Entrepreneurs, to ensure business continuity, they should always catch business opportunities; those opportunities that are sustainable attractive, appeared at the right time, and to make products, services or transactions that are high rated (the extent possible) by clients.

Referring to business success, the opportunity must meet a number of conditions (Sasu, 1998). Among these, arises the possibility of starting a company having a full coverage from the client, whose potential and which report based on risk - profit fit the purpose and values of the entrepreneur.

Here, for example, it is shown the structure of SME's in Romania according to the nature of the customer (Fig. 2).

Fig. 2 Structure of SMEs in Romania according to the nature of customers

Source: White Paper on SMEs (2010)

Development potential refers to the market share that can be won as a result of the incomes size that can be obtained, as the growth rate and also the period in which business can be exploited.

Estimated profit of the launched business on it, to justify the time and capital to be invested, being higher than their opportunity costs. This depends on the capital required, followed by time to break even, the risks to be assumed and the existence of alternative

use of time and capital required. Another condition regards the possibility of maintaining the profitability of the business.

In time, profitability may decrease or disappear, due to internal factors (management errors that can create various problems within the organization, such as unjustified costs or staff turnover), or external (the emergence of new competition, of substitutes products, changing technology, necessities and desires of consumers,

relations with suppliers and/ or customers etc.).

Last but not least is necessary to have the possibility of development, diversification and integration of business on it. Given the high degree of business risk and uncertainty, the entrepreneur should have great flexibility so that he can choose from several options

when it comes to resources and technologies, establish collaborations and strategy.

Then, products and/ or services that are performed must be really needed by consumers, in terms of price, reliability, quality.

We give the event a complete picture of available business opportunities for Romanian entrepreneurs (Fig. 3).

Fig. 3 The intensity of the event business opportunities

2.1. Creating small-sized enterprises (SMEs) due to the action of a variety of factors influence increased

SMEs have an important role in the process of improving the current economic situation.

For Romania, as a developing country, the creation and rapid expansion of SMEs is required as a priority for action. Thereby, we bring a number of reasons, such as (Russu, 1996):

- by their ability to adapt quickly to market conditions, SMEs are true, advanced pawns of economic transformation;
- developing a strong sector of SMEs. is closely linked to strengthening the economic base of political pluralism;
- known difficulties of privatization and restructuring of public companies make SMEs to be seen more and more as resources to facilitate these processes;

- only a strong decentralization of economy allows its effective exploitation of available resources.

The chances of SMEs creation and rapid expansion are conditioned by their environment of existence and action (Rasca, 1998). Macroeconomic context, enterprise reform, privatization and economic restructuring policy define this environment, the characteristics of which we refer here (Russu, 1996).

First, we state the existence of a government orientation towards a market economy, which has created quite rapidly a legal and institutional basis, indispensable in the process of initiating market mechanisms; this framework requires further refinements and additions to allow market mechanisms to play their regulatory part.

Having gone through a prolonged and deep recession, with multiple causes, the economy begins to be characterized by a

certain macroeconomic stabilization, a gross domestic product growth, a reduced inflation rate, and recovery of productive activity. A high level of unemployment (Fig. 4), we think that is likely to encourage the creation and development of small-sized companies,

knowing their special role on the number of job expansion in the context of public sector constrain.

Fig. 4 The evolution of unemployment

Source: Business Day, Economics and Finance, 25 Feb. 2011

The legal framework for the creation and operation of SMEs, both with exclusively domestic capital and foreign ones, we can say that it was created and it is well individualized; however, many inadequate and bureaucratic practices still persist

hindering and distorting action law (Roman, 2005).

Recently added here and motivational aspects or some European requirement in the matter (Burciu et al., 2007). Their knowledge by entrepreneurs is particularly important (Fig. 5).

Fig. 5 The information from the SMEs on European regulations posed by EU accession

Source: White Paper on SMEs (2010)

That level of information on SMEs in European regulations posed by EU accession and is related to the situation in which the

SMEs on their intention to access funds from the Community budget (Fig. 6).

Fig. 6 Statement of intent SMEs access EU funds

Source: White Paper on SMEs (2010)

Recent studies have highlighted several obstacles on accessing European funds by SMEs (Fig. 7).

Fig. 7 Obstacles to accessing European funds for SMEs

Source: White Paper on SMEs (2010)

However, in essence, it should be noted that the main features of the framework to create and operate small outlines the idea that there are many favourable conditions for accelerated development sector.

2.2. Strengths and drawbacks related to the initiation of business by small-sized firms

Careful analysis of their qualities, skills and availability funding compared to the start

a business requirements envisaged enable potential entrepreneurs to assess his chances of success in future work. Depending on the outcome of the assessment, he will decide whether to engage in that business (Sasu, 1998).

This decision will be facilitated if business discussions with other potential small business entrepreneurs in the area considered for future business and the company intends to implant the business, these discussions will build better about the fact they hold in

really necessary characteristics to become a good entrepreneur-owner of a successful small business and the difficulties that the company expected to start in early stages of operation.

Option to create a small-sized company involves knowing the advantages and disadvantages involved in (Resnik, 1988), normally this would be implemented in practice only if the strengths exceeding inconvenience (Chivu et al., 2001).

The range includes the following strengths (Sasu, 1998):

- Satisfaction of doing something in their own way. Many entrepreneurs believe that the best way to enter the business is to start from zero as emerging business, increase satisfaction and reasons as an original idea became fact.

- Avoiding a bad reputation. Not all businesses are being sold have a good reputation. In some cases either company or employers have an unhealthy relationship. Starting a business avoid this delicate issue.

- Using new ideas unconditional. When a business has a truly unique idea, you may not be able to use an existing business because it is harder to convert an existing business in a desired project.

Obviously, in this plan there are some drawbacks. Here are just a few of them:

- Saturation. Quite often, a competitor entering a market without an influx of new consumers. Experienced entrepreneurs know the approximate number of local market consumers is aware that their share of the market will be protected if the number of competitors will be minimal. Elimination of new competitors in these markets requires a group effort.

- High cost of new equipment. Starting a business than taking over an existing one, requires normally higher costs due to price equipment. Obsolete equipment are sometimes available, but the entrepreneur should carefully consider possible alternatives. Even if out-dated equipment, the cost can it exceed those of similar equipment that would get by buying an existing business.

In the same context is not neglected any difficulty gaining a reputation. For many entrepreneurs, an important obstacle is to overcome consumer inertia. The name creates a certain confidence of consumers, and some of them hesitate to get in touch with new entrepreneurs.

3. Conclusions

Entrepreneurs are people with legal, always looking for new opportunities for business combinations, as methodical and meticulous anticipation and all actions. Most often, they first identify the need and then combine labour, materials and capital needed to meet this need.

A common orientation of these is the initiation and development of business by small-sized companies, even if long periods of time, SMEs have been considered a low and even, as some authors of the economic literature, unsustainable - of large enterprises.

Currently, this type of companies stated scale of increasingly large as competitive entities, able to adapt easily and productive social systems subject to rapid change processes.

Abstract

Identify and research components of human society and the relationships they are a major concern for both sociology and social psychology, political science or anthropology. Using a widely accepted concept, global society is composed of a set of social formations, understood as networks of individuals who share cultural and subcultural models from which to develop processes relative uniformity, distribution status, roles and functions and space selective targeting against general problems of society the main types of social formations are groups, communities and organizations. Groups are social formations in which individuals interact directly based on rules accepted and recognized as members of a distinct entity within a specific time and place. Communities based on the same recognition of rules and principles, but do not involve direct interaction between members (any ethnic, or believers of a particular rite, for example). Party organizations are deliberately set up to achieve a particular purpose, using explicit decision and control strategies.

Keywords: organization, social groups, communication, role and status

1. Introduction

Psychosocial groups is one of the main themes of social psychology. Qualitative differentiation of groups derived from the members who compose them, that the types of interactions that develop between them. From this point of view, we make a distinction between conceptual and methodological primary groups (small groups with a relatively small number of members),

side groups (consisting of several primary groups) and tertiary groups (sets). At each of these levels of structure groups show a specific psychosocial phenomenology, which requires treating them as distinct forms of social reality, but being a close interdependence. In this chapter we consider issues of social small groups first integrative level where there is dynamic interaction between phenomenology psychosocial and psychoindividual. [1]

Groups are dynamic systems which provide the first level of integration within the overall social system in which institutions and organizations will be higher levels of psychosocial life structure. It is generally accepted that social small groups (primary groups or small groups - in the terminology of other authors) has the following essential characteristics: [7]

- A small number of members, which enables direct interpersonal perception and mutual basis for developing a complex emotional interactions, information, influence or act. The upper limit is estimated at approx. 20 to 30 members, beyond which direct interactions such as "face to face" are not possible.

- direct intimate emotional relations, manifested in the form of sympathy, antipathy or indifference sociometric, this type of interaction is taking place background processes and psychosocial phenomena group. A close interdependence of members, born in the context of joint and making a sense of group solidarity and cohesion.

- Differentiation of roles between group members in this regard, the group appears as a distribution of roles, so that its constituent functions can be performed properly. The existence of common goals and values, relational system prerequisites for development of group members.

Although these features have a high degree of relevance small groups intimate

nature, consider that in this form they can not form the basis of operational definitions. The reasons are multiple. Not all features are necessarily present to the same group, given their great typological diversity and quality distinct phases that groups go through the process of their creation. On the other hand, some of these features are not explicit, in turn requiring complex steps operationalization. Therefore, based on critical analysis of different conceptions of social systems of these specific psychosocial propose another way of defining operational small groups, from structuring role that pregnancy has on their organization as dynamic systems and psychological function consciousness of belonging to the group, in correlation with transforming sense of "I" in the sense of "us".

Small groups is interactional dynamic systems, consisting of a relatively small number of members (2-30), which possesses the following features:

(a) participate directly and consistently to achieve common tasks imposed or adopted by consensus;

(b) directly interact throughout achieve pregnancy, based on values and patterns of behavior, acting and attitude required and / or adopted by the group;

(c) have a consciousness of belonging to the group and recognize each other as members of it (have internalized a same social identity, permanent or temporary, formal or informal);

(d) develop stable relations between its members aleatory , put directly on the type of work they perform in common, namely the type of task undertaken.

As a synthesis of the above, we interpret small groups the interactional dynamic systems based on self-development and adaptation to the environment. Hence some essential features can configure exactly the concept that the circumscribing area of social reality. thus:

a) between system elements (group members) is developing direct relationships, aleatory and relatively stable, amounting to psychosocial group structures (structures, socioaffective, communication, influencing, motivational, normative axiological;

b) further development of its structures, all (microclustered) acquires attributes and functions mere sum of qualities irreducible components;

c) groups are teleological vector systems, the common goals of members having a structural role for life and group work;

d) the complexity of its structures, groups psychosocial mechanisms of self develops internal and external mechanisms that ensure the cohesion, stability and efficiency of joint activities against a continuous learning and development;

e) small groups subsystems are in global social system, which makes the development of coordination and subordination relations with other structural and functional social subsystems (individuals, groups, organizations, institutions);

f) the same as sub-groups complex relations with the external environment, the substantial nature relations, energy, information and psychosocial;

g) due to their dynamic, groups go through developmental stages and processes of training, development, active manifestation and dissolution profiles of these steps being the group's history ';

h) specific psychosocial processes small groups involves a complex interaction of factors, axiological, cognitive, emotional and motivational, sociocultural influences on the fund created by the external environment;

i) probabilistic laws work in groups with different degrees of generality (valid for all groups or only for certain groups, such as sub-components and specific laws).

2. Group dynamics and psychosocial functions

At the most representative structural-functional theories of social groups, Parsons, Bales and Shils [6] emphasizes two main dimensions of any social structure: a) dynamics and b) the duties of the Controlling system. In the most general sense, the term means all the dynamic forces acting on the group as a result of interaction and organization in time of different types of psychosocial processes: socioaffective, motivational, cognitive-evaluative, communication, influence and achieve pregnancy.

In a particular acceptance, having originated in the work of K. Lewin, the term means all psychosocial methods by which the group can be used as a tool for formative intervention on individuals and social

organizations (Gergen, K., et al., 1992 , Maisonneuve, J., 1989) [8]. Although seemingly distinct, the two meanings are closely linked: psychosocial mechanisms and specific knowledge small group allow their use for exerting control over individuals, groups or organizations (for therapeutic purposes or to optimize some aspects of activity within these formations , for example).

Correlated with dynamic problems are formulated and designed to fulfill the role of internal and external groups. Thus, the global social system, groups meet multiple and complex functions, as derived from triple their immediate natural environment and there individual key link between individual and social, basal part of the various types of structures and social formations. Consequently, small group functions will manifest the following directions:

(A) the task in terms of efficiency to meet the criteria grouped and social optimality, the main task with the role of factor association for the group.

(B) psychological satisfaction of needs of group members and solving psychological problems they face in intra-or extra-level group;

(C) providing and maintaining cohesion, coherence and group limits the system, the fund achieve its constituent tasks, which are also the essential conditions of its existence;

(D) regulating relations between the group and other groups, organizations and social institutions, and between them and people covered their formal or informal.

Whatever its nature, the group that bases its existence on psychosocial system capacity to meet the different psychological necessities of its members.

Basic needs integration, affirmation or social recognition, the needs for affection, communication and protection, the descent or addiction - all these configurations specific motivational people may be satisfied in different ways, to an extent which depends on structural and functional qualities group as a system. Group dynamics will be closely linked to individual motivational dynamics of vectors and those resulting in a relational context, interpersonal, intragroup and intergroup and system capacity to meet the needs and aspirations of its members, the conditions offered by the normative and

axiological sociocultural space, respectively.

Group is an interactive environment in which the harmonization of needs not only between individuals of the social imperatives members, but also create new needs, representations and attitudes, which may relate to other members of the group as a thumbnail image of the company or different segments of society global. This phenomenon of "remodeling group psychological context" is achieved by adjustments, adjustments or restructuring the cognitive level, affective, motivational, behavioral, relational and behavioral, the fund created by the ability to influence group membership, but also the pressure , aspiration or comparison.

To achieve satisfaction of needs of its members, the group must meet two essential conditions, which are also the conditions of its beings: the task and maintaining cohesion and limits the are identified. As shown, the task is a key constituent group, whether it is fixed from the outside, as if a formal or adopted by consensus, as in informal groups.

In these situations, the task provides a rationale for the group, even if sometimes a pretext for carrying out functions related implicit needs of its members, which can not be satisfied only by a group interactional context.

As will be shown on the task performs a triple function:

1) polarize and orient the efforts and actions of group members;

2) intra-and intergroup relations structure;

3) connected life and work of the group coordinates global social system, the values, rules and general objectives of socio-cultural group to which it belongs.

Consequently, the nature of the task will profoundly affect the development of interpersonal relationships, especially in terms of leadership and group structure as a system oriented towards a specific purpose.

Correlative nature of the task performance will directly influence psychosocial group processes, is a synthetic indicator of overall system functionality. Serving constituents (the task at a high level of performance) is strongly conditioned by maintaining cosivity enabling coordination and joint efforts focus on the substance of the possible elements of dysfunctional. The group achieved a constant pressure for conformity, facilitates the action of centripetal factors against the spin and try

to increase their attractiveness for its members so as to maintain within the unit and functionality.

Parallel to achieve these basic functions, the group has the ability to mediate and regulate the relations of its members with other groups, organizations, institutions, playing both as a "relay" and that of a "social buffer".

3. Structures and processes of group psychosocial

Small groups social self is as dynamic systems from the development of a set of definite relations between members, due to the conduct of joint activities. The timing of these relations define the group psychosocial processes (diachronic aspect of interpersonal relationships) and how to set up relations at a time defined psychosocial structures (synchronic aspect of interpersonal relationships). The two issues are dialectical and complementary nature, the processes leading to configuration structures, and these, in turn, is the group conducting psychosocial processes. How to show the observational level interactions between psychosocial processes and structures is phenomenology group, the third key dimension of the dynamics of social groups.

