importance of Communication under Economic Crisis

Most economic crisis lead to rumors, to distorted perceptions regarding the economic environment, to stress, to lack of control, to panic, to disorientation, to uncertainty, to lack of security and even to major lack of balance in the whole society. The first affected by the above mentioned facts are companies, their owners and managers, but also other stakeholders and parties directly involved in the life of a company. They may have reactions such as denial, avoidance of responsibility, disclaimer of culpability, justification. Finally, the reactions are transformed into positive ones: acceptance, remediation, corrective actions, optimism and confidence. One of the factors that make the transition from a negative attitude on the crisis to a survival-oriented behavior, if not to optimism, is the communication between the company and stakeholders and between the company and the economic environment as a whole.

Individuals react differently to a given situation. Their personality, temperament, and the environment in which they have developed and worked, the psychological, social, economic, political factors and the factors of other nature have led to different, complex, sometimes opposed reactions. Social context involves individual's interaction, which can be achieved mainly through communication. The role of communication is important because it can lead to sustainable and productive relationships between individuals or to the opposite reactions of rejection, conflict, and indifference. Human relationships influence the creation, the existence and the development of the enterprises, and of the economic environment. Companies cannot exist without individuals, whereas a powerful connection is created: individuals depend on the existence and the proper functioning of companies, while companies cannot exist in the absence of individuals.

In times of financial crisis, communication takes magnitude, since individuals need accurate information on the facts (in order to eliminate rumors and distorted perceptions of the economic environment). On the other hand,

using communication and tools offered by psychology, individuals can recover their balance (by eliminating stress, lack of control, panic and disorientation). Last but not least, the uncertainty, and the lack of security and balance can be controlled and removed only when panic and disorientation in the society are reduced. Thus, individuals can make correct and rational decisions related to the crisis situation, can identify the causes, clear them off and restore the social and economic balance.

5. Conclusions

The current economic conditions in the European Union launch new challenges for companies and their stakeholders. The uncertainty, the increasing number of cases of bankruptcy, the risk adversity of investors, the reduced liquidity, the stricter credit conditions, the price volatility are some aspects that require changes that may be catalyzed through communication, as an essential instrument of survival and exit from the crisis. The responsibility of managers will be to develop survival strategies and powerful instruments of risk management, whereas investors will be more prudent and conservative. Creditors will tighten their underwriting procedures and auditors will face stricter internal controls in order to avoid audit failures. Confronted with the threat of losing their jobs, employees will become directly interested in the success or failure of the company where they work. In our opinion, the main catalyst of all these changes will be communication.

Aspects Regarding the Accountancy of Mines Closure Projects Financed Owing to Loans Ratified by the World Bank

Boca (Rakos) Ileana-Sorina

lilitafree@yahoo.com

Student in doctoral studies at "Valahia" University of Targoviste

Abstract

The accounting and financial registering of the expenditures regarding the projects of mines closure, preservation, and ecology works financed by the International Bank for Reconstruction and Development are carried out according to the Accountancy Law no. 82/1991, re-published, and to the new accounting Settlements in accordance with the 4th and the 7th directives of the European Economic Communities that are in force beginning with January 10th 2010 owing to Order no. 3055 dated October 29th 2009.

According to theses legal stipulations, yearly financial reports drawn out by the juridical persons of public interest are the object of a statutory audit.

Key words: project, implementation, World Bank, loan, financing, restructuring, mining industry, accountancy, account, financial reports

JEL Classification: M48, G28

1. Introduction

World Bank is an institution including five international financial institutions, namely: The International Bank for Reconstruction and Development – IBRD; The International Finance Corporation - IFC; The International Development Association - IDA; The Multilateral Investment Guarantee Agency – MIGA; The International Center for Settlement of Investments Disputes - ICSID.

The World Bank is generally more successful in enforcing its conditionality on the Romanian. The results are still mixed, but there is a strong sense that the overall vision that underlies the WB operations in Romania is correct and that big lending programmes like PSAL-industrial

restructuring and privatisation, ASAL (reforms in agriculture) or the currently negotiated PAL can play a role in pushing the reform a head. Technical assistance in areas like improving the business environment, strengthening the financial sector or restructuring the land market in rural areas is badly needed. Each institution plays a distinct part in fighting against poverty and with a view of improving the living standard of the population belonging to the countries in course of development. The generic term of **World Bank** mainly regards IBRD and IDA, and the major financing projects are provided by IBRD.

The International Bank for Reconstruction and Development (**IBRD**) was founded in 1945 and includes 185 member states. IBRD's objective is poverty diminishing in solvable and average incomes countries in course of development promoting durable development through loans, guarantees, and analysis and consultancy services. IBRD is a financial intermediary, borrowing funds in international capital markets for lending to its member countries.

IBRD is funding operations are designed to meet a major organizational objective of providing low cost funds to borrowing members. The loans are given to the governments or to the public institutions of the countries in course of development, on the basis of governmental guarantees. IBRD gets its funds mainly from the international financial markets, with a maximum solvability share. IBRD emits obligations and passes the benefit of small interests to its clients. The projects are evaluated by the Bank according to the capacity of the benefiting country to pay its debts.

The programs supported by IBRD belong to two categories: **Programs for economic and social infrastructure projects** – meant for modernizing and developing certain fields, such as: the energetic field, transports,

agriculture and rural development, education, birth control, health, and food supply. In order to determine the efficient implementation of the programs, IBRD requires the beneficiary State's participation with a certain share (between 10 and 30%). **Programs of field adjustment**, as elements of supporting economic reform, promoted through macro-stabilization programs of the International Monetary Fund and meant to cover external deficit – loans with a view of adjusting the private field (Private Sector Adjustment Loan - PSAL) and the public sector (Programmatic Adjustment Loan - PAL).

2. Content

The expenditures for mines and quarries preservation and final closure, including the monitoring of post-closure environmental factors in the case of national companies, displayed by the technical programs of closure and preservation, previously elaborated and approved according to legal stipulations, are provided by the companies' own resources and by budget allocations included in the budget of the Ministry of Economy, Trade, and Business Environment, according to the yearly lists of works drawn out by the main ordering credit institutions.

The expenditures necessary in order to carry out auxiliary activities belonging to the process of mines closure and ecology as well as the ones regarding the organizing and carrying out of public acquisitions, tests and expertise needed during the project/closure/ecology works, and the organizing and finalizing receptions are stipulated by the general devises of the objectives to be closed while noticing the total approved sums for each objective.

The payment of the services targeting such activities carried out at the objectives to be closed is done according to the internal norms and/or tariffs approved by the order of the main ordering credit institution. The expenditures occurring while closing mines and quarries are registered by accountancy according to the stipulations of Accountancy Law no. 82/1991, re-published, and to the applicable accounting settlements. The administration of the funds coming from the State budget with a view to preserving and finally closing mines and quarries is done by the Ministry of Economy, Trade, and

Business Environment while noticing legal stipulations.

The expenditures meant for mines closure, preservation and ecology works are monthly demanded by the main ordering credit institution according to the demands of opening budget credits accompanied by the centralizing Report of the companies' returns evidence.

Returns evidence is drawn out according to the technical closure or preservation programs of the mines and to the effective expenditures resulting out of the works reports monthly drawn out by the companies. Returns evidence is checked and approved by the General Department of Public Finances that has jurisdiction upon the economic entity that undergoes closure, preservation or ecology works.

All economic and financial operations that have been carried out are registered at the moment they occur by a document that represents the basis of accounting registering; they accordingly become justifying documents. Consequently, mining units have to register the expenditures for which they demand subsidies according to the stipulations of the Accountancy Law no. 82/1991, re-published, with subsequent modifications and completions.

With a view of a unitary approach, noticing the criteria of efficiency and performance of mines' closure and ecology works a specialized company has been founded; it should provide, owing to its highly experienced staff, the efficient management of the process of mines and quarries closure that targets: the operative survey and solution of the specific problems that may occur while carrying out the works, the permanent collaboration with the companies that administrated or exploited those units.

The company is called CONVERSMIN S.A. – Mines Preservation and Closure Company – and is under the authority of the Ministry of Economy, Trade, and Business Environment; it is a Romanian juridical person whose capital entirely belongs to the State; the Romanian State, through the previously mentioned ministry, is its sole shareholder.

CONVERSMIN S.A Bucharest implements the mines closure policy; it provides the management of the activity through attributing

the contracts of public acquisitions according to the legislation in force that regards all the component elements (preservation, planning, underground closure, ecology works, monitoring, sale of recovered stuff, technical support) as well as unpredictable events (calamities); it also targets the survey of the projects' implementation including the post-closure monitoring stage, the efficient use of resources, the periodical correlation of legislation with the other contact fields, and, last but not least, the providing of a permanent dialogue with the communities.

Another aspect one should have in view while stating the coordinates that mark the foundation of a specialized company involved in closure and monitoring activities, is the implementation of a unitary social policy; such a thing is possible through attracting a larger number of persons in the closure activity due to the fact that, as a rule, closed mining units belong to areas having a mono-industrial character and jobs for mining specialized persons might be quite difficult to be found.

This company carries out preservation and underground closure works employing workers belonging to the national mining companies. The carrying out of the underground mining closure works by a sole specialized operator plays an important part in surveying and quickly settling the specific problems that may occur during the works or during the permanent collaboration with the companies that have managed or exploited the units, especially in the areas where beside the mines to be closed the activity of other units placed within the same perimeter still goes on.

The reference stuff provided by the mining sub units in the country are centralized either by the national companies or by autonomous administrations; further they are sent towards the technical and economic council as original, written documents, sealed and signed as well as electronically to the secretariat of the General Department of Mining Resources; they are accompanied by a forward letter and a presentation letter at least 10 working days before being analyzed.

In order to properly implement the projects financed by IBRD, at the level of the Ministry of Economy, Trade, and Business Environment, they have founded the Management Unit of the

Mines Closures Project, an organism in subordination of the Ministry of Economy, Trade, and Business Environment, with both external financing and from the State budget. In accordance with World Bank procedures, for the management of the project, a Project Management Unit (PMU) was created, appointed by the Secretary of State (Minister, in Romanian terminology).

Romanian administration: over the duration of this projects it had three general managers (whose tenure bears a good correlation with the lifespan of the governments who appointed them). The first general manager was a political appointee (with no experience either in mining or in social mitigation), while the other two came from the mining industry. Similarly with their staff, none had any experience in social development.

The staff employed by this unit has the proper skills and resources needed to efficiently coordinate all sorts of aspects connected to the financial and payment management of the projects. The Project Management Unit (PMU) under the Ministry of Economy is the implementing entity of the mine closure and environmental remediation component of the World Bank-financed projects for the mining sector.

This Projects Management Unit (PMU) yearly elaborates a budget project at the end of April which is rectified in June and September. Such budget projects are drawn out according to the estimates of each contract of mine closure works.

These budget projections are submitted by PMU

to the Ministry of Public Finances which, through its specialized department, analyzes and transmits to PMU its agreement or disagreement upon the proposed trimester project; afterwards, it submits the budget projections to the Ministry of Economy, Trade, and Business Environment where they are minutely analyzed; finally, they send PMU the trimester distribution of the allocated budget. Each month, PMU establishes a credit. They draw out a sole credit establishing for each decade of a month that includes all the categories of expenditures; accordingly, the first decade includes salaries expenditures, the second one includes exceptional expenditures (business trips, etc.), and the third decade includes goods, services, and works expenditures.

Accountancy is drawn out in two currencies: lei and dollars, and in two accounting systems: the Romanian one and the one according to the last Accountancy International Standard. In order to register all financial operations and origin sources they use financial accountancy.

The sums that enter PMU account have their origin in two sources: the State's budget and IBRD loan.

Beginning with 2009, the system works according to pre-financing, namely: the Romanian State is the one that also provides the part of the loan; subsequently, the money enters the State's account out of the loaned sum.

PMU incoming money enter the account 770, "Budget Financing" (Incomes out of non-refundable financing programs) with analytical items according to the two financing sources: IBRD and the State's budget, money used for the following settlement operations: mine closures expenditures, services expenditures, goods expenditures, operational expenditures (salaries, supporting PMU administrative activities, etc.). The expenditures account employed by PMU is 673, "Internal transfers expenditures". The whole allocation is registered according to title 11, "Expenditures for non-refundable financing programs" 80.01, art. 65, paragraph 65.01, "Expenditures afferent to non-refundable financing programs". In case of each financing source there are analytical items for each category of expenditures.

For each category of expenditures there are sub-analytical items of 2nd degree in case of each contract. At the end of the administration period the accounts employed are closed owing to account 121, "Profit and loss"; at the end of the year, account 121, "Profit and loss", is closed owing to account 117, "Retained earnings". According to the credit of account 770, "Budget financing" payments are registered; according to its debit, they register the monthly closure owing to 121, "Profit and loss"; depending on the character of the expenditures, afferent accounting notes are drawn out.

The software used with a view of keeping the accountancy of the projects of mine closure is called "Plan Procurement Erasmus"; according to its conception, accounting operations detail all accounting data that represent the foundation of the counts.

All mine closure, ecology, and preservation works contracts are drawn out on the basis of FIDIC, namely, works payment according to the amount of executed works comes first (project or execution variations may occur, namely supplementations of the amount of works or diminutions that regard renunciation to certain works).

Accounting notes are monthly drawn out on the basis of the character of the expenditures: 80% of the sum meant for payments is provided by IBRD, and 20% of the sum is provided by the State's budget. Let's consider the following:

Salaries at the end of the month:

673 "Internal transfers" = 421 "Staff, due salaries" 80% World Bank

673 "Internal transfers" = 421 "Staff, due salaries" 20% Government

673 "Internal transfers" = 431 "Social insurances" (all contributions)

In case of account 673, "Internal transfers", they use analytical items for each of the two financing sources; for each financing source there are sub-analytical items in case of each category of expenditure.

Payments are done according to settlements; centralizing documents for each article are drawn out, including returns evidence, according to calculation breviaries and measuring methods, periodical delivery and reception minutes. The sites inspector analyzes and signs each document, and finally draws out a technical report and issues a document that certifies the payment; the document should be endorsed by the Ministry of Public Finances and by the Local Public Administration in the area the sites is located.

PMU receives the whole file and has it checked by its Technical Department, where the public acquisitions specialist thoroughly checks the file, including the implemented public acquisition procedure and the observation of all legal norms regarding the sub-contractors.

The PMU procurement process is carried out in accordance with guidelines World Bank Procurement under IBRD Loans and IDA Credits "of May 2004, and "Selection and Employment of Consultants by World Bank Borrowers" of May 2004, and provisions contained in the Loan Agreement. The mission also noted that the PMU maintain and provide timely documentation of

processes. Procurement and have an archiving system which facilitates complete documentation verifying.

Once PMU has checked all technical details included in the technical report of the discount, it certifies the reality and exactness of the sums contained by that structure, and, according to it and to all the estimations made by the financial department, draws out the proposal of payment accept. Under the supervision of PMU accounting and technical specialists the proposal of payment accept is drawn out; the invoice is enclosed according to the two financing sources; further, the proposal is submitted to the PMU's manager in order to be signed, then to the manager of the General Department of Mining Resources who is going to approve the settlement signed by the Financial Administration whose sum is contained by the accept notes. At the level of PMU's financial department they issue the proposal of authorizing a certain expenditure belonging to the budgetary commitment and to the payment authorizing. PMU accepts the payment of the works that have been carried out according to the mentions made by the General Department of Mining Resources; afterwards, PMU manager signs the invoice as being "ready to be paid". PMU specialists check on spot each work that has been carried out. Such documents bear the accept of the unit's own financial control, the accept of the financial inspector delegated by the Ministry of Economy, Trade, and Business Environment, distributed at the level of the Ministry of Economy, Trade, and Business Environment; they are finally approved by the minister who is the main ordering credit entity. PMU financial department draws out the payment document – payment order, external payment disposal – and the payment order, signed by PMU manager, is submitted to the Treasury. Further, payment is being done; the next day PMU receives the account extract containing the payment from the Treasury which is registered as follows:

673 "Internal transfers" = 401 "Suppliers"

Payment of the invoice:

401 "Suppliers" = 770 "Budget financing"

At the end of the semester the balance sheet with

all its afferent annexes is drawn out; lei and dollars balance is drawn out monthly.

All accounting files belonging to the projects are drawn out according to Erasmus IT

accounting software of PMU. Reserve saving of accounting files, transactions, and reports is done as follows: monthly in case of accounting files and transaction and each trimester in case of periodical reports; reserve files are stored on the server and CDs and preserved in a fireproof safe. PMU draws out in due time trimester financial reports belonging to the Financial Monitoring Reports (FMR) given automatically and easily by the IT software. PMU has established appropriate internal controls for project's including regular reconciliation of bank accounts, reconciliation of statements on payments Bank with project accounting records, proper allocation of tasks and policies and proper accounting procedures. Future payments will be made by the Ministry of Public based on eligible expenditures reported regularly by the PMU. Follow the MPF to issue a decision on the planning submission following withdrawal request and the latest talks, the Ministry will forward the following damage by the end of June 2010.

3. Conclusions

Accounting systems are informatics based, complex and vast being conceived by a Romanian financial IT software company. The IT accounting software employed by the Projects Management Unit displays efficient security levels and is used in order to draw out the financial monitoring reports of the project. The funds received from World Bank and Romania's State budget are considered to be the financing sources of the project.

ABSTRACT

The obligation to make financial statements according to the IAS/IFRS allows the European groups, with branches in another European country to reduce costs. In fact, instead of multiplying the editing of the accounting data (the balance sheet according to the local national law and the one according to the group norms), it is possible for them to respect the local norms, publishing only the balance sheet according to the IAS/IFRS.

Many of the economical analysts assume that the international comparability of the financial statements heads to using only one set of accounting standards for making the financial statements.

Key words: IAS/IFRS, international comparability, local norms, costs, balance sheet

JEL Classification: M4, M14, M48

1. Introduction

The development of competition, the globalization and the growth and integration of the capital markets require comparable accounting information based on superior-quality standards, an accounting information to consolidate and not to obstruct the global efficiency of the market.

The obligatory adoption of the current IAS/IFRS norms for the creation of the financial statements of the European

companies- and especially of the listed ones- are a necessary step for the full integration of the financial markets of EU member state.

The 4th and 7th CE directives contributed to the harmonization of the base accounting information of the stock companies, determining a general improvement of the European accounting norms quality, and this due to the greater comparability of the companies' account, which eased the activity of the trans-border companies.

But, the accounting directives did not manage to reach the objective of full comparability for the European entities' balance sheets, in exchange obtaining a "formal equivalence" of the optional accounting norms which is more simple.

2. Short History Concerning The Actual Accounting System Configuration

On one side, the lack of a full harmonization is a consequence of the chosen instrument; the directives are normative acts, in essence principle norms, suspected of a different application in the member states. It is not surprising that the accounting directives admitted, in a series of cases, alternative solutions or optional accounting treatments, or that they haven't challenged all the aspects of the accounting domain concerning the balance sheet. The use of a greater number of general and principle notions did nothing else but amplify the interpretations given by each

member state, reducing the convergence degree of the national accounting norms.

On the other hand, historically and politically speaking, choosing a principle instrument, such as the directive one, is certainly appreciated; the presence of a large number of accounting options eased the approval of the directives and their implementation in various countries of Europe, allowing to surpass the resistance of the same member states to the accounting harmonization policy preferred by the communitarian institutions. It is enough to think about the long periods of time that were needed to implement the accounting directives (Italy, for example, implemented the 4th directive after 13 years from the deadline) in order to realize the difficulties brought by the tendency to impose the member states to give up- even partially- the own accounting traditions, consolidated and to converge to an unitary model.

The slow process of fully applying the principles established within the directive was the cause of their quick ageing; while the member states were struggling to comply their own national legislation and accounting practice to the communitarian requests, the social and economical context changed, making the directives to become completely inadequate to reach the objective to ease the intra-communitarian exchanges.

The most radical changes are the ones concerning the financial markets. During the 90s, the international real estate markets, so as the European ones went through a deep changes period, mostly due to the increased use of the new IT technologies and of the economy's globalization, which made possible reaching high mobility levels of the capital, leading to a progressive closeness of the financial markets.

The evolution of the international financial scenario lead to the increase of the European society number which intent to enter an extra- national context (the so-called global players) and which are obliged to feed with balance sheet information that is more comparable and complete, facing the ones supplied by the balance sheets made under the communitarian directives, applied in a pretty different manner in each member state, this problem becomes more pragmatic and dramatic in the case of the investigations on

the extra- European markets, as a consequence of the obligation stipulated in the majority of the rulebooks to make the reconciliation of the accounting prospects with the local accounting norms.

Also within the EU, adopting applicative disciplines and national procedures that are very detailed and differenced denied the possibility to mutually recognize the accounting prospects which the Union aims to reach, with unavoidable consequences for the european emitters to elaborate and present more accounting documents fascicles, in order to be listed in the member states, others than the ones coming from.

3. The Accounting Systems Of The Main Member States Of The Eu

Within the economical doctrine that deals with the accounting systems which are put under national regulation, a common thing is the division of the accounting systems' "family", which follows the one of the juridical systems and mainly coincides with the distinction between the civil law and common law.

For the common law system, the role of the accounting norms would be glorified on one side because of the slack character of the juridical norms in matter of accounting, and on the other side because of these norms' own characteristics, in which practice always had an important role. It is no surprise, therefore, which the accounting audit and the "generally accepted" accounting standards concept were created because of these regulations¹.

In the UK, from an initial situation that lacked the rules and uncertainties concerning the identification of the accounting norms, it reached, in the 80s, to a careful regulation of the accounting domain. The normalization process of the English accounting standards is mainly due to the categories interested in editing the balance sheet (the ASB- Accounting Standards Board), to which was trusted a formal setter standard role, as well as the recognition, by law, of the juridical value of the accounting standards

¹ In fact, both norms are born in the SUA

made by this organization.² Once with the application of the European accounting directives, a normalization process of the accounting standards was initiated, which changed the traditional importance given to the professional originating accounting norms.[2]

In present, the system is not far from the one present in the majority of the EU countries, by which he is attributed the judge role as a consequence to review at the last analysis the compliance with the IFRS, made by the IASB.

In the civil law systems, the existence of a well defined juridical frame and the traditional defensive to the non legislative sources that do not belong to the state determined a reduce relevance of the accounting standard in the juridical area.[4]

Of a real interest for the similarity of the juridical traditions are the experiences gathered by France and Germany.

It is very well known that in France developed, starting with the 70s, a great debate concerning the balance sheet discipline, focused on the necessity to reach a codification of the accounting right, understood as a specific branch of law, characterized by various principles and sources³.

The accounting legislation started to be developed during the 80s, especially because of the impulse derived from the application of the 4th directive. With this occasion, a general law was elaborated as concerns accounting, qualified by the COB as being the “code” of the accounting standards.

² By the activity of the Companies Act in 1989 which expressly requires the managers of the big companies to stipulate in the lower corner of the financial statements if the accounting standards have been respected and to specify the eventual reasons for which derogations were necessary. For an assembly view of the evolution and functioning of the English accounting system, Khanna B. and Pozza L, in *Regno Unito*, in Provasoli A. și Vigano A – *Processi*, pg. 116, present how the Companies Act norms do not contain and adequate and real recognition of the accounting norms.

³ Fortunato S – *Bilancio e contabilita d'impresa in Europa*, Bari, 1993, pg.37, Andrei P., *Sistemi contabili e infomazioni di bilancio*, în Franco Andrei P., *Sistemi contabili e infomazioni di bilancio*, în Franco Angelli; Andrei P. -*Sistemi contabili e informativa di bilancio*, in Franco Angelli, Milano, 2000; Viandier A. și C De Lavzaingheni- *Droit comptable*, Paris, 1993

Using the “code” term is altogether improper; classifying the French accounting norms is actually only partial, because it does not include fiscal accounting standards and as such does not include the accounting of the so-called “civil” companies, which practically make only a fiscal log [5].

In the harmonization and legalization process of the French accounting system, a huge step was made by the adoption under a juridical form of the ministerial decree, of the so-called “plan comptable general” (CNC)-Conseil, being a public consulting and coordination organization for accounting under the authority of the Finances and Economy Ministry. The juridical relevance of the accounting standards included in the “plan” is confirmed by its penal punishments in case of inobservance.

As concerns Germany, it is necessary to highlight the fact that the German accounting system was developed traditionally as a system with a powerful legal base, in part due to the adopting of a “reverse dependency” model between the civil and fiscal balance sheets, and in consequence to base its fiscal determinations on certain sure rules with juridical value.

The fundamental principle of the German accounting system is represented by the notion of „Grundsätze ordnungsmässiger Buchführung” which, most probable, is the matrix of the notion, in Italian, of „fair accounting principles”.[3]

The principles⁴ of the German accounting are configured as being true and real „commercial uses”.[1]

Even in this case, after the application of the accounting directives and legalization of certain balance sheet principles, revealing the determination by induction of the accounting principles by a civil court decreased substantially⁵, even after recognition of the European accounting systems; therefore, applying the accounting directives represented for all the member state a radical change

⁴ During this chapter, to the “accounting principle” term is associated the term of “accounting standard”

⁵ For a reconstruction of the debate that took place in Germany, varying with the juridical nature of the fair accounting principles, also look at Livantino M. și Pecchiari N. –*Germania*, in Provasoli A. Și Vigano A. - *Processi di formazione dei principi contabili în alcuni paesi europei*, Napoli, 1998.pg 163

moment, and of development for the accounting traditions.

4. Conclusion

The elaboration process of the accounting directives needed, on another hand, a substantial effort- in terms of finding a compromise that would have lead to a formal convergence of the two current accounting macro systems, which belong to the common and civil "law" juridical macro systems.

Despite sustained effort, there is a common opinion in the accounting doctrine, according to which, because of the diversity of the juridical frame and, in general, of the "environment" and social- economical factors to initiate the "normalization" of the accounting standards, several models were followed by various member states.[4] In order to make an unique communitarian market, the accounting harmonization process came only with one meaning, an obligatory one.

Abstract

The annual financial statement is a technical and accounting instrument capable to provide with, periodically, a synthetic representation of the patrimonial and financial statement and of the economical result of an entity. In Europe, the financial accounting phenomenon was born in the second half of the 80s, when the legislature started to modify the aspects concerning the procedure to make the balance sheet. Later on, in the beginning of the 90s, computing and accounting techniques studying was begun, by creating a real and true branch of the economical sciences, called „financial accounting”.

For these reasons, the attention was mainly focused on making specific norms, concerning the structure and evaluation of the financial statement, aiming to limit the liberty enjoyed by the administrators in choosing the rules to adopt in making the balance sheet. The fact that each evaluation of a patrimonial item is changing, varying with the purpose the one that makes the balance sheet proposes to get to by evaluation, was recognized; therefore deriving the necessity not to let to the administrators the decision concerning the way that the patrimonial elements will be evaluated, a highly- important decision

and with a practically relevant impact over the obtained results

Key words: annual financial statement, economic result, financial accounting phenomenon, accounting system

JEL Classification: M4, M41, M48

1. The purpose of the accounting systems' classification

Classifying the international accounting systems is necessary for the next reasons:

- in order to understand to what extent the accounting systems of various countries are similar;
- in order to study the way of the accounting systems' evolution and future development;
- in order to understand the reasons for which some nations exert a dominant influence for the accounting area and others do not.

The cultural influences over the accounting systems were studied by various researchers in the domain according to which culture, or better said the values shared by a society are also reflected in the accounting systems. The main variables by which these phenomena can be explained are:

- a) the professional control versus the legal one;
- b) uniformity versus flexibility;
- c) prudence versus optimism;
- d) confidentiality versus transparency;

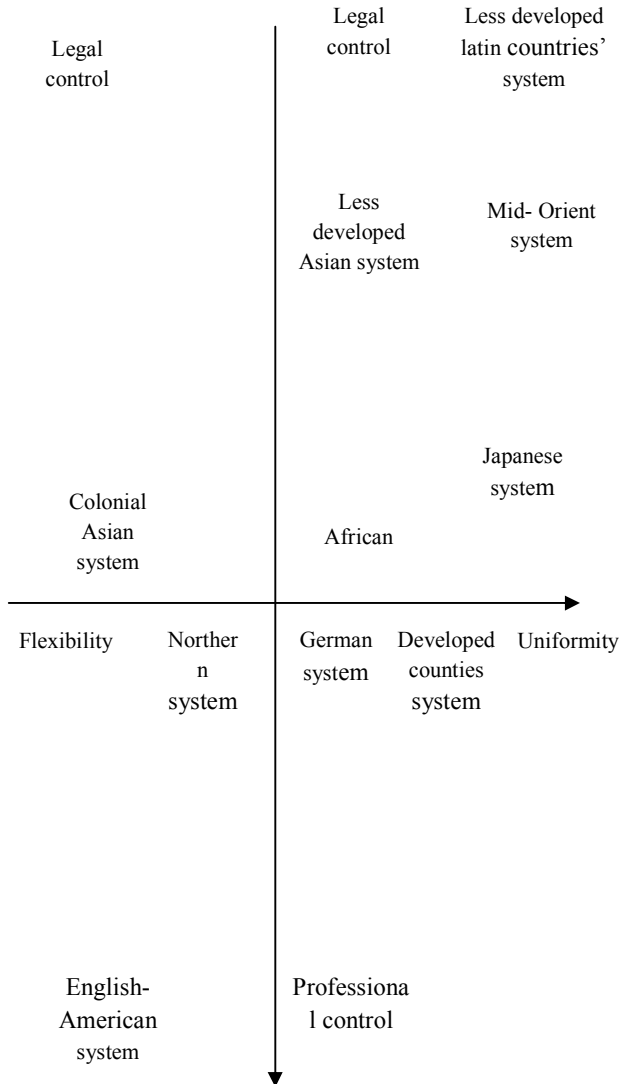

Figure no. 1 Flexibility vs uniformity and legal control vs professional control in the world's accounting systems or „norm application”

Source: Radebough and coaut, 2006

- a) *Professional control and legal control*

This variable represents the preference for a professional opinion and auto-regulation of the profession more than to adhere to prescriptive legislative norms and legal controls.

On a world level, the accountants do their jobs in various ways, for example in the UK the concept of “true and fair view” depends highly on the accountant’s opinion as an independent professional.

In countries like France, Germany and Italy, the main role of the accountant is to apply detailed and prescriptive legislative norms.

The dimension, valence and authority of the accounting profession are, in general, directly proportional to the prevalence, in a certain accounting system, of the professional control.

b) Uniformity versus flexibility

This social value reflects the preference for uniformly applying the accounting procedure, for its consistency in time, than for flexibility in applying the norms, varying with the specific circumstances of each society.

For example, in France and Spain there is an unified accounts’ plan on a national level, and the influence of the fiscal norms over the balance sheets is significant. In the UK and USA, in exchange, the conviction that flexibility is needed in applying the rules is more spread, translated as a greater attention for their inter- temporal comparison.

For example: the balance sheet formats regulated by law in many of the European countries and cannot be modified. But, in the UK and USA, there is no application standard form, but only a minimum respected content.

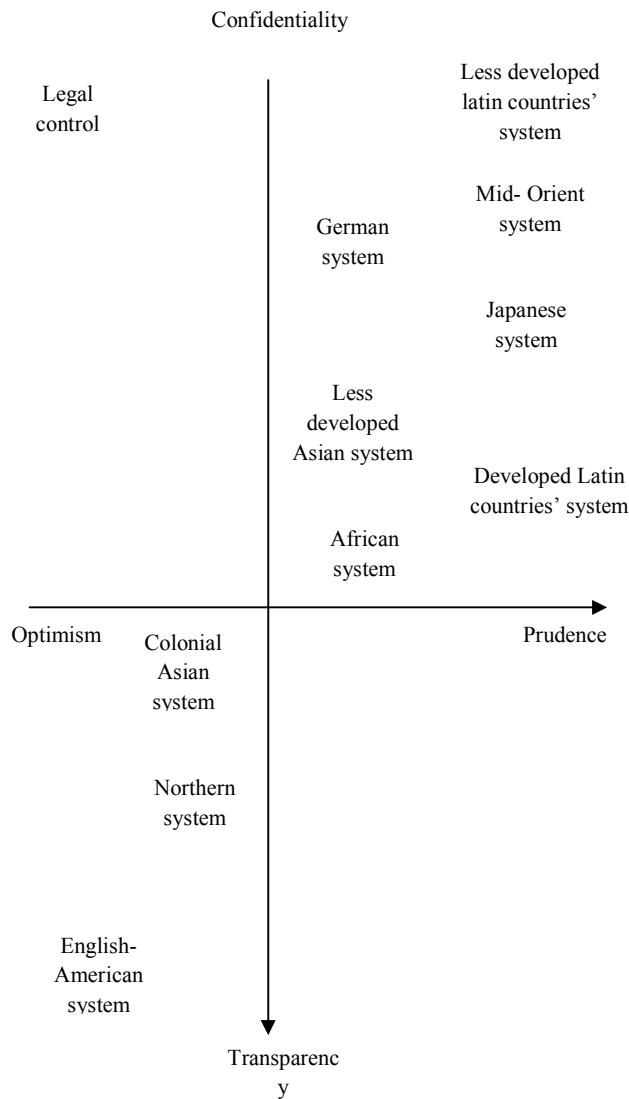

Figure no. 2 Evaluation and the financial information

Source: Radebaugh and coaut. 2006

c) Prudence versus optimism

This variable reflects the preference for a prudent variable of the patrimonial elements' evaluation, which consists in confronting the future risks, instead of a more optimist and less adverse approach of the risks.

It's about one of the most important characteristics of an accounting system, because prudence is one of the most rooted and omnipresent fundamental principles.

The prudence principle varies a lot from country to country, passing from the prudential- connoted accounting systems (Japan, France, Germany, Switzerland) to the less prudent ones, such as USA, UK, and from certain points of view the northern countries.

Prudence seems to be tied to the capital markets' developments, the influence of the fiscal norms over the balance sheets and the various pressures exerted by the financial information users.

d) Confidentiality versus transparency

This variable reflects the preference for confidentiality and spreading the financial information only to the ones involved in the entity's management, instead of a more transparent approach of the accounting information spreading.

The influence of the management over the quality and quantity of the supplied financial information is relevant. Confidentiality seems to be strongly connected to prudence, even if the last one seeks the patrimonial elements' evaluation and not of the supplied information. In certain countries, there is a minor financial disclosure compared to others; in Japan, France, Germany and Italy, confidentiality is better preferred than in the UK or USA.[1]

Transparence is often tied to the spread capital and the development of the capital market, because the companies are put under significant external pressure concerning financial information spreading.

2. Difficulties in classifying the accounting systems

Various accounting systems are often associated to various countries; nevertheless, a country can have more than one accounting system, for example one for the listed companies and another for the not listed ones. Sometimes, the bigger companies can adopt accounting rules that differ from the

ones that represent the “legislation” or the accounting norms of a country (e.g. the Japanese companies that use the USGAAP or the European ones using the IFRS).

Therefore, it would be more correct to refer to the “dominant accounting system” of a country (Nobes, 1998), which is the one used by the majority of the existent economical entities of that country. Another difficulty is that the accounting systems can radically change in time, such as it happened in China, Russia and the majority of the East Europe countries [2].

The financing system of the entities is most likely the most important reason why there are differences between the international accounting systems, revealing in fact that there are various purposes why the balance sheets are published.

The dominant financing system of a country represents one of the main variables capable to explain the purposes of the balance sheet. There can be identified 3 financing system types:

- a) the systems based on capital markets;
- b) the systems based on credit capital- government type;
- c) the systems based on credit capital- financial institutions type.

The accounting systems, of the countries in which financing by capital markets is prevailing, tend to be different to the systems in which the entities are prevailingly financed by the credit capital.

The insider/outsider model

The accounting systems afferent to the strong equity countries

In the strong equity countries, the biggest part of the financiers are outsiders, which is they do not have a privileged relation with the company [1].

This category includes both small shareholders and institutional investors (insurance companies, investment companies etc.). Within the “weak equity” context, the

biggest part of the financiers (families, governments, banks and other entities) are, in exchange, insiders, which meaning they have frequent and opportune access to the reserved financial information, because the most times they have a long- term relation with the financed subject [2].

Table no. 1 an example of the characteristics of the two accounting systems

Characteristics	Strong equity	Weak equity
Security depreciations and provisions	The balance sheet norms do not coincide with the fiscal	The balance sheet norms follow the fiscal ones
Profits afferent to the unmade changes	Reported in the profit and loss account	Late or unreported
Legal reserves	Absent	Obligatory
Schemata of the profit and loss account	Net costs classified varying with their function (costs afferent to sales)	Costs classified by their nature
Cash flows	Obligatory	Not required, often edited
Profit per share	Obligatory for the listed companies	Not required, often reported

A “strong equity” accounting system type, also called Anglo-Saxon, has the following characteristics:

- legal system: common law;
- fiscal system: no influence of the financial norms over the balance sheet evaluations;
- balance sheet users: especially the risk investors (outsiders);
- characteristics of the financial information: “devoted framework”, prevalence of the competence principle over the prudence principle;
- additional information: high transparency degree;
- evaluation: optimism, using the current values (fair value), no limit for profit distribution; examples: Australia, Canada, Ireland, the Northern

Countries, New Zealand, Singapore, UK and USA.

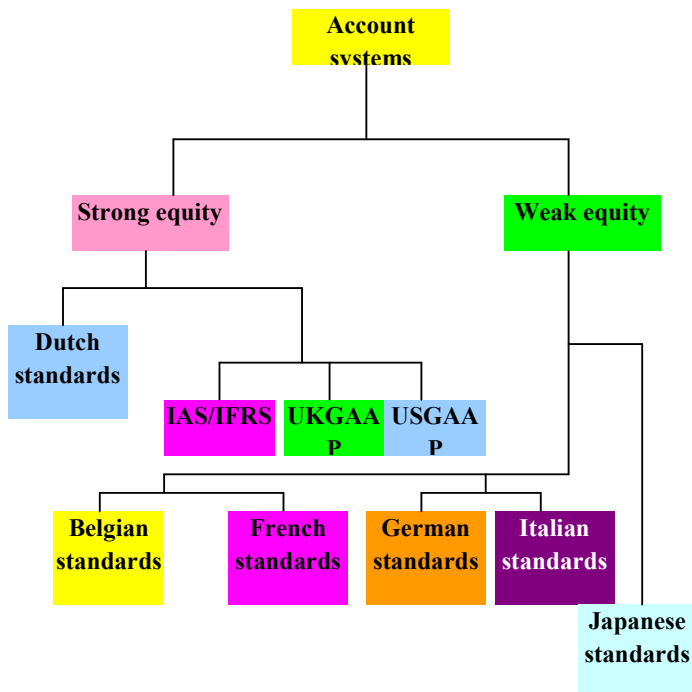

Figure no. 3 The structure of the international accounting systems

Source: Nobes Parker, Comparative International Accounting, 5th ed, Prentice Hall, 1998

2) The „weak equity” type accounting systems

The “weak equity” type accounting systems (known as European) have the following characteristics:

- the law system: specific legal norms;
- the fiscal system: is known for the influence of the fiscal norms over the balance sheet evaluations;
- the balance sheet users, especially social creditors, fiscal authorities, sometimes risk investors;
- characteristics of the financial information: prevalence of the prudence principle over the competence principle, reduced relevance of the financial information for the stakeholders;
- additional information with a high confidentiality degree;

- the evaluations of the patrimonial elements are characterized by prudence, use of the historical cost, the just value is not admitted; no limit for the profit distribution, in some cases the creation of hidden reserves. Examples: Belgium, France, Germany, Italy, Japan, Portugal, Spain, Switzerland.

3. Conclusion

The evolution of the internationalization process of the economical entities and globalization of the financial markets determined an increase of the demand for information on behalf of these sectors’ operators, which highlight more and more the need for uniform accounting rules, shared internationally. Therefore, the financial and economical harmonization process recorded, in Europe, in the last years significant progress, finding its applicability in practice in significant economical domains by adopting the international standards IAS/IFRS by the member states of the EU.

The transition to the IAS/IFRS determined fundamental changes in the financial reporting system of the entities, generally leading to a deep review of the evaluation and representation criteria of the patrimonial structures in the balance sheet.

One of the objectives of our paper, as previously mentioned, is to investigate several problems that result from this transition to the IFRS, concerning the effects these one bring to the economical performance. In many of the European countries, the local legislation allows the adoption of the IAS/IFRS for all the companies, even if they are not listed and do not make consolidated financial statements; in some cases, even for the making of the individual balance sheet of the holdings or company groups.

Abstract

The appearance and evolution of insurance were strongly connected to the development of the society. Each evolutionary stage had a strong impact on insurance regardless of the activity field (life insurance, commodity insurance, and so on). Insurances and accounting have evolved simultaneously. This thesis points out the most important moments in their evolution, globally and locally. Nowadays, accounting has developed a new, specialized branch dedicated to insurance – actuarial accounting. In Romania, this branch adopted the IAS/IFRS.

Key words: Insurances, accounting, IAS/IFRS perspectives

JEL Classification: M41, G22

1. Introduction

The society development was influenced by the people's effort and endeavor concerning their own fortune and protection in front of different events able to destroy their existence and even their evolution.

At the insurance origin are human being's protection needs and solutions found in order to create the most appropriate ways to manage all risks. It's impossible to say when insurance's origins are. In some sense, we can say that, „insurance appears simultaneously with the appearance of human society”.

Talking about accounting's origin we can affirm these were directly affect by private propriety's birth, by money's development and, last but not least, by the growth of the commerce market. Politics, trade, money, and credit are all of them stimulating accounting development.

The history of accounting is as old and fascinating as civilization, among the most important professions in economic and cultural development. The role of accounting in the ancient world is coming into clearer focus with new archaeological discoveries and innovative interpretations of the artifacts. It is now evident that writing developed over at least five thousand years—by accountants.

2. Insurances and accounting origins

The roots of insurance might be traced to in Egypt, where, around 6500 BC, the stone cutters developed a mutual fund in order to cover all community damages generated by disasters. early methods of transferring or distributing risk were practised by Chinese and Babylonian traders as long ago as the 3rd and 2nd millennia BC, respectively. Chinese merchants travelling treacherous river rapids would redistribute their wares across many vessels to limit the loss due to any single vessel's capsizing. The Babylonians developed a system which was recorded in the famous Code of Hammurabi, c. 1750 BC, and practised by early Mediterranean sailing merchants. If a merchant received a loan to fund his shipment, he would pay the lender an additional sum in exchange for the lender's guarantee to cancel the loan should the shipment be stolen or lost at sea.

The concept of the 'general average' was invented by the inhabitants of Rhodes around 800 BC. Merchants whose goods were being shipped together would pay a proportionally divided premium which would be used to reimburse any merchant whose goods were jettisoned during storm or sinkage.

The Greeks and Romans introduced the origins of health and life insurance c. 600 AD when they organized guilds called "benevolent societies" which cared for the families and

paid funeral expenses of members upon death. Guilds in the Middle Ages served a similar purpose. The Talmud deals with several aspects of insuring goods.

Accountants participated in the development of cities, trade, and the concepts of wealth and numbers. The Babylonians were the first to use "accounting books" tablets, which represent a summary document of inventories or transactions and contain additional explanatory markings. With stylized signs all information could be recorded directly on the tablets, eliminating the need of tokens (small clay balls).

Later in Greece in Delos, Olympia and Delphi the priests regularly used the inventory, the balance sheet and some other reports in order to manage the temple's fortune.

With the growth of towns and trade in Europe, the medieval guilds undertook to protect their members from loss by fire and shipwreck, to ransom them from captivity by pirates, and to provide decent burial and support in sickness and poverty. By the middle of the 14th cent., as evidenced by the earliest known insurance contract (Genoa, 1347), marine insurance was practically universal among the maritime nations of Europe. In London, Lloyd's Coffee House (1688) was a place where merchants, ship-owners, and underwriters met to transact business.

Italian merchants developed commercial ties throughout the Mediterranean. With the Crusades, beginning about 1000 AD, demand for exotic Eastern goods developed and Italian merchants expanded trading ties throughout Europe. The most successful merchants developed complex trading relationships across Europe and into Asia, which required money and credit and improved accounting methods. Evidence suggests that double entry bookkeeping developed in the Genoa-Venice-Florence area in the 1200-1350 period, part of a vast commercial revolution. Accounting records of several companies indicate complete double entry accounting. Luca Pacioli Franciscan monk and mathematician, published *Summa de Arithmetica, Geometrica, Proportioni et Proportionalitate* in 1494. It was a summary of existing mathematical knowledge of the time and contained a section on "Details of Accounting and Recording" that described bookkeeping as used in Venice. Pacioli's *Summa* was the first complete description of double entry bookkeeping.

In Romania the roots of insurance might be traced in Transylvania in the XIV century where the first mutual protection associations appear, created by different manufactures in order to cover for fire damages and even life insurance. In Brasov in 1744 several small organizations founded "Casa de incendiu" – "Fire house".

Talking about a real Romanian insurance association, it was also created in Brasov in July 1848 "General institute for life annuity". This association offered all members, regardless of religion or nationality, a life annuity.

2.1. Insurances evolution during 1871 - 1948

This period was a very important one for insurance in Romania, through the fact that:

- in March 1871, through a High Princely Decree, the first Romanian insurance company, DACIA, was funded having a corporate funds of 3 million lei. In 1873, a second insurance company was funded, ROMANIA, having a corporate funds of 2 million lei. These Romanian insurance companies had as funding members and administrative council members important figures of the politic, economic and social scene of the age. In 1881, the two Romanian insurance companies merged and created a sole company, DACIA-ROMANIA, which became a strong company. As a consequence of the creating of these insurance companies and development of the local insurance market, one by one the foreign insurance companies started retreating, giving up their portfolios to the Romanian companies

- the laying down and publicating of the balance sheet in insurance were attained according to the norms provided in C. com. for anonus societies, completed with special norms elaborated by the legislator for this activity field. This settlements were attached to the content of the law from the 7th of July 1930 and developed the following aspects:

- The corporate funds and reserves were presented as distinct posts in the liabilities;
- The debtors and creditors were enlisted separately in the balance sheet, accounts compensations were not permitted; this represented one of the most important dispositions regarding the balance sheet, by which they tried to eliminate the enterprises practice of compensating the account receivables and debts in order to make

proof of a better liquidity; furthermore, the dubious account receivables had to be booked in the assets together with the corresponding amortizing;

- in case of added value of the titles or goods, the difference appeared separately in the assets, with the specification of making a fund for currency fluctuations in liabilities, so that the added value isn't an achieved profit and, consequently, should not affect the result;
- constitution expenses were amortized in one year, with the specification that article 37 forbade the distribution of dividends bigger than 5% before the writing-off of the constitution expenses were amortized.

2.2. Insurances during the communist period 1949-1990

After the nationalization, in 1948, the insurance companies went in the property of the state with all their assets and liabilities, and the public insurance institution were also entered in the new structures of the planned economy.

The insurance sector has gone through a transfiguration, transformation period, some of them being positive others imposed by the monopole quality which the state imposed. A first step was made in 1948 when the insurance companies were nationalized and passed on to the property of the state. Their entire portfolio and technical and mathematical reserves were passed on to the Sovromasigurare Soviet-Romanian insurance company.

In 1952 an integral Romanian capital was made, State Insurance Administration - ADAS, company which was specialized in insurance, reinsuring and damage commissariat activities. ADAS has continued its activity under the general governance of the Ministry of Finance, according to certain decrees specially issued for it. The only things established by ADAS were the risks submitted in reinsuring, the limit of own and the conditions for reinsuring.

The year 1949 represented the transition to standardized accounting and the development of the first chart of accounts in our country. Accounting's adapting to the informational requirements of the planned economy, especially regarded the soviet experience. This is why, at the beginning of the 50's accounting works of Russian authors were translated and turned into Accountancy textbooks, which represented the theoretical basis for the development

of a new accounting system. Accounting's standardization was only assured by the state, through the Ministry of Finance which introduced clear accountancy norms. Accounting was considered a control tool of the plan execution and protection means for the integrity of the property of the state. A first step towards the standardization of accounting was elaborating a general accounts frame, from which chart of accounts detached, differenced through the activity branch. At the same time, norms regarding the booking in accounts technique were settled, being adapted to the decimal system which assured the rationalization of accounting booking. Accounting was organized in a sole informational circuit (accounting monism), closely following the production function of the enterprise and the calculus of the overall costs.

2.3. A new age of insurances 1990 – 2002

When the market economy is adopted, the insurance sector will also start undergoing a deep transformation process. After 1990, important legislative changes have appeared which led to the ousting of the state monopole, the apparition of several insurance companies and the settling of the competitive climate on the Romanian insurance market.

The dereliction of the centralized economic system and the orientating towards the economy market generated a big crisis between the new economical reality and the old ways of representation and shaping which existed in accounting. Romania's transition to the economy market enjoined the adoption of a new accounting law, which corresponded with the new conditions specific to the new free economy, a competitive one. During the centralized economy we did not have an accounting law, but norms elaborated based on the Decisions of the Council of Ministers and norms adopted by the Ministry of Finance, in its quality of sol accounting norm setter. In the interwar period a public accounting law existed. Thus, the accounting of the private enterprises was not submitted to settlements coming from the state, but, as mentioned above, it was under the incidence of the stipulations of the Commercial code, which established the liability for dealers and the other persons that used commerce paper work, to keep the accounting registers. Due to these circumstances, in 1991 appears the Law no.

47, concerning the constituting, organizing and functioning of the incorporations in the insurance field. This Law stipulated the fact that in Romania the insurance activity was done through insurance companies, insuring-reinsuring companies and reinsuring companies and as well as intermediating companies (intermediating agencies). According to the Law, the companies activating in the insurance field, could have been constituted as a joint stock company or as a limited liability company.

After 1990, on the Romanian insurance market, a large number of insurance intermediation companies have appeared (over 800 activating companies by 2000), which acted like agents and also as insurance brokers (in fact, only a few companies were insurance brokers).

In 1994, by the initiative of thirteen companies, the National Union of the Insurance and Reassurance Companies in Romania¹ was funded. Nowadays the National Union of the Insurance and Reassurance Companies has 21 insurance and insurance-reassurance companies as members.

By the appearance of Law 32/ 2000, the Insurance Supervision Commission was founded. The commission was an independent, self-contained organism, being financed by the insurance companies, having the role of settling and supervising the insurance market. The Insurance Supervision Commission is led by the Insurance Supervision Commission Council, consisting of five persons (a president, a vice-president and three members).

3. Insurance accounting's tendencies

3.1. The opening of insurance accounting towards the European Directives

In the past decade, in Romania accounting in the insurance field was treated like an extension of the financial accounting. The specific elements of this field were maintained in predefined templates, created to register the financial situations and performances of certain companies with financial or industrial activity and too little modified in order to apply to the insurance requirements. Thus it got to the point where the specific income and expenses for

this activity to be presented in only two accounts, which were "Income from the insurance and reinsurance activities" and "Expanses with the insurance and reinsurance activities", and the technical reserves, which represent a major component of an insurance company, could only be found under the "Other reserves" category.

The above presented situation completely changed starting with 2002, with the approaching of the Romanian accounting to the international one, manifested in the past few years, has also included the insurance activity.

The new accounting settlements, harmonized with the European Directives, were specially created for this activity field, and more precisely Order 1187 from the 25th of December 2005 "Accounting settlements in accordance with the European directives specific for the insurance field" which had applicability starting with the 1st of January 2006. They include an accounts plan specific for insurance, in which the income and expenses from the insurance and reinsurance activities are found in distinct accounts, an entire class for technical reserves accounts, a particular set of financial situations – balance sheet, a profit and loss account (a technical account for life insurances and also a non technical account for general insurance), the situation of treasury fluctuations, the situation of the modification of the company's own capital and the explicative notes of the annual financial situation.

In the European Union (EU), there are two types of accounting settlements which can be applied in the insurance field:

- Accounting Directives: Directive 91/674/CEE concerning the annual accounts and the consolidated accounts of the insurance companies, the 4th Directive (no. 78/660/CEE) concerning the annual accounts of certain types of societies, the 7th Directive (no. 83/349/CEE) concerning consolidated accounts;
- The European Commission's (EC) Regulation no. 1606/2002, which submits the liability for the application of these IFRS adopted at a community level, by EC regulations in order to lay down the financial situations consolidated by the quoted companies, starting with the 1st of January 2005.

In what concerns the putting in practice of Regulation no. 1606/2002, in a first stage at an EU level all the effectual international standards

¹ the National Union of the Insurance and Reassurance Companies in Romania = Uniunea Nationala a Societatilor de Asigurare si Reasigurare din Romania (UNSAR)

except IAS 39 (which was adopted with some modifications considered temporary and exceptional) were adopted. The strategy published by CSA has the purpose of explaining the process which will be continued in view of the application of the stipulations of the Order of the Minister of Public Finances no. 907/2005, according to which insurance companies just like public interest entities, can also lay down a set of financial situations in accordance with IFRS and of Regulation no. 1606/2002 according to which quotable entities must apply IFRS when laying down the financial situations consolidated in the period following the 1st of January 2007.

3.2. A new approach of insurance accounting from the IAS/IFRS perspectives

According to the strategy concerning the implementation of IFRS in the insurance field, approved by the CSA Council on the 3rd of October 2006 ("The Strategy"), starting with the financial exercise of the year 2007, insurance companies that are not quoted on a regulated market or that are in process of marking in the day of balance sheet and lay down consolidated financial situations, will lay down this financial situations in accordance with IFRS. For the financial exercises of the years 2008 and 2009, all the companies in the insurance field, regardless to whether they are or are not quoted on a regulated market, have to lay down annual and consolidated financial situation in accordance with the IFRS as a second set of financial situations, for the information exigency of the CSA, the marker and other users. Starting with 2010, depending on the results of the evaluation of the effects concerning the application of the IFRS and the requests and evolution registered at an EU level, the companies in the insurance field are going to lay down annual and consolidated financial situations in accordance with IFRS as a single set of financial situations.

The adopting of the IFRS determines a major change of the accounting language for the insurance companies in Romania as well as for the consultants on accounting matters, the AUDITORS, the analysts in the financial accounting field. The transition towards IFRS will not only regard the accounting field, but will have bigger implications from the basic activity planning to the company's strategic management.

The adopting of the IFRS implies:

- A new performance evaluation system,
- Improving the quality of information intended for management in order to take the best decisions,
- The increasing of competitively, and last but not least
- The changing of the entire reporting base.

For investors, the implementation of the IFRS will lead to an upbringing in the credibility of the information presented by companies, a better understanding of the risks and benefits and through assuring a comparability of the financial results of companies in the same activity field.

IFRS are based on principles and impose new responsibilities to those that lay down the financial situations; because of this the companies that will use IFRS will have to apply accounting principles according to how were they emitted, as a condition to attain transparent financial and of a high quality reports.

For companies in the insurance field, IASB decided to introduce a specific standard for this field, process which will be realized en route of two stages. IASB conceived **phase I** as an essential moment in the attaining of the final standard. During the first phase there will not be a comprehensive and final standard for the insurance field, the applicable principles that are those provided by IAS 32 "Financial instruments: presentation and description", IAS 39 "Financial instruments: spotting and evaluating" and IFRS 4 "Insurance contracts".

For the requirements for stock and insurances capacity improvement to be ensured, there must be applied the accounting principal that are prudent and relevant for the suitable decisions. When we talk about prudence, the accounting principles refer, at least, at the following:

- the evaluations must be performed so that the information's credibility to be ensured
- when certitudes exists (including the use of accounting estimation), they must be recognized and evaluated
- prudence must not lead to a deliberated over evaluation of the debts

The basic IFRS characteristics for the insurance are:

- the actives and the financial debts are managed according IAS 39
- the insurance companies will only apply the IFRS that are demanded. The IFRS referring to insurance contracts will be only applied for those (including reinsurance contracts). As the IFRS 4 puts it, the definition for the insurance contracts is one of financial substance not a legal one. An insurance contract is “a contract through whom the insurance company accepts a signifying from one part (the insured), agreeing to compensate the insured in case a future insecure specified event (the insured event) will affect in a negative way the insured.” The insured is defined as being “the part how has the right to compensation in an insurance contract if an insured event appears.”
- An insurance risk is “a risk, different from the financial one which is transferred from the contract owner to the insurer.”
- A financial risk is “the risk of a possible modification of one or more rates of the specified interests, prices of the financial instruments, prices of the merchandises, of the exchange rate, of the prices or rates index, of the credit index or other variables. The only condition is that the non-financial variable’s modification must not be particular for one of the signing parts.”

The second Step has a lot in common with the finalization of the Solvency II model. The

European Commission wants to revise the insurance solvability requirements for the European Union, to improve a set of aspects especially in what concerns the more subtle approach towards the risks profile. The construction of a single market needs the creating of a coherent and operative system to monitor the societies insurance solvability in the European Union. This system will need to respond to the challenges represented by the growing competition, the continuous integration of the stock markets, the stronger development of the financial mixtures, to the new distribution channels, etc. From this point of view, we can say that the Romanian insurance market made a big step in the last years, quantitatively and qualitatively speaking. A legal frame had evolved, frame that is compatible with the European laws regarding solvability, the professional calcification requirements, the implementation of risk management procedures, of intern control, comporting governance and, at the same time, to consolidate the supervising authority. As a result, the insurance companies will need to assign a bigger attention to supervising the business risks and the financial results that they obtain, because this can have positive or negative effects over solvability.

Profitability of the Credit Institutions within Actual Context Financial Economical Crisis

University Lector Doctor Bratu Silviu Marius
University Lector Doctor Bratu Alina Ramona
University "Spiru Haret" Constanta
bratusilviu@yahoo.com

Abstract

Profitability represents one of the clue sources of the capital development, a relevant indicator of the competitive position for a banking institution and its management quality, that permit to a bank to maintain a certain profile of risk, offering protection towards the problems on short terms, being known the fact that a healthy banking system is built on profitable banks with an adequate capital.

Key words: profitability, banking system, financial economic crisis, credit institutions

JEL Classification: G2, G20, G21

1. Introduction

Getting of some increased performances represents the major objective of all actors, participants at economical activity.

Selecting the best measure viewing the performance purpose of all entities, implicitly also those of the credit institutions, represents a challenge for different users of the financial situations.

This way, the owners want to know the value of property, besides the managers' capacity of the entity administration in order to create value. Members of the administration councils want to evaluate the quality of the administration and to conceive remuneration contracts which translate the bank strategic objectives.

The managers have to transfer their leading politics into concrete and measurable indicators. The creditors want indicators able to demonstrate the crediting institution capacity to generate future treasury fluxes necessary for debts reimbursements.

2. Content

For performance evaluation of a business it should be looked for modalities through which are possible to measure financial and economical consequences of the historical management decisions, referring to investments, financial operations. The main questions at which we have to answer are: if the resources are efficiently used, if the entity profitability is at the expected level and if financing options are prudently and correctly selected. At a general view, *profitability represents the main criterion in appreciation of the crediting institution performances.*

Profitability of a crediting institution can be defined as its capacity or its potential of getting profit after payment of all expenses. It can be measured being based on the used capital, positive cash flux and the report between net profit and selling. *Profitability represents the main criterion in appreciation the performances of economical entities.*

One of the clue sources of the capital production is represented, without any doubt, profitability of the crediting institutions, under the shape of the reported profits. An essential condition as for a banking system to be healthy, represents the component in its structure of some profitable banks, capitalized adequately. Viewing to establish the competitive position of the bank on the banking markets, besides its management quality there is used as relevant indicator "profitability". This permits to crediting institution to preserve a certain profile of risk and offers protection towards the problems on short terms.

Banking performances and their analyse are very useful to investors, societies which ask for a credit, the average deponents or business men who have stabile relationships and of great evolution with a certain banking institution. The performance can be defined as being the measurable level of stability of a

bank activity, characterized through reduced levels of all risking categories and a general tendency of the profit, increasing it from a period to another.

Capacity of making profit is one of the most dynamic components of the factors which influences the strategy of an entity, and can be measured through efficient economical-social indicators and those of profitability. Accountancy dimensions of the performances are extracted from the banking account results. This puts into evidence the winning sources of a bank, the quantity and quality of these, besides the quality of the crediting portfolio of the bank and concentration of its expenses. At the same time, the structure of the loose-profit account admits getting of an assembly image regarding the business of a bank. Characteristic of a bank is the fact that, in a traditional mood, the major income banking source has been constituted in calculating interests, but, more and more, at the present moment they are orientating themselves towards non-traditional activities getting incomes, that are also reflected into the profit-loose account. So, as an example, the incomes from transactions operations, investments and incomes based on commissions have begun to have a significant preponderance into the results of the modern banks.

The concept of profitability is not associated in a special way to the banking domain. Analysis of the profitability measure nature, determination of the economical-financial indicators or instrumentation of some modalities for profit planning represent components of the economical management components as a general view whose main task is realization of profit. Profitability represents one of the clue sources of capital generating, a relevant indicator of the competitive position of a banking institution and that of its management quality, that permits the bank to maintain a certain risking profit, offering protection towards the problems on short terms, being known the fact that a healthy banking system is built on profitable banks, capitalized adequately.

Profitability of a banking society may be influenced of some factors. One of these, that produce modifications into the structure and establishment of banking profits, is represented by the obligatory reserves, motivated at their turn by the legal capital requirements and the measurement of monetary politics. Having in view to maintain the confidence into the banking system, crediting institutions are

obliged to respect certain minimal requirements of capital.

In conditions in which certain activities and assets suppose smaller capital require, the banks will have the tendency to modify their business in the favour of these, but, because these have a smaller risk the brought profits by these will be inferior. It should be taken in view the fact that the existence of some minimal obligatory reserves, besides the existence of some legal requirements of excessive liquidities will have a harmful effect on the results.

Another major factor that influences the profitability of a crediting institution, besides the political business options of this, is fiscal taxation. This influences the competitiveness of the diverse instruments and segments of the financial markets. So, as an example, the taxation of the incomes from interests, combined with non-taxation of the capital wins, can make the deposits less attractive than proper capital investments.

As an effect, the banks adjust their business and politics decisions in order to minimize the taxes to be paid and to profit at the same time of the eventual "gates" in fiscal legislation. Above all the level and transparency of the profit taxation, the clue domains that should be in view at evaluation the business environment and that of the bank potential profit are if/how are taxed non-realized profits and incomes from interests, and if there are admitted, or not the provisions ahead of taxation.

In certain cases, inflation can increase operational costs of a bank faster than its incomes. Marking the assets values at the market requires recognizing of the wins, non-realizes as incomes, because these incomes are going to be cashed; this aspect can influence the quality of the profits.

Taking into consideration the fact that the tolerance with which the banks operate is traditionally a little one, any change into the level rate of the interest will generate modifications of the gross profit percentage.

The evolution of the markets which traditionally constituted the unique domain of the banks led to these opening towards other institutions that became competitors to the banks. At their turn, these also modified and diversified their activity portfolio on other non-traditional markets, reason for which these do not fulfil any more a simple intermediary role, respectively of accepting deposits and awarding credits. An analyse on profile structure of the banking institutions in the most

developed countries relieve the fact that traditional banking activity is only profitable as while as it is seen from the margin. And the incomes from other sources have become a significant contributor of the result.

Between the incomes that contribute to increasing of the banking profit we can especially remind, incomes from commissions, besides those from activities based on transactions with titles. Changing the profile structure of the banks has as an effect profitability melioration without majoring the traditional crediting risk, which results from crediting portfolios.

Within profitability analysis should be started from the consideration of the income structure of a bank and the components of this these. The analyst will pursue the tendency of this evolution over the observing period of time.

In the figure nr.1 we have presented the way in which the bank incomes are created within a period of 5 years (2004-2008).

Figure 1 – Banking Income Structure x

From the diagram analysis there can be determined the quality and profit stability of a bank, besides the sources of this and modifications intervened in their structure. One can easily observe that the incomes from transaction and from banking investments have become a more and more important contributor within the total of incomes, while the income contribution from interest was diminished.

These tendencies require an analysis to be profoundly made, because within normal conditions incomes from investments are less stabile than incomes from interests. An explication of this tendency could be that there were done adverse modifications within macro-economical environment or those of the banking market, what could offer determined reasons of such an orientation. There has also contributed to this orientation the fact that profitability of investments has been greater

and greater in comparison with profitability of the borrowings.

There exist two ways for profitability estimation and that of the risk within aleatory environment using selected hypotheses of work:

- there is considered that the past time is a mirror of the future. From the multitude of profitability anterior registered into similar investments there is distinguished an average. This central tendency has the greatest chance to be also registered in the future. Considering that, in the future the conditions of exploitation remain non-modified (or they modify themselves in a non-significant way), we can admit without making any mistake, that the average deviation of the future profitableness towards the central tendency will be the same or in any case, very appropriate of that anterior registered. The two measurements of the anterior performance, the average and the average deviation will constitute pertinent estimators for profitableness appreciation and the risk of new capital investments;

- the second way is researched for non-similar investments to those presented anterior (new produces, new markets) or for exploiting conditions modified substantially (new technologies, variations of the economical increases, inflation etc). Within these conditions, the experts in the economical previsions will identify different states of the future economical nature (optimistic, stationary, and pessimistic) and they will look for the best estimation of the cash-flows for these possible states. There will be extracted from these a hope of profitableness (having the greatest realization probability) and a “hope” of future profitableness deviations towards the central estimated tendency.

In order to get an answer at the fact that investment profitableness have been greater and greater compared with borrowing profitableness it should be realized a comparison of the income structure and the structure of the assets. This could offer conclusions regarding the quality of the assets management.

Figure 2 – Assets Structure Versus Income Structure

In the figure nr. 2 we have realized the comparison of the way in which are made up diverse asset categories with those of the gross incomes. The comparison has as a purpose the exact determination of the modality in which are engaged the bank assets and if the general incomes are, or are not measured with major weight in assets engaged for each category of assets (with other words, they are incomes got at the place where the energy is consumed). A normal situation is represented by the case in which the assets are engaged in categories of products which generate the greatest incomes at an acceptable level of risk. A similar analysis can be made having in view identification of the credit categories that bring proportionally reduced efficiency.

Making an analytical comparison of the expenses groups with interest with the debt connected debts categories there can be put into evidence the presentation of a bank towards specific financing sources, besides if there took place changes within the structure of its financing sources.

Within a system with an intensive concurrence, the banks cannot afford to offer produces or business services insufficient profitable. International banks and financial conglomerates, especially, should establish explicitly the exact contribution of their constituent parts through a good organization of their functions.

An evaluating frame of the performances for banking institutions comprises a number of elements like: an organization able to permit a clear allocation of the incomes and expenses on units of activities, in a close report with different business and/or produces and/or market segments lines of a certain bank, an internal system of establishing the transfer prices in order to evaluate the contribution of the diverse units of activity to the result, and efficient means and consequent of incorporation of the respective risk elements within the performance evaluation frame. At the moment in which there are known the net contributions along lines of activity, produces or markets there is possible to establish clearly which are the client segments the most promising and which produces should be analysed regarding their capacity to generate incomes.

The profit represents the final result which reflects the net effects of the politics and activities of a bank in a financial exercise. Stability and its increasing tendencies are the best synthetic indicators of a bank performance, both in the past and in the future.

For economical and financial state evolution of the banks, there can be used a system of banking performance indicators which should have in view[1]:

- a. net tolerance of the interest;
- b. profit rate;
- c. rate of the assets utilization;
- d. rate of the economical profitableness;
- e. equilibrium effect;
- f. rate of financial profitableness.

Also, for profitableness evaluation of the banking institutions we might have in view: intermediating tolerance, average profitableness of the proper capital (before and after taxation), dividends as percentage from the net incomes after taxation and so on.

All indicators under observation along a time period for establishing the tendency of profitability. Analysis of the modification for diverse indicators in time express modifications of the politics and bank and/or its business environment.

3. Influence of the Financial Crises on Profitability of Credit Institutions.

At the actual moment the profitability of the credit institutions is strongly influenced by the financial crisis released into American space which gradually comprised the whole world. The crisis changed fundamentally the behaviour of companies, of the banks or advocates, leading to diminishing of the investor implication for real initiatives on real estates, capital markets or financial projects.

As a crisis effect everybody postpone as much as it is possible the taking of a decision within conditions of a great volatilization of the macro-economical parameters, legislative frame, etc.

Specific, the banks have suddenly become hyper-prudent, the buyers – obsessed of the adequate prices at the immediate risks.

Release of the financial crisis has been produced at the same time with colossal Lehman- Brothers bankruptcy whose effect could not be provided by Bush administration. The gravest consequence was that the banks, seeing that, indifferent of the greatness and the weight of danger they can succumb any days, they lost their confidence each other, becoming extreme of suspicious ; who knows what dangers watch in the neighbour bank and if the borrowed money are under the danger to be lost. Inter banking credit, a very large instrument used in the past, was hanged up.

The banks do not borrow between them any more, when they have liquidity discomforts, they cannot satisfy the client cash requirements in economy. The stocks they still had at hand, put them at the central banks, there where money are not lost.

Companies and banks develop due-diligence activities over this period as control instruments. On the other side the banks want to assure themselves of the fact the there will not be met difficulties of the crediting return on behalf of the clients, and the companies analyse other variants to attract liquidities. They also re-negotiate contracts for smaller interests. On real estate, within this period, activity is orientated towards hire re-negotiation. There also exist cases in which companies or physical persons who purchased lands, give them up to the banks, because they do not have any more financial means to start constructions on those lands and neither funds to be able to return the credits.

The value of these lands mid while knew a considerable reduction, so that the banks

recuperate, in some cases, only partially from the awarded credit values, this fact having a direct effect on their profitability.

It is also a solution used by banks over the crisis period to re-structure the debt credits.

In the frame of this programme the banks had an approach directed towards the clients who had an orderly behaviour regarding the payment of obligations, but who after October-November 2008 began to report delays. So, the banks divided the affected by crisis clients in three categories:

- those who are also entered into the crisis;
- those who have great rates;
- those who have incomes in a diminished trend.

The management of the banking institutions adopted the following solutions:

- awarding of a waiting period (for unemployed clients);
- awarding of a period of diminishing the payments (for those who have greater rates);
- extending the crediting period (for those with smaller incomes).

The last analysis made on banking system shows that great European banks will register, probably, both in the year 2009, and 2010, substantial loses. The main impediment in the way of economies revenues is given by the hard conditions of crediting which in this way limit awarding of borrowings and implicitly the funds circulation. In the case in which the crediting will not be retaken there exists the risk as the economical increasing level to remain non-significant or even to enter a new recession.

The banks play in this way a special important role in the process of overtaking the crisis, because the collecting of a capital and awarding of much more credits may contribute to the end of the financial crisis. Evidently re-taking of the crediting will have a positive influence on profitability of credit institutions.

4. Conclusions

It can be stated without doubt that profitability represents the main purpose of any credit institution. It is one of the clue resources of the capital generation. The profitable banks make a healthy banking and sustainable system.

Evaluation of the performances and implicitly the profitability of banking institutions are made through indicator system

of banking performance, whose tendency should be pursued in time.

Financial crisis has affected in an unprecedented way majority of the world economies, and within these frame the credit institutions played an important role. The crisis release itself started from the bank Lehman-Brothers bankruptcy, a bankruptcy that released ulterior like in a domino play other American banks or in other countries.

At the present The United States of America seem to be appropriate to the final of this crisis, but our country will have much time to wait until national economical reestablishment.

Abstract

The choice of the best production cost calculation method is a decision that must be taken performing a very clear distinction, the two notions being frequently confused as being the same thing, the cost expense respectively.

The construction production makes no exception to the rule, especially since the construction process is very complex, and documents used in tracking and determining the costs are specific to this sector of the economy. In this scientific approach we will start from IAS 11 “The construction costs” and the legislation in Romania which try to match the standards, but, unfortunately, this attempt remained only on paper because in practice the companies from the construction field work as they consider best. The units within the construction field use the order calculation method because through the specific of this construction activity, this method suits best.

Key words: consumption, costs of administration, production of construction, development.

JEL Classification: M1; M11; M20

1. Introduction

The success of any business depends on management, and the building is no exception. A proper management and a good strategy is the way to secure the success of that activity.

The most important element in a long time pursued by managers due to continuous and rapid development of society is time. A specific element of time management is to

define activities necessary to achieve the objective building, defining what should be done by identifying specific activities aimed at achieving the elements of the organization activities. The main instruments used for determining the sequence of activities are: network graph with the activities represented in the network nodes (method METRA), network activity graph represented by arrows, diagrams conditional method (method GERT) and standard graphics.

For the proper execution of the projects the managers are shown the following methods of programming: Gantt chart, critical path method (CPM), graphical method of evaluation and update of the program (GERT), technical evaluation and review of the program (PERT).

In the sector of the construction activity, management of construction works involves the planning, development, design, monitoring during implementation, the final construction, maintenance and ultimately, reconversion.

Throughout the period of the construction project implementation, another issue of major importance followed by managers is the correct accounting of costs and revenues forecasted to be completed following the execution of construction works.

The main problem in the case of accounting management for accurate tracking of costs and expenditure is the demarcation between cost and expense.

Some authors talk about the substitution of the cost with that of the production expenditure “to avoid confusion between the concepts of cost and cost of production”[4].

A correlation between the cost and expense is given by the following statements: “expenditure is a materialized and living labour consumption expressed in money

generated by some economic processes or social – cultural activities,” and cost “an economic category expressing in money, the costs of living and materialized labour expenditure performed in order to purchase or manufacture and sell units of goods, works or services rendered by an enterprise”.

To demonstrate the link between cost and expense we will refer to the cost of production which is the total production costs incurred by an enterprise for production and dissolution in a period of time. Another demonstration that the costs and expenses are very close is given by the fact that most expenses are constitutive elements of the costs, such as some costs become expenses. (e.g. cost of consumables stocks)

As the cost is related to the consumption of factors that occasioned it and which, in order to be pursued and reflected, must have an account expression, the cost represents the account expression of all factors of production consumed in the production and distribution of material goods, works and services. To conclude, the costs consist of materialized and living labour consumption, expressed in value terms, consumptions, which form the production and distribution expenses incurred by the enterprise.

Looked from this point of view, the cost is a correlation between the expression value of expenditure to be carried out to obtain a production and its dissolution in a period of time and quantity of goods, works or services that form the production.

At the origin of the cycle of operation, accounting notes operating values flows, designated by the term expenditure supporting treatments adapted to management objectives. Accumulation of these expenditures on a good or service created by the undertaking gives a designated value through the term cost [3]. In the year the expenditures also include depreciation and provisions established [8].

The cost is the monetary expression of materials, labour and services necessary to achieve a determined economic objective[2].

Factors that determine the organization of management accounting and cost calculation are related to the profile and size, type of production and organization, the organizational structure, technological process, the production process, the degree of integration and the degree of

mechanization and automation of the production process.

The general principle of organization and execution of work of computer costs is determined by *the profile and size*.

How the construction units use the estimate as a method of calculating the cost, and how this is done using software for preparation of estimates, the method that fits, and which, moreover, is adopted at the construction method is the method based on the principle of centralization of data.

The second factor that influences the organization of management accounting and cost calculation is the type of production and organization of it. Under this second factor, businesses can be divided into three categories: [5]

- Enterprise with mass production;
- Enterprise with serial production;
- Enterprise with individual production.

Depending on the kind of production that has an organization, the management accounting and cost calculation is done in different ways. Thus, in the case of mass production is using the method of calculation phases. If it is about the individual production then the method used on products or product groups, and in the case of series production may use any of the methods mentioned above. It should also be noted that if individual output can be used on commands and methods that production is organized, tracked and managed according to the method of criterion related commands. Well can be used THM method, precisely because the production process is a large number and variety of machine tools.

2. The analyse of the problem

Activity of construction and assembly falls within the category of individual production, precisely because the main feature of the construction is the unique character that it has. This character does not refer to the physical form that takes construction when ready, but the uniqueness of the construction and assembly which are each building process.

Production of construction included in the production complex that calculation is the cost of production stages, according to estimates on calculation objects, the component currencies estimate the overall

cost is the final product called construction. Also, the calculation of final price includes the cost of installation, which, in construction case is called labour.

Specifics of implementation of construction works require that in the organization of cost calculation to be use the most appropriate method of calculation. Ensure a fair calculation is in turn conditioned by the proper accounting of production costs, required to provide dates necessary to track and calculate properly the costs of production.

Essential problems of the organization of calculation construction costs are: specifying calculation object, setting the unit of account, the choice of method of distribution of indirect costs, and choosing the method of calculation.

In the construction, object of calculation is what builds the subject: civil construction, bridge, road, etc.

If we talk about ancillary production that have the service department of the execution of construction works, then the object of calculation is, for example, the extracting of ballast, and concrete or mortar prepared by the company.

Setting the unit of calculation is based on the calculation's object, and may be in natural units, such as how many civil constructions are included in the construction contract, the number of cubic meters of cement produced in conventional units, such as the number of apartments in the project included, or value units.

Tracking the cost of executing the construction works is pursuing several indicators:

- overall production cost estimate is the cash equivalent of the work provided by the manufacturer to pay the beneficiary. Price estimate is that the resulting estimates of value, including the benefit of the contractor. The production of construction includes the organization site share that shall be levied from the beneficiaries;
- overall production cost is the sum of the planned costs that is planned for implementation of construction works. This is equal to the value of the planned price estimate, less the benefit provided and estimate reductions achieved or increased by the cost overruns from the estimate.

- global production on cost-effective includes all costs incurred in getting established on the basis of accounting dates, plus allowances of organizational development.

Because the works are conditioned to the estimate by category of works to be fully respected, determined that the cost structure of production in the construction industry on the estimate by category of work, thus reach the structure of costs production adopted in preparing the estimate of works and to highlight and calculating costs. In general, items of computer costs are:

- material
- labour
- equipment
- total direct costs, the sum of the three
- indirect costs
- costs for the organization of work site
- total cost.

a) Cost of raw materials and consumption materials represent approximately 55% -60% of total costs and reflect the expression value, the consumption of raw materials and materials, indicating the costs of supply and transportation to site. Also in this category include costs to transport equipment and technological equipment to the site.

b) labour costs represent a 18% -20% of total costs and include direct wages to the directly productive workers. In this category include costs and materials handling on site, the costs of handling equipment and facilities and increases the interruption to the work performed under the service or exploitation, and other increases directly related to construction activity and the amounts paid for time actually worked. Increases granted to staff increases for special conditions of employment, increases the construction site workers are not locals, increases in labour for work done in artificial light at night are part of the labour cost category.

c) costs include all equipment costs for operating machines and mechanisms for their construction, such as depreciation, transportation, installation, disassembly, spare parts, fuel and lubricants, incurred in the maintenance and operation, or the rent paid for equipment leased from third parties. Wages of direct workers, drivers and other workers used equipment, machinery and installations shall include all in the article "equipment costs".

d) indirect costs include costs of administration and management unit and other costs incurred in creating the conditions necessary for the execution of construction works.

Given their general nature, they can not be directly assigned to work at the time of publication, but indirectly to end management with the help of conventional calculations. Due to the particularities of the construction industry, the indirect costs are distributed differently than in other productive units. Thus, in construction, the indirect costs are calculated by percentage shares, shares that are otherwise subject to negotiation between the contractor and the beneficiary.

There are several categories of costs that, at first glance appear to be part of direct costs of production, but in fact do not fall into this category. Thus, service costs and supply of deposits formed on site, including staff salaries permanently serving these deposits (manipulator, downloaded, receptionist), not included in direct costs, but fall into the indirect one. Also in the fall and indirect costs due retributions directly productive workers, which do not relate to actual time worked, such as allowances during leave rest growth by age and other payments are made for time not actually worked. Direct wages staff works maintenance, technical revisions, current and capital repairs of fixed assets of general interest, are recorded in the category of "indirect costs".

Indirect costs are carried out on components, the main elements being: technical administrative personnel wages, depreciation of administrative buildings and fixed assets of administrative, bank interest, go for business, office costs, etc. .. In total production costs, indirect costs have a share of 12% -15%.

e) Costs of organizing work site have a share of 3% -8%, a share that varies depending on the nature of work performed. This article includes the costs of execution and acquisition of objects of organization development and construction costs immaterialized provisional and definitive constructions, including staff's wages involved in the work of organizing the site, as we see in this figure:

Fig. 1. Costs of organizing work

The method chosen for the assignment of indirect costs represent special importance for correctly calculating the cost of construction, the choice of sitting in nature and particularities of the works carried out the technological process.

The method of calculation is considered a "concrete technical organization of book production costs and sales, based on a sequence of specific steps and processes used to determine the cost per unit of finished product, work performed or service provided by a property"[4].

Another definition considers that "the method of calculation includes all costs of collection processes, where certain principles, costs incorporated places on costs, products, product groups, the works in a certain period of management (month, quarter, year) and processes leading to quantify these correlations between production costs and it has occasionally, in order to determine the full cost of production and per unit of product"[3].

Regarding the choice of method of calculation of costs, companies in the construction field from our country have opted for the method order. This method is applicable to industrial units with individual production or series, which at the end of the present management and production running, as is the case for economic units operating in the civil construction sector. Commands' method is customizes by:

- purpose of individual order is represented by the request of customer: in ante calculation subject of calculation is the final product, construction, and used in calculation is the command post against which collects direct and allocated costs indirect costs
- collected for each command in hand, costs can be analyzed separately;
- for each command in the special treatments are needed;
- the production process is not uniform, each command will has its route on

production, depending on the particularities of each command;

- production running varies from one period to another, depending on the stage in which the execution of construction works is;
- implementation duration is relatively long, being generally greater than one year;
- the main objective of the method is to determinate the profits for each command executed and evaluation of production in progress.

A command represents a property that is passing to the all stages of processing from execution to settlement. In general, orders issued for the implementation of a construction to start as stated in the technical project, preserving the characteristics and the technical details presented; launch any order requiring a time of preparation for the actual launching of the work.

Before issuing the order for implementation of proper control of construction works will receive a numerical symbol in the schedule command that is part of the book of orders. The symbol of an order contains more figures mean launch date order, but may also include other dates relating to command and make it easier to identify. In order sheet, are generally overlooked the following dates:

- number,
- description command: civil construction floor and attic floor
- the code assigned to that work: P + E + M
- start date order
- the technical details of the order : the work of organizing the site will be made in a time, will use a number of workers, the equipment, machinery and plants used are
- the end date of order.

The next step is for the design, preparation and execution of programming work, draw up a list of rules of consumption of materials and raw materials and time, along with documents on the main inputs: the schedules for consumption and warrants to establish consumer cost of raw materials and materials consumed, receipts and salaries for the establishment of labour, is wages directly depending on the time worked, hourly rate, and the allocation of indirect costs to determine the rates of absorption in the final cost of work. Anticipated issuance of the documents listed above have the purpose and

level of compliance set out in the estimate ante calculated general works, the costs to have the most significant share in the cost structure and create prerequisites for referral during the overrun them. Method of calculation on orders presents two options: method commands in a short period of implementation, and method on orders under the contracts. The first type of calculation can not be applied to the execution of construction works, because one of the features of construction works is the period of time that takes place.

The types of contracts, depending on their negotiation, can be:

- fixed-price contracts, which are subject to escalation clauses for a price
- cot plus contracts are contracts with a percentage in addition to final negotiated percentage above with the beneficiary. In the execution of construction, the method adopted is that of fixed-price contracts.

Schematic[7], training cost when using the method of computer commands looks as follows:

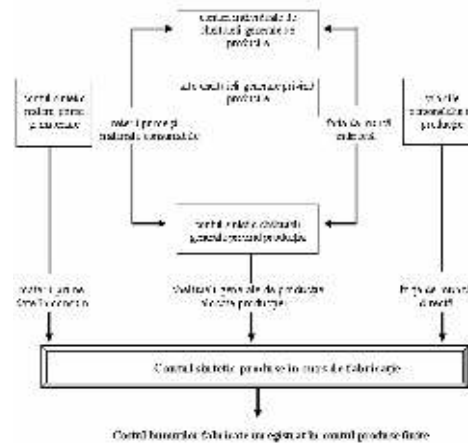

Fig. 2. Cost when using the method of computer commands

3. Conclusions

As you can see from the presented above, due to the advantages presented, method of calculation on the orders of the cost of construction works is best appreciated by units operating in this area, because the method is simple and not require a large volume of work. But like any other method and it has its limits, because accounting practice of constructions is very much

developing estimates additional consumption or to overcome the increasing price. Just for this reason, it would be better if accounting practice will try to use another method of calculation that allows the calculation of deviations from the consumption and thus, by using flexible budgets, to avoid the use of estimates for additional work.

The Views of Accounting – Management Relation

Budacia Lucian Constantin Gabriel
Romanian American University
lucian.budacia@yahoo.com

Abstract

The management's task is to make decisions, which ensure continued viability of the organization and control the implementation of those decisions. Where accounting (management) enters? It is part of the total information, available to management. It is important to recognize the partial role of accounting. Accounting is only a part of the complex set of information and organizational structures. The role of accounting is to provide relevant financial information within those structures. Rarely, accounting will provide sufficient information to enable making a decision to meet the target or to control the implementation of organizational plans.

Key words: accounting, management, managerial planning, managerial decisions

JEL Classification: M1, M41

1. Introduction

As part of the economic information system, accounting provides most of the information in order to make decisions at micro and macro levels.

The development of capitalism, financial markets, diversification and continuous growth of trade and the need for new financial resources have led to the separation, in modern companies, of own equity contributions by their leadership. Under these circumstances, the decision is delegated by the owners - shareholders to management (managers), they keeping only the control function.

The management's task is to make decisions, which ensure continued viability of the organization and control the implementation of those decisions. Where

accounting (management) enters? It is part of the total information, available to

management. It is important to recognize the partial role of accounting. For example, as regards the desire to manufacture a new product, the management will take into account production and sale costs and income that they will produce. This is information that the accounting system should provide. In any event, management will consider other aspects of the decision, issues on which the accounting may not be helpful, such as technical problems of manufacturing the product, availability of employees across the necessary production and their marketing knowledge, nature of the market in which the product will be sold until the point where the product falls under the category of products existing in the company, etc.. Accounting is only a part of the complex set of information and organizational structures. The role of accounting is to provide relevant financial information within those structures. Rarely, accounting will provide sufficient information to enable making a decision to meet the target or to control the implementation of organizational plans.

2. The role of accountancy in the firm's management

Accounting may contribute to the management process in several ways. It has a role in *identifying and measuring information*: i.e., in determining how factors associated with a particular decision are recognized and quantified. The appropriate approach to these issues may depend on the decision to be evaluated and the alternatives available to the organization. Most of the accounting deals with techniques and procedures, but our definition of accounting

describes it as a *process*. Practical techniques are implemented into a human process, and accounting will be influenced and will influence the human context in which it is located, which in our case is the context of making managerial decisions.

Also, accounting has a role of *communication* in decision making. This role can have both positive and negative effects. The positive side is that accounting can help to ensure a common language by which managers can understand the effects of the decisions taken into account. The danger in terms of accounting information, is the fact that it tries to measure the financial consequences of actions (which is in the interest of most participants), as it sees things in an objective and accurate way (it is a rare case, as we will see later), and because it is usually more available than other sources of information, it is not paid due attention. An organization in which managers try to make and control decisions, based solely on accounting information, is unlikely to remain viable for long.

3. The cycle of managerial decisions

The economic and financial analysis is one of the basic tools of modern performing management, which underpins operational and strategic decisions, the management process, which cannot be done only on based on experience and routine.

Although many decisions are unique and are not made according to rules, stringent steps or programs, there are certain events that occur frequently in the review of issues that managers face. These events form a system, called the management decision cycle.

The *first stage* of this cycle is to identify the problem or need. Then in the *second stage*, the accountant identifies all reasonable alternatives for action that will solve the problem or answer the need. In the *third stage*, the accountant prepares a full analysis of each action, identifying the total cost thereof, cost savings or financial effects of economic forecasts. For each alternative there could be the need for different information on costs. In the *fourth stage*, after studying the information collected by

the accountant and organized in a logical manner, the management selects the best course of action. In the *fifth stage*, after the decision was made, the accountant drafts a post-decision audit report, to provide the management with information about the decision. If the solution is not completely satisfactory or if the problem persists, the decision cycle resumes from the start. If the adopted solution solved the problem, then the decision making process is considered completed.

4. Accountancy – a language of the process of identification, measurement and communication of economic information

Accounting is the process of identifying, measuring and communicating economic information to allow solid judgments and decisions by the users of such information.

In other words, accounting is a language - the language of business. Like all other languages, it has its own vocabulary, ways of expression, terminology and conventions - and because of them, it has its difficulties in interpretation and understanding. It is a language which affects, to a certain extent, all life, therefore being a language that everyone should be acquainted with.

Managers are responsible for planning on short and long term and for drafting overall development strategy, which determines the directions of the company for many years. Strategic action plans direct the management's daily or monthly activities. A strategic plan mentions the company's objectives, its organizational structure and its policies on growth and product lines or services. Retail markets are identified as part of the strategic plan, and as well as any other actions that affect the organization. These strategic plans often determine the projects that managers are willing to take into account.

Once managers determine that a project deserves to be examined, what information is needed to evaluate alternatives? Managers need sufficient information to identify how each alternative will affect company operations, but they should not be overwhelmed by a too large stream of data.

The management accountant is responsible for providing information relevant for each alternative.

How does the management accountant decide which information is relevant and which is not? Identical data for all alternatives are not relevant. In the event of a proposal to reduce spending on labor by installing an automated production line, the total value of sales remains unchanged, then this information must not appear in the assessments of various machines. Similarly, although the accountant can use data on past operations to prepare cost estimates or alternatives, historical data are not relevant to projections of future operations and do not orient managers in their choice for a certain alternative. The accountant should include only those predictions or estimates of costs that are relevant to decision making. Decision-relevant information is data on costs, income and future consumption of resources which are different for each alternative.

Accounting is a system for providing information (especially financial) to those who should decide and control the implementation of such decisions. In any case, the information provided by the accounting depends on the person who makes the decision and why the decision is made. For example, the type of information requested by the Executive Director of a multinational company such as ICI or Ford can be very different from the type of information requested by a member of a country cricket club. The first one might, for example, require information on the variety of products manufactured and sold by the company, information on quantity, price, cost, profitability and competitive position with regard to each product separately. The latter may request information about the annual subscription to be paid by members, the cost of social functions and so on.

In accounting, a distinction is often made between what is called "management accounting" and what is called the "financial accounting". (The latter is rather a misleading name considering that all types of accounting are to some extent financial.) Management accounting deals with providing information to managers who make decisions about the

allocation of resources in an organization. In opposition, the financial accounting deals with providing information to other users who are not managers, such as shareholders, customers, etc.

As managers determine the accounting policy of the company and are responsible for preparing financial statements, they often the function of external communication of financial accounting at the expense of its role as management tool for the internal activities of the company. This latter role becomes really important when the organization does not have an information system on management accounting, such as small and medium enterprises.

5. Managerial planning, decisions and control

The managerial control is the process by which managers ensure that employees behave and act in accordance with plans, organization structure and rules. Control consists of measuring and correcting performances recorded by the subordinates' activity, in order to achieve the objectives and set plans.

It is important to recognize the role of feedback mechanism (data used in verification and control) with regard to the general framework. The feedback highlights the interdependence between the various stages of the framework. (E. g. The result of a certain stage provides information that can influence the formulation of the previous stages). Given that interdependence exists, to some extent, in all stages, the feedback is present in the whole system of planning and control.

The current activity of the company leads to permanent decision-making processes of different magnitude and importance. The final outcome of each such process consists in the decision-making. Its effective application exceeds, by implication and effects, the boundaries of the information system of the company, involving most of its subsystems. In fact if you look at the decision making process in connection with the other processes taking place within the enterprise, we may notice the existence of successions of cycles process comprising:

- ✓ Decision-making;
- ✓ Practical implementation of the decision;
- ✓ Recording the effects, whose achievement involves, more or less, all the company's subsystems.

The start of the decision-making process is initiated by an event or situation, whose occurrence is deemed by the decision-makers as goal of the decision-making process. It is clear in this case that a certain event triggers a decision-making process only if it receives from the decision-maker the nature of "triggering event".

In any case, it should be stressed that the interpretation of information is a vital part of an accountant's job, and it is clear that this aspect must be regarded as an integral part of the communication process. It should be noted that the definition of accounting shall not extend to decision-making. Of course, many accountants are involved in decision making, but in such cases they meet a managerial role than the role of accountant. We do not want in any way to say that accountants should not be involved in management, but it is important to distinguish the accounting from decision-making. It is important that the information provided by an accountant to be as objective as possible, and if accountants do not have a clear distinction between accounting and decision making in their mind, there is a high risk that, unconsciously, to manipulate the information provided so that decision made to be the one they desire.

6. Conclusions

In the decision making process, the role of the accountant is to provide accurate, timely information and in a useful form. To achieve this, the accountant must collect relevant information and report them in a relevant way to management.

Internal Control - Key Element of the Financial Control System in the European Union

Budacia Lucian Constantin Gabriel
Romanian American University
lucian.budacia@yahoo.com

Abstract

The internal control refers to the financial control performed by organizational structures of internal control at the economic entity (public authorities of central and local administration), including a priori approval systems (ex-ante) and internal audit (a-posteriori or ex-post). One of the basic features of internal control is the distinction between management and public internal financial control (PIFC), on one hand, and internal audit, on the other hand, which provides the functioning of the first and the independence of the second. The European Commission is the developer of the concept of public internal financial control (PIFC), the goal being to provide an operational model and structure to help national governments in reshaping their internal control environment and in particular to improve control systems in the public sector in the EU, in line with international standards of good practice.

Key words: internal control, internal audit, financial control

JEL Classification: G3, G32

1. Introduction

Activities grouped under the generic name of "**financial control**" refer to examining the financial achievement of the goals and programs undertaken by different public entities, in order to prevent or to discover any irregularities, errors, deficiencies, to fix them and avoid them in future. This type of control can be achieved at the same time with the targeted programs or subsequently the completion of the activities thereon.

Legal provisions existing at Community level designed for such activity have been grouped in a separate chapter of the *acquis*, called "financial control" (Chapter 28 for the negotiations of Romania's accession to the European Union). One of the features of this chapter is that it

includes quite a few acts of general and compulsory nature (provisions of the founding treaties, regulations or decisions). Most existing mandatory acts regulate bodies specialized in financial control, their organization and operation, procedure to be followed for control, legal documents that record control results (reports issued by expert authorities) and their legal effects. The remaining *acquis* consists either of non-binding legal acts (recommendations of the EU institutions) or documents issued by the control authorities (reports). The legal force of the latter is quite insignificant, most containing only recommendations to Member States and/or EU institutions.

The *internal control* refers to the financial control performed by organizational structures of internal control at the economic entity (public authorities of central and local administration), including a *a priori* approval systems (*ex-ante*) and internal audit (*a-posteriori* or *ex-post*). One of the basic features of internal control is the distinction between management and public internal financial control (PIFC), on one hand, and internal audit, on the other hand, which provides the functioning of the first and the independence of the second.

The European Commission is the developer of the concept of public internal financial control (PIFC), the goal being to provide an operational model and structure to help national governments in reshaping their internal control environment and in particular to improve control systems in the public sector in the EU, in line with international standards of good practice.

The purpose of the **public internal financial control** (PIFC) is to check the fulfillment of formal and legal terms so that funds allotted to a public institution to be properly spent. Its correct operation provides a first "filter" to ensure a sound financial management of any public authority.

PIFC is provided by an internal structure of the said public institution, which structure has the power to undertake the employment of different funds granted to the respective institution. According to the Community *acquis*, the person in charge in this respect cannot be, at the same time and for the same operations, the person responsible for managing the accounts related to that activity (account officer).

Internal audit is an independently organized activity in a public institution, which is devised to carry out checks, inspections and analysis of its internal control system (PIFC), in order to assess the extent to which it fulfills the public institution's objectives and uses financial resources effectively and efficiently and to communicate to the institution's management any deficiencies and irregularities and to propose measures to correct deficiencies and improve results.

Regulation no. 1605 of the Council on June 25, 2002 on the Financial Regulation for the general budget of European Communities defines in the art 85-87 the concept of *internal auditor*. Thus, each institution will establish an internal audit structure which must comply with international standards. The internal auditor appointed by the institution will be responsible to it for the sound verification of systems and procedures of budget execution. The regulation sets out some incompatibilities for internal auditors; they cannot be responsible for empowerments or account officer.

Among the auditor's responsibilities, the Regulation provides the approval of the institution regarding risks, by means of independent opinions on quality of management systems and control of funds and recommendations for improving the operations' implementation. Also, the Regulation focuses, in particular, on the main responsibilities of the internal auditor:

- ◆ Assessment of compliance and efficiency of internal management system and the performance level of departments in implementing policies, programs and actions by reference to related risks;

- ◆ Assessment of compliance and quality of systems for control and internal audit applicable to each operation of budget execution.

In exercising their duties, the internal auditor enjoys unlimited access to all information necessary to complete such duties. Upon the termination of the assessment, the internal auditor draws up a report containing the audit's

results and recommendations for the institution. The auditor submits also a yearly report of internal audit, which mentions the number and type of internal audits performed, their recommendations and measures taken by the institution.

Each institution sets out their own rules concerning internal audit so that to ensure complete independence of the auditor while carry out its duties and responsibilities.

The European Commission stipulates that the financial control systems must function based on the following principles:

- Clear distinction between management, financial control and internal audit;
- Efficiency of customs administration;
- Existence of legislation in line with European directives;
- Existence of an unique contact point for OLAF cooperation;
- Independence and competence of the external audit;
- Protection of EU financial interests.

The implementation of the public financial control system must be approached as a long term process which requires the commitment of all parties. Experience has shown that establishing new decisions and rules without the agreement and consent of all participants may result into claims of misunderstanding and resistance endangering the entire adjusting process. Therefore, the adjustment of the internal control system in the public sector should be preceded by a period of perusal and debate.

The European Commission has acquired significant experience while implementing and developing the public internal financial control. Such experience proves that the sound commitment of the central authorities is the key prerequisite for the success or the project concerning the PIFC's adjustment.

In most cases, such central authority is the Ministry of Finance. This is the logic decision as the result of a proper internal control reflects the situation of the national budget's financial management.

The PIFC system is devised to provide transparent and appropriate methods and organizational structures ensuring that public funds are used for the goals envisaged by the budget authorities (Government and Parliament).

Moreover, a performing internal control environment is an efficient tool to prevent

corruption and fraud. The public sector sustains the external control, performed by the Parliament and by the supreme audit institution (in Romania, this is the Court of Accounts). The Government is responsible, before the Parliament, for managing, implementing and controlling its policies and needs systems to organize accounting and budget procedures, internal control standards and inspection services fighting against fraud and corruption.

Usually, the systems of the traditional public internal control are based on an ex-ante central control system and ex-post inspection focused on the third part of claims, complaints and doubtful transactions, infringements of budget rules and punishment of human errors.

Compared with the modern system of PIFC, the traditional system, given its solid lawfulness and uniformity nature, lacks the criteria of economy, efficiency and effectiveness with respect to the management and control of public funds.

The internal control is based on transparency both in its relations concerning responsibility and in terms of methodology and harmonization standards. Transparency is a default manifestation of the government, with responsibility for raising revenue and spending it as constructive as possible.

PIFC comprises international and European standards of good practice and aims to provide optimal approaches for reforming the traditional national control system.

PIFC considers as important the concepts of management and internal audit, which should be decentralized, functional and independent. PIFC does not focus on budget and accounting techniques (although internal control may suggest improving these systems), or the inclusion of inspection on topics such as investigating and prosecuting individual cases of fraud or serious irregularities. The public internal control is preventive in nature and aims to ensure that adequate systems are implemented to remove possible phenomena of corruption and fraud.

The public internal control itself is subject to external evaluation by the supreme audit institution.

The main international standards of public internal financial control are the standards defined by INTOSAI guidelines for internal control in the public sector and the statement of the European Confederation of Internal Audit Institutions on the internal audit in Europe while

the external public audit is subject to the Declaration of Lima in 1977 on the concept of auditing.

The public internal financial control: **CFIP = SMFC + AI + UCA** is defined as having three pillars:

- The system of management and financial control (SMFC, management /management responsibility);
- The system of functional independent internal audit (AI), and
- A central harmonization unit (UCA) for developing methodology and standards for the first two pillars.

2. The system of management and financial control

Managers at all levels must be responsible for all activities they have performed, not only in functional (operational) policy, but also in management and financial control policies.

The first level of control should be the management level. Each manager is responsible for establishing and maintaining satisfactory systems of and financial management control until the completion of tasks of plans, programs, budgets, accounts, checks, reporting, archiving and monitoring.

Risk assessment is a tool to be used as part of the control system, able to help identifying risks or risk areas.

Risks must be assessed and then managed in accordance with organization policy. Risk assessment is then made by management and not by internal auditors.

3. Functional independent internal audit

Public institutions should be endowed with a functional independent internal audit in order to act as support for the management and having as target to provide assessments of the internal control systems.

The audit report is addressed directly to the manager at the highest hierarchic level, but the approval regarding the fulfillment of the audit is independent from the manager's opinion. The internal auditor is not part of the financial service department, but the auditor relates directly to the highest level of management.

The role of auditors is to assess the appropriateness of the internal control system implemented by the management, to underline weaknesses, to provide recommendations to improve it where necessary. Such formal role is officially shaped and explained in the Chart of internal audit – document signed by the management and auditors.

The audit work is governed by a set of rules and ethic code arising from the professional audit abilities and standards and not from managerial training. The set of rules and moral ethics is usually detailed under a document named Code of conduct for internal audit and is signed by auditors upon their appointment or certification as internal auditors.

The auditor significantly differs from the expert in inspection and review. The auditor pursues the appropriateness of the control systems in terms of efficiency, effectiveness and economy, underlining weaknesses which may endanger the achievement of the company's goals. Subsequently, the auditor submits before the manager or director, recommendations on where and how to improve systems.

Auditors must not be involved in management tasks (others than those in their charge) for which they cannot undertake responsibility. Auditors assess and recommend while managers decide whether the auditor's decisions are to be followed. This is because, in the end, responsibility lies with the managers. Auditors cannot be punished or prosecuted as such obligation belongs to the managers in the event of system or human errors or to the judicial authorities in the event of severe irregularities and/or fraud.

4. Central Harmonization Unit as adjustment vector

Considering the term required for the complete implementation of PIFC and the concept's applicability at all government levels, a vital central structure is necessary, namely the Central Harmonization Unit – empowered to administer the development of PIFC.

The Central Harmonization Unit is responsible for developing and promoting control and internal audit methodology based on accepted international standards and standards of good practice and for coordinating the enactment of new legislation concerning management responsibility (the financial management and control system) and internal audit.

CHU represents the prerequisite for a successful implementation and development of PIFC, but, in fact, it has become part of PIFC.

5. Conclusions

When the funds of the European Union are spent in member states, close cooperation between the European Commission and member states is required as regards the internal control and internal audit. It may be described as follows:

- For expenses directly administered and made by the Community, the internal control lies with the General Directorate administering them, based on ex-ante approval of the financial transactions while the internal audit is performed by the General Budget Department (The public services of the beneficiary state are involved, at some extent, when such aid is granted to non-member states).

- For expenses co-financed by the European Union, the internal control of member states lies with the local, regional or national government services (and with public companies, universities or private sector in the event of research) while the internal audit is carried out by the General Budget Department and the Commission's services (together with the related internal auditors from the member state in the event of Structural Funds and research);

- For expenses financed entirely by the Community, but administered by the member state, the internal control is performed by the certified national agencies within the member state while the internal audit is carried out by a national authority, the General Budget Department and by the certifying General Department.

In all cases, the external audit is conducted by the European Court of Accounts in liaison with the external audit bodies within member states and, to a certain extent, in an informal collaboration with the external audit bodies of the beneficiary states.

Given the formal responsibility assigned for the execution of the EU budget, the Commission must prove that there is an adequate internal control at all levels and that provides and uses an appropriate internal audit function for both direct costs and for

cases in which EU funds are paid and managed by member states or agencies.

The compliance with European Union requirements on budget process, financial control and audit is a basic obligation of members of the European Union. At the same time, we have to stress the role and objectives of EU control and financial audit aimed at proper management of funds, in accordance with EU objectives and general and sectoral regulations governing the Community sectoral policies.

The purpose of financial control and auditing in the EU is to ensure taxpayers, through the EU Council and European Parliament, that EU funds are well managed and spent in accordance with the objectives and the general and sectoral regulations of the policies to be followed .

Abstract

Continuous improvement of business environment is a key priority of governments to strengthen the functioning of market economy. In this context, the general framework of accounting and financial auditing accounting improves continuously its information quality by applying the accounting rules in accordance with EU Directives (the Fourth and Seventh-).

For analyzing a company's overall efficiency is particularly important the quantity and quality of existing information of financial-accounting nature existing at a time into the economic system of an enterprise, preferably at levels becoming more analytical. The financial statements of a company are the most important means by which accounting information is made available to decision makers. Therefore, companies publish their financial statements in a more explicit manner, as to be understood by the interested reader. Responsibility for annual financial statements to be in accordance with accounting regulations consistent with European Directives enter the entity's management and is communicated by a written statement attached thereto.

Success in accounting is influenced to a great extent by the quality of human resources and their competency. Annual financial statements are drawn up and presented yearly and have the purpose to meet the common informational needs of users. Auditing annual accounts raises the

degree of credibility and relevance of the information presented by financial balances. Control is a really effective contributing factor in maintaining activities at an operational level, and in the intelligent and competent solving of issues related to development and economic growth.

Key words: improvement of business environment, accounting rules, EU Directives, accounting information.

JEL classification: M 41

Accounting information can be a „mass” consumer good as it is employed by a numerous users, from small and medium enterprises to big companies operating on the stock market, from the Fiscal Administration to the large mass of citizens who act as small investors and economists.

Comparing accounting with a language starts from the premise that this science represents a tool created by society to assembly and to transmit a specific type of information [1].

Success in accounting is influenced to a great extent by the quality of human resources and their competency [2].

User diversity and their international needs led to the imposition of new requirements for accounting and financial statements. Users expect data certified by independent professional accountants. Each user of accounting data wants to receive real accounting data that reflect reality even if it

is said that we are dealing with a “truth built on accounting conventions” [3].

The basic component of modern management, control [4], provides operative knowledge on how economic and social activities are carried out, compliance with the economic, financial and contractual discipline, and prevention of economic imbalances.

Control is a really effective contributing factor in maintaining activities at an operational level, and in the intelligent and competent solving of issues related to development and economic growth [5].

To this purpose, financial audit and the profession of auditor [6] have emerged; they bring a supplemental input of credibility to the financial data prepared and published by enterprises. Audit [7] generally designates the professional examination of information in order to express a responsible and independent opinion by reference to quality criteria (standards).

It was observed that accounting data from financial statements meet only partially the needs of financial and economic analyses. This derives from the fact that:

- annual accounting records provide only retrospective or contemporary information regarding financial statements [8];

- in yearly accounting records, values are not recorded in accordance with the evolution of prices and, as a result, reality is erroneously presented;

- there are subjective data (i.e. net value of immovable corporate assets and their depreciation are affected by the retained durations of usage);

- the application of accounting standards that are strongly marked by taxation, in the context of sturdier requirements related to financial communication, reduces the value of the information presented by annual statements and leads to the use of methods to dissimulate the real situation, known as “creative accounting”. Creative accounting designates the process by which, taking advantage of the gaps in accounting regulations, figures are manipulated, and taking advantage of the flexibility offered by the accounting system, the only measurement methods chosen are those that can “produce” the expected accounting result. In general, it

is believed that results, equities and indebtedness are the most affected by creative accounting techniques [9].

To ensure a greater openness to analysis needs, the theory and practice of the field recommend several lines of action, of which we mention:

- to reduce the importance of accounting results by assessing their quality in relation to cash-flow. Cash-flow information is thought to be one of the most intelligible and objective categories of information, which presents facts without leaving room for subjective interpretation;

- to restrict the phenomenon of creative accounting through the “process of accounting harmonisation” at the European and international level, a process concerned with the preparation and improvement of the content of annual accounts [8].

In order to be useful in the decision-making process, accounting information must meet certain characteristics: relevance, reliability, comparability, and intelligibility. It is considered that in order to make the analysis meaningful, the information from annual records must be used in correlation with the following factors:

- the company size (big companies are less vulnerable to third-party decisions than small ones);

- the business risk;

- the economic, social, political and cultural environment.

The term “audit” originates in the Latin word “*audire*” which means to listen, to hear and the English verb “to audit” means to control, to examine, to inspect.

The profession of auditor emerged as a necessity, and the person who acquires this status assumes the final responsibility for the audit. The term “auditor” is also employed to refer to an auditing company [10].

Internal auditing refers to the assessment activity carried out within an entity, as a service. Its functions encompass, among others, the examination, assessment and monitoring of the conformity and efficiency of accounting and internal control systems [10].

External auditing aims to guarantee the credibility of the information disseminated by the company to external users (associates,

creditors, banks, fiscal authorities, clients, suppliers). Known in literature as “external control”, it is, fundamentally, an accounting control, carried out by professionals in the field in order to increase the usefulness and credibility of the financial and accounting information that the company disseminates outside, or, more precisely, that the company is compelled to or has the interest to make public [4].

External audit can take two forms, i.e.:

-*legal* or *statutory auditing* that encompasses verifying compliance with the tasks related to the oversight of company accounting, and the censors’ verifying and certifying of the balance sheet, according to legal provisions and on the basis of the mandate received from the GMS;

-*contractual auditing* carried out upon the request of an entity or individual, for purposes that are defined by the financial auditing agreement concluded with the auditor.

Strategic auditing is another type of auditing and refers mainly to performance assessment and the examination of the management decisions’ suitability, focusing on the reliable assessment of an enterprise’s chances to succeed, on a certain term. This type of audit highlights the company strategy at a given moment regarding [11]:

-the field of activity in which the company operates;

-the spatial location of each field knowing that companies develop considering several fields of activity;

-the real geographical size of each field;

-the strategy pursued by the company according to each kind of activity.

The ethical rules of the accounting profession were established by the IFAC in 1980 and provide that the professional associations of accountants in each country develop their own ethical code, aiming to guide professionals in their behaviour and in their professional relationships with the others [7].

Financial auditors must carry on their activities according to the following basic principles in order to achieve auditing objectives [10]:

-**Integrity** that implies not only honesty but also the fair conduct of work and

sincerity. The principle of honesty requires all financial auditors to be fair and intellectually honest and not to get involved in conflicts of interest;

-**Objectivity**, according to which a professional financial auditor must be fair and must not allow that objectivity be affected by prejudice, conflicts of interest or external influences;

-**Professional competency**. A financial auditor must possess the knowledge necessary to prove his/her professional skills, to act in a manner appropriate to his/her professional reputation and to avoid any behaviour that could discredit the auditing profession.

-**Confidentiality**. One of the basic skills of a financial auditor is keeping the secrecy regarding the data obtained during the exercise of his/her profession. Confidentiality implies that a financial auditor must not disclose any information obtained during auditing if he/she has not a legal, professional or other type of permission that forces him to disclose information.

-**Professional behaviour** – a professional auditor must act in a manner appropriate to the profession and must avoid any behaviour that could discredit the profession. This requires that the auditors show responsibility toward clients, third parties, other members of the auditing profession, employers and the public in general;

-**Technical standards** – a professional financial auditor must provide professional services in accordance with relevant technical and professional standards. Auditors have the duty to meet carefully and competently the client’s instructions and must meet the requirements of integrity, objectivity and independency.

Annual financial statements are drawn up and presented yearly and have the purpose to meet the common informational needs of users. Auditing annual accounts raises the degree of credibility and relevance of the information presented by financial balances.

Annual financial statements are subjected to an overall examination and to an analytical examination.

Overall examination aims to check if annual accounts:

- are coherent and consistent with accounting data;

- are presented according to accounting principles and accounting regulations in force;

- take into account the events following the closure of the financial exercise;

- provide a faithful, clear and complete image of patrimony, results and the financial situation.

Thus, the opinion of the professional in auditing and certifying annual accounts addresses two key issues [12]:

- the materialization and correct application of the procedures used in the current financial-accounting activity of the company;

- the way the image of the patrimony, financial situation and results obtained by the company is presented at a given moment.

The **analytical examination** of annual accounts is carried out through analytical examination techniques, some general and particular rules specific to annual accounts that require [13]:

- to establish indexes specific to the financial analysis and their compensation with other periods of management or with other companies;

- to compare the account data with the previous and prospected data of other similar companies;

- to compare the percentages of the turnover and some entries in the results account.

In order to express a motivated opinion, based on the financial situation, the auditor conducts a careful study with the help of various specific procedures. The auditing of annual financial statements is carried out in three main stages:

- the initial stage involves two phases: the orientation and planning of the audit, and the acceptance and contracting of the service;

- the stage of execution, in which the auditing takes place;

- the stage of conclusions.

1. Conclusions

Adoption of European regulation no. 1606/2002 is mandatory for the application of International Accounting Standards (IAS), since the year 2005, by all European entities

which use public saving. In this respect, the European Commission has undertaken a program having as target the compatibility of European Directives with international accounting standards. The seventh Directive of the European Union aims mainly the uniform regulation into the Community space of the rules and practices for preparation and presentation of consolidated accounts. Compliance is required by necessity of: globalization of national economies; Romania's access to international capital markets; transparency and simplification of financial reporting.

To achieve these goals, in the last period took place in Romania a series of legislative changes which included: amending and completion of Accounting Law no. 82/1991; accounting rules in accordance with Directive IV and VII of the European Union; the adoption of International Financial Reporting Standards (IFRS) and International Accounting Standards (IAS), through the Order of the Minister of Finance. In Romania, regulations in accordance with the Seventh Directive of the European Union largely assimilated its provisions applicable to groups of companies which conduct businesses on its territory. Generically, the group, into the view of national and European regulations, represents the companies ensemble formed from parent company and its subsidiaries. In principle, the group presents consolidated financial statements, having the main objective of informing users fairly about the financial position and results of the member entities of the group, considered as a whole.

For analyzing a company's overall efficiency is particularly important the quantity and quality of existing information of financial-accounting nature existing at a time into the economic system of an enterprise, preferably at levels becoming more analytical. The financial statements of a company are the most important means by which accounting information is made available to decision makers.

Annual financial statements are drawn up and presented yearly and have the purpose to meet the common informational needs of users. Auditing annual accounts raises the degree of credibility and relevance of the

information presented by financial balances. Control is a really effective contributing factor in maintaining activities at an operational level, and in the intelligent and competent solving of issues related to development and economic growth.

Abstract

The goal of the scoring method is to provide predictive models for the assessment of the bankruptcy risk of an enterprise. Its implementation requires observing a set of enterprises from two different groups: a group of companies with financial difficulties and a group of enterprises with no financial problems. For each of the two groups is established a set of rates, and then is determined the best linear combination of rates which allows the differentiation between the two groups of companies.

The scoring method refers to profitability indicators, indicators of asset structure, liquidity indicators or efficiency indicators. The condition for selecting the indicators which show the company's performance is the independent relation between them. The existence of correlations between indicators would lead, during that function, to record the repeated influences of the same economic or financial phenomenon.

Key words: risk, efficiency, Z score, financial results

JEL Classification: G3, G32 , G33

1. Introduction

Once the transition to the market economy it emerged as an objective necessity the knowledge of precise information related to the bankruptcy risk at a future time. The concern for the prediction of the bankruptcy

risk, worldwide, starting with the 60s of the last century, led to the development of a method called the scoring method which had a significant development due to the use of statistical elements of financial situations analysis, starting from a set of rates.

The scoring method is based on a grouping system of certain indicators which are found in correlation with the health status or the bankruptcy of the companies. The bankruptcy risks methods of analysis are techniques of discriminate analysis that group the financial characteristics of the companies which function normally and of those in difficulty. The linear combination of certain indicators, called the score function, makes the approximation (with a certain probability) of the bankruptcy risk.

Bankruptcy prediction uses this statistical technique called discriminate analysis for the transformation of the information offered by the economic and financial indicators into a score able to present the success or failure of a business. The discriminate analysis is able to offer a combination between two or more financial rates resulting from the application of a technique named multiple discrimination.

2. Scoring method

The score reflects the linear function of certain variables (indicators), weighted with certain average coefficients obtained through the least squares method, starting with the observations made on a significant set of companies, in simple terms, it means that this technique permits that after an analysis on a firm to obtain a figure (score) which tells if the

company will collapse or not. The score can be obtained using a function like:

$$Z = a_1 \cdot X_1 + a_2 \cdot X_2 + a_3 \cdot X_3 + \dots + a_n \cdot X_n$$

where:

$a_1, a_2, a_3, \dots, a_n$ - weighted coefficients;

$X_1, X_2, X_3, \dots, X_n$ - variables (financial rates).

From technical point of view, the determination of the score requires following some complex work phases:

Choosing a sample of companies composed of two groups, one that includes failed or ailing companies (e.g. companies with outstanding issues in payment rates, suppliers) and another that includes companies with no financial issues;

Comparison over a period of time, based on a set of indicators likely to be significant, of the two groups (bankrupt/non-bankrupt companies)

The Selection of indicators that realize the best discrimination. This phase is based on different statistical tests, the result being the choice of indicators with permanent and strong action within the samples studied.

Development through the discriminated analysis technique of a linear combination Z of significant indicators (X_i),

Choosing a point (or points) of inflection to perform predictive classification of enterprises in the two groups. The goal is to minimize the errors or the cost of prediction error;

Priori analysis of the rate of success of scores Z by comparing the predictive classification with the known situation of the companies in the sample. It is a priori success rate in the sense that it is based on a sample test with which led to the construction of the function score;

Posteriori analysis of the success rate of Z functions by analyzing the degree of relevance for another sample of companies. The built Z function is likely to be useful and credible for a further period and to a much broader population of companies. Certification of this hypothesis can only be achieved through a subsequent test of the score built.

All the previsions and predictions are based on the data published in the financial situations. Selecting the indicators within the scoring method is realized starting with the results of the healthy companies, but also with

the companies being in difficulty, on significant periods: 20-30 years.

The world economic literature uses frequently three models: Altman Model also called „Z” Model, Canon and Holder Model and the Bank of France Model.

2.1. Altman Model or „Z” model

It is a statistic and mathematical predictive model of the bankruptcy state developed in USA in 1968 and subsequently in 1977 by professor Altman. The model includes five variables considered to be the most representative for a company. With the help of this model, professor Altman was able to predict almost 75% of the bankruptcies of some companies with approximately two years before their production.

The mathematical representation of the model is:

$$Z = 1,2 \cdot X_1 + 1,4 \cdot X_2 + 3,3 \cdot X_3 + 0,6 \cdot X_4 + 1,0 \cdot X_5$$

where:

- the X_1 variable reflects the companies' flexibility and is obtained as a ratio between working capital (current operating assets – current operating liabilities) or goodwill and total assets:

$$X_1 = \frac{\text{Working capital or goodwill}}{\text{Total assets}}$$

- the X_2 variable represents the rate of self-financing total assets and is computed as a ratio between the reinvested earnings (net result of the exercise – dividends of shareholders) and total assets:

$$X_2 = \frac{\text{Reinvested earnings}}{\text{Total assets}}$$

- the X_3 variable represents the economic profitability rate and is computed as a ratio between the gross result of the exercise and total assets:

$$X_3 = \frac{\text{Gross result of exercise}}{\text{Total assets}}$$

- the X_4 variable shows the indebtedness of the company and is computed as a ratio between market capitalization (for the companies not listed at the stock exchange it is used the social capital) and medium and long term debts:

$$X_4 = \frac{\text{Market capitalization} / \text{Owner's equity}}{\text{Long-term and short-term debts}}$$

The market capitalization represents the market value of the subscribed and paid capital. In the case of companies not listed at the stock exchange it can be used instead of this indicator, the value of owner's equity.

-variable X_5 measures assets and is computed as a ratio between turnover and total assets:

$$X_5 = \frac{\text{Turnover}}{\text{Total assets}}$$

Depending on the score of the companies the following situations can be included:

- a) if $Z < 1,8$ it means that the company is insolvent, near to bankruptcy;
- b) if $1,8 < Z < 2,2$ it means that the company is in a tough situation;
- c) if $2,2 < Z < 3$ it means that the company's situation is good;
- d) if $Z > 3$ it means that the company is in a very good situation.

To demonstrate this we use the data from the table below:

Table no.1

Nb. Crt.	Indicators	N	N-1
1.	Total assets	21.628,897	23.405,086
2.	Working capital	9.005,326	8.741,520
3.	Reinvested earnings	1.254,476	1.404,305
4.	Owner's equity	18.088,759	19.599,098
5.	Turnover	27.461,100	31.197,944
6.	Long-term and Short-term debts	3.396,998	3.570,160
7.	Gross Income	2.187,844	2.624,732

Using the data from the table above we see that the variables of the Altman Model record the following values:

$$X_1^N = \frac{\text{Working capital}}{\text{Total assets}} = \frac{9.005,326}{21.628,897} \cdot 100 = 41,6\%$$

$$X_2^N = \frac{\text{Reinvested earnings}}{\text{Total assets}} = \frac{1.254,476}{21.628,897} \cdot 100 = 5,79\%$$

$$X_3^N = \frac{\text{Gross result of exercise}}{\text{Total assets}} = \frac{2.187,844}{21.628,897} \cdot 100 = 10,11\%$$

$$X_4^N = \frac{\text{Owner's equity}}{\text{Long-term and short-term debts}} = \frac{18.088,759}{3.396,998} \cdot 100 = 532,49\%$$

$$X_5^N = \frac{\text{Turnover}}{\text{Total assets}} = \frac{27.461,100}{21.628,897} \cdot 100 = 126,9\%$$

$$X_1^{N-1} = \frac{\text{Working capital}}{\text{Total assets}} = \frac{8.741,520}{23.405,086} \cdot 100 = 37,3\%$$

$$X_2^{N-1} = \frac{\text{Reinvested earnings}}{\text{Total assets}} = \frac{1.404,305}{23.405,086} \cdot 100 = 5,99\%$$

$$X_3^{N-1} = \frac{\text{Gross result of exercise}}{\text{Total assets}} = \frac{2.624,732}{23.405,086} \cdot 100 = 11,3\%$$

$$X_4^{N-1} = \frac{\text{Owner's equity}}{\text{Long-term and short-term debts}} = \frac{19.599,098}{3.570,160} \cdot 100 = 549\%$$

$$X_5^{N-1} = \frac{\text{Turnover}}{\text{Total assets}} = \frac{31.197,944}{23.405,086} \cdot 100 = 133,3\%$$

$$Z_N = (1,2 \cdot 41,6) + (1,4 \cdot 5,79) + (3,3 \cdot 10,11) + (0,6 \cdot 532,49) + (1,0 \cdot 126,9) = 49,92 + 8,106 + 33,363 + 319,494 + 126,9 = 537,783 \Rightarrow 5,377$$

$$Z_{N-1} = (1,2 \cdot 37,3) + (1,4 \cdot 5,99) + (3,3 \cdot 11,3) + (0,6 \cdot 549) + (1,0 \cdot 133,3) = 44,76 + 8,386 + 37,29 + 329,4 + 133,3 = 553,136 \Rightarrow 5,531$$

Summarized the obtained data are as follows:

Table no.2

	Indicators	N	N-1
X_1	Current assets ratio	41,6	37,3
X_2	Working capital ratio	5,79	5,99
X_3	Profitability ratio	10,11	11,3
X_4	Financial stability ratio	532,49	549
X_5	Assets turnover	126,9	133,3
	Z Function	5,377	5,531

From the obtained data it can be observed that the analyzed company has a very good situation from the point of view of the solvency and implicitly of the bankruptcy risk, the values of Z function state that the company is viable.

2.2. Canon and Holder Model

This model, built in 1978, applies to industrial companies with a number of employees between 10 and 500 and is based on the analysis „liquidity-chargeability”. The model is also based on the Z function having the following structure:

$$Z = 16 \cdot X_1 + 22 \cdot X_2 - 87 \cdot X_3 - 10 \cdot X_4 + 24 \cdot X_5$$

where:

- the X_1 variable represents the reduced liquidity rate and is computed as a ratio between claims, financial investments on short term and available funds, on one hand and on the other short-term debt:

$$X_1 = \frac{\text{Claims} - \text{Funds}}{\text{Short-term debt}}$$

- the X_2 variable represents the financial stability ratio and is determined as a ratio between long-term capital and total debt:

$$X_2 = \frac{\text{Long-term capital}}{\text{Total debt}}$$

- the X_3 variable shows the degree of financing sales from external resources and it is determined as a ratio between financial expenses and turnover:

$$X_3 = \frac{\text{Financial expenses}}{\text{Turnover}}$$

- the X_4 variable shows the degree of payment of personnel and it is determined as a ratio between expenses with personnel and value added:

$$X_4 = \frac{\text{Personnel expenses}}{\text{Value added}}$$

- the X_5 variable shows the weight of the operating gross result in the total value added and it is determined as a ratio between the operating gross result and value added :

$$X_5 = \frac{\text{Operating gross result}}{\text{Value added}}$$

The decision rule Conan- Holder shows:

Table no.3

Z Score	Bankruptcy probability	Company status
Negative	> 80%	Unfavorable situation
0-1,5	75-80%	
1,5-4,0	70-75%	
4,0-8,5	50-70%	Uncertain situation
8,5-9,0	35%	
9,0-10,0	30%	Favorable situation
10,0-13,0	25%	
13,0-16,0	15%	
Z > 16,0	Sub 15%	Excellent situation

For exemplification we use the data from the table below:

Table nr.4

Nr. Crt.	Indicatori	N-1	N
1.	Claims	1.265,86	1.182,95
2.	Liquid assets	2.236,03	1.721,61
3.	Short- term liabilities	3.121	2.580,32
4.	Long- term capital	18.507,89	20.824,77
5.	ilities	21.628,89	23.405,09
6.	Financial expenses	381,60	259,24
7.	Turnover	27.461,10	31.197,94
8.	Personnel expenses	10.569,78	13.159,88
9.	Value added	14.337,54	17.391,29
10.	Operating gross surplus	3.678,93	4.127,37

By using the data from the table above the variables of the Altman model record the following values:

$$X_1^{N-1} = \frac{\text{Claims} + \text{Liquid assets}}{\text{Short-term debt}} = \frac{1.265,86 + 2.236,03}{3.121} = \frac{3.501,89}{3.121} = 1,12$$

$$X_2^{N-1} = \frac{\text{Long-term capital}}{\text{Total debt}} = \frac{18.507,89}{21.628,89} = 0,86$$

$$X_3^{N-1} = \frac{\text{Financial expenses}}{\text{Turnover}} = \frac{381,60}{27.461,10} = 0,014$$

$$X_4^{N-1} = \frac{\text{Personnel expenses}}{\text{Value added}} = \frac{10.569,78}{14.337,54} = 0,737$$

$$X_5^{N-1} = \frac{\text{Operating gross result}}{\text{Value added}} = \frac{3.678,93}{14.337,54} = 0,256$$

$$X_1^N = \frac{\text{Claims} + \text{Liquid assets}}{\text{Short-term debt}} = \frac{1.182,95 + 1.721,61}{2.580,32} = \frac{2.904,56}{2.580,32} = 1,13$$

$$X_2^N = \frac{\text{Long-term capital}}{\text{Total debt}} = \frac{20.824,77}{23.405,09} = 0,89$$

$$X_3^N = \frac{\text{Financial expenses}}{\text{Turnover}} = \frac{259,24}{31.197,94} = 0,008$$

$$X_4^N = \frac{\text{Personnel expenses}}{\text{Value added}} = \frac{13.159,88}{17.391,29} = 0,757$$

$$X_5^N = \frac{\text{Operating gross result}}{\text{Value added}} = \frac{4.127,37}{17.391,29} = 0,237$$

$$Z_{N-1} = (16 \cdot 1,12) + (22 \cdot 0,86) - (87 \cdot 0,014) - (10 \cdot 0,737) + (24 \cdot 0,256) = 17,92 + 18,92 - 1,218 - 7,37 + 6,144 = 34,396$$

$$Z_N = (16 \cdot 1,13) + (22 \cdot 0,89) - (87 \cdot 0,008) - (10 \cdot 0,757) + (24 \cdot 0,237) = 18,08 + 19,58 - 0,696 - 7,57 + 5,688 = 35,082$$

The data being summarized it shows that:

Table no.5

	Indicators	N-1	N
X ₁	Quick ratio	1,12	1,13
X ₂	Financial stability ratio	0,86	0,89
X ₃	The degree of financing sales through borrowed sources	0,014	0,008
X ₄	The contribution of the personnel expenses at the at the existence of value added	0,737	0,757
X ₅	The weight of EBE in value added	0,256	0,237
Z FUNCTION		34,396	35,082

Taking into consideration the decision rule Conan- Holder we can state that the analyzed company has an excellent situation regarding the bankruptcy risk, the probability of bankruptcy being under 15% and the financial position has a Z score better than in the year N.

3. The score function of the Balance Sheet Centre Database of the National Bank of France

The Balance Sheet Data Centre Database of the National Bank of France records companies, they pay income tax and that have less than 500 employees and that are classified in 3 categories: in bankruptcy, normal and vulnerable. The companies that are in bankruptcy are companies that were sanctioned through judicial proceeding and that are observed over 3 years before the bankruptcy.

The variables used are the accounting ratios. The companies are characterized through 19 ratios that follow four main aspects of their behavior: financial structure, activity ratio, profitability and management ratio. In certain situations, a ratio can take excessive values or can not be calculated. We are talking about the ratios that have the denominator equal to zero. For not diminishing the quality of the results by eliminating a sample of companies with such rates, it will be defined for each rate, an interval between certain limits, up or down, and the rate will tend toward one of these limits.

The Risk detection system developed by the Balance Sheet Centre Database of the National Bank of France's comprises three score functions, which are used in two stages.

First stage: The function Z score

For characterizing the financial behavior we use a first scoring function, which was built by comparing the companies in bankruptcy with normal companies. We are talking about Z function, which comprises 8 ratios concerning the analyzed year, having the following expression:

$$Z = -1,255 \cdot R_1 + 2,003 \cdot R_2 - 0,824 \cdot R_3 + 5,221 \cdot R_4 - 0,689 \cdot R_5 - 1,164 \cdot R_6 + 0,706 \cdot R_7 + 1,408 \cdot R_8 - 85,544$$

here:

- the R_1 variable represents the sampling ratio financial expenses and is determined as a ratio between financial expenses and the gross operating surplus:

$$R_1 = \frac{\text{Financial expenses}}{\text{GOS}}$$

- the R_2 variable represents the ratio of covering the invested capital or the ratio of financial stability and is determined as a ratio between long-term capital and the invested capital (total assets):

$$R_2 = \frac{\text{Long-term capital}}{\text{Invested earnings}}$$

- the R_3 variable represents the cash flow to debt ratio and is determined as a ratio between cash flow and total debt:

$$R_3 = \frac{\text{Cash-flow}}{\text{Total debt}}$$

-the R_4 variable represents the ratio of sales profitability and is determined as a ratio between the gross operating surplus and turnover:

$$R_4 = \frac{\text{GOS}}{\text{Turnover}}$$

- the R_5 variable represents the days payable outstanding ratio, expressed in days, with the formula:

$$R_5 = \frac{\text{Accounts payable}}{\text{Merchandise}} \cdot 360$$

- the R_6 variable represents the increased value added ratio:

$$R_6 = \frac{VA_1 - VA_0}{VA_0}$$

- the R_7 variable represents the days sales outstanding ratio and is determined as the duration of a turnover, expressed in days, with the formula:

$$R_7 = \frac{\text{Accounts receivables}}{\text{Sales}} \cdot 360$$

- the R_8 variable represents fixed investments ratio, from own resources and is determined as a ratio between the value of investments and value added:

$$R_8 = \frac{\text{Investments}}{\text{VA}}$$

Depending on the value of Z score the companies are grouped as it follows:

a) if $Z < -0,25$ it results that the company is in difficulty with a high risk (70-100%);

b) if $-0,25 < Z < 0,125$ it shows that the company has an uncertain financial position, having an average risk (45-70%);

c) if $Z > 0,125$ it results that the company has an appropriate financial position, having a low risk (10-45%).

Second stage: the intervention of the score functions Y1 and Y2

In the second stage the objective is to make a distinction, between the companies that have a low score and those that are close to bankruptcy, with the help of two additional scoring functions Y1 and Y2. The companies that obtained an unfavorable score, under -0.25 are distributed in two groups, according to the value of the R1 ratio.

The first group is formed by companies that are characterized by GOS equal to zero or negative, or by a ratio R1 greater than or equal to 215%.

A second group comprises companies that have an R1 between 0 and 215%.

For the first group we calculate the score function Y1, which uses 7 ratios among two years, the time evolution having an important

role in the characterization of the bankrupt companies, if the bad situation last several years before the bankruptcy. For the second group, comprised of companies characterized by a R1 ratio between 0 and 215%, the calculation of Y2 uses 13 ratios among two years.

The risk analysis can be completed also by a series of non-financial aspects such as business management issues (moral and professional quality, reputation, experience in the respective sector of activity), company personnel (number and structure, quality and qualifications of the labor force) production facilities (age, technology), utilization of the production capacity, investments made, marketing policy (scope of activity, demand, suppliers, pricing policy, promotional policy, etc.).

4. Conclusions

The risk analysis methods described above allow the measurement of past performances of the company, informing in small extent on its future. The financial results can degrade very quickly over time. Hence, it is more and more obvious the need for more precise information about the future, regarding the risk of bankruptcy. As a response to these practical requirements, the Company's diagnosis of the financial situation has undergone a significant development because of the use of statistical methods of analysis based on a set of ratios.

The scoring methods offer a synthetic assessment of the financial situation of the company, by looking forward (for the provision or detection difficulties) and as looking back. In this sense, they allow both an effective assessment of the bankruptcy risk for purposes of diagnostics and monitoring risk by the external partners and particularly by the lending institutions, in addition, these methods allow us to test ratios and combinations of ratios for foreseeing the difficulties for companies.

Also, they contribute to the solving of the difficulties created by the multitude of indicators of the financial balance, by treating rigorously the problems made by their interdependence or redundancy, leading to a selection and hierarchy that avoids the subjectivism in assessments. The development

of these methods required a study of the risky business characteristics and of the process of deterioration of the situation, which is an essential source for insight into the financial behavior of companies.

We can say that discriminatory functions provide an overview of financial information relating to business, but they can not indicate the origin of the difficulties of the company. Regarding the application of the scoring methods to business realities of our country, we can adapt and apply most of the methods of analysis used in Western countries.

Abstract

The fiscal policy has been a part of the economic policy, contributing by specific means to drawing up the economical program of governance. The fiscal policy, seen as specific field of the economical policy, represents the conception and immediate action on organization, management and carrying out the fiscal activities; in other words, one should understand that fiscal policy signifies an assembly of methods, techniques and principles, which concern the operations, relationships, institutions and stipulations within fiscal field. Considering the current integration on the European unique market, the member states are liable to monitor the size of budgetary balance on current account and the public debt inventory, so that they will be able to comply with the restrictions stipulated in The Treaty of Maastricht (1992) and completed by The Settlement of Economic Steadiness and Growth (1997). The two agreements foresee special mechanisms in coordinating the fiscal and budgetary policies, assuming the drawing up of steadiness programs able to aim towards the re-equilibration on short term, or storing the budgetary surplus on long term. In this way, both the East-European states, currently candidates to Euro area, and the West-European states, before the adhesion to Monetary European Union, have started strategies of fiscal adjustment; these strategies consisted of measures able to ensure the necessary conditions on fulfilling the objectives imposed by means of nominal convergence criteria. In this paper, an

analysis was proposed over both the changes carried out by the fiscal policy that was adopted by after-communism countries, members of European Union, and over the challenges created by fiscal policy, in conditions of experiencing results of the current economic crisis. The research method consists of storing, analyzing and comparing the data concerning the fiscal policy tools and the budgetary deficiency over EU member countries, provided by Eurostat database.

Key words: fiscal policy, governmental income and expense, budgetary deficiency

JEL Classification: G3, G38

1. Introduction

Structurally integrated within the economical policy of the state, the fiscal policy meets the following specific features:

1. the fiscal policy should provide a dynamical character, should be emphasized by mobility and flexibility, but should also prove the ability of adapting to concrete requirements of each duration;
2. simultaneously, it has to be endowed with a unitary character, based upon the concept of assembly, so as to ensure the functionality of the entire economical-financial mechanism;
3. it should indicate a global-systematical character and long term steadiness;
4. To be carried out preponderantly within distribution sphere.

The macro-economical stability and success of economical growth depend crucially on implementing an adequate mix of fiscal and monetary policies. These ones, along with the adopted strategies, must see that the social objectives pursued within them are

realized without resorting to persistent budgetary deficits that may, eventually, put in danger the macro-economical balance. We cannot talk enough of the state's need to have a consolidated healthy public finances system (Balcerowicz, 2006). For this reason, the purposes of the fiscal policy should allow all the economical agents, but also the population to benefit of the advantages a free market gives, to pursue realizing the EU fiscal policies' established objectives, but also be compliant with other EU policies, such as the work places' policy, the environmental policy etc.

The fiscal policies of the new EU members are determined both of the apparent problems of the society, which continues to confront with the costs associated to the transition, but also of the rather rigid and exigent norms concerning the EU fiscal policy. When establishing the fiscal policy, certain elements are taken into account: the objectives to modernize the countries' infrastructure, developing the environmental projects, long-term fiscal costs made to reform the health and retirement systems and the obligations to contribute to the EU budget. Furthermore, the problematic of the new EU members' fiscal policy can be fully understood by describing the main constraints of the transition period: inheriting a state of premature welfare, the free-rider behavior and fiscal evasion and the institutional and juridical fragility.

According to the Maastricht Treaty, the governmental deficit and public debt are limited to 3% and 60% of the GDP, for all the members of the EU Economic and Monetary Union. Tightly connected to this, there must also be assured the compliance with the Economical Stability and Growth Treaty. Furthermore, if the monetary policy is authorized to an independent central bank, such as the European Central Bank, the fiscal policy is constrained significantly, for the fact that besides assuring solid public finances, it must also support the ECB's objective to stabilize prices (Lungu, 2005).

From the EU experience, we may affirm that coordinating the fiscal policies towards the tax domain is necessary and must take into

account the nature of the taxes (indirect, direct). In exchange, the fiscal coordination of the policies concerning allocation of the budgetary resources is not a must, because in the EU member countries the budgetary discipline is maintained to stabilize economy and unique currency, and the fiscal policy in the policies of redistributing the budgetary resources is limited by the level of the EU budget existing funds.

The present paper aims to offer an assembly image of the changes made by the fiscal policies adopted by the post-communist countries, also EU members (Bulgaria, the Czech Republic, Estonia, Latvia, Lithuania, Poland, Slovakia, Slovenia, Romania and Hungary), and also to present the fiscal aspects specific to these countries and the challenges they faced when integrating in the EU.

2. The analysis of the governmental income and expense of the post-communist countries, newly entered in the European Union

A close look over the income of each new member state, compared to the average of the EU-27 level, will unveil different ways in which they face the new EU member status and certain common characteristics, differentiating them from the old EU countries. The post-communist states hold 8 of the first 10 positions within the EU concerning the greatest share of indirect taxation. The analyzed data and the tendencies within the newly entered fiscal policies lead to a series of remarks, which we will present next.

The indirect taxes have the greatest contribution to the formation of the public financial income in almost all the new EU member states. For example, in Romania, the indirect taxes meant 44% of the total public income in 2006, while in Bulgaria, for the same period of time, the share was 55.27%. Exception- only two of the new EU member states, the Czech Republic, which in 2006 recorded a social contribution share in total income of 44.68% and Slovakia, which also has a great share of social contributions.

Almost all the post-communist countries have decreased the share of the direct taxes within the public income, for reasons such as:

- The relatively low level of economical development, which involves a reduced tax base, both for the company's profit and the individual's income

- The need to attract new productive investments, which determined low tax rates both for the companies and the individuals, sometimes even favoring the introduction of single rate tax systems;
- The direct taxes affect the international product and services' competition, while the VAT is refunded on export and has no effect on the local companies' capacity to export. Also, the direct taxes are more difficult to collect than the indirect ones;
- The motivational psychology of the individuals favor the indirect taxes compared to the direct ones, often perceived as a threat to personal welfare.

The new governments, who wanted to make visible a fundamental change concerning policies oriented more towards the market, easily adopted the reform of introducing single rate taxation. This was also motivated by the necessity to reduce the huge level of fiscal evasion, both legal and illegal. Therefore, seven of the ten countries adopted the single rate tax system, in 2009, the smallest rate being in Bulgaria – 10%, and the highest in Latvia- 23%. In the case of Romania, in the year 2005 a fiscal reform began, which aimed to replace the progressive tax system with the single rate one of 16%, still maintained even in present, and aims to stimulate the investments and capital accumulation. The signs gave by the single rate tax seem to indicate that it was well implemented. Nevertheless, the success in improving tax collection depends mostly on the complementary reforms of the social insurance contributions. The increased margin rates of salary taxes can be a major obstacle in improving tax collecting after the reform.

The previous experience shows that it is important for the decisional factor not to look only at the simple dichotomy between consume and income taxes, or to analyze only the specific characteristics of each tax in the local context. For example, the effect the consume taxes have on the economical efficiency depends on their characteristic of being mainly uniform or target specific goods.

Table 1: The countries' governmental income(GDP percentage)

	2000	'01	'02	'03	'04	'05	'06	'07	'08
EU (27)	45.40	44.8	44.2	44.1	44.0	44.4	44.9	44.9	44.6

On the other hand, the effect the income taxes have on the work offer depends on their progression rate. This indicates that each country's decision concerning own tax model involves detailed technical analyses, but also a difficult political decision between a greater economical growth and an improved equity (OECD, 2007). In table 1, are presented the governmental incomes of several countries, on areas, as GDP percentage.

Next, we will present the size and evolution of governmental expense of the new member states, in the context of the problems faced after EU integration. If, in the year 2006, the governmental expenses on the Eu-27 level recorded the lowest value of the last five years (46,3%), in the year 2008 these expenses were 46.87 of the GDP, increasing compared tot the last two years (see table 2). The most increased share was reported in 2003, at 47,3%. Comparing the expenses as GDP shares, at the level of the post-communist countries we may observe relatively great differences. While in the case of Hungary, the governmental expenses are around the 50% GDP value, in most of the other countries this share was more close to 40%. The adequate size of the governmental expenses is, actually, difficult to determine because it depends on each country's social preferences.

Table 2: The countries' governmental expense (GDP percentage)

Schneider and Zapal (2006) divide the EU newly entered ex-communist countries into two categories: the ones with a "big government" and the ones with a "small government", varying with the level of public expenses. We may also develop this idea, by including the two countries that were accepted in the EU since 2007, Romania and Bulgaria. As it may be seen in tables 1 and 2, there may be a direct connection between the size of the governmental expenses and the size of the fiscal deficits. We may conclude that these countries seem to be fitting in the "big government" category, confronting with difficulties in covering own income. On the other side, fiscal deficits attract public loans, which further on, lead to an eventual increase of the governmental expenses, especially by rates and repayment installments.

The "small government" category countries have recorded average deficits, situated mostly under the 3% GDP value, by the year 2007. We mention that these have implemented single rate tax systems, which leads to the conclusion that they managed to have a better collection of budgetary income and, therefore, a better control over the budgetary deficit.

However, based on the financial and economical crisis, we may observe that, in the year 2008, a governmental deficit increase occurs for both government categories. Thus, of the second category countries, which have surpassed the 3% GDP limit, we may see Lithuania (-3.2%), Latvia (-4%), Romania (-5.4%). In addition, Estonia, which from 2002 to 2007 maintained in an increasing way the budgetary surplus (in the year 2007, this was 2.7% of the GDP), in 2008 it records a -3% deficit of GDP. The only country which since 2004 to 2008 maintained an exceeding budget situation was Bulgaria, this one increasing its surplus even based on the crisis which affected the year 2008, to +1.5% of the GDP.

Although the reduction of the public sector and governmental expenses in the non-crisis period generated positive effects, obvious for the economy of the new member states, threats still exist, and problems connected to the government's little power to influence the economy and society. All of these countries still need important investments in education, healthcare and infrastructure, which must be supported in order to comply with the European development standards. Their main objective is the economical growth and a better redistribution of income in benefit of the disfavored categories of the population. Since the beginning of the 90s, the moderate governmental investments were constantly increasing in the transition countries of the Eastern and Central Europe than in the EU (Gabor and Szapery, 2004). This is normal, as long as the marginal social productivity of the infrastructure investments will tend to increase in the less developed countries.

The analysis of the governmental income structure of the post-communist countries, members of the EU, indicates that the indirect taxes have the biggest contribution to the formation of public income in almost all of the EU newly entered post-communist states. Even more, in these countries, the need to attract new productive investments lead to more reduced direct taxes.

The adoption of the single rate tax, motivated by the necessity to reduce the relatively high level of the fiscal evasion, characterizes seven of these post-communist states (Estonia – 1994, Lithuania – 1994, Latvia – 1997, Slovakia – 2004, Romania – 2005, Bulgaria – 2008 and the Czech Republic – 2008), and seems to have been well integrated. Nevertheless, the

success of improving tax collection greatly depends on making complementary reforms within the social insurance contributions' system. The decision of each country on the way to vary its own tax model takes into consideration more than the simple dichotomy between consumes and income taxes, and involves detailed technical analyses.

Moreover, the size of the governmental sector significantly varies from country to country, the extremes being Hungary - where the governmental expense represent almost 50% of the GDP and Slovakia, which in 2008 reported governmental expense of 33% of the GDP. The reduction of the public sector and governmental expenses generated positive effects, obvious for the economy of the new member states, but threats still exist concerning the government's power to reduce economy. All of these countries still need public services and important investments in order to reach the European standards for education, healthcare and infrastructure. For the following period, the new EU entered should maintain a relative increased level of the public investment expenses, taking into account their relatively low public capital stock.

3. Conclusion

Although most of the new member states have managed to respect the fiscal criteria of the Economical Stability and Growth Treaty, and their long-term fiscal viability was not threatened by the slow rate of last period economical growth, certain fiscal consolidations were needed to be made. In the year 2008, under the crisis conditions, five of the 10 countries surpassed the 3% GDP limit. The choice of postponing the integration in the Economic and Monetary Union for reasons of incompliance with the fiscal norms will make that reaching for the convergence criteria to be

delayed, due to accumulating additional public debt and interest rates during the waiting period. We may conclude that there certainly are rather big differences concerning the total fiscal burden of the new and old EU member states. By examining the general taxation as a GDP share, on the EU territory we may observe that the newly entered states are characterized by a more reduced tax rate than the old member states. Therefore, the reward for a better fiscal policy is greater than before, but the risks involved by an inadequate fiscal policy are even greater.

Abstract

The catastrophe bonds have become an important asset class of the international financial market and the recent disasters that affected economies all over the world reinforced the need of reflection upon this risk transfer instrument. Within this context, this paper is an attempt of modelling the volatility of a catastrophe bond index, mainly the Swiss Re Total Return Index, through a GARCH approach.

Key words: bonds market, volatility, financial environment

JEL Classification: G1, G12

1. The Catastrophe Bonds Market

Natural catastrophes prove to be an important concern all over the world due to their high economic, social and environmental implications. The recent Haiti and Chile earthquakes or the European windstorm Xynthia brought to attention, once again, the matter of natural risk management as well as the importance of the suitable instruments and mechanisms that permit the allotment of the financial resources when such events occur, an alternative to the traditional (re)insurance contracts.

One such instrument is represented by the

catastrophe bond – an insurance-linked financial product through which disaster risk is transferred to the capital markets, using the securitization technique, when certain trigger

conditions, associated to the occurrence of catastrophic events, are met. It involves the existence of a reinsurance contract between the ceding company – usually a (re)insurance company and a special purpose vehicle (SPV) and the issue of bonds by the SPV.

This financial instrument appeared in 1997 as a consequence of the damages produced by natural disasters such as Hurricane Andrew or the Northridge earthquake that proved to be too costly for the reinsurance companies. Since their inception, the market of the catastrophe bonds expanded and developed and, in 2007, the peak year of this market, after a decade of use and refinement, “cat bonds” have matured substantially, becoming integrated into modern catastrophe risk management practices (Figure 1) [1].

Figure 1. Annual Issue Size

Source: GC Securities, February 15, 2010

In spite of the circumstances imposed by the financial crisis in late 2008 and early 2009, the catastrophe bond market continued to have a crucial role for both (re)insurance companies and investors. Therefore, in 2009, as financial markets stabilized generally, catastrophe bond issuance conditions continued to improve with USD 3.4 billion of risk capital issued through 18 transactions (mainly, a 25 percent increase over 2008, in terms of risk capital) [2].

As for issuance activity registered during the first quarter, 2010, in comparison with 2009, declined in terms of risk capital. However, for the catastrophe bond market the second and fourth quarter stand, historically, for the most intense periods of issuance [3].

Figure 2. First Quarter Catastrophe Bond Issuance 1997 through 2010

Source: GC Securities Proprietary Database, March 31, 2010

A crucial issue related to the catastrophe bond is reflected by the type of trigger mechanism that determines if the principal of the bond is paid to the sponsor: (1) the actual losses of the ceding entity – indemnity; (2) a loss industry index – index; (3) the reported values of the parameters of the disaster – parametric; (4) the parameters

of the catastrophe event are introduced into a model in order to forecast the expected losses of the sponsor – modelled loss; (5) an adaptation of the parametric trigger – parametric index; (6) the setting of the industry index weights after the occurrence of the event through modelled loss methods – MITT (modelled industry trigger transaction, patented by Swiss Re Capital Market) [5].

Figure 3. Risk Capital by Trigger Type

Source: Adapted by the authors from GC Securities, 2008

In terms both of risk capital and number of transactions by trigger type, the cedent companies showed, in the last years, a preference for index triggers, while the modelled loss ones are the least chosen (Figure 3 and Figure 4).

Figure 4. Transactions by Trigger Type

Source: Adapted by the authors from GC Securities, 2008

As far as the covered perils are concerned, the industry showed a propensity towards the US earthquake and US hurricane for all the 1997-2007 period (Figure 5). The same perils seem to be the object of cover through

catastrophe bonds for the following period, 2008-2009.

Moreover, multi-peril transactions (the same dollar of risk principal is exposed to at least two or more perils) accounts for 42 percent of total risk principal issued [4].

Figure 5. Risk Capital by Specific Peril

Source: Adapted by the authors from GC Securities, 2008

One issue that should be mentioned as being of a particularly importance for this market is the introduction of some bond market indices, developed by the reinsurance company Swiss Re. These indices were launched in 2007 and are, according to the company, the first step associated with the significant increase in transparency as far as the CAT bond returns are concerned.

The computation methodology is owned by Swiss Re, the determination is made weekly and they are published on Bloomberg. These indices, named Swiss Re Cat Bond Indices, track the price return and the total rate of return for USD denominated cat bonds. Swiss Re Cat Bond Indices track the performance of the main basket, all outstanding USD denominated catastrophe bonds [6].

Within the main basket of bonds that are included in the indices one can identify: the Single-Peril US Wind CAT Bonds, Single-Peril California Earthquake CAT Bonds and the BB CAT Bonds (S&P rated). Moreover, the indices measure the coupon return, the price return and the total rate of return.

In addition to these indices, there are catastrophe bond mutual funds that come to expand the market. Among these, one can mention the AIG Diversified CAT Bond Funds or Clariden Leu CAT Bond Funds.

Figure 6 and Figure 7 display the weekly evolution of two of the most important catastrophe bond total return indices, from

November 2004 till April 2010 for the first one and from January 2007 till April 2010 for the last one.

2. Testing the volatility of the Swiss Re Cat Bond Total Return Index

In order to assess the volatility of the Swiss Re Cat Bond Total Return Index (SRCBTR), we have checked the stationarity of the considered time series – weekly data from November 2004 until April 2010. As can be noticed from Figure 6, the SRCBTR is not stationary, fact that was proven after performing the Augmented Dickey-Fuller test. The tests and models were performed by using Matlab numerical computing environment [7].

Therefore, we have transformed the data by computing the logarithmic returns of the series (Figure 8). The Augmented Dickey-

Fuller test proves the transformed time series is stationary.

Figure 8. Weekly Logarithmic Returns of the SRCBTR

It is widely known that most financial return series exhibit some degree of autocorrelation and, more importantly, heteroskedasticity. Therefore, we plotted the sample ACF (auto correlation function) of both the transformed time series and of the squared values of the transformed series (Figure 9 and Figure 10).

Figure 9. Sample ACF of SRCBTR Returns

Figure 10. Sample ACF of Squared SRCBTR Returns

As can be noticed, the return series exhibits significant correlation from lag 1 to lag 5 and at lag 7. In addition, the sample ACF of the squared returns illustrates the degree of persistence in variance.

In addition, to sustain the graphical analysis, we quantified the correlation (for the returns and squared returns series) by using the Ljung-Box-Pierce Q -test (under the null hypothesis of no serial correlation). The outputs evidence that significant correlation exists both in the returns and the squared returns (in Table 1 and Table 2, respectively, the first column reflects the number of lags for which the test was performed; $H=1$ confirm the serial correlation, the other columns reflect the p-value – p , the statistic test – $Stat$ is higher than the critical value of the Chi-Square distribution – CV).

Moreover, the Engle's test for the presence of ARCH effects was performed (the null hypothesis is that a time series is a random sequence of Gaussian disturbances, more specifically that there are not present ARCH effects). The output is presented in Table 3 and there is significant evidence in support of heteroscedasticity ($H=1$ indicates rejection of the null hypothesis).

Table 1. Ljung-Box-Pierce Q-test SRCBTR Returns

Lags	H	p	Stat	CV
10	1.00	0.00	94.37	18.30
15	1.00	0.00	98.03	24.99
20	1.00	0.00	100.35	31.41

Table 2. Ljung-Box-Pierce Q-test Squared SRCBTR Returns

Lags	H	p	Stat	CV
10	1.00	0.00	56.75	18.30
15	1.00	0.00	58.24	24.99
20	1.00	0.00	60.65	31.41

Table 3. Engle's ARCH test for the SRCBTR Returns

Lags	H	p	Stat	CV
10	1.00	0.00	57.76	18.30
15	1.00	0.00	59.36	24.99
20	1.00	0.00	58.98	31.41

All the above mentioned results implied the calibration of a GARCH (*generalized autoregressive conditional heteroscedasticity*) model.

The word “autoregressive” indicates a feedback mechanism that incorporates past observations into the present. The word

“conditional” indicates that variance has a dependence on the immediate past. The word “heteroscedasticity” indicates a time-varying variance (volatility). One type of GARCH models EGARCH (P, Q). Its general model for the conditional variance of the innovations, with leverage terms and an explicit probability distribution assumption [8], is:

$$\log \sigma_t^2 = k + \sum_{i=1}^P G_i \log \sigma_{t-i}^2 + \sum_{j=1}^Q A_j \left[\frac{|\varepsilon_{t-j}|}{\sigma_{t-j}} - E \left[\frac{|\varepsilon_{t-j}|}{\sigma_{t-j}} \right] \right] + \sum_{j=1}^Q L_j \left[\frac{|\varepsilon_{t-j}|}{\sigma_{t-j}} \right]$$

The Matlab environment generated the parameters presented in Table 4, mainly an ARMAX (3, 0, 0)/EGARCH (2, 1).

Table 4. Estimated parameters

Parameter	Value	Standard Error	T Statistic
C	0.00066	0.000100	6.5704
AR(1)	0.17189	0.053939	3.1868
AR(2)	0.13055	0.053848	2.4244
AR(3)	0.18836	0.049601	3.7976
K	-0.79181	0.13478	-5.8750
GARCH(1)	1.3921	0.056477	24.6497
GARCH(2)	-0.45927	0.054352	-8.4498
ARCH(1)	0.57794	0.059099	9.7792
Leverage(1)	0.14324	0.034096	4.2009

Consequently, the model extracted the filtered residuals and volatilities from the index returns. As shown (Figure 11), the lower graph exhibits the variation in volatility present in the filtered residuals (innovations).

Figure 11. Filtered residuals and conditional standard deviations

After filtering the model residuals from the return series, we standardize the residuals by the corresponding conditional standard deviation

and examine the ACFs of the standardized residuals and squared standardized residuals (Figure 12 and Figure 13, respectively).

Therefore, by comparing the ACFs of the standardized residuals to the corresponding ACFs of the raw returns reveals that the standardized residuals are now approximately i.i.d. Moreover, the chosen model sufficiently explains the heteroscedasticity in the raw returns.

Figure 12. Sample ACF of Standardized Residuals

Figure 13. Sample ACF of Squared Standardized Residuals

As previously performed, in order to substantiate the graphical analysis, we quantified the correlation of the standardized innovations by performing the Ljung-Box-Pierce Q -test. In addition, we performed the Engle’s test for ARCH effects.

The results are displayed in Table 5, Table 6 and Table 7, respectively and indicate acceptance of the null hypotheses ($H=0$, with highly significant p Values).

Table 5. Ljung-Box-Pierce Q-test for the standardized innovations

Lags	H	p	Stat	CV
10	0.00	0.82	5.83	18.30
15	0.00	0.95	7.24	24.99
20	0.00	0.98	8.76	31.41

Table 6. Ljung-Box-Pierce Q-test for the squared standardized innovations

Lags	H	p	Stat	CV
10	0.00	0.66	7.71	18.31
15	0.00	0.81	10.20	25.00
20	0.00	0.83	13.99	31.41

Table 7. Engle's ARCH test for the standardized innovations

Lags	H	p	Stat	CV
10	0.00	0.71	7.18	18.31
15	0.00	0.81	10.14	25.00
20	0.00	0.81	14.32	31.41

3. Conclusions and further research

The analysis of the catastrophe bond market showed that this instrument gained its place within the financial environment and became a robust alternative for the traditional insurance contracts. Moreover, through the development of market indices, the participants of this market proved an interest in making their products, in particular, and the insurance-linked market, in general, more transparent by offering important information.

In the end, the research focused on one of these indices, mainly the Swiss Re Cat Bond Total Return index in an attempt to test for variation in volatility. The identified EGARCH model is satisfactory in explaining the heteroscedasticity in the raw returns. Within the future research one will be considered other catastrophe bond indices and mutual funds.

Abstract

In Romania, the Order 3055/2009 entered into force on January 1st 2010 and it repealed the Order 1752/2005 on the approval of accounting regulations in accordance with European directives. Some major steps were taken in order to harmonize the Romanian legislation with the EU legislation based on the collective ability and will to align domestic standards in the economic area with the standards in force of the European Union.

Key words: EU regulations, company's turnover, accounting principles, financial statements.

JEL classification: M 41

In Romania, the first accounting regulations harmonized with the Fourth Directive of the European Economic Community and with the International Accounting Standards were implemented in 1999 but only in some companies listed on the Stock exchange and in some enterprises of public interest. After this first initiative, between 2000 and 2005, the scope of the regulations was extended according to various criteria, among which the most important ones are: the total assets, the turnover and the number of employees. The total value of the assets and of the turnover is expressed in Euro and not in lei.

In Romania, the financial statements drawn up by legal persons encompass the balance sheet, the profit and loss account, the situation of changes in capital, the situation of cash flows,

and explicative notes to the annual financial statements.

The profit and loss account is present both in the balance sheet, by the abbreviated meaning of the financial year's outcomes (account 121), which can be gross or net, and in the annual financial statements, in a detailed form. In the latter form, the profit and loss account encompasses the grouping of expenses and revenues by the nature of the activity that has created them, grouped in operating, financial and exceptional expenses and revenues, the results corresponding to each of these, the gross and final net result of the financial year compared with the data of the previous financial year.

In 1999, the Order 403 of the Ministry of Public Finances produced the amendments to the General Plan of Accounts that were necessary and sufficient for that time; thus, some accounts were repealed, some new accounts were introduced and other accounts changed name. In addition, Order 403/1999 settled the basic rules and principles, the form and content of annual financial statements.

According to legal provisions (Order 3055/2010 on the accounting regulations in accordance with European directives), the following accounting principles must be applied in the recording of operations that involve revenues and expenses: the principle of the financial year's independence that refers to the separation of the current financial year from the previous years and the principle of non-compensation between expenses and revenues. Just as accounting

regulations must be met in the recording of accounting data, in the preparation of annual financial statements, expenses and revenues must be grouped by their nature in appropriate categories. Failure to comply with the regulations in force is punishable according to the gravity of the misdemeanour.

Each entity must adopt its own accounting policy that is all accounting, fiscal and legal decisions, applied internally and externally, that seek to ensure profits and the entity development. Changes in the company policy may be brought by:

- the economic and social context in which the entity operates;
- the acquirement of relevant and reliable data that can lead to an upward evolution on short term and to spectacular results.

The economic benefit translates as the potential to contribute directly or indirectly to the entity's cash flow. This contribution is reflected either by the increase in cash inflows or by the decrease in cash outflows. Thus, the potential can be productive when the asset is used separately or together with other assets to provide services or to produce goods that could be sold by the entity. In addition, the potential may take the form of cash convertibility.

In order to be relevant financial statements must be easily understood by all their users, credible through the elimination of significant errors, and easy to analyse in time and space. All these requirements must be supported from a theoretical point of view by the entity's policies and from a practical perspective by the compliance with the laws on accounting and the other regulations in force in Romania.

In order not to disturb the outcome of the financial year, expenses that belong to other financial years are recorded in the account of 'advance expenses' from which the amounts pertaining to each accounting period are subsequently deducted. Revenues are recorded in the credit of 'advance revenues' thus meeting the same principle, i.e. the principle of the separation in time of financial years. A special stress is put on the recognition and assessment of assets and liabilities and their presentation in financial statements.

In what regards the recognition of revenues from sales, two requirements must be met in order for them to be valid. The quantification of revenues and expenses stipulated by Order

1752/2005 refers to the possibilities of measurement, recognition and assessment of management accounting and financial accounting. These three characteristics described by quantification are provided by Order 3055/2009, i.e.:

- size of revenues can be assessed in a credible manner;
- transaction costs can be assessed in a credible manner.

A new element emerges, that is *the probability that the economic benefits arising from the transaction be generated by the entity.*

"Table 1. Recognition of revenues from sales"

<i>Order 1752/2005 – Revenues from sales are recognised when the following requirements are met:</i>	<i>Order 3055/2009 – Revenues from sales are recognised when the following requirements are met:</i>
a) the entity has transferred to the buyer the significant risks and benefits that arise from the ownership of the goods;	a) the entity has transferred to the buyer the significant risks and benefits that arise from the ownership of the goods;
b) the entity no longer manages the goods it has sold at the level that it would normally do if it still owned them, and it no longer has effective control over them;	b) the entity no longer manages the goods it has sold at the level that it would normally do if it still owned them, and it no longer has effective control over them;
c) the revenues and expenses incurred by the	c) the size of revenues can be assessed in a

transaction can be quantified.	credible manner;
	d) it is likely that the economic benefits arising from the transaction be generated by the entity;
	e) transaction costs can be assessed in a credible manner;

The costs supported by the entity related to the construction of systems that provide the facilities necessary for operation are recorded according to their nature, by period, if in the contracts concluded with facility providers it is stipulated that their ownership is going to be taken over by the service or construction work provider.

The final balance of the profit and loss account represents the definitive outcome of the financial year, established at its end and cumulated since its beginning.

In the plan of accounts, the amendments brought by Order 3055/2009 in what regards expenses and revenues refer to the introduction of commercial discount accounts and of accounts of expenses in the area of environmental protection.

„Table 2: New entries and changes in revenue and expense accounts”

Order 3055/2009 new expense accounts	Order 3055/2009 new revenue accounts
new account: 609 – commercial discounts received	new account: 709 – revenues from commercial discounts
new account: 643 – bonus expenses representing the staff’s participation in profits	new account: 712 – revenues from revenues related to costs of services in progress
new account: 644 – expenses on remuneration in	the account name is changed:

equity instruments	711 – revenues related to stocked costs of products
new account: 652 – expenses on environmental protection	

The profit and loss account from annual financial statements is subject to some changes in accordance with the plan of accounts and related to it:

- in line 04, the revenues related to commercial discounts (acc. 709) that are part of the turnover are newly introduced;
- in line 07, the name is changed to revenues related to the costs of production in progress (acc. 711), the previous name being stock variation;
- in line 07, cumulated with the revenues related to the costs of production in progress, the revenues related to the costs of services in progress are newly introduced (acc. 712);
- in line 16, expenses on commercial discounts (acc. 609) are included in operating expenses.

A company’s turnover can be defined as the total amount of revenues produced by its main activity including the revenues from commercial discounts.

Romanian regulations are more and more in line with EU regulations; it can be said that Romania took another important step toward a common framework in the implementation of legal provisions in the field of accounting.

Users of financial statements prepared under these regulations include current and potential investors, employees, creditors, suppliers, customers, and other relevant state institutions as well as the public. They use financial statements to meet part of their information needs. According to stakeholders, needs may include the following information:

- a) Investors. Bidders of risk bearing capital and their advisers are concerned about the inherent risk in trading and profitability of their investments. They need information to decide whether they would buy, keep or sell equity instruments. Shareholders are

concerned in information to enable them to assess the entity's ability to pay dividends.

b) Employees. Staff and their representative groups are interested in information on the stability and profitability of their employers. They are interested in information to enable them to assess the entity's ability to provide remuneration, pensions and other retirement benefits and career opportunities.

c) Creditors. Lenders are interested in information which enables them to determine whether loans and interest will be repaid at maturity.

d) Suppliers and other creditors. Suppliers and other creditors are interested in information which enables them to determine whether what they are owed will be paid at maturity. Suppliers and other creditors are generally interested in the entity on a shorter period than lenders unless they are dependent on the continuity of the entity when it is a major customer.

e) Customers. Customers are interested in information about an entity's business continuity, especially when they have a long-term cooperation with the entity or are addicted to it.

f) State and other relevant institutions. State institutions and other authorities are interested in resource allocation and default activity entities. They require information to regulate the activity of entities, to determine tax policy as a basis for calculating the national income and other statistical-like indicators.

g) Public. Entities may affect the public in various ways. For example, entities may have a substantial contribution to the local economy in many ways, especially by the number of employees and working with local suppliers. Financial statements may help the public, providing information on recent developments and trends related prosperity of the entity and its sphere of activity.

Although not all information needs of users can be met by general purpose financial statements, there is information that may interest all users.

Conclusions

A company's turnover can be defined as the total amount of revenues produced by its main activity including the revenues from commercial discounts.

Romanian regulations are more and more in line with EU regulations; it can be said that Romania took another important step toward a common framework in the implementation of legal provisions in the field of accounting.

Abstract

In recent years, FASB and IASB have intensified research on fair value measurements and planned to further expand the scope of applicability of fair value measurements. However, organizations responsible for formulating the principles, enterprises, social bodies and academia are locked in a dispute over the advantages and disadvantages of fair value measurements, and no consensus has been reached yet. This paper explores the arguments for and against fair value and tries to find out whether advantages are superior to disadvantages of fair value measurements.

Key words: fair value, FASB, IASB, measurement

JEL Classification: M4, M41

Introduction

The concept of fair value caused many debates concerning the meaning of modern accounting as a theory and practice. First, this concept was used for the financial instruments. Today, the tendency is to extend the application of the fair value to many other elements of the financial statements, even to the module of assets and liabilities of a company.

Historical cost accounting was sufficient as long as a company's assets consisted mostly of identifiable tangible assets. With the increased prominence of intangible assets, such as intellectual capital, human resources, brand names, technology advances, or corporate culture, this accounting model resulted in undervaluing and under-recording assets that contributed significantly to the achievement of a company's strategic goals and objectives.

Therefore, the accounting model of the companies that invest an important part of their resources in intangible assets does not reflect their real capacity to generate future profits; consequently this model doesn't reflect the real value of the company. For example, intangible assets that are recorded in the balance sheet - purchased copyrights, patents, and other legal rights - are recorded at historical cost. Other intangible assets, such as brand assets, assets arising from marketing and supplier relationships, and knowledge assets developed from research and development are not recorded at all. Consequently, great disparities between companies' book and market values have been observed, and the users of financial statements have pressed for more relevant fair-value information.

Although recent accounting standards reflect the increasing acceptance of fair value as a measurement attribute, the shift towards the fair value accounting model has not been without controversies. Fair value accounting information continues to be criticized as being less reliable than historical cost, especially when based on subjective assumptions. Estimation errors introduce distortion not only into the balance sheet, but also into the income statement. Furthermore, unrealized changes in fair values from one period to the next, which must now be reported as gains and losses in financial statements, distort the results of operations, if and when they flow through the income statement each period. And finally, fair value accounting requires proper matching of assets and liabilities, which is even more difficult to implement than the

matching of revenues and expenses under a historical cost model.

For the past decade, in order to improve the decision-making relevance of financial statements, the Financial Accounting Standards Board (FASB) has been adding more fair value recognition, measurement, and disclosure standards to the body of U.S. generally accepted accounting principles (U.S. GAAP). The International Accounting Standards Board (IASB) follows a similar approach. As a result, a mixed accounting model has been developed, which is still primarily based on historical cost but with an ever increasing application of fair value accounting.

In present times, the need to replace historical cost with other valuation bases arises from investors, who have a direct interest in assessing the real value of a company, since they have to decide on how to manage their share of capital. This is why the pressure coming from the investors and the accounting regulation bodies has recently led to an evolution of the accounting models of a company, from one based on historical cost towards an accounting model based on the fair value of the assets and liabilities.

Consequently, a shift has occurred in recent years towards using the balance sheet as the primary financial statement conveying information to shareholders, and the income statement reporting economic income as simply the change in value over a period of time.

The extension of the scope of fair value is favored by the development of capital markets and the improvement of the means for data processing. Thus, fair value as valuation basis is strongly supported particularly in countries whose economy is based on the capital market, but also has numerous critics, especially in European countries.

Applying fair value in book-keeping seems to allow for the creation of financial statements that provide third parties with a better assessment of the present and future performances of the company, and therefore provides them with more solid grounds for decision-making.

Several authors [1, 4, 7, 9] provide an analysis of the benefits and criticism related to fair value. The supporters of fair value argue that it is useful as a valuation system – not

necessarily at a general scale – using the following arguments:

a) it is forecast-oriented

Fair value allows the best forecasting of the future treasury flows, since it is based on estimates of such flows. This allows financial analysts to make a more correct estimate of the future treasury flows.

b) it provides more objectivity and accounting neutrality

As it is determined by reference to external data, either directly, through market values, or, when no active markets exist, through references to models based on parameters resulting from external data, fair value has a “neutral” value, meaning that it is not influenced by the company itself.

It is believed that the amendments made to historical cost, particularly when it comes to adjusting it to the depreciation of the assets, is based on very rough, subjective estimates, subject to the interest or the company’s manager. Whereas fair value is believed to prevent the excessive use of creative book-keeping endorsed by managers [2].

We do not agree fully to this appreciation, all the more so since fair value itself is often times estimated by the accounting professional, employee of the company. Even if a valuation expert is used, an authorized person acting as consultant to the company, just value is still not safeguarded against subjectivism.

c) it allows for a better comparability of fungible assets, in particular financial instruments

Using the model of fair value as valuation method allows for a creation of financial statements of assets valued for current values, regardless of the date they were acknowledged in the accounts.

d) they provide a better perspective and comparison on the present and future performances of the company

By generalizing the valuation system based on fair value, the new means of quantifying the result (which would also include the latent pluses and minuses generated by fair value valuation), would also improve the degree to which accounting records express the company’s economic value.

e) it improves the shareholders' control over the managers

This could be achieved if financial statements were entirely assessed based on fair values. Thus, the managers would have available an important database for calculating and controlling certain indicators that may increase value for the shareholders, such as the Economic Value Added – EVA, or the Market Value Added – MVA).

Furthermore, such financial statements would allow for a better understanding of how much of the global share value results from the company's ability to obtain an asset efficiency higher than the one on the market, and, on the other hand, how much is due to the mere possession of the assets [2].

f) its low complexity, especially for short-term financial instruments

For short-term financial instruments, the use of fair value as valuation base is simple if we take into account the existence of numerous market references. The same applies to long term quoted instruments.

g) it provides coherence for an active management of financial risks

More often than note, companies manage their rate risks, price risks, and even the risks derived from non-saleable instruments such as swaps. Such management is better ensured by using current values as reference points. Today, numerous groups of companies use fair value in the active management of their price risks.

h) it has a "much more universal" character than historical cost

According to the traditional accounting model, which is based on historical cost, anything that doesn't have a cost is not registered in the accounting records. According to this principle, certain financial instruments would not be registered in the accounting records, in particular derivative products which, by definition, do not generally require the presence of financial flow at their origin, which has a negative impact on valuations based on future treasury flows. This gap incurred by the use of historical cost disappears when the valuation is made based on fair value.

i) provide information for the investors which are useful for decision making

Generally, an investor assesses the risk that he is ready to accept in exchange for a particular return. The assessment is based on the

information available to him. The information about the market value at the reporting date, the changes in that value provide the investors valuable information for them decision making. Therefore, if an investor knows the market value of a financial instrument and has information about its terms and risks, he has the basics for evaluating the market's expectations. [5].

The critics of fair value show that this concept was introduced to the accounting practice without any thorough theoretical study and without a prior analysis of the consequences of using this principle as basis for the general valuation of assets and liabilities [2].

Indeed, many accounting specialists have certain reserves with regards to fair value, which are the cause – or perhaps the effect – of the multiple aspects involved by this concept. The disadvantages of fair value, as presented in specialized literature, are presented below:

a) it doesn't always provide reliable information

If the market specific to a certain asset does not exist or is not active, fair value will be obtained based on valuation models, which are themselves based on a series of estimates and which are subjective and hard to verify. For instance, in the case of the updated value, it is necessary to estimate the life of the asset, its residual value, the treasury flows it will generate in time and, finally, the update rate. Estimates are inherently subjective. Thus, the valuation method incurs an inherent risk, and another risk related to the intentional manipulation of data.

b) its concrete determination gives rise to serious technical and financial problems

Thus, if there is no market value available at hand, and specific valuation methods are employed, it is necessary to be familiar with the methodology of asset valuation and to determine future market movements that are not directly observable. On the other hand, and in relation to the above, the cost entailed by obtaining the application of fair value may be high. Without external ratings, fair values must be calculated inside companies, using models whose conception, completion

and control operations are highly expensive, at least relative to the benefits assigned to such values.

c) it creates difficulties in determining the allocable result

The new values of assets and liabilities are potential, latent values. Also, using valuation methods based on fair value implies including in the result such “virtual” elements as are generated by the market’s evolution, which are only “potential” gains or losses. Such a result, obtained from adjustments of the elements of the balance sheet in accordance with the market value or estimated value, is inconstant and is generated by causes that, as a rule, cannot be controlled through decisions of the company’s managers.

d) it benefits one of the categories of users of the accounting information, namely the investors

And that is because it provides, first and foremost, information on the company’s stock exchange performances, which are not directly relevant to the other users of the accounting information, who would have the right to be supplied with implicit or explicit information specific to their interests. Thus, the other users of the accounting information (banks, suppliers, clients or employees) have different informational requirements with regards to company accounting.

Anyhow, it is difficult for accounting norms and regulators to manage to satisfy the interests of all the users. Even though they claim to be open towards all the user categories, accounting regulation bodies (IASB and FASB) are beneficial mostly to investors, as the norms were created relative to their requirements. In fact, the two regulating bodies are promoters of fair value, supporters of value for the shareholder and of the importance of capital markets which are where value is formed and communicated. It is obvious that investors, while they might not be the main users, are at least the designated users who, it is expected, should have certain privileges with regards to the requirements and supply of financial information. To this aim, they wish to be informed based on fair values. To them, the absence of quick and accurate information on the effects of the markets’ evolutions on companies may increase the degree of uncertainty, which can lead to an increase in the costs of capital for a company.

The Europeans are far more skeptical with regards to the usefulness of fair value for other categories of users of the accounting information, and valuation methods based on fair value are heavily criticized.

In the table below we have summarized the main advantages and drawbacks involved by the use of a valuation system based on fair value:

Table no. 1 Qualities and limitations of the fair value

Qualities of the fair value	Limitations of the fair value
It allows for an estimate of future treasury flows, an aspect which is highly appreciated by investors. (predictability)	Estimates may affect the reliability of the information provided, since they are not exempt from subjectivism, and the different interpretation of the factors taken into account may lead to covering up intentional mistakes or manipulating the numbers.
For certain items (such as financial instruments), fair value is very easy to determine. (simplicity)	Many elements of financial statements don’t have active markets, and therefore their valuation is completed by means of rather complex techniques. These involve resorting to valuation specialists, which can increase the cost for obtaining the application of fair value.

It ensures the comparability of financial information by valuating similar items in the same manner.	If various valuation techniques are used, the elements taken into account when calculating the fair value may differ from one company to another, which has a negative impact on the comparability of data.
Since it uses data from external sources (market prices), fair value is independent of the decisions of the management and date of the transactions (neutrality).	Only such values are objective and neutral as are established by a valuator who is not the accounting professional employee of the company, and are based on market prices.

Conclusions

When analyzing the advantages and drawbacks of fair value, one must establish the target, respectively the users of the financial statements. Who benefits from fair value valuation and who doesn't?

Different users may demand different accounting reports, and confusion reigns if issues are discussed at cross purposes. A shareholder might recognize a gain from a fall in the market value of debt as creditworthiness deteriorates, but not the creditor. Bank shareholders might wish to see bank deposits at fair value, but not the depositors. A bank regulator would also be concerned about reporting deposits at less than face value if such reporting affected depositors' confidence in the banking system. While an investor might welcome the information about volatility that fair value accounting reveals, not so a central banker who might be concerned about feedback effects on systematic risk. A bank regulator might be concerned about marking up banks' capital during speculative times with the resulting incentive for profligate lending [10].

The biggest advantages of fair value is that it can reflect timely the profits and losses because of the market risk and the impact of credit

quality, and could be more fairly to reflect the commercial banks' true financial position and operating results, promote financial stability in a certain extent. But at the same time, the measurement from the traditional mode of the transition to fair value model will cause the volatility of assets, liabilities, profit and loss, which in the macroeconomic area may affect the operations of the business company, then gives the banking sector and even the entire financial system a negative impact.

To this limitation of the fair value, one may add the cost for obtaining it, which is by no means low, in the case of many companies, particularly when subject to the valuation are items that are not transacted on an active market.

Empirical evidences show that investors want both measurements. They want reliable and transparent fair value information to determine the actual value of their investment. They also want historical cost information that helps them to determine whether management has discharged the stewardship entrusted to them.

A process can be created and implemented whereby historical cost and fair value information is reported side by side, which will enhance relevance, reliability and comparability. In addition, some actions should be taken to eliminate the current limitations in fair value accounting. These may be:

- Establish more robust accounting, valuation and auditing guidance.
- Provide more education to preparers, auditors and users about fair value accounting.

Therefore, it will not be good for any one if the debate between the two approaches will be ongoing. Rather, focus should be given to implement fair value accounting in reporting all assets or liabilities to reflect their true value without eliminating historical cost accounting.

According to a different opinion [6], the use of fair value does not necessarily lead to a new accounting system, or an accounting revolution, so to speak, but to an evolution of the accounting model. In support of this reserve with regards to the importance of fair value, it is shown that fair value has

coexisted for a while with historical cost, within a mixed accounting system. The difference stands only in the name, given that, in the past, the concept was used under the name of current value.

Lean accounting, a new global approach

Cretu Laura

Universitatea A.I. Cuza, FEAA

laura84_cr@yahoo.com

Abstract

Lean revolution is unstoppable! But before we start the crazy race and transform the whole business into a lean one and the managerial accounting into lean accounting, to align our thinking with lean standards, it is important to take a breath moment to convince ourselves that we know to use these concepts and that we understand their essence.

The new engine of the knowledge society and human development are the know ledges and those who have the know-how will hold the economic power. We live in a world where know ledges have become an important factor of production and, therefore, in this article I intend to explain and elucidate the terms that lean accounting operates, I will emphasize the importance of lean approach to the accounting in the process of transforming the company into a lean enterprise, I will define lean accounting and review the lean costing methods and, in the end I will highlight the benefits of using the lean accounting methods and the potential barriers to their implementation.

Key words: lean concept, lean accounting, benefits

JEL Classification: M4, M41

1. Introduction

Starting with 1980, the European and American factories have faced a radical change. Mass production and scientific management techniques from the early 1900s were challenged by the Japanese manufacturing technique *Just in Time*. This manufacturing concept was adopted worldwide and has become known as *lean production*. In the past 20 years, based on lean production, has developed a new

concept, that of *lean enterprise*, which became quickly a part of the business vocabulary.

The term *lean* was first brought to public attention in 1990 when it was published the book *The Machine That Changed The World* by James Womack, Daniel Jones and Daniel Roos, a description of an extensive system of production developed by Eiji Toyoda and Taiichi Ohno at Toyota Motor Co., in Japan. The Toyota lean manufacturing system has become over the years a model for Boeing, Porsche, Pratt Whitney, Danaher Corporation, Wiremold Company, Pella Windows and others.

Lean enterprise concept is based on three simple, but radical ideas: eliminating waste, continuous improvement and respect for people. A lean enterprise produces more with the existing resources by eliminating activities that do not create value. This means that the companies that apply lean thinking have the opportunity to do more with less - less human effort, less equipment, in less time using less space - while providing customers what they want, when they want, where they want at an optimal price in relation to quality.

In order to assist companies in their transformation into "lean enterprise", accounting will have to adapt to the changes and provide relevant, accurate, understandable and timely management information. Therefore, a new Knowledge Society product will take the name of *lean accounting* and will use some new methods and tools designed to simplify accounting systems and to eliminate waste from company activities, while maintaining economic and financial control and a high performance.

2. What is the lean concept?

The Knowledge Society, constantly change the customer values. What today only wants tomorrow will become a real need. Technology, which is in a continuous transformation and improvement, produce major changes in customer behavior. Can we now imagine that, in the information society, we could live without mobile phones, internet or e-mail? And yet, some time ago, these things do not even exist.

Adjusting to new economic environment, the Japanese from Toyota cleverly set up a management system that emphasizes the importance of customer and what he wants and value.

The principles underlying lean thinking were set out by James P. Womack Womack and Daniel T. Jones in *Lean Thinking: Banish Waste and Create Wealth in Your Corporation*, a book published in USA in 1996, and they are:

- specify the *value* for each product family, from the final customer's standpoint;
- identify all component activities of the *value stream* for each product family, eliminating as much as possible those loss-making activities;
- ranking value creation activities in a sequence (stream) of clearly identified steps, so that the final product reach the final customer as going through a *continuous flow*, without much interruption, intermediate stops;
- once value flow was established and implemented, any internal or external customer can apply the *system "pull"* to pull the product upstream, on the stream of production;
- when the value have been specified, the value-creating activities identified, the waste eliminated, the value stream set and implemented, you can pass on to the operational process and *improve* it, until it reaches an optimal level, those that the value added is maximum and is eliminated most of the waste.

The simplest definition of the lean concept calls for three fundamentals: *flow*, *pull* and *continuous improvement*.

Flow means that the manufacturing processes should work as a continuous flow with minimum disruption. In the lean

language, these continuous processes are called *value streams* and are contrary with the flowcharts of most companies, such departmental and functional organization.

Customer value is provided through the value stream, and in an ideal situation, a value stream contains only *value-add activities*. In lean companies, those activities are defined by the client, and everything that is a *non-value activity* is called *waste* and it is eliminated. As tool for the identification of the activities, events, information and planning time within a value stream, usually it is used *value stream mapping* - VSM. Usually this is a chart that includes all necessary steps to go from receiving an order to supply the product / service requested by a client.

In a lean company, *flow system* concept is applied everywhere: from the first action of the value stream and by the time the product / service reaches the customer.

In a perfect flow system, production process does not suffer any interruption, which means that it will be no need to stock up, there will be no waste, and the equipment will always running. But for this, production process must be perfectly synchronized with the consumption rate of clients. This rate, in the lean language, is called *takt time*. Therefore, considering the takt time value, you can make adjustments on the production process, so that it aligns with customer demand. If demand is bigger than the production capacity, adjustments will be introduced in sense of minimizing the required time to produce a product, and reverse, if demand is lower, then the takt time must increase and the resources allocated to the production process to decrease similarly.

Generalizing, the concept of lean was achieved by applying this paradigm to the processes outside manufacturing, such as healthcare, financial services and construction.

Pull concept put to forefront the following idea: the production process should occur in response to actual demand and not following forecasts made on the speed of rotation of stocks. A *pull-type system* is used to manage production flow and to set each tasks when the flow process is initiated. Instead of producing based on forecasts, it will occur only when an order is received. To keep the

system operating at a constant and optimum level, lean practice us use *level scheduling*.

Let's take the example of the supermarket chain Wal-Mart. They implement a Business Process Management system that when customers pass beyond cash registers and the voucher is issued, information regarding the sold products is sent in the upstream of the supply chain and replenishment the triggers. So, as the client consumes a product/service, the pull-type system will replenish their consumed stock. In the lean language, the signal to replace what is consumed is called *kanban*.

The *continuous improvement* refers to the fact that a company should made efforts to reduce waste and the process of improving productivity should be constant and should never have an end point. Employees in an organization must be encouraged and must have responsibilities to improve company products and processes and also be empowered to implement the new changes. *Kaizen* is the lean concept used to address it. The word is Japanese and, in essence, means continuous improvement. Japanese management model has demonstrated many times that progress in small steps, but fast, reliable and lead to long-term, wins. Unlike the western concept which implies a total change at intervals of time, using large amounts of resources, through kaizen it is aimed a gradual improvement, slow but continue, with the improvements from day to day.

3. What is lean accounting?

Many companies try to implement the lean production methods and acknowledge that management accounting methods are outdated. Traditional accounting system is designed to support older manufacturing processes based on mass production and, with the shift from mass production to lean manufacturing, traditional accounting methods must also be adjusted or changed. Lean accounting is the term generally used for accounting changes that a company needs to support lean thinking and lean manufacturing.

Lean accounting concept has two accepted understandings and may be used in an inappropriate manner. The first sense is the

accounting for lean (lean accounting that records changes) and the analysis/determination systems and cost control for lean companies. The second sense is that of *lean accounting* and it is referring to the need for lean principles in the administrative processes of companies. Therefore, it follows that the first fundamental objective of lean accounting can not be other than providing to the production, logistics, marketing, sales, research and development relevant, accurate, fast and useful information, for guiding decisions in the company's lean transformation process. The second key objective will be that of simplifying accounting systems by eliminating waste and unnecessary transactions and still maintaining an economic and financial control of the company.

4. Lean accounting principles, practices and tools

To become a lean enterprise, a company must apply the principles of lean management at any sector level, not only at technical, logistical and production level. Therefore, by the point of accounting, the five lean principles are:

- *value*: instead of trying to forecast the standard cost of the product based only on internal calculations and motivating excess production in order to reduce deviations, accounting methods will be based on what costumers values;
- *value stream*: cost accounting focuses on determining the value stream costs and not the individual product; tracking the costs and profitability of the value streams drive to continuously improvement of the company's activities and enables an excellent cost control; lean principles agree that maximum profitability is given by the maximization of the product flow through a process and not by maximizing the use of labor and equipment;
- *flow and pull*: while the traditional accounting system is based on an internal forecast, lean methods starts with the costs of the customer orders (external);
- *continuous improvement*: principles set forth above are intertwined, creating a proactive vision so that lean accounting to

become a real support for strategic decisions; accountant staff works with cross-functional teams to improve their activities and to provide a perspective picture on the entire business.

Brian Maskell in his article *Lean Accounting: What's all about?* [9, p. 37] makes a classification of the main methods and tools used by lean accounting. Among these are:

- *tools* - visual indicators, performance tables, box scores, value stream boards, "Plain English" for preparing the financial statements, value stream maps.

- *methods* - value stream costing, value-based pricing, target costing, capital planning 3P approach; Plan-Do-Check-Act (PDCA) of all problems; Hoshyn deployment policy.; use Sales, Operations and Financial Planning (SOFP) for budget preparation.

A lean production system is characterized by focusing on product family. Physical material flow takes place without obstacles since purchasing materials until finished product is delivered. The flow, at planning level, is extracted from the customer order and, therefore, synchronized with what the market actually requires. So, a lean organization reduce the internal time work, final product is delivered faster to customer and inventory is reduce.

In lean vision, individually product costing represents a waste of time. The only cases where this would be relevant are: the valuation of stocks (in the early stages of adopting lean) and determining the selling price in case of special products.

Value Stream Costing is a lean accounting method that replaces traditional methods of cost calculation. Lean accounting collect costs and report them according to the value stream as a whole, and not by product or department. According to lean thinking, cost varies depending on the volume of production. Maximum profitability is given by creating a maximum flow of product through the value stream when the customer makes the request. Value stream costing is calculated weekly and makes no distinction between direct and indirect costs.

Target Costing is a lean accounting tool used to understand how the company creates value for its clients and what must be done to increase this value. Target costing is used

when new products are designed and when the value stream team must make further changes to increase the value of the flow.

In lean enterprises budgeting and financial planning is done every month, each value stream, and the process is called *SOFP (Sales, Operations and Financial Planning)*. The process is fast and efficient. Lean planning have roots in the company's operational needs - marketing activities, sales, production, etc.- and this means that we can have balance and valid reports before closing the month, creating the ability to manage and control the organization proactively.

Routine decisions that management must take are supported by the lean accounting box score. *Box score* is a table that brings together company's financial performance, the operational performance and the capacity of the value streams, here including productive activities and productive capacity that could be used.

Capital planning in a lean company is not based on an analysis of indicators such ROI. When the top management needs to take a decision on a major investment, the method used by lean accounting is the *3P method* (Production, Preparation, and Process). A 3P process takes into account available personnel, production capacity of enterprise and other resources available and proposes several strategies to use and increase their profitability [1, p.30].

5. Benefits of lean accounting

Lean accounting followers assign it a number of benefits which worth mentioning. The first would be that lean accounting closely follows lean manufacturing and can report in an exactly way what happens on the production floor. However, this benefit is registered only by companies that are implementing or have implemented lean manufacturing, like Toyota, Boeing, Aero Gear Inc., Danaher and others.

Another advantage is that lean accounting systems collect data by the value stream and not by department.

Lean accounting is representing a new direction to accounting and by adapting to the information society requirements, frequently uses non-financial performance indicators to

help management with vital in formations. Although there are traditional costing methods that use these indicators, lean accounting manages to apply them in three different circumstances: at the work cell level, at the value stream level, or at the company equipment level [8].

Another addition that lean accounting register is the common and current reports and the intelligibility with which they are drawn. It can be understood even by non-accounting managers.

Once lean principles become part of the company daily routine, lean accounting system will reduce the need for the already known data analysis. In other words, a certain amount of inputs, be it made of materials, raw materials or direct labor, will always have the same output of goods/ services and therefore should not be calculated this indicator every time. So, the lean accounting systems eliminate those activities that are not creating value.

6. Barriers who might delay the application of lean accounting

In 2008, on the Manufacturer magazine's website study appeared a study, *Lean Accounting Report 08*, as part of The Manufacturer Industry Research Programme, in collaboration with BDO Stoy Hayward and aiming to examine the popularity and use of lean accounting in lean manufacturing companies from UK. The study was made using a questionnaire with 15 questions. After the researchers received the feedback from participants and analyze them, they reached the following conclusions: 65% of respondents know about lean accounting, yet 49% of them only know the basics and rudimentary notions. Researchers also highlighted that 60% of managers do not understand lean accounting key concepts. The managers believe that the implementation of lean accounting in companies strikes these barriers: company culture (42%), inability to measure benefits (51%); implementation time (32%), accounting staff attitude (30%), top management attitude (18%).

We could say that the lean accounting implementation is about to face the same

difficulties that traditional methods faced some times ago.

The society is constantly developing and thirst for information is difficult to sedate. Although it seems very appropriate today to say that traditional costing methods do not meet the needs of management, we can not deploy some preconceived ideas about the fact that what has survived over time, and here we refer to traditional methods, should not be changed.

In the Knowledge Society, the accounting professional's world is changing very fast. In their attempt to represent the economic reality and its evolution, accounting professionals must keep up with these changes and become multi-valent. In these days the accounting knowledge are not enough. They must learn also from other areas that intersect with it. Only this way they will be able to maintain their position in the economic environment and remain the steadfast pillar of the economy.

Unfortunately, lean accounting is often facing the inability to adjust the accounting staff and with their reluctance towards new.

As a new method, lean accounting and is facing with the recognition from international regulatory bodies, as IASC, FASB and others.

Another difficulty is linked to the costs involved in the implementation of such a system. Like any new investment, a lean accounting system involves some costs of implementation. Sometimes such a system can be expensive, depending on company size and adaptation point to the change.

7. Conclusions

Lean Accounting is right now a work in process, as Brian Maskell told in one of his papers, and is difficult to foresee whether it will develop or not in the current economic context. It is in early stages and probably will be more widely accepted by those companies that have, or are about to implement lean manufacturing. However, while accounting professionals seek ways and learn how to translate the financial impact of adopting lean principles in the financial statements, specialized international forums should develop a plan for implementing lean accounting and strictly comply it with

rigorous requirements of international accounting standards.

Taxation of Revenues from Transfer of Real Estate Assets to Own Patrimony

Cucosel Constantin
North University of Baia Mare
costin.contab@xnet.ro

Abstract

Direct taxes, which are levied individually, represent the oldest form of taxation. They are levied either on certain material assets or types of activities, or on revenue or wealth. Direct taxes are nominative and their amount and due date are established in very precise terms, therefore they are fairer and more desirable than indirect taxes.

Direct taxes may take two forms: real or objective taxes, and personal or subjective taxes. The personal ones occur as income taxes and wealth tax.

Key words: direct taxes, asset, real estate, patrimony, levy

JEL classification: H71

1. Presentation of wealth taxes

Within the fiscal procedures of various countries, wealth taxes occur in different forms [1]:

- *Taxes on wealth proper*
- *Taxes on wealth circulation*
- *Taxes on wealth increases or increases in the wealth's value.*

A) Taxes on wealth proper may occur both as taxes levied on the wealth but paid out of the revenue obtained from that wealth, and as taxes levied on the wealth itself. Taxes on wealth proper may take the following forms:

a) Taxes on real estate assets, which occur as building taxes and land taxes. The taxation base in this case is either the replacement value or the value stated by the owner, or the capitalized revenues related to the assets at hand. The tax rates are generally low;

b) The net asset tax, which is levied on the entire fixed and mobile asset property of a tax-

payer; the tax amount is calculated either using pro rata rates, (in Germany, Austria, Netherlands, etc.), or progressive rates (in Denmark, Sweden, Switzerland, etc.).

B) Taxes on wealth circulation are applied to the transfer of property rights over fixed and mobile assets from one person to the other. This category includes the following:

a) Inheritance tax, in which case the object of taxation is the wealth received as an inheritance by a physical person. This tax may be calculated either globally, for the entire wealth inherited (the USA, UK, Australia, etc.), or separately, for the share of wealth assigned to each heir (Belgium, France, Sweden, Germany, etc.). The tax is calculated based on progressive rates, and the maximum rate may reach, in some case, up to 80%;

b) Tax levied on donations, which was introduced to prevent people from avoiding to pay inheritance tax by claiming the wealth was donated while the person was alive. The tax is applied to the person receiving the donation, called the donee, and is calculated based on progressive rates the level of which depends on the value of the donated wealth, family relationship, time and purpose of the donation, etc.;

c) Taxes levied on sale-purchase agreements for real estate assets or movable assets; these occur within onerous wealth circulation procedures, and they are the responsibility of the buyer. To calculate this tax, some countries use pro rate rates, others use progressive ones;

d) Tax levied on securities (shares, bonds, etc.);

e) Tax levied on capital circulation and commercial papers.

C) Taxes on wealth increases (increase of the wealth), are levied on the additional value incurred by certain assets over a given period of time. This category includes the following:

a) *Tax on the added real estate value*, which was introduced in order to levy tax on the additional value incurred by certain real estate assets (land and buildings), over the period of time between purchase and sale, without any expenses incurred by the owner to that aim. The subject of taxation is the seller of real estate assets, and the object is the difference between the selling price and the purchase price;

b) *Tax on wealth increases obtained at times of war*, which are levied on the wealth acquired during or as a direct consequence of war. In some countries this tax was introduced as a tax on the war over-profit, which was calculated either on the profit exceeding the level of that period considered as basis, or on the profit that exceeded a certain rate, deemed normal.

2. Wealth taxes in Romania

In Romania, the main forms of wealth taxes are as follows:

- *Taxes on buildings and land*, as taxes on wealth proper
- *Taxes on wealth circulation*:
 - *inheritance taxes*;
 - *taxes levied on donations*;
 - *Taxes levied on the sale-purchase of real estate assets or movable assets*.

The taxes on buildings and land, as a form of tax on wealth proper, are included in the category of local taxes and fees, and are regulated by the Law no. 571/2003 on the Fiscal Code [2].

The *tax on revenues from the transfer of real estate assets to the own patrimony* was introduced beginning on June-1st-2005, through the Law no. 163/2005, on approving the Government Emergency Order no. 138/2004 on amending and completing the Law no. 571/2003 on the Fiscal Code [3].

According to these legal provisions, the following were subjected to taxation: revenues obtained from the transfer of the property right over *constructions of any kind and land that comes with them, which have been sold within 3 years (inclusive)* after the date they were acquired, as well as revenues obtained from the transfer of the property right over *lands of any kind, construction-free, acquired after January-1st-1990*.

The taxable revenue obtained from the transfer of real estate assets is the positive

balance between the value that these real estate assets, lands and/or constructions, were sold for, on one hand, and their base value on the other hand.

The following were exempted from taxation: asset contributions to the social capital of trading companies, as well as revenues obtained by selling any kind of buildings with the land that comes with them, construction-free lands from inside or outside towns, acquired by the tax payers by any of the following means:

- a) restoration of the property right;
- b) inheritance or donation between relatives down to fourth degree inclusively;
- c) real estate exchange.

The base value of real estate assets subject to taxation, *according to the way they were acquired*, was established taking the following into account:

a) the purchase price, in the case of real estate assets acquired through purchase, increased by 5%;

b) the value of the real estate asset, as established in the document, if it was obtained through a donation, exchange, life annuity, payment, adjudication, maintenance agreement, court decision, etc., increased by 5%;

c) for new constructions, their cost at the time of completion, as established through an authorized expert's report, according to the law, plus the value of the land that comes with it;

d) the value resulting from the expert's reports used by the public notary chambers, at the date when the real estate assets were acquired, if their base value cannot be established through the means provided at letters a)-c);

e) the value established depending on the way they were acquired, as established at letters a) and b), for lands located inside or outside town limits, updated as per the economy inflation rate for the last month for which official data is available, as communicated by the National Statistics Institute, if, at the time they were acquired, there were no available expert's reports prepared by public notary chambers. For lands and constructions of any kind, acquired by the tax payers in a way that does not specify the value they were acquired for, the base value is the minimum values established in the first expert's report used by the public notary chambers having jurisdiction over the area where the land is located;

f) the purchase price for assets acquired as per the conditions at letter a) or the value mentioned for assets acquired as per the conditions at letter b), plus the cost of any such works or services as may increase the value of the real estate asset, at the time of their completion, proved through an authorised expert's report, as per the provisions of the law.

The tax was calculated by applying a *10% rate to the taxable income*, determined as presented above.

The public notaries who have endorsed the documents operating the transfer of property right must calculate, cash in and pay the tax *to the state budget no later than the 25th of the month following the one when the document was endorsed*.

If the transfer of the property right for constructions or lands has been completed through other procedures between living persons, not involving notaries, the tax payer must submit a statement of the income obtained within no more than 5 days of the sale of the asset, to the fiscal body having jurisdiction over the location of his fiscal domicile. Tax payers whose fiscal domicile is not in Romania have submitted statements of the revenues they obtained to the fiscal body having jurisdiction over the location of the real estate asset at hand.

The Law no. 163/2005 established that, *beginning with January-1st-2006*, the income tax for physical persons, for revenues obtained from the transfer of real estate assets from the own patrimony, must be calculated using a *tax rate of 16%*.

The procedure for calculating tax on revenues obtained from the transfer of real estate assets from the own patrimony has been modified, *beginning January-1st-2007*, at the coming into effect of the provisions of the Law no. 343/2006 for amending and completing Law no. 571/2003 on the Fiscal Code [4].

Thus, when transferring the property right and its dismembered rights, through legal documents between living persons, on constructions of any kind and the lands that come with them, as well as on lands of any kind, construction-free, the tax owed by the tax payers is calculated as follows:

a) for constructions of any kind and the lands that come with them, as well as for lands of any kind, construction-free, *obtained within 3 years* inclusively:

- 3% up to the value of lei 200,000, inclusively;

- over lei 200,000, lei 6,000 + 2% calculated for the value over lei 200,000 inclusively;

b) for the real estate assets presented at letter a), *acquired more than 3 years ago*:

- 2% up to the value of lei 200,000 inclusively;

- over lei 200,000, lei 4,000 lei + 1% calculated for the value over lei 200,000 inclusively.

The tax *is not due* in the following cases:

a) when the property right on lands and constructions of any kind was obtained by restoring property right on grounds of special laws;

b) when the property right is obtained as a donation between relatives and in-laws of up to the third degree of relations, as well as between spouses.

The tax is not due in the case of property rights and their dismembered rights if they were obtained through inheritance and the procedure is debated and finalized within 2 years of the death of the person authoring the inheritance. If the inheritance procedure is not finalized within the above-mentioned deadline, the heirs owe a tax of 1% of the value of the inherited assets.

The due tax is calculated based on *the value stated by the parties* in the document operating the transfer of the property right or its dismembered rights. If the value stated is lower than the guideline value established through the expert's report prepared at the public notary chamber, the tax will be calculated based on the level of the value established through the expert's report, except in the case of transactions made between relatives or in-laws of up to 2nd degree of relation, inclusively, as well as between spouses, in which case the tax is calculated based on the value stated by the parties in the document operating the transfer of the property right.

The public notary chambers must update at least once a year the expert's reports on the circulation value of real estate assets, which will be notified to the territorial departments of the Ministry of Public Finances.

The due tax is calculated and cashed in by the public notary before certifying the document or, if such is the case, after drafting the final inheritance document. The due tax that was cashed in is then paid no later than the 25th of the month following the one for which it was

retained. If the transfer of the property right or its dismembered rights is made through a court decision or another procedure, the due tax is calculated and cashed in by the relevant fiscal body. The courthouses that issue definitive and irrevocable decisions notify the relevant fiscal body with the decision and related documentation within 30 days of the court decision becoming definitive and irrevocable. For other procedures, which are executed neither by public notaries nor by courthouses, the tax payer must submit a statement of the income he obtained within 10 days of the date of the transfers, to the relevant fiscal body, in order to have the due tax calculated. When recording rights acquired based on documents certified by public notaries or certificates of inheritance or, if such is the case, courthouse decisions and other documents in the other cases, the actuaries of the land registry offices shall verify that the requirement of paying the tax has been met, in case the tax payer cannot bring proof of having paid this tax, shall refuse to record the rights until such tax is paid.

The tax established as per the conditions above has been *distributed* as follows:

- a) a share of 40% revenue to the consolidated budget;
- b) a share of 50% revenue to the budget of administrative-territorial units having jurisdiction over the real estate assets that were subject to the transfer of rights;
- c) a share of 10% revenue to the budget of the National Agency of Cadastre and Land Registration in order to carry out the activity of real estate publicity.

Through the government emergency order no. 106/2007 [5], which came into effect *beginning January-1st-2008, these destinations are modified so that the established tax is paid and retained entirely to the state budget.*

The procedure for calculating, cashing in and paying the due tax, as well as the requirements with regards to income statements, are established through methodological regulations issued through a common order of the ministry of public finances and ministry on justice, taking into account the opinion of the National Union of Notaries Public from Romania.

In case that, after the document has been certified or the final document has been drafted by the public notary for an inheritance procedure, it is found that there were errors or omissions in calculating and cashing in the tax,

the public notary will notify the relevant fiscal bodies of this situation, explaining the causes that led to that error or omission. The relevant fiscal bodies will issue taxation decisions for the taxpayers who must pay the tax, to ensure that the tax is cashed in. The responsibility of the public notary for failing to cash in or for erroneously cashing in the tax is only involved if it is proved that the public notary is guilty of having completely or partially failed to cash in the tax, and that he did so on purpose.

Public notaries must submit bi-annually, tot the territorial fiscal body, an informative statement on the transfers of real estate assets, including the following elements for each transaction:

- a) contracting parties;
- b) value recorded in the transfer document;
- c) the tax on the revenue obtained from the transfer of the real estate assets from the own patrimony;
- d) the notary fees due for the transfer.

3. Conclusions

In its initial form, the tax levied on revenue obtained from the transfer of real estate assets from the own patrimony, which was introduced beginning with June-1st-2005, was included in the category of *taxes on wealth increases* (increases of the wealth), respectively *taxes on the added real estate value* and it was levied on the additional value registered for real estate assets (buildings, lands) over the period between its purchase and its sale; this tax was calculated by applying a 16% rate (over the period June-1st-2005 – December-31st-2005 the rate was of 10%) on the difference between the sale price and the purchase price of such assets.

The new methodology for calculating this tax, applicable beginning January-1st-2007, establishes this tax as belonging to the category of *taxes on wealth circulation*, which are levied in connection to the transfer of property rights over fixed and mobile assets from one person to another, respectively the category of *Taxes levied on the sale-purchase of real estate assets or movable assets*, which occur when wealth is circulated in an onerous manner.

Currently, in addition to the loss incurred by the dramatic drop in the value of constructions and lands as measured on the real estate market, the seller must also undergo the fiscal burden of

the tax which wouldn't have been owed to the state budget if the initial taxation system had been kept in place.

Analysis and Evolution of School-Related Budget Expenses in the Town of „Viseu de Sus”, Maramures

Cucoşel Constantin
North University of Baia Mare
costin.contab@xnet.ro

Abstract

In any country, a significant part of the national revenue is made available to cover the expenses incurred by the completion of its functions and tasks. The state, as institution, serves society from a political and social point of view, meaning that it creates the necessary conditions for maintaining public concepts and institutions, as well as the legal, religious, and philosophic ones.

Budget expenses are allocated from the state budget so as to cover military expenses, the maintenance of the state apparatus, payment of the public debt, to ensure subsidies, develop the state economic sector, cover social and cultural requirements, as well as research and development ones.

Key words: budget expenses, school-related expenses, degree of completion

JEL classification: H52

1. The role of public expenses

Public expenses represent the second stage in the distribution of public finances, which is the allocation of public financial resources to various purposes [1]. The actual use of these resources for the completion of targets established through government programmes related to social or economic activities, or other kinds of activities carried out through such programmes is reflected in the public expenses. By means of public expenses, the state covers the public requirements for goods and services deemed to have a higher priority for each given period of time.

The public expenses are a monetary expression of the social and economic relations occurring between the state, on one hand, and the physical persons and legal entities on the other hand, as the state's financial resources are allotted and used so as the state may achieve its functions.

The economic contents of public expenses are often related to their purpose [6]. Thus, certain expenses express a *definitive consumption of gross domestic product*, representing the value of payments made by public institutions in the specific forms of ongoing expenses, whereas other public expenses express an *investment of gross domestic product*, representing the state's participation in financing the gross building of capital, both in the field of material production and in the non-material one.

Since it does not participate directly in the productive activity, the state covers its expenses related to military purposes, maintenance of administrative and police bodies, justice sector, etc., by using some of the national revenue created from material production.

The state completes its two functions – domestic and foreign – by means of a complex and varied system of institutions and entities; amongst them, a permanent army, the police, constabulary, security, justice and public attorney office, administrative bodies, school and church institutions take a particularly significant role. To ensure their maintenance, the state spends yearly large amounts of money.

In order to observe the size of the actual increase in public expenses, one needs to analyze their evolution relative to the progress of gross domestic product (or national income) and obviously, to use the same concepts. The weight

of public expenses relative to the gross domestic product shows the mutations that occurred in the distribution of the gross domestic product, over a given period of time, through the state's intervention.

2. Analysis on the execution of school-related expenses over the period 2006-2008

The degree of completion of expenses related to primary education in 2006 [7] is presented in *table 1*; thus, one may see that the highest degree of completion was in the case of other expenses—100%, whereas the provisions for staff-related expenses were completed up to 98.65%, the ones for goods and assets were completed to 79.64%, and the lowest degree of completion was for capital expenses – 53.88%.

Table 1 Degree of completion for total expenses executed in 2006

Name of the indicator	Scheduled for 2006	Paid in 2006	%
Total expenses	4,560,000	4,260,114	93.42
Staff expenses	3,729,000	3,678,630	98.65
Goods and services	478,000	380,695	79.64
Capital expenses	330,000	177,789	53.88
Other expenses	23,000	23,000	100.00

The degree of completion of staff expenses in 2006 [7] is presented in *table 2*, where one may see that the amount of staff expenses did not meet the scheduled level, missing the target by 1.35%. Also, one may notice that the money salaries expenses were completed up to 99.74%, whereas contributions were completed up 95.32%.

Table 2 Degree of completion for staff expenses executed in 2006

Name of the indicator	Scheduled for 2006	Paid in 2006	%
Staff expenses	3,729,000	3,678,630	98.65
Money salaries expenses	2,807,000	2,799,776	99.74

Contributions	922,000	878,854	95.32
---------------	---------	---------	-------

When analyzing the degree of completion for goods and services expenses executed in 2006 [7] (*table 3*), one will notice that the highest degree of completion was achieved for travelling, relocation and transfers – 141.73; also, the budget amounts for ordinary repairs were exceeded by 119.26%, whereas pharmacy related expenses were completed 100% and it was only the goods and services expenses for that year that didn't reach the budgeted amount, with 34.32%, and the ones related to inventory items, with 16.45%. Zero completion was recorded for expenses related to books, publications and documentary materials.

Table 3 Degree of completion for goods and services expenses

Name of the indicator	Scheduled for 2006	Paid in 2006	%
Goods and services	478,000	380,695	79.64
Goods and services	332,000	218,074	65.68
Ordinary repairs	112,000	133,574	119.26
Inventory items	20,000	16,709	83.55
Travelling, relocation, transfers	8,000	11,338	141.73
Books, publications, documentary materials	5,000		0.00
Pharmacy	1,000	1,000	100.00

Table 4 shows that, in 2006, the expenses related to pre-school education were completed to 100% [7].

Table 4 Degree of completion for pre-school education expenses in 2006

Name of the indicator	Scheduled for 2006	Paid in 2006	%
Total expenses	1.002.000	1.002.000	100,00
Staff expenses	840.000	840.000	100,00
Goods and services	92.000	92.000	100,00

Capital expenses	70,000	70,000	100,00
------------------	--------	--------	--------

The degree of completion for primary school expenses in 2007 [7] is presented in *table 5*, and one may notice that staff expenses, capital expenses and other operations were completed at 100%, whereas goods and services expenses were completed up to 91.12%, and the scheduled self-financing was only completed to 57.14%.

Table 5 Degree of completion for total expenses in 2007

Name of the indicator	Scheduled for 2007	Paid in 2007	%
Total expenses	4,202,000	4,179,000	99.45
Staff expenses	3,263,000	3,263,000	100.00
Goods and services	259,000	236,000	91.12
Capital expenses	658,000	658,000	100.00
Self-financing	14,000	8,000	57.14
Other operations	22,000	22,000	100.00

Table 6 shows that in 2007 staff expenses within pre-school education were completed up to 100% [7].

Table 6 Degree of completion for staff expenses in 2007

Name of the indicator	Scheduled for 2007	Paid in 2007	%
Staff expenses	3,263,000	3,263,000	100.00
Money salaries expenses	2,564,000	2,564,000	100.00
Contributions	699,000	699,000	100.00

Table 7 analyzes the degree of completion for goods and services expenses executed in 2007 [7]; one may notice that several categories of expenses have been completed to 100%, such as: expenses related to ordinary repairs, to travelling, relocation and transfers, and books, publications and documentary materials. One may also note that goods and services expenses

were completed to 92.44%, and the ones related to inventory items – 75%

Table 7 Degree of completion for goods and services expenses

Name of the indicator	Scheduled for 2007	Paid in 2007	%
Goods and services	259,000	236,000	91.12
Goods and services	238,000	220,000	92.44
Ordinary repairs	5,000	5,000	100.00
Inventory items	4,000	3,000	75.00
Travelling, relocation, transfers	7,000	7,000	100.00
Books, publications, documentary materials	1,000	1,000	100.00

In that which concerns pre-school education expenses for 2007 [7], their degree of completion is presented in *table 8*, where one may note that staff expenses and capital expenses were completed to 100%, whereas goods and services expenses were completed to 81.98% of the scheduled amount.

Table 8 Degree of completion for pre-school education expenses in 2007

Name of the indicator	Scheduled for 2007	Paid in 2007	%
Total expenses	918,000	897,000	97.71
Staff expenses	789,000	789,000	100.00
Goods and services	111,000	91,000	81.98
Capital expenses	17,000	17,000	100.00

For the year 2008 [7] the total expenses made for primary school were completed as shown in *table 9*, and, in decreasing sequence, they were as follows: staff expenses– 102.57%, other expenses– 99.53%, capital expenses – 97.25% and goods and services expenses – 84.71%.

Table 9 Degree of completion for total expenses in 2008

Name of the indicator	Scheduled for 2008	Paid in 2008	%
Total expenses	4,786,000	4,826,501	100.85
Staff expenses	4,197,000	4,304,823	102.57
Goods and services	412,000	349,020	84.71
Capital expenses	154,000	149,765	97.25
Other expenses	23,000	22,893	99.53

As an analysis of the staff expenses for 2008 [7], *table 10* below present the degree to which they were completed:

Table 10 Degree of completion for staff expenses in 2008

Name of the indicator	Scheduled for 2008	Paid in 2008	%
Staff expenses	4,197,000	4,304,823	102.57
Money salaries expenses	3,332,000	3,342,110	100.30
Contributions	856,000	962,713	112.47

In the case of goods and services expenses made in 2008 [7] the degree of completion is presented in *table 11*; one may notice that the highest degree of completion occurred in the case of expenses related to relocations and transfers – 182.28%, but a high degree of completion also occurred with professional training expenses– 144%. The expenses related to ordinary repairs were completed up to 100%, the ones related to inventory items – 98.58%, and the lowest degree of completion was for goods and services expenses – 84.14%.

Table 11 Degree of completion for goods and services expenses in 2008

Name of the indicator	Scheduled for 2008	Paid in 2008	%
Goods and services	412,000	349,020	84.71
Goods and services	350,000	294,492	84.14
Ordinary repairs	30,000	30,000	100.00
Travelling, relocation, transfers	6,000	10,937	182.28
Inventory items	6,000	5,915	98.58

Professional training	2,000	2,880	144.00
Other expenses	17,000	4,796	28.21

The expenses related to pre-school education in 2008 [7] were completed to a degree of 87.31%, out of which 89.31% for staff expenses and 63.07% for goods and services expenses (*Table 12*)

Table 12 Degree of completion for pre-school education expenses in 2008

Name of the indicator	Scheduled for 2008	Paid in 2008	%
Total expenses	1,100,000	960,410	87.31
Staff expenses	1,016,000	907,430	89.31
Goods and services	84,000	52,980	63.07

Following the analysis of the expenses related to primary schools and pre-school education, the progress of these expenses is presented in *tables 13* and *14* below.

Table 13 Evolution of primary school expenses over the period 2006 – 2008

Name of the indicator	2006	2007	2008
Total expenses	4,260,114	4,179,000	4,826,501
Staff expenses	3,678,630	3,263,000	4,304,823

The value progress of expenses for pre-school education over the period 2006-2008 is presented in *table 14*.

Table 14 Evolution of pre-school education expenses over the period 2005 – 2008

Name of the indicator	2006	2007	2008
Total expenses	1,002,000	897,000	960,410
Staff expenses	840,000	789,000	907,430

3. Conclusions

Following the analysis of expenses related to primary schools and pre-school education, as presented above, we shall analyse the progress of these expenses in *tables 13 and 14*.

Table 13 Evolution of primary school expenses over the period 2006 – 2008

Name of the indicator	2006	2007	2008
Total expenses	4,260,114	4,179,000	4,826,501
Staff expenses	3,678,630	3,263,000	4,304,823

The evolution in terms of value of the expenses related to pre-school education over the period 2006 – 2008 is presented in *table 14*

Table 14 Evolution of pre-school expenses over the period 2005 – 2008

Name of the indicator	2006	2007	2008
Total expenses	1,002,000	897,000	960,410
Staff expenses	840,000	789,000	907,430

As it may be observed in the data presented above, the expenses related to *primary schools* in 2007 have dropped relative to 2006 by 1.9% with respect to total expenses, and 11.3% with respect to staff expenses, but total expenses rose in 2008 relative to 2007 by 15.5%, respectively the staff expenses increased by 31.9%.

The same tendency applied to the expenses related to *pre-school* education, which saw a drop in 2007 relative to 2006, by 10.5% for total expenses, respectively 6.1% staff expenses, followed by an increase in 2008 relative to 2007 of the total expenses by 7.1%, respectively staff expenses by 15.0%.

Abstract

Any organization is obligated to adapt, to the business environment, maintaining in the same time, the internal cohesion and reducing to minimum the uncertainty that characterizes the internal and external transformations of the environment. This phrase refers to the sustainable activity that enterprises must develop day by day. In this direction, each participant in the economic activity, should identify the instruments, that lead to the development wanted in the company and especially to the funds, necessary for the progress. An analysis of the financing sources available for each enterprise, in achieving the plans for expansion, is a good start.

Key words: sources of financing, leasing, vehicle, equipments, real-estate.

JEL classification: D92

1. Introduction

The process of choosing a mean of financing is a combination between science and art. Entrepreneurs must take into account many factors that can influence their economic activity. They must estimate the financial resources that they need in order to turn their company to a high level in the business environment.

Depending on the stage in the life cycle of a company, financing needs are different and the possibilities for finding appropriate sources differ also. At the launch, the

enterprises have difficulties regarding the capital required to start their business, because at this point they represent a high risk for creditors and investors. The result of this situation is that most companies at the beginning are financed from own resources of the entrepreneur, such as savings, personal loan, but also resources provided from the family and friends. In the stage of development and growth, when firms are usually financial established, companies have multiple funding sources as a result of the customers and suppliers acquired. At this point the company can apply for a credit. In the decline stage, when the demand, sales and profits fall, also the financing possibilities are reduced.

Potential sources of funds, to finance business activities, depending on the need to return the amount financed, are divided in: repayable and non - repayable.

Non-repayable funds are provided from European Union (European Funds, Structural Funds), the World Bank.

Repayable funds come from internal sources of financing, represented by financial institutions such as banks, microfinance institutions, investment funds, leasing companies, credit on trade effects, credit from suppliers and customers, and from external sources of financing, from international financial institutions, such as the World Bank, European Investment Bank.

2. Leasing – original technique of financing

Generally speaking, **leasing** is a long-term financing operation practiced by a financial company and having as a juridical support, a lease contract.

According to the definition of the leasing operation, it is a triangular operation involving three partners having complementary interests: *the supplier* (a simple vendor or even the producer, interested in selling their asset, who will close a sales agreement with the financier of the leasing operation, assuming the typical obligations of a seller, such as delivering and installing the ordered asset at the established date and place and offering a warranty of compliance of the product to the specifications), *the financier* (which can be a financial institution or a bank specialized in placing capital in medium or long term investments, in optimum profitability conditions) and *the lessee* (or user, who has the interest of using a product without investing too much in acquiring it, thus being able to direct their own funds elsewhere).

As the Romanian economic sectors, requires modernization of the equipments, machinery and vehicles used, the leasing activities played a key role in financing new investment projects, especially after 1990.

Also, leasing can be useful to boost the development of some sectors, governors can promote tax breaks for leasing operations. Leasing can be an effective mean of developing underdeveloped regions.

In the same time, leasing represents a way to create funding sources for financing investments, proving to be one of the most effective means of financing productive investment and providing extra security to the capital holder. The state encourages financing investment through leasing operations.

Noteworthy is that the lease transaction is structured so that, this operation eliminates the difficulties faced by operators, regarding financing investments, such as the long period for obtaining a credit.

3. Past and present issues in the evolution of leasing

Lease financing developed as an important credit form after 1970. As leasing operations developed, we witnessed specific forms of organization, trade and financing.

The first leasing company established in Romania was S.C. Mister D. Leasing S.R.L. in 1994, but the first legislative support for leasing in Romania appeared in 1995, and in 1997 was issued the first Leasing Law – GO 51 / 1997, ratified in 1998. In February 1996 appears the **Association of the Leasing Companies of Romania (A.S.L.R.)** and in March 2004, the **Association of Leasing and Non-Banking Financial Services (A.L.B.)**, non-profit organizations both members of LEASEUROPE (an organization controlling around 80% of the European leasing industry). The purpose and objectives of A.S.L.R. and A.L.B. are to defend and represent the interests of the leasing companies of Romania.

If, at the beginning, the leasing market of Romania was equaled to the car leasing market, this association began to fade over time, although car leasing still has the main share of the respective domain. The evolution of leasing was due mainly to the fact that this sector has immense potential, but also to the opening of international companies' branches in Romania.

4. An analysis of the Romanian leasing market

„Chart no.1. Romanian leasing market (000 EURO)”

Source: Reports of A.L.B.

We can affirm that the leasing market has grown visibly between 2005 and 2007. Despite this growth, the percentage rate of growth decreased from one year to another as follows:

- 2005-2006: 62%
- 2006-2007: 51%

Leasing market represented in 2005 less than 1% of GDP in 2006, about 3% of GDP and in 2007 4% of GDP. The value recorded in 2008 signifies a reduction of 2.6% of the leasing market, because the real estate sector was blocked.

The leasing market recorded a slowdown, right from the third trimester of 2008, especially on the automotive and real estate leasing sectors, show the official data from A.L.B. During the final months of 2008, the drop of new cars sales – as an effect of the pollution tax, and the increase of financing costs, had a negative effect on the car leasing market.

In 2009, the leasing market recorded a slowdown, with 72 percentages, reaching approximately, 1,33 billion EURO. This situation is caused first of all because, of the slowdown recorded in the automotive market, like we mentioned before, and secondly because of the slowdown recorded in the equipment leasing market. Due to present economic situation, the incomes of the leasing societies, fell significantly, as they concluded in 2009, a small number of contracts.

Leasing companies can maintain their profitability rate in the context of the world crisis, by providing a diversified operational leasing offer, by providing closed period promotions, quality services. The companies must pay attention to their exploitation costs and direct their investments to cost-effective domains.

The world crisis may represent a development opportunity for operational leasing, second-hand leasing, medical and agricultural leasing. The representatives of the operational leasing companies claim that many firms are to turn to this segment during the crisis, in order to reduce their car fleet maintenance costs. In the case of operational leasing, the maintenance costs for cars are predictable during the entire period of the contract.

5. Romanian leasing market year to year

We are now going to make an analysis of the leasing market, starting from the three sectors financed by leasing: transports, equipments and real-estate and put a stress on the situation recorded in the last two years when there were major changes due to economy's cyclic nature. We are also going to take into account the category of the leasing company (independent, captive, or bank subsidiaries), the origin of the financed product (domestic, European Union, or imported), the category of the user (public, corporate, retail), the duration of the leasing contracts. The data used is taken from the reports of the two above mentioned associations: A.L.B., A.S.L.R.

Chart no. 2 presents the economic sectors financed through leasing operations between 2005 and 2009: vehicles, equipments, and real-estate.

Chart no.2 . Romanian leasing market year to year (000 EURO)

Source: Reports of A.L.B. and A.S.L.R.

6. Automotive leasing

The automotive leasing market, registered an increase between 2005-2007 (48% between 2005-2006, 37% between 2006-2007). In 2008, the increase is difficult to observe, the analysis indicating an increase of only 1%. The situation, is getting worse in 2009, when we assist, at a slowdown of approximately 75%, in this sector, the incomes reaching the value of 839.589.000 EURO.

In 2009, as we can notice from the chart no.2, 55% of the total value of the automotive leasing market is obtained from cars' financing, 21% from heavy commercial vehicles, 16% from light commercial vehicles and 2% from other types of vehicles.

If we analyze the destination of the automotive financing according to the user's category, we shall notice that in 2009, 91% of the total financing went to the corporate sector, 8% to the retail sector and only 1% to the public sector.

According to the leasing companies' category, in 2009 the following situation was recorded: over half of the automotive financing was given by leasing companies subsidiaries of banks (63%), the rest being shared by independent leasing companies (13%) and captive leasing companies (24%).

Moving further on with our analysis and taking into account the duration of leasing agreement, we can note that as the duration of the contract is longer, the value of the financing increases. Firstly, 26% of the financing is destined to the contracts of five years, secondly – contracts of four to five years (24%) and thirdly, contracts of three to four years (23%).

If we take into account the origin of the financed asset, over the past year, leasing companies financed 80% Romanian assets, 10% EU assets and 10% imported assets. Based on these results, we can affirm that the slowdown registered on the automotive leasing market is caused by the absence of contracts concluded with external partners this year.

7. Equipment leasing

Equipment leasing does not comprise just a greater risk, but also a larger profitability. The proof is offered by the companies specialized on different categories of equipment. Lately, there have appeared companies oriented exclusively on agricultural devices, medical equipment, IT, food industry and wood processing. The assertion of such companies on the market is not accidental; it is based on several conditions. Among these, there is the experience of the company and of the staff in the destination industry for the financed

assets, the knowledge of governmental programs to support these sectors, a territorial sales and service network and strategic partnerships with domestic and foreign suppliers and financiers. Therefore, the equipment leasing sector grew considerably over 2005-2007:

- 2005-2006: 114%; 357.933.000 EURO
- 2006-2007: 68%; 454.223.000 EURO

The situation changed in 2008 when there was a reduction in equipment leasing of 4%, that is 44 222 000 EURO. In 2009 the equipment leasing market, follows the same trajectory, like the automotive leasing market. In 2009 the equipment financing were divided as follows: 22% in constructions, 8% in IT and software, 8% in metallurgic industry, 4% in food industry, 5% in medical equipment, 9% in agricultural equipment, 3% in wood processing, and 41 % in other sectors. The equipment field was downsized by the great incidence of sophisticated fraud. The lack of access at the Banking Risk Central, as well as the lack of adequate judicial procedures, increased the volume of financial fraud losses.

8. Real estate leasing

The construction sector had an unprecedented boom in Romania over the past few years, in both civil and industrial sectors. This led to an increase in construction equipment leasing volume, but it also created the basis for the development of real estate leasing, as an efficient alternative for real estate projects financing.

Nevertheless, real estate leasing in Romania is still at its initial phase, as it had a low leasing market share of only 17% in 2008. This is due to the legislative deficiencies that do not allow real estate leasing to be clearly delimited from other types of leasing and, due to the lack of real estate specialized companies concentrated to explain to the potential clients the advantages offered by this financing form.

The legislative problems regarding the transfer of a building that is the object of a lease contract and the large amounts of money needed to be invested are responsible for the low market share of this type of leasing. The development of real estate

leasing depends greatly on the existence of a balance between the long term funds attraction (15-20 years) and the placement thereof.

The field specialists believe that the new Fiscal Code should also comprise an analysis of the fiscal implications for the real estate leasing, as there are problems in VAT refunding and some legislative imperfections related to the ownership transfer of the asset at the end of the lease contract.

Starting in 2005, real estate leasing has a new strong “adversary” which is the lack of trust from the part of the clients for this type of financing, due to the dispute in which it was implicated the only company on the Romanian market, specialized in real estate leasing (the Romanian branch of the German company MTS Leasing,), and caused damage among 500 clients, both private persons and companies.

When we analyze the evolution of the real estate leasing over 2005-2007, we may say that it was about to become an increasingly viable alternative to real estate credit. We notice a growth of over 200% over this period. But the situation recorded in the last two years, annuls these suppositions as the financing of the real estate sector is about 232 million EURO, with a drop of 34% in 2009, compared with 2008 (see chart no. 2). This year, the financing of the real estate sector is dominated by the industrial and commercial building category with a total of 57%, office spaces class A, B and C with 26%, the residential sector 18% and the hotel sector 7%, while the rest of 4% is represented by land acquisitions. On the background of the international crisis, the real estate leasing market was significantly affected starting with July, 2008.

9. Concluding remarks

Generally speaking, **leasing** is a long-term financing operation practiced by a financial company and having as a juridical support, a lease contract.

Lease financing developed as an important credit form after 1970. As leasing operations developed, we witnessed specific forms of organization, trade and financing. The first leasing company established in Romania was S.C. Mister D. Leasing S.R.L.

As the Romanian economic sectors, requires modernization of the equipments, machinery and vehicles used, the leasing activities played a key role in financing new investment projects, especially after 1990.

From the analysis carried out, we observe that the Romanian leasing market had an oscillatory trend over 2005-2008. If during 2005-2008 there were growths of over 50%, in 2009 we assist a decline of 72%.

From the research made on the Romanian leasing market year to year, it results that the automotive sector recorded the highest values over the entire analyzed period, including 2009. Equipments and real estate recorded an ascending trend between 2005 and 2007, but the equipment sector declined in 2009 with 76% and the real estate with 43%, as a result of the blockage of the real estate and the request for construction equipment. The decline of new vehicles sales – as an effect of the pollution tax and the increased financing costs – had a negative consequence over the automotive leasing market.

As a conclusion, leasing companies are going to concentrate on the dynamic sectors of the economy in order to maintain their profitability rate in 2010. Leasing companies must develop operational leasing, reduce their costs, and make cautious investments, to cover the decline registered in the automotive and real estate sectors business, that begun in 2008.

The Impact of the UE Integration on Inflation Phenomenon in Romania

Damian Monica

“Alexandru Ioan Cuza” University of Iași
m0nicadamian@yahoo.com

Abstract

Integration into the UE had generated a series of costs and benefits for the member states, with a major impact on the macro-economical level. From the perspective of the inflation rate, Romania has followed the scenario of those states that had adhered in 2004. This paper will analyze the inflation process in the pre as well as the post accession period, the factors that determine the inflation in the context of the EU accession, as well as the analysis of the correlation between the inflation rate and the main macro-economical indicators.

Key words: Integration, inflation process, main macro-economical indicators.

JEL Classification: E3, E31

1. Introduction

The adoption of the single currency implies carrying out the nominal convergence criteria provided in the Maastricht Treaty, namely: the medium inflation rate is to not outgrow by more than 1.5% the average of the first 3 states to register the best results in the field where prices are concerned, the budget deficit is to not surpass 3% of the GDP, the public debt is to not disrespect the fluctuation limits foreseen by the currency exchange mechanism of the European Monetary system by more than 60%, the long-term interest rate is to not exceed by more than 2% that of, at most, 3 member states that have scored the best results in the price field. Out of all these criteria, the first remains the critical point for the Romanian economy. Not fulfilling these criteria involves the lack of sustainability in the process of macro-stabilizing the Romanian economy. [4].

Inflation is a macro-economical process, which communes with the main macro-

economical indicators. The inflation phenomenon has become a major preoccupation for the monetary authorities in various countries of the world, especially at the beginning of the 21st century, reality which determined that the objective to diminish inflation down to a tolerant level become, in time, the most important objective of monetary policy.

Inflation might become the biggest barrier in the way of Romania's adoption of the single European currency, at the initially scheduled date, given the fact that it is a process hard to control by the state in the context of the current economical crisis, being that many active companies on the Romanian market will be tempted to compensate the drop of the sales capacity through applying pressure on prices.

2. Factors that determine inflation in Romania

Low inflation is a key component of long-term sustainable economical growth and of ensuring convergence with European economies. In this context, in August 2005, BNR, decided to calibrate the monetary policy, based on the inflation rate, going to the strategy of aiming the inflation. As such, in 2005 the recorded inflation rate was 8, 6%, that being the second year in which Romania was situated on the manifestation plane with only one digit. The disinflation process continued throughout 2006, in December 2006 recording an annual inflation rate of 4.87%, slightly below the agreed target of 5% despite the overspill in demands, which constituted a deterrent agent. This evolution was determined by the descending evolution of volatile prices (down to -2, 51% in December), especially dramatic drops recorded by vegetable and fruit prices and decrease of oil prices on international markets. Also, governed prices recorded a 4 point drop. The advantageous impact on consumership prices was also

sustained by the appreciation in the national currency in proportion to the euro, the exchange rate recording a growth of just 9, 6% in

December 2006, compared to the 19.1% that was reached in the same period of the previous year.

Table no 1. Annual growth of prices

	2006				2007				2008				2009			
	T1	T2	T3	T4	T1	T2	T3	T4	T1	T2	T3	T4	T1	T2	T3	T4

Source: National Bank of Romania

If in the first semester of 2007 the inflation rate in Romania had a descending trend, down to 3, 8%, in the second semester this changed its evolution and at the end of the year the inflation rate was 6, 57%. The evolution of the first semester was due to the appreciation of the national currency in respect to the euro and the decreases registered by the fuel prices and to some of the governed prices of the first trimester, 3.33% difference compared to the end of the previous year.

The inflation rate changed its trajectory starting with the 3rd trimester, following the influence of the significant growth of volatile prices. These recorded an almost double dynamics as opposed to the inflation rate, consequence of the side effects induced by the production decrease in vegetables and fruit. Governed prices have lessened their contribution to the inflation rate, because of the stability of power energy prices and the lower spread adjustments applied to heat energy prices, natural gas and water, sewage and sanitation services.

The inflation rate of this year has exceeded the superior limit of the target that was established for this year by 1, 57%.

Another agent that determined the evolution of inflation in the year 2007 was the harmonization of the financial legislation with the EU acquis, in what excises are concerned.

The inflation process was accelerated in the first semester of 2008, reaching its maximum level, 9, 04%, in July, before it being mitigated to 6,3% in December. In the period between January and July 2008, the inflation bite was determined supply-wise, generated by the tensions present on the agro-alimentary market (consequence of the production decrease of 2007), and on the other hand, by the international impact of the growth of oil and natural gases listings. The influence of these 2 factors was diminished in the second semester, but pressure persisted demand-wise, which led to the superior limit of inflation to be outgrown by 1.5%.

Figure 1 The deviation between the inflation rate and its target

The inflation rate has changed its descendant trajectory recorded in the second part of the previous year, reaching 6, 71% at the end of the first trimester of 2009. The evolution was due to the growth of oil listings on the international markets and the pressures exerted by volatile prices, the registered variation being that of 4,34% compared to the 2, 49% at the end of year before that. Starting with the second trimester, the prices' growth rhythm slowed down until October, being subsequently mitigated by the cigarette producers' decision to outmatch the inflation impact of the exchange rate that would be applied on excises. The dynamics of volatile prices has had an unfavorable influence on the inflation rate, the growth having been determined by the growth rhythm pertaining to fuels (from 2, 4% in September, to 13, 2% in

December), while the growth rhythm of governed prices slowed. The acceleration of the disinflation process was determined by the appreciation of the national currency as opposed to the euro. The deviation between the inflation rate and the target set for this year was diminished, as can be seen in figure 1. From the graphic we can see that the accelerated rhythm of inflation (1,7% more) took place in 2007 along with Romania's accession to the EU.

From the perspective of the nominal convergence criterion, referring to the inflation, the divergence between the average variation of the harmonized index of consumership prices and the average inflation rate of the best performing 3 member states of the EU, had registered a decrease in 2007, as can be seen in figure 2, following that in future years the divergence would grow up to 3,8%.

Figure 2 The nominal convergence criterion

Although it saw a descendent trend starting with 2008, the inflation level in Romania has recorded the highest values in the EU, outgrowing the inflation rate in the EU by a lot.

As a macro-economical process, inflation is generated by a series of factors that compete, be it even with different intensities, over shorter or longer periods of time for its implementation and sustenance. The inflation mechanism generated by these factors, in itself, influences the evolution of all the markers of real economy.

The use of the monetary policy instruments (the exchange rate, the money supply, the interest rate) has a certain effect on inflation as well as inflationary expectations.

We will analyze the influence of these factors on the inflation rate with the help of the correlation parameter and the determination parameter.

The correlation parameter measures the intensity of the link between the determining

factors and the interest rate, and we will determine the weight by which it influences the factors over the inflation rate with the help of the determination parameter.

2.1. The influence of the monetary supply on the inflation rate

The influence exerted by the monetary supply on the inflation rate is direct, as certified by Fisher's formula:

$$M \times V = P \times Q$$

M – monetary supply

V – the rotation speed of money

P – price growth index

Q – the gross domestic product

If the rotation speed and the GDP are immutable, any change in the monetary supply will translate into a change, of similar magnitude, of the prices index. In Romania, the control over the monetary supply represents the most important monetary instrument for the cease of inflation [10].

Table no 2. The monetary mass and the inflation rate during 2006-2009

Date	Monetary mass (x)	Inflation rate (y)	X ²	X * Y	Y ²
	<i>Annual fluctuation (%)</i>				
2006T1	30,40	8,40	924,16	255,36	70,56

2006T3	22,70	5,48	515,29	124,40	30,03
2006T4	28,10	4,87	789,61	136,85	23,72
2007T1	28,80	3,66	829,44	105,41	13,40
2007T2	22,40	3,80	501,76	85,12	14,44
2007T3	28,20	6,03	795,24	170,05	36,36
2007T4	33,70	6,57	1135,69	221,41	43,16
2008T1	34,80	8,63	1211,04	300,32	74,48
2008T2	38,90	8,61	1513,21	334,93	74,13
2008T3	31,10	7,30	967,21	227,03	53,29
2008T4	17,50	6,30	306,25	110,25	39,69
2009T1	15,40	6,71	237,16	103,33	45,02
2009T2	11,70	5,86	136,89	68,56	34,34
2009T3	10,70	4,94	114,49	52,86	24,40
Total	381,00	94,27	10685,00	2485,00	627,58

Source: National Bank of Romania

In order to establish the type or correlation between the two variables we will calculate the parameters a and b from the following system of equations:

$$\begin{aligned} na + b\sum x_i &= \sum y_i \\ a\sum x_i + b\sum x_i^2 &= \sum x_i y_i \end{aligned}$$

By replacing the data in the table we will have:

$$\begin{aligned} 15a + 381b &= 94,27 \\ 381a + 10685b &= 2485 \end{aligned}$$

$$r_{y/x} = \frac{n\sum x_i y_i - \sum x_i y_i}{\sqrt{[n\sum x^2 - (\sum x_i)^2][n\sum y^2 - (\sum y_i)^2]}} = \frac{15 * 2485 - 2485}{\sqrt{(15 * 10685 - 145161)(15 * 627,58 - 8886,83)}} = 0,48$$

The correlation parameter's value of 0,48 indicates a weak connection between the monetary supply and the inflation rate.

In order to determine the weight of the influence of the monetary mass on the inflation rate we will calculate the determination parameter.

$$R^2 = (r_{y/x})^2 = (0,48)^2 = 0,23$$

The value of the determination parameter shows that only 23% is the influence of the monetary supply on the inflation rate, the rest representing the influence of other factors.

2.2. The influence of the interest rate on the inflation rate

Using the same correlation indicators to determine the influence of the interest rate on the inflation rate during 2006-2009 we have reached the following results:

- The value of the regression parameter "b" is 0,8475, which indicates that between the interest rate and the inflation rate there is a direct correlation.
- The correlation parameter between the two variables is 0,65, which signifies a average intensity bond.
- The weight of the influence of the interest rate of the inflation rate, measured through the determination parameter is 42,25%, the rest 57,75%

By solving the system of equations we obtain the following values: a=4 and b=0,09. The b parameter shows that in a growth of 1% of the monetary supply, the inflation rate grows by 0,09%. Its positive value indicates that there is a direct correlation between the monetary supply and the inflation rate.

The intensity of the connection between the two variables is measured with the help of the correlation parameter.

representing the influence of others factors.

It is a known fact, found in specialty literature, that the rise of the interest rate discourages crediting, which equals a drop in demand. A low demand will have an impact on the inflation, as it will decrease. BNR establishes the interest rate for the monetary supply based on the objectives considered. To support economic growth during the economical crisis, National Bank of Romania has reduced the interest rate from 10,25%, registered value in the second semester of 2008, during the period of financial turbulence intensification, down to 8% at the end of 2009.

The bond between the **exchange rate** and the inflation rate is one of the most controversial economical topics in Romania. The advocates of maintaining a fixed exchange rate blame the depreciation of the national currency, calling it a major cause of the inflation. The BNR governor believes that the exchange rate is determined by the evolution of inflation and not the other way around [10].

However, the exchange rate has an influence on the inflation rate through import prices. Thus, from 2005 and until mid-2007, the significant appreciation of the national currency as opposed to the euro has lead to a drop in import prices, which fostered the disinflation process. The depreciation of the Leu compared to the Euro,

beginning mid-2007, determined the growth of import prices which amplified the inflation bite.

3. The effects of the European integration on the Romanian economy

The efforts put in by Romania toward the accession to the EU on January 1st 2007, resulted in a positive economical evolution. Thus we can state that in 2006 there was an acceleration of the economical growth (from 4,3% to 7,7%) and of the disinflation, as well as a drop in the unemployment rate.

Some specialists agree that moderate inflation can contribute to the full occupancy of the work force, the economical growth and stable financial markets [7]. Also, in specialty literature there is speak of certain "beneficial" consequences of moderate inflation, for production as well as for the economical mechanism. Therefore, moderate inflation constitutes a stimulant factor for the economical growth [5].

In Romania, moderate inflation has stimulated **economical growth**, the GDP reaching 9,3% in the second trimester of 2008. The impact of the financial crisis on the national economy was very strong, fact which determined a sudden drop of the GDP, starting with the second semester of 2008, the indicator recording negative values throughout 2009.

Inflation and unemployment represent 2 macro-economical phenomena, whose evolution depends on the macro-economical stability of that certain country. Specialty literature mentions that, on a short-term, there is an inversely proportional relation between the inflation rate and the unemployment rate. In Romania, during the analyzed period of time, the **unemployment** rate has evolved in a manner opposite to the inflation rate. The ascendant trend of the unemployment rate in the period starting 2006 and up to the 4th trimester of 2008, was influenced by the domestic demand for work places and the migration of the work force abroad. The intensification of the uncertainties regarding the effects of the financial crisis on the national economy and on the external partners, postponement of investment projects has lead to the lert

growth of the unemployment rate, reaching 7,5% at the end of 2009.

The growth of the **budget deficit** exerts a negative influence on the inflation process, in the sense that the 2 macro-economical indicators follow the same evolution path. Even so, the weight of the general budget deficit consolidated in the GDP between 2008 and 2009 has recorded an accentuated growth (120% in 2008), while the inflation rate saw a descendant trend.

The inflationary phenomenon, along with other factors, contributes to the growth of the current account deficit, due to massive imports made by the country in question for the coverage of the insufficient national production [8]. Thus, Romania's **current account deficit** followed the same evolution as the inflation rate, growing in the same proportion in 2007, waiting upon the drop of the current account deficit by a much higher percent than that of the inflation rate due to the effects of the financial crisis, felt in the 4th trimester of 2008, which had repercussions on the internal and external demand, thus determining the decrease of the current account deficit by 2 points as opposed to the previous year, the descending trend of the current account deficit was highly accentuated in 2009, reaching 4,3%.

4. Conclusions

Romania's integration into the EU has lead to an accelerated growth of consumership goods' prices in the year of the integration, similar to that recorded by member states that adhered in 2004, followed by a drop of the inflation rate, the inflation rate target representing the main objective of the monetary policy in Romania.

From the perspective of the factors that influence it, we might conclude that there is appositive bond between the monetary supply (M3) and the inflation rate, as was identified by economist Irving Fisher, exerting a moderate influence on the inflation process. The monetary supply constitutes the main monetary device on which NBR acts in order to reach the inflation target.

From the analysis made, we find that the fact that the interest rate exerts a direct influence on the inflation rate, although in specialty literature it is identified as being an indirect bond.

The results of the study show that during the period analyzed, Romania registered positive results in the consolidation of the macro-economical stability up to the 3rd trimester of 2008, the negative impact of the financial crisis changing the trajectory of the economical indicators.

Comparison between CPI and HICP in Romania

Damian Monica

“Alexandru Ioan Cuza” University of Iași

m0nicadamian@yahoo.com

Abstract

Measuring the inflationary process, as a macroeconomic phenomenon, is done in several ways. National Institute of Statistics calculates every month the consumer price index (CPI) and the harmonized index of consumer prices (HICP), dates which are transmitted to the European Commission of Statistics. This document will analyze the differences between these 2 indices, weighting system used to compute the 2 indices, and also the contribution of goods and services price dynamics at the annual inflation rate in Romania in 2006-2009.

Key words: consumer price index, harmonized index of consumer prices, inflation rate

JEL Classification: E3, E31

1. Introduction

An important element in assessing a country's economic evolution, in a certain period of time, is that concerning the way in which the consumer prices have developed. The measurement of consumer prices evolution is made by some price indices, of which the most used one is CPI. This is also called “retail price index”(in England) or “Cost of living index” (in Germany).

CPI is one of the macroeconomic indicators which have a major impact on social and monetary policy decisions. In this way, each country has developed national methodologies that ensure a truthful reflection of price trends from one period to another.

Need for data comparability at European level, on the evolution of consumer prices, led to

the adoption of Board Rules no.2494/1995 concerning harmonized indices of consumer prices.

There are differences at conceptual level between CPI and HICP, so we find necessary to present the differences between these two concepts.

2. Conceptual differences between CPI and HICP

CPI measures overall changes in prices for goods bought and tariffs of services used by the population in a certain period (current period) from the previous period (base or reference period). CPI is calculated only for the elements which are contained in the direct consumption of the population ,being excluded: consumption from own resources ,expenses for investment and accumulation, interest paid on loan ,insurance rates, fines, taxes etc. and also expenditures paid for agricultural production work of individuals households [5].

Romania's UE accession involves increasing importance given to HICP ,because the nominal convergence criteria on inflation, which needs to be made for adopting the euro, is expressed in terms of HICP. European Central Bank aims to keep inflation low, but close to 2%, over the medium term.

HICPs are economic indices built for measuring the changes in time of the goods and services prices bought by households. HICP measures inflation in euro area to implement monetary policy in the euro area and to evaluate the convergence's inflation according to the Maastricht criteria.

The harmonized index is based on “internal” principle of the consumer concept, taking into account the consumption of all households in the

economic territory of the country ,regardless of income, nationality ,social or residential status ,except for foreign embassies in Romania ,taking

This is a major conceptual difference from the CPI which uses the principle of "national" consumption; abide by residents' consumption expenditures whether performed inside or outside the country. Consumer spending abroad refers to tourist and transport services abroad.

Another difference between the two indicators refers to the using by HICP of the concept "net expense reimbursements" for drugs (amounts deducted offset)and of insurance premiums (deducted compensation).

Price changes for owner-occupied dwellings are excluded from the calculation of the HICP , while in the consumer price index these fluctuations are included in some countries.

Regarding the calculation of the two indices, both CPI and HICP are Laspeyres indices with fixed base, however being differences in the weighting schemes.

into account also expenditure of foreign visitors in Romania.

$$\text{Indicele Laspeyres} = \frac{\sum q_0 p_1}{\sum q_0 p_0}$$

where:

p0 is the price of a product during the (reference)

P1 is the product price in the current period

q0 is the quantity of product sold during the base period

Although between CPI and HICP national definition there are conceptual differences ,the impact of them on the final result is negligible, as can be seen in Figure 1.

Figure 1 . Evolution of the inflation rate in Romania during 2006-2009 according to HICP and CPI

Each member country of the European Union calculates the two indices, each of them serving a different purpose:

- CPI is used in monetary policy, social policy (minimum wage, indexation, social welfare, pensions) and fiscal and budgetary policies;

- HICP serves to inflation's comparability at European level and for setting policy at

Weights used to calculate CPI and HICP come from the same source, being determined by the structure of expenditure Household Budget Survey by analyzing the average monthly expenditure of a household to purchase goods and payment of services necessary to their needs, adjusted by including costs incurred by Romanian tourists outside Romania. The use of different weights would not allow a fair comparability between Member States of the European Union. For year t are used weights derived from the structure of the household average expenditure in year $t-2$.

Share of product groups is determined by their importance in average household budgets. To maintain the relevance of the index, reflecting changes in consumer habits, weights are updated periodically.

3. Structure of consumer price indices and contribution of dynamics of goods prices and services to inflation rate

To calculate HICP is used COICOP classification (Classification of Individual

European level.

Consumption by Purpose), and for the CPI, the nomenclature used is divided into 3 levels of aggregation (groups, positions and types), namely: (i) the group of food, (ii) group non-food products and (iii) services group.

The impact that the price variation has on HICP depends on the average amount spent by households for that product. The bigger the share of goods and services in the consumption basket is, the bigger the impact on HICP. In Romania, food and non-food goods have a high share in the consumer basket, while services have a small share of approximately 17.68%, hence the impact on CPI. According to data from the National Statistics Institute, in 2006-2009 period, the weights used for the CPI calculation showed insignificant variations. If the share of food in 2006 was 40.71%, thereafter it decreased by 3.13 percentage points, while the share of non-food goods recorded an upward trend, reaching a value of 44.05% in 2009. The same trend was followed by services in the period 2006-2009, the share of services in the consumer basket raising by 1.33%.

Figure 2. Evolution of weights used in calculating the CPI in the period 2006-2009

According to the classification of individual consumption by purpose, used in calculating the HICP, in Romania, food and soft drinks have a high share in the consumer basket (37.25% in 2009) versus the value recorded in the European Union (15.93%). Any change in prices of these groups, because

they hold great weight in the consumer basket, will lead to an increase in general price index, as can be seen from Table 1. Regarding maintenance of the dwelling, their share in the consumer basket is the second as value after the food products.

Figure 3. Share in the consumer basket of 2009 HICP components

In the graph we can see the spread between the consumption basket weights recorded in Romania and EU-related to hotels and restaurants (7.81%), recreation and culture (5.24%), transport (8.06%),

which means, assigning a larger part of consumer spending at EU level to above mentioned destinations. Note that both at EU level and in Romania the expenditure on education have the lowest share

Table 1. Contribution to annual inflation rate in Romania

Year		Food goods.	Non – food goods	Services	CPI total
2006	Cart share (%)	40,71	42,25	17,04	4,87
	annual growth of prices	1,07	8,33	5,12	
	Contribution to inflation interest	0,44	3,52	0,87	
2007	Cart share (%)	38,92	43,54	17,54	6,57
	annual growth of prices	9,14	3,60	8,55	
	Contribution to inflation interest	3,55	1,56	1,49	
2008	Cart share (%)	37,50	44,70	17,80	6,30
	annual growth of prices	6,02	5,96	7,71	
	Contribution to inflation interest	2,25	2,66	1,37	
2009	Cart share (%)	37,58	44,05	18,37	4,74
	annual growth of prices	0,38	7,72	6,86	
	Contribution to inflation interest	0,14	3,40	1,26	

Source: NIS, author's calculations

In 2006, the increasing of non-food goods prices by 8.33% contributed to the increasing of inflation interest by 3.52%, following that in 2007 and 2008 the contribution to inflation interest to be relatively low. Due to the significant share of non-food goods in the consumption basket of 44.05% and 7.72% increase in their prices, consumer price index increasing at 104.74% in 2009 is mostly attributable to the impact that they had. Accelerating inflation in the integration year at 6.75%, it was due to the contribution of food to 3.55%, before cooling it in 2009 at 0.14%. Regarding services, because of a low share in

the consumption basket, dynamic's services prices contribution at the increasing of CPI is relatively small.

4. Conclusions

Before the euro becoming the common currency ,each country measured the inflation based on specific national procedures and methods. With the introduction of the euro, came the need to measure inflation across the euro area, which allow comparisons between countries, with HICP happen.

The harmonized index of consumer prices and consumer price index measures inflation faced by consumers, a macroeconomic phenomenon of great importance in the evaluation of a national economy stability. HICP is used to determine whether a country is ready to join the euro area. National Institute of Statistics calculates both the consumer price index for domestic needs and the harmonized index of consumer prices for comparability at European level.

Both indicators are based on weights in the consumer basket of goods and services determined by analyzing the average expenditure of households. Thus, Romanians spend almost 40% of total consumption expenditure on food while the European share of food in the basket consumption is much lower (16%).

Financial Crisis: causes and consequences

Magdalena Dediu

dobrea.alina@gmail.com

Abstract

This paper models the global financial crisis as a combination of shocks to global housing markets and sharp increases in risk premia of firms, households and international investors in an intertemporal (or DSGE) global model. The model has six sectors of production and trade in 15 major economies and regions. The paper shows that the shocks observed in financial markets can be used to generate the severe economic contraction in global trade and production currently being experienced in 2009. In particular the distinction between the production and trade of durable and non durable goods plays a key role in explaining the much larger contraction in trade than GDP experienced by most economies.

The results show that the future of the global economy depends critically on whether the shocks to risk are expected to be permanent or temporary.

Keywords: Global Financial Crisis, International Trade, DSGE models.

JEL classification: G15

1. Introduction

The collapse, sent a wave of fear around world financial markets. Banks virtually stopped lending to each other. The risk premium on interbank borrowing rose sharply to 5 per cent, whereas typically it was close to zero. Although authorities scrambled to inject liquidity into financial markets, the damage was done. The risk premium on corporate bonds shot up even more to over 6 per cent. Large CAPEX projects were shelved, the corporate sector virtually stopped borrowing, trade credit was hard to get and, with falling demand, particularly for investment goods and manufacturing durables like cars, trade volumes collapsed.

CAPEX or Capital expenditures are expenditures creating future benefits. A

capital expenditure is incurred when a business spends money either to buy fixed assets or to add to the value of an existing fixed asset with a useful life that extends beyond the taxable year. Capex is used by a company to acquire or upgrade physical assets such as equipment, property or industrial buildings.

The result is that the global financial crisis has seen the largest and sharpest drop in global economic activity of the modern era. In 2009, most major developed economies find themselves in a deep recession. The fallout for global trade, both for volumes and the pattern of trade has been dramatic. The OECD predicts world trade volumes could shrink by 13 percent in 2009 from 2008 levels.

Governments have responded with an easing of monetary and fiscal policy that in turn have their own effects on activity and financial and trade flows. The downturn in activity is causing unemployment to rise sharply and, with it, a political response to protect domestic industries through various combinations of domestic subsidies and border protection. There is potential for protectionism to rise further.

The objective of this paper is twofold: to model the global financial crisis and explore the differences between a sharp rise in global risk that is permanent versus one that expected to be temporary and second, to show the impact of the policy response, especially the fiscal response. To do this, a dynamic, intertemporal general equilibrium model that fully integrates the financial and real sectors of the economy is used to unravel and understand the mechanisms at work. The model incorporates wealth effects, expectations and financial markets for bonds, equities and foreign exchange as well as trade and financial flows. It is a suitable tool to analyse the impact of the crisis and policy responses on global trade and financial flows.

The paper is organized as follows. In the next section, the main features of the Gcubed model that is used in this analysis are described briefly as the model is documented in full elsewhere. In section 3, the simulations to represent the financial crisis are described and the justification for the size of the shocks chosen. It turns out five shocks are needed: three for the crisis itself and two for the subsequent policy responses which covers monetary and fiscal stimulus.

In section 4 we explore the impact of the crisis and unpick some of the mechanisms at work by initially surmising what would have happened had the United States alone been affected by the crisis. We also explore the critical role of the reappraisal of risk premiums, in particular whether the shocks are permanent or temporary.

The effects of the massive policy response are addressed in Section 5. It turns out that most of the monetary easing is already captured by the endogenous monetary policy rule incorporated into the model, but not so the fiscal stimulus deployed around the world so we concentrate on this aspect in this section. Finally, in section 6, some of the main insights are highlighted and discussed.

2. The model

The *G-cubed model* is an intertemporal general equilibrium model of the world economy. The theoretical structure is outlined in McKibbin and Wilcoxen (1998) 4. A number of studies—summarized in McKibbin and Vines (2000)—show that the G-cubed modelling approach has been useful in assessing a range of issues across a number of countries since the mid1980s.

5 Some of the principal features of the model are as follows:

§ The model is based on explicit intertemporal optimization by the agents (consumers and firms) in each economy⁶. In contrast to static CGE models, time and dynamics are of fundamental importance in the G-cubed model. The MSGCubed model is known as a DSGE (Dynamic Stochastic General Equilibrium) model in the macroeconomics literature and a Dynamic Intertemporal General Equilibrium (DIGE) model in the computable general equilibrium literature.

§ In order to track the macro time series, the behaviour of agents is modified to allow for short run deviations from optimal behaviour either due to myopia or to restrictions on the ability of households and firms to borrow at the risk free bond rate on government debt. For both households and firms, deviations from intertemporal optimizing behaviour take the form of rules of thumb, which are consistent with an optimizing agent that does not update predictions based on new information about future events. These rules-of-thumb are chosen to generate the same steady state behaviour as optimizing agents so that in the long run there is only a single intertemporal optimizing equilibrium of the model. In the short run, actual behaviour is assumed to be a weighted average of the optimizing and the rule of thumb assumptions. Thus aggregate consumption is a weighted average of consumption based on wealth (current asset valuation and expected future after tax labour income) and consumption based on current disposable income. Similarly, aggregate investment is a weighted average of investment based on Tobin's q (a market valuation of the expected future change in the marginal product of capital relative to the cost) and investment based on a backward looking version of Q .

§ There is an explicit treatment of the holding of financial assets, including money. Money is introduced into the model through a restriction that households require money to purchase goods.

§ The model also allows for short run nominal wage rigidity (by different degrees in different countries) and therefore allows for significant periods of unemployment depending on the labour market institutions in each country. This assumption, when taken together with the explicit role for money, is what gives the model its "macroeconomic" characteristics. (Here again the model's assumptions differ from the standard market clearing assumption in most CGE models.)

§ The model distinguishes between the stickiness of physical capital within sectors and within countries and the flexibility of financial capital, which immediately flows to where expected returns are highest. This important distinction leads to a critical difference between the quantity of physical capital that is available at any time to produce goods and services, and the valuation of

that capital as a result of decisions about the allocation of financial capital. As a result of this structure, the G-cubed model contains rich dynamic behaviour, driven on the one hand by asset accumulation and, on the other by wage adjustment to a neoclassical steady state. It embodies a wide range of assumptions about individual behaviour and empirical regularities in a general equilibrium framework. The interdependencies are solved out using a computer algorithm that solves for the rational expectations equilibrium of the global economy. It is important to stress that the term ‘general equilibrium’ is used to signify that as many interactions as possible are captured, not that all economies are in a full market clearing equilibrium at each point in time. Although it is assumed that market forces eventually drive the world economy to neoclassical steady state growth equilibrium, unemployment does emerge for long periods due to wage stickiness, to an extent that differs between countries due to differences in labour market institutions.

In the version of the model used here there are 6 sectors (energy, mining, agriculture, manufacturing durables, manufacturing nondurables and services) and 15 countries/regions as set out in Table 2.2.

3. Simulating the effects of the crisis Events leading up to the crisis in 2008— the baseline

The focus of this paper is on disentangling the many influences of the financial crisis on the global economy and in particular to see how well the model can explain the macroeconomic and

sectoral responses to the crisis in confidence that we model through risk shocks. The ‘crisis’ is defined here as the bursting of the housing market bubble in late 2007, the ensuing collapse in the subprime mortgage market and related financial markets and the subsequent collapse which resulted in a sharp increase in risk premia around the world.

The problem in precisely modelling the crisis is that there are already shocks in the baseline that affect subsequent global dynamics independently of the crisis. Here we are focussing only on the additional shocks from the crisis. The problem is that some of the seeds of the financial crisis were sown in the decade before the crisis. There were a series of large global events, such as the bursting of the dotcom bubble in 2001 and the rapid growth of China, that were already reshaping the pattern and level of world trade before the 2007 – 2008 financial crisis hit. Some of these events, like the large disparities between savings and investment in China (a surplus) and in the United States (a deficit) led to large differences between exports and imports for each nation so that large current account surpluses were accumulating in China and large deficits in America. Some people attribute these growing global imbalances as contributing causes of the crisis, and there is some truth in that. But the focus of this study is on the impact of the crisis itself on world trade and not on trying to disentangle the various contributing factors to the crisis, as important as that issue is.

Therefore, besides population and productivity trends shaping the baseline for the world, some of the key events over the last decade influencing the baseline would be:

§ First, there was the Asian financial crisis of 1997 -98, which saw Asian economies generate large current account surpluses that had to be invested offshore to keep their nominal exchange rates low. Capital flowed out of Asia into US dotcom stocks driving up equity prices.

§ Next was the bursting of the dotcom bubble, which saw the booming NASDAQ over 1998–2000 burst in 2001.

§ Fearing a downturn and possible deflation, the US Federal Reserve eased monetary policy in 2001 in a series of steps to 2004. Some argue that they eased too much for too long.

§ But, with easy credit and a rising housing market, a boom in house prices followed and a period of high growth in credit and leveraged loans. Risk premia hit low levels and leveraged deals became common as investors chased yields in an environment of lax regulatory oversight.

§ Rising demands from China (and, to some extent, India), plus a booming world economy saw commodity prices rise across oil, minerals and food from late 2004 to late 2007. The shock to the global economy from this commodity price boom was as big as the first oil shock in the 1970s .

§ Rising prices and inflation caused monetary authorities to tighten policy from mid 2004 to June 2006.

Each of these major events set up their own dynamics for the course of the world economy and helped shape the underlying baseline. Some of these events such as the easing and tightening of monetary policy are endogenous to the model and already incorporated in the baseline. It is important to appreciate that the results reported here are *deviations* from baseline from the financial crisis, as defined here. What is important is the relative contribution of different effects and to disentangle the impacts of the financial crisis on the global economy in the short to medium run.

The five shocks to represent the crisis and the policy responses

The above events have led to the now well known global downturn. All official forecasting agencies, such as the IMF and OECD, have described this downturn and so will not be expanded here. As the IMF notes ‘Global GDP is estimated to have fallen by an unprecedented 5 per cent in the fourth quarter (annualized), led by advanced economies, which contracted by around 7 per cent’ 10 . Japan has been particularly hard hit with a fourth quarter GDP (2008) plummeting by 13 per cent. Demand for durable goods has been particularly hard hit. With the downturn there has been a sharp upturn in savings by households (and commensurate reduction in consumption), driven by a reappraisal of risk by households and a loss of net worth with falling house prices and equity prices. So shocks need to be devised to account for three things;

§ The bursting of the housing bubble and loss in asset prices and household wealth with

consumers cutting back on spending and lifting savings.

Three main shocks capture the onset of the global financial crisis:

1. The bursting of the housing bubble causing a reallocation of capital and a loss of household wealth and drop in consumption.
2. A sharp rise in the equity risk premium (the risk premium of equities over bonds) causing the cost of capital to rise, private investment to fall and demand for durable goods to collapse.
3. A reappraisal of risk by households causing them to discount their future labour income and increase savings and decrease consumption.

Shock 1: The bursting of the housing bubble

Falling house prices has a major effect on household wealth, spending and defaults on loans held by financial institutions. Events in the United States typify a global phenomenon. From 2000 to 2006, house prices in some areas doubled to subsequently collapse. These changes in some areas have generated dramatic news headlines but, overall the United States index of house prices has fallen by 6.2 percent in real terms from the 1 st quarter 2008 to the same quarter in 2009 .

While house prices were rising so strongly, credit was supplied liberally to meet the demand as perceptions of risk fell. The rising wealth boosted confidence and spending. The housing bubble was a global phenomenon centered mainly on the Anglo-Saxon world.

The investment decision by households is modelled analogously to how we model the investment decisions of firms within an intertemporal framework subject to adjustment costs for capital accumulation. The household invests in housing to maximize consumption from the stream of future service flows that housing provides. This stream of services is analogous to a production function based on inputs of capital and a productivity term. We model the housing part of the crisis as a fall in the productivity of the service flow from the housing stock. This fall in expected future productivity of housing means that the Tobin’s q for housing drops when the shock occurs. The drop in housing productivity in the United States is assumed to be 10 per cent lower in 2009 and is calibrated to give, along with the other shocks, a drop in house prices in the US of the order of 6 per cent, roughly what has been observed for the

last year 15 . A plausible scenario is where productivity returns to 'normal' by 2013.

Shock 2: Rising equity risk premia

The surprise upswing in commodity prices from 2003 but most noticeable during 2006 and 2007 led to concerns about inflation leading to the sharp reversal in monetary policy in the US. This tightening in US policy also implied a tightening of monetary policy in economies that pegged to the US dollar. It was the sharpness of this reversal as much as the fall in US houses prices and the failures of financial regulation that led to the financial problems for 2008 - 09. Lehman Brothers' failure was primarily due to the large losses they sustained on the US subprime mortgage market. Lehman's held large positions in the subprime and other lower rated mortgage markets. But mortgage delinquencies rose after the US housing price bubble burst in 2006 - 07. In the second fiscal quarter 2008, Lehman reported losses of \$2.8 billion. It was forced to sell off \$6 billion in assets. The failure of Lehman Brothers in September 2008 and effect on risk premiums across markets can be seen clearly on chart 3.3.

Permanent versus temporary shock

– The initial rise in the equity risk premium since the collapse of Lehman Brothers has been of the order of 8 percentage points. But what will matter for the results is whether the initial rise in equity risk premium continues into the future and is indicative of a 'new state of affairs' by business or whether it turns out to be transitory. Arguments can be made either way. At the time of the crisis there was plenty of commentary, some of it from official institutions, about dire consequences and parallels drawn to the Great Depression. But the policy response was also massive with the clear intention of getting things back to 'normal' as soon as possible. Hence under this shock of a rise in equity risk premium, to see the difference it makes, we model two scenarios; one where the risk premium is permanently higher by 8% and the other a scenario where the risk premium falls by half in year 2 and then is back to baseline by year 3. We label the first one 'permanent' and the second 'temporary'.

Shock 3: A rise in household risk

The reappraisal of risk by firms as a result of the crisis also applies to households. As households view the future as being more risky, so they

discount their future earnings and that affects their savings and spending decisions. As with the previous shock, we model two scenarios: one permanent and the other temporary. The increase in household risk in the United States is assumed to be 3 percentage points in the permanent scenario and returning to zero by year three in the temporary scenario.

3.3 Permanent versus temporary shock

– The initial rise in the equity risk premium since the collapse has been of the order of 8 percentage points. But what will matter for the results is whether the initial rise in equity risk premium continues into the future and is indicative of a 'new state of affairs' by business or whether it turns out to be transitory. Arguments can be made either way. At the time of the crisis there was plenty of commentary, some of it from official institutions, about dire consequences and parallels drawn to the Great Depression. But the policy response was also massive with the clear intention of getting things back to 'normal' as soon as possible. Hence under this shock of a rise in equity risk premium, to see the difference it makes, we model two scenarios; one where the risk premium is permanently higher by 8% and the other a scenario where the risk premium falls by half in year 2 and then is back to baseline by year 3. We label the first one 'permanent' and the second 'temporary'.

Shock 3: A rise in household risk

The reappraisal of risk by firms as a result of the crisis also applies to households. As households view the future as being more risky, so they discount their future earnings and that affects their savings and spending decisions. As with the previous shock, we model two scenarios: one permanent and the other temporary. The increase in household risk in the United States is assumed to be 3 percentage points in the permanent scenario and returning to zero by year three in the temporary scenario.

4. Effects of crisis without a fiscal policy response

Mechanisms at work

To appreciate the mechanisms at work from the three shocks an illustrative scenario where permanent shocks affect the United States *alone* is shown in chart 4.1. The bursting of the housing bubble has the biggest negative impact

on real consumption, which being roughly 70 percent of the domestic economy, has the biggest negative impact on real GDP. The permanent loss in wealth causes consumption to fall sharply and because the housing shock is assumed to be permanent, consumption is permanently lower in all periods. The financial shock has the largest negative impact on stock market values from baseline in 2009 and an equally large impact as the bursting of the housing bubble on investment. The equity risk shock causes a shift out of equities into other domestic assets, such as housing and government bonds as well as to asset purchases overseas. The shift into government bonds drives up their prices and pushes down real interest rates substantially. This surprisingly raises human wealth because expected future after tax income is discounted at a much lower real interest rate. Thus in the US, the equity shock alone is positive rather than negative for consumption in the short run.

Investment on the other hand falls sharply. The equity shock reduces US investment by about 20 percent below baseline. The rise in equity risk implies a sharp selloff of shares due to a large rise in the required rate of return to capital. The higher equity risk premium implies that the existing capital stock is too high to generate the marginal product required from the financial arbitrage condition and investment falls and, over time, due to the existence of adjustment costs, the capital stock falls and potential output is permanently reduced.

5. Conclusions

This paper has explored the impact of three major shocks representing the global financial crisis on the global economy. For the crisis itself three shocks are needed to capture the observed drop in asset prices and reduction in demand and trade. It is necessary to simulate the bursting of the housing bubble centred in the United States and Europe, but extending elsewhere, rising perceptions of risk by business as reflected in the equity risk premium over bonds and rising perceptions of risk by households. The paper has also explored the difference between a permanent and a temporary loss of confidence.

The policy response has been dramatic. So the analysis has included a monetary easing across the globe and a fiscal stimulus of varying proportions across countries and regions. Simulating the effect of the crisis itself (that is ignoring the policy responses not already built into the model such as endogenous monetary

policy rule) on the United States alone (the 'epicentre' of the crisis) shows several things. Had there not been the contagion across other countries in terms of risk reappraisal, the effects would not have been as dramatic. The adverse trade effects from the United States downturn would have been offset to some degree by positive effects from a global reallocation of capital. Were the US alone affected by the crisis, Chinese investment could have actually risen. The world could have escaped recession.

When there is a reappraisal of risk everywhere including China, investment falls sharply – in a sense there is nowhere for the capital to go in a global crisis of confidence. The implication is that if markets, forecasters and policy makers misunderstand the effects of the crisis and mechanisms at work, they can inadvertently fuel fears of a 'meltdown' and make matters far worse.

The bursting of the housing bubble has a bigger effect on falling consumption and imports than does the reappraisal of risk, but the reappraisal of risk has the biggest effect on investment. Rising risk causes several effects. The cost of capital is now higher and leads to a contraction in the desired capital stock. Hence there is disinvestment by business and this can go on for several years – a deleveraging in the popular business media. The higher perception of risk by households causes them to discount future labour incomes and leads to higher savings and less consumption, fuelling the disinvestment process by business.

When there is a global reappraisal of risk there is a large contraction in output and trade – the scale of which depends on whether the crisis is believed to be permanent or temporary. The long run implications for growth and the outlook for the world economy are dramatically different depending on the degree of persistence of the shock. As expected, the effects of the crisis are deeper and last longer when the reappraisal of risk by business and households is expected to be permanent versus where it is expected to be temporary. This difference and a third scenario where agents unexpectedly 'switch' from one scenario to the other is explored in McKibbin and Stoeckel (2009b). The dynamics for 2010 are quite different between the temporary scenario and the expectation revision scenario even though the shocks are identical from 2010 onwards.

Some Aspects Concerning Global Performance Reporting in Romania

Deju Mihai

Solomon Daniela Cristina

University "Vasile Alecsandri" of Bacau, Faculty of Economic Sciences

comatbacau@zappmobile.ro

solomon_daniela@yahoo.com

Abstract

Worldwide social and economic disparities, financial and political instability, major corporate scandals, global warming of the planet imposed unprecedented change in the economy, facilitating the transition from the concept of performance to "**global performance**". Concerning to global performance reporting on national level, we appreciate that the information submitted is insufficient and lets to the assessment of each entrepreneur the manner in which these aspects of environmental and social performance must be reported

Key words: global performance, sustainability performance, sustainable development

JEL Classification: P1, P17

1. Introduction

New approach known as the "**triple bottom line**" (**TBL**), "**sustainability performance**" or "**performance globale des entreprises (PGE)**" (in French) has captured public attention in recent years determining a large part of companies to change their attitudes, values, orientation favouring the formation of a responsible vision concerning reporting that should include three aspects - economic performance, social performance and environmental performance.

Such "sustainable" reporting is possible by applying the guidelines provided by The Global Reporting Initiative (GRI) which entered in October 2006 in their **third generation** named **GRI G3 Guidelines**, and which appears to be the best "**compatibility standard**", generally accepted standard of sustainable reporting.

2. Global performance – multidimensional concept

Companies must implement *sustainable development* coordinates. Microeconomic dimension of macroeconomic concept of sustainable development is represented by *Corporate Social Responsibility (CSR)* which requires "a firm's stance and attitude to voluntarily integrate into their current strategy and activity, concerns (projects and actions) on social nature, for a cleaner and friendlier environment, in terms of ensuring the economic success of the business that is done." [1].

The key issue for sustainable development is the reconciliation between two human aspirations:

- need for further economic and social development;
- protection and improvement of environment (*the only way for welfare of both present and the future generations*).

Global tendencies imposed a new approach concerning enterprise's performance that should focus on three coordinates - **economic, social and environmental** respective - "**global performance**" ("**performance globale des entreprises - PGE**", "**sustainability performance**" or "**triple bottom line - TBL**") designed to meet the current requirements of all users, managers, investors, shareholders, customers (consumers), employees, state.

Economic dimension is inevitably linked to the two pillars of *sustainable development* - *social performance and environmental performance*. Actions in the economic - financial sphere of a company have impact on social environment but especially on the natural environment, the major concern being to operate in such a way as to leave future

generations a world that offer them better terms.

United Nations demonstrated a continuous concern for social and environmental problems, requiring firms to follow the *10 principles* defined in 2008 by the Global Compact [7].

Companies must adopt, to sustain and promote the fundamental values of human rights, the work rules (standards), the environment and fight corruption.

The financial dimension is very well represented in the reporting of business performance, says a global survey [2] realized by Deloitte Touche Tohmatsu in December 2006 to which attended 175 directors and members of the Board of Directors.

Current reports often do not provide a complete picture of company performance, particularly in social and environmental impact. In terms of monitoring *financial performance* most of surveyed companies (87%) were assessed as excellent (43%) or good (44%). But, in sharp contrast, as regard to *non-financial performance*, only 29% describe it as excellent (5%) or good (24%).

In an attempt to extend the applicability area of *non-financial performance* parameters, companies face different **obstacles** [2]:

- *unclear responsibilities regarding non-financial performance factors;*
- *time constraints;*
- *poorly developed methodology for analyzing non-financial performance;*
- *lack of familiarity with instruments for measuring non-financial performance;*
- *lack of comparative data evaluation (lack of comparable data from competitors on the characterization of non-financial performance)*
- *fear that these parameters could provide too much information to competitors.*

However, many companies will improve in time, business performance and financial results through a *balanced mix of financial and non-financial objectives*, and correct identification of issues and commitments such as employment, innovation, customer satisfaction is considered to be art rather than science.

3. Reporting global performance in Romania

Like the rest of the world, Romania should contribute to the creation of a sustainable

society, which would develop without affecting its environment, and the future of next generations. For this, we need people who understand that a proactive attitude can make a difference and can help improve present and future living conditions.

According to the results of the study *International Survey of Corporate Responsibility Reporting 2008* realized by KPMG and recently published [4], Romania shows a weak responsiveness to the *domestic enterprises* level with regard to the information related to sustainable performance, while *multinational companies* that invested in Romania are more active in this direction of reporting.

Study results showed that Romanian companies are less mature than most companies in the world when it comes to *voluntary reporting* of non-financial information.

Few are the companies that have assimilated and implemented new reporting model, the company *Holcim Romania* being a good example. Since 1997 the company has invested over 390 million euro in environmental protection, of which only 57 million euro in 2006 and is the first company in Romania that implemented since the beginning of 2004 the integrated management systems "Quality - Environment - Safety", holding therefore triple certification: quality management (ISO 9001), environmental management (ISO 14001) and occupational health and safety (OHSAS 18001) by compiling since 2002 an annual report *Corporate Sustainable Development Report* [3] on the global performance reporting with the principles of social responsibility.

The study also shows that most companies in the world can quantify aspects of social responsibility and can report it, and in future will spread in all countries and sectors until the youngest players.

Reporting global performance is at the beginning of the road in Romania, successful initiatives of several companies are commendable in this respect, such as:

- The "Green office" - internal recycling program of Cosmote company that aims to reduce the amount of used paper, moderate use of energy and water; the program had

results in reduction the company's operating costs with a direct effect on improving economic and financial performance.

▪ **The resources efficiency and conservation Program** of PepsiCo - included in the annual program of social responsibility, which aims to reduce water consumption, fuel and electricity with real impact on the environment but also on improving economic efficiency.

There are many companies in Romania who want to be (perceived as) responsible through involvement in environmental activities, but which have no backup strategy, in this respect they must focus on *one strategy and direction "green"*.

From the 1st of January 2010, under new accounting regulations in Romania approved by OMFP 3055/2009, it becomes possible the separate *accounting and reporting of costs concerning environmental protection* (in general chart of accounts, a new account was created "652. *Expenditure on environmental protection,*" in the group "65 *Other operating expenses*", which keeps track of environmental costs, for the period) for:

- *air protection;*
- *wastewater management;*
- *waste management, protecting soil, groundwater and surface water;*
- *protecting biodiversity and landscape;*
- *other environmental protection activities.*

Administrators' report prepared for each financial exercise by the *board* may include, "*when is necessary and to the necessary extent to understand the entity's development, performance or financial position, together with the analysis of financial indicators and analysis of non-financial indicators - key performance, relevant to specific activities, including information about environmental issues and employees*", without being presented a model of non-financial performance reporting and analysis.

Romanian companies listed on the Bucharest Stock Exchange (BSE) have the obligation to prepare an *annual report* which must provide the following aspects of environmental performance [5]:

- *to describe the environmental issues that may affect the use of assets by the issuer;*
- *to assess aspects concerning the impact of basis activities of the issuer on the environment.*

In conclusion, we appreciate that the new approach to performance was the result of an accumulation of *factors* influence among which we mention [6]:

- *globalization phenomenon*, which leads to *limiting the role of the state*, multinational companies development, the extend of cross-border trade with major consequences on the management of financial, human, material and information resources;
- *implementing new information technologies* which allow the achievement, processing and transmission (dissemination) of information in useful time; universal language XBRL, the Internet make possible the implementation of G3 guide by any interested organization (all information is transmitted electronically and not on paper and therefore a saving of resources is accomplished);
- *the growing interest of managers* to know all aspects of company performance, especially the issues of non-financial performance;
- *the interests of investors and suppliers* increasingly concerned about the moral conduct of firms;
- *diversification of consumers needs* facilitated the emergence of new, organic products;
- *employee's concerns* about working conditions, job stability; incentives offered by other companies obliges the company to make attractive offers, under competitive labour market conditions but not least to maintain an ongoing dialogue.

4. Conclusions

We outline the special importance that should be granted to the presentation of "global performance" ("sustainable performance") as a new approach to company performance that should focus on three dimensions - economic, social and environmental. Because of its complexity, the evaluation mechanisms used by businesses today fail to measure and integrate in a balanced manner the three dimensions of sustainable development. Existing

instruments assess each dimension of the global performance separately or in the best measure of interaction between these two.

*The implementation of **sustainable reporting** until the level of small and medium firms will allow close monitoring of global performance, will restore confidence and insure transparency and liquidity necessary in financial markets so they can perform their critical functions of circulatory system of the modern economy. From the above considerations, it therefore requires that the application of social responsibility will not remain at the stage of choice but an **obligation** for every organization.*

Long-Term Financing Alternatives

Dobre Elena
"Ovidius" University of Constantza
elenadobre2006@gmail.com

Abstract

Companies need capital to ensure the proper development of their activity. Most of the times, the long-term capital needs of a company outrun its possibilities to cover these needs through equity funds. Consequently, the need for long-term capital implies external long-term financing. Possibilities are many, but a company should choose to finance its assets in that way that would better benefit its future financial situation. The capital policy structure plays an important role in this latter sense, as the company should first establish whether its capital structure policy calls for equity, debt or a mix of these two. Long-term financing mainly refers to stock or bond issues or leases. The purpose of this article is to analyze the last two of these possibilities by making a short description of these financial instruments, together with a parallel between costs that each instrument would generate for the company.

Key word: financing, long-term debt, leasing

JEL Classification: D 92

1. Introduction

When a company's capital requirements exceed its ability to generate cash internally, the company must raise funds externally. Businesses usually finance long-term assets with long-term capital. Every time a company raises funds externally, it must decide which type of securities to issue.

There are several aspects that need to be taken into consideration before issuing securities, but needless to say, transaction costs seem to play the first role. Therefore, transaction costs are proportionately smaller for larger issues, due to the fact that the fixed cost is spread out over a larger issue. In cases of

relatively smaller issues, the variable costs are greater. Economies of scale make larger issues more attractive. Larger issues can also help promote relatively liquid secondary market for the bonds.

Debt, stock (common and preferred) and leases are the main sources of external long-term corporate financing. The total amount of common stock issued at any time is sensitive to the stock market conditions. Therefore, in periods of relatively strong demand for common stock, companies try to take advantage of the rising markets. Consequently, new-issue activity tends to increase during periods of rising share prices. Correspondingly, companies are usually reluctant to sell new issues of common stock when the share price is low by historical standards.

Similarly, the volume of fixed income security issues (preferred stock and debt) tends to vary with the level of long-term interest rates. During periods of rising long-term interest rates, companies tend to favour short-term borrowing. Then, if and when interest rates fall, many companies start replacing the short-term debt with long-term fixed-income securities.

When a company plans to issue long-term debt, it should consider whether issuing domestic or international bonds, and, if it plans to issue domestic debt, which type of debt would be suitable. In any of these cases, it may be possible to obtain a modest reduction in the total cost of the transaction with short-term debt management. Still, a company should not issue debt when conditions look volatile and temporary bad. Therefore, issuers should remain flexible regarding timing in order to prevent temporary factors from adversely affecting their cost of borrowing.

2. Long-term debt innovations

Companies that wish to raise funds externally by issuing long-term debt must offer attractive debt opportunities to potential lenders. Debt contracts must be designed to meet the needs of both borrowers and lenders, as the principle of Two-Sided Transactions applies in this case. Compared to traditional debt instruments such as secured or unsecured debt, most debt innovations in the bond market refer to some form of risk reallocation. Risk reallocation adds value by transferring risks away from issuers or investors to others better able to bear them. If a company can design a security that would suit the risk-return preferences of a particular class of investors, risk reallocation may be beneficial. Investors with a comparative advantage in bearing some types of risks will pay more for purchasing innovative securities that will allow them to specialize in bearing the respective risks. Recent debt innovations in the bond market referring to risk reallocation include issues of commodity-linked bonds, collateralized mortgage obligations, floating-rate notes, credit-sensitive notes and extendible notes.

Developed in response to the rising and increasingly volatile prices on the international markets, commodity-linked bonds involve the dependence of the principal repayment, and in some cases the coupon payments, on the price of a particular commodity (especially oil or silver), or on a specified commodity price index. This type of security enables the producer of a commodity to limit its exposure to a negative evolution of the commodity prices that would eventually affect its revenues. By issuing commodity-linked bonds, a company can increase its debt capacity by shifting the debt service burden from periods when the commodity producer is least able to pay to periods when it is most able to so.

For example, an oil producer could issue an oil-indexed bond with interest payments that will float the same way the level of oil prices floats. Investor's yields would be significantly lower, but both investor and the company could later have potential benefits. Firstly, the after-interest cash flow of the issuing company would be more stable than the cash flow recorded if the company issued a fixed-rate debt, which would

eventually have a positive influence by reducing the default risk. Secondly, investing in an oil-indexed bond could be attractive to investors that want to speculate on oil prices evolution, an opportunity not otherwise available in the commodity futures or options market. In this latter sense, securities innovations involving risk reallocation add value by completing the market.

In cases of collateralized mortgage obligations issues, reinvestment risk is reallocated in a different way, respectively the same way the principal and interest payments are passed through pro-rata from investors in mortgage pass-through certificates to certificate holders. Considering the fact that the mortgagor has the option of requesting prepayment at par value after a short period of time, investors have to ensure against prepayment risk, as this risk would seriously affect them. It is obvious that, if interest rates drop, mortgages will be bought back, which would mean a premature return of the principal and a lower reinvestment rate for investors.

Addressing this prepayment risk, collateralized mortgage obligations impose that the mortgage payment stream is shifted from a portfolio of mortgages into several debt instruments. The resulting debt instruments are prioritized in terms of the right to receive principal payments. Resuming, unless full payments of the foregoing series is made, holders of the next series will not be able to receive principal payments. The mortgage prepayment risk is therefore transferred to the lower-priority classes, while uncertainty regarding timing of full repayments of debt obligations is significantly reduced for the higher-priority classes.