Theoretical and experimental investigations indicate that there are four main types of structure (processes) psychosocial group: socioaffective structure (preferential processes), structure of communication (communication processes), structure of power (influence processes) and business structure (processes to achieve pregnancy). To these we add two more categories, although seemingly secondary importance are the training and development group as a social system: motivational-attitudinal structure and structure-axiological participation. Of these, communication structures, influence and activity can have both a formal character, as determined by the constitutive rules of institutional groups, and an informal, spontaneously generated in the context of interaction members in any category of groups. Other types of structures (socioaffective, motivational and participatory-axiological) are mainly an informal, with events in any type of group, although some aspects of formal structures

may influence how to set and expressions. [11]

One of the most important factors is the group dynamics socioaffective relationship that develops between members, since the first moments of their meeting. Emotional structures of the group, or 'sociometric matrix' - the terminology of Moreno, are at the background against which it will develop and manifest all the other structures. However, affective relations as a factor for integration dinamogen life group members and their individual development. From this point of view the group can be considered not only as a general system of relations, but also a framework that ensures the development of emotional, cognitive and relational members, as a condition of his own maturation, social functioning and survival. Affectivity group is as a background that is inserted all other forms of emotional experiences. [12]

Social microclustered provide conditions for complex structuring of affective relations of its members, structure which is based on two main plans, each turn involving two relatively distinct forms of manifestation:

1) the intra-group plan, take emotional processes such as preferential interpersonal relationships and feelings to that of the group: as a whole, between the two forms of affection are closely inter-intra, finding his first term in the sociometric matrix group and the second in the cohesion, psychosocial climate and performance. These types of structures socioaffective were the subject of numerous experimental research, as one of the main themes of small groups

2) the plan extragrupal, emotional processes are structured as compared to other groups who are in relationships and connectedness, and in relation to the social environment in which they operate, the environment consists of organizations and institutions which affect the general social conditions the group. Problems with these types of structures most often addressed in research on the psycho-sociology and psychology of crowds organizations.

Socioaffective structure of the group is how to configure the preference relations of the members at a time, relationships can take the form of attraction, rejection or indifference sociometric. These relationships are of propensities, with a conditioning complex, unable to be identified only by simplifying

the relations of sympathy, antipathy or indifference, developed in the context of interpersonal relationships extragrupale (Moreno, J.-L., 1970).

Factors which determine sociometric choices, trying to identify factors involved in structuring relations within groups socioafective proved particularly difficult, because many existing conditionality in this process and the complexity of relations between different categories of stakeholders: primary or secondary determination or conditioning, individual, group or sociocultural, structural or functional, etc. synchronous or diachronic.

One of the most interesting theoretical openings on this issue is provided which considers sociometric choice as fundamentally conditioned by axiological content of interpersonal relations. From this perspective, any "meeting" has a default evaluator social and valued, values the key individual, group and culture that determines the appearance of "elective affinities". Grid axiological underlying sociometric choices is "coloring" very personal, in fact synthesizing psihoindividuali many factors, psychosocial and sociocultural.

Some research shows a strong relationship between sociometric choices and membership of a particular effort to strengthen and empower the group. This correlation is explained by the significance of the group as a whole has for each of its members in pursuance of the differentiated function of satisfying his needs, individual and social value for members to create a climate event indispensable figures in this context, every effort strengthen the group is in line with an important series of individual and collective motivational factors, which facilitates the formation of preferential positive relationship to those who contribute to meeting the respective vectors motivational default.

A wide range of factors which determine the formation and structure of preferential relations within groups, the following are considered most significant: social intelligence, interpersonal communication skills, charisma, prestige intra-and extra-group, altruism and self-help available competence and involvement in solving problems facing the group, status recognized formally and informally.

Depending on the nature and composition of the group, type of load to be carried out and general socio-cultural context in which working group, the configuration factors that mediate preferential relationships may vary considerably, but each time could be identified a factor that may be considered "purely emotional", taking in that area and ineffable mystery that characterizes the formation of elective affinities. In fact, each of these factors produce certain "emotional echoes" of a sociometric choice whose integration results.

Sociometric technique allows the analysis quantified two dimensions of group structures: a) socioafective size, which is the distribution of potential group members form emotional choices, sociometric rejection and indifference; b) evaluative-cognitive dimension, which expresses the "visibility" interpersonal preferences of third parties (transparency) and members' ability to perceive the real nature of interpersonal preferences of the group they belong to (Grama, D., 1974, Golu, P., 1974)

3.1 Structure authority

Group members are different and as having the ability to influence collective activity and behavior of other members. Formal hierarchy or authority structure expresses informed members of the group depending on the capacity, which is conditioned by a complex series of psychoindividual factors and situational psychosocial. [3]

The structure of formal authority (or institutional power) corresponds to the organizational institution that belongs to the group, responsibilities of various positions exercised varying degrees of competence, experience and authority by those who occupy them. Mention distinction being made in this case between power and authority: the power of expressing a person's access and control means determining the behavior of subordinates, while recognizing the authority reflects the ascendancy of a person in a community, recognizes the particular qualities personal values the social position of consensus over which aspirations.

The most important matter of exercising power and authority in groups refers to the relationship between formal and informal

structures thereof. These reports can be convergence, divergence, complementarity, competition or conflict, with varying degrees of intensity and shades in the form of manifestation.

3.2. Structure of the task

The task is the main factor guiding and structuring group work and against which performance is assessed. The task is defined a set of objective requirements, conditions and models developed and validated actionable social, externally imposed or adopted by consent. The load structure will mean all the functional relations between group members, relations imposed by the proper conduct of business to achieve that goal. Typical configuration of functional relations shall designate the types of loads: additive, complementary, convergent, conjunctive, disjunctive, compensatory. In addition to typological dimension, your task is characterized by: overall structure, which expresses the existence of patterns, explicit information and strategies to achieve practical, way of consolidation with the tasks of other groups, complexity, duration, etc. full realization. [13]

Type of task, overall structure and mode of consolidation in tasks other groups are the main factors that will regulate the interaction of group members. Thereby, the other structures (communication, and influence socioaffective) will require continuous reporting task structure, compatibility and harmonization of these structures is the surest way to improve group performance, positive climate and interpersonal relationships.

As a result of the above, psychosocial group structures can be represented by graphs which can be associated with the corresponding matrices. This opens a formal logical analysis of group structure, aimed at optimizing certain structural and functional parameters: performance, psychosocial climate, cohesion, leadership, degree of conflict, interpersonal, intergroup relations, etc.

4. Conclusions

To this end was the concept of congruence of group structures, indicator expressing the degree of functional compatibility between

two or more structures psychosocial group: task structure, communication, influence and socioaffective. The concept was developed on mathematical notion of distance and proved extremely relevant theoretically and practically useful in designing, controlling and correcting small groups social dynamics, particularly the industrial, military and "project" . The group has a higher index matching its functional structures with both its performance is better, more stable psychosocial climate, the general trend of such a group being positive. Conversely, a low congruence indicates active or latent failure in the compatibility of group structures. Group performance will be low, the overall trend is worsening psychosocial climate and the further deterioration of interpersonal relationships

Abstract

The results of the research made by authors highlights the importance that is given to ensuring sustainable performance of the SMEs in the economic, social and environmental point of view. This work has been prepared as part of project POSDRU/88/1.5./S/55287 “Doctoral thesis in economy at European knowledge standards (DOESEC)”, co-financed by the European Social Fund through Sectorial Operational Programme Human Resources Development 2007-2013 and coordinated by The Bucharest Academy of Economic Studies in partnership with Timisoara West University.

Keywords: Sustainability, SMEs performance, sustainable performance

J.E.L. Classification: M2

1. Introduction

The purpose of this paper is to analyze the Romania SMEs' concerns regarding the assurance of a sustainable performance out of the three perspectives: economic, social and ecological, in order to develop a sustainable behaviour of SMEs. The article is based on a literature's review regarding sustainable development. Further, the paper proposes the concept of performance measurement in order to encourage the sustainable development of SMEs and to suggest the performance assessment approach.

2. The role of SMEs

Small and medium enterprises (SMEs) are assumed to play a key role in social and economic development in Romania.

SMEs play a central role in growth, competitiveness, innovation and employment, because of their flexibility and ability to innovate [1]

In the European Union, about 23 million SMEs provide around 75 million jobs and account for 99% of the total number of enterprises. SMEs will continue to play a key role in economic growth, competitiveness, innovation and employment, owing not only to their flexibility, but also to their ability to innovate [2].

Given the current economic context marked by globalization of phenomena, the need has increasingly arisen for deep changes in terms of SMEs performance, so that they can improve their competitiveness and respond to the growing demands of all stakeholders: customers, shareholders, staff, suppliers, partners and the society as a whole. A successful organization must have the ability to continuously monitor external environment, so that it may identify opportunities, changes, trends and risks. It should also be able to detect, attract and allocate the resources needed [3].

At the same time, the organization must have the ability to actively learn, change and innovate [4].

Sustainability is a measure which describes the potential of an organization to maintain or improve its competitive position in the eyes of its customers and shareholders while having the ability to act and react

within a changing competitive environment [5].

Sustainable development is the development that meets the needs of the present without compromising the ability of future generations to meet their own needs [6].

The definition of sustainable development provided by the Brundtland Report renders the interpretation of sustainability subjective, for it does not specify whose needs will be met nor how sustainable development will be achieved; as a result this has led to a plethora of definitions of sustainability which are inherently different [7]

Elkington [8] who uses the triple-P perspective, considers an organization sustainable if a certain minimum performance is attained in the three so-called “p-area’s”. The three P’s stand for people, planet, and profit. The main point is that the “bottom line” of an organization is not only an economic-financial one; an organization is responsible to its social and ecological environment as well. From this perspective, an organization needs to find a balance between economic goals (profit) and goals with regard to the social (people) and ecological (planet) environment. (figure 1)

Figure 1 The Triple-P concept of sustainability

Source 1 Elkington J., *Cannibals with Forks; The Triple Bottom Line of 21st Century*, Business. Capstone, Oxford, 1997

Dyllick and Hockerts transpose the definition, by means of the stakeholder concept, to the organizational level. They define corporate sustainability as “meeting the needs of a firm’s direct and indirect stakeholders (such as shareholders,

employees, clients, pressure groups, communities), without compromising its ability to meet the needs for future stakeholders as well” [9].

3. The sustainable development of Romania's SMEs

This research is based on the sustainable development model defined by Elkington.

3.1. Economic perspective of sustainable development

Nowadays, we can talk about an increasingly high orientation of quality management systems’ models promoted by the international standards ISO 9000 towards the re-organization processes in terms of satisfying customer requirements, and other relevant stakeholders in order to ensure sustainable business development[10]. The literature widely discusses the impact of implementing the model defined by the ISO 9000 on business performance [11], [12] taking into account the particularities of SMEs [13], [14]. It points out that “the success of an organization is based both on meeting current and future needs and expectations of current, potential customers and final users and the consideration of other stakeholders” [15], [16]. Thus, according to ISO 9004:2009, sustainable success of an organization can be ensured by developing its capacity to meet the needs and expectations of its customers and other stakeholders, on long terms and in a balanced manner.

Figure 2 Activities for sustainable development

Source 2: authors processing, 2012

According to a previous research of the

authors, we can say that there are concerns regarding the sustainable development of SMEs [17]. The research highlighted that, in order to support sustainable development, organizations need to concentrate on Focus on customer satisfaction (75), Monitor and measure the operation of your QMS (65), Strive for continual improvement (80%), Consider implementing business excellence models in the company operations (58%) and Organizational self-assessment performances (63%).

3.2. Social Perspective

The latest literature tradition to have impacted our understanding of corporate social responsibility is that of sustainable development. It was the Brundtland Commission [18] that for the first time systematically emphasized the link between poverty, environmental degradation, and economic development. Its definition of sustainable development, as meeting the needs of the present, without compromising the ability of future generations to meet theirs, extends the responsibility of firms both inter-and intragenerationally. Thus firms are expected to also consider traditionally unrepresented stakeholders such as the environment and as well as future generations. Although many CSR authors have taken up the notion of a “triple bottom line” [8] there remain important tensions between the CSR and the sustainable development debate [9].

It's very important that social responsibility is promoted by all types of business in all sectors, from SMEs to the multinational. For SMEs, the concept is essential because they have the greatest contribution to business results and on employment. Many SMEs act socially responsible in particular the local community, but broadening the scope of “Good Practice” can contribute to social responsibility in the enterprise. A number of socially responsible companies aware of environment issues and says that such guidance may lead to increased efficiency and profit. Economic effects of social responsibility can be divided into direct and indirect effects. Positive direct effects resulting for example in a better working environment leading to increased employee

motivation and productivity and a more efficient use of natural resources. Indirect effects resulting from increasing interest of consumers and investors correlated with better market opportunities. In response, the criticism of business activity it harms its reputation leading to damage to property values (name brands and images).

For deepening and broadening effects of enterprise social responsibility on their performance is necessary for companies, authorities and universities, through efforts converged to create a program for research and technological development.

3.3. Environment perspective

Worldwide, we can state that the environment is a priority for all industries [19]. According to the Industrial Policy in the perspective of post-Lisbon strategy, Romania has set as main target the achievement of overall strategic goals of sustainable industrial development strategies according to environmental and climate change and energy, in order to increase the competitiveness and the performance of those industries which may have a competitive advantage to counter the economic crisis.

In correlation with the other policies and strategies of the national economy and the European Economic Recovery Plan, Romania's industrial policy has as main objectives:

- competitiveness and market access;
- improving the general framework conditions, specific research and eco-development for the active participation in the new European Research Area;
- consolidation of the environmental potential of industry ;
- sustainable use of resources;
- development of industrial and public-private partnership;
- modernizing the labor market.

To achieve this objectives, there have been defined some policy instruments presented further in this paper.

In order to identify the maturity level of Romania's SMEs for implementing an environmental integrated approach, the authors have conducted a comparative study,

analysing the guidelines for the environmental integrated approach [20] and the tools defined by Romania’s Industry Policy. The results of the comparative study are presented in Table XX.

Table 1 Comparative study between the guidelines for an environmental integrated approach and Romania's industrial policy instruments

Guidelines for an environmental integrated approach	Romania's industrial policy instruments
Research and Development	<ul style="list-style-type: none"> - Equipping and/or arranging for testing and calibration laboratories and their accreditation, if applicable; - Performance of experimental models, prototypes, assimilation of new technologies that operators performed on the basis of Romanian R & D units; - Performing benchmarking analysis for manufacturing activity in order to achieve the plans of restructuring - development - viability, whose implementation will be monitored
Research on Alternative Fuels	<ul style="list-style-type: none"> - Certification of products and/or getting environmental label products
Policies to Encourage Alternative Fuels	<ul style="list-style-type: none"> - Implementation and certification of quality management systems and / or environmental management systems; - Implementation and certification of security management and health, social accountability management systems and food hygiene and / or information security management systems; - Encourage development of competitive clusters (clusters / poles of competitiveness, growth poles, urban development poles, etc.), in accordance with the European industrial policy initiatives.
Fuels	- No policy defined

Infrastructure Development	
Incentives for Fleet Renewal	<ul style="list-style-type: none"> - Organizing and arranging exhibitions inside economic operators, presentation stands and promotional products industry; - Registering and protecting external market marks, Romanian industrial designs.
Congestion Mitigation	- No policy defined
Consumer Eco-driving	- No policy defined

Source 3: authors processing, 2012

As we can observe in Table 1, several directions defined by the guidelines for an environmental integrated approach are not yet defined at national level. The comparative studies allow the definition and implementation of government policies and programs to support Fuels Infrastructure Development, Congestion Mitigation and Consumer Eco-driving concept. Using the existing policy instruments, Romania will be able to align to the requirements of the environmental integrated approach but this fact will be possible only in the medium and long considering the lead-time of the research and development activities. In the industry areas, it typically requires 5-7 years to design, test, build, obtain government certification and introduce complex automated production tools. Any policy that is implemented without allowing sufficient time can adversely affect manufacturers, their suppliers, their employees and consumers.