3. Protective covenants

Debt issues contain covenants that impose restrictions on the long-term bond issuer. Protective covenants are contained in a financial contract that is designed to protect the bondholders. In cases of public debt issues, the bond indenture, as the contract is called, presumes a trustee that acts as an agent for the bondholders and monitors the issuer's compliance with the provisions of

the indenture. For a private issue, the bond agreement, specify the maturity, principal amount, interest rate, mandatory redemption schedule and other elements, but, in many cases, they include a number of restrictive covenants. These covenants often spell financial tests that must be met before the borrower can act in one of these directions:

- Incur additional indebtedness - debt limitation;
- Use cash to pay dividends or make share repurchases - dividend limitation;
- Mortgage assets - limitation on liens and/or a negative pledge clause;
- Borrow through one of its subsidiaries - limitation on subsidiary borrowing;
- Sell major assets - limitation on assets dispositions;
- Merge with another company or sell substantially all its assets to another company - limitation on merger, consolidation or sale;
- Sell assets and lease them back - limitation on sale and leaseback.

Debt limitation covenants prohibit a borrower from issuing additional long-term debt if it would cause the issuer's interest coverage ratio (EBIT to total interest) to fall below 3 times (the interest coverage test), or if it would cause its ratio of tangible assets to long-term debt to fall below 1.5 times (the asset coverage test). A dividend covenant restricts cash dividends or share repurchases to \$10000000 plus 50% of cumulative earnings, less the cumulative amount already used for this purpose, since the date of issuance of the bonds.

Any covenant can restrict the company's flexibility. For example, the interest coverage test can restrict the company's ability to issue new debt. Let's suppose the company's earnings before interest and taxes (EBIT) are \$45 million, and interest is \$11 million. We will determine how much additional 5% debt the company can incur without reducing the interest coverage ratio below 3 times.

First of all, if interest expenses rise to \$15 million, the interest coverage ratio (ICR) will be 3 times:

$$\text{ICR} = \$45 \text{ million} / \$15 \text{ million} = 3$$

Therefore, the extra \$4 million of interest (we have assumed that interest expenses increased from \$11 million to \$15 million) will allow the company to issue an additional debt amounting \$80 million:

$$\begin{aligned} \text{Additional debt} &= \$4 \text{ million} / 0.05 \\ &= \$80 \text{ million} \end{aligned}$$

Bond indentures and bond agreements also specify events on default. In case the issuer fails to pay interest or to repay principal promptly, defaults on another debt issue or fails to adhere to one of the covenants imposed, the lenders can demand immediate repayment of the debt. Often, however, bondholders will try to negotiate before pursuing default proceedings, because they usually do not want to take ownership of the company.

4. Leasing versus borrowing

Leasing is an alternative to debt. The reason is that the company must make its leased payments in order to continue to use the leased asset. Failing to do so, the lesser can reclaim the asset (because legally speaking, he is the owner) and sue the lessee for not paying.

Failing to make a lease payment has the same consequences as failing to pay interest or repay principal on outstanding debt. In case a company fails to make a lease payment, the lesser is considered a creditor for the company and can force the lessee to go bankruptcy. Therefore, when making a financial analysis of a company, its lease payments obligations are included in the same risk category as the company's interest and principal repayment obligations.

In order to compare leasing with borrowing, we will assume that the company's total after-tax obligations will be exactly the same either using leasing as a financing possibility, either issuing debt. Hereinafter, we will determine which one of these alternatives provides the greater financing amount considering the particular after-tax payment stream.

Suppose a company has a coal mine project under consideration, with a total cost of \$100 million. The project involves, among other purchases, three electric shovels, which cost \$10 million each. The company expects the shovels to be worth \$500000 each after 10 years of use. The company's cost of debt, considering a 100% debt financing with no over collateralization, is 12% before taxes. The project's weighted average cost of

capital (WACC) is 15%, and the marginal income tax rate is 40%.

The required return for computing the present value of the lease payments and the depreciation tax deductions is the lessee's after-tax cost of identically secured debt. The reason for this equity of costs is due to the fact that both lease and debt payments of the company belong to the same class of risk.

In order to determine the net advantage to leasing, it is necessary to first calculate the forgone depreciation tax deductions per year (FDTD):

$$\begin{aligned} \text{FDTD} &= (\$1000000 - \$500000)/10 \\ &= \$950000 \text{ per year.} \end{aligned}$$

Consequently, the related tax savings forgone per year (RTSF) would be:

$$\begin{aligned} \text{RTSF} &= \$950000 \times 40\% \\ &= \$380000 \text{ per year.} \end{aligned}$$

Therefore, the net advantage to leasing (NAL) for the company would be of -\$54236, determined as follows (calculation is made assuming that lease payments are made at the end of each period, rather than in advance, respectively at the beginning of each period):

$$\begin{aligned} \text{NAL} &= \$10000000 - \$9930644 - \\ &\quad \$123592 \\ &= - \$54236 \end{aligned}$$

Hence, the net advantage to leasing is negative. The main reason for this negative value would be the company's ability to use tax deductions associated with ownership of the assets. Considering these facts, the company should better borrow and buy the shovels rather than lease them.

Moreover, by determining the internal rate of return (IRR), we will evaluate the cost of lease financing (after-tax cost). The internal rate of return is the discount rate that makes the net advantage to leasing equal zero:

$$0 = \$10000000 - \Sigma[\$1427000/(1+\text{IRR}) - \$500000/(1+\text{IRR})]$$

Solving this equation, the resulting IRR is 0.0758 or 7.58%, greater than the 7.20% cost of identically secured debt. Accordingly, the company should borrow and buy the assets.

5. Concluding remarks

Long-term financing is often used by companies to ensure adequate capital for funding activities such as purchasing assets, performing large-scale projects or increasing

facilities.

Raising funds externally by issuing long-term debt involves a series of risks, such as prepayment risks or risks involving negative evolution of prices. Recent innovations in the bond market have made possible a particular form of risk reallocation, in order to assure investors against several risks they would be exposed to, and therefore make bonds more attractive. Commodity linked-bonds and collateral mortgage obligations are two of these bond innovations that address a particular risk of the investor.

Most of the today's debt issues contain protective covenants that restrict the issuing company's area of action. Financial tests must therefore be met if the company wants to further finance its activity or make other actions that would eventually affect its financial situation. As shown, an additional debt can be incurred by a company only after achieving the interest coverage ratio.

Referring to leasing as a long-term financing alternative, it provides an affective way of obtaining long-term assets. Still, when compared to debt, leasing would not be the best solution for a company, as the costs of financing assets through leasing are greater than the after-tax cost of identically secured debt. In consequence, debt is the cheapest alternative to long-term financing, but it should not be used excessively, as it could as it could lead to an increasing financial risk for the company, and therefore affect its economic situation, by boosting costs of all financing sources.

Abstract

The LIFE programme was adopted in 1992 to support the implementation of Community policy and legislation in the field of the environment. For period 2007-2013 the new financial instrument is LIFE + has as objective to contribute to the development, implementation and updating of Community environmental policy and environmental legislation, also seeks to facilitate the integration of the environment into other policies, and achieve sustainable development in the European Union.

Key words: environmental project, financial instrument, best practices, European Union.

JEL classification: O19, Q50

1. Introduction

Environmental protection is justified for at least two reasons: ecological systems are the only ones able to secure the regeneration of the natural fund of resource and to maintain the environmental conditions and human activities have negative repercussions on the functioning of these systems.

Progresses made in this direction depend on the possibilities to provide appropriate financial support. Since the economic system does not have the mechanisms needed to integrate ecological costs, the rational administration of financial resources is the alternative to make available the funds needed for environmental protection. The European institutions are highly interested in environmental protection being among the most active ones at international level. This interest led to the development of highly effective financial tools that will be analyzed in our paper.

The LIFE program represents the outcome of continuous seeking of efficient means for the allocation of financial resources in environmental protection. The Habitat and Birds directives represented the main driving force in the improvement of this instrument, which is organized

in three pillars. The paper aims to present the patterns of these pillars and to outline their effects on project design. There are also proposed several models of projects as best practices.

2. Measures to be financed by life+

For the 2007-2013 period the new financial instrument is LIFE +. This has as objective to contribute to the development, implementation and updating of Community environmental policy and environmental legislation, also seeks to facilitate the integration of the environment into other policies, and achieve sustainable development in the European Union. The following measures may be financed by LIFE+ if they satisfy the eligibility criteria set

- operational activities of NGOs that are primarily active in protecting and enhancing the environment at European level and involved in the development and implementation of Community policy and legislation;
- developing and maintaining networks, databases and computer systems directly linked to the implementation of Community environmental policy and legislation, in particular when improving public access to environmental information;
- studies, surveys, modelling and scenario building;
- monitoring, including the monitoring of forests;
- capacity building assistance;
- training, workshops and meetings, including the training of agents involved in forest fire prevention initiatives;
- networking and best-practice platforms;
- information and communication actions, including awareness-raising campaigns and, in particular, public awareness campaigns on forest fires;
- demonstration of innovative policy approaches, technologies, methods and instruments;
- specifically for the nature and biodiversity component:

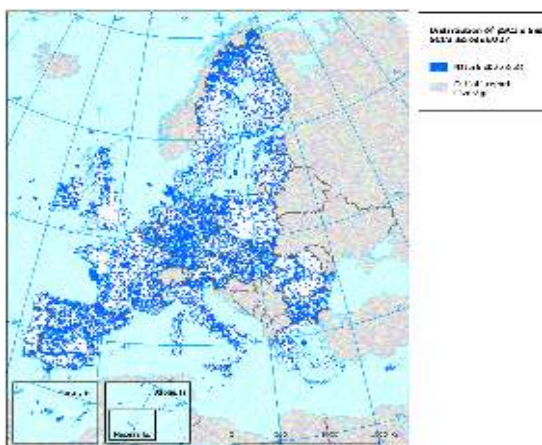

- site and species management and site planning, including the improvement of the ecological coherence of the Natura 2000 network,
 - the monitoring of conservation status, including setting up procedures and structures for such monitoring,
 - the development and implementation of species and habitats conservation action plans,
 - the extension of the Natura 2000 network in marine areas,
 - the purchase of land, provided that:
 - the purchase would contribute to maintaining or restoring the integrity of a Natura 2000 site,
 - land purchase is the only or most effective way of achieving the desired conservation outcome,
 - the land purchased is reserved in the long term for uses consistent with the objectives set out in Article 4(2),
 - the Member State concerned shall, by way of transfer or otherwise, ensure the long-term reservation of such land for nature conservation purposes.

3. Life+ components

LIFE+ Nature and Biodiversity

The specific objective of LIFE-Nature is to contribute to the implementation of Community nature protection legislation: the “Birds” Directive (79/409/EEC) and the “Habitats” Directive (92/43/EEC), and in particular the establishment of the “Natura 2000” network for the in situ management and conservation of Europe’s most remarkable fauna and flora species and habitats.

The Natura 2000 Network is an ecological network of natural areas designated to conserve Europe’s rich but vulnerable habitats and species.

Source: EEA,2009
Fig. 1 Natura 2000 Network

The network includes over 20,000 sites from all member state Collectively the cover a substantial area: almost a fifth of Europe’s land and water.

The specific objectives of LIFE+ Nature and Biodiversity

- to contribute to the implementation of Community policy and legislation on nature and biodiversity
- to contribute to the consolidation of the knowledge base for the development, assessment, monitoring and evaluation of Community nature and biodiversity policy and legislation;
- to support the design and implementation of policy approaches and instruments for the monitoring and assessment of nature and biodiversity and the factors, pressures
- and responses that impact on them, in particular in relation to the achievement of the target of halting biodiversity loss within the Community by 2010 and the threat to nature and biodiversity posed by climate change;
- to provide support for better environmental governance by broadening stakeholder involvement, including that of NGOs, in consultations on, and the implementation of,
- nature and biodiversity policy and legislation.

In the box below is presented an example of project aims to maintain the actual conservation status of the species in several Natura 2000.

Box 1 Example LIFE+ Nature and Biodiversity Project

Best practices and demonstrative actions for conservation of Ursus arctos species in Eastern Carpathians, Romania

Total Budget: 515,066.00 €

Life Contribution: 386,300.00 €

Duration: 15-JAN-2010 to 20-DEC -2013

The project aims to maintain the actual conservation status of the species in several Natura 2000 sites by applying best practices and demonstrative activities and promoting them at national and European level. Preventing the decline of brown bear population in the area is a key objective.

Overall the project targets to promote a friendly cohabitation between bears and humans based on gathering more information on the bears’ hibernation and feeding habits and searches for an active protection of hibernation dens from highly disturbing human activities such as logging. Measures will include banning human activities at critical periods, extending of the Animal Rescue

Mobile Unit team's activity as well as increasing the capacity of the Bear Cub Rehabilitation Center. The project will set up several demonstration agriculture, livestock and farm protection systems using equipment and substances that keep bears away and will introduce a new "bear friendly" eco-label.

Source:

<http://ec.europa.eu/environment/life/project/Projects>

A proposal for project must either be a *LIFE+ Nature* or a *LIFE+ Biodiversity* It cannot be a mixture of both.

TABLE 1 The key differences between LIFE+ Nature or a LIFE+ Biodiversity projects

LIFE+ Nature	LIFE+ Biodiversity
exclusively in relation to the objectives of the Birds and Habitats Directives	not restricted to the Birds and Habitats Directives, but is in relation to the Commission Communication "Halting the loss of biodiversity by 2010 – and beyond"
best practice and/or demonstration	demonstration and/or innovation
long-term, sustainable conservation measures and investments in Natura 2000 sites, species and habitats	demonstration of the feasibility of measures in favour of biodiversity monitoring, evaluation and active dissemination of these measures are an integral part of the project
land purchase and long-term lease or compensation eligible	only short term lease or compensation are eligible
infrastructure and equipment costs 100% eligible (public bodies and NGOs)	infrastructure and equipment costs only partially eligible (depreciation)

Source: LIFE+ Nature and Biodiversity Guidelines for applicants 2009

LIFE+ Environment Policy and Governance supports technological projects that offer significant environmental benefits, for example process or efficiency improvements.

This part of LIFE+ also helps projects that improve the implementation of EU environmental legislation, that build the environmental policy knowledge base, and that develop environmental information sources through monitoring (including forest monitoring).

The LIFE Regulation defines five areas eligible for funding:

- land-use development and planning,
- water management;
- reduction of the environmental impact of economic activities;
- waste management;

- reduction of the environmental impact of products through an integrated product policy.

The specific objectives of LIFE+ Environment Policy and Governance shall be, in relation to the objectives of the 6th EAP, including for the priority areas of climate change, environment and health and quality of life, and natural resources and wastes:

- to contribute to the development and demonstration of innovative policy approaches, technologies, methods and instruments;
- to contribute to consolidating the knowledge base for the development, assessment, monitoring and evaluation of environmental policy and legislation;
- to support the design and implementation of approaches to monitoring and assessment of the state of the environment and the factors, pressures and responses that impact on it;
- to facilitate the implementation of Community environmental policy, with particular emphasis on implementation at local and regional level;
- to provide support for better environmental governance by broadening stakeholder involvement, including that of NGOs, in policy consultation and implementation.

Box 2 Example of LIFE+ Environment Policy and Governance Project

Waste Network for sustainable solid waste management planning and promotion of integrated decision tools in the Balkan Region,

Perioda 01-JAN-2009 to 31-DEC - 2011

Total Budget: 869,451.00 €

Life Contribution: 431,742.00 €

The BALKWASTE project aims to spread awareness of the EU waste strategy and policy and its implementation in Member States to the whole Balkan region, using Romania and Bulgaria as case studies.

The following results are expected:

- A 60% diversion rate from landfilling for the municipal wastes;
- A 50% reduction of landfilling of biodegradable wastes;
- At least three new waste management plants in the region in each case study region;
- Training of personnel to use the decision support tool (software developed by the project to assist decision making in waste management);
- Support to 10 decentralised waste management authorities;

- A procedure for monitoring the performance of waste stakeholders;
- Raised awareness among stakeholders;
- Development of a Balkan Waste Network.

Source:

<http://ec.europa.eu/environment/life/project/Projects>,

LIFE+ Information and Communication co-finances up to 50 percent projects that spread information about environmental issues, such as climate change and conservation. This strand of LIFE+ can also support forest fire prevention awareness and training campaigns.

The specific objectives

- o to disseminate information and raise awareness on environmental issues, including forest fire prevention;
- o to provide support for accompanying measures, such as information, communication actions and campaigns, conferences and training, including training on forest fire prevention.

Box 3 Example of LIFE+ Information and Communication project

Promoting green products , Romania

The main objective of the project is to conduct an awareness-raising campaign, in order to promote the production and consumption of green products – those products that conform to the EU eco-label scheme and other environmental protection related tools and initiatives (e.g. EMAS, Energy Star, Carbon Neutral).

Duration 01-JAN-2010 to 31-DEC -2012

Total Budget: 1,269,503.00 €

Life Contribution: 618,700.00 €

The specific objectives of the project are to:

- Make the business argument to producers regarding green products;
- Raise consumer awareness of green products;
- Increase the recognisability of green products;
- Increase preference for green products by showing the environmental and financial benefits.

Source:

<http://ec.europa.eu/environment/life/project/Projects>,

During the period 2007-13, the European Commission will launch one call for LIFE+ project proposals per year. The financial envelope for the

implementation of LIFE+ shall be set at EUR 2 143 409 000 for the period from 1 January 2007 to 31 December 2013.

4. Conclusions

Public and/or private bodies, actors and institutions may receive financing through LIFE+. At least 50 % of the budgetary resources for LIFE+ dedicated to action grants for projects is allocated to measures to support the conservation of nature and biodiversity.

At least 78% of LIFE+ resources are used to fund action grants for projects. The maximum rate of co-financing of action grants is 50% of eligible costs. However, for projects concerning the protection of priority habitats or priority species, LIFE+ may finance up to 75% of eligible costs. At least 50% of the funds allocated to action grants for projects are reserved for nature conservation and biodiversity. In addition, at least 15% of the funds allocated to action grants for projects are reserved for cross-border projects.

Co-financed projects must be distributed proportionately by the Commission. The Commission establishes indicative annual allocations for the periods 2007-2010 and 2010-2013 based on the total population and population density of each Member State, and the area of sites of Community importance in each Member State and the proportion of a Member State's territory covered by sites of Community importance. Additional funding may be allocated to land-locked Member States.

The Accounting Image of Public Entities from the Perspective of Suppliers-Users of Accounting Information Local Public Administration Sector

Ph.D Student Dragu Gabi Georgiana
Universitatea "1 Decembrie 1918 Alba Iulia"
georgiana.dragu@yahoo.com

Abstract

According to position document no.11 "Economic and Monetary Union", Romania has committed to report after the European System of Accounts ESA 95. The exploratory study was used to enframe the issue into the general context. The data was collected by means of empirical experiment. The purpose of this research was to present the current image of accounting information delivered to the users/used by their suppliers. A particular issue was highlighting the necessity of shifting focus from the examination of financial statements' annexes to the analysis of annotations and the evaluation of unused prefinancing at the end of 2009 simultaneously.

Key words: European System of Accounts, accounting information, financial statements.

JEL Classification: M41, O13.

1. General background

The need for relevant, objective information emanates from the entity's relation with the field of activity and requires an adequate offer. The accounting information delivered systematically by the practitioners of economical entities should be subservient for all the users of accounting products. The market of these information represents the intersection of this type of information demand and supply. The informational demand represents not only the informational necessities of various users, but also the pressures they make upon the information generator system. The informational supply represents not only the information obtained within the accounting informational system available for various users, but also their

delivery means and forms

In comparison to other informational sources, the accounting information are highly credible. This credibility is attained by the auditors who are responsible for the certification of synthesis documents presented to the users by the managers.

2. Romanian background

In the case of Romania, national accounting is attempted to be positioned between two accounting cultures – the traditional continental accounting and the anglo-saxon accounting. Due to the communist indoctrination, customs and the many legislative changes, the Romanian accountant that works in the public system demonstrates an aversion to change and he still needs to be said what/ how/ when to act.

The International Accounting Standards (IAS/IFRS/IPSAS) bare a cultural knowledge difficult to assimilate, they are based on the professional reasoning (that was not taken into account during the centralized period) and principles according to which a single problem might have multiple solutions (a fact that leads to controversies when confronted with the control board that might have some other solution). However, no matter their form, the International Accounting Standards are permanently changing, are becoming more and more complex therefore the Romanian accountant must become an international one, holding to the principles and conditions of international accounting.

To converge means „to tend toward an intersection point, a common conclusion or result” [1].

In the accounting domain, convergence is a relatively new term, introduced in 2001 by

the International Accounting Standards Board in the context of defining the objectives. One of these objectives states the following: „To collaborate actively with the national standards’ regulation boards in order to identify qualitative solutions so that national accounting standards achieve the convergence with the accounting standards established by IASB” [2].

„According to the Romanian explanatory dictionary the conformity is defined as “a relation between two resembling or identical entities, matching, congruence, identity. The accounting conformity is the process that determines the congruence between the presented regulations’ content and the elaboration of financial statements, representing an attunement of the national regulations to the regulations presented by the regional and international accounting standardization boards”. We adhere to the following conclusion according to which „Convergence represents the integration on a national basis of IAS/IFRS/IPSAS principles and theoretical background, respectively embracing some of the accounting processes stipulated by the international standards whereas standardization within accounting domain designates the consistency among and attunement to the accounting standards of various states in the european level” [3]. The objectives of the accounting standardization include[4].

“... to ensure the settlement of accounting practices and therefore contribute to accounting enhancement”;

“... to allow the accounting information users to make rational decisions based on the accounting information”;

“... to act as a moderator among the various participants in the economical field, especially among accounting information suppliers and accounting auditors that certify the quality of information thus ensuring the social credibility of the accounting information”;

“... to allow the consolidation of accounting information at society’s groups level”;

“... to allow the elaboration of national statistics”.

According the review of materials dealing with performance in public institutions made by Eugeniu Țurlea in the article "Performance of

public sector entities, between present and future" two different opinions are emphasized.

The following authors Bouckaert & Balk, Jones & Pendlbury, Likierman wonder whether it is appropriate, possible and necessary to measure performance in public bodies.

They bring in supporting their opinion as an argument the difficulty of defining the concept, the impossibility to establish an indicator of measurement, that its value decreases as valuable management tool, if not used properly.

On the other side, it is presented the positive opinion of the author Robert & Colibert.

Robert and Colibert sustain the public sector’s performance measurement on the basis of engagements’ accounting.

In their opinion, the performance concept simply means that current entities’ revenues must be compared with current expenditures with the purpose of expenses’ coverage as well as for surplus.

The authors believe that accrual accounting represents the most secure and feasible performance measurement instrument.

Their opinion is based on the recognition of the correlation between expenditures and revenues which are being related to the same practice.

The most eloquent influence in favour of adopting the accrual accounting is apparent in case of New Zealand which moved from a surplus result (based on cash accounting) of 1 billion dollars, during the first year new system way of reporting (based on accrual accounting) to ten times smaller surplus.

Regarding the economical account, in many European Union’s states the financial account is referred to as accrual due to lack of data and is characterized by the registration of revenues and expenses’ commitments, ratified as to integrate the financial dimension of economical values based on the management of the economical accrual. Using the single-entry strategy, the Romanian public institutions register the revenues and expenses automatically based on the economical accrual for the reference period.

The managerial circuit regarding the commitments activity is based on the principle of separating the attributions of the people that have the capacity of credit release authority from the attributions of the people that have the capacity of accountants.

3. The Romanian subsectors' reporting

According to the position document no. 11 "Economical Monetary Union", Romania has committed to report after the European System of Accounts ESA 95.

The introduction of subsectors' reporting is based on the 2009 internal and external reporting requirements established by the enactment of the Order of the Ministry of Public Finances no. 629/2009 regarding the approval of the Methodological Norms for the elaboration and deposition of public institutions' financial statements and also on some 2009 monthly financial reports with subsequent modifications and addenda (Order of the Ministry of Public Finances no. 2290/2009, Order of the Ministry of Public Finances 2941/2009).

The accounting information user deals with two types of subsector organization:

-once the public institutions' reports are distributed into subsectors each one is assigned the annex for the affiliation subsector
once the public institutions' reports are distributed into subsectors each one is assigned the annex for the affiliation subsector

- Annex 40a "Public institutions' assets and debts statement from central administration"
- Annex 40b "Public institutions' assets and debts statement from local administration"

Annex 40c "Public institutions' assets and debts statement from the social insurance domain (public assistance, social security, health insurance)"

The classification of public institutions is necessary in order to circumscribe the Public Administrations' area, its division into subsectors, but is also necessary for defining the modalities of the financial statements' aggregation.

The ESA 95 handbook divides the public administrations' sector into four sectors

- Central Administrations (S.1311),- Intermediate Administrations (S 1312), do not exist within Romanian subsectors.- Local

Administrations (S.1313),- Social Insurance Funds (S.1314).

Analyzing the structure of S.13 sector is necessary for evaluating the classification of the institutions into the above mentioned subsectors and assessing the transactions made by/ within public administrations.

It should be noticed the difference between public sector and public administrations resulting from the modalities of institutions' clasification. According to ESA 95, an institution is included into S.13 subsector based on its financing modalities and on its committment to the so called 50% criteria. Since this criteria is strictly statistical, the inclusion or exclusion of an institution into the public administrations' list is not entirely based on its economical and legal profile.

In the case of Romania, the institutions are included into the public administrations' area based on two elements:

- financing modalities
- legal statute

The most difficult resource to manage is the time. Time cannot be: stocked. Time cannot be: traded Time cannot be: bought. Time cannot be: sold Time can only be used..Today, for a good manager, it is not enough to know how to do, but to make others acknowledge as well.

The information is obtained, a precise meaning is given to the operational context to turn it into a helpful piece of information to their job, unfortunately to find good information, at the right time, for the right person, has become a difficult task as sequel to the immense volume of information.

The management of knowledge has to be replaced by a management of competencies. This involves the idea of integrated approach, know how to do (expertise) and the behaviour (ability, to know how to be).

"The expertise combines the experience of knowing what to do at the highest level, deep compression of mechanisms and processes implemented, a more intuitive capacity for diagnosis and vision for actionIt is about a sequence of steps leading to outside information, knowledge and expertise in the end [5].

The complexity of public sector that is

characterized by activities by the development and implementation of public policies and providing services not being directly connected with the resources available and required quality creates difficulties in establishing performance criteria.

For analyzing the performance measurement markers (in accordance with the activity specificity of public entities) other markers than financial ones must be considered.

By 28 February 2009, for 5 of the 7 operational programmes, the rate of rejected exceeds 50%.

Of the amount allocated for the period 2007-2009, 22% was absorbed through the contracted projects, but only 2,3% of the amount was effectively paid. Of the amount allocated for 2007-2013, only 6,3% was absorbed by 28 february 2009.

The analysis of each operational programme shows major intervention areas and even entire priority axes for which there are no approved projects that could attract funds. For example, for the program POS-CCE, only one priority axe was accessed and for POS-DCA no project met the conditions in order to be approved

The authorities of local public administration who run the social services, the managers of public social security services organized under the regulations of the Law no. 47/2006 regarding the national social security system as well as the chief executives of services' legal entities are responsible as employers for the reorganization of social services under the law, within the approved standard costs (e.g. standard cost for maternal centers, standard cost for protected buildings, standard cost for social centers etc.)

In order to manage its dependency, the manager tends to respond with priority to requirements of developing groups that control resources. As resources are limited in time and money, the organization cannot simultaneously equally treat all requests.(Nekka H 2005) [6].

The competition cannot be created or destroyed, it is only transformed, and if it disappears in a certain part of life it appears, logically, in the same amount into another area .

Even though the national norms do not give a comprehensive definition, it is still mentioned that the patrimony result is an economical one, representing the institution's financial

performance, respectively the patrimony deficit and surplus.

Although it is considered an economical result (the patrimony result), according to the economical theory by which the economical result represents the difference between the total revenues and the opportunities of all production means (entries) used during a certain period of time, including the unrealized elements acknowledged in equity but which do not transit the patrimony result account, it does not cover the entire area of the phenomenon.

From analyzing the financial reports' components reflecting the performance, further guidelines can be inferred:

- from analyzing the patrimony result account, the image of performance building follows;
- from analyzing the execution-revenues accounts, both estimated budgetary revenues/credits and the performed ones follow;
- from analyzing the execution-revenues accounts and expenditures, column cash payments result (cash accounting)

The latter are reflected as the entity's way of financing and persistence assurance and are found in the treasury's cash flow report (cash report).

The financial reports must provide real time useful information to the users, respecting the cost-benefit rapport.

From this point of view, the accounting information users may encounter difficulties due to the coexistence of:

- patrimony result – budgetary execution result
- payments' result – treasury's cash flow

The most frequent confusions are those of not levying:

- the difference between the accounted, estimated and effectively cashed revenues
- the difference between payments (cash payments of available/financing creditor turnover) and the fact that the budget regards them as payments and accountancy regards as payments the 6th category "Chart of Accounts".

The models of entity's performance presentation are the ones recommended by

IPSAS 1 “Presentation of financial statements” including, among others:

- the net assets’ statement – equity change
the treasury’s cash flow statement

The financial performance statement/ profit and loss account reveals the entity’s financial performance through the surplus/deficit outcome as a difference between revenues and expenditures.

In this analysis, special attention must be given to:

- how the classification of expenses is made according to their nature and function
- how the correlation is made between the patrimonial account outcome – expenses execution account(s) according to their source of financing and pooling in the patrimonial outcome.

In a correlated way, attention must be given to the exceptions where the balance sheet’s patrimonial result is different from the one in profit and loss account (territorial administrative unites consolidating schools’ financial statements, infusion centres that have multiple funding).

Performance must be regarded on each source of funding related to the specific field of activity.

Allocation of costs by destination requires distribution involving the use of professional reasoning,

Unlike the other public institutions, in the case of territorial administrative units the cash surplus from the current activities is transferred to the working capital at the end of the year.

Synthesized, the information on these influences is presented in the notes which, in turn, depend on professional reasoning applied, depending on the accounting policies adopted. For instance, according to annex “Annotations (Analysis report) to the centralized financial statements of Bucharest – proper activity – in 31.12.2008 Expenses”

The surplus in 31.12.2008 representing 104.717.888 lei includes the local cash budget at the state treasury representing 104.717.279 lei (transferred at the end of the year into the cash working capital) as well as the sum of 609 lei remaining at the end of the year in the account of Fixed Fund Administration (cashed in on 31.12.2008), but reimbursed at the end of 2009 to the local budget.

For the conformity, we find the same amount in the annotation regarding “The achievement of revenues and expenses highlighted outside the local budget in 31.12.2008”

“The total of achieved revenues do not include the 2007 balance accounts, carried over in 2008 and the working capital includes the local budget surplus as well (104.717.279) which was transferred to the cash working capital, a surplus that was also returned to the annual account of the local budget (Annex 13)”.

To correlate the reported sum within the working capital, we additionally examine Annex 21 “Revenues, Expenses and Surplus of Local Budgets in Territorial Administrative Units” and we find the amount of 104.717.888 (104.717.279+609) in the surplus column.

4. Conclusions

To conclude, it should be noted that in order to facilitate the understanding of the set of financial statements elaborated at the end of a certain period, the focus should be shifted from the crossed examination of the multitude of annexes to financial statements to the analysis presented by their annotations.

In order to adjust the way of highlighting the sums representing unused prefinancing at the end of 2009 and their transfer to the working capital within the units subordinated to city halls according to the final legal regulations, it is necessary that they have the possibility to use the account 131 “Working capital”.

The dynamic environment in which public entities operate, the downward trend of public resources, poorly presented objectives, public distrust (though declining), are a challenge for public accounting as a factor in performance.

The Relationship Between Environmental Accounting and Sustainable Development

Ducu Corina

petresex@yahoo.com

Abstract

The specific dimensions of sustainable development are interconditioned, but in the present paper we intend to emphasize the importance of the ecological dimension. The role of the natural environment in achieving the economic activities is vital, but its quantification possibilities are reduced. In this situation, the concept of sustainable development can be complemented by environmental accounting, in an attempt to more clearly present the negative effects on the environment generated by the economic activities. Measuring these effects and their inclusion in the national accounting system are more difficult to achieve, but the importance of protecting the natural environment to provide an opportunity for the future generations, determines us to try to look for and find appropriate solutions.

Key words: environmental accounting, sustainable development, environment

JEL classification: M 41, N5

1. Introduction

The constant struggle for development and increase of the competitiveness between states should be conducted in conjunction with the concept of sustainable development. This concept implies the compatibility of four systems: the economic, the environmental, the human and the technological one, so that to ensure meeting

the current needs, without compromising the ability of the future generations to meet their own needs.

2. Content

Sustainable development requires the detection and calculation of some indicators to analyze the phenomenon as a whole, *particularly in the environmental dimension*.

An instrument used for this purpose can be represented by environmental accounting. This actually has a double representation [3]:

- environmental accounting is a tool necessary for recording, storing and organizing the environmental data of physical and/or monetary type;
- environmental accounting is a source of information for analysis and which integrates special indicators defined to assess the effects of the human activity on the natural environment.

Conceptually, environmental accounting is known, but its application is more difficult to accomplish. Even though specific indicators to the natural environment are generally used and calculated, they are not presented as forming a unified whole called environmental accounting.

At first glance it seems a new concept discovered to present it purely theoretically, because the classical concept of accounting lead us to believe that the use of environmental accounting is unimportant.

Just like sustainable development, environmental accounting also examines the macroeconomic activities, but they are

influenced and conditioned by the multitude of activities at microeconomic level.

In conclusion, environmental accounting can be applied both at macroeconomic and microeconomic level. At microeconomic level, the analysis of the firms primarily seeks to examine the negative externalities. At macroeconomic level it supplements the information provided by the gross domestic product, because this indicator does not include the matters relating to the natural environment.

The need to supplement the information provided by the macroeconomic indicators of results lies in the existence of the market failures and of the externalities. In such cases by the information provided by environmental accounting some market failures can be corrected.

The natural environment is a source for the economic resources and the space in which all the economic activities take place. However, it is not measured by the gross domestic product. The gross domestic product should also present how the value-added was obtained, namely to reflect the effects of the economic activity on the natural environment.

The limits of the GDP are those activities which cannot be measured using this indicator. Among these we mention: **the unreported and unrecorded activities** (the underground economy or the black market); **the activities that are not carried out on the market** (the non-marketed services, such as housework, voluntary work); **the on one's account activities that cause pollution**, these not being reduced from the gross value-added [4].

In the context in which the above-mentioned activities are not included in the calculation of the GDP, we must admit that some of the quantified economic activities lead to the deterioration of the natural environment, to the reduction of the natural resources. These activities determine the increase the GDP of a country, but also lead to the respective country's depletion of assets.

The need to record such information was the starting point to calculate an indicator called the green GDP. The green GDP is determined by subtracting from the conventional GDP the depreciation of the natural resources. The indicator thus determined indicates to what extent an economic activity increases the national wealth or its reduction, by using the natural resources.

In 2004, in China, the use of the green GDP as a macroeconomic indicator was announced. Two years later, the first report on this indicator was published. The results obtained showed that the economic losses caused by pollution were of 66.3 billion U.S. dollars or of 3.05% of the national economy. The indicator was no longer calculated because it was obvious that the readjustment of the GDP means the reduction of its growth to acceptable levels, even zero in some regions.

The economist Serge Latouche said that if we want to adjust the GDP with the damage produced to the natural environmental and with all the consequences on the natural and cultural patrimony, then we obtain zero or even negative growth.

These examples come to strengthen the belief of some economists that it makes no sense to calculate this indicator. Those supporting this belief are economists who are used that the values recorded by the GDP to be positive and obviously the higher they are, the more they demonstrate the performances of the respective economy.

In the present context when the focus is on sustainable development such concerns are childish and do not fit in the new world order. The development of a company without taking into account its effects on the natural environment no longer has the desired purpose. The claim that "sustainable development is the current development, but without jeopardizing the development of the future generations," no longer has a point.

The national accounting system cannot yet capture all the aspects of the relationship between nature and economics. The national accounting system performs the assessment of goods and services, whether they are sold or not on the market, both for the production prices and for the market prices. The goods and services which are outside the market represent goods and services produced and used in households. They may be evaluated either based on the production cost or based on the prices of similar products on the market.

In the national accounting system the use of the natural environment in economic activity is not included. The possible losses suffered by the future generations because of the irrational use of the natural resources at present are not recorded in the production

accounts of the national accounting system, but they are nevertheless recorded as “other changes in the assets”. [2] There are economists who find it difficult to quantify the effects on the natural environment and for strictly pragmatic reasons to continue to determine the macroeconomic indicators of results as before.

Despite the difficulties of including the negative effects on the environment caused by the human activities, we believe that developing and implementing the concept of environmental accounting is a step in supporting sustainable development. The argument in favour of this statement is represented by the following classification of the most polluting countries.

Table no. 1. Polluting countries

State	Total emissions (Million metric tons of emissions)	Emissions per capita (Tons per capita)
China	6017	4,58
USA	5902	19,78
Russia	1704	12
India	1293	1,16
Japan	1246	9,78
Germany	857	10,4

Source: www.capital.ro “The top of the most polluting countries in the world”, January 2010

In the ranking of the most polluting countries depending on the total emissions China detaches itself, being followed very closely by the U.S.A. The rating is totally different if we use as criteria the emissions per capita, when the U.S. appears on the first position, followed by Russia and Germany.

The concerns for the integration of the natural environment in the system of indicators have occurred since 1990. Since then we have desired the environmental indicators and the “green” accounting to provide man’s implications on the natural environment. The European Union has included among its missions the economy - environment relationship, detailed by the communications of the European Commission (Commission Communication on Environmental Indicators and Green National Accounting).

3. Conclusions

In conclusion, environmental accounting can be considered part of the classical accounting, since the latter aims at “measuring, evaluating, knowing, managing and controlling its own assets, debts and capitals, as well as of the results obtained from the natural and legal persons’ activity. Environmental accounting must meet the same end but concerning the current assets and debts, that will be paid by the future generations, given that some of the natural environment is being used irrationally in the contemporary period.

The Leasing – Source of Financing Investments. Modern Forms of Leasing Contracts

PhD. ec. Dumitrean Ioan
University 'Al. I. Cuza' Iasi
The Faculty of Economics and Business Administration
The Doctoral School of Economics
ioan.dumitrean@feaa.uaic.ro

Abstract

One of the main reasons that leasing is a financial alternative so popular in the world is the one that synthesizes its own „philosophy”: It's not ownership of the assets but their effective use is the one leading to profit. The key aspect is the proper use of capital resources: the investment of money in what generates „business” and brings profit, like publicity, the superior qualification of the staff, stocks, exploring new markets, research, development, instead of blocking them by purchasing fixed assets.

This article aims to approach the leasing as a source or as a financing alternative investments, to highlight the benefits given by that to the three parties involved in a lease - the lessee or the user of the lease, the lessee or the leasing company and the good or the assets supplier which are the subject lease. There are also the main modern forms of leasing which are more common in business finance.

Key words: leasing, investment, lessor, financial leasing, operating leasing, full pay out leasing, cross-border leasing, buy and lease, sale and lease back, cession-bail, leasing adosse, experimental leasing, time-sharing leasing, renting, credit-bail d'actions, master leasing, wet-lease, leveraged lease.

JEL Classification: M4, M41.

1. Introduction

As known, the leasing first appeared in the United States of America in 1877, the American Company Bell Telephone Comp operations (this company moved to "renting phones", instead of selling them), and gradually penetrating other countries, mainly in

Europe (United Kingdom, France, Belgium).

The first form of leasing born from the need of getting a finance in order to pursue a productive activity, appeared in 1950 throughout the U.S., when the manager of a food factory in California received a profitable order, but he had no funds to purchase necessary equipment to honor the order. In this situation, that manager was sent to a financial institution, requesting it to purchase needed equipment and the immediate rental to his firm. After closing the transaction in these conditions and the delivery of the ordered products by customer, the food company manager, encouraged by the benefits and the advantages achieved by the used method, founded the first specialized leasing company called *United States Leasing Corporation* [4].

In 1952 a company was established a special company dealing with leasing. Later, in Europe have developed regulations that define the contractual relationship based on leasing and specifies what operations it includes. In the United States the leasing was regulated by the Uniform Consumer Credit Code and the Uniform Commercial Code.

The leasing was determined in its appearance by objective causes. Thus, in the U.S., the UK and in other countries were difficulties in financing business because of the rigidity of existing forms and processes. Businessmen felt the need to equip their commercial companies with modern equipment, while the equipment of facilities was outdated, especially as a result of their obsolescence influence. The make purchase of goods from the seller (supplier) in order to rent them to those customers who needed them has appeared as a saving and effective formula [2].

The term "leasing" comes from the verb 'to lease from English which means "to rent". Etymologically, the word "lease" is of French

origin, coming from the older "Lais", derived from the verb "laisser" (leaving another), which has its origins in Latin "laxare".

The leasing is an agreement transferred by the lessor, in return for payment or a series of payments, the right to use a good for an agreed period of time.

The lease is the contract whereby one party called the lessor (the beneficiary) transmits forward over of a specific period of time, the right to use the personal goods whose owner is another party called the lessee (user), at his request, for periodic payments known as rate lease (rent) and at the end of the lease, the lessor is obliged to respect the user right option [1]:

1. to buy the asset (the guaranteed residual value);
2. to extend the lease;
3. to cancel the lease.

2. Leasing - financing alternative investments

Without being itself a source of financing investments, the leasing creates the opportunity for business to dispose of certain assets without being required to buy (without becoming their owner). For the user (direct investor) the leasing is a way of investment finance that do not affect the debt capacity and it is not a loan in the classic sense of the word. Hence, it is required to register separately in the accounting the rent corresponding to the leasing operations.

Unlike an ordinary rental, the leasing gives the lessee the right to become owner of the property at the end of the contract at a specified price. Such a lease appears an interesting alternative of a source of investment financing [5], as a substitute for loan [5].

Determining the costs involved with leasing (credit bail or cessionbail) is a rather complex operation. This aspect is particularly important in determining the structure of financing investment when it comes choosing the sources of financing, their contribution to fund training projects or company programs.

3. The modern forms of the lease

The lease is shown in practice in many forms [4], mainly influenced by the specific

lease transaction as a whole and by several factors, such as: funding possibilities provider, the market limits, the degree of organization of production and sales, etc.

Next we turn our attention to some of modern forms of leasing.

The literature of international trade law, has also shown that **operating lease** (also called *functional lease*) knows in turn, the following forms:

1. **True lease**, which is actually a genuine lease, the contract being cancelled and having as subject tools, machinery and equipment temporarily employed by the user in commercial activities.

2. **Service and maintenance lease** is to enable users to receive, besides equipment provided by the lessor (who is the property maker), certain related services and specialized technical assistance.

The understanding of the procedures and techniques that are being used requires also knowledge of how to engage the parties and especially the role of incumbent companies specialized in drawing up leases.

The leasing is defined as when concluding the contract is directly between suppliers and customers. In this case, the 2 sides agreed immediate deadlines, the contract terms and conditions and stipulates terms that are considered appropriate for its completion and performance bonds assumed.

The leasing is defined as when done indirectly through a specialized company. Currently, most leasing operations are performed by such companies. Their number is increasing. For instance, only in the U.S. - the country in which the lease was born - is operating over 400 leasing companies. Today, however, United States Leasing Corporation remains the most important, a company that was created in 1952.

These companies are: general, brokerage or integrated, in report on the operations required to perform. Lending and services functions are those that define the role of the lease system. It should be noted that through the contract, these companies assume the risks of the operations they perform.

The leasing companies share the technical life of machinery in two periods: *primary period* equal to the economic life of the asset, namely the time the car is considered unlikely

to suffer obsolescence and a *secondary period* equivalent time period which lasts from the end of economic life by the end of technical life of the car. The primary period usually corresponds with the tax depreciation period, namely the time established by the law in which the financier can deduct depreciation expense.

The leasing companies and manufacturers are considering to the end of the lease, and the need for expenditure determined by the specific equipment that is the object of the contract, which involves their active presence in the exploitation of property assets by the user.

After the calculation of rates, depending on the indicators mentioned above, the lease can be classified as follows:

1. Gross and net lease rental;
2. Leasing with full depreciation and amortization partial leasing.

Gross lease, which is known as *full-service leasing*, is the way in which rates include the following components:

- Net selling price (acquisition cost) of goods forming the object of the contract;
- Expenditure for maintenance, repair and service equipment, machinery and equipment;
- Profits made using the leased property.

In this form of lease may be stipulated in contracts that suppliers provide training and specialization of staff employed by the user, for efficient operation, but also rational of machinery and equipment. Inserting such a clause in the contract, instills the user requirement to comply with the provider instructions exactly on how to use the goods.

Usually, this type of operations is not usual to reduce the amount of lease rate after the first contractual period, because once with the exploiting of the good, the maintenance and repair costs have a tendency to increase. Moreover, the leasing companies include, in case of full-service leasing contracts, added lease rate, calculated according to intensive use of equipment, which is called the *lease bonus* or *royalty*. The setting of the interest subsidy is critical to operating lease, which have a shorter duration and include the risk of failure of production or export prices, where equipment cannot be given again in leasing.

The *net lease* is that which the rates include the net selling price of the equipments and the benefit of using that property. In this case, the supplier or sponsor is no longer involved in providing repair, maintenance, support and training for the personnel assigned to operate the equipment, the costs of these activities are borne by the user.

The *lease with full amortization (full pay out leasing)*, requires that lease that in which the total leasing paid by the user to the financier- minus the total amount paid as a benefit -fully depreciated (or overwhelming proportion) asset value. The leasing amount is established since the end of the contract so as to achieve this goal. Accordingly, the amount of residual value is reduced significantly so as to represent an honorary amount. This type of contract (which in practice takes the form of financial leasing contract) is used primarily in German law, which is called *Modell*, a lease with a symbolic residual value of 1 Euro.

The *lease with partial depreciation (non-full pay out leasing)* assumes the existence of a significant residual values which gives the user the meaning right of option. It's usually the case of the operating leases, in which the lease rates do not cover the full value of acquisition cost incurred by the sponsor, for the equipment available to the user, thus, never became fully recoup the amount of charging equipment rates, the leasing company sets a residual value to ensure, if the user expresses asset purchase option, the recovery of expenses incurred.

The lease-back agreement defines those legal relationships with the owner of equipment or even of a company of *selling* an equipment or the business to a leasing company, and then take them as *rental*, the leasing company obtaining the promise of *reselling* them at lease expiry. The contract is also called *sale and lease back*, because of the financial specifics of this process to sell goods or to the re-lease. In French law, the contract is called *cession-bail* if it has properties as object and *leasing-adosse* to movable property.

As shown, in the lease-back agreement, the owner of the property and meets also the quality of provider and that of user, the

second being · the credit institution (the leasing company).

By selling the goods, the user (owner) obtain financial resources that are necessary and it staggered back, as leasing rates (rent) and to the contract expiry, the user pays the price difference, thus regained their goods covered transaction. Therefore, the purpose of concluding this contract is to obtain monetary funds, since, unlike other leasing seeking to purchase by a company of some equipment it needs, in case of lease-back operations, the company has that equipment, being their owner, however liquid funds are not sufficient to conduct business. In this case, appealing to *lease-back* is very advantageous for plant owner, whereas without sacrificing their exploitation - and being necessary for fulfilling orders - obtaining capital to develop its economic activities.

This type of leasing is used for fixed assets, which fulfills a function of the mortgage, but also to moveable, allowing a longer-term financing.

The lease-back agreement has advantages for the sponsor, because of the acquisition of ownership of property, and seeing the credit guaranteed until full recovery from the user.

A variation of *lease-back* agreement is the *combined leasing* (also called *lease-back provider*), used in relations between French traders. Under the lease agreement combined, a leasing company sells the products they made, while the latter provides the basis of a lease producing company, giving them the opportunity to rent them to turn to third parties under contracts of lease (in fact, under lease) of ordinary tenancy.

O.G. no. 51/1997 defines the *lease-back* contract as a legal one by which a person sells industrial equipment to a leasing company, to use the leasing system, with repurchase obligation (Article 22).

In terms of tax, the lease-back agreement is exempted from any tax on the sale, if the sponsor of the former owner leases the property immediately.

As it can be seen in the lease-back transaction, the good role is to serve as collateral. Throughout the contract, the lending institution owns the property. These qualities cease only when he has recovered all the money they gave the user from signing the contract.

The experimental leasing is a technique used by manufacturers to promote sales. Under this type of contract, the goods are leased for a short period of 2 or 3 months, experimentally, provided that the expiration of the option contract giving the user the purpose of purchasing goods, when appropriate to its requirements, respectively meaning of their refund, if present shortcomings.

Time-sharing lease agreements are characterized by letting *jointly* by several beneficiaries of certain high-value equipment in *time share*. This form of lease has been adopted in practice for economic reasons, mainly due to the high cost of equipment or machinery, and their rapid obsolescence. The financial benefits of this operation lie in the low lease rates that each user pays.

The time-sharing contract covers mainly electronic computers (for which he has been called *computer leasing*), and other equipments, being first used by General Electric Company in 1965. Subsequently other large companies have used the operation. Currently over 100,000 firms with ongoing time-sharing contracts and over 80% of worldwide fleet of large computers is exploited by this system.

In our law, the time-share leases are linked to an agreement between users, made to the common use of industrial equipment, and it may be the subject to a building, for an investment (Article 23 of O.G. no. 51 / 1997).

Renting is - as the name states - those leases concluded in the short or very short term and include the *day or hour rental* of goods, especially of vehicles or construction equipment. Renting is an American contract, which was taken in European trade. This type of lease (also called *hire* operation) is actually a simple rental lease not showing characteristics of leasing, such as the user's option or the problem of calculating and highlighting of the assets depreciation which is its object. Other authors have considered that *renting* operations are forms of transition from regular rental to leasing, starting from their very short duration and simplicity of legal relations that arise. The main duty of the owner / lessor is to provide the user equipment, machinery, or adequate public transport, according to applicant needs and to ensure their service.

The renting company is a company that has

standardized equipment or means of transport, concluding traditional location contracts taking into account the increased demand on the market.

In commercial practice, the renting operations appeared as a necessity to rent for reduced periods of time.

Renting or hire your show its usefulness especially for vehicles. Thus, a renting company can rent, by contract, a car for a time when their business requires the operator to make several trips, or rent a truck to do more commercial operations in several locations.

The shareholder leases (credit-bail d'actions) is a financial technique first used in France by *Groupement Francais d'Entreprises*, to meet the growing needs of small and medium enterprises for fundraising.

The operation is somewhat similar to the *lease-back* contract used for movable and immovable goods, assuming the following concrete steps: a small or medium sized stock company increases and constitutes its own capital by *issuing up (new) shares* which are underwritten by an investment fund, the investment fund *fails* in location issuing shares, which in turn will pay a regular sum of money by way of rent, when the contract expires the issuing company having the opportunity to *redeem* their shares at a price agreed with the investment fund, taking into account the payable amounts made by paying the rent.

Since our legislation does not expressly forbid it, shareholder leasing is possible under our law, subject to conditions under company law and also to orders and regulations issued by the National Securities Commission. Moreover, the original form (without amendments by Law no. 99/1999 on some measures accelerating economic reform), O.G. no. 51/1997 regarding the leasing companies and leasing operations, expressly stipulates that securities can be the object of the lease.

Also called the *container lease*, the master leasing is used by transport companies, its appearance being determined by the benefits that the carrier has by a rental of containers, then by their acquisition, which would entail additional costs of organizing an efficient operation, maintenance and repair of containers and preparation of qualified personnel.

The specialized companies in keeping

their fleet of containers available to the carriers for *a specified period (term leasing)* or for *a particular trip (trip leasing)*. The major leasing companies have entered in this field, imposing itself through the use of complex rental contracts called *master lease system*.

- *Leveraged lease* - the leasing company finances only a part of the asset value, the difference being covered by various creditors (who are financial companies), this lease is used where it forms the subject of his valuable equipment (see Figure);

- *Leasing producer* - involves the providing of a total financing by the leasing company, by purchase from the manufacturer, only with its funds, of leased property;

The international or cross-border leasing lease was founded and developed in the third historic generation of this modern tool of investment and financing, with features for international leases. It has evolved and improved through the use of the export companies, for which industrial development was a working activity.

To internal leasing also called national leasing, where not only the lessor and the user reside in the same country, but usually the leasing object is produced in that country, where for international leasing business can be set various options. Thus, in the foreign or international leasing practice is very important to establish groups of variants, because each is the subject of legal, economic and fiscal different regulations. The international leasing has some outstanding issues and phenomena, especially in conditions when the states involved have different laws.

Among differentiated forms of international leasing, in the sense of overcoming the state boundaries of a country, a relatively comprehensive definition, we can distinguish 2 basic shapes. Through a brief and concise interpretation are given the characteristics of cross-border leasing, according to the stakeholders address in the leasing business, the country where the subject lease will be used and where funding will be made. The complexity and difficulty of the leasing business are obvious and arise from the states transactional status where is made.

The first form of cross-border leasing consists in leasing business, in which the

leasing object is movable property investment to be used for business purposes. The lessor resides in the same country with the supplier / manufacturer of the leasing object and the user is residing in the importing country.

The second basic form of cross-border leasing is characterized by the fact that the leasing company in the exporting country and are not leasing business relationships with the direct external leasing user, but through a foreign leasing company, so in the country where the lease user resides. The leasing company, as the external lessor leasing may be a company organically linked or in cooperation with the leasing company from the country of the leasing user. We can deduct the following economic and financial relations between the business partners in this cross-border leasing form [6] :

1. The purchase contract of the leasing object is concluded between the domestic supplier / manufacturer of and the foreign leasing company;

2. The leasing contract is concluded between the leasing company and the user leasing of the importing country;

3. The purchase price of the leasing object is paid to the supplier / manufacturer by the foreign leasing company;

4. The leasing rates are paid by the user leasing to the leasing company, both residing in the importing country.

In the case of this form of cross-border leasing, the lease is between the leasing company, as lessor, and the user leasing of the importing country, and therefore the lease will be perfected according to law in that country representing a typical contract leasing business in that state.

4. Conclusions

In **conclusion**, it may indicate that leasing proved to be a viable and effective alternative to any other form of financing (lending), its features, which gave rise to the spread of the principal means of support and development of commercial activities and production, leading to the elaboration of some "principles", which determines the importance of the leasing:

1. not the ownership of fixed assets, but actual usage is what brings profit;

2. to be the owner of old or obsolete equipment is of no use to anyone and does not constitute an advantage for a company;

3. getting into operation, with a minimum capital investment of some modern equipment and performance, increases the efficiency and induces the increasing business volume and activity, finally bringing more profit.

Abstract

One of the major characteristics of the audit is to permanently resort to various criteria, norms and standards. This attitude is, on the other hand, much more systematic as the audit is applied as professional norms.

It is of a major importance to respect the stages of the financial-accounting audit, both for the auditors and for the patrimonial audited unit whose administration can be defined as a totality of decisions that apply its strategy. We may consider that when the financial audit gets support from the internal control it appears as an operational audit, and when it determines the application of the strategy it appears as the audit of the administration control.

Key words: internal audit, private companies, strategy, control;

JEL classification: M42;

1. Introduction

Up to 1999, in our country, there has not been any regulation regarding the internal audit, as this activity has not been part of the organizational culture or part of the requirements of the organizations owners. Many times, people made a real confusion between the concepts of internal auditing with the things in practice that is an internal control, which is compulsory only for the entities with state-capital or with a majority of state-capital.

The general definition of the internal audit was given by the O.U.G. no. 75/1999, modified, by the financial audit activity

republished, as it follows: “the internal audit represents the activity of objective examination

of all the economic activities in order to provide an independent evaluation of the risk management, control and management processes“[6].

2. Content

At the same time with the application of the International Accounting Standards and the auditing of the financial situations, by applying the European directives, in 2000, an order of the Minister of Finances [7] introduced some extremely theoretical, minimal provisions regarding the internal audit, with various translation and interpretation faults, which, nevertheless, constituted a necessary opening for learning and accommodation with this new and complex profession.

The definition of the internal audit according to which the minimal norms of internal audit (General frame) approved by the Order 1267/2000, is one with a general character “the internal audit represents the activity of objective examination of all the activities of the entities in order to provide an independent evaluation of its risk management, control and management processes. The activity of internal audit is exercised within the entity by various persons inside and outside it. The practices of internal audit are differentiated according to the purpose, the size, the structure and the fields of activity of the entity”.

These norms are applied starting with 1st of January 2001 and they are compulsory for the

following entities submitted to the financial audit:

- trading companies and firms;
- autonomous administration;
- banks;
- insurance and re-insurance companies;
- real estate companies;
- other companies that operate on the capital market.

The results of the activity of internal audit are materialized in reports and other documents based on the legal provisions regarding the internal activity, the management orders decisions, and the reports as well as other documents are presented only to the entity management with the necessary measures and with the obligation to pursue the achievement of the recommendations within the entity.

The connections between the financial audit activity and the internal audit regarding the persons who manage the compartments of the O.U.G. 75/1999 regarding the financial audit activity, consider that it has a so-called inferior character of a form compared to another, "responsible for the organization of the internal audit activity, the coordination of the works/commitments and signing the internal audit must have the quality of financial auditor".

We may thus understand that this last paragraph is addressed to the economic entities where the state is not a majority shareholder.

The legal regulation regarding the financial audit activity offers the following definition: the financial audit represents the examination activity which makes the auditors examine the financial situations in accordance with the audit standards harmonized by the international audit standards and adopted by the Chamber of Financial Auditors of Romania, stated in the Chamber".

The above definition analyses the persons who manage the audit department and do not respect the Internal Audit Standards, which are defined in the glossary: "the person responsible for the internal audit activity – the highest position within the entity – holds various responsibilities regarding the internal audit activities. In an internal audit activity, classically organized that would be the Internal Audit Manager. In the case when some internal audit activities are given to various external service

providers, the person responsible for the internal audit activity is entitled to survey the execution of the service contract and ensures the whole quality of these activities, reports to the general managers and to the Council of Administration on the internal audit activity and monitors the implementation of the recommendations resulted from this mission. This position can also have the name of general auditor, manager of the internal audit or general inspector".

From the point of view of the activity contents and its efficiency, both for the financial audit and for the internal audit, O.U.G. 75/1999 states that, in their turn, the financial auditors effectuate, on the occasion of the independent planning/exercising of the active financial auditor profession and the evaluation of the internal audit function, both in what regards the conformity degree of the area containing the applied programs, and of its performance in order to determine the extent in which the results of the internal audit are based in developing their activity of financial audit.

Such interference may produce confusions for the managers of an organization, without bringing into our attention the fact that we may easily go down in the so-called incompatibility. Also, due to this confusion, the management (if it is not properly advised) may easily fall into a trap of seeing at a certain point the inutility of an internal audit department, in the conditions in which a document which regulates the financial audit may establish some regulation for the internal audit and, starting from this point, the demand to the ones who certified a financial exercise to organize and execute some activities of internal audit.

The performance standards describe the nature of the internal audit activities and provide the quality criteria on the basis of which the performance of these services may be evaluated.

The internal audit activity helps the entity to keep the efficient controls by evaluating their efficiency and by promoting their continuous improvement.

On the basis of the results of risk evaluation, the internal audit activity evaluates the conformity and the efficiency of the controls regarding the entity management, operations and information systems.

This evaluation regards the following aspects:

- viability and integrity of the financial and operational information;
- operations efficiency;
- assets protection;
- respecting the law, the regulation and the contracts.

The internal auditors:

- establish the extent to which the targets and the objectives were defined with respect to the operations and the programs and if they are in accordance with those of the entity;
- revise the operations and the programs to establish the extent to which the results correspond to the established targets and the objectives and if these operations and programs are implemented or achieved the way it was stipulated;
- establish, for the control evaluation, the extent to which the management defined adequate criteria to determine if the targets and the objectives were reached. If these evaluation criteria of controls are adequate, the internal auditors collaborate with the management in order to elaborate corresponding evaluation criteria of controls.

In the consultancy missions, the internal auditors examine the controls in conformity with the mission objectives and they pay attention to the existence of any significant weak point regarding the control.

Within the entity's identification and evaluation process of the significant presentations of the risk, the internal auditors take into consideration their knowledge about the control systems which they acquired during their consultancy missions.

According to the provisions of the Article 25 of the Governmental Emergency Order no. 75/1999, republished in the Official Monitor of Romania, no. 598 of 22 August 2003, the Chamber elaborates norms of internal audit respecting the International Standards in the field.

Starting from the provisions of this article, the Chamber's Council has approved, by the Decision no. 88/19 April 2007, the Norms of the internal audit, elaborated and published by the Institute of the Internal Auditors, and some Procedures regarding the general frame of the development of the missions of internal audit.

3. Conclusions

In Romania, after joining the EU, we consider that there is no need for a regulator of internal audit which forces an entity to organize its activities in this sense. The one that presently gives the imperative tone is the market, the image and the management need to ensure that the activity systems which it coordinates, respect the legality, are well-organized, efficient and reach the proposed objectives. Without any doubt, at the beginning of the internal audit activity, the two documents, respectively OG 119/1999 and, later, 1672/2002, had an extraordinary role.

Due to the fact that the IIA/USA Standards are sufficient and clear, including the MPAs, we consider that there is a real need for manuals of internal auditing for every organization, which could harmonize and adapt these standards to the specific of each activity, taking into consideration that the standard is not obligatory, as the law has an imperative character.

New Approaches of Cost Calculation and Impact on Performance in The Furniture Industry, XXI Century Perspective

Ene Dumitru

*Valahia University of Targoviste,
armata_ultra86@yahoo.com*

Abstract

Management accounting system is a useful tool for enterprise management, which aims to achieve performance piloting enterprise by promoting efficiency and effectiveness. To be successful in today's economic environment requires the use of a calculations system and management costs. The firms use type information in various forms in making decisions. The manager expects the management accounting a permanent assistance before, during and after the action, to define objectives, to understand whether the objectives are relevant and to measure performance. Using Standard-cost method, the standard- single cost version is a direction of improvement of Management Accounting and Calculation Cost in the furniture industry and is, probably, a viable solution to companies in Romania to cope with strong competition from EU Europe, in complex economic context, particular XXI century.

Key words: calculations system and management costs, management accounting, Standard-cost method.

JEL Classification: M4, M41.

1. Current issues in theory and managerial accounting method

Current Issue able to challenge theory and managerial accounting method relate to: a reassessment of the concept and identify key performance indicators characterizing the performance: the concept of "cost-value", target-cost and cost of activities. Analyzed in terms of domain information and a business decision, and shall cause accounts, assist and

decide on the company's financial position, economic and financial performance and cash flows generated from investing / finance, employment / resource use, production / distribution of wealth created by an entity that is simultaneously legal, economic and financial. To be efficient in the current economic environment requires the use of a costing system and management costs. Cost calculation goal is to identify causes not only the objects of cost. This approach shows the ability of calculating system to provide an analysis which links financial performance of enterprises to processes and activities.

French National Accounting Council defined the management accounting since 1996, that is designed primarily business needs, it is a part of its information system, providing an economic modeling company in order to meet the objectives of performance measurement and aid in decision making. Of its composition are:

- performance measurement process;
- substantiation methods of decision.

The current development stage, management accounting, shows International Federation of Accountants, in preambling its conceptual framework, answers to enterprise's needs to operate in a dynamic competition and competitive environment.

Two of the concepts that dominate the modern management of organizations are value and performance. We observe (in Romania) that this is the statement (in internal or external environment of business) of such value creation for customer and shareholder or achieve global performance claims. These may be just nice words or, conversely, may be a synthesis of the general approach to company management. We can use cost as inducer of value and, depending on the characteristics of competition and how to use the product, cost is considered insufficient for assessing performance, it must be supplemented by using a tool to express the request. Recitals above

are all many reasons that handle the company must adapt to new conditions that characterize the context in which the undertaking. Up to now several decades, productivity growth and cost reduction strategy was a satisfactory and easily implemented organisation. Today economic context is not the same and firm performance is subject to several competitive advantages factors. These is to be declined by the structure so as to be able to act on them and then be able to measure acquired progress. In addition, management tools are closely related to strategy, but also the structure organisation [1]. Structure becomes a key performance parameter and a variable to be managed, an action instrument for flexibility. The new management is to compel a company built to work across vertical [2].

Cost is still an inducer of value, but not sufficient for performance evaluation, so depending on the characteristics of competition and how to use the product, use the cost must be supplemented with a tool to express themselves more on request . To rely on the rarity value, management accounting must take into account certain factors such as quality, flexibility and time, which does not deal with traditionally management accounting, but which have become strategic stakes. Type companies use cost information in various forms in making decisions. The manager expected of a management accounting permanently assistance before, during and after the action, in order to define objectives, to understand whether the objectives are relevant and to measure performance. Cost calculation goal is to identify causes and not just their transfer to the cost objects .This approach shows the ability of the cost to provide an analysis linking financial performance of business processes and activities.

2. Standard-cost method in the base model - single cost: direction of improvement of Management Accounting and Calculation Cost in the furniture industry enterprises

Management Accounting System is a useful tool for enterprise management, which aims piloting enterprise to achieve performance by promoting efficiency and effectiveness.

Approaching the management accounting as interface between strategy and current management, it demonstrates its functions of knowledge and analysis of costs and outcomes, control costs and use of information obtained to develop programs, to reduce their stock,

management guidance in decision making through provided information .

Special attention is given its qualitative structure of management accounting, such as costs and revenues, and consequently results. Knowing the cost is always a necessity when economic performance is concerned and, therefore, a real management accounting must always follow the cost-performance tandem. Evolution of concepts in the field of costs led at accreditation to the idea that the purpose of Management Accounting is less to make known the cost of products, how to act on them rational Imputation fixed costs method is constitute a technique that completely avoids the cost variations, fixing of selling prices, estimate of stocks, and at level of responsibility centers - to establish their efficiency by responsible managers. I believe that choosing the best methods calculation of costs is one of the key elements for mining process, especially for entities with furniture industrial profile, intervening all-production-sale acquisition circuit. For this reason it can be stated as superficial or inadequate treatment of issues related to calculating costs can be an obstacle in obtaining performance or may be a factor what make under question further activity. Choosing the most appropriate method of calculation leads to the fulfillment of two major goals: to ensure the issue of quality information to users and improve operations, control them and adding a value.

Standard cost method is classified as forecast calculation methods and operational tracking of the production process allowing the establishment of production costs in advance before the start of production and making budget control actual costs against the default, on the kinds of irregularities and cases, while deployment of the production process. In this way, it offers undeniable advantages of studying and analyzing intelligence on the line of production efficiency, can meet such an important function for modern enterprise management, that the investigation and prediction tool and is therefore a valuable tool for the decision.

According to the concept of this method, unit production costs must be calculated in advance, using for this purpose preset sizes. While carrying out the production process is organized operative tracking of expenditure that gives rise to that, by comparison with standard costs, to establish the irregularities on

places of spending and on the causes, so as to make the budgetary control of costs. In the original conception of standard cost method no longer have to calculate the actual cost, because the standard cost is considered scientific cost and at the same time, real, reason for any deviation the actual Costs from Standard-Costs is regarded as a deviation to normal and as such should pass directly into financial results. Still not exclude the possibility of calculating the actual costs of production achieved. This is done adding, or, subtracting of the standard-cost a deviations taken from management accounting which will track not only on places the costs and causes, but also on products. Calculation model is as it:

$$Cu_e = \frac{Cts \pm A}{Q} \quad \text{that,}$$

Cu_e = is the effective unit cost;

Cts = total Standard-cost;

Q = quantities produced.

The main work that involves the application of the standard cost method is:

- Standard calculations development on product;
- Calculating, tracking, analysis and reporting standard deviations for control budget;
- Management Accounting organizes in terms of application of Standard-cost method.

For development Standard calculation of product these works are necessary:

- standards for direct costs development , work that involves development of quantitative standards for materials and workmanship and value pricing standard setting the standard supply and standard wage rates;
- standards for indirect or overhead costs development , which involves performing the following work: creating the production budget of indirect costs or overhead of the department, on the one hand, and budgeting administration overheads or overhead of the company, the party spelled and finally:
- calculations development of the standard unit cost on product or budget of unit cost in the structure of calculating items, specifically that the respective enterprise.

Developing standards for production costs is necessary to establish assortments and standard production volume to determine the optimal use of production capacity of industrial enterprises.

Calculating, tracking, analysis and reporting deviations the actual costs from standard costs is done in operatively (daily, decade, etc.) on

expenditure places on calculate articles and on causes (if even on products or their parts), for is done control budget and make decisions from management on the Value Side of the Manufacturing Process. For this purpose are prepared reports and statements for irregularities in the structure mentioned, and through centralization is obtained the report or deviations company.

Standard-cost method has the advantage of calculate labor rationalization, as the standard unit cost determined in advance is considered real cost and therefore not calculated the actual cost of finished products and production in progress at the end of each management period, and deviations are regarded as deviations from normal and pass directly into the company's financial results. The finished product and that in progress may settle at the cost standard. This feature but not removes the possibility calculating the actual cost of time to time, by distributing deviations to the finished product and production deviations in progress by conventional criteria, such as, for example, report that standard costs of production.

Another advantage of the standard-cost method and that cost is that although the concept is based on total costs using the classification of costs production into direct and indirect, it uses and classification of costs into variable and fixed production, allowing cost analysis compared with output and calculation of specific indicators direct-costing method, namely the equilibrium point optimal activity, the coverage factor, coefficient and interval safety, required for making based scientific decision. So, using this method is made operational control of how the material resources consumed by tracking work life separate by tracking distinct, complete and permanent deviations during activity, and not at the end of management as in classical methods, both stock and in accounting and the overall issue since the appearance, that their identification and distribution until the.

A main feature of the standard-cost method consists in the existence of adequate operational comparisons between actual expenditure and that pre-established taken as the baseline. The application of Standard-cost method, the standard version cost-only leads to increasing the practical value of accounting information and, implicitly, to improve the organization of economic activities. All this results in a better foundation costs budgets and,

consequently, establish benchmarks as well to express the normal conditions of industrial activity. Management based on predetermined size as the standard - cost method corresponds to the principle of objective-based management and accounting gives in its quality of providing useful information decisions and corrective action, a major importance.

In these conditions, accounting becomes the industrial enterprises, a useful tool for management, enterprise management, as its main mission is not to determine the cost of production, but to check if it determined in advance, was respected leaders sectors. In this way, management accounting can make tracking and control of classification in provisions of the budget and can provide expenditure information on the level of expenditure production. Standard-cost method aims, mainly, to increase the role of production costs in ensuring achievement of the objectives in directing and good function of the company. The main purpose of such calculations is to provide operational information needed to budget, evaluate, coordinate and control the activity or enterprise.

Starting from the role and place of management accounting information in the modern, application of standard cost method gives it a matter of expediency, given the leverage in the process of preparation and decision making to trigger corrective action.

The standard-cost method replaces the simply operations of collecting and recording the actual data, to compare them to the end of the management period to achieve the commands method used in furniture enterprises, by providing an analytical character, operational and information predicting that their exploitation to increase the efficiency of future activity.

More than ever, standardization of production costs should be based on quantitative and values standards and with technical and economic reasons. This is required because deviations from the standard of actual expenses caused while carrying out the production process, have a more significant deviations higher than the end of the statement period, leading in many cases to late decisions, or the data evaluated in isolation, which only shows what was done, but not as developed. They necessarily require operative determination of the causes, because they are essential to future decisions and actions to correct deviations in achieving targets in improving activity . But to increase the role of management accounting, information relating to

deviations should be presented to interested bodies in a suggestive form, so they can take corrective measures operational.

A prerequisite for the practical standard-cost method, besides the existence of a scheme sufficiently comprehensive scientifically based standards, is the existence of a well-developed techniques and operations production programming. This implies requires the existence a corresponding level of the organization of production, and a high degree of knowledge and explanation of economic and technological factors of production for all products and, especially products and new technologies. Organization in good conditions of primary documentation on the expenditure and production cost calculation, and proper organization of records deviations from standards are also necessary prerequisites for adopting this management accounting and cost calculation method.

Track production costs through accounting in standard-cost method case can be performed in one of the following: Standard-partial cost, standard-single cost and standard-cost Double. Differences between these variants lies in the reflection of costs in the calculation accounts in the calculation and recording of deviations from standard costs. Considering the advantages and disadvantages of each of the three variants of standard-cost accounting organization, consider the alternative that best meet the management needs in the furniture industry is the standard version single cost. This option enables for establishing effective costs deviations from the standard costs during the unfolding process of production, costs of calculation articles and on causes, which facilitates cost effective budgetary control and decision making at all high levels of command. This also eliminates workload caused by the operation of in progress production inventory, whereas the recording system of consumption and production obtained in accounts only standard cost calculation, it is to determine the accounting method.

In conclusion, we believe the adoption furniture enterprises and introduction of standard-cost calculation method, the standard version single cost, meet the need for increasing the use of information on international activities and integrates modern management conception based objectives, continuous improvement in the cost of using

production orientation and strengthening economic management..

Standard-cost method is one of the methods of cost calculation was used successfully in the furniture industry in developed countries. Technical progress in industrial enterprises requires the use of more efficient equipment and new ecological technologies. Indirect costs have a much higher share in the total costs of production. In this sense overheads budgets becomes an actual and acute problem . For this, Standard-cost method provides a basis for comparison conclusive and operative to assess the evolution of actual costs.

A first condition for applying the standard cost method would be the existence of a coding nomenclature materials, and materials used, technology operations and products. All materials used in the furniture industry receive a code that is composed of information storage site, article, etc. rather than use. The fabrication technology is the same over several exercises and product nomenclature is constant Another prerequisite is the existence of a system of rules for consumption and which may become the standard after a pertinent analysis of their value. These conditions exist in all enterprises in the furniture industry where the production process is based on a technology flow to be fully respected. Standard-cost is a pre-established cost that acts as a yardstick for measuring and comparing the actual cost, and as a tool for guidance and clarification of the conditions which must operate an enterprise. In essence, the standards expresses the size or antecalculate values, and some foreseeing items related to forecast conditions are expected the unfolding this future activity an enterprise.

Standard cost theory as the ideal standard can be achieved in the best conditions of production and labor organization. The forecast cost of standard does allow any damage to machines or interruptions of work, and require a level of effort that can only be achieved by the most skilled and efficient employees, to work at a yield of 100%.Some managers believe that these standards give rise to new values, new motivations. These managers reveals that, although employees know will not fit the standard they always remember the need to increase effort and efficiency constatnte.But most managers believe that using these standards tends to discourage even the most diligent employees.

Realistic standard-cost it's a difficult cost to determine, but not impossible to obtain. These standards allow a normal period of interruption of production and recovery periods of labor and are set so that average to be achieved through reasonable efforts, but effective enough. Variations from these standards are very useful because management and administration represent deviations from normal, through repetition of inefficient. All these deviations require greater attention from managers.In addition to these standards can serve several purposes besides abnormal signal deviations in terms of costs, can be used also in cash flow antecalculul sites and inventory management.

In contrast, ideal standards can not be used in antecalculating and planning;they do not allow inefficient and therefore appear in unrealistic figures in terms of planning and antecalculating. Normally Standard - cost is correct estimated cost and easily obtained. In determining of normally standard-cost is better to take into consideration the variation of working hours and especially their efficiency. Also, an information system existing in the enterprise and program management applications can enhance the reduction of working time in developing standards and standard costs fare for materials, labor and overheads.

Today no longer presents a special problem the computer inventory management and finished products. With the launch of the production of a batch of products can cause the quantity of materials supplied and the time required to achieve this production for making decisions on production next period.

There may be fixed for each link organizational of responsibility centers, and within their standard of spending. Production cost should be broken by sectors which through their work influence its size.

Given above the precisions was presented, can say that the standard-cost method does not require some special conditions that can not be achieved. Each enterprise must acquire modern management techniques to insure formation one adequate information system of a specific activity carried. Market economy requires this action,and transform cost information into the main tool to ensure competitiveness and profitability of the enterprise.

3. Conclusions

As a synthesis of research results consider the following:

- cost is a synthetic indicator reflecting efficiency of planning systems, record and control. It is measured by total consumption related to production of product, conditioned of technology and production organization, so it is designed to evaluate the product produced at a concrete stage of the production process;
- choosing the most appropriate costing methods in an enterprise leads to the fulfillment of two major goals: to ensure the issue of improving quality information and user operations, control them and adding a value.

Carried research allows drawing conclusions regarding the improvement of managerial accounting:

- full costing method costing, which are used in the furniture enterprises, has a number of drawbacks and is not oriented to meet the management accounting function: getting accurate information on the cost of manufactured products, ensuring the efficiency of the structural subdivisions of manufacturing production;
- using Standard-Single Cost Method, applied in conjunction with direct costing method in enterprises in the furniture industry in Romania is a direction of improving managerial accounting.

In conclusion, it can be said that this paper has addressed a complex topic research and interest, as improving methods of costing and managerial accounting is probably a viable solution to companies in Romania to cope with strong competition from EU Europe, in complex economic context, particular XXI century.

Abstract

The present period is characterized by extensive processes of economic and financial turbulence, both in terms of companies and in terms of banking companies, having as objectives the promotion and the implementation of some methodologies applied on European and global level. The purpose of credit analysis is to avoid loss of profit due to bad debt, because of granting loans to customers who cannot refund debt or because of not granting loans to good potential customers. From this perspective risk analysis in lending activity represents an area of major importance in lending activity, finally expressing opinion about sincerity certification of financial statements, the confirmation of the legal provisions in force, the following of the management principles of companies under review.

Keywords: credit risk, lending activity, bank companies, credit analysis, performance.

JEL Classification: J32, J21.

1. Risk concept in credit activity of bank companies

As part of this risk analysis process has importance in increasing the performance bank, limiting waste of resources and early detection of anomalies and deficiencies at companies level.

Decision process in terms of lending requires the following of the next steps: economic and financial analysis of the applicant organization, credit application analysis and credit decision.

Analysis bank takes into account both non-financial issues (quality management and organization, strategy development, industry, position in society branch) and financial performance. Therefore, the collection of a certain stability to the debtor is a very important condition of its credibility and a prerequisite to reduce its borrowing cost. In terms of high-risk lending resources are available at no cost. Basically the more stability / reliability of the debtor will be higher, the more both other conditions of loan will be more favorable to it, and the banks which intermediates it become less vulnerable to shocks. Analysis of risk in lending activity is a mean to prepare rationally and operational the manager actions, is the reason to be considered a preliminary stage of elaborating pre credit, leading finally to approve the funding application or contrary to dismiss it. In economic theory, the notion of risk is substituted by other concepts, most often by the 'flexibility'. No matter its economic or financial valences, flexibility is defined through the organization capability to adapt and respond efficiently to the environment changes [11].

Credit risk can be defined as a phenomenon who may appear during the development of loan transactions and causing negative effects on activities through deterioration of business quality, less profit or even loss recording.

Through different definitions from the literature of the risk it's trying to find new significations and values over economic activity:

-the risk is the variability of possible outcomes depending on an uncertain factor [3];

-the risk is the probability of occurrence of an event an undesirable event [5];

the risk is an uncertainty about a loss [16];

- the risk means the income variability under the environmental pressure [12];
- the risk can be defined as the possibility that losses will be higher than it was expected [10];
- the risk is an uncertainty about the production of damage [13];
- the risk it's translated through profit variability gave ton the average profitability in the last financial years The risk is nothing but the organization inability to adapt itself in time and at lowest cost, and to the variation of environmental conditions. [14];
- the risk is an element of uncertainty which may affect the activity of a trader or a economic transaction[1];
- the risk is that situation where there is the possibility of a hostile deviation [17];
- the risk is one of the most vague and most elusive concept that is difficult to define by the economists and by the investors [9];
- the risks and the uncertainties inevitably are related of many events and circumstances that should be taken into account in determining the best estimate [21].

Risk is defined as the phenomenon that comes from circumstances for which decision-maker is able to identify possible events or even probability of appearance, without being able to specify which of these events actually will occur.

In a bank must be concerns for an organized approach, and control for the systemic risk [15].

Customer confidence is essential for a bank, so it must earn and maintain her financial reputation through qualified staff and effective management.

The risk management activity must always have in mind that any business involves risks, but the biggest risk is actually to ignore it.

Credit risk or the risk of the other party (partner) is defined as the probability that the issuer of the instrument can not pay interest or repay the capital in the specified conditions, condition from the credit agreement. Credit risk means that payments could be delayed or not made which will cause default, cash flow problems and will affect bank liquidity[4].

A risk monitoring system performance must be able to ensure sustainable and harmonious development of the bank, avoiding the assumption that additional risks in terms of their corresponding not-remuneration.[2].

Lending activity is based primarily on business viability and realism of the clients to identify and assess capacity to pay, to generate revenue

and cash as the main source of loan repayment and interest payment. The analysis and the lending activity must take into consideration the influence of external factors on the projects proposed by the customers, e.g. non-financial issues wich may have unforeseen effects on doing business and refund loans.

Applying the principle of prudential banking activity primarily involves knowing and understanding the activity of the borrower. This allows the bank to protect its own funds and deposits and also the judicious selection of clients[4].

2. Evaluating and measuring the risk credit

The banks need to identify risks of each application and loan proposals, to recognize them and help reduce and even eliminate this risks. For this, we need a study or risk sensitivity, because only in this way it can be reduced or eliminate. According to this study the credit applications are approved or refused. The risk increases exponentially with the pace of change, this means that most times, the ability to transform the market is greater than its ability to understand and appropriate adaptation to the risks[6].

Risk evaluation is not an exact science. There are factors that could make acceptable a situation or a combination aparently unfavorable(e.g. indebtedness is high, but shareholders have guaranteed loan. Also, typical indicators are not the same for all industries. Even if the indicators and the figures seem good in credit risk analysis, they could get worsen if risky business are hidden and the control system is weak[7]. Risk reduction can be achieved only by knowing well all the bank customers, the decision-makers controlled or uncontrolled, all the results achieved as a result of the credit line approval. The banks need to know as well the factors leading to failure and business failure. Lending risk may be regarded as inherent and can be found in documents, reports, summaries at the level trader who borrows from the bank. According to the order 1752/2005, legal entities prepare annual financial statements consisting of balance sheet, profit and loss account, statements of changes in equity, cash flow statement and notes.

Table 1- The risk evaluation: the quality management

Evaluation	Integrity	Competence
Excessive risk and unacceptable	-never fulfill their commitments; -Provide inadequate information on which they can not have any basis; -it isn't done anything to maintain the relationships	- it hasn't the experience and the necessary qualities; -unappropriate organization and inability to influence; -lack of control systems; -takes risks in a way almost irresponsible.
High risk	-rarely fulfill their commitments; -provides information with low reliability; -little contribution to maintain the relationships	-low-experience; -partial view of the situation; -inappropriate and low-organizing capacity of influence; -low-control systems; -assume unnecessary risks.
Moderate risk	-respect of commitment -provide reasonable-quality information, -maintain relationships	-experience; - environmental qualities; -vision of the situation; -control system
Low risk and acceptable	-always respects its commitments; -provide quality information, credibility; -fully contribution to maintain relationships	-professional qualities, excellent experience; -visionary -organizational structure and capacity to influence; -excellent control; -it is not assuming risks.

Preparing these situations is mandatory for companies listed on the Bucharest Stock Exchange, some public corporations, national companies of national interest, and some categories of companies operating in the capital market[19]. Analysts to assess the

credit risk using tables (e.g. table 1) to evaluate the risk regarding the management quality, the industry dynamics or the financial status.

Lending must be profitable for the bank, by expanding and diversifying the loan portfolio, the source of additional revenue in terms of manageable risk, and also for the customers, that in the credit account can develop business, to obtain profit and on that basis to repay the borrowings and to pay the interest.

In lending, the bank seeks the applicants to provide credibility for their repayment at maturity and the return interest.

For this, the bank requires the borrowers to provide guarantees to cover the maximum debt consists of the loans and the interest.

Bank lending activity is accomplished by credit plan, which is correlating with the resources to cover them (on terms and currencies) and strategy, financial plan and business plan of the bank. The specialists when are granting loans they must make quantitative estimates regarding the rotation period of the capital. So, it take into consideration: duration of stocks of raw materials, unfinished production stock-length; finished products during storage; time receipts from debtors; time payments to suppliers. In the evaluation of lending risk, bank specialists are considering the issues with the trader may have to end of cycle production, marketing and transfer of assets in cash. Credit risk is included in the type of financial risk, which concerns the structure of business financing. This financial risk is highly dependent on the customer ability to achieve performance and profit, because it is from which the debt will be repaid. Through profit and other performances it will be improved the structure of the capital. The banks evaluate the risk in a complex program analysis of credit documentation and establishing the guarantees. This risk assessment is a component of commercial banks strategies. This is because, in the complex analysis are determined the resources, the limits, economic policy of the customer, are made considerations regarding economic and financial legislation, the product market and the strategies regarding the market sharing. The most used indicators in the analysis of credit risk are:

1. ratio between liquidity / total debt for the trader.
2. ratio between gross profit / total debt for the trader.

3. ratio between total debt / (total assets for which the trader borrows).
4. interest coverage.
5. general indebtedness.

Determining indicators is made by comparative periods or by assessing trends.

The approach manner and exposure to risk is based on the report that the bank considers it acceptable between the risk taken and profit forecast (the total portfolio, the activities and transactions).

The bank is granting loans to economic entities capable of generating cash flows, with good reputation in business, with an appropriate credit rating and to individuals who obtain secure incomes and are credible in terms of fulfilling their contractual obligations to the bank.

He bank may grant loans and other facilities to economic entities who register losses or they due to the seasonal pattern of activity performed, whose trend is declining and the company shows solid recovery program losses and profitable activities.

Bank's risk assessment methods take into consideration the following factors:

- exceeding credit limits;
- unexplained increase of the financing facilities limits;
- providing financial information with delay;
- an unfavorable ratio between debt and equity;
- changes in leadership;
- on the one hand the disagreement between the accounting and budget data and on the other hand the control data.

3.The signification of credit risk management

Today, leading banks, who are implementing appropriate policies for risk management becomes a necessity, as well as assimilating of employees some new techniques and tools for risk management. A performant banking strategy should include both programs and bank risk management procedures that aim, in fact, minimizing the probability of appearance of risks and potentially exposure of the bank. The main objective of these policies is to minimize losses or additional expenses incurred by the bank and central goal of bank activity is getting a bigger profit for shareholders. The importance of bank risk management is not limited only to minimizing costs. Constant preoccupation of the leadership to minimize risk exposure has positive effects

on employees' behaviour, that are more rigorous and conscientious in fulfilling their job tasks, and it is not neglected the psychological effect of discouraging some fraud activities. Obtaining an image more realistic about customer's financial position suppose that on the base on the annual financial statements develop new information to better meet the needs of the bank's analysis, the diagnostic and assessment.

Credit risk management is not done only by consultation with national bodies (Credit Information Bureau-CRB, Payment Incident Bureau-PRC, Credit Bureau, National Promissory file-FNBO) but also by applying policy restrictions on credit to every bank.

According to Regulation no. 1 of National Bank of Romania, Central Banking Risks is a mediation center, which manages on behalf of the Romanian National Bank, the information of banking risk for users, while maintaining banking secrecy.

To get not to situations where the customers could not repay the loans, the bank uses the credit policy and some restrictions designed to eliminate the risk of such activities.

The most important of these is the decision of not granting credit to:

- mismanagement economic agents, without prospect of recovery;
- economic agents wich are not contributing to financing capital assets or investments;
- economic units wich are in reorganization or liquidation.

Risk management requires as insurance form against credit risk the provisioning[20].

Provisioning system in commercial banks, regulated by norms, is intended to protect bank capital, and legal protection of individuals' deposits, loans to cover any uncertainties in the recovery, settling in this system provisioning coefficients for each category of loan classification (Table 2).

Tabelul 2 Provisioning coefficients for different categories of clasification

Clasification category	Coefficients
Standard	0%
In observation	5%
Substandard	20%
Doubtful	50%
Losses	100%

[Banking Law no.58/1998]

The amount of risk provisions vary depending on loan classification. Thus, each category loan classification corresponds to a coefficient of provisioning.

Risk provisions are related to each approved loan and are intended to cover any loans, or debt service which from the analysis or the initiation of legal proceedings, shows the uncertainty in their recovery. A special attention is given to real and correct assessment of credit risk and interest and possibilities to exploit certain guarantees envisaged in loans, so the volume to cover up provisions to be recovering for doubtful loans and interests.

All the banks and the financial institutions must improve their understanding and practice of banking risk management in order to successfully cope with the various ranges of products.

If the bank risk management process and overall management system are effective, then the bank will be successful. The banks can successfully manage banking risks if they recognize the strategic role of risk and if they use the paradigm of analysis and management in order to increase efficiency.

4. Conclusions

This paper establishes the general rules about risk analysis in lending activity in terms of assuming credit risk consciously, taking into account the following factors:

- Compliance with prudential measures imposed by national regulatory authority;
- Expected profit must justify the risk exposure;
- Any loss must be covered by provisions and profit so to not damage the bank's financial situation;
- The risk must be tailored so that the loss produced by its materialization could be considered normal for banking activity and the bank image, both internal and external it will not be damaged;
- The acceptance of some risks that have a due time;
- The acceptance of quantifiable risks only;
- Compliance of the business risk by the bank and the customers, too, customers who will participate with some of its resources at the project financing.

Searching for the Unique Conceptual Accounting Framework. The IASB Conceptual Framework Versus the FASB Conceptual Framework

Gadau Liana

Ph.D. Lecturer

Bucharest Spiru Haret University

lianagadau@yahoo.com

Abstract

The last decade, especially, has brought major mutations in the evolution of national economies through the accentuation of the international financial character of globalization.

In the last years the number and the complexity of companies which operates on international financial markets increased. Today, more than ever, the investors in order to operate in these markets must have current, sufficient and comparable information on various investment opportunities. This is why the accounting has become the common language of business on international markets.

The global economic reality justifies once again the necessity of global standards which must be applied in the same manner so as FASB (Financial Accounting Standards Board) and IASB (International Accounting Standards Board) or national standardization bodies. The high quality accounting standards are a necessity for the capital markets system for the reporting required worldwide to ensure international comparability.

In order to achieve the convergence between IFRS and American International referential US-GAAP, must be accomplished a unique conceptual accounting framework, which will be used for both referential.

Next we will make a comparative study of the conceptual accounting framework developed by the IASB and the FASB, in order to capture some of the similarities and the significant differences between the contents of the two accounting framework, which arguments the need for a single conceptual framework.

Keywords: the global harmonization of accounting, the high quality accounting

standards, a unique conceptual accounting framework.

JEL Classification: M4, M41.

Introduction

The last decade, especially, has brought major mutations in the evolution of national economies through the accentuation of the international financial character of globalization. Lately, the increasing of the role of finances in economy led to changes in the ratio of social forces, through the domination of financial capital over other forms of capital. Worldwide, over time, two major models of financing were outlined, one structured around banks, and the other model anchored in the capital market or stocks, both covering a large part of the funding needs of enterprises.

In the last years the number and the complexity of companies which operates on international financial markets increased. Today, more than ever, the investors in order to operate in these markets must have current, sufficient and comparable information on various investment opportunities. This is why the accounting has become the common language of business on international markets. Under the pressure of the capital markets internationalization, this situation made possible the phenomenon of harmonization and standardization of accounting firms.

The global harmonization of accounting has become a necessity with the large development of the international financial markets, because only intelligent and qualitative accounting information comparable

to local operators can ensure transparency and efficiency of financial markets.

Thus, the comparability and credibility of the information provided by the financial statements are factors in the functioning of the global economy, thus ensuring a better allocation of financial resources and a reduction of the transaction costs.

For a good period of time due to political, economic and financial interests, the activity of internationalization of normalization accounting through the standards issued by IASB (International Accounting Standards Board) was in strong opposition to the activity of FASB, the American standardization organism.

The global economic reality justifies once again the necessity of global standards which must be applied in the same manner so as FASB and IASB or national standardization bodies. The high quality accounting standards are a necessity for the capital markets system for the reporting required worldwide to ensure international comparability.

US-GAAP/FASB IASB has pledged to elaborate accounting standards of high quality, but this is a difficult, time consuming and costly process.

In order to achieve the convergence between IFRS and American International referential US-GAAP, must be accomplished a unique conceptual accounting framework, which will be used for both referential.

Next we will make a comparative study of the conceptual accounting framework developed by the IASB and the FASB, in order to capture some of the similarities and the significant differences between the contents of the two accounting framework, which arguments the need for a single conceptual framework.

As definition, a conceptual accounting framework, is an elaborate accounting theory or doctrine, considered to be a source for a set of principles, a "generator of standard/norms, so that is why it was compared with a" constitution".

It is important to specify that the international accounting framework draws on the concepts of the American accounting framework, but shows its peculiarities.

A comparative approach from the objectives of financial statements point of view

IASB's accounting framework treats the objective of financial statements, which is to provide information on financial position, performance and changes in financial position related to an enterprise, hence the name of frame for preparing and presenting financial statements.

U.S. accounting framework treats a wider range, in treats the financial reporting objectives, namely:

The first objective: providing useful information for investors, bankers, creditors, and other beneficiaries of the accounting information in order to help them to make rational choices regarding the business, the investments and the loans etc.

The second objective: is to provide accounting information to help investors and lenders to forecast future cash flows of the enterprise;

The third objective: is the provision of information on economic resources of enterprise, related rights, the effects of transactions, events that may affect such resources and rights.

A comparative approach from qualitative characteristics of the accounting information point of view

The both conceptual frameworks prioritize the economic aspect of the accounting information, focusing around the utility of accounting information; accounting information "is produced and broadcast only if the decision is useful".

The conceptual framework defines the usefulness of international accounting information in relation to four quality characteristics: understandability, relevance, reliability, comparability, all four considered main characteristics, which the international professional approaches them without making their hierarchy. It feels a gentle incline for qualitative characteristics: relevance and credibility, the basic features (this is explained by the fact that the international conceptual framework has strong influences of the conceptual American framework).

The American conceptual framework defines the usefulness of financial information

by reference to a much wider range of qualitative characteristics, the relevance, the credibility, the comparability and the consistency being essential.

Unlike the international conceptual framework, the American one hierarchy these four quality characteristics like this: relevance and credibility are basic characteristics, while comparability and consistency are considered secondary features.

A comparative approach from the accounting information users' point of view

The international conceptual framework aims to meet the information needs of a wide range of users such as investors - to decide whether to invest or not; the owners of an enterprise - to assess the performance of their investments and of the managers; the financial lenders - to decide in which circumstances to grant loans; the enterprise managers - to analyze the performances and the enterprise's liquidity, the tax authorities - to check compliance with tax obligations of the company, the competitors, the employees, the customers and last but not least the public.

Unlike the international conceptual framework that addresses a wide range of users, the American framework focuses especially on the stock market investors which is deemed privileged user accounting information, as U.S. financial markets have an essential role in financing big business.

The American framework provides a very restrictive view on the range of users of accounting information, without taking into account the need of information of all those involved in the functioning of the enterprise. The accent is put on expected accounting information because the investors are interested primarily on the future cash flows than the current profit.

A comparative approach through the evaluation bases point of view

The international conceptual framework proposes the next evaluation bases, which can be used in the financial statements, in various combination and degrees of use: historical cost, current cost, realizable value, the discounted value of future cash flows.

The same framework specifies "no basis for evaluation has a general validity and is not fully satisfactory.

By SFAC5, the American conceptual framework proposes several bases of evaluation, namely: historical cost, current cost, the net value of realization, the present value of future cash flows, and the current market value. If we make a rigorous comparative approach of the evaluation bases proposed by the two conceptual frameworks we can observe many similarities but also differences. Next, I will emphasize only a few differences to understand the necessity of a single global framework.

A first difference of the American framework regarding the evaluation base is that according to the American framework the selection of the evaluation methods depends on the nature of elements, given that relevant and reliable information are provided (ex, historical cost is especially applies to property, most of the stocks categories, debts, the current cost is applied to some categories of inventories, the net value of realization is applied to categories of stocks and short-term debts, the current value of future cash flows is applied to long-term debts; the current market values is used for marketable securities).

Another difference is that the current market values do not appear separately as an evaluation base on the IASB's conceptual framework, being included in the wider concept of realization value.

A comparative approach regarding the structure of the financial statements set point of view

The financial statements are prepared by American companies under FASB framework and include: the balance sheet, the profit and loss account, the cash flow statements, the equity variance situation, notes to the financial statements, the statement of comprehensive income.

A peculiarity of American accounting is that none of these documents is standardized; the very name of the document may differ from company to company, considering that flexibility is more important than standardization of the financial statements.

In the American accounting the operating expenses are presented in the profit and loss account after their function, therefore the notions of stored production or production assets are not used. Another feature of the

American accounting regarding the financial statements is the presentation of the profit and loss account in analytical and synthetic form.

The analytical form calculates the net profit through the progressive method, step by step, reflecting the elements used to calculate the net profit.

Through the synthetic form the net profit is calculated by a single stage by grouping different types of incomes in the first part of the report and the main categories of costs and expenses in the second part of the report, presenting the advantage of simplicity and rapid calculation of the net profit.

Another peculiarity of the American accounting is represented by the Statement of comprehensive income (economic), which provides relevant information for performance analysis of the companies.

The SFAC 130 Reporting Comprehensive Income - does not require a standardized model of the financial statement for the global result, giving the companies the possibility to present it in the Statement of capital variation or as a separate situation to pursue profit and loss account or as a combined situation of the net income and comprehensive income.

According to SFAC 130, the Statement of comprehensive income should include all transactions and events undertaken during the financial year, relating to current operating activities, affecting the capital, and the realized and unrealized gains or losses.

The American FASB gives to the Economic outcome (overall) a great importance and a special place into the set of financial statements, the reason being that this index reflects more accurately the company's financial performance. Not the same can be said about the international conceptual framework.

A comparative approach regarding the elements used as a base in the elaboration of the financial statements set point of view

According to the international accounting framework are defined five factors: assets, liabilities, equity - in the balance sheet and income and expenses in the profit and loss account.

According to the American conceptual framework are defined ten elements considered vital to preparing the financial

statements: assets, liabilities, equity, incomes, expenses, gains, losses, the overall result, shareholders' contributions, and the distributions in favor of owners.

At a first analysis it is noted that the American framework, compared with the international framework, also defines five elements: profits, losses, comprehensive incomes, shareholders' contributions, distributions in favor of owners.

It is interesting to see how the international framework treats these five elements which are not found among the basic elements defined by them. Thus, gains, losses, fall into the category of revenues, respectively expenditures.

Another difference between the two frameworks is the fact that the International framework doesn't define the elements of the economic result (or global). This does not mean that the overall result wasn't studied by the international organism. Thus, the second method of presenting the statement of changes in equity under IAS1, called "The situation of gains and losses registered on behalf of the exercise" is a statement of comprehensive income, similar with the one presented by the SFAC 130 Reporting Comprehensive Income.

Also another difference resulted from the comparative analysis of the factors used in the elaboration of the financial statements in light of the two frames, refers to the fact that the International framework does not define the elements: the stakeholders' contributions and the distributions to owners as the American framework defines them.

There can be observed similarities and differences from the definition of the same elements given by the two conceptual frameworks (ex assets - according to the IASB are resources that need to obtain for enterprises future economic benefits, under FASB are defined as probable economic benefits, debts - according to the IASB are current obligations under FASB are likely decreases of future economic benefits, etc.).

In conclusion, through this comparative approach of the two frameworks against the objectives of the financial statements, of the qualitative characteristics of accounting information, the categories of users of accounting information, the measurement bases, the components of the financial statements, the elements used for their elaboration, were emphasized the differences, discrepancies between the two frameworks

and why it is necessary that IASB and FASB to concentrate their efforts on developing a single conceptual framework at global level.

The Use of Cash-Flow Statement for Decision-Making

Georgescu Cristina Elena
cristina_georgescu95@yahoo.com

Asaloş Nicoleta
nicoleta_asalos@yahoo.com
 Ovidius University of Constanta

Abstract

The Cash-flow statement provide an important ingredient of decision-making due to the company's financial stability and viability.

The succes and survival of every organisation depends on its ability to generate an aquire cash. Cash flow is a concept that we all understatnd. Companies survive because they have cash, they fail when they don't. We must therefore be interested in a company's ability to generate cash for itself, and to acquire it from other sources. This can be clearly seen in cash flow statement. Thus the focus of this article is on understanding and interpreting cash flow statements.

Key words: cash, Cash-flow statement, decision-making, managerial accounting.

JEL classification: M41.

1. Introduction

Cash management is closely interlinked with solvency. A company that manages its cash resources effectively is unlikely to have any solvency problems. Consequently, the way that a company manages its cash it's crucial to its long-term survival. It must fund the business in the most efficient way and optimise its use of cash resources. If we want to understand the company's financial performance, its opportunities and its threats, we must be able to analyse the way that it is managing cash.

The cash flow statement may be the most important financial statement for managers. It traces the flow of funds (or working capital) into and out of their business during an accounting period.

The cash flow statement's primary purpose is to provide information regarding a

company's cash receipts and cash payments. The statement complements the income statement and balance sheet. It is important to note — cash flow is not the same as net income. Cash flow is the movement of money into and out of company, and it can be affected by several noncash transactions.

2. Presentation of Cash-Flow Statement

All entities that prepare financial statements in conformity with IFRSs are required to present a statement of cash flows. [IAS 7.1]

The statement of cash flows analyses changes in cash and cash equivalents during a period. Cash and cash equivalents comprise cash on hand and demand deposits, together with short-term, highly liquid investments that are readily convertible to a known amount of cash and that are subject to an insignificant risk of changes in value. Guidance notes indicate that an investment normally meets the definition of a cash equivalent when it has a maturity of three months or less from the date of acquisition. Equity investments are normally excluded, unless they are in substance a cash equivalent (e.g. preferred shares acquired within three months of their specified redemption date). Bank overdrafts which are repayable on demand and which form an integral part of an entity's cash management are also included as a component of cash and cash equivalents. [IAS 7.7-8]

The cash flow statement reports the cash provided and used by the operating, investing, and financing activities of a company during an accounting period.

IAS 7 requires that cash receipts and payments be classified as operating, investing and financing activities. The cash flow statement will summarize the cash flows so that net cash provided or used by each of the three types of activities is reported. Beginning

and ending cash must be reconciled based on the net effect of these activities.

Operating Activities

The statement provides information about the cash generated from a company's daily operating activities. Operating activities are those which produce either revenue or are the direct cost of producing a product or service.

Operating activities which generate cash inflows include customer collections from sales of their primary products or services, receipts of interest and dividends, and other operating cash receipts.

Operating activities which create cash outflows include payments to suppliers, payments to employees, interest payments, payment of income taxes and other operating cash payments.

There are two different ways that this can be shown on the statement, referred to in the accounting standard as *the direct method*, and *the indirect method*. They only differ in the way they identify the operating cash flow.

The direct method shows that the cash receipts and payments, whereas the indirect method reconciles the operating profit to the operating cash flow. All companies must show the reconciliation to the operating profit in the notes to the accounts. Consequently, this is the most popular way of arriving at the operating cash flow. The direct method is easier for non-accountants to understand, but less commonly found in the accounts.

If the company uses the direct method to calculate the operating cash flow it will still have to show the reconciliation to operating profit – *the indirect method*. This starts with the operating profit and then adds back any paper charges (primarily depreciation) that have been made in arriving at the profit to show the cash that will be generated from this period's trading. This is then adjusted for any changes in the working capital, to arrive at the cash generated from operations during the year.

2.2. Investing Activities

Investing activities include buying and selling noncurrent assets which will be used to generate revenues over a long period of time; or buying and selling securities not classified as cash equivalents.

Cash inflows generated by investing activities include sales of noncurrent assets

such as property, plant, and equipment. Investing activities can also include the purchase or sale of stock and securities. Lending money and receiving loan payments would also be considered investing activities.

2.3. Financing Activities

Financing activities include borrowing and repaying money, issuing stock (equity) and paying dividends.

2.4. Capital expenditure and financial investment

This is a new heading. Under the old standard there was a heading called "investing activities" which combined capital expenditure and financial investment with acquisitions and disposals.

Capital expenditure and financial investment represents the investment in the company's fixed assets. However, the fixed asset investments exclude investments in a business that is a joint venture, associate or subsidiary as these would be regarded as part of acquisitions and disposals.

2.5. Income Flows and Cash Flows

The income statement and balance sheet are based on accrual accounting which was developed based on the principle of matching. The matching principle states that revenues generated and the expenses incurred to generate those revenues should be reported in the same income statement. This emphasizes the cause-and-effect association between revenue and expense. Many revenues and expenses result from accruals and allocations that do not affect cash.

A company can operate at a profit and continually be short of cash. It can also generate huge inflows of cash from operations and still report a loss. The statement of cash flows can explain how these situations might occur. Answers to these questions cannot be found in the other financial statements.

There are two types of items that cause differences between income flows and outflows: noncash income or expense and nonoperating income or expense. An example of a noncash item on the income statement would be depreciation or amortization. An example of a nonoperating item on the income statement would be a gain on the sale of an asset. These transactions must be reported on a cash flow statement in order to properly

determine the true effect of conducting business on cash.

3. Interpretation of the cash flow statement

The cash flow statement will follow the order shown above, although it is possible to combine the management of liquid resources with financing as long as the cash flows relating to each are shown separately.

There is also some flexibility in the reporting of the cash flows. Whilst the detailed cash flows must be shown in the accounts, companies may decide to report gross cash flows on the statement itself, disclosing the detailed cash flows in the notes.

The positive net cash flow permitted the company to make substantial additions to its property, buildings, and equipment and to pay off a substantial portion of its long-term debt. If similar conditions prevail in the future, the company can continue to finance substantial growth its own cash flows without the necessity of raising debt or selling stock.

Once they have constructed a cash flow statement, they will be much closer to understanding the financial position of their company. While a balance sheet and income statement are tools for management, without a cash flow statement they are limited barometers and may even be misleading.

3.1. Operating Activities

When interpreting a cash flow statement, it is particularly important to examine the net cash provided by operating activities. This figure indicates how successful the company is in generating cash on a continuing basis. A negative cash flow from operations may be a sign of fundamental difficulties. A positive cash flow from operations is necessary to avoid liquidating assets or borrowing money just to sustain day-to-day operations.

The cash flow statement will tell them where money came from and how it was used. When analyzing cash flow, the first place to look is the cash flow from operating activities. It tells them whether the firm generated cash or whether it needs a cash infusion.

A few periods of negative cash from operating activities is not by itself a reason for alarm if it is based on plans for company growth or due to a planned increase in receivables or inventories. However, if a negative cash flow from operating activities is

a surprise to managers and owners, it may be undesirable.

Over time, if uncorrected, it can foretell business failure. Managers and owners should pay particular attention to increases in accounts receivable. The cash flow statement gives the true picture of the account. A large increase in accounts receivables may warrant new billing or collection procedures.

3.2. Investing Activities

The cash flow statement puts investing activities into perspective. At one glance, they can see whether or not a surplus in operations is being used to grow the company.

A lack of investing activities, which is few purchases of new equipment or other assets, may indicate stagnant growth or a diversion of funds away from the company.

3.3. Financing Activities

The financing activities section of the cash flow statement will show repayments of debt, borrowing of funds, as well as injections of capital and the payment of dividends. As a company expands, this area of the cash flow statement will become increasingly important. It will tell outsiders how the company has grown and the financial strategies of management.

Together, the three sections of the cash flow statement show the net change in cash during the period being examined. A comparison between past periods will give owners and managers a good idea of the trend of their business. Positive trends in cash flow may encourage owners to consider long-term financing as an aid to growth and increase their comfort level concerning the company's ability to generate cash for repayment. Strong cash flow will also make it easier to acquire financing and to negotiate with lenders from a position of strength. Preparation of a cash flow statement is the first step toward financial management for long-term success.

4. Conclusions

The cash flow statement is one of the three major financial statements prepared by companies. It explains how cash was generated and how it was used during a period. The cash flow statement is widely used a tool for assessing the financial health of companies.

In general, sources of cash include net income, decreases in assets, increases in liabilities, and increases in stockholders' capital accounts. Uses of cash include increases in assets, decreases in liabilities, decreases in stockholders' capital accounts, and dividends.

For external reporting purposes, the cash flow statement must be organized in terms of operating, investing, and financing activities.

Managers focus on cash for a very good reason - without sufficient cash at the right times, a company may miss golden opportunities or may even go bankrupt.

The cash flow statement is a valuable analytical tool for managers as well as for investors and creditors, although managers tend to be more concerned with forecasted statements of cash flows that are prepared as part of the budgeting process.

Leasing, a Solution to Credit Rationing

Georgescu Maria - Andrada

National School of Political Studies and Public Administration
 andradageor@yahoo.com

Abstract

In this paper, we shall examine if leasing is a solution to credit rationing, considering that the limiting of the bank credit supply will determine the orientation of enterprises towards leasing. This argument was brought in the specialty literature by [9]. They consider leasing "the last financing resort". The statement is justified by the rights the lessors have in case of bankruptcy of the user company.

For [9], unlike the previous works, the comparison must not be made between leasing and the ordinary debt, but between leasing and secured debt. The weighing of the advantages and limits of the two forms of financing will allow the analysis of the choice of financing by the enterprises, when the constraints of the capital supply force them towards expensive solutions.

In a first section, we shall introduce the concept of credit rationing and we shall analyze its effects on the financing policy of the enterprise. Then, we shall appreciate the qualities of leasing, respectively of the secured debt, and we shall justify the nature of the financing mobilized by the companies when the bankruptcy risk increases.

Key words: leasing, credit rationing, financing policy, qualities of leasing, bankruptcy risk.

JEL Classification: M4, M41.

1. Introduction

In the leasing operation, the user has the use of the asset for the term of the contract and, in the end, he will find itself in the same situation as if he had purchased the asset [15]. As a consequence, we shall consider

that the choice between leasing and bank loan will operate in the view of separating the

investment decision of the financing one and, at the same time, that the leasing decision is a financing decision. It is true that postulating that the leasing decision is an investment, and not a financing, decision, we admit that the choice of resorting to leasing, rather than to a bank loan, has a certain incidence on the project exploitation flow. In fact, if certain expenses, such as those related to the maintenance of the asset, are undertaken by the lessor, the project exploitation flows would change. Or, in most contracts, the lessee is the one bearing the inherent risks of the economic property over the asset (the technical risks), and the lessor, the risks related to the financial aspect of the operation. Therefore, the leasing decision is analyzed in the paper at hand as a financing decision, whose choice is determined by comparison to the bank loan, the latter being considered a competing financing modality.

2. Credit Rationing and Market Balancing Possibilities

The central determinant of a bank's analysis in order to grant loans is the quality of the borrower. Those who borrow have personal information regarding the risk level of the projects undertaken, and those who lend do not have them, in spite of the expenses mobilized for evaluating the success of the investment project. This asymmetry of information, ex-ante to granting a loan, may lead to the balancing of the credit market, by rationing the demand. [22] focused on this phenomenon.

In the model developed by the authors, the balance interest rate is the one that maximizes the bank's profit. At this level of the interest rate, not all credit demands will be satisfied. Hence, balance through rationing will occur. On the credit market, a balance without rationing can be obtained by acting

on the interest rate: its increase would determine certain companies to not resort to loans, and then rationing would end up not depending on the quality of the enterprise. Or, the authors show that the bank has no interest to act as such: in fact, if the increase of the debtor rate allows an adjustment between supply and demand, those who borrow can answer to the debtor rate increase by increasing the risk of the projects undertaken. The lender will thus be exposed to a reduction of anticipated outturn. As a consequence, it will preserve the rate unchanged. An identical reasoning applied in case of guarantees requested by debtors leads to similar conclusions. Therefore, credit rationing is performed without considering the risk presented by the enterprise, determining the agents to not be able to borrow at the given rate, even if others, presenting the same characteristics, have access to bank credits.

Or, it has been proven that credit rationing reaches the riskier enterprises and, especially, the small and medium enterprises [17]. In order to be able to justify the exclusion from the market of the small and medium enterprises, [17] relies on a second form of rationing, highlighted by [22], which results from “theorem” 6, presented in their article. According to [22], if we divide the population of potential borrowers into several groups, characterized by different risk levels, it is very possible to notice that one or several groups of identical individuals are excluded from the market. In their model, the average expected profitability of the bank is not a monotonous function of the interest rate: market balance can be characterized through several rates. If we consider three groups of identical individuals, then the bank will charge optimum rates r_1 , r_2 and r_3 . To these rates correspond profitabilities expected by the bank, noted R_1 , R_2 and R_3 , which are, themselves, equal to the bank’s refinancing rate. The authors show that if the three groups of individuals obtain the credit, then we must have equality between the expected profitabilities R_1 , R_2 and R_3 . When the bank’s refinancing rate increases, one or more groups of homogenous individuals will not be able to obtain the credit, if the profitability expected by the bank is inferior to the cost of the borrowed funds, and that regardless of the rate magnitude. As a consequence, the bank will exclude the riskier group (groups).

The authors show that when the groups of borrowers presenting different risk profiles obtain credit from the bank, the increase of the

bank’s refinancing rate will lead it to the exclusion with priority of the riskier group or groups. This is the case of the small and medium enterprises, which present a far greater bankruptcy risk than the large enterprises [17].

On the basis of a study of the Bank of France, executed in 1998, [16] confirms the existence of a discrimination of the interest rate depending on the size of the loan (correlated with the enterprise size), but with weak dispersion inside each class identified according to the amount borrowed (credit size varies between 15,240 and one million and a half Euros). As a consequence, the interest rate varies slightly depending on the credit risk presented by the borrower, factor dependant on its financial structure, its activity sector and its availabilities. If this is the case, the un-risky enterprises and, nevertheless, incapable of bearing a high debtor rate, will have to give up their investments, which, in fact, according to the author, is a form of rationing.

Still, credit rationing can be eliminated if the bank is capable to distinguish between the two groups of borrowers (risky and less risky): the size of the loan is a pertinent signal for the lender to distinguish correctly the high performance enterprises from those in difficulties ([12], [14]).

The bank can suggest the so-called “separate” contracts, based on a debtor rate and a certain level of the guarantees ([3], [2]). The riskier enterprises will accept to bear a higher interest rate, but will register only weak guarantees, due to their risk of loss in case of bankruptcy. On the contrary, the less risky enterprises will accept strong guarantees, in exchange for lower interest rates ([3], [2]).

The existence of a privileged relation between the enterprise and the bank may still diminish the “undifferentiated” rationing, sometimes derived from the examination of far too general criteria. The financial relation unfolding throughout a long period of time may allow the reduction of the informational asymmetry, by gradually obtaining information regarding the enterprise. Credit rationing, therefore, will refer especially to the more doubtful borrowers. [4] shows that the advantages of the existence of a new privileged relationship occur especially at the level of the credit availability and at the level

of the guarantees requested (which are less constraining). The impact on the credit cost remains contested: [18] and [20] highlight a “hold –up” phenomenon that operates to the bank’s profit. According to the authors, the bank, via the privileged relationships established, has private information on the enterprises, information inaccessible to other banks. If the enterprise chooses to change its financial partner, this can be interpreted by the other banks as a sign of the enterprise being abandoned by its current financial partner. Therefore, the bank has a certain market power over the enterprise, and that allows it to appropriate a more important part of the income created by the enterprise, by practicing a higher interest rate than the one that could be obtained from other banks.

As a consequence, it seems that the risk of credit rationing reaches the riskier enterprises. Under these conditions, the enterprises will see themselves refused by the funds givers and will return to alternative financing sources. In the following section, we will consider that an alternative to bank credit rationing is represented by leasing. The central pillar of this alternative is represented by the rights the lessors have in case of bankruptcy of the user company and the costs of the bankruptcy incurred by them (the lessors).

All printed material, including text, illustrations, and charts, must be kept within the paper margins as presented in this example. Please do not write or print outside of the column parameters. All body text is set in two columns.

3. Credit Rationing and Worsening of the Financial Situation: Resorting to Guaranteed Financing

In this section, we shall show that credit rationing will force the resorting to leasing. In fact, the unavailability of the bank credit, whose origin can be the excess of indebteding or an asymmetry of information regarding the risk of the projects and development perspectives of enterprises, will lead the company to accept the granting of real guarantees or to prefer the financing, more costly, through leasing. The lessor, thus in a situation of monopoly, can impose a higher debtor rate, accepted by the enterprise as a result of the fact that the project is profitable and it has no alternative financing source.

3.1. Resorting to Financing That Gives Priority Rights to Their Givers

The risks to which the capital givers expose themselves allow the justification of the connection existing between the bankruptcy probability of the enterprise and the nature of the external financing mobilized. According to the trade-off theory, when making financing decisions, enterprises must perform an arbitrage between the fiscal earnings related to indebteding and the anticipated costs of bankruptcy. The companies incurring important bankruptcy costs will use fewer debts.

The risky enterprises must register important guarantees. The acceptance of high guarantees allows the debtor to signal the quality of the project undertaken [3].

In particular, the guarantee allows the reduction of the dilution rights of the creditors in case of bankruptcy, because the contract allows for an ex-ante separation of the rights over the enterprise’s assets. [5] show that different creditors of the enterprise do not react the same way upon notification of bankruptcy and notes that there is no negative reaction from the secured creditors. The authors explain this result through the fact that the priority of their rights is only rarely breached in case of enterprise bankruptcy. [24]

The secured creditors have not only the right over the asset object of the guarantee, but also a right over the other assets of the enterprise, in case the size of the guarantee is insufficient for the full recovery of the outstanding capital owed. The value of the secured debt increases, for its holders, when the bankruptcy probability is high and, as a consequence, it leads to a diminishing of the value of the unsecured debts. [23]

Under these conditions, the cost of the secured debt will be smaller than the cost of the unsecured debt. We notice the fact that the protection granted to the secured creditors brings forth a reduction of the cost of the secured debt, compensated through the increase of the debtor rate claimed by the unsecured creditors, such as the cost of the total debt remains unchanged. Still, if the creditor does not reply in case of loss of legal protection over its liability, then the enterprises can perform a wealth transfer

from the secured creditors to the unsecured ones.

As a consequence, the secured debt will be a form of financing mobilized by the enterprises having high indebtedness rates or presenting a more important bankruptcy risk. The securing of debts is thus justified through the magnitude of the risk undertaken by the capital givers, factor that depends on the age, size of the enterprise and, at the same time, the size and maturity of the contract.

[11] confirm the existence of a negative and significant relation between the enterprise's bankruptcy probability (measured through age) and the probability that the loan would be granted. Therefore, the size of the enterprise influences the manner of financing adopted: since a small enterprise has more chances of being wound-up than a large enterprise, then it should preponderantly resort to secured debts ([11]; [1]). Also, the longer the contract maturity, the higher the probability that the loan would be secured.

For [21], leasing has the same properties as the secured debt. As a consequence, we can expect that the factors influencing the securing of debts (size, age and bankruptcy risk) would also be at the origin of more important resorting to leasing. Only [20] highlighted negative and significant relation between the enterprise's size and the weight of leasing. However, the authors note that the financing policy is explained, mainly, through self-financing insufficiency.

Generalizing, enterprises that pose a higher risk of bankruptcy bear serious constraint on external financing. In this case, credit rationing forces them to self-finance. In fact, they will reduce the size of the dividends distributed and will cover their financing needs through leasing. The lessor, benefiting from an efficient guarantee in case of bankruptcy, will accept more easily to finance these enterprises. Under these conditions, resorting to leasing is directly proportional to the enterprise's bankruptcy probability. According to [9], the enterprises are forced to perform an arbitrage between the secured debt and leasing on the basis of the implicit costs of the two forms of financing and of their availability, availability that depends on the risk incurred by the offer-givers. We shall analyze this argument under the following point.

3.2. Costs of Bankruptcy and the Situation of Creditors: A Ratio in Favour of Leasing

[7] illustrates the existence of a positive relation between the use of the debt secured through mortgage and the weight of leasing within the enterprise. Hence, the enterprises using leasing resort to the same extent to the secured debt. Then what is the foundation of the enterprises' preference for one or the other of the financing forms?

The tendency of enterprises to resort to leasing or to the secured debt differ depending on the importance of the contract negotiation costs, the costs related to the loss of financial mobility and the acceptance criteria imposed by the offer-givers. For [9], the financing of the contract negotiation through secured debt brings forth lower trading costs than in case of negotiating leasing contracts. In case of leasing, the acceptance of financing is based on the nature and quality of the asset financed, which leads to the need of the lessor to evaluate it, as well as on the money value of the asset throughout the entire leasing contract term. Also, the lessor and the lessee must define an acceptable residual value. In case of a secured financing, the offer-giver's exigency refers solely to the efficiency of the guarantee. This imposes the condition of maintaining the money value of the asset pledged as security.

Also, since the enterprise chooses leasing, it must consider the costs related to the loss of the financial mobility. It is committed for an irrevocable period, during which the contract cannot be terminated without incurring quite large penalties. In case of financing through secured debt, the re-sale of the asset is accepted by the secured creditor if it benefits of a new guarantee, equivalent to the previous one.

There is, according to [9], an arbitrage based on the trading costs brought forth by the conclusion of the financing contract (leasing or secured debt) and on the explicit cost of the financing source, which is linked to the magnitude of the bankruptcy costs incurred by the offer-givers. In particular, financing through leasing brings forth for the lessor weaker bankruptcy costs than for the secured bank creditors. This is explained through the fact that the lessor is the owner of

the asset: he takes possession of the asset more easily and quickly, and with minimal legal costs. However, for the secured creditor the procedure is lengthier. Thus, the lessor avoids the slowness of the bankruptcy procedure and can achieve the quicker re-sale of the asset on a secondary market.

[10] show in their study, performed on 137 leasing operations, that the re-sale value of the asset represents, on the average, 37.8% of its purchase price. Related to the amount of the outstanding leasing installments owed (estimated at 59% of the asset's purchase value), the part recovered by the lessor represents 64% of the value of the financing granted. The authors also show that, on the average, a period of 12 months elapses between the moment of starting the bankruptcy procedure of the user company and the moment when the lessor recovers its liability in the form of re-selling the asset, this interval varying between one and 44 months. These elements demonstrate the lower level of the costs imposed on the lessors, compared to the bank creditors; this determined them to increase their offer, especially when the enterprise becomes risky.

According to [9], when the bankruptcy risk of the enterprise is low, the arbitrage is performed on the basis of the transaction costs: the secured debts will be, in this case, preferred to leasing. When the bankruptcy risk increases, leasing becomes the only available financing source for the enterprises subjected to bank credit rationing and which present a high bankruptcy risk. The unavailability of the bank credit thus constrains the enterprise either to give up its investment projects, or to privilege a very expensive financing source. The higher expenses associated to leasing find their origin in the higher trading costs, in the cost related to the loss of financial mobility and in a higher risk premium. The lessor's strength on the market may determine him to increase the debtor rate charged. In fact, [20] analyzes the effects of having information on the setting of the credit price. The existence of privileged relations between the bank and the enterprise leads to the diminishing of the asymmetry of information between borrower and lender, but can also give the bank certain strength on the market, which it will exercise on the enterprise in the form of a cost of credit higher than the one that would ensure competitive balance. To the same extent, the lessor, in the situation of single lender, can

benefit from its power on the market to over-rate the operation.

We notice that in the study of [9] and of [6], the evaluation of the company's probability of bankruptcy is performed on the basis of computing Altman's Z score. Altman relies on computing a score based on 5 indicators: "Working Capital/Total Assets", "Retained Earnings/Total Assets", "Earnings Before Interest and Taxes/Total Assets", "Market Value of Equity/Book Value of Total Liabilities" and "Net Sales/Total Assets" [13]. The limit threshold is of 2.657. As long as the computed score is higher than this threshold, the enterprise is considered little risky.

[8] exclude from the computation of the Z score the ratio between the market value of equity and the book value of the liabilities. Truly, according to these authors, as the enterprise approaches bankruptcy, the market value of its own capital will diminish; this will favour an increase of the indebtedting lever. Thus, for evaluating the connection between the probability of bankruptcy, the indebtedting degree and the weight of leasing, authors use a score that does not integrate this indicator, but introduce in their analysis a dichotomic variable equal to 1 if the book value of the own capitals is negative. No significant relation has been determined between the value of the modified Z score, the deterioration of own capitals of the enterprise and the weight of leasing and the ex-ante bankruptcy costs.

4. Conclusions

The analysis of the specialty works confirms the resorting to leasing as the banking indebtedting becomes unavailable or too expensive. If the intensity of credit rationing leads to a gradual resorting to leasing, is it necessary to say that the specialty literature does not explain the causes related to credit rationing for enterprises. Does it have its origin in an excessive indebtedting or in a strong asymmetry of information over the quality of the borrower? Under these conditions, leasing will be privileged by the enterprises for which the creditors refused to commit more, or by the enterprises which do not have access to bank credit: this is the case, for

example, of the young enterprises or of the ones in formation.

Abstract

The financial crisis that affected the world market in late 2007 and determinate the failure of some prestigious banks and an unprecedented collapse of the stock market indices had multiple causes and lead to the transformation of the global financial market. To determine the causes that have pushed the commercial banks to accept risks becoming higher and higher involving derivative transactions, will examine what changes occurred in the recent decades in the structure of international financial markets, especially in the banking activities typology.

Key words: financial crisis, commercial banks, derivatives

JEL classification: G21, G24, G01

1. Introduction

Many financial analysts consider that the main responsible for triggering the crisis are the commercial banks and their engagement in the derivatives transactions.

The causes of the global financial crisis can be considered to be of historical, institutional and technological nature. From a historical point of view, most European countries except Great Britain, Denmark and the Netherlands did not follow the U.S. model of deregulation of the banking sector started in the '80s, continuing to separate the real estate sector of the stock market and maintaining all banking activities under one strict regulation.

That way of regulating the financial system legislation did not allow commercial banks to engage excessively in the stock market transactions with the underlying mortgage instruments. European markets closest to the U.S. are structurally Denmark and the Netherlands. At the opposite end are Austria, France and Germany, countries that maintain a strict regulation of the banking system.

The origins of the subprime mortgage crisis are multiple and can be found both in banking and real estate sectors. These causes include borrowers unable to pay mortgage rates, riskier lending decisions of the banks, increasing indebtedness of corporations and individuals, and the central bank regulations and policies, the financial innovation, , including derivatives playing a critical role as well.

2. Recent evolution in the contemporary banking systems

The changes in contemporary economic environment drove the reorientation of the banking system towards activities outside its traditional domain. The purpose for this mutation by the commercial banks was and remains finding ways to maintain profitability while avoiding destabilising the banking system.

The banks' classic economic role can be summarized using the notions of economic agents in search of financing and agents in possession of funds looking for efficient investments.

The two categories of agents, lenders and borrowers, can interact either in a direct financing circuit – for bilateral transactions, or through indirect financing – where a broker is interposed between them. This broker role is classically assumed by commercial banks. They possess the required mechanisms to transform the characteristics of financial agents' debt and credit, thus assuring compatibility between their demand and offer for financing. Consequently, banks can provide long term financing based on short-term resources, or can give out variable interest rate loans based on fixed rate resources.

A commercial bank's traditional economic functions, sub served to their role as a broker, can be fitted into four large types of operations¹:

- deposit collections;
- credit loans;
- inter-bank operations;
- payment means management.

In the last decades credit loans to non-financial entities was no longer the banking sector's exclusive domain. This can be attributed to the general economic environment, to relatively high real interest rates, but also to the development of alternative financing solutions.

In the ten years, the loans by U.S.A. commercial banks to the non-financial sector diminished from 41.12% in 1997 to 19.96% in 2003, afterwards increasing to 31.72% in 2007, the year when the mortgage loan crisis begun. (Fig 2.1)

Figure 1 Percentage of loans given out by American commercial banks to the non-financial sectors²

In the same timeframe, savings institutions, credit unions, insurance companies and pension funds underwent similar evolutions, as their given out credits' fraction of the total financial sector credits diminished. In turn, there was an increase in loans granted by investment funds, including monetary funds, mutual funds, mortgage funds and ABS issuers. The evolution of loans granted by each of these financial institution types relative to the total financial sector credit volume during 1997-2007 is represented in the figure below:

³ Source: Federal Reserve Flow of Funds Accounts 1997-2007

Figure 3. The number of commercial banks in the United States 1990-2007

Due to this economic context, the profitability of the American banking system decreased, as banks lost their competitive advantage in attracting funds and granting loans.

Facing reduced profits, American banks began giving out increasingly riskier credit, using derivatives as risk mitigation instruments. Furthermore, they engaged in non-specific activities, amplifying the disintermediation phenomenon. Among these activities outside the traditional banking role is derivatives trading, whether as buyers or dealers. This further amplified the risks assumed by the banking system.

The same tendencies manifested themselves in other developed countries. Disintermediation occurred mostly in countries

with financial systems based on the capital market, such as the USA and Great Britain, while countries whose financial markets consisted preponderantly of banking recorded lower growth rates for non-traditional banking activities. The reason for this is that capital-based financial systems offer more alternatives to financing through bank loans, thus increasing competition and reducing bank profits from traditional activities.

The financial markets globalization gave companies access to the international capital markets, and consequently even banking systems in countries with less developed capital markets were not spared from diminished profitability. One such case is Australia's, which although not possessing a developed capital market, recorded banking losses as companies accessed the international capital markets.

Confronted by reduced market shares both in attracting deposits and loan granting, with implicitly lower profitability and menaced by looming bankruptcy, banks chose to either give out riskier credit (or to new credit markets) or extend their activities to the capital market.

Banks which failed to adapt to the new market conditions took losses, and the number of bank bankruptcies in the recent years is on the rise. Also, there were more bank mergers and acquisitions. Figure 2.3 shows the number of active banks in the United States between 1990 and 2007, according to the Federal Deposit Insurance Corporation⁴.

One of the most important tendencies in contemporary banking, with effects throughout the world economy, is in our opinion the unprecedented propagation of mortgage loans. Considered one of the most risky credit types, due its long duration and uncertainty about the lender's payments, mortgage loans grew significantly in the United States between 1960 and 2006, to more than 15% of total banking assets. Concurrently, bank involvement in non-traditional activities increased, as the fraction of non-interest related income rose to 20% in the same period. The same tendency towards higher risks assumed by the banks, leading to losses and bankruptcies in banking, also manifested in other countries. Banks in Norway, Sweden and Finland gave out larger real estate credits, encouraging growth in the real estate sector. This growth was followed by a slump in the market, leading to losses for the large credit institutions bigger than those of American banks, when measured against the GDP.

French and British banks also suffered from the real estate market collapse, recording higher credit provisions and even bankruptcy for large bank financed real estate projects – York and Olympia.

Nor were the banks in protectionist financial systems, such as the German and Swiss ones, sheltered from problems caused by involvement on the mortgage loan market. In Germany, the BfG Bank suffered losses of over 1 billion Deutsch Marks in 1992, and regional banks in Switzerland went bankrupt.

In the case of Japanese banks, the real estate market crash led to bankruptcy for banks such as Banking Company and Sumitomo Trust. According to official data 21 of the largest Japanese banks owned over 136 billion dollars in underperforming loans, for which no payment had been made for at least 6 months.

The banks' credit portfolios depreciation, due to doubtful loan grants, is real and applies to worldwide banking activities.

These were the main factors leading to this phenomenon:

- the banks lost their role as main financial brokers, due to new opportunities of financing and investment;
- deposits importance as banking financing sources decreased, following financial disintermediation and the emergence of the capital market as an investment alternative;
- the simultaneous loss of bank loan profitability and increase in credit risk.

Following these evolutions, traditional activities profitability decreased, and there was a rise in the share of non-interest revenue in total banking turnover.

Banks confronted with this phenomenon had two options to maintain their previous profitability level, as they either:

- gave out much riskier credit, especially mortgage loans,

Or

- turned towards other areas of the financial market, such as trading on the capital market or derivatives activities. For example, the American banks' derivatives trading grew from \$8 trillion in 1992 to \$91.1 trillion in 2005. Additionally, a concentration of these activities occurred in the same period, as the top five banks (JP Morgan Chase, Bank of America, Citibank National, Wachovia Bank National, HSBC Bank USA National) owned in 2005 95.5% of all bank traded derivatives contracts.

⁴ The data refers to the banks insured through FDIC. Source: www.fdic.gov

3. Conclusions

The period preceding the housing bubble burst and the onset of the U.S. subprime mortgage crisis was marked by changes in the activity of commercial banks.

Faced with the diminishing profitability due to gradual loss leading role of the credit market comparing with the investment funds, commercial banks were forced to move to new areas of the financial markets or to show a lower degree of prudence in the lending activities.

Thus, the role of banks in the capital market increased, both as intermediaries and partners in the derivative transactions.

In our opinion the development of these new activities by commercial banks, and in particular the use of derivatives can be considered only good for the development of financial markets and world economy. The main challenge for the banks is to find a line of balance between coverage of risks through derivatives and other risk-taking resulting from speculative activities with such derivatives.

Abstract

In this paper we wish to point out that some measures taken by the government to reduce budget deficits in times of economic crisis have the opposite effect, i.e. widening budget deficit. In Romania's case the measures are focused on increased taxation and reducing public spending instead of stimulating business environment in order to increase GDP. Most time even this increase in taxation and these spending reductions generates revenues reductions, thus deepen the deficit.

Key words: budget deficits, economic crisis, increased taxation, spending reductions.

JEL Classification: G01, E32.

1. Introduction

Fiscal policy has, in the wake of the recent financial crisis, become the center of attention in macroeconomics. Given the perceived urgency of preventing a very deep recession, the initial attention was almost exclusively focused on the pros and cons of fiscal stimulus measures, but some attention is now shifting to the need for longer run sustainability.

Budget deficits are inevitable and appropriate during an economic downturn, but maintaining a balanced budget in the long run is desirable in order to avoid unsustainable debt dynamics for the next generation.

Large and sustained deficits pose an economic and political challenge. A big deficit can reduce national savings and domestic investment, lower future incomes, and lead to

high interest rates and inflation that are damaging to the economy and residents. It can also affect exchange rates. The threat of these developments in large economies can also precipitate a financial crisis as trading partners, investors, and consumers take actions to minimize their risks that collectively freeze the system. The large levels of debt begat by deficits mean that a country has less flexibility in time of crisis. High debt levels also mean large debt-servicing costs, which limit a government's ability to make needed investments.

Significant deficits are also a political problem because balancing big budget deficits generally entails unpopular spending cuts and tax increases.

2. Country budget deficits before the current economic crisis

Nine OECD countries regularly ran surpluses in their general government financial balance during the decade preceding the current global economic crisis (2004-2007): Australia, Canada, Denmark, Finland, Ireland, South Korea, Luxembourg, New Zealand, and Norway [1]. Fourteen out of 28 OECD countries had a fiscal surplus in 2007: Australia, Canada, Denmark, Finland, Iceland, Ireland, South Korea, Luxembourg, Netherlands, New Zealand, Norway, Spain, Sweden, and Switzerland (Figure 1). The amount of the surplus ranged from 0.2 percent of nominal gross domestic product in Ireland to 17.7 percent of nominal GDP in Norway.

Figure 1: General government financial balances (2007)

source: OECD Economic Outlook 85 database

The Maastricht Treaty establishing the European Community stipulates that budget deficits should not exceed 3 percent of GDP with an escape clause suggesting that the deficit can be higher under exceptional and temporary circumstances, but should still stay close to the reference value. Greece and Hungary were the only European Union member states in 2007 that ran deficits larger than the 3 percent reference value; their deficits were 3.6 and 4.9 percent of nominal GDP respectively [2].

In 2007, Romania recorded a government budget deficit of 2.5 percent of gross domestic product in international terms, as we show in Table 1. During 2004-2008 period, negative budget balances of important dimensions were especially encountered in France, Greece, Germany, Italy and Great Britain, many times leading to the triggering of excessive budget deficits procedures, provided by the Stability and Growth Pact (Table 1).

2.1 The case of Romania

As we can notice from the data presented in Table 1, during almost the entire period analyzed, the consolidated general budget deficit of Romania was much smaller than the deficits registered in the countries found in the same economic and political situation, such as Slovakia, Hungary or Poland. In some of them, the budget deficit approached or even exceeded 10% of the GDP (the case of Slovakia in 2000). Even after the accession of Hungary, Slovakia and Poland to the European Union, the deficits registered in these three states were much deeper than the limit stipulated through the Maastricht Treaty, of 3% of the GDP. On the contrary, Romania complied with this nominal convergence criterion after 2002 although, under the conditions of the current financial crisis, this limit will be exceeded (Table 2).

Table 2 The budget deficit of Romania during the period 2000-2009 (in % of GDP)

2000	2001	2002	2003	2004
-4,4	-3,5	-2,0	-1,5	-1,2

2005	2006	2007	2008	2009
-1,2	-2,2	-2,5	-5,5	-7,2

Source: [2], [3], [4]

Analyzing the evolution of the budget deficit in other countries of the European Union as well during the period 2004-2008, we can ascertain that there were many cases when the budget deficits were substantial. Negative budget balances of important dimensions were especially encountered in France, Greece, Germany, Italy and Great Britain, many times leading to the triggering of excessive budget deficits procedures, provided by the Stability and Growth Pact. Taking into consideration all these aspects, the evolution of the budget deficit of Romania during the period 2000-2008 can be appreciated as being a normal evolution through the events that our country has experimented and through the similar previous cases seen at the international level.

Nevertheless, the objective of adopting euro as a national currency imposes the

intensification of the efforts to maintain the budget deficit at a low level, including from the perspective of maintaining under control the inflation, as a distinctive criterion of nominal convergence. In this manner, the public debt can be maintained at a sustainable level as well.

As we can notice from the data presented in Table 2, abruptly in 2008 the consolidated general budget deficit of Romania became deeper, much deeper than the limit stipulated through the Maastricht Treaty, of 3% of the GDP, in 2009 reaching the alarming level of 7,2%. What causes this negative evolution? Economic crisis? Government policy to reduce the effects of the crisis? We intend to answer these questions in the following sections.

3. Budget deficits in current crisis time

Deficits in one country at a time of economic crisis—and in an era of increased global interconnectedness—have ripple effects in others, making fiscal choices a matter of more than domestic concern. This has been seen during the recent crisis. The economic and financial collapse created massive wealth loss and severe employment declines, which caused consumers to retrench, businesses to cut investments, and the downward spiral of a global recession to take hold.

Countries addressed these challenges by allowing their fiscal deficits to grow; they replaced private consumption with public consumption with the goals of creating jobs, restoring confidence, and jumpstarting economic growth. Such measures in any nation help to stimulate the other countries' economies as added consumption—both by government and that induced in the private sector—draws imports across borders. This linkage underpinned the push for coordinated fiscal stimulus packages in countries that could afford them. There was an active debate on whether countries were doing less than they could afford to do to boost the global economy or doing too much—risking destabilization through excessive deficits.

Source: [1]

3.1 What caused the deficit?

Budget deficits are inevitable and appropriate during an economic downturn, but trying to reduce the budget deficits thru intern measures, the government obtained the opposite: a deeper deficit.

In our opinion the following factors caused the deficit:

- The inadequate tax politics promoted by the competent authorities; the proliferation of tax evasion phenomenon, also because of the multiple exceptions and exemptions given by the state regarding the payment of some taxes and duties; the relative reduced rate of collecting the duties, taxes and contributions, especially at the level of the state enterprises.
- The taking over of the sums from the privatization of state capital companies by the budget, allowed, in the last 10 years to complete the tax incomes and, in such manner, to maintain the budget deficit at a lower level, in conditions of high public expenses level.
- The budget expenses were continuously bigger than the ordinary revenues, forcing the public authorities to loan money which means the rise of the expenditures.
- Tightening credit conditions for the private sector are exacerbated by high government financing needs, following an expansionary fiscal policy. Increasing strains on banks' liabilities have led to a sharp

deceleration of domestic credit growth, with serious consequences on economic growth.

- In order to benefit from the IMF resources, based on the principle of conditionality, the member states must elaborate and implement certain programs referring, among other things, to the budget deficit size. Such programs were implemented by Romania as well.

3.2 The lump-sum tax deepen budget deficit in Romania

The lump-sum tax introduced beginning with May 2009 led to an avalanche of companies which suspended operations or applied for dissolution or voluntary cessation. According to data provided by National Trade Register Office [5], the number of companies which suspended their activity rose almost 11 times in the first half of this year, compared to the corresponding period of 2008. In the first half of the year, the number of companies which suspended their activity skyrocketed, to 80,013 from 6,698 in January-June 2008, 112.893 compared to 9186 during January-September 2008. The growth is of 1128.97% [6]. However, this phenomenon is considered by businesspeople to be a positive consequence of the lump-sum tax [7]. The companies chose to suspend the activity instead of paying the lump-sum tax. Tightening taxation definitely leads to unemployment and unemployment leads to lower standard of living for population. Unemployment means not only that the state does not collect tax and contributions to special funds, but also increases the costs of granting state unemployment fund.

4. Which is the deficit solution?

The answer at this question should be simple: more stimuli to create demand in the economy.

Reducing unemployment is the key of reducing budget deficit. In this context, there is a key role for fiscal policy, notably to shore up investor confidence by presenting a credible medium term fiscal consolidation based on prudent macroeconomic projections.

A continuation of bank lending would also

be ensured, although at more a moderate pace, in order to allow the financing of productive investments, which will be crucial to rectify the external imbalances and to maintain employment. While the economic downturn in the Euro Area, representing 70% of Romania's exports [8], may significantly dampen export performance in the short run, it is expected that once demand by the Euro Area will pick-up, the trade channel will play a more prominent role in boosting growth. Until then, the reducing of the budget deficit must be based on internal measures, especially structural and fiscal ones, in order to reduce unemployment and to raise demand in economy. The Romanian economy needs a strong signal from fiscal policy. While many countries are coming up with stimulus packages to fight the crisis, in order to reduce budget deficits, tax reforms are an obvious element of fiscal incentives and are indeed expected to be effective at stimulating the economy.

However, convergence and stabilization needs could be satisfied by restructuring fiscal expenditure towards productive investment and speeding up the absorption of EU structural funds, while ensuring they target the right priorities. This would trigger a positive demand effect in the short run, while at the same time increasing Romania's future growth potential.

5. Conclusions

In this moment (2010), Romania's fiscal strategy, seems to be based not on incentives to business, but on the identification of measures for better financing the budget in order to keep the budget deficit at lower limits. CAS's growth by 3.3% since mars 2009, increasing ahead of time the excise duty on tobacco and spirits, introducing the **lump tax** and the growth of local taxes are attempts to collect as much, without regard to the needs of the business environment facing crisis. The reducing budget deficit measures in Romania are also focused on reducing public expenses, which many times generate reducing public revenues. Unfortunately most of the measures taken by government to reduce budget deficit leads only to reducing public revenues faster than reducing public expenses, which means nothing more than deepen budget deficit.

The success of reducing deficit measure is

based on the system capacity to develop the tax base, to stimulate the economy, to stimulate interest in investment, create an open business environment, friendly, stable. The budget revenue is a consequence! It grows the more businesses are flourishing.

Since budget revenue is proportional to GDP, the key factor in increasing revenue is to increase GDP.

Overall Performance of the Company - Means of Evaluating It and Influential Factors

GUNI CLAUDIA NICOLETA

Spiru Haret University

borsanclaudia@yahoo.com

Abstract

Even though it may seem easy to define and measure, the performance of a company constitutes a whole universe within which you may find various ideas and theories. Analyzed from the perspective of company management, performance represents the capacity of the company to reach its objectives. This is the reason for the multitude of facades of the company performance concept, the measuring indicators, whether financial or non-financial. As far as capital investors are concerned, a company's performance concretizes in the size of the obtained profitableness remunerating the capital that they invested in the business.

Key words: global performance, stock indicators, efficiency, financial indicators.

JEL classification: L25

1. Introduction

The performance simultaneously incorporates all the other economic concepts of efficiency, performance, growth, stability, the profitableness of an organization, reflecting the past results obtained, but also its future development possibilities. Of course this term has a different epistemological meaning in English than in the Romanian economic literature, according to which performance is only associated at a higher lever of a company group with better results. In the Romanian economic literature, only the best of the best companies are considered to be performant.

The Romanian correspondent for the Anglo-Saxon term "performance" is that of "economical overall efficiency", which tackles the classical concept of efficiency in an entirely new and complex manner, from a multi-criteria

perspective. From a pragmatic point of view, a model of economic efficiency is developed under the shape of a matrix which encompasses both the effects and the efforts which are particular to a company's activity, based on which, by means of a combined analysis, we can find the efficiency indicators of the activity (ratio between effect and effort and vice versa). This new approach of a company's efficiency has brought about an important contribution to both theory and practice in Economy.

Taking into consideration the axiom according to which a company cannot be efficient unless it is productive, performance is defined by authors as being "a state of competitiveness of the company, which has been reached by an efficiency and productivity level that guarantees a lasting presence on the market".

We considered that the preference one shows in using the "performance" concept both in the Anglo-Saxon and in the Romanian literature is due to its complexity, that is to its capacity of comprising all the aspects of a company's efficiency, both from a historical point of view and from the point of view of its future developmental possibilities.

On the other hand, overall performance characterizes all the company's activity aspects. The term performance has known a gradual development both as far as its informational contents are concerned and as a means of expression by certain specific indicators.

Thus, up to the 60s and 70s, since the technical and scientific revolution is the driving force behind the economic and social development both at a macro and at a micro

economical level, the main performance indicators that were being used were the turnover and the assets volume in order to mirror the company's dimensions. The most performant companies were considered to be

those that were biggest as far as both their technical potential and sales values are concerned, no matter the evaluation of available resources and of the profit margin they reach.

In the 70s and 80s the greatest importance was given to the accounting benefit or profit, as a difference between incomes and expenses of the company, while the role of managerial accounting element in the decision making process was overrated. The economic development models which were being applied in this period were those which completely ignored the natural factor as well as the social one, fact which determined the generalization of the profit in both the theory and the practice of Economy, generating important damages.

There followed a 10 year period during which, due to the remarkable boost of capital markets and of the financial transactions at the overall economy level, it was considered that stock indicators such as *PER* (Price earnings ratio), *Earnings per share* or *the situation of treasury fluxes* may synthetically reflect the competitiveness of performance of the company. Later on, using modern indicators for measuring performance, such as *EVA* (economic value added), *MVA* (market value added), *CFROI* (Cash Flow Return on Investment), *TSR* (Total Shareholder Return) has become necessary in the context of taking into account the costs for financing the company's activity and its market value.

Of course, all these financial indicators present certain economic activity aspects, but cannot be used single handedly, because none of these have the capacity to synthetically reflect the performance of a company under all its aspects. Thus, *lucrative*ness, defined as the capacity of an organization of making profit, was naively used as an expression of the company's competitiveness. For a long time it was considered that maximizing profits represented the main objective of the company, which ultimately leads to a maximizing of the shareholder value on both short and long term and at a thriving of the community.

However, the pollution and unemployment rates prove the opposite and underline the necessity of approaching the company performance from a multi-criteria perspective, regarding not only the shareholders' interests,

but also those of the other social partners of the company.

The overall performance is founded on the shareholder interest theory. From this point of view, the members of the company's managerial team need to prove their capacity to harmonize the interests of all shareholders, even though these may be regarded as contradictory at a certain point. The managerial team's ability is precisely reflected in its capacity to make hierarchies and to satisfy the various interests of the social partners.

Maximizing the company value means more than just increasing the shareholders' capital value, it also means increasing the value of the capital borrowed as preferential stocks, bonds and credits. A sum of all these may lead to an increase of the total value of the company on the long run, and, moreover, performance also means satisfying the interests of the other social partners (i.e. clients, suppliers, consumers etc). By all means, the theory of interest shareholders does not only mean an optimum satisfaction of the interests of all the company's social partners, but also the harmonizing of these interests in the possible limits and having an arbitrage between these interests, according to their importance in the relationship with the given company and to the impact of these partners on its market performance.

Nevertheless, setting a series of unique performance criteria for all companies is impossible to achieve. The very advocates of the interest shareholder theory do not recommend a methodology based upon the arbitrage between the company's social partners, but taking into account multi-criteria objectives of performance, subordinate to the main objective of the company, that of maximizing its overall value. Using multi-criteria performance objectives according to the advocates of the interest shareholder theory is considered by some authors¹ as a handicap of the companies which put into practice the interest shareholder theory, which gives way to ambiguity and inconsistency regarding the accomplishment of the major objective of the company. This weak point, they

¹ Donaldson T., Preston L.E. – The Stakeholder theory of the corporation concepts evidence and implications, The Academy of Management Review, vol.20, 2002.

say, is being speculated by the managers in order to satisfy their own interest first, under the pretence of harmonizing the interests of all the company's social partners.

Under the pressure of the requirements related to the trimestral, bi-annual and annual financial report, the managers of the rated companies are mainly concerned with obtaining good short term financial results, which determines a rapid growth of the stock value of the shares and consequently, a good ranking of these. Therefore, there is a particular preoccupation of managers with the improving of the short term performance in the detriment of long term performance, which in specialized literature is called "the obsession of capital markets for getting a profit" as the only measure of the rated company's performance.

The efficiency of the internal system for measuring results also influences the performance of the companies. The specialists² gave special attention ever since the 80s on the impossibility of the accounting system to supply relevant information to managers with the purpose of making higher quality decisions. Inevitably, if nothing but financial results are looked for, the non-financial aspects of the company's activity are involuntarily omitted.

As R. S. Kaplan³ „what you get is what you measure.”

Even though the main users of the information generated by the company are the managers, there are also other beneficiaries, i.e. its business partners or interest shareholders: employees, clients, suppliers etc. Evaluation of a company's competitiveness level is made depending on the degree of accomplishment of certain performance criteria, mostly financial. As there is no one indicator (not even profit) able to determine a company's performance, for the evaluation of its results and perspectives it is recommended to use a complex indicator system reflecting different aspects of the activity, not only financial, but also non-financial in nature.

In the case of rated companies, the calculation and interpretation of the classical financial indicators (rate of return, active

efficiency, stock indicators etc) and of modern indicators (EVA, MVA, CFROI etc) constitute the object of the fundamental analysis used by investors when deciding to invest / de-invest. However, in order to appreciate the intrinsic value of the transacted titles, the investors also use various non-financial pieces of information.

The sources of these non-financial pieces of information used by analysts when evaluating the titles are more or less confidential. Thus we can notice the incapacity of the external valuating systems of information by the investors to reflect the essential aspects of their performances. We can therefore explain the ever-growing interest of investors for non-financial pieces of information, needed in order to properly estimate the market value of the rated companies: strategy quality and degree of accomplishment, fidelity and satisfaction degree of consumers, capacity to innovate, management quality and experience, ability to attract gifted personnel.

It is therefore clear that performance is not an absolute, but a relative value, determined by the expectations and interests of the social partners of the company. It cannot be quantified with the aid of one single indicator, but instead it demands a multi-criteria approach of all aspects of its activity: social, technical, technological, financial etc. its evaluation is subjective and difficult because it expresses the present and potential investors' perception regarding historical results and future development perspectives in the specific local and national context.

For companies which are valued on the capital market, performance is reflected under the shape of intrinsic value or market value, which may be the same, but which most of the times differ as a result of the efficiency degree of those specific financial markets. Therefore, the information regarding the overall performance of the issuing company, such as profitability, exploitation risk determined by the profitability degree, liquidity, solvency, dividend policy, non-financial information are all integrated by the investors as market value of the titles according to which one may establish the real value of the company.

On the other hand, demand and offer of capital, as well as the varying subjective expectations of investors regarding the company

² Jonson H.T., Kaplan R.S. – *Relevance Lost*, Harvard Business School Press, Boston, Massachusetts, 2001.

³ Kaplan R. S., Norton D. P. – *The balanced scorecard – measures that drive performance*, Harvard Business Review, 2002.

competitiveness contribute to forming market value for the company, ultimately representing the official recognizing of its performance. It doesn't matter whether the intrinsic value of the company is raised, in the conditions where there are no investors on the market convinced of the value, nor willing to pay it in return for their capital investment. As a rule, the intrinsic value differs from the market value, however, on the capital markets this difference is not significant.

It results that the performance recognized on the market is also dependant upon the typology of the investors, and upon the way it is perceived by the investors, as it is a well known fact that the experience and competence of sophisticated investors is bigger as far as the evaluation of the value is concerned, as compared to unsophisticated investors. For this reason, companies must be permanently interested in the official acknowledgment and the increase of their prestige on the market. Accomplishing these objectives may be done not only by financial and non-financial information, but also by other means of communication, such as: information meetings, financial publicity notices, communicates, press conferences, interviews etc.

2. Conclusions

To conclude, overall performance comprises all aspects of the company's activity, of its relationships with its social partners and its future development perspectives.

Performance may be expressed by means of financial indicators which especially characterizes the historical results of the companies, as well as with the aid of non-financial indicators, which have the capacity of reflecting the qualitative sides of the activity, generating long-term value. The official acknowledgement of the competitiveness of the valued companies is the market value, representing the relative and subjective measure of the perceptions and expectations of the investors regarding the efficiency of those companies, established in the context of the confrontation between the demand and the offer of capital.

The performance of the valued companies is significantly influenced by the form of corporate governing, respectively by the capacity of

decision makers to identify and harmonize the interest of the most significant social partners.

Other important factors which have a strong impact over the performance which are valued on the capital market are:

- quality of the informational system - managerial, as an endogen variable which allows for the evidentiating, control and accomplishment of the most important performance criteria;
- the efficiency of the reporting policy and of the means of supplying information to the investors, strongly influenced by the possibility to manipulate the financial – accounting information by the company managers;
- contents and compulsoriness of the legal provisions regarding the supply of information on the capital market;
- pressure of financial markets on managers, towards the realization of short term performances, to the disadvantage of long term performances;
- efficiency of the capital market, respectively its capacity to transmit and incorporate all the significant information at the stock level of the titles;
- capital demand and offer, respectively the typology and competence of the investors, which ultimately determines the market value of the companies.

The continuous valorization of the titles on the capital market constitute the official guarantee of the companies' competitiveness, which leads to gaining accessible financing, and ultimately leads to an improvement of their performances.

Agricultural Credit for Romanian Farms

Harangus Daniela

Tibiscus University Timisoara

danaharangus@yahoo.com

Abstract

The potential of agriculture financial support is very important for farms. One of this financial supports is the bank credit, especially the agricultural credit. Agricultural credit means a certain degree of risk for the banks. Banks must analyze and identify risks in al five stages of the unfolding crediting process. Agricultural credit brings along specific risks for banks, in connection to: the pressure from the natural and economic environment, the season despondency of agriculture production, the time gap between harvest and product selling, etc. The access of agricultural farms to the bank credit offer is determined by a series of factors having a negative or positive influence, meaning the farms financial performances and the efficient management of risks by commercial banks. The analysis made by commercial banks in crediting begins with client selection and stretches to the dimensioning of the maximum credit volume that can be given to a petitioner. The evolution of agricultural credits in the period 2006 - 2009 and their percentage in the total bank crediting is unsatisfactory and extremely low for the development of a performing agriculture. This means it is necessary for banks to rethink and implement a flexible crediting system.

Key words: bank credit, agricultural credit, risk for the banks.

JEL Classification: Q14, Q18.

1. Introduction

At the beginning of the third millennium, agriculture needs financing resources in order to obtain performance. One of the important financing resources is the agricultural credit given by the commercial banks. The development of agriculture represents a

priority area for the Romanian economy. The Romanian transition from the centralized economy to market economy was a complex phenomenon, without historical precedent, generating confusion and leading to an absence of a prospective vision. Incoherent actions, depending on conjectural interests gravely affected Romanian agriculture. The government solved only the problem of land restitution, but not the issue of consolidating high performance agriculture. The access of agricultural farms to the bank credit offer is determined by a series of factors that have a negative or positive influence. Romanian agriculture faced special problems regarding access to bank credits, because in competition with other sectors in the economic activity (industry, commerce, transportation, etc) agriculture was thought to be unattractive and with a high risk for the banking sector. Romanian agriculture stringently needs crediting. No country in the world can afford to neglect or leave only to the discretion of game interplay in the current market the agricultural activity and the food industry, which ensure food for the population. Food security depends on the prosperity of agriculture [1], and the prosperity of agriculture depends on the flexibility and efficiency of the crediting system maintained for the sustaining of agricultural activity in general, and the flexibility and efficiency of the agricultural credit in particular.

2. Factors and conditions in the process of crediting agricultural farms

The factors having a positive influence in the agricultural credit offer are mainly:

- the high agriculture potential in all country areas, Romania having one of the most favorable natural and climatic conditions in Europe;

- the improvement of the legal framework regarding agriculture insurance;
- the assuring of more flexible conditions for commercial bank crediting, etc.

The factors having a negative influence over the agriculture credit offer are the following:

- the excessive break of agricultural property, which led to a massive reduction of the used areas and the loss of traditional agriculture bank clients;
- the faulty functioning of the land market and the delays in issuing property titles over the land;
- the low profitability of agriculture activities and the reduced level in education and information which discourages agriculture farmers to ask for credit;
- the difficulties in constituting guarantees solicited by banks. Most farms do not own the land they grow their crops on, the land being leased, and the agricultural inventory is in its most part depreciated and has a small value;
- the lack of bank expertise in evaluating risks that are specific to agricultural activities.

The access of agricultural farms to the bank credit offer is also influenced by the financial performances of the farms and the efficient management of risks by the commercial banks. The banks must manage both the bank credited activity risk, specific for agricultural activities, and its own business risk. The analysis made by commercial banks in crediting starts from client selection and end at the dimensioning of the maximum credit volume that can be given to a petitioner.

The eligible credit client selection made by banks is done depending on a series of criteria which are stipulated by the bank normative.

These criteria regard mainly the following aspects:

- the efficiency of the credit petitioner business;
- the credit eligibility or reliability of the client;

- the agricultural farm dimension and the dimension of their activity, namely small farms and large farms [2];
- the guarantees or collaterals constituted by the agricultural farms at asking credit;
- the possibility of marketing a corresponding quantity of products, that would ensure the obtaining of income for the farmer's family needs, reimbursing bank credits and paying due interest.

Agricultural farms asking credit from commercial banks must meet a series of criteria and financial performance so as to gain the bank trust regarding the fact that the credit can be paid back in due time, together with the interest, without the bank having to resort to the debtors' guarantee enforcement. Commercial banks credit eligible agricultural petitioners. These are agricultural producers exploiting agricultural land or growing animals. In order to sustain investments in agriculture, banks give credits if the following conditions are satisfied cumulatively:

- the project which is to be financed has economic validity, meaning the capacity to reimburse credit;
- there is the necessary infrastructure for the respective project (land, buildings, utilities, etc);
- the petitioning farmer is experienced in agricultural activities;
- the credit applicant also obtains other income either from agricultural activities, or from other activities, income that can be used to reimburse credit and interest.

The methods used by commercial banks in the process of crediting regards the approach of the following aspects:

1. *The circumscribing of the five stages of the unfolding in the crediting process*, namely: asking for credit, analysis and evaluation, approval, crediting and reimbursing the credit;

Asking for credit and its reimbursing (the first and last stage of the crediting process) are initiated by the client and accepted by the bank. The other three stages in the crediting process, namely the credit analysis and evaluation, the credit approval, credit giving,

Period	Total credits - mil. RON-	out of which for:	
		Agriculture, forestry, fishing -million RON-	Perce tage
2006	105,270	2,770	2.63
2007	167,956	3,783	2.25
2008	228,266	5,669	2.48
2009	230,972	6,492	2.81

are initiated by the bank in the interest of the client and the benefit of both parties, the bank, and the client. The initiating entity is the one assuming a series of responsibilities and obligations. These responsibilities and obligations are found both in the crediting contract and in the documents on which the instrumentation of the crediting filed is based (credit request, reimbursing graphic, cash flow, the clients declarations, etc).

2. *Fundamenting the crediting decision*, meaning the negotiation of the credit between the bank and the agricultural client, and the evaluation of the petitioning client reliability, based on the performance indices and the risk indices applied to the bank.
3. *The good management of agricultural credits* given by the bank, based on the two fundamental principles: the prudence principle in bank crediting and the efficient management principle.

3. Results and discussions

Commercial banks give credit to eligible petitioners. These are the agricultural producers, exploiting agricultural land or growing animals. The petitioning farmer must be experienced in agricultural activities. The volume of agricultural credit is determined according to the technologies necessary for cultures or animal categories and the expenses involved by the current activity in agricultural production. The credit volume is also given by the reimbursing possibilities on part of the client. The evolution of agricultural credits in the period 2006- 2009 and their percentage in the total crediting from crediting institutions is as presented in the following table:

Table 1. The evolution of credits

Source: The National Bank of Romania, Monthly Bulletin, no.196/2010, p.60.

The percentage of the agricultural credit in the total crediting is very low in comparison to other activity sectors, namely: services, industry, constructions, public administration, education and health, etc. At the end of 2009, the percentage of bank crediting on activity sectors, from the total crediting is as follows [5]:

- for services the percentage is of 28.8%;
- for industry the percentage is of 17.5%;
- for public administration, education and health the percentage is of 4.7%.

In comparison to these the percentage for agricultural crediting is of only 2.81% in the total crediting from the banks, which is extremely low and unsatisfactory for the development of a performing agriculture.

The decreased volume of agricultural credit has set its mark on the support and development of investments in agriculture and the performances recorded by this sector. The fact that agriculture cannot be competitive in the situation in which the modern sector is breaking apart and all the approximately four million countryside households are sustained with insignificant amounts of money, in the conditions of a low level in agricultural productivity, must be taken into account. The low profitability of the Romanian agriculture, the use of old fashioned methods and techniques in the production activity, the lack of adequate biological material, etc., are due to the insufficiency in volume and diversification of the agricultural credit. The prosperity of agriculture depends on the flexibility and efficiency of the crediting system maintained for the sustaining of agricultural activity in general, and the flexibility and efficiency of the agricultural credit in particular. The lack of financing in agriculture seriously affects the activity and performances of agricultural exploitations. Generally, the lack of financing is not only a break in the emergence of new business, but mostly an inhibiting factor for the existing ones. The multiple problems

agriculture confronts with need an intervention and with the aid of credit, which is to ensure the rhythmic and sustained financing of agricultural farms and to represent an economical and financial instrument of agricultural policy this is possible.

In the past years different measures for promoting and sustaining agriculture were promoted, including the awarding of short-term credits for farmers and for different suppliers and shop keepers who depended on the activity in agriculture. The Romanian commercial banks were and still are poorly interested in giving credits to agricultural farms. This fact is mainly due to: the insufficient knowledge of the specific features of agriculture production, the over- evaluation of its risk associated with the agriculture production, the lower rate of profit in comparison to other areas of activity, etc. The solving of the current issues regarding credit in agriculture must start from the premise that agriculture is a strategic economical activity, conditioning the global development of Romania.

The specific features of agricultural credit are given by the particularities of the agricultural sector, namely:

- the season character of agricultural production;
- the production period does not coincide with the working period, a specific feature that imposes a high degree of risk on the agricultural credit;
- the action of some natural and biological factors that come into play over the entire unfolding of the agriculture production process, associating it with a high degree of risk;
- the different periods of time (the time gap) between the expenses involved and the obtaining of profit by selling agricultural products;
- the long production cycle in agriculture, with implications on establishing reimbursing terms for agricultural credits, the quantum of credits to reimburse and the limit term periods given by the banks;
- the low profitability in agriculture, which makes it compulsory to give low income credits.

Also the particularities and specific features of the production processes in agriculture lead to a greater need for crediting in this sector in comparison to other sectors of the national economy. Many times, the agricultural credit represents the sole solution for the establishment of an agricultural exploit which would have from the start the production means and the work hand that are strictly necessary. The need for credits in agriculture is also boosted by the fact that the immobilizing of funds in agriculture is greater than in other sectors, and the agriculture workers own capital is not sufficient. Romanian farms, in comparison to other economic agents, have limited access to bank credits, being thought of as unattractive and risky for the banking sector. The limited access of agricultural exploitations to bank credits is also mainly due to: the high risk of fluctuations in production depending on the natural conditions; the lack of an adequate system of insurance which could guarantee the compensation of loses; the instability of commercial and selling markets for the obtained agricultural products. Also, the lack of a high performance management, the discontinuity in obtaining profit, the long production cycles and the high transition and risk costs restrict the access to credits for agricultural exploits.

4. Conclusions

The restricted access of agricultural farms to bank credits, in the conditions in which Romania has a high agricultural potential, makes it necessary for the commercial banks to rethink and implement a flexible crediting system. This system must also have in view the selection of the guarantees solicited by the bank. The preference of financial institutions for real guarantees, meaning mortgages, furthers limits for the access of agricultural farms to bank credits. Also, for the increase in volume for agriculture credits the development and expansion of bank networks in the rural environment by setting up agencies and bank branches, is a must. These can provide information and professional counseling to agricultural farmers [4]. On the threshold of the third millennium the development of a performing agriculture depends to a great extent on the flexibility and efficiency of the

crediting system practiced by the commercial banks and the access of agricultural farms to bank credits. Crediting agriculture, as any banking activity, involves a certain degree of risk. The risk is permanently present, in any business, and most of all in the activity of agricultural exploitations, the risk occurring or not, in connection to the conditions created. The crediting risk means the taking of a risk by the bank both for the non- payment of the lent money to the client, and also the risk of the credited business and the risk of client bankruptcy. Many banks still classify the financing of agriculture as a category of high degree risk activity because of the low level of profitability in this branch and the high exposure to natural factors, without the necessary protection from the system of agriculture insurance [3]. In the category of high risk credits were also included medium term and long term credits, credits to which few agricultural farms have access. Of course, the banks permanently monitor the risk evaluation, especially in the case of credits given to economic sectors that are highly exposed to risk, such as agriculture. Banks analyze, during the whole period of the unfolding of the crediting process, the following:

- the financial performances of the credited client;
- the prognosis of the future performances of the credited client over the period left to the term of full credit restitution;
- the preservation modality, the quality and the structure of the guarantees offers to the bank;
- the way of using and managing the given credit;
- the constituting of restitution sources for the credit and the payment of implied income;
- the evolution and influences of the competitive environment over the client that was credited by the bank.

The banks must re-think the issue of risks implied by the crediting of the agricultural activities the agricultural activities may constitute, for banks, a vast segment of customers, a diversified one, disciplined and with a high potential of absorbing some modern bank services and products.

Challenges in Estimating Goodwill in Current Financial Crisis

Holban (Oncioiu) Ionica

Alexandru Ioan Cuza University of Iasi and Academy of Economics Studies from Bucharest

E-mail: NELLY_ONCIOIU@yahoo.com

Abstract

In recent decades is a significant change as a result of increasing importance of intangible elements. Technology development, particularly in technology transfer and communications, reduce cycle time and technological competition from the more pronounced are some elements that attract the attention of enterprises on ways to remain competitive. The essence of the ability of a person, a company or an entire company to generate wealth is primarily in the specific knowledge in its possession. The transition to IFRS based reporting has resulted in fundamental departures from many of the long accepted norms embedded in indigenous GAAP systems now superseded in IFRS adopting jurisdictions. The rules relating to goodwill accounting, measurement and reporting represent an excellent case in point, the traditionally dominant capitalize and amortise regime having been disposed of in favour of an impairment testing regime pursuant to which periodic amortisation charges are no longer required. The main goal of this paper is to analyse the problems concerning goodwill recognition and valuation of the goodwill in crisis period.

Key words: goodwill accounting, measurement, reporting, goodwill recognition, valuation of the goodwill.

JEL Classification: G01, G32.

1. Introduction

The transition to IFRS represents the latest episode of goodwill's often turbulent story. One striking feature of this framework for goodwill measurement and reporting is its order magnitude increase in complexity compared to typical prior practice. Application

of this system requires navigation through several layers of difficult and potentially contestable choices. It is for this reason in particular that much of the recent literature relating to this issue focuses on the incentive compatibility problems which may be associated with the implementation of impairment based approaches to goodwill measurement and reporting [e.g; Beatty & Weber, 2006; Hayn & Hughes, 2006]. Without derogating from the importance of these findings, the focus of this paper is squarely cast on a different issue, the degree to which firms actually comply with the formal precepts of the standards governing impairment testing regimes. Prior studies appear to have been constructed on the tacit assumption of systematic standards compliance on the part of financial statement preparers.

The measurement of the good will as a residual value is consequent with the "top to bottom" approach, according to which the good will is viewed as an investment part which is based on the buyers expectance regarding the future economical benefits resulted from the enterprises group.

2. Literature review

Goodwill inhabits an unruly and unsettled domain. Accounting theorists have long debated and rarely agreed on its nature and source. In the process they have generated a tangled collection of mostly irreconcilable explanations.

According to Sands [1963], goodwill represented the value capable of being generated by an organization as a consequence of facing less than competition in the markets in which it operated. On the other hand, Gynther [1969] proposed that goodwill came into being as a consequence of the existence of

a range of factors which while favourable to the economic position and performance of a firm were not capable of being measured and recognized individually. Notably, the conceptual confusion relating to goodwill is not limited to the accounting literature. Legal conceptions of goodwill as expounded by the courts have also shown considerable variation over time, and often varied substantially from those accepted at various points in time in the accounting and commercial domains. From the early 17th century onwards, a string of cases have been decided in which courts have attempted to define the term goodwill, and to determine the circumstances in which it might arise, and what it might attach to were it to arise.

Early cases adopted a simple and relatively narrow conceptualisation of the phenomenon. For example, in *Broad v Jollyfe* the court took the view that goodwill represents but the selling of a man's custom, leaving another to gain it. A later and better known case is that of *Crutwell v Lye* in which Lord Chancellor Eldon offered his famous formulation that goodwill is "nothing more than the probability that the old customers will return to the old place." This definition places strong emphasis on what may be termed "force of custom" as the basis for the existence of goodwill. On this approach, goodwill only comes into existence by virtue of those distinguishing characteristics of a particular business which increase the likelihood of repeat business, thus increasing enterprise value.

The shift to the IFRS "capitalizes and test for impairment" approach and its analogues in US GAAP should therefore not be seen as a transition to an inherently new or superior technology. This much has already been made clear in a growing body of literature critical of both the conceptual foundations and practical consequences of the IFRS and US GAAP goodwill impairment testing regimes. Watts [2003] represents an early and high profile example of some of the criticisms which have been levelled at this approach. Other commentators, including Massoud & Rayborn [2003] have expressed similar sentiments, and questioned the desirability of a reporting framework so reliant on subjective judgments without appropriate verification checks and balances. Others have asserted the existence of

obvious technical flaws in the manner in which asset impairment standards have been drafted [Haswell & Langfield-Smith, 2008]. Consistent with the concerns raised in these conceptual contributions, evidence is accumulating in the empirical literature of an array of problems associated with impairment testing regimes.

3. Issues on recognition, measurement and impairment of goodwill

The investment is regarded as an active (large active, the entire company) then this is divided in the components and after the different elements are accounted the remaining is the good will.

Controversy related to goodwill is reference mainly to the recognition and evaluation.

1. The good will concept one of the first articles that make a reference to the commercial fund was published in the year 1884, although this concept is much older. Leake [1948 quoted by Bloom 2006] presents a discussion that took place in the year 1571 which utilize the expression good will. But he is also the one who claims that the first references to the term good will MO in a class about which Lord Eldon commented: "the good will that was the subject of the sale is nothing more than the probability of a old client to come back." Making a reference to one of the components of the good will, clients' fidelity. Since then were written numerous articles and books about this subject, the same as generations of accountants were confronted with this problem.

2. Is the good will a active or not. In order to establish the arguments for and against the recognition of the good will as an active, we will analyse the definition of the immaterial actives established by the International Organism of accountancy normalization and problems in identifying the immaterial actives which it faced. The accountancies of an element in the immaterial immobilizations category requires that an enterprise to demonstrate that the element fulfils the definition of an immaterial immobilization and the criteria to recognise the active (it is probably that the enterprise is to obtain future economical advantages due to the active and if its costs can be evaluated.).

IASB argues that goodwill is the only item of intangible assets for which depreciation is very difficult to identify. It does not generate cash flows independently of other assets or groups of assets and, therefore, its recoverable amount cannot be measured individually. Accordingly, if there is any indication that goodwill may be impaired, the recoverable amount is calculated for the cash-generating unit to which it belongs.

IAS 38 immaterial immobilizations says that the good will is studied by the international standard of financial reporting (IFRS) 3, enterprises groups representing the unidentifiable part of the payment made by the buyer.

According to IFRS 3 the good will obtained in the enterprises group is determined as a difference between the acquisition count of the owners and the part that belongs to the buyer in the just value of the actives, debts and the future debts identifiable of the entity. The good will represents an advanced payment made by the buyer in the count of the future economical benefits which can result from the combining the identifiable actives and the actives which individually analysed do not fulfil recognition criteria in individually situations but for which the buyer is willing to make a payment in the buying process.

The above summarizes the current requirements of IFRS 3, concerning goodwill recognizing and initial measurement. But, a new standard – IFRS 3 (Revised) – has been published in January 2008 and comes into effect from July 2009. IFRS 3 was revised in a joint project between the IASB and FASB, aiming at taking a broader view at business combination accounting and at unifying the accounting treatment at a worldwide level. So, the IASB and the FASB agree to work together and to pool their resources as both Boards considered that it was the most effective method to eliminate as many as possible of the differences between IFRS and US GAAP.

The revised standard gives entities the option, on a transaction-by-transaction basis, to measure non-controlling interests either at the fair value of their proportion of identifiable assets and liabilities, or at full fair value. The first method will result in measurement of goodwill, which is basically the same as with

the existing IFRS. The second method will record goodwill on the non-controlling interest as well as on the acquired controlling interest.

The revised IFRS 3 uses the term “consideration transferred” (replacing “cost of the business combination”) which is sum of the acquisition date fair values of assets transferred, liabilities incurred to seller and the equity interests issued, including contingent consideration. It does not include acquisition-related costs, which are recognized as expenses. Goodwill can also be measured on a “full goodwill” basis, which means that goodwill is recognized for the non-controlling interest in a subsidiary as well as the controlling interest.

The goodwill may contain intangible assets that support depreciation, and which are not separately identifiable, because their cost cannot be reliable determined. Also, some components of the goodwill (i.e. “managerial team”, “collective intelligence of the team”) do not have a definite economic life. Consequently, most of the companies take advantage of all these ambiguities belonging to the various types and uncertainties of theoretical issues, in order to develop an opportunistic attitude that serves their own perspectives and targets.

In the current crisis is important the reference to fair value or value in use, and disclosure which of these reference bases has been adopted. While it is likely that in most circumstances recoverable value will be determined by reference to value in use, the possibility that the fair (market) value of certain asset classes may be reliably determinable, for example, by dint of the existence of active markets for assets of the class in question, means that it will on some occasions be feasible to determine recoverable amount on a fair value basis.

An obvious problem which arises where this information is not provided is the lack of capacity on the part of the financial statement user to understand how goodwill is distributed across a business, where it is concentrated and what types of underlying business activities it is principally associated with. This results in a diminished capacity on the part of financial statement users to develop detailed reporting entity impairment risk profiles.

By way of contrast, firms choosing to adopt

the fair value approach to impairment testing face a lower required disclosure burden and avoid the obligation to provide details such as discount rates and assumed growth rates. The challenge presented as a consequence of the decision to adopt the fair value approach to goodwill impairment testing is to find an appropriate benchmark asset portfolio, a current price for which can be reliably observed.

4. Conclusions

Intangible assets are identifiable non-monetary assets, without physical substance, held for use for the production of goods or services, to be rented to third parties or be used for administrative purposes. Recognition of an element of intangible asset requires the company to demonstrate that the item meets the definition above: to have identifiable character, to be controlled, to obtain future economic benefits and can to be able to asses at a reliable cost.

But goodwill is the difference between the

consideration paid and the purchaser's share of identifiable net assets acquired. This is a "partial goodwill" method because the non-controlling interest is recognized at its share of identifiable net assets and does not include any goodwill.

Consequences of financial crisis on ethics in business

Holban (Oncioiu) Ionica

*Alexandru Ioan Cuza University of Iasi and Academy of Economics Studies from
Bucharest*

E-mail: NELLY_ONCIOIU@yahoo.com

Abstract

On January 20, 2009, the European Forum held in Paris under the auspices of the OECD business ethics. Speaking at the forum were discussed substantive issues of ethics in business under current economic and financial affairs.

The economic and social costs of international crisis representing, as is known, not only financial losses in 2008, but also reduced production in many countries, slowing economic growth in others, job losses and the credibility of financial markets, a resurgence of problems of polarization and social tensions. Ethics in business today requires reconfiguration of the international financial and economic systems based on schemes to ensure managerial factors stimulating and transparent.

In this context, the main question which will be discussed is 'How can we act responsibly as decision makers in a society that is increasingly unpredictable and unknown to us?' It is well known that moral philosophers have long insisted that they can solve this problem by finding valid arguments for what is good and evil and on this basis formulate rules for responsible action. The aim of this paper is to give an argumentation for the inadequacy of the moral philosophers' standpoint. Instead we should reflect upon the conditions themselves that declare an action to be moral.

Key words: ethics in business, international crisis.

JEL Classification: G01, G32.

1. Introduction

Among the major causes of crisis and failures of the market economy are the weaknesses and inadequacies and business

ethics. Policy makers in the economic-financial, national and international researchers and politicians stands for a fundamental revision of international economic and financial system to encourage new rules and behaviours in order to rebalance the relationship between market and regulation authorities public affairs to print more social responsibility, ethics and morality.

The current crisis has shown us clearly that economic and market can not govern themselves and that exorbitant profits and the primacy of financial innovation can not and must remove the minimum necessary and sufficient business ethics.

Globalization requires to create a framework for the international financial system more secure and solid basis of multilateral cooperation on the factors involved, knowing that an increasingly interdependent world economy to function effectively it needs rules and international instruments adjustment based on the principle of "win-win" as a series of ethical requirements of sustainable development locally and globally to reduce the impact of negative externalities (external marginal costs induced others) as well as promoting positive externalities (external marginal benefits generated third parties).

Starting from the criteria for optimal paretian, demanding a new set of ethical standards of economic and financial mechanisms not only involves taking rights (benefits) but also responsibility so that enrichment, improvement of some (better off) should not be made on account of worsening economic and social ones (worse off). Business Ethics entails consideration of the benefit, mutual benefit for both intra-and intergenerational developed countries and for the developing and the objectives of equity,

inclusion, cohesion and social solidarity. Moreover, with this increased complexity and unpredictability comes the awareness that it is society itself - through its actions, decisions and omissions - that must be assigned blame for the fact that damages occur.

This will be a central argument in the following question: How can we act responsibly (as decision makers) in a world that is fundamentally unknown to us? Moral philosophers have long insisted that they can solve the problem by finding valid arguments for what is good and evil and on that basis formulate rules for responsible action. We might follow moral principles in good conscience, but we cannot exempt ourselves from the negative consequences of our decisions in today's risk society. In what follows, two central concepts in particular - responsibility and conscience - will be examined in the light of such a financial crisis context.

2. Literature review

Max Weber (1904/1991) has described the first trend, and shown how science, technology, law and organization have contributed to an advancing rationalization of our lives. As a result of our ability to see *causal* relationships between social phenomena, we are now better able to predict specific events and their consequences. This knowledge-and-control optimism is well illustrated in Frank Knight's classic study *Risk, Uncertainty and Profit* from 1921, where our ability to calculate risk and master uncertainty is discussed as a distinctive feature of modernity. Consequences that earlier affected the individual are now treated as 'risks' and understood as calculable risk; the calculus of risks can be applied to almost everything - from the risks of nuclear power to the risks of smoking. It is in this sense, Ulrich Beck (1995) says, that the calculus of risks exemplifies a kind of morality without morality, the 'mathematical morality' of the technological age. It permits a type of technological moralization which no longer directly employs moral and ethical imperatives; for instance, mortality rates, under certain conditions of air pollution, replace Kant's 'Categorical Imperative'.

Complementary, and often opposed, to this development optimism we can identify the second trend. The complexity of social processes

has distorted their predictability to such an extent that we can no longer rely on causal explanations of risk. This is a central theme in Charles Perrow's celebrated study from 1984, *Normal Accidents: Living with High-risk Technologies*. When investigating commissions assess the causes of an accident, the normal practice is to show how damages can be traced back causally to specific decisions and persons. However, according to Perrow, few technical risk-bearing systems are themselves linear systems; that is to say, systems where one can operate with indubitable calculations of if-then consequences. Instead of predictability we need to get used to the notion of unexpected effects, and this applies not only to the technological and industrial world, but also to the social and political world.

The Norwegian labour relations scholar Philip Herbst (1976) has shown in his study of 'Manichean logic' how the proposition 'deliver us from evil' creates a monolithic structure that compels the separation of good from evil in an absolute sense. Paradoxically enough, however, the result can be the exact opposite of the intention; namely, that instead of promoting the good we end up with a totalitarian regime. Totalitarian logic, which sets out to establish absolute certainty over what is good and what is evil, as a result of its own premises will fail to establish that certainty.

Instead of utilitarian thinking, nature's 'moral infallibility' must be defended. It means encapsulating in an ethical reflection the conditions for life and future life, a standpoint very close to Habermas (2001) in his contribution to the ethical debate on gene technology. Habermas's premise is that the power that alters organisms is different from the power that intervenes into dead or passive matter.

3. The conscience of ethical responsibility in business

Ethics of responsibility is typical of the businessman owe to provide immediate consequences not only intentional, but those unintentional. Although Weber's conception was sometimes interpreted as asserting the disjunction between business and morality,

his plea was responsible for reverse business ethics, "because - says the author - the responsibility and the ethics of belief (moral as such) are not mutually exclusive, but are completed, together forming only real man, the man who can be cut out of the businessman, the entrepreneur or entrepreneur authentic." Ethical paradox" may be called into a serious man of business interrogations: to assume responsibility and economic risks inherent in its action or to remain in moral judgment, abstract, lack of commitment behind it? This dilemma - responsibility / morality itself undertakes shift the focus discourse on human rights code of conduct of business of the "moralism" in ethical responsibility. For business a number of common moral values (compassion, altruism, love close, philanthropy, etc.) Business must compatibles moral philosophy with specific purpose.

In reality, any business is subject to rules / regulations that define 'game'. Respect 'rules of the game' when they are rational and incentive is enough to define the responsibility of the coordinates 'business ethics'. Exceeding the limits set by economic and legal rules conflict behaviour and challenges the responsibility of the businessman. Of course, sociological constraints such as excessive taxation, excessive state control, low purchasing power, voluntarism, corruption, etc. may lead to liability disclaimer.

On top of that in many ways it is difficult to find fault with the motives of 'business ethics' and corporate social responsibility' and morality. Esteem should be understood here not as a personal trait but rather as a quality conferred upon one or that one confers upon others. It wins and loses increases and decreases in social systems. From the legal world the concept of responsibility is familiar to us as the basis for deciding what consequences a norm violation will have for those violating the norm. When it comes to morality, however, the sanctions never go further than censure. One can rebuke a company for not acting morally, but one cannot oblige a company to act morally through morality. Only laws are legally binding for all parties. Morality and ethics will always have the sense of being a personal matter. Of course, there abound those moralists who would make their moral programmers into more than just a personal matter. They are prominent whenever

legislation is passed on issues that have moral overtones: abortion, gene manipulation, euthanasia, the environment, etc. But such campaigns can never be more than an attempt by an ethical programmed to provide grounds for legislation. The law can only exist in relation to the enforcement power of the state. The demand for a legal virtue is therefore difficult to implement in a modern society. So this is where one stands with censure as a means of sanction: censure of business leaders who say that they have a responsibility primarily towards owners and employees, but not towards the environment and society. Morality censures others for their indifference while it craves the opposite for itself: devotion, sympathy, or, to quote Sartre, 'identification with the other'. Censure can be painful, especially for those directly affected by it, for instance in the form of a tarnished reputation. However, it has no legally binding effect.

In the risk society, despite our having accommodated ourselves to a set of specific moral principles, there is no escaping the fact that our moral apparatus is no longer adjusted to the way the modern society functions. For while on the one hand moral principles are independent of time and events fixed in the past, decisions are acutely time-dependent and adapted expressly for the future. A constant tension is thus created between morality and decision making, a fact not difficult to verify, be it in the business world, politics or science. The consequences of the risk society's decisions seem to escape our human powers of perception completely. More risks accumulate at the centre, which for an entire lifetime will remain unseen and incomprehensible to those exposed to them, only to become known finally to succeeding generations. The moralizing of the mass media over who has the final responsibility becomes slightly comical in such a context.

Responsibility has no natural anchorage. We must be prepared to acknowledge that responsibility rests with the role, and not with the person playing that role. Our own era is characterized as a time of deep moral ambiguity despite the attempts of moral philosophers to diminish pluralism and to reject moral pluralism.

4. Changes and trends in business ethics

At the OECD has developed a directory of multinational enterprises (Guide for Multinational Enterprises) which covers a wide range of issues in business ethics. This guide has been agreed by OECD member states and signed by 11 OECD member countries and includes general principles and recommendations that promote compatibility with the laws, the protection of consumer interests, human rights, concern for employment, labour relations, protection environment.

From 2000 until now have been solved half of the over 135 complaints on this guide used by a rate of 40% of multinational companies as a model to establish guide was used by rating agencies and Scholarships when they developed recommendations for corporate responsibility (Corporate Responsibility).

Another multilateral instrument relates to corporate governance principles (PGC) developed by the OECD as part of Stability Forum on key standards of sound financial markets. If high ethical standards are desirable in their own right, PGC are directly connected with corporate performance so that it emphasizes the idea that generates ethical performance (profit).

OECD Convention on Combating Bribery has also contributed to improving global ethics. Convention considers as a crime of bribery by a public official in exchange for favours in obtaining or retaining international business.

As the OECD has developed policy response to economic and financial crisis meant to strengthen business ethics in various ways. In this respect, it is said, the assistance it can provide OECD countries to enhance transparency in areas such as transparency, competition, corporate governance, taxation and pensions, while promoting a better financial education and seeks to identify areas in which serious shortcomings of regulatory instruments.

Develop new rules for global economy in the post-crisis is also a requirement that requires a collective effort and an agreed international response. These rules should help create a framework of economic and financially sound and secure with involvement of all players which implies an increase in the importance of a moral and responsible business environment.

5. Conclusions

All forms of moral communication in the crisis society is more a case of playing down the importance of our need for principles of moral communication and for the allocation of responsibility, needs that derive more from self-justification than from actual circumstances, and instead look towards the contingent aspects of our existence where the challenge is to handle greater complexity more competently.

There are too many business managers with pretensions to moral responsibility; they have all the right answers without having asked the questions. One question we must ask is the following: Are we applying moral communication intelligently? The answer is a fundamental shortcoming in the traditional ethics of responsibility, and this shortcoming is one of self-application, or perhaps we might say, of the prohibition against 'self-exemption'. To defeat this shortcoming we need ethics which can make us more sensitive to how we communicate morality, rather than giving principles for right and wrong behaviour.

Evolution of Fiscal Pressure in Romania Compared to other European Union Member States

Mihaela Ioana Iacob

Universitatea „Aurel Vlaicu” din Arad

mihaiacob1976@yahoo.com

Vanina Adoriana Boglea

Universitatea „Aurel Vlaicu” din Arad

vanina.boglea@yahoo.com

Abstract

This article analyzes the concept of fiscal pressure and fiscal optimum. A comparative study of the fiscal pressure between Romania and the other EU member states has also been made. The academic literature analyzes the specific problem of the fiscal pressure from all points of view and the problem which pressed upon the theoreticians and also the practitioners of the last decades remains the fiscal optimum. The difficulty in resolving the problem consists in opposite interests: on one hand, the government is willing to acquire the highest level due to the ascendant tendency of public expenses; on the other hand, the tax payers long for a much reduced level in order to dispose of more financial funds.

Key words: fiscal pressure, European Union, taxation

JEL classification: O23, E62

1. Understanding the fiscal pressure

Although at the tax payer's level the tax seems a necessary evil, by virtue of honesty and good citizenship, he agrees to pay it as long as this tax won't affect his normal behavior in economy and society. That is why it is considered that the purpose of the fiscal system consists in realizing some financial objectives (financing the budgetary institutions), economical objectives (stabilizing the economical cycles) and social objectives (acting upon the system of distributing welfare) and for qualification we use the concept of fiscal pressure.

An efficient tax policy is the one capable

to offset the following two trends: on one hand, the state wishes to have a high level of taxes, as it needs to finance the growing

public expenditures, whereas, on the other hand, the tax payers want as low a tax level as possible, which trend is caused by the degree of bearability of a high fiscal pressure.

Fiscal pressure is generally given by all the obligatory tax bites which are calculated by reporting the total sum of obligatory tax bites (taxes, social insurance contributions) in a given period, usually one year, to the size of gross domestic product achieved during the same period by a national economy.

Besides the fiscal pressure technically determined, at a macroeconomic level, there is also a psychological fiscal pressure that measures the tax threshold of tolerance of each taxpayer and that, most often, takes the form of individual fiscal pressure determined as a ratio between the total extent of mandatory levies paid by a taxpayer and his total income before tax.

The specific problem of the fiscal pressure generated a series of attempts of the American theoreticians, and not only, to rethink the problem of the fiscal optimum.

Thus, in 1974, Arthur Laffer transposed graphically (Laffer Curve) an idea expressed in 1776 by Adam Smith, according to which too high tax rates destroy the basis on which taxation acts.

Arthur Laffer believes that there is a threshold of maximum fiscal pressure to which any increase generates a reduction in the tax capacity, because a too high fiscal pressure will discourage the taxpayer to invest, save, produce and work.

Laffer Curve illustrated in the form of a

graph relationship between tax rate and income level of taxes.

According to Laffer Curve, the amount of obligatory tax bites is an increasing function of the fiscal pressure rate, but only until a certain maximal board, marked by M point, which corresponds to the maximal level of the curve, then it becomes an decreasing function of this rate, going until the cancellation if the rate would reach the theoretical level of 100%.

The relationship was the theoretical argument for showing the opportunity of the reduction of the marginal taxing rates which had arrived at very high levels during the application of the keynesist economic policies and of the development of the state's welfare. An important diminution of the direct taxes and an attenuation of their progress are to be wanted also because the people with larger incomes are those who invest and save more. The reduction of taxation must come along with the public consumptions diminution, in order to liberate the necessary resources for restarting the production.

2. Analysis of the Romanian fiscal pressure

As for Romania is regarded, the fiscal political measures that are promoted by the fiscal authorities, other factors come into sight, such as the quality of administrating the fiscal debts of the state and the level of compliance with the tax, all these have influenced the volume and structure of compulsory drawings, as well as the fiscal pressure they put.

Graph number 2 shows the dynamic of the fiscal pressure in Romania between 1990 and 2008.

Graph 2: Evolution of fiscal pressure in Romania 1990-2008

The analysis of the statistic data from Romania shows the fact that the pressure of the compulsory taxes/drawings, calculated through taking into consideration all the taxes and social contributions collected by the public budgets, have been reduced from 35,5% in 1990 to 27,7% in 2008. Much of the interval we have analyzed, the pressure of compulsory taxes/drawings has been oscillating around the value of 27%, registering a small increase in 2008, compared to the level registered in the previous year.

Our country, with a fiscal system under 30% is situated in the category of the countries with an average fiscal obligation, in which, although the pressure of compulsory taxes is not an exaggerated one, and in some situations even unbearable, especially in the conditions in which the gross domestic product on an inhabitant is relatively small. The practical experience has shown that, an approximately equal level of pressure of the taxes, this is easier to bear in a country where the gross domestic product is higher than in a country in which the GDP is lower.

This big discrepancy between the moderate fiscal system in Romania and the tax payer's perception upon the almost unbearable level is explained through the fact that the level of the fiscal tolerance doesn't depend on the absolute level of the fiscal

obligations, but as well as on the size of its tolerance.

For accrediting the idea that in Romania there's a high fiscal system, a great part has been played, along time, by the existence of a large number of compulsory taxes, charged both to legal and natural persons as well as the legal instability which has characterized the Romanian fiscal system. In our country, there wasn't a strategy of the fiscal evolution; the fiscal system has functioned under the form of a mechanism with deranged movements, without having the capacity to orientate the economic development towards performance.

3. Comparison to the member states of the European Union

Compared to other European countries, members of the European Union, we can observe that the level of this indicator in Romania puts our country on the 1st place among the European countries. On the first places, together with Romania, we can find Slovakia, with a similar weight-under 30%-as well as other two Baltic states: Lithuania and Latvia. The highest share of taxation in GDP has been recorded in Denmark, Sweden, Belgium, France, Italy and Finland.

We can appreciate that, outlying countries (except the northern countries) tend to practice a lower fiscal system Great Britain and Ireland, Spain and Portugal, Cyprus and Malta, The Baltic States and Poland, Slovakia and the newest member states Romania and Bulgaria, have a lower fiscal system, while the "continental countries" (France, Benelux, Germany, Austria, Hungary, The Czech Republic and Slovenia) either overpass the European mean or are close to this.

This wide variety of tax ratios in the Union is not new. Even before the 2004 enlargement, the EU included a number of member states with tax ratios close to the 50% mark, such as the Scandinavian countries, but also several low tax member states, such as Ireland, Greece, Spain and Portugal.

There are substantial differences not only between the UE15 and the new member states but also amongst the latter. One may

distinguish two groups of countries: a smaller one composed of three countries (Cyprus, Hungary and Slovenia) with tax levels exceeding the EU-27 average (37.5%) and the remaining new member states with lower tax ratios: from the Czech Republic (36.9%, less than one percentage point below the average) to Romania (27.7%, with 9 percentage points below the average).

We have to take into account that the comparison of the pressure of compulsory taxes in Romania, with the levels registered in other states, is not very conclusive, because the fiscal systems have different structures and the levels of economic development are different.

Making a comparison between the pressure of compulsory taxes in the European member states and appreciating the level of pressure in the European Union, in general, confront many difficulties determined by the influence of a variety of general and specific factors for each country such as [1]:

- differences in accounting periods and methods;
- voluntary social security contributions, which are fairly large for some countries (including Germany), are included as tax revenues in the national accounts but not in the revenue statistics; so are the employer social security contributions for government employees;
- imputed government contributions are not included in the revenue statistics;
- inheritance and gift taxes are not considered as taxes in the national accounts while they are included in the revenue statistics;
- for EU countries, VAT and customs revenues are shown net of the amounts transferred to the European Commission in the national accounts while the revenue statistics show gross data.

In underlying the restrictions determined by the use of the pressure indicator of compulsory taxes, we can also add the opinion according to which "this indicator is somehow limited as a comparison measure between countries along time. Among the factors that can influence the level and tendency we can enumerate: the extension of some countries through expenses for social and economical security, rather than through

direct governmental expenses, even if social transfers are or not subject of taxation”[2].

The deficiencies of this indicator are also presented in the work “The Fiscal System and Prices in the Market Economy”[3] where it is appreciated that “the differences between countries, most of them established in time, have to be interpreted carefully, because they can reflect either differences of institutional type regarding the social protection systems, being able to be explained through the weight of the social dues in the total of compulsory taxes, or as a certain policy regarding the budgeted deficit.” It is also shown that “the level and structure of compulsory fiscal taxes depend on the number of factors out of which some have an evolution that doesn’t depend on the state’s will: it’s the case of the demographic structure of the country, especially the weight of the older persons.”

The pressure of the compulsory drawings must be analyzed in a larger frame, not through limitation at the appreciation of the level of pressure but through its linking with the influences of some factors such as:

- the purchasing power of the net profit-the level at which the remained profit after being taxed ensures the needs of sustenance, of spending the spare time as well as of saving the housekeeping;
- the compensations the budget flows financed through taxes induce;
- the level of the tax benefits and the payers to which they refer;
- the existence of a fiscal moron of proportions;
- the evolution of the gross domestic product and of the fiscal incomes.

4. Conclusions

The level of this indicator in Romania puts our country on the 1st place among the

member states that have reduced fiscal pressure. On the 1st places along with Romania, there are several other countries with a similar weight-under 30%-Slovakia as well as other two Baltic states: Lithuania and Latvia. The highest share of taxation in GDP has been recorded in Denmark, Sweden, Belgium, France, Italy and Finland.

The downward trend of the level of taxation manifested in Romania can be considered as an effect of the general trend of fiscal loosening, resulting in reducing the rate of corporation tax, starting from the 1st of January 2000 from 38% to 25% and then to 16% starting with the 1st of January 2005, the general tax rate reduction of VAT from 22% to 19% followed by the introduction of the reduced rate of 9% and 5%.

This large discrepancy between moderate taxation in Romania and the level of perception of the tax payers upon the hardly bearable level is explained through the fact that, the level of supportability of taxation depends not only on the absolute level of tax obligations, but also on the size of its bearing base (GDP)

Academia de Studii Economice

Abstract

Law no. 273 of June 29, 2006 on local public finance has been (partially) operating since the 2007 fiscal year. It establishes the principles, the general framework and the procedures for training, administration, employment and utilization of local public funds, as well as the responsibilities of local administrative authorities and of public institutions involved in local public finance. This law repeals Government Emergency Ordinance no. 45/2003 on local public finance, published in the Romanian Official Gazette, Part I, no. 431 of January 19, 2003, approved with amendments by Law no. 108/2004, with subsequent amendments, as well as with any contrary provisions.

Keywords: Local budget, budgetary principles, credit officers, public debt, taxes, local taxes.

JEL Classification: H72

1. Preliminaries

In the context of some activities' decentralization, Government's passing of some public institutions in the administration and financing of local administration authorities shall be made exclusively under law and only with financial resources to ensure their achievement.

The norm provides that this is done differently, as follows: the first year distinctly comprises amounts deducted for special purposes in the annex to the state budget law,

these sums being necessary for the financing of transferred or new public expenses, as well as for allocation criteria; while in the following years that particular resources are comprised in the ensemble of deducted sums for the equilibration of local budgets allocated to administrative-territorial units, excepting those distinctly nominalized in the state local budget annex.

2. New rules applicable to the of local communities' budgets

Revenues and local budgets' expenditure, as well as other incomes and expenses outside the local budget, aggregated at the administrative-territorial unit's level, make up the general budget of the administrative-territorial unit, which after consolidation, by eliminating amounts transfers between budgets, reflects the dimension of the public financial effort in the administrative-territorial unit in that year, as well as both the equilibrium and imbalance that may exist.

Approved budget appropriations are used to fund local government, programs, projects, activities, actions, objectives and others alike, according to the purposes set out in laws and other regulations, and will be engaged and used in strict connection with the forecasted level of budget revenue collection.

Regarding the budget approval/multi-annual commitments, revenues and expenses will be authorized for the budget year by approving local budgets. Approved amounts at the expenditure section through budgets we refer to, in which payments are undertaken and

mandated, stand for the maximum which can not be exceeded.

As in previous legislation, expenditures are made only within approved budgetary credits, the utilization of budget appropriations for purposes other than those approved drawing responsibility of those who are guilty.

Local budget revenues consist of:

- a) individual revenue consisting of: taxes, contributions and other payments, other incomes and allowances deducted from income tax;
- b) amounts deducted from certain incomes of the state budget;
- c) subsidies received from the state budget and other budgets;
- d) donations and sponsorships.

Substantiation of local budget incomes is based on determination and assessment of taxable field and of tax base on which depends the calculation of related taxes and charges, assessment of services and their gained incomes, as well as other specific elements, including data series for the purpose of a correct income assessment. Meanwhile, the substantiation, the measurement and the distribution of local budget expenditures on credit officers, destinations, actions, activities, programs, projects and objectives respectively, is made in accordance with the responsibilities of the local administrative authorities, taking into consideration priorities set by them for their proper running and for that respective local community's interest.

3. Principles applicable to local revenue and expenditure system

The principles operating in regard to the theme approached in this paper are:

1. *The principle of universality.* Revenues and expenditures are totally included in the budget in gross amount. Therefore, budget revenues can not be directly allocated to a specific budget expenditure, excluding donations and sponsorships that have distinct established destinations.

2. *The principle of transparency and publicity.* The budget process is open and transparent, being accomplished through:

- a) publication in the local media, on the public institution's website, or displaying the

local budget project and its annual execution account at that respective local administrative authority's office.

b) public discussion of the local budget project, during its approval.

c) presentation of the annual execution account of local budgets in public hearings.

3. *The principle of unity.* Budget revenue and expenditure is recorded in a single document to ensure efficient use and surveillance of local public funds. Retention and utilization of extra-budgetary revenue, as well as the establishment of local public funds outside the local budget are prohibited, unless the law provides otherwise.

4. *The principle of monetary unit.* All budgetary operations are expressed in national currency.

5. *The annual principle.* Revenues and expenditures are approved by law for a period of one year, corresponding to the fiscal year. All transactions of receipts and payments during the fiscal year in a budget's account belong to the corresponding execution of that respective budget.

6. *The principle of budget specialization.* Revenues and expenditures are registered and approved within budget according to their sources of origin and to expenditure categories which are also grouped according to their economic nature and their destination.

7. *The principle of balance.* Budget expenses are wholly covered by revenues of that particular budget.

8. *The principle of solidarity.* The local budgetary policies can help both administrative-territorial units and individuals living in extreme difficulty by allocating amounts from the budget reserve fund constituted in local budgets. From the budget reserve fund which is represented in the local budget, local councils, counties or the General Council of Bucharest may approve aid to territorial-administrative units in situations of extreme difficulty, at the request of these administrative-territorial units' mayors or on their own initiative.

9. *The principle of local financial autonomy.* Territorial-administrative units are entitled to sufficient financial resources which local government authorities may use to perform their duties under and within the law. Local administrative authorities have the competence

to establish the levels of taxes and local charges under the law.

Allocation of financial resources to balance local budgets should not affect the application of local administrative authorities' budgetary policies in their field of competence. Therefore, the amounts deducted for special purposes must be used by local administrative authorities only in accordance with the law.

10. *The principle of proportionality.* Territorial-administrative units' financial resources must commensurate with the responsibilities of local authorities established by law.

11. *The principle of consultation.* Local administrative authorities, through their associative structures, should be consulted on the allocation of financial resources from state budget to local budgets.

4. Rules, competences and responsibilities in the local budget process

Article 14 of the above-mentioned legislative act introduces a number of budgetary rules:

- Making payments directly from the collected revenue is forbidden, excepting the cases where the law provides otherwise.
- Budget expenditures are targeted and limited and are determined by authorizations contained in special laws of the annual budget laws.
- No expense can be registered in the local budgets and can not be undertaken out of these budgets if there is no legal basis for that expense.
- No expense from public funds can be committed, authorized and paid unless it is approved by law and unless it has budgetary provisions and funding sources.
- After approval of local budgets, legislative acts having implications on them can be approved only by specifying the sources for covering income diminution or budget expenses growth that are related to the fiscal year for which the respective local budgets have been approved.

With regard to the skills and responsibilities in the local budget process there have been done no essential changes. However, we remind the

most important reference points as they are currently regulated.

The related budgets are approved as follows:

- a) the local budgets, the domestic and foreign loans' budgets and the non-reimbursable external funds' budgets, by local councils of villages, cities, municipalities, sectors, counties and the General Council of Bucharest, where appropriate;
- b) the public institutions' budgets by the above mentioned councils, depending on their subordination.

During the fiscal year, authorities may approve budget rectification within 30 days since the state budget rectification law came into force, as a result of fundamental proposals of the credit officers. Local budgets' rectification shall be applied the same procedures as their initial approval, excepting the periods of budget calendar.

Local administrative authorities have the following competences and responsibilities with regard to local public finance:

- a) elaboration and approval of local budgets in condition of budgetary balance according to terms and provisions established by this law;
- b) establishment, determination, control, monitoring and collecting tax rate and local taxes, as well as any other incomes of administrative-territorial units, through specialized departments under the law;
- c) tracking and reporting of local budgets execution, as well as their rectification during the fiscal year in conditions of budgetary balance;
- d) establishing and observing the performance of activities in the local interest public services domain, including the option of passing those services in the charge of some authorized economic operators or local public services, in an effort to increase efficiency for the benefit of local communities;
- e) direct contracting of domestic and foreign loans for short, medium or long periods and ensuring payment at maturity of liabilities resulted from here, as well as guaranteeing such loans and ensuring payment at maturity of the liabilities resulting from these loans by beneficiaries. *Note: County Councils Presidents are applied the provisions that*

were shown, similar to the executive authorities.

In the stated plan, credit officers are of three types: chief officer (CO), secondary officers (SO) and tertiary officers (TO). *Chief credit officers* of local budgets are the mayors of administrative-territorial units, the Mayor of Bucharest, mayors of the Bucharest sectors and the county councils' chairmen. The chief credit officers may delegate this right to substitutes or other persons empowered for this purpose. Through the instrument of delegation, the chief credit officers specify the terms and conditions.

Leaders of public institutions with legal personality, whom are allocated funds from local budgets, are *secondary* or *tertiary credit officers*.

Referring to the role of officers, we show that CO analyze the way in which budget appropriations are used, these being approved by local budgets or by public institutions' budgets, whose coordinators are secondary or tertiary credit officers and approve the spending of their budgets while respecting legal provisions.

SO allocate budget appropriations approved for their own budget and for budgets of public institutions whose leaders are tertiary officers, and approve expenditures from their own budgets in compliance with legal provisions.

TO use budgetary appropriations that have been allocated to them only for tasks of the units they lead, in accordance with the approved budgets provisions and conditions set by the law.

In terms of credit officers' responsibilities, we remember that they must engage and utilize budget appropriations only within the limits of provisions and approved destinations and for expenses strictly related to those public institutions' activities while considering legal compliances.

As a result, all credit officers are responsible for:

- a) the elaboration and substantiation of their own budget project and observing the way incomes are accomplished;
- b) the engagement, the liquidation and authorization of expenditures within approved budgetary appropriations and budget revenues that may be collected;

c) the integrity of goods that are owned or run by the institution they lead and the organization and maintenance of accounting, the timely submission of financial statements regarding the situation of the patrimony which is under management of the budget execution;

f) the organization of the surveillance system of the public acquisitions and investment program, as well as the organization of program surveillance, including their associated indicators and maintenance of patrimony record.

4. Conclusion. Highlighting the role of control

With regard to the theme we have approached, we can remember that preventive financial control, internal public audit and subsequent assessment have a key role within this framework. Preventive financial control and internal public audit is exercised over all operations affecting local public funds and/or public and private property and are exercised according to legal regulations in the field.

Engagement, liquidation and authorization of local funds expenditures is approved by the credit officers and their payment is made by the accountant, with the exception of art. 54 paragraph (7), which states that: "Payment of expenses to villages and public institutions whose financial-accounting department has a staff number of less than five persons shall be made by the credit officer and the authorized person responsible for accounts, in compliance with methodological norms on organization, recording and reporting of budgetary and legal commitments.

In all cases, the engagement and authorization of expenditures shall be made only by preventive financial control

endorsements, while substantiation and utilization of local funds and local budgets execution account are controlled by the Court of Accounts.

Abstract

Severely affected by the crisis, considered as the deepest one since the Great Depression between 1929-1933, the European Union's economy has recorded the sharpest decline in its history starting with the end of 2007. In response to this downturn, interventions included implementing the European Economic Recovery Plan, changing the fiscal policy, together with a coordinated support of all member states to stabilize the financial and banking sector. Still, the instruments used to counteract the negative implications of the crisis and the fiscal measures taken by each state member differ notably, as the economic conditions differ from one state to another. Through this paper we intend to analyze the European Union's reaction to the new challenges in the economic environment, and in particular, Romania's way of addressing a period of deep constraints.

Key words: fiscal policy, European economic recovery plan, fiscal adjustments.

JEL Classification:E62

1. Introduction

Within any economic activity, expenditure is an essential part, on which relies the future development of the respective activity. At the level of the national economy the problem of public expenditure for the financing of different fields or economic sectors claims the existence of a large income so that these

expenses may be covered. Due to the present crisis, which gradually deteriorated the economic climate in the last two years, limiting public expenditure became an essential priority for all governments. Considering this context, Romania too has had difficulties facing these problems, as the gap between public expenditure and public income started to deepen. Still, this increasing gap was not the effect of the increase of expenditures, but was caused by a lowering of the total revenue. Therefore, European governments have been making serious efforts to support the economies by adopting packages of measures with strong economic impact, whereas among all fiscal measures have the biggest impact on the short-term. Most of these fiscal packages refer to tax cuts, but in some cases states preferred to increase their revenue. Regardless of the measures taken, they are all aiming one objective: the economic recovery.

2. Europe facing the crisis. The European Economic Recovery Plan

The two years of economic decline seriously affected Europe's economy.

One of the first measures taken by the European Commission to combat the current economic situation was the launch of the European Economic Recovery Plan (EERP) at the end of 2008 (COMM (2008) 800 final). Aiming to avoid a deep recession by stimulating demand and boosting consumer confidence, the plan recommends a high budgetary infusion of Euro 200 billion, respectively 1.5% of EU total

GDP. In fact, this major injection of purchasing power was considered the first pillar of the recovery plan, while the second pillar addresses to the necessity of re-directing European Union's short-term actions in order to assure long-term competitiveness ([1]).

However, the initial budgetary infusion was followed by an extra injection of Euro 2.6 billion in the EU budget in 2009, and will continue with a second budgetary infusion of Euro 2.4 billion in 2010.

Considering the two pillars mentioned before, the plan makes recommendations for the member states, such as a mixing policy of revenue and expenditure instruments which includes:

- Increasing the level of public expenditure;
- Granting financial incentives, public guarantees and loan subsidies;
- Reductions of taxes and social contributions;
- Temporary reductions of the general level of VAT.

Still, none of these measures were strictly imposed by the European Commission. Therefore, depending on its economic conditions, each European state had a different approach regarding fiscal stimulus packages. For example, Hungary preferred to increase the corporate income tax rate from 16% to 19% and VAT rate from 20% to 25%, while reductions of the personal income tax on employment were applied. On the other hand, Belgium lowered the VAT rate for the construction of private and social dwellings from 21% to 6%, Germany granted incentives for buyers of environmentally friendly cars and Spain was in favor of 100% rebate on the wealth tax ([2]).

But let's have a look on some of Europe's figures before and after the strike of crisis. Firstly, analyzing GDP volume evolution, there is an obvious deceleration of the growth rate in 2008, followed up by a severe contraction in 2009, respectively -4.1% (Graph 1). The explanation for this situation lies back in the decline of demand, one of the major problems that Europe has been facing with since autumn 2008.

Graph 1. Evolution of EU GDP volume (million Euro)

So

source: European Commission

As several measures to stimulate general demand have been taken, a slight increase of +0.7% of the GDP volume is expected to be recorded by the end of 2010.

Making a short analysis of the general government budget balance, we observe the fact that after 2007, the total EU expenditure has been constantly growing, from 46.1% of EU total GDP in 2007, to 46.6% in 2008, respectively 50.1% in 2009 (Graph 2). In contrast with this trend, the total EU revenue had a short increase in 2008 to 44.8% of EU total GDP, while in 2009 recorded a slight reduction to 44.7% of the total EU GDP.

Graph 2. General government budget balance (% GDP)

So

source: European Commission

Projections for 2010 suggest a similar evolution, maintaining the increasing trend of the total expenditure, along with the decreasing trend of the total revenue, the expected deficit for 2010 reaching a record level of 6.5% of EU GDP ([3]). This indicates the fact that European

governments have put into practice recommendations of the Economic Recovery Plan, as the impulse in general demand is based on increasing public expenditure policies, accompanied by temporary reductions of taxes (decreasing revenue policies).

Accordingly, sustained efforts to stabilize European economy have marked the first positive evolution since 2007. The modest +0.3% increase of the GDP volume at the end of the third quarter of 2009 was the first signal, and was followed by the positive estimates of the European Commission for 2010 GDP evolution (+0.7% increase compared to 2009). Still, measures taken to counteract crisis must and will be maintained, as economic recovery is a difficult and long-term process.

3. Romania's case. Fiscal policy adjustments in times of crisis

After several years of economic growth, Romanian economy has first signaled problems in autumn 2008. Due to the severe economic environment deterioration, authorities started taking a series of measures beginning with 2009. Therefore, several fiscal adjustments have been made, including both revenue and expenditure policy changes. Still, given the need for fiscal consolidation, the fiscal stimulus measures have been restricted to the priority areas of the economy: supporting businesses, reinforcing labor market and supporting household income.

Firstly, a tax exemption has been applied for capital gains obtained from trading securities on the stock market. This exemption has been limited at a period of one year, between January 1st 2009 and December 31st 2009. In addition, reductions of dividend taxes for non-residents have been applied, from 16% to 10%, together with permanent exemptions for specific capital gains of non-residents. On the other hand, starting with 2009 authorities implemented a 1% increase in the social security contribution for employees, a 2% tax of gross income for incomes deriving from agricultural activities, and a gradual increase of the excise duties, as stated in the 2009-2012 Convergence Program.

Another fiscal facility introduced in 2009 and maintained in 2010 was the tax exemption of interest rates for deposits of residents and non-residents. Furthermore, starting with January 1st 2010, reinvested profits are exempted from tax (the initial entry into force was the second quarter of 2009, but was brought ahead by more than half year). Fiscal costs of this measure are estimated at Lei 240-420 billion in 2010, indicating an important decrease in budgetary revenues, but the impact on the labor market would be a positive one, leading to lower unemployment costs.

Continuing the pursuit for economic recovery, government adopted in 2010 an additional package of measures, in compliance with EERP recommendations and in connection with the four priority areas of the Lisbon Strategy. Considering one of the top priorities of the European Economic Recovery Plan - employment protection - and due to the fact that unemployment rates have reached the highest levels in the last 5 years, a range of fiscal facilities addressing to both employees and employers have been introduced. As a result, employers can benefit of six months exemption of social contributions by hiring jobseekers that have been unemployed for a period of minimum three months ([4]). With its stated purpose, that of increasing labor demand, this particular measure aims to improve unemployment rates, which would eventually have a positive impact on general demand.

Moreover, both employers and employees are eligible of exemptions from social contributions in cases of technical lay-offs. In such cases, the treatment of revenues was modified by 2009 State Budget Law as follows:

- For employees, the revenues are treated as non-salary income and taxed accordingly;
- For employers, a 100% exemption from payment of the state and social security budget contributions applies.

In addition, the period for which unemployment benefit was granted in 2009 was extended by 3 months, having a budgetary impact of Lei 0.18 billion. The fiscal facility

referring to the exemptions from social contributions in cases of technical lay-offs was introduced in 2009 and is planned to be maintained in 2010, generating an estimated budgetary effort of about Lei 1 billion.

Expenditure policy, on the other hand, has been focusing on limiting public expenditure, in order to lower the public deficit. In this context, important cuts in public expenditure for goods and services and have been made, the pension increase has been limited to the inflation rate, reductions of bonuses in the public sector have been applied and recruitment in the public sector has been suspended. Still, in order to sustain the economic recovery, and according to EERP recommendations, government has planned a massive investment process in the public sector in 2010, as previously done in 2009, when Euro 10.2 billion were allocated to investments, which account for 20% of the aggregate budget expenditure for 2009, or for 7% of Romania's GDP respectively ([5]).

On the short-term, according to the 2009-2012 Convergence Program, assumed budgetary policy for 2010 was formulated considering the objective of reducing the budget deficit and the net financing for the public sector. 2010 budgetary program aims a 5.9% of GDP deficit, 2 points lower than the one recorded in 2009. Measures taken in order to lower the deficit mainly consist of reductions of current public expenditure, and include ([6]):

- Limitation of personnel expenditure by freezing wages (except wages below Lei 705 monthly) and freezing on hiring in the public sector, together with reductions of overtime pay and bonuses;
- Reduction of pension expenditure generated by freezing pensions (except social pension) and a further rationalization of disability pensions and early retirement in the context of stricter application of existing regulations;
- Reductions of public expenditure for goods and services;
- Economies generated by a better administration of the social security programs;
- Reevaluation of property tax,

increases of excise duties for cigarettes and fuel.

Apart from limiting the current expenditure, fiscal stimulus measures for 2010 refer to maintaining VAT rate and flat tax levels, ensuring conditions for absorption of structural and cohesion funds, establishing a medium-term expenditure framework along with combating tax evasion and improving revenue collection.

4. Concluding remarks

Within its legislative competence and financial resources and instruments available, the European Union has taken a series of driven measures to combat current financial crisis, but also to prevent future similar crises. Moreover, the European Parliament and European Commission issued several documents including proposals to promote economic recovery. Still, it must be stressed that, especially in financial and macroeconomic matters (e.g. demand stimulation), the EU has a role of rather coordinating national measures (EU budget is only 1% of gross national income of EU27) and controlling the national measures compliance with EU legislation. Consequently, the European Economic Recovery Plan does not contain strict regulations for EU members, it only provides a fiscal framework for action.

Fiscal adjustments in the short-term policies of EU states, as stressed previously, point out several differences concerning instruments used to counteract the decline. Some considered increases of VAT rate or corporate income tax rate, others maintained their current level, while some preferred temporary cuts of specific tax. Yet, all consist of mixing revenue and expenditure instruments.

Regarding Romania's case, the main concerns of the short-term anti-crisis fiscal strategy adopted by authorities are to stop the economic decline and to stimulate economic growth and to maintain and create jobs, in the context of the need for fiscal and budgetary consolidation. Measures taken so far indicate the fact that government is planning to maintain current tax levels and to apply several exemptions on income tax, in order to protect population and to create general demand.

From Professional Judgement to Audit Professionalism in a Global Economy

Ionescu Iancu Octavian

PhD candidate, Academy of Economic Studies, Bucharest, Romania

E-mail: octavian.i.ionescu@gmail.com

Abstract

In an increasingly globalised economy, the quality and professionalism of a business is becoming more important than ever before. The audit profession is no exception. This paper examines audit professionalism, its trend and its relationship with professional judgement. It is discovered that there is a contradiction between the commercial logic and the professional logic in the audit practice. This article argues that the key to bring a balance to this contradiction is professional judgement.

Key words: audit professionalism, commercial logic, professional logic.

JEL Classification: G32, G38.

1. Introduction

Financial audits exist to add credibility to the implied assertion by an organization's management that its financial statements fairly represent the organization's position and performance to the firm's stakeholders and to consolidate trust in the business world. The financial statements must present information that are true and fair, that reflect the economic reality of the transactions, that are impartial, prudent, relevant and credible. As a professional and an expert in accounting, the financial auditor and his work, respecting laws and International Standards on Auditing, adds credibility to the financial statements.

Unfortunately, over the last decade the accounting profession has been beaten up badly in the press and with some justification. Global scandals like Enron, Parmalat, World.com, the current financial crisis with the collapse of big banks like Lehman Brothers together with numerous

litigation faced by auditors are just a few of the factors that fuelled the society and regulator's critics. Different researchers investigating the issue place emphasis on a variety of phenomena that created the environment in which these major scandals were possible. The consequence was that the entire accounting and audit profession has had its reputation tarnished. The forces at work were numerous and complex. Corporate and individual greed, delivering services that acted to impair independence, becoming too close with clients, and participating actively in finding ways to avoid the provisions of accounting standards were only a few of the causes but the main cause that embedded all the rest was deficient professionalism. The profession's historical defences to combat these forces proved ineffective. The bottom line is that the profession and the society as a whole, has paid a high price for the accounting profession's failure to meet the expectations of investors, creditors, and other users of financial statements.

All these facts prompt to a more considerate approach towards the use of professional judgement in every stage of an audit and to allocating a greater importance to the issue of professionalism.

2. The concept of professional judgement

Throughout his work, the financial auditor uses an important and central element: professional judgement. Professional judgement is the cornerstone for the audit profession and is applied in all stages of an audit, from planning stage to the audit opinion. Professional judgement is an integral part of audit and cannot be dissociated from it.

Professional judgement in auditing is the

application of relevant knowledge and experience, within the context provided by auditing and accounting standards and the rules of professional conduct, in reaching decisions where a choice must be made between alternative possible courses of action [1]. By referring to professional standards, concepts like independence and objectivity, professional competence, integrity, professional scepticism and responsibility are implicitly incorporated in the definition of professional judgement. It is clear that professional judgement takes place in the context of professional standards reflecting the collective judgements of the profession. Professional standards are therefore important in exercising professional judgement as they act as references and lighthouses for auditors. The absence of comprehensive professional standards combined with factors such as the increased frequency of business failures and the inability to meet public expectations have increased auditors' exposure to liability claims. The quality of professional standards will definitely impact the professional judgement of the auditor and both will impact the quality of the audit work. The professional judgement exercised by the auditor in the course of an audit together with the quality of the audit work will, consequently, impact the level of audit professionalism (see Figure 1.).

Figure 1. The relationship between professional judgement and professionalism¹

3. The concept of professionalism

Many attempts have been made to define a profession, in general, and professionalism, in particular. The essence of professionalism is a

¹ Original conception of the author.

commitment to develop one's skills to the fullest and to apply them responsibly to the problems at hand. Professionalism requires adherence to the highest ethical standards of conduct and willingness to subordinate narrow self-interest in pursuit of the more fundamental goal of public service [2].

Professionalism is an aspirational standard with a few essential elements: competence, personal integrity, responsibility, accountability and public obligation. The competence element comprises relevant, up-to-date skills and capabilities appropriate to the particular task and a broader foundation of relevant experience, knowledge and understanding. Competence, as part of professionalism, must also include appropriate non-technical skills such as communication, business, leadership, management competences. Competence must also be supported with relevant qualifications and maintained through continuing professional development. Integrity refers to a clear commitment to abide by a code of ethics which is recognised and administered by the professional community. Responsibility and accountability comprises a set of personal obligations and responsibilities which sit alongside the contractual obligation to an employer or client and a matching accountability which is also separate from that of an employer. Public obligation is another essential element of professionalism which refers to a contribution to protect the public interest, to social responsibility commitment and to a contribution to the professional community alongside support from that community [3].

4. Commercialism versus professionalism

Throughout the audit profession the push was on to extend the range of services provided. The consulting practices grew in different ways among the firms, mainly directed by the different talents of the personnel with the firms. These people were not paraprofessionals, but rather they were relatively high-paid personnel with strong skill sets in areas only distantly or even unrelated to accounting or auditing. Their numbers grew rapidly, and their success in

generating high-margin fees gave them an increasing voice in firm management. Their relative success created enormous pressure on the auditing and tax practice, both to grow revenues and to increase margins. The successes in the consulting practice increasingly influenced behaviour by auditing leaders and the impact of these behavioural changes gradually affected the behaviour patterns of audit personnel as well. Improved profitability became the key focus. These changes associated with the growth of consulting practices evolved relatively slowly over a period of about forty years. In essence, the cultures of the firms had gradually changed from a central emphasis on delivering professional services in a professional manner to an emphasis on growing revenues and profitability [4]. The focus on delivering quality professional service did not disappear, of course. No one rang a bell in a firm and announced that quality professionalism is out. But, on the other hand, keeping the client happy and doing what was necessary to retain the client achieved a prominence that did not exist prior to the advent of the successful consulting arms within the firms. As a direct consequence, it can be concluded that over the last forty years the core values of the professional firm were undermined by primarily commercial interests. Action is therefore needed in order to restore the degree of professionalism that audit firms once enjoyed and to better prepare the audit profession for the challenges it may expect from the present as well as from the future.

5. Conclusion

The audit framework was undermined, and the result was what we have recently seen in massive bankruptcies, corporate restructurings and ongoing litigation.

The gradual changes in internal firm culture effectively altered the long-standing value systems of firm leaders and the results have been costly and problematical to reverse. The cultural changes evolved over a long period and have become pervasive in nature. However, the professional auditor has a powerful tool at his/her discretion: professional judgement. Now is the time to use professional judgement more than ever to bring a balance between the logic of commercialism and the logic of professionalism

for the benefit of the audit profession and the society at large.

Therefore, the current challenge of firm leaders has to be to gain an understanding of how the current culture evolved and how best to use professional judgement to eliminate the damaging commercial initiatives and restore a proper and expected degree of professionalism.

The Larosiere Report - the Road to Financial Stability in the European Union

Ionescu Iancu Octavian

PhD candidate, Academy of Economic Studies, Bucharest, Romania

E-mail: octavian.i.ionescu@gmail.com

Abstract

The Larosiere commission was given by the European Commission president the dual task to research the causes of the present global financial crisis and come up with recommendations on how to reform the regulation of financial markets. The Larosiere commission published its report known as The Larosiere Report in February 2009. The report lays out a framework to take the European Union forward. Ambitious reforms are proposed, projected on two main dimensions: a macroprudential dimension and a microprudential dimension. The creation of a new European System for Financial Supervision covers the microprudential dimension and it refers to the transformation of the existing level 3 committees into 3 new European Authorities under one central institution. Regarding the creation of these new institutions two suggestions are presented: one about the cross sector cooperation between these institutions, and the second about the need to have a fiscal back-up, a fiscal power alongside the supervisory one in this newly created European System for Financial Supervision.

Key words: The Larosiere Report, macroprudential dimension, microprudential dimension.

JEL Classification: M4, M42.

1. Introduction

From July 2007 the world faces the most serious financial crisis since the 1929 Great Depression. As the international financial crisis unfolded, it was clear to all that the global financial system was in need of significant reform. What has not been clear is

exactly what changes are needed. In the last few months, three reports by the working group on Financial Reform have started the process to chart a way forward. These reports are led by the former Chairman of the US Federal Reserve, Mr. Paul Volcker, Lord Turner from the UK's Financial Services Authority [1] and the former governor of the Banque de France Mr. de Larosiere. There is a high degree of consensus between the three reports which is an encouraging start but one would not underestimate the difficulty of forging an international consensus across such a broad range of complicated issues. In this article I will discuss about the Larosiere report and the recommendations it proposes to stabilize and enhance the financial system. I will focus on main recommendations: the creation of the European System for Financial Supervision and the review of the mark-to-market accounting principle. These two coordinates will reform, enhance and stabilize the financial system in the European Union. The Larosiere Group's mandate covered the issues of how to organize the supervision of financial institutions and markets in the European Union, early warning and crisis mechanisms, how to strengthen European cooperation on financial stability and how European Union supervisors should cooperate globally. The strength of the report lays in the ambitious plan to set up two main institutions of macro and microprudential supervision of the European financial system: the European Systemic Risk Council at macroprudential level and the European System for Financial Supervision at microprudential level. The Larosiere report identifies a number of causes that triggered the present financial crisis. The Report identifies a number of the causes of the financial crisis such as the existence of

excess liquidity, which led to rising asset prices and growth in credit volume. This in turn led to a housing bubble which was exacerbated by increased mortgage lending and poor lending practices. The use of structured financial products to manage such credit exposure and their lack of transparency meant that the extent of the risk being taken on by financial entities was unknown or unquantifiable. The Report also identifies a failure on the part of regulators to identify systemic issues, rather than those related to a particular firm or industry, as contributing significantly to the crisis. A failure to react to the crisis, caused by inadequate information exchange and a marked lack of collective decision making between national supervisors, is also blamed for the failure to mitigate the impacts of the crisis as it developed [2]. As a consequence, the Larosiere report underlines the necessity for the European Union to adopt measures to improve the process of systemic problems identification as well as measures to improve the exchange of information between national supervisory authorities.

2. The Lamfalussy process

In order to understand the changes that will take place by the creation of the European System for Financial Supervision, it is important to present the present processes of European financial system regulation and supervision. The present approach to the development and adoption of financial services legislation in the European Union is the Lamfalussy process, named after the chair of the European Union advisory committee that created it, Baron Lamfalussy. It comprises a four-level procedure that speeds up the legislative process. The parts of the Lamfalussy framework which are of most direct relevance to regulators are the committees on which they are represented, notably the Committee of European Banking Supervisors (CEBS), the Committee of European Insurance and Occupational Pensions Supervisors (CEIOPS) and the Committee of European Securities Regulators (CESR). These are sometimes called the „Level 3 committees” because they are at level three of the four levels of the Lamfalussy process. Under the Lamfalussy arrangements, the Commission proposes framework legislation and it is adopted under the 'co-decision' procedure that involves

both the European Council and the European Parliament. This is Level 1. It is supplemented at Level 2 by more detailed implementation measures, adopted by the Commission and endorsed by a qualified majority of Member States. The detailed Level 2 legislation is prepared by the Commission on the basis of advice provided by representatives of national supervisory authorities, acting through the 'Level 3' committees (CEBS, CEIOPS and CESR). In finalising their advice, the Level 3 committees consult extensively with providers and users of financial services. The Level 3 committees also aim to foster supervisory convergence and best practice, principally through the creation of guidance. Finally, at Level 4, the Commission ensures that Member States are complying with applicable legislation and it pursues enforcement action where required. Analyzing Lamfalussy process, it clearly results that, at present, the most important supervisory structures for the European financial system are the level 3 committees. The level 3 committees are examined in depth by the Larosiere group and based on their structure, improvements in the financial supervisory system are proposed.

3. From the Lamfalussy process to a European System for Financial Supervision

After having examined the present arrangements and in particular the cooperation within the level 3 committees, the Larosiere group considers that the structure and the role of the existing committees are not sufficient to ensure financial stability in the European Union and all its Member States. Although the level 3 committees have contributed significantly to the process of European financial integration, there are a number of inefficiencies which can no longer be dealt with within their present legal structure. This is why the Group proposes the establishment of a European System of Financial Supervision.

The European System for Financial Supervision should constitute an integrated network of European financial supervisors that will work based on the level 3

committees, improved and transformed into three European Authorities. In the Larosiere group's opinion, the Commission, the Council and the Parliament should immediately start the necessary legislative work to transform the level 3 committees into three European Authorities: a European Banking Authority, a European Insurance Authority and a European Securities Authority. The new European Authorities will replace the present level 3 committees: CEBS, CEIOPS and CESR.

The European System for Financial Supervision will be a largely decentralised structure because existing national supervisors, who are closest to the markets and institutions they supervise, would continue to carry-out day-to-day supervision and preserve the majority of their present competences. But in order to be in a position to effectively supervise an increasingly integrated and consolidated European financial market, the Authorities will carry-out a defined number of tasks that are better performed at supranational level. Particular attention will be paid to large cross-border institutions which pose systemic risks which were not detected by the present supervisory structures.

The European System for Financial Supervision must be independent from possible political and industry influences, at both European and national level. The Authorities should have sufficient resources and powers. But in order to strengthen legitimacy, proper accountability to the political authorities at the European and national levels should be ensured. In short, the European Authorities must be independent from the political authorities, but fully accountable to them. The European System for Financial Supervision must work with a common set of core harmonized rules and rely on high quality and consistent information.

To realise this ambitious objective, the Larosiere group proposes a two stage process that will lead to the strengthening of the European supervisory system, will raise the stability of the financial system and will restore trust in the financial markets.

4. Establishing the European System of Financial Supervision

After the preparation in Stage 1 (2009-2010): Preparing for a European System of Financial Supervision, the establishment of the European

System of Financial Supervision is planned for Stage 2 (2011-2012). The establishment of the European System for Financial Supervision is a daunting task. The establishment will take place through the transformation of the level 3 committees into three new European Authorities: the European Banking Authority, the European Insurance Authority and the European Securities Authority.

These Authorities should have their own autonomous budget, commensurate with their responsibilities. In addition to the competences currently exercised by the level 3 committees, the newly created Authorities should have the following key-competences:

- legally binding mediation between national supervisors,
- adoption of binding supervisory standards,
- adoption of binding technical decisions applicable to individual financial institutions,
- coordination of colleges of supervisors,
- designation, where needed, of group supervisors,
- licensing and supervision of specific European Union-wide institutions (like Credit Rating Agencies),
- binding cooperation with the European Systemic Risk Council to ensure adequate macro-prudential supervision.

In this second stage, national supervisory authorities should continue to be fully responsible for the day-to-day supervision of firms. The Group recommends that planning for the 2 stages of the new system be started immediately. To this effect, a group of high-level representatives of the Finance Ministries, the European Parliament, the Level 3 Committees, and the European Central Bank to be chaired by the European Commission, should come forward with a detailed implementation plan.

5. Suggestions

In order to support the successful implementation of the Larosiere report recommendations, I shall present a few

suggestions. The first suggestion is about the cross sector cooperation and communication enhancement between the three new European Authorities. Supervising large complex financial institutions requires an ability to distil an enormous amount of detailed and highly technical information into a coherent picture of individual firms' risk positions, to assess that picture against global market developments and to judge the viability of firms in various market scenarios. In this activity, communication plays a critical role. To avoid a possible isolation tendency in the sector of which each Authority is responsible and in order to have a better information flow within the European System of Financial Supervision, I suggest the setup in parallel with the three Authorities of a Committee for Cross-sector Cooperation. The Committee for Cross-sector Cooperation can have members from each Authority, designated by rotation, and its main role would be to facilitate the exchange of information and best practice procedures between Authorities, as well as to centralize aspects regarding microprudential supervision within the European System of Financial Supervision. The second suggestion refers to the necessity to have a fiscal power, alongside the supervisory power, within the European System of Financial Supervision. Any structure for financial supervision and stability needs a fiscal back-up. Although this aspect has been omitted by the Larosiere report, the financial crisis has made that abundantly clear. The current national structures are backed by the national Treasuries. A European financial supervisory structure needs a European fiscal arrangement at institutional level. Without such a European fiscal arrangement, crisis management has to remain at national levels, leading to financial protectionism. Moreover, leaving expensive crisis management at national level, while shifting supervisory powers towards the supra-national level, could be described as national taxation without proper control and national representation. A fiscal power would strengthen the authority and efficiency of the European System of Financial Supervision in times of economic effervescence but especially in times of crisis.

5. Conclusion

The aspect of the supervisory changes for the financial system in the European Union presented in the Larosiere report is conceptually clear and with sufficient implementation details. Overall, its general structure is attractive. It makes it clear that the key is to coordinate not to centralise all activities in one institution. The change of the present financial supervisory structures by its transformation into an institution with significant powers and resources is a definitive step towards a systemic approach to financial markets' regulation and supervision at the European Union level. But will this be enough to restore the single market? The financial crisis and the large state aid packages have forced ailing banks to re-focus on their home market and reduce their activities abroad. Market integration is declining and competition diminishing. It will take time before the effects of the measures discussed above become visible, and the single market process advances again. The stability of the financial system in the European Union will depend on these changes.

Abstract

The state must accomplish its objectives. For overtaking each economical, industrial, cultural, political, technical sector needs, needs financial resources; but not always the state internal financial resources cover entirely financial needs. Therefore, each state needs to apply for external or internal loans.

Key words: *public debt, external public debt, consolidated debt*

JEL: H6;

1. Introduction

This paper presents briefly the concept of public debt offering at the same time a short analysis of the evolution of the concept in Romania. In a market economy in a continuous movement but also in the present economic and financial context, public debt exists and is ever growing.

2. General aspects of public debt

The state can be compared with a man. Thereby, like any other individual, the state has specified needs; needs that come from all the subordinate sectors. For answering of all the requirements, the state first, needs resources, rather financial resources. If it could answer of all the requirements in each domain everybody would be content; but appear the everlasting conflict needs-resources. The need, in economical sense, represents material requirements of goods and services, at various averages of activity development, of people life and activities. Therefore, its gratification presumes goods and services consuming. The resources represent all the elements that can be used for production of material goods and services calculated for needs gratifications. Financial resources, as good as other

resources are limited comparative with needs. Thereby state must appeal to multiple means for answering, to some extent, at its requirements. One of the solutions is the state internal or external loans contractions

According to law no.313/2004 – the law regarding public debt– the governmental public debt designate the integrality of internal or external financial obligations of the state at specified moment of time, coming from contracted loans direct or certified by the Government through the Ministry of Finance in the name of Romania from the financial markets. In the same law is specified the fact that all the internal or external obligations, contracted by the local public authorities, from the financial markets, compose the local public debt. Thus, the public debt contains governmental public debt and local public debt.

Generally, the state is borrowing to complete routine resources; taxes, contributions and other taxes deductible; when it has not enough cash in treasury for making its outstanding payments to subordinate domains. Thus, when the incomes are insufficient for cover the costs, the state appeal to such loans for equilibrating the state budget. In our country, the government is authorized to contract internal or external loans for different purposes such as:

- a) needs financing at short notice of the state budget;
- b) state budgetary deficit financing;
- c) governmental loans liquidation and amortization; and redemption of unpaid debts;
- d) interest payment but also of other costs related to public debt;

There are more concepts that define public debt term. Thereby, we can analyze floating public debt, as being at short notice public debt and contains contracted loans on periods up to one year, in order to cover the downs generated by the differences in time of

the income with the budgetary expenses; consolidated public debt, as being the totality of the debts resulted from the state budget contracted for medium and long term, but also of the debts that have arisen from terms extensions of loans returning which means medium and long term public dept.

In terms of creditor quality, the public debt can be gross debt, designating loans total value, whatever these are placed and net public debt which not contains loan value placed in governmental institutions.

Public debt increases every time whenever a budgetary deficit is funded by the contracted loans.

The state procure its needed both inside and outside financial resources. So we have an internal public debt and an external public debt.

For Romania, internal public dept has as an activity object the financial tools: bonds, government papers, treasury certificates but also the state loans contracted at the Romanian credit institutions or from different governmental agencies.

Regarding the external debt, in the most part it consists in barrowing from other states governments, foreign banks and different regional or international financial institutions.

Maastricht Treaty, which builds the European Union, set the economical criteria by a state can join forum. One convergence criteria, in financial field, concerned the indebtedness of relative state; this one had to be less than 60% of the State Gross Domestic Product.

Romania has fulfilled this criterion. By reference to the percentage of public debt to GDP, note that it is almost nonexistent in 1990, approximately 0.9%, then gradually increased in 2002 reaching at the percentage of 28.5%, while the end of 2009 public debt to GDP ratio reached a value of 29.29%. The following table shows the public debt ratio to GDP after 1990:

Table no. 1. Share of total public debt to GDP 1990-2009

Year	Public debt ratio to GDP (%)
1990	0,9
1992	20,4
1994	17,5
1996	27,8
1998	27,6
2000	31,4
2002	28,5
2004	22,5
2006	20,4
2008	21,8
2009	29,29

Source: calculating on Ministry of Finance data

Although the share of public debt to GDP increased in the last 3 years, it is well to remember the 7.49% percentage increase of public debt in 2009 against 2008, this thing thanks especially to contracting loans from the International Monetary Fund and from European Union but internal loans based on bond issues too. Relative with other European Union countries, we are ok, is not expected the fact that we passed the level of 60% of GDP, maximum permissible value to European Union members.

Among European Union countries members, according to some transmitted data by the de Organization for Economic Cooperation and Development (OECD), regarding debt ratio, next states are in the worst state:

- Italy – with a debt ratio to GDP of 127,2% is on third place in a top of World's Biggest Debtor States.
- Greece - with a debt ratio to GDP of 123,3% is on fourth place in same OECD top.
- Belgium - with a debt ratio to GDP of 105,2% is on fifth place.
- France – falls below percentage of 100%, in case of this state, debt ratio to GDP is 92,5%.

Relative with above data, Romania looks good, but is worrying the fact that Romanian government loans to cover current needs as budget system regular salary and pension payment instead of, for example, to invest in infrastructure debt in Gross Domestic Product of top 20 The World's Biggest Debtor Nations

3. External public debt – total public debt component

According to law no.313/2004 – law regarding public debt– external governmental public debt designate all financial obligations of the state coming from contracted loans direct or certified by the Government from persons or corporate body unresident in Romania.

External public debt can be contracted directly by state or certified in state name or account. To assess external debt level characteristic to a state and for making international comparisons between states are used a number of indicators. Among them the most important are:

- external public debt in year ...(EPD);
- external public debt service (EPDS);
- external public debt ratio to GDP;
- ratio between external debt and goods export;

External public debt service represents all payments arising from external public debt repayment, outstanding rates, interest, commissions, etc.

Another analysis indicator of external public debts is ratio between external debt and export trade that shows how much time is necessary to refund state debt based on currency received from abroad sales of goods and services.

In current economical conditions, in full financial crisis, many of world state governments looked for external funding to cover budgetary deficits, fact that conducted to explosive external debt of these states.

World Bank published in 2009, top 20 The World's Biggest Debtor Nations.

In next table (table nr. 2) are presented the volume of external public.

Table nr 2. The World's Biggest Debtor Nations 2009

Source: www.cnbc.com

Regarding Romania, external public debt continues to be a main component of total public debt. Thereby, in period 1990 – 1995 Romanian authorities' appeal constantly to foreign international agencies, Romanian authorities quit at the foreign loans and the focus is on the internal loans.

Afterwards then (in same time) with decrease of state rating given by international agencies, Romanian authorities quit at the foreign loans and the focus is on the internal loans.

Since the year 2000 is hardly returning again at the foreign loans.

During the 2000-2003 year the relationship

Nation	Eternal Debt (USD)	GDP 2009 (USD)	External debt (% of GDP)
Ireland	2.39 trillion	77.3 billion	1,352%
United Kingdo	9.26 trillion	2.17 trillion	427.6%
Netherla - nds	2.58 trillion	652 billion	395.6%
Switzerl - and	1.23 trillion	316.1 billion	390%
Belgium	1.32 trillion	381.4 billion	345.6%
Denmark	627.6 billion	99.1 billion	315.2%
Sweden	916.42 billion	333.2 billion	275%
Austria	869.13 billion	323.2 billion	268.9%
France	5.22 trillion	2.11 trillion	247.2%
Portugal	538.1 billion	232.4 billion	231.5%
Hong Kong	659.27 billion	301.3 billion	218.8%
Norway	577.80 billion	276.5 billion	208.9%
Finland	376.8 billion	183.1 billion	205.7%
Germany	5.33 trillion	2.81 trillion	189.4%
Spain	2.53 trillion	1.37 trillion	184.7%
Greece	594.60 billion	339.2 billion	175.3%
Italy	2.71 trillion	1.76 trillion	154.6%
Hungary	231.33 billion	186.3 billion	124.2%
Australia	891.26 billion	819 billion	108.8%
SUA	13.67 trillion	14.25 trillion	95.9%

between external and internal debt was increased from 156,66% in 2000, at 292,44, which shows a much slower growth of the

internal public debt than the external one. Overall, during the 1990-2009 periods, foreign public debt was 60% from the total public debt, while internal public debt was just 40%.

Graph. nr.1. External debt ratio evolution in GDP during 2000-2009.

Since 2000, when the external debt ratio in GDP is registering a value of 22, 2% and until 2002 when the percent goes to 21,3%, the foreign debt registered a decline. Besides this period of evolution, the external debt ratio evolution is a progressive one.

4. Conclusion

Romanian public debt is fitting into the maximum of 60% from the GDP; this limit is characteristic UE members' states and was established by the Maastricht Treaty. At the end of 2009, Romanian public debt is registering a value of 30% from GDP, as shown by the graph below:

Graph nr. 2 Public debt ratios from GDP in period 2000 – 2009

At the end of 2009, Romanian public debt ratio from GDP is 29, 29%. This ratio is comfortable because a public debt ratio from GDP fewer than 60% is a highlight condition for euro taking up.

Abstract

The crisis is now a big problem all over the world. The impact of economic global problems over euro zone is very powerful, especially on the lay-off. The most danger for the common people in periods of recessions is the unbalance between the charges and revenues. For balance his expenses and incomes, a person needs to find different solutions. In this work, we have analyzed the budget of the household and then, we tried to give solutions for common people to survey the crises; we made a rescue plan for consumer's finances. Among the first steps of the rescue budget are: to analyze of what you have now, not what you had; make a plan with stages and objectives, then chose the most suitable modality to save the money, and always keep an historic of the incomes, expenses and saving money.

Key words: charges and revenues, budget of the household, crises, rescue plan.

JEL Classification: D11, G32.

1. Introduction

A big problem in nowadays for all over the world, especially in the industrial countries is the recession. The most danger for the common people in periods of crises and recessions are the unbalance between the expenses (charges) and incomes (earnings, gains, revenues). For balance his expenses and incomes, a person need to

apply to extern sources.

But, the impossibility to applying to the extern sources because their cost is high or the lay-off, may lead to the forced execution by creditors and finally to personal bankruptcy and the lost of proper goods. Romania needs a law for person's bankruptcy, to protect persons against forced execution.

On the other way, in such periods, many opportunities come into view, especially for the acquisitions for homes and cars, because their price is low.

2. Steps to secure the consumer's financial future in the US

After Suze Orman a recession rescue plan should have five steps¹:

Step1: Live on half

Whether someone is single or in a double-income household, the person needs to live only half of what he is used to, and to put the rest in the bank. If all of a sudden he fined himself without a job – or his partner fined themselves without a job – he is now going to have his income cut by 50 percent almost immediately.

By living on half now, the person will know whether he can really afford to pay his bills if the worst happens. When a person is freaked out, that is no time ...and it's never too early to start formulating an unemployment action plan.

This step is the first to use and cut expenses as necessary.

¹ Book: Suze Orman's 2009 Action Plan, Keeping your money safe & sound.

Step2: Stash your cash

In today's economy, cash is the king and the credit could be shrinking daily.

If the credit card is no longer available, what does the consumer do if he loses his job and have no savings? He will be in serious trouble.

Before this recession, credit cards could always be used in case of emergency. Now, credit card companies are making it more difficult for people to use their cards.

Therefore, a good advice is to pay for things in cash.

Each month can add up to big savings and a person can increase his savings even more if he find the right account, if he compares the interest rates of savings accounts, CDs and other bank products.

Step3: Make the stimulus package work for you

In US, the new economic stimulus package changes the rules for tax credit for first-time home buyers.

Part of the intention behind the economic stimulus plan passed by US Congress is to create millions of jobs for Americans, but it's also designed to lend a helping hand to those out of work.

If it happens to get laid off, to lose the job, a person has 18 months where that company has got to cover him with health insurance.

Step4: Make your home affordable

The loan modification program is designed to help families dangerously close to foreclosure. The US government estimates it could help 3 to 4 million homeowners keep their monthly mortgage payments if and only if they are qualify in this program.

Step5: Look at what you have, not what you had

Things will get better, get worse ...in the next three or four years, it will start to turn around. But there are a few years until every single person feels a hope again.

This is why it is so important to look at what you have and be grateful, instead of looking at what you have lost and feel angry.

After Jean Chatzky there are 5 steps to secure your financial future:

- build a cushion

- pay down debt
- rebalance your portfolio
- keep your job
- work on your credit score.

Also, according to them, there are essentials things that a person in US can't afford to skimp on, because sooner or later will affect them, such as:

- retirement planning
- insurance
- exercise
- healthcare
- charity.

3. A recession rescue plan for consumer's finances in Romania

In generally, and also in Romania, we should follow the next steps for success:

- Find a motivation for savings
- Make a plan with stages and objectives
- Chose for the most suitable modality to save the money
- Make the saving money before the spending money
- Keep an historic of the incomes, expenses and saving money.

These are the steps we must follow to succeed.

The necessity of having saved money is obviously: the risk of losing the job, the risk of unwanted events, medical surgery etc.

Also, we can see some opportunities offered by the crisis if we have savings and as a paradox to save more money. An example is a person who searches to rent a house; the market price is 500 euro; he finds an owner who needs liquidities and agreed to negotiate at the price of 400 euro, 20% under the price market, with a period condition: one year or half year. In this case, the person save 1200 euro per year and the owner is satisfied to have fast liquidities.

A Romanian in media spends from 100 lei, 71, 5 lei for consumed food or goods, 15, 6 lei for taxes, contributions, dues and fees. According to the National Statistic Institute, they spend over 90% of theirs incomes.

Table1. Total expenditure of main household categories in 2008

Total expenditure of main household categories in 2008	Total households Trim 4 lei	Total households (percentage)	Households of employees (percentage)	Households of farmers (percentage)
1. Money expenditure of which, for:	1753,97	84,28%	93,35%	68,88%
-purchasing of consumed food and beverages	1282,02	61,6	-	-
-purchasing of non-food goods	61,23	2,9	-	-
-other expenditure	85,27	4,1	-	-
-taxes, contributions, dues, fees	325,45	15,6	-	-
2. Equivalent value of agricultural products consumption from own resources	327,12	15,72	6,65	31,12
TOTAL EXPENDITURE (1+2)	2081,09	100%	2315,29 100%	1775,96 100%

Source: *Population income, expenditure and consumption, bulletin INS, 2009 and my calculation*

Table2. Total income of main household categories in 2008

Total income of main household categories in 2008	Total households Trim 4 lei	Total households (percentage)	Households of employees (percentage)	Households of farmers (percentage)
1. Money income of which:	1917,06	82,7%	90,45%	68,85%
-gross salaries and other salary rights	1193,33	51,5	-	-
-income from agriculture	51,62	2,2	-	-
-income from non-agricultural independent activities	60,42	2,6	-	-
-income from social provisions	516,04	22,3	-	-
-income from ownership	7,03	0,3	-	-
-other income	88,62	3,8	-	-
2. Equivalent value of income in kind obtained by employees	74,34	3,2	3,68	2,36
3. Equivalent value of agricultural products consumption from own resources	327,12	14,1	5,87	28,79
TOTAL INCOME (1+2+3)	2318,52	100%	2624,72 100%	1919,57 100%

Source: *Population income, expenditure and consumption, bulletin INS, 2009 and my calculation*

In 2008, the final trimester, the income of household was 2318,52 lei (increasing 23%, towards 2007, and 59% towards 2006) and the expenditure of household was 2081 lei. (89,8% from total income)

A study made in January 2009 shows that

many of the Romanians have the strict necessary goods, 35% of the interviewees, but almost of them are dreaming to buy cheap goods en rates or to take a loan. Third of them intend to spend their holidays in the country and half out. Half of the consumers do not intend to reduce money

expenditure for purchasing of consumed food and beverages, but 30% intend to reduce the budget for clothes because of the crisis.

4. Conclusion

In conclusion, how to escape from the debts? The consumer needs a plan for debts management. First the person should make a budget:

- -Total income: 100%
- -Total expenditure: 20% debts (for example), 80% money expenditure for purchasing of consumed food, beverages and non-food goods etc.

If for example, there are 30% debts, a person should reduce the expenses and he will have 70% money expenditure for purchasing of consumed food, beverages and non-food goods etc. and has to identify not necessary expenses.

A person can reduce the expenses by organizing the bills, not making any more debts, changing the companies who offer utilities (e.g. the phone, TV), changing the bank or the credit card etc. Some acquisitions can be postponed and it is advisable to buy cheap things.

The first priority is the financial stability. One of the rules is to keep more liquid money in bank products. We have to be preoccupied by the safety of money.

Regarding the financial behavior, a person must have in mind that the money mustn't been wasted. The money should covered rational and adapted charges because of the crisis. Also, the buying capacity of Romanian is going down. *It is necessary more then ever to think positive, to stop spending and to start saving and try to consume Romanian products.*

Abstract

Social, economic and legal factors resulted in differences in the financial statements from one country to another. These factors have contributed to use different criteria to recognize the structure of financial statements and the option for different bases of valuation. They also affect the scope and disclosures in the financial statements. Committee IASC is employed in mitigating these differences and seeks to harmonize regulations, standards and procedures for preparing and presenting financial statements. Harmonization requires that financial statements provide useful information for making economic decisions.

The elements in balance sheets are recognized according to four basic criteria: definition, measurable character, relevance, reliability. The valuation of the elements in balance sheets is one of the most difficult accounting issues. The elements presented in financial statements are valued using the rules of „historical cost” or basic accounting procedures.

The issue of the valuation of items that are an entity’s assets has been analysed in many studies and various opinions have been expressed, some of them transforming into real balance sheet theories. The difficulties encountered when it comes to establishing “definitive” valuation rules are generated by the aim pursued: the faithful image of assets or the user’s interest.

The elements presented in financial statements are valued according to the provisions of the regulations in force, the Accounting regulations in accordance with the Fourth Directive of the European Economic Community and the International Accounting Standards, after the rules of „historical cost” or basic accounting procedures.

Key words: assets, balance sheets, cost, value.

JEL Classification: M 41

The historical cost is used as a measurement basis by the external users of accounting data. Being seen as an accepted effort to obtain revenues, opposite to the market value, the historical cost can be divided over several financial years, because the revenues obtained will be connected with the efforts obtained, according to the principle of the financial year’s independence. The measurement of the elements in the balance sheet structure has advantages, but also a series of disadvantages: undervaluation of assets, overvaluation of results that affect the faithful image of data.

The opponents of the historical cost principle think that “The objectivity of the historical cost is more apparent than real [1], because:

- not all assets are purchased (it is the case of property, plant and equipment produced by the entity);
- dividing the activity over several years involves the recovery of some assets’ value in time (amortization);
- the purchase cost supposes a choice related to the manner in which additional costs are processed;
- the concepts of expenditure and result are subjective by nature”.

According to the moment chosen to determine the value of the asset, the following values corresponding to valuation bases used are recognised [2]:

- original value (inflow historical cost) that refers to the efforts, the payments made so that an asset can enter an entity;

- reproduction value (replacement cost) that refers to the amount of funds that the entity should spend to obtain an equivalent asset;
- the net realizable value that is associated with the gain obtained after selling an asset if it was sold today;
- the present value resulting from the sum of the gains obtained by using the asset.

In the IASC Framework for the Preparation and Presentation of Financial Statements, the following recommendations [3] are made in what regards measurement systems:

- historical cost;
- current cost
- realizable value;
- present value.

Specific to the American accounting system, in the measurement of the elements in balance accounts, is the provision of data that are useful to creditors and investors with different evaluation bases:

- historical costs of property, plant and equipment;
- current stock costs;
- current market values for stock market assets;
- net realizable values for short term receivables;
- present values for long term receivables.

In the American accounting system, the elements of the balance sheet are presented in a functional way, according to the economic destination of goods. According to the legal view, the presentation of elements in the balance sheet depending on liquidities-liabilities criteria is secondary, the stress being put on the destination-provenience criterion that is used to define balance sheet structures. The liquidity-liability criterion is to be found inside the structure, and additional data regarding possible “misconducts” are presented in annexes.

The assessment bases can be arranged as presented in Table 1.

Thus, the balance becomes a source of data oriented toward the requirements of external financial analyses, the information of users and resources employed each year in the business’s life, the meeting of national a ccounting requirements.

“Table 1. The arrangement of the assessment bases”

Method	Asset elements	Liability elements
Historical	The amount of cash or	Amount of proceeds

cost	cash equivalents paid or the fair value at the time of acquisition.	received in exchange for the obligation or, in some circumstances, the amounts of cash or cash equivalents expected to be paid to satisfy the liability in the normal course of business.
Current cost	The amount of cash or cash equivalent that would have to be paid if the same or an equivalents asset were acquired currently.	Undiscounted amount of cash or cash equivalents that would be required to settle the obligation currently.
Realizable value	The amount of cash or cash equivalents that could currently be obtained by selling the asset in an orderly disposal.	Their settlement values, that is, the undiscounted amounts of cash or cash equivalents that are expected to be required to settle the liabilities in the normal course of business.
Present value	The present value of the future net cash inflows that the item is expected to generate in the normal course of business.	The present value of the future net cash outflows that are expected to be required to settle the liabilities in the normal course of business.

The Romanian accounting regulations referring to measurements, inspired by the Fourth European Directive and the International Accounting Standards represented by the Accounting regulations approved by OMFP no. 94/2001 takes into account the following four moments of valuation:

1. the moment of entry;
2. the moment of registration;
3. the moment of financial year-end;
4. the moment of disposal.

The provisions of articles 7 and 9 of Law on Accounting no. 82/1991 republished establish the following rules for the valuation of balance sheet elements:

1). when they enter an entity assets are valued and recorded in accounting at their carrying value, also called *book value*, that is determined as follows:

- the assets representing an input to the entity equity, at their *added value*, established after a valuation carried out according to the law, depending on the market price, their condition and location;

- assets obtained onerously, at their acquisition value, called *acquisition cost*;

- assets produced by the entity, at their *production cost*;

- assets obtained free of charge, at the *utility value*, established depending on the market price, their condition and location;

- assets obtained through exchange with other assets are recorded at the *fair value* of the assets received in exchange.

A special case is represented by the valuation of fixed assets whose initial cost includes the estimated costs for dismantling and removing the asset and the restoration costs for the site at the end of its lifecycle. These costs are reflected by the creation of an appropriate surplus. Dismantling/removing costs will be recorded in the profit and loss account during the life of the fixed asset, by including them in the annual amortization expenditure. The surplus thus created is used only for the purpose it was initially created.

2). the valuation of assets during recording is made at the present value of each element, also called *asset value*, established according to the asset's utility, its condition and the market price. In the case of receivables and debts, this value is established according to their expected proceeds and payments.

3). valuation at the financial year-end refers to the assets that can be valued and is reflected in the balance sheet at the carrying value and the

book value correlated with asset recording results. Carrying value or book value is compared with the asset-based value as follows:

a. For assets:

- plus-differences between the asset value and the carrying value are not recorded, and are kept at their carrying value;

- minus-differences between the asset value and the carrying value represent a depreciation and are recorded in accounting books in two different ways:

- irreversible depreciation (definitive) specific to property, plant and equipment, is due to physical depreciation or obsolescence. The extent of these depreciations is recorded based on amortization;

- reversible depreciation that is recorded based on depreciation surpluses.

b. For liabilities:

- for liabilities like debts, minus-differences between the asset value and the carrying value are not recorded in accounting, these elements being kept at their carrying value [4];

- plus-differences between the value established during recording and the carrying value of liabilities like debts are recorded in accounting books by the creation of a surplus.

4). at their disposal items are valued and deducted from accounts at their carrying value. For property, plant and equipment and circulating assets with an over a year production cycle, if production costs include the interest rates of the capital borrowed to finance the production of the asset, this issue must be presented in explicative notes, mentioning the value of the interest rates corresponding to the financial year.

Besides the basic accounting procedures, accounting regulations provide alternative accounting procedures, methods referring to inflation adjustments. Based on these, the values attributed to balance sheet assets can be presented at values other than the historical cost, one of the following measures being recommended in this respect:

- revaluation of corporate property, plant and equipment that takes into account inflation, the asset's utility, its condition and market price;

- valuation through methods that are designed to take into account inflation for the

elements presented in the balance sheet, including equity and the profit and loss account.

It should be noted that, according to IAS 29 – “Financial reporting in hyperinflationary economies”, entities that opt for inflation adjustments prepare and present a distinct set of financial statements encompassing the balance sheet, and the profit and loss account adjusted to inflation. These are preceded by an intermediate trial balance sheet, which will be the basis for the tax declaration, after making the corrections provided by fiscal regulations.

The implementation of the rules established by the alternative accounting procedures makes compulsory the presentation of explicative notes after revaluation. The values produced after inflation adjustments must be presented in a distinct set encompassing the balance sheet, and the profit and loss account, accompanied by explicative notes. According to IAS 16 “Property, plant and equipment”, pluses and minuses resulting from the revaluation of property, plant and equipment will be accumulated in equity under the heading “Revaluation surplus”.

It is necessary to make a distinction between current balance sheet assessment and an entity’s valuation through patrimonial methods based on the balance sheet for various commercial transactions. The balance sheet valuation is very important in accounting because it refers to asset size and to the determination of the financial year-end result; any increase in assets or in liabilities leads to the augmentation of the result and, vice-versa, the spreading of results over the years is modified.

In order to prepare a faithful image of the assets, financial statements and results obtained, the rules of implementation of the Law on Accounting no. 82/1991 provide, in article 23, that the regulations of asset valuation and the other accounting standards and norms previously presented must be satisfied in good faith.

Accounting theory and practice mention and use methods of asset valuation such as:

a) Historical cost or carrying value

According to this method, when they enter an entity, assets are recorded and valued at their carrying value or book value. At financial year-ends, assets are valued and reflected by the balance sheet at their carrying value, that is, the book value correlated with the inventory results.

The methods of valuation by the current purchasing power refer to the presentation of balance sheet items depending on the purchasing power at the year-end [5].

The usage of the historical cost is recommendable, in circumstances of relative economic stability, when the annual inflation rate is composed of a single figure.

b) Indexed historical cost

This method supposes the correction of book values in the case of assets other than cash with a single index corresponding to the general evolution of the purchasing power [6]. Because of the variations in purchasing power, cash items generate profits or loss depending on the ratio of debts, receivables and cash.

c) Replacement value

As prices rise, using this procedure allows the entity to build the necessary resources needed to renew property and equipment and to maintain the productive potential. This system has an impact on profits and, subsequently, on taxation.

d) Present value (the venal value at inventorying)

The venal value is the price that a prospect buyer of the entity is supposed to pay, taking into account the condition and location of that asset. This value is established according to the market and utility.

e) Gross value

It is used in the functional balance sheet, where assets are recorded at their gross value, without taking into account the depreciations registered during their operation. In order to ensure balance sheet equality, liabilities include corrective accounts.

f) Valuation in inflation circumstances

Inflation is a complex phenomenon with multiple aspects. The inflation phenomenon can exist and develop within limits accepted as normal but can also surpass these limits and create a hyperinflationary environment. In this case, one cannot overlook the implications that inflation has in the economic and financial results of the company.

Conclusions

On entering into the property there is used the input value or booked value. For the inventory of the assessment the valuation is made to the current value of each element, called inventory value, determined by utility, state property and the market price. Loans and debt are likely evaluated to the probably receivable or payment value. At closure, for

the balance sheet, assets valuation is realized at the value of the property entrance, meaning the book value agrees with the result of inventory. At the exit from property the entrance value is used. The premiums on redemption of bonds are treated as an asset, which corrects the Debenture loan. If the value shown in the balance sheet significantly differs from net realizable value (if the company does not intend to use assets in the production process) and salvage (the intended use of the asset), this difference is presented in total and by category in notes.

The issue of the valuation of items that are an entity's assets has been analysed in many studies and various opinions have been expressed, some of them transforming into real balance sheet theories.

The difficulties encountered when it comes to establishing "definitive" valuation rules are generated by the aim pursued: the faithful image of assets or the user's interest.

Abstract

This paper try to realize an analysis of the public revenues and expenditures in Romania in the last few years tacking into account the economic crisis context.

In this period public revenues have a different evolution characterized by decreasing of the most important tax revenues.

Concerning the public expenditures is a continuously increasing and the effect is higher budget deficit. The most important aim of this article is to find the causes of tax revenues decreasing and the solutions for diminishing the actual budget deficit. This issue is on the actual government agenda for avoiding an increasing of the budget deficit.

Keywords: tax revenues, budget deficit, public expenditures, economic growth

JEL Classification: H53, H62, H72

Introduction

Analysis of the public revenues and expenditures is important because reflect the consequences of the fiscal and budgetary policy adopted by the government.

Governments throughout the world strive to find solutions to minimize the negative effects of the crisis and, as is well known, taxation is a powerful instrument for the State intervenes to

adjust an upset balance, stimulate investment, encourage the affected sectors and discourage others.

Many European countries have entered into strength competition to provide tax relief solutions with a view to encouraging investments so that the economy can be launched on the economic growth direction.

Thus, they have cut down on the tax rates applicable to the profit obtained from certain activities, just as salary-related taxes and contributions, seeking even to contrive tax amnesty schemes and apply low tax rates on the profit obtained in tax havens or in countries where taxation is very low, all of this being done in an attempt to re-launch investment and stimulate the economic growth.

The Romanian fiscal policy is characterized by a low fiscal pressure, only 31% of GDP in 2009, comparing with the other European countries with a fiscal pressure higher the 40%.

This low fiscal pressure was favored by the flat tax rate applied in 2005. It was one of the most important fiscal measure for stimulating the economic growth and the consumption. Also the 19% VAT rate and the excises rates are lower comparative with the other EU member states.

Before the economic crisis the tax revenues were enough for covering the public expenditures and the budget deficit was under the 3% limit imposed by the EU.

Our taxation system is based on indirect taxation which reaches to 12% of GDP, especially consumption tax. It is known that the indirect taxes are not a stable source of revenues and the evolution of consumption is a major cause of evolution of tax receipts.

Economic crises is started in 2008 on the end of the year, but the most affected year was 2009, and for the moment is to early tot do a real prognosis for 2010.

Although its size and extent are exceptional, the crisis has many features in common with similar financial-stress driven recession episodes in the past.

The crisis was preceded by long period of rapid credit growth, low risk premiums, abundant availability of liquidity, strong leveraging, soaring asset prices and the development of bubbles in the real estate sector.

The fiscal costs of the financial crisis will be enormous. A sharp deterioration in public finances is now taking place. The decline in potential growth due to the crisis may add further pressure on public finances, and contingent liabilities related to financial rescues and interventions in other areas add further sustainability risk. Part of the improvement of fiscal positions in recent years was associated *inter alia* with growth of tax rich activity in housing and construction markets. [1]

Methodology

Our analysis is based on the figures of the budgetary execution from 2007-2009, available of the Finance Minister site.

First, we realize short analysis of the absolute data of the revenues and expenditures. Then, we use a structural analysis of the main categories of revenues and expenditures on the same period.

The most relevant indicators are the share of the revenues, expenditures and deficit in GDP. These indicators correlate the evolution of the GDP with the evolution of public revenues and expenditures and reflect the global fiscal burden in Romania.

For revealing a clear evolution we must correlate these indicators with the economic growth, for anticipate the future evolution of the budget deficit and to conceive the solutions for diminishing it.

Finding solutions for decreasing the budget deficit should represent a priority for the government.

Results

For a global view on the situation of the public finance in Romania in this context of economic crisis we have to analyze the both sides of the public budget: revenues and expenditures.

The effects of economic crisis are felt deeply in 2009 when the revenues are characterized by a decreasing trend. This evolution can be followed in the next table for the main categories of tax revenues.

“Table 1 Budget tax revenues”

mil lei	2007	2008	2009
Total revenues	127108.2	165546.6	156624.9
Fiscal revenues	76365.8	94846.8	88324.3
Direct taxes	29263.9	36202.8	35207.6
Income taxes	26319	32948.9	31829.9
Corporate tax	10558.3	13059.4	11893.0
Personal income taxes	14374.9	18500.4	18551.4
Other income taxes	1385.8	1389.1	1385.5
Property taxes	2944.9	3253.9	3377.7
Indirect taxes	46916.8	58211.4	52727.5
VAT	31243.2	40873.6	34322.4
Excises	12511.8	13646.0	15579.2
Other indirect taxes	2306.1	2729.5	2170.4
Custom duties	855.7	962.3	655.5
Other fiscal revenues	185	432.6	389.1
Social contributions	38843	49007.8	47872.0

Source: Budgetary execution, www.mfinante.ro

In the next figure we can see that the maximum point for the tax receipts was attained in 2008 followed by a decreasing in 2009.

“Figure 1 Tax revenues evolution”

Source: Budgetary execution, www.mfinante.ro

Analysis of the absolute data of public revenues reveals major decreasing in 2009 comparing with 2008:

- the total revenues decrease with 5%;
- the fiscal revenues decreasing with almost 7%;
- direct revenues decreased with 2,7%;
- indirect taxes decreased with 9,4%;
- corporate tax revenues decreased with 9%

“Figure 2 Tax receipts evolution”

Source: Author’s calculations

But also we have in 2009 some taxes with higher receipts like property tax with 4,8 % higher revenues and excises with 14% revenues increased. As an explanation for this increasing we are agree with the taxation theory which sustain that the property taxes are the most stable sources of revenues even in the economic crises, fact revealed by the figures from the budgetary execution.

Concerning the indirect taxes we have a major decreasing for VAT with 16% decreasing explained by the consumption reduction. In this context of economic crises when consumption is lower we have a paradox because excises revenues are higher and this is happening because the tax base imposed in the case of excises is represented by the product with inelastic demand. Even if the price is increased, the demand for this product it is not decreasing and this leads to higher receipts.

The evolution (decreasing with 31%) of the custom duties is linked also by the removing these taxes in the EU starting with 2007, but also with decreasing of automobiles imports.

A little decrease is registered by the social contributions with only 2 %, because in the

2009 were increased the social contributions taxes rates

“Table 2 Tax receipts as % of GDP”

%GDP	2007	2008	2009
Total revenues	32.5	32.8	31.0
Fiscal revenues	19.5	18.8	17.5
Direct taxes	7.5	7.1	7.0
Income taxes	6.7	6.5	6.3
Corporate tax	2.7	2.6	2.4
Personal income taxes	3.7	3.7	3.7
Other income taxes	0.4	0.3	0.3
Property taxes	0.8	0.6	0.7
Indirect taxes	12.0	11.5	10.4
VAT	8	8.1	6.8
Excises	3.2	2.7	3.1
Other taxes on goods and services	0.6	0.5	0.4
Custom duties	0.2	0.2	0.1
Other fiscal revenues	0.09	0.1	0.1
Social contributions	9.9	9.7	9.5

Source: Budgetary execution, www.mfinante.ro

The global fiscal pressure is revealed by the percentage of the tax revenues in GDP.

The maximum fiscal pressure was in 2008: 32.8% and decreased to 31% in 2009, not because are decreasing some tax rates, but the main cause was reducing the tax base. For example reducing the taxably profit for many companies or reducing consumption

The same result as in the case of absolute data we have for property tax and excises the revenues which are increasing with 0.1 percentage points and 0.4 percentage points of GDP. The most important decreases are for VAT 1.3 % GDP and corporate taxes 0.2 of GDP.

Structural analysis of the public revenues reveals that the most important role in budget financing is played by the indirect taxes which have 33%, followed by social contribution with 30% and direct taxes with only 22% of the total revenues in 2009.

“Figure 3 Structure of tax revenues”

Source: Source: Author’s calculations

Analysis of the public expenditures reveals a continuously and generalized increase of all categories, except the capital expenditures because the rhythm of investments was reduced.

The highest increase is for the interest expenditures because the governments use to cover the lack of tax revenues some borrows from commercial banks with high interest for paying the pensions or the salaries for the budgetary employees.

“Table 3 Public expenditures”

mil lei	2007	2008	2009
Total expenditures	136556.5	190340.2	193025.4
Current expenditures	122127.8	164080.1	172340.9
Personal expenditures	25588.9	45609.7	46710.7
Goods and services	25835.1	33008.7	28835
Interests	2739.7	3650.7	6061.8
Subsidies	6873.7	7898.5	7215.4
Transfers	61090.4	73912.6	81427.5
Capital expenditures	14410.4	26727	23175.3
Deficit	-9448.4	-24793.6	-36400.6

Source: Budgetary execution, www.mfinante.ro

The share of expenditures in GDP reveals a real overgrowth of the public expenditures. Personal expenditures if in 2007 were only 6.5% of GDP reach in 2009 at 9.2% of GDP, because of the increasing of the number of employees from the public sector.

“Table 4 Public expenditures as % of GDP”

% GDP	2007	2008	2009
Total expenditures	34.9	37.8	38.2

Current expenditures	31.3	32.6	34.1
Personal expenditures	6.5	9.1	9.2
Goods and services	6.6	6.5	5.7
Interests	0.7	0.7	1.2
Subsidies	1.8	1.6	1.4
Transfers	15.6	14.7	16.1
Capital expenditures	3.7	5.3	4.6
Deficit	2.4	4.9	7.2

Source: Budgetary execution, www.mfinante.ro

But the most important issues are the budget deficit increase and covering of this deficit, fact realized through a borrowing from IMF.

The IMF and the European Commission demanded that the budget deficit be lowered from 7.2% in 2009 to 5.9% in 2010, with the 3% target delayed until 2012.

We try to correlate the evolution of public expenditures with the evolution of economic growth for 2006-2009.

The correlation between economic growth and public expenditures is almost 40%, but is an indirect correlation because in this period of economic crisis the budgetary expenditures increase.

An increasing of public expenditures with 1% means almost 2% of economic growth decrease.

“Figure 4 Correlation between economic growth and public expenditures”

Source: Source: Author’s calculations

But a powerful correlation can be founded between the budget deficit and economic growth, almost 70%, an indirect correlation, because the budget deficit increase when the economic growth decrease.

"Figure 5"

Source: Source: Author's calculations

Results show that a weak fiscal stance, low economic growth, the timing of parliamentary elections and majority left-wing governments are the main causes of excessive deficits in the EU countries. Supranational fiscal constraints, national efforts to reduce public debts, growth promoting policies and mechanisms to avoid political opportunism and partisan effects are essential factors for an EU country to avoid excessive deficits. [2]

The actual Government is considering a reform of revenue for 2010, to increase the level of contributions paid to the budget, where flat tax, tax on profit and income tax can be maintained, but a decision on VAT is to be taken according to the sustainability of budget deficits.

Even if we have the lowest fiscal burden in Romania, this fiscal burden is hard supported especially by individuals with a low income.

May voices talk about of VAT increasing, may be for the moment is a good solution but with a few amendments: the existence of a few reduced rates for necessary goods and higher rates for example for goods considered as luxury goods.

VAT is a regressive tax and for this reason the lower income people will be the most affected by increasing of this tax.

The most distortionary measures with a negative impact on economic growth are introducing the minimum corporate tax and increasing the labor force cost through social contribution. First measure has reduced the number of companies and the second stimulate employer to tax evasion. [3]

But we have to consider also the evolution of public expenditures and try to find some solutions for reducing them. It is not enough to increase the revenues without reducing or at

least maintaining at the same level the public expenditures.

This is a general issue in any economic crisis because there are a few factors which favored the expenditures increase like unemployment, increasing of public debt.

Conclusions

The economic and financial crisis has taken its toll on public finances and this fact is reflected in increasing the budget deficit.

The solution for decreasing the budget deficit should be based on the long term fiscal measures, like stimulus for private and public investment, accessing the EU funds for public and private projects, maintaining a limited rate of unemployment and inflation.

These conditions are necessary for helping the economy to recovering and also for acceding to euro zone for Romania in the next period.

The role of the audit report in the enterprise evaluation

george_sene@yahoo.com

Abstract

Enterprise evaluation has an economic and financial character. The evaluator's investigations regarding the enterprise financial situations as well as the numerous economic, technical and strategic analyses are finally meant to establish the real enterprise values reflected in the market value.

Going from the accountant information to the analysis one represents a stage imposed by the vocation of the two activities; the accounting vocation is that of observing a layout pursuing the respect of various strict rules and principles, while the vocation of the financial analysis is to formulate an appreciation of the performance of the analyzed entity, being preoccupied with the pertinence of the valuable judgments that were enunciated.

The information offered by the accounting department and mostly by the financial accounting department constitutes a material adapted to the needs of the financial analysis, a material used essentially for the financial diagnosis as it provides the most elaborate, systematical, synthetic and homogeneous information, required to evaluate the enterprise financial situation, its performance and the risks associated to obtaining all these.

In evaluating the enterprise, the financial diagnosis must provide the information needed in estimating the incomes and the expenses, so that the evaluation methods depend on the pertinence of the diagnosis.

The credibility of the accounting information is offered by the auditors in their auditing missions which bring the added value and a better protection for the shareholders, investors, creditors and other interested parties.

Key words: financial diagnostic, audit report, standards, SWOT analysis, IFRS.

JEL Classification: M4, M42

Within the market economy the free property transfer represents one of the important piles of the economic mechanism. The mobile assets of the enterprises are sold (machines, equipments), real estate properties (lands, constructions), financial assets, non-corporate assets (licenses, brands) or enterprises as a whole.

The question is the following: how much do I sell with or pay for the respective property or assets? At the base of the price is the value. Both the buyer and the seller are interested in the value of the respective assets, of the real estate property or of the enterprise. If the value is estimated, the price is a tangible element resulted from the negotiation. The price could be equal, smaller or higher than the value.

According to IVS1, the market value is defined as it follows: the market value is the sum estimated for a property to be changed, at the date of the evaluation, between a determined buyer and a firm seller, in a transaction with the price objectively determined, after a corresponding marketing activity, in which the involved parties acted advisedly, prudently or without any constraints[1].

From the text of the definition, we find the conclusion that the market value is probably the price that could be reasonably obtained on the market at the date of the evaluation.

It is right this market value that the evaluator is asked to estimate in order to communicate it to the beneficiary (the seller or the buyer).

The professional in this field of activity is the enterprise evaluator. He must state his opinion competitively, considering a series of reasoning and calculations, which are finally

presented in a report named evaluation report.

The evaluation of an enterprise presents a special complexity that is why it is needed to make up a team of evaluators. This team comprises experts in various fields: jurists, movables evaluators, real estate evaluators and professionals in accounting.

The question that we try to find an answer to is that if the audit report may be used in the enterprise evaluation. To answer this question, we believe that we should analyze an evaluation report, an audit report, their contents, the addressability, the conclusions formulated in opinions.

The settlement of the enterprise evaluation is described in the International Standards of Evaluation Practice – GN6. Within this standard, we meet all the elements required to evaluate the enterprise in a pertinent manner. In the fourth part, there are various references: the enterprise evaluators reflect the market value of all the components of the accounting balance of a company to be in accordance with the Accounting Standards [2].

At the same time, the application instructions stipulate that the evaluator should take all the steps needed to ensure that all the consulted information are credible and adequate for the evaluation process as well as the financial and accounting information.

The question that comes in this context is: *who is entitled to best appreciate the way in which the financial and accounting information reflect the reality are correct, pertinent to be evaluated and transposed into value?*

We consider that within the enterprise the evaluator's role is that of achieving a corresponding accounting activity, respectively records, evidence, indicators for calculations. The financial auditor is the one who checks the correctness of this information if all the norms and the regulations in force are respected. In this sense, the auditor or the audit team will proceed to fulfilling the audit mission.

After finishing all the audit procedures, the verification of the events following the closure of the exercise and the accumulation of the final tests, the auditor should elaborate the opinion according to which the financial situations are presented or not in accordance with the general frame of financial reporting.

Thus, the auditor must decide if there are enough audit tests in order to formulate the conclusions that lay at the basis of expressing the opinion of the audit report. That is why it is

demanding to examine the entire audit report so that the auditor is sure that the audit components were adequately executed and documented and finally the objectives were reached.

For the final conclusions accuracy, the auditors may use [3]:

- The verification lists of the working documents;
- The final observations and the meetings with the client;
- The verification list of closing the undertaking;
- The general revision of the financial situations;
- The end of mission overview;
- The events overview following the exercise closure.

The audit report represents the final stage of an audit and insurance mission, the product of the activity developed by the auditor, through which the final conclusions are presented as a consequence of examining the financial information of an entity, a necessary report for the users of the financial situations.

The form and the content of the issued audit report are stipulated in the International Audit Standard of 700 "Formulating an opinion and the report of the financial situations" which treats the auditor's responsibility to formulate an opinion regarding the financial situations.

Before elaborating the report, the auditor must revise and evaluate the conclusions which result from the audit tests obtained as a basis to express an opinion upon the financial situations.

This activity of revisions and evaluation must put into evidence the way of setting up and presenting the financial if they respected the general provisions accepted by the financial reporting, either IAS/IFRS, or the national provisions in accordance with the European directives.

According to the standards, there is a certain way of presentation of the audit report in order to ensure a reasonable understanding degree by the interested parties, as well as to make the reader identify easily some special situations.

Thus, the structure of an audit report is, generally, similar to the examined financial situations, with various particularities, from

case to case, but each report presents its own way some basic elements, respectively:

a) The identification part which contains **the title** of the report and to whom the respective report is addressed, respectively **the addressee** (the recipient);

b) **The introductory paragraph** where they debate upon various issues regarding the identification of the financial situations submitted to the audit as well as the declarations of assuming the responsibilities which resort from this mission both for the enterprise management and for the auditor;

c) A description of **management responsibility** to set up the financial situations;

d) Description of the **auditor's responsibility** to express an opinion upon the financial situations and the field of audit application;

e) An **opinion paragraph** which expresses the opinion regarding the financial situations and a reference to the general applicable frame of financial situations used to set up the financial reports;

f) **The final part** where they obligatorily present the date of drafting the report and the auditor's signature.

From the addressee's point of view, the report should contain some information regarding the persons to whom it is addressed on the basis of the conditions stipulated in the engagement or in other established provisions. In general, the report is addressed to the shareholders or the Council of Administration of the beneficiary enterprise with the audit of the financial situations.

In what regards the opening part, the report must outline some dates of identification of the audited financial situations as well as the date and the period covered by the respective financial reporting.

Usually, in the report they assume some identification information from the balance sheet (the value of assets, debts and capital) and from the account of profits and losses (the size of the turnover and enterprise result).

The auditor must present in his report the applicability area of the audit, declaring that the audit was made in accordance with the established standards and practice.

The report must contain in this part a declaration regarding the way in which it was planned and the way in which the whole process was developed in order to obtain a reasonable insurance of the financial situations.

Also, the report must provide information regarding the way of examining the information using texts and tests and other procedures in order to sustain the initial sums of the financial situations as well as the other information presented; the auditor's evaluation regarding the accounting principles used in elaborating the financial situations; the evaluation of the significant estimations of the entity in drafting the financial situations as well as the evaluation of their general presentation.

The auditor will also present in his report a declaration which sustains that the audit offers a reasonable basis to express his opinion.

By far, the most consistent paragraph of the report is the reference to the opinion. The auditor's report must clearly express the auditor's opinion regarding the financial situations saying that they represent with constancy all the significant points of view (or offers a correct and truthful image) in accordance with the respective frame of financial reporting and, when there is the case, if the financial situations are in accordance with the statutory requirements.

The two terms used to express the opinion, "offer a correct and truthful image" or "present with fidelity, from all the significant points of view" chosen by the Audit Standards are equivalent.

We consider being necessary that, besides the opinion of the truthful image, the auditor in his report must include any other information used in the audit mission which made him formulate such an opinion.

It is very important that the auditor writes in the audit report the date when the audit was concluded as it marks the moment until the auditor examined all the operations and the transactions reflected in the financial situations.

And since the responsibility of drafting and presenting the financial situations belongs to the entity management, the auditor must not write in the report the date before the management staff signed and approved the financial situations.

At the end of the audit mission there is the issue of the decision that the auditor must foreshadow for the type of the most adequate audit report, considering the set of circumstances in which he developed his activity and the conclusions he reached after

examining the probing elements. The first decision deals with the existence of the elements which should identify the respective digressions and evaluate their significance as well as their influence upon the financial situations.

These determinations represent the starting point in establishing with accuracy the most appropriate type of report.

In the practice of the audit, we find the following types of expressions:

- An opinion without reserves;
- An opinion with reserves;
- The impossibility of expressing his opinion;
- An unfavorable opinion or a certification refusal.

The uniformity in the form and the content of each type of report mostly the ones which present certain modifications supporting the user for a better understanding of the reports.

The categories of audit reports according to the auditor's conclusions regarding an audit mission are:

- Without reserves - if: all the auditor's requirements are fulfilled; the auditor reaches the conclusion that the financial situations present a truthful image in accordance with the general frame of the established financial reporting.
- With reserves - if: the auditor considers that, in general, the financial situations present a truthful image, but the field of the audit mission was significantly restrained or the accepted accounting principles were not entirely respected.
- Impossibility to express an opinion – if: the limitation of the field of the audit applicability is so significant and comprising that the auditor did not obtain enough corresponding audit evidence.
- Unfavorable opinion or refusal to express an opinion

The causes that distance the auditor from an opinion without reserves must be established in an increasing order according to their gravity. In fact, the beneficiary of the audit report upon the entity financial situations will be much worried by a refusal to express an opinion than to express an unfavorable opinion (the last type of report) than a report with reserves.

Having thus formed an image about the audit report categories and the auditor's mission, we may state our opinion regarding the role of the audit report in the enterprise evaluation. We

must identify where the evaluator must use the information in the audit report. In this sense, we consider that the general presentation of the structure of an evaluation report simplifies the identification of the way in which the audit report supports the evaluator.

The structure of the evaluation report may contain five main parts [4]:

- introduction – where they present the transmission letter, the title page, the contents, the abstract of the main facts, the evaluator's certification and signature.
- premises of the evaluation – contains: the special hypotheses and the limitative conditions; the object, the purpose, the usage and the instructions of the evaluation; the evaluation basis and the type of the estimated value; the date of the estimated value; the currency of the report the methods of payment; the property inspection; the sources of the used information; the cause for non-publication.
- data presentation – implies: the enterprise description (diagnosis analysis, including the economic and financial diagnosis); the analysis of the securities market and transactions with similar participations.
- data analysis and conclusions – contains: the evaluation methodology (evaluation methods); values reconciliation and the proposed value
- appendixes

From the structure of the evaluation report, we get the idea that the audit report may be used in the diagnosis analysis, that is in the third part, but also in the fourth part of the evaluation methodology.