4. Conclusions

Considering the analysis results, we can conclude that in Romania there are concerns about the orientation of SMEs' activities to sustainable development. The findings can be considered a starting point for future researches aiming identifying the best ways for sustainable development of Romania's SMEs, of the three perspectives.

Improving Customer Churn Models as one of Customer Relationship Management Business Solutions for the Telecommunication Industry

Slăvescu Ecaterina Oana

ecaterinaslavescu@yahoo.com

Panait Iulian

The Bucharest Academy of Economic Studies

iulian.panait@gmail.com

Abstract

Nowadays, when companies are dealing with severe global competition, they are making serious investments in Customer Relationship Management (CRM) strategies. One of the cornerstones in CRM is customer churn prediction, the practice of determining a mathematical relation between customer characteristics and the likelihood to end the business contract with the company. This paper focuses on how to better support marketing decision makers in identifying risky customers in telecom industry by using Predictive Models.

Based on historical data regarding the customer base for a telecom company, we proposed a Predictive Model using Logistic Regression technique and evaluate its efficiency as compared to the random selection. In the future, we will focus on extending our study by integrating more business considerations and mining models in order to adjust the churn models or redesign marketing activities for the telecom industry.

Keywords: predictive models, data mining, churn, time series econometrics

J.E.L. Classification: C25, C26, C32, C53, C81

1. Introduction

Competition in the telecommunications industry is very aggressive, since on each national market there are at least four carriers struggling to maintain their market share by offering very similar and very attractive products and services. This is the main reason why, in order to maintain their

profitability, telecommunications operators are very concerned in controlling *churn* – generally defined as the loss of subscribers who switch from one carrier to another (Gopal, Meher, 2008) – and, based on predictive data mining techniques, developing new efficient CRM strategies to retain customers .

Keeping in mind the fierce competition on the market, the focus of telecommunication companies has therefore shifted from building a large customer base into maintaining and strengthening the previous developed base, in witch case it is valuable to identify in advance those customers who are likely to switch to a competitor in the near future, the so called churned customers.

Statistics have showed that is 5 to 6 times more profitable to keep existing customers than to attract new ones (LeBoeuf, 2000). This is why, churn prevention can be regarded as a popular way of reducing the company's costs, while increasing the profitability, which is the basic key for survival on the market, especially for listed companies.

This paper is organized as follows: in Section 2 we will present the concept of CRM and its close interference with churn, especially in telecom, while making a literature review on this subject, Section 3 will present the methodology insisting on logistic regression technique and its application in building a predictive churn model, Section 4 presents the predictive model build based on a data base from a Romanian telecommunication company, and, finally, Section 5 provides the conclusions.

2. Customer Relationship Management and telecom churn management

Since is an established fact that the building of long term relationships with customers provides multiple benefits to businesses (Dwyer et al., 1987) and since it has been acknowledged that old customers are more profitable in the long term, because new customers are attracted by promotional offers and tend to switch to another provider at the moment they receive a better discount (Gopal, Meher, 2008), and having to deal with this present necessity of better “Customer Relationship Management”, “(CRM) is a healthy and promising newcomer which has appeared on the business radar”(Greenberg, 2002).

Despite its large recognition as an important business strategy and the fact that the term gives the definition by itself: the management of relationship with customers, there is no widely accepted definition of CRM.

According to some authors (Lin, Xu 2009), CRM comprises a set of processes and enabling systems supporting a business strategy to build long term, profitable relationships with specific customers.

Kincaid (2003) defines CRM as a enterprise approach to understanding and influencing customer behavior through meaningful communications in order to improve customer acquisition, customer retention, customer loyalty and customer profitability.

Parvatiyar (2001) defines CRM as the strategic use of information, processes, technology, and people to manage the customer relationship with the company across the whole customer life cycle.

The same idea is considered by Swift 2001; Kim et al., (2003) – in their opinion CRM consists of four dimensions: Customer Identification, Customer Attraction, Customer Retention and Customer Development.

The above given definitions have shown that in some way, CRM strategies are nowadays more focused on retention, and CRM is more and more becoming a process of retaining customers, with the help of business intelligence and data mining, to maximize the customer value to the organization.

So, in the business world (and we are referring especially to the telecommunication sector), CRM consists of all the activities that can transform a regular customer into a loyal

one by exceeding its requirements.

If referring to the application of CRM strategies into the telecommunication sector, in order to upgrade regular loyalty and retention campaigns, we must specify that a current particularity of the telecommunications market is modelling the attrition risk (or the churn risk, where *churner* is a common term used both in academia and practice to denote the customers with propensity to leave for competing companies). According to some marketing studies (Berson et al., 2000), the average churn rate for mobile operators is approximately 2% per month, which means a loss of 25% of its customer base within a year.

For a customer, cancellation costs are relatively small, given the fierce competition in the market which consists into providing similar services (in terms of price and quality) and offering discounts on handsets and various other accessories.

Nowadays, price is no longer a differentiator, since many telecom providers tend to equal each other's prices. The main differentiator have become the additionally services.

In the present the customer is “serviced”, not only “sold” (Cool, 1996).

Therefore, for almost all mobile phone companies, the biggest challenge is, at the present, switching from reactive to proactive retention, in other words retaining customers before they take the decision to end their contract and identifying those customers with a high churn risk (Slăvescu, 2011).

In order to maintain market share and profitability, telecom companies have used various approaches or management/marketing strategies to retain customers and prevent serious churn problems.

At present, most of the strategies are based on data warehousing - maintaining and managing historical and very detailed data obtained from many computing and point-of-contact devices – and data mining techniques that enriches and transforms data into meaningful information for business decision makers.

In this spirit, a common churn management process involves constructing a churn prediction model using past churn data, and determining key variables influencing churn. The churn model is then used to

identify and classify a list of customers with potentially high risk of churn (potential churners) from existing customer data, to perform the appropriate retention activities (Berson et al., 2000; Au et al., 2003; Chu et al., 2007; Coussement et al., 2008; Ngai et al., 2009).

The efficiency of a company's combined CRM and churn management strategy is measured in terms of effectively decrease of the churn rate (or increase of the retention rate), and not only by whether it can locate a list of potential churners. In our study we will concentrate in building a model in order to identify customers with a high churn risk, the development of a model that can generate the increase of the retention rate, being on our list of future research interest.

3. The methodology: data mining techniques and logistic regression

Data mining is an integrated technique that involves analysis, filtering, extraction, and statistical analysis for large amounts of data; it has numerous applications in addressing business problems (Chu et al., 2007; Coussement et al., 2008; Lariviere et al., 2004; Lejeune, 2001; Luo et al., 2007; Ngai et al., 2009). Data mining can be used for analyzing the production process, investigating the marketing efficiency, studying the management effectiveness, or measuring the evolution of the company's stock exchange value (Panait, 2011).

Previous studies utilized various data mining technologies to assist telecom companies in resolving churn problems (Kim et al., 2004; Hung et al. 2006; Xia et al., 2008; Tsai et al., 2010).

Generally, churn is estimated using predictive models that are built based on a significant sample from the database, containing both churners and non-churners at a selected moment (i.e April 2010) and their historical data (at least last 3 months of information regarding their financial situation, their call detail records, their personal details- age, gender, address, etc).

Then, by using an appropriate software predictive tool (we have used Chordiant, but we can also use SPSS, UNIQA, etc.) the model is created by automatically applying a set of algorithms over the selected data set.

There are several categories of prediction models in statistics and data mining that can be applied to churn prediction problems. Past research shows that Decision Tree, Neural Network, Logistic Regression are well suited to this type of problem. For our model we have decided to use Logistic regression.

Logistic regression is a technique in which unknown values of a discrete variable are predicted based on known values of one or more continuous and/or discrete variables. A logistic regression model is distinguished from a linear regression model because the outcome variable in the logistic regression is binary or dichotomous.

If we consider a collection of n independent variables which will be denoted by the vector: $x_n = (x_1, x_2, x_3, \dots, x_n)$, and the conditional probability that dependent variable is present be denoted be $P(Y=1|x) = y(x)$.

Then the multiple logistic regression model is given by the equation: $f(x) = \beta_0 + \beta_1 x_1 + \beta_2 x_2 + \dots + \beta_n x_n$, in which case the dependent variable is given by: $y(x) = \frac{e^{f(x)}}{1 + e^{f(x)}}$.

In our case, the dependent variable is the churn prediction, and it can take the values: “churn” or “not churn” and the independent variables are the fields contained in our database that we have considered relevant for modeling churn. In this study, x_n =historical attribute variables (i.e. age, tenure, etc.), $y(x)$ = the probability of churn.

The model performance is measured by the hit and the lift rates. The hit rate is the ratio of the number of correctly classified targets to the number of classified targets. In other words, this is the ratio of true positives to the total number of hits identified.

Hit ratio (H%) = $A/(A+B)$, where A is the number of subscribers predicted to churn in the predictive time window who actually churned, B is the number of subscribers predicted to churn but did not. (Hung et al., 2006)

The lift rate is the ratio of hit rate (H%) to the overall monthly churn rate.

For instance, after building the model, we can rank order all customers by their churn score, and define hit ratio (H%) as the hit ratio of the “10% Customers with top churn score”.

If the overall monthly churn rate = 2.5% and hit ratio (10% most risky churners)

= 25%, then $LIFT(10\%)=25/2.5\%=10$

The lift curve is a measure of productivity for modeling: with random sampling of the entire customer base we would yield 2,5% churners; focusing instead on the 10% top-churn-risk-score customers we would yield 10% churners (Hung et al., 2006).

4. The churn model and the results

In our study we have used data from a mobile telecommunication company, taking a sample of 51691 cases – mobile postpaid customers, where a postpaid customer is a client having a contractual setting for a specific period of time (12 or 24 months) with the carrier – containing both customers that have churned in april 2010 (churners) and customers who have remained loyal in the same month (non-churners) and their historical data for a period of 6 months before the “churn moment” (October 2009 to march 2010). All chosen customers have had tenure of at least 9 months.

We have used 80% (41353 cases) of the entire data set for the training set, which is the data set used to build the model, 10% of the original data set for the test sample, which is the data set used to identify and correct wrong predictions of the model during the building phase, and 10% for the validation set, used to measure the performance of the model against the real outcome.

The training set contains 47.78% churners (19752) and 52.22% non-churners (21601).

There were 13 independent variables included in the model, that have been considered by our Chordiant application as statistically relevant in influencing the churn rate: average number of calls to the Call Centre in the past 6 months, number of visits in the representative stores of the carrier in the last 3 months, average invoice in Euro in the past 3 months, average invoice for voice services only in the past 3 months, average on net call duration (in minutes) for the last 4 months, number of months before expiring the contractual period, etc., each having a specific performance measured by the correlation coefficient (CoC). (See Figure 1)

Figure. 1 The list and performance of the independent variables

The model incorporates the following predictors:	
Field	Performance
AVG_NO_ENQUIRIES_IN_PAST_6M	60.62
RETAIL_VISITS_3M	52.13
A3_TOTAL_NET_REV	55.87
NO_MONS_SINCE_LAST_SMS	56.26
SUM_MO_VOI_OTHER_SERV_MIN	56.94
SDV_MO_VOI_NAT_CALL_CENTER_MIN	54.86
RTS_MO_VOI_MIN	64.75
SDV_MO_VOI_NAT_CALL_CENTER_CNT	54.34
MONTHS_TO_OOC	54.98
A4_MO_VOI_MIN	56.73
A4_MO_VOI_NAT_OTHER_MIN	61.09
A3_AVERAGE_R_VOICE	52.86
A3_AVG_REVENUE_OFFNET_VOICE	52.12

Source: Snapshot from the application

The correlation coefficient (CoC) is a measure of how well trends in the predicted values follow trends in past actual values. It is a measure of how well the predicted values from a forecast model "fit" with the real-life data. In our case it measure the relative influence of each predictor to the outcome variable. We can observe in Figure 1, that the most “predictive” variable is the number of visits in the representative stores of the carrier in the past 3 months.

The performance of the model is given, in our case by the CoC, which is 76.001%, and the lift ratio, as defined in the previous section. The lift ratio for this model is 35,7% (see Figure 2), meaning that if targeting top 10% of the customers with the highest churn score, we can identify and retain 35,7% of them, compared with a 2,5% medium retention rate obtained if randomly selecting the customers.

Figure. 2 The ten deciles of top-churns and the model lift for each

Source: Snapshot from the application

5. Conclusions

Predicting churn customers using CRM strategies and data mining techniques is an important issue for telecom companies in competitive markets of today.

Our study contains important insights in building predictive models and an empirical example based on real data from a telecommunication Romanian operator, which is quite an innovative research for the Romanian market, national scientific literature on this subject being rather scarce.

According to the performance measures generally used in the international studies, it seems our model is significantly better than random, with a lift ratio of 35.7%.

As most studies of the telecom churn problem, we have focused on constructing an effective churn prediction model to locate lists of potentially lost customers in advance. However, identifying potentially lost customers does not mean those potentially lost customers can be retained and that will be the main subject of our future research studies.

The Role of Communication in Tourism Development

Stan Silvia

“Ovidius” University of Constanta
sylvys2010@yahoo.com

Abstract

This paper explores an ecotourism website, various discussions organized around sustainable tourism and a declaration on responsible tourism. It is meant to show that communication plays a key role in tourism in the current international economic context. Tourism development represents an economic activity, which can facilitate economic growth and which can fight against unemployment, poverty alleviation or climate changes.

Key words: communication, tourism development, ecotourism, sustainable tourism, responsible tourism;

J.E.L. classification: F02

1. Introduction

After the 2010-2011 relative recovery from the 2008-2009 economic crisis, the rhythm of the economic growth in the developed countries is expected to be reduced. This fact will probably affect the emerging economies and tourism industry in particular as tourism provides benefits for the economies of developing countries, where most of the sector's new tourism jobs and businesses are being created. This is why responsible tourism is becoming a necessity more than ever and tour operators, travel agents, product owners, industry organizations or governments from many countries are trying to implement it.

Communication in tourism development can be an important tool meant to support effective responsible tourism activities. It is aimed at strengthening relationships and at facilitating stakeholder participation in the design and in the implementation of development policies or projects. It ensures that activities respond to local needs, local

ownership and link sustainable tourism products to markets. The use of the appropriate terminology advance sustainable tourism policies and strategies, develop interpretations of key responsible tourism issues or experiences and can stimulate further discussions in various thematic areas.

2. Ecotourism

The term *ecotourism* goes back to the Goofus and Gallant cartoons, which were about two contrasting boys who respond to the same situation in different ways. Goofus invariably chooses a selfish or irresponsible response, while Gallant always responds with kindness and generosity.

The lack of precise, commonly used definition of *ecotourism* has been a cause of misunderstanding as it was confused with *adventure tourism* and *nature tourism*. Many seminars have been conducted for stakeholders about eco-friendly and people-friendly travel. The aim was to link tourism and environmental protection and to explore ecotourism resources. Various ecotourism awards have been created to highlight leaders developing ecotourism in different places around the world and many conventions on biological diversity developed incentives for an improved communication from government officials to managers striving towards ecotourism.

Lao People's Democratic Republic [1], winner of the 2007, 2008 and 2009 Ecotourism Spotlight Awards, has created an ecotourism website in which the vision for ecotourism is expressed. It enlarges about a local socio-economic development and simultaneously about Lao's unique cultural heritage or splendid biodiversity conservation in order to become a world renowned destination specializing in forms of sustainable tourism through partnership and cooperation.

Towards realizing the vision for ecotourism, the government agencies and the

private sector work to realize the strategy and the action plan. Therefore, Laos and international stakeholders cooperate to preserve the richest network of ecosystems on the Indochina Peninsula, to conserve the charismatic species, to minimize the consumption of the irreplaceable resources such as the energy and to protect the forests, the aquatic resources, the heritage sites or the unspoiled diverse ethnic lifestyles and traditions. The principles of Lao's ecotourism refer to the cooperation between the authorities and local people in order to promote responsible business practices for poverty alleviation and for the benefit of the national economies, of the local businesses or of the local residents.