The third part of the evaluation report contains the diagnosis analysis of the enterprise. Here we follow the causes regarding the juridical, commercial, operational, management and human resources aspects as well as the economic and financial aspects. The conclusions of the SWOT analysis may decisively influence the value of the enterprise. The audit report may present special information to the evaluator when the economic and financial analysis as well as the SWOT analysis is made.

The importance of the financial analysis in the enterprise evaluation is essential. It must be made regardless the reason of approaching

the evaluation (on comparison, income or patrimony).

The financial analysis will reflect in:

- The synthesis of the account of profit and loss;
- The corrections effectuated upon the reported historical financial indicators;
- The analysis of the enterprise financial performance;

The International Financial Reporting Standards (IFRS) states that: the objective of the financial situations is to provide information about the financial position, the performance and the modifications of the financial position of an entity that are used to a large area of users in making various economic decision [4].

Within the global enterprise diagnosis, the financial diagnosis represents the most relevant component. The financial resources, the way of using these resources has a decisive role in the adequate functioning of the other elements.

The financial diagnosis establishes the economic and financial health condition of the enterprise. Consequently, special attention must be paid to the way in which the financial situations are presented or not in accordance with the general frame of financial reporting. The financial auditor is the one that makes his decision regarding these aspects. He has the competence to express a professional and pertinent point of view.

The audit report constitutes to the evaluator certitude that the financial and accounting activity was developed in accordance with the legal provisions. Consequently, the value will not be affected by those aspects regarding the general frame of reporting. The usual corrections will be made, which are required in such a situation.

If the audit report is signed with reserves, the evaluator should identify the causes that led to the expression of the auditor's opinion as well as the way in which those causes influence the enterprise value.

If the auditor finds himself in the impossibility to express his opinion, the diagnosis and evaluation process gets complicated. The experts should identify the causes that led to such a situation, the gravity of the facts and the influence they have on the present and future value of the enterprise. There are situations when such an opinion may determine significant corrections brought by the evaluator.

In case the auditor refuses to express his opinion or in case his opinion is unfavorable, that represents an alarm signal for the evaluator. The financial and accounting activity could not be in accordance with the legal provisions in the field, influencing negatively the company's activity. The consequences are very serious. Quantifying them is pretty hard to achieve, realizing corrections implies a special attention and the value is deeply affected.

As a conclusion, we may say that, in the enterprise evaluation, the evaluation team should have an auditor or they should have at their disposal an audit report drafted by a competent person.

Conclusions

The auditors have an important role in society. The investors, the creditors, the employers, numerous experts and the large public count on the financial auditors' activity regarding the correct accounting and financial reporting, an efficient management and competitive consultancy for a variety of aspects afferent to the business and the taxation.

The audit mission finalized in an opinion without any reserves represents for the evaluator a warranty that the accounting and financial activity was developed in accordance with the legal provisions, that the enterprise value will not be affected by those aspects regarding the general frame of reporting, or if the auditor's opinion is contrary or with reserves, that could represent for the evaluator an alarm signal as the financial and accounting activity influences negatively the company's activity.

Ethical Banks: An Alternative in the Financial Crisis

Mascu Simona

Universitatea „Ovidius”Constanța

mascu_simona@yahoo.com

Abstract

The goal of this paper is to discuss the issues of ethics, moral hazard and behavior in banking regulation of the global financial system.

The paper is focused on the specific characteristics of ethical banks, compared with those of traditional ones, and provides a picture of the extent of this phenomenon.

Through this paper I also intend to argue that the recent crisis has not just been a banking crisis, but also a crisis of professionalism and banking ethics. The credit crisis calls into question the functionality and good performance of traditional banks. The full incorporation of ethical values and principles by traditional financial intermediaries might be a form to solve their misleading financial situation.

Keywords: ethical banking, sustainability, financial crisis, moral hazard

JEL classification: D82, D83, G01, G21

1. Introduction

For many of us, the expression “ethical banking” is an oxymoron. Also, the name “ethical bank” is controversial, because what is “ethical” or not is subjective.

“Ethical banking” is a term difficult to define. A very restrictive way to describe it would be as an “umbrella concept” of investing based on a combination of financial, social, environmental and sustainability criteria.

The activity of ethical banks is focused on social and human values, which emphasize the solidarity and responsibility for society and environment. In this context, it is imperative to talk about sustainable banking activity. This

means that banks involve in financing businesses

and projects characterized by social, cultural and environmental value-added, as an expression of capitals entrusted by depositors and creditors, which aim to encourage the development of responsible, durable projects. It appears that in the US, the epicenter of the financial crisis, sustainability was the last thing on the agenda of some of the largest financial institutions in the world.

Banks and financial systems have to be flexible when integrating social changing values. This process has to be public, open, and supervised by external social auditors in order to maintain and strengthen trust, which is an essential value.

2. Ethical banks versus traditional financial intermediaries

Ethics and banking are not words that naturally flow together. It is known that the primary aim of a bank is to make a profit.

Financial intermediation is not charities. Banks have to make sufficient profits to satisfy their shareholders. So it might be curious that banks are founded for social and ethical purposes. It might sound confusing hearing a banker saying that “money should be a tool for social good” or that “investment should be for the good of the community and the environment”.

However, banks don't operate isolated because their activities have social and ecological consequences. The ecological impact of financial activity is difficult to see, but there is a possible indirect impact through the financing of certain economic activities. This philosophy can be defined with the term of Sustainable and Responsible Investment (SRI): “This is a concept that continues to evolve. Nevertheless, the constant within this area is that sustainable and responsible investors are concerned with long-term

investment; and environmental, social and governance (ESG) issues are important criteria to determining long-term investment performance.” [1]

In table 1 are presented the most representative distinctive features of ethical and classical banks.

Table1. Ethical banks versus classical banks

Traditional banks	Ethical banks
The activity is subordinated to the reaching of several quantitative objectives, mainly the market share and profitability.	Operate with a clear set of ethical values, known, accepted and respected at all the hierarchical levels
The focus is on maximizing the financial gains.	Pursue the obtaining of both financial and social gains.
The investment strategy and risk profile are established by bank’s management	The investment decision belongs, firstly, to customers by choosing the ethical project to be financed with their funds.
Don’t provide information concerning the destination of attracted and borrowed funds.	Publish on a regular basis a list with all the investment projects that received financing.
Grants financing without taking into account the ethical behavior of the applicant, or the impact of his actions on society and environment	Finance those companies whose projects perform a positive influence on society and environment

Ethical banks reveal that their financial intermediation activity gathers customers aware of the importance of social responsibility and solidarity. In Europe, the

ranking of ethical banks term the amount of funds with ethical destination places on first place Great Britain, followed by Netherlands, Sweden, Switzerland and France. Therefore, some countries have an unexploited potential for the social value added.

In the list below are mentioned a couple of ethical banks worldwide:

- South shore Bank (USA);
- Shore Bank Pacific (USA);
- Self Help Credit Union (USA);
- Charity Bank (UK);
- Co-operative Bank (UK);
- Smile (bank) (UK);
- Triodos Bank (Netherlands);
- Banca Etica Popolare Universal;
- Ethic Bank (Italy);
- Grameen Bank (Bangladesh);
- Bank Rayita (Indonesia);
- Citizens Bank (Canada);
- Banco Solidario (Bolivia);
- Banque Alternative Suisse (Switzerland);
- Ethikbank (Germany);
- GLS (Germany);
- Credit Cooperatif (France);
- Cultura Savings Bank (Norway);
- Caisse Solidaire du Nord-Pas de Calais (France); [2]

Figure1. Ethical banks' logos

There is one high street bank in the UK with an ethical policy, and that’s the Co-operative. The bank has its roots in the co-operative movement that started in the 19th century as a way of creating a fairer model of capitalism through shared ownership. The bank remains committed to those ideals, and members all receive a share of the profits.

Table2. Sales and profits at The Co-operative Group

Financial highlights	2009	Growth vs 2008
Group sales	£13.7 bn	+ 31%
- Trading Group sales	£11.6 bn	+ 37%
- CFS sales	£2.1bn	+ 6%
Underlying Group operating profit before significant items	£473 m	+ 20%
- Underlying Trading Group Profit	£338 m	+ 22%
- Underlying CFS Profit	£177 m	+ 21%
Profit before payments to and on behalf of members (equivalent to the pre-tax profits of a plc)	£402 m	+ 85%
Members' funds	£4.5bn	+ 15%
Dividend paid to customer members	£55m	+ 16%
Net borrowings	£1.6bn	+£949m

Source: Co-operative bank

The Co-operative Bank has seen a 38% jump in new current accounts as consumers deserted the bigger banks in droves in the wake of the financial crisis. It gained 140,000 new customers, taking the total to 1.2 million, and doubled its share of the current account market to 4%.

"We're already seeing a flight to trust," said Peter Marks, the chief executive. "People are weary of big business, especially in the financial services sector. They want to feel confident about where they're putting their hard-earned savings." [3]

The Co-operative is said to have turned down £1 billion (\$2.2 billion) worth of

business over the past 15 years on ethical grounds.

Following are examples regarding the Co-operative bank's social goals in 2009:

- £11.3m invested in communities in 2009;
- £6.7m raised for charity this year;
- Voted Responsible Retailer of the Year – for the third year running;
- CFS voted Best Financial Provider by Which? Magazine;
- Revival of The Co-operative Bank's unique customer-mandated Ethical Policy;
- 250,000 young people benefited from Group community projects covering renewable energy and recycling;
- £5m pledged to support the co-operative enterprise hub;
- CFS Toxic Fuels campaign raising awareness of the impact of tar sands extraction;
- The Plan Bee campaign raising awareness of honeybee decline, funding research, and encouraging people to help bees and plant bee-friendly wildflowers;
- 15% reduction in packaging target met a year ahead of schedule; [4]

Another bank which have an ethical policy is Triodos, but it doesn't offer personal current accounts. Its services include business and charity accounts, and personal savings. They declare every loan they make, a uniquely transparent measure. Triodos set out to use money for good, and will only finance businesses that "add cultural value and benefit people and the environment". They are best known for investing in wind power in the 1980s, long before it was a fashionable cause.

The Ecology Building Society has seen a vast increase in savings deposits since the crunch, building on a 10% increase in 2009. Britannia Building Society, currently merging with the Co-op Group to form a "super-mutual", noted that 140,000 new savings accounts had been opened.

3. The financial crisis due to ethical crisis

The present financial crisis is much more than a financial one. It is a crisis of ethics and it was facilitated by the moral hazard. Banks assured that they were well capitalized. This was enough to convince regulatory authorities

and the policy makers that the bank's behaviour posed no risk to the economy.

In this crisis the world of finance is experiencing what the pharmaceutical world has known for a while, that product can cause 'serious and rare' adverse events that are hard to detect. Pascal Lamy, the Director-General of WTA declared:

"Finance is one of the last 'black holes'. A sick bovine or a hazardous lighter cannot cross borders; a toxic product still can". The fact is that the current financial crisis has its roots in financial innovation.[5]

Today's financial crisis has its roots in corporate irresponsibility around the subprime mortgage market in the US. If

"responsible lending' which presumes providing credit, based on background checks and professional judgement, to people who can accommodate regular repayments without getting into financial difficulty had been observed (or if tighter regulatory oversight had been imposed), we might not all be in this position right now.

The crisis in ethics was facilitated by a regulatory culture that does not adequately control hazards, moral hazard is said to lead to excessive risk taking. A number of central bankers, including Mervin King of the Bank of England, Paul Volcker, and Alan Greenspan, support that banks are "too big to fail". In the recent financial and economic crisis the number and nature of rescues in sophisticated financial markets and systems has dramatically increased the salience of the issue (too big to fail). Regulators placed their faith in market data and ignored the potential risks of bank behavior. Now, many discovered that banks may be "too big to let fail".

Although much has been said about the inevitability of banking crisis, such attitudes tend to reflect willingness to tolerate risk ignoring its consequences.

The financial draws attention to the fragility of markets and the importance of trust and organization for their stabilization. Now the idea of deregulation and free market is under observance. Financial markets are no longer seen only as a way to promote choice and efficiency, but they also need to be ordered, tamed and civilized.

The actual financial crisis has become a pervasive collapse of trust. Banks no longer

trust other lenders. Investors no longer trust banks. Lenders no longer trust borrowers. Many banks appear to be failing in their duty to society as well as to shareholders.

The Financial Trust Index captures the amount of trust that Americans have in the institutions in which they can invest their money. [6]

Graph1. Percentage of people trusting various types of banks

Source: Financial trust index

It is evident the way consumers have been flocking to ethical banks since the financial crisis began.

The present crisis is fundamentally one of trust and integrity, and therefore ethical in its foundation, its solution cannot be a mere institutional reorganization or some additional regulatory measures. It needs an ethical response at all levels: the individual, the corporation and the government and regulatory entities.

4. Concluding remarks

Nowadays, profitability and solidarity are two notions which have to be brought together although longtime perceived as being contradictory.

Is time to intensify concerns in the banking system, in terms of awareness of the credit institutions to support ethical and sympathetic investments.

Banks should adopt alternative strategies, to increase customers' confidence and to configure a banking activity based on social responsibility providing investment for social and ethical purposes. It also aimed to provide a place for people savings where the customer could be sure that their money would not be used for projects they didn't approve of. The lending criteria of an ethical bank is that what the borrower plans to do with the money must be socially, environmentally or culturally useful.

The ideology of purpose that will dominate the future is one that finds acceptance and participation by society at large, unleashes human potential, draws individuals and organizations towards ethical behavior, and makes it possible for every human being to make a difference. Only the purpose of 'serving the real needs of humanity' is likely to meet these requirements." [7]

We need to get back to collaborating the old-fashioned way. That is, people making decisions based on business judgment, experience, prudence, clarity of communications and thinking about how, not just how much.

The other way of regarding our present dilemma is to see it as moral retribution for the excesses of past years.

It is time to set our moral compass so that our decisions are not governed by mere personal gain. The wider community is important and without it we cannot live a full and happy life.

lianaugb@yahoo.com

Abstract

The purpose of this paper is to implement the concept of pertinent costs in practice. The primary issue discussed in the article was the decision making process and its difficulties, then generally references were made to costs, and particularly to the notion of pertinent costs. Finally, we exemplified, through a case study, the importance of these category of costs in the decision making process. The study was conducted at a company with production activities faced with several decision alternatives upon which pertinent costs theory could be successfully applied.

Key words: pertinent costs, decision making process, savings, global savings, regional savings

JEL Classification: M4, M41

1. Foreword

In life, everyone faces the every day decisions elements. Whether it is a simple decision such as: what is for breakfast?, or what should I wear today?, whether it is a major decisions such as: should I change my job?, or should I enroll in MBA courses, all these decisions have a common element. This element is the basic decision making process that involves gathering information, taking into account future costs and benefits, determine alternatives and choosing one, taking action and determine the results of the chosen alternative. In this context, opportunity costs pertinent costs and relevant

revenues for each option should be considered in decision making.

2. Theoretical elements related to costs

One of the main goals of management accounting is cost calculation. However, some authors, especially those from the Anglo-Saxon environment, see cost accounting as part of managerial accounting (logical, because business management is interested primarily in costs). In that light, cost accounting represents an interface between financial accounting, destined for external reporting and management accounting, used only for internal purposes. [1]

Management accounting provides three types of information to the managers:

- Data on production costs, for pricing and stock assessment;
- Analysis of costs for operational planning and control;
- Special analysis to substantiate the decision-making process.

Currently, project managers must choose from several alternatives, opting for those variants that have the potential to maximize the enterprise value. In the assessments they make, managers rely on financial data strictly organized, provided by management accounting.

To achieve their aim, namely to maximize the value of the company and hence its profits, managers often are unable to act on income, or better said, their actions in this regard are limited. So, most often they use ways that allows cost reduction.

To the three dimensions defining the characteristic of cost (content, moment of cost

calculation and coverage) can be added another one referring on the pursued objectives of an enterprise and purpose of techniques adopted in costs construction. It represents the dimension of the utility of a cost, which can answer the question: why is a particular cost calculated?

A cost calculation can be justified only if the resulting indicator is presented as an element of response to a question previously asked. In the face of a determined management issues, it should be chosen a specific type of cost in order to obtain the best solution. The chosen type of cost is the one that a manager can associate to a decisional context, and it is called a pertinent cost (a cost that is useful to a specified decision). [2]

But pertinence is not the result of an inherent quality, prior to a type of cost, it comes from the adequacy of the cost as a result of a previous asked question. In fact there are as many pertinent cost as there are issues needed to be resolved. The notion of pertinence is subjective and varies from one company to another.

Decision-making process involves determining the possible events, possible solutions, evaluating the consequences of each solution, depending on different events, choosing solutions that provide the best level of satisfaction taking into account the objectives pursued in the short term forecast horizon or longer term. In fact, pertinent costs for decisions making can only be future expected costs.

An important distinction between the long term and short term decision is that the former cannot easily be reversed whereas the later can often be changed. The action that follow short term decision are frequently repeated, and it is possible for different actions to be taken in the future. [3]

The best cost is not necessarily the one that has more quality, but the cost that arises when, where and with the accuracy desired by the user.

The concept of "pertinence" is different from that of "accuracy" of the cost. Accuracy sends to validate the arithmetic calculations that allowed the determination of a cost. The accuracy degree of calculation can sometimes be achieved only with the "price" of a prohibitive information access cost, compared to the gain obtained by the precision and accuracy of cost calculation. In this context, it is best to determine an

approximate cost at an exact time, than an accurate cost at a later time. [4]

3. Case study

A company with an industrial profile has six factories in different regions of the country. The company has contracts with its clients and is working only with firm orders. The required product quantities, for 2010, are expressed in the following table:

Table 1. Demand for the six regions

Region	Demand
Transilvania	52,000
Maramureş	10,000
Banat	22,000
Muntenia	32,000
Moldova	48,000
Dobrogea	15,000

Currently each factory is equipped with a semiautomatic machine that needs three specialized workers to operate it. Personnel costs are proportional to the amount produced and ads up to 5.5 euro/pcs. Other variable costs on the existing equipment are 2.3 euro/pcs., and equipment depreciation expenses are worth 28,000 euro.

The general manager of the company receives an offer to buy an automated machine that requires one person to oversee it, thereby reducing personnel costs by 3.7 euro/pcs. The machine costs 380,000 euro, linear amortized over a period of 5 years. The other variable costs remain unchanged (2.3 euro/pcs).

Since buying these machines requires a considerable investment effort, the manager examines the possibility of concluding a lease for that equipment for a period of 5 years. Annual leasing rate amounts to 106,000 euro a year, and some variable costs are borne by the leasing company (0.7 euro/pcs). The residual value of the equipment at the end of the contract is 0 euro.

To determine the optimum solution in each region, in order to reduce production costs, following steps are necessary:

1. The first step is to express the annual cost for each option. This requires knowledge of cost

items for each option considered. These cost elements are expressed in the following table:

Table 2. Cost items required for each option

Option 1: Keep the current machine	
Description	Cost
Personnel expenses	5.5 euro/pcs
Other variable expenses	2.3 euro/pcs
Fixed expenses (existing equipment depreciation)	28,000 euro
Option 2: Buy the new machine	
Description	Cost
Personnel expenses	1.8 euro/pcs
Other variable expenses	2.3 euro/pcs
Fixed expenses (new equipment depreciation plus existing equipment expenses)	$76,000 + 28,000 = 104,000$ euro
Option 3: Conclude lease contract for the new machine	
Description	Cost
Personnel expenses	1.8 euro/pcs
Other variable expenses	1.6 euro/pcs
Fixed expenses (leasing rate plus existing equipment expenses)	$106,000 + 28,000 = 134,000$ euro

Table 3. Expression of annual costs for each option and each region in part

Region	Present situation	Acquisition	Leasing
Transilvania	433,000	317,200	310,800
Maramureş	106,000	145,000	168,000
Banat	199,600	194,200	208,800
Muntenia	277,600	235,200	242,800
Moldova	402,400	300,800	297,200
Dobrogea	145,000	165,500	185,000

Figure 1. Cost chart for each region in the three options

2. The second step is to determine the optimal option for each region separately. The optimal variant is to minimize the costs leading to a profit growth.

Table 4. Optimal situation in each region

Region	Optimal situation	Value
Transilvania	Leasing	310,800
Maramureş	Present situation	106,000
Banat	Acquisition	194,200
Muntenia	Acquisition	235,200
Moldova	Leasing	297,200
Dobrogea	Present situation	145,000

Optimization was made considering the cost of each variant in each region. Thereby the optimal situation means that in Dobrogea and Maramures will remain at the current situation because the existing equipment purchase or lease would not justify; in Banat and Muntenia best option is to purchase new equipment because they reduce variable costs fully covers the cost of the existing equipment, in Transylvania and Moldavia the optimal variant is the conclusion of a lease to use the new equipment.

3. The last step is to calculate the global economy made. The optimized results and the achieved savings for the studied enterprise are presented in the following table:

Table 5. Achieved economy of each region and global savings of the enterprise

Region	Present situation	Optimal situation	Savings
Transilvania	433,600	310,800	122,800
Maramureş	106,000	106,000	0
Banat	199,600	194,200	5,400
Muntenia	277,600	235,200	42,400
Moldova	402,400	297,200	105,200
Dobrogea	145,000	145,000	0
Total	1,576,200	1,300,400	275,800

4. Conclusions

The best cost for each management option is obtained by applying the pertinent cost theory. It is very important to determine a cost in time in order to make forecasts upon the future economic activities of an enterprise.

Because the pertinent cost theory was applied upon the analyzed enterprise, it can develop, at least in the four regions in which the reduction of costs is possible by replacing the existing equipment. In can easily be observed (see table 5) that following the optimal situation the company makes an overall economy in costs of 275,800 euro. In the future the manager will probably replace the existing machine in the other two regions provided the extension of customer portfolio.

Intangible Capital Accounting

Mihalache Arsenie-Samoil

“Alexandru Ioan Cuza” University of Iași / Romania
arsenie_samoil@yahoo.com

Abstract

The new economy based on globalization is increasingly important, which shows the decisive role played by intangible capital in achieving the competitive advantage of companies. However, this intangible capital is the hidden side of a company's value, as it represents the company's intangible resources, which cannot be measured by the financial metrics used to measure tangible resources. Given the functional importance of intangible capital, several models were proposed by the literature in order to explain its structure and provide an opportunity to assess it. The term most often used by accounting community is that of intangible assets. Van den Berg (2002) believes that traditional accounting and financial systems have lost the ability to inform on the value of a company, which is expressed increasingly by intangible assets. Experts estimate that intangible assets determine nowadays up to 60-70% of a company's value. The investments in intangible assets significantly exceed those in tangible assets, further increasing the difficulty of accurately assessing the value of a company. These are some reflections that cause us to focus on the issue of companies' intangible capital accounting.

Key words: globalization, intangible capital, company's value, intangible assets, intellectual capital

JEL Classification: M4, M41

1. Introduction

The interest in the concept of intangible capital emerged along with significant differences between a company's market value and its net accounting value. The conceptual development of this term was achieved in three different directions.

A first direction comes from the accounting area, where the term used most often is that of

intangible assets. Increasingly, more and more specialists recognize the limitations of traditional financial accounting reports for companies that are characteristic to the new economy based on globalization, where the share of intangible assets far exceeds the one of tangible assets. However, they are concerned with the introduction of possibly subjective elements, such as non-financial annual reports. Therefore, they try to find relevant indicators, defined as precisely and thoroughly as possible, which is an activity regarded as a basic feature of the accounting profession.

A second direction is the finding of appropriate metrics for the intellectual capital. To this end, various models were developed for the assessment of intellectual capital. The third direction comes from the field of strategic management which points out the fact that, until the eighties, the literature relative to strategic management considered a company's external environment to be of major importance for the understanding of competitive advantage. It was believed that resources were distributed evenly and were quite easily accessible to companies in same industry. Thus, the role of management was to find intelligent ways of combining both products and markets, depending on the bargaining power of suppliers and buyers, on entry barriers, on the power of substitution products.

However, the internal factors are more important. In fact, this new insight (*resource-based view*) suggests that competitive advantage is primarily due to differences between company-specific resources. Intangible assets appear to be the only resources that pass the test of resource evaluation criteria, which provide competitive strength: the criterion of creating value for the customer, the criterion of rarity, the criterion of uniqueness, the criterion of the cost of copying.

Due to the different research directions, confusion can arise regarding the use of certain terms: intangible capital, intellectual capital, intangible assets, and knowledge assets. The term 'intangible assets' is used especially in finance and accounting, the term knowledge assets in economy, while the term intellectual capital especially in management.

In the current economic context, where human intelligence and creativity have gained an increasingly important status, intangible assets such as knowledge have become the new core of competences.

If in the traditional economy, production factors used to be the land, labour and capital, in the new economy knowledge become the essential component of the productive system.

The classical economic theory defines *capital* as one of the three production factors, alongside land and labour. It mainly refers to buildings, equipment, installations, etc. used to produce other goods (the relevant literature uses the term *physical capital*). Thus, intangible capital is a term used to signal the presence of such a capital, different from the *physical capital* and the *financial* one (Peltoniemi, 2006).

There are many approaches to this concept showing how difficult it is to define something so 'intangible,' as well as how important it has become in the economy and society of knowledge.

2. Intangible assets – concept and evaluating methods

Arthur Andersen defines intangible assets as those "resources controlled by the company that have the following attributes: they are not physical; they are able to produce net profits in the future; they are protected by the law" (Arthur Andersen, 1992). Intangible assets represent almost 70 percent of the market value of modern companies.

The real source of wealth of nations and companies has to be found in people, in their knowledge and competence, as well as in the internal processes and reputation of a company.

The IAS 38 standard, "Intangible Assets," defines intangible assets as follows: "An intangible asset is an identifiable non-monetary asset without physical medium and held for use in the production or supply of goods or services, to be leased to others, or for administrative reasons.

There are numerous methods used to measure intangible assets. The works of several expert authors illustrate over 30 different methods. This large number results probably from the fact that research on intangible assets and intangible capital was the result of practitioners' wish (Bontis, 2002, p. 623) to create and develop sophisticated measurement tools and methods, which meant a huge progress. In the following, we present, briefly, four of the main methods used to measure intangible assets (Luthy, 1998 and Williams, 2000).

The direct intellectual capital method (DIC) to estimate the monetary value (symbolically called value and expressed in monetary units) of intangible assets by identifying its many components.

Once identified, these components can be measured directly, either individually or as an aggregate coefficient;

The market capitalization method (MCP) that calculates the difference between a company's market capitalization and shareholders' equity, as value of its intangible assets;

The method of yields and asset recovery rates (MPA) (ROA). The average of gross return of a company over a given period of time is divided by the average of tangible assets of the company. The result is an MPA for a company, which is then compared with the average in that field. The difference is multiplied by the average of the company's tangible assets in order to achieve an average annual gain resulted from intangible. Dividing the average earnings by the company's average cost of capital or interest rate, we can get an estimate of the company's intangible assets;

The scorecard method (SC). The various components of the intangible assets and human capital are identified for the determination of indicators in the form of scores. Based on various indicators, composite indicators can be generated.

3. Intellectual capital – concept and evaluating methods

The interest in the concept of intellectual capital has emerged with the observation of significant differences between a company's market value and net accounting value.

The conceptual development of intellectual capital was made from two different, yet converging, directions.

The first direction was generated by the need to increase the company's competitiveness capability and achieve a strategic advantage on increasingly competitive markets by intensive capitalization on intangible resources. From these resources, the focus was on information and knowledge, trademarks and patents, organizational behaviour and organizational culture. In other words, the question is how to achieve a more efficient management of intangible resources in a company in order to increase its competitiveness.

The second direction was generated by the trend towards success consolidation of companies with a continuously growing ratio of market value and financial balance value.

Many authors have attempted to define more precisely the term intellectual capital but this is not easy due to its complexity, as well as the still embryonic phase the field is in. Consequently, both practitioners, and researchers in the field of intellectual capital prefer, as a starting point in their actions, different classifications thereof based on its ingredients. The most commonly used is one in which intellectual capital consists of human capital, structural capital and relational capital;

- Human capital includes the competence, skills and intellectual agility of employees;
- Structural capital includes processes, systems, structures, brands, intellectual property and other intangible assets owned by the company but not recorded in the balance sheet;
- Relational capital reflects all the valuable relationships established with customers, suppliers and other important contributors.

There are other classifications, but the differences are often more form and less substance.

When we speak of intellectual capital, it is a static approach. Bontis, Crossan and Hlland (2002) suggest that the level of analysis, intellectual capital represents the stock of knowledge that existed at some time in the company. It is what the company learned in a cognitive sense. Managing this stock of knowledge as they grow up is really knowledge management (knowledge management). Therefore, pragmatically speaking, knowledge management aims to evaluate and develop the intellectual capital of a company in order to

create value for consumers and other stakeholders. Semantically, both concepts are linked by the concept of knowledge.

One of the most important activities related to intellectual capital management is to evaluate it, for which various authors have proposed different models, some of which are presented below:

- Indicator of market value, net carrying value (Market-to-Book Value) - is calculated as the difference between a company's market value and net carrying amount. The market value of a firm is calculated as the product of share price and total number of shares. Net carrying amount is calculated as the difference between total assets and total liabilities. Therefore, what remains is the intangible nature.
- Tobin's Q Ratio - This index compares the market value of an asset with value representing the cost of replacing that asset.
- Balanced Scorecard - This model, developed by Robert Kaplan and David Norton, allows managers to translate mission and strategy into a comprehensive performance assessment. This model suggests to look at the company from four perspectives: learning and growth perspective, internal process perspective, customer perspective, financial perspective.
- Sveiby's Intangible Asset Monitor - This model was created by Karl-Erik Sveiby to classify intangible assets into three categories: external structure, internal structure and individual skills. Structure refers to external customers, suppliers and other stakeholders that are considered relevant for a particular company. Internal structure refers to systems, databases, processes that support company. Individual competencies refer to individual experience, the knowledge, skills, abilities and ideas of employees.
- Skandia's Intellectual Capital Navigator - This model is the result of continuous efforts made in the field of intellectual capital by Leif Edvinsson and his team from the Swedish company Skandia. Taxonomy scheme offered by the market value is used by those interested in the field of intellectual capital. Total market

value is composed of financial capital and intellectual capital. Intellectual capital is divided into human capital and structural capital. In turn, structural capital consists of customer capital and organizational capital, which is capital plus capital innovation processes.

- Assessment of intellectual capital statements (Intellectual Capital Statements) - In recent years, given the importance of becoming more intellectual capital assessment statement, with which a company reports and the "invisible" intangible of a company. These instruments have different indicators, but also certain forms of presentation. The best known such statements are: the Declaration of intellectual capital assessment developed by the Ministry of Science, Technology and Innovation of Denmark (to be found in The Guideline for Intellectual Capital Statements).

4. Intangible assets bookkeeping

After a long discussion, the international accounting referential addressed first detailed accounting for intangible assets by IAS 38 (enacted in 1998), and determining criteria for recognition, measurement bases and reporting requirements of these categories of property.

Recognition of intangible assets requires the following key criteria:

- of identifiable intangible nature;
- possibility of controlling use of property;
- their ability to generate future economic benefits;
- credible assessment.

The identifiable character of an intangible asset requires that it be "distinguished from goodwill (IFRS, 2005, p. 1676). The identifiable condition is satisfied if the intangible asset is separable (i.e. can be sold, transferred, licensed, leased or exchanged and future economic benefits attributable to that asset can be distributed, without depriving the company of future economic benefits from other assets used in the same activities). At the same time, intangible rights must arise from contractual or other legal rights, whether those rights are transferable or separable from the entity or other rights and obligations.

Identifiable intangible assets include patents, copyrights, licenses, customer lists, brand names,

software, marketing rights and specialised expertise. A feature that these elements have in common is the lack of material, physical substance, and their having a useful life greater than one year (fixed or indefinite).

Some intangible assets may be kept in or on a physical medium, e.g. CD (for software), legal documentation (for a patent or a license), film, etc. Eliminating confusion for the correct classification (as property, plant under IAS 16 or as intangible as IAS 38) requires professional reasoning in order to identify the most significant element based on their relative importance or comparative.

The possibility of being in control of the use of intangible assets – Control involves both the ability of the entity to draw benefits, future economic benefits arising from the involvement of these assets and the power to restrict third party access to those benefits, benefits.

As a rule, such entities get their ability to control means of legal rights as registered copyrights, patents, restrictions on trade agreements (if this is allowed) or legal coercion of employees to observe confidentiality.

These rights missing, the entity cannot usually have sufficient control over the economic benefits expected from teams of professionals and education and training programs or from specific technical or management skills. Moreover, in the absence of rights that enable it to protect or to control its relations with customers or their loyalty, the entity is not usually in sufficient control of any economic benefits from customer loyalty and relationships with them. Thus, considerable costs incurred for staff training, building a portfolio of customers, market shares, relations with customers or their loyalty may not yet be recognized as intangible assets, although these expenditures are investments in marketing and as "the drive" that triggers long-term profits.

The future advantages (benefits) that may be associated with future economic intangible asset may take the form of revenue from sales of products or services, savings, cost reductions or other economic benefits resulting from the use of intangible asset to the company.

In general, however, recognizing an intangible asset is subject to the probability

that the economic benefits pertaining thereof return to the entity. Evaluating the probability of future economic benefits must be made based on rational calculations representing the best estimate for the set of economic conditions existing during the life span of intangibility.

Using reasoning to assess the safety of future economic benefits associated with obtaining the intangible asset attributable to the available evidence is based upon initial recognition, giving priority to external evidence. Relying on fair value, determined primarily by reference to an active market or, failing that, by using the best available information involves determining the present value of cash flow, adjusted according to the probability of its implementation and the time value of money. Even at low probability of occurrence of cash flow, it is construed that fair value can be determined and the asset will be recognized.

Credible evaluation of intangible assets is conditioned on how to obtain them, so that initial assessment is done at their cost of production:

- For a separately acquired intangible asset, the price paid for obtaining it reflects the probability that expectations of future economic benefits associated with the intangibles acquired return to the company. In other words, the cost effect is the likelihood of intangibility.
- In many cases, intangible assets are internally generated. The baseline to which they are recognized as assets is difficult to determine due to the nature of these categories of property, for which many expenses have been incurred before their being acknowledged as assets.

Expenditure on intangible assets obtained are treated according to the stage where they occur, in their creation or in the research phase or stage of development.

The whole argument is based on credible assessment of the project concept (as a set of joint actions and scheduled for a particular purpose).

During the research phase of an internal project, expenditure on activities aimed at obtaining new knowledge, searching, delivering, evaluating and selecting alternatives. These costs are recognized as costs in the period they were committed.

The development phase of an internal project involves expenses that can be capitalized if the following can be proved: technical feasibility of

completing the intangible asset, the will to complete, the capacity to use or sell the intangible, the mechanism by which future benefits are likely to evolve, the ability to assess credible costs attributable to the intangible during its development.

Categories of assets as brand names, models, and internally generated customer lists can reach values that can be estimated with difficulty and that meet the criteria for their recognition as assets separate from the internally generated goodwill.

Their non-recognition as assets is justified by the principle of prudence, associating failure to capitalize expenses with the uncertainty about assessment methods rather than with the volatile nature of their value.

The life span of an intangible asset can be very long or indefinite. There may be both economic factors and legal factors that influence the life span of an intangible asset. Economic factors determine the period in which the company will receive future economic benefits. Legal factors may restrict the period during which the company controls access to those benefits. Life span is the shortest of the periods determined by these factors and the depreciated value of an intangible asset will be allocated on a systematic basis over such period.

The life span of an intangible asset is construed as indefinite when – based on the analysis of all relevant factors (the organisation's intended use of the intangibles, typical life cycles, technology wear and tear, commercial or other types of obsolescence, stability of the domain, the expected actions of competitors, the level of maintenance expenditure, the length of control of the intangibles, the dependence of the intangible life span on another asset) – there is no foreseeable limit to the time period in which intangible is expected to generate net cash flows for the company.

5. Conclusions

The new economy based on globalization is increasingly important proving the decisive role played by intangible capital in achieving the competitive advantage of companies. But this intangible capital is the hidden part of the value of a company as it represents the company's intangible

resources, which can not be measured by financial metrics used to measure tangible resources. Given the functional importance of intangible capital, the literature has suggested several models to explain its structure and to provide an opportunity to assess it.

In terms of financial accounting recognition or measurement, issues of intangible assets continue to stir controversy. The more so in a society marked by competition and change, estimating future benefits arising from investments is less dependent on their physical or intangible nature and more on the characteristics of the market within which it operates (the degree of competition, the speed of technological change).

The relevance and reliability of accounting data require an appropriate accounting treatment and international bodies (IASB and FASB) regulating their accounts placed on their common agenda a long-term joint project for intangible bookkeeping.

For now, accounting rules encourage (without requiring) companies to disclose in their explanatory notes those investment categories that have long-term impact on the performance of the company, but not exceeding the limiting threshold of their recognition as assets (IAS 38) in the balance sheet.

Accounting evolution is slow and there will always be a gap between the volume of the immaterial and intangible assets recognized, because you can not make a credible assessment of all components involved in the investment process.

The Impact of Using New Information Technologies on Accounting Organizations

Mihalache Arsenie-Samoil

“Alexandru Ioan Cuza” University of Iași / Romania
arsenie_samoil@yahoo.com

Abstract

Knowledge is an increasingly valued production factor¹ as by means of computer-based equipment its reproducible feature has been highlighted.

Accounting has turned into the art of warranting the success of an organisation only to the extent in which it uses information technologies with a view to obtain and manipulate information. Via this medium, any patrimonial unit can produce a maximum profit with a minimum of effort.

In order to be able to survive a within a fiercely competitive environment, the necessity of modernizing businesses appears as mandatory, by adopting the new information technology with a view to increasing their economic performance [4].

Within a global information environment, for an organisation modernizing process to be efficient, such businesses should have the following characteristics: flexibility, openness, receptivity to integration and globalization, standardization, digitalization, and artificial intelligence.

Integrating and computerizing the activities in an organisation and carrying out the operations within a digital economy and a virtual organisation, highly interconnected, calls for the expansion and acceptance of the computer-assisted accounting method, real-time work, accepting new ways of working and new activities.

Hence, it is increasingly relevant that topics as intelligent business, virtual business, the expansion of the Internet, e-commerce, e-banking, and global computerization of society are directions which mankind cannot avoid. Under these circumstances, businesses, willingly

or against their will, need to modernize.

Simultaneously, experts in accounting need to understand their field of competence through the lens of this development. In the accounting professional environment, a series of technological mutations will make their presence felt. Such mutations will strongly influence – from a theoretical as well as practical viewpoint – the financial – accounting field. All these events will entail a series of challenges accountancy will have to cope with.

The current issue at hand is: what is the impact of using the new information technology on business accounting and to what extent the use of such technology contributes to the growth of the business economic performance?

Key words: intelligent business, virtual business, e-banking, e-commerce.

JEL Classification: M4, M41

1. Introduction

The progress recorded in the IT field, its impact on various operation fields, the long time elapsed since the beginnings of computer-aided accounting and the experience accumulated in the field have prompted a question to us: is it the time to try to adjust accounting to IT in general, and to computer science in particular? This seems a more justified question as the relation between accounting and computer science has been so far one of a single-direction influence: computer science has adjusted to accounting. The development of the accounting information systems has limited itself to digitalising accounting procedures without producing their change. Hence, considerable advantages have been obtained with respect to processing speed,

¹ "We enter a society of knowledge, where the main economic resource is no longer the capital or labour, but knowledge, and where intelligent workers will play the central role." - Peter Drucker

the accuracy of processing and cost cutting. Which poses a new question: are these achievements sufficient?

Within this context, that computer science will determine a total transformation of accounting appears to be increasingly relevant, not only because the procedure will be modified, but because it will stop being an autonomous function of the organisation which is to be integrated in a general information processing system.

2. Accounting-related information technology

The endeavour of analysing the impact of IT on the accounting field should begin with the role of accounting. The developing directions of accounting derive from the study of its goal and imply the analysis of the accounting principles, methods, and procedures that lead to meeting the goal set.

Accounting represents an information system that quantifies, processes and communicates (transmits) financial information to an identifiable economic entity, thus connecting the economic activities and the decision-making factors. [5]

The managerial information system is made up of interconnected subsystems offering the information required for an organisation to operate [5]. The accounting information system is the most important subsystem as it plays the leading part in directing the economic data flow both to all compartments of an organisation and to interested parties outside the organisation. Thus, it offers a full picture – clear and accurate – of the structure and dynamics of the assets, of the financial standing and results achieved.

Information has lately been considered as an increasingly significant production factor as the IT equipment has highlighted its reproducibility. In order to process and manipulate these data and pieces of information while using IT equipment, we need other information resources of which we would like to mention specialised personnel and software. In order for all these factors to be put to practice, we also need a way of combining these information resources, namely a working technology that we could apply as with any other technological process. Thus, we arrive at a technology based on information or, simply, the information

technology [7].

Accounting has adjusted to the requirements of those who need its information. Therefore, from rudimentary accounting of the Egyptian culture based on a simple-entry accounting system, we have come a long way to the double-entry one, where there have been attempts to eliminate the basic informative support (i.e. paper) and replace it with a less vulnerable one as well as a faster one as a means of collecting, processing, and transmitting financial-accounting data.

The transition to the means of electronic storing and processing has undergone a gradual development. The first computer and the first accounting applications were invented in the second half of the twentieth century. At the time, many users connected via non-intelligent terminals would use a central computer. During their initial stage, these systems were limited to reproducing manual accounting systems, meaning they repeated the same procedures of accounting data processing but this time by means of a computer. Consequently, the same kind of data were collected, the same information was generated which in turn were transmitted to the same recipients and the same organisational structure was preserved.

The next step was made when personal computers appeared on the market, allowing thus to decentralise data processing. The information needs at that time underwent significant changes: company management and shareholders manifested new and more diverse needs for information, such as the value of the intangibles (customers' satisfaction). There was even a demand for information uncharacteristic to the traditional accounting reports – e.g. data on the impact on the environment, the risks the organisation may face, management of the intellectual capital, the innovation capacity, the degree of customers' satisfaction, the employees' learning capacity and motivation [10].

New means of information are now available to accountants owing to which they are able to collect, manage, process, disseminate and analyse both the accurate, actual data resulted from classical economic transactions and those referring to

knowledge, the company intangibles. Such information circulates in an integrated way via some applications as the intranet, the extranet and the Internet, data mining, knowledge bases, document management, etc., among which the Electronic Data Interchange (EDI) occupies a special position.

3. The main information technology in the modern organisation

Here are only some of the new technologies one has to bear in mind when developing and exploiting systems, if we consider that they are no longer the prerogative of computer science experts, but they imply the involvement of users, i.e. managers, in order to ensure a successful implementation.

- The Internet, the extranet and the intranet with all their derived applications: the Web, electronic mail (e-mail), the World Wide Web, file transfer protocol (FTP), Internet Relay Chat (IRC), news groups (Usenet news groups), Gopher, Archie and WAIS, Telnet, Blog [8];
- Electronic data interchange and electronic payment systems: EDI (Electronic Data Interchange), EFT (Electronic Found Transfer), ACH (Automated Clearing House), FEDI (Financial Electronic Data Interchange) [9];
- Electronic management of documents and groupware, e-banking, e-marketing, e-learning;
- electronic systems to organize meetings: discussions on the Internet (forums, interest groups);
- e-commerce with the following business models: e-Shop, e-procurement, e-auction, e-mall, Third Party Marketplace, Virtual Communities, etc. [3];
- various functional application integrating technology: ERP (Enterprise Resource Planning), middleware technology – organization applications integrating kit (Enterprise Application Integration);
- Data warehouse, Data marts and Data mining;
- Optical Character Recognition;
- Automatic Teller Machine - ATMs;
- Artificial intelligence and its applications: intelligent systems, expert systems, fuzzy

systems, connectionist systems, genetic algorithm-based systems, multiple agent systems, hybrid systems, shape recognition, speech recognition and understanding robotics, general problem-solving equipment, computer-aided learning, natural speech processing [1];

- Multimedia systems: remote connection, telephony, videoconferences, virtual universe, radio – TV channels receipt, etc [2];

Other information technologies: we list under this category all modern types of technology designed for CAD (computer-aided design), security and access technologies - firewall, electronic signature, digital certificate, etc [6].

4. The impact of it use on accounting

In as far our concern is with the impact of the new I&CT on the accounting information system [4], we can point out the following trends:

- A better communication via interconnection. The internet can be used by any application of the accounting information system where communicating data intervene, offering several major advantages as compared to other network types. One of these advantages lies in the fact that it can be used on any hardware platform without any special efforts. The expanding possibility irrespective of the geographical location, attracting new customers from all over the world, communicating at any time, identifying and getting information at any time, round the clock operations;
- A stronger integration. The accounting information system should be part of an integrated application system within the organisation if one wishes to benefit from the EDI and ERP system advantages. The accounting information system is the one that offers most of the economic and financial data needed to carrying out the organisation operations. Nonetheless, it is not sufficient in itself as the efficiency of using data resources of the organisation depends on how each component of the data system interacts with the other components and to what extent they are

integrated. Consequently, the accounting information system can no longer be seen separated from the other functional components of the system but as a full part of the components as a whole, inseparable at times.

- A new support to carry out accounting records. The support on which accounting records are made is dematerialised with a view to eliminating paper support and automatically taking over the data for the accounting article directly from electronic documents. By means of this processing method the classical bookkeeping of accounting documents is also eliminated;
- An easier and faster document flow. Primary document circuit is completely different as many intermediate stages of checking and approving are also eliminated. Yet, this requires giving an increased attention both to the observance of current legislation and accounting regulations and to the observance of internal control and finance-accounting auditing procedures;
- Building up virtual archives. The ways documents are archived undergoes radical changes. We no longer resort to lacing up accounting document files, but to much more simpler ways which do not require extra work or larger room for archives. The document and record keeping concepts are being redefined; new occupations are being created such as: record manager and electronic library custodian;
- A complete transformation of internal control and auditing of the accounting information systems. These operations are given new objectives and new ways of being carried out. Hence, we are now facing the issue of performing the audit around the computer and inside the computer; the issue of creating some universal auditing systems as a result of IT system becoming internalising and globalising;

As to the impact of the new I&CT on the accounting profession [4] we can point out the following:

- The life-long training of the professional accountant. They should train on a permanent basis with a view to being updated to the novelty with an impact on their activity in the field. Hence, the accounting profession should accept the challenges imposed by the

new technologies. We refer here mainly to setting a unanimously-accepted standard with respect to with extending the method of computed-based accounting technique;

- Carrying out activity within a digital economy and a virtual strongly-connected organisation. Integrating and digitalising the activity in an organisation call for the extension and acceptance of the computer-based accounting method, working in real-time, accepting new types of work and activities.
- Shifting the stress from the microeconomic to the macroeconomic level. The context of integrated organisation functions and simultaneous large-scale use of ERP products and the digitalization of the microeconomic phenomena, the concept of national accounting may become an omnipresent one, whereas the company accounting would constitute a mere working mode;
- Developing an event-oriented accounting rather than a simple-economic fact-oriented one. The professional accountant will have to promote the idea of recording and event under all the aspects of the accounting processing applied to a simple economic fact / phenomenon. This challenge is the effect of accounting data digitalisation and integrated processing;
- Outstanding results in the artificial intelligence field. The professional accountant has to place a special focus on the instruments of artificial intelligence that can be used in their field of activity.
- The radically changed perspective of the accounting profession. For the current finance-accounting professional it is no longer sufficient to have a detailed knowledge of the accounting technique, of how to perform checking or auditing, of the legal framework or to have some knowledge they need to perform economic and financial analyses. Such professionals need to have increasingly detailed knowledge with respect to the use of the new I&CT, of the strategic advantages the company could obtain by implementing such technology, of how these advantages can be turned into profit for the organisation. Under the new

circumstances, professionals should secure their education and training necessary to carry out financial and accounting practice that meet the challenges of the new information technology.

- Eliminating the language barriers between the various professionals within the organisation. The need to know and the ongoing training of all employees in order to apply the new strategies determines the break off barriers that so often are laid between the professional of the various operating fields in an organisation;

5. Conclusions

Topics such as intelligent organisation, virtual company, extending the Internet, e-commerce, e-banking, and global digitalisation of society become more and more obviously the trends humankind cannot avoid. Under these circumstances, organisations – willingly or against their will – will have to modernise by implementing the new information technologies. In order to make the process of modernising organisations efficient in a globally digitalised environment, such organisations need to be flexible, open-minded, receptive to integration and globalisation, standardised, digitalised, and intelligent.

Meanwhile, accounting experts need to understand at least in part the scope of their competence from the perspective of such developments or otherwise their views will be distorted and easily influenced. In the professional accountants' field of activity a series of technological mutations are being noticed. Such mutations are likely to have a significant influence on the financial-accounting field from a practical and theoretical point of view. All these will entail a series of challenges to which the profession will have to overcome.

Accounting has grown into the art of ensuring the success of an organisation only to the extent such organisation uses the new information technologies with a view to collecting, processing and transmitting the data. Such activity allows to every patrimonial entity to produce the highest profit with the least effort determining thus an increased economic performance.

Does the Model of Evaluation Based on Fair Value Answer the Requests of Financial Information Users?

Abstract

Does the model of evaluation based on the fair value answers the requests of the financial information users?

The financial situations have as purposes the presentation of the information concerning the enterprise financial position, the performances and modifications of this position which, according to IASB and FASB, must be credible and useful. Both referential maintain the existence of several conventions regarding assessment, like historical cost, actual cost, the realizable value or actualized value that are characterized through different degrees of credibility and reliability. The historical cost, habitually used across the years, appears from real transactions that the enterprise underwent as a real value at the moment of initial recognition. The fair value, sustained and used lately, reflects an estimation and not only an assertion (inducing the market value) and tends to cover all the values appearing out of the economical plans. It is the only evaluation base including derived instruments.

Could it be asserted that the evaluation model residing in the fair value is in concordance with the needs and requests of the financial information users? This paper shows pro and against argumentations but also some necessary actions and measures to be taken by the specialists in the field.

Key words: fair value, financial information, derived instruments, corporal assets.

JEL Classification: M4, M41

1. Introduction

The objective of the financial situation is the presentation of credible and useful information concerning the enterprise financial position, the performances and modifications of this position according to the two accounting referential IASB and FASB. Both referential sustain the existence of several conventions regarding evaluation, like historical cost, actual cost, realizable value or actualized value, that are characterized by different degrees of credibility and reliability. Initially, referential did not prescribe or privilege none of these possible conventions, but only made the observation that the evaluation at the historical cost is frequently used in elaborating financial situations. In the past years, the regulators are heading more and more to the support of the fair value and its extensive application.

This value is instrumented within the standards referring to financial instruments, to real estate investments or agricultural products, but it also appears within the requests concerning the evaluation of the corporal assets at a reassessed value (with some references to the real market value) or concerning the evaluation of intangible assets (especially the goodwill).

2. Historical cost and fair value

The historical cost results out of real transactions that the enterprise underwent, being a real value within the moment of initial recognition, most of the times a value easy to establish. According to the historical cost model, the assets are registered at cash

value or at a cash equivalent or at the real value from the moment of their acquisition. Liabilities are registered at the value of equivalents received for the debts or, in some cases (for example, the income tax) at the value which is expected to be paid in cash or cash equivalent to the satisfaction of debts arising from the activity. [1]

But the economical parameters (like purchasing power, interest rate, enterprise profitability) has evolved in time, with modifications of their values and that is why unusual items appear in financial situations to a distorted value. As I have mentioned previously, any accounting referential accepts a series of adjustments like reassessment, replacement cost or indexing to inflation but no one could assure the correct presentation of the full and fair image of the enterprise activity.

After a long presence in the financial statement, the historical cost doesn't reflect any more the true and fair image of the enterprise activity, and that is why it was necessary to use some corrections like: inflation restatement, assets revaluation or the use of a minimal value between the accounting value and actualized value (named *net realizable value* in connection to the inventories and *recoverable value* in connection to the assets).

Fair value (real, correct) is the amount at that we could trade voluntarily an asset or settle a liability, between parties within a transaction in which the price is objectively determined. In such a transaction it could be used the market price for goods having an active market or the replacement value for goods that don't intervene on an active market.

The fair value is the result of theoretical and practical research of *different specialists for different purposes, but with the same target*: that of expressing as correct as possible the real value of an element at a certain moment, after initial recognition. Fair value is undoubtedly the most complete term referring to assessment. Fair value consists also in determining the market value based on the principle of supply and demand. There are differences between expressing an opinion referring to market fair value belonging to an individual element at a certain moment and expressing an opinion concerning the market fair value of an entire enterprise as a whole. In order to assess the enterprise fair value there are some

considerations necessary concerning past performances, future potential gains, economic climate, involved human resources while the constraints in determining *the cost of a single element are far less intense*. [2]

Determining the fair value reflects an estimation and not just an observation (the case of the historical cost) and, like in any estimation process, expressing an opinion is absolutely necessary. Any opinion is submitted to the subjectivity and to the will of the assessor, this explaining the differences appearing in the determination of the value. Fair value induces the market value and tends to cover all values coming out from *estimations based on economic calculations*. As a consequence, fair value must not be misled with the acquisition price. Sometimes they can be equal, but the fair value is a theoretical result of the supply and demand rapport, while the acquisition price is the value at which *a transaction actually takes place* and depends on the negotiation abilities of the two parts and on *the relative usefulness* of goods for one or another parts involved in the transaction.

A. Smith is the one that offers to the value two significations: that of usefulness of a particular object (*use value*) and that of a means that allow the access to other goods (*exchange value*). In the economist opinion, for the elements that have an usefulness value that is great enough, the exchange value tends to be worthless. Smith considers that *the process of usefulness motivates the economic production process and represents the fundament of this value*, but its measurement *is reflected through cost, the one allowing an objective assessment*. [3]

This economic theory concerning the value is taken and accepted by accounting profession too, being reflected through the model of the historical cost (also named *the general model of assessment*).

It is interesting to mention that the adjustments made by accountants in order to ensure the reality of the value do not always allow an objective approach, which means that in such situations like evaluation in uncertain conditions, the accounting value of the assets is never increased by the positive differences of this value. Only in the case of reassessment and inflation, when it is

considered that uncertainty disappears through the existence of assessment paper as a documentary justification or of some indices calculated at a macroeconomic level, regulators allow the raise of the value.

The reference to historical costs and systematic underestimation of the result (through a generalized prudence) brought vehement critics to this model. The model presents asymmetrically the information and opens the way towards creative practices allowing the externalization of the latent added values in well calculated moments, reacting like a sort of controlling instrument of the result. The introduction of fair value model as an assessment model and the elimination of historical cost represent the object of reconsideration process concerning the accounting standards, a process which is not supposed to develop without criticism and without creating difficulties in the accounting normalization.

3. The need of financial information users and the fair value

Could we assert that the assessment model based on fair value answer the needs and requests of the financial information users?

According to this model, the result of the enterprise is measured in concordance with current economic conditions, considering profit and latent loss generated by the evolution of the market parameters from the outside of the enterprise. According to the assessment model based on the historical cost, gains and losses are not recognized in accounting until the moment of the effective realization of the transaction on the market. This fundamental difference within the evaluation objectives of the performance fuels a sustained dispute with some arguments presented further on.

Those supporting the historical cost reveal the fact that, in the case of acquisition of a bond held to maturity, the fair value variations across this period of time are not pertinent at all as the enterprise is ensured to receive at the maturity the initially invested amount of money and not the bond value market. Instead, the fair value supporters sustain that, by using this value, we could better measure the performance at a certain moment, because the recognition of value differences between entry cost and the

previous value is allowed. Historical cost offers information about value differences only at the moment of assessed item derecognition. But fair value is not sustained only in the case of present performance assessment, but also of forecasts, because unlike historical cost, this takes into account some external factors affecting the enterprise activity. According to FASB, fair value concept invokes the market concept, with a purpose of emphasizing the elements that could explain the generated market price. Determining the real value resides on an assessment model whose parameters must be anticipated by the market.

The reflection of these two assessment conceptions concerning the enterprise financial situations reveals the fact that, in case of using the historical cost, the presented performance is homogenous with the evolution of cash or cash flow, because the operating activity is well defined and the immediate fluctuations are neutralized. In the same time, by using fair value model, the enterprise performance reflects immediate variations of the market, taking away the current treasury situation and the current ability to handle treasury resources. Bernheim sustained in an article that, fair value, *more than other assessment bases, is justified mostly through its capacity to offer information about future cash flows.* [4]

The difficulty in finding a replacement cost or the controversies regarding future cash flows fuelled by the multitude of actualization models, led the specialists towards a saving solution: *fair value*.

Starting with the elaboration of standards concerning financial assets, we could notice a reconsideration assessment tendency through market values, considered the end of historical cost era. Historical cost is unconditionally accepted only at the moment of initial recognition, because later on any assessment will be made at fair value which is reflected by market, as a value appearing from a normal transaction developed in equal access conditions to information for the parts involved within this transaction.

Taking into account all these, the result, as an expression of values variation concerning assets and liabilities, involves an element generated by the transaction itself,

classified as an operational element, and a virtual element classified as a financial one. In such conditions, in order to not distort the information, the enterprise might present during the Explanatory Notes the virtual part of the result determined by plus or minus latent values and might take into account this information in dividend distribution process.

Concerning the assets, FASB as well as IASB use the technique of actualized value in order to realize an assessment close to that indicated by the market. The calculation of this value involves the determination of a time horizon, of an actualization rate and of some estimated cash flows. In order to overlap the fair value, these necessary elements must reflect the anticipated features of the market. [5]

Thus it appears a sort of emphasis of time value for assets, liabilities and capitals. If this function consists in ensuring a better prediction of cash flows, then fair value is more pertinent than historical cost because it permits the realization of a distinction between two assets with a same entry value but generating different cash flows. A fair value assessment tends to depressurize the prudence principle, because both added values and minus values appear in the balance sheet. This approach should balance the predictions of cash flows generated by the enterprise activities.

Manager's decisions do influence the size of the result as the manager is the one that decides the moment of transaction and that models this result. He is the one that can decide to hurry or to slow down a transaction, not taking into account the features of the enterprise activities.

4. A compromise between historical cost and fair value

Analyzing the historical cost and fair value, C.Hoarau and R. Teller propose an accounting model of substantial or strategic value ("*le modèle comptable de la valeur substantielle*"). [6]

This is seen as an interpretation instrument of possible distortions between financial value (market value) and internal value (management value), between the issues of short term value and that of a long term strategy assessment. Strategic value results from the integration process of the value perceived by the customer and the value created by the enterprise. The

justification of this model is reflected through the cost accounting capability to model the multidimensional aspect of global performance. This is possible by overlapping the objective of simple cost calculation necessary to assess the incidence of choice reflecting the value at the moment when demand meets supply in time and space. This was put into practice within a normalization project of the accounting elaborated by Jenkins Committee (this committee is a subdivision of AICPA – an organism responsible with the regulation of financial reporting in United States). The recommendations concerned the development of an accounting model of *economic reporting (business reporting)* that could better satisfy the needs of information users and replace *the financial reporting model*. Hoarau and Teller consider such a model as an expression of the following relation:

Fair Value = f (strategic value). They sustain that fair value model is created on the actual value of present and future projects. Such a model comes to ensure the investors' need for real and credible information, rather than that of other users categories of the information presented in the financial situations.

The answer at these searches must contain the fair values of the items presented in the financial situations. Any of the defined values might be considered a fair value in certain circumstances. Finally, the rightfulness of the chosen value will depend on the professional reasoning of the specialist dealing with the financial situations.

The decrease or the increase of market values generates mutations in the enterprise performance that could lead to assessments with a high sensitivity degree, influencing even the enterprise. Out of this perspective historical cost ignores the value mutations generated by the market, ensuring the continuity of the enterprise. At this point, we ask ourselves: *could the concept concerning the continuity of activity be maintained as a basis of financial situation elaboration in the context of assessment of all structures at fair values?* But markets efficiency problems are related to accounting assessments.

Furthermore, we could ask again: *have accounting standards worsened the crisis of the credits turning it from a liquidity crisis into a solvency one?*

There have been used subjective models that had not reflected correctly the real conditions in the past months. This has led to massive decreases of banks that forced other players to use a lower benchmark. This has also led to the tendency to sell before the decrease of the price, creating a vicious circle.

Like a general comment, I would assert that the preparation of the annual balance sheet will be more difficult this year and will take greater efforts and a more sustained work out from the companies responsible. The specialists have the main responsibility to present to the owners the real and correct image of the enterprise financial position.

As *vulnerabilities* of the accounting model in the context of the current financial system development, we could remember: the securitization expansion in the economic model of financial institutions; the incapacity of the accounting model to face up these innovations which allowed to „throw out from the balance sheet” of some financial assets by the means of creating entities with a particular purpose; the problems related to the derecognition of some assets; the complexity of some hybrid instruments which raises the difficulty of their reliable reassessment; the fair value and its procyclical effects; the unrealistic expectations referred to the information included in financial situations.

In the current economic context, fair value could also have some *pro arguments*:

- it is the only assessment base surprising derived instruments;
- it contains actual information;
- it permits the performance measurement using the global result;
- it assures the comparability at a moment after initial recognition for similar assets but acquired at different time;
- it is oriented to forecasts, because it is based on future cash flows;
- it permits a global accounting of the assets’ value which is characterized, in some cases, by important periodical fluctuations;
- it assures a higher consistency of risks management concerning the owned assets;

- it limits the marking practices of the gains through discretionary sell of assets;
- The inexistence of active markets do not justify the fair value abandon but the development of assessment methodologies;
- Fair value didn’t generate the financial crisis and its abandon will not solve the problems.

Giving up the fair value when markets are decreasing, would deprive investors of useful information, would also affect the neutrality of accounting as well as the independence of the normalization organism.

In the same time we could bring some *arguments against fair value*:

- Fair value cannot ensure the precision of historical cost;
- The lack of active and liquid markets makes fair value subjective;
- We notice some risks involved by the models in use (the past is not a reliable basis for the estimation of the future);
- It does not reflect the management intention to keep the asset but that to sell it;
- The accounting purpose is not to reassess the entity (this is the task of the market);
- At the market decrease, the reassessment to a fair value could determine the non accomplishment of maintaining capital criteria;
- Fair value is procyclical which means that it accelerates the market decrease by encouraging the sales in order to fulfill the capital conditions.

5. Action directions for concerned organisms

IASB launched a few actions leading to the resettlement of fair value. This Board admits the necessity to clarify IFRS addressed to the new markets development. IASB monitored the evolutions from the US in order to avoid inconsistencies in accounting treatments under IFRS or under American Standards (US Generally Accepted Accounting Principles-GAAP).

On 16 September 2009, IASB launched a guide project to measure the financial instruments fair value on markets that are no longer active. By this, IASB takes into

account the raise of consistency between IFRS fair value and the one given by GAAP.

IASB will work closely to FASB in order to develop a common approach to the problems related to assets and liabilities evaluation resulted from the purchasing by the means of the Emergency Economical Stabilization American Act and other international programs.

The Board will help the promotion of GAAP measures, the ones allowing entities, in rare cases, to reform financial instruments that take the form of securities.

Moreover, the GAAP allow some loans that are not considered securities to be transferred from „sale” (measured at the smallest value between its cost and market price) to „investments” (measured at depreciation cost).

IASB admits the necessity of continuing the examination of accounting principles IFRS for financial instruments, taking into discussion a possible replacement of IAS 39.

IASB consolidation projects as well as the Financial Stability Forum (FSF) responses involve a series of actions from the Council of London. IASB will improve, by rapid procedures, the accounting international standards and will be more open to the reports out of the balance sheet and to the convergence with GAAP.

At concept and standard level, things have not changed yet. But they have certain inertia. At this moment, the concept of „*fair value*” that is attributed to the assets appearing in enterprises accounting balance sheets is analyzed and revised and it is given different interpretations. It is not excluded that next year there would appear some other new issues concerning the manner according to which the assets are emphasized in the balance sheet.

6. Conclusion

The estimation of fair value is complex in the conditions of an inactive market full of uncertainties. In these circumstances, the expansion of fair value model utilization might be considered from the perspective of the costs involved and that of the purpose to which the financial situations are intended. A too complex model, incoherent and not adapted to the economic realities which are supposed to be represented, could harm the accounting information credibility.

The consequences of the accounting model on the behavior of the actors involved must be considered in the elaboration process of the new accounting model. This model is foreseen to reflect the way by which these entities are able to create value.

Abstract

Cash flow arising from relationships with third party entity that occur in connection with fighting money mutual rights and obligations are known as cash flows. Accordingly to the three types of specific activities of economic entities, we find three of its essential functions, namely: operating, investing and financing, each of these features contribute to the variation in cash. In Romania, the cash flow statement is considered part of the annual financial statements since 2001, with the entry into force of the Gazette 94/2001 for approval of accounting regulations harmonized with the Fourth Directive of the European Economic Community and International Standards Accounting.

Key words: cash flow, operating, investing, financing

JEL Classification: M11, M41

1. Introduction

Any economic entity is an open system has multiple and complex relationships with both its structural components and the outside environment, generating, real flows and cash flows.

Cash flow arising from relationships with third party entity that occur in connection with fighting money mutual rights and obligations are known as cash flows [7]. Accordingly to the three types of specific activities of economic entities, we find three of its essential functions, namely: operating, investing and financing, each of these features contribute to the variation in

cash. The continental accounting system, applied in our country and the Anglo-Saxon recognize three categories of cash flows, grouped by the nature of what it generates in: cash flows from operations, cash flows from activities investment, cash flows from financing activity.

2. Materials and Methods

Thus, Treasury economic entity can be analyzed within flow, earnings and payments that period, but within the stock, treasury that the economic entity at a time, realizing the link between the two variables thus: treasury at beginning of period + earnings period - period = treasury payments at the end [7].

For liquidity management, used a document called cash flow forecast which will highlight future cash flows on the three types of activities of the economic entity.

In Romania, the cash flow statement is considered part of the annual financial statements since 2001, with the entry into force of the Gazette 94/2001 for approval of accounting regulations harmonized with the Fourth Directive of the European Economic Community and International Standards Accounting.

Current regulations in force, respectively Gazette 3055/2009 approving accounting regulations consistent with European Directives repealed Gazette 1752/2005 which was made a number of changes in accounting reports did not contain specific provisions related to its preparation, which

allows enforcement existing international practice. International Accounting Standard IAS 7 [1].

Cash flow statement, cash flow sets (the context of our work and cash flows) as the entrances or exits of cash and cash equivalents and cash flow by drawing panel is intended to provide a base of users of financial statements to assess the economic entity's ability to generate cash and cash equivalents and its needs to use those cash flows.

In the cash flow statement, according to the functional approach to the economic entity's activities, flows are grouped together, as I said, in three categories:

- flow generated by operating activities (operating);
- Investment flows from the activity;
- flows generated from financing activity.

Analysis of cash flows on all three types of activities is useful for correlating with cash profit or loss, cash separation of the activities involving non-cash, assessing the economic entity's ability to meet its obligations for payments cash flow evaluation cash for future activities (cash flow strategy). Utility analysis is time that global change is outlined in the Treasury cash balance resulting from management of real assets (from operations) and the results of operations and finance capital investment, know the fact that when real and monetary flows do not coincide, as it actually happened, the Treasury shall ensure gaps in payments associated with these flows[5].

Cash generated from operating activities are the result of the main income generating activities of the economic entity, they result from transactions which contribute to the formation of net income. The value of cash flows from operating activities is a key indicator of the extent to which the economic entity's activities have generated enough cash flow to repay loans, maintain the functional capacity of the entity, pay dividends and make new investments without recourse to external financing sources.

At the same used with other information, values related to operating cash flows may be useful for forecasting future cash flows related to operating. IAS 7 illustrates some of the cash flows generated by operating activities: cash receipts from the sale of goods and services, cash receipts from royalties, fees, commissions and other income, cash payments made to suppliers goods and service providers, cash payments made to and on behalf of employees, payment of taxes, payments and cash receipts generated by the purchase / sale of securities

purchased for speculative purposes (or investment transactions), given that stocks are similar.

Cash flows arising from investment activity. Investment activities are the acquisition and alienation of long-term assets [4]. In this category are classified: cash payments for acquisition of land and fixed assets, intangible assets and other such long-term assets, cash payments arising from the construction undertaken by direct labor, cash receipts from the sale of land and buildings, plant and equipment, intangible assets and other such long-term assets, cash advances and loans made to other economic entities (not if the economic entity is a financial institution which granted an advance), proceeds from repayment of advances and loans made to other parties (not If a financial institution).

Cash generated from financing activity. Financing activities are activities that are to change the size and composition of debt equity and economic entity. In this category fall: cash receipts as a result of issuing shares, cash payments to shareholders to purchase or redeem shares economic entity, cash receipts due to the issuance of bonds, the proceeds of loans received, cash repayments loans [2].

Statement of cash flows can be made, in accordance with IAS 7, using either direct

method, that information relates to receipts and payments in their rough sizes or indirect method that the net result is corrected with influence monetary transactions with nature, with elements Revenue and expenses associated with cash flows covering investment or financing activities, to influence changes in working capital items required for the treasury.

Economic entities are encouraged to report cash flows from operating activities using the direct method, since it provides information useful in forecasting future cash flows and are not available, the indirect method [3].

Although IAS 7 should use the direct method, especially for informational needs of investors who can make a better forecast of future cash flows, most economic entities prefer using the indirect method because the method of calculation closer to accounting reporting format and to the more discreet in the publication of financial statements required by the cash flow statement direct method would not benefit image entity.

We propose, for example, developing cash flow statement using direct method, for 2009, SC CANAL, based on data from financial statements (Table1.):

Table 1. Cash flows situation

Element name	Previous 2008	Current 2009
Cash flows from operating activities:		
Receipts from customers	7.166.698	6.688.848
Proceeds from short-term loans	-	-
Payments to suppliers and employees	5.537.580	4.949.235
Interest paid	22.287	17.307
Payments to consolidated budget	80.959	206.168
Proceeds of insurance against earthquakes	-	-
Net cash from operating	1.525.872	1.516.138

activities		
Cash flows from investment activities:		
Acquisition of shares	-	-
Purchase of tangible fixed assets	838.028	470.111
Proceeds from sale of tangible	61.612	62.943
Interest received	10.831	31.409
Dividends received	-	-
Net cash from investment activity	-765.585	-564.463
Cash flows from financing activities:		
Proceeds from issue of shares	-	-
Proceeds from long-term loans	-	-
Payment of financial leasing liabilities	247.861	121.044
Dividends paid	131.917	143.900
Net cash from financing activities:	-379.778	-264.944
Net increase in cash and cash equivalents	380.509	686.731
Cash and cash equivalents at beginning of period	-	380.509
Cash and cash equivalents at end of period	380.509	1.067.240

3. Conclusions

The presence of the cash flow statement helps to improve information for users but also to strengthen the prime source of accounting information, because is the basis of any strategic and financial analysis.

The effects of the Global Crisis on the Loan System

Mocanu Nelu

Universitatea Liberă Internațională din Moldova

E-mail: nelly@cta.ro

Abstract

This paper offers a broad introduction to the workings of the global financial system, the dynamics of the main financial markets, the nature and goals of the key financial institutions and the crucial role played by central banks and regulatory agencies. An important part of the paper focuses on the 2007-2009 global economic and financial crisis, reviewing its causes and consequences, as well as evaluating the merits of the numerous government intervention schemes in the U.S. and Europe. In the end, however, such a blister would not be possible either without an inadequate regulation framework.

Key words: global crisis, loan system, financial crisis, financial market, central bank.

JEL Classification: G01, G21

1. Introduction

The temporary liquidity bottleneck could by the actions at first are overcome. Nevertheless, the crisis is not yet put up, because it just concerns not a pure one liquidity crisis, but around a loan and solvency crisis from not yet to foreseeable dimensions. Above all they are unclear Back effects of the financial crisis on the "real" economy, thus on investments, production and above all the private consumption.

But how could it at all generally come? For a first several ropes, that transported this process, must crisis analysis is brought together: to the one, the interest level plays a crucial one in the USA Role and with it the global interest rate differential, the new finance market protagonists and instruments are to the other to name, that dominate this "game" decisively. Building, the potential repercussions become on this analysis the finance crisis on the "real" economy sketched and in conclusion some, the "favourable"

opportunity appropriate regulation suggestions presented.

2. Interest politics and global interest rate differential

Starting point of the analysis is the bursting of the new economy - blister before good seven years. The American consumers chose the international economic network: the US market its consumer for one fifth of the global consumption responsible is, the most important home market of this is world and consequently the private consumption absolutely has one in the USA critical world-economic meaning. That was notwithstanding interest level in the USA still higher than in other countries, exactly in the direct comparison with Japan. The Japanese one central bank pursued as reaction to a stubborn one namely deflation de facto zero interest politics. This with it walking around global interest rate differential provided the necessary and steady one capital stream in the USA. The interest rate differential was an important factor, so that its role as a global "debtor and consumer the USA further-plays last authority" on high accomplishment balance deficit could.

At the end of this years-long one(s), from low interests supported it came upswing phase at the American real estate market this summer now however to one for a long time prophesied correction. The trend reversion consists at first those they real estate prices no more into the infinite climbs but a cooling found out. The global liquidity, that to big extent in the US-market flowed, became into the hands of American home candidates given, even if these under normal circumstances for not financially sound would have been considered, so-called "Supreme Mortgages", too German: second-class mortgages.

No personal capital for such loans was required not rare odder abandoned the

acquaintance payments for years, what it boom, major-driven, kindled even further.

What from the immobilize-crash in the USA a global credit crisis could do, new finance market instruments were, this itself in the last years of big popularity pleased. The mortgage banks in the USA tried over the bonds, its cancellation risks of this from time to time more than questionable, To pass on real estate credits, in that on the other hand others banks the separate credits focused and at investors in it to whole world as special bonds, it sold. The most popular instrument products structured such; the so-called ones were "Collateralized Debt Obligations" (CDOs). That is a promissory note that in several trenches-after kindness and cancellation risk the underlying credit pool-was apportioned.

The bigger the cancellation risk, the bigger the risk prize. This deceptive at such constructions was, however, that even the trenches, that seemingly quite good against losses protected was and in so far as from the pertinent rating - marked agencies wrongly with topmost music became, pulled in effect with a market collapse became. Speak, an IKB or Saxony LB that as well itself such CDOs secure allegedly had swamped, suddenly stood in it's for tax and supervision reasons to Ireland evacuated investment vehicles, named also "Conduits", before red numbers.

The crucial protagonist group in this game of the global one(s) the speculative hedge were concatenation of credit risks funds as well as investment banks. This most narrowly into the credit network entangled protagonists, the hedge funds, therefore fall also already by the dozen about. That would be essentially not further problematically; they would become with the insoles exclusively its customers-in normally extremely moneyed privateers-works.

However, their business model is based on the so-called one to the one "Leverage", that is they work with credit levers, in that it on the insole capital a multiple about foreign capital picks up.

Become with the so multiplied total capital then among other things the high-risk trenches the structured finance products bought. The credits for their levers get it of the big credit institutes that even in normally also such funds drive. To the other, there is their model in the

transformation of periods: Long-term, little fungible and partially illiquid and intangible assets become in normally at short notice financed. The systemic dynamite lie justified in this "Term Mismatch" now on the one hand and on the other hand in the intangible investment structure.

The credit cycle with the inter result closes with it, that the global credit system over Conduits and speculation businesses into the break-in of the US-American mortgage market entangled is. The interconnection explains also the interventions the big central banks: the credit system threatened literally, to dry up. The mistrust of the credit institutes can among each other potentially to the drying up of the interbank market leads and there still is the danger that they Credit-giving banks her/its/their positions "herd-nicely" liquidate must. then, many have to structure products, for them, it up to now at all no market prices gives, compulsory-sold becomes and would cause a chain reaction. However, the real size of the too expectant credit and solvency crisis is absolutely foreseeable,

3. Stake and its real consequence

Not only the USA even have interest in a strong demand in the USA but the entire world economy, all in front the big export countries like China, Japan, the OPEC states and Germany. Consequently, the real estate boom was in the USA for long time, at least short-term interest of the entire participant.

While from official side conciliatory a "cleaning thunderstorm", this, is spoken of to a more realistic reappraisal of the risks leads and greeting in this respect is, the reactions of the governments speak and grade banks another language.

The reason for it is in the central meaning of credit money for the real economics. The nature of the credit funding if it is to be accelerated economic activities, this regulatory agencies buying power level is lifted. In the reverse conclusion, the current restraint means with it credit award a lowering of the buying power. The credit cancellations is not moreover restricted on the real estate market but can itself on CDOs with credit cards and auto credits as well and with the funding of private-equity-investitures stretches. Now

what he/it as liquidity crisis of sides still. It is played down banks, can change fast into a solvency crisis; with entire economic consequences in form one, at first US-American, economic situation break-in absolutely with global dimension.

Admittedly, the grade banks can reduce the money in price further, they have however nevertheless only restricted direct control over them money quantity. The willingness of the banks, that them from the grade banks, to call accessible done liquidity, it can don't influence directly. Moreover, also the central banks know not, where the risks lie and they have which size. Short: the means and instruments of the central banks, the crisis, to catch, are restrict.

4. A time window for new rules

The limited money politics therefore must through more strongly preventive working, political measures are supplemented-in these senses must the crisis used as chance for the regulative protagonists becomes. At first place, Hedge would have to funds and this other market protagonists and its owners (big banks, investment banks) are regulated clearly more strictly. After this youngest experiences with these protagonists signal in the meantime also the USA and Great Britain willingness, the rules, to intensify. However, this industry is to the biggest share to find in different finance locations, why itself for an effective control at first only the increase of this it offers domestic banks - and finance market regulation.

The finance market crisis threatens worldwide the prosperity. However, in her latest pointing cooperate false developments of the markets and policy which often go back far back in the past: the global deregulation of markets without suitable political-institutional imbedding and control; the retreat of the state in many lands which has subjected more and more economic activities to the imperative of the capital markets; the process of independence of the finance sphere; the growing dissimilarity with the accumulation resulting from it of the assets which go hunting after more and more unrealistic yields and worth increases.

The Involvement of the International Monetary Fund in Financing the Heavily Indebted Poor Countries

Irena Munteanu

Universitatea „Ovidius” Constanta

irena.munteanu@yahoo.com

Abstract

The International Monetary Fund was created following the agreements reached at the monetary and financial Conference of Bretton Woods (July 1944) and it is one of the most important international organisms for exchange rate and financial cooperation. Although its objectives were and still are hard to reach, the importance of the IMF derives precisely from its ambitious policies of stabilizing the balances of payments. Considered by many analysts as the “rich countries club” - due to the votes’ assignment procedure weighted on the contribution to resources, the IMF is, nevertheless, a real support for transition and poor countries.

Within our study, starting from the official data provided by the IMF, we have carried out an analysis of the financial support activity for the heavily indebted poor countries (HIPC). The research allowed us to observe that the role of the IMF has intensified over the recent period. This does not support the analysts’ critical opinions that the IMF activity should restrain. Moreover, we have noted that, as the financial crisis spread from the developed countries to the developing ones, the IMF has reinforced its support to the low-income countries. The new initiatives will conclude in the increase of the IMF preferential loans volume up to 17 billion euro by 2014. In this context, we consider our research takes into consideration present-day, interesting issues for a large range of users.

Key-words: loans, credit facilities, poor countries, PRGF, HIPC.

JEL: G20

1. Introduction

The Agreement of the IMF represents the legal framework which defines the rights and obligations of the member states.

The Agreement of the IMF has been modified three times after the Bretton Woods conference. [7] According to its Agreement, the IMF undergoes activities that fall within the system (loan operations, production of financial-monetary information, etc), but, especially activities that fall within the regulatory connection of the international financial and monetary system. [5]

According to the first Article of the Agreement, the IMF has the following objectives:

- to promote monetary cooperation;
- to facilitate the expansion of international trade;
- to remove the exchange restrictions in international trade and financial flows;
- to offer member states short and medium term loans in order to address temporary difficulties in external payments balances, without these countries having to adopt potentially damaging measures for the national and international prosperity;
- to promote exchange rates stability and avoid monetary devaluation as an international competition means;
- to shorten the duration and diminish the external payments balances difficulties of the member states. [6]

According to its objectives and the means at hand, the IMF is also implicated in financially supporting poor countries.

2. Poverty Reduction and Growth Facility

In September, 1999, the IMF introduced the Poverty Reduction and Growth Facility (PRGF)

in order to make the poverty reduction and economic growth goals even more important for the loan operations towards the poorest member states.

Starting with August, 2008, 78 countries with low incomes are eligible for PRGF assistance. Eligibility is mainly based on the IMF evaluation of a country's per capita income, drawing on the maximum eligibility limit for eligibility to World Bank preferential lending (currently the 2007 per capita gross national income of \$1,095).

The PRGF loans have a 0.5% annual interest rate. The repayments are made twice a year, starting in the second half of the fifth year up to the tenth year since the disbursement.

Among the eligible countries confirmed as of August 2009 there are: Afghanistan, Albania, Angola, Armenia, Azerbaijan, Bangladesh, Benin, Bhutan, Bolivia, Uganda, Uzbekistan, and Vietnam.

An eligible country may normally borrow up to 280% of its IMF quota under a three-year engagement, although it can be increased up to 370% of quota in exceptional cases. In each case, the amount depends on the country's balance of payments need, of the strength of its adjustment program, and its previous and outstanding use of IMF credit. In the initial three-year arrangement is 140% of quota is accessed, then 125, 110, 90, 70, and 50% of quota for those using the facility up to six times. [8]

"Low-access" PRGF arrangements with a standard level of 10% of quota may be used by members with little or no immediate balance of payments need, which still desire an engagement with the Monetary Fund as guidance for policy implementation. PRGF-eligible members with per-capita income above 75% of the maximum eligibility limit for World Bank preferential lending, or members borrowing on commercial terms, may combine PRGF arrangements with lending from the IMF's non-preferential Extended Fund Facility. [1]

In the recent years, most borrowings from the IMF were made through the PRGF initiative.

3. The Exogenous Shock Facility

Member states may also access the Exogenous Shock Facility (ESF) which helps countries deal with economic shocks, such as

price increase on food products and fuel, or natural disasters that cannot be managed by the governments and which have a negative impact on economies. The 0.5% interest rate is the same as for the PRGF, the repayment period is between 5 and 10 years. [2]

During the first eight months of 2009 the new PRGF-ESF agreements have reached 2.1 billion SDR compared with the same period of 2008 when the amount was only 0.8 billion SDR. This amount includes:

- (i) SDR0.8 billion to four countries with new agreements,
- (ii) increases for seven arrangements totaling 0.3 billion SDR,
- (iii) approximately SDR0.1 billion in ESF financing for ten countries.

According to the data provided by the regional departments for each country, the new engagements from the end of 2009 were of approximately 0.7 billion SDR.

4. Policy Support Instrument

In the past years, many low-income countries (LICs) have made significant progress towards economic stability and no longer require financial assistance from the IMF. Still, many of these countries continue to seek the Fund's counsel, as well as its monitoring and approval of their economic policies. In order to come to the aid of these countries, the IMF has created a support and policy signaling program called the Policy Support Instrument (PSI). [3]

Aside from loans, some of the low-income countries are also eligible for debt-relief according to two key-initiatives:

-The Heavily Indebted Poor Countries – HIPC-Initiative introduced in 1996 and consolidated in 1999, through which the creditors offer debt-relief in a coordinated manner in order to reestablish debt durability;

-The Multilateral Debt Relief Initiative where the IMF, the International Development Association (IDA) of the World Bank, and the African Development Fund (AfDF) have cancelled 100% of their debt claims for certain countries in order to help them advance towards reaching the Millennium Development Goals.

5. New Instruments. Provisions for facilities agreements over 2010 – 2014

The IMF support to the poor countries needed an update, first of all because of the improved economic conditions of the respective countries. More states have made great steps towards macroeconomic stability. In the 90's the great majority of the low-income countries were confronted with long term economic problems that required a long-term radical changes policy, which was often accompanied by debt relief or cancellation.

Nowadays, despite all that, many of these countries have become more open and integrated in the world economy. The low-income countries are now joining the international capital markets, entering the goods and services markets, attracting foreign investment, cultivating their financial sectors and benefiting from the money sent home by the citizens working abroad. [4]

Despite this large international opening, there also comes a greater vulnerability and an exposure to the world economy ups and downs. This was pointed out by the impact the sudden booms in food and fuel prices had on many countries' economies over 2007 and 2008. There followed the economic crisis. It was obvious that a new generation of more stable, yet more vulnerable low-income countries would need a new generation of support loan facilities from the IMF.

On April 23, 2009, the Executive Board of the IMF adopted a series of ample reforms of the concessional loans for the low-income countries, thus creating a new range of facilities that is more flexible and more adapted to the increasing diversity of low-income countries and their needs. These reforms will become effective and operational as soon as all current creditors and collaborators of the PRGF-ESF trust give their consent and the additional loan arrangements shall be guaranteed by the community.

In order to satisfy the credit demand up to 2014 there is estimated that there shall be needed loan resources of SDR11.3 billion (\$17 billion).

Taking into consideration the available resources, there shall be mobilized supplementary loan resources of SDR9 billion (\$14 billion) and new undertaken resources of SDR1.5 billion (\$2.8 billion). It is foreseen that, just like in the past, the required additional loan resources will be mobilized through bilateral contributions.

Nevertheless, the greatest part of the necessary additional resources will come from the internal IMF resources – including those related to the limited gold sales approved by the Executive Board on September 18, 2009, with additional bilateral contribution of SDR 0.4 billion required in order to complete the financing package.

There is expected that these reforms should increase the available resources to SDR 11.3 billion (\$17 billion) by the end of 2014, including \$8 billion over the following two years. This overcomes the G-20 estimates that foresaw additional loans of only \$6 billion over the following 2-3 years.

This reform shall also offer exceptional debt relief.

6. Conclusions

The role played by the IMF in supporting the development process derives from its functions. This institution is the main environment for the coordination and surveillance of the national monetary and fiscal policies. Moreover, the IMF was actively involved in the reform processes of the transition countries. As the IMF officials pointed out, this institution has a determining role in ensuring a profitable dialogue in view of analyzing the problems these countries undergo and establishing the most adequate strategy to solve them.

The organization was accused of supporting the capitalist military dictatures befriended by the European and American corporations. The critics also add that the IMF is hostile to the democracy, human rights and work rights ideas.

Still, the greatest reforms of the past two decades at the Fund's level were in the LIC support area. The IMF has activated a new package of loan facilities for the poorest nations of the world, a measure taken partly due to the present economic crisis.

The world financial crisis had and still has a powerful impact on the poor countries, many of them being confronted with a significant deterioration of their external positions. The loan request up to October 2009 was stronger than expected (the new borrowings reached SDR2.1 billion by mid-September 2009, compared with SDR0.8 billion over the entire 2008).

The concessional financing request of the

IMF is expected to remain at a high level over 2010 since many poor countries will continue to be confronted with a hostile environment, even if the global demand starts to recover.

Consequently, the IMF has to be prepared for the possibility that financing shall maintain at the present level of approximately SDR 2.7 billion (\$4 billion) for at least another year to the end of 2010. On the medium term, there is estimated that request could reach SDR 1.5 billion per year, double the historic long-term medium. Based on that, the total concessional loans is estimated to SDR 11.3 billion (\$17 billion) up to the end of 2014. These forecasts take into consideration doubling the access limits approved by the Governing Board in April 2009, as well as the implications of the new facilities range.

Although there are voices criticizing the activity of the IMF, we cannot deny its role along monetary history and accept that the facilities offered to poor countries are sometimes the only chance they have not to enter financial collapse.

Aspects Regarding the Dispersal of the Financial Crisis within the Banking Systems of the USA and the UK

Irena Munteanu

Universitatea „Ovidius” Constanta

irena.munteanu@yahoo.com

Abstract

The problems related to the financial crises or banking systems have fascinated the public and have been reflection subjects for economical analysts. The present financial crisis offered us the possibility to study a broad range of aspects regarding financial crises in general, the deficiencies of the modern banking systems, but also the strong connection between the two phenomena. In the present-day context, when we inevitably stumble upon the smaller or greater effects of the international financial crisis, the issue has become even more exciting. Starting from the general framework of the present crisis, we have analyzed within our research its effects on the American and the British banking systems. Although the specialized literature contains many materials referring to financial Crises, the present study contrastingly emphasizes the problems the two banking systems were confronted with, which represents a novel approach. Moreover, as the effects of the crisis are felt by everyone, the issue at hand is still “hot”.

Key words: financial crisis, sub-prime, financial debt, banks nationalization, non-performing loans.

JEL: G01

1. Introduction

The crisis, just like any other cyclical fluctuation is presented as an accumulation of errors leading to the wrong allocation of an enormous amount of capital at the level of the society. Crises have common elements and specific characteristics [8] (Munteanu, 2009),

and the characteristics of economies, their capacity to attract revenue, the inclination for savings or consume, position states differently in times of crisis. [2] (Balaceanu, 2009).

The financial crisis of 2007 had the unique aspect that it had started in the banking segment and later went to all other markets. The banking sector had always represented a crucial area of the economy, as a system, but also as a financial mediator or active participant to all financial and capital markets [1] (Anghelache, Anghelache, 2009). Nowadays, the econometric models penetrate the economic and financial analysis [7] (Druică, Cornescu, Munteanu, 2008), and the results are often relevant to the end-users.

Within the banking sector, central banks are a cardinal pillar, and during crisis conditions, it is the monetary policy decisions that can truly make the difference [5] (Cecchetti, 2008), especially that in the present crisis situation there is a strong relation between the monetary policy and the financial assets' price volatility [4] (Bernanke, 2000).

2. The impact of present crises on the American banking system

The duo *Financial Crisis – the American Banking System* may be regarded from the cause-effect point of view both ways. [9]

Since the dedicated literature has touched many aspects regarding the causes of the propagation of the crisis, we shall concentrate especially on the quantifiable effects at the banking system level.

It is already well known that at the

origin of the crisis lie the mistakes made on the US mortgage market, in the great volume of sub-prime loans given over 2005-2007. Therefore, high risk credit companies have given a total of 7.2 million credits amounting to \$ 1300 billion. Apparently, almost \$1000 billion were given by only 25 companies, which most American analysts regard as the originators of the crisis.

Approximately 25 banks relied on giving sub-prime loans, loans which did not take into account the assumed risk and were given without any security to insufficient income people.

After the crisis began, many people became unable to pay when the interest rates got higher. Thus, mortgage loans delinquency grew because the clients that had gone for sub-prime credits were no longer able to honor their promises of payment.

It can be noted an ascending trend of the late repayment credits starting in 2007. If during this year the share of 180 delay days credits was 6% of the total credits, in 2009 it rose to 14%. More and more people became insolvent once interest rates went up, causing losses to banks. This was only possible due to the fact that eligibility criteria had not been analyzed prior to the authorization of the loan.

The debt determined by floating sub-prime credits were afterwards transformed into securities backed by the mortgaging US government corporations – Fannie Mae, Freddie Mac, Ginnie Mae, etc – and then sold on Wall Street.

But the debt level of the owners of such titles was already extremely high, and the capital reserves, minimal. In their effort to stay solvable, exposed banks went for loans on the financial market to cover their losses. This, in turn, led to an interest rate increase pressure which finally generated the liquidity crisis on the market.

The financial services sector on the whole, suffered losses amounting to thousands of billion dollars, some companies being more affected than others.

As a result, the value of Citigroup recorded the most significant loss in absolute terms over 2007-2008, the price of its shares dropping by over 70%.

The drop is more than \$20 billion larger than the one suffered by UBS bank which lost 75% of its value. The losses of Citigroup,

amounting to \$68.1 million, together with those of UBS amounting to \$44.2 million, and other American corporations, led to the total loss of the sector of \$692.5 million.

The effects of the crisis were deeper carved by the bankruptcy of numerous banks all over America, their number recording an upward trend over 2007-2009 reaching an unprecedented average of 11 bankruptcies per month.

Figure.1: The number of bankrupt banks in the USA over 2000-2009

Source: Federal Deposit Insurance Corporation.

According to the graph, after a three-year period, 2005-2007 when there was either no bankruptcy or the figures are no reason for concern, starting with 2008, starting with the massive losses recorded, with the fierce lack of liquidity, many banks became insolvent and their assets were taken over by various companies.

The banks' bankruptcies started in 2008, but in 2009 reached their peak at a total of 120, after the insolvency in early November of five more financial institutions.

The biggest of the five banks was United Commercial Bank of San Francisco with \$7.5 billion in deposits and subsidiaries in USA, Hong Kong and Shanghai, followed by United Security Bank of Sparta, Home Federal Savings Bank of Detroit, Prosperan Bank of Oakdale and Gateway Bank of St. Louis.

Thus, in 2009 there were around 11 insolvencies a month and the resources of the guarantee authority dropped under the \$10 billion threshold, compared with \$45 billion only the previous year. The figures come close to those recorded in 1992, the most

difficult year for the American banking system, when there were closed 181 financial institutions.

3. The particularities of the propagation of the Crisis in the British banking system

The financial crisis was felt in the Great Britain banking system immediately after its beginning. It was already showing signs of going towards a recession similar to that of 1992 because of the common element – the excessive increase of debts.

The Bank of England had already called attention on the matter of the great share of debt that UK families had in the total debt.

In early 2009, the total volume of British personal debts rose to £1460 billion, exceeding the amount the country produced per year. This amount recorded an increase of approximately 165% since 1997, every British family having an average debt of approximately £60 000. Obviously, the crisis expanded in a natural manner to the UK, as well.

Moreover, it is obvious that the greatest share of the debt was represented by mortgage loans.

The impact of the financial crisis over the British banking system stood up through: banks nationalization, stock market shares drop the necessity of emergency credit acquisition from the Bank of England, stopping loan floating.

The most important nationalization was that of the Bradford & Bingley bank in September 2008, a British financial institution specialized in mortgage loans with a network of approximately 200 subsidiaries. In order to save the bank from collapse, there was perfected an agreement with the Spanish group Santander to take over the retail deposits and the subsidiaries network for the amount of €504.9 million. Santander acquired over 2.7 million savings accounts from B&B containing deposits of €26.5 billion, these accounts being transferred to Abbey, another bank acquired by Santander in 2004.

Another bank the crisis had a major impact on was Northern Rock, a bank nationalized in February 2008, the value of its shares having dropped by approximately 40% on the London stock exchange in September 2009. thus, the market value of the fourth greatest

loaner in UK reached £1.2 billion. The stock value drop determined the bank's clients to draw a total of approximately £2 billion, meaning almost 8% of the bank's deposits.

Northern Rock contracted an emergency loan from the Bank of England as it was mostly counted on capital markets than clients' deposits in order to finance its activity, 73% of the income was covered in loans from other banks.

Besides Northern Rock, Bradford & Bingley, which was also counting on inter-bank credit to finance its mortgage credits, also recorded decreases in stock value in September 2009. The value of Bradford & Bingley shares dropped by approximately 7.7%, recorded the greatest decline since 2000 and reaching the level of 329.75 pence / share.

Share devaluations were also recorded for the Royal Bank of Scotland and Lloyds Banking Group, banks rescued from bankruptcy by the state. UK Financial Instruments, the organisms managing state shares in nationalized banks announced a £10.9 billion loss over the stock exchange depreciation of the two banks' shares.

Regarding the loans offered by the British banks during the crisis, the Royal Bank of Scotland and Barclays Plc, two of the largest banks in UK, reduced loan floating even after promising the government that they would offer more credits in order to support the comeback of the economy.

RBS and Lloyds Banking Group Plc, the two large banks saved through governmental help, together with Barclays Plc, reduced the total amount of credits by £165 billion over the first half of 2009. RBS and Barclays reduced loan floating by 11%, the greatest drop recorded over large banks in Europe, diminishing the loan level for private personas and companies by 9.5% over the first half of 2009.

4. Conclusions

The effects of the 2007 Crisis were in deed dramatic, both from the financial and the psychological points of view. The United States, "the country of all possibility", fully deserved the collocation, only this time in a negative way. In a country where citizens felt

secure, protected by the developed American economy, deeds almost unimaginable for the first decade of the 2000's: chain bank insolvencies, unemployment and forced sales, companies nationalization.

In the British system the total loans authorized by the top five UK banks dropped, in average, by 5.4% over the first semester of 2009, a drop five times bigger than that recorded for the top ten banks in Continental Europe.

RBS, 70% owned by the government, reduced its loans portfolio by £91 billion, Barclays by £50 billion and Lloyds by around £24 billion.

As a conclusion, UK recession had at its basis the financial services, different from other states such as Germany and Japan where problems were represented by decreasing demand, government inability to find ways to stimulate industries, etc.

Practically, if these latter countries had a more industrial crisis, the UK was confronted with a credit crisis, greatly due to its connection to American economy. The UK Treasury spokesman declared: "British economy has suffered the economic equivalent of a massive heart attack and it is still weakened. With a banking sector still in trouble, we are not out of danger".

Actually, the UK and the US will only be able to recover if they correct the fundamental imbalances, especially since the countries' economies are based on financial services.

Materiality – Precondition or Consequence of Applying Professional Reasoning in Preparing and Presenting Financial Statements

Prof.univ.dr. Victor Munteanu

Lector univ.dr. Alice Țîntă

Universitatea Româno-Americană București

E-mail: a2c_vm@yahoo.com

Abstract

The reliability of the accounting information is one of the most significant features in terms of quality and refers to its capacity to influence investors, creditors and other users of the financial statements in their decision-making. A reliable piece of information helps users assessing present, future and past events, confirming and correcting potential past errors.

The use of materiality in the accounts helps us simplifying processing of accounting information, but we must be very attentive to the results and if they are needed in the present format.

The threshold of materiality is not applied in a rigid way, but every year we need to make difficult decisions in this regard, decisions which consider both the size and characteristics of the company and its specific situation, decisions which will tend toward a degree of accuracy of 100%, only by practicing in time of the professional reasoning by the certified accountant or accountant expert.

Key words: financial statements, information, reliability.

JEL Classification: M4, M41

The information's reliability regarding a certain element which must be acknowledged in financial statements, may not be assessed distinctly, but it must be assessed within the frame of the main objective of the financial statement, namely to provide useful information for decision-making with respect to investments, financing or exploitation. Moreover, the relevance must be taken into account within the frame of the drafting of the entire set of the financial statements and the

way according to which an acknowledged element is useful in the decision-making process.

Example¹

The ALFA Company manufactures apparel for the BETA Company, which operates a domestic retail chain. In time, BETA has become the main client, ensuring 80% of ALFA's retail market. Although, the international standards do not provide explicitly such case, the ALFA management has to provide in their financial statements, information regarding the sales' preponderance towards BETA in order to ensure the relevance of the information provided. BETA is a significant client, which may affect the future economic situation of ALFA. Therefore, failure to provide such relevant information may affect the decisions made by users based on the financial statements.

The *General IASB frame* claims that the information's quality depends on the contribution of the **information's nature and materiality benchmark** when drafting the financial statements. The information's nature refers to the information's descriptive feature (related to a new activity segment, related to an incorporeal immobilization, etc.) and the materiality benchmark endorses the information's numerical feature (the value of the outcome achieved within the new segment, the value of the reported incorporeal immobilization, etc.).

By means of an original disposition, the *British standard* presents the materiality benchmark as a self-contained feature and moreover the most significant feature. This significance arises from the fact that failure to provide significant information leads to complicated financial statements, which limit the understandability of the other information provided.

¹ Price Waterhouse Coopers, *Applying IFRS*, www.pwc.com

The two positions regarding the reasoning ascribed to the materiality benchmark regarding the qualitative features are blended in the *American frame*. This defines the materiality benchmark distinctly from the qualitative features, but closely related to relevance and reliability.

For instance, the decision to not provide certain information may be made due to the fact that investors (main users according to the American definition) do not need such information (it is not relevant) or the involved elements are too small (both in nature and value) to be provided (the information is not significant).

In accountancy, the **materiality benchmark** is defined under the form of a principle named the *Principle of the materiality benchmark*, (materialité or relative importance in French, with the remark that these expressions are not standardized).

The materiality benchmark represents the grounds of the concept of *true and fair view* from the British accountancy and from there it has been taken-over as concept by the International Accountancy (and Financial Reporting) Standards and as feature of the true and fair view in the European directives. It should be noted that in the European accountancy the principle of the materiality has been hardly assimilated and is not explicitly defined among the principles defined in the *Fourth Directive* of the European Union.

In Romania, until 1999, the concept of materiality was called *relative importance*. The relative importance is defined as the significance that an uninformed user, which seeks a decision, assigns to an item or event.

At present, this principle is not explicitly stipulated in the Accounting Law no. 82/1991, modified and republished, but following the attempt to harmonize the Romanian accounting with EU Directives and International Accounting Standards, the principle of materiality is clearly defined between the nine principles listed in the *Accounting regulations in Romania*. Moreover, the order regarding accounting regulations refers to this principle, the notions of significance and professional reasoning to be applied as regards the presentation of information, more concise and more detailed: "the elements of the Balance Sheet and the Profit and loss account indicated by Arabic numerals may be combined into a single

element in the financial statements of the company, where individual values are not significant to evaluate the property, profit or loss for the year". Although there have been published mandatory schemes for the Balance sheet and the Profit and loss account, likely to limit the freedom of those who prepare such situations, the Explanatory Notes can reflect the professional reasoning.

In the development regarding the implementation of the concept of materiality in the accounting rules, the American regulators have been those setting the cornerstone. In a first stage of the legislative process, the American accounting regulation authority, FASB (Financial Accounting Standards Board) introduced in each accounting standard requirements of the form: "the provisions of this standard should not be applied to items which are not significant". FASB defines the concept of materiality as the magnitude of omission or wrong declaration of the accounts which, in the light of existing circumstances, is likely the reasoning of people who rely on that information to be affected by that omission. A decision not to disclose some information may be taken, for example, if the amounts in question are too small to have any significance (not significant).

The concept of **materiality** is provided by the *General framework for the preparation and presentation of financial statements* as a component of the qualitative characteristics of financial statements, specifically as part of the information's relevance. This means that **a piece of information is material** when *it is likely for that person who used it to act differently if he did not have access to that information*. A piece of information is material if it can reasonably affect the assessments and decisions on the report or if its omission or erroneous declaration could influence the economic decisions of users. When assessed whether an item is significant, there are assessed together the nature and size of item. Depending on each situation, either the nature or size of the item could be the determining factor.

Example

As a result of the financial control that occurred in the last quarter of the concluded financial year, the

ALFA Company received fines totaling 10,000 u. m. This amount represents 1% of the company's total expenditure. Viewed from this perspective, the received fines can be considered insignificant in value. Since fines are received for irregularities found in the work, they can be considered as significant, this requiring their presentation separately in the Profit and loss account.

However, the concept of materiality is directly related to the concept of *aggregation*. Thus, the definition of the materiality principle states that any item that has a significant value should be presented separately in the financial statements, and insignificant items, but having similar nature or functions, will be added up, not requiring a distinct presentation.

In this respect, the *IAS 1 Presentation of financial statements* states that the financial statements result from the conclusion of a large number of transactions that are structured by aggregation, by group, depending on their nature or purpose. If an item is not individually significant, it is combined with other elements either in the financial statements or Notes. There are times when an item that is not significant enough to be presented in the financial statements may be significant enough to be presented in the Explanatory notes. For *example*, individual assets of the same nature and function are aggregated in the Balance sheet, even if individual values are high. However, items which differ in nature or function are presented separately.

Applying the principle of materiality and aggregation, in terms of values, we can group small items with low values in a line-item called *Other fixed assets*, and the production line, transportation means and buildings separately because they present high values.

But in applying the principle of materiality we should not take into account only the quantitative aspect. To also apply the quality aspect of materiality, we should consider in conjunction with the presentation requirements of *IAS 1 Presentation of financial statements*, firstly the standard requires the presentation of the following categories of fixed assets: tangible, intangible and financial. Also, it states that detailed information on components of the three categories can be submitted in Explanatory notes. Consistent with the stated above, the listed items may be presented

in the Balance sheet as follows:

Excerpt from the balance sheet of ALFA Company on December 31.12. 200X

Fixed assets	Values
Tangible assets	260.000
Intangible assets	3.000
Financial assets	12.000

In the case presented above, although the values of the financial assets and intangible assets are lower than the values of the tangible assets, they must be presented separately due to their relative importance in terms of nature. Since the line-item "*Tangible assets*" includes structures significant in value, an explanatory note on the item may be presented.

Another rule which focuses heavily on the notion of significance is the *IAS 8 Accounting policies, changes in accounting estimates and errors*. The revised definition adds materiality definition and guides companies in selecting accounting policies by providing relevant and reliable information, and therefore significant. The previous standard was a reference to materiality in relation to the accounting treatment of significant errors: "errors found in the current period and which have an important significance threshold, so that the financial statements related to one or more prior periods can no longer be considered giving confidence at the date of their issuance". This version simplifies the notion of error and refers to significant and insignificant errors; the formulation of accounting addresses directly the notion of error, without different references for significant or insignificant errors occurred in the same period. Therefore, we consider that any error (significant or not) occurred in the current period must be corrected before the approval for publication of financial statements, and significant errors discovered in previous periods during the current period are corrected by retrospective treatment to ensure comparability of information presented for earlier periods.

An importance maybe as high as in *IAS 1 Presentation of financial statements* is given to materiality when applying *IAS 10 Events after balance sheet date*. This rule requires that events

subsequent to the date of the balance sheet to be submitted if they are of such importance that their failure would affect the ability of users of financial statements to review and make decisions.

The *General framework for the preparation and presentation of financial statements* shows that the relevance for economic decisions requires consideration of the nature and importance of significant events.

These are just some of the rules referring to the materiality threshold, but if we analyze all the rules we may say that whenever the idea of applying the professional reasoning in a business there raises the necessity of determining a threshold of materiality.

Measuring and assessing materiality

FASB contends that, in most cases, the relative size, rather than the absolute one influences reasoning in determining the materiality of an item. Losses due to undecided customers or due to assessment errors in inventory, easily borne by a large company, can create major difficulties to any small company, generating, at the limit, even bankruptcy.

Another factor that affects reasoning in determining materiality is the degree of precision that can be achieved in estimating the size or nature of the item. It is considered that the size of cards considered immaterial may increase as the degree of accuracy decreases. For *example*, debts to suppliers can be estimated with a greater accuracy than contingent liabilities arising from litigation, and a deviation considered insignificant in the first case becomes significant in the second.

Owing to the difficulty of *determining an exact threshold of materiality*, we can remember only *conventions*, in the sense that there are considered significant, for example, all items that exceed 5-10% of total assets. In practice simple rules are used, such as applying certain percentages of income, assets or net profit or a relevant element of the financial statements. Such quantitative limits must be applied, however, very carefully to each case, taking into account qualitative factors such as the nature and frequency of occurrence of an item, possible

long-term effects and the cumulative effect in some similar items.

Although this random materiality threshold is of great help in determining the relative importance, professional reasoning cannot miss, especially when it comes to judging the nature of an item or event.

According to our studies, we have found guidance based on practical experience of British specialists. According to it, the meaning of a structure, an event or a transaction is calculated taking into account the following elements:

- The size of the item is compared with the general (total) amount resulting from accounts;
- The size of the item is compared with its previous values;
- The size of the item is compared with the entirety from which it makes part and if it has a high weight, it is necessary to present it in a distinct item-line;
- The nature and size of the item is considered;
- It is considered that certain elements are always deemed as significant.

The American experts, by means of the Securities Commission (SEC) have determined several levels for the materiality threshold. Thus, the following are considered relevant:

- Debts to directors or shareholders higher than 1% of the assets' value;
- Any item higher than 5% of the assets' value; and
- Any activity related to oil or gas exploitation which represents more than 10% of the incomes' value.

The threshold of materiality does not claim that insignificant item in nature or value should not be counted or reported.

For *example*, fraud is an important element, regardless of amounts' size. Freedom is wider in the American practice, in particular, which argues that if a certain element is not considered significant, it does not matter whether it is accounted for by a theoretically wrong manner. For example, for a computer of 10,000 um, that, in principle, must be recorded as expense according to its usage, the company may decide to record it directly as expense. Considering the

amount as insignificant, the relative significance is low, which makes the theoretically wrong method of recording element in the financial statements to not influence the decision of an investor or other user of the financial-accounting information.

Most practice cases in which the materiality is at question involve much more vague information and are more complex than that presented by us and requires a careful and specialized examination by a professional. The reasoning on the threshold of materiality depends on the specific situation of each case. An amount considered insignificant in a situation may be significant in another situation. The decision depends on the nature of the item, the absolute value and weight of the item in the total amount of revenue, expenses, assets or liabilities, firm size and other indicators of activity, as appropriate.

We have determined that materiality is a concept both qualitative and quantitative. Information is deemed significant if its lack determines a wrong decision. Certain elements are important only in nature, regardless of their size or the amounts involved.

Conclusion

In our opinion, **the threshold of materiality should not be applied only to the presentation of financial statements, but to any accounting processing in a company in order to obtain relevant information** given the low cost of processing in terms of the advantages arising from the use of such information. This leads us to believe that processing of events that have an insignificant impact compared with the company's total assets may be performed in an aggregate manner and even by derogation for the basic accounting principles.

The standard provides the concept of materiality as a distinct criterion for the classification of assets in the balance, but also as a feature of the profit and loss account, and last but not least we can consider that exactly this principle of materiality is the one that underpins the preparation of Explanatory notes which are included in the financial statements. We can illustrate the above said by the requirements of *IAS 1 Presentation of financial statements*: "the rationale for separate presentation of assets is based on assessing the nature and liquidity of assets and their materiality threshold, leading in most cases to separate presentation of the business fund and assets from the costs of development, the monetary and non-monetary assets and current and fixed assets".

Moreover, as a result of the uncertainty inherent in conducting business, many elements of financial statements cannot be measured accurately, but only estimated. The assessment involves judgments based on the most recent information available and may relate to determining moral wear and tear or lifespan of inventory, consumption of economic benefits from depreciation of assets, or percentage of sundry debtors.

Abstract

Liberal professions in Romania are going through a difficult period, of adapting to conditions in economic, financial, educational, moral and other crises specific to a transitional period from planned economy to a market economy, excessive competitive.

In Romania, the economic field is disputed by several associations representing liberal professions, such as: accounting experts (CECCAR), auditors (CAFR), evaluators (ANEVAR), insolvency practitioners (UNPIR), economists (AFER), engineers (AGIR), lawyers (bar associations), notaries (UNNPR), tax (CCF), legal advisers (UCCJR) and others.

The financial crisis has deepened the gap between school and liberal professions and associations. It appeared mafia clan structure to promote the interests of certain groups in the liberal professions which have accepted it. I therefore consider that it is time to unite legal and economic formations under one name, as shown in this paper.

Key words: financial crisis, liberal professions, free professions

JEL Classification: A11, G01

1. Observations on liberal professions in Romania

As a concept, **liberal profession** means an intellectual activity carried on by a person on

its own (self-employed) part necessarily of a professional nature [1].

Although traditional expression is the **liberal profession**, the Romanian language explanatory dictionary (DEX, 1998 edition), as well as the regulations in the past decade, use the term **free profession**. DEX defines liberal professions as exercised by a person on their own (without being permanently employed in an institution or enterprise).

In Romania, the professions are currently in the process of organizing on “mafia clans”, in which the initiative group of professional interests are to maximize through undemocratic practices that apply in the first phrase: “if I vote no for me, you are against me and then you will be removed”. Following the principle “if you're not with me are against me” in Romania is established and then disbanded or gone many associations, NGO's or foundations.

Five associations that occurred in the economic field share the field interest: CAFR, CECCAR, ANEVAR, UNPIR and CCF, which, as I mentioned before, promote the interests of some person or groups in the liberal professions who have accepted .

A close look at what happens in ANEVAR, CECCAR, UNPIR, CAFR, CCF, AFER, AGIR, etc, leads to the following conclusions developed in the scientific communication:

- There are no performance evaluation standards in the profession
- Nepotism dominates the organization of the professions

- There is no transparency in the allocation of work.

Also, between school professionals and associations of liberal professions there is a critical failure which is ignoring one to another: the school does not promote the liberal professions and liberal professions exclude teachers from associations. The phenomenon is widespread and it is practical manifested by outsourcing teacher from associations and, especially, from their management (the exceptions prove the rule).

1.1. Liberal profession or free professional activity?

- Using the expression of *free profession* is criticized because, *a contrario*, suggests "*there are professions that are not free, which would be forced or compulsory labor, in violation of art. 4 of the European Convention on Human Rights and art. 42 the Romanian Constitution, republished*".

- Meanings of those two phrases do not overlap completely. Free professional activity means "profession exercised by a person on their own without being permanently employed somewhere". Liberal profession means an intellectual profession, which belongs to the spiritual culture (architecture, philosophy, law, medicine) or/and that depends by an "order", an unconventional professional body, with a particular pay.

2. The Union of Liberal Professions from Romania. CEPLIS (European Council of Liberal Professions)

In Romania, liberal profession are formed in the following:

- Order of Architects from Romania [2];
- Chamber of Financial Auditors from Romania - CAFR;
- National Union of Bars from Romania;
- Experts and Licensed Accountants from Romania - CECCAR;
- National Association of Assessors from Romania - ANEVAR
- National Union of Romanian bailiffs
- The body of technical experts from Romania - CETR;
- College of Pharmacists in Romania

- National Union of Practitioners in Reorganization and Liquidation from Romania;
- College of Physicians from Romania
- Private Practitioners Association of Dentists from Romania;
- Veterinary College from Romania
- National Union of Notaries Public from Romania
- Order of nursing, midwives and nurses from Romania
- Order of Dental Technicians Romania;
- Romanian Press Club
- Romanian Association of Real Estate Agencies - ARAI
- Order Geodesy from Romania
- College of Psychologists from Romania
- Chamber of Fiscal Consultants [3];
- Mediation Council

General Assembly of the European Council of Liberal Professions - CEPLIS, which took place on November 17, 2009 in Brussels approved, at a proposal from the Executive, a number of priorities - guidelines of this organization for year 2010, among which we remind [4]:

1. Tracing, carefully, all developments of the liberal professions in the EU and establish a dialogue with European institutions to promote the views of our socio - economic sector. Important documents such as the "Small Business Act", a proposal for a Directive on "patients' rights in cross-border health care" and in "Green Paper on the managerial staff", will occupy an important place in CEPLIS concerns.

2. Establish an intergroup of MEP's concerned about the future of liberal professions and actively participate in all events organized by CEPLIS;

3. Promoting the document "Liberal Professions Act for Europe" which is to take the form of a European Commission Communication, as it has happened with the document "Small Business Act", which establishes principles to govern relations between liberal professions and institutions. This document should propose specific measures and support mechanisms that promote the principles of relations between liberal professions and institutions.

4. Support for its members to adopt Codes of Conduct at European level, which include shared values of the liberal professions,

developed by CEPLIS in collaboration with the European Commission.

A major concern of CEPLIS in this direction is to start a broad action regarding the sharing of these common values to the general public, which has not been "salted" enough in front of negative stereotypes on liberal professions' social - economic sectors.

In this regard, CEPLIS will require to its members to publish articles in national newspapers to advertise through radio and television liberal professions' shared values and codes of conduct which give specificity to our socio – economic sector.

5. Developing relationships with organizations representing customers and patients professions. In this regard, CEPLIS will establish a Standing Committee which will deal with relationships' developing with clients' organizations.

6. Involvement in a great measure, of CEPLIS members to work organization and improving representation in the structures CEPLIS.

7. A CEPLIS priority in this project is to increase the number of members who, ultimately, to constitute an "academic network, and ensure the viability and visibility of the Institute;

3. What we propose?

It's time to **unify** the interests of liberal professions organizations in the economic and legal field under a single name: "**Association of independent experts in accounting, liquidation, evaluation and audit from Romania**", whose bases have already been released. We mention that availability proof of the name was obtained from the Ministry of Justice, following the Association's statutes to be submitted to the court.

Association of independent experts in accounting, liquidation, evaluation and audit from Romania has the principle to defend the interests and rights of all members and affiliated bodies.

Principles of organization of this new association is developed in this work, among we mention:

- Integrity
- Justice, honesty, sincerity
- Objectivity, independence, professional secrecy (confidentiality)

- Professional and technical compliance
- Professional competence and ethical competence (good reputation)
- Universality
- Collegiality
- Harmonization.

"Association of independent experts in accounting, liquidation, evaluation and audit from Romania", further named "the Association", may join with other non-profit legal persons, national and/or abroad, or may enter into unions or federations and may establish collaborative links with similar organizations in order to achieve its goals and objectives.

Practically, the Association will have the following structure:

Figure 1 The structure of "Association of independent experts in accounting, liquidation, evaluation and audit from Romania

AFTER - Association of Faculties of Economics from Romania

CECCAR - Body of Expert and Licensed Accountants from Romania

UNPIR - National Union of Insolvency Practitioners from Romania

ANEVAR - National Association of Assessors from Romania

CCF - Chamber of Fiscal Consultants

Association of independent experts in accounting, liquidation, evaluation and audit from Romania may have branches or subsidiaries in the country or abroad, as territorial structures, based on certified decision of the General Assembly, through which will be allocated a property.

Subsidiary have not legal personality it could function as independent structures of the Association. Legal personality of the branch is acquired under the legislation in force in the country in which it is based the established subsidiary.

Subsidiary is led by its Board of Directors composed of at least three members. The procedure for selecting the branches of the Association Board is established by the Association of independent experts in accounting, liquidation, evaluation and audit from Romania.

Branch is an entity with legal personality and may enter in their own name, legal acts of management and conservation as determined by the General Assembly through its constitutive act and may conclude legal documents, in the name and on behalf of the Association, only on prior decision of the Governing Board of the National Association.

The association can set up branches, as territorial structures based on authenticated decision of the General Assembly through it is allocated a property.

Patrimony of the Association is composed of a patrimonial asset originally, worth 2000 lei and comprises: computer, phone, fax, multiplier, printer, filling device with plastic ring, library with limited access for members, membership dues.

The entire property will be shown and maintained in accordance with Romanian law in force, on behalf of the Association and will be used exclusively to achieve its objectives.

3.1. Association's activities

To achieve the stated purpose, the association aims to achieving the following activities:

a) Establishment and publication of books, periodicals, pamphlets, posters, brochures, software and other information materials, accounting and financial interest. The first publication that will appear it will be called "Financial and legal advisor".

b) Organizing training courses, seminars, conferences, public debates, and organizing marches and other related financial activities.

c) Advice and guidance to persons interested in financial accounting, assessment, audit, and in other areas of interest relating to economic life.

d) Development of own and in partnership with public authorities in the country and abroad.

e) The development of their economic activities for self-financing.

f) Other activities provided by law, according to the purpose of the association.

g) Issuance of European driving license and organization maintenance;

h) Organization of seminars and summer schools for continuous training of members;

i) Promoting of independent expert at national level.

Changing of scope and objectives of the Association shall be made only by the founders or founders most alive, and if any one of the founders is not alive, this could be done only by vote meeting of four-fifths of the members of Board.

In all cases, the change of the Association's scope may be done only if it was made in whole or in part, or, at the proposal of at least two members of Association, it can not be fulfilled.

3.2. Association Members

The association is composed of:

a) Founding members - who were founded the association and contributed to the material and moral foundation and social heritage and creation;

b) Associated - members - members who are joining after founding the Association, which are part of any recognized professional and graduates of an exam of entrepreneur and investor;

b) Honorary Members (without vote);

c) Volunteering;

d) Staff employed under labor law;

Can become a member of the Association of independent experts in accounting, liquidation, evaluation and audit from Romania, any person who submits a letter of this adhesion. Membership is acquired through adhesion approval by the Board. Honorary Membership is awarded by the Board of Directors for having an important contribution to this activity or association who had a special activity in the areas of interest of the Association. Exclusion can be done by the Board of Directors, at the proposal of at least two members of the association, for very well founded reasons, with appeal right for those proposed to be excluded.

4. The main purpose of the Association

The association aims to protect and respect the rights of its members, respecting national laws, without interests of groups, without

discrediting a member for others, as we see that happening in the present organizations, which have their own "laws" not taking into consideration the main laws of the country, which are clearly stating in their content terms of appeals and deadlines for solutions.

We believe that the right to complain and to appeal of the members who consider themselves injured by decisions of the organizations where they are affiliated, should exist and should be legislated. In current circumstances, we must submit to unjust decisions without the right to appeal, although we contribute to these organizations, but the interests of certain groups are higher than respectful to the liberal profession itself.

Abstract

The financial crisis in Romania has expressed in an eloquent manner and meant large negative effects, such as external factors generated by the trigger of the financial crisis in Romania in October 2008 and internal factors for society that fundamentally influenced the decreasing of funding in 2009.

In 2010, promotion of private initiative is, in our opinion, one of the methods that attenuate the financial effort of state for social segment which generates costs and, is producing revenue for the state. In this paper we promote the idea of opening a fundamental process of restructuring the SME's management mentality, that of safeguarding of the enterprises with existing instruments, but also with new proposals to the Government, for regeneration as soon as possible of the country's economic and human factors capable of working.

Key words: risk, financial crisis, enterprises

JEL Classification: G33, G01

1. The influence of some factors on financial indicators in 2009”

-Global economic recession has affected all Romanian companies, from largest to smallest. Moreover, access to the funds that the bank could provide for business was locked by the state. Basically, through the Ministry of Finance which borrowed from private banks

almost all the money from market to pay salaries and pension budget, the Government, indirectly, locked the national economy. Thousands of companies throughout the country unreasonably have long waited the repayment of VAT to which they were entitled, and that the financial taxation delayed to make it, deadlines being exceeded with months. Instead, for every invoice issued, but not received, the state further requires for firms to pay VAT de-capitalising them and pushing them towards bankruptcy. Establishing flat tax to be paid even by companies which were not registered profit, has determined in 2009, that 120.509 companies to suspend its activities. -Currency depreciation; it equaled or exceeded the substantial discounts of cars sellers that showed discounts and promotional prices about 30 - 40%.

-Transactions with new cars had a significant rebound, and volumes were decreases of 50% or even 60% compared to the same period last year, some car dealers being forced to close their showrooms and to lay off some employees.

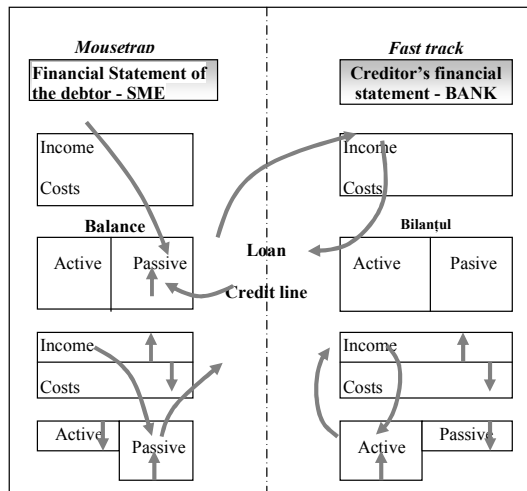

-Romanians real income levels have been affected by currency depreciation: those who had paid rates have experienced the strongest rate shock. Payment amounts were not to be neglected, the rates increased from one quarter to another and even 30%, while nominal revenues remained constant or even declined in condition of rising unemployment. This could lead only to

overdue and late payment, short-term liquidity problems, increasing leases terminated, an influx of requests to reschedule the payment obligations.

-Decrease of the credit line.

☒ We present you below the scheme regarding the financial flows in Kiyosaki's view, where the bank is the creditor and the SME is the debtor.

“Fig. no. 1. Financial flows in Kiyosaki's view”

SME	Bank
Income < Costs	Income > Costs
Debts < Receipts	Loans < Capital
Asset accounting=Sheet liabilities	Asset accounting=Sheet liabilities
Real asset < Actual liability	Real asset > Actual liability

“Table no. 1. Fundamental correlations in economic cycle in financial crisis”

2. Financial crisis in Europe

Except Poland, where the number of bankruptcies in the first nine months of 2009 remained below 1.000, in all other countries, the recession has felled many SMEs. Romania is by far the most affected, given that in the first six months of 2009, over 100.000 SMEs went into bankruptcy, from a total of 600.000 registered at the ministry.

Germany. German SME's bankruptcies mean problems for Europe. Germany's economic recovery could slow because more and more midsize companies - the skeleton of industry - can not face with market's conditions and bankruptcy. This situation has a negative impact on euro area, under the condition in which, according to The Wall Street Journal,

Germany, has the largest economy on the continent [1].

In **Poland**, 497 companies have declared bankruptcy in the first nine months of the year 2009 compared with 317 during the entire 2008, according to Coface, the credit insurer. In the first half of 2009 the SME sector has been hit by falling demand and by the tighter credit conditions.

In **Hungary**, SMEs have been affected by evaporation of demand and by reducing the access to financing, but unlike Poland, the current situation shows no improvement. Industrial production continues to be 20% lower than in 2008, and SMEs production has fallen by a fifth.

In the **Czech Republic**, 6591 entities (companies and individuals) were asked in the first nine months of 2009, the reorganizing under bankruptcy protection, up 70% compared to last year. 58% of all complaints are made by companies, according to Creditreform, credit agency. Czech Union of SMEs said that access to credit is the main problem with which is facing the sector. Lack of funding leads to postponement or cancellation of investment plans.

3. Economic crisis' situation in Romania

In our country, 90% of SME's are affected by economic and financial crisis, difficult economic situation leading to increased number of bankruptcies. Among the measures that companies have taken to decrease the impact of economic crisis, 36% of them have reduced administrative costs, 19% have reduced the number of employees and 9% have reduced the income of employees, as represented in the chart below.

Fig. no. 2. Anticrisis measures taken by Romanian SME's

Year 2010 has not yet good signs for Small and Medium Private Enterprises in Romania. Last year alone, over 190 thousand SMEs and authorized individuals have ceased. Specifically, we present in table from below, cases that favor bankruptcy and measures to avoid bankruptcy, some of them being even proposed by SME and NCPSMER (National Council of Private Small and Medium Enterprises in Romania), as measures for the economic crisis.

“Table no. 2. Causes that promote SMEs bankruptcy and measures to avoid it”

Causes that promote SMEs Bankruptcy	Measures to avoid SME's bankruptcy
-Depreciation of national currency.	-Reducing costs through layoffs.
-Lower transaction with cars.	-Employee salary reduction.
-Decrease real estate transaction.	-Reducing administrative costs.
-Reduce your credit line.	-Icing liquidity.
-Reduced access to financing and funding hinder.	-Simple bookkeeping and halving the tax on buildings[2].
-High costs of interest.	-Allocating of minimum 0.5% of GDP for the foundation and development programs for SME's [3].
-Exports decline.	-Widespread of the absence of taxation of reinvested profits and reinvested dividends.
-Low income.	-Ministry of SMEs of
-Increasing the CAS's costs.	
-Introduction of minimum tax.	
-Sales decrease.	

-Price increases.	programs on an emergency immediately after the 2009 budget approval.
-Incapacity of paying.	-VAT payment when goods are delivered, services are rendered or works are executed.
-Entering into insolvency.	-Elimination of abusive controls on companies.
-Declining real incomes of Romanians.	- Encouraging exports through subsidies.
	-Creating Counter-Guarantee Fund of the credits in the first half of 2009.
	-Significant and urgent reducing of extra-taxation.
	-Simplification of procedures for accessing structural funds and increasing access to consulting services in this area [4].

4. Anti-crisis measures taken by the current Government

Emil Boc's government took steps that led to the cancellation of firms. By eliminating the taxation for microenterprises with 3% of incomes, Boc government put most common obstacle to self-employment solutions. In addition, by introducing flat tax, hundreds of thousands of small companies, generally with a single employee, were closed.

Also, there are many companies that are in bankruptcy, but have not yet said so. Many require judicial protection, asking for insolvency, to be safe from creditors. Among **crisis measures** already taken by the Government is allocating the largest share of GDP over the past 20 years, for investment, facilities for hiring unemployed and purchase of nearly 17.000 homes through "First Home" program.

Continuing Rabla program, building houses for rural specialists, rehabilitation of thermal and county road blocks, First Silo Program, NHA housing selling to tenants, supporting SMEs and local authorities which are accessing EU funds by providing state guarantees and technical unemployment are other measures already

taken by the Government and presented by Emil Boc.

Among the measures to support businesses, the premier noted reinvested taxed profits, deferred payment of outstanding obligations, accelerating tax refund, state aid, incentives for energy and chemical industry, reducing taxes and tariffs parafiscal. Among crisis measures, Emil Boc recalled including VAT at 19% and maintaining a flat at 16% [5].

But all these measures seem not to be the best and not sufficient for the effective exercise of SMEs because, due to other measures adopted by the Government such as the introduction of flat tax, there are favorable conditions for progress.

5. Some considerations upon anti-crisis measures

Experts say the biggest problem of business is restricted access to credit, and bad news is that banks will not finance companies resumed in 2010, because it will analyze the situation of companies which will seeking loans on the balance sheet situation of 2009, which "looks disastrous."

On the other hand, banks have their own reasons to think twice before approving a loan. In 2009, arrears over 90 days were recorded in loans, over three times higher than in 2008 and represented 75% of all amounts due.

Neither in terms of tax payment obligations to the state, companies did not do better. Experts recommend to the companies with debts of more than 30 thousand lei and debts to the budget over 30 days, to avoid insolvency and forced execution by preventive composition with regulated by Law 381/2009. Preventive composition is an amicable settlement between the debtor and creditors that hold at least two thirds of the value of receivables.

5.1. How can you be protected from insolvency?"

According to the law, insolvency or bankruptcy of the debtor's assets are characterized by insufficient cash funds available to pay outstanding debts.

It is considered that it may declare bankruptcy when the debtor, after 30 days in arrears, has not paid its debt to one or more creditors. Bankruptcy is imminent when the debtor

proves that it can not pay at maturity, outstanding debt incurred with the funds available from the due date.

For companies trying to save his business, the next step is the **process of reorganization.**

6. Reorganization – as a measure against bankruptcy risk for SMEs

In the current economic situation is expected as part of economic agents continue to encounter difficulties in activity and even to go insolvent.

Unfortunately, most of those traders who go into insolvency, unnecessarily are trying to recover the activity of society through their own efforts, without resort to specialized consultants in the field and without the use of legal provisions designed just for protection. Such attempts of recovery leads mostly with a failure, so that society finally comes to bankruptcy, without any possibility of economic recovery.

Law no. 85/2006 of insolvency ("Insolvency Law") specifically provides judicial reorganization, as a extent of recovery of economic activity of a company in a state insolvency or in impending insolvency, being real chance of recovery and continuing a business that normally would be under bankruptcy.

6.1. Reorganization procedure Romania

Unlike the laws of other states, Romanian legislation does not regulate the judicial reorganization procedure, which still can not remove a conventional reorganization. This method of reorganization involves, in practice, debtor negotiations with major creditors on rescheduling the debt payment, but in such a procedure the debtor has no legal protection [6].

Judicial reorganization, aim the "redressing of the debtor and payment of liabilities in terms of restructuring the company and its activity" [7], and saving in this way, a company in default, but still viable.

Judicial reorganization is triggered by an application for entry in insolvency which the debtor in insolvency or in a state of imminent insolvency or a creditor, submit

to the Court. In this application the company must accompany the several pieces, among which the declaration by the debtor and shows its intention to enter into the reorganization procedure.

After introducing the application and verification of documents submitted by the debtor, if the legal requirements are met, the judge will order the opening of the general procedure. By this decision to initiate proceedings, the judge will appoint an judicial administrator. To qualify the reorganization procedure it must be proposed such a plan by the debtor, by the judicial administrator or by the creditors. **The plan should contain concrete ways to restructure the company, which may take the form either the debtor's restructuring and continuing future business or liquidation as part of the debtor, or a combination of two previously proposed methods.**

Reorganization of the company closes when you have met all payment obligations assumed by the reorganization plan.

6.2. Advantages for entering into reorganization procedure

There are several advantages of opening the reorganization procedure for a company in difficulty, such as:

- From the date of opening of the reorganization law there **are suspended all judicial or extrajudicial actions** aiming to achieve claims against the debtor or his property. Thus, under art. 36 of Law no. 85/2006, the law suspended all judicial or extrajudicial actions to achieve the claims against the debtor or his property, so that no creditor can no longer operate separate companies in insolvency proceedings to recover his claim. Also under this article there are suspended any levy of execution or attachment of company accounts. All payments made during the insolvency proceedings will be made by a single bank account, which can not be stopped.
- **No longer pay outstanding debts than under a reorganization plan without paying interest or penalties.** From the opening of proceedings, under art. 41 of Law no. 85/2006, no interest rate, increase penalty or charge will not be added to claims arising, prior to the opening of proceedings (excluding guaranteed

debt). Thus, by stopping the flow of interest and penalties, it is prevented the increasing liability company.

- The possibility of **rescheduling payment of debts** by creditors, etc.

- The company that was willing to open insolvency proceedings may be subject to judicial reorganization under a reorganization plan, through which can be obtained in certain circumstances or may even require, rescheduling of payments to creditors during the reorganization, which may take up to three years, with possibility of extension for another year.

- In judicial reorganization, the debtor business is conducted by a special administrator named by the company management, who may even be the administrator. Thus, leadership activities of the debtor may remain in the hands of the debtor's former management bodies, which are best placed to continue the company's activities. Their work is supervised by the judicial administrator.

- According to art. 77 of Law no. 85/2006, applications for the recovery procedure or other rights shall be exempt from stamp duty, which is an advantage in making steps to recovery.

- In the judicial reorganization, the company operates on the principle "business as usual", remaining an economic market player, and can keep customer brand and heritage.

- During insolvency, the company does not pay and does not charge VAT.

7. Mergers - another measure to counter the risk of bankruptcy during the crisis

Fusion is a "technical and legal process through which the restructuring of companies is done" [8], when two or more companies come together to form a single society. Fusion brings benefits related to strengthening of the company's market, getting a larger share local market or even expansion into other geographic regions. Another advantage of fusion is related to business saving and personnel rescue in conditions of market competition and its impact on business. Vertical integration of business is another benefit of the fusion, so

that it shortens the chain of production and distribution. For example, a furniture manufacturer may purchase a wood supplier to eliminate the problem of raw material acquisition. Because it will be reduced certain costs, it will increase company's profits. Another advantage of the fusion is diversifying its product portfolio by launching its own range or buying a player that already offers that product. Fusion also offers an advantage in terms of taxation.

Abstract

An increasingly confirmed theory in recent decades claims that a product is purchased for what it represents for the customer, and not for what it is itself (subjective utility theory), the product is purchased for the service they provide, for the safety, for the comfort, for fashion, for what it gives to its user. Life insurance is a way of financial protection, safeguard and preserve the family property. It is part of a family financial plan, along with other real estate investments, shares, bank deposits, insurance is a guarantee fund related to the availability of needed cash in case of unexpected situations, without being affected the other saving forms, usually with pre-established terms.

Key words: market, insurance market, customer, financial plan, investment

JEL Classification: G22, G24

SWOT analysis is a synthetic analysis instrument of strategy implemented by an organization.

Aims to determine whether the current strategy of the organization and the weaknesses are relevant and able to cope with changes in external environment. It can be used to assess whether there are opportunities that can be exploited and / or continue using existing resources and organizational skills.

A SWOT analysis has two components:

1. Internal analysis

a) strengths (assets) of the company: for example, a prestigious company, which enjoys a high reputation, high quality offer, good sized distribution network, well trained staff:

b) weaknesses (deficiencies) of the company: confusing market position, brand is unknown, insufficient promotional pressure, downgrading of some of the models / lines / ranges of products, lack of investment, new trade marks etc.

2.External analysis:

a) market opportunities (occasions): new (external) markets penetration capacity, offer diversification;

b) threats (hazards, risks) low purchasing power of population, increased competition, etc..

AIG LIFE INSURANCE SWOT ANALYSIS

Strengths	Weaknesses
<ul style="list-style-type: none"> • AIG Life is one of the major life insurance companies in Romania, a subsidiary of American International Group, the world leader in insurance and financial services. • AIG Life has the highest ratings for financial stability, enjoying a AAA rating since the first assessment made by Standard & Poor's in the 80s. • AIG had a spectacular evolution over time, currently having offices in approximately 130 countries and jurisdictions. • AIG insurance policies give its owners a real financial security. • AIG Life has an excellent reputation in the market regarding the payment of benefits and compensation awarded. 	<ul style="list-style-type: none"> • Due to the large area of coverage the company AIG Life is sometimes difficult to control all the agencies. • Distribution of financial products through brokers may have a negative effect providing unprofessional customer support services. • Human Resources Management needs to be improved for staff retention through adequate training and motivational packages.

Opportunities	Threats
<ul style="list-style-type: none"> • Market share increase by offering flexible financial programs to customer requirements. • Revaluation of market niche related to the east area of the country by opening new agencies <p>Promote and develop the skills and experience of sales force</p> <ul style="list-style-type: none"> • Active involvement in development of the private pension system <p>”Product development of "bancassurance"</p>	<ul style="list-style-type: none"> • market leadership position threat of the recent purchase by Wiener Staedtische Omniasig Life • market penetration of new life insurance operators. • loss of clients due to unfair practices of insurance competing companies.

A SWOT analysis is useful to summarize the relationship between the influence factors of external environment, the organization's strategic skills and the possibility of implementing new strategies. Information synthesizing from the SWOT analysis lead to the following conclusions of the strategic nature:

- Company AIG Life, through the organizational position and culture, enjoy a privileged status today among the most important insurance companies in Romania. Therefore, the company must take an active role as market maker. This means investment in advertising, press conferences, TV appearances, etc.
- The company must combine experience and professionalism of its employees with the know-how, financial strength and reputation of the American International Group.

- AIG Life has to properly promote the group offer products and adapting to the needs of companies with state majority.

Regarding human resources, radical changes of employee-employer relations are necessary, mainly for administrative functions personnel (departments SOP, New Business, Claims, Underwriting, IT). In this sense, change is needed for awarded salaries, and for the staff preparation and development.

Thus, despite existing globally tensions, AIG continued to expand its world action area and build strategic alliances with companies in other industries (eg bancassurance partnership with Raiffeisen Bank). Adopting a cautious market strategy, focusing on strengthening of financial stability and achieving long-term results, the company is a growing life insurance company. In my opinion, a more aggressive marketing policy is required, the exact delineation of target market segment and market imposing by increasing the competitive advantage - maximum financial security for its customers.

ASIROM VIENNA INSURANCE GROUP
SWOT ANALYSIS

Strengths	Weaknesses
<ul style="list-style-type: none"> • For over 17 years, ASIROM (Romanian insurance) is a Romanian traditional insurance company, giving them security and comfort they need, always defining the local insurance market trends. • ASIROM is among the top 40 companies in the region which consolidates the VIG team. • opinion leader and market maker in Romania The most powerful organizational structure and the largest territorial network. • special quality of ASIROM products and services led to the award by the well known certification organism, Moody International, of ISO 9001 quality standard certificate (voted three times consecutively). 	<ul style="list-style-type: none"> • In 2007, the company reported losses of 9.54 million euros. • Distribution of financial products through brokers may have a negative effect providing unprofessional customer support services.. • Human Resources Management needs to be improved for staff retention through adequate training and motivational packages. • Reduction of the general insurance market share, which was due to the policy of lower commissions with key brokers, which have reduced gross underwritten premiums.

Opportunities	Threats
<ul style="list-style-type: none"> • Increased market share. • Asirom has proposed this year a 30% increase in the level of gross underwritten premiums compared with 2007. • rebranding program for refreshing company image and for entering under the Vienna Insurance Group umbrella. • Because VIG benefiting over 180 years experience in insurance • Active involvement in development of the RCA and CASCO insurances. 	<ul style="list-style-type: none"> • market position threatened by the emergence of new competitors on the market • new market penetration of life insurance • Loss of customers due to unfair practices of insurance companies competing

Conclusion

Company ASIROM Vienna Insurance Group is now in a good enough position in insurance companies top. To assess the strength and experience of Vienna Insurance Group. Both companies have a good rating, AIG internationally, ASIROM VIG nationally, as a romanian insurance company. Due to the rebranding program, ASIROM and UNITA Vienna Insurance Group will represent a significant competitor to AIG Life Romania. AIG objective is to keep top spot, and for Asirom Vienna Insurance Group, a bigger market share, and one held up as the top companies.

Abstract

Expectations related to the draft budget and action plan of the government are high, but the possibilities are limited, fiscal policy needs time to regain credibility after two years of drift. Although the economic crisis knocking on the door Romanian government has a few available means to stop it. Regarding the quality of the budget, this is far from what might be called a model of good practice.

Key words: budget, ethical dilemmas, crisis, financial crisis, deficit, saving

JEL Classification: H6, H61

Although at the beginning of the year 2009 global economic crisis knocking on the door of Romania, the government has little available means to stop it. Fiscal policy of the last few years for growth was completely unpredictable, deepening macroeconomic imbalances, while remaining on the agenda of structural reforms have been left aside. The state is still contributing about 30% of GDP, because the privatization was stopped lately, and Romania is the last place among new EU members in transition to a market economy chapter, and sometimes exceeded by Bulgaria (after some indicators EBRD). We missed the opportunity to make deep fiscal consolidation and reform of how budgets are built on the time when the economy "was thumping" Instead we managed to reach a deficit of almost 5% of GDP in conditions of economic growth of nearly 8% .

Unfortunately, the quality of the budget process is far from what it might be called a model of good practice. How the state have such a share in the economy, the impact of poor management policies of public funds is much

amplified. Deficiencies appear everywhere: in the ability to make a coherent program, both the Ministry of Finance and the ministries, revenues and expenses are unpredictable, often occurs the temptation of allocation of significant slice of the budget for social measures taken in blue, for budget sector wages, pensions, without an analysis of the long term financial impact or on other programs. In addition, as budgets are actually public statements on government policies, how fiscal policy has been built in recent years speaks volumes about the quality of governance in Romania.

Analysis of the parts that worked poorly in our fiscal policy would be useful to us, even in crisis, for two reasons. First, we can formulate realistic expectations of what government can actually do in the coming months. Second - and perhaps even more important - the crisis is an opportunity to forced reform, but rapid, of our public finances, as the Romanian economy bankruptcy in the second half of the '90s triggered the transition to economy market.

Of course, if we are not careful it can happen vice versa: the economic crisis can be an excellent excuse for poor governance, for the proliferation of exceptions to rules and laws, for opaque and corruption generating policies.

It is recommended to be analyzed and corrected the next deficiencies that chronic manifest itself in Romanian fiscal policy.

1. Romania should have a four years budget, instead it has four to six budgets yearly.

2. Some types of expenses are overstated (capital expenditure), while others (current cost) always end up being higher than originally scheduled

3. Spending peaks in November and December

4. Overestimation of budget revenues, whether as the result of populist promises before elections or just as lack of competence, was the rule of last years.

5. Arbitrary budget allocations: regression in terms of good governance and a return of previous reforms road.

6. Significant slices of public budgets are allocated to sectors with significant recurrent costs (education, health, agriculture, railroad)

7. The promised increases in salaries and pensions in the last two years, in combination with a low GDP growth (2-3% maximum) are a serious threat to the sustainability of deficit in 2009.

8. Deficits are now very expensive for Romania

What to do

- *Increased transparency of the budgetary process and enhance administrative capacity in the Ministry of Finance and the ministries.*

It is unlikely that the fiscal policy can be anti-cyclical used in 2009 after escaping total control in periods of economic growth. But we hope to fiscal consolidation and deficit reduction correction. This can not be done in practice by

increasing revenue, but a rationalization of expenditures made in the context of a medium-term reform program. A strong and credible commitment to reform itself could bring additional revenue to the budget: international financial institutions, IMF and EU itself are willing to provide financial assistance coupled with a clear program of reform, if there is the certainty of good uses of funding. Administrative capacity improvement is a long process for sure, but even now it must be accelerated if earlier the opportunities were wasted. So, the crisis would provide an opportunity for reform to a better fiscal policy. If the budgets are based indeed on "multi-annual budgetary programming", must be clearly linked to macroeconomic developments, and the deviations from original plans must be justified. As mean, placing any program or new measures should be considered as a cost-benefit analysis and compared with other alternatives for use of public money (opportunity cost). In addition, there is urgent need strong institutions to verify how public money is spent. This depends on the performance of internal auditors of the budgetary institutions and the external auditor (Court). In addition, performance and the execution of public budgets must be more transparent to the public because of the crisis. Same should be more transparent the work of these auditors. As public information, there are quite a few data on budget execution compared with initial budgets, complete data about budget revisions and their justification, analysis of revenue and expenditure changes. As well, the work of the Court is quite obscure to the general public.

- *At least until it will increase the ability to make quality predictions, forecasts should be very cautious, especially on the revenue, and expenditure that are not required to be reduced.*

No need to be a doctor in economics to realize that the "jumps" in the collection of 6 to 7% of GDP from year to year on the budget income are unrealistic. Not to mention that in countries with solid fiscal institutions is hard to predict what will happen with the budget revenues in 2009, so prudence is essential. Yet, because the most important budget revenues are

received quarterly (VAT, income tax), we will not know which was the real effect of the crisis on the 2008 budget until February. If again the revenue will be overstated and expenditure will be spread by these excessive amounts, we have higher deficits and it will not be covered only by using non-renewable resources, as the money from privatization and reserve funds. On the expenditure side, as I said, the crisis would have an opportunity: it should finally revised the structure of government and how to pay public sector. Will be more difficult than it first seems to reduce salary costs (which will still be needed in 2009 because of shortage) if a clear justification is not provided, such as a credible reform of the administration. We can look at public sector strikes in Hungary to see what awaits us if budgeting living with a wrong impression. Will require general criteria, paying targets in public sector, promotion, bonuses, redundancies, criteria that are similar in whole bureaucracy and not appear against a certain class.

- *Budget volatility should be reduced, if we do not want fiscal policy to deepen the crisis itself.*

Although some flexibility is needed, adjustments should not be as reasons for sudden changes in public policy or, worse, the introduction of expenditure and revenue were simply "forgotten" when was the first budget. Corrections should take place mainly due to the revision of macroeconomic indicators scheduled by the Commission for Prognosis and the Ministry of Finance. At the same time, exceptions to the rule - this time motivated by "public interest in times of crisis" - should be avoided. These include transfers to municipalities besides law, county councils, exemptions from the public procurement law (as has already happened at the beginning of this year on Energy). Long-term losses in terms of good governance far outweigh any short term gain (if there any) and can return the way reforms made with much effort in recent years.

Conclusion

In conclusion, in fiscal policy of Romania there are no short term solutions other than long term. If the fiscal institutions are not strengthen once and for all, even during the crisis, the government will have no capacity to "control" the public policy tool to use it against recession, or at least not to put additional pressure on a suffering economy. How much time will not increase the capacity of the Ministry of Finance and resort, huge sums are spent inefficiently, while the private productive sector may not get the money to restore the economy afloat. Where saving money is used elsewhere, together with realistic and prudent estimates of budget revenues should ensure, though, that fiscal policy is not continuing its pro-cyclical tradition.

Impairment of assets - between regulation and deregulation

Professor Traian Nicolae, Ph.D.

*Affiliation: Faculty of Economic Studies,
University Ovidius Constantza, Romania*

E-mail: traiannick@yahoo.com

Abstract

Objective of IAS 36 *Impairment of assets* is to prescribe procedures that apply to an undertaking to ensure that its assets are carried at amounts not exceeding their recoverable amount if the carrying amount is recoverable in full. An asset is carried at an amount not exceeding the amount will be recovered through its use or sale. If this case proves, is described as impaired assets and IAS 36 requires the company to account for a loss of value. Also, the rule specifies that a business case should include (lessen) a loss of value and should provide information on assets that have depreciated.

There may be situations in which external influences or changes in production methods within the entity led to decreased value of an asset far more than is acknowledged in annual depreciation costs. In this case, it is said that the asset is impaired.

Key words: Impairment , recoverable amount, value in use

JEL classification: M41

1. Introduction

To identify whether a revalued asset may be impaired depends on the basis used to determine its fair value:

- if the asset's fair value is market value, the only difference between the fair value of assets and net selling price is given by the direct additional costs required for disposal of the asset;
- where disposal costs are negligible, the recoverable amount of a revalued asset is necessarily close to or greater than its revalued amount (fair value). In this case, after the revaluation requirements have been applied, it is unlikely that revalued asset is impaired and recoverable amount should not

be estimated, and

- where disposal costs are significant net selling price of the revalued asset is necessarily less than its fair value. Therefore, the revalued asset will be impaired if the value of use is lower than the revalued amount (fair value). In this case, after the revaluation requirements have been applied, an enterprise applies this standard to determine whether the asset may be impaired, and

- if the asset's fair value is determined on a basis other than market value, asset revalued amount (fair value) may be higher or lower than its recoverable amount. Therefore, after the revaluation requirements have been applied, an enterprise applies this rule to determine whether the asset may be impaired. Example of assets covered by the rule IAS 36

- land, buildings, machinery, equipment and financial investments held at cost and other assets recorded on the market value model under IAS 16 and IAS 38;
- intangible assets and goodwill;
- investments in subsidiaries or joint venture.

2. Definitions

The following terms are used in this rule, having the meanings specified:

1. Active market is a market where the following conditions exist:
 - goods traded on that market are homogeneous;
 - at any time, under normal conditions, one can find buyers and sellers, and
 - prices are publicly available.
2. Carrying amount is the amount at which an asset is recognized after deduction of combined depreciation and accumulated impairment losses.
3. A cash-generating unit (CGU) is the smallest identifiable group of assets that generates cash inflows from continuing use,

entries that are largely independent cash inflows from other assets or groups of assets. Definition of "cash generating unit is clear. However its implementation is difficult and is based on estimates.

4. Corporate assets are assets other than goodwill that contribute to future cash flows, both cash-generating unit of analysis and those of other cash-generating units.

5. Disposal costs are additional costs directly attributable to disposal of an asset or cash-generating unit, excluding finance costs and income tax expense.

6. Cost of an asset is depreciated value or other value in the financial statements replaced cost less residual value of the asset.

7. Depreciation (Amortisation) is the systematic allocation of the depreciable amount of an asset over its useful life period.

8. Net fair value is the amount you can get from the sale of an asset or cash-generating unit, voluntarily, between parties to knowingly, in a transaction where the price is determined objectively, less costs of disposal.

9. An impairment loss is the difference between book value (higher) and the recoverable amount of an asset or cash-generating unit.

10. The recoverable amount of an asset or cash-generating unit is the maximum of fair value less costs to sell and value in use.

11. Useful life is either long the expected use of the asset by the entity or the number of production units or other similar entity expects to obtain from the asset.

12. Value in use is the present value of future cash flows expected to be derived from an asset or a cash-generating unit.

3. Identifying an asset that could be impaired

As a general rule, an asset is impaired when its carrying amount exceeds its recoverable amount. A company must establish each balance sheet date whether there is any indication that an asset may be impaired. If any such indication exists, the enterprise should estimate the recoverable amount of the asset.

Moreover, whether or not evidence of an impairment, it must also:

- annual test for impairment any intangible assets with indefinite life or intangible asset not yet available for use by comparing its carrying

amount to its recoverable amount. This impairment test may be made at any time during a reporting period, provided they make the same point in each period. Various intangibles can be tested for impairment at different times. However, if such an intangible asset was initially recognized in the current period, that intangible asset will be tested for impairment before the end of the current reporting period.

- annual testing of goodwill acquired through business combination.

In addition to analyzing prudential principle at least once a year book value of assets of the estate, the concept of materiality and to identify whether the recoverable amount of an asset must be estimated. For example, if market interest rates or other market rates of return on investments have increased during the period, a company not required to make a formal estimate of recoverable amount of an asset when:

- if the discount rate used in calculating the amount of use of the asset is unlikely to be affected by the increase in these rates on the market. For example, increases in short-term interest rates may not have a significant effect on the discount rate used for an asset that has a long useful life remaining, or

- if the discount rate used in calculating the amount of use of the asset is likely to be affected by these rate increases on the market, but prior to detailed analysis in relation to the recoverable amount shows that:

- is unlikely to be a significant decrease in recoverable amount because future cash flows likely to grow. For example, in some cases a firm may be able to demonstrate that adjusts its revenues to offset any increase in market rates, or

- it is unlikely that lower recoverable amount is the result of a significant impairment losses.

External sources of information

- During the market value of an asset has declined significantly more than expected as a result of the passage of time or normal use.

- During the period there were significant changes in business or adversely affect such changes will occur in the near future, the technological environment, market, economic

or legal firm operating in the market or an asset that is dedicated .

- market interest rates or rates of return on marketing investments increased during the period and it is possible that these increases affect the discount rate used in calculating the value of an asset utilization and significantly reduce its recoverable amount.
- book value of net assets of the reporting enterprise is greater than its market capitalization;
- The available evidence of obsolescence or physical asset.

In Appendix B to IAS 36, which amends and IAS 16, is an important addition to these indications, namely:

- During the period there were significant changes in adverse effect on business, or is expected to occur in the near future such changes extent or manner in which an asset is used or expected to be used. These changes include non asset, plans to discontinue or restructure the business that owns an asset, the disposal of an asset before or reestimarea previously expected useful life of an asset as limited rather than unlimited.

Once the asset meets the criteria to be classified as held for sale (or included in a group classified as held for sale), is excluded from the scope of this standard and is accounted for under IFRS 5 Non-current assets for disposal and discontinued operations.

Internal sources of information

- Cash needed to acquire the asset or cash after his operation and maintenance requirements are significantly higher than originally projected.
- Net current cash flow or operating profit or loss generated by the asset are significantly worse than expected.
- There was a significant decline of net cash flows or operating profit forecast or there is a significant increase in projected losses generated by the asset.
- The increased operating loss or net cash outflows for the asset, when current period figures are similar to those expected.

If there is an indication that an asset may be impaired, this may indicate that during its remaining useful life, depreciation method and residual value of the asset should be reviewed and adjusted based on international accounting

standard applicable to the asset, even if not recognized for it any impairment loss.

4. Measuring recoverable amount

An impairment occurs when the carrying amount of an asset exceeds its recoverable amount. Asset's recoverable amount is the maximum time of:

- Fair value of assets minus sales costs, and
- value in use.

There will always be necessary to calculate both figures above. When one of them seems to be higher than book value when the asset is not impaired, and therefore no need to calculate another number.

Under IAS 36, there are three situations to three rules for determining the recoverable amount of an individual asset:

1. If fair value less costs to sell, or use of the asset value greater than book value when the asset is impaired and there is no point calculating or estimating the recoverable amount.

2. If fair value less costs to sell can not be reasonably estimated because there is no basis to make a reliable estimate of the amount of active sales obtainable freely between parties to knowingly, in a transaction in which target price is determined, then the recoverable amount the asset may be considered of value to use.

3. If the asset is held specifically to be sold, the asset's recoverable amount can be considered equal to its fair value less costs to sell.

If the company has assets that do not generate cash inflows from continuing use of, entries that are largely independent of those from other assets or groups of assets, then the recoverable amount is determined for the cash-generating unit to which the asset belongs , except if:

- or fair value less costs to sell is higher than book value, or
- use of the asset value can be estimated to be close to fair value less costs to sell and the latter can be determined.

Determination of fair value less costs to sell IAS 36 provides several cases or rules for determining fair value less costs to sell, so:

I. If there is a binding contract of sale, the fair value less costs to sell is determined whether the transaction price to target price, the price is adjusted for the additional costs would be directly attributable to asset disposal.

II. If there is no sales contract, but an asset is traded in an active market, fair value less costs to sell is the market price of the asset less disposal costs. When the current auction prices are not available, the most recent transaction price can provide a basis on which to estimate the net selling price, which demonstrates that there have been significant changes in economic circumstances between the transaction date and the date is estimates made.

III. If there is no contract of sale or an asset in an active market, fair value less costs to sell is based on the best information available to reflect the amount that an enterprise could obtain, on balance, the sale assets voluntarily, between parties to knowingly, in a transaction in which the target price is determined after deducting the costs of disposal.

Sales costs in the standard sense, not all costs and overheads involved in the sale, only direct costs of the asset sale process. Examples of such costs:

- Legal costs, postage, and fees for similar transactions;
- travel costs of the asset;
- additional direct costs to bring an asset in the optimal condition for sale.

Benefits to conclude contracts of employment (as defined by IAS 19 Employee Benefits) and costs associated with reducing or reorganizing a business that is not an asset transfer additional direct costs for its disposal. The current standards do not provide a clear pattern of calculation or reasonable estimate of fair value and that, as the amount of use is very subjective because it relies on estimating the parameters or factors actually difficult to validate. The latest information emerging www.iasb.org site, it appears that FASB is working on a handbook to estimate fair value and the IASB to provide a working model.

5. Determining value in use

Calculation of asset value in use analysis should reflect the following:

- estimating future cash flows that the firm expects to obtain from the asset;

- expectations about possible variations in the amounts or periods related to these cash flows;
- time value of money, represented by risk-free interest rate market;
- price level of uncertainty inherent in the asset, and
- other factors such as nelichiditatea, which will reflect market participants in valuing future cash flows that the firm expects to obtain from the asset.

This model involves two important factors:

- future cash flows (cash inflows and outflows arising from continued use of the asset and its ultimate disposal), and
- appropriate discount rate for these future cash flows.

Such as the Company may adjust future cash flows and discount rate used. Whatever the business approach to reflect expectations about possible variations in the amounts or periods related to future cash flows will result to reflect the estimated present value of those cash flows, ie the weighted average of all possible outcomes. Appendix A to IAS 36 provides additional guidance in using present value techniques for assessing value in use of an asset.

Principles as the basis for determining value in use:

- Cash flow projections should be based on reasonable assumptions and admissible as the best estimate of management on the set of economic conditions that will exist during the remaining useful life of the asset. A greater importance should be given to external evidence;
- Cash flow projections should be based on the latest financial projections and forecasts approved by management, but shall exclude any estimated future cash flows resulting from improvements or improvements to asset performance. Projections based on these projections and forecasts shall cover a period not exceeding five years unless it can be justified for a longer period, and
- Projections for cash flows, outside the period covered by the latest predictions and forecasts to be estimated by extrapolating the projections based on forecasts and projections using a constant or decreasing growth rate for subsequent years, unless an

increasing rate can be justified. This growth rate should not exceed the average long term growth for the products, sector or country or countries where the company operates, market or asset that is used unless a higher rate may be justified.

Estimates of future cash flows should include:

- projections of cash inflows from continuing use of the asset;
- projections of cash outflows required to generate cash inflows from continuing use of assets (including cash outflows to prepare the asset use) and can be directly attributed or allocated assets, on a reasonable and consistent, and
- net cash flows, if any, to be received (or paid) for the disposal of the asset at the end of useful life.

Future cash flows have been estimated for the asset in the current state.

IAS 36 that are based on management's estimates about future cash flows are based on latest forecasts and forecasts up to five years, they in turn are analyzed for consistency and correct the causes for the differences between past projections cash flows and actual flows achieved.

Determination of Discount Rate

Rate (or rates) should be a discount rate (or some rates) before tax that reflects current market assessments of:

- time value of money, and
- asset specific risks for which future cash flow estimates have been adjusted.

Example: A rate that reflects current market assessments of time value of money and risk-specific asset is the return that investors would ask her if they chose an investment that would generate cash flows with the amounts, timing and risk profile equivalent to those the firm expects to be actively generated.

6. Cash-generating units

A cash-generating unit is the smallest identifiable group of assets which includes assets and generate cash inflows from continuing use, entries that are largely independent cash inflows from other assets or groups of assets.

Recoverable amount of an individual asset can not be determined if:

- use of the asset value can be estimated as a

value close to fair value less costs to sell it (for example, when future cash flows from continuing use of the asset can not be estimated as negligible), and

- asset does not generate cash inflows from continuing use, entries that are largely independent of those from other assets.

In such cases, the use and therefore recoverable amount can be determined only for cash-generating unit of the asset.

Example

A mining company owns a railway to support its mining activities. The railway can be sold as scrap and not only generates cash inflows from continuing use, entries that are largely independent cash inflows from other assets of minei.Nu is possible to estimate the recoverable amount of the railway, because the value of its use can not be determined and probably differs from the residual value. Therefore, the company estimates the recoverable amount of cash-generating unit that owns the track, this unit is represented by the mine, taken as a whole.

Identifying cash-generating unit that owns an asset involves the application of professional reasoning. If recoverable amount can not be determined for an individual asset, the company identifies the smallest group of assets that generate largely independent cash inflows.

To identify whether cash inflows from an asset (or group of assets) are largely independent cash inflows from other assets (or groups of assets), the company takes into account various factors, including how management monitor its activities (eg monitoring product lines, the business, individual locations, the district or regional areas, or otherwise) or how management makes decisions on the continuation or disposal of assets and business operations .

Example

A transport company on a contract basis, providing the municipality that requires minimum service conducting operations at five tracks. Assets and cash flows associated with each route can be identified separately. One of the routes operating with significant loss.

Since the company has no option to reduce any of the routes, the lowest level of

identifiable cash inflows from continuing use that are largely independent of those cash inflows from other assets or groups of assets, is the cash inflows generated by the five routes together. Cash-generating unit for each route is the transport company as a whole.

Recoverable amount and carrying amount of cash-generating unit

The recoverable amount of a cash generating unit is the maximum fair value less costs of disposal unit and value in use. The carrying amount of a cash-generating units must be determined consistently with how it is determined the recoverable amount of cash-generating unit. Thus, it:

- includes only the book value of those assets can be directly attributed or allocated on a reasonable and logical unit generating cash assets that will generate future cash inflows expected to quantify the use of cash-generating unit, and
- does not include the carrying amount of any liabilities recognized unless the recoverable amount of cash-generating unit can not be determined without taking into account that debt.

In some cases, although some assets contribute to predicting future cash flows, that can not be allocated to cash generating units on a reasonable and consistent. It could be if goodwill or assets of a corporation, such as those belonging to the corporate headquarters.

In determining the recoverable amount of cash-generating unit may need to be taken into account certain liabilities recognized. This can happen if the disposal of a cash generating unit would require the buyer to take over the job. In this case, the fair value less costs to sell (or estimated cash flow from disposal at the end) of cash-generating unit is the estimated selling price for the assets of cash-generating unit and also for debt, less costs of disposal.

In order to make a successful comparison between the carrying value of cash-generating unit and its recoverable amount, the carrying amount of the debt is deductible when determining both the book value of cash-generating unit and its recoverable amount.

Impairment loss for a cash-generating unit

Impairment loss shall be recognized on a cash-generating unit (the smallest group of cash-generating units to which goodwill has been allocated or a corporate asset) if and only if the recoverable amount of the unit (group of units) is less than its carrying amount.

Impairment loss should be allocated to reduce the book value of assets of the unit in the following order:

- First, any goodwill allocated to cash-generating unit (group of units), and
- then, other assets of the unit (group of units) on a proportional allocation (pro rata) based on book value of each asset in the unit.

In allocating an impairment loss under the policy mentioned above, the carrying amount of an asset shall not be reduced more than the maximum of:

- fair value less costs to sell (if determinable);
- amount of use (if determinable), and
- Zero.

Aspects on improving the financial reporting framework

Professor Traian Nicolae, Ph.D.

*Affiliation: Faculty of Economic Studies,
University Ovidius Constantza, Romania
E-mail: traiannick@yahoo.com*

Abstract

Access to financing from capital markets is conditional on fulfillment of financial communication, accounting rules set by local authorities. But accounting rules in each country depends on national traditions, accounting as a social phenomenon, strongly conditioned by cultural factors, broadly (ie economic, social, legal, fiscal, political and even religious in each country). In October 2002, international accounting standardization (IASB: International Accounting Standards Board) and American (FASB: Financial Accounting Standards Board.) signing an agreement on that date (called the "Norwalk" FASB agreement) with the purpose to ensure a greater convergence of accounting frameworks issued by two accounting regulatory bodies.

Key words: international accounting standardization, financial reporting

JEL Classification:M41

1. Introduction

Convergence process is visible to the IASB's work: a first phase, the "improvements" to existing IAS standards have been reviewed several of the IAS, one has been repealed (IAS 15) and others created and still an improvement project separately (IAS 32 and 39 for financial instruments). In addition, new rules were adopted, (the nine standards IFRS), converging with U.S. accounting referential. Were also taken important steps towards convergence and standardization of the American body. FASB has issued several standards that eliminate differences in relation to international referential (eg. SFAS

151, 153, and 154) and modified one (SFAS 123) to be closer to international treatment.

Major directions of convergence between FASB and IASB are:

- a) Convergence of financial statements (financial reporting);
- b) The convergence of business combinations;
- c) Convergence on the accounting framework;
- d) Convergence of revenue recognition.

Convergence between the two referential concerns but other issues, such as leasing operations, debt settlement, reporting earnings per share or income tax. In essence, the term "harmonization" has been replaced by the "convergence", which shows an increase in compatibility between global accounting frameworks (IFRS and U.S. GAAP) due to U.S. financial market importance in the global economy. Following convergence efforts made by both bodies of normalization, in November 2007, the SEC agreed that firms listed on the New York publishing financial statements comply with IFRS standards without reconciliation to U.S. standards.

2. FASB- IASB convergence project on financial statements

FASB-IASB joint project objective is to establish a common standard for presentation quality financial statements to enhance the ability of individual investors, creditors and other users of accounting information to:

- a) understand the present and past financial position of the entity;

b) understand operating, financing or other past activities that change the financial position of an entity;

c) use the information presented in financial statements (together with other sources) to assess the value and uncertainty of cash flows generated by the entity.

This standard will address presentation and manner of reporting information in financial statements, including classification and presentation of totals and subtotals.

FASB and IASB share human resources and research for this joint project and work together to coordinate issuing a discussion document to be submitted. The project involved members ASBJ (Accounting Standards Board of Japan), FASB and IASB. The project is conducted in phases, as follows:

Phase A: to be discussed include a set of financial statements and requirements for presenting comparative financial information. IASB and FASB have concluded deliberations in this phase in December 2005.

Phase B: addressing fundamental issues of disclosure in financial statements. Phase B includes:

a) develop principles to guide the aggregation or disaggregation of each financial statement information;

b) determine the totals and subtotals to be reported in financial statements each (may be included categories such as operating and financing);

c) a decision on recycling / reclassification of items of other comprehensive income in profit or loss for the period and the characteristics of transactions and events should be recycled, and when their recycling.

d) to reopen discussion of standards FAS 95 and IAS 7 "Cash Flow Statements" including the possibility of prescribing the method using only the direct or indirect.

Phase B is the first result of a discussion document submitted was published in the second quarter of 2008.

Phase C: addressing the presentation and report interim financial statements under U.S. accounting system (U.S. GAAP). IASB may reconsider some of the requirements of IAS 34 "Interim Report". Phase C is to:

a) the financial statements be included in an interim report;

b) entities should be allowed to submit financial statements in an interim report in a condensed form, and if so, provide guidance on the manner in which accounting information can be condensed;

c) the comparative period required or permitted to be interim reports.

d) if the principles for public entities differ from those non public entities.

3. Convergence on the composition of a complete set of financial statements

A complete set of financial statements in international accounting system comprises:

(A) a balance sheet;

(B) a profit and loss account;

(C) a statement of changes in equity, reflecting either: (I) all changes in equity; or (II) changes in equity other than those arising from transactions with owners acting in that capacity;

(D) a statement of cash flows;

(E) notes, comprising a summary of significant accounting policies and other explanatory information.

Following the efforts of convergence, the IASB revised IAS 1 in september 2007 so that a complete set of financial statements comprises:

(A) a statement of financial position at the end of the period;

(B) a statement of comprehensive income for the period;

(C) a statement of changes in equity for the period;

(D) a statement of cash flows for the period;

(E) notes, comprising a summary of significant accounting policies and other explanatory information, and

(F) a statement of financial position at the beginning of the earliest comparative period when an entity applies an accounting policy retrospectively or makes a retrospective restatement of items in its financial statements, or when reclassifies items in its financial statements.

4. Reporting overall performance

Total comprehensive income includes all components included:

- Profit or loss for the period and
- Other elements of the results overall.

Other comprehensive income is defined as items of income and expenses (including related reclassification adjustments) that are not recognized in profit or loss for the period, as allowed by IFRS standard. Components of other comprehensive income include:

(a) changes in revaluation surplus (IAS 16 rules under "Tangible assets" and IAS 38 "Intangible Assets");

(b) actuarial gains and losses relating to defined benefit plans recognized under par. 93A of IAS 19 "Employee Benefits";

(c) gains and losses arising from translating the financial statements of foreign operations (according to IAS 21 "Effects of Changes in Foreign Exchange Rates");

(d) revaluation gains and losses on available for sale financial assets (under IAS 39 "Financial Instruments: Recognition and Measurement ");

(e) gain or loss resulting from the hedging instrument that is determined to be an effective coating operation (under IAS 39 „Financial Instruments: Recognition and Measurement ").

Adjustments for reclassifications represent amounts that have been recognized as other comprehensive income element in the current period or prior periods reclassified to profit or loss for the period.

Under revised IAS 1 (para. 81), company performance can be reported:

(A) in a single financial statement: statement of comprehensive income, or

(B) two statements:

1) Profit and loss, the components of profit or loss period, and

2) Statement of comprehensive income, beginning with the reporting period and the profit or loss of the components included in other comprehensive income. For clarity, hereinafter, we call this form of presentation "simplified format.

At minimum, the following statement of comprehensive income includes all elements:

(A) revenue;

(B) cost of financing;

(C) the profit or loss resulting from associates and joint ventures accounted for using the equity method;

(D) income tax expense;

(E) a single sum total including: i) gain or loss (after tax) from discontinued operations and ii) the profits or losses (after tax) recognized at fair value less costs of sale or disposal of assets or asset groups failure which is discontinued;

(F) profit or loss;

(G) each component of other comprehensive income classified as such (excluding amounts in (h));

(H) the part of other comprehensive income relating to associates and joint ventures accounted for using the equity method;

(I) total comprehensive income.

Information in paragraphs (a) - (f) is minimal information to be submitted as an unreviewed IAS in the income statement. These will be reported according to IAS 1 revised, all in a profit and loss account, if an entity decides reporting financial performance in the two situations, otherwise this information is reported together with other related elements of global performance for a situation of comprehensive income.

Paragraphs (g) - (i) is specific information other comprehensive income and they will be included in a "simplified" situation of comprehensive income, if an entity decides reporting financial performance in the two situations, either with other elements related performance for a comprehensive statement of comprehensive income, if an entity decides to establish a single financial statements.

In consolidated financial statements, statement of comprehensive income should, necessarily, disclosure and information on the breakdown of profit or loss for the period, but the total comprehensive income:

- Attributable to minority interests,

and

- The share equity holders of the parent.

If an entity chooses reporting financial performance in the two situations, where information on the breakdown of profit or loss will be presented in the income statement.

Under IAS 1 revised comprehensive income situation structure (complete or simplified) and profit and loss account (if made) can be enriched with other elements

in place, headings and subtotals when managers appreciate that this information is relevant for understanding the entity's financial performance. So in addition to the minimum required by IAS 1 revised rule, an entity may supplement or amend the order of the items reported to offer the most relevant for understanding the presentation of financial performance achieved and anticipated future results. This should take into account factors like the materiality or the nature and function of various components of revenue and expense recognized.

Before the last revision of IAS 1 states that an entity shall be in the income statement or statement of changes in equity or in the notes, the amount of dividends recognized as distributions to shareholders during the year and the amount of, the action (appear. 95). According to IAS 1 revised reporting this information can not be done unless the situation changes in equity or notes. In other words, the revised IAS 1 prohibits disclosure of dividends recognized as distributions to owners in the statement of comprehensive income or loss (if made). This is because the statement of comprehensive income or profit or loss (if made) are changes in equity not resulting from transactions with owners. However, distributions to owners should be reported separately from information on performance or statement of changes in equity (which groups the changes in equity from transactions with shareholders), or in the notes (IAS 1 revised, IN16, BC75).

IAS 1 revised reiterates ban reporting of income and expense items as extraordinary items either in the statement of comprehensive income, profit and loss account (if established) or in the notes.

5. Reporting information on profit or loss for the period

Revised IAS 1 has basically the same reporting requirements on profit or loss for the period (whether they are presented in a separate statement- income statement, whether reported in the statement of comprehensive income) as its initial version.

Thus, just as in the penultimate review (August 2005), the new IAS 1 does not require presentation of earnings operation as a separate item in the profit and loss, his motivation

remains the same fact . Thus the Basis for Conclusions of IAS 1 before the last revision is argued that this omission was made because IAS 1 does not define "operating activities", and therefore can not rule requires reporting an undefined element. However, it implicitly recognizes that in practice some companies have such information, asking is that if companies choose to report the result of exploitation, it does not exclude elements that are normally considered operational, such as the example, adjustments for depreciation of assets on the grounds that these items do not appear regularly, and depreciation expense by virtue of the fact that they do not generate cash outflow (11-12 BC).

These recommendations are made out of IAS 1, raises, but questions about their authority in financial reporting practice.

Also, the revised IAS 1 (para. 97) requires, as a previous version, as when certain items of income and expenses are significant, the nature and value are presented separately, stating that such information may be reported either in notes or the statement of comprehensive income or loss (if made). For example are given the same circumstances that can lead to disclosure of such income and expenditure (para. 98)

a) making adjustments for depreciation of inventories to net worth or tangible achievement to recoverable amount, and also resumption of such adjustments for depreciation;

b) restructuring and recovery business entity of any provisions for restructuring costs;

c) sales of tangible assets;

d) investment sales;

e) discontinued operations;

f) settlement of disputes;

g) other reversals of provisions.

As with its predecessor, IAS 1 revised (§ 99-100) requires the presentation of an analysis of expenses recognized in profit or loss for the period are by nature or by position, recommending that the analysis is presented in comprehensive income statement, or account profit and loss (if made). In the revised rule are given the same classification examples included with the

previous standard (IAS 1 revised look. 102-103).

Presentation by the nature of expenses:

- Income
- Other income
- Changes in inventories of finished goods and work in progress
- Raw materials and consumables used
- Employee benefits expense
- Depreciation and amortization expense
- Other expenses
- Total expenses
- Gross profit (before tax)

Presentation by expenditure's functions:

- Income
- Cost of sales
- Gross margin
- Other income
- Expenditure Distribution
- General administration expenses
- Other expenses
- Gross profit (before tax)

Like the previous version, a revised IAS recognizes both forms of analysis of expenses recognized in profit or loss for the period, managers may opt for that method of classification of expenditure which they consider more relevant and credible. It also requires that entities present in the statement of comprehensive income or profit and loss account (if drafted) expenditure classified by functions of the company to report additional information in the notes on the economic nature of such expenses (including depreciation expense and impairment and costs of benefits granted to employees). This communication is further justified by the fact that information on the economic nature of expenses is useful in estimating future cash flows (para. 104-105).

Similarly, IAS 1 revised rule does not require, but encourages companies to submit an analysis of expenses by nature or by function in the statement of comprehensive income or loss (if made). Therefore, some companies may show a mixed review of expenditure in the income statement as long as the notes are shown after analysis by function and nature of expenses.

6. Reporting information on transactions with owners

Revised IAS 1 requires an entity to disclose changes in equity when all changes in equity during the year as a result of transactions with owners, unlike a previous rule that allowed IAS reporting all changes in equity, including those related to performance. The new vision (revised IAS 1 para. 106 (b)), changes in equity statement must include:

(A) total comprehensive income, showing separately the amounts attributable to owners of stock and minority interest;

(B) for each component of equity, the effects of restatements or the retroactive application in accordance with IAS 8 "Accounting Policies, Changes in Accounting Estimates and Errors";

(C) the amounts of transactions with owners acting in that capacity, stating separately their contributions and distributions in their favor;

(D) for each component of equity, a reconciliation between the carrying amount at the beginning and end of the period, separately disclosing each change or changes in the equity component.

Revised IAS 1 (para. 109) reiterates the theoretical distinction between two types of changes in equity: those related to performance and those related to transactions with owners, awards presented, moreover, and IAS 1 before the last revision (appear. 98). In this regard it is noted that changes in equity between the two reporting dates reflect the increase or decrease in net assets during the period. And also that, unless "changes resulting from transactions with owners that are manifested in their capacity as owners (such as equity contributions, redeem the entity's own equity instruments and dividends) and transaction costs directly related to such operations, the overall change in equity during a period represents the total amount of revenues and expenses, including gains and losses generated by the entity during the period (whether those items of income and expenses are recognized in profit or loss or directly as changes in equity).

Revised IAS 1 (para. 110) clarifies that equity adjustments evidence of prior periods (correction of errors or changes in accounting policies), in accordance with IAS 8, there are changes in equity, but balances adjustment elementlor initial equity (mainly of retained earnings). As prescribed revised IAS 1 (para. 106 (b)) an entity shall disclose separately the effect of adjustments relating to corrections of errors (retrospective restatement), respectively related adjustments of accounting policy changes (retrospective application). These adjustments must be reported for each prior period and the beginning of the period. Revised IAS 1 prohibits disclosure of dividends recognized as distributions to owners in the statement of comprehensive income or loss (if made). This is because the statement of comprehensive income or profit or loss (if made) are changes in equity not resulting from transactions with owners. Therefore the revised IAS 1 (para. 107) prescribes that an entity shall disclose the amount of dividends recognized as distributions to shareholders during the year and the amount of the action when changes in equity or notes.

Present and future of the accountant in the Romanian economic environment

 Ph D Lecturer Pantea Mioara Florina
 “Aurel Vlaicu University”, Arad
 cristina_nc2@yahoo.com,
 miofp75@yahoo.com

Abstract

The accounting professionals currently have an important role within the enterprise and society. Investors, creditors, employers and other departments of the financial community, including the government and the public, rely on professional accountants for accurate financial accounting and financial statements, for an efficient financial management and for competitive advice regarding various businesses and tax issues.

Key words: accountant, accounting, future.

JEL Classification: M4, M41

In his book called „General accounting”, Bernard Colasse wrote: „A significant number of pedagogical and specialized papers concerning the enterprises accounting are deliberately defined technical as the accountant would operate in a historical, social and organizational void. These papers are in accordance with a legend which presents the accountant as an odd human being locked in a ivory tower who is disconnected from reality and time and deaf to the noise of the external world”. Is it really so? Definitely no, it has never been and, what matters most, will never be ! The arguments ... follow:

In order to understand the accountant as a character in the enterprise’s movie, we must understand more about accounting, his score.

Rudimentary forms of accounting existed from ancient times. The early human need to count can be found in human prehistory and it was proved by the notches on animal bones or cave walls dating from the

primitive age. Although the „patrimony” belonging to prehistorical human did not count many „assets”, the human being felt the need „to keep the record” of these assets for a better „administration” or maybe to compare his wealth to the one of his neighbors. This need has evolved along with the people evolution, increasing and diversifying simultaneously with the „patrimony” development which should have been known and managed, thus moving from the simple notches to memorial accounting, simple booking and booking by double entry.

Antiquity, middle ages, capitalism, contemporary period, all of them had their own accounting and their own accounting standard. By accounting, the accountant reflects a certain economic reality. Can it be correctly reflected by someone who does not know it, by someone who is disconnected from this reality?

The analysis of these steps shows the formation and development of two major different accounting cultures. At present, these cultures are dominant worldwide and are considered rivals by some authors: Anglo-Saxon accounting culture and Continental-European accounting culture. According to these two cultures we also notice two “types” of accountants, as the accounting profession organization is connected and serves the accounting system.

These accountants’ profile will be a resultant of the environment in which they operate.

In USA, as a representative country for the Anglo-Saxon system, the accounting

profession is divided in private accounting and public accounting.

Private accountants work for a single enterprise and the public accountants serve the public interest and work on their own. Some public accountants make a partnership as an accounting company where they operate together. In USA, certified public accountants CPAs have a particular status. There are also certified accounting companies (CPA firms) whose employees are mainly certified public accountants. We can mention some of the largest companies operating worldwide through branches: Arthur Anderson & Co, Coopers & Lybrand, Deloitte & Touche, Ernst & Young, KPMK Pest Marwick and Price Waterhouse.

The services provided by a private accountant are: enterprise costs analysis in order to reduce costs, budgeting for setting short, medium and long term objectives, development of accounting informational and internal audit systems.

USA private accountants provide audit services, fiscal consultancy and management consultancy.

In France, as a representative country for the continental accounting system, there are two types of accountants: chartered accountants and commissioners of accounts. According to French legislation, these categories mentioned above have a general interest mission and must accomplish certain training requirements certified with diplomas in order to give them appropriate competences. Meanwhile the French accounting system professionals must respect the professional Code of Conduct. The specific missions of these two types of accountants are different depending on mission classification. Thus, the chartered accountants can perform the following missions: the accounting system enterprise review, helping an enterprise with accounting management and annual financial statements elaboration and not least, financially and legally recommendations for managers.

If French chartered accountants have contractual missions, the commissioners of accounts have missions of legal nature. Such

kind of missions are: certification of annual financial statements' correctness and fairness, associates' report and management report on any error or fraud discovered, competent authorities' report of the enterprises' illegal activity, triggering an alert procedure in case of serious facts which may compromise the enterprise activity and so on.

According to French legislation, the same person may be a chartered accountant and a commissioner of accounts, but only for different companies. The commissioners of accounts are forbidden to keep accounts or to interfere with a company management as well. In France, there are different professional authorities regarding the chartered accountants and the commissioners of accounts. Thus, the chartered accountants are organized in Order of Chartered Accountants (OEC) and the commissioners of accounts are organized in Commissioners of Accounts National Company (CNCC). Each of these bodies has its own tradition and contribution to accounting work organization.

The role of professional accountants within companies and economies differ depending on every country characteristics. In countries such as USA, United Kingdom, Australia, the private accounting system has power and influence in developing accounting standards, which solve several accounting issues, the degree of independence of the accounting profession being very important. In France, private companies are not allowed to make regulations, while in Germany the regulations of Code of Commerce are complied. In France and Germany, the legislation is very detailed, meanwhile in United Kingdom the legislation issues some prescriptions and the accounting professionals have their own important role in solving accounting problems. In France, there is also a general chart of accounts which imposes the accounts' structure and assessment and registration rules in accounting.

Various studies have proved that the Anglo-Saxon accounting system is manageable, optimistic and transparent. The Latin countries accounting system features conservatism and confidentiality.

The continental Europe accounting authorities' power is not so important, although the Order of Chartered Accountants (OEC) was established in 1945, Commissioners of Accounts National Company (CNCC) was established in 1969 and since then these authorities operate continuously and they adjust to the needs of its members and to the economic environment.

This is not the case of the Romanian professional accounting authorities which had that "hiatus" moment during 50 years in the socialist period. Maybe this is the starting point in understanding the current Romanian accountant behavior!

First of all, we should make a difference between the accountants who operated mainly during the old regime, the ones who have started their career during the shaky years of the 1990 – 2000 decade and the ones who became professionals after 2000. Few of those in first category truly succeeded to adapt to the new realities. They are still waiting for implementation rules and methodologies for each news to the prejudice of professional judgment; they are frightened and confused by any legislative change, they are more than cautious toward fiscality (to the prejudice of tax payer!) and they do not succeed to surpass the mentality of "simple tax subordinated holders of ordinary books".

The professional accountants who started to work in the early 90s are the ones who are currently at full professional maturity. They were compelled early in their career to adapt themselves, constantly and rapidly, to any "legislative whims" and to any national accounting system' changes, more or less coherent.

"The young accountants" which begun since 2000 are the best adapted, considering they had experienced changes starting in school and they know one single reality that is a reality in constant motion. For these accountants the change is a way of life and adaptation is part of their survival techniques.

To analyze the Romanian accountants and to understand their behavior we should make the distinction between the freelance

accountants and the accountants who work as corporate employees.

Obviously, accounting services outsourcing has strengths and weaknesses. The main advantage would be specialization within an accounting office such as: general accounting, bookkeeping, administration, fiscality, wages consultancy, legal related issues and so on. These experts, each in his specialization field, may provide competent consultancy to a company, which an employee accountant could not offer. As for the employee accountant, the great advantage is that he knows thoroughly the enterprise situation and he participates effectively to its activity; consequently he has the capacity to provide knowingly solutions. In case of accounting offices, which may have tens of corporate customers and where the touch with the enterprise reality is not so regulated by the specialist; these disadvantages can lead to misunderstanding and wrong accounting treatment of some aspects regarding the enterprise activity.

Whether it is the freelance accountant or the employee accountant, all of them must have the essential qualities: knowledge, competence and consciousness, independence of mind, disregard material, morality, probity and dignity, because according to accounting profession's ethical code assuming public responsibility is a distinct sign of this profession.

According to the same code, a professional accountant's responsibility must not be limited to meet the customer's or the employer's need. The accounting profession's public is made up of customers, credit suppliers, governors, employers, employees, investors, business community, funders and other persons who rely on objectivity and integrity of professional accountants to maintain an appropriate operation of economy. This trust implies that the accounting profession has a public responsibility for the welfare of community and institutions served by the professional accountant.

This is why the accounting profession standards, no matter of accounting expert's

operating field or level, are strongly influenced by public interest, such as:

- independent financial auditors help maintaining financial statements' integrity and efficiency presented to financial institutions as a partially support for loans and to shareholders for raising capital;
- financial managers have attributions in different financial management fields and contribute to an efficient and effective use of economic and public entity's resources;
- internal auditors provides the insurance of a correct internal control system which increases the trust in external financial information regarding the enterprise;
- tax experts help consolidating the trust and efficiency and also to an appropriate tax system implementation;
- managerial consultants have a responsibility regarding the public interest in sustaining an appropriate managerial decision taking process.

In conclusion, the accounting professionals currently have an important role within the enterprise and society. Investors, creditors, employers and other departments of the financial community, including the government and the public, rely on professional accountants for accurate financial accounting and financial statements, for an efficient financial management and for competitive advice regarding various businesses and tax issues.

This is the current position of the accountant in the enterprise and society, but which is the future of this profession and which will be the next role of accounting professional in the future of the Romanian development society?

Obviously the accounting professionals can keep this favorable position (after all no matter what others may say this is the truth!) only if they continue to provide exclusive services to the public at a level which proves a well-based public trust. It is on Romanian accounting profession's interest to inform the accounting services users that these services are performed at the highest performance level and according to ethical requirements.

Accounting information is a product like any other. If a turner accomplishes a lathe, an accountant provides accounting information. The continuous product improvement and its adjustment to customers' needs must be everybody's concern. Market researches have as aim the identification of customers' needs, of satisfactions and dissatisfactions of the customers regarding a certain product. The accountants must be permanently connected to the informational needs of their customers, the accounting information users.

The new trend and the new perspective in accounting profession is the anticipation of accounting information needs and implicitly the development of accounting techniques tools for meeting these needs. This is possible because the technological advance covers a major part of the accountant's routine through computer software. Therefore, the accountant has more time for creativity and active participation to the company's life. As other authors stated, the accountant tends to become an important pole within the company, being the center of the decision taking process.

Beyond this aspect, it becomes increasingly clear and significant the social role of the accountant because he is the individual who establishes and gives the wages to thousands of employees. The corporation and its employees' welfare depend and will depend on accountants

In the future, it should be clearly made also in Romania the distinction between the various services provided by accounting professionals: bookkeeping, payrolls, annual financial statements, fiscal reports, fiscal consultancy, audit and certification, budgeting and forecasts, calculation and costs control, management consultancy and so on. A special and important function which exists in USA, but in Romania is missing, is the one of information system design. This identifies the organization's information needs, both internal and external. Using flower charts and manuals, designers develop and implement the system to meet those needs.

This concern may have the following positive consequences:

✓the redundances discharge in financial reports and the discharge of useless information, i.e. the effective implementation of the principle of materiality;

✓provides information adapted to categories of users;

✓generates the prerequisites for information and users needs forecast, which we consider the next step in accounting profession development.

The final conclusion is that the professional accountants have and will have an essential role in the company's favorable evolution and automatically in the whole economy. They are able to influence the decisions of enterprises' managers directing the entire business trend. The future accounting professionals are not docile performers, on the contrary, they are performant specialists, dynamic and creative, flexible and efficient in their actions.

Regarding the Romanian professional accountants, although on social plan they benefit from less consideration than the professionals from others countries, they can succeed through effort, vocation, competence, professional probity, having all the opportunities to gain their deserved role in the Romanian corporate environment and society.

Abstract

If the accounting measurement of economic performance has a lot of techniques and tools we can not say the same for the other two objectives, environmental and social. On the assumption of maximizing benefits, the question arises whether social enterprises reach performance levels similar to those of financial performance are not as interested in social responsibility aspect.

Key words: social responsibility, social performance

JEL Classification : M41, M43

To investigate the relationship between the two can start from premises that generally moot when the financial performance of firms take into account both the value of its shares and accounting performance measured based on various indicators: the benefit per share, profit etc..The concept of enterprise social responsibility (Corporate Social Responsibility) occurred in the U.S. in 1980. Concept was first used and defined in 1953 in "Social Responsibilities Of The Businessman 'of Howard Bowen. This social responsibility, defined as "a number of requirements that lead to policy decisions and guidelines of conduct consistent with the objectives and values of society.

The concept has penetrated Europe much later and then experiencing a deepening and ongoing development. So if it includes only the top responsibilities based company fulfill its

essential functions, relative to production, employment and growth in time has come to encompass this concept and consideration of environmental issues, development of society and social relations.

Currently witnessing the transition to a new phase of concept development through the exercise of responsibilities that arise and lead to environmental improvement, which implies the emergence of a new concept: the societal openness (Corporate Social responsivness). The concept is defined by the ability of firms to respond to social pressures by applying a relationship management company that correlate with various stakeholders.

Unlike the American vision of societal responsibility, which amounts to philanthropy foreign economic activities of, the European approach tends to believe that such actions are not carried out within the scope of social responsibility and that they be assessed in the usual terms of business .

This approach is defined European Commission on CSR, which includes in its sphere of voluntary integration of social and environmental concerns in its activities. Undertaking concrete economic prosperity (economic objective) is pursued in conjunction with respect for the environment (ecological objective) and improve social cohesion (social objective).

If the accounting measurement of economic performance has a lot of techniques and tools we can not say the same for the other two objectives, environmental and social. On the assumption of maximizing benefits, the question arises whether social enterprises reach

performance levels similar to those of financial performance are not as interested in social responsibility aspect.

To investigate the relationship between the two can start from premises that generally moot when the financial performance of firms take into account both the value of its shares and accounting performance measured based on various indicators: the benefit per share, profit etc..

A useful tool in measuring the social elements of business performance could be a likely extrafinanciară dashboard. This picture can be developed in several areas such as: trading partners (suppliers and customers), employees, shareholders, etc..

Regarding social performance of a trading company can be assessed in terms of quality and its relationship with suppliers and customers, their ethics and their social and environmental responsibility. Another aspect would be the quality products offered by enterprise customers as ecological (their biodegradability, recyclability, environmental impact, etc..).

Social responsibility of business entails its concern for the welfare of its employees: their rights, creating optimal working conditions, the labor security and hygiene, proper wages, etc..

Shareholder behavior and decisions that they take and they reflect the social involvement of business, since it protects the environment and help to increase social welfare not only its employees but also other categories of people (by operation of patronage, sponsorship Support the work of NGOs, etc..).

What is clear is that all this involvement and the actions they entail costs for business generates. But that would benefit these concerns for the enterprise? There is this benefit, and if so can it be measured?

One way would be to correlate economic performance of enterprises' social responsibility of business activities provided that economic efficiency requires, among other things, best use of resources, both material impact on the environment and human, which determines the social objective of business.

In other words should reveal how the environmental and social externalities influenced the economic performance of the company.

Social costs are the main strategic concern of social accountability plan a business. Practice shows that these costs are lower if they are made to prevent damage than to their compensa. Ca difference between the cost of any compensation due and cost impact studies and social protection and environment may be considered a win.

In the same category of social costs, those relating to falls and investors, creditors, suppliers, customers, government organizations or NGOs in the field. Promoting good relations with them will enable the company to avoid social conflicts and environmental issues. Moreover building an image of "green business" contributes to preferring the company as a partner in the economic activities generating the income.

We can not neglect any fiscal impact. Such technologies will generate polluted tax expenses (eg costs for emissions of carbon dioxide emission taxes), while the use of environmental technologies, are granted various tax incentives to generate tax revenue. Recognition of the same tax benefits and social costs of the enterprise. Lever rule by taxation, encourage enterprises to carry out an activity beneficial to the environment both ecologically and socially. Knowledge and application of these measures by the company can increase its performance by reducing costs of business tax.

Corporate management and other third parties to which it has some social responsibility using accounts to obtain information about the consequences on growth opportunities and environmental costs.

Ideally, all (or even a majority) of business impacts society and environment to highlight the company's accounting system.

The idea of OMFP 3055/2009 refers to the requirement of recognition of provisions for "the cost of removing the negative effects, environmental products, punishable by law, which generates and outputs of resources embodying economic benefits, regardless of the entity's future actions. Similarly, an entity

recognizes a provision for plant closing costs of oil, provided that such entity to remedy the damage already.

Same normative act also provides that "unlike this case, an entity may intend or need, for commercial reasons or due to the pressure requirements of legal, to make expenditures to act in a certain way (eg by fitting smoke filters in a certain type of factory). Since the entity can avoid future costs through various actions, for example, by changing the manufacturing process, it has a future obligation related to that expenditure, and therefore will not recognize any provision." The latter situation will be accounted for expenses in a separate account: 652 'Expenditure on environmental protection' group 65 'Other operating expenses.

With this account is recorded environmental costs, for the period, that environmental taxes paid (5121) allowances of greenhouse gas purchased, environmental costs incurred in advance for the year in progress, etc. . By incorporating these costs as a result of the exercise highlighted the economic impact on the outcome.

Provisions established for costs related to environmental protection, for: air protection, wastewater management, waste management, protecting soil, groundwater and surface water, biodiversity and landscape and other environmental protection activities will be presented the balance sheet under "Other provisions".

Another annual financial reporting document contains information on environmental and social role of the company's "managers report. This, to the extent necessary to understand the development entity, performance or financial position, including financial indicators, and where appropriate, non-financial key performance indicators, relating to environmental matters and company employees .

OMFP 3055/2009 on accounting regulations consistent with European regulations do not specify the obligation to use other accounts to highlight environmental and social impact of business environment, but each company according to information needs and applying the principle of materiality can create their own analytical accounts highlight all the

inputs and outputs related to social responsibility activities. In practice, currently in Romania, only a small proportion of these operations are highlighted either voluntarily or through coercive action of direct or indirect regulation. But without such information relating to business transactions impact on the environment, the system can not support business decision consistent action on environmental and social objectives.

One reason for this situation is the current accounting system is an information system built to measure economic performance as a basis for past and current economic performance, but provides a projection of future performance.

Finally there is a rigorous strategy of highlighting the effects of environmental and social impact of the company, leading to information which allows the best measures to improve enterprise performance at both economic and environmental and social. Short-term recognition of environmental costs resulting directly affect the outcome of the current (economic, social or environmental) by determining the new current costs recognized as expenses in the period, and future obligations are recognized as expenses in reserves. Long-term effect of this expenditure often result future business growth and sustainability of its economic, social and environmental.

Since financial accounts do not offer many techniques to highlight the company's social performance could be a useful tool for environmental management accounting. The structures they can provide identification to be treated as externalities current income by internalization, or binding on future results, by transforming their future obligations through provisions.

Another useful tool would be cost-benefit analysis to determine specific indicators of social and environmental performance, especially since they are increasingly sought as the company's financial partners and civil society.

Abstract

The elaboration of international referentials IPSAS (International Public Sector Accounting Standards) by competent bodies (IPSASB – International Public Sector Accounting Standards Board) involves a continuous junction between the specific needs of national accounting systems in the context of the harmonization process and their convergence and the identification of the needs of economic, political, social systems, whose interdependency is evident.

This process determines the continuous update of IPSAS, for being able to answer to many current problems. The study aims to highlight through a positivist approach, combining quantitative with qualitative research, how Exposure Draft 42 – Improvements to IPSASs, succeeds to capture the need for changing of content, namely terminology of 12 IPSAS. Following the purpose of this process, through the adoption of changes in January 2010, we can identify how comments of various professional accountancy bodies influenced the final decision of IPSASB.

The study is of great importance for both the theoreticians from accounting field, who can make an image on the research trends in this field, and the practitioners who can get the answer to some problems of IPSASs, whose solution will be achieved by international standard approval.

Key words: accounting standards, IPSAS, improvement, approval

JEL classification: H83

1. Introduction

IFAC recognizes the need for international financial reporting standards for public sector, with

a role in improving accountability and financial management. The International Public Sector Accounting Standards - IPSAS has as objective the improvement of financial reporting of entities from public sector, leading to a common language which is desirable in the international financial community [1].

These referentials converge with IFRSs issued by IASB by adapting them to the public sector context when it is the case. This is the reason why „IASB Framework for preparation and presentation of financial statements” represents a relevant reference for users of IPSASs.

Thus, with the approval and implementation of referential „Improvements to IPSASs” in May 2008 by IASB (International Accounting Standards Board) the problem regarding the update of IPSASs is mentioned, IPSAS that are influenced by modified IFRSs.

This study aims to capture how the amendments of the 12 IPSAS proposed by IPSASB are supported by respondent countries, members of IFAC, being drawn to the following construction:

- Presentation of IPSASs role in the accounting system of public institutions;
- Reflecting the evolution of Exposure Draft (ED)42- Improvements to IPSASs;
- Analysis of content and terminology changes stipulated in the ED 42;
- Analysis and interpretation of answers provided by professional body of accountants from different countries, IFAC members;

- Interpretation on each modification of the degree of its acceptance;
- Comparison with the final version, to determine the degree of influence on the initial version of the comments.

The results will determine how the updating of IPSAS represents an individual problem of specialists from public sector accounting, or is a close interdependence with the fluctuation of changes occurring on IFRSs, outlining the idea that harmonization and convergence of accounting systems is a road without going back [2].

2. The role of IPSAS/IPSASB

From the historical point of view IFAC – through the Public Sector Committee (PSC) launched in 1996 a project to develop a set of accounting standards for entities from public sector, known as IPSAS. After July 31, 1998, PSC issued 27 IPSAS Standards inspired from IAS / IFRS, being based on the accrual accounting [3].

The aim of this single set of standards is to include a clear statement of the principles, having to do with almost all types of events, transactions and structures that appear in public institutions practice.

The existence of a set of standards provides important positive implications for organizations and individuals who have adopted them, such as:

- reduce capital costs and facility use of a consistent reporting standard in various countries subsidiaries (for entities);
- provide relevant information that assist in making decisions and that lead to greater investment opportunities (for investors, creditors);
- provide better information for market participants in a disclosure-based system.

Undoubtedly, the standards offer high quality information, with a greater transparency and coherence, so that the financial situations of the entities might be compared both in time and space.

Maintaining the content of these referentials, directly connected to reality, supposes that IPSASB should organize a continuous process of updating the referentials. Such an approach marks the current period of IPSASB's concerns regarding the issuance of two exposure drafts (ED) for the convergence between IPSAS and IFRS.

The first one, „Improvements to IPSASs” (analysed by us) proposes amendments for 12 existing IPSAS in order to comply with equivalent IFRS. This ED was discussed by IFAC on 30th of

June, 2009 with the aim of having some comments until 30th of September 2009. After being modified with the received amendments, it was launched in January 2010, going to be applied after 1st of January, 2011. IPSASB declared its intention of launching a new ED in 2010, with the purpose of bringing changes and updates to IPSAS.

The second one, „The Equal Authority of IPSAS Paragraphs” suggests that the Preface to The Public Sector International Accounting Standards should be revised in order to clarify the fact that all IPSAS paragraphs have equal authority, an approach that was adopted by IFRS.

Another aim of IPSASB is to ensure the convergence of its standards with the statistics basis of reporting that require that governments should present financial information about the general governmental sector. IPSASB issued a project that suggests requirements related to presenting the information about the general governmental sector within financial situations with general purpose, where the entities from the public sector choose to act in this way and offer better means of explaining the differences between the statistical reporting basis and IPSAS. These were prepared in close relation with the departments of statistical reporting. [4]

3. Research Design

The objectives of this study may be structured as follows:

- establishing the amendments stipulated; through a theoretical research we briefly present the main points for discussion in the ED 42.
- analysis and interpretation of answers provided; through a content analysis [5] we build a database in which the answers given by respondents (n = 10) will be measured with 1 (YES) and with 0 (NO).
- establishing the degree of acceptance of amendments proposed for discussion by IPSASB; through a descriptive process (SPSS version 16), we determine the degree of acceptance of proposed changes.
- Establishing the influence of comments on the final version of ED 42; by comparing the

results obtained in the previous paragraph and the final form of IPSAS-Improvements to IPSASs, we can express an opinion regarding the power to change the respondent organizations.

Thus, we have formulated two hypotheses by whose validation or invalidation we will test their reality.

H1. More substantive changes and editorial changes proposed to those 12 IPSASs will increase the convergence degree between IPSAS and IFRS.

H2. The formulated comments made at ED 42 influenced in a significant report the final form of improvements to IPSASs.

The scientific research contributes to the efforts to deepen the knowledge required by retrospective nature imposed by the realized normative research, and by the prospective nature, given by the realized empirical research. Among the human socio science methods used in this approach, we can specify: analysis of documents, comparative method and observation method.

4. Results

The IPSASs subject to change and their content are presented schematically in Table 1. Improvements to IPSASs. These are structured in two parts: part I refers to more substantive changes, and part II refers to editorial changes.

Table 1. Improvements to IPSASs

PART I
<p>Name: IPSAS 5 „Borrowing costs”</p> <p>Changes (ED 42): Components of borrowing costs in definition of borrowing costs; Amortization of discounts or premiums relating to borrowings; Amortization of ancillary costs incurred in connection with the arrangement of borrowings.</p>
<p>Name: IPSAS7 „Investments in Associates”</p> <p>Changes (ED 42): Required disclosures when investments in associates are accounted for at fair value through surplus or deficit.</p>
<p>Name: IPSAS 8 „Interests in Joint Ventures”</p> <p>Changes (ED 42): Required disclosures when interests in jointly controlled entities are accounted for at fair value through surplus or deficit.</p>
<p>Name: IPSAS 16 „Investment Property”</p> <p>Changes (ED 42): Property under construction or development for future use as investment property.</p>
<p>Name: IPSAS 17 „Property, Plant and Equipment”</p>

<p>Modificari (ED 42): Sale of assets held for rental.</p>
<p>Name: IPSAS 25 „Employee Benefits”</p> <p>Changes (ED 42): Replacement of term “fall due”; Curtailments and negative past service cost; Plan administration costs; Guidance on contingent liabilities.</p>
<p>Name: IPSAS 26 „Impairment of Cash-Generating Assets”</p> <p>Changes (ED 42): Disclosure of estimates used to determine recoverable amount.</p>
<p>PART II</p>
<p>Name: IPSAS 1 „Presentation of Financial Statements”</p> <p>Changes (ED 42): Editorial changes</p>
<p>Name: IPSAS 3 „Accounting Policies, Changes in Accounting Estimates and Errors”</p> <p>Changes (ED 42): Status of implementation guidance</p>
<p>Name: IPSAS 6 „Consolidated and Separate Financial Statements”,</p> <p>Changes (ED 42): Editorial changes</p>
<p>Name: IPSAS 10 „Financial Reporting in Hyperinflationary Economies”,</p> <p>Changes (ED 42): Editorial changes</p>
<p>Name: IPSAS 14 „Events After the Reporting Date”</p> <p>Changes (ED 42): Dividends declared after the end of the reporting period.</p>
<p>Name: IPSAS16 „Investment Property”</p> <p>Changes (ED 42): Consistency of terminology with IPSAS 3; Investment property held under lease</p>

Based on these issues for discussion, a total of 10 professional bodies of IFAC member countries answered. Grouping their agreement or disagreement is realized in Table 2 - Positioning of respondents.

Canada, namely PSAB does not agree with the amendments brought by IPSASB with the aim of updating the 12 IPSAS because of three reasons: there is no clear relation between the 19 IFRS that were updated in May 2008 and the IPSAS subject to updating through ED 42, in other words, the documents that contain the improvements brought by IFRS, respectively, the suggestions made for improving the IPSAS are separated and their relation cannot be noticed, even if the purpose of ED 42 is to update the 12 IPSAS as a result of updating the IFRS that stand at

the basis of these; ten of the improvements made by IASB will be reflected in the following exposure drafts of IPSASB. At the same time, IPSAS do not contain references about the date of coming into force or the date of the last modification of IAS on the basis of which they are drawn up; four of the improvements brought to IAS are considered not to have equivalent in IPSAS. One of these, regarding the earnings per share does not have equivalent in the accounting of the public sector, but the other three can also be applied to the public sector, respectively the intermediate reporting, the accounting of the governmental subsidies and assets held for selling and discontinuous operations.

UK, Sweden and Switzerland expressed their total agreement with the suggestions of updating included in ED 42, without having any objection about them.

France stated in the letter sent as an answer to the proposal of improving IPSAS that they did not agree with the process of convergence of IPSAS with IFRS, considering it a waste of energy of IPSASB because some essential aspects of the public sector are not taken into account by IPSAS. The French specialists consider that the exposure draft issued by IPSASB should be an independent document and not one related to the one that contains the improvements made by IFRS. Nevertheless, France expressed its agreement related to 10 of the amendments, but they have objections about 3 of them:

- The French specialists consider as inadequate the fact that IPSAS 7 „Investments in Associates” defines the information for investments in the associated enterprises as being especially excluded from its area of applicability. With this purpose, they suggest elaborating some stipulations for the future international accounting standards that use financial instruments.

- IPSAS 8 „Interests in Joint Ventures”. The necessary information when the interest in joint ventures is analysed by excess or deficit. The disagreement is due to the same considerations as in the previous case.

- IPSAS 1 „Presentation of Financial Statements”. Editorial changes – The Committee of Norms for Public Accounting (CNOCP) consider as inadequate the proposal of this amendment that has at its basis IAS 39 standard, because of the fact that the French specialists oppose to adopting the IAS 39 dispositions for the public sector. Nevertheless, CNOCP appreciates the fact that IPSAS 1

introduced the financial assets owned for transaction in the category of current financial assets.

Australia, namely the Department of Finance and Deregulation of the Australian Government, agrees with the amendments proposed by ED 42 with the exception of the 2 amendments brought to IPSAS 16 „Investment Property” referring to the properties owned for building or development that are supposed to be registered with their fair value. The reasons for the disagreement are as follows: Most part of the goods acquired for investments are not available for selling within the period of building and therefore, the fair value, which is mostly based on the selling prices, is irrelevant; The main problem of management during the phase of building a project is the variation between the real costs of building and the costs stipulated in the building budget. Again, the fair value is irrelevant; IASB did not explore adequately the difference between a property owned through partial rehabilitation (which supposes minimal changes to the existing asset) and a property obtained in order to be developed (usually, the changes in the structure of the respective asset are significant).

Federation of European Accountants (FEE) supports IPSASB initiative of bringing updates to IPSAS as a result of updating IFRS in May 2008.

South Africa, through the two institutions that had the same answer to the proposals for amendments, namely the Accounting Standards Board and the The South African Institute of Chartered Accountants, expressed its disagreement about these amendments, coming with suggestions of improvement as follows: It was suggested the introduction of a basis paragraph for conclusions in many of the IPSAS amended. Through this paragraph IPSASB makes specific reference to taking into account the changes brought to IFRS/IAS. In this way, both institutions suggest that a similar wording should be used to elaborate the new basis for conclusions that will be added to the improved IPSAS. They also suggest that within the basis for conclusions, the paragraphs that refer to the revisions of 2003

should be separated by those which refer to the following revisions.

Tabel 2. Positioning of respondents

COUNTRY	More substantive changes						Editorial changes						
	1	7	8	16	17	25	26	1	3	6	10	14	16
Canada	0	0	0	0	0	0	0	0	0	0	0	0	0
UK/1	1	1	1	1	1	1	1	1	1	1	1	1	1
UK/2	1	1	1	1	1	1	1	1	1	1	1	1	1
Sweden	1	1	1	1	1	1	1	1	1	1	1	1	1
South Africa/1	1	0	0	0	0	0	1	0	0	0	0	1	1
South Africa/2	1	0	0	0	0	0	1	0	0	0	0	1	1
Switzerland	1	1	1	1	1	1	1	1	1	1	1	1	1
FEE	1	1	1	1	1	1	1	1	1	1	1	1	1
Australia	1	1	1	0	1	1	1	1	1	1	1	1	0
France	1	0	0	1	1	1	1	1	1	1	1	1	1

The results confirm the first hypothesis, demonstrating that within their content all the changes refer to the closeness between IPSAS and IFRS, both in form and content. From the point of view of the acceptance or refusal, the countries can be divided in three categories: those which completely reject the amendments (Canada); those which unanimously accept all points of view (UK, Switzerland, Sweden), respectively those which insist on some aspects that, in their opinion, should be approached more clearly and should aim at public institutions characteristics, as the excessive closeness to IFRS is not advisable.

The estimation of the acceptance or refusal of the amendments is done by analysing the data basis (tabel 3 – The rate of acceptance of the amendments) through a descriptive research.

Tabel 3. The rate of acceptance of the amendments

Changes	Agreement / Disagreement	
	YES	NO
IPSAS 5	90%	10%
IPSAS 7	60%	40%
IPSAS 8	60%	40%
IPSAS 16	60%	40%
IPSAS 17	70%	30%
IPSAS 25	70%	30%
IPSAS 26	90%	10%
IPSAS 1	60%	40%
IPSAS 3	70%	30%
IPSAS 6	70%	30%
IPSAS 10	70%	30%
IPSAS 14	90%	10%
IPSAS 16	80%	20%

In this context the second hypothesis is true, all the amendments having a rate of acceptance of over 50%.

In order to achieve all the stipulated aims, we made a comparison on two levels: the first one, between the final form of ED 42 (IPSAS Improvements) that appeared in January 2010 and the initial form proposed in June 2009; the second one refers to the report between the suggestions and the opinions stipulated by the different organisations and the final form of IPSAS Amendments.

As a conclusion, we can say that IPSASB assumed part of the objections brought by those who gave a response, even if in a percentage their acceptance wouldn't have been compulsory. These refer to:

- the amendment to IPSAS 5, Borrowing Costs should be excluded from this project and addressed in the separate Borrowing Costs project.
- the proposed amendment to IPSAS 6, Consolidated and Separate Financial Statements should not be adopted.
- to remove the distinction between Part I (more substantive changes) and Part II (editorial changes).

5. Conclusions

Elaborating and updating the international IPSAS referentials is a complex process that supposes more steps: identifying the needs of the accounting systems, elaborating the standards content, testing their degree of acceptance, changing them and only afterwards applying them effectively.

Romania, IFAC member through CECCAR should get more involved in this scientific and practical step.

From the perspective of the research we intend to realize an empirical study (questionnaire) having as theme to determine the way in which CECCAR members know the international referentials and can identify aspects that are characteristic to the Romanian public accounting system; in the future these aspects can be solved through IPSAS amendments, starting from the stated intention of IFAC of issuing them annually.

Accounting Models Regarding the Transactions of Inward Processing of Goods

Paliu-Popa Lucia, Ecobici Nicolae, Dina Ionela-Claudia
 “Constantin Brâncuși” University of Târgu Jiu
 univers_cont@yahoo.com, nycu2004ro@yahoo.com, dina_claudia@yahoo.com

Abstract

With an increasing international trade, a more and more significant expansion was experienced by combined commercial operations, also including goods processing transactions. The expansion of these international economic affairs had as motivation the multiple direct and indirect positive effects they produce both at micro and macro level, such as: obtaining a significant commercial profit and on this basis, increasing the currency contribution, increasing the general indicator of the international trade volume, relieving the balance of external payments of certain payments in currency, making optimum use of production capacity and labour force etc.

Given the complexity of the combined commercial operations of foreign trade, in this article we shall address the commercial transactions of inward processing of foreign goods in terms of accounting models specific for conducting these transactions.

In this regard, after the theoretical delimitation of these operations we shall emphasize the benefits of inward processing of foreign goods but also without forgetting the limitations of these international commercial operations.

To develop accounting models we shall first clarify the tax matters that affect the entry in the accounts of inward processing of foreign goods, then we shall proceed to their reflection in accounting starting from a case study, if the recipient of such operations is based in the extra-community or community area. Thus we will be able to identify the conditions that the entities must meet in order to use as little cash money, the affecting fiscal conditions and the reflection in accounting of inward processing of foreign goods.

Key words: Accounting models, processing of goods, processing transactions

JEL Classification: M4, M41

1. Introduction

Due to the increasing international trade a significant expansion is experienced by the combined operations which include inter alia, the counterpart, re-export, goods processing transactions, brokerage transactions of international sale and purchase, operations that combine elements of operations of export, import, provision of services, manufacturing, in a single transactional mechanism, designed and implemented by specialized commercial firms. Compared to imports and exports of goods and services, the combined operations are customized with issues such as the following: [3]

- more complex character and higher value of the transactional assembly;
- the legal basis of operations is usually established by two or more contracts, which have a certain connection;
- the transaction has a higher degree of risk;
- the achievement of transactions requires a specific financial assembly.

The motivation for the expansion of these international economic affairs is the production of *multiple positive effects*, direct and indirect, both at micro and macro level, such as: obtaining a significant commercial profit and on this basis, increasing the currency contribution, increasing the general indicator of the international trade volume, relieving the balance of external payments of certain payments in currency, making optimum use of production capacity and labour force etc. Given the complexity of foreign trade operations, we shall deal next with commercial transactions of goods processing.

To reflect such operations in the accounts, we must first emphasize the defining elements, specific for conducting these transactions, the contracting parties' advantages and disadvantages and the related tax treatment.

Theoretical considerations on goods processing transactions

Processing of goods is an international economic affair conducted on a contractual basis between two companies from different countries, in which one performs custom-made works (processing raw materials, semi-finished goods) based on models, drawings and under the other company's brand, which takes over the finished product in order to place it on the market. This operation, also called custom-made production, developed especially on West-East and North-South relations, through outsourcing by Western firms of intensive industrial productions in labour, in countries of Central and Eastern Europe or from developing regions. [3]

Processing of goods differs from the traditional import-export operations by the transaction object that is the *processing* of raw materials or semi-finished materials, which usually belong to one party (the importer), by the other party (the exporter) and not the sale of goods or finished goods which is the basic characteristic of traditional export-import operations.

The partners of processing transactions are named according to their position in transactions, as follows:

provider, processor, operator or performer (is the one who receives the goods for processing or intermediates the processing);

recipient, or sequencer (is the one who delivers or sells the goods for processing and receives the resulting products referred to in the Law on Customs Code as *compensating products*). [8]

Providers or performers of processing operations are companies with factors of production but no branded products and in economic affairs in general and in the international affairs, in particular, have weaknesses in the management and marketing activity.

The recipients of these operations are companies that most often have prestigious brands and that tend to expand their businesses capitalizing the advantages arising from the strong position they hold in this market.

Processing transactions of goods may have different motivations, which generally mean *benefits* for the business partners.

The main benefit followed by the recipient of goods processing operations is to make capital out of the difference between the higher cost of labour in his country and its low cost in the provider's country.

The higher the difference between costs and the greater the labour productivity in his country, the higher is the motivation for relocation of production. In turn the provider is primarily motivated by the possibility to improve his production capacity and to obtain income in foreign currency even if he lacks a marketing system and destination channels that would allow direct and immediate access to foreign markets.

However, inward processing transactions favour imports of technology and improvement of productive capacities of the performer, who is an exporter of labour, leading to higher labour force skills, thereby allowing him access to materials and raw materials of better quality that meet and are better for the needs of a competitive production.

Processing transactions have a number of limitations, some common for any international economic affairs, other specific to this commercial operation.

The limitations of such operations relate primarily to: [3]

the potential risk for labour exporter that, in the case of adverse circumstances which can appear on the market of such products, the importer would call off the goods processing transaction;

the risks related to delays that may occur in the transportation of raw materials and which may adversely affect the production schedules;

the price risk, which manifests for the exporter of labour when there is an unfavourable trend in the price of the finished product made, compared to the price of production factors used to produce it;

the provision of an income in foreign exchange lower than for the normal export of finished products originating entirely from domestic production;

the labour exporter's passive position in foreign markets, regarding the actions to promote and market the products, with direct consequences for his position on the international market.

Considering the position of Romanian companies in processing transactions, we can find the following *types of operations*: inward processing transactions, where the units in our country are service providers; outward processing transactions, where the Romanian companies are benefiting from processing services.

Accounting Models Regarding the Transactions of Inward Processing of Goods

The transactions of inward processing of goods consist of processing, transforming or repairing in the national territory of goods owned or imported from a foreign partner.

Therefore, depending on the economic situation of goods sent for processing, there are *two types of inward processing*: [5] inward processing of foreign goods; inward processing of imported goods.

Due to the complexity of these operations, in this article we shall deal with the *reflection in accounting of inward processing operations of foreign goods*, which are not introduced in the economic circuit of the provider's country. The transactions in this class were known, until the Customs Code appeared, as transactions of processing through "ennoblement" (variant of application of the active Lohn).

Because, once Romania joined the European Union, the recipients of inward processing services may be companies from the extra-community or community area for which different problems are raised in terms of taxation, separate treatment of the two situations is required.

Regardless whether the recipient belongs to the extra-community area or not, in inward processing of foreign goods, such goods remain the property of the company which delivers them to processing, carrying out in the export with compensating products only a transfer of labour, namely an *export of services*, whose payment is usually made in foreign currency.

a) Accounting of transactions of inward processing of foreign goods, when the recipient is a company in the extra-community area

Where the recipient of inward processing of foreign goods is an entity of the extra-community area, before recording these

operations in the accounts, we should first clarify some *tax matters*, which are:

on receipt of goods by the provider, because such goods remain the property of the company which delivers them to processing, the suspensive regime is applied to import duties, involving the suspension of payment of import duties until the export of resulted compensating products, meaning that customs duties, the value added tax and other amounts due to the state in a normal import of goods, are no longer paid;

the suspension of import duties is conditioned, under the Law on Customs Code, by the provision of a guarantee to cover the collection of import duties that may be due if the conditions of inward processing are not exactly met; the guarantee of import duties may be provided by a cash deposit or a letter of bank guarantee issued by a bank approved by the customs authority;

because the transactions of inward processing of goods are made on the own account of the holder of inward processing, then all costs related to goods transportation in the country, the export of compensating products, the insurance costs and fees payable when the goods re-enter the recipient's country are the responsibility of the recipient, the labor importer.

In order to understand the model of reflection in accounting of inward processing operations of foreign goods, which are not introduced in the economic circuit of the provider's country, we considered it necessary to start from an *application*.

To this end we assume that a foreign trade company, Romanian entity, receives raw materials for processing from a foreign partner worth EUR 50.000 at a rate of 4,10 RON/EUR. The guarantee of import duties is performed with a letter of bank guarantee for which the bank fees is RON 2.000.

It is known that processing of raw materials is carried out by another company that charges the foreign trade company with labour services worth RON 20.000, with 19% VAT, in turn this company charges the foreign supplier with services provided worth EUR 10.000 at the rate of 4,20 RON/EUR (on the date of external invoice, the rate is 4,15 RON/EUR).

This case generates in the accounts of the foreign trade company the following *entries*: The receipt of raw materials from a foreign partner for processing, worth EUR 50.000

(EUR 50.000 x 4.10 RON/EUR = RON 205.000)

Debit 8032 "Assets held for processing or repair" 205.000

Guarantee of import duties with a letter of bank guarantee, whose value is determined as follows:

The amount of raw materials received for processing: RON 205.000

Customs duty for the goods received (RON 205.000 x 10%): RON 20.500

Value-added tax (RON 205.000 + RON 20.500) x 19%: RON 42,845

Total guarantees: RON 63.345

Debit 8011 "Guarantees and warranties" 63.345

Payment of the bank fee related to the guarantee provided, in the amount of RON 2,000

627 "Expense: with banking services and similar charge" = **5121** "Cash at bank in lei" 2.000

Reflection of the labour invoiced by the entity providing services worth RON 20,000, with 19% VAT:

% = **401** 23.800
628 "Other third party services expenses" "Suppliers" 20.000

4426 "Input VAT" 3.800

Payment of services delivered:

401 "Suppliers" = **5121** "Cash at bank in lei" 23.800

Invoicing by the foreign trade company of raw material processing services amounting to EUR 10.000 at the rate of 4,20 RON/EUR (EUR 10.000 x 4,20 RON/EUR = RON 42.000):

4111 "Customers" = **704** "Revenues from services" 42.000

Concurrently, the values in the accounts outside the balance are cancelled:

Credit 8032 "Assets held for processing or repair" 205.000

and:

Credit 8011 "Guarantees and" 63.345

warranties"

Collection of the foreign invoice of EUR 10.000:

Amount in RON on invoicing: EUR 10.000 x 4,20 RON/EUR = RON 42.000;

Amount in RON on receipt: EUR 10.000 x 4,15 RON/EUR = RON 41.500;

Unfavourable exchange rate difference: = RON 500.

% = **4111** 42.000

5124 "Cash at bank in foreign currencies" "Customers" 41.500

665 "Foreign exchange losses" 500

Comparing the data from the income accounts with those of expense accounts, related to the hypothetical example considered, it appears that the income from the inward processing transaction exceeds the costs registered, resulting a taxable profit of RON 12,000 (RON 42.000 - RON 500 - RON 20.000 - RON 500), profit which is found, after closing the accounts, in the final balance in hand of the account 121 "Profit and loss." If the foreign trade company is also the provider of operations of raw materials processing and change into finished products ordered, then such activities involve the conduct of consumptions of electricity, water, direct and indirect labour, maintenance and operating expense of the equipment, depreciation of property and other expenses, which are highlighted in the provider's accounts with the specific expense accounts in the 6th class, "Expense accounts".

To determine the cost of such goods processing, the management accounting uses different methods and techniques, which are the result of aggregation of direct and indirect costs incurred in processing.

The finished products resulting from inward processing operations must leave the country in which processing was performed, being re-exported outside the community.

b) Accounting of transactions of inward processing of foreign goods, when the recipient is an entity in the community area

If the recipient of transactions of goods inward processing is an entity of the Community area, then the operations of receipt, processing of goods and invoicing of services delivered are similar to those recorded in case a); the only one which differs is the *tax treatment* which lies in:

The guarantee of import duties on foreign goods receipt is limited only to the value added tax if the recipient of the Community country does not communicate the provider his valid registration code for value added tax. If the recipient is registered for VAT purposes in his country and communicates the Romanian provider his registration code for VAT, then the customs authority may not require the guarantee of import duties, given the fact that in the case of failure to deliver the goods resulted to the beneficiary, the provider highlights the value added tax payable for the goods received through the reverse charge procedure and not through the actual payment of the tax.

The processing services are invoiced by the recipient *with* Romanian VAT, if the recipient failed to communicate to the provider his registration code for VAT purposes, or *without* VAT, if the Romanian provider was informed of the recipient's registration code for value added tax.

To understand the reflection in accounting of inward processing transactions of goods, with the recipient in the Community area, we will start from the same application previously considered, with *two alternatives*:

the guarantee of import duties is carried out because the recipient does not communicate the provider his registration code for value added tax;

the guarantee of import duties is not carried out because the recipient communicates the provider his registration code for value added tax.

As mentioned above, the difference from case a) is shown in the first alternative when the provider must invoice the services to the Community recipient with value added tax, case which involves the following entry:

4111	=	%	<u>49.980</u>
"Customers"	704		42.000
		"Revenues from services	
	4427		7.980
		"Output VAT"	

In compliance with the law in force, the Romanian provider must keep records of materials received for processing using the document "Register of tangible goods received for expertise or works to be carried out". [6]

Starting with 01 January 2010, in order to implement the simplification measures in the

field of value added tax on transactions of inward processing of foreign goods, the following *conditions* must be fulfilled: [7]

Regarding the main contractor:

shall be a taxable person registered for VAT purposes in the Member State of establishment;

shall not have a registration code for VAT purposes in the Member State where the works on movable tangible assets are actually carried out;

shall submit his registration code for VAT purposes to the contracting party/parties.

Regarding the other economic operators involved:

they must be taxable persons in terms of value added tax.

Regarding the products processed:

they must return to the Member State in which the main contractor is established and that assigned the registration code for VAT purposes submitted by the main contractor.

2. Conclusions

In order to obtain positive direct and indirect effects, both at micro and macro level, a significant expansion was experienced by combined commercial operations which also include goods processing transactions, effects that are reflected in achieving significant commercial profit and on this basis, increasing the currency contribution, increasing the general indicator of the international trade volume, relieving the balance of external payments of certain payments in currency, making optimum use of production capacity and labour force etc.

For making models for reflecting the transactions of inward processing of foreign goods in the provider's accounts, it is important to determine correctly the tax treatment depending on which the entity in Romania allocates funds to guarantee the import duties when they are suspended and in relation to which the provider issues the invoice with or without VAT.

In order to go through specific situations, highlighting of these transactions is made in relation to the area in which the recipient is established and if he belongs to the Community area, in accordance with the conditions required by the laws in force.

Although these transactions of inward processing of foreign goods have some advantages, we should not forget the

limitations of such operations, the most important ones relating to the potential risk of the labour exporter that, in the event of adverse circumstances which can occur on the market of those products, the importer may call off such transactions or delay greatly in the transportation of raw materials and materials, which may adversely affect the production schedules.

Financial Modeling in the Investments Companies

Pepi Mitica

Ovidius University of Constanta

pepi.mitica@gmail.com

pepim@hotelolimpic.ro

Abstract

This paper is meant to deal with a generous theme, the auditing of S.S.I.F. and implicitly with the capital market, lent for such an accomplishment it is necessary to identify the audit in accordance with its standards, with its well defined subject matter named entity of audit. The optimum entity of audit on the capital market cannot be anything else but the intermediary of the capital market or the S.S.I.F.. The tranzactioning system of the Exchange Stock grants a reasonable assurance from the point of view of the audit enclosing it self in inherent limits that affect the ability of the audit to detect the errors.

Key words: financial modeling, audit, capital market, stock exchange.

JEL Classification: M 42

1. Modeling the entity of audit

The Service and Financial Investment Companies (S.S.I.F.) are juridical persons, constituted in the form of firms on shares, issuing nominative shares, which have exclusively as an activity object the carrying out of services, of financial investments and which functions only on the base of C.N.V.M. authorisation.

This paper is meant to deal with a very generous theme, namely, the auditing of S.S.I.F. and implicitly with the capital market, lent for such an accomplishment it is necessary to identify the audit in accordance with its standards, with its well defined subject matter named entity of audit.

The optimum entity of audit on the capital market cannot be anything else but the intermediary of the capital market or the Service and Financial Investment Companies.

1.1 Identify of relevant professional organism and the reasonable assurance

The Values Stock Exchange – Bucharest as a relevant professional organism of the capital market is an element on the base of which one may determine the audit proceedings.

In our opinion and according to the standards of audit, an audit is projected to offer a reasonable assurance so that the financial situations taken as a whole are not wrong significantly.

The reasonable assurance is a concept related to connected to accumulation of the proofs of audit necessary so that the auditory to come to the conclusion that there are no significant errors in the financial situations considered as a whole.

The insurance degree refers to the whole process of audit.

The tranzactioning system of the Exchange Stock grants a reasonable assurance from the point of view of the audit enclosing it self in inherent limits that affect the ability of the audit to detect the errors.

These limits are caused by factors as:

- The use of the tests – the negotiation and the tranzactioning in the continuous and intermittent market;
- The inherent limitations of any accounts system – the period relatively uncertain of the accounts situation concerning the transactions of accomplished movable values, but undiscounted and unrecorded in registers;
- The fact that, the majority of proofs of audit are persuasive and less conclusive – the market of capital and the tranzactioning of the movable values by means of B.V.B. and of S.S.I.F. grant persuasive proofs of audit having in view the dynamic of the

transactions and implicitly of the patrimonial modifications that must be accounted.

The audit that we suggest to be achieved has a high degree of specificity having in view the capital market that represents the system in which S.S.I.F.-s moves and which has a series of peculiarities, but also a specific normative frame. That is why, we have considered as being interesting to compatibilize the two microsystems, respectively that of the audit and that of the market of capital with its main actor S.S.I.F....

From this point of view, we started the research of the market of capital with the instruments of the audit, trying to identify in the S.S.I.F. compartment the elements of the audit:

- the covering area of the audit;
- standards of audit;
- proofs of audit;
- the threshold of materiality;
- risk in the audit;
- fraud and error in the audit.

We will consider the utility of the account – financial information as being a factor of quality of the analytical procedures of audit that influences their efficiency in the accomplishment of a degree of certainty.

1.2 Modeling financial audit with computerized system of information (C.I.S. MEDIUM)

At the same time, we have researched the possible identification in a medium with Computerized System of Information (the CIS medium) with the market of capital, having in view the fact that the market of capital, in general, can be considered as CIS medium. And in particular, the institutions of the market of capital, respectively the ones that represent the secondary market, are these CIS mediums:

- RASDAQ is a CIS medium, respectively an on-line operation system;
- BVB is a CIS medium, respectively a network operation system.

Other problems researched are the identification of the approaching of audit to S.S.I.F. having a choice between two ways of approaching the audit:

1. The approaching based on system (ABS);
2. The direct approach of matter (ADF).

Having in view that S.S.I.F. as an entity of audit cannot be approached in an isolated way but

only as a systematic approach within the market of capital, we have considered that the approach of the audit on ABS system is the most suitable one.

To support this point of view we bring the following arguments based on the fact that the audit within the approach based on systems uses the so called tests of control for conformity, these:

a) The identification and evaluation in profoundness of the relevant key controls and the evaluation of the size in which the audit can base on the controls presuming that they were organized and function properly.

In the case of S.S.I.F. - this testing is accomplished on the base of the information if the Accounts Department of the internal and external audit of S.S.I.F. using the information from:

- the register centralizing the movable values that reflect the situation of movable values and the analysis of all accounts for which there is a position in a certain movable value;
- register for the evidence of daily activity that enumerates the positions of all movable values being in the possession or under the control of the Society of Movable Values;

b) The testing for conformity of the key controls if they have operated efficiently during the period subject to the audit;

In the case of S.S.I.F., it is achieved by means of Independent Register and of the Societies of Positioning (SNCCDD) which have the information in counterparty in comparison with the existing evidence from the S.S.I.F.-s registers;

c) The testing by mean of fund procedures of a certain number of transactions, accounts situations in order to determine if the financial declarations of this are made up completely and accurately.

In the case of S.S.I.F.-s, one will use the information extracted from the Great Book and the checking Balance on the base of which the reports are made up for C.N.V.M. and the financial declarations.

2. Modeling the performance to S.S.I.F.

We have considered as being interesting to approach in our research the audit of performance or of the management to

S.S.I.F. having in view the fact that S.S.I.F. is a society of financial services and is correlated with the market of capital by means of the quality (the performances) of the services (the transactions) achieved for the clients or for itself.

In the audit of performance of S.S.I.F. we have used analytical procedures of the audit which is based on two elements:

- The financial – accounts information;
- The decision of investments on the market of capital.

On the market of capital in general and within the S.S.I.F. in particular the performance is connected to the quality of the financial accounts information, to its accuracy, by the way it reflects the general economic phenomenon and its tendencies. The analytical procedures of audit of the accounts financial information being able to develop in two directions:

- The utility of the accounts financial information in the decision of investments on the market of capital;
- The effect of the accounts financial information in the decision of investment on the market of capital.

The performance on the market of capital is also connected directly to the quality of the investment decisions taken based on the accounts financial information.

For the investment decision we have considered as being the best approach of audit, respectively the best analytical procedure of audit is represented by the financial analysis, an analysis that developed in two directions.

- The analysis of the capital market and,
- The financial analysis of the annual accounts this being developed in its turn in three directions:
 - Univarious analysis;
 - Multivarious analysis;
 - The indicators of the Stock Exchange of Values.

In such a way we have created a quadrilateral of research by audit to S.S.I.F. which, for a better understanding, we have represented it by means of the following logical scheme.

3. Model of indentify the fraud and error in the audit of S.S.I.F.-S

A document of the European Council from 1995 specifies the notion of fraud, this:

a) from the point of view of the expenses any intended act or intended omission that refers to:

- the use of declarations or false documents incorrect or incomplete that generate the restrain of funds from the communitary general budget in a wrong way or un properly;
- the use of the funds with other purposes than the ones they were initially meant for;

b) from the point of view of the incomes, any intended act or omission referring to:

- the use of declarations or false documents, incorrect or incomplete having as a consequence the diminishing of the resources of the general, communitary budget, or of the funds administrated by him or on his behalf;
- the unrevealing of information disobeying specific obligations with the same effect;
- the use with other purposes of a benefit legally obtained having the same effect.

The error can be defined as any unintended mistake concerning:

- mathematical or accounts mistakes in the recording of the accounts data;
- the wrong application of the accounts policies (principles, rules, methods, etc).

During his mission, the auditory also takes into consideration the risk to discover in the activity of the entity he audits some significant infractions caused by frauds and errors.

Within the market of capital, having in view the specificity of the activity, the fraud and error can be found in the same way but in a different form, with specific names.

To understand this phenomenon within the market of capital and strictly relational in the activity of the S.S.I.F.-s, we have to interpret some notions which as a whole create the payment abuse.

These notions are:

- the privileged information by which one understands an information of a precise nature that was not made public, which refers directly or indirectly to one or more issuers or to one or more financial instruments, and which, if conveyed publicly could have a significant impact on the price of those financial instruments or on the price of the derived financial instruments with which they are connected.

When it refers to financial instruments derived on goods, “the privileged information” it means the information of a precise nature that was not made public and which refers directly or indirectly to the derived financial instruments and which the participants on the markets, on which the respective derived financial instruments are transacted, expect to receive in accordance with the accepted market practices;

- the accepted market practices refer to the practices in one or more markets and which are accepted by C.N.V.M. according to the community procedures.

For the persons responsible with the execution of the orders concerning the transacting of the financial instruments “the privileged information” means, at the same time, the information of a precise nature, conveyed by a client, in relation with its orders that have not been executed yet, referring directly or indirectly to one or more financial instruments, information which, if made public, could have significant effects on the price of the respective financial instruments or on the price of the derived financial instruments with which they are connected.

Audit procedures applicable to financial investments:

1. Initial procedures: The applying of the initial procedures to the balances and records in the financial investment accounts that will be afterwards tested:

- The reconciliation of the initial balance with the audited sums in the previous year;
 - The Revising of all the activities referring to financial investments with an impact on the balancing elements and on the account of profit and loss and the investigation of the records that seem unusual from the point of view of the source;

- The obtaining of the financial investment programmes of the company and the checking of the degree in which this presents with fidelity the accounts recording that are at the base of their making up.

2. Analytical procedures: The applying of the analytical procedures by analysing the output of the respective investments (interests, dividends) comparatively with the provisions of the company.

3. Detailed tests concerning the transactions: The checking of the accounts recordings in the accounts of financial investments, incomes and expenses, respectively their own capitals.

4. Detailed tests concerning the balances: The inspection and the determination of the number of titles held in the portfolio that are kept with the company.

- The confirmation of the existence and the number of titles deposited in other places.

- The recalculation of the incomes accomplished from investments.

- The revising of the documents that permits the determination of the market value.

5. Presentation and publication: The comparing of the financial situations with the presentation requirements provided by the accounts standards and in the account frame in force.

- The appreciation of the size in which the financial investments are identified and classified according to the financial situations.

- The appreciation of the quality and quantity of the supplementary information published in notes concerning the base of evaluation, the profits and the accomplished and unaccomplished losses, the minor interests, titles deposited as guaranty.

Abstract

The audit that we suggest to be achieved has a high degree of specificity having in view the capital market that represents the system in which S.S.I.F.-s moves and which has a series of peculiarities, but also a specific normative frame. That is why, we have considered as being interesting to compatibilize the two microsystems, respectively that of the audit and that of the market of capital. We started the research of the market of capital with the instruments of the audit.

Key words: audit, annual accounts, financial accounts information.

JEL Classification: M 43

1. The audit of performance to S.S.I.F'

We have considered as being interesting to approach in our research the audit of performance or of the management to S.S.I.F. having in view the fact that S.S.I.F. is a society of financial services and is correlated with the market of capital by means of the quality (the performances) of the services (the transactions) achieved for the clients or for itself.

In the audit of performance of S.S.I.F. we have used analytical procedures of the audit which is based on two elements:

- The financial – accounts information;
- The decision of investments on the market of capital.

On the market of capital in general and within the S.S.I.F. in particular the performance is connected to the quality of the financial accounts information, to its accuracy, by the way it reflects the general

economic phenomenon and its tendencies. The analytical procedures of audit of the accounts financial information being able to develop in two directions:

- The utility of the accounts financial information in the decision of investments on the market of capital;
- The effect of the accounts financial information in the decision of investment on the market of capital.

The performance on the market of capital is also connected directly to the quality of the investment decisions taken based on the accounts financial information.

For the investment decision we have considered as being the best approach of audit, respectively the best analytical procedure of audit is represented by the financial analysis, an analysis that developed in two directions.

- The analysis of the capital market and,
- The financial analysis of the annual accounts this being developed in its turn in three directions:

- Univarious analysis;
- Multivarious analysis;
- The indicators of the Stock Exchange of Values.

In such a way we have created a quadrilateral of research by audit to S.S.I.F. which, for a better understanding, we have represented it by means of the following logical scheme.

2. Audit by analyse of the annual accounts

Without trying to exacerbate the role of the personal interests in elaborating a realist analysis, we wished in the above presented information to show the importance of an assembly thinking which may permit a good “reading in between the lines” of the annual accounts.

However, the most important part of the financial analysis is based on inflexible and impersonal models of calculation of the financial indicators: “the indicator (financial o.n.) represents a procedure of reporting a figure to another figure being an accepted and easy to understand conventional manner (...). An isolated number does not represent useful information; the comparison is the key”.

This procedure, as we can see, is a procedure of analysis to the risk of audit.

The audit has to apply the analytical procedures at the end of the audit, when it can formulate a general conclusion concerning the conformity of the financial situations as a whole, what the auditors know referring to S.S.I.F... The conclusions which we draw from the result of such a procedure will be formulated with the intention to corroborate with the conclusions drawn during the auditing of the components or of the individual elements of the financial elements, respectively, the annual accounts .

The Auditing by financial analysis of the annual accounts must help the formulating of some general conclusions concerning the credibility of the financial situations.

These conclusions can identify by univariuous analysis the liquidity and the profitability, by means of multivariuous analysis and the stock exchange indexes, the solvency of the society of movable values.

The application of the analytical procedures of audit by financial analysis is based on the hypothesis that the relations between the data exist and are maintained in the absence of some conditions known as, being contrary.

The presentation of these relations assures proofs of audit as to the exhaustivity, the precision and validity of the proposed data by the accounts system.

However, the trust in the results of the analytical procedures will depend on the evaluation of the risk by the auditors, the analytical procedures to identify similar relations to the expected ones when, there exist in fact, significant errors of declaration.

2.1. Audit by the analyse of the financial accounts information

In the contemporary economy being in a continuous transformation, the spectacular modifications are accomplished in a short time on the base of same financial decisions taken by

utilizing the accounts information and based on the accuracy on its relevance.

But, if this information is proved to be incorrect, having in view the economic events based on which these were generated or are wrongly understood, the results of the decisions will be far from being at the anticipated level.

The solving of the paradigm represents a problem of audit and it is the essential preoccupation of the accounts profession.

The auditing can be accomplished on the base of a thoroughly research of the financial-accounts information.

In our opinion, the accuracy and the relevance of the financial-accounts information consists in the capacity to answer the following questions.

- Is the nature of the financial-accounts information understood by the institutional investors and by the intermediaries from the Romanian market of capital?
- Is the financial-accounts utilised by the financial analysts and by investors that act on the market of capital?
- Is it necessary to improve the informational quality of the accounts balance in the actual form.

We also propose to establish the measure in which the financial-accounts information comprised in the annual accounts and other sources of documentation is understood and utilized by the investors from the market of capital from Romania and if this market is an efficient market.

The safety degree which the auditors grant to the results of the analytical procedures depends of a series of factors which we will presents as a conclusion of the utilization of the instruments of the financial analysis as analytical procedures of audit.

A first factor of which the safety degree of the results of the analytical procedures of audit depends on is represented by the threshold of significance.

The threshold of significance of the implied elements, for example when the balance of the stocks are significant, the auditors not based only on the analytical procedures in order to formulate the conclusions.

For certain element of incomes and expenses, when these are not significant as individual elements, the auditors can base only on the analytical procedures.

A second factor of which the safety degree of the results of analytical procedures of audit depends on is represented by the directing of other procedures of audit to the same objectives of audit, for example, in our case procedures performed by the auditors for revising of the subsequent cashing of debts, such as, the revising of the subsequent cashing that cannot confirm or refute questions that appear as a consequence of the application of the analytical procedures of the accounts of debts.

A third factor of which the safety degree which the auditors grants to the results of the analytical procedures depends on is represented by the precision with which the foreseen results of the analytical procedures can be forecast.

In our case, the auditors normally expects a greater consistency, in the case of the comparison of the margin of the gross proceeds from a period to another than in the case of the comparison of operational expenses.

The fourth factor of which, the safety degree which the auditors grants to the result of the analytical procedures, depends on is the evaluation of the inherent risk and of the risk of control. In the internal control case of the process of selling orders is weak and, as a consequence, the risk of control is raised, then for drawing the conclusions referring to the debts a greater trust in the detailed tests of the transactions of the balance is necessary than in the analytical periods.

The purpose of this Standard of Audit is to establish the standards and to assure instructions for an auditor whose client utilized a Society of Services and Financial Investments further on named S.S.I.F. This standard also describes the reports of audit of the companies of services that can be obtained by the auditors of the clients.

The auditor has to take into consideration the way in which S.S.I.F. affects the accounts systems and the systems of internal control so that the audit can be planned and accomplished into an efficient model of audit.

3. Model of identify the fraud and error in the audit of S.S.I.F.-S

A document of the European Council from 1995 specifies the notion of fraud, this:

- a) from the point of view of the expenses any intended act or intended omission that refers to:
- the use of declarations or false documents incorrect or incomplete that generate the restrain

of funds from the community general budget in a wrong way or un properly;

- the use of the funds with other purposes than the ones they were initially meant for;

b) from the point of view of the incomes, any intended act or omission referring to:

- the use of declarations or false documents, incorrect or incomplete having as a consequence the diminishing of the resources of the general, community budget, or of the funds administrated by him or on his behalf;

- the unrevealing of information disobeying specific obligations with the same effect;

- the use with other purposes of a benefit legally obtained having the same effect.

The error can be defined as any unintended mistake concerning:

- mathematical or accounts mistakes in the recording of the accounts data;
- the wrong application of the accounts policies (principles, rules, methods, etc).

During his mission, the auditor also takes into consideration the risk to discover in the activity of the entity he audits some significant infractions caused by frauds and errors.

Within the market of capital, having in view the specificity of the activity, the fraud and error can be found in the same way but in a different form, with specific names.

To understand this phenomenon within the market of capital and strictly relational in the activity of the S.S.I.F.-s, we have to interpret some notions which as a whole create the payment abuse.

These notions are:

- the privileged information by which one understands an information of a precise nature that was not made public, which refers directly or indirectly to one or more issuers or to one or more financial instruments, and which, if conveyed publicly could have a significant impact on the price of those financial instruments or on the price of the derived financial instruments with which they are connected.

When it refers to financial instruments derived on goods, "the privileged information" it means the information of a precise nature that was not made public and which refers directly or indirectly to the

derived financial instruments and which the participants on the markets, on which the respective derived financial instruments are transacted, expect to receive in accordance with the accepted market practices;

- the accepted market practices refer to the practices in one or more markets and which are accepted by C.N.V.M. according to the community procedures.

For the persons responsible with the execution of the orders concerning the transacting of the financial instruments "the privileged information" means, at the same time, the information of a precise nature, conveyed by a client, in relation with its orders that have not been executed yet, referring directly or indirectly to one or more financial instruments, information which, if made public, could have significant effects on the price of the respective financial instruments or on the price of the derived financial instruments with which they are connected.

Audit procedures applicable to financial investments:

1. Initial procedures: The applying of the initial procedures to the balances and records in the financial investment accounts that will be afterwards tested:

- The reconciliation of the initial balance with the audited sums in the previous year;

- The Revising of all the activities referring to financial investments with an impact on the balancing elements and on the account of profit and loss and the investigation of the records that seem unusual from the point of view of the sum or of the source;

- The obtaining of the financial investment programmes of the company and the checking of the degree in which this presents with fidelity the accounts recording that are at the base of their making up.

2. Analytical procedures: The applying of the analytical procedures by analysing the output of the respective investments (interests, dividends) comparatively with the provisions of the company.

3. Detailed tests concerning the transactions: The checking of the accounts recordings in the accounts of financial investments, incomes and expenses, respectively their own capitals.

4. Detailed tests concerning the balances: The inspection and the determination of the number of titles held in the portfolio that are kept with the company.

- The confirmation of the existence and the number of titles deposited in other places.

- The recalculation of the incomes accomplished from investments.

- The revising of the documents that permits the determination of the market value.

5. Presentation and publication: The comparing of the financial situations with the presentation requirements provided by the accounts standards and in the account frame in force.

- The appreciation of the size in which the financial investments are identified and classified according to the financial situations.

- The appreciation of the quality and quantity of the supplementary information published in notes concerning the base of evaluation, the profits and the accomplished and unaccomplished losses, the minor interests, titles deposited as guaranty.

The fraude with the credit cards

Lector univ. dr. Daniela Petraşcu
Universitatea „Lucian Blaga” Sibiu
Facultatea de Stiinte Economice
daniela.petrascu@yahoo.com

Abstract

The swindle with cards at the bank automates became a major preoccupation in the bank area.

In some countries, the swindle at the bank automates become an important problem and they adopted measurements and proceedings with the purpose to prevent and limit the consequences. It is very probable that this type of swindle will migrate from the countries where the fighting methods have been implemented, in the countries that did nothing yet in this area. (Office for non-commercial deductions– Swindle with cards at the bank automates, 1998).

Key words: credit card, fraud, bank

JEL Classification: E51, K42

The main swindle-methods with credit cards at the automates, are: (Petraşcu D, Rev. Finanţe, bănci, asigurări, nr.5/2007, Frauda cu carduri la automatele bancare, pag.56-57).

a) Finding out the PIN.

The criminal obtains the PIN by supervision of the titular of the card in the moment he introduces the PIN in the automate, or by using a video closed circuit. The card's data are obtained afterwards by copying the magnetic band (skimming) or from the information printed on the receipts issued on an ATM.

b) Swindle between acquaintances /family members.

A person acquaintance of the card titular, enters, with or without the titular agreement, in possession of the card and of the PIN and uses the card for transactions of cash-release. The card titular disputes afterwards the transactions, when he receives the account excerpt.

c) Card theft.

A card is stolen from a titular that has written the PIN on the back of the card or who keeps the PIN in the wallet. Until the moment the card is reported as stolen/lost by the titular and blocked in

the authorization system of the bank, the criminal has access to the card account.

d) Card withdrawn from ATM.

The criminals often operate in groups or by two or three and have as target vulnerable card titular, for example old persons who use the bank automates.

The card titular is being approached, eventually in a foreign language; by criminals that pretend that they do not know to use the ATM or who try to distract attention (requesting information, etc.).

While the card titular attention is distracted by one of the criminals, the other one presses the button “cancel” and redraws, not seen by the titular, the card from the automate. Once the transaction cancelled, the criminals allow the titular, who is convinced that he has the card in the ATM, to continue the transaction.

In the moment he observes that nothing happens, the titular becomes confuse. The criminals mention that they had similar problems too and suggest to the titular to introduce once again the PIN.

The titular is being persuaded to continue the transaction supervised by the criminals. Again nothing happens and the titular believes that the automates has redrawn the card and leaves, leaving the criminals in the possession of the card and of the PIN.

e) Blocking the mechanism for cash-issuing.

The criminals initiate at the ATM a transaction of issuing cash in a small value. In the moment in which the money-dispenser had open, the criminal leaves a banknote or a piece of cartoon in the dispenser. The ATM extracts the requested sum from the box and sends it to the dispenser. The ATM observes an object in the dispenser, and shuts itself sending an error code to the central computer that cancels the transaction. The criminal de-blocks the dispenser, picks up the cash and continues to do such transactions, which thanks to the error code sent from the ATM, are not put out from his card account.

As preventing modality, the error code generated by the ATM must be identified and the excluding of this code for cancelling the transactions.

f) Redrawing of cash by blocking the dispenser sensor.

The criminal requests at the ATM the maximum sum for a transaction. The transaction is approved and the cash is being redrawn from the boxes and transported to the dispenser. The blind opens and the criminal introduces an object which blocks the passing of the cash at the sensor. The dispenser sends an error code to the central computer which initiates the cancelling of the transaction in the card account. The criminal picks up the cash and continues the swindle. (Zolya S., Dissertation, Univ. Lucian Blaga, Sibiu, 2006).

As preventing modality, the error code must be identified that is being generated by this type of swindle and the setting of the system for not processing the transaction cancelling in the clients account.

g) Redrawing banknotes from the package issued by the ATM.

The criminal initiates a transaction for the maximum sum released by the automate. When the cash is released by the ATM, the criminal extracts the banknotes from the centre of the package, leaving the first and the last banknote. The ATM detects the two banknotes and transmits an error code to the central computer which cancels the entire sum from the clients account, although the criminal picked up the most part of the sum.

The preventing modality is the same with the one described at the letter f) of the present.

h) The Trojan. (Petraşcu D., *Creditul bancar un risc asumat*, Ed. Alma Mater, Sibiu, 2008, pag.213).

The criminal creates a false ATM, where the titular introduce the card and the PIN. The information on the magnetic band and the PIN are electronically captured and used afterwards for the production of false cards.

i) Libanese loop

The criminal introduces a piece of transparent film in the card reader of the ATM and waits for a client to introduce the card for a transaction. The film blocks the card in the ATM and the criminal supervises the card titular while he introduces the PIN. After the client leaves, the criminal redraws the film that has blocked the card in the ATM and gets the card. Having the card and the PIN he does transactions at the ATM.

j) Closed TV circuit of high resolution.

The criminals install a hidden TV closed circuit that registers the embossed date from card and the PIN. These data are afterwards used to produce false cards.

k) Blocking the cash release.

The criminals stick on the dispensers opening or introduce an object that blocks the banknotes release. After the titular leaves, the criminal removes the obstacle and takes the money.

l) Applying on the ATM's keyboard a special foil

This foil is used for finding out the PIN, on the foil remains printed the number which the titular has formed for the card. For this modality, is necessary that the criminals supervise closely the ATM and to interfere after each transaction.

m) Organizing swindling auctions.

The clients take part in auctions, strongly advertised, with goods with reasonable prices. At the entrance, the clients are being requested the card to be passed over through a terminal with magnetic band reader, that seems to be a POS and to introduce the PIN. The explanation is that in case the client decides to buy something, the length of the transaction will be reduces this way. Afterwards, the data registers in the terminal are used to produce false cards.

The counterfeit and the falsification of the credit cards is in beginning phase in our country, but worldwide has gain alarming size, the loses being of billions dollars annually. (Buzatu N., Popa G., *Expertizarea bancnotelor și a altor instrumente de plată*, Ed. Little Star, București, 2003, pag.79).

1. Instead of conclusions

Money is the blood of economy. This is an aphorism validated by the historic experience, a truth which transcends all historic centuries and all economic and political systems. (Buzatu N., Popa G., *op.cit.*, pag. 5).

Finances, banks and the capital market built an empire which extends its borders beyond our imagination. This empire subjugates our life and makes us all (people, institutions, governments and nations) to depend from the power and the „dirt of the money”.

In this context, from one day to the other one, the number of criminalities of economic nature that develop in the bank system is growing. Not long ago, when a bank discovered it was the victim of a swindle, it tried to keep confidentiality, not making public information about the suffered loss and tried to recover the losses from its own reserves. Obviously, under the impact of the legislative, economic, social and also technical transforming, the banks were forced to collaborate with the organizations involved in the fight against swindle.

Worldwide the market of card development and the more obvious development of the Internet facilitates among with the benefiting effects that

can not be disputed, a large palette of criminal activities stimulated also by the anonymity offered by the electronic environment and the reduced possibility to discover and punish the perpetrators.

To counteract these acts and to avoid the producing of the losses or their recover, special measures for preventing and recovering must be taken, in which are involved together with the institutions for law-applying the financial-banking organizations, the merchants and the clients.

Abstract

Under the current circumstances wherein the economic environment is hallmarked by increasingly faster and more complex changes, for a required and expected development of Romanian market, the local firms will increasingly use financial instruments. Consequently, their accounting, presentation and description of information related to individual or consolidated accounts and the analysis of impact as regards their use over the entities' performances and financial standing become hot topics for professional accountants, for which the aspects approached in the paper are increasingly useful.

The article aims to present the main amendments to the international standard concerning classification and evaluation of financial instruments.

Key words: International development, evaluation, financial instruments

JEL Classification: M41, O16

1. Introduction

Within the latest G20 meetings, organized as a result of the financial crisis started worldwide, a series of actions that should be taken urgently in the accounting field have been presented. They mainly focus on the fair value evaluation of financial instruments, reduction of complexity as regards accounting standards concerning financial instruments, reduction of procyclicity and using those provision practices that result in counteracting the cyclic effects.

Thus, as regards regulation of financial instruments from the accounting point of view,

the International Accounting Standards Board (IASB) has launched an IAS 39 revision called „Financial instruments: acknowledgement and evaluation” in three stages.

2. IAS 39 revision

The first stage is focused on the classification and evaluation of financial instruments, the second stage will approach their depreciation, and the third stage will review the analysis of cover accounting against risks. The final purpose of this revision consists of replacing the IAS 39 standard, a change generated by the need of simplification and clarity in the approach of financial instruments.

First of all, it is required to classify financial instruments in two major categories: those evaluated at the depreciated cost and those to be evaluated at fair value.

Therefore, a financial asset or a financial debt will be evaluated at the redeemed cost, if two requirements are met:

- a) The tool is a straight loan;
- b) The tool is managed based on contract.

Financial assets or financial debts that do not meet cumulatively the two requirements will be evaluated at fair value.

At the derecognition of a financial asset or a financial debt evaluated at the redeemed cost, however the entity has to present separately in the profit and loss account, the gains or losses generated on this occasion. For a more detailed analysis of the two categories considered for the classification of financial instruments is firstly necessary, a conceptual delimitation of the following terms: redeemed cost, fair value, straight loan and instrument managed based on contract.

The redeemed cost is the sum to which a financial asset or a financial debt is evaluated at the primary acknowledgement minus

reimbursements of the main, plus or minus accumulated depreciation using the effective interest method for each difference between the primary value and the overdue value, and minus any discount (direct or by using a reserve account for credit risk) for depreciation or impossibility of recovery.

Fair value is the sum for which an asset can be traded or a debt can be settled willingly, between the interested and aware parties, within a transaction wherein the price is determined objectively.

According to the IASB sense, the straight loan can be defined as a contract that gives rise to, specific data, to a cash flow representing payments of the main and the main related interest. The contract that changes the overdue dates or amounts to be paid of the main or the interest do not represent the straight loan unless it protects the creditor or debtor.

An entity should find out if a contract is a straight loan wherein the financial asset or financial debt is denominated.

Some examples of straight loans are shown as follows:

- a) Profitability for holders, that is as :
- A fixed amount (e.g. zero coupon bond);
 - Fixed profitability in the instrument lifetime ;
 - Variable profitability, that during the entire instrument lifetime is related to a single reference of quotation or noticeable interest (e.g. LIBOR) and/or for which interest rate adjustment is carried out according to the approach described below;
 - A combination between a variable profitability and a fixed profitability. For fixed and variable interest rates, the interest is calculated by multiplying the interest related to the period of time with the sum of the main during the period of time.

b) a type of contract that is a combination between a fixed interest and a variable interest. Such a contract can reduce cash flow variability by setting a limit for the variable interest rate or increase its variability as a fixed interest rate becomes variable.

For instance, *the cap, floor and collar* contracts reduce the cash flow variability, enable the efficient management of interest rate risk and, compared to the swap contracts, has the advantage of providing the investor the opportunity of receiving the favourable variations of interest rate, at the same time restricting potential losses.

A *Cap* contract is a series of caplet contracts (call options on interest rate), that are due at

dates corresponding to payments of future interests related to an existing credit. A *cap* is a group of call operations on the interest rate for which a primary incentive is paid. This incentive is equal with the sum of incentives related to individual caplet contracts. If at certain fixed times the reference rate is lower than the cap rate, payment is made void. A cap buyer is thus covered against the risk of rising the interest rate over a certain level. As a rule, a bank chooses to buy a cap in order to cover the interest rate risk when it has assets at a fixed rate and sensitive assets or when it has a long on bonds.

The *Floor* is a put option (floret) or a sequence of options on the interest rate, that provides the buyer the opportunity of covering against the interest rate risk by means of a floor rate related to a given sum and period of time. If at fixed moments the reference interest rate is lower than the Floor rate, the Floor seller pays the buyer the difference between the two rates, and if the reference rate is higher than the Floor rate, the Floor option will not exert.

For instance, in case when a bank grants a credit of Eur 300 million for 5 years, with a fixed interest rate of 5 % or LIBOR variable, if an interest rate rise is expected, the bank will choose to grant the credit at a variable interest rate. The Floor buying at an exercise price (floor rate) of 3 % will enable the bank to cover its position. If the LIBOR interest rate is higher than 3 %, then the Floor option will not exert, and the bank earning will be equal with the difference between LIBOR and incentive. If LIBOR declines below 5 %, the Floor option exerts, and the bank will encash the difference between the Floor rate and LIBOR.

If the bank has a high risk aversion and the interest rate volatility is high, the cover of interest rate risk can be accomplished by buying a Cap and a Floor at the same time. In fact, this option represents a Collar contract.

When the interest rate rises over the Cap interest rate level, the Cap option exerts and the bank will encash the difference between the market interest and the Cap rate, and in the opposite situation, when the interest rate will have a downward trend, lower than the Floor rate, the Floor option exerts and the bank will encash the difference between the Floor rate and market interest.

c) contract provisions that enable the debtor to pay a debt instrument in advance

(e.g. loan or bonds) or allow the creditor to send the debtor the debt instrument before the due and that are not contingent to some future events. In such case, the sum paid in advance should substantially represent the paid amounts of the main and interest.

Any other types of contracts from where result cash flows that are not generated by payments of the main or related interest are not straight loans. An interest rate swap (IRS-Interest Rate Swap) or a forward contract, for instance, do not represent a straight loan because the generated cash flows do not meet the above mentioned requirements.

Financial instruments are managed based on contract only if their performance is evaluated by the entity's management, according to the IAS 24 „Presentation of information concerning affiliated parts”, based on some contract cash flows generated when they are held or issued.

If financial instruments are managed based on contract, they do not depend on the management intentions for a certain financial instrument. This requirement does not assume an „instrument-by-instrument” classification approach. Nevertheless, an entity can have several units that are managed in different ways. For instance, a bank that carries out several activities can have an investment unit managed on a certain basis and another trading unit managed on a different basis. Therefore, it is most likely that financial instruments held in the investment unit will be managed differently than those held in the trading unit.

When classifying the financial instruments in line with the entity's business model, at the redemmed cost for those kept in the long term respectively, and at fair value for those kept for trading, limitation to the two categories is required. It means an effective estimation from the beginning will be framed in a category or a different category, especially as the business model is changed by entities very seldom.

However, an entity cannot reclassify a financial asset or a financial debt between the two categories, regardless the circumstances.

The expected date of enforcing the new regulations is 2012, with the permission of previous application.

3. IFRIC 9 amendments

Amendments have been also provided to the IFRIC 9 „Revaluation of incorporated derived instruments” interpretation. Thus, an entity should evaluate if necessary or not that an

incorporated derived instrument should be separated by the host contract and recorded as a derived instrument when the entity becomes part to the contract for the first time.

Further revaluation is forbidden, except situations where there is an :

- Either a modification of contract terms that significantly change the cash flows that the contract required if its terms would not have been changed;
- Either a reclassification of a financial asset within the category of instruments evaluated at fair value by profit or loss, cases when revaluation is required.

An entity sets if a modification of cash flows is significant, analysing the extent in which future predicted cash flows, associated with the incorporated derived instrument, the host contract or both experienced changes and if modification is major in relation to previously predicted cash flows, related to the contract.

Evaluation of extent to which an incorporated derived instrument should be separated by the host contract and recorded as a derived instrument at reclassification of a financial asset, apart the category of instruments evaluated at fair value by profit or loss, should be carried out based on the existing conditions at the most recent dates:

- a) Date when the entity became part to the contract for the first time; and
- b) Date when a modification of the contract term took place and significantly changed the cash flows the contract would have required, if its terms would not have been changed.

In line with this evaluation, it should not apply: more precisely, the mixed contract should be approached as it have not been evaluated at fair value with fair value modifications recognized in the profit or loss. If an entity cannot accomplish this evaluation, the mixed contract should remain entirely classified at fair value by profit or loss.

Amendments to IFRIC 9 also generated amendments to IAS 39. Therefore, in case when, according to IAS 39, an entity should separate a derived instrument incorporated by its host contract, but cannot evaluate separately the incorporated derived instrument, either at the time of acquisition, or at the end of a subsequent period of financial reporting, this should assign the entire mixed contract at fair value by profit or loss. Similarly, if an entity cannot evaluate

separately the incorporated derived instrument that should be separated at reclassification of a mixed contract apart the category of instruments evaluated at fair value by profit or loss, the reclassification concerned is forbidden. In such cases, the mixed contract remains entirely classified at fair value by profit or loss.

4. Conclusions

Accounting of financial instruments according to the rules contained in international standards or in national norms is completed by means of presentation and description of related information in summarized documents. Based on this information, auditor certificates, interested users appreciate the impact of using financial instruments on the entity's financial standing and performances and take economic decisions.

IAS 39 is not clear as regards the extent in which the risks and benefits of a transferred asset should be taken into consideration in order to find out if derecognition is suitable and how should risks and benefits be approached. In some cases (for instance, transfers with total swap of efficiency or put options sold unconditionally). The standard chiefly shows the derecognition opportunity, while in other cases (for example, credit guarantees) this is unclear. Others also questioned if evaluation should focus on risks and benefits or only on risks, and how different should aggregated and evaluated risks and benefits be.

We suggest an approach of de derecognition, according to which the entity transferring a financial asset to continue recognizing that asset as far as the transferring entity has a continuous involvement in it. Continuance of involvement could be set in two ways :

- a) A reacquisition provision, such as a call option, a put option or a repurchase commitment; and
- b) A provision to pay or encash a compensation based on modifications of transferred asset value, such as a credit guarantee or an option settled net in cash.

We consider that transfer of risks and benefits should be evaluated by comparing the previous exposure before and after the transfer to variability of sums and moments of net cash flows of the transferred asset. If the entity exposure, based on updated value, has not changed significantly, the entity should conclude that it significantly held all risks and benefits. In

this case, the asset should continue to be recognized.

We express our disagreement that when the fair value option is applied on financial debts, an entity should recognize the income as a result of lowering credit quality and an expense with loan as a result of improving credit quality. It is not useful to report reduced debts when an entity is in financial difficulty because the level of its debts is too high and it would be difficult to explain the users of financial standings, the reasons for which income is recognized when debt reliability deteriorates. The fair value should exclude the effects of modifications concerning the credit risk specific to the instrument.

We recommend to include the credit risk concerning financial debt in the fair value evaluation of that debt for the following reasons:

- a) The entities carry out modifications of the fair value attributable to the credit own risk, for example, by means of renegotiation or repurchase of debts or by using derived instruments;
- b) Credit risk modifications affect the market price of a financial debt and, as a result, of its fair value;
- c) Practically, it is difficult, to exclude the credit risk modifications from the market price; and
- d) The fair value of a financial debt, that means the price of that debt within an exchange between a buyer and a seller that are interested and aware, at the initial recognition reflects the credit risk.

It is questionable if the fair value share in the financial debt attributable to credit quality modifications should be particularly presented separately in the profit and loss account or separately in equity capitals.

While description or separate presentation of such modifications would be often impossible in practice, presentation of such information would be useful for users of financial standings and would help diminish the expressed concerns.

We consider it is necessary to include a presentation that helps identification of fair value modifications of financial debts resulting from the debt credit risk modifications. This fact is a reasonable representation of the fair value modification that is assigned to modifications in the debt

credit risk, particularly when such modifications are major, and will provide the users relevant information to understand the effect of profit or loss as regards such a credit risk modification.

Abstract

Accountancy deals with the measurement, registration and control of the most important parts of business. Accounting is a central activity in a business' economical life. The role of accountancy becomes even more important in modern economy, which relies on information. Due to the fact that resources are insufficient, choosing between several alternatives is necessary, and information provided by accountancy is needed to identify the best alternatives. Considering the importance of the financial – accounting information in making decisions, the quality of that information is vital.

In contemporary economy, which is in a perpetual transformation, spectacular transformations are carried out in a short period of time based on financial decisions taken by using accounting information and based on its relevance and accuracy. If this information is proved to be untrue for the economic events based on which they have been generated, or are not correctly understood, the result of the decisions will be far from the expected one.

Key words: Accounting activity, Strategic management, organization.

JEL Classification: M21, M41

1. Introduction

The unprecedented development of the human society nowadays has impelled information as an indispensable necessity for the decision making process.

The information in general represents a piece of news, a communication, a new element about

an object, a phenomenon, a process, an activity according to which the decision makers establish the measures to be taken in future so that the activity they run to be efficient.

Information represents new knowledge, as compared with the situation in the past it represents a greater interest for users.

2. The role and importance of accountancy in any organization

An organization, no matter its management, its branch of activity, its way of using capital, the nature of capital, develops its activity in connection with the norms which are to be observed, it develops its activity within some flows of financial and monetary nature.

The reason of an organization stands in the creation of some material, spiritual and intellectual assets, in order to satisfy the market consumers.

The totality of internal and external flows of an organization have to be known for various reasons.

The qualitative and quantitative knowledge of the flows is possible only through accountancy, it taking over all the financial information.

The actors are different and special, each having his own score which interferes with the others.

A lead actor, remarkable within an organization is the accountancy with a well – defined mission, with well – established duties and responsibilities.

Accountancy offers the picture, the range of information regarding the activity of an

organization, and the activity of an organization means flows which are to be expressed, known, analyzed, controlled and influenced.

The channeling of flows is not possible without having financial information necessary for management, worked out in an accessible way by accountancy.

A way of getting information is the narrative way of important events, but this is not enough for an exhaustive coverage.

That is why they resort to a logical language of business which is accountancy.

Having a knowledge of finance, of effects and their causes is not possible without resorting to accountancy.

Accountancy should not be understood only as a mirror which reflects, but it would rather be understood as an aggregate at the manager's disposal, operating as a support of current, tactical and strategical decisions regarding management in general and financial in particular.

Accounting, through the information it generates becomes the authoritative support of decisions regarding the reglementation of organization activity.

The organization interacts with its environment. Between it and its environment there triggers a lot of real, monetary, financial and international flows. Most of these are known by means of accountancy.

Accounting, by its nature, is a real records of an organization, an information generator regarding the position, standing and the tendency of the organization.

The general financial position is established by historical and forecasting accountancy. This financial position is expressed by reports possible to be determined by accounting information regarding: profitability, liquidity as ability of the organization to fulfil current obligations, solvency being the organization capacity to settle long term obligations.

By the variety of reports calculated on information given by accountancy, the temporal comparison can be achieved, the accounting allows a temporal and spatial comparison regarding the organization position and evolution.

The financial accounting, coupled with the managerial or administrative one, enlarges the sphere of control, penetrating the cost area too.

The knowledge, analysis and cost influence are possible through information offered by

internal management accounting. The efforts and consumer factors are known, controlled and influenced to obtain the goods, the services demanded on the market.

Both financial accounting and internal managerial one offer information regarding organization and management control.

Being a business language, accountancy offers basic information necessary for management, by means of which it assures that the resources were and have been got and used effectively, really and efficiently, in accordance with the organization objectives and with the laws which govern their behavior.

3. Demand and supply of accounting information

Information has become a negotiated product which presents a series of features, that is:

- a very low cost of sending, as a result of using information technology which allows free access to all those interested;
- the results of the information production are not always the desired ones (or more precisely the rightly receivers are not the only users), in this field not existing laws to really protect it;
- the information can often be with a high level of perisability, which lately has led to the rise of its distribution and use;
- the information supply needs a series of special qualities and information technologies, the speciality degree in this field being extremely high;
- the development of information technology is reflected by the progress of information programs and of computer networks.

At present we receive information from a variety of sources, from the „indirect” ones such as television, radio, books, newspapers and printed matters, to the „direct” ones, conversation respectively.

At organizational level, information is of different types:

Accounting information, generated by the accounting system, lies at the basic of numerous financing reports.

Financial information with operational character is to be found in financial reports which serve to making operational decisions

by the internal actors of the organization. This category of information has in view the budgets, investments, treasury, the state of accounts, the credits and debts.

The financial information with a strategic character is included in the reports to the organization leaders/groups, reports which serve to support and follow the organization strategic objectives, having an important synthesis level.

Financial information asked by external actors. The environment in which the organization develops, represents an important factor in the organization operation, that is why a quantity of information, especially financial must be produced to satisfy different external actors. Although this information is already at the disposal of an organization, because it answers the internal need, the format in which it is supplied to the external environment can be significantly different.

The information offered by accounting lies at the basis of decisional process both within and outside the organization. The accounting information represents an instrument and like most of it cannot serve but only to those who are not able to use it or use it wrongly. However, its way of being used can be learned, and accountancy must finally offer information which can be used by all those who want to use it correctly, be they professionals or not.

The user of information and the purpose of its use represent a specially important factor in this field.

From an accounting point of view, an item of information has value if it is useful to its users in making decisions to lead to the expected results.

The decisions which imply the making of information refers to:

- the necessity and utility of its production;
- the selection of one of the alternatives of its production.

The information processed in accounting, also called accounting information, is sent by means of different reports to the decision – makers, also called information users.

Therefore, the users of accounting information can be classified under three categories:

- those who administrate an organization;
- those outside, but having a direct financial interest in the organization;
- persons, organizations and institutions having an indirect financial interest in the organization.

The enterprises, as entities of business environment, publish a set of information regarding the results of activities developed in a certain period.

These reports are possible as a result of quantification by means of which they are placed at the users disposal, information of general use about the activity developed, allowing the calculation of a set of indicators to estimate the future flow of events.

The accounting synthetic documents represent for users of financial information a data base necessary for making economic decisions.

This type of information are used by persons who have a direct financial interest within the organization, the present and prospective shareholders, the debtors as well as the persons who have an indirect financial interest within the organization such as banks, stock exchange, clients, suppliers, trade – unions, the state and its bodies, justice, the public, national accountancy.

These suppliers are numerous and they form a various population, but the most important category of beneficiaries is made up by investors.

The idea of trying to satisfy directly all the real and prospective users with accounting financial information is a difficult attempt, even quite impossible.

4. The role of accountancy in the decision – making process

Accountancy can be regarded as an instrument which allows the communication of economic information in other words, as a universal economic language. Accountancy, in a continuous dynamics has imposed as the most important subsystem of information and decision – assistance within an organization. Accounting as a subsystem of information, has been constantly adapted to the enterprise informational needs and of their environment, the information system representing the assemble of elements which allow the collection, stocking, processing and communication of information.

Although accounting is, in many ways, considered as a measuring instrument of financial results or as a means of evaluating the patrimony, constituting an important element of the organization administration, in

reality the role of accountancy is more diversified, resulting from the partners' expectancy during their transactions.

Accounting, by the operations it generates, has in view the reliability among partners participating in the economic life, a reliability to convince on the financial position of a company, of its solvency as well as on its exploiting performances, in the same time assuring enough elements to lead to conclusions about the way in which the organization is administrated.

For today's world, accountancy is a practical activity developed by professionals who have the role of furnishing useful information in decision making at the level of economic entities.

The making of an accounting information starts from the observation of an entity and of its specific activity.

The data processing in order to obtain information is made by using the language and the means specific to the accounting system, so that they can answer the users' need.

The information activities peculiar to the accounting system are those regarding the making and use of accounting information. They stand in actions which refer to data creation, collection, stocking and processing and also in sending information.

The role and importance of accounting within the informational system for decision making is immense as it makes the connection between economic activities and decisional factors.

In order to make a correct and efficient decision, the manager has to establish the purpose, to identify the means and variants to attain it, to choose the optimum variant, to put it in practice and to follow the way in which it is used, to analyse the results.

The accountancy information has an essential importance throughout this decision – making process.

Therefore, when a decision has in view economic problems, the accountancy offers information for three managerial functions: planning, controlling and evaluation.

The economic information represents a special interest for accountancy. To this accountancy category also belongs the accounting information. This is obtained by own methods, approaches and instruments for processing economic data.

It is the most real, precise, complete and operational information representing the support of managerial process.

Most of the decisions made in the managerial process are based on information got from accountancy, so the accounting information takes an important place within the system of economic evidence in general and within the economic informational system in particular.

In order to be useful within the managerial system an accounting information, must have four main qualitative features: to be intelligible, relevant, reliable and comparable.

The making and publication of some accounting information to present in a balanced manner all the qualities mentioned above, must lead to getting some financial positions to reflect a real image of the patrimony and the financial standing of the organization.

The main responsibility to make and to present the organization financial position belongs to its management. The managers of the organization are also interested in the financial information and additional data management to contribute to the planning, decision – making and control processes.

Management has the ability to determine the form and content of such additional information to satisfy their own needs.

The general framework of making and presenting the financial positions makes the statement that the published financial standings are based on useful managerial information about the financial position of an organization, about its results and modifications.

In the process of participating in the economic life, the entity cannot any longer be satisfied with a simple accountancy to keep books of former data. We witness the appearance and the development of some new activities, which supplement accountancy: management control, financial control, financial analysis and accounting audit.

Book – keeping represents an important component in the informational system of an organization. By its way of data processing, accountancy offers exact information regarding the existence and movement of patrimonial elements, presenting in a

synthetic way, the results of the developed activity.

Accountancy represents an important support of an organization management, furnishing information meant to sustain the decision – made.

Accountancy is the information source of any negotiation, being a reference instrument to determine costs and prices economically motivated, it serves as a means of communication, using a common language, accepted by all participants to the economic and social life and helps to settle a possible conflict or dispute.

Accountancy does not represent a goal in itself, it is an informational subsystem which quantifies, processes and sends financial data about an identified economic entity.

Accounting is that which makes the connection between economic activities and decisional factors.

It can be said that the rough data regarding economic activities represent an input in the accounting system and the processed information needed for decision making, represents the output.

The information has been necessary along the history of mankind as any human decision is based on knowledge.

The information in real time must be included in economic studies, the accounting included. Accountancy in real time has to allow the knowledge of reality in an optimum time so that the adequate decision should be made.

5. Conclusions

The interpretation of accounting information is vital for an accountant, it is an integral part of the communication process.

It must be mentioned the fact that the definition of accounting does not extend over that of decision – making.

Of course, many accountants are implied in the decision – making, but in such circumstances they play more a managerial role rather than that of an accountant.

Therefore, it is important the distinction of accounting in decision – making. It is important that the information offered by the accountant be as objective as possible, but if the accountants have not a distinct difference in their mind between accounting and decision making, there is a great risk that they unconsciously

manipulate the given information so that the decision made to be the one desired by them.

In the decision – making process, the role of the accountant is to furnish correct, timely, exact and useful information.

In order to achieve this, an accountant has to collect the corresponding information and report it in a relevant way to management.

Abstract

Within the achieved survey, the authors started from the reality according to which risks management must be prudently achieved, such way not to lead to severe consequences at the sovereign liability's level. The major risks encountered in sovereign liability's management are herein analyzed. The authors analyze the approach known under the name of assets and liabilities management (ALM) also presenting an advanced system for risk's valuation (CAR-cost at risk). The result of the survey highlights the fact that the public debt management may create a series of traps, if we refer to the fact that after the years 1990 it has been considered as a separate public policy, with separate objectives with regard to the cost and risk generated by the public debt. This implies the analysis of the financial characteristics of the treasury flows of assets and selection, up to the possible level of the characteristic liabilities in order to contribute to the decrease of the budgetary impact over the liability service costs.

Key words: Risk, Public Debt Management, Assets and liability management

JEL Classification: G32, H63

1. Introduction

The major objective of the public debt management is to ensure that the government's need for financing and its payment obligations are fulfilled at the lowest possible cost on medium and long term, in accordance with a prudent risk degree.

As a matter of fact, the said costs include the insolvencies of the Companies and Banks, and the long term credibility and the low ability of the government to mobilize the internal and external savings.

A prudent management of risks is essential in order to avoid the debt's dangerous structures and strategies (including the monetary financing of the government's debt), by taking into consideration the macro-economic consequences of the sovereign liability.

Debt management should contain the main financial obligations over which the central government exercises its control. Generally, the obligations include both tradable and untradeable market debts, such as the preferential financing obtained from bilateral agreements and multilateral official sources [4]. The purpose of the debt management has extended in a number of countries in recent years. Nevertheless, the debt from the public sector, that is included or excluded from the central government mandate with regard to debts' management, differs from one country to another, depending on the nature of the political and institutional frame [1].

2. Risks met within the sovereign debts management

Mainly, the developed countries that have stable and liquid markets for the government's papers, concentrate for many times on the market risk, and can use valuation tests and sophisticated portfolio patterns to measure it.

Instead, the markets from the emergent countries which have access to the limited

foreign capital markets (have relatively undeveloped capital internal markets), should give a greater priority to the refinancing risk [7].

Equally, within the policies for debts' management should be included, as major objectives of the government, the promoting of developing a market of the internal debt.

The said objective is quite relevant for the countries where the market constraints are of such nature, insomuch that the short term debt, the rate of the oscillatory debts and the debt in foreign currency, at least on short term, represent the only viable alternative for monetary financing.

That is why, the decisional factors should try to reduce to the minimum the costs regarding the debt service and the cost for holding liquid assets, under the reserve of an acceptable risk level, by conceiving a reference plan on medium and long term [3].

Furthermore, the transactions that seem to reduce the costs with the debt service, for many times, include significant risks for the government, so that limit its ability of refunding the amounts to the creditors. The main risks occurring in the sovereign debt management can be also seen in table 1.

Table1. Main risk categories

Risk types	Signification
Market risk	It refers to the risks associated with changes of the market prices, such as: interests' rate, exchange rates, prices of raw materials, and the cost with the debt service. For the two types of debts, internal or external, the changes of the interests' rates influence the costs regarding the debt service when, the fixed rate debt is refinanced. The debt with floating rate also changes the moment the rates frequency change. Consequently, the debt on short term with fixed or floating rate is considered to be more risky than the fixed rate debt on long term. The excessive concentration on the fixed rate debt on long-run term may be more risky as the future financing requirements are doubtful.
Refinancing risk	The risk the debt is refinanced at a higher price, and under extreme cases, not be refinanced at all. According as the refinancing risk is limited to the risk for which the debt could have been refinanced, at a higher interest rate, this can be considered a market risk type. Thus, real economic losses can be generated in addition to the purely financial effects of the higher rates of interests, but for many times, this item is separately covered. The management of the said risk is very important for the countries with emergent markets.
Liquidity risk	There are two types of liquidity risk. One refers to the cost the investors confront with in their attempt

	to go out from a position, in case the buyers' number significantly decreased, or because of the lack of activity on a certain market. This kind of risk is quite relevant in case the debts management includes the liquid assets management or the use of the derived contracts. Another form of risk liquidity, for the debtor, refers to a situation under which the volume of the liquid assets may rapidly diminish in front of the unforeseen obligations flow and a possible difficulty in cash increase might occur through loans, within a short period of time.
Credit risk	The failure risk of the debtors over the loans, or over other financial assets. This risk is very important, in case the debts management also includes the management of liquid assets.
Payment risk	Refers to the possible loss the government, as partner, may record following the failure in paying the debt, no matter the reason is, another one except payment failure, by another Party.
Operational risk	This contains a varied range of risk types, including transactional errors at different stages of execution and recording of unguardedly operations or interruptions in the internal control activity or in systems and services, juridical risks, security violation or natural disasters that influence the economic activity.

Source: International Monetary Fund/ World Bank-Guidelines for Public Debt Management, March 21, 2001, pp. 11.

Consequently, in assessing and implementing a strategy for the internal governmental debt management, in order to obtain the objectives in

connection with the risk and cost, and any other objective connected with the sovereign governmental debt, the government should monitor and reexamine the possible exposures that might occur at the public central administrations' level and at the enterprises with state capital, and, where possible, be aware of the general financial position of the debtors from the public and private sector.

Concurrently, the exchanges between costs and the refinancing risk [2] occur when a debt instrument is chosen and an exchange between the cost reduction and the financing risk reducing usually exist. In this context, an advanced valuation risk system, used by the Danish authorities, is the so-called "Cost-at-Risk" (CAR-cost at risk), which is similar to the "Value-at-Risk" (VAR Value-at-Risk). The CAR measure is concentrated on the risk regarding the increase of the interests' rates by calculating the debt service cost within a certain probability interval.

But, the respective distribution probability, is to be calculated starting from patterns and hypothesis referring to the future development of the interests' rates.

However, in order to decrease the costs, the debt managers have achieved a few innovations regarding the use of the sale instruments and techniques. Generally, such innovations are achieved in order to increase the demand – in many cases from the foreign investors' part — and to increase the liquidity.

2. Assets and liability management - ALM

In our opinion, within the developed countries, the decisional factors try to learn from the Companies that successfully managed their business and the financial risks.

For example, the financial agents try to manage the business and the financial risks by adapting the financial characteristics of their debts to the assets, taking into consideration the basic objectives of the business. This approach is known under the name of assets and liability management (ALM). For example, a Life Insurance Company is in the field of life insurance policies sale that have a relatively stable payment structure on long term, determined based on the actuarial tables, according to the death rate. But, in order to minimize the financial risk, a Life Insurance Company will invest the profit from the policies'

sale in long term assets in order to fit with the foreseen payment from its policies.

That is why, from certain points of view, a government is like a Company: cashes capital from the taxpayers part and from other sources and uses it in order to pay the functioning expenses, makes transfer payments, buys foreign currency, invests in the public infrastructure and in the Companies with state capital and pays the debt service.

Therewith, this may contract loans and provides guarantees. The multiple governmental operations can be used to fulfill a varied range of macro-economic, regulatory, national defense objectives, and of social policy.

Nevertheless, within the said process, the government draws up financial and credit risks that can be managed by taking into consideration the different types of risk associated with the assets and liabilities.

But, there are important differences between the role of the government and the role of the private companies. While, some governments have tried to quantify the value of their assets and liabilities, more and more governments try to do the same in the future, this not being essential for the ALM[6] approach. Instead, the objective of the ALM approach is to take into consideration the different types of assets and obligations the government manages, and to analyze if the financial characteristics associated with the active ones can provide information referring to the management of costs and risks of the governmental liabilities. This implies the analysis of the financial characteristics of the treasury flows of assets and the selection up to the possible level, of the characteristic debts in order to contribute to the decrease of the budgetary impact over the debts service costs.

The use of an ALM conceptual frame for the problems connected to the debt management may be a useful approach for many reasons:

- motivates the cost/risk analysis of the government's debts portfolio through an analysis of the government's fiscal revenues that are to be used for the debt's service;
- allows the managers of the government's debt take into consideration the other types of assets and liabilities portfolios the government manages, except the fiscal revenues. For example, this may imply the government's decision referring to the need of keeping a property right in producing certain goods and services, and the best

managerial structure in order to manage the assets it wants to keep.

But, the public debt management may create a series of "traps"[5], if we refer to the fact that after the years 1990 it has been considered as a separate public policy, with separate objectives, regarding the cost and risk the public debt generates. These new elements refer to:

A) Increase of the government's financial position vulnerability by the risk increase, this might leading to a lower cost and a lower deficit on short term [5]. This is the reason why the debt managers should avoid their portfolios exposure to great risks. This element stands:

- Maturity's structure. A government confronts with problems between the long-term and short-term problems that should be prudently managed. For example, the excessive use of the short-term debts or with a variable interest rate that could let the government uncovered at a possible increase of costs with the debt service, in case the interest's rate increases and payment failure may occur. This problem could also affect the achievement of the Central Bank monetary objectives.

- Excessive exposures of the exchange rates. These may have many forms, but the prevalent ones are the excessive emission of denominated debt in foreign currency and currency indexed debt. The said practice could let the governments become vulnerable to possible increases of the debt service cost if the exchange rate depreciates, and the non-payment risk occurs if they are not able to refinance the debt.