The purpose of this website is also to provide travelers with ideas about the so-called ecotourism attractions. They include green forests, endless mountains, cascading waterfalls, hidden caves, rare wildlife populations and remote villages housing communities of ethnic minorities. World heritage sites include charming and well-preserved old urban settlements, lesser-known archeological places, temple murals, woodcarvings and pottery.

Nature and culture-based tourism activities are encouraged to generate income for local communities. In order to support community-based tourism, several actions are encouraged. Thus, eating local dishes ensures that the travelers' money stay local and provides tourists with an authentic meal and a tremendous cultural experience. On the other hand, purchasing decorative devices supports local artisans and their traditional crafts, while taking a local guide will make the trip more enjoyable and more educational. Looking for local accommodation such as family-run guesthouses, riverside bungalows, star-rated hotels or colonial-era villas, for local restaurants and for local entertainment venues, near historic attractions or away from the tourist areas, in tranquil gardens, will be a genuine experience with Lao culture and people. Visiting national protected areas will help generate income and awareness to support the conservation of threatened wildlife ecosystem. Other ecotourism activities include trekking, kayaking, bird watching and camping.

The travel website contains references to entry-exit points, to bridges, to international border crossings, to the acquisition of a visa by passport holders, to visa extensions or to the establishment of a visa-free tourism zone. Ideas about the climate, about distinct seasons, about the colorful New Year's festival, about the indigenous languages, about upscale shopping establishments, about provincial capitals, about international direct dial, about business hours for government offices and for private businesses are also included. Information regarding basic health precautions such as eating well-cooked food, drinking bottled water, staying hydrated, avoiding being bitten by mosquitoes and wearing protective clothing is priceless for cultural interactions.

The website enlarges upon well-run ecotourism accommodation places, such as tree-top accommodation, which offers access to forest canopy cable networks, boat landing guest houses and tropical design houses, which use local architecture and building materials. Such places are located in or around natural areas and in ecotourism resorts, where the use of chemicals in daily operations is minimized and waste is well-managed. On the other hand, open-air restaurants offer continental and local cuisine. Information on transport such as regular service to various destinations, international carriers with flights to these destinations or ferry rides across the rivers is also important.

Several ecotourism do's and don'ts for a cultural and friendly travel through the country represent an attraction of the website. Therefore, guests find out that Lao people greet each other by pressing their palms together to “Nop,” that using the feet for anything other than walking or playing sport is generally considered rude and that touching someone's head, bathing nude, kissing and hugging in public is very impolite. Lao people appreciate clean and neatly dressed visitors, who must take the shoes off before entering a Lao person's home. In this country, it is respectful to gently crouch down when passing someone who is seated, but it is inappropriate to step over someone in the path. Travelers are encouraged to speak softly and to avoid confrontation. They should object to begging, but they can give gifts to established

organizations or to village elders. Tourists should not touch sacred items or enter sacred places without permission and women should not touch a monk or a monk's robe. Vacationers should not leave litter and should help prevent forest fires. Eating delicious Lao food, refusing to buy wildlife products, as such commerce endangers many species and encouraging local craftsmen, by purchasing new quality handicrafts, help local business and farmers. The use of drugs is illegal while women and children should be protected from sexual abuse and exploitation by reporting suspicious behavior.

3. Sustainable Tourism

The role of communication in sustainable tourism e-conference [2] from June 2006, organized by World Bank, World Tourism Organization and supporting institutions opened a healthy dialogue in which new topics were introduced. An improved communication for sustainable development in the tourism industry is highlighted as tour operators and travelers complain about the lack of transparency from the ground. An award for national tourism board websites as a useful and cost-effective tool for communication was proposed in order to illustrate sustainable tourism practices. National tourism portals could be reviewed in order to provide information that prompts greater understanding of the place and motivates a trip.

Investors and travelers should have access to timely information on governmental and non-governmental organizations, trade associations, community groups, local tourism businesses, development banks, environmental agencies or tourism offices, including updates on disasters. The proposal was that they could be rated not only by what they have online, but also by what they can participate in independent ecotourism groups. Dialogues need lively public forums, online and in the natural world. The lack of communication generates risks in project implementation. If the information is public from contract bidding to field research, such initiative leads to a greater chance of success. Information should be reliable and consistent. Ideas should be shared in an interactive manner and conferences, bulletin boards or informal conversations hold the keys to

spreading the content. There is also a trend towards decentralizing communication and allowing people with a common interest to discuss the issues on their own terms. The results are a frank discussion and an exciting proposal for follow-up work. Anyway, investment in travel writing ought to be a priority.

Despite its successful outcomes, ecotourism has also failures. The travelling public was insufficiently targeted in the green travel declarations. Many official ecotourism events are not particularly eco. Although there is a great deal of discussion around certifying destinations, there has been little attention given to the environmental impact of transportation. Financing remains elusive for communities as well as entrepreneurs and there are no clear indications of how ecotourism projects and services will be funded in the future. Travellers are generally ill-informed by government and by tourism board propaganda, while governments continue to regulate ecotourism in a manner that does not provide incentives. Entrepreneurs and environmentalists complain that it takes a long time to teach government officials the basics of ecotourism and that social organizations are uncertain of whether to promote ecotourism as a development or as a conservation strategy. Ecotourism promoters often have difficulties in having their voice heard by national or regional ecotourism advisory councils and ecotourism associations have a poor record of listening to their members. On the other hand, tourism policy is rarely interesting for the traveller.

Many problems come from the complexities of ecotourism regulation, product development and marketing. Participants to various summits questioned whether travel could be considered a sustainable activity because of basic environmental impacts associated with the use of motor vehicles and aircrafts.

Sustainable tourism is not the same as ecotourism. Ecotourism is a form of tourism involving visiting usually protected areas. It is intended to be a low-impact and often small scale alternative to standard mass tourism. Its purpose is to educate the traveler, to provide funds for ecological conservation, to directly help the economic development and the political empowerment of the local

communities or to provide respect for different cultures and for human rights.

4. Responsible Tourism

The 2002 Cape Town Declaration on Responsible Tourism in Destinations [3] defines responsible tourism as the market trend in which any tourism business maximizes local economic benefit, and simultaneously provides more enjoyable experiences for tourists by means of a greater understanding of environmental integrity and cultural diversity.

Focusing in particular on businesses, responsible tourism refers to destination management strategies and to the implementation of the guiding principles for economic, social and environmental responsibility. It requires regulations, incentives, supportive policy frameworks and adequate funding, on which authorities, business and local community cooperate in destinations. Responsible tourism is regarded as a behavior. It is more than a form of tourism. It represents an approach to engaging with tourism. It emphasizes that all stakeholders are responsible for the kind of tourism they develop or engage in. Different groups will see responsibility in different ways and what is considered responsible may differ depending on originating markets and destinations.

Economic responsibility means reducing social or economic inequalities, reducing poverty and providing economic development to the less developed countries. Investors should have corporate social responsibility, should assess the economic impact on local livelihood and the local people's lack of access to resources or should adopt equitable business practices. If fair prices are paid and charged, the risk is thus minimized and shared. Investors should recruit and employ staff by recognizing the international labor standards, the responsibility and the market advantage that can go with it. By reporting the progress transparently, by achieving responsible tourism targets in emerging tourism destinations, by adopting a responsible approach and by committing to specific responsible practices in originating markets, corporate businesses can assist and provide small tourism-related enterprises with

capacity building or with mentoring and micro-financing support.

Environmental responsibility involves environmental initiative against planet panic, global warming and the earth's crisis. It promotes education and awareness for biological diversity or the sustainable use of the resources. It reduces waste, over-consumption and carbon emissions. Managers should take into account wildlife issues, vulnerable ecosystems and protected areas, should deal with natural diversity and should consider the volume or the type of tourism the environment can support.

Social responsibility makes reference to the access for disadvantaged communities and individuals and combats sexual exploitation of human beings or the erosion of lifestyles, for reasons of social diversity.

Destinations and tourism operations are following responsible tourism as a pathway towards sustainable tourism. Responsible tourism and sustainable tourism have an identical goal, that of sustainable development. The pillars of responsible tourism are therefore the same as those of sustainable tourism, namely environmental integrity, social justice and economic development. The major difference between the two is that, in responsible tourism, individuals, organizations and businesses are asked to take responsibility for their actions and for the impacts of their actions. This shift in emphasis takes into account the insufficient progress towards realizing sustainable tourism. This is partly because everyone expects others to behave in a sustainable manner. The accent on responsibility in responsible tourism means that everyone involved in tourism, namely government, product owners, transport operators, community services, tourists, local communities or industry associations should achieve the goals of responsible tourism.

5. Conclusion

The world has paid a lot for ignoring the well-known economic risks of the financial system. On the other hand, many other global risks such as economic disequilibriums, climate changes and the information gap may appear. This is why responsible tourism is important for the progress of the world economy. It encourages tourism activities

meant to offer better quality services for visitors to a destination and fights for several global economic causes such as employment creation, foreign currency earnings, education, health or the environment conservation.

Globalization, Entrepreneurship and Small Business

Stan Ștefania Anca

„Vasile Alecsandri” University of Bacau, Faculty of Economic Sciences
anca_stan68@yahoo.com

Abstract

New product innovation often comes from small business. Most the radical inventions of the last century, such as the computer, come from small companies, not large ones. And this will not change.

Globalization will continue to modify and mold the environment of small business and entrepreneurship. The competition from abroad places strong pressure on small business in terms of efficiency, price, quality, cost, control, marketing, expertise, customer satisfaction and innovativeness.

Globalization is an unstoppable phenomenon, presenting opportunities to those who are prepared and threats to those who are not.

Key words: small business, globalization, entrepreneurship, innovation.

J.E.L. classification: M19

1. Globalization and entrepreneurship

For many small business, going global is no longer just an interesting to do – it is essential to the long – term health and performance of the company.

We start with a descriptive overview of the relationship between globalization and entrepreneurship.

Globalization has begun to dismantle the barriers that traditionally segregated local barriers opportunities and local firma from their international counterparts. Local markets are becoming integral parts of broader, global markets. Consequently, internationally oriented entrepreneurs can now view a much broader range of opportunities and competitive modes, unrestricted by national boundaries. In this integrating global environment, entrepreneurs and emerging business face both new opportunities and formidable new challenges.

As a concept, globalization is generally perceived to include a variety of inward and outward aspects of economic activity, including the following:[1]

- the knowledge and flexibility that allows movement across national borders;
- the ability to take advantage of opportunities anywhere in the world;
- the capacity to move capital and source/distribute products/services in other countries;
- a commitment to transnational management of factors of production;
- the capability to market/or adapt a portofolio of products/ services to specific markets successfully;
- the ability to be simultaneously active in a number of independent business and/or be members of strategic alliances in other countries.

In today’s business environment, most of an organization’s activities are becoming global in nature. Firms across the world have recognized that globalization is a reality that creates unlimited opportunities while intensifying competition and threats. The four characteristics of globalization are increasing worldwide interconnections, rapid discontinuous change, and increased number and diversity of participants in business and other activities, and growing complexity.

Growing interconnections brought about by the globalization process require that both managers and organizations expand on traditional repertoires of roles. As national economies, political systems, cultures, technologies, resources, and industries increasingly converge – perhaps to meld, perhaps to take shape in new forms – global management skills and abilities become more important to all organizations. These skills will be diverse.

Traditional knowledge and skills remain important. Yet global managers can better respond to global demands by learning continuously managing diversity, and

developing a global mindset. This encourages managers to think “outside the box” of tradition. For the individual manager, the task is to prepare for projects, jobs and careers in a future where direction is unclear. This requires that many learn to live with ambiguity. For organizational leaders as well, the challenge is to manage tradition and chance. Global firms may mix and match traditional principles with newly developed ones that borrow best practices world wide.

Globalization will continue to modify and mold the environment for small business and entrepreneurship. The competition from abroad places strong pressure on small business in terms of efficiency, price, quality, cost, control, marketing, expertise, customer satisfaction and innovativeness.

The globalization of economy is growing faster and faster at all economy, require business to produce high competitive products and entrepreneurs who are basically small business, have large potential to produce competitive products.

Entrepreneurship is the process by which individuals, teams, or organizations identify and pursue entrepreneurial opportunities without being immediately constrained by the resources they currently control. Entrepreneurial opportunities are conditions in which new goods or services can satisfy a need in the market. Entrepreneurial opportunities came in many forms such as the chance to develop and sell a new product and the chance to sell an existing product in a new market.

International entrepreneurship is a process in which firms creatively discovers and exploit opportunities that are outside their domestic markets in order to develop a competitive advantage.

2. Small business created by young entrepreneurs: a solution to the crisis?

The globalization of the small enterprise will most likely be the most important development in international business as we begin the new millennium. Most the radical inventions of the last century, such as the computer, come from small companies, not large ones. And this will not change

It is widely aged that small enterprises are the backbone of modern market economies, thus play an important role particularly in

developing countries. Some advantage of small business are:[2]

- Flexibility. The small firm can easily adjust to even the most dynamic changes in the market. As they change they even improve their profit pictures.
- Small volumes are all that is needed. Small and efficient entrepreneurship will reach out to remote and scattered markets. But since they are efficient, entrepreneurs can survive easily under such circumstances.
- Understanding their markets well. Small entrepreneurs are almost an extension of the existing third – world markets. They are sensitive to and aware of the new developments in their markets, and they respond well.
- Efficiency. Unlike their global gigantic counterparts, entrepreneurs are efficient and are low – cost operations. That enables them to succeed under trying conditions that prevail in the small markets of the world.
- Speedy decision making. Almost by definition, one of the greatest advantages of entrepreneurial cultures is that these enterprises can make decisions very quickly and implement the action oriented critical decisions almost immediately. The poorer markets of the world have urgent needs, and such speedy actions are very appropriate.
- Innovativeness. As Drucker (1985) posited, entrepreneurs are very good at converting bright ideas into organized business activities. They generate and cultivate innovation in society.

The globalization of economic activity has a dual impact of small business. For some, it provides new opportunities for expansion and growth by taking advantage of international market potential. For the majority, however, growing economic globalization is increasing the competition with foreign enterprises and it is an inward process that brings competitive challenges and threats. For those small business, globalization bring risks that they unlikely survive in their present form, without improving quality, cost competitiveness and management practices.

Entrepreneurs who are basically small businesses, is the most important player in the building of the globalization, and have

large potential to produce competitive products. Because they have power, wish, to do innovation, desire to accept personal responsibility to create an event by their way, and wish to get high achievements.

In Romanian economy, the transformation that started in the 1990s has changed the market economy, caused a transition of national economy into market oriented one. The transformations had a significant impact on a reform in the labor market and it mostly affected the young people. The development of entrepreneurial talent is important to sustain a competitive advantage in a global economy that is catalyzed by innovation.

Becoming owner of a micro or small enterprise could be an alternative for a young person who has an entrepreneurial mindset. Identifying and nurturing entrepreneurial potential among youth can have long term implications for Romanian economic development.

Young people are a great resource for the development of the society but their potential is not fully exploited because of the labor market inefficiency. Youth entrepreneurship varies according to the age.[3]

Pre – entrepreneurs (ages between 15 to19): This is the formative stage. These young people are often in transition from the security of the home or education to the workplace.

Budding entrepreneurs (ages between 20 to 25): This is the growth age. These young people are likely to have gained some experience, skills and capital to enable them to run their own enterprises. They often follow one of the enterprise pathways: remaining stuck in marginal activities; going out of business; running successful enterprises.

Emerging entrepreneurs (ages between 26 to 29): This is the prime stage. With valuable experiences in business, emerging entrepreneurs have a higher level of maturity than the young people in the lower age groups. Hence, they are more likely to run more viable enterprises than younger people.