- Debt with options. Unless adequately managed, this increasing incertitude of the issuer effectively decreases the portfolio's duration, creating a greater exposure to the market or refinancing risk.

- The conditioned, implicit liabilities, such as implicit guarantees granted to the financial institutions, which must be adequately managed.

B) Debt management practices that provide stability between the private and governmental decisions that underestimate the real cost of the interest, meaning [5]:

- Debt guaranteed by shares of the state capital enterprises or other assets. By this practice the interests' cost is underestimated and wrong decisions may be taken with regard to assets management;

- The debt guaranteed from specific sources of the revenues obtained from future taxes. If a next revenue flow is intended for the payment of the debt service, a government could be less willing to undertake the said changes that influence the revenues, even if the said changes should improve the tax fiscal system.

- The debt with exempt or reduced taxation. This practice is used in order to encourage the governmental debt placement. The impact over the deficit is ambiguous as it depends on the taxation of the current assets and on the profit rate equalization after the public titles taxation (taxable or non-taxable).

C) Wrong reporting of the conditioned guarantees and liabilities. These could underestimate the actual level of the government debts through [5]:

- Inadequate coordination or procedures with regard to the loans at the ministers' level, loans that could be guaranteed by the central government, or by companies with state capital;

- Repeated annulment of debts for the government inferior levels or for the companies with state capital;

- Guarantee of the loans with a high probability of execution (without constituting adequate budgetary provisions).

D) Use of the non-financial markets' channels[5]. Under some situations, the practices might be distorted by:

- Special arrangements with the Central Bank for concessional credit, including account overdrafts with zero interest or low interest or special treasury bonds;

- Forced loans from the suppliers' part through due expenses or by issuing some promissory notes. These practices tend to increase the governmental expenses cost;

- Creating a captive market for the governmental securities. For example, in some countries, the government's retirement plan is conditioned by the governmental titles purchasing. In other cases, Banks are obliged to take over governmental debts against a certain percentage from their deposits.

3. Conclusions

Conclusively, in assessing and implementing a strategy for the internal governmental debt management, in order to obtain the objectives connected to the risk and cost, and any other objective connected to the sovereign governmental debt, the government should monitor and reexamine the possible exposures that might occur at the Central Public Administrations' level and at the level of the enterprises with state capital, and, where possible, be aware of the general financial position of the debtors from the public and private sector.

In the authors' opinion, within the policies of debts management should be included, as government's important objectives, the promoting of the development of an internal debt market. On the other side, the decisional factors should try to minimum reduce the costs regarding the debt service and the cost for holding liquid assets, subject to an acceptable risk level, by conceiving a medium and long-term reference plan.

INVESTMENT FUNDS IN RELATION WITH SPONSORS, INVESTORS AND PORTFOLIO COMPANIES

Ioana RADU, Phd. student
Babes Bolyai University, Cluj Napoca
Faculty of Economic Sciences and Business Administration
E-mail: ioana19radu@yahoo.com

Abstract

The paper presents a briefly description of the main relations that can be encountered in the functionality of the investment fund with its participants – fund & sponsors, fund & investors, fund & portfolio companies. These three perspectives allow identifying the key role of the investment funds due to their activity objective. Maintaining a permanent concern to the market they operate on and to the preferences of investors, the investment company can obtain a solid competitive advantage and a strong image on the market, and nevertheless making the activity more effective.

Keywords: investment fund, sponsors, investors, portfolio companies

JEL classification: G24

1. Introduction

The development of the capital market over the past decade has intensified the attraction of the investors towards the offers of gain opportunities. Participating or “playing” on the capital market has become a trend among investors, regardless of their financial power. This “game” created in time a varied and sophisticated capital market, also leading to the “specialization” or “hybridization” of the financial instruments being exchanged, which eventually determined the globalization of the financial system, which allowed investors to gain access to different markets.

The globalization of the financial system was accompanied by less intermediation from the banks. The base support of the access on the capital market, the bank intermediation is now gradually being replaced by associations or consulting and/or investment groups, identified as private equity investment funds.

Investments through investment funds have spread rapidly because they allow the easy access of small investors to the capital market, especially since small investors do not possess the necessary knowledge, information or experience, time and capital-wise, to invest smart. These conditions have also created the premise for the foundation and development of a new specialized financial investment form – private equity investment funds.

The institutions founded as investment funds become intermediaries between capital holders and those in need of capital. In this respect, two aspects regarding the promotion of funds and of the services they provide can be analyzed: regarding their way of getting investors to invest in the fund, but also the way in which they can invest by involving different target companies.

The institutions founded as investment funds become intermediaries between capital holders and those in need of capital. In this respect, two aspects regarding the promotion of funds and of the services they provide can be analyzed: regarding their way of getting investors to invest in the fund, but also the way in which they can invest by involving different target companies.

Within this interdependence it is also necessary to identify the importance of sponsorships in the emergence of investment funds, as follows.

The working substantiation of any investment fund depends on the relationships between the investment society and the other actors, but also on the promotion of the fund to them. Therefore, the analysis of the interaction between these participants can be considered from 3 perspectives:

- ***Investment funds and sponsors***
- ***Investment funds and investors***

• **Investment funds and portfolio companies**

Figure 1. Investment fund in relation with its participants

A. INVESTMENT FUNDS and SPONSORS

Within the investment fund – sponsors relationship there must be identified the importance of this relationship in the foundation and development of the fund. Basically an investment fund cannot be founded based on the fund managers sources and on the sums raised from the investors, but on the sums raised from sponsors. Moreover, these sponsors offer consultancy services and promotion of the investment fund to capital owners. They become themselves promoters of the fund, often being confused with investment advisers.

Usually among sponsors there are individual investors or investment banks that are very familiar with market opportunities as far as investments are concerned. These sponsors make decisions such as:

- Establishing investment objectives and strategy;
- Choosing the type of target companies to be included in the fund portfolio;
- Making a list of the participants in view
- Having in view the investment fund foundation and functioning legal provisions

The sponsor has a business plan that they are willing to apply in the activity of the investment fund. If the plan is accepted and agreed upon by the investment company management, the sponsors can decide to participate with capital, therefore becoming shareholders.

As far as sponsors are concerned, they are hard to find. They are usually the ones who make the first step because they have the „know how” in investments. They bring forward the plan and the business strategy, which then they

get the fund on the market. The interest of these sponsors resides in the fact that they can create a profitable connected activity besides the other activities they develop. For instance, investment banks that wish to participate in different investment funds, do it based on the confidence they have in their management, as well as based on the existent investment strategies. On the other hand sponsors will suggest new strategies, and depending on their influence on the market they may attract important investors. (for instance Morgan Stanley, Goldman Sachs, UBS AG, JP Morgan Chase Bank, Barclays, etc)

B. INVESTMENT FUNDS and INVESTORS

This relationship between investors and the investment fund can be easily observed depending on the activity object of the funds, namely – collecting and gathering capital from various people (individual investors) and/or institutions (institutional investors), having in view its investment in accordance with the official investment policy of the fund in capital market instruments, municipal and/or corporate bonds, shares exchanged on the share market, as well as other goods allowed by the regulatory authority, all in view of obtaining additional profit from the gains resulted from the investment.

As far as the relationship between the two actors is concerned the correspondence investment fund-investors or investors-investment fund needs to be identified.

In order to identify the relationship and direction of the informational flow between the two participants, the demand and offer of the market defined by the two shall be identified. Therefore, on the investment funds or capital exchange market, investors can be regarded from two perspectives: as demanders, clients of the investment fund, when the fund provides investment services in their account and on their reserves on the basis of the contract – when one refers to the goods and services market; as providers (of money) when one refers to the financial market, as without their placements the fund could not gather the necessary resources to develop its activity.

Regardless of the position from which one takes into consideration the investors, one can observe that they have the most active

role in the functioning of the fund, which is why the promotion should be performed by the investment fund, as “the money fight” always begins from the one in need of reserves and in need of clients.

Once the relationship investment fund – investors is identified, the problem is how these investment funds can attract the investors and which are the particular promotion methods.

Generally, within the investment fund – investors relationship, the fund has to play a very active role as far as the fund promotion, strategies and performances are concerned, because the fund can only function based on the money provided by the investors.

In the particular case of private equity funds, the attraction and promotion activities are developed regarding the following aspects:

1. the attractiveness of the investment strategy of the fund in accordance with the emission prospect¹

- The choice of the investment geographical area
- The size of the business opening investment
- The orientation towards a specific activity domain – the choice of the investment area
- The involvement within the company (the participants’ form)
- The period of investment (that guides the type of investment)
- The way of investment – the actual strategy

For instance: Globinvest – FAPT is a fast growing private equity fund, that places a considerable weight of the resources gathered in shares listed in Romania, with a smaller liquidity, but with a strong growth potential.

A specific trait of private equity funds, is their strategy of investing in high risk placements, namely they invest over 70% in shares, the rest in bank deposits, treasury notes, municipal and corporate bonds, derived instruments and even cash.

For instance, Globinvest - FAPT declared a fund structure comprising: over 90% shares, 3,63% deposits and 4,53% cash reserves.

2. the fund performance or the report profit – risk, is a very important aspect regarding

investments, but it depends on what kind of risk every investor prefers. If we refer strictly to the case of private equity funds that correspond to investments in high risk capital funds, then investors will take a high risk in the hope to gain high profit. Still, one needs to consider the fact that the value of the share titles will be affected by the evolution of the capital market and the installment rates as an answer to economical, political or financial factors. The influence of these factors on the fund shall be determined by the type and due date of the placements, by the evolution of the portfolio goods issuing, by the exposure level of the fund in relation to each issuing, as well as the manager’s ability to invest. The fund is at risk and there is no assurance that the investment policy of the manager shall result effectively in the increase of the share titles value.

Although the fund performance and profit indicators are important because they show the increase or decrease percentage of the fund units values held by investors, it shall be considered the fact that these indicators reflect a past performance, which, although relevant, does not represent a guarantee for future evolutions.

3. the reputation of the trustees attract investors’ attention by the safety they can ensure to the invested sums and the titles owned by the fund based on the portfolio placements.

4. the reputation of the shareholders and of the fund managerial team become important elements in choosing upon an investment society to manage the capital of investors, they have to look trustworthy and able to hold confidentiality. Moreover, they have to present transparent investment strategies, as well as the results obtained by using the investors’ money funds.

Usually, within the managerial team there has to be at least one professional risk manager (PRM), as well as chartered financial analysts and other financial professionals.

5. the guarantee of the invested sums at the level of the capitals held in fund units. As well as in the case of any deposits, the invested sums have a certain degree of coverage that ensures a guaranteed compensation threshold.

In Romania the guarantee is ensured by the Investors’ Compensation Fund Inc. The compensation is ensured by the Fund in the

¹ The emission prospect of the fund comprises information regarding the administration of the fund, the investment policy, the rights and obligations of the investors, further contractual provisions regarding the relationship between the investor and the investment company.

case of the impossibility of returning by the an intermediary of the monetary funds and/or financial instruments of an investor, entrusted only on the basis of an intermediation contract of carrying out financial investment services. Until 12.31.2012, the investor compensation ceiling limit is established gradually to reach 20.000 Euro, as follows:

- a) at the time of the Fund authorization the equivalent in lei of 1.000 euro/ individual investor;
- b) from the 1 of January 2006 the equivalent in lei of 2.000 euro/ individual investor;
- c) from the 1 of January 2007 the equivalent in lei of 4.500 euro/ individual investor;
- d) from the 1 of January 2008 the equivalent in lei of 7.000 euro/ individual investor;
- e) from the 1 of January 2009 the equivalent in lei of 9.000 euro/ individual investor;
- f) from the 1 of January 2010 the equivalent in lei of 11.000 euro/ individual investor;
- g) from the 1 of January 2011 the equivalent in lei of 15.000 euro/ individual investor;
- h) from the 1 of January 2012 the equivalent in lei of 20.000 euro/ individual investor.

The equivalent in lei of the compensation ceiling is calculated based on the reference prices communicated by B.N.R. at the date of the finding of the situations mentioned under art. 47 Law no. 297/2004 regarding the capital market and under the conditions established by the C.N.V.M. Regulation no. 3/2006.

C. INVESTMENT FUNDS and PORTFOLIO COMPANIES

Whereas the promotion of investment funds to target clients is concerned, there is a particular situation, due to the fact that the investment fund will be promoted by using the target company, especially because of the effects resulted from being involved in the activity of the company.

Still, it is known that the fund does not invest in any kind of company, choosing only those companies that would ensure benefits, respectively the recovery of the initial investment and a multiplied gain over the invested sums.

It is common knowledge that any company needs financing in order to develop. In order to achieve that, it is necessary for it to make business plans so as to attract investors as soon and as easy as possible.

Therefore, within the investment funds – target companies relationship, the companies in

need of financing shall initiate the partnership by creating and presenting the business plan to those who can finance them (the investment fund).

In order to finance a company, investment funds shall evaluate all business plans of the companies in view to be financed, out of which they shall choose only that or those the correspond to their investment vision.

2. Conclusions

Within any financial society maintaining the portfolio of clients becomes a crucial part of the marketing strategy applied by the investment company or the investment fund. In the financial services field, like in other domains, the process of carrying out of the services involves a multitude of relations between the provider and the consumer. The concept of care towards the consumer is strongly related to that of the consumer satisfaction.

Therefore, it is important to observe the main connections that can be set between the participants in relation with the funds functionality.

University of Petroșani, Faculty of Sciences
robert.szabo@yahoo.com

Abstract

Financial balance sheet approach allows emphasizing the relationship between sources of funds held by the enterprise and allocating these funds. It is the accounting records that describe the synthesis of assets and liabilities of the company at year end and the other cases provided by law, all balance is highlighted by the double representation of heritage, providing a separate description of assets and liabilities. The main indicators of financial stability analysis, after studying the balance sheet, are: working capital, working capital requirements, respectively the net Treasury. For example, a case study, was made on the company Beta S.A.

Key words: financial balance, financial stability analysis, balance sheet

JEL Classification: M21, G31

Etymologically, the word balance, which defines the concept of scale with two plates that are in balance, derived from the words "bi" and "Laux. The first definition given of was "balance of wealth", in relation to sources (resources) of its acquisition, the balance formed the subject of constant concern both for those who prepared it and those who use it as a management tool heritage. There are several theories which have emerged on the balance model, modeling side of the property and balance functions. Balance can be defined as an array of wealth in monetary units having size and economic value of property claims in relation to their funding sources and the result obtained.

Balance in the general sense is defined as a situation which is prepared annually summary, based on the books and records of which reflect the work and its results. Balance is the official document management company. Actual elements of balance are: - balance sheet itself - the profit and loss - Annex - annual report. Balance sheet accounting is a synthesis document which shows assets and liabilities of the company at year, and other situations stipulated by the legislation. Thus, the dual representation of heritage is done with balance sheet asset that reflects the state of the company providing a separate description of assets and liabilities. Pooled assets and real property assets of the debt and equity and debt liabilities. Financial balance sheet approach allows emphasizing the relationship between sources of funds held by the enterprise and allocating these funds.

According to regulations, consolidated balance sheet is a document which presents assets, liabilities and equity of the entity's financial year, and in other cases provided by law. For the purposes of these rules sheet items are defined as an asset is a resource controlled by the entity as a result of past events from which it expects to generate future economic benefits to the entity and whose cost can be reliably measured, a current debt is an obligation of the entity arising from past events and the settlement that is expected to result in an outflow of resources embodying economic benefits, equity represents the residual interest of shareholders in the assets of an entity after deducting all liabilities. Theories of balance intend "to look for balance, and according to its base content and the assessment of the content, so it becomes the main information system and data analysis and management

work of socio-economic entity. Financial balance sheet approach allows emphasizing the relationship between sources of funds held by the enterprise and allocating these funds. Legal approach allows emphasizing the balance between rights and obligations that the opposition between active and passive.

Thus, if the legal optical passive approach to balance the economic commitments are outlined in the eyes of financial liability coverage appears to balance the contributions of funds or funding sources held by the company. For example, a loan from a credit institution, is an operation which has financial implications for the balance, a consideration of resources (funds) further, and legal implications is the formation of new debt the company and its obligation to repay this due to some maturity.

The balance sheet reflects the financial terms of use (allocation) of funds legally and from the economic rights of property and debt held by the company. For example, possession of materials are available for business, in financial terms, use of funds for setting up such stocks, and in legal terms, an asset ownership over them. Also supply goods to third parties, following the payment to be made under contract terms at a later date, is a financial transaction which has the following meanings: a new source of funding until the debt falls due, and while a use this funding. This operation is interpreted in terms of the legal significance: a new commitment and ownership while the property asset.

Internal structure can be presented on the balance sheet assets and liabilities duration criterion. Thus, items are arranged according to asset liquidity and liability positions according to charging. Assets can be sorted according to their degree of liquidity, which indicates their possibility to be converted into monetary form, in the longer term more or less close, and in normal use. Some activities are intended to be consumed in a period of time, more than one year, as property or assets, with a low liquidity. This includes tangible, intangible property and financial assets in a category called *inmediară* course. Assets are characterized by low liquidity, differentiated according to their nature, amortizable or depreciable and amortizable according to the normal life span. Degree of liquidity may be affected by certain transactions, such as for example the disposal of assets. They are also called permanent or stable

allocations due to slower rotation of capital invested in them. Part of assets consumed in a cycle of exploitation, the liquidity is less than a year.

These assets, including money held are in the form of money, have a high degree of liquidity. This includes assets and current assets, consisting of various categories of inventories: raw materials, production in progress, finished goods, receivables and cash availability. Current assets are called cyclical or temporary allocations as recovery of capital invested in them are made at the conclusion of an operating cycle (supply - production - sales).

Liabilities can be structured by the degree of charging ie their ownership to become due on a certain period. Thus, each element corresponds to a passive commitment but payment obligations are distinguished by very different maturities. Moreover, some elements of passive restraint does not include any repayment at maturity, equity falling into this category.

Equity is the residual interest in assets after deducting all business debt, including aggregate result, net of all transactions and events past.

The equity category fall: equity, equity-related premiums, reserves, revaluation reserves, retained earnings and other equity. Equity have a high chargeability and low and are called permanent sources *stabile*. Unele liabilities, the nature of debt repayment involves a binding obligation and the degree of charging is different depending on payment deadlines. Thus the nature of the medium and long term debt also comes in permanent and stable sources, the degree of charging is more than a year. Medium and long term debts include loans to finance investments and other debt. Short-term debt and current liabilities comprise operating liabilities and short-term loans.

Are characterized by high chargeability, is called cyclical or temporary sources and are generally contracted for necessary operating cycle. Operating debt obligations include operating results of the deployment cycle: debts to suppliers, employees debts, obligations to the public budget, debt to shareholders, other debts. Short-term loans are loans from credit institutions operating cycle needs.

The main indicators of financial stability analysis, after studying the balance sheet are: working capital, working capital requirements, net Treasury respectively.

For definition and calculation of working capital (WC) assets and liabilities are grouped based on the criterion duration of assets and liabilities. Thus, assets are grouped into assets with higher liquidity and assets of one year with a high degree of liquidity, less than a year. Liabilities are grouped into permanent capital including equity and other debt with charging more than one year and short-term debt charging less than a year. Permanent appropriations in assets, are usually covered by permanent sources. If sources are higher than permanent ongoing need for allocating the funds, the surplus of unrestricted funding cycle can run for renewal investments in stocks and debt, and this resulted in the potential use his name, that of 'fund bearing. "The revolving fund is an expression to achieve long-term financial stability and its contribution to the achievement of short-term financial balance." [2]

The revolving fund is determined by the relationship: = capital revolving fund permanent - permanent allocation = (equity + debt on medium and long term) - (fixed assets). This determination by the revolving fund account is the most relevant in terms of its significance. Revolving fund and can be determined as follows: revolving fund = assets - liabilities revolving fund balance determined by patrimony (financial) is called net working capital overall. If working capital is positive means that are permanent sources of funding allocations for permanent cover.

Where working capital is negative, permanent sources do not provide full funding of fixed assets, with a revolving fund insuficientă. Thus, a positive working capital reveals an equilibrium because financial assets are financed in a sustainable manner, using stable sources, mainly equity and medium and long term loans. Negative working capital indicates a state of permanent financial imbalance as sources are insufficient to finance the permanent appropriations, and in this situation there is need to turn to sources in the short term needs at the expense of operating cycle. In phase tanzitie to a market economy, many enterprises especially those owned or privatized state recorded a negative working

capital because of losses in consecutive financial years, which led to reduction in equity. Under these conditions had to resort to cyclical sources for permanent allocation needs and often these sources were the outstanding debt due by the suppliers and in particular to the state budget, local budgets, social security funds special.

The revolving fund can also be analyzed according to the permanent capital structure, equity and debt respectively medium and long term. This analysis allows us to highlight the extent to which financial balance is achieved through equity, that the degree of financial autonomy of the company. The indicator shows the degree of autonomy to appoint its own working capital and surplus highlights equity to net assets. Own revolving fund (ORF) is determined Thus: FRP = equity - assets can also cause working capital loan (WCL) as the difference between working capital and fund its working capital: $WCL = WC - ORF$. Revolving fund loan (foreign) expresses the size of resources lent long term to finance short-term assets.

Working capital - functional significance: a functional balance is based on an economic classification that takes into consideration the following criteria: The Active separation between allocations intended to serve the continuous activity and not the first general consumption (assets) and those not destined to remain sustainable in the enterprise (active circulating) Liabilities: separation between financing resources serving the needs of structural (stable resources) and those who disappear at the first general (except for financial debt).

Financing needs of the operating cycle are generally covered by temporary sources called debt service. Financing needs of the operating cycle, which are called cyclical or temporary use, short-term allocation is that the firm must make to stock up raw materials, production process of manufacture, finished goods, such as and to provide various customer redemption. Thus, the company must supply the goods to resell them if engaged in trade and raw materials to achieve the finished product and aids in the operation, and the characteristics of the manufacturing cycle, follows a period the realization of the products for sale, and duration of their

storage. Also in trading links with customers should give them some time payment, accumulating debt generating financing needs. Meanwhile, the work, the company recorded debt providers that received some payment terms of the consideration of goods and services supplied or work performed or provided by them. In the short term debt liabilities of the company is found to employees, shareholders, state, etc.. Debt maturity mentioned, they are sources of financing current assets.

The difference between financing needs and debt service cycle are called exploitable needed (need) for working capital (NWC). $NWC = \text{allocation cyclical} - \text{Cyclical sources} = (\text{stocks} + \text{debt}) - \text{debt service}$. Interpretation of positive or negative values of working capital requirements should take into consideration the causes that led to these situations.

Thus, if the difference between allocations and cyclic cyclical sources is positive, it means an extra cycle operating needs in relation to their sources of training. This can be regarded as normal if the increase is due to financing needs, due to development work, otherwise the result may be a negative gap between stock liquidity and liability for debts and liabilities. If the difference between allocations and cyclic cyclical sources is negative, it signifies a temporary source surplus to the needs of current assets. This can be regarded as normal if the acceleration due to rotation of the engagement of current assets and liabilities with maturity more relaxed, otherwise the result can only be temporary disruptions in supply and reânoinerea stock or increase their debt service due to nonpayment at maturity. Components are elements of treasury cash assets and liabilities, including availability plays a vital money. Mention of financial assets: investment securities, commercial paper receivable, certificates of deposit. Treasury liabilities are short term loans, such as: cash loans, credit balance on current account, credit mobilization of claims. Relationship of net cash calculation is: $\text{Treasury (T)} = \text{active cash} - \text{cash processing}$. Treasury may determine and subject to financial balance equation: $WC = NWC + NT$, where $NT = WC - NWC$.

A positive cash result of employment is effective and reflects a financial equilibrium înreprinterii providing short-term financial autonomy. Depending on the size of the surplus cash is placing question efficient and safe

financial market - its money. Treasury shows a negative net financial imbalance and signifies a potential cash shortfall to be covered in short term loans which have a high purchase cost, while charging a high degree. Between profitability and liquidity of inter-relationships exist. Thus, an activity creating profitable treasury premises obtaining positive and a positive cash directly influence the possibility of obtaining a desired profitability level. A profitable business but not necessarily a positive cash it changes depending on financing needs and favorable or unfavorable gap between the maturity proceeds and maturity payments.

To exemplify the above information was made following case study, the SC company Beta S.A. S.c. Beta S.A. is a publicly owned company.

The main products manufactured and marketed by the company are: HP and UHP graffiti steel electrodes, calcined petroleum coke, concrete blocks and cathode, calcined anthracite, electro, silicon carbide, Soderberg paste. Products produced by s.c. Beta S.A. are used primarily metallurgical year.

The balance sheet is made available on 3 consecutive years 2007, 2008 and 2009 and made a financial analysis based on balance, that the first phase of financial management, one based on balance sheet.

Balance sheet

- thousands Ron -

ASSETS	2007	2008	2009
Active service life > 1 year	23.213.513	30.411.481	55.608.627
Total Assets	23.213.513	30.411.481	55.608.627
Active service life < 1 year	77.482.839	64.482.929	60.564.872
Cash assets	503.976	824.677	93.807
House and bank accounts	503.976	824.677	93.807
Total	77.986.	65.307.	60.658.

Active assets	815	606	679
LIABILITIES	2007	2008	2009
Liabilities with maturity > 1 year	47.754.474	48.539.826	73.527.458
Equity	43.769.387	45.050.972	71.011.949
Debts that must be paid >1 year	3.228.301	2.733.555	1.926.671
Revenue in advance	756.786	755.299	588.838
Liabilities with maturity <1 year	53.445.854	47.179.261	42.739.848
Debts that must be paid <1 an	53.445.854	47.179.261	42.739.848
Total Liabilities	101.200.328	95.719.087	116.267.306

Tabel nr. 1

Further three indicators are calculated financial balance (in Table. 2)

Indicators of financial balance

Indicatorii	2007	2008	2009
NGWC	24.540.961	18.128.345	17.918.831
NWC	24.036.985	17.303.668	17.825.024
NT (Cash Flow)	503.976	824.677	93.807

Tabel nr.2

After calculations we can draw the following conclusions made: thus we see that, Global Net Working Capital Fund, determined by the balance sheet by subtracting permanent source of net fixed assets, positive values were registered during the 2007-2009 period analyzed. This means that the company can finance the whole stable means of sustainable resources, sustainable resource surplus funds

being used to fund cycle. On the other hand, positive working capital surplus revealed a potential short-term liquidity (current assets) to potential liability for short-term (current liabilities).

WCR (working capital requirements), calculated by subtracting the total current assets, non-cash assets but debt with maturity less than one year) înregistrează also positive throughout the period analyzed.

This means that temporary needs exceed temporary resources, with a temporary resource shortage. Given the scope of the company, but this situation is not favorable because it is financed from surplus to the needs of sustainable resources.

NT (Net Treasury) is the most meaningful expression of employment to show positive net eficiente. The treasury is not only sufficient to fund operating activities, but also to achieve a positive treasury to allow the holding of cash or cash make investments.

A positive cash means that now constitute financial investments from financial partners for an amount that exceeds the resources obtained from short-term financial partners. If the company "SC Beta SA, shows that positive net treasury from work done is emits a surplus of funding, but nevertheless fluctuate dramatically from one year to another.

Evolutions and Implications of the Convergence Indicators in Romania's Crisis Damaged Economy

Mihai Rebiga

*“A.I.Cuza” University Iași, Faculty of Economy and Business Administration
Email: rebigamihai@yahoo.com*

Abstract

The article aims to analyze the leading factors' in terms of monetary convergence within the European Union level evolution. Thus, it explores a number of specific indicators of which we could mention inflation, long-term interest rates, public debt and budget deficit, but the analysis also takes into consideration other indexes as well. Under these conditions it follows the impact produced by these changes in the Romanian economy in the past as well as their future influence in the economy in case they are marked in the limits required by the EU for new countries that wish to adopt euro as local currency.

Key words: Monetary policy, inflation rate, long-term interest rate, exchange rate, public debt, budget deficit

JEL Classification: M41, G01

1. Introduction

After the integration in the European Union, the next target for Romania is to achieve the Euro Area, and to adopt euro as currency replacing the Romanian leu. The problem is that in order to be included in this area, Romania needs to accomplish the convergence criteria. These are a little too restrictive, especially when thinking of the present economic crisis. During this article, the indicators concerning these criteria are analyzed by evolution and

implications.

The paper is structured as follows: Section 2 presents the evolution of inflation in Romania in 2005-2009 and the implications the captured changes had, along with some expectations for the period ahead. Section 3 examines the long-term interest rate, focused on its past developments and implications on the economy on the one hand and its current changes and future implications on the other hand. Section 4 studies the indicators included in the Public Finance criterion, from past to present, analyzing the expectations of public authorities and actual results recorded by the economy. Section 5, which concludes the analysis, brings to light a disturbing issue for some, but very present and real at the same time. It is better not to focus on achieving limiting objectives during economic crisis, reached by practicing restrictive policies, but it is advisable to practice other policies to encourage economic expansion. It is indicated to take into consideration restrictive measures to get closer to achieving the objectives set by the convergence criteria only after the crisis is past.

2. Price stability criterion – crisis source

Mugur Isarescu, governor of the Romanian National Bank outlined in his article “Nouă lecții din actuala criză financiară” as a prime crisis developing factor the low level of inflation, mentioning that the measures taken by Fed, in order to obtain price stability through increasing interest rates has had a high number of credits move to the subprime category. The fact that the low level of inflation coexisted with a high level

of liquidity in earlier periods seems to be the main source of this phenomenon, whereas a non-involvement of central banks' monetary policies would have led to high inflation, leading to crisis, while the measures taken, brought the economies on the brink of financial instability. A very important element in issue is the lack of solid regulations which have led to a risk accumulation performed by economic agents[2].

Under these conditions, the price stability criterion contained in the Maastricht Treaty, cannot be seen as a strong field in what regards convergence on a European scale, any more. It implies that a member state must have durable price stability and a medium inflation rate, calculated for the year before the examination, not higher than 1.5% of the arithmetic average of inflation rate in the three most advanced states in regards to price stability. From this perspective I've chosen to analyze inflation in Romania from 2005 until present. I will also analyze the prognosis made by the main authorities in this domain. The table below presents the inflation rate evolution in Romania compared to that of the top three states in this domain from the European Union.

Table no. 1 The inflation rate criterion in 2005-2009

EU State	Inflation rate(%)
2009	
Luxembourg	0.0
Belgium	0.0
France	0.1
Romania	5.6
2008	
Netherlands	2.2
Portugal	2.7
Germany	2.8
Romania	7.9
2007	
Malta	0.7
Finland	1.6
NL, FR	1.6
Romania	4.9
2006	
Finland	1.3
Poland	1.3
Sweden	1.5
Romania	6.6
2005	
Finland	0.8
Sweden	0.8
Netherlands	1.5
Romania	9.1

(Source: Eurostat)[7]

As it can be seen in the previous table, Romania has always been far from reaching this criterion. Even if in the years 2005 and 2006 this wasn't an objective, the measures taken by BNR were meant to attract part of the money supply in the banking system so as to limit inflation levels. In these two years, as a result of high interest rates, as we shall see in the next section, some controlling exchange rates, influenced mainly by foreign capital from Romanians working abroad and speculative capital coming from foreign banks which were trying to get a higher profit from using their capital.

In what regards the year 2007, on the same pathway, even the most optimistic specialists were taken by surprise by the registered price

massive capital injections have been performed, mainly with speculative purposes. Actually, in the anti-inflation policy applied in Romania, from the beginning there could be seen two directions: on one side there was price control through controlling the total amount of currency in relation to the totally quantity of goods, and on the other was price control through level indicator, the inflation level reaching the lowest value since the beginning of the post-December economy. Even under these conditions, the inflation level of 4.9% was bigger with far more than 1.5% than the average for the top three EU countries, which registered only 1.3%.

At the end of 2008, the financial crisis affected all the states in Europe, thus the average for this indicator reaching 2.6%. Even so Romania was more affected than other European states, and registering an inflation rate of 7.9%. This was mainly because of the end of the massive foreign capital injection. More so, the foreign banks, which used to pump money in the Romanian economy, in order to gain higher profits, saw themselves in difficulty due to the lack of liquidity which struck the economies of the countries they had their central headquarters in. As a result the main solution was to retreat the sums invested until that moment in other economies. As Romania had those sums as the main instrument for controlling the exchange rate and financing the economy, it saw itself in the situation where the liquidity crisis had worsened, and the exchange rate could not be controlled anymore. Under these conditions, even if the liquidities were limited, the inflation worsened. The lack of liquidity phenomena could be overcome by increasing the money circulation speed, based on the principle set by Irvin Fisher, which states that $M \cdot V = P \cdot Q$, where M stands for Money Supply, V stand for money circulations speed, P stand for Price levels, and Q stands for the quantity of good in the economy. Even so, the general tendency was to limit consumption, especially as the economy was confronting a high unemployment rate, caused by bankruptcy and dismissals. As a result, panic had led to a decrease in money circulation speed.

More so, the credit contracted by the Romanian state from FMI had led to new restrictions in public spending. Even if the capital injection had led, in some extent, to a drop in exchange rates for foreign currencies on the Romanian market, the restrictions in public spending had aggravated the economical situation. Instead of a coordinated expansionist policy coordinated on both monetary and fiscal pathways, the good parts brought in by BNR's policy were canceled because of an inappropriate fiscal policy partially imposed by the loan contracted from FMI. As a result, even if the year 2009 brought a lower level of inflation, and the policies practices by BNR were meant to encourage consumption, the state of imbalance at

a national level persisted. More so under the conditions in which the inflation rate in Romania reaches 5.6%, most of the EU countries register extremely low levels for this indicator, as it can be seen in the above table. Some EU states even register negative values for that indicator which could lead to some perturbations.

Regarding the entrance of capital, the Reinhart couple, show in their study "*Capital Flow Bonanzas: An Encompassing View of the Past and Present*", the fact that in times with high levels of capital entry, real PIB constantly has high levels, following that when the capital entry stops, PIB would register a sudden drop and then start to rise again making it possible to reach the previous top values in 3 – 4 years (Reinhart, C. M., Reinhart, V., 2008). Also, the real exchange rate drops in times with high capital entries, and rises suddenly in the year after the entries have been stopped, the national currency registering a depreciation and then ascending again 3 – 4 years after foreign capitals begin entering again. Taking this further, the low inflation rate registered before the shock, would register a quite sudden increase and will get back to normal values in the following years.

Taking this model, Mugur Isarescu, makes some forecasts in his article „Finantare si ajustare in economia Romaniei” which demonstrates that the reasoning is good, and the anticipative analysis fit in the charts. As a result, it is expected that the inflation rate will drop in the following periods[1], but I personally the anticipations a bit too optimistic. The inflation rate is dropping but maintain this trend depends on the policies deployed by authorities.

A very interesting analysis on this matter can be found in the Romanian Government's convergence program for the 2009 – 2012 interval, in which it is estimated, following this model, a decrease in inflation rate of 3.7% in 2010, 3.2% in 2011 and 2.8% in 2012[4]. These estimations are made mainly in anticipation to our joining the Exchange Rate Mechanism, event which is desired to happen in 2012. In what regards this mechanism, some specialists consider that joining it would offer both serious advantages and disadvantages. Of the advantages we could name a higher confidence in Romanian economy generated by a lower

currency risk[3]. Another mention worthy factor is inflation limiting. Taking part of a such mechanism imposes making use of inflation limiting measures, which generate trust in regards to the economy, both from the inside and the outside. At the same time, from the challenges we cannot ignore the fact the theexchange rate equilibrium level cannot be determined when prices are not yet totally adjusted, a fact which could generate negative effects on the economy in the future.

3. The interest rate convergence criterion – impact on the Romanian economy

According to the Maastricht Treaty, this criterion implies that the long-term nominal interest rate (10 years) should not exceed, the average interest rate registered in EU member countries (more than three) which shows the best results in terms of price stability by more than 2% in the year before the evaluation.

Even with Romania having joined the EU in 2007, I believe it is necessary to analyze the indicators' evolution starting with 2005. This was a year that we can consider the threshold, because starting this year, the Romanian National Bank changed its monetary policy, setting the main objective on targeting the inflation. It is interesting to examine how the central bank used the interest rate instrument as leverage in influencing the inflation and exchange rate. As mentioned in the previous section, with capital account liberalization and increasing interest rates, huge amounts of money began entering our country. Increasing interest rates came as an extreme measure for reducing the money in circulation. Some authors have heavily criticized the central bank at that time for its monetary policy, considering it the main culprit for the long-term crisis Romania faced. Among the main arguments mentioned were encouragement and stimulation of high interest rates, which, together with the taken measures regarding the obligations of commercial banks, had led to credit's choking[5].

I personally believe in the central bank's policy, although a good period of time the credit was discouraged due to high interest rates. The demonstration comes when analyzing credit's

evolution after the reference interest rate began dropping. We could see that most of them did not reach the economic agents in order to aid their investments and increase production, but the consumers in the form of consumer credit. In fact, the consumer credit was granted much too easy and with a very small check, becoming the main reason for the financial crisis spreading in our country.

Towards a better understanding of this phenomenon, it is necessary to follow the time evolution of interest rates and to make some mentions about the credit change in this range. The table below presents the registered data for the 2005-2009 period:

Table no. 2 The interest rate evolution in the 2005-2009 range

EU State	Interest rate
2009	
Luxembourg	4,23
Belgium	3,90
France	3,65
Romania	9,69
2008	
Netherlands	4,23
Portugal	4,52
Germany	3,98
Romania	9,69
2007	
Malta	4,72
Finland	4,29
Netherlands	4,29
Romania	7,13
2006	
Finland	3,78
Poland	5,23
Sweden	3,70
Romania	7,23
2005	
Finland	3,35
Sweden	3,38
Netherlands	3,37
Romania	6,99

(Source: ECB)[8]

As can be seen from the table above, the interest rates reach high levels in Romania during the analyzed period, values that are well above the average required in the interest rate convergence criterion. It is very important to take into consideration the high inflation as an explanation, indicator that gives us a lead to the lower limit of the positive real interest rates.

It is very important to end this section concluding that, although the interest rate is high, which creates a disadvantage in terms of our future accession to the Euro Area, it has important implications regarding the balance of payments deficit limit, especially as where most of the loans in Romania go to consumption, not domestic consumption but one that is satisfied by imported goods.

4. The public finance situation convergence criterion

This criterion is divided into two main objectives, both related to public administration. The first requirement is to limit the public debt to no more than 60% of GDP, or the ratio of public debt in the GDP to decline enough to be considered approaching the reference value at a satisfactory level.

In this sense, the public debt evolution in Romania between 2005 and 2009 is captured in the following table:

Table no. 3 The public debt evolution in the 2005-2009 range

Year	Public debt/GDP
2005	20.4%
2006	18.4%
2007	19.9%
2008	21.8%
2009	29.3%

(Source: The Romanian Ministry of Public Finance)[9]

As can be seen in the table above, this criterion is the only one that can be considered achieved so far. Thus, we can observe that the public debt is limited within the whole range of just below 30%. However, we should not

conclude that Romania recorded outstanding performance in this area, but rather that this criterion is not restricting enough, the maximum margin being very permitting.

The second direction the public finance stability criterion is set on is budgetary discipline and it states that the budget deficit is not to exceed 3% of GDP. From this perspective Romania was quite far from achieving its objective lately. A bad governance, based on data that is far from the reality in the budget drafting period, trying to forget everything about the crisis we are currently facing and betting on economic growth when it was not possible, made the budget deficit in recent years much bigger than targeted. Moreover, the Romanian Ministry of Public Finance's expectations presented in the convergence programs have been and still are very optimistic, as if trying to detach from the current economic reality. Thus, in May 2009 in the convergence program they were hoping for a 2009 budget deficit of 5.1%, 4.1% for 2010 and was expected to achieve the targets set by the criterion in 2011, reaching a level of only 2.9% in GDP. The Convergence Programme published in 2010 brings some changes, consisting of enlarged percents as follows: 2009 budget deficit of 8.0%, 2010 - 6.3%, while expectations for 2011 fell to 4.4%[4].

A key aspect in terms of public finance stability consists in choosing the normal way of intervention when facing an economic crisis. Thus, recession periods require tax measures designed to stimulate the economy. Under these conditions a lower level of taxation is indicated, leaving a higher disposable income to the population for consumption and, most important, investment. A proper intervention should also take into consideration the increase of the public expense rate, the aim being to influence the government consumption as a component of total consumption on the one hand, and encouraging the investments directly by public investment or indirectly through subsidizing the private sector on the other hand.

However, the main issue in Romania is reaching the limits imposed by the IMF in this blurred present. Thus, in times of crisis, measures such as mass layoffs, wage reduction

or limitation of consumption and public investment appear inadequate. But being constrained by the limitations of the convergence criteria on the one hand and the ones coming from the international institutions that accepted to loan the Romanian state on the other hand, the authorities can be understood more easily. However, when facing recession, the state should probably be more protective to its population. The budget deficit seems to be tolerable during economic crisis in order to help rebuild the private sector of the economy.

5. Conclusions

The conclusions are obvious at this point. Although Romania wishes to be included in the Euro Area, the benefits of the single European currency bring much less to the Romanian economy than the sacrifices needed to be made in order to achieve the objective. Our authorities should forget about the convergence criteria for the moment, focusing on how to help the economy regain its strengths and go back to the normal trend that we were on before the present crisis started ravishing the country. Never the less, the loan from the international institutions and the conditions imposed by them are not to be forgotten but I think the authorities could find other ways of reaching their targets without getting so many people fired. After all the welfare keeps a high public expense level without any productivity coming from the personal that got dismissed.

Farther more, a possible implementation of the single monetary policy could have negative effects on the Romanian economy at present, especially because the National Bank will not have the authority to intervene on the market to defend the national currency, inflation targeting and indirectly boost economy practiced by the credit policy. The most pessimistic version of the story is that of a national collapse following the shutdown of the NBR beneficial interventions.

Implications of the Current Financial Crisis on SME Sector in Romania

Roman Angela,
Ignătescu Valentina Diana
„Al. I. Cuza” University of Iași
aboariu@uaic.ro
valentinadiana.ig@gmail.com

Abstract

SME sector has an important role in national economies through its significant contribution to the creation of GDP and to increasing labour employment. The current crisis has seriously affected a substantial part of the SME sector in Romania, as in other world countries. Such an assessment can be explained by the fact that unlike large firms, SMEs are generally more vulnerable in times of crisis for several reasons, among which we mention: they can not reduce their size because they are already small, individually they are less diversified in terms of economic activities, have a weaker financial structure, they depend significantly on credit, have a lower credit rating, have fewer financing options due to limited access to financial markets.

This paper aims to highlight the main effects of the current crisis on SMEs sector in Romania, the main problems it faces, and some anti-crisis measures taken by national authorities and some international institutions.

Key words: crisis, SME sector, financial market, current crisis

JEL Classification: G01, M21

1. Introduction

According to economic literature and practice in different countries doesn't exist a universally accepted definition of the concept of small and medium sized enterprises. The definition of SMEs varies according to the international organization that aims through its mission to support SMEs in the Member States of the European Union, also varies according to the country and even the sector of activity. For example, according to the World Bank, a

firm is micro, small and medium if it meets at least two of the three following criteria: the number of employees; the asset value or the annual value of turnover, see Table 1 [5]. Global Financial Markets Department of the International Finance Corporation used as the criterion for size classification of SMEs the credit amount because some banks are unable to make reports taking into account the size of the enterprise.

„Table 1. World Bank definitions of MSMEs”

Firm size	Empl oyees	Assets (in USD)	Annual sales (in USD)
Micro	< 10	< 100,000	< 100,000
Small	< 50	< 3000,000	< 3000,000
Medium	< 300	< 15,000,000	< 15,000,000
Loan size proxies			
Micro	< 10,000 USD		
Small	< 100,000 USD		
Medium	< 1,000,000 USD (< 2,000,000 USD*)		

*for some advanced countries.

In the OECD publications and, in particular, in those of the Centre for Entrepreneurship, SMEs and Local Development there are used two definitions of SMEs, namely: national and regional definitions, and Eurostat definitions to ensure a degree of international comparability.

In the European Union the single market without internal frontiers and the interaction between national measures and those imposed by the European Union to support SMEs, required to establish a common definition for these companies. Thus, on April 3, 1996, the European Commission adopted a Recommendation (Commission Recommendation 96/280/EC of 3 April 1996), which established the first definition of SMEs; applied throughout the European Union. On May 6, 2003, the European Commission adopted a new definition of SMEs, taking into account the economic development of EU

countries since 1996. This definition came into force on January 1, 2005 (see Table 2) and is applied to all policies, programs and measures for SMEs launched by the European Commission [3].

„Table 2. European definition of SMEs”

Type of SME	Number of employees	Turnover (in EUR)	or	Balance sheet total (in EUR)
Medium	< 250	≤ 50 million		≤ 43 million (27 million in 1996)
Small	< 50	≤ 10 million		≤ 10 million
Micro	< 10	≤ 2 million		≤ 2 million

In Romania, from January 2006, the legislation on SMEs (Law 346/2004 on stimulating the creation and development of small and medium enterprises amended and supplemented by Government Ordinance no. 27 of 26.01.2006) is entirely harmonized with the Recommendation of European Commission nr.2003/361/EC.

The SME sector has an important role in a national economy by contributing significantly to its economic and social development. Such an assessment results from the following arguments [8]: SMEs generate most of the GDP of each country, usually between 55% - 95%; provide jobs for most occupied population; present the largest dynamism, aspect demonstrated by the evolution of their number, the volume of turnover and the size of employment, high sensitive than the large companies; they have a high degree of adaptability to market requirements due to their smaller size and the direct involvement of the entrepreneur in the current activities; offer professional and social fulfillment of a significant proportion of the population.

In the European Union, SMEs have a share of 99.8% in total business, generating 58% of the added value of the EU-27 economy and provide more than two thirds of total employment [7]. The significant importance of SMEs sector for the sustainable development of European economies has been recognized repeatedly by the European Union institutions, in particular by placing this sector in the center of Lisbon Strategy, especially since 2005, but also by adopting various measures to support and stimulate the development of SMEs. An extremely important moment in European

policy for SMEs is the adoption on June 25, 2008 the initiative called the Small Business Act (SBA), aimed at enhancing sustainable growth and competitiveness of European SMEs. Also, the Small Business Act propose, for the first time, the establishment of a comprehensive policy framework for EU Member States and aims at establishing irrevocably the principle “Think Small First” in policy development - from legislation to public services - and promoting the growth of SMEs by assisting them in solving problems which hamper their development [1].

The significant contribution of the SME sector to economic and social development of countries permits the assessment according to which the functionality and the performance of an economy are conditioned by its companies, mainly by SMEs.

This paper is structured as follows: the second section highlights the main consequences of the current crisis on SMEs sector in Romania, but also from other countries. Section three highlights the main synthetic steps taken to support small and medium sized enterprises. Our study ends with conclusions.

2. Analysis of the effects of the current crisis on the SME sector

The global economic crisis has dramatically changed the market conditions in which firms operate. The redemption of debts by the financial institutions increased capital costs and reduced credit availability, while the exchange rate adjustments have raised the price of imported inputs and exports become more competitive.

Even in "normal" economic conditions the governments have recognized that in order to survive and grow, SMEs need specific policies and programs, hence the full range of measures for SMEs in force in most countries of the world. However, now SMEs were particularly hard hit by the global crisis. These companies are now vulnerable for several reasons: in addition to traditional challenges regarding access to finance, which continues to apply, appear new capital supply difficulties.

It is important to note that SMEs are generally more vulnerable in times of crisis for several reasons, among which we mention: it is harder for them to reduce their activities since

they are already small; they are less diversified individual within their business; they have a weaker financial structure (eg. lower capitalization); they have a lower credit rating; they are strongly dependent on credit and have fewer financing options.

To examine the effects of financial crisis on SMEs in Romania, we consider the results of the investigation conducted by the World Bank Group entitled "The Financial Crisis Survey", which aims to measure the effects of financial crisis on firms. The first wave of survey covers six countries in Eastern Europe and Central Asia - Bulgaria, Hungary, Latvia, Lithuania, Romania and Turkey. The interviews for the survey on the financial crisis were conducted in June and July 2009 and took into account 1.686 companies. We consider this study by the World Bank as being relevant to our research because, as we observe in the table 3, over 60% of firms in the sample selected from those six countries are SMEs [11]. While only one third of the firms analyzed are large enterprises. Moreover, the data obtained in the study showed significant differences between the effects of the financial crisis on small and medium enterprises, on the one hand, and on large enterprises, on the other hand.

„Table 3. The composition of the sample analyzed in the study conducted by World Bank”

Country	No.	The composition of the sample depending on the firms size (in %)			
		Small	Medium	Large	Total SME
Bulgaria	150	47	35	18	82
Hungary	187	34	30	36	64
Latvia	226	36	31	33	67
Lithuania	239	39	34	27	73
Romania	370	30	36	34	66
Turkey	514	25	42	33	77

In addition to the questionnaires about the financial crisis, all baseline survey respondents were contacted to determine if the company was still active or have become inactive. Based on the responses were determined exit rates of the firms from the market in 2009 compared to 2008. These exit rates can be analyzed in figure 1 [2].

As we can see, the percentage of firms closed in 2008-2009 was highest in Turkey (5.79%), followed by Latvia (4.54%) and Romania (3.28%). Hungary is the country that

has not closed any firm in the analyzed period. If we consider the closed companies, insolvent and the ones impossible to locate, we see that the situation changes a little, Romania is on the first place with a rate of 17.59%, followed by Bulgaria (16.39%) and Turkey (15.57%). On last place is Lithuania with 4.35%.

„Figure 1. Exit rates of the firms in analyzed countries during 2008-2009”

The intensity of the effects of the financial crisis on the firms in the six countries examined has varied by country and sector. The drop in demand was the main effect of the financial crisis in all countries (as can be seen in Figure 2) [11]. The survey showed that about 75% of firms considered that drop in demand was the most important effect of the crisis. In Hungary and Turkey the drop in demand was slightly lower (70.3% and 71.3%), while in Bulgaria and Romania had higher values (78.12% and 78.47%).

Regarding the second effect of the financial crisis on firms the situation has not been the same in all countries. For example in Lithuania and Romania the second most important effect of the financial crisis on firms was considered the increase in debt level while in Hungary has been considered the increase in input costs. In addition, it was surprising to note that access to credit was considered the effect of the crisis with the greatest impact only by a small number of firms in all countries.

„Figure 2. The main effects of the financial crisis experienced by firms”

The effects of the crisis on firms were different not only across countries but also on other characteristics of firms. For example, in Romania and Lithuania a large proportion of companies with domestic capital say that debt increase was the second most important effect of the crisis than those with foreign capital. Moreover it seems that foreign capital firms were immune to this effect.

As a result of the financial crisis, the average decrease of sales in the analyzed period was significant in all countries, but higher values were recorded in Latvia and Lithuania (48.4% and 48). In Romania, sales dropped as a result of the crisis with 35.90%. In the six countries, financial crisis effect measured by the percentage change in sales was presented as an inverse relationship with firm size: large firms have reduced sales less than medium-sized firms and medium firms have reduced sales less than small firms. Thus firms with few than 5 employees experienced an average reduction of 36.7% of sales while larger firms have experienced a contraction in sales of 33.1%

Current liquidity constraint due to the manifestation of the financial crisis determined firms to increase the utilization of internal funds to finance their working capital. Another frequent response to current liquidity constraint was delaying tax payments to authorities and suppliers. Also, in response to financial crisis firms seek to restructure their debt.

Regarding loans granted to SMEs, as a result of financial crisis, has been a clear slowdown for various reasons. Because the credit crisis, banks have no access to long-term

funds from international capital markets, the parent banks or international financial institutions as were before the crisis. Funds are more expensive and riskier loans are due to higher chance of default. The slowdown of exports to the occidental markets and increasing unemployment is a sign that there is less demand for products of SMEs. Meanwhile, another important factor with major impact on SMEs is the situation of the real estate market which was also affected by the decrease in mortgage lending.

Focusing the research on Romania, we observe that the analysis realized by the National Council of Private SMEs in Romania on a sample of 1.099 SMEs in all industries, from all age groups and developing regions show that between October 2008 - March 2009, over half of SMEs (57.58%) reduced their activity and about 15% of firms went bankrupt (see Figure 3).

As shown in Figure 3 a significant part of the SME sector in Romania is strongly affected by the current crisis, also as are other countries around the world [8].

“Figure 3. The impact of the global economic crisis on the activity of SMEs from Romania during October 2008 - march 2009”

According to the National Trade Register Office, the number of firms which have suspended their activity in January-February 2010 increased more than four times over the same period of 2009. Thus, compared with January-February 2009 when have been registered 2.710 suspension of the activity across the country, from January to February 2010 there were 12,886 firms that have suspended their activity, so we observe an increase of 375.50% [9]. Therefore, in the context of the current crisis, the economic environment in Romania has deteriorated

significantly. As regards the SME sector, the main problems facing by firms in the context of the current crisis are mainly low domestic and external demand of goods and services, late payments from customers, increased cost of bank loans, tighter bank lending standards.

3. Measures adopted in the context of the current crisis to support the SME sector

In the context of the current crisis, worsening macroeconomic imbalances led national and international authorities to take meaningful steps to restore macroeconomic stability and ensure economic revival. In this regard, the biggest investors and multilateral lenders in Eastern Europe, the European Bank for Reconstruction and Development (EBRD), EIB Group and World Bank Group, had to pay up to 24.5 billion euro to support banking sector in the region and to finance lending the firms affected by global economic crisis. This initiative completes national anti-crisis responses and support the real economy through lending by private banking groups and it's particularly addressed to small and medium enterprises.

Deteriorating the business environment in Romania has imposed, as well as in other states, the adopting of a set of anti-crisis measures from the Government [4], including: non-taxation of reinvested profits, the possibility of compensation of recoverable VAT with payable VAT, outstanding deferred payment obligations to the state budget, state aid, support for export production by guarantee and indemnity (in particular, by Eximbank), CEC Bank and Exim Bank capitalization to support SMEs, the establishment of the Contragarantations Loan Fund for SMEs, improving the investment law, including by reducing the amount of investment eligible for facilities from 50 million to 10 million Euro, etc.

In order to relaunch the Romanian economy and, directly, the resumption of bank lending, the central bank reduced interest rate monetary policy and bank reserve requirement rates. However, deteriorating ability to pay the bank customers, especially SMEs, still causes negative economic outlook for banks to be reluctant to grant credit.

Shortly after the outbreak of the crisis, the EBRD granted a loan of 100 million to Transilvania Bank. The loan, which was paid in full in December 2008, aimed at helping the client to continue to provide loans for small businesses. With a total of over 125,000 SME customers, BT is perceived as "the SME Bank" in Romania, with an estimated 18% market share in terms of SME financing. In March 2009 the EBRD granted the same amount of money and credit to another Romanian bank, Romanian Commercial Bank, which represents another form of credit lines for SMEs.

4. Conclusions

SME sector is one of the main pillars of national economies through the significant contribution on creation of GDP and significant contribution to increasing employment. The significant contribution of the SME sector to economic and social development of countries permits assessment that the functionality and the performance of economies are largely conditioned by the development of this sector.

In the context of the current crisis, a significant part of the SME sector in Romania is strongly affected, as also in other world countries. The effects of the current crisis on SMEs business is are primarily a significant decrease of the revenue, the reduced opportunities to enter on new markets, reduced access to finance and thus reduce opportunities to develop and even to survive.

The deterioration of international and domestic economic environment has resulted in new barriers to the way that SMEs conduct their activity, including, primarily, the decreased domestic and external demand of goods and services, late payments from customers, significantly reducing access to credit, due to increase their costs and tighter bank lending standards.

Given the central role of the SME sector in the national economy, national authorities, European Commission and some international organizations have adopted a range of anti-crisis measures, to support the SME sector. However, restoring the normal functioning of the sector, including the national economy depends significantly on how are implemented the measures, but also on the cooperation

between authorities and institutions involved in coordinating and supporting SME business.

Abstract

Through our study we wanted to find out to what extent the economic agents comply with some of the requirements for the disclosure of information in the individual annual financial statements, formulated in the Accounting Regulations in Compliance with Fourth Directive of the EEC (approved by the Order of the Public Finances Minister no. 1752/2005 with subsequent amendments), to bring some clarification and to make proposals for improvement in the current accounting regulations, in order to help the preparatory of financial statements and to improve the quality of the information necessary for the users of financial statements in making decisions.

Key words: financial statement, profit distribution, debt, financial position

JEL Classification: M4, M41

1. Introduction

It is known the fact that one of the objectives of accounting, in the area of practical or applied accounting, is to provide necessary information for fairly presentation the financial position, financial performance and other information related to unrolled activity (article 9 from the Accounting Law no. 82/1991, republished in 2008). Achieving this objective is, according to some authors, “a performance criterion of accounting, the accuracy of message contained in the information offer of the *accounts science*” [1].

Regarding the information which must be reported in the *Balance Sheet* and *Income Statement* (the format of Balance Sheet and

Income Statement can be found at the articles 22 and 23, respectively 37 from the Accounting Regulation in Compliance with Fourth Directive of the EEC approved by the Order of the Public Finances Minister no. 1752/2005), this is presented, entities being required to meet a certain format, a standardized one, using a software provided by the Ministry of Public Finance. Also, regarding other two components of the financial statements, the *Changes in Equity Statement* and *Cash-Flow Statement*, we can make the same remark, entities using example models from the accounting regulations, without a standard structure electronically available. It remains to be seen whether this information properly reflect the financial position and financial performance of the reporting entity or, in other words, if it presents “the accounting truth”. This depends on the extent which compulsory provisions from accounting regulations are respected, during the financial year and the reporting period closing works and the manner which, using the professional reasoning, within the regulatory framework, the appropriate accounting policies are established and applied.

For information presented in the financial statements be reliable, it must meet, among the others, the condition of completeness. Or, to achieve this, the accounting treatment applied must be presented in the *Explanatory Notes to the Financial Statements* in its entirety. Therefore we intend to find out to what extent certain information required to be presented in the notes to the financial statements is related by a number of economic agents.

As is known, the *Explanatory Notes to the Financial Statements* provide information about: *accounting regulations* which stand at the base of the annual financial statements preparation; *accounting policies* applied by the entity; *additional information*, relevant to the users' needs of adequately understanding the financial statements, information that completes and explains the data contained in the properly financial statements. Concerning the presentation in the explanatory notes of the first two categories of information (about the *accounting regulations* and *accounting policies*), the results of our study are subject to other articles. In this article we intend to address only issues related to *additional information*.

2. The objectives of the study and the documentation base

Related to the *additional information*, relevant to the users' needs of adequately understanding the financial statements, information that completes and explains the data contained in the properly financial statements, we tried to find out to what extent:

- the entities present information on the historical cost when they practice the revaluation of tangible assets;
- the entities report by segments the achieved turnover (by categories of activities, by geographical markets);
- the entities recognize extraordinary revenues and expenses and, if so, to what extent they offer explanations about their nature and size;
- the entities offer explanation about the nature and size of the deferred revenues and accrued expenses;
- the entities classify and present the debts and claims according to the exigibility, respectively the liquidity, in appropriate mode;
- when the result at the end of the reporting period is profit, the entities present its destinations and when the result at the end of the reporting period is loss, the entities present its coverage sources.

To meet the previously mentioned objectives, through our study we examined the annual financial statements from a number of 12 entities listed on the Bucharest Stock Exchange, entities from different regions of Romania.

We considered that the results of our study would be most relevant if we analyze the

financial statements of some listed entities, which, as is known, give a greater attention to the consequence that the financial information disclosure might have, than analyze the financial statements of small companies, which are especially interested in the tax implications of unrolled activity rather than the quality of the information presented for different categories of users, or the attraction of new investors.

All the entities studied are listed on the Bucharest Stock Exchange on tiers I and II. Also, we believe it is important to know what accounting regulations were applied by the entities studied until December 31, 2005, respectively before the application of the Accounting Regulations in Compliance with European Directives approved by the Order of the Public Finances Minister no. 1752/2005. All the entities applied the Accounting Regulations Harmonized with Fourth Directive of the EEC and with the International Accounting Standards approved by the Order of the Public Finances Minister no. 94/2001. We didn't include in the study entities that until December 31, 2005 applied the Simplified Accounting Regulations Harmonized with European Directives approved by the Order of the Public Finances Minister no. 306/2002.

Selected entities belong to different areas of the economy: trade, construction, industrial manufacturing, repairs - maintenance, handling, transport and others. Concretely, the activity of these is represented by: the wholesale trade (of computers, peripheral devices and software; of metals and metal ores); the building of ships and floating structures; the manufacturing of various products (pesticides and other agrochemical products, plates, sheets, tubes and plastic profiles; paints, varnishes); the handling of crude oil, mineral oil products, petrochemical products, liquid chemical products and other finished goods or raw materials for import, export, transit; the production of ferrous metals in primary forms and ferroalloys forms, parts and accessories for motor vehicles and engines; the electricity transmission and others.

The necessary data for making judgments over the aspects treated in the study we made are presented in the following table:

Tabel no. 1 The disclosure of additional information

Clasa Categorie	Obiective	1	2	3	4	5	6	7	8	9	10	11	12
1	Informații de detalii necesare pentru prezentarea în perioada							X	X	X			
2	Informații privind reevaluarea activelor	X	X	X	X	X	X	X	X	X	X	X	X
3	Informații privind reevaluarea activelor	X	X	X	X	X	X	X	X	X	X	X	X
4	Informații privind reevaluarea activelor	X	X	X	X	X	X	X	X	X	X	X	X
5	Informații privind reevaluarea activelor	X	X	X	X	X	X	X	X	X	X	X	X
6	Informații privind reevaluarea activelor	X	X	X	X	X	X	X	X	X	X	X	X
7	Informații privind reevaluarea activelor	X	X	X	X	X	X	X	X	X	X	X	X
8	Informații privind reevaluarea activelor	X	X	X	X	X	X	X	X	X	X	X	X
9	Informații privind reevaluarea activelor	X	X	X	X	X	X	X	X	X	X	X	X
10	Informații privind reevaluarea activelor	X	X	X	X	X	X	X	X	X	X	X	X
11	Informații privind reevaluarea activelor	X	X	X	X	X	X	X	X	X	X	X	X
12	Informații privind reevaluarea activelor	X	X	X	X	X	X	X	X	X	X	X	X

3. The presentation of the information on the historical cost for the revaluated assets

Analyzing the options of the economic agents for the revaluation of tangible assets or their keeping at historical cost, we found out that all the entities adopted the revaluation value as an alternative to historical cost (they made revaluations) at one time or another, for certain categories of tangible assets, on their own initiative or due to a legal obligation. But only in 25% of cases we met a *presentation of the information both to the revaluation value and the historical cost for revaluated assets*.

The absence of the information on the historical cost for revalued assets could be justified by the impossibility of obtaining it by the entities without great efforts, at least for those economic agents who were set up before 1990 and still functioning. For many assets these entities may not have such information, being given the fact that in the 1990-2000 period there were made repeated revaluation required by a series of regulations, justified by the price changes that occurred either due to price liberalization in the economy or the effect of inflation. Such revaluations were imposed by:

- Government Decision no. 945/1990, on the inventory and revaluation of the patrimony of state economic units;
- Government Decision no. 26/1992, on the revaluation of some assets and liabilities as a result of the unification of the exchange rates of the Romanian leu and prices and tariffs in these circumstances;

- Government Decision no. 500/1994, on the revaluation of tangible assets and the share capital change;
- Government Decision no. 983/1998, on the revaluation of buildings, special buildings and lands.

We mention that the manner of reflecting in accounting for the revaluation differences, imposed by the above mentioned regulations, was different from one period to another: either by increasing reserves, either by inclusion in the share capital, or by reflecting revaluation differences.

After the year 2000, there were issued regulations allowing entities, so not imposing them, to make the revaluation of tangible assets, namely:

- Government Decision no. 403/2000, on the revaluation of tangible assets;
- Government Decision no. 1553/2003, on the revaluation of tangible assets and setting input value for fixed assets.

4. The presentation of detailed information about the turnover, extraordinary revenues or expenses, deferred revenues and accrued expenses

Entities are required, as long as the categories of activities and the geographical markets substantially differ from each other, to provide *detailed information on turnover*. At the economic agents we studied, the situation is as follows: 83.33% of them, respectively 10 from 12, make a detailed presentation of the turnover by categories of activities (or products) and geographical markets, sometimes distinguishing the domestic turnover from the export turnover (41.67%), or only by categories of activities (25%), respectively only by geographical markets (16.66%).

None of the entities recognized in the Income Statement *extraordinary revenues or expenses*, and therefore, we can't discuss about the presentation of detailed information in the explanatory notes related to their value and nature.

Regarding the *deferred revenues and accrued expenses* we relate the following: in the Balance Sheet there are deferred revenues for 75% from the entities (9 from 12), only 33.33% of them (3 from 9) presenting information about the value and nature of

these in the explanatory notes, and there are accrued expenses for all the entities, only 16.67% of them providing information about the value and nature of these in the explanatory notes. The requirement of presenting such aspects in the notes is for the cases when such information is material in evaluating the results. Obviously, such elements will affect the results of future years, but equally, the indicators determined in the Balance Sheet, which characterizes the financial structure, liquidity and solvency of the entity. Therefore, as long as deferred revenues and accrued expenses have a maturity that exceeds 12 months, we consider necessary that economic agents present them detailed by maturity.

5. The presentation of the debts and claims according to the exigibility term, respectively liquidity term

Romanian regulator requires that entities make a *presentation of the debts and claims according to the exigibility term, respectively liquidity term*, creating in this respect an example model for an explanatory note (Note 4 *Statement of claims and debts*).

We found out that all the entities studied comply with this requirement of disclosure. However, we met some situations where the preparatory of the financial statements do not fit just properly some of the claims or debts according to the liquidity term, respectively the exigibility term. For example:

- at the debts category, the payable dividends older than one year (from 2005-2007 period) are reported as having an exigibility term within 1 and 5 years (instead be presented according to the future maturity, they are presented according to their oldness);
- at the claims category, the receivable VAT is reported as having a liquidity term which exceed 1 year.

6. The proposal for accounting profit distribution or loss cover

In compliance with the Accounting Law, the annual financial statements must contain, among the others, *the proposal of distribution of accounting profit or coverage of accounting loss*. Accounting Regulations approved by the Order of the Public Finances Minister no. 1752/2005 (point 258) also mentioned that “in the

explanatory notes must be separately presented the proposal of distribution of net profit by destination, like this: a) the amounts distributed to reserves, b) the amounts distributed for covering the losses from previous years; c) dividends; d) other distributions”. In this respect, the regulator built an explanatory note model, Note 3 *Profit distribution*, which contains the possible destinations of the profit. In order not to leave out the case when the result for the reporting period is a loss, in the content of the same explanatory note model is made a mention, through a footnote attach to the title, as that “in the case of covering the retained accounting loss will be presented its coverage source”.

Regarding the result for the reporting period, we find out that 75% from the entities studied (8 from 12) register a profit and 25% a loss. The information on profit distribution is appropriate presented by only 50% entities (4 from 8) which register profit. The others (50%) consider “*net profit to be distributed*” only the part allocated to legal reserves, the part which remain being considered “*undistributed profit*”. One of those latter entities present, however, within the same note, but bellow the model created by the regulator, the proposals for profit distribution, while the others merely make a mention in the following manner: “the distribution of the profit from the year 2008 will be decided by the General Assembly of Shareholders in 2009”; “the distribution of the profit is registered in accounting by destination after the approval of annual financial statements”; or “at the General Assembly of Shareholders whose date will be settled in the future will be discussed and submit for approval the Balance Sheet for the reporting period ended on December 31, 2008, including the manner of distribution of net profit”. This latter entity presents, in addition, information on the distribution of the previous year profit, in compliance with the approval of the General Assembly of Shareholders.

In the model created by the Romanian regulator for an explanatory note on the distribution of profit appear the next two terms “net profit to be distributed” and “undistributed profit”. Some of the preparatory of financial statements instead of understanding through the “undistributed profit” the part of profit which distribution is

proposed to the general assembly to be deferred, understanding it as the part of profit which no allocation was register in the accounting at the end of the reporting period (at December 31, N, using the account 129 “Profit appropriation”) and which the distribution will be reflected in the accounting after the approval of financial statements (in the year N+1). In these circumstances, at the “net profit to be distributed” instead of appearing all the destinations which the approval is proposed, there are appearing only the amounts allocated for the legal reserves. Perhaps the preparatory of financial statements is taking into account the correlation between the “undistributed profit” from the content of this *note* and the value to be transferred at the beginning of the next year from the account 121 “Profit or loss for the period” to the account 117 “Retained earnings”. Therefore, it is necessary a clarification for consistently use the notion “retained earnings”.

None of the entities which the result at the end of the year is loss present its coverage sources. The information about the coverage sources of the loss couldn't be presented maybe for the reason that between the explanatory notes models there is none with this destination. This assertion is based on our next issue: analyzing the extent to which current models of explanatory notes indicated by the Romanian regulator are used, we found out that all the entities studied presented information, even if not completely, in all the 10 explanatory notes to the financial statements. We believe that, if the regulator had created a model for an explanatory note called, eventually, “Loss coverage”, indicating the covering sources for the loss (retained earnings, reserves, premium related to capital, share capital), certainly the entities which register a loss would have respected the requirement of presenting the information over the covering sources for the loss. An additional argument in favor of the above assertion is also the attempt of the preparatory of financial statements to adjust the model created by the regulator in the following manner, not very successful:

Figure no. 1. Note 3 Profit distribution, prepared by S.C. „X” S.A.

note 3		- Fin. -
Profit distribution		
Destinatia	Valori	
Net loss	1.092.795	
- share reserves		
- legal reserves		
- accounting loss covering		
- profit participation dividends		
Net loss	1.092.795	

Another problem related to the distribution of the profit is that concerning the part of the result which is going to be allocated as *profit share payable to employees*. Although the profit share payable to employees is (article 1, paragraph 1, letter e from The Government Ordinance no. 64/2001) one of the destinations of the accounting profit that have remain after the deduction of the income tax (i.e. net profit), through the Order of the Public Finances Minister no. 128/2005, is indicated, for its accounting treatment, the creation of provisions. We should mention that, since January 1, 2010, the same accounting treatment is prescribed also by the accounting regulations which apply to the economic operators (approved by the Order of the Public Finances Minister no. 3055/2009, regulations which replace previous ones approved by the Order of the Public Finances Minister no. 1752/2005 with subsequent amendments), in the following way: in the financial statements for the year which profit share payable to employees is proposed, its equivalent value is reflected as a provision, the expense being a result of the employee service (point 191, lines 2 and 3).

Two from the economic agents studied made this kind of distributions. In both cases, the preparatory of financial statements had a dilemma, namely: where should be presented in the financial statements such a distribution of profit? Obviously, as long as it is suggested that the registration in accounting be made by the rule available for the provisions, such values should be presented in Note 2 *Provisions* not in Note 3 *Profit distribution*.

The entities we analyzed present the information both in Note 2 and Note 3. But to present this information in Note 3 they proceed to a recomplition of distributed net profit with the value allocated to the employees for their participation in profit, which create a discrepancy between net profit

for distribution (Note 3) and net profit presented in the first two components of the financial statements, Balance Sheet and Income Statement.

Using the judgment, certainly a value can't simultaneously represent a distribution of net profit and an expense. It appears, therefore, a contradiction in the accounting regulations. If it is considered that such an obligation results from the employee's service, for an unitary regulation to these issues, it should be amended the regulation on "profit distribution of national societies, national companies and companies with integral or majority state capital, and autonomous companies", so that employees' participation in profit do not appear between the destinations of "accounting profit remaining after deduction of income tax". An additional argument can be represented by the need to ensure a certain consistency in presenting the information in some documents that serve, among the others, to the analysis of economic and financial indicators. In the revenues and expenses budgets, documents which reflect the obligation engaged and established by the entity for profit participation, the employees' participation in profit does not appear on the expenses side, but represents one of the profit destinations.

7. Conclusions

Studying the compliance of the information presented by various entities with the requirements of accounting regulations for the individual annual financial statements preparation and presentation, the results lead us to the conclusion that there is a certain "distance" between accountant regulator who prepares regulations, and accountant professional (practician) who apply (must apply) them.

Therefore, we consider that still must be made some efforts both directions which ensure the preparation and presentation of some quality information necessary for the users (financial statements preparers and regulation bodies). Accountant professionals must continuously improve their professional preparation, disposing in this way of an appropriate framework within international body related to international orientations – however the will, effort and personal exigencies are very important – and to pay the appropriate attention and importance to the application of accounting regulations, to the quality and the presentation form of the information prepared. Accountant regulators must concern with improving accounting

regulations, on the one hand, in order not to "confuse" accountant professional by misunderstandings which may arise from their manner of formulating these, and secondly, establish an appropriate framework necessary to achieve reliable and relevant information, comparable at European and international level.

Extending the Cost Calculation by Allocating Fixed Expenditures Using the Direct-Costing Method

Prof. Univ. Dr. Ruse Elena
Spiru Haret University

Faculty of Accounting and Financial Management
Email: iatan_e@yahoo.com

Abstract

Estimating future costs helps the manager understand how costs evolve, influencing his decision to develop a business strategy.

Costs react differently to changes in production volume or in a business in general.

There are costs that vary with the volume of production or with development, while others remain fixed regardless of the changes in the volume of activity. Between these extremes we can find costs with their characteristics (variable costs and fixed costs). The type of analysis used in the costs evolution is related to the method of calculation (the total cost analysis or determining the unit cost). The emergence of a calculation method that allows the rapid determination of the production cost but it also helps to establish indicators with a broad spectrum of information needed to ground the decisions for the effectiveness of a business led to the Direct-Costing method. The Direct-Costing method based on regrouping the production costs in variable costs and fixed costs, allows the obtaining of a partial cost, fixed costs being spread over the outcome. Using an improved version that allows the allocation of fixed costs on products plays a key role in the decision making process of the enterprise, leading to a better prediction of both the activity as well as of the outcome which allows choosing the optimum version.

Key words: direct-costing method, costs evolution, business strategy, enterprise

JEL Classification: M4, M41

1. The conceptual framework of the Direct-Costing method

Estimating future costs by developing a budget helps the manager understand how costs evolve, with influence on the

development of a business strategy.

Costs react differently to changes in production volume or in a business. Some costs vary with production volume or with development, others on the other hand remain fixed regardless of the changes in production volume. Between these extremes there are costs that show the characteristics of both variable costs and fixed costs. The costs evolution depends on the type of analysis used, if the total costs are analysed or if the unit cost is determined. The emergence of a calculation method that can ensure the fast determination of the production cost, which can allow setting some indicators with a broad spectrum of information, needed to substantiate decisions, led to the Direct-Costing method. The Direct-Costing method involves attributing to products only variable costs and not fixed costs (these costs will be planned on a global level and will not be included in the cost of each product). Using the Direct-Costing method means determining the overall profitability or for different types of businesses and then determining the cost for each product. For each product the gross profit contribution or the variable costs margin will be determined. Taking into consideration the limits of determining a partial cost, this option may not be a sustainable solution since it does not create the necessary framework for determining the total cost of the product.

2. The improved version of the Direct-Costing method by allocating fixed costs to products

A studied version is that of allocating fixed costs based on the gross contribution to profit.

An attempt was made to allocate fixed costs having as an repartisation criterion the volume of sale achieved.

Applying the version mentioned involves following these methodological steps:

Step 1. Regrouping the costs from section 1 and 2 into variable costs and fixed costs.

- separating variable costs into:

- variable production costs;
- variable sale costs.

Step 2. Determining the partial result 1 by eliminating from the total sale volume the variable production costs.

Step 3. Determining the partial result 2 by removing from the partial result 1 the variable sale costs.

Step 4. Determining the distribution percentage, by sale volume, of fixed costs for each section on products for that section.

Thus, the percentage of allocation of fixed costs per section can be calculated using the formula:

$$\%CF_{\text{section}} = \frac{CF_{\text{section}}}{\text{Sale}_{\text{section}}} \times 100$$

The percentage from which the fixed costs of section 1 are allocated, depending on sale volume is:

$$\%CF_1 = \frac{CF_1}{\text{Sale}_1} \times 100$$

The percentage from which the fixed costs of section 2 are allocated, depending on sale volume is:

$$\%CF_{II} = \frac{CF_{II}}{\text{Sale}_{II}} \times 100$$

Step 5. Determining the share of fixed costs per section, relating each product from the section (the product between the distribution percentage of the section and the sale volume corresponding to the product from that section).

The share of fixed costs per section is calculated using the formula:

$$\text{Share } CF_{\text{section}} = \%CF_{\text{section}} \times \text{Product Sale}_{\text{section}}$$

- For section 1:

$$\text{Share } CF_1 = \%CF_1 \times \text{Product sale}_1$$

- For section 2:

$$\text{Share } CF_{II} = \%CF_{II} \times \text{Product sale}_{II}$$

Step 6. Determining the gross contribution to profit of each product from the section and also the total for the section (partial result III). The contribution per product is obtained from the difference between the gross contribution to sale profit of each product from the section and the share of fixed costs of that section, the

two being allocated to the products of that section. The gross contribution to the total of the section is the sum of the gross contributions on the products of that section.

Step 7. Determining the distribution percentage according to sale volume, fixed costs of the group formed by section I and section II, on the products included in this group.

The allocation percentage is calculated using the formula:

$$\%CF_{\text{group}} = \frac{CF_{\text{group}}}{\text{Sale}_{\text{group}}} \times 100$$

Step 8. Determining the fixed costs share of the group, for each product from the group, by multiplying the allocation percentage of fixed costs of the group with the sale volume for each product from the group.

Thus the fixed costs share can be calculated using the formula:

$$\text{Share } CF_{\text{group}} = \%CF_{\text{group}} \times \text{Product Sale}_{\text{group}}$$

In this step the fixed costs of the group of sections are allocated to the products manufactured in this group.

Step 9. Determining the final result at the group of sections level as well as at the level of each section and product.

The final result is obtained as the difference between the gross contribution to the profit, for each section, allocated to the products from that section, and the share of fixed costs of the group of sections allocated to the group's products.

Step 10. Determining the unit cost per product as the ratio between total costs (variable total costs + fixed costs) and the quantity of product obtained.

Covering fixed costs in the improved version of the Direct-Costing method has as an allocation criterion the sales volume.

Following the successive elimination of variable costs and of fixed costs from the sales volume, the final result was obtained both on the product as well as on the total section group, allowing a more detailed analysis of the profitability of production corresponding to any product from the two sections analyzed.

Calculating the allocation of fixed costs per product by sale volume for the group of sections consisting of section I and section II:

Table 1. Allocation of fixed costs

Indicators Products	-	-	Step 2	-	Step 3	Steps 4 și 5		Step 6	Steps 7 și 8		Step 9
	Sale volume	CHVP	CBPP (I)	CHVD	CBPD (II)	CFS		CBP (III)	CFG		Final result

Total group	978510	589245	389264	81973	307290	106203	-	201087	35207	3,6	165880

Where:

- CHVP = variable production costs;
- CBPP(I) = gross contribution to profit from production (the 1st partial result obtained after eliminating the variable production costs from the total volume of sales);
- CHVD = variable sale costs;
- CBPD(II) = gross contribution to profit from sale (the 2nd partial result obtained after eliminating the variable production and sale costs from the total volume of sale);
- CFS = fixed section costs;
- CBP(III) = gross contribution to profit at a section's level (the 3rd partial result obtained after eliminating the fixed costs of the section from the gross contribution to sales profit);
- CFG = fixed sections group costs.

Using this version has a critical role in decision making process of the enterprise because it leads to a better forecasting of production activity, as well as of the result which leads to choosing the optimum version knowing that the determination of contribution is closely linked to the sale prices variation and to the variable costs.

During it's operation, there are a number of restrictive factors acting on the production process, factors which can influence the outcome of activity in a given period. When a factor is limiting the business, the company must increase the size of contribution. This can be achieved by calculating the average contribution of the key factor and the version that leads to the highest average contribution corresponds to a maximum total contribution.

The IPO Underpricing Phenomenon – An Analysis of the Romanian Capital Market

Phd. Sandu Diana Ramona

diana_ramona_sandu@yahoo.com

Abstract

Why companies give up to substantial sums of money when, during an Initial Public Offer (IPO), they sell securities at a lower price, compared to the one obtained at the end of the first trading session, is an intensely debated question in the literature. After we systematize the main theories that explain the underpricing behavior, according to last relevant research, the paper objective is to analyze the domestic capital market in order to identify the level of the studied phenomenon. Using the adjusted initial return for the successfully closed IPOs, we measure the underpricing level and offer an interesting view to investors and companies.

Key words: underpricing theory, domestic capital market, investors, company

JEL Classification: G14, G11

1. Introduction

When a company decides to become opened to investors by carrying out an initial public offer, managers and shareholders are aware of the important changes associated with this step. The decision is complex, with many implications and aspects (to whom should the company offer its shares, what should be the offer price, when is the right moment to go public, how and in what volume should the issuer allocate the shares to investors). The level of the offer price is a key factor and has become a controversial topic of literature because of its major market implications.

We assume that, as IPO underpricing phenomenon is a global one, the Romanian capital market has also a certain degree of IPO underestimation. According to economic literature, one of the major factor related with

this phenomenon is the level of investors optimism. However, we are aware of the changes in investor behavior along with the financial crisis and the weak confidence in investment environment. This is why we anticipate a certain change in the Romanian IPOs appreciation, especially after 2007.

2. Overview of major underpricing theories

Reality proved that, in most cases, the shares sold to investors through IPOs are offered at a reduced price or at an *underestimated* one, while substantial increases in their price occur on the first day of trading. The phenomenon is known in literature as the *IPO underpricing*. Moreover, specialized research recorded changes in this practiced form of *discount*: 21% in the 60s, 12% in the 70s, 16% in the 80s, 21% in the 90s and 40% between 2000 and 2004 [9].

Among the first observers of the underpricing phenomenon we can mention researchers Stoll H. and Curley A. (1970), Logue D. (1973), Ibbotson R. (1975). The phenomenon proved to be a global one, primarily in the IPOs belonging to companies with effective operational activity.

Theories attempting to explain this phenomenon, expensive for the issuer, at a first sight, are grouped into four categories:

- Theories of information asymmetry;
- Theories focused on institutional reasons;
- Theories related to the right of control;
- Theories focused on the investors behavior.

In the first group of theories regarding the *information asymmetry*, one of the three major parties involved (the bank, the issuer, the investor) has access to more information than the other two. Thus, if the bank is holding an internal piece of information, it

will use it for underestimate the shares in order to boost the demand [1]. According to other opinions, the issuer is more informed about the real value of shares and uses the underpricing to signal the market and attract investors [17]. Specifically, issuers with poor performance shares seek to sell them at an average price. To distinguish from them, the good issuers try to sell their shares at a lower price, in order to transmit a signal, hoping that their sacrifice will be recovered through future appreciation of shares or future issues.

Interestingly, the underpricing signal is stronger than the one provided by donations or advertising.

Researchers Michael R. and Shaw W. (1994) reject the signaling theory and argue that some issuers voluntarily wish to give investors a good feeling by giving up to a part of their potential funds.

Informational asymmetry becomes in more cases the "winners curse" for investors [13]. Thus less informed investors receive shares in the oversubscribed but not performing IPOs, while those better informed receive shares from the less subscribed but performing IPOs.

Researcher Baron D.P. (1982) provides an explanation for the underpricing phenomenon using the *theory of agent*. This time, the issuer is less informed, but in the relation with the intermediary agent, not compared to investors. To motivate the intermediary agent in the distribution of shares, the issuer will accept a price reduction because a continuous monitoring is expensive.

Theories focused on institutional reasons argue that the underpricing phenomenon is preferred to avoid possible future complaints from shareholders relating to future bad performance of initial public offerings [6].

However, Drake P. and Vetsuypens M. (1993) conclude that IPOs that were the subject of complaints to lawcourts offered a high degree of underpricing, but did not eliminate the lawsuits risk. Furthermore, Ritter J.R. and Welch I. (2002) consider that the argument of avoiding future lawsuits is not robust enough to explain the underpricing phenomenon, maybe just in a small degree.

Theories related to right of control claim that once the company becomes public, the control right must be separated from the property right. When the separation is incomplete, conflicts between the third-party owners and managers

are imminent. Two models attempt to provide explanation for underpricing, but from different perspectives. Brennan M.J. and J. Franks (1997) suggest that underpricing is a defensive form of managerial control in order to avoid oversight by too many shareholders. Stoughton N.M. and J. Zechner (1998) argue that IPOs underpricing practice tries to minimize costs and encourage monitoring.

According to *theories focused on the investors behavior*, the irrational buyers rise the share price or issuers do not put enough pressure on banks to cooperate, in order to reduce the level of underpricing.

Most opinions converge to the idea that the underpricing phenomenon, identified on a high level during Internet Bubble, is explained by the increased optimism of investors, who wanted to buy big amounts of securities offered through IPOs, especially in the first day of trading, which automatically led to an important difference between the offer and closing price. In time, however, investors accumulate new information, the excess of optimism is replaced by rationality and they stop paying more than the real share value. The share price goes down and many IPOs show a low performance on the long-term .

An interesting approach belongs to the author Derrien F. (2005): the issuer is not the only one who gives up to some cash by *leaving money on the table* [3]. The issuer knows that shares are offered in reality at a high price and only the market optimism generates the increase on the first trading day. He also knows that at any given time, securities will be valued at their fair value, namely when the offer will be nominated as with long-term underperformance. In these circumstances, investors who bought the shares offered through the IPOs, also lose a part of the invested capital, if they fail to close their long positions in time and wait until the price falls below the offer level.

In addition, researcher Leite T. (2007) shows that the underpricing phenomenon is more pronounced when IPOs are preceded by high capital gains and reduced after periods of low market returns. This demonstrates that issuers fail to adjust prices in real time according to publicly available information.

Whether issuers seek to attract investors, to protect themselves from the lawsuits, to encourage monitoring or to signal the market,

the underpricing phenomenon is a reality and comes from the company's decision to offer its shares at a certain price but also comes from investors reaction, which may slightly increase the stock price by a great demand.

3. Data sources and methodology

The Romanian capital market has not been characterized by the procedure of initial public offering, as a normal and main way of listing a company, but by the Process of Mass Privatization which quoted a large number of companies. In another interpretation, one can say that it was ignored one of the most important steps which normally should be carried out before opening a company to the public: the initial public offering of shares. The Mass Privatization Program allowed, at that time, in an easy and prompt manner the subsequent sales of gained shareholder certificates. Thus, many companies were listed on Bucharest Stock Exchange in order to allow the trading of shareholder certificates, without an IPO procedure. So, when finally they did the primary sale of shares, they were already listed, their shares were already traded.

For the present paper, we selected the Romanian successfully IPOs, who took place at the Bucharest Stock Exchange, between 2003 and 2009, and by which the companies listed. We found only 13 IPOs, the major part of them offering shares or allocation rights and the last three fund units. All numerical data were acquired from the online reports offered by Bucharest Stock Exchange.

For measuring the market influence, we used BET-C, the composite Bucharest Stock Exchange index, which reflects the price movement of all the listed companies, excepting the investment funds (SIFs).

In order to study the level of the Romanian IPO underpricing phenomenon, we calculated, for the selected IPOs, the Adjusted Initial Return Indicator (AIR) as the difference between the Raw Initial Return (RIR) and the Market Index Return (MIR), for the first day of trading and also after 7, 14, 21 and 30 days.

The raw initial return, calculated for every studied IPO, expresses the variation of the closing price for the selected day of trading (P_{t_n}) compared to the offer price (OP), where t_n is the

first trading day for $n=0$:

$$RIR = (P_{t_n} - OP) / OP (\%)$$

The market index return is calculated in a similar manner, as the variation of the closing BET-C value for the selected day of trading (I_{t_n}), compared to the closing value of the day before the first session of trading (I_0), for all 13 IPOs:

$$MIR_n = (I_{t_n} - I_0) / I_0 (\%)$$

As an example, for the IPO of S.C. Vrancart S.A., the adjusted initial return indicator for the first day of trading (15 July 2005) is:

$$AIR_{VNC} = RIR_{VNC} - MIR, \text{ where}$$

$$RIR_{VNC} = (P_{t_1(15 \text{ July } 05)} - OP) / OP \text{ and}$$

$$MIR = (I_{t_1(15 \text{ July } 05)} - I_{0(14 \text{ July } 05)}) / I_{0(14 \text{ July } 05)}$$

In the end, after we determine all the AIR indicators for the selected IPOs, we calculate the mean, the standard deviation, the minimum and the maximum level, as measures for the Romanian underpricing phenomenon.

The results and also the main input data are systematized in Table 1.

4. Results

Before observing the results, we must recognize an important limit of the present study: the lack of data. As we mentioned in the previous section, after 2003 there were only 13 successfully IPOs on Bucharest Stock Exchange, as initial methods for listing the companies. Despite this, we used the present data in order to study the underpricing phenomenon, being aware of limitations.

As it can be seen from Table 1, although not all IPOs have been characterized by underpricing, for all selected trading days, we obtained a level between 18 and 31%. This in fact, confirms the hypothesis that domestic IPOs, between 2003 and 2009, were on average underpriced.

The medium level of underpricing, 20.27%, recorded in the first day of trading approaches the one that researchers Goergen M., Khurshed A., McCahery J. and Renneboog L. (2003) identified. Studying the European IPOs between 1996 and 2000,

12	OTP WiseRO	WRO	08 October 2009	8,947,800	200.00	2650.73	4.92%	-8.04%	-7.78%	-10.54%	-19.76%
13	OTP Green Energy	GRE	01 April 2010	8,803,766	202.00	3519.93	-3.35%	-10.42%	N/A	N/A	N/A
MEAN							20.27%	30.63%	19.78%	18.29%	19.56%
Standard deviation							57.92%	85.26%	71.45%	71.64%	68.67%
Maximum							159.05%	230.82%	195.49%	200.72%	184.27%
Minimum							-65.62%	-66.69%	-68.65%	-57.31%	-44.69%

they determined a level of underpricing about 30% [5].

The study results differ from those obtained by Ursu S. (2007), who registered a 55.24% underpricing level for the first day of trading, because the database was completed with the latest IPOs. These last IPOs, in the context of financial crisis and low investor interest, were characterized by the lack of underpricing, being in fact overvaluated at the first sell moment (see the negative AIR values in the second part of the Table 1).

The high value of standard deviation shows the high level of heterogeneity of studied IPOs, an idea also supported by the significant registered differences between the maximum and minimum values.

5. Conclusions

The present study focuses on the IPO underpricing phenomenon observed at the level of Romanian capital market.

Because few companies listed on BSE, by carrying out a successful IPO, identifying only 13 IPOs in 2003-2009, we used the Adjusted Initial Return indicator as a measure for the underpricing level.

The hypothesis set forth at the beginning of the study, according to which Romania is characterized by IPO underpricing, is confirmed if we consider the final average value for all selected days of trading. However, although data are limited, we observe a significant change once the event of financial crisis occurs. Securities offered through IPOs, that started trading since late 2008, have achieved values below the offer price. Thus, in the last 5 IPOs conducted, only one was characterized by a low degree of underpricing (WRO-4.92%). The rest of them, on the contrary, had a dropped course in the first day of trading under the offer price.

Assuming the limits imposed by our insufficient data, we believe that due to the financial crisis, investor optimism was severely hit. This fact led to the loss of interest in new securities issued through IPOs and consequently dropped the price under the offer level. During this period, we can say that the underpricing phenomenon is not present but, taking into account previous recorded values, the final average indicator is positive and we can say that overall we had a moderate level of IPO underpricing.

In the light of our results, even though the number of local public primary sales of securities, in order to list on the stock exchange, is small, we conclude that the Romanian capital market was no exception for the general presence of underpricing phenomenon. But, with the appearance of financial turbulences, influencing the attitude and confidence of investment environment, underpricing phenomenon disappeared. This shows that a significant percentage of its manifestation is due to investors optimism, who through their demand generate and maintain high prices.

We hope that once the financial environment will find the balance and consequently investors will show confidence in the market, new IPOs will appear in the local stock exchange. Thus, over time, multiple data will make possible a better analysis of the underpricing phenomenon.

Abstract

The present work proposes to realize a complex research of the investment in view of current conditions characterized by a global economic crisis. A special attention will be given to the opportunity and the efficiency of the investment as an instrument in the management decision for the development of a company.

Many aspects that a company has to take into account in its development strategy find themselves out in the financing programs regarding a maximization of the profit through investment of the capital in tangible and intangible assets, implementing of new technologies, measures for protection of the medium or financial investments.

The paper is structured as follows:

- *Global Financial Crisis*
- *The economic crisis in Romania*
- *Investment – Theoretical viewpoints*
- *The controversial problems of the appearances of evaluation and recognition of corporal and immaterial asset*

The scientific novelty work is focused on the element of complexity and actuality of information, which, due to deep changes from the structure markets, of transformations alerts and the process of productions based on the technical progress unknown in history, becomes vital.

Key words: economic crisis, financial investments, history progress, global financial crisis

JEL Classification: G01, G14

1. Global financial crisis

The global financial crisis, brewing for a while, really started to show its effects in the middle of 2007 and into 2008. Around the world, stock markets have fallen, large financial institutions have collapsed or been bought out, and governments in even the wealthiest nations have had to come up with rescue packages to bail out their financial systems.

On the one hand many people are concerned that those responsible for the financial problems are the ones being bailed out, while on the other hand, a global financial meltdown will affect the livelihoods of almost everyone in an increasingly interconnected world. The problem could have been avoided, if ideologues supporting the current economics models weren't so vocal, influential and inconsiderate of others' viewpoints and concerns.

A collapse of the US sub-prime mortgage market and the reversal of the housing boom in other industrialized economies have had a ripple effect around the world. Furthermore, other weaknesses in the global financial system have surfaced. Some financial products and instruments have become so complex and twisted, that as things start to unravel, trust in the whole system started to fail.

2. The economic crisis in Romania

The world economic crisis is felt increasingly hard on the Romanian market. Although, globally it is estimated to go up slightly shy, the Romanian economy crisis occurs deeper, with more extensive effects both on economic indicators, as well as the human factor. Analyzing recent statements by the IMF, and results of studies conducted by Deloitte on the perception of Romanians

on global economic crisis we conclude that we are an optimistic people.

Director General of the International Monetary Fund, Dominique Strauss-Kahn, in according Mediafax said that the current International Monetary Fund forecasts predict an increase of 3% of world economy in 2010.

However governments should not withdraw too quickly incentives for savings, because it could trigger "a double recession, such as W", IMF director of interview that: -typically, unemployment continues to increase for one year after the start of recovery, during which the authorities must not withdraw support measures.

-IMF loans this year will be provided four times higher compared to 2008 to assist countries affected by crisis.

-G20, the group of the largest economies of the world, would be more representative if it included a few new members.

A recent study prepared by Deloitte show that Romanian entrepreneurs in their majority, believe in the economic recovery and prepare new products and services, but also anticipates big expenditure and staff reductions. In an recent report prepared by Deloitte, 40% of Romanian companies expect economic recovery in the next six months and are among the most optimistic in the region.

Romanian companies continue their business growth strategy, but with greater emphasis on costs. On the other hand, one in nine businessmen expected tightening of regulations, the following year and released a warning of difficult access EU funds " , said President of Deloitte Romania, George Mucibabici, according to NewsIn.

In addition, the interest in the Romanian business environment for accessing European funds is increasing, conclusion which follows from the fact that although the projects have lower values compared to 2008, their number increased by 38%. So it increased the interest of Romanians to access European funding at this time of crisis, but changed the structure of projects submitted for European funding.

Thus, 90% of projects submitted for European funding were for the development of human resources with the remainder distributed among projects for SMEs and cooperation (5%). Compared with last year, 80% of funding projects aimed the investment in equipment, projects of interest (5%) and projects on human resources (15%). In conditions of economic crisis, the Romanian entrepreneurs are beginning

to give importance to human capital, an intangible asset subject to research a growing number of experts from various fields, both psychologists, sociologists, and especially economists.

Across Central Europe, nearly three quarters of respondents believe the economy will be worse or remain the same next year. On the other hand, contrary to this trend conservative and pessimistic, show business optimism in the prospects that they have their companies, only 15% of respondents expressing negative expectations for the future.

Analysts state that the economy will show signs of recovery early in the last three months of the year, after it reaches its lowest point in the third quarter, but optimism should be moderate because recovery depends on the eurozone, is still unclear whether government measures will have a lasting impact on the private sector.

Finally we ask does this crisis end in the last quarter of 2009? It will meet as "V's" or rather from the first quarter of 2010 we wait a second recession, with more severe effects on overall economy unrecovered, watching as "W's"?

There are many questions asked, but who does? Nobody has the key, we all try to assess the effects of the crisis, and even more so to estimate the likely evolution in the near future.

Industry and services have a contribution of 70% and decreased 5.3% to GDP in the first half of 2009, by 7.6%, the National Statistics Institute data show. Meanwhile, agriculture and construction had a lower intake, only 11.8% of the total.

The largest share in GDP had decreased services - 2.9% of the total. Looking at the use of GDP, we see that an important contribution to the reduction product had a final consumption of households in Romania (contribution of 9.7%) and gross fixed capital formation (contribution of 4.8%).

Moreover, investments in national economy in the first half of 2009 have decreased by 16.7% compared to same period in 2008. Investment in construction in November decreased by 3.2%, while those in machinery and vehicles has decreased by 33.5%. Branches in which a higher volume of investment was achieved are industry, trade, services, agriculture and construction.

3. Investment – theoretical viewpoints

A proper characterization of the phenomenon of investment is based on: economic, financial, accounting and legal terms.

-In economic terms, investment is all consumption of resources that are currently used in the hope of future economic effects. In terms of financial investment is the creation of productive capital by forgoing immediate consumption of monetary resources, capital designed to achieve a future revenue stream.

-In accounting terms, investment is transforming the available money in physical assets subject to amortization, or financial assets. The expense of investment, is processing assets and finance money in tangible assets that increase property developer. This is an expenditure whose effect extends beyond the current year.

-In legal terms, investment is the creation of heritage items that may be the subject of property.

Considering investment as a phenomenon ,financial and monetary, it would be appreciated as these represent involvement on a long of a term capital of to his investor or given the accumulations of the populations in the aim obtaining of a the maximum gain with minimum of risk afterwards.

After some specialists, through investments are apprehended:

- " an act where one spends his money funds in hope that in the future shall be received big sums of money"[1]

- " anything used as an active capital in the aim of realization of economic efficiency and therefore of profit."[2]

- " Anything the expenditure of funds were in the sight realization conditions needfulness to obtain in future, on a specific distance the expected effects."[3]

- " investments have four elements, scilicet the investor, the object of investments, the cost and the effects."[4]

- "The term of investments is used most frequently surprised the flux of fated his expenditures to increase or to maintain the stock of real capital."[5]

As an agreement between the theories of the specialists, the components of the concept of investments are as follows:

-the concrete and material content of the effort of investments, I consider investments as a particularly structure of different funds as the nature and the volume, what I am brought in the realization of the project;

-the factor "The time", which show the fact as the any project of investments has a period of scroll, presented through stages and good moments described and on during which the indicators economically have the project have particular ways of evolutions;

-the concept of efficiencies, according to which the investor accepts the utilization of present funds for an effective series(receipts) in the future, more than the initial expenditures;

-the risk, carry results from the concrete way of achieve in the after days of the effects waited. Risk appears due to the fact that these effects waited are maybe, but not certainties, the degree of risk be inverse proportionate the probability of achieve the waited effects.

In the literature the maul can find a series of approaches on the concept of investments, such as in large sense and in liminary sense, or in economic sense, financier and the bookkeeper.

In large sense and from the microeconomic view, investment identified with the placements of the economies of physical his juridical persons in different areas and below different forms, as of example:

-Equipments of productions, therefore an increase the technical capital;

-The modernization of fixed capital;

-The stock of circulating assets;

-The constructing of buildings;

-The purchasing of buildings;

-The purchasing of stocks;

-Research Science and projection;

-The transport and the winding-up of the equipments of productions

In professor's Dobrota view, investments represent an addition to the capital, to personal existing patrimony, addition that result from the use of part of economies obtained from the activity of respective person.

The concept of investments has represented always a subject of discussion. The economist P. Caspar proposes a series of criteria appreciatory investments:

- for an expenditure on an employee today, is expected to be obtained a result tomorrow.

-this expenditure conduces to a constituted sinking-fund that is a capital of which effects are produced on an what

period exceeds the of a landmarks exercise.

-the correspondence expenditures conduces to a multitude of capacities of production or the commercialization of the enterprise.

-there is evidence as the different expenditures on employee increase the patrimonial undertook

And a supplementary condition applied to these expenditures were delimitate of the expenditures of operation:

-Place a break an in a report with the tendencies extrapolate from pasts.

All in sphere of the concepts concerning the answers of long-term capital existed the which specialists tried to accredited the term of " multi investments" as be certain which expenditures have the characters of investments but are settled all the some in the category current expenditures, because they have no frequent and the repeatability of investments the appearance.

Pierre Masse says as investments is " an expenditure dispute about future an uncertain" or, otherwise gave up to," the satisfaction quickly and sure, on the expense of the economies of which we dispose currently against of a future hopes of which support represents it just good invested"

The French economist F. Aftalion formulates the next definition: " The investments represent the renunciation to the monetary sources and current liquids against of a hopes future funds, obviously else big.

Nicolae Feleaga in his book " The risks of bookkeeping to balance among milleniums" brings an important contribution and a binevenues to this research themes and does the specification as the nameable studies take into account the investments considerate measurable excluding investments material toes enterprises how are for instance: Investments in the strategic reflection, in formalization of his methods or the organizational investments.

The author says that analyses of immaterial cannot be confined to a distinction between immobilizations and expenditures. If undertake achieves the important expenditures in this area, means they expect to obtain a series of advantages in exchange. The author considers as the investment as a papers of give in the immediate satisfaction of certain and against of a hopes of future benefits brought of good invested has a series of consequences.

In the researches done in this in area, the specialists adopt many concepts: investments, funds, expenditures or active.

The specialists consider that the mutations from the modern economy have a double consequence: On one side he causes a movement of the process of production from matter and energy towards information and knowledge and then lead to an interconnection and a diversification without unprecedented these. In the same time the specialists consider as the blast of informal technologies, nationalization the economies, globalization markets led to an index of uncertainty of the phenomena much more than by now what does as the productive classic his models don't the maul gives results. New in stage these shall must set-up on the strength of the fashions of which his organization based on the development flexibility and the speed of reaction to changes in order to integrated in a economy based on cognition.

A report of OCDE specifies as " despite of conceptual difficulties the practical and in the definiteness immaterial and in the adoption as an account rule which permits their taking in a account manner the proper maul, the economic contribution of immaterial investments to the growth of the performance and competitiveness undertake does necessary the progressive these uses in accounting systems ".

4. The controversial problems of the appearances of evaluation and recognize of corporal and immaterial assets

Objective the financial compliant situations of general frame for the elaboration and the presentation of financial situations elaborated of IASB is delivered informations about the financial sprocket, the performances and the modifications of financial sprocket ale of the entity, carry the useful of a by-pathes large spheres of users in the taking of economic decisions.

The fate of financial bookkeeping is connected with the elaboration, the presentation and the publication of balance-sheet in accordance to foresee of a frame conceptual bookkeeper.

The determination of the base of mensurement, used for the ascertainment different patrimonial elements in situations represented, one of the problems most difficult of bookkeeping. Recognise of a

active or a debt were a long weather the appanage of expert bookkeeper.

„Initial recognition of an asset is subject to credible assessment of its cost. After this time the assessment is doing the inventory, closing the year and the date of expiry of the estate.” [6]

The examples most typical the one by-paths according to the expenditures investigatory, to brands, to the commercial background

In the practice and in the theory of accounting were accredited on many bases of mensuration. As part of creating the presentation of financial sheats elaborated of IASB these are: The historic cost, the current cost, the nett value of realization, the actuallisated value.

Problem consist in the choice to fit the maul among these in contextually to satisfy the requirements of the users of accounting information on oe side and an observance of principles and an accounting foundations on the other hand.

Producers and the users of financiers sheets appreciated as , in the mensuration and the presentation of accounting information, as most utilized is the historical cost, although presents some weak points. This croppered another bases of evaluation. Moreover, the tendency is to pass to the utilization of current cost as a response to the incapacity of the model of the bookkeeper based on the historic cost solved the incident to effective problems of modification prices the unmonetary assets.

It is obvious as the determination clear value of realization is released of an uncertainty an estimation nice and an erect incites the how much good time sold really on sale caning generate the different estimations from the assessors.

„There are more than one difficulties and divergences between different viewpoints in the determination of historic cost especially in the case the production costs of a good obtained from own production.”[7]

In condition of inflation and hiperinflation by experience the years past were focussed serious difference of situations flatly falled across the undervaluations of the assets registrated to a historic cost became obsolete the in report with the monetary devaluation.

And yet certain experience from past makes impossible the prevision of earnings in the fight between the historic cost and the right value.

Abstract

The aim of this paper is to address the implications of using public expenditures and debt accumulation to enhance the Romanian economic recovery and support the economic development and growth on the long run. Firstly, we have presented a brief introduction that reviews the literature on the role of using public expenditures in times of economic downturn and their effects. Secondly, the paper presents, in a critical manner, according to the economic and functional classification, which categories of expenditures were financed by the government in 2009, compared with the previous two years, as a result of the stand-by agreement contracted by Romanian government with the international financial institutions. In the last part, we have presented two of the most important effects of public debt accumulation in Romania: the crowding-out effect and the intergenerational equity.

Key words: public expenditure, debt accumulation, crowding-out effect.

JEL Classification: H63, H83

1. Introduction

Using public spending in order to stimulate the economic recovery in time of recession was initially proposed by the Keynesian school of thought.

According to Keynes (1970) [1], in periods of economic decline it is useful to employ higher public spending, given the multiplier

effect that public final consumption and investment demand entails.

It is known that in the current global crisis, governments with high share in the global economy implemented the Keynesian policy, trying through budgetary fiscal stimulus alleviating the economic decline.

Keynes's ideas were developed by P.A. Samuelson, W. Schultz, L. Harris, Gunnar Myrdal, Hyman Minsky and others who are refining his theory today.

According to Samuelson, in period of economic downturn, state becomes the most important player in the economy, he's "visible hand" is necessary for the economic recovery, in response to market mechanism's weakness.

Also, Alvin Hansen claimed, in the context of the interventionist state, carrying out public spending, considering the stabilizing effect of the whole economy affected by the phenomena of crisis and unemployment.

There are also economists (Auerbach and Feenberg, Dolls, Toshiki etc.) that emphasize the productivity of public investment spending and of social spending, such as unemployment benefits for boosting quickly demand, inducing private investment and thus contributing to the economic recovery.

In what concerns the neoclassical view about public expenditures and by default, on the Keynesian view about financing them by borrowing, it is assumed that if there is a high level of unemployment in the economy and the interest sensitivity rate of investment is low, the expansionary fiscal policy will lead to little or no increase in the interest rate and will increase output and income. In addition, the neoclassical view assumes that government spending increases private investment due to

the positive effect of government spending on the expectations of the investors.

Therefore, there is crowding-in rather than crowding-out. Keynesians agree with monetarists on the crowding-out hypothesis only when the economy is operating at the full-employment level.

According to Khan et al. (2009), the neoclassical view assumes full employment and advocates for competitive markets against government interventions. Also, according to the neoclassical loanable funds theory, “the balancing of savings and investments will be solved by the interest rate mechanism”. [2, p.8]

It is also considered that increases in government spending generate an increase in the interest rate in order to bring the capital market into equilibrium and crowd-out private investment.

2. Using public expenditures in the context of the economic and financial crisis

In times of recession, public expenditures can be seen as a good solution for the recovery of all economic sectors in difficulty and also as a source of further investments, thus contributing to long term economic growth.

The need for public financing of certain economic programs meant to decline the negative effects of the economic crisis became a priority at the end of 2008, in order to stimulate the private sector and the Romanian recovery.

The most important change in public expenditures was related with the stand-by arrangement contracted by our Government with international financial institutions (the International Monetary Fund, the European Commission, World Bank and with other international financial institutions), as a preventive measure in the context of the current crisis.

The external loan was nearly €20 billion and of this amount, €13 billion from the IMF represented a “stimulus package”, in order to counter the negative effects of the crisis.

This measure imposed certain limits in terms of budgetary deficit for 2009 and also for the next period. Romania’s budgetary deficit in 2009 was within the target of 7.3% of GDP (36.4 billion lei, respectively 7.2% of GDP), agreed by the Government with international financial institutions. In 2010,

Romania will have to be within the target budget deficit of 5.9% of GDP.

In 2009, consolidated budget expenditures amounted 193.0 billion lei, an increase with 41.35% compared with 2007, as results from Table 1. [3].

Table 1. Evolution of public expenditures in Romania during 2007-2009

Year	2007	2008	2009
Total public expenditure (millions lei)	136,556.5	189,121.7	193,025.4
Current expenditures	122,127.8	166,371.3	173,340.9
Capital expenditures	14,410.4	23,203.4	23,175.3
% of public expenditures in GDP	33.08	37.52	39.29

Source: (Developed by authors, according to data from the Ministry of Public Finance)

In the economic expenditures structure for 2009, we can see that current spending prevailed, representing 34.1% of GDP, respectively 172,340.9 millions lei, an increase with 3.58% compared to 2008 and with 41.93 compared with 2007, while capital expenditures accounted 23,175.3 millions lei, respectively 4.9% of GDP, decreasing with 13.3% compared to 2008.

The largest share in current expenditures was with social assistance transfers (63,962.1 millions lei), which represented 12.7% of GDP, followed by staff costs (46,710.7 millions lei, 9.2% of GDP). Expenditures on social assistance have increased by over 18% in 2009 compared to 2008, while staff costs increased by 2.4%, mainly due to salary increases approved in the second half of 2008. It is noticeable that high spending was on unproductive areas, which does not bring added value in the economy. Payments for salaries of government employees and pensions have consumed all Government resources, both internal and external.

If we talk about capital or investment expenditures, although the Government undertook in 2009, as in 2010, to allocate 7% of GDP for investments, budgetary execution for the last year shows that only 4.6% of GDP had this destination. According to EBRD

experts, although the loan was aimed at allocating more than €10 billion on infrastructure projects, investments in Romania are almost nonexistent, making this crisis extending.

Sustained participation of state with public capital is able to contribute to economic recovery, to poverty alleviation, improving business productivity, households and government services.

The Romanian Government important projects are: "First House", Romanian village revival program-10 houses for specialists, "Rabla" and the public-private partnership to build Comarnic-Braşov highway.

This year, through the "First House" program, the ceiling for government housing guarantees increased to €75,000, aiming at a multiplier effect in the economy, at increasing employment and bringing as many business resources in a period marked by economic difficulty. It should be noted that our state pays for these guarantees, between €60,000 and €75,000 on stages of implementing the construction.

In the case of "Rabla" program, money is taken from the Environment Fund, which collects money from taxpayers who pay the tax pollution. In what concerns the public-private partnership Comarnic-Braşov, it is known and stated by the Minister of Transport, that the project would have never been built with money from the state budget, because it would have increased the budgetary deficit.

According to the functional expenditures structure of the state budget, in 2009, the biggest expenditures were with social and cultural activities (31.3% of total expenditures), followed by general public services (23.63% up from 14.94% in 2008), economic affairs (22.43% of total expenditure increased from 21.18% in 2008) and costs for insurance and social protection (21.50% in 2009, compared with 19.2% in 2008).

The higher percentage of economic affairs expenditures is justified, given the economic and financial crisis.

The lack of credit has affected in particular SMEs, which faced difficulties in funding, compared with large companies. Thus, our state established the legal framework for granting "minimum schemes" (a maximum of 13 schemes were included in the Law on State Budget, 2009), state aid schemes, which were approved by the European Commission (since

May, 2009), totaling 210 millions lei for 100 potential beneficiaries SMEs from all sectors, in order to support businesses affected by the crisis, also it has extended government guarantees to support the export production, (as it increased by 900 million lei the share capital of the House of Savings Bank) etc.

As the current crisis has generated an unemployment rate that increased from 4.9% to 7.8% between January 2009 and December 2009, reaching 8.3% in February 2010, additional costs with unemployment benefits and reductions of unemployment insurance revenues were necessary.

We should also mention that solutions in order to stimulate job creation, to recognize the value of work, must be found, because employment is the real way to economic improvement. In this context, we find as very important the Government's decision, in February 2010, of exemption for a period of 6 months the payments of social contributions for employers which employ for at least 1 year unemployed persons, which have been unemployed for at least 3 months, the aim being reducing spending for the next period for all social budgets and employing almost 500,000 persons.

As the IMF representatives stated since the end of the last year, Romania is spending very much on wages and pensions. Our country is among the states with the most unsustainable public pension budgets of the European Union and according to the EU's forecasts, the estimated share of GDP spent on pensions state will have an upward trend, from 8.4% in 2010, to 15.8% in 2060 [4, p.147].

In 2009, the Romanian state has spent on pensions 48 billion lei, representing 9.5% of GDP and 31% of the state revenues. State budget lent pension budget with € 1.5 billion in 2009. Pension costs for 2010 will be 7.36% of GDP (538 billion lei).

Currently, Romanian public pension system is facing numerous abuses, including: the massive increase for cases of disability retirement, of 50% from 600,000 persons in 2001 to 900,000 in 2009; triple of the annual number of early retirements; disagreement between the lowest (350 lei) and the largest public pension (37,000 lei), more than 100 times, a ratio of 1 to 100; the actual average retirement age under the legal. This suggests an unfair system and we think that there is a need for a pensions budget on a self-sustaining

based, according to the contributivity principle.

The new pension law aims to introduce a mechanism to discipline early retirement system, to increase the average age retirement at 65 years for women and men, to eliminate all discrimination in the system, to reduce pensions set at a high level, and also to contribute to the unification of public pension system.

For the next period are necessary reductions of unproductive expenditures, such as staff costs and increases of intellectual and economic investments in strategic areas, which can represent an exit from crisis.

3. Effects of public debt accumulation

The current financial crisis rises many questions about how much should governments spend and therefore borrowing impose the necessity to rethink the old model of development.

In order to achieve and sustain growth and development of the national economy, governments often borrow large amounts of money to finance expenditures on public goods and services that promotes growth and increase nation's welfare.

The development of public debt and budget deficits has become a crucial policy problem not only in developed countries but mostly in emerging economies, like Romania. Political debates about the future course of fiscal policy and the need to keep government debt under control abound, and the sustainability of public finances is one of the most widely discussed topics in economics in these days.

In recent years, in this time of economic slowdown and regression many countries have built up substantial amount of public debt, often accompanied by growing public sectors and shortsighted fiscal policies. In many developing countries, structural fiscal deficits and growing unfunded social security commitments have raised concerns about the long-run consequences for intergenerational distribution and the political sustainability of the welfare state.

A sizeable literature has adopted the overlapping generations modeling framework to examine intergenerational welfare effects of fiscal policy. This literature has examined two channels through which public debt and

unfunded social security affect the intergenerational distribution. The first channel of intergenerational effects works through capital accumulation, and the second through price changes of assets traded among members of different generations.

In many OECD countries, however - particularly in Europe where union influence in wage bargaining is institutionalized - rates of unemployment and public spending on unemployment benefits are quite high. Moreover, in time of financial crisis, both unemployment and net public debt have increased considerably in the last 3 years.

Taking into consideration the actual financial crisis and the necessity of government intervention to help the economic recovery, in case of Romania, which is financing this intervention through public debt (where the amount of external public debt is over 81 % of total public debt), we analyze two of the most important effects of public debt over economic development and growth: *the intergenerational equity and the crowding out effect*. A major reason why emerging economies are more prone to financial crises than mature economies is that of the atypical composition of their debt.

So far, the literature has largely focused on external debt, notably on the inability of emerging economies to borrow on the international capital markets in their domestic currency, which is sometimes coined the external dimension of "original sin".

This suggests that the burden on future generations of increased public debt and the economic burden of high equilibrium unemployment could be interrelated and that the latter perhaps aggravates the negative welfare effects for future generations.

The conventional approach postulates a positive relationship between both the deficit and the inflation rate and the deficit and a negative current account, but no perceptible impact of the deficit on economic activity. Indeed, according to this theory, a rise in the deficit results in an additional supply of government bonds, which can only be sold by offering a more attractive yield, is creating upward pressure on interest rates. Consequently, the initial boost to the economy created by the deficit's impact on global demand ends up being partially diluted by the falloff in investment attributable to higher interest rates. This is called the "crowding out"

effect. Also, the resurgence of demand draws in its wake an overheating of the economy, resulting in price increases.

Two different views exist on the effects of increased government expenditure on investment. The traditional view argues that government expenditure crowds out private investment. Higher government expenditure, whether financed with taxes or debt, increases the demand for goods and services, raising interest rates, making capital more expensive and, as such, reducing private investment.

The non-traditional view supports the positive effect of government expenditures on investment. The crowding in of investment occurs when the economy's resources and labor are fully used.

That may arise in many developing countries where, for example, government expenditure on infrastructure can induce private investment. We find evidence consistent with the first view for both developed and developing countries, but consistent with the second view only for developing countries.

In the case of Romania, where the economy is not a fully developed and functional one, and taking into consideration the crowding out effect, we estimate that the impact over economic development and growth is a positive one, because of the latent financial resources that are "standing" without being used for further investments, especially in private sector, reasoning the lesser evil. The use of these latent and inactive financial resources by the state is more efficient and positive for the economy, instead of not using them.

Besides, if these borrowed resources are used in the adequate sectors, for example for investments in infrastructure, where the incomes and the benefits are positive for both sides, first for the private sector, enhancing the development of new areas of business and improving the existent one and by the other side, has positive effect over the public sector because new jobs are created and by this path, the recovery of the economies is possible.

In time of economic and financial crisis, the most evident features are: the consumption decreases, the production slows and thus, unemployment rate increases.

Even if governments borrow for making public expenditures, in such given conditions, like economic crisis, any financial resources

that are back in economic cycle, represent a way to trigger the economic recovery.

Moreover if money is spent for public productive projects, like infrastructure or buildings (houses, flats), the impact over the private sector is a positive one and it contributes to the economic recovery and development, on the long run.

4. Conclusions

In the context of the economic and financial crisis, there was a need for Romanian government programs in order to boost competitiveness, to support certain sectors in danger of collapsing and helping those who have been hurt by the economic downturn.

In 2009, after analyzing the economic classification of public expenditures, we have found that current spending prevailed, especially those for social assistance transfers (pension costs, unemployment benefits) and staff costs, while capital expenditures decreased, compared with 2008, although the stand-by arrangement contracted by the Romanian government with financial international institutions aimed at allocating more than €10 billion on infrastructure projects.

Our opinion is that there is a need for further investments in Romania, in order to stop extending this crisis and also that are needed reductions of unproductive expenditures.

Regarding public debt and the evolution of borrowing process issued by the Romanian Government, we must draw a warning about the risks that Romania is complying. If borrowed financial resources are not used in a productive areas, such as public investment in infrastructure, the negative effects of public debt will appear and this will maintain the crisis for and long time in our country, public policies will be unable to recover the economic development and growth, in worst case Romania will reach the unsustainable level of public debt, basing our affirmation on the present worse example of bad management of public debt like Greece.

Relevant Aspects of the Credit

Conf.univ.dr.ec. Adrian ŞIMON,
Universitatea "Petru Maior" Tîrgu-Mureş
e-mail: adr_simon@yahoo.com

Abstract

The word "credit" comes from the Latin language, but it was only until 1447 that the word "credito" with the commercial meaning appeared. The credit represents a contractual agreement in which a borrower receives something of value now and agrees to repay the lender at some later date. Anytime when an individual financial something with a loan, they are using credit. (Andrew Eduard 2000).

The credit score measures the financial credit worthiness of borrower. With credit score information, the lender assesses the risk involved in landing a sum of money to the borrower. The Credit Bureaus and Fair Isaac Corporation (FICO) closely guards the mathematical calculations; this calculation involves the analysis of large financial data. The FICO Credit Score ranges from 300 to 850. A credit score of 660 puts the borrower as potentially. Subprime where are borrower with blemished and limited credit history.

A higher Credit Score indicates better financial credit worthiness. (Dennis Estrada, 1997)

Keywords: credit, risk analysis, types of credit, financial crisis

JEL classification: E51

1. THE IMPORTANCE of risk analysis in credit evaluation

The nature of the business and the competitive environment in which the company operates determine to a large extent the assets investment financial decision and profit dynamic of the company.

Risk analysis is performing to understand the company's positions, its strategy and its effects on financing needs.

There are several steps that should be followed such as:

- *Identify the risk*

Define and document all risks inherent in the management, products, company, industry and economy that could affect the company's operations, and thus its ability to service its debt.

- *Evaluate the risk*

It should be evaluated how and what extend the risks will affect the operations of the business.

Generally the business risk regards the quality and efficiency of the assets, performance risk is determine through income statements analysis and financial risk is determined by how the assets are funded by liabilities. Management risk is determined by how well management controls the above three major risks.

- *Mitigate the risks*

After a through understanding of the risks has been made, it is in the bank's best interest that the risk are minimized. Once the interrelationship of all the risks has been defined, a balance must be found between the risks and return, which is done through the structure of the loan agreement, collateral as well as appropriate covenants.

A complete analysis is one that incorporates all available information regarding the company and industry in which it operates

The banks usually use the following sources (Golosoiu, 2002) of information such as *customer interview* that provides the most important information needed in credit investigation, including the type and the amount of loan required, sources and plans for repayment.

Internal source the credit files on any other current or previous borrowings, checking account activity, and other previous current deposits.

External source such as other banks, the client has the connections with, Credit

Information Bureau Database, Payment Incident Bureau Database, governmental organization, etc.

2. FINANCIAL crisis in Romania

There are no direct effects as the banking system is fundamentally sound. One can look at the lack of exposure to “toxic assets” which lie at the root of the crisis; also the traditional banking products are dominant due to their high profitability. Last but not least the prevalence of the “originate and hold” paradigm must be taken into consideration.

The indirect effects are significant. There is a major impact on the availability of foreign – exchange denominated credit, there is a decline in the volume of FDI inflows and an increased likelihood of profit repatriation, in the context of an ongoing process of international deleveraging. The negative impact on foreign demand affects Romania’s exports. The increase in the exchange-rate volatility represents a decrease in investors’ appetite for risk in emerging markets.

However, there are some alleviating factors such as NBR’s prudent policies provided a cushion for the banking system consisting of high level of reserve requirements (allows for the gradual adjustment of banking system liquidity, depending on the evolution of market conditions) and prudential and administrative measures (slowed down the expansion of credit to the private sector, supported lending in domestic currency to the detriment of forex credit, limited overall risk exposure). Also there is a low share of overdue and doubtful loans in total loan portfolio (1.1% as of September 2008). Starting 15 October 2008, the guaranteed level for bank deposits (per individual and per credit institution) is EUR 50,000 from EUR 20,000 previously; this represents a confidence boosting measure.

The continental type financial system, dominated by banks is expressed through a moderate impact of declining stock prices on corporate financing.

Wide external imbalances are no longer acceptable. That is because of High economic growth in recent years and even disinflation has come at the price of an ever larger current account deficit.

The crisis will have an ambivalent impact on the magnitude of the current account deficit (both exports and imports will decelerate).

The likely decrease in the FDI flow will make financing more expensive and significantly less available.

There are mitigating factors with regard to the availability of financing resources (alternative financing sources, credit lines from parent banks to their local subsidiaries will not be discontinued).

Economic activity will decelerate, but inflationary pressures will persist, as contracting external demand and subdued investment render a slowdown in economic growth unavoidable. Also rise in unemployment will follow and inflationary pressures are not likely to subside next year.

The fiscal position is likely to deteriorate in the absence of corrective action.

There has been a steep decline in new loans to corporations. The decline started a year ago as the credit bubble deflated, and has accelerated in the last months, during the peak period of the financial crisis. From August – October 2008 new loans were 36% less than they were in the prior three-month period. The drop was particularly large in October, 2008. Lending for productive investment such as physical and working capital has fallen as much as lending for leveraged buyouts (LBOs) and mergers and acquisitions (M&A). Revolving credit facilities have fallen more than term loans, and non-investment grade lending has fallen more than investment grade lending.

Although new lending has fallen, since September 2008, there has been a sharp increase in commercial and industrial (C&I) loans reported on the balance sheets of U.S. banks. CKK (2008) interpret this as new bank lending; however, our evidence is inconsistent with this view. Instead, we suggest that the rise in C&I loans on bank balance sheets comes in good measure from an increase in draw downs on pre-existing revolving credit facilities (“revolvers”). These draw downs are not just from high quality borrowers who are shifting from the commercial paper market because of disruptions in that market. Many of them are very large, low credit-quality borrowers, who are now borrowing on the generous terms

that were offered during the credit boom, though they are now much riskier. While this may help these firms, it may also crowd out new lending to other firms. The amount of outstanding revolving credit is very large, and banks may be holding back on new loans to protect against flood of draw-downs if the economy continues to deteriorate.

3. MEASURES that should be taken to combat the financial crisis

- The current account deficit must be brought down through adequate policy measures
- A large budget deficit must be avoided
- A disorderly adjustment will occur and it will be neither smooth, nor reasonably sized
- A massive drop in foreign capital inflows is likely to follow (reduction in international reserves and loss of international credibility)

The past decade has seen dramatic losses in the banking industry. Firms that had been performing well suddenly announced large losses due to credit exposures that turned sour, interest rate positions taken, or derivative exposures that may or may not have been assumed to hedge balance sheet risk. In response to this, commercial banks have almost universally embarked upon an upgrading of their risk management and control systems.

Coincidental to this activity, and in part because of our recognition of the industry's vulnerability to financial risk, the Wharton Financial Institutions Center, with the support of the Sloan Foundation, has been involved in an analysis of financial risk management processes in the financial sector. Through the past academic year, on-site visits were conducted to review and evaluate the risk management systems and the process of risk evaluation that is in place. In the banking sector, system evaluation was conducted covering many of North America's super-regional's and quasi-money-center commercial banks, as well as a number of major investment banking firms. These results were then presented to a much wider array of banking firms for reaction and verification.

The purpose of the present article is to outline the findings of this investigation. It reports the state of risk management

techniques in the industry -questions asked, questions answered, and questions left unaddressed by respondents. This report can not recite a litany of the approaches used within the industry, nor can it offer an evaluation of each and every approach. Rather, it reports the standard of practice and evaluates how and why it is conducted in the particular way chosen. But, even the best practice employed within the industry is not good enough in some areas. Accordingly, critiques also will be offered where appropriate. The article concludes with a list of questions that are currently unanswered, or answered imprecisely in the current practice employed by this group of relatively sophisticated banks. Here, we discuss the problems which the industry finds most difficult to address, shortcomings of the current methodology used to analyze risk, and the elements that are missing in the current procedures of risk management and risk control. (ANTHONY M. SANTOMERO, 1997 Commercial Bank Risk Management: An Analysis of the Process).

4. IMPORTANCE of credit risk for non-financial institution

For the most part managing credit risk is a defensive skill. The role of the corporation is to stop bad things happening or reduce their impact. The major concern in credit risk is seldom from large number of small, even risky, borrowers/creditors but from "excellent" risk that collapse without much warning and from inadvertent concentration of creditors that turn out to be highly collated. This means concern about receivable, suppliers and off balance sheet assets.

Credit risk management is usually based on a combination of reliance on public debt ratings, reports from other agencies for private firms, short term nature of most client accounts, aging reports. Credit risk is far from static. (Bryan Ranason, 2007 Credit strategies)

5. TYPES of credit

Due to great diversity of the forms the credit can take, the elements involved and the purpose there are more types of credit, according to:

Economic nature and the parties involved:

- Commercial Credit takes place between the economic agents in the form of postponing the payment
- Banking Credit the participants are on side the economic agents and on the other side the bank
- Consumption Credit selling of goods for personal and long term use with the payment in installments
- Bond Credit the credit taken by the state when issuing securities to cover debt
- Mortgage Credit the credit guaranteed with fixed assets such as buildings or land

Debtor's and creditor's nature:

- Private Credit
- Public Credit the state is the debtor, that borrows in order to finance the deficit, and the natural and legal persons are the creditors.

Nature of guarantees:

- Real Credit requires real guarantees such as buildings, valuable objects, goods
- Personal Credit the guarantees are represented by personal testimonies of third parties

Extend of the creditor's rights:

- Credits that can be declared eligible before their maturity date: the creditor has the right to ask for payment with or without announcing the debtor

- Credit that cannot be declared eligible before their maturity: the creditor can only ask for the repayment at an established date

- Mixed credits are conditioned by the right of the creditor to use it for different purposes agreed by the debtor also

Way of paying off the obligations:

- Redeemable credit the payment is done entirely at maturity
- Non-redeemable the repayment is done in instalments, that include also the interest,

Maturity date of the credit

- Short-term credits are given usually for one, maximum 2 years
- Medium-term credits are given for a period of 3 to 5 years and sometimes for 7 years
- Long term credits are given for periods of up to 25-30 years.

Firm Acquisitions Strategy

Conf.univ.dr.ec. Adrian ŞIMON,
Universitatea "Petru Maior" Tîrgu-Mureş
e-mail: adr_simon@yahoo.com

Abstract

We analyze the intents of acquiring firms and target in the firms in the case of thirty recent M&A deals involving at least one firm. The findings indicate that horizontal acquisitions help retain or gain market leadership. Market entry may be a dominant motive for MNCs acquiring domestic firms, and MNCs may offer higher premiums than domestic acquirers for the acquisition.

Keywords: acquisitions, efficiency, target, market power.

JEL classification: F 23, G34

1. Introduction

Mergers and acquisitions (M&A) are fast becoming one of the key drivers of growth industry. Jensen and Ruback have classified acquirer intents into four categories

- to reduce production or distribution costs,
- financial motivations,
- to gain market power in product markets,
- to eliminate inefficient target management.

1. McCann has elucidated the following benefits accruing to service firms, increased economies of scale, increased market share, more efficient resource allocations, the ability to provide new services, a larger asset base, added name recognition, and acquisition of expert talent lacking in one or the other firm.

2. Brouthers et al have identified 17 merger motives, grouped into three categories - economic, personal and strategic motives.

3. Lubatkin has identified three potential sources of strategic relatedness between the acquiring and target firms that could be treated as motives for mergers - technical economies (scale economies through

improvising process efficiencies), pecuniary economies (achieved through dictating prices by exerting market power), and diversification economies (improving a firm's performance relative to its risk-attributes through managing a portfolio of business).

4. Gadiesh et al identify six key rationales for pursuing mergers - active investing (acquiring a company and running it more efficiently as a standalone firm); growing scale (exploiting economies of scale); building adjacencies (expanding into closely of related business); broadening scope (the scope of their products or technologies); redefining the business (by acquiring a new capability/competence in the wake of a major environmental shift); and redefining the industry (by changing the boundaries of competition through evolving new business models).

2. EFFICIENCY theory

With the merger of two companies, there is a possibility of lower unit costs, stronger purchasing power or gaining of management efficiencies. The differential efficiency theory argues that there are differences in the efficiencies of managements between companies. Hence when firms merge the less efficient firm will be brought to the level of the more efficient firm. It is likely that such potential gains in efficiency are more probable with firms in related businesses, so that there is significant managerial efficiency in the acquired firm, resulting in both personal gain (to the shareholders), and larger societal gains.

The problem with the differential management theory is that almost every firm operates below its efficiency frontier, and therefore is inefficient. The causes may be an inept management or lack of critical capabilities or resources (key success factors) required for surviving in that business. In such instances, conglomerate mergers

provide firms with the required managerial know-how and access to critical resources.

Efficiency theories also provide the rationale for synergy in mergers. Synergy occurs when the value of the combined firm exceeds the value of the individual firms. There can be three types of synergies namely, financial synergy, operational synergy, and managerial synergy.

Financial synergy results in lower cost of capital; operational synergy results from combining operations of hitherto separate units or from knowledge transfer; managerial synergy is realized when managers of either the acquiring or the target firm possess superior planning and monitoring abilities to their counterparts.

In other words synergies occur when mergers provide opportunities to leverage indivisible assets% resources (like people, equipment and distribution networks) over a larger scale and scope; when vertical integration through mergers eliminates transaction costs; by exploiting the firm's unused managerial capabilities in new product-markets through diversification-led growth; or by exploiting investment opportunities or cash flow streams that would be made available through a merger.

One important variation of the efficiency theory of merger is Jensen's management competition model. Jensen describes takeovers as a disciplinary force in the capital market, which functions as a market for corporate control.

Also, critics against financial synergy argue that it cannot be achieved in an efficient capital market.

Hence adherents to capital market efficiency have to explain the missing link between the public information financial statements and the public information incorporated in the stock price.

3. TARGET Firm's Intent

The managerial efficiency hypothesis suggests that the preference for pure-play securities stems not from lack of confidence in the market's ability to value complex organizations, but from the perceived inability of management team may reach a point of diminishing returns as the size and diversity of assets under their control increases. Part of the problem is that top management may be unaware of the unique

problems and opportunities of a subsidiary in a different line of business. An announced motive in many sell-offs is to sharpen the corporate focus by spinning off (or divesting) units which are a poor fit with the parent company's other operations.

The issues of management incentives and accountability are related to management efficiency. Bureaucratization of management and consolidation of financial statements can stifle entrepreneurial spirit and result in good (bad) performance going unrewarded (unpunished). Incentive compensation plans tied to parent company stock options may be meaningless or even counterproductive. A spun-off subsidiary has the advantage of an independent stock price directly reflecting the market's response to management actions, and more closely linking compensation to performance.

4. MONOPOLY or Market Power Theory

A significant motive for mergers and acquisitions is that it helps increase the firm's market power through increase in size (market shares). Increase in market shares leads to an increase in industry concentration, which provides firms with greater growth opportunities through access to better technology, control over demand and supply of intermediary and services, or the power to set prices, establish industry norms (dominant designs) in technology or (best practices) customer service. The acquiring firm can gain power through collusive synergy or through competitor interrelationship. Market power is achieved by cross-subsidization of products, deterring potential entrants, or limiting competition through tacit collusions. However, past studies show that the market power theory is weaker than the efficiency theory in explaining merger and acquisition.

5. ACQUIRING Firm's intent

A firm can acquire a larger volume of operations sooner if it goes for horizontal acquisition, rather developing internally. The resulting increase in market share will help the firm achieve economies of scale and pursue more growth opportunities. In the case of vertical acquisition, the firm gets control over its resources and raw materials through backward integration; marketing capability and distribution network through

forward integration. This will give the acquiring firm better control over a larger part of the value chain, which in turn, will give the firm an advantage over its competitors. Similarly, access to better technology is also a reason for a firm acquiring another firm.

6. RAIDER Theory

Raider theories focus on how an acquirer with no strategic intent (popularly known as private equity funds – whose only motive is to earn financial returns investments) acquires a controlling stake in a target firm to transfer wealth from the company stockholders to the acquirer stockholders. The primary value that raiders add would be to acquire distressed firms with inappropriate capital structures and restructure them to make them more efficient. Most often, these firms would be taken privately through leveraged buyouts and other forms of restructuring. Recently, private equity firms with access to substantial funds have bought distressed firms in a variety of sectors.

The acquiring firm is often able to see opportunities available to the target firm other investment bankers fail to see. By providing the target firm with sufficient capital flows, restructuring and selling off of non-profitable assets, the acquiring firm's intent is to enhance the value of the target significantly.

7. TARGET Firm's Intent

The target firm would sell out to a private equity fund primarily to fuel its expansion and growth plans, for which its current operations might not be able to generate sufficient capital resources. Target managers also look for access to superior (corporate) management capabilities, advice on inorganic growth strategies, and enhancement of their valuations.

8. INFORMATION or Valuation Theory

Since there is an information asymmetry between financial statements and the public information incorporated in the stock price, new information may be disclosed during a merger deal. Information theories refer to the revaluation of the firm through disclosure of new information during the merger negotiations, the tender offer process, or planning for a strategic alliance% joint

venture. The two major explanations of new information suggested by Bradley, Desai and Kim are:

A. stimulating the management to implement a higher-valued operating strategy (kick-in-the-pants explanation);

B. disclosure of assets% resources that were undervalued by the market, unearthed by bidders with access to superior information. (sitting-on-a-gold-mine hypothesis). These disclosures lead the market to revalue the firm with the new information. This theory is also known as the valuation theory.

9. ACQUIRING Firm's Intent

Acquiring firms get access to inside information about the target firm during the acquisition process. The information will be more valuable in cases when such information is not freely available in the public domain (where the target is either a privately-held company or owned by the government). The additional information could be leveraged by the acquirer to chalk out a strategy that provides for greater synergies and value addition.

10. TARGET Firm's Intent

The target firm's current owner's% managers might undervalue the firm because of the sheer complexity of the managerial holdings. For example, in vertically integrated firms, owners'% managers might not have the necessary information to value all their assets% resources, and therefore an acquisition would be able to release information about these assets and rationalize the value of the firm accordingly.

11. FINANCIAL Advantages

Financial advantages in terms of tax advantages and higher valuation may induce mergers and acquisitions. Differences in the treatment of period income taxes and capital gains for taxation purposes guide mergers. Another tax benefit is to merge a highly profitable firm with another firm reporting losses, thereby reducing the tax liability of the profitable firm. Similarly, since a lot of insider information is revealed during the bidding process (as discussed in the section on information theories above), the

undervalued target firm gets reevaluated and its stock price rises, resulting in significant advantages to the target firm.

Firms can use acquisitions to capitalize their tax liabilities by buying out small high-growth firms with little or no dividend payouts, and subsequently selling them off to realize capital gains.

Retiring owners of privately-held firms could use sell-offs as means to convert their potential (but uncertain) period incomes to capital gains by a tax-free exchange of securities, thereby earning shares of the combined firm.

Possibilities to Improve the Quality of Accounting Information

Lector univ.dr. Tinta Alice
Prof.univ.dr. Munteanu Victor
Lector univ.dr. Zuca Marilena
Universitatea Româno- Americană București
E-mail: a2c_vm@yahoo.com

Abstract

Quality requirements of accounting information can be derived implicitly from the fundamental principles of accounting practices stipulated under the Law of accounting.

Based on such legal frame, according to which the accounting should give an accurate picture of economic reality, we can conclude that quality accounting information is information obtained by the rules on property valuation and other accounting rules and principles.

Quality is defined by a set of attributes that determines the usefulness of information in decision making. The four main features are: comprehensibility, relevance (significance), credibility (reliability) and comparability.

In its search for a true image, accounting can and should produce qualitative improvements in its information supply. Growing demands of internal and external users require such improvement.

Key words: globalization process, quality, comparability, financial forecast.

JEL Classification: M41, M42

Accounting has become a vital tool in any trader's current life. In the same context, we believe that, in fact, accounting is the most important source of information on a nation's economic activity. Essential in the decision-making process and in post-decision analysis, accounting introduces means for the assessment of companies' performances.

The transition to a market economy requires major shifts in accounting. The implementation of the new accounting system in the Romanian economy has generated numerous and complex issues for the users of the accounting information. It is possible and necessary to improve the quality of accounting information, with direct influence on the

decision-making process (M. Niculescu – "Diagnostic economic", Ed. Economică, Bucharest, 2002).

The Law of accounting (Law 82/1991) does not define explicitly *the quality of accounting information*. "Accounting as a major instrument of knowledge, management and control of assets" (Art.2/Legea 82) is focused primarily on technical matters concerning the registration of various operations, processing and publication of information, the valuation of property and control of economic operations.

Quality requirements of accounting information can be derived implicitly from the fundamental principles of accounting practices stipulated under the Law of accounting.

Based on such legal frame, according to which the accounting should give an accurate picture of economic reality, we can conclude that *quality accounting information is information obtained by the rules on property valuation and other accounting rules and principles*.

It is not surprising to encounter the same perspective at the French regulator, given the source of inspiration for our accounting information. "Compliance with the procedures and rules in force enables the accounting information to reflect accurately business reality"(Celine Michailesco – "Qualite de l'information comptable", in vol. "Encyclopedie de comptabilite, controle de gestion et audit", Ed. Economica, 2000).

The quality criteria considered by the French regulator concern the compliance and accuracy of information. The compliance ensures intelligibility of financial documents and their comparison in time and space. The accuracy is a quality that covers both accounting records, which must be as accurate as possible, and the accountants, who should mirror the reality in a loyal and faithful way.

According to the *Anglo-Saxon standards*, **quality information** is relevant and reliable

information, useful for the decision-making process. As a summary of various approaches, we can conclude that, explicitly or implicitly, the quality of accounting information is related to its usefulness in decision making. The general framework for preparation and presentation of financial statements, issued by the International Accounting Standards Committee (IASC), the issue of quality accounting information is presented directly and explicitly. The first two parts of the general framework deals with the objective of financial statements and qualitative characteristics which determine their usefulness.

Quality is defined by a set of attributes that determines the usefulness of information in decision making. The four main features are: comprehensibility, relevance (significance), credibility (reliability) and comparability.

Intelligibility is the quality of information to be easily understood by savvy users (who have sufficient knowledge of economic and accounting) and interested users (the desire to study the information presented).

Relevance (significance) is the ability of information to influence the users' *decision*, modify it according to its retrospective or predictive value.

Relevant information is information that generates behavioral changes of beneficiaries, enabling them:

- To assess past and present events;
- To predict performance, financial condition and other aspects of business activity;
- To acknowledge and correct past developments of various aspects of business activity.

Relevance is dependent on the nature of information and its importance. The importance of information is designated by materiality, i.e. limit where the omission or incorrect declaration of information affects user decision.

Information may be considered significant if it exceeds (Professional judgment in enforcing the accounting standards, Ed. Economică, 2001):

- Approximately 5-10% of profit prior taxation; or
- Approximately 1-2% of turnover; or
- Approximately 1-2% total assets; or
- Approximately 2-4% own capital.

Obviously, such thresholds should be carefully valued per each separate case by involving quality aspects.