The reason for the importance of promoting youth entrepreneurship:[4]

- creating employment opportunities for self – employed youth as well as the other young people they employ;
- bringing alienated and marginalized youth back into the economic mainstream and

giving them a sense of meaning and belonging;

- helping address some of the socio – psychological problems and delinquency that arises from joblessness;
- helping youth develop new skills and experiences that can then be applied to other challenges in life;
- promoting innovation and resilience in youth;
- capitalizing on the fact that young entrepreneurs may be particularly responsive to new economic opportunities and trends

This paper analyzes the necessity of applying the contemporary concept of entrepreneurship to the Romanian market, with a special emphasis on the role of the young people. To accomplish the objective of this study, comprehensive desk research was combined with consultation of young people. A questionnaire was designed to analyze the attitudes of young people when starting their own business. The population of this study involved students from the “Vasile Alecsandri” University of Bacau. A total of 120 students were targeted for this study. All the students involved were in their final year of studies.

The results of the survey showed that most of the students (82,46 percent) would like to start their own business at some time in the future. The most commonly started motivation for starting a business was “to be your own boss”. Some claimed that they disliked “being told what to do” or felt that they were not good at taking orders from others. Participants have perceived that owning their own business would provide them with independence, freedom and flexibility, giving one the freedom to make decisions about their salary, working hours and location, their career and the direction of their business. Being your own boss was seen to allow someone to be self-reliant and in control. Apart from the personal rewards, an equally common reason cited for starting a business was reaping financial rewards. Many believed that owning their own business was the easiest or the most guaranteed or the sole way of making lots of money. A few have said they felt exploited working for others and wished to receive the direct benefits from profits they generate.

Over two thirds of those surveyed (68,4 percent) felt they have the practical skills needed to start a business of their own and most of the rest felt that they could acquire these skills. The perceived importance of “accepting the possibility of loss in order to have a chance of succeeding” was high, although relative to several other characteristics the risk taking was seen as less critical to the success of an entrepreneur. Generally the respondents rated themselves low, relative to entrepreneurs, on their attributes.

In 74,36 percent of cases the most important reason given by students for not starting their own business was the lack of the right idea. The surveyed students indicated that they are mostly deficient in the foreign languages (32,64 percent) considered to be the basics of entrepreneurship skills for small business (26,12 percent) and international transactions (18,64 percent).

The biggest obstacles to starting their own business as indicated by surveyed students are:

- an unstable political and economical situation (46,34 percent)
- long and complicated registration procedures (18,24 percent)
- excessive taxes (12,4 percent).

3. Conclusions

In today’s rapidly evolving and globalizing societies and economies, education must foster entrepreneurial cultures and attitudes and provide the necessary tools. This study has shown that students today need courses and programs that lay down a basic framework for understanding the concept of entrepreneurship. Introducing a structure for supporting and encouraging entrepreneurship education and designed to stimulate and facilitate entrepreneurial activities could result in a lower unemployment rate, increased establishment of new companies and fewer failures of existing businesses.

By cultivating the youth entrepreneurship aptitudes, the young people are also taught to be responsible, enterprising individuals who may become future entrepreneurs or entrepreneurial thinkers and will make their contribution to the economic progress and increase of sustainable communities. Young

people can no longer expect to find the traditional “job -for - life” careers but rather “portfolio careers”(contract employment, freelancing, periods of self – employment).

Entrepreneurship education for students must focused on developing student’s skills to start their own ventures, or a more enterprising attitude to different situations:[5]

- developing more creative, innovative approaches to learning, school work and the school community;
- developing in students the self – esteem, confidence and positive attitudes necessary for consideration of entrepreneurship or self – employment as a viable career option;
- developing in students the attitudes, skills and behaviors to succeed in work – force entry and career progression;
- developing in students the positive attitudes, skills and behaviors needed for integration into the community and participation in its development;

Globalization is an unstoppable phenomenon, presenting opportunities to those who are prepared and threats to those who are not. Globalization will continue to modify and mold the environment or small business and entrepreneurship

Being Global: How to Manage Human Resource in the 21st Century

Stan Ștefania Anca

„Vasile Alecsandri” University of Bacau, Faculty of Economic Sciences
anca_stan68@yahoo.com

Abstract

Markets are global and competitive and the numbers of companies doing business abroad increases every day. Today, the success of individuals and organizations are measured by their adaptability to change. So does the need for international Human Resource Management.

The world needs a corps of global leaders who can take on the pressing challenges and contribute to an inclusive and sustainable economic system.

The new leaders for the new global environment will have the ability to continuously change themselves without changing their values and virtues.

Key words: human resource, global leaders, global teams, global mindset.

J.E.L. classification: M19

1. Managing the human resource in the 21st century

Organizations depend on people. Organizations do what people do. An organization behaves the way its employees behave, the way its managers direct it.

Today we are living in an age of intensive global interdependence, one where the old way of seeing the world as a predictable, independent mechanism no longer fits. Building on the new quantum physics of the twentieth century, a new model must emerge where the whole organizes and even partly defines the parts. Within organizations, the new framework requires that we pay attention to the relationship between people, to the validity of each person's unique reality and to the multiple creative possibilities that exists at any moment in time.

The importance of people as vital assets is largely overlooked today. Today, managing human resource effectively is more important

than ever. Managing human resource effectively requires understanding all of the human resource policies and practices that make up an organization's human resource management systems as well as the interconnections that link the parts of that system together. Because managing people effectively is rather complex, it requires cooperation among human resource professionals, line managers, and all other employees.[1]

Dealing with people is probably the most difficult thing we will ever encounter in life. People are very complex creatures. Not a single person thinks, feels, sees, understands and behaves the same way. We all come from different cultural, national, religious, ethnic and political backgrounds. This makes each and every one of us unique with different set of morals, beliefs and values. This complexity and variety also reflects on our everyday work lives. People's characteristics values and beliefs form attitudes and behaviors that strongly influence their choice of employment.

Management cannot simply set certain policies and procedures in place and then sit back and watch the days go by. Managers need to put in the time and the effort it takes to deal with the complexities of employees. Internally, managers need to respond to a very diverse work force and variety of business models for various different business units. Externally, things can be worse for managers where the complexity, variety and diversity is even higher in customer needs, cultural values, government regulations.

In addition, organizations have to deal with interdependence. The less rigid organizational borders are, the easier it gets for the organization to take advantage of globalization. This also means, that organizations are more and more exposed to the effects of problems around the globe, such as the recent economic crisis.

Today, the success of individuals and organizations are measured by their adaptability to change. Organizations have abandoned the traditional thinking of what work is and how people should work. Employment now means have more than having a job. It is not just something and individuals does, but a combination of shared responsibilities and individual.

Leaders see human resources assets that need to be managed conscientiously and in tune with their organizations' needs. Today's most competitive organizations are working to ensure that – now and a decade from now – they have employees who are eager and able to address competitive challenges. Increasingly, this means attracting and retaining superior talent and stimulating employees to perform at peak levels.[2]

2. Global teams

Many managers now believe that improving the teamwork process in their organization is essential for ensuring their organization's success. Using team-based organizational structures, employers hope to achieve outcomes that could not be achieved by individuals working in isolation. But the payoff from teams isn't automatic. To create and orchestrate teams, people need to be selected, appraised, compensated and trained in ways that reflect the unique relationships that develop between employees who work together.

As a result of the increasingly global business environment, many companies are building teams that cross-national borders and/or include members from different countries of origin. Individuals from different racial and ethnic backgrounds will need to work together in a local workplace, a multinational corporation or an international organization.

Global teams are cross – border work group made up of multiskilled, multinational members whose activities spare multiple countries. Managers and members of global teams are faced with the challenge of how to access and utilize individual member's strengths, while at the same time minimizing coordination losses from communication problems, language differences, varying work styles, and misunderstandings. The challenge in managing global teams

effectively is to recognize underlying cultural causes of conflict, and to intervene in ways that both get the team back on track and empower its members to deal with future challenges themselves.

The most advantages and competitive use of global teams involves simultaneous contributions in three strategic areas:

- First, global teams help companies address the differentiation challenge, enabling them to be more locally responsive by providing knowledge to meet the needs of different regional markets, consumer preferences and political and legal systems.
- At the same time, teams provide integration benefits, helping organizations achieve global efficiencies by developing regional or worldwide cost advantages and standardizing designs and operations across countries.
- Finally, these teams contribute to continuous organizational learning, knowledge transfer and adaptation on global level.

Typically, teams are of two types: intercultural teams, whose members come from different countries, and meet face to face, and virtual global teams, whose members remain in separate locations around the world and conduct their work electronically.

There are four key design techniques that help create a supportive environment for global teams: clearly specify the task objective and align it with organizational strategic initiatives; make appropriate resources available; select team members who have the skills, abilities and experience to work in a global team, including the team leader if appropriate; and create a sense of urgency.

It is important to establish a clear task objective and to align the objective with organizational initiatives, whether those initiatives are tied to global efficiency, local responsiveness or organizational learning or knowledge creation. If team members do not know how their task fits with overall objectives as well as with their own priorities, it will be more difficult for them to commit and hence, to participate fully in the team's task. The more clearly and specifically managers can define the task, the greater the likelihood that teams with short

life cycles and urgent deadlines meet with success.

Global teams are embedded not just in one, but in many contexts that may possess quite different systems of organizational support, including budgets, work processes, human resource policies and support people, such as facilitators, administrative support, and information technology tools and facilities. Incompatible or insufficient resources are a major source of complexity and frustration for global team collaboration.

Global team members need to be adapt at working with task uncertainty, member diversity, and a variety of team situations. Team members too often are selected based only upon professional expertise or job roles alone, or upon their availability to do the technical work. Research indicates that employees tend to be more comfortable and effective in a global teaming situation if they are capable of performing the core tasks for their roles, are self-disciplined and goal-directed, are flexible, collaborative and willing to share and exchange information, and remain open to feedback.

Global team members should be perceptive and receptive to differences in people and culture, ways of thinking, and alternative approaches to processes. They need to be capable of handling the uncertainty. They should also be committed and connected to the business and competent in using technology required for their roles. These skills, while desirable in many work settings in multinational corporations, are particularly crucial to the viability of global teamwork.

Teams can fail when they are unable to cultivate trust among their members or when they cannot break down often – formidable communication barriers. Trust is critical to the success of global business teams in that it encourages cooperation and minimizes unproductive conflict. Each member of a global teams brings a unique cognitive lens to the group. If harnessed effectively, the resulting diversity can yield significant synergies and produce a collective wisdom superior to that of any individual. Without mutual trust, however, team members may shy away from revealing their true benefits. The absence of trust is likely to turn a team’s diversity into a liability rather than an asset.

Communication barriers resulting from differences in geography, language and culture also can sabotage global business teams. With members living in different countries, separated by time zones and conflict schedules, arranging team meeting can pose logistical challenges. Undoubtedly, technology (e-mail, teleconferencing, video-conferencing) can enable members to work together despite geographical distance: but technology should be viewed as a complement to, not as a substitute for, team meetings. Face – to face meetings foster familiarity and trust – not easily established virtual meetings. When members cannot see one another’s body language and direct experience one another’s reactions, the emotional dimension critical to a team’s success suffers.

Members of global business teams typically come from diverse cultures and, as a result, may bring different values, norms, assumption and patters of behavior individualistic and collectivistic cultural norm for decision

3. Global leaders for the 21st century

New times demand new kinds of leaders. The global world of the twenty-first century will require new world class leaders: leaders with a unique combination of attributes and personal characteristics. The new leaders for the new global environment will have the ability to continuously change themselves without changing their values and virtues.

Real global leaders are a new breed with identifiable traits. They have a natural curiosity about the world that leads to relationships with people very different from themselves. From these relationships come insights and innovations that span national and cultural boundaries. While driven to enhance their own prosperity, real global leaders also recognize the impacts of their actions on communities and the planet, and the fact that their personal prosperity is interdependent and shared with the prosperity of others.

To be an effectively leader in the twenty–first century one will need to possess the following key attributes:[3]

- an ability to develop and convey a shared vision;
- a service/servant orientation;

- commitment to risk – taking and continuous innovation;
- a global mindset;
- comfort and confidence with technology;
- competence in systems thinking;
- recognition of the importance of ethics and spirituality in the workplace;
- a model of lifelong learning.

A key leadership attribute of twenty-first century leaders will be the ability to see the world and the workplace with a global mindset. Global mindset can be defined as the ability to perceive and decode behaviors and situations in various cultural contexts. Global mindset is thus the capacity to appreciate the differences among cultures and bridge the interfaces between them. Leaders who possess a global mindset are able to view situations from a variety of perspectives, develop trusting relationships with individuals from different contexts and identify promising routes to successful collaboration.

Global mindset is critical for success as a global leader, but its true benefit comes when global leaders act as global entrepreneurs and leverage mindset for value. Global leaders use their global understanding and connections to identify the opportunities among cultures and regions and turn them into new value-creating operations.

Effective leadership mind the twenty-first century will require the ability to be a systems thinker. Systems thinkers have the ability to see connections between issues, events and data points, to see the whole rather than just its parts. Systems thinking requires the ability to frame structural relationships that result in dynamic networks as opposed to straight patterned interactions or relationships predicated on one's position in the hierarchy.[4]

A twenty-first century leader must think in terms of whole systems, seeing the business as part of a wider environment. This new leader views business opportunities not simply from the perspective of a solo player, but as one player among many, each coevolving with the others. This attitude is sharply different from the conventional idea of competition, in which companies work only with their own resources and do not extend themselves by capitalizing on the capabilities of others. In the global market,

global leaders want to make use of the other players – for capacity, innovation and capital.

Twenty-first century leaders must be willing to take risks. And not only should they themselves be creative, they should encourage and reward creativity around them. New leaders must be truly open to the wide range of perspectives and possibilities essential to identify trends and to generate choices.

The big problems we face are global. The financial crisis, climate change, poverty and corruption all require leaders who can understand people different than themselves, forge cross-boundary solutions and foster value creation that is broadly shared.

4. Conclusion

International business success is dependent upon the leader's understanding of the global landscape and the ability to rapidly adapt to the changes that impact the business environment. Leaders of domestic organizations as well as those of global companies must handle issues of globalization such as competition, mergers and acquisitions, dissolving borders and cultural diversity. Therefore, the great challenge for the new generation of leaders will be to gain direct knowledge and real experience in a wide variety of geographical areas and to build and articulate a clear vision, even as both the workforce and clientele become increasingly diverse.

We frequently talk about *changing society*, but society has always been changing. Today change seems to have become an intrusive concept, possibly because change occurs at a much faster pace than before, and the consequences are much more extensive.

New Approaches on Management Systems Audit

Costel Stanca

Constanta Maritime University, Navigation and Maritime Transport Faculty
costel.stanca@cmu-edu.eu

Abstract

The practice of management systems implementation became a large practice in the latest decade for all type of organizations. The trends moved from the known quality management to many other fields such as the environment, health and safety, food safety, social responsibility and others.

Most of the audits of systems developed in compliance with ISO standards were organized and performed guided by ISO 19011 standard [1]. The evolution of practices lead to the revision of this set of guidelines and last year ISO launched a new edition.

This paper presents in brief some challenges faced by auditors during the management systems audit and the elements revised in their practice according to latest requirements.

Cuvinte cheie: audit, management system, ISO 19011

Clasificare J.E.L.: M19, M42

1. Introduction

Defined as a systematic process of objectively collecting and evaluating evidence in order to confirm or not the compliance with defined criteria (i.e. a reference standard such as ISO 9001 for quality management systems), the audit it is a broadly used practice [2].

The need to extend the good management practices and to have a common approach lead to implementation on a large scale of the requirements defined by specific ISO standards or other similar set of rules. The most popular standard proved to be ISO 9001 (more than one million organizations were certificated up to the end of 2009), but other

standards like ISO 14001 became also a good reference for management system implementation [3].

All standards and similar set of rules related to management systems require to plan and perform an internal audit and the need for recognition of the results of implementation confirmed by an independent party lead to the external audits.

The auditing practices are different taking into account the large fields this process is required, but for the management systems the most known set of guidelines is provided by ISO 19011 developed for the audit of quality and environmental management systems [4].

The first edition of ISO 19011 was approved in 2002 and cancels and replaces the other standards addressing the audit of management systems provided by ISO for these fields.

Following the practice to revise periodically the management system standards ISO approved last year a new edition of ISO 19011 providing updates able to answer to actual specific of management system audits.

This new edition extended the set of audit principles, introduced the concept of risk in audit, improved the guidance on audit planning and performing and provided clarifications on auditor competences.

The changes of the auditing guidelines were made based on the feedback provided by third party auditors involved in management systems audits and proved that the actual practices are well established and mature [5].

2. Audit principles

The guidelines provided by ISO 19011 are grouped in 7 chapters, the audit process planning and performance being addressed in the 5th and 6th chapters, following the known Deming approach (plan-do-check-act) [2].

After the presentation of scope, normative references and definition of specific terms the

guidelines includes a number of six principles able to assure that the audit is an effective and reliable tool[1]:

- Ethical conduct;
- Fair presentation;
- Due professional care;
- Independence;
- Evidence-based approach;
- Confidentiality.

Previous edition included first five principles only, but a new one was introduced: “*confidentiality – security of information*”.

Even if a clause of confidentiality is a part of almost all auditing contracts and the good practices imposed to have a clear declaration of confidentiality from the auditors in each audit opening meeting, ISO considered as appropriate to extend the set of auditing principles emphasizing the importance that the auditors will be prudent in the use and protection of information acquired in the course of audit performance [5].

3. Audit planning

Preparation and planning the audit activities are the first activities initiated by an organization when decided to perform an audit.

At this stage taking into consideration the audit objectives and criteria the auditing team should establish steps related to development, monitoring and improvement of an appropriate audit programme, as well as the needed resources to achieve the audit goals.

When decide to perform an audit each organization considers the requirements defined by the regulations, stakeholders, reference standard and own management system documents.

The risks associated to specific activities performed by the organization should provide an important input in the audit planning.

The orientation to risk-based audit it is another important change provided by the actual practices in the management systems audit.

During the development of audit programme the lead auditor should prove a proper understanding of using the remote audit in such a way that the results of the audit process will be not negatively affected.

Current market environment increased the focus on the audit efficiency and effectiveness asking from the professionals in the audit field the capability to select and perform with good results remote activities based on available communication facilities.

The extent of the audit programme is given by the specific of the organization taking into consideration the nature of business, size and other relevant issues.

For the use of organizations providing conformity assessment services in the field of quality and environmental management systems, such as certification bodies, International Accreditation Forum established requirements related to the duration of audit duration.

For example both stages of an environmental management system audit performed in a company with 126-175 employees operating in oil and gas extraction, due to high complexity environmental aspects, should be covered within 12 man/days [6].

The latest edition of ISO 19011 intended to show a flexibly in audit planning according to the size, maturity level and complexity of the audited organization.

At the stage of audit planning the responsibilities are assigned to one or more auditors and appropriate resources are allocated.

All the above presented steps must be well established in a documented procedure together with all necessary details related to the performing of audit activities and keeping of appropriate records.

Such records will provide objective evidences for the formulation of audit findings, including the conclusion related to the compliance with the established criteria.

The audit procedure should have annexed the forms to be used for records. Such records may be:

- Audit plan / programme;
- Audit Report;
- Nonconformity report;
- Corrective or preventive action report
- Etc.

The 2011 revision of standard provides a clear guidance on managing audit programme process flow.

4. Audit activities

Actual practices related to management systems audit provided by third party organizations includes two stages and most of the time both are performed on site.

The first audit stage is focused on collecting and analysis of general data about organization, main documentation and results of system processes such as internal audit and management review.

The new edition of audit guidelines increased the role of internal audit in the evidences proving that the management system requirements are effectively followed.

The second audit stage is focused more on specific operational processes and on identifying on site appropriate evidences related to implementation of management system defined requirements.

The management systems developed by most of the organizations already covers more than one standardized field (quality, environment, health and safety, food safety, energy management, information security, risk, ship and marine technology) and that is why auditors should be ready to perform the audit activities according to the level of integration of implemented systems.

The processes addressed by management system integration include:

- Policy and objectives;
- Management representative;
- Control of documents and records;
- Internal audit;
- Control of nonconformities;
- Corrective and preventive actions;
- Management review.

The stages performed on site begin with an opening meeting when the main issues of the audit are discussed by auditing team with the audited representatives.

Based on effective communication the lead auditor clarifies at the opening meeting all specific data related the audited organization.

Following the process flow described by the ISO 19011 standard the auditor collect evidences make comparative analysis with the requirements and establish the level of compliance.

The audit is based on interview, direct observation and document review. When a

deficiency is found adequate corrective action is initiated.

Professional auditors' challenges are given by auditing of processes with particularities such as:

- Statutory and regulatory requirements;
- Effectiveness of internal audit;
- Continual improvement.

New electronic based systems leads to practices like collection of data in electronic format with better results in using time for keeping records and preparing and reporting audit findings.

The actual key elements in performing the audit activities provided by the new guidelines are related to:

- Risk-based approaches;
- E-auditing;
- Integrated auditing.

The audit ends with a meeting when the audit team communicate the conclusion of the audit based on collated results received from the involved auditors.

5. Auditor competencies

The complexity of the audited systems and the increasing of number of integrated management systems generated some changes in the last chapter of ISO 19011 standard where the appropriate competencies for auditors are described.

Annex A provides examples of discipline-specific knowledge and skills of auditors and Annex B includes additional guidance for auditors planning and conducting audits.

It is clear that the selection process for an effective team should focus on auditors with multidisciplinary competencies.

The emphasizing of “auditor attributes” and better description of competence evaluation criteria are another two issues addressed by changes in the auditing guidelines.

The trend to use auditors with competencies related to more than one reference standard is confirmed today by auditors' training providers.

They are organizing very often sessions where the future auditors are trained for integrated systems.

This approach proved to be appropriate in order to provide assistance in better identification of processes cu

multidisciplinary characteristics and use of audit tools effectively covering in the same time the requirements of all reference standards.

6. Impact of audit process

The role of management system audits is more that clear for all organizations which decided to implement the requirements of a standard related to this field.

It is maybe the moment to take into account the need of movement from the main goal given by the measurement of compliance level towards consideration audit as an added value process.

The performance of auditors may have as one of the indicators the number of recommendations based on audit findings.

Such recommendations are oriented to transform, when is the case, the management system documentation from a bureaucratic set of procedures and large quantity of records in one realistic and in line with the business needs.

The certification audit team may become useful by [7]:

- Providing information to top management regarding the ability of organization to meet strategic objectives;
- Identifying problems which, if resolved, will enhance the organization's
- Performance;
- Identifying improvement opportunities and possible areas of risk.

Anyhow the provision of recommendations should be realised having in view the important focus on confidentiality.

Should be assured, for example, that a solution developed by a competitor and observed in an previous audit will not be suggested as an improvement solution to the audited organization.

7. Conclusions

The new edition of ISO 19011 standard provides updated references in order to provide effective audits for management systems.

Main changes in the auditing standard are related to capability to audit integrated systems in a risk-based approach and taking into consideration all current practices and

opportunities given by communication technologies.

The auditors are required to improve own competencies in order to answer to the new challenges, being able to use new techniques and to follow in the same time the requirements of more that one reference standard.

It is recognized the fact that due to general economic environment a large number of companies decided to not continue certification of own implemented management systems.

This decision is met often in organizations which fished more than two certification periods.

To recover the interest for third party audits the certification bodies should orient the audit process to the added value that may be provided be the auditors, having direct impact in business development.

Abstract

This paper aims to underline the role and importance of a quite recent issue for managers and marketing responsables, in fact, the strategic quality, analysed at both objective and the client level. The study propose the identification of the main possible vectors of the strategic quality and to structure several ways to manage the issue. The perception of the quality ,in general, could be influenced by the distribution system, type of products or market position and therefore, the strategic quality could be quite different like nature compared with the industrial quality. Strategic quality based on the industrial quality from the fuctional point of view and require specific means to be managed.

Keywords: quality, strategy, client, needs

JEL Classification: M10, M11, M19, M21

Introduction

The strategic feature of the Total Quality represent at the moment a present and permanent concern of the main part of managers, due to its double character: both objective (the performance point of view) and subjective (the client point of view). The daily practice still demonstrate the existence of a gap between the requirements of the Total Quality philosophy and the ordinary quality assurance control. That`s why managers should understand the special nature of the strategic quality concept and to learn to apply it in the current activity.

The strategic quality objectives

It is obviously that the management strategies doesn`t allways take into account the marketing point of view in order to correlate the level of quality performance with the the client needs. The perfect identification of the market requirements could be a loss of time and ressources if the answer in terms of quality will not touch the customer`s needs.

We could assign four main dimensions to the strategic quality:

- The product quality
- The quality of „total product”
- The enterprise quality and
- The chain quality[5]

The product quality is to be analysed at two levels: the objective one and at the quality level perceived by the client. This dimension of quality has a cost but also generate measurables savings and position (quite difficult to be measured). Paradoxically, in practice, the objective quality is the most difficult to be appreciate from the client point of view. Therefore, quality represent what the client really expect ,not what answer to the technical demands of the producer or provider. A logically start for a good quality policy base on the deep study of the client expectations.

The quality of „total product”, concept developed by T. Levitt in the `80 th, leads to distinguish four hypostasis in the product definition: [5]

- Generic product-the material product and its commercial environment;
- Expected product-the extension concerning services provided together with the product;
- Expanded product-integration of

additional material components or new services;

- Potential product-translation of the unexpected, additional features or uses.

A careful consideration suggests to reverse the approach of reflection about quality and to pay more attention to the specific factors of the potential and expanded products, in order to lead in practice to an extension of the client service and to give an alternative to the eternal position based on the price or the quality of the generic product. It is very important to perceive that the cost of that additional quality factor is in general lower than their impact.

At the stage of enterprise quality the contractor has to impose itself (corporate identity) in parallel with its products and that is a very important strategic imperative. At this point, the contractor must answer a very difficult question: what is the company specific? This point of view requires a survey of consumers in order to establish the real specificity perceived and to develop the enterprise quality.

Every company depends on an assembly of providers upstream and intermediate clients downstream in order to manage its business. The chain quality will depend consequently on the establishment of closed relationships with the different partners. It will be founded on both classical quality procedures and cooperation forms (assistance) in which clients will help the partner to progress in quality. [5]

Landmarks and means of the strategic quality

Strategic quality based on the industrial quality from the functional point of view and require specific means to be managed.

The perception of the quality, in general, could be influenced by the distribution system, type of products or market position and therefore, the strategic quality could be quite different like nature compared with the industrial quality. Marketing studies demonstrate with many examples this point of view. All these shows that the strategic quality is of a very different nature compared with the quality perceived by the producer or provider. That's why it is very important to identify the possible vectors of the strategic

quality. The strategic management of a company usually pay attention to several landmarks to be followed :[6]

- The factors of excellence;
- The factors of total quality perceived by the contractor;
- The total quality and coherence.

The factors of excellence-Peters and Waterman talk about five principles of "chaos management" which make difficult the link with the traditional managerial approach, but anyway, the global quality sign up in the strategic approach. [5]

The factors of total quality perceived by the contractor-H. Lesca [5] proposed a more scientific approach, using eight factors concerning the capacity of the enterprise to improve the total quality:

- staff motivation
- professional competence
- ability to perceive the external environment and to predict future
- reaction speed of the enterprise
- innovation capacity
- effectiveness of communication and information flow
- tasks parcels reduction inside the enterprise
- better cost management

This hypothesis was tested and hierarchised in the order indicated above. This approach has the merit of testing the causes likely to have a decisive influence on the ability of enterprise to improve total quality of their service. In conclusion, this analysis remain functional in the measure that it is expected to restrict the area of the quality approach by subjecting the eight types of cases to different types of criteria in order to retain only a course of action.

The total quality and coherence-the strategic quality appears like a result of the enterprise audit translated in the means coherence establishment. Thus, total quality will occur as a result of the enterprise coherence in relation to the environment on both short and long term, through specific methods concerning all activities. There are two factors to be taken into account for this issue:

- The environment audit and
- The organisational answer, focused

currently on just-in time.

The environment audit has a great importance, because, as already showed, quality is not only objective, nor subjective, this global perception could be touched only through a careful observation of:

- the client expectations-which suppose both the level and the transfunctionality of listening the client voice;
- product evolution this marketing issue in fact, could be the engine of strategic innovations and profit source through the cost optimisation, services variety or a better structure of capital.
- competitors behaviour-the benchmark become the key factor to improve the total quality, due to the systematic audit and the accent on practice and process.
- chain organisations behaviour-the upstream and downstream, the sale forces and the buyers have to be listened in order to a better management of the total quality.

The organisational answer- from the traditional perspective, quality results from a combination of methods used by specialists in functional organizations. In this regard, even the quality assurance preserve earlier features of the control. In the current approaches, the quality function tends to disappear when it is broadcasted inside the enterprise. That's why the effectiveness will depend on the organization manner implemented to manage it.

Methods and techniques of the strategic quality

Strategies focused on quality are considered competitive strategies, because the mission of quality, today, in general, is to face the competition.

The most popular is the continuous improvement strategy. The continuous improvement strategy, a strategy considered an integrative, transfunctional strategy of a company, aims at gradual and continuous improvement of the products and services quality, as well as of the productivity, with the participation of all personnel.

Kaizen concept, the largest Japanese management concept was made famous by Masaaki Imai, President of Cambridge Corporation in Tokyo and the European Institute Kaizen, author of "Kaizen, the key to Japan's Competitive Success".

In his opinion, Kaizen is a concept 'umbrella', which brings together most of the concepts and practices typical of Japanese, such as: Company Wide Quality Control (CWQC), Kanban, quality circles, suggestion systems, improving productivity, etc. Kaizen strategy represents an alternative strategy to innovation. Unlike the latter, which involves improving processes and products in large jumps through technological innovation, Kaizen strategy adopt the principle of graduation, with "small steps". Such improvement does not involve substantial technological changes, as innovation and can achieve conventional know-how.[1]

Other differences between Kaizen and innovation strategy are as follows:

- Innovation strategy is focused mainly on results, while for Kaizen strategy prevails the process orientation;
- Innovation requires investment, sometimes considerable, to achieve the desired result, while the Kaizen strategy can achieve the same result with relatively little effort, constantly made;
- Kaizen strategy is oriented towards the worker, which is considered the main success factor of enterprise. The innovation strategy is instead oriented towards technology and financial issues that are involved in innovation.

The central point of the Kaizen strategy is Company Quality Control (Japanese version of total quality management).

Kaizen strategy is based on a number of methods, techniques and tools: PEVA action plans, quality circles, small working groups, suggestion system, Kanban, Total Productive Maintenance, the method of "3S" and "5S", etc., detailed below:

- Deming Cycle (PEVA)- Deming emphasized the importance of ongoing collaboration between

research and design, production and sales, quality improvement process, as a graphic presentation that bears his name: Deming's circle. This suggests that to improve quality, cycle "plan" - "run" - "check" - "acts" must be constantly repeated. This suggests that to improve quality, cycle "plan" - "run" - "check" - "acts" must be constantly repeated.

PEVA is the sequence of activities for improvement, noting that it is essential to understand and correctly evaluate the consequences before acting.