Credibility (reliability) is the quality of the information to be free of errors in terms of representation of reality and communication. To be credible information must:

- Represent faithfully the transactions and other events in the life of the company;
- Account the events and transactions in accordance with their substance and economic reality and not just according to their legal form;
- Be neutral, i.e. not be influenced;
- Be provided in compliance with the principle of prudence, i.e. it should express precaution in substantiating value judgments necessary for preparing estimates under conditions of uncertainty, so that assets and income are not overstated and liabilities and expenses are not understated;

Comparability - is a general attribute of any type of information that allows users to make comparisons over time and space.

Comparability in space implies the possibility of users to compare financial statements of related businesses. This implies certain uniformity in the area of accounting methods. Given that the choice of accounting methods belongs to the company (obviously within the limits of national or international standards) and the incidence of this choice on performance, it is essential for companies to submit financial statements, which detail the accounting methods used. The analyst needs also information on any change in accounting methods or procedures for their implementing. International rules require not only mentioning the change of method, but also the presentation of reasons for such change and its implications in terms of performance.

Comparability over time means the possibility of comparing successive financial documents of the same company. It involves certain permanence in time of accounting methods and the need to have the figures of the previous financial year.

These characteristics of information may be collected and ranked differently according to users' interests. In financial analysis, the focus is on the features of information, which concern relevance and reliability, without neglecting the requirements of comparability in order to assess companies' performance, financial position and their dynamics.

Given the facilities brought by the IASC, the importance of information from yearly accounts must be tempered. Measuring performance based solely on accounting information still presents a number of limitations:

- It has an historical character, especially when financial statements are published in a few months after their issuance, it ensures knowledge of past performance; it provides changes in delay;
- It does not provide information on the resource difficult to assess, but vital for the enterprise (human capital, "the hard core of competence" of the company etc.)
- It generates a cost of treatment, often very important in relation to the results.

Analyzing the aforementioned, we list below the most significant means which lead to the improvement of accounting information's quality:¹

1. Harmonization of accounting principles given the internationalization of business

Business internationalization and globalization of financial markets bring into discussion the issue of multiplication of accounting rules and differences arising thereof in terms of accounting treatment of certain operations.

In a time of intense activity in mergers, public offers of purchase, the issue of accounting and [depreciation of purchase difference (goodwill or overvaluation) has exceeded the area of the accounting environment, becoming a major financial problem. We should not disregard a number of issues, some very complex, for which harmonization can contribute essentially to obtaining a true picture. We consider items relating to:

- Change of methods for determining the net situation;
- Capitalization of development costs;
- Establishment and valuation of assets;
- Foreign exchange operations and financing - location.

Stock control bodies have determined that International Accounting Standards Committee (IASC) to restrict, within the accounting rules they publish, the number of options offered to companies and to specify the conditions of use. A major effort in this direction is necessary.

Pending a better harmonization of rules, it is imperative that Romanian companies face conditions of fair competition.

Therefore, it is necessary:

- To undertake an inventory of accounting methods that involve significant divergence from those of our major economic partners in Europe and worldwide;
- To highlight the aspersions in the accounting reform;
- Foreign companies operating in Romania - to submit the differences in accounting rules and which lead to disadvantages for the Romanian entities.

2. To define an overall conceptual framework and promote research of accounting principles to guide best options for their best applications

IASC has defined a conceptual framework to introduce accounting standardization. It is designed to help, in a deductive way, to obtain normative solutions appropriate to and accounting issues. Given the wide variety of legal environments specific in each country, an international conceptual framework has, naturally, a general character.

Such approach is also considered in our country, thus achieving the modernization of accounting legislation. This allows, on one hand, the connection to the specificities of each economy, such as keeping the spirit of European directives and recommendations of the IASC.

3. To ensure autonomy of accounting from the rules of taxation

Despite progress, taxation maintains several traditional positions that interfere with the accounting rules and methods. We underline in this respect the necessary distinction between normal and derogatory depreciation and the need to apply provisions in practice. Accordingly, the company must provide information, in the Annex, concerning the

¹ N. Tabără, E. Horomnea, C. Toma - „*Conturile anuale în procesul decizional*”, Ed. Tipo-Moldova, Iași, 2001.

distortions in the annual accounts caused by:

- Methods used to calculate separately the depreciations and in both tax and accounting perspectives;
- Tax treatment of differences arising from revaluation;
- Summary indicating the extent to which the profit or loss was affected by the application of tax provisions and their implications for equity.

Without supporting a total "disconnection" of accounting from taxation, there should be cleared off any interference between accounting and taxation. This could be achieved by requiring the registration with the Table of determination of the tax outcome of operations recorded in the accounts for tax reasons (redemption exceptions, provisions covered, etc.). Obviously, it is certainly the right of economic operators to implement a reliable system to explain differences and to allow the management to exercise adequate control.

4. To define and implement management accounting

Accounting is a system of organizing and structuring information providing, consequently specific processes, a set of data capable of meeting the needs of different users in real time. The current accounting system has not developed some economic information required by managers of companies, not being reflected some specific elements of economic activity.

Modern computing means allow the development of a multidimensional accounting, able to meet all objectives. It is important to obtain reliable information, intelligent, relevant and pertinent to permit a significant improvement in the measurement of management performance. This raises the need and possibility of introducing intermediate management balances and financing table.

Therefore, it is necessary to analyze the list of accounts and presentation methods that are required by the Accounting Law and the Regulation on its implementation, so they do not constitute a hindrance on effective use of accounting by economic operators.

It is necessary to give companies, as options, more flexibility in using accounting tool to meet the operational needs with a high

degree of mobility and specificity. We deem that this approach implicitly assumes a re-normalization of essential aspects of accounting.

5. To develop solutions to business applications on the difficulties of applying accounting principles

Making available the means necessary to meet business' needs is essential to improve financial information. For instance, we should remember the negative influence that the inflation process, specifically in the transitional period, carries on delivering a true image, making it necessary to use an accounting adjusted for inflation.

6. Comparative study on the practices of companies on international accounting principles

Comparative studies have already been made by international bodies or press organizations and private institutions.

However, research is needed on two levels, if possible, harmonized internationally and domestically:

- Internationally, a harmonized framework can be developed by research, questionnaires, criteria of choice for business and performance of accurate investigations of the accounting methods used by major global companies;

- On European or national level, more nuanced approach is necessary, that would reduce the degree of selection of the companies or based on samples of some particular points in certain sectors. Some attempts have been made by the European Union, study commissioned by Federation of European Chartered Accountants - FEE or nationally. These studies must be adapted in the wider context of an effort carried out internationally.

7. Publication of accounting and financial forecast

On European and international levels, companies develop and publish two forecast documents:

- Account for results;

- Financing plan.

Forecast information is still often criticized. One of the points at issue is that of discrimination in communication of provisional documents. There are opinions that support the need for confidentiality of these documents; it is the reason for which the principle of publication has been excluded.

The enforcement of this principle in such field is delicate (in particular equality between employees of the company and its shareholders is increasingly difficult to meet). Today it is necessary to develop the employee-shareholding employee, which cannot be to the detriment of other shareholders. Forecast information for employees should be published.

Moreover, it is understood the interest that a profitable company expresses with regard to the "publication" of its results. Immediate effects occur in terms of the exchange quotation of issued shares, attracting potential investors, entering new markets, etc. Obviously a different behavior will "promote" the economic operator in financial difficulty.

8. Active participation of the accounting profession in the development of accounting rules and economic growth of the company

The false idea according to which the accountant is the expression of "red tape" and the restriction of the economic operator remains what has always been: a lie. The strictly limited nature of most resources (except for, fortunately, human intelligence) requires the enthronement of the principle of economy, the effect maximum.

The development and enhancement of exchange of information regarding the accountant profession have always been beneficial in this respect. We suggest here a revival of national and international events by means of which communication becomes operational and efficient.

An improvement of the efficiency of international scientific events is possible through improved procedures for election of delegates and setting the criteria for competence and membership in such an institution.

Also, the transparency of action of international organizations and a better

preparation of meetings exercise positive influences on the development and strengthening of the prestige of the accounting profession.

9. The restructuring of accounting and financial information sources available to the public

The sources of accounting and financial information are diverse and dispersed, and often useless information is provided.

The consequences of such situation are manifold:

- Increased costs for business;
- Appearance and ambiguous interpretations of the elements of uncertainty in the management of the company;

The criteria *characterizing* the accounting information relate to:

- Rapid dissemination;
- Extent of dissemination;
- Availability in time and space.

The accomplishment of a structured system of information requires the establishment of data banks to centralize all accounting and financial information published by the company.

The following matters should be, however, clarified:

- the nature of stored information (annual accounts, interim statements, management reports);
- Broadcast manner (on request consultation in real time or delayed);
- Material means of access available to users (nature of terminals, accessibility etc.).

Although such development cannot happen on short term, it is inevitable with the development of modern computer technology, which facilitates obtaining information in real time.

10. Acceleration of development and publication of financial information

The acceleration of publication terms can be done in three ways:

- Acceleration of accounts' establishment;
- Acceleration of the process of publishing or making information available;

- Compliance with statutory deadlines for publication.

The accelerate accounts' establishment is the responsibility of companies and cannot be achieved only through proper organization of financial and accounting information-generating services. Currently, annual closing of accounts is seen by many companies as an unusual procedure that requires hard work of research, analysis and presentation of accounting information. Measures are needed to optimize procedures for closing the annual accounts, including obtaining intermediary reliable information. Several directions can be considered:

- Preparation of frequent intermediate situations (quarterly, monthly);
- linking financial accounting information with management information;
- Indication of materiality of information;
- Development of accounting functions to control and analysis of auditors;
- Acceleration of the information's process of publishing or making it available.

The delay in establishing the accounts requires an improvement of the publishing manners.

The acceleration of the publication process relies heavily on the communication policy of firms, which should not perceive financial information as a mere compliance with a legal obligation, but as a response to the information needs of different partners of the company.

The increased complexity of processes, together with increased degradation of information requires the decrease of its publication terms.

11. Simplification of financial information for the general public

We note that the information is not always appropriate to demands of the audience to be addressed. It is abstract for the general public given the subtleties of accounting rules and financial accounting language.

The legal framework of accounting information is, in fact, inadequate to business realities, which are different. Currently, information is monolithic. The companies' peculiarities are least considered.

This reflection re-launches the debate on the principle of unity of financial accounting

information. The type and content are essentially defined, irrespective of the information's broadcaster or recipient. Therefore, the need to reflect on the real needs of different groups of user

An analysis of the users' needs shows that segmented information according to recipients, useful in this context cannot be conceived as a system with several levels. This would include basic information for the general public and additional elements for different users.

The information for the general public could be formed from an abbreviated report, together with a vocabulary and explanations to make the financial and accounting language available.

12. Establishing a comparison of the requirements on financial information

The obligations on financial information differ from country to country. Therefore, the following aspects are significant:

- Content of annual financial information;
- Internal information requirements;
- Permanent information;
- Dissemination of financial information;
- Time of publication;
- Control of accounts;
- Obligations continuous information are more or less strictly defined;
- Information is more or less easily and directly accessible by country, but as a general rule, anyone, who wants information, can acquire it;
- The publication terms are highly variable, but they are not related to the extent of obligations: countries that publish more information are not necessarily those which publish it at the earliest, except U.S.;
- Finally, the notion of reliability of the accounts is seen differently by groups of countries: Anglo-Saxon, Continental Europe (Germany, France) and others (Switzerland and Japan).

It can be noticed that financial information published by companies depends on the importance of that country's financial markets. The assessment of financial markets has led to defining broader obligations on financial information in Anglo-Saxon countries.

Meanwhile, in its search for a true image, accounting can and should produce qualitative improvements in its information supply. Growing demands of internal and external users require such improvement.

THE ROLE OF THE ACCOUNTING AND AUDIT STANDARDS IN THE GLOBALIZATION PROCESS

Tulvinschi Mihaela

Stefan cel Mare University of Suceava, Romania,

e-mail: mihaelat@seap.usv.ro

Abstract

The audit rules are necessary, they being able to be useful as much for the auditors and for the audit beneficiaries. For the auditors, the rules make first of all a support item, a guide or a support in applying the methods, techniques, procedures and second of all a support and justification item, for the case where difficulties show up. In what regards third-parties, these will be assured that the audit is made by unitary criteria, no matter by whom it is made.

Even if solicited by various firms, in order to raise the credibility of the financial situations they published, the audit process cannot take place at random, without the existence of legal regulations. Due to the increasing importance the audit gets in developing any business, in time imposing the necessity to make professional specific standards, that are to insure a minimum quality of the audit process an a certain performance to the auditor profession.

Key words: audit, audit rules, report rules, audit process

JEL Classification: M41, M4

1. The national audit regulations

In Romania, the audit as a regulated profession is known after the year 1990. More exactly, terms as “financial audit”, “financial auditor”, “financial audit standards or regulations” have been introduced in our vocabulary after the adoption of the accounting law no. 82/1991, and also after publishing its appliance regulation in 1994.

Of a great importance for the further financial audit, financial auditor free profession, accounting expert and authorized accountant professions’ development was

publishing, in the Official Monitor no.243 of August 30th, 1994 the Government Ordinance no. 65/1994 regarding organizing the accounting expertise and authorized accountants activities, approved by law no. 42/1995 referring to the attributions of the Romania Authorized Accountants and Accounting Experts Organizations (CECCAR) to make regulations regarding the professional activity an ethic behavior of the accounting experts and the authorized accountants.

The normalization efforts of the CECCAR, combined with the support of the academic specialists and the accounting commissioners from France had, as an effect, publishing the “Financial audit and accounting balance certification rules”, due to the National CECCAR Conference Decision no.3 of October 23rd, 1995. The reference rules of the financial audit were classified as follows:

- accounting rules, or the common rules for all the ones that establish, control and use the accounts
- proper audit rules, or an assembly of rules established by the professional authority the auditor reports to in exerting his mission.

Also, the proper audit rules are divided in: professional working rules, opinion reporting rules and general professional behavior rules.

A problem that must be approached is connected to the audit normalization process. This process has, in general, 5 stages:

- first of all, on a national level, there must be a normative document that establishes a professional organization, that disposes of disciplinary powers to its members;
- second of all, there must be an professional ethic code, that stipulates the obligation of the organization members to apply the rules in their missions and that stipulates creating an organization (committee, commission, workgroup) which has the task to make the rule project;

- that organism makes or coordinates the research efforts and the necessary consultations, and presents a final version of the recommendations, version that is put under debates and is to be approved by the supreme forum of the professional organization (the only one that disposes of full control and punishment powers over its members);

- those made rules become applicable, and for that the professional organization adopts adequate publishing, informing and forming means (courses, seminaries, debates);

- the last episode of the audit normalization process is organizing the quality control. According to international practices, the external quality control can be organized on 3 ways:

- a first method is the one where any society or expertise/audit cabinet accepts to be periodically controlled (usually once every 3 years), friendly, by another society or profile cabinet;

- another method is the one that means direct involvement of the professional organization, that is the case where it specifies a number of cabinets or societies that accept to do, temporarily, only quality control; that means that the mentioned cabinets are not working, in the considered period of time, as normal audit or expertise cabinets, dedicating themselves only to the control of other cabinets or societies they must survey;

- finally, there is also the method where the professional organization creates, within its superior structures, a specialized organization (for example, the General Control Department of the CECCAR), which has own coordination personnel, but which can also use controllers submitted in the national list and section lists.

The applicable rules in the financial audit are: accounting rules, control rules and proper audit rules. These rules are supported by internal regulations, but also by international and European recommendations.

The accounting rules that must be respected for the audit are the common ones for all the ones that are involved in accounting, make accounting balances, verify, certify or use financial situations.

The control rules are an assembly of rules defined by an authority exterior to the expertise or audit cabinets, and can be a national or international cabinet. These rules

will allow the use homogenous criteria and methods in all audit missions.

The audit rules are divided into three categories: general professional behavior rules, professional working rules and report rules.

The general rules determine the professionalism degree an auditor must comply with. Most of the external audit missions are made by people that comply with certain demands connected to professional experience. In most of the countries, people that wish to practice as auditors must adhere to an organization that is recognized for its professionalism in the domain. The more the audit users want a higher professional level of the auditors, the more exigent conditions will be imposed for a person to be part of the mentioned organization. From this point of view, most of the professional organisms impose these requirements:

- requirements regarding professional training: special studies in the financial-accounting domain, preferably university studies specialized on accounting;

- experience regarding specific practice: before giving the free- practice right for the audit domain, the candidates must have a minimum specific practice number of years (for example, in an audit cabinet or accounting expertise)

- promoting a specific exam: this consists of a complex testing, where the accent is put on the disciplines of the accounting domain.

The professional working rules are made for the auditors in professional working guides that help in understanding the way in which audit evidence are collected for making opinions.

The report rules aim only for those audit missions that are finalized by a written report. These rules include, mainly, the rules that are to be respected in conceiving and making of the reports regarding financial situations of the economical agents.

2. Evolution of the international audit rules

One of the characteristics of the financial audit is that at least 2 auditors, found in the same situation will have to reach at the same conclusions. In order to assure this homogeneity, the audit companies and professional organizations have taken

measures that have been concretized as unitary methods' adopting and common approach. This does not mean that all the auditors act strictly identically, each cabinet developing methods and techniques that will lead to reliable conclusions.

The international rules that regulate the audit profession are American, and this is due to the fact that the USA is one of the countries with the most vast experience in what regards the financial audit domain.

The first financial audit standards (ISA) were made in the years 1939- 1951, by the AICPA, by a permanent committee regarding audit procedures.

By the year 1972, the actual standard collection was finalized, and the name of the committee was modified into the Audit Standards Executive Committee (Aud Sec), this also having the role to interpret the generally accepted audit standards (GAAS). In the year 1978, the AudSec was replaced by the Audit Standards Board (ASB), which had the task to establish the main rules the financial auditors must respect in their missions.

The AICPA established the professional conditions an authorized accounting expert must comply with. This institute has made studies and researches, has published papers regarding numerous and various subjects of the accounting, audit, certification, insurance and accounting/ fiscal consultation domains. Within the initiatives made by the AICPA in order to promote the services offered by authorized accounting experts are included: national publicity campaigns, making of professional certificates and efforts made by the Certification Services' Special Committee in conceiving and promoting new assuring services.

The AICPA, by its committee, has made new standards and rules that can be classified as follows: audit standards, compilation and reviewing standards, other certification standards, the professional behavior code.

The ASB is responsible for publishing certain recommendations regarding various subjects connected to the audit. These recommendations are called Statements on Auditing Standards.

The Accounting and Review Services Committee makes recommendations regarding the responsibilities of the accounting experts,

when these are involved in making financial situations of companies that are not listed and that do not make the object of an audit. One of the standards made by this committee, made in the year 1978, replaces all the former standard formulations regarding financial situations that have not made the object of an audit. This standard refers to two types of specific services and those are:

- the case where the accounting expert helps the client to make the financial situations, without offering any assurance in what regards the contents of the situations (compiling services)
- the case where the accounting expert makes a review and applies the analytical procedures which offer a relatively reasonable base in expressing a limited assurance that there are not significant modifications to be done in the financial situations (reviewing services).

In 1986, the American Authorized Accounting Experts Institute has published statements on Standards for Attestation Engagements. The purpose of this publication is double. On one side, it offers a reference area, which is to be respected by the standardization organizations in their standard defining activity, aiming only to specific certification services. On the other side, it offers an orientation area for the practitioners, in the case where no other standards exist.

The professional behavior code was made by the Committee on Professional Ethics, which is part of the AAAEI. The behavior rules apply to all the services made by the accounting experts and offer a reference area for the more technical standards.

In Great Britain, the main rules and regulations for the audit were made by the following professional organisms: The Chartered Institute of Management Accountants, The Institute of Chartered Accountants in England and Wales, The Chartered Institute of Public Finance and Accountancy, The Association of Chartered Certified Accountants, The Institute of Chartered Accountants of Scotland. The five mentioned professional organizations, members if the International Federation of Accountants, have determined clear regulations for the audit, that are mostly about technical standards for the audit, but also adopting an ethic behavior code. One of the

most important measures taken in GB aimed to monitoring the quality if the made audit, especially for the public interest firms. After the monitoring was made, the existent relation between the auditor and the client was analyzed, and the way in which it affected the professional reasoning of the auditor and the audit opinion.

In France, the accountant profession is regulated by the Superior Council of the Accounting Experts' Order (CSOEC), and the National Accounts Commissars Company. The last mentioned organism is a member of the European Accounting Experts Federation, the International Accountants Federation and the International Accounting Standards Board. The main objectives that the professional organizations in France aim to are:

- developing the accountant profession in order to reach a high-competence level;
- assisting the state institutions in the accounting normalization process;
- organizing training courses;
- cooperation with the international institutions (EU, World Bank, BERD) in order to make normalization and harmonization projects for the accounting and audit domain.

On an European level in the year 1989 the European Accounting Experts Federation (FEE) was established, located in Brussels, made by the reunion of the European Accounting Experts' Union and the Accounting Experts Group of the CEE. The FEE published recommendations regarding the accounting reviewing of the ASB.

At the base of the juridical function of the audit, on the European level, an important role is played by the European directives, the most important being the 8th directive of April 10th 1984 regarding the legal control exerting conditions of the synthesis documents. This directive is considered to be the third concretization of the European accounting harmonization (the first two being the 4th directive in 1978 and the 7th in 1983). The objectives of the 8th directive are:

- the harmonization of the qualifications of the persons able to make the legal control of the synthesis accounting documents;
- assuring a increased level of theoretical knowledge and capacity to apply this knowledge in legal control practice;

- authorizing the persons and societies to do legal control.

The most important international organization in the audit domain is the IFAC, created in 1973 in New York. The mission of the IFAC is to develop the accounting and audit profession in order to allow it to assure superior- quality services for the public interest. The IFAC is a non-profit, non-governmental professional organization. By its cooperation with member and regional organizations, the IFAC initiates and coordinates the international normalization efforts from a technical, ethical and educational point of view. Within the IFAC, the permanent technical commissions are activating, in the following domains: education, ethics, financial and management accounting, information technology, international audit standards, international audit practices, international standards on professional services' quality, international standards on reviewing missions, relations with member organizations.

The International Audit Practices Committee is the department designated by the IFAC to make and develop the standards and declarations regarding the audit activity. The IAPC, by its activity, tries to harmonize the audit practices of the IFAC member countries and to minimize major differences, developing internationally applicable audit standards. These standards contain base principles and procedures, and also supplementary explanations and indications.

By the issued standards, the IFAC assures the international uniformity of the audit practices. In order to support member countries in implementing the international audit standards, the IFAC, by its IAPC, follows to promote and adapt these standards voluntarily. In order to obtain as much diverse opinions as possible, subcommittees made of specialists that are not IAPC represented can be made.

The international audit standards apply to the audit of the financial situations or in the case of connected services. International standards contain base principles and procedures, such as supplementary explanations and indications. For extraordinary situations, the auditor can consider detouring from the stipulations of one or more standards to reach the objective of its

activity in a more efficient way. In such situations, the auditor must be prepared to justify his detour from the international audit standards.

The international audit standards are exclusively applied to all the significant aspects. Any limitation of the applicability area of the international standards is clearly stipulated in the introductory paragraph of each standard. In some cases, the standards have at the end a paragraph that stipulates the specification of the public sector Committee. In the case that a standard does not contain such a paragraph, it is applicable to all the significant aspects of the public sector.

The international audit standards do not have a greater power than the national regulations of a certain country. If the national audit rules of a member country differ or are in conflict with the international standards, the professional organizations of the mentioned country must assure respect for the obligations of the IFAC members established in the constitution document.

In conclusion, it can be affirmed that the globalization and internationalization of the accounting profession have contributed to the development of the international audit standards. In the conditions of an obvious globalization, the investors and the capital markets' regulation organizations demand for more and more complete audit rules that are to attest the credibility of the world financial situations. The international audit standards are an assembly of reference practices created to improve the quality of the financial information on the international markets.

3. Audit standards in the globalization process

The actual world, considered as an assembly, but mostly the actual economical world is in a continuous movement, manifesting as a permanent changing process. Today, we assist at a powerful globalization of commercial changes, of national economy forces and the never before growth of the financial markets' importance.

Within the nowadays globalization process, when the economical borders of the countries virtually disappear, and the businesses get a more international characteristic, the economical world has

created an universal language of business, concretized in international accounting and audit standards [7].

In a globalized world, communication in the economical language in general, in the language of accounting and the one of financial audit especially demands unity in conceiving the organization and leading methods for the commercial, administration and resource control companies, and also unity of the principles and accounting methods to develop, present and audit the financial situations.

The International Standards of Accounting Reporting group (ISAR), which gathers more than 100 countries within the 25-27 of September 2002 conference but also in the 2003 conference, has identified the obstacles the entities are facing in accounting leadership and quality financial information supply, and also some of the major difficulties that make hard to run the globalization process. Regarding the organization and leadership methods of the companies, within the mentioned conferences, the Corporate Governance concept was suggested (GC).

The CG, as an organization and leadership method for the commercial companies that stake the way the globalization goes on, is presented in the profile scientific literature by the Organization for Economic Cooperation and Development- OECD defined as: "the Corporate Governance is expressed by a set of relations between company management, its board, its shareholders, other title owners; nevertheless, it offers the structure that all the methods are established to reach these objectives and monitor the desired performances" [4]. The Corporate Governance is an art of leading, which varies in each country with the national legislative regulations, the complexity of the major stakeholders and specific conditions of the company, the complexity degree of the business, world economic status.

The FEE published, in July 2003, a very important document called „Financial Reporting and Auditing Aspects of Corporate Governance”, in which the followed are mentioned: „The FEE considers that the recommendations regarding Corporate Governance must be revised, so that they become efficient for the training and presentation of quality financial information,

by applying the International Financial Reporting Standards.

The Corporate Governance is one of the numerous mechanisms that stimulate economical and social development along with [10]:

- the commercial and consume rights rules;
- respect to ownership right
- respect to the contract rights and obligations
- fiscal and cash discipline.

The principles of the corporate governance are mentioned in the IAS no. 260, "Communicating the Audit Aspects to the governance responsible". There is no unique corporate governance model at a global level. The structures of the leading boards and practices vary with each country. A common principle is that the entity must dispose of a governance structure that allows the board to exert an objective reasoning regarding the society business, including independent financial reporting. The corporate governance principles focus especially on the companies that are listed. Problems that appear along the financial situation audit must be declared to the governance responsible. Audit problems, highly important to the governance are those problems that appear in auditing financial situations and which, in the auditor's opinion, are also important and relevant for the governance responsible in surveying the financial reporting and information presentation processes [10].

The IAS 240, "responsibility of the auditor to take into consideration fraud and error in a financial situations audit engagement" stipulates that the primary responsibility in fraud and error prevention belong to the governance responsible and the board of the entity. The board, under the survey of the governance responsible, must create an adequate climate and establish correspondent controls for preventing and detecting the frauds and errors within the entity.

The auditor must take into consideration the problems that appear as a consequence of the financial situations' audit and communicate them to the governance responsible. Such problems may refer to [4]:

- modifying the accounting policies and practices;

- possible effect over the financial situations of significant risks;

- audit adjustments, recorded or not by the entity, that have or may have a significant impact over the financial situations of the entity;

- important uncertainties that may doubt the capacity of the entity to continue its activity;

- disagreements with the board regarding certain problems which, individually or cumulated, could be important for the entity's financial situations;

- other aspects, such as significant debts in the intern control, frauds that involve management, that elicit the interest of the governance responsible.

IAS 315, called "comprehension of the entity and its environment and evaluating the significant misrepresentation risks" warns the auditor and highlights the importance of intern control, identifying and evaluating the risks of the financial situation's existence risks and misinterpretations, and also the opportunity of a systematical and permanent communication with the persons tasked with governance and management.

4. Conclusions

It is remarked the fact that the international audit rules make an eloquent reference in harmonizing with the international standards and the European directives of the financial audit. The audit standards taken by our country apply in auditing the financial situations by financial auditors, members of the CECCAR. Financial auditors, persons or companies, activate in the domains of financial audit, internal audit, and also financial, accounting and fiscal consultancy, assuring financial and accounting management and professional special training in the domain.

In conclusion, one fact must be highlighted: that internationally there are clearly established objectives in what regards corporate governance, which is taken as an economical phenomenon in the long road of globalization. In almost all the countries there are preoccupations and direct actions that aim to the protection of the shareholders, power balance within the company boards, extension of the legal audit and audit committee making,

organizing internal control, understanding of the transparency significance and financial information quality. In this context, the role is obvious for the globalization process of the International Accounting Standards, the International Financial Reporting Standards and the International Audit Standards.

Resolving Ethical Dilemmas in Financial Audit

Professor PhD Turlea Eugeniu
Academy of Economic Studies Bucharest
eturlea@yahoo.com

PhD Student Mocanu Mihaela
Academy of Economic Studies Bucharest
mihaela.g.mocanu@gmail.com

Abstract

Resolving ethical dilemmas is a difficult endeavor in any field and financial auditing makes no exception. Ethical dilemmas are complex situations which derive from a conflict and in which a decision among several alternatives is needed. Ethical dilemmas are common in the work of the financial auditor, whose mission is to serve the interests of the public at large, not those of the auditee's managers who mandate him/her. The objective of the present paper is to offer support in resolving ethical dilemmas in financial audit. Methodologically, the paper applies an innovative moral reasoning framework – the Potter box – to a scenario frequently encountered in financial audit. Authors conclude that the Potter box can be a useful tool for both professionals and academicians in thoroughly investigating ethical decisions already made or in analyzing alternative courses of action.

Key words: financial audit, dilemmas, decision-making process.

JEL Classification: M4, M42

1. Introduction

Financial auditors are highly respected professionals who offer credibility to the financial statements they audit and through their attest work ensure trust in the marketplace. Although mandated by the management of the auditee, financial auditors are required to represent the interests of the public at large: creditors, investors, business partners, government etc. However, their mission cannot be accomplished without ethics, especially because, throughout their career, auditors face various pressures both

from within the company and from without it. They must often make difficult decisions when faced with ethical dilemmas.

Generally, the literature in the field connects the process of resolving such dilemmas with moral development frameworks such as those of Kohlberg, Gilligan etc. Moreover, widely spread in the auditing literature is the model of Jones [4]. The present paper aims at providing a fresh perspective on the topic of solving ethical dilemmas. For this purpose, the authors apply an innovative moral reasoning framework that has successfully been used by specialists in the media – the Potter box.

The paper is organized as follows: the first section brings arguments that support the need for ethics in the profession of financial auditors. Then, authors define the notion of “ethical dilemma” and briefly discuss ethical dilemmas in financial audit. The following section presents the instrument promoted in this paper, namely the Potter box – a four-step moral reasoning framework. Then, the paper describes a situation that creates an ethical dilemma for the auditor involved. This situation is then analyzed by using the Potter box. The final section of the paper presents the authors' conclusions.

2. The need for ethics in financial audit

Financial auditors report on the truthfulness of financial statements, by stating their opinion on whether these statements provide a true and fair view of the audited company's financial position and performance. Financial auditors are not regular service providers, but offer an intangible good for which no proper price can be meaningfully set. Their work offers credibility to the financial statements and thus ensures trust in the marketplace. The

beneficiaries of the audit work are not only the audited companies, but also the investors, the creditors, the governmental institutions and other stakeholders.

Thus, the financial audit profession has characteristic features that inherently connect being a good professional and practitioner with having a proper ethical behavior. First of all, auditors are paid by the auditee's management, not by those whose interests they represent. Second of all, the profession emerged rather recently compared to other professions such as medicine or law, thus lacks the history, customs and self-understanding of traditional professions. Third, the responsibility of financial auditors mainly consists in seeking out and revealing the truth about the financial position and performance of the audited company. Last but not least, auditors play the role of "watchdogs" in the market economy, by protecting the interests of absentees investors, thus their judgment should not be impaired by personal or financial interests. Under these circumstances, the role of financial auditor seems very difficult to play. However, ethics provides a valid solution to the above mentioned structural problems of the profession [1].

3. Ethical dilemmas in financial audit

In general, an ethical dilemma is a complex situation a person faces in which a decision must be made about the adequate action to be taken [2]. A dilemma may derive from the conflict between the rightness or wrongness of the actions and the goodness or badness of the consequences of the actions. In other words, doing what is morally right apparently results in a bad outcome and doing what is morally wrong seems to lead to better effects. From another perspective, an ethical dilemma is a conflict between at least two ethical principles both of which could lead to an equally good or equally bad outcome. In such a situation, obeying one principle leads to transgressing another, whereas both principles seem equally valid [6]

Over time, philosophy has argued in favor of and against many different ethical principles. This paper briefly presents some of the most representative and disputed ethical principles [3]. First of all, according to Aristotle, moral virtue is a middle state between two extremes. Thus, this view promotes the ethical principle of balance, moderation, temperance, the so-called "golden

mean" referring not only to the appropriate quantity, but also to the appropriate time, appropriate public, and appropriate way. Second of all, Kant's categorical imperative dictates to act according to that principle that one desires to become universal law. This ethical principle is to be followed at the expense of all natural tendencies and socially accepted standards, thus encouraging obedience and loyalty [3].

Third, Mill's principle of utility dictates that one must seek the greatest happiness for the greatest number of people, or in other words, the best balance of good over bad. Last but not least, Rawls states that justice is present where no social differences are taken into consideration. The so-called Rawls „veil of ignorance" eliminates roles and social differences, thus creating an imaginative equality, and asks the decision-maker to place his/herself in the position of the people his/her decisions may influence. All these ethical principles have been subject of intense debate and can be both embraced or rejected by an ethical agent [3].

In financial audit, the ethical requirements are set, at international level, by the Code of Ethics for Professional Accountants, issued by the International Federation of Accountants (IFAC). According to Section 100 of this Code, the financial auditor is required to comply with the following fundamental principles: integrity, objectivity, professional competence and due care, confidentiality and professional behavior [5]. The principle of integrity is equivalent with straightforwardness and honesty in all professional and business relationships, while the principle of objectivity requires that no bias, conflict of interest or undue influence of others overrides professional judgment of the auditor. Moreover, the financial auditor is required to be competent and to comply with all relevant laws and regulations, thus maintaining the reputation of the profession.

Financial auditors face a diversity of ethical dilemmas, starting with the first steps in their career. For instance, a junior auditor recently hired may receive a suggestion from a senior to sample the files instead of analyzing them all (as instructed by the partner), because otherwise he/she would spend twice the time budgeted for that specific task and thus he/she might be in danger of being considered

incompetent. Or it may happen that a client asks the auditor to perform less and less attest work, by giving up financial audit first in favor of a limited review, then in favor of a compilation, although professional judgment and skepticism would require to thoroughly perform a financial audit. There are similar numerous cases in which such pressure on the auditor puts him/her in the position of making a difficult decision.

4. Resolving ethical dilemmas

Several frameworks have been developed as aid for resolving ethical dilemmas, not only in financial audit, but also in various other areas: medicine, media, social work, research, public service etc. The framework most widely used in the specific area of financial audit consists in the following six-step approach [2]:

- (1) Obtain the relevant facts.
- (2) Identify the ethical issues based on the identified facts.
- (3) Determine who and how is affected by the outcome of the dilemma.
- (4) Identify the alternatives available to the person that must solve the dilemma.
- (5) Identify the likely consequences of each alternative.
- (6) Decide the appropriate action.

Although this approach is rather simple and easy to apply, the present paper promotes another framework – the moral reasoning framework of Potter. This framework encourages the innovative ethical analysis by identifying four dimensions that support reasoning in case of ethical dilemmas.

Figure 1 displays the Potter box, with its four elements:

- (1) Defining the situation;
- (2) Identifying values;
- (3) Establishing principles;
- (4) Choosing loyalties.

Figure 1: The Potter Box

Source: [3]

Thus, according to the Potter framework, the first step in the ethical decision making is the accurate definition of all facts of the issue at hand. Second, the analyst should identify the most important values that influence the discourse and the reasoning in moral matters of the decision-maker. The third step is the explicit use of an ethical principle, otherwise the conclusion is considered not to be morally justified. Last but not least, the analysis includes also the choice of loyalties by the decision-maker.

The use of this framework is particularly useful in clarifying ambiguous situations or contradictory loyalties. Being aware of the values that drive the thoughts and actions of the decision-maker is also critical in avoiding taking fast decisions, without proper reflection, based on personal preferences or unexamined prejudice. However, the moral reasoning framework of Potter cannot justify immoral behavior. The model serves only in circumstances in which several professional values are equally credible and can legitimately compete to one another. Once identified, the values can be validated in the third and fourth quadrant, with the help of principles and loyalties.

5. Case study

For the purpose of applying the moral reasoning framework previously presented, this section analyzes, by using the Potter box, a representative scenario that poses an ethical dilemma to the financial auditor. This scenario is inspired and adapted from one of the ten cases presented for discussion in Chapter 5

„Acquiring good ethical judgment” of the work ”Understanding Accounting Ethics” by Cheffers and Pakaluk. These cases, including the one discussed in this paper, are taken from actual forensic accounting practice, and are meant to develop the reader’s „sensitivity” to the ethical dimensions of the accounting and auditing profession [1].

The chosen case study emphasizes a problem that often challenges financial auditors in their daily work: „How do you do your work – when you don’t have the time?” The case is approximately the following:

Sara Johnson is an experienced partner in a CPA firm, whose largest audit client is a mental health provider, VitaCare. Sara deeply admires the president of the audited company, William York, a good friend of hers from college, who, for humanitarian reasons, had given up a well-paid job in order to take on the management of VitaCare.

VitaCare is a recurrent client of the CPA firm, and, as in past years, it mandated the audit company to perform a review as at the 30th of June, required by the creditors of the auditee. The deadline for the auditor’s report is the 15th of August. VitaCare’s system relies on Medicare reimbursements for its revenues and due to the importance of these reimbursements, Sara plans to personally review the reimbursement documentation. However, Sara and VitaCare agreed upon the fact that these papers will be sent to her on the 10th of August.

This year, however, on the 10th of August, William calls Sara to explain that the papers will be delayed, due to the fact that the person in charge with preparing them is ill. They both state their commitment to finish the review on time. However, a few days later, Sara receives another call from William, who announces that the papers will be even more delayed. Once again, both Sara and William reaffirm their commitment to finish the review in due time. It is not until the 14th of August (one day before the deadline) that Sara receives the required documentation, together with the apologies of William, who emphasizes his need to have the review delivered by the end of the 15th of August.

Unfortunately, when Sara received the papers in the late morning of the 14th of August, she did not have the time to look at them. She had lunch planned with her son, who had just returned from an overseas trip. After lunch, she had an interview with a job candidate and in the

evening, she had to attend a party for her husband in another city that she could not cancel, since her husband and she have recently had some issues.

Given these facts, the question is what should she do, how should she deal with this situation.

First of all, according to the moral reasoning framework proposed by Potter, one should carefully **define all facts that build up the situation**. Thus, the case presented is that of an audit partner that cannot fulfill her responsibilities concerning a review of the financial statements as at the 30th of June, due to time limitations. Critical aspects of the presented situation are the following:

- the auditee is a recurrent client;
- the audit partner and the manager of the audited company are old friends; moreover, the audit partner carries great admiration for the manager;
- the deadline is very tight, thus the time pressure is high.

All these aspects may represent threats to auditor independence. The Code of Ethics for Professional Accountants stipulates that the auditor must have not only independence of mind, but also independence in appearance. Independence of mind is the state of mind that permits an individual to act with integrity and exercise objectivity and professional skepticism. Independence in appearance means avoiding facts and circumstances that may lead a reasonable and informed third party to think that the virtues of integrity, objectivity and professional skepticism have been compromised.

In this case, both the requirement of independence in appearance and that of independence of mind may have been endangered. The fact that the auditee is a recurrent client poses familiarity threats, while the feelings of admiration and friendship that the audit partner holds for the manager of the auditee create a self-interest threat. Time pressure is also an important aspect that may tempt the audit partner not to carry out her work (premature sign-off).

At a first level of analysis, it is obvious that Sara faces an ethical dilemma:

- to sign off the papers without reviewing them would mean to infringe the principles of integrity and objectivity, since such a decision would be based on the trust in

William and in her positive experience from the analysis of similar papers in past engagements;

- to explain to William that, unfortunately, she cannot deliver the review report within the deadline, due to time constraints would mean to break her promise made to her friend, but in this case she would act with integrity and objectivity;

Once the situation is defined, in order to solve this ethical dilemma, it is necessary to **identify the values, the principles and the loyalties that compete with each other in the decision-making process** of the audit partner, Sara Johnson. Thus, what are the conflicting values in this case? It is important to note that values form the reference framework in which theories, decisions and situations make sense to people. They influence the moral discourse and judgment of individuals and ultimately generate behavior.

For Sara, the value that may drive her decision in this particular circumstance is, on one hand, friendship. Friendship is accompanied by trust, respect, affection, and admiration. The ethical principle that validates this value could be to maintain mutual trust in friendship relationships, thus breaking William's trust or not trusting him would be unacceptable, since in this manner, this principle would be infringed. From this perspective, her loyalty would be directed to her friend. From this perspective, based on the identified value, principle and loyalty, the ethical dilemma of Sara would be solved by signing off without reviewing the documentation on Medicare reimbursement, especially that the long term relation with the client does not pose any suspicion of misstatement or omission in this audit area.

On the other hand, Sara's values could be integrity and objectivity. The Code of Ethics for Professional Accountants define integrity as straightforwardness and honesty in all business relationships, while objectivity allows no bias, conflict of interest or undue influence affect professional judgment. The principle that validates these two professional values (integrity and objectivity) would be to always offer correct and objective information. By the choice of integrity and objectivity as driving values, Sara would also assert her loyalty for the CPA firm and thus for the profession. As a consequence, the course of action that conforms to the identified values, principle and loyalty would be

for Sara to honestly state her impossibility of issuing a review report, instead of delivering it without properly analyzing all necessary documentation (as in the first alternative provided above).

Of course, the debate can be enlarged. There are also other alternative courses of action for the audit partner. First, Sara could ask some of her fellow partners to work late hours on the 14th of August in order to support her in delivering the review report. However, they may not have the necessary experience, competence or information for performing the analysis of the reimbursement papers. Second, Sara could discuss with the creditors of VitaCare and ask for an extension of the deadline.

However, this could also be inappropriate, since, on one hand, this is not her responsibility, and, on the other hand, it would create suspicion among creditors and eventually have negative consequences for VitaCare. At most, she could suggest William to negotiate with the creditors an extension of the deadline for the review report. In fact, Sara cannot be blamed for not respecting her contractual obligations, because without proper documentation from the client, her job is impossible to perform within the time limits. The responsibility of providing the papers for review in due time (on the 10th of August) belongs to the audit client and the time pressure thus generated is due solely to his tardiness.

This analysis, performed with the help of the moral reasoning framework of Potter, does not offer a firm solution on for the ethical dilemma at hand. However, it does clear up the underlying issues of the decision-making process, by bringing to light the conflicting values, principles and loyalties on which different courses of actions are based. The analysis was performed from a micro-level perspective, namely from the perspective of a complex individual, with a complex life that includes not only the work as auditor, but also important personal relations with family and friends.

6. Conclusions

Ethics is inherently connected to the work of financial auditors. Such professionals find themselves in a rather unusual position: of not

being paid by the ones whose interests they represent, with whom they do not even come into contact. Moreover, the auditing profession is young compared to others and its mission, although noble, is a difficult one: seeking out and revealing the truth about the financial position and performance of the audited company. Through their work, auditors protect the interests of the investors and ensure a climate of trust in the marketplace. Without ethics, surmounting this difficult position and fulfilling these requirements are nearly impossible.

In fact, auditors are confronted with many different pressures: time pressures, budget pressures, competition-related pressures, litigation risks etc. that may lead to complex situations in which delicate and difficult decisions are to be made – the so-called “ethical dilemmas”. In such situations, the decision-making process is a very complex one, since not only the auditors’ values, but also their principles and loyalties are critical for the final choice. The Potter box, consisting in four elements: the situation, the values, the principles and the loyalties, can be used as an instrument for making decisions that can be supported by solid arguments, since values are validated in the third and fourth step (by the choice of principles and loyalties).

Therefore, this moral reasoning framework can be successfully applied in financial audit too, making professionals aware of their ethical position.

Principles for factoring transactions accounting and tax

Viorel Turcanu

Moldovan Academy of Economic Sciences, Professor, Dr.Hab,

Anna Zachernicinaia

Moldovan Academy of Economic Sciences Doctoral Candidate, auditor

Abstract

The up growth of business rivalry at the consumer and services markets make many of the suppliers grant delayed or deferred payments to their customers and act as creditors who thus accept credit, exchange and interest risks. It results in the suppliers' floating assets withdrawal and has a negative impact upon their financial statements showings. Factoring is one of the ways to release funds that have been frozen on accounts receivable.

Key words: factoring, the adherent, financial risk, accounting tax, financing

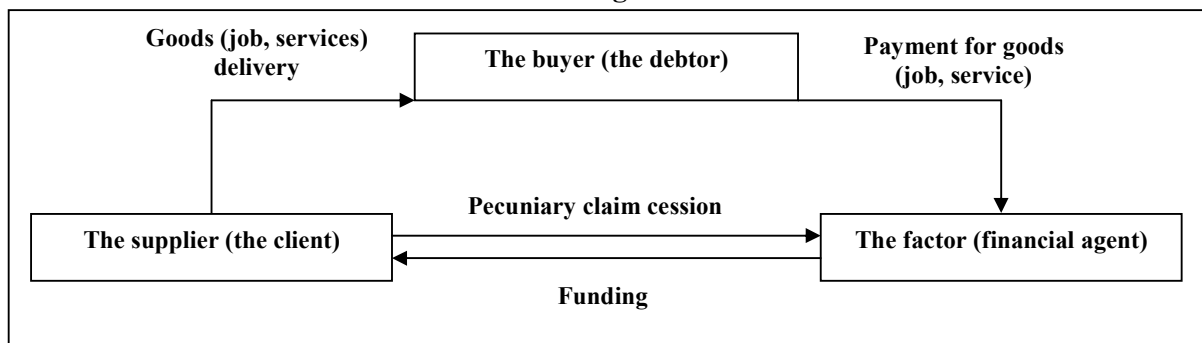

JEL classification: G 32

1. Introduction

Factoring is a kind of financial service that commercial banks or their subsidiaries (factors) render to small and medium business (clients). In factoring operations the client assigns the right to claim debts to the factor and the factor partially pays the client's claims to their debtors about 70 to 90% of the total debt value before the payment is due. The remaining sum, less interest rate, is paid when the debtor pays his debt off.

Chart

How factoring works

2. The history and the mechanism of the factoring

Factoring has its origins in the 17th century as a reseller operation that later on became a form of crediting. Factoring has been

widely practiced abroad as a tool to protect civil circulation property and financial interests by factoring banks and factoring companies. Our commercial banks first factoring operations date back to 80s. Today factoring transactions are governed by

legislation and are widely practiced in some ex-soviet countries such as Russia, Ukraine and Belarus. Moldovan factoring market is still incipient. Operating commercial banks' licensed activities include factoring transactions however there is actually just one company dealing with factoring transactions in Moldova, NFC-Moldfactor.

The table below summarizes factoring transactions being practiced:

**Table
Factoring Types**

By compliance with the Accounts Receivable Sales Contract	By the contractual parties place of performance	By the buyer's factoring transaction awareness
<p><u>1. Non-recourse (no turnover)</u> - Complies with the contract, the accounts receivable are actually being sold.</p> <p><u>2. Recourse (with the turnover)</u> - does not comply with the Accounts Receivable Sales Contract. The company that sells the debt assumes liabilities and risks for the debtor's failure to pay the debts and pays the factor's damages.</p>	<p><u>1. Domestic</u> - sales contract parties and factoring company are residents of the same country.</p> <p><u>2. International</u> - the supplier and his client are residents of different countries.</p>	<p><u>1. Open</u> - the buyer is aware about the factoring transaction and makes payments to the factor's account.</p> <p><u>2. Quiet</u> - the buyer is not aware about the Factoring Contract and makes payments to the supplier who in its turn transfers them to factor.</p>

It is reasonable that we shall consider factoring as a method of the company's floating assets management so far as it is being

reflected within assets only and never appears among liabilities. In factoring transaction there is a decrease within the Accounts Receivable on the supplier's balance sheet and at the same time an increase within Cash Assets account. Thus factoring changes the floating assets structure: accounts receivable are transformed into cash assets, cash inflows increase and give an opportunity to increase materials and goods purchase that results in production and future sales increase and consequently in the company's profits growth.

First of all the factor's concern is a reward for the factoring service. Factoring fee usually comprises three basic components: fixed processing fee, fixed interest rate from the client's turnover that covers factor's service cost value (control over the due payments, activities for payment delays, accounts receivable current record and due reports to the client) and a reward for acceptance of cash, credit and interest risks.

The basic international act that governs crediting on pecuniary claim cession is the UNIDROIT (International Institute for the Unification of Private Law) Convention on International Factoring that was adopted on May 28, 1988 in Ottawa and took effect in 1995. Moldova has not yet joined this Convention so far.

Our national legislation stipulates factoring in Civil Code article 1290 "under a factoring agreement a party, the supplier of goods and services (adherent), undertakes to assign the existent or future claims under sales, service or production contracts to another party, factoring company (factor), who undertakes to carry out the following two liabilities:

1. Financing the adherent, the loans and the advance payments included;
2. Record-keeping of the claims;
3. Notification and collecting debt payments;
4. Acceptance of risks against the Debtor's insolvency concerning the claims being assigned (del credere)".

Factoring does not appear on Business Licensing Law as a separate activity subject to licensing. However article 26 of the Financial Institutions Law lists licensed financial operations, crediting included (consumer and mortgage loans, recourse and non-recourse

factoring, transaction crediting, guaranties and securities etc.). Since under the Civil Code not only banks may practice factoring transactions, any commercial organization that has factoring on their articles of association, as well as sufficient funds and experience, may practice financing under debt claim cession as a financial agent without any license.

Factoring transactions record-keeping has been described neither in national accounting guides nor in laws. The example given below is based on international practice and is an advisory opinion.

Example

Factoring transactions record-keeping on supplier's and factor's chart of accounts

Under the Sales Contract the supplier A has shipped the goods to the amount of 120,000 lei, 20,000 lei VAT included, to the buyer B. Under the contractual provisions the buyer B undertakes to pay for the goods within 60 days after shipment. The supplier A signed a Non-recourse Factoring Contract with Factor C and thus assigned the right to claim the due payment for the shipped goods. The seller notifies the buyer about the transaction. Under the contract Factor C first transfers 90% of the shipped goods value to the supplier A and the remaining 10% transfers as soon as the buyer makes the payment, less the factoring fee. The factoring fee amounts to 3% of the transaction value Under the Factoring Contract.

This transaction **on the supplier's A accounts** shall be shown as follows:

1. Showing the debt on sold goods

Dr 221 "Accounts receivable" - 120 000 lei,

Cr 611 "Sales Revenue" subaccount 6112 "Sales Revenue - Goods" - 100 000 lei,

Cr 534 "Taxes Liabilities" subaccount 5342 "Value Added Tax (VAT)" - 20 000 lei.

2. Showing the assignment of the pecuniary claim to the factoring company C:

Dt 229 "Other debtors" - 120 000 lei,
Cr 221 "Accounts receivable" - 120 000 lei,

3. Funds transferred by the Factor C under factoring contract (initial payment of 90%):

Dr 242 "Bank Account" - 108 000 lei,
Cr 229 "Other debtors" - 108 000 lei.

4. Remaining funds (10%) transferred by the Factor C, the factoring fee included (120 000 - 120 000 x 3% - 108 000 = 8 400) as soon as the buyer makes the payment:

Dr 242 "Bank Account" - 8 400 lei,
Cr 229 "Other debtors" - 8 400 lei.

5. Showing the Factor's C factoring fee:

Dr 714 "Other operating expenses" - 3 600 lei,
Cr 229 "Other debtors" - 3 600 lei.

This transaction **on the factoring company C accounts** shall be shown as follows:

1. Showing the supplier's A assignment of the pecuniary claim:

Dr 229 "Other debtors" - 120 000 lei,
Cr 539 "Other liabilities" - 120 000 lei.

2. Funds transferred to the supplier A under Factoring Contract (initial payment of 90%):

Dr 539 "Other liabilities" - 108 000 lei,
Cr 242 "Bank Account" - 108 000 lei.

3. The buyer's debt payment:

Dr 242 "Bank Account" - 120 000 lei,
Cr 229 "Other debtors" - 120 000 lei.

4. Showing the factoring fee (120 000 * 3% = 3 600 lei):

Dr 221 "Accounts receivable" - 3 600 lei,
Cr 611 "Sales Revenue" subaccount 6113 "Sales Revenue - services" - 3 600 lei.

5. Factoring fee reckoned towards settlements with the supplier A:

Dr 539 "Other liabilities" - 3 600 lei,
Cr 221 "Accounts receivable" - 3 600 lei.

6. Final settlement with the supplier A:

Dr 539 "Other liabilities" - 8 400 lei,
Cr 242 "Bank Account" - 8 400 lei.

3. Conclusions

To sum up the aforesaid it should be mentioned that a company may sign factoring contract with a bank or a factoring company to reduce the client's insolvency risks during the world recession. Bank fee costs may be reckoned towards operating activities costs that shall be deducted for taxes under article 24 "Deduction of costs for running business" of the Tax Code as customary and necessary that have been paid or incurred by the taxpayer when running his/her business. The factoring service benefits are apparent for each transaction party, the supplier, the factor and the buyer. Factoring is the most efficient method both for the suppliers who increase sales and explore new markets and those newly created companies who lack funds due to the payments delays. Factoring is a way to accelerate the exporter's capital turnover. It is common that such companies have an unfavorable balance structure that blocks their access to bank loans. In such a case the factor mediation solves the problem of short-term loans. Besides, through the factoring companies mediation it is possible to cut down the executive expenses and to increase operating efficiency since along with record-keeping the factor company deals with their client's transactions credit control and carries out business analysis, selling strategy analysis and market study. The factor company concern is in the reward first of all. Financial agents not only receive a return on loans and a factoring fee but also a fee for other financial services offered within a factoring transaction. In his turn the buyer is concerned with the commercial credit (the seller ships the goods

with an average 3-month payment delay), increases the purchase amount, minimizes the risk of getting faulty goods and accelerates capital turnover.

Fiscal Tendencies within the Community's Field

Viorel Țurcanu, Prof. Dr.
Academy of Economic Studies of Moldova, Chișinău
Drd. Perifan Mihai
Drd. Caraman Tania

Abstract

The Stipulations of Treaty of Maastricht concerning the Monetary and Economic Union offer a new dimension to the politics of general taxation, by strict limitation of the governments' possibility on financing the public outgoings by loans. The Accord for Steadiness and Development foresees that member states having a budgetary deficiency greater than 3% have to establish not-carrying deposits of rates of interest, which transform in non-reimbursable penalties in situation where deficiency reduction is not performed. The general objective is that the budgets of member states have to maintain equilibrium over the economic cycle, reason for which any increase of the public outgoings will be financed by the increasing of excise taxes.

Keywords: taxation, budgetary deficiency, fiscal policy, tollage of exchanges

JEL classification: E 62

1. Introduction

Taxation stands for an important instrument of national sovereignty, which ensures the achievement of public revenue and makes it possible for governments to implement policies in certain areas. Meanwhile, as an instrument of economic regulation, taxation can be used to influence consumption, to encourage savings or to adjust the organization of companies.

Responsibility for fiscal policy appertains to the Governments of Member States, taxation being considered a symbol of national sovereignty. In the EU, taxation policy is essential for all member states, the organization

and functioning of the community assembly making the actions of a country to have an impact not only on that country but also on the neighboring countries.

In the past, differences between the tax rates of various goods among different countries tended to influence the commercial activities, producing both distortions between production and distribution of goods and social repercussions. Therefore, in order to reduce fiscal burdens, taxpayers moved their residence in another member state where the tax regime was more tolerant.

Differences in tax rates, as well as the "migration" according to the tax system led to an apparent competition between member states in terms of taxation. The integration into the EU, the introduction of single currency, as well as the interactions and the influences of national systems of taxation in member states, require a thorough analysis of these systems and, if possible, a common management, aiming at decisions on this matter to guarantee that policy taxation in a member state has a desirable impact on other member state, at the same time ensuring real sovereignty of European Union citizens and their representatives, a sovereignty manifested by member states' common actions.

In this context we must exhibit that the European Treaty contains no specific provisions for alignment to revenue. Therefore, taxation, especially the direct one, and coordination of taxation proved to be relatively difficult to put into practice. Taking into account that the coordination of taxation procedure is of special importance, the European institutions seek to create an appropriate framework for harmonization.

2. Normative marks of the EU regarding taxation

The creation of the Single Market and the completion of the Economic Monetary Union led to new community initiatives in the taxation area. Eliminating restrictions on free movement of capital has caused fears that national tax bases could be eroded by competition in revenue, leading to a tax burden shift from capital to labor force, having adverse consequences on employment and on social protection.

As a result, the Community aims at a number of objectives when constructing general tax policy. A first long-term goal was to prevent differences between indirect tax rates and tax systems which may introduce distortion of competition within the single market.

As regard to the direct taxation, the existing legal framework is generally represented by bilateral agreements between member states, aiming to "eliminate legislative ambiguities" that lead to tax evasion and to avoid double taxation.

Although the related objectives were generally accepted, national governments have been reluctant to make major steps in harmonizing tax systems within the Community. For this reason, all tax measures must be adopted by the European Union unanimously.

3. Direct taxation

With regard to direct taxes, the European Community Treaty does not explicitly specify their alignment and, according to the principle of subsidiarity, it allows Member States freedom to make necessary regulations. However, since direct taxation has an impact on the free movement of goods, services, people and capital, as well as on the right of individuals or companies establishment, member states should establish a national tax system that respects these fundamental rights.

The appearance of some special circumstances, such as double taxation or cross-border economic activities, has required the

adaptation of some legislative measures common to all member states, measures applicable in particular to companies, and that are adopted by the Council unanimously.

The implied measures were initiated in 1990 as evidenced by two directives and one convention. Directive no. 90/435/EEC refers to the abolition of double taxation of profits distributed between parent companies in one of the member states and their subsidiaries located in another Member State. Directive no. 90/434/EEC reduces the tax burden that may impede the reorganization of companies and Convention no. (90/436/EEC) based on the Treaty's Article no.239 introduces an arbitrary procedure to avoid double taxation regarding the adjustment of profit between associated enterprises located in different member states.

Business and investment taxation. Before January 1, 2007, the place Romania will occupy among the European Union states in terms of taxation has been thoroughly examined. The imposed final conclusion was that we hold a favorable position, while community officials' recommendations for a tax increase have a foundation. Currently, we have revenue that could embezzle major investments from west towards us. Income taxes' level and the costs borne by employers divide Europe into two separate entities, the main advantages being represented by the countries that joined the union since 2004. In Ireland and Cyprus workers pay the lowest direct taxes, as contrasting to the Portuguese whose incomes are taxed at about 50%. The highest employment costs are borne by German employers. The states that joined the EU since 2004 seem to be more attractive for both employees and employers in terms of the level of direct taxes and social security contributions. However, Ireland remains the most attractive. Out of the total revenue, the Irish pay taxes and insurance costs of 6.34%, thus registering the lowest level of taxation compared with employees in European Union countries. Among top-employees who pay the lowest taxes, the Irish are followed with a difference of 1.44% of workers in Cyprus, the amount paid by them adding up to 8.77% of total revenue. In the same category, Malta and

Luxembourg are the following ones, while incomes of the British are taxed at 23%. The higher taxes and costs of health insurance are paid by the Portuguese, whose total incomes are taxed at about 50%. **Under \$ 10,000:** In Lithuania, one of the ten countries that joined the EU in 2004, the total costs that an employer bears, including social security contributions, amounts to 5124 euros, the equivalent of 6697 dollars annually. Thus, the Baltic State records the lowest average total costs relating to hiring for companies. Still below the amount of 10,000 euro sum the costs borne by employers in Slovakia, Estonia and Hungary. It seems that the most difficult situation is faced by German employers, where the average costs amount to 50.417 euros. (*S. Diaconu, Curentul, January 4, 2007*)

4. Indirect taxation

Starting with 1992, by the elimination of border taxes and customs formalities at the member states' borders, indirect taxation has undergone major changes by introducing new laws regarding excise duties and by the intra-community rules regarding the value added tax.

The Value Added Tax. The main source of this law is Directive no. 77/388/EEC on the common system for implementing this taxation, also called "The Sixth VAT Directive".

Directive shall apply in countries belonging to the community (principle of territoriality) and includes regulations on: taxable persons, taxable transactions, the exceptions and exemptions (for both goods and services), the place of the tax rates transactions, the standard tax rates (which are the same for both goods and services), deductions and how to calculate them, persons responsible for VAT (including taxpayers' obligations and regulations applied in special cases, such as the farmers or the travel agencies).

The Directive has been gradually implemented, with transitional stages for each member state and has simplified the application of the VAT system, making distinction between sales among taxable persons, sales to individual traders or sales to VAT exempt traders.

Under the new regulations (Directive no. 92/77/EEC on the approximation of VAT rates), member states shall apply a standard VAT rate of minimum 15% (Directive no. 99/49/CE) and are allowed to apply up to two reduced rates (of minimum 5%) for certain goods or services of social or cultural nature. The same directive allows member states to fix for a limited time zero rates or rates below 5% for certain products.

Excises. The principle underlying the application of excise duties is that they apply in the country where consumption takes place. General regulations refer to products subject to excise duties and to the holding, the circulation and the surveillance of such products (see Annex 4).

These rules, applicable from January 1, 1993, underline a strategy regarding the approximation of tax rates, tax structures harmonization and establishment of the general framework regarding the possession and circulation of products. Regulations apply to alcoholic beverages, processed tobacco and mineral oils and allow the circulation of goods in the member states, the excises being paid by the final purchaser at rates set by the member state where consumption takes place.

The minimum rates of excise duties on alcohol and alcoholic beverages, cigarettes and processed tobacco products other than cigarettes, are established by the Directives no. 92/87/CEE, 92/79/EEC and 92/80/EEC. Given the internal market and the real values of these allowances, every two years, the Council reviews the minimum rates and may impose new regulations. With regard to mineral oils, Directive no. 92/82/EEC regulates the excises' rates on these products. To respect the environment, the Commission promotes the use of renewable energy products, putting forward two proposals in this respect, one referring to an excise duty reduction on fuels produced from agricultural sources (bio-fuels) and second, referring to the harmonization of indirect taxation of energy products.

5. Conclusions

From another perspective, despite all efforts recently undertaken by the European Commission, we may emphasize the fact that tax harmonization is far from being satisfactory. Coordination of taxation at the community level faces two major obstacles: the decision-making procedure under the principle of unanimity and the lack of proper assessment of those obstructions to the social and economic development deriving from inappropriate undertaken decisions.

In these circumstances, the Commission (Verona, 12-13 April 1996) outlined its ideas for a comprehensive strategy on taxation. Three major issues are confined here and they constitute the key elements of tax policy of the European Union in the coming years: member states' tax accumulations stabilization; a stable functioning of the single market; improvement of labor market and reduction of unemployment.

The IMF governance?!

Abstract

The paper makes an analysis of the relation between International Monetary Fund and Romania during the financial crisis started in 2007 and the effects and the results of the economic and fiscal policy in Romania due to the involvement of the IMF and the internal political decision.

Key words: International Monetary Fund, loan, Financial crisis

JEL classification: G28, G01

After almost 6 years since the first agreement, that was successfully realized by the Romanian authorities, with the IMF, Romania was, once again, finding itself in the position of having to sign a loan agreement with this financial organization, this time around, the amount employed being unprecedented in the history of our relations with the Fund, respectively, 12.95 billion Euros. The official reason: diminishing the effects of the financial crisis on the Romanian economy. The unofficial reason: the up and coming electoral campaign at the end of 2009. IMF's presence in Bucharest, disavowed in the beginning even by the president, Traian Basescu, questioned by many of the politicians and even some economists and disliked by the vast majority of the population, has become a certainty in the spring of last year. Now, after one year since signing the loan, the quasi-generated opinion is that the IMF is governing over Romania.

Is this affirmation true or false? By analyzing the steps that have been taken by both parties, since the signing of the loan agreement, we can conclude that there are many arguments

in favor of this affirmation, but also sufficient elements that lead to this conclusion.

In May 2009, the Executive Council of the IMF approved a 17.1 billion dollar loan. The program had as its main goal the diminishing the effects of the crisis and covering some extra costs for the social security system. After a robust economical growth in between 2003-2008, with a GDP average of 6.3%/year, mostly fuelled by FDIs and the flux of foreign capital in and out the country (facilitated by foreign banks that opened subsidiaries in Romania), at the end of 2008, Romania was confronted with a sudden halt of the growth rhythm and problems in retracting the foreign capital.

The national currency lost 15% in relation to the Euro and the current account deficit has grown. Moreover, the increasing fiscal deficit left very little room to maneuver when the economy started declining and the reforms, that could have turned the economy around to become more productive, were stopped. Under the circumstances, the IMF, under agreement with the World Bank and the E.U., have taken it on themselves to support the Romanian economy by signing a 12.95 billion Euro stand-by agreement with the Romanian authorities as part of a larger financial support package of 20 billion Euros.

This is the first loan program of its size and importance in the history of this country, by which means the economical decline was hoped to stop and the adjustment measures of the economical policies were to be supported, in order to avoid the grave consequences of the economical crisis. The program regarded three main elements: the fiscal consolidation, the reform of the banking sector and the reduction of inflation in order to maintain a financial stability.

The goal was to support public investments and, all the while, limiting the fiscal deficit in order to ensure a long term improvement of competitiveness. By rationalizing pensions and salaries and streamlining public loans it was aimed to obtain a supplier efficient and transparent public sector.

Also, with the intent to diminish the negative effects of the crisis on the vulnerable part of the population, pensioners and those supporting low wages, the government was going to increase the expenses for the social security system. In regard to the monetary policy, the National Bank of Romania (BNR) committed itself to reducing the inflation and maintaining it within the limits set, all the while securing to reduce the reference interest rate. At the same time, the commercial banks agreed to support financing in order to grant extra capital and foreign banks to keep their money in the country.

Although at a first glance the conditions set by the IF for the Romanian government seemed “more humane”, meaning less strict, in time it was demonstrated that this “humane side of the Fund” only shows one side of the shield. Given the crisis and the findings made by the Fund’s specialists, in time, who emphasized that in situations in which strict conditions were set, things worsened, the IMF did not give details on the impositions made on our country but it did warn, even from the beginning, that in the absence of a firm commitment from the Romanian government, that will lead to a clear assumption on its behalf, they can get back to certain conditions or even the revision of the whole program.

What is interesting though, is the fact that the first evaluations made by the IMF (September 2009 and February 2010) highlighted the meeting of the majority of the quantitative performance requirements, including the deficit target of the general consolidated budget. The IMF evaluated that the efforts put in and the implementation of the program have lead to the increase in confidence and a reduction of risks on the financial markets, and that the economy shows all the signs of a first stage recovery.

In 2009, inflation was maintained at 4.7%, over the superior limit of the target set for inflation by BNR, but it was also lower than in

2008 (6.3%). It is also mentioned in IMF’s report of February 2010, that the tension on the financial market decreased and, maybe the most important thing is that, exports have begun to rectify. More concretely, in the IMF report, roundly, Romania was beginning to look better: a growth of the GDP by 1.3%, a decreasing inflation, towards 3.5%, a contracting current account deficit, starting at 12.5% of the GDP in 2008 and reaching 4.5% of the GDP in 2009 (compared to the 7.5% stipulated in the terms of the program). The IMF considered, at that time, that in 2010 the economical activity will improve and that “the perspective continues to depend on some uncertainties, but that risks are mostly balanced”.

At the end of the report the IMF stated that from its perspective, “financial tensions were weakened and the economical recession reached its low point in Romania”.

What could have happened then, in these 2 short and fateful months (February-April 2010), that upon the return of the IMF in April 2010 sudden chaos began, concerning Romania’s disastrous situation, that culminated with a public statement from the president, Traian Basescu, who presented a drastic deduction of salaries, welfare pensions, allowances etcetera. The sensation of a country on the verge of collapsing has travelled the whole of Romania, that has unexpectedly frozen.

This turn of tables happened 2 months ago (a period of time too short for it to have registered something significant from an economical perspective). Or maybe the answer should be found in the past or even in the external economical circumstances. Obviously, with this occasion we have managed to see the less humane side of the IMF. Or is it that of the Romanian government? This situation revealed After a significant percent of the money that was loaned to Romania has fueled the pension fund and budget salaries for a year, even with the IMF’s agreement, without being oriented toward investments and sustaining the real economy, for the achievement of the “social peace” that was absolutely necessary, considering the impending electoral campaign, after BNR infused IMF money into the commercial banks, that later loaned money to the government, with significantly higher interest rates (6%-4%) than the 3.5% that the IMF granted us the loan with,

though this action took place under the strict supervision of the IMF, now, suddenly, the Fund is declaring that “it doesn’t trust the government” and changed its attitude entirely.

In 2009, 8.3 billion Euros entered Romania, from the IMF and the European Council. The Central Bank also received 1.225 billion Euros and the Department of Finances 2.225 billion Euros. Moreover the Department of Public Finances also attracted over 37 billion Euros from the budget, through state emissions, at the beginning of 2009. All this money was used by the Finance Department to cover current expenses – pensions, salaries and the reimbursement of some loans that had reached their expiration.

You don’t have to be an expert in the economical field in order to realize that there is something definitely wrong with this picture. It is clear that the current government has swallowed billions from the IMF to cover the holes in the salary and pension fund, that Romania is in debt for nothing, that we do not have major investments, that the degree of occupancy is dropping and that this country is not on the right track. But all this took place under the strict monitoring of the IMF.

From this moment on there are only 2 ways to go with this. With the government lied, when presenting the situation to the IMF it overestimated the budget income and masked the negative evolution of the economy, or the IMF, constricted by the recent global evolution, the case of Greece and the cease of grants at a global level, revised its position radically and forced a strict program that it did not foresee onto the government, in order to reduce budget expenses. One thing is sure though, and that is that by carefully analyzing the facts and figures, both parties are equally guilty. Where was the IMF when Romania couldn’t realize or apply a pertinent anti-crisis program? Where was the IMF when the money destined for investments, the only solution to saving the country, were directed toward fueling current expenses in order to buy social peace? The government’s exoneration and transfer of all its responsibilities onto the IMF’s shoulders is risky but the indemnity of the Fund is also a highly problematic matter.

The IMF is not a stranger to the way Romania presents itself now, one year since

signing this loan that has indebted the Romanian people immensely, and over a long period of time, but the Romanian government is RESPONSIBLE for the country’s economical situation.

With 250,000 more unemployed people than last year and a consumership that is already on a descending trend, the Romanian economy is still in contradiction with itself, without being able to give any insurance that, based on these drastic measures to cut salary and pension expenses, it will be able to set itself on its feet.

What guarantee does this government give that the money will not be wrongly used, by making some least optimal public acquisitions, at this time, (promotional web sites worth 500 million Euros) and that this sacrifice made by the citizens, some of them among the poorest people in Romania, will not be, once again, futile, seeing as how Romania made a commitment to the E.C. to reduce the budget deficit from 7.4% to 5.9% this year and the 850 million Euros, the 5th installment from the IMF, are exclusively destined for BNR and not for the financing the deficit, it is obvious that there are serious measures to be taken in Romania. However, these severe measures to reduce salaries by 25% and pensions by 15% are not the only ones to be taken, let alone the fairest. These sudden cut backs will affect consumership even more, and, although they will not directly influence it, the private sector. The effects on the private sector will be observable shortly thereafter. Without a correct and honest evaluation of the Romanian economy, any measure of this type may seem cynical and prove inefficient on a medium and long term.

There are much more efficient measures that would be more easily handled by the population, such as reducing tax evasion, reducing the handicaps of private, but more importantly, state owned societies (also by taking fiscal amnesty measures), reanalyzing the expenses on public acquisitions and prioritizing them, in parallel with the improving the collection of income.

The IMF says that there are drastic provisions to be made, and we all agree that they should take place. But it would have been better though, if we were to have acted bravely ever since last year, and if the Fund would have been more careful regarding the path that the money

took. It does not, however, tell us what actions we should implement. It is the Government's duty to choose the ways by which the established targets will be met. Unfortunately the government seems absent and this is why we are constantly under the impression, that we are being lead by an external force, feeling that was had time and time again throughout our history. We are acting as though on external command, without an ample and concrete analysis and without social and political solidarity.

The result seems foreseeable: an aggravation of the crisis in parallel with the growth in degrees of our debt. Who will be responsible for an eventual failure? The IMF government?

The Dynamics of the World Population between Demographic Explosion and Implosion (period 1950-2050)

Abstract

The population is the general premises of the existence, of the dynamics and structure of the employment factor; it is the labor market support, the employed persons. Therefore the analysis and forecasts on the development of the population are very important. Our paper presents the trends of the world population and its projections for the period 1950-2050. Based on the levels, structure and trends of Earth's population (in general, on continents and on countries), we decided to point out the dynamics of the population that emerges within the demographic processes in Romania.

Key words: population, demography, evolution

JEL classification: J11

1. Historical changes regarding the continental population

By the role that work has in all resources and production factors, the population is the primary component of any society, and hence of any economy. The population is the indispensable condition for the existence of any society, of any population whose economic role is reflected in the fact that it is the support of the primary production and active-creator factor and which represents the consumer and the virtual recipient of the results of any economic activity.

The issues of the dynamics and structure of the world population, of its distribution by country and by geographical area is the subject

to some extensive historical research and forecast.

Within the XXth century, especially in the second half thereof, the approach views of the *relation between the population and economy* (both of them regarded in dynamics) have multiplied themselves, the points of view as regards this subject becoming not only much more diverse but also opposite. All these views are characterised by *the population transformation in endogenous factor* (in internal, intrinsic side) of the economic development (of the economic growth), factor that, at its turn, is determined by the economic processes. The double position of the population in the demo-economical relations system - as main production factor and as virtual recipient of produced goods - is a strong argument in the favour of the *demographic factor* as endogenous factor of growth and economic development. The correlations between the two variables are diverse and very difficultly to be quantified. It is known that *the effect of the demographic impact upon the economic factor is felt after many years from the date of the demo-economic phenomenon occurring*. So, within the last decades, the research intended to identify certain essential, durable relations between the population evolution and the economic growth became more intensive.

Although the demographic matters are the favorite subject of the politics of countries (governments), of each country, more and more institutes and international organizations are concerned about what happened and especially what will happen to the demographic processes on continents. Based on such concerns, there have been introduced

into the ideas circuit expressions such as "Asian demographic explosion", "African demographic explosion," the depopulation of Europe ", "populating North America".

The transition from the analysis to the statistical data and the structures of the world's population and of individual countries in the preparation of the demographic projections has become a major problem of maximum complexity. Taking into account that the socio-economic and demographic forecasts are a starting point in designing strategies and policies in these areas, it is also required such a background of projections as to boost the confidence of decision makers at all levels (social and economic individual agents, national states, international organizations) in such instruments. The increasing professionalism of the specialists in the field,

the capitalization techniques and modern tools of public record and aggregation of those data have become constituent elements of studies of population dynamics.

General conclusions about the future of Earth's population, by the year 2025 and 2050 reflect the general progress of social sciences in this millennium.

In Table 1, it is captured Earth's population distribution on continents and on geographical areas in the years 1950, 1975, 2004 and 2008. However, the sizes of the population on continents are in relation to their weights in the planetary land surface.

In the table there are given the projections funded by prestigious institutes regarding the population size, the number of people who will populate the continents in the year 2050.

Table 1

WORLD POPULATION
continents-century1950-2050

- million people and % -

Continents	Share in the Earth's Surface	Population									
		1950		1975		2004		2008		2050

WORLD		2.555,4	100	4.087,3	100	6.377,6	100	6.707	100	9.300	100

Source: *International Programs Center, Bureau of the Census, U.S. Dept. of Commerce; The World Almanac and Book of Facts, 2005, 2009*

As it can be seen, in 1950, Earth's population of 2.555.4 million people spread over the continents as follows: 1.436,9 million people in Asia (56,6% from its total); 546,4 millions in Europe (21% from its total); 227,3 millions in Africa (8,9% from its total); 220,8 millions in North America (8,6% from its total); 111,4 millions in South America (4,4% from its total); 12,5 millions in Oceania and Australia (0,5% from its total).

If it is compared the population of each continent with its area it results that the intensity of the population of the continents was very uneven. Thus, on the Asian

continent which which occupied and still does 21.4% of the world, there was concentrated 56.6% of the global population, so the population's density was 2.6 times higher than the planetary average. Also on the European continent, the population represented 21% of world population, although the continent's surface is 15.7% of Earth's dried land.

In contrast, in Africa, in South America, in North America, in Oceania and in Australia the degree of population was much less. These continents were populated well below the overall average. In South America, for instance, which owns 12.1%

of the Earth, people living on this continent in 1950 represented 4.4% of total population. The population density here represented 37% of the world; it was 3 times lower than the imaginary global average. Africa had also a special position. This continent had 8.9% of world population, its territory representing 20.6% of the Earth's land.

2. The Asian demographic explosion, the perspective on the African demographic explosion

During 1950-2004, on all continents there were registered increases in population. The same upward trend is recorded in the period 2004-2008. But these absolute gains of population experienced very different rates, which made that the continental structure to change significantly. For example, during 1950-2004, on an overall growth of 149% (6377,6/2555,4), the demographic increases in Asia, Africa and South America were much stronger, which made that the increases of these continents to grow as follows: 4 percentage points more in Asia (from 56,6 to 60,6); 4.8 percentage points more in Africa (from 8,9 to 13,7); 1,4 percentage points more in South America (from 4,4 to 5,8).

Europe and North America recorded population growth rates below the overall average. As an effect of the increase of only 34%, the share of Europe's population in the world reached 11.4%, so a decrease of 9.6 percentage points. Regarding North America, it reduced its share in the world population by 0.6 percentage points.

In conclusion, Asia, Africa and South America have focused most of the population increases in the latter half of the twentieth century. From the total population growth of 3.822,2 million persons, 3.331,3 millions represented absolute growth in the three continents. But the most significant structural continental change is the absolute population growth of Asia with more than 2.4 billion people, of which China's population growth was of over 800 million people. Therefore, quite rightly it is stated that the period is identified with "the Asian demographic

explosion", especially "the Chinese demographic explosion".

A special interest - theoretically and practically - has the projections that the specialized institutions do regarding the possible developments of the population on continents in 2050.

The overall average increase during 2004-2050 was evaluated at 45% (9300/6377, 6) and at 38% (9300/6707) during 2008-2050.

In the first half of the XXI century, Africa and Asia will witness both absolute and relative population increases in their countries. As a result, Africa will have 18, 2% of the world's population to 14, 5% in 2008 and 13, 7% in 2004 and to 8, 9% in 1950. In turn, Asia will concentrate 61.1% of the total world population, compared with 60.4% in 2004, 2008 and compared with 56.6% in 1950.

South America and North America will know the absolute population increases, but at rates lower than the world's average (34%, and 38%). Under these conditions the South American share will decrease in 2050 to 5.3% from 5.8% in 2004, and the share of North America will reach 7.6%, compared with 8.6% in 1950.

Regarding Europe, there will appear depopulation; the continent's population will absolutely decrease.

Much has been made about the demographic explosion in Asia in the late twentieth century. Many experts insist that in the first half of the XXI century there will be another demographic explosion on this continent. Indeed, if one takes into account the absolute growth of the Asian continent population of 1.828.6 million during 2004-2050 (5693/3864,4 millions) and of 1.639 millions (5693/4054) in 2008-2050, that assessment is fully justified. In addition, the share of the Asian population in the total world's population remains huge, about three fifths (61.1%) compared to 60.4% in 2008. This share is almost three times than the share of the continent in the earth's surface (21.4). So, the density of the Asian population is three times higher than world average.

The same assessment can be done if it is taken into account some Asian countries such as India (with an absolute increase of 536 million people); Bangladesh with an increase of 100% (280 to 141 millions);

Nepal also with an increase of 100% (53,3 to 27 million people); Pakistan with an increase of about 140 million people; Yemen with an increase of 3,5 times (from 20 to 71 million people).

There are a few Asian countries which in 2050 will know decreases of population, such as Japan, with a minus of about 27 million people, of South Korea.

If the analysis would only define the criteria for the economic development level, it could be said that some developed countries of Asia record the absolute decline of population and other relatively moderate increases, while the least developed countries, by contrast, will witness a significant increase.

But if one compares the demographic forecasts for the period 2000-2050 relating to African countries with forecasts for Asian countries, it must be concluded that the most powerful demographic explosion is emerging in Africa. The statement is based primarily on the relative growth of the total population of the continent, which will be of 95% (1706,4/873,7) in 2004-2050 and of 75% in 2008-2050, compared with the relative increase of 45% throughout the world. It will get to the point when the share of the African continent is close to the planet Earth's population share (18,2%, and 20,6%).

„The African population explosion” and high concentration of African population may be marked with greater strength if they do real forecasts regarding some countries of the continent. Besides the fact that the population doubled in eight countries on the African continent, the population size will triple by 2050. Here are the African countries where the increased population will experience much higher rates than the continental average: Benin (18,1 millions in 2050 to 7,2 million persons in 2004); Burkina Faso (39,5/9,2 millions); Chad (29,2/9,5 millions); The Democratic Republic of Congo (181,2/58,3 millions); Guinea (30,1/9,2 millions); Madagascar (65,5/17,5 millions); Mali (32,5/11,9 millions); Malawi (29/11,9 millions); Nigeria (307,4/137 millions); Somalia (25,5/8,3 millions); Uganda (83,6/26 millions).

If we compare to the population levels in these countries in 1970, then the *idea of African demographic explosion is even*

more reasonable. With nearly 30 years earlier, in Nigeria, for instance, there lived 55 million to 307 million persons as are projected for 2050.

These African countries will massively by overpopulate in 2050; they will be inhabited by over 815 million people, which will mean half the African population. Four African countries will each have in the same year, more than 100 million people (Nigeria, The Democratic Republic of Congo, Egypt, and Ethiopia).

The only country on the African continent that will see decline is South Africa where there will live about 31 million people in 2050 compared to almost 43 million at present.

3. Socio-economic considerations on the development and demographic structures

Some reputed demographers (C.P. Blaker) formulated a new theory of the progress of population in modern times, the national stage occurs globally asynchronous. These stages are as follows: *stationary* (resulting from the confrontation of the relatively equal high birth and mortality rates) *early expansionary* (the percentage increase of mortality is lower than the relative increase in birth) ; *the expansion of the termination* (decreases the mortality rate more than the birth one), *stationary* (birth and death are balanced at low levels), *decline* (lower birthrate than death rate).

All these considerations of demographers and sociologists are based on current the knowledge of the people. It seems that human knowledge in the coming decades will move within other parameters. The American scientist Ray Kurzweil launches the revolutionary idea, that through "nano-robots (robots with ultra-microscopic dimensions), injected into the body, the whole body will be freed of all imperfections and the muscle structure, the bone structure, arteries and brain cells will undergo an intense process of regeneration. Even if, now, the technology has not reached such performances, the discoveries in genetics and an appropriate technological breakthrough will enable people to "ensure" the body against disease

and aging. Although Kurzweil's theory has some science fiction elements, including the idea of immortality, however, the considerable growth perspective of the average life expectancy is entirely plausible, which means changing the sequence of stages of population development. If are taken into account the studies showing that in developed countries, this increase in life expectancy at birth is accompanied by the declining of fertility, it will result in a dramatic change in the population's distribution by age.

In 1850, in the United States, it was registered an average age of population of 19 years and over one hundred years, in 1990, the average age reached 34 years, a trend that will worsen so that by the year 2050, the U.S. median age will rise to almost 40 years! Within 200 years, 1850-2050, the average age of population in most developed countries of our world will grow by 21 years, over 2 times.

In some European countries and in Japan, as a result of fertility rate that will not increase, estimated by the demographer Nicholas Eberstadt, based on UN data, the average age of population in Germany will reach 54 years, in Japan at 56 years and 58 years in Italy. In comparison to the U.S. trend in these countries, around 2050, the average age will be 14 years higher in Germany, with more than 16 years in Japan and more than 18 years in Italy, which means more dramatic changes. In this case significant problems may arise concerning the relationship between productively employment and the retired persons.

The new relationship between economics and demography was realized in developing new analytical concepts. The demographic transition is the concept (term) with the highest cognitive and methodological value. The vision of modern demographic transition means the transition from high birth and mortality rates (often with small natural increases) at the lower levels of the two basic demographic variables (sometimes with relatively high natural increases). When the birth rate is high and it is increasing, and the mortality rate records decreases with delay, there may be a population explosion.

The increasing professionalism of the specialists in demography has resulted in

the substantiation of concepts with which it is analyzed and assessed the population's dynamics and its structural changes. By these concepts it is surprised and appreciated the relationship between stability and change in conducting demographic problems.

In general, specialists in the field believe that change requires knowledge of (highlighting) the factors affecting a particular state (A), transforming it into another state (B).

In a first approach, the process of change is seen only as a result of factors outside of it. In time it came to the realization that the new state (B) is due to its natural state (A), to its dynamic transformation and to some external factors. The emphasis is on stability.

A second perspective on the report shown is by reversing the ontological priorities, accepting the fact that change is most important and stability is a slow change. In such a perspective, the socio-demographic historical reality consists of continuous processes and their results, with acceleration and deceleration phases. In fact, this way of approaching the change is synthetically expressed by the conclusion became a common good: the steady state is relative, while the state of imbalance is absolute.

So, the changing social reality is a series of human acts of knowledge, creation and practical actions. Knowing is very important. But more important is to use what you know, to conceive strategies for transformation.

This final point of view implies two sets of analysis. The first one seeks to explain why and how these socio-demographic aggregations can lead to institutions (political, economic, religious, pedagogical, aesthetical, etc.). The second analysis examines the new compounds resulting from the change in question. According to this view, between institutions and changes there is a permanent relationship of interdependence, the changing having acceleration or deceleration times.

Social sciences have identified four such types of interdependence relations, so called: drift, evolution, revolution, mutation.

In the spirit of social change theory, it can be argued that the prospect of

Romania's population by the year 2050 is a multi-factorial mutation.

It can hardly be a simply demographic derivation because the society as a whole is aware of the change project and its scope. High degree of knowledge makes the process of change to be perceived by the population, even if its deep meaning remains hidden.

This change cannot be reduced to a simple socio-demographic evolution, because the emerging process can not be reduced to a progressive update of the original program to be applied without major disturbance.

Finally, the prospective on the Romanian population in the first semi-centenary of the third millennium can not be classified in the category of revolution, which expresses a crisis of legality. As such, this state of crisis can not be solved by introducing on an administrative-political way some foreign socio-demographic patterns.

The socio-demographic mutation is defined as the change that occurs on introducing new programs. Only in this field there is nothing radically new. As a result, the specific nature of the mutation change is that the history, the premises of the mutation are emerging along with the mutation.

The demographic transition theory has been deeply studied in the recent decades in many directions. The main cause of the diversification process of the perception methods of the economic - demography interdependence lies both in the growing complexity of the population's issues, and in the new characteristics of the socio-economic development during the globalization process.

Moreover, in this new socio-economic background, the demographic transition can not be deducted and characterized only by taking into account the two fundamental sides of the population's dynamics. Therefore, different specialists have found and examined other types of demographic transition, such as age structure transition, which means, ultimately, aging (J. Bourgeois-Pichet); *marriage transition* (K. Hajnal); *type of family transition, transition rates, especially rates of female activity* (J. Durand); *territorial mobility transition* (W.

Zelinski); *urbanization transition* (Vl. Trebici).

Anticipating, we can say that many of the recent developments in specific countries' populations can be analyzed and assessed especially in light of these kinds of demographic transition and less on the relationship between fertility and mortality rates.

If the demographic transition is a law-like process with a global, regional and national nature, the ways and concrete forms of this process differs from one country to another, from one community to another, as from one historical period to another. However, it was naturalized the view that population should be regarded as endogenous side of the sustainable development and also as a multi-factorial process, the cultural factors accounting for an increasing role.

4. The specific dynamics of the population of Romania at the turn of centuries and millennia

In the recent decades - more than in the past and with more professional techniques - the medium and long demographic projections have been subject to all the national authorities and UN specialized institutes. However, there are institutes and private and joint organizations that conduct research activities of the population dynamics on the global level, on large geographic areas and in the individual countries.

The studies undertaken in the recent years have failed to answer a number of questions concerning the demographic transition. "The demographic transition - it is stated - is a law-like process for all countries, its ways and forms will differ from country to country.

As the factors, besides the economic and social ones, a major part is played by the cultural ones, as the American demographer Anslez J. Coale demonstrated.

Most times, the projections made by these institutions and organizations provide identical or very close information to each other in terms of future population sizes. Clearly, these projections have reached common assessment on the meaning of

evolution (down or up) of the population at its various levels of structure and time horizons.

Most demographer specialists, along with national and international institutions use for their century-old analysis, the following information about the Earth's population: in 1750 – 1 billion people ; in 2000-6 billion people ; 2050- 9,3 billion people. In 1950, total world population was of 2.730.000.000 persons. So in 250 years (2000/1750), the world's population increased by 5 billion people, which means an average annual increase of 20 million people. Obviously, the average annual bonuses have been increased from one century to another, from a semi-centenary to another and even from five to five years.

According to some projections prepared by the specialists in the next 50 years, Earth's population will increase by about 3.3 billion people. Such an overall increase in the next 50 years would result in an average annual increase of about 66 million people. Each year Earth will be populated with a number of people equal to the current population of countries like France, Britain, and Turkey.

The greatest population growth is expected to occur in countries with low per person incomes in Asia and Africa, densely populated countries. In Asia, the population growth in the next 50 years will be over 1.5 billion people. Only in India, the population will increase by 420 million, reaching 1.4 billion people.

From such a perspective, the first question that we ask is: in what relation is (will be) the demo-socio-economic change in Romania with the changes of the same processes on a planetary and continental level?

The general answer to this question will be made by comparing the projections regarding Romania with the ones expected to happen in the world.

In Romania, beginning the transition to competitive market economy (capitalist) marked, among other things, changing the evolution of the population. If the period 1930-1991, the population's dynamics in Romania joined on a continuous upward trend since 1992, it was characterized by a strong downward trend. The census of the population and buildings in 2002 confirmed this decline and the demographic

projections for Romania announce a continuing downward trend started in 1992 with greater intensity.

The census of the population in 1930 recorded that Romania had 14.280.721 people, the one in 1966 recorded 19.103.163 people. The census of the population in 1978 recorded that Romania had 21.914.187 people. In 1991, in Romania were 23.203.187 people.

However, this level was far from 30 million people, a figure which was planned by the Ceausescu regime and who formed the basis of the demographic policy in the decades 7th and 8th of last century.

During 1930-1966, a period in which there were important general historical processes (the war in 1941-1945, changing the country's borders), there was a decrease in natural growth rate from 14,8‰ to 6,1‰. This decrease of natural increase was due both to the falling birthrate from 34,1‰ to 14,3‰, but also to the decrease of the mortality rate from 19,3‰ to 8,2‰.

In fact, the sub-period 1955-1966 is the one which strongly marked the characteristics of the demographic transition in Romania. The notable declines of demographic variables in those years were the basis administrative support and political policy of population growth in the next sub-period. During 1967-1978, it was originally marked a change of meaning of the natural growth. Thus, in the years 1967-1968, the natural increases were about three times higher than in the years 1964-1966. Maintaining a birth rate of around 20 ‰ and the death rate of about 9 ‰, it resulted in relatively high natural increases. Based on these natural increases, in 1978 our country's population reached 21.914.163 people, which meant a total increase of nearly 2,800,000 people from 1966.

The period 1979-1991 marks another atypical development of the Romanian population. The continuous reduction of the natural growth (from 8,7‰ to 1‰) was exclusively due to the mortality reduction that reached 11,9‰ in 1991 to 18,6 ‰ in 1979.

Whatever the real causes of these dynamics were, during 1979-1991, the population increased by nearly 1,300,000 people. However, the year 1991 is the turntable of the change of the direction

belonging to the population development in Romania.

During 1992-2002, the development of population in Romania knew special trends. Natural growth turned negative due to the decrease both of birth rate and the growth of death rate. From a natural growth of minus 2.7 per thousand inhabitants in 1992, it was minus 2.5 ‰ in 1996 and to minus 2.7 per thousand inhabitants in 2002.

As a result, at the population and housing census in 2002, Romania's population was of 21,890,910 people. It was numerically lower with 1,504,110 people compared to the one in 1991. According to the National Institute of Statistics, in 2007 Romania's population reached 21,537,563, continuing the downward trend.

Most prospects view that, in 2050, the world population will reach 9.3 billion people to 6.3 billion in 2000 (1998), which means a relative increase of 47.6%. For its part, Romania will register at the same time horizon, absolute notable decreases. If we use as a source The World Almanac and Book of Facts, the absolute reduction in the range expected for 2004-2050 will be of 3,678,000 people, representing a relative reduction of about 17% (3.678./22.356). The projections of other international institutions such as the The Population Reference Bureau on the global population, advances the figure of 15.7 million people for the population in our country in 2050.

Comparing the estimated level of Romania's population for 2050 with the population of Romania in 1990, we see an absolute reduction of nearly 4,600,000 people. So, the population growth in the period 1948-1990 will be canceled by the decrease that will be marked until 2050.

If the Romanian territory will depopulate, in the optimistic variant with 17% and the Earth's population will increase by 47%, then it will take place the reduction of the share of population in our country in the world's population from 0.35% in 2000 to 0.20% in 2050.

This phenomenon of population decline in our country is also caught by the National Institute of Economic Research. Vasile Ghețău, the Professor and Director of the Center of Demographic Research "Vladimir Trebici", supports the theory of

Romania's population decline by 2050 of about 16 million people.

This decrease is due to the declining birth rates and increasing life expectancy. The decrease of fertility is determined by factors that, from the years 1960-1970 have triggered massive recoil of fertility in most developed European countries in terms of economic and social progress: the women's empowerment and its increasing participation in the economic activities outside the household, the increase of the duration and level of education, the increase of social mobility, the high cost of child care etc.

Moreover, the new economic and social realities have left their mark on the downward evolution of the phenomenon: the degradation of living standards, unemployment, uncertainty, stress, changes in attitudes and behavior on marriage, contraception, and divorce. The time gap regarding the massive fertility decline in our country to the developed European countries is explained by forced pro-birth policies of the former regime.

Another cause of the decrease of population in Romania is still the high mortality rate. When the standard of living, the quality of care and the access to health services will undergo sensitive improvements and the lifestyle of people will be directed towards a better health, the decrease of the mortality rate by age and the increase of the average of life will know the desired evolutions.

The atypical situation of the decrease of population in Romania consists of the size of the reduction, and increased migration, especially as there was no reliable statistical information about this phenomenon. In addition, the future evolution in the external migration is unpredictable today, being directly dependent on the economic and social development of Romania, on the immigration policies of the developed countries, on the membership of the European Union.

Keeping a low birth and fertility rate, and due to the aging generations, different in size, the age structure of the population in our country will continue to change.

In time, the effects felt as a result of the population decline will consist of specific economic problems, on the one hand on the

labor shortages and on the other hand, on the insufficient economic resources necessary to support the elderly. A low number of children today means that in the future we will have fewer taxpayers and thus lower income or higher taxes. If a pensioner in 1990 was supported by 2.7 employed persons, in 2006 a pensioner is supported by only 1.30 persons, following in 2050 as an adult to pay for the pensions and allowances of 9 people.

Until now, Romania's population decline did not have negative economic effects – says the Professor Ghețau – but it also might be said that it had rather positive effects by reducing the costs made by the family and the state for pre and post natal leave, child benefit, health care, education. However, "everything that has been good so far, in time has terrible consequences, by long-term demographic connection, if there is not a substantial recovery of birth."

Since all former socialist countries of Europe will register a decrease in population in the coming years, there can also be made links between the socio-demographic policies of boosting the population growth in the years of the socialism and the freedom of people to decide on family size, starting with the period that marks the transition to the new socio-economic system, on the market. The population declines in these countries are a consequence of understanding the development, but this is not the only cause,

especially that there are countries that are experiencing decline and have not gone through such a process. In conclusion, we can state that there is no single major cause of the depopulation of these countries; this phenomenon is influenced by many factors.

Influence of Implementing Social Responsibility Programmes on the Evolution of Companies

Abstract

For most companies in Romania the corporatist social responsibility domain is reduced at social investment campaign – donations, patronage, philanthropic actions – oriented towards problems considered to be of community interest. Some of these programs are considered to be inefficient, don't have social and marketing clear objectives and aren't professionally evaluated and promoted. For the wide public the news about the companies' social programs have a lack of credibility, and for the journalists the official statements to the press about such community actions aren't interesting.

Key words: Corporate social responsibility, strategies, programmes, proactiveness.

JEL classification: R11

Figure 1.1 Analysis of responsibility

Source: Patrick d'Humiers, *Le développement durable*, Editions d'Organisation, 2005, p.180.

The challenge consists of identifying the impact of social responsibility and of assessing the situation in economic and

2. What I give and what I gain if I implement a CSR programme

The vast majority of companies reject spontaneously the external costs that are imposed by the regulations in force. This reaction can be explained by a tendency of saving the resources on a short term, which, on a long term though, generates greater costs than a proactive attitude of integrating social responsibility within the corporation would have. Let us take for instance the environment issues: certain corporations are comfortable buying the cheapest antipollution devices on the market instead of investing in research and development which might lead to discovering less polluting production methods (“end of pipe” approach) and which would generate long term cost reduction or even a competitive advantage, therefore, income.

- On a short term, corporate social responsibility generates supplementary costs through:
 - Keeping in line with the ever more exigent norms/regulations;
 - Precautionary investments and voluntary provisions, for various risks related to social and environment aspects;
 - Incurring the new qualitative requirements of the customers, of the the employees and of the public authorities (exploitation costs); corrective programmes;
 - Specific expenses regarding the elaboration and funding of initiatives.
- On a medium and long term, social responsibility creates new income for the corporation:
 - Conquering new markets by adapting the supply;
 - Launching on the market products that aim at satisfying a growing demand of ecological/ethical products;
 - Saving resources by eco-efficiency practices, by changing those processes capable of generating net reductions of production costs.

The correlation between financial performance and responsible social behaviour is most often than not emphasized by examples of practices that proved to be efficient (“Best Practice”)¹. A study done by IBE (Institute for

financial terms in order to exploit the opportunities of growth and competitiveness.

Business Ethics) has demonstrated though by calculating the financial indicators and of corporate responsibility that the “ethical” companies have generated a significantly superior added value and an average 18% higher profit than the rest of the companies.²

3. To what extent the implementation of a CSR programme may influence the evolution of a company

The company may do this before its competitors or it may wait for a general sectorial involvement in order to act based on the costs/advantages analysis. But, depending on the general pressure of society, of regulations and of markets exerted on the company, this may adopt different strategies:

- 1) Transferring the supplementary costs onto the final consumer willing to accept them, hoping to obtain the desired results at the level of society;
- 2) Integrating the supplementary costs under the effect of the regulation applied to all companies. The optimization of this integration might create a competitive advantage;
- 3) Generating of supplementary income by growth and innovation, exploiting the expectations and opportunities on the market regarding corporate social responsibility.

The organization has to define its own strategy combining these three strategic options according to its degree of involvement.

Regarding the attitude and strategy adopted by a corporation in relation to social responsibility, it is worth mentioning Carroll’s model of societal performance (1979). For Carroll, societal performance corresponds to a responsibility that is analyzed in terms of:

- four hierarchized components: economic, juridical, ethical, philanthropic;
- a way of managing responsibility, by means of four philosophies in their turn hierarchized: opposition, defense, progress, proactiveness ;

implemented and proven on successful projects”(Spawar Systems Center, San Diego, California- counseling office).

² S. Webley, E. More, “Does Ethics Pay?”, Ethics and Financial Performance, IBE Publications, 2003 / www.ibe.org

¹ Best Practices-“effective high-leverage technical and management processes that have been

- discrimination and environment – the two specific fields to which the Carroll model is applied.

The first dimension is associated with the “**Pyramid of social responsibility**” which Responsibilities:

Figure 1.2 The pyramid of social responsibility
Source: **Carroll (1991)**, taken from:
www.oldredlion.here2stay.org.uk/ethics, accessed on
November, 20th 2008, 14.00.

Archie Carroll describes the essential characteristics of every level but some of them are challenged by specialists. For instance, for a great part of researchers the fourth level of the model – philanthropy – has different significances than those attributed by Carroll.

This approach by which corporate social responsibility is defined in philanthropic terms is specific to the United States of America³. The company donates a part of its profit to charitable causes, without expecting any benefit in exchange.

The European model is based on integrating social responsibility into corporation's operational activities and into investments oriented towards the community. Although there is no universal “best way”, the cultural differences being obvious, we still consider this model as more viable because:

- corporate social responsibility becomes integrate part of the process of creating value which, in its turn, provided it is correctly managed, will generate competitiveness and will contribute to the wealth of the society;

- in case of difficult situations, there is the stimulus of implementing social responsibility

more efficiently, as an instrument of managing the crisis; whilst, if this is exerted according to the philanthropic model, which is peripheral as compared to the central activity, it will always be the first thing to be given up in situations of crisis.

We shall dwell upon the second dimension of managing corporate social responsibility which displays four attitudes that might characterize a corporation:

- 1) *Ignorance*: associated to a “zero” degree of responsibility. What characterizes such a corporation is: exploiting the weak points of the regulatory systems and of the society where it is implanted;
- 2) *Defensive*: classic attitude. It translates into philanthropic or Mecenat actions but not all expenses of this kind are necessarily related to social responsibility. On the contrary, not being a Mecena does not automatically mean irresponsible from a societal point of view.
- 3) *Adjusting*⁴: it is equivalent of a preventive social responsibility which consists of ensuring a certain comfort through adhering to the norms. It aims first of all the preservation of corporation's reputation and manifests into a behaviour code. If this behaviour code is only the responsibility of the communication department, there are serious risks regarding the credibility of the management both inside, and outside the organization, and the company could be in this case be suspected/accused of false publicity.
- 4) *Proactiveness*: the corporation integrates the social/societal and environmental risks in defining its policies, in applying and controlling the procedures. This initiates partnerships with groups of interest and actively participates in solving the present or future problems that might appear in the environment where it activates.

Starting from the analysis of the companies that are listed on the stock market: Eurostoxx 50 and CAC 40 and of other multinationals, the researchers of the Novethic group suggest a typology of strategic positioning of corporations as related to the issue of social responsibility:

³ Mallen Baker -

⁴ Revue *Management & avenir*, n°7, Zouhair Benbrahim, “Éthique et Gouvernance: Entre intentions et pratiques”

Figure 1.3 Types of “responsible” strategies of multinationals

Source: *Novethic* study, November 2002, <http://www.novethic.fr/novethic/upload/etudes/ImpactDD.pdf>, accessed on November, 24th 2008, 18.00.

Besides integrating a coercive system based on the internalization of the restrictions related to social responsibility, it is also indispensable and complementary to implement a system of management that should aim at the adherence of the groups of interests, of collaborators, to the values and objectives of the organization and which should also maintain a balance between the permanent adaptation to the external pressures and the organizational cohesion.

Elaborating a “responsible” strategic plan

A strategic plan allows the company to create a connection among three major stages: pressure, impact, operational inflexion. The purpose of such a deep analysis is to help the organization to manage the degree of seriousness of various challenges (de exposure degree) and to determine the ways of involvement and action.

Corporation’s exposure degree and, consequently, the pressure exerted on it are determined by four parameters:

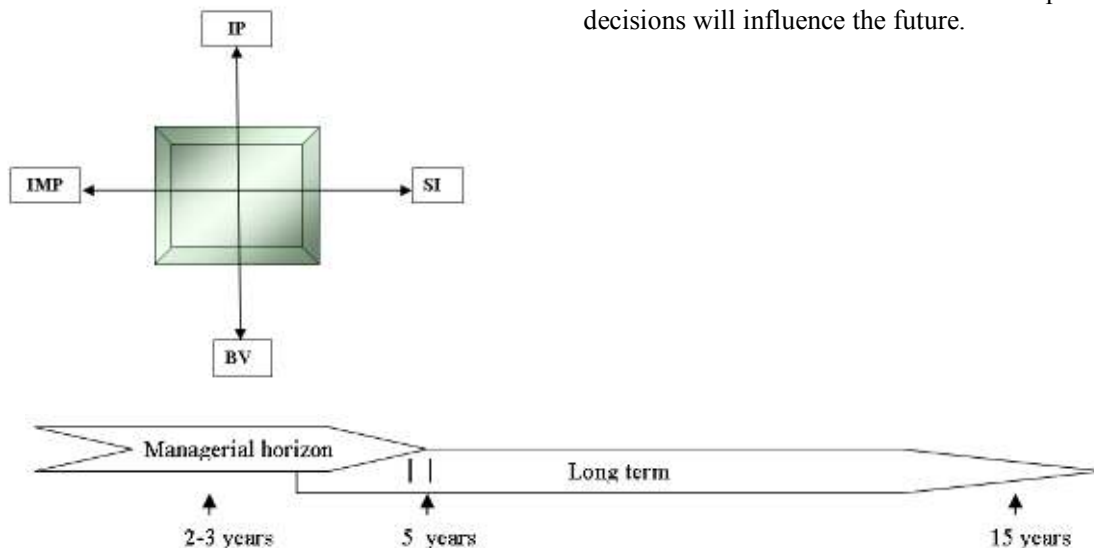

Figure 1.5 Projecting the potential impact of CSR on company’s results

Figure 1.4 The parameters measuring the corporation’s exposure degree

IP - Involvement in Planet’s problems

- Connection with the social and political problems ;
- Presence in the «South» and in the developing countries;
- Role in ensuring vital needs.

IMP- Real environment impact from production to product

- Security of production, the effect of the product upon health;
- Wastes ;
- Eco-conception of product.

SI - Social impact of activity

- Importance and welfare of personnel and community;
- Mobility need;
- Capacity to manage long term commitments.

BV - Brand vulnerability

- Company trust ;
- Positioning/receptivity to change;
- Capacity to listen and answer the needs of the groups of interests.

For each of these key parameters influencing the company’s perennality, the corresponding strategic horizon should be outlined. The “responsible” management process is a complex one which needs an interval of at least 2-5 years of leadership in order to reach pertinent results in the eyes of the civil society and financial community observers. It is advisable to go beyond the managerial horizon in order to identify the long term risks and opportunities and understand to which extent the present decisions will influence the future.

After analyzing each factor according to certain criteria, they are organized in a top

conferring priority to those items that have

the greatest strategic importance. The criteria that have been used are the following:

- economic impact;
- evolution in time;
- situation in space;
- competitiveness factors.

The first attitude adopted regarding corporate social responsibility is the defensive reaction towards the risks that the company is exposed at, the second being focused on identifying and exploiting the opportunities by offensive and proactiveness. The “responsible” strategic review should act as a “compass” for the corporation subjected to multiple pressures from external or local factors which wish to orientate the company’s action in the direction of each momentary specific preoccupation, which do not always correspond to the global project of long term corporate social responsibility.

4. Conclusions

In general, we cannot bring a real dimension of the social responsibility concept as a guarantee of the organization’s business success, but we have to be aware of the fact that this isn’t just an instrument of the value

maximization through image construction, but an essential element of the long term success, which is strongly bounded by the social and environmental performances of the community.

Without being perceived as the sign of economical power, the social responsibility takes the form of a civic corporatism – a way of establishing stable and profitable business relations for everybody, a non aggressive method, a friendly way of communicating with the society. In this way the RSC is nothing else but modern, open, flexible method of management. In this context the social responsibility isn’t just an attribute of the multinationals companies, but an elementary condition of the economical game in an open market.

Abstract

In a time when the world is interested in phenomena such as ecology, the environment protection, the safety of food, the ozone layer, the waste of resources, starvation and their effects, the initiatives concerning social responsibility are more and more welcomed.

There has been observed a more obvious need of the companies to appeal to community in order to find the necessary support and resources to accomplish their mission and objectives. For the society to develop, the population and the business sector must involve in communication and social responsibility programs. The state is added to these two elements, which can act as a catalyst in making every one responsible. Thus, we can have a real process, by means of which we create a responsible society in which the companies try to cultivate a sense of responsibility and a better capacity to understand the economic, social and environment problems the society is confronted with, and the consumers are equally exigent and responsible.

Key words: competitive advantage, corporate social responsibility, benefits for community, risk management

JEL classification: R11

1. Introduction

In order to gain legitimacy, a requirement of the civil society, the multinational company has no other option but to implement a real social responsibility policy, to integrate it in the industrial strategy, in the communication function and, most importantly, in its systems of management.

The management of corporate social responsibility is often wrongly perceived as a “brand management” technique due to the

sensible connection between the brand image and the opinion society. The use of this technique strictly as a communication instrument is inadmissible. One should use an incremental approach, step by step, by integrating elements that are already known to or practiced by the organization. Corporate social responsibility is first and foremost a way of continuous learning and improvement.

2. Integrating CSR programmes – a process of constant improvement

The process of corporate social responsibility is an extension and an enhancement of the qualitative processes, by integrating the long term factors, of ethics, by taking into account the groups of interests that may include even the civil society. Both have a mutual engine, that of constant improvement (Deming’s wheel: *Plan-Do-Check-Act*).

The involvement of the corporation in the process of societal responsabilization is based on a series of key factors of success and on two *behaviour postulates*:

- ✓“Walk your talk” (apply what you say): it is about creating a system of management of social responsibility which should offer a clear vision and develop products and services reflecting the real, effective commitment of the company regarding its global responsibility.
- ✓“Talk your walk” (say what you are doing): it aims at defending a professional and visible profile of the company that has committed as an active, honest and sincere actor on the road of social responsibility.

Key factors of success:

- ✓Ensuring a process that is at the same time ascendant and descendent, developing a conscience of responsibility among the company’s managers, on all levels, giving

them the possibility of constantly learning and of suggesting solutions.

- ✓ Ensuring and anticipatory, flexible management.
- ✓ Integrating corporate social responsibility into the quantitative and qualitative objectives, ensuring its coherence and “mapping” the progress on objectives and domains, the purpose being that of correlating (or even quantifying) the costs and advantages.
- ✓ Ensuring a fair measurement of performance, of progress but also of failures, understanding and evaluating them.

- ✓ A preference for an incremental evolution, with small steps, rather than for ruptures that are always brutal.
- ✓ Favouring flexibility, harmony, diversity and innovation.
- ✓ Ensuring transparency and credibility.

Stages of the process

Three learning stages characterize the progress towards corporate social responsibility, represented as follows:

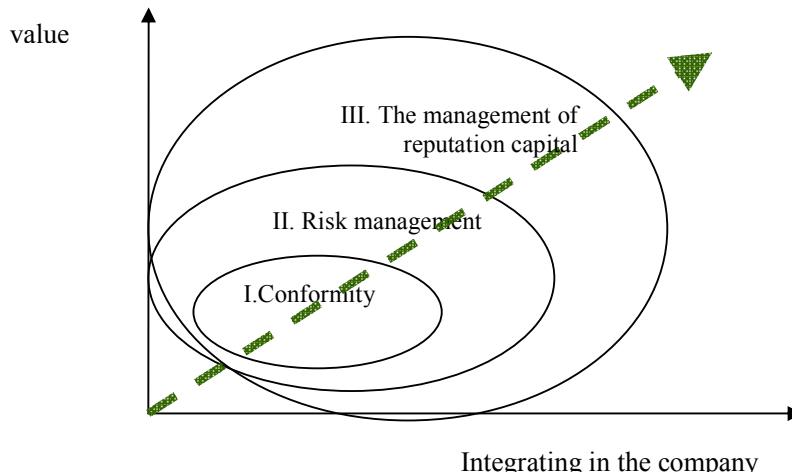

Figure 1. Stages towards CSR implementation

Source: Olivier Dubigeon, “*Mettre en pratique le développement durable*”, Edit. Village Mondial, 2002, p. 78

First stage: Regulatory conformity

The reference is not about the regulated efficiency control systems, perceived as performance drawbacks, but about adopting certain programmes meant for instance to develop formation processes, conformity audit processes, correctional actions, to repair the caused damages: all of these allowing the company to go further beyond the strict compliance with the regulations.

The second stage: Risks management

The multinational company may adopt a preventive attitude implementing the risk management in an extended perimeter (including the so-called “*reputation risk*”). Environment policies, environment management systems, pollution prevention techniques or recycling are characteristic for this stage.

Approaching the issue in terms of precaution allows the company to minimize and prevent risks, to develop certain ecological techniques and, at the same time,

to reach operational excellence, to diminish the damages and to minimize the costs. In the context of risk globalization, this kind of measures have become more and more delicate, more and more complicated for the following reasons:

- It is harder and harder to stay informed on potential risks and answer efficiently once they manifest;
- Multinational companies are intensely monitored by a significant and growing number of groups also. Moreover, these groups are interconnected thanks to the Internet allowing for the facts to be instantaneously transmitted (or for the reality to be twisted) to millions or even billions of consumers;
- The need for transparency is growing under the pressure exerted by the consumers, the employees, the local community which no longer trust companies without them proving the manner in which the production is made

and what impact its products have on society.

The third stage: Reputation capital management

Risk management, even extended to cover societal risks, is nothing but a stage on the road to corporate social responsibility. It is a preventive stage. Reputation capital management, by its proactive actions, allows for the companies to advance voluntarily towards an optimum compromise between their own interests and those of the present and future generations. Initially engaged in a development dynamics, the company transforms the environment, social and societal problems in a competitive advantage: this implies analyzing and, then, minimizing the impact of the products during their entire life span, from raw materials, through production and products use, till recycling. The companies that have reached this stage of improvement are trying to establish a “win-win” relationship with the groups of interests with positive effects the reputation and perennality of the organization.

Three stages of maturity characterize the practice of corporate social responsibility: a restrictive approach, a cumulative approach and integrative approach.

The restrictive approach: the organization is basically motivated by financial profitability, its social field or the environment representing regulated constraints that it has to comply with.

The cumulative approach: the company makes efforts to address both social problems as well as those regarding the environment and the stake of financial performance as efficiently as possible. The corporation makes a number of annual reports (activity report, environment report, social responsibility/sustainable development report). Nevertheless, these annual reports and especially the social responsibility/sustainable development report present all the fields separately, reflecting a segmented organization of the respective responsibilities.

The integrative approach: in order to solidly anchor its legitimacy, the company needs to develop a social responsibility management system which should allow the management of the relationship among the three pillars – economic, social, societal and

environment performance and their integration into the corporate government. This integrative dimension transforms the corporate social responsibility into a vision and a sense shared by their groups of interests and, consequently, into a formidable ambition for the future.

By taking into account the entire range of problems, the internal display of intentions, the establishing of some preliminary diagnoses, the definition of the internal organization methods, the decision to get involved in various programmes and the systematic construction of a dialogue with the groups of interests, the “reporting”, the research and the partnerships we find ourselves in the middle of specific and complex process of management.

3. The role of the decision factors in the implementing of CSR programmes

- The Board of directors, the general director, evaluates the process of social responsibility (activity report) and establishes the objectives (annual action programme).
- The social responsibility/sustainable development committee ensures the dynamics of the process and its managerial reality.
- The coordinator of the social responsibility integration process runs the committee, ensures the execution of the corporation social responsibility programmes, the connection with the exterior and the technical quality, as well as the cohesion and coordination of all involved.
- The functional departments suggest, make the connection and supervise the evolution of the process (the financial department, the human resources, sales and communication departments).
- The operational departments initiate and apply the progress actions (research-development, industry and marketing).
- Management personnel.
- The internal “volunteer” teams.

The manager faces a paradox difficult to solve: the corporation social responsibility cannot be imposed by coercion and cannot exist independently of external actors. The challenge consists of committing the company and various actors on the road to societal responsibility, by drawing attention, adapting to various social and cultural

contexts, guarantying at the same time coherence at worldwide level.

On the one hand, social responsibility by its nature cannot be imposed, because it aims at improving human practices and behaviours with the purpose of widening the area of responsibility of each actor and the global responsibility of all parties involved.

On the other hand, since the study refers to multinational companies the assurance of coherent values and strategies both at the level of all branches, and the level of the relationship with the groups of interests is to be expected. Companies have to impose a certain discipline in their management so as to allow for the recognition but also for the sanction of those actors that do not comply with certain fundamental ethical requirements.

How can all the actors be mobilized into a common direction at the same time keeping in mind various social and cultural contexts? Where is the border between negotiable and not negotiable and how can the appreciation of value go along with sanctioning? The solutions depend on the maturity and conscience of the company's entities, as well as on the pressure exerted upon reputation; however, the necessity of establishing a balance between inducement and coercion is obvious.

Incenting the employees

It consist of developing a climate of trust and esteem among the employees, favouring and rewarding those behaviours that comply with company's values and strategies, developing everyone's capacity to contribute to the strategy and fulfillment of the objectives by:

- Encouraging the employees' responsibility;
- Active listening to and permanent dialogue with the employees;
- Favouring self-diagnosis of social responsibility practices;
- Sharing and transversal exchange of corporate social responsibility practices;
- Conferring value to team commitment towards reaching global performance;
- Rewarding remarkable results.

Incenting the suppliers

It supposes requirements on behalf of the multinational company regarding the

suppliers; i.e. they should be persuaded to adopt and enforce the same standards as those applied by the company, the cooperation with them being ceased in case of noncompliance with the commitment.

Multinational corporations have numerous suppliers especially those in the retail sector – for instance, Carrefour has 50,000 suppliers while the automobile manufacturer General Motors has 10,000 suppliers. This is why, taking into account the costs of the systematic control process, most companies control the suppliers *a posteriori*, that is only if certain cases of nonconformity behaviour on behalf of the suppliers are signaled. An environment of trust is thus created and the company is not perceived as a watch dog by the suppliers but at the same time the corporation is exposed to certain risks. Therefore, a number of measures become essential, as follows:

- Observing suppliers' policies, performance, objectives and values;
- Watching the suppliers and their behaviour in terms of social responsibility/sustainable development and selecting the "responsible" ones;
- Assisting the selected suppliers in a non-financial manner;
- Partnerships with the local institutions and NGOs which can in their turn control the suppliers' activity;

Incenting consumers and customers

Educating and growing the consumers' awareness (especially in terms of over costs resulted from environment protection related activities) as well as the customers' represent a major challenge for those corporations that have chosen the path of social responsibility. The company shares this responsibility of educating and growing population's awareness with the educational system, the local community and the family.

5. Instruments of social responsibility management

In order to implement social responsibility in the corporation and to fully integrate it in the organizational culture, the management has a number of instruments as follows:

Table 1 The 10 instruments of integrated responsibility management

Internal charta	The chart of decisions and commitments. Brand's characteristics
Impact chart	Identifying the problems specific to societal responsibility and the risks already present or threatening the company
The corporate social responsibility/sustainable development committee	Programme, evaluate, stimulate
CSR indices matrix	Selected criteria starting from referentials, in order to fulfill the CSR/sustainable development chart
The mechanism of consulting the groups of interests (stakeholders)	Ways of listening to and consulting with the groups of interests that allow for a permanently updated inventory of their expectations ("societal watch")
Internal programmes behaviour	Internal expression and valorization, formation and progress
Extra-financial evaluation	Performance indices that complete the financial information
Interactive Internet/intranet	It asks for the interested public's opinion and answers to it (Sustainable development/societal report and "best practices")
Partnership related communication	Open presentation of partnerships results

Source: Patrick d'Humiers, *Le développement durable*, Editions d'Organisation, 2005, p. 195

4. Conclusions

We believe that the corporate social responsibility can be considered a world profitable business strategy that brings benefits both to society and the initiating organizations. Success consists in finding a balance point between the awareness of the society's problems, the needs of the different target groups and the management, financial and material capacity of the organizations.

The consequences of the social responsibility increase are essential for the positive development of the economies. The consumers must be educated continuously in this direction for the role they play daily and develop, respecting the moral principles without decreasing the intrinsic economic reason of the buying act in order to satisfy the major objective of each company, that is, to create loyal consumers.

Thus, the great challenges of the Romanian business environment are going to be given or indicated by the reformulation of the mission and objectives, the implementation of new strategies, the development of a quality culture, the detachment of the political area, the promotion of a responsible and performant management. The social responsibility is a concept with a large application which can prove to be efficient in the Romanian structures of business, too. Although the debates do not highlight an urgency as far as the integration of the social responsibility is concerned, the practice has proved that

when it is really incorporated in a structure, it can generate tight connections or links in the decisional process and added value in the value chain of the different groups of interests.

The process of the integration of the social responsibility in the structures of an organization must be made in an integrated manner. In this context the efforts must also be directed towards finding out other modalities, ways, managerial patterns that should make effective this process. The managerial practice offers us a large enough palette of patterns that can be adapted to the system and structures of business environment.

Regulation and deregulation of the financial markets

Cristina Duhnea

Abstract

The regulation and oversight of the financial markets is made necessary by both their complexity and the imperfect real economies in which they play a lead role. The paper makes an analysis of the evolution of the regulation and deregulation of the financial markets.

Key words: financial market, regulation, deregulation, European Union

JEL classification: G28, G15

1. Introduction

Financial market regulation's main purpose is to promote financial institution stability. Its secondary objective is to block the effects of asymmetric information¹, where some market agents are in possession of information unavailable to others. This regulatory function is especially important to individual investors, who lack the capacity to procure such information through research or rating agencies. Thirdly, regulation must promote fair competition on the financial markets. To this end, regulation must fight the insider trading phenomenon, and to

ensure sufficiently high financial institution capitalization, especially in banks².

The financial market regulation took different shapes and directions, depending on the respective macroeconomic and political environments. Also influencing regulation were the financial integration and globalization phenomena present in the world's economy during the last decades.

2. Regulation deregulation of the financial markets comparative analysis

The oversight organization can be either a dispersed structure (such as on the American and UK markets) or as a highly concentrated one (as is the case in Germany).

An increasing number of countries show a tendency to task a single institution³ with the regulatory and oversight responsibilities. In countries such as the USA and Japan, with a single financial system, the issue of regulation/deregulation has different implications than in the European Union, where additional complexity regarding the adequate regulation of the financial services market arises from the existence of parallel European and national systems.

¹ L. White, "Technological change, financial innovation, and financial regulation, in the U.S.: The challenge for public policy", apărut în "Performance of financial institutions" de P. Harker și S. Zenios, Cambridge University Press, U.K., 2000, page 12

² Rod Apps, David. Goacher, "The monetary and Financial System", Bankers Workbook Series, London, 1996, page 152

³ Ovidiu Stoica, "Mecanisme și instituții ale pieței de capital. Piețe de capital emergente", Editura Economică, București, 2002

The issue of establishing a single regulatory and oversight authority has been raised increasingly during recent years, given the support at the Union level for the universal bank model. *But how effective would such a single regulatory institution be: could it alone protect all investors, inspect financial institutions and provide market oversight in twenty-seven countries?* On the other hand, the current market fragmentation, including the regulatory institutions, contributes negatively to both intra-European trading and the pursuit for an integrated European capital market.

While the US capital market regulatory body has existed for decades, and the market structure is fundamentally unchanged since the '40s, the European Union institutions tasked with financial services oversight have lack the age and experience of their American counterparts. The challenges they face are however bigger and more complex, even more so after the introduction of the Euro and the EU expansion. In the 2000s, when the financial market grew to include emerging market sectors, existing issues were supplemented with concerns for steering the development of the new markets towards a healthy maturity.

The last few years have seen a trend in published works introducing the notion of deregulation, often presented as the opposite of regulation.

Assuming then that regulation describes the oversight and control of capital markets, we can see **deregulation** as a process involving the relaxation of the barriers imposed on trading and market participants, with the purpose of allowing for stronger competition, and in turn for better satisfaction of demand.

This international deregulation trend includes market liberalization phenomenons, opening up national markets, and lifting existing restrictions. From this perspective, we can also see a link between deregulation and the accelerated globalization of national capital markets⁴.

There are two main aspects of the deregulation process. Firstly, beginning with the capital flow liberalization in the '70s, there were major changes affecting strictly the rules and regulations for capital market trading (such as the abolishment of fixed commissions in 1975 and the start of primary and secondary market disintermediation, accelerated by the introduction of electronic trading systems). Secondly, other major changes concerned the fundamental laws governing capital markets, both national and international, towards integration.

Deregulation manifested differently on the main capital markets, with the US and European cases as the most important ones.

In progress for the last twenty years, the deregulation process contributed significantly to the acceleration of financial globalization, the positive effects of which were previously satisfactorily compared to their disadvantages. But the latest financial crisis, encompassing national economies since 2007, weighs the opportunity of deregulation with the need for protecting, providing oversight for and controlling the national capital markets.

The issue of regulation and deregulation in the EU is more complex than in the case of the US, since it must address two big domains: on the one hand, it has to consider regulating national capital markets, with their inherited structures, regulation models and trading traditions. On the other hand, it must strive towards regulating the single market resulted from the integration of the national ones.

The regulation of European Union financial markets is consequently tightly related to one of the main targets of the union's authorities - that of establishing a single market, including financial services. This purpose implied the deregulation of member states' national capital markets, and the re-regulation of the financial services market at the community level.

But the years following the signing of the Treaty haven't had a positive influence on financial integration and the creation of the single financial services market. Therefore, The European Commission initiated in 1999 the Financial Services Action Plan, which aimed to establish a combination of laws, amendments to

⁴ Ovidiu Stoica, "Mecanisme și instituții ale pieței de capital. Piețe de capital emergente", Editura Economică, București, 2002, pag. 70

existing regulations, communiques and EC recommendations towards eliminating the flaws impeding the liberalization of the European financial services market, all of which was to take place within 5 years. The Barcelona meeting of the Council of the Action Plan for Financial Services resulted in the acknowledgement that besides existing regulation initiatives, also worth considering are the consultancy level and quality (Lamfalussy Report), the danger of over-regulation, the need for flexibility, the differences in financial services offered to companies (wholesale) and to retail, and the ways to collaborate across oversight activities.

Created with the intent to accentuate the EU financial integration, the Action Plan aimed for a coherent set of regulations, which were to accelerate financial integration and harmonize the national laws with the European directives for an efficient financial market.

During 2001-2004, under the Financial Services Action Plan (FSAP) several directives were drawn, concerning guaranties, market abuse, financial brokers, remote financial services marketing, financial conglomerates, issue prospects, occupational pension funds, IAS regulation, exchange quotation, public offerings, and harmonization of transparency requirements to allow for quicker cross-border listing.

Special consideration was given to market manipulation and privileged information trading⁶. These phenomena were the target of one of the earliest European financial services market directives, in 1999. After long debates, as part of the FSAP actions, a new directive regulating these issues emerged in 2003.

At the end of the Action Plan's run the 2004/39/EC was issued, concerning the financial instruments market (MIFID), viewed as one of the most important European capital market regulations.

The whole set of regulations resulted from the FSAP had the purpose of establishing a community level legal framework, which when implemented nationally would result in deregulation, and in turn in additional flexibility in across-borders trading, increased liquidity, more competitive European markets, a rise in total investments accomplished by helping the public to trade securities with maximum

efficiency and minimal costs, and introducing new trading methods. All this would allow for the proliferation of financial instruments best fitted to the needs of market participants.

We view the Action Plan as an important contributing factor to the acceleration of the financial integration in the European space. Producing visible results, it was the first successful regulatory initiative towards sketching a single financial services market.

From these positive results and concluding the debates initiated by the European Commission at the end of the FSAP, resulted a White Book titled "The Financial Services Policy for 2005-2010". It encompasses the principal action directions to finalizing the creation of an integrated financial services market. The policy's objectives concern less the legal framework itself, and more the qualitative aspects linked with creating an integrated financial services market, financial services market consolidation, removing remaining barriers to free, cheap capital circulation in the EU, the continuous implementation and evaluation of existing regulations, strengthening cooperation and convergence in oversight, and deeper connections with other financial markets during the financial globalization process.

The financial integration process initiated by the Maastricht Treaty resulted firstly in a deregulation process at the member states' national capital markets level, especially after the legal framework initiated by the FSAP was finalized. As intended, this deregulation process involved eliminating restrictive and protective national regulations, and replacing them with a set of prudent directives, applied in non discriminatory fashion in all member states.

The immediate and direct consequence of applying the European directives was increased competition between financial intermediaries in member states, which were able, after the introduction of the European passport, to extend their activities to other European Union countries.

Deregulation accelerated nationwide implementation following across the FSAP European and European-level re-regulation seemed, in early 2007, to lead the financial markets

towards an unprecedented European integration and an accelerated development. Unfortunately the changes caused by the international financial crisis begin to novel years 2007 2008 which brought the national financial markets in the European Union collaps. Sensitive topics such as hedge funds and private equities transactions returned to date because are considered partly responsible for triggering the crisis.

3. Conclusions

We think that the latest evolutions of the main financial markets put to danger the entire regulation work both in The European Union and other financial systems like United States, China and Japan and prove that “deregulation” is a tricky concept that can bust the development of the financial market towards a perfect economic environment but can also create chaos when the financial instability escalades and all the actors involved use the lack of regulation to minimize the loss.

The ongoing financial crisis must be a lesson and the future developments in the field of the financial markets regulation must, in our opinion take into consideration:

- A re-regulation process that bring in the financial markets new rules;
- Enforced protection for consumers against toxic financial instruments;
- Recreations of the financial systems by bringing back to basics the banks.

Management methods and techniques used in the companies to have a profitable business

Enea Constanța,
Universitatea Constantin Brâncuși din Targu-Jiu
Enea Constantin,
Universitatea Constantin Brâncuși din Targu-Jiu
mail: *eneacostante@yahoo.com*

Abstract

Methods and techniques of management used in Romanian small and medium enterprises (SME) represent the understanding and management application of the business. To choose the best combination of methods and techniques to be implemented is a decision that must bring the business closer to achieving its objectives. The existence of more techniques and methods of management makes managers to use a specific set, a specific combination of methods and techniques, that proves the involvement that managers have in their managerial tasks. The importance of decision making is showed by Herbert Simon because management is as important and almost identical to decision making. He believes that „the factory of the future will be functional based on automatic decisions taken in the next office, that is also automated” [1].

Key words: profitable business, management methods, techniques

J.E.L. M10;

Introduction

To write a future not too far from the present is becoming an adventure in these times of radical fast changes.

If the future will be predictable over longer periods of time, -tens of years- than decision making would not be so complex and difficult to achieve. Because of general instability of a social, economic, political nature, decision making and its result must be continuously improved.

The necessity of decision making as a current practice is based on future uncertainty on one side but answers the necessity of removing

the consequences of things that already have happened.

Decisions are the result of a process of stages that are considered to be next [5]:

1. Recognising the fact that there is a problem that cannot be resolved other than by a solution, a decision that will generate a rule or a principle ;
2. Establishing the minimum conditions that the answer must satisfy;
3. Identifying the solution that will satisfy a minimum of conditions;
4. Incorporating the decision in actions that lead to its realisation ;
5. Identifying the result after applying the decision taken as to the actual course of events.

This process is important and complex. Decision making is specific to managers of all hierarchy and recently to knowledge workers, and experts. Decision making is generated by the need to resolve an existing problem and to foresee future situations that are similar and can happen in a given scenario.

Studying managerial practice, *decision, based on a time table* that are found to be viable, were considered to be the following [6]:

✓ *Strategical decisions:* Are found to be viable over a time table of 3 to 5 years; Are used by high level managers that have all the information of the business and its future; Are used to contribute to accomplishing objectives over a medium to long time frame.

✓ *Tactical decisions:* Are referred to periods of time between one and a half and two years; Are used by high ranking managers; They view both the ensemble and the distinct activities of the SME; They contribute to a realisation of policies, programs and plans for SME's.

✓ *Current decisions:* Time frame of a few months; Are used by medium and low level

managers; Used to accomplish individual objectives.

By the rate that decisions are made in a organisation we distinguish 3 categories:

✓ *Periodical decisions*: Are adopted especially in the production process; Are adopted in regular intervals of time; In the process of decision making there can be used mathematical elements.

✓ *Random decisions*: Are taken at irregular intervals of time; Decision quality depends on the potential of the decider.

✓ *Unique decisions*: Have an exceptional character; The quality of this decision type depends more than other decision types on the potential of the person deciding.

The decider based on his native and learned skills can partially or fully anticipate the possibility of making a decision. So we have two decision types:

✓ *Anticipated decisions*: Elements involved in the decisional process are known long in advance; Are specific to SME that are scientific ruled but also to evolved.

✓ *Unpredictable decisions*: Elements involved in the decision making process are known a short time before making a decision; Quality of the decision taken depends mostly on intuition.

Knowing the decision power of the decision taker, decisions can be:

✓ *Integral decisions* – that are adopted by the decision taker, without advisement by the superior manager. These are decision types specifically of current decisions, periodical and anticipated decisions.

✓ *Advised decisions* – are taken by the decision taker, but for their application a high level manager's advisement is necessary. Such decisions are mostly strategic, tactical that are forefiled over higher lengths of time.

The decision taker selects the optimal variety from the multitude of decisional variants, and can be a person or a group of persons. When the management is participative, meaning that decisions are taken by a group of persons, the decision is partial, case in which the time volume is bigger than when the decision is taken by a single person. In this case when decisions are taken by a single person, decision type is singular or individual.

Taking a decision is a complex process with high risk and great responsibility for managers of any hierarchy levels [6].

Choosing the best combination of methods and techniques of management

The above has referred to the decision making process and its effectiveness, like the types of decisions existent in managerial practice are just an introduction in the more complex problem of an SME that asks how to implement the science that is management? What managerial techniques, are needed at a business level to have a profitable and capable activity?

Decisions are taken in the sense that they are needed even from the beginning of the SME and throughout its lifetime. It is the responsibility of high level managers to decide:

✓ What type of mixed activities will the new business have;

✓ What structure of organisation will answer better the primary objective?

✓ What are the features of the worker of the SME?

✓ What are the methods of management and its techniques that are applied in a Romanian SME?

To answer in more detail to the last question we consider the existence of a SME called SC X SRL, that has its primary activity, production of wooden panels and furniture from stratified wood, for the internal and external market. Since its beginning, high level managers and associates have considered opportunistic, for the Romanian market to build a business based on the production of furniture and panels from stratified wood. Because there is no continuous flux of internal or external requests, the decision has been taken to have other secondary activities such as the production of pallets, for transport, production of doors, and windows from stratified wood. The decision has proven to be effective, resulting in a growth of internal and external clients and growth of profits by SC X SRL.

For such a diversity of activities a single SME the high level managers have decided there is a need for an organisational structure that is more flexible, and in no case based on strict hierarchy. The most opportune method of management is knowledge management, where the workers were hierarched by their knowledge and leadership was not based on hierarchy or relations between the

employees but on knowledge and cooperation rather than subordination.

For a better functionality of SC X SRL its managers have applied usual techniques of management, indispensable for the best development of any activity. These are: session method, method of competence and responsibility, elaboration of the business plan especially for the financing of a new project from external sources, SWOT method and benchmarking. Benchmarking is hoped to become a usual technique of management because of its special effects that offer SC X SRL, after such a technique the business will know its standing comparative to other business and can improve its activities.

As a management method knowledge based management has been chosen considering the advantage of including both objective, partial and exceptional management types.

It is to be noted that for SC X SRL both techniques and methods of management are interlaced, and the decision of using one or the other is taken based on internal conditions existent at any given moment.

Conclusions

Decision is the base instrument of a manager regardless of his level of hierarchy. To adopt the best decision in the case of any given problem is the dream of any manager. Intuition and charm experience and acquired knowledge help managers in their work to make the best decision.

The optimal method of combining methods and techniques that are applied at a managerial level of Romanian SME is a fact that happens, most of the times these decisions are decided of the succession of many events. And the decision to apply one or the other is taken after its initialisation in practice.

The Balance Point's Role In The "Cost-Volume-Profit" Analysis

Prof. Univ. Dr. Elena Ruse

University: Spiru Haret

College: Management Financiar Contabil Constanta

latan_e@yahoo.com

Abstract

Managers use the "Cost-Volume-Profit" (CVP) analysis as a support in decision making, some of which are strategic decisions.

The fundamental hypothesis of CVP analysis is based on:

1. Changes that occur in business volume entail changes in revenues and costs;

2. Total costs are split into variable costs and fixed costs;

3. The total variable costs structure includes direct and indirect variable costs of a product, like fixed costs including direct and indirect fixed costs;

4. The analysis of revenues development and total costs in relation to production volume is carried out within a relevant time interval;

5. Within the limits of the relevant time interval the analysis coordinates (selling price, unitary variable cost and fixed costs) are known and constant;

6. CVP analysis can be conducted on a single product, taking in consideration that the total ratios of different products would remain constant as the number of total units sold changes.

Key words: cost-volume-profit, analysis, balance point

Jel Classification: M1, M41

Based on the distinction between variable and fixed costs, the analysis of the correlation between the volume of activity, costs and profit, is directed, essentially towards decision making regarding company management in business forecasting. Used since the end of World War I, the analysis of

this correlation can be done by calling on indicators like:

- The balance point (critical point);
- The safety interval and dynamic safety index;
- Coverage factor;
- Index of sampling;
- Volatility coefficient or operational leverage.

The balance point in time:

The time t in a given period of time in which the balance point can be achieved can be determined using the formula:

$$t = \frac{T \times CA^*}{CA}$$

T - the number of management periods taken into consideration.

Production is carried on for 12 months, and the time t in which the balance point is achieved will be:

$$t = \frac{T \times CA^*}{CA} = \frac{12 \times 5600,00}{12600,00} = 5,33 \text{ months}$$

which means 5 months and 10 days.

The balance point will be achieved on the 10th of June.

In time, the cumulated turnover rises to a point when the margin on variable costs fully covers fixed costs. At that time (june 10) the result is zero. From this moment until the end of the year, the variable costs margin will generate only profit.

Most of the time the activity of the business is not done at the same pace during

the year, and especially sezonal units make and irregular turnover during the year. The sezonal variations from the exercise do not affect the operating conditions of the business and do not influence the level of the critical turnover but

between time and level of turnover is impossible. Different achievement rates between quarters, show that the time of reaching the balance point has moved, it being achieved later.

Calculation of this time can be determined as follows:

- From the development of turnover;

change the moment when the critical point is achieved.

Taking into consideration the unchanged operating conditions, the critical point of 5600.00 lei will not be achieved on June 10 because the use of proportionality

- From the development of variable cost's gross margin.

Table nr. 1: Cost's gross margin

Period	Quarterly variable cost's gross margin	Cumulative variable cost's gross margin
0	1	2
1st quarter	872,54	872,54
2nd quarter	436,27	1308,81
3rd quarter	1308,81	2617,62
4th quarter	1308,81	3926,43

The evolution of the cost's gross margin

Achieving the balance point earlier represents an additional safety margin for the business.

Calculating the balance point for a unsteady production involves determining a steady unit of production.

Where:

\overline{m}_u is the variable cost's average gross margin per unit

The variable cost's average gross margin per unit can be determined using the formula:

The critical point can be mathematically determined using the formula:

$$Q^* = \frac{CF}{m_u}$$

$$\overline{m}_u = \frac{M}{\sum_{i=1}^n Q_i}$$

The company S.C. MEDA SRL sold during the managed period the following products:

Table nr. 2:

<i>Product's name</i>	<i>Quantity sold</i>	<i>Variable unit cost</i>	<i>Unit selling price</i>
0	1	2	3
A	9 buc.	963,73 lei	1400,00 lei
B	23 buc.	328,07 lei	600,00 lei
C	25 buc.	121,79 lei	300,00 lei

The fixed costs made by the company amounts 9072.80lei.

The variable cost's average gross margin per unit will be:

$$\overline{m}_u = \frac{14636.07}{9 + 23 + 25} = 256.77 lei$$

The physical volume of production at the balance point will be:

$$Q^* = \frac{9072.80}{256.77} = 35.33 pcs$$

The numbers are found in table nr. 3.

Table nr. 3: The unit and total gross margin

r crt	Indicators	Products sold			
		Total	A	B	C
	1	2	3	4	5
	Quantity sold		9	23	25
	Unit selling price		1400.00	600.00	300.00
	Unit variable cost		963.73	328.07	121.79
	Unit gross margin		436.27	271.93	178.21
	Turnover	3390.00	1260.00	1380.00	750.00

	Variable costs related to the sold products	1926 3.93	8673. 57	7545. 61	304 4.75
	Total gross margin	1463 6.07	3926. 43	6254. 39	445 5.25

The average selling price is determined:

$$\bar{P}_v = \frac{CA}{\sum_{i=1}^n Q_i} = \frac{33900.00 lei}{57 pcs.} = 594.74 lei$$

The critical turnover can be determined:

$CA^* = Q^* \times \bar{P}_v = 35.33 pcs. \times 594.74 lei = 21012.16 lei$ The critical turnover can also be determined using the following formula:

$$CA^* = \frac{C_F}{M} \times CA = \frac{9072.80 lei}{14636.07 lei} \times 33900.00 lei = 21014.38 lei$$

The structure of production at the balance point.

Determining the structure of the physical volume of production at the balance point is by the weight of each product from the total production obtained.

Table nr. 4: The structure of production at the balance point. Product name	Production obtained		The structure of production at the balance point
	Physical units	Relative numbers	
0	1	2	3
A	9	15,79%	6
B	23	40,35%	14
C	25	43,86%	15
Total	57	100	35

The structure of production at the balance point is:

Table nr.5: The structure of production at the balance point.

Product	The structure of production at the balance point	Selling price	Critical product's turnover
0	1	2	3
A	6	1400.0	8400,00
B	14	0	8400,00
C	15	600.00 300.00	4212,16
Total	39	-	21012,16

Changes in operating conditions may occur in the operating activities of the company, dependent or not on the company's management. These changes may influence the balance point and are determined by:

➤ *Company structure* – as a result of expansion or restriction of production capacity and which leads to the change of fixed

cost's level. Their rise, generated by the expansion in production capacity, will move the balance point, which means an increase in the company's effort to produce and sell more output to cover additional costs of investment. The reduction of capacity will determine a decrease in the fixed costs level and hence a reduced effort to reach the balance point;

➤ *Current operating conditions* – by changing the selling price of products, the

purchase price of raw materials, wages rates, working time, rules of consumption of raw materials, transport rates, energy, etc. These elements influence the variable costs margin. *A rise in the margin reduces the company's effort to reach the critical point as a decrease in the margin increases the company's effort.*