- Quality circles, coming from the '50s, where are applied the PEVA plans to solve problems-represent the privileged form of applying the Kaizen concept at group level.
- The suggestion system- considered as the simplest technique used in the continuous improvement strategy. It involves collecting improvement suggestions made by staff.
- Method Just-in Time (JIT) is originally a method of coordination of production processes, which ensure the production and delivery of parts (assemblies), only at the right time, established by orders coming to the next work station. It is part of methods to "pull" production, was applied for mass production, which can be divided into small lots.
- Method of "3S" requires coordinated development of three categories of activities which concern the removal of all that is useless at work; ordering useful objects left and preparing them so they can be used anytime' ensuring clean in the entire area affected by the job.
- Method of "5S" involves the development of two more categories of activities concerning the maintenance of a hygienic and pleasant workplace and a strictly respect of work procedures.

Conclusions

This paper aims to evidence the need to give priority to customers and its relationship

with quality from a strategic perspective in order to demonstrate that the mobilization of all sale forces of the enterprise can ensure the success of this approach.

Today it is recognized that in many companies this approach has evolved from quality centered on product to the quality centered on process. Although the concept of strategic quality became known, advancing to a Although the concept of strategic quality became known, advancing to a strategic formula evolve more slowly. The recognition of both globality and transversality of the quality and the use of the strategic means of the continuous improvement strategy could bring advantages for client and enterprise as well.

Agent Theory and Its Impact on Economic Crisis

Abstract

This article wants to design a liaison between the world economic crisis and agency theory, trying to determine if the current crisis is a consequence of the common corporate governance practices. More specifically, it indicates that these practices lead to excessive risk taking, like subprime mortgage securities, because they have no penalty for the manager, or don't damage his wealth in the case of collapse. Simultaneously, golden parachutes and other exit packages incite termination of the employment agreement since they reward failure, and provide little incentive for the executives to perform properly.

Keywords: Agent theory, principal, agent, incentives, financial crisis

JEL Classification: M29

1. Introduction

There has been found many causes of current global financial crisis, including uncontrolled real estate market, the large volume of subprime mortgages in the United States and even neo liberal philosophy. We are trying to show that one of the main causes of the current crisis is mainly a matter of stimulation. Incentives can be defined simply as anything that causes someone to take a particular action. Encounter different types of incentives and learned to answer the first years of life. As a child, for example, parents promise that if we go to a movie or eat all the vegetables we get a new computer

game only if we manage to get top marks in school. But incentives are often a penalty. If you break the rules of the road, you can be put to prison. If a company is discharging too many pollutants in water, it will be fined for each liter of pollutant discharged over the legal limits set for the company.

Simply, an incentive is a way to determine people to make more and more good things and therefore less bad things. However, incentives can have unexpected consequences. Consider the architectural landscape of Amsterdam. Do you know why homes are unique in this beautiful city? This is because property taxes depended on the width of the facade residence. As a result, owners decided to build very tall and narrow buildings that extend very far back, with narrow and very steep stairs. Since it was impossible to bring furniture in the house using the stairs, houses were provided with hooks in the ceiling and almost as wide windows as the entire house. I am convinced that people who have imposed these fees were originally thinking about how to bring about higher taxes on property, and not how to promote a different architectural style.

Incentives represent the boundary of corporate life, especially when it comes to top managers and their understanding and proper sizing is the key to resolving almost any organizational difficulties. The corporate governance practices, including those related to reward top managers, are debated in these troubled times. The reason for this approach is based on the recommendations coming from what is called "agent theory" [5]. Agent theory has long been the dominant model used to solve problems related to reward top

managers. This means that the principal (shareholders), whose primary objective (and unique) is to maximize the value of the company, delegates this task to a rational agent with risk aversion (manager). The principal creates major clearing contracts to control the opportunism of the managers, opportunism derived from information asymmetries arising between agent and principal.

2. Agent theory – a description

Agent theory is an influential approach to study corporate governance in strategic management [3]; [9], [12]; [15]. While some authors tend to be pessimistic about the effects of separation of ownership from control, modern theorists [5] move from the study of capital market failures to their effectiveness [7].

Modern theorists tend to be (too) optimistic about the fact that different governance mechanisms (eg, the market for corporate control, market for managers) have solved the problems agent. In fact, some theorists [5] suggest that the mechanisms of governance have achieved a high degree of refinement, thanks to which organizational theorists would not have to worry about studying the problem of organizational control.

The basic principal-agent model shows that the efforts, if not observed can be achieved through economic incentives. The compensations of the managers must increase by the profit obtained by the company. Since such structure of economic incentives damages insurance, the expected compensation is higher under uncertainty conditions. This, in turn, may lead the principal (shareholders) to not want to induce more effort. Thus, it can tolerate inactivity. Berle and Means [2] found that separation of ownership from control exists in many different degrees and that this separation is almost complete when there is a substantial minority among shareholders. Pratt and Zeckhauser [14] confirms that the problem of separation of ownership and control is only a part of the economic problems which can be classified as principal-agent problems. Indeed, Pratt and Zeckhauser's research topic is that businesses, employees and consumers often face the problem of agent. The two

have a more optimistic view of the seriousness of the agent problem, although recognize that things can improve with the introduction of creativity in governance.

Arrow [1] notes that the agent problem is an important factor of economic life and the principal-agent relationship has a significant effect and a significant economic magnitude. Very important is that the theory tends to predict very complex commissioning functions to align the economic interests of principal and agent. In fact, we don't observe such complex relationships. An obvious explanation for this divergence is that the mathematical problem of principal-agent does not take into account the bounded rationality.

Levinthal [10] describes organizational models that include agent problem, trying to broaden the number of those interested in these models and to stimulate production of new research. He aims to highlight the methods in which strategic management can contribute to organizational knowledge using specific mathematical forms. Moreover, Levinthal uses ideas of Simon [16], March and Simon [11] and Cyert and March to critically analyze models of agent theory from the theory of firm behavior's perspective.

Jensen and Meckling [8] suggests that if a manager has no debts or holds shares in the company he runs, it will not directly responsible for any cost. In this situation, the managers have an incentive to make decisions contrary to the best decisions that maximize shareholder wealth. Of course, shareholders can engage in a wide range of activities to monitor actions and decisions of managers. To move forward, managers can receive penalty bond which will take effect if they violate the interests of shareholders. These continuous conflicts between managers and investors, together with monitoring and rewarding mechanisms designed to reduce these conflicts are very expensive. All these costs are referred to by Jensen and Meckling as agent's costs. Total agent's costs consist of the costs of monitoring agent made primarily in order to regulate and monitor agent's behavior, expenditures made to reassure the principal and residual costs or costs due to unsolved conflicts of interest between agents and principal - this third category is very broad.

In a world of efficient capital markets, managers, trying to gather funds from external sources, bear full responsibility for these costs. Because managers bear the entire responsibility of occurrence of these costs in an attempt to raise capital, they have a strong economic incentive to choose that capital structure that minimizes the total cost of agent.

Jensen and Meckling examine the consequences of dilution of holding 100% of the entrepreneurial firm. However, real economic interest was moved to the modern corporation with many shareholders, but the translation from the theoretical scenario to another scenario isn't described. The two describe the situation definitely doing the exercise:

One of the most serious limitations of this analysis is that we didn't analyze in this paper its applications on a modern company whose managers have very few shares or have not at all. We believe that our approach can be applied to this case, but ... [these issues] remain to be studied in detail (p. 356).

As a critique of the work of two, Williamson [19], commenting that research, notes that "logic that links micro models and composite applications in which they are used is often visible, but rarely used on the whole" (p. 188).

3. Different types of corporate governance structures

Based on this theory, there have been established a number of "best practices", including the independency of the board of directors, separation of chairman and CEO positions, and the use of incentives. But many of the recently bankrupt companies have followed these practices. Let's take the example of investment bank Lehman Brothers. This company has adopted almost all of the governing practices and even created a special section on its website to explain that the bank has very strong corporate governance structure, including setting stimulents guidelines and a code of ethics.

For most companies which went bankrupt during the financial crisis in 2008, most salary packages were composed from variable incentives based on annual performance, both composed of cash, as well

as stock shares. In accordance with the last report presented by Lehman Brothers, the general manager has received 34 million dollars as annual salary, 85% of it being in the form of shares and options. This model is typical in industry. A similar compensation model was used in large financial institutions such as Bank of America, Citigroup, Goldman Sachs, JP Morgan Chase s.o.

One issue of stock options and other similar instruments is that managers rewarded with such instruments gain profit when share price increases, but don't lose value when the stock price falls. Managers can respond to these tools taking higher risks, since their wealth will not suffer if stock prices decline. This is probably the main reason that companies like Lehman Brothers, Fannie Mae or Freddie Mac were involved in risky businesses such as mortgage securities. Managers can have very large gains in situations of high uncertainty, without the risk of losing their money. Moreover, they only need short-term increases in stock prices to exercise options. In fact, managers are not forced to keep stocks more than one day [15]. The growth of stock prices for one day is not a real gain for a business. Rather it attempts to stimulate forgery of financial statements, tax evasion and other fraudulent actions.

But things could be worse. Additional practices are contrary even to shareholders' objectives. This refers to packets for leaving the company, often called "golden parachutes". A golden parachute is a clause in the manager employment contract stating that it will receive certain benefits (usually money and/or shares) if the employment relationship ends (due to acquisition, bankruptcy or other causes). The argument that led to the emergence of this clause is that, thus protects the managers of risks not under their control. Let's consider, for example, the case of former CEO of Hewlett Packard, Carly Fiorina, who received 21 million dollars compensation when she was dismissed in 2005. Then she got 21 million dollars when HP bought their options and pension benefits. Thus, having such ridiculous output packages, the effects are disastrous because, simply put, they reward failure. What incentives should be invented for a manager to achieve performance if he is rewarded for failure? Could these reasons provide managers incentives to drive the

company to extremes if the future does not sound well? As an collateral effect, this practice causes frustration among other employees of the company that don't have such clauses in their employment contracts, leading to lower staff morale and creating a state of injustice. For this reason, banks rescue plan approved by US Government states that "institutions that sell shares to the Treasury... must meet the standards of stimulating the managers that will prohibit the payments of golden parachute type ... Golden parachutes will be completely prohibited for ensuring the managers in this case."

4. Conclusion

The 2008 financial crisis has taught us at least two important lessons in terms of incentives. First, we still have much to learn in terms of risk. Not all risks are equal, and the excess risk may be more dangerous than assuming any risk. Even if it is clear that in business you have to take risks to make a profit, before that crisis it has been taken risks with disastrous consequences. Thus, setting incentive policies that encourage managers to take risks without limit may be fatal to long-term survival of companies. Furthermore, current risk management tools do not fully capture the intrinsic characteristics of risk and uncertainty. They proved to be inadequate, requiring rethinking-or even eliminating, to avoid the chaos that can occur, especially considering the complex nature of modern finance.

In this respect, Nassim Taleb [17] was very clear (and surprisingly prophetic): "Globalization creates a general fragility, reducing volatility and giving the appearance of stability. In other words, creates devastating Black Swans. We have never lived under the threat of a global collapse. Financial institutions have been merged into a smaller number of large banks. Almost all banks are interconnected. Thus, financial ecology is swelling into gigantic, incestuous and bureaucratic banks - when one falls, all fall. The increased concentration among banks seems to have the effect of making financial crisis less likely, but when it happens, are more global in development and hit us very hard. The landscape was transformed from a highly diversified

ecology of small banks, with varied lending policies, to a more homogeneous framework of firms that all resemble one another. Indeed, we now have fewer failures, but when happen... I get chilled at the thought. Government-controlled financial institution Fannie Mae, when I look at its risks, appears sitting on a powder keg, vulnerable to the slightest breeze. But don't worry: their army of scientists calls these events unlikely. "

Second, payment practices offended public opinion leaders and political leaders. The way the current incentives are built requires urgent review, especially for CEO compensation, since they generate billions on short term but destroy value on long term. Current systems do not stimulate managers to perform adequately. Rather, it encourages them to behave so as to obtain a good performance in the immediately horizon in order to get annual bonus and to exercise options. Instead of promoting the actions favourable to companies' owners , these systems give rise to opportunistic behavior.

There is no easy solution to the problem of incentives. Many compensation schemes seem unbeatable on paper, but have different consequences-sometimes harmful- in practice. Incentives design is not an exact science, there are many trials and errors in this discipline. Unfortunately, the dominant theory has failed to provide satisfactory answers to the question of how to align the interests of shareholders, managers and society as a whole. Thus, both practitioners and researchers alike need to join forces and to rethink their compensation practices.

Motivation in Insurance Sales

Stofoer Ovidiu-Ilie

Abstract

Everyone makes a lot of projects over the entire life. Some projects are completed, but others do not. That's because our lives contain unexpected situations, some pleasant, but others undesirable. Also unpleasant situations as accidents, hospitalizations, deaths may generate financial frustrations, along with physical discomfort.

Many Romanians see insurance as a product that “is not up their alley” including it in the luxury category. Furthermore, the media shows, sometimes amplify certain cases of doubt in relations between insurance company - customer. Appropriate marketing, allied with the informational technologies can improve the complete relationship between the two entities - the offeror and the consumer.

Keywords: life insurance, insurance marketing, consumer behaviour.

J.E.L. Classification: M 31

1. Introduction

Life insurance plays a key role in managing risks in modern societies. It can provide income to beneficiaries on an income earner's untimely death or loss of ability to work [1].

Insurance, as savings instruments, implies the deposit of money involved, in reasonable amounts over a long period of time, not for huge gains, but rather for safety. Although they are extremely useful (Maslow speaks of protection at his famous pyramid on level 2), Romanians accept them very hard. Therefore is very important to make the sale of these products by sales experts to have a high success ratio. Full exploitation of every detail will ensure sales success.

2. Insurance utility

Regardless of the amounts required by additional life insurance reserves (profit), what is to be appreciated is the protection aspect it offers, in the long run. Due to the element of unpredictability, people are exposed to financial fluctuations that may occur in sensitive moments of life. Thus, loss of a job generates lower standard of living that can lead to physical/psychiatric illness; the loss of a family member involves funeral expenses, and if the deceased was the financial supporter of the family, a rehabilitation is necessary to a new financial situation; serious injury leads to a person incapability to work, resulting in a lowering of the standard of living and leading to the appearance of substantial difficulties. Another unpleasant aspect is being unable to guarantee a future for the children, to ensure their studies or help them successfully launch into adulthood. Insurance has the role of creating a barrier to these fluctuations, in order to reduce, as much as possible, the amplitude of negative income.

The immense destruction that fire [2] has caused to a local shopping center on small business, caused the small business owners to directly or indirectly realize, how good it would have been if they would have gotten insurance for their business. Their last tardy remark how they couldn't have afforded to buy insurance has no foundation when they watched helplessly as what constituted their daily livelihood was destroyed by a huge fire. Certainly, little effort (but still an effort) that they would have made by insuring their business would be offset by the beneficial effects of compensation. That is why, once again, it justifies the claim that people purchase insurance for a future that due to unpredictability generates uncertainty. There is that saying as we are too poor to afford us cheap stuff. As for many years insurance was

seen as a luxury item, which is not exactly true, this “daring” to afford a “small luxury” would have provided a substantial financial reserve.

Bill Quain noted the propensity of people with money to differentiate between these types of debt, noting investments (cash increase) and expenditures (cash decrease) [3]. He said that millionaires delay short gratification for long-term financial security, buying goods that increase their value, such as stock and not items that lose value over time, such as expensive furniture...

Obviously, in the current crisis, not even stock would be a happy solution. According to the Employee Benefit Research Institute and American Savings Education Council, 66% of Americans are unable to make sufficient savings to retire because of current financial responsibility (liability) [4].

Romanian mentality is hard to change, so hard work is needed from professional insurance agents to make better understood the usefulness of these financial products.

The crisis was an obstacle for those undecided to make their insurance because:

- it has decreased the purchasing power, or
- psychological effect affected them too much.

Regarding the current crisis, Alan Greenspan, in his “The Age of Turbulence: Adventures in a New World” argues that financial market turmoil of the world that began in the summer of 2007 was an “accident waiting to happen” [5].

On the other hand, the economic crisis has imposed on insurance business in a negative trend recording results contrary to the development aspirations of the companies in the economic field. Irritating to a crisis is that, as highlighted by Keynes [6], replacing an upward trend with a decreasing trend often occurs suddenly and violently, while replacing a downward trend of an upward trend is marked, usually by sudden curve. This aspect is fully felt, currently.

Insurance companies are responding to particular needs of the consumer, since the customer of an insurance company is not just looking at a payment amount (premium) but also more favorable terms, the guarantee of compensation, promptness in case of an accident. This additional attributes are often more important than basic service and are essential for differentiation of an offer [7].

3. A few considerations about marketing in insurance

Paraphrasing a natural statement [8], that companies need to keep many of the skills and competencies that have ensured their success in the past, and to form completely new concepts and skills, in order to grow and prosper in the new economy, we can say that for the individual involved in sales is necessary to be complementarity between the existing skills and adapt to new requirements of working; explanation is that, although most often the sales person belongs to a company, also often has the status of freelance. To insurance, this status emerges best, if we relate to professionalism that a difficult sale demands, as that of life insurance. So, often, daily experience shows that these professionals are easily recruited by companies dealing even with other types of sales.

It is known that marketing is a whole system of economic activities related to scheduling, pricing, promotion and distribution of products and services designed to satisfy current and potential customers [9]. Public image of insurance companies established mainly through his actions in the field of advertising and public relations is closely linked to the company's marketing mix, including activities necessary to provide an insurance product purchaser [10].

Marketing mix is probably the most famous marketing term [11], consisting of the 4P that: price, placement (distribution), product and promotion (communication), can be regarded as a vector in four dimensions [12]:

Marketing mix = Product x Price x Placement x Promotion

As the amount of these components is more inspired, the marketing efficiency is higher. A comparison, but not very academic one, is mixing the ingredients for a successful culinary preparation, quantity and quality will provide the taste and appearance of that item being prepared.

Most marketing efforts of most insurance companies are focused on promoting component. Promoting insurance products is through personal presentations, special promotional activities, advertising and public relations. Promoting insurance is sometimes tricky, since it involves the particularity of

these products which is substantial amounts of money that the individual invests and whose effects may not be seen, as sometimes the insured risk does not happen, such as the non-life products. Moreover, in this area we find the so-called paradox of insurance: that person enjoys losing some money, in that, if the insured risk does not happen, the money paid does not come back in any form to the client; any monies that the customer could benefit from it would be for not so pleasant situations. In this idea, in general, insurance companies take into account that such products, on the anniversary of each year when there was no need for any compensation, grants discounts to premiums paid, which I pointed to, when discussing price strategies. As regarding the life insurance segment in Romania, we can say that pessimism about their life expectancy, if we look at the investment aspect of these products, or overly optimistic about not experiencing or expecting the effects of risk at a personal level, referring to the protection component, we can invoke the “Latin” image of Romanian people: “carpe diem”.

4. Important issues for sale

Individual, as a consumer, acts as a carrier of demand for consumer goods and services, to maximize the satisfaction of its needs by using the limited resources at its disposal. In other words, he seeks to maximize economic utility based on the hedonist principle [13]. Usually, it is recommend the emotional attraction in the case of hedonistic products and rational attraction in the case of utility products. Emotional attraction varies from sentimentality to fear (fear of injury or death). Purchase decisions are aimed at obtaining satisfaction or removal of a nuisance [14], something that is shown in the figure 1.

Figure 1. Satisfaction vs. Inconvenience Spectrum

Source: [14]

A problem that requires attention and debate in the insurance industry is the relative effectiveness of different distribution

systems. Two systems dominate the market [15]:

- agencies' own insurance companies, so-called direct sales force, where an agent sells policies for only one insurer;
- Insurance broker - an agent may be representing one or more insurers

Direct selling is often imposed by the characteristics of services provided. As mentioned above, insurance distribution can be made directly by the company or through intermediaries (insurance agents and insurance brokers). If insurers are limited, most times, to the sale of products of an insurance company, brokers are designed to optimize solutions without further limited to a company's products, but choosing a solution as close as possible to the customer's expectations. It can be said that a new company entering the market, most times, was made through intermediaries, so that, when it is found that the company's products sold, to enter e market through direct sales.

Any sale may be divided into four stages: prospecting, interview, presentation and selling. According to relationship marketing concept, we can talk about a fifth step: service. The interview involves, initially, a free discussion – small talk – to make the transfer of trust and enthusiasm of consultant to potential clients and identify needs - vital sales process.

Selling insurance is difficult only by phone although, for example, in 1994 Genertel [16] was created, a company launched in Italy to ensure insurance services through the phone. I personally have made two sales using audio Yahoo Messenger and admit I have to admit I have felt the frustration of not having and eye contact, which, according to research is important, as shown in the figure 2.

Figure 2. The importance of sense in influencing people

Source: [17]

Since we have referred to the telephone approach, it is important to follow only setting a meeting and not a telephone sale. This affirmation is based on some features of negotiations by phone [18]:

- greater confusion - lack the visual feedback,
- greater ease in saying “No” - is less complicated and painless to refuse while on the phone,
- increased speed - telephone negotiations always take less than face to face meetings,
- increased competitiveness - on the phone, people tend to be impersonal and to the point. Therefore, will dominate the other person with the best arguments,
- increased risk - as a faster negotiation and more competitive than a meeting in person, bear in mind that hasty actions are a source of threat for those who undertake them,
- caller advantage - the person who places the phone call is in a privileged position.

During an interaction with a client, using a support of retention of certain important aspects (desirable is that this support is a piece of paper, other means of recording audio and video could create discomfort) increase the chances of achieving a professional discussion. Schiffman [19], obviously taking notes:

- better helps the sale man to retain certain information,
- assures a position of control and authority,
- develop analytical skills, involving three senses: tactile (the hand that writes), hearing (listening to the potential client) and sight (looking to see what you write),
- becomes even for the potential client a support in providing information, helping them to open up easier,
- provides signals for the customer that the agent is fully interested in what he hears.

Schiffman also in one of his complementary works [20] suggests that taking notes helps sales consultant to retain the potential customer needs and to improve presentation. Even claims that having always a pad and pen, these tools helps to build the solid professional relationship. Furthermore, he seems upset by the fact that many sellers fail to use this basic tool - notes.

An unprofessional strategy [21] approach to sales exposes consultants to potential problems, such as:

- long and multiple phone conversation - agents attempt to sell through the phone - which is very difficult,
- lack of interest from potential customer,
- constant objections,
- mistrust,
- denial of subsequent recommendations,
- lack of repeat sales.

In the sales work, very important is to establish a network of knowledge (developing relationship with other people) [22]. This relationship can provide the following advantages:

- bring new customers or leads to new opportunities,
- provides valuable information and resources about potential customers and other useful events to own work,
- help finding the right people to fill key positions, increasing their employment opportunities – many of the old consultants seek to create their own teams to become team manager (unit managers / team leaders),
- helps in solving different problems.

5. Ethics in Insurance - motivation vs. Manipulation

A career in sales is one of the best areas on which we can say that success is linked to performance. Thus, a really good salesman can make more sales with a mediocre product than a mediocre seller with a truly remarkable product [23]. Difficulty producing performant insurance consultants is related to the ignorance of the population of the utility of insurance and distrust in of those who sell it. An insurance agent's image is a poor one not only in Romania. Acclaimed actor and director Woody Allen, through one of his character that you play in “Love and Death”, said rhetorically: “There are some things worse than death. If you've ever spent an evening with year insurance salesman, I'm sure you know what I mean.”

Business Ethics imposed emergence of the concept of marketing ethics [24], which relate to marketing based on integrity, which promotes ethical solutions. It is said that to the people involved in business, what is

illegal is allowed. However, many people wonder whether it is ethical to get people to do something, to buy a product/service, etc. It can give an affirmative answer works, given the fact that everything is done in society (family, friends, business), because people are persuaded to buy, to try to vote, to contribute to a cause or other [25]. Ethics is a very important aspect of sales. This term refers to the analysis of two words (manipulation and motivation) as often these terms are sometimes confused.

Although for some [26], motivation comes from a cynical perspective, handling subtle nuance to this definition, Zig Ziglar sends us to compare kindness with deception [27]. The differences are in the person's intention, motivation and making people act in their own way while manipulation has often resulted in a forced acceptance. Motivation can be defined as the stimulating action to an end, whether the stimulus is consciously or unconsciously [28].

Motivation is ethical and long term, one that is recommended in the sale of insurance, speaking of a long term relationship between agent and client, and the other is immoral and temporary, offering after the momentary advantages, a nasty picture of that agent being in the same field, an extremely high price to be paid. Basically, to handle/manipulate, means to influence someone to act for the benefit of another, especially through fraudulent or unscrupulous methods. One form of manipulation is the lies that can be conventional, half-truths and selective omissions [29], so are not always obvious, but all, as long as they are not whole truth, represent danger.

Many insurance agents are not false in any conventional sense, but the omission of information is just as dangerous if it is to think that perhaps what is omitted can be a very important clause. Also, half-truth can be dangerous thinking about the presentation of the insured's rights, but avoiding the presence of the obligations they have.

The classic example is related to the fact that policyholders are told they can withdraw the money they want but they omit to say that not the full amount and are presented with half truth, avoiding to tell them that the first three years, can not terminate the contract

with the return of money.

6. Conclusions

Although there is serious competition on the Romanian insurance market, the great dispute is not between specialized companies, but between them on one hand and consumers on the other. The consumers, most times, are not interested in prospecting what the insurance companies have to offer, in order to locate the most suitable offer to their needs, but put in the balance whether or not to get insurance, to invest in such financial product, or whether to invest in deposits, stocks, bonds etc. This happens most often when mixed life insurance with saving component, allows people to analyze them only from this perspective, making them comparable with other investment products, but neglecting the most important aspect of security: financial protection.

Insurance sales are a daily challenge for those working in this field both in terms of their financial advantages, especially in terms of utility they have on customers.

Using appropriate marketing techniques, improving insurance agents' skills will provide an effective relational process between insurance companies and customers.

Abstract

Change, taking into account the acceleration of globalization, becomes more and more used within organizations, being a central point of concentration of attention for the management but as well for the employees. In order to become truly efficient and to enter within the organization, the reasons of change must be accepted by a sufficient number of actors. Change can involve, in an inherent manner, a risk that not everybody is willing to take.

Keywords: management, resistance, change, organization, manager

J.E.L. Classification: M50

1. Introduction

The manner in which employees perceive a change is in close connection with the manner in which they react to this one. There are four categories of reactions, even if there can be more variations of these ones. If employees notice that the change is not compatible with their needs and aspirations, they will oppose to this one. In this situation, employees are sure of the fact that this will get worse one the change has been adopted. If employees cannot understand the manner in which the change will influence them, they will present resistance or, in the best case, they will adopt a neutral attitude. Very many people avoid the unknown, the unsafety, in most of the cases due to the fact that they think that a change worsen things.

2. Consequences of resistance to change over the personnel of the organization

If the employees notice that a change will be produces no matter the objections that they have, there is the possibility to oppose resistance, but they will accept it with resignation. Even if their first reaction is opposition, once the change is unavoidable, they will not see other solution than to accept it. If the employees notice that this change is in their interest, they will become motivated to accept it. In an evident manner it is critical for employees to feel trustful that the change will be a benefic one. The manager is the one that has the obligation to build an environment in which the employees' attitude will be one of acceptance. One must notice that three from four situations involve a certain degree of resistance. This resistance to change represents a behaviorist/emotional response to real threats or imaginary ones over daily routine. Managers must understand the resistance to change and to learn techniques to overcome them. There are few managers that have not been confronted with resistance from the part of employees, even if the change has been attentively created in order to correspond with the needs of these ones. It is important for the managers to learn to confront themselves with resistance, due to the fact that unsolved efforts for implementation of changes are expensive. These costs refer to a smaller level of employees' loyalty, a small probability to achieve certain objectives of the organization, a loss of money and resources, but also the difficulty to repair the unsuccessful effort.

People oppose resistance to change from many reasons. The resistance to change does not necessarily mean that they will never accept it. In many cases, there exists the possibility to confront with the phenomenon of resistance for the methods of introduction of different changes that have not been favorable ones. The manager, by the implementation of some drastic changes, can create a powerful feeling of insecurity. Maybe the manager has not informed in due time, the employees about change. Sometimes, even if the change is introduced, the resistance phenomena can appear. The manager can use resistance to change as a means to analyze the organization. If the minor changes are rejected, one can observe that there are many types of problems, just like problems that are connected to morale, the level of implication or the level of trust.

Individual behavior or a group that appears as a consequence of organizational change that can take a lot of forms, being different from acceptance to active resistance. The resistance can be as subtle as passive resignation or as evident as deliberate sabotage. Resistance can be as well, immediate and postponed. It is the easiest thing for managers to deal with the phenomena of resistance when this is evident and immediate. For example, a company proposes a change, and the employees' response is concretized by a slowness of the work rhythm or by threatening to start a syndicate movement. Even if these responses can be harmful, their cause is clearly identifiable.

Trust is a characteristic of high performance teams, in which the members of the team believe in integrity, personality and in the capacity of the other members. Managers who trust their employees transform the process of change in an open, honest and participative one. Employees who trust the management are more willing to apply a supplementary effort and to try something different. Disbelief, on the other hand can make that a change that has initially been well conceived, can fail.

When different radical changes are introduced without announcing employees, these one will develop some anxiety concerning implications. Rumors have the role to fill in the hole created from the lack of official announcements, in such a manner

that, employees will develop some negative attitudes against changes. They can develop some behaviors of dysfunctional type – complaining, working slower or impairing the moral of the department. Managers should avoid the creation of situations in which employees are taken by surprise, developing thus a fear for change. They can make this by informing all employees in a corresponding manner.

The calendar of change compared to other events can increase the resistance to change. Weak synchronization can be caused by events within the organization or events from personal life. For example, bringing a young manager from outside the organization, in the same time in which all the equipment and procedures are being updated, can increase the resistance to both modifications. Managers should take into consideration, if possible, other events that take place in the same time with a major change, in order to avoid a bad synchronization.

The approach used in the presentation of a change can increase the resistance to change if people do not like the manner in which this one is presented. An inaccurate approach in the case of a change can be caused by the change of manner in which one communicates or in choosing the communication channel. The transmission of a message or of an e-mail, for example, cannot be as efficient as the personal transmission of the message of change. An approach can as well be considered as inadequate in the case in which the person who transmits the message of change does not agree with this one. Finally, the words used to explain the change can generate inefficient reactions. Announcing the employees that they will not see a salary increase or they will not benefit from certain bonuses, for a certain period of time and that all employees must make an effort to increase productivity, is an example of inaccurate approach due to the fact the employees will conclude that supplementary work will not bring them any benefit. Even so, explaining the necessity of the change, due to the fact that the respective company will not be put in front of certain risks, can generate a more intense cooperation through change.

Despite assays to reduce the resistance to change within an organization, some

reactions to change are unavoidable. Negative reactions can manifest themselves by an open behavior, and resistance to change can also have a passive character. People can have four basic reactions concerning change, and they can feel disadvantaged, disappointed, disoriented and to have the impression that they suffer from a loss of identity. Managers can use some interventions to cope with these reactions [7].

Lack of commitment in the process of change represents a form of psychological receding. The employee seems to lose his interest, initiative and place of work. Employees that come out of this state, continue to fear of change, being in expectation, hoping to something better. Employees who are not involved are present from a physical point of view, but from a mental point of view they are absent. Typical situations of this type involve the following affirmations: “No problem” or “This will not affect me”.

The basic managerial strategy to cope with such persons is to offer them the possibility to express their displeasures. Such employees could be aware of the change from their behavior, and presenting some good intentions of the manager can be a benefic action. Helping them to express their feelings, one can find solutions more easily. Sometimes, people that have initially been passive, become after a certain period of time more sustaining to change, as a consequence of open communication with an emphatic manager.

Another reaction to change is the non identification with the change itself. People react in this way when they feel that their identity has been threatened by change, thus feeling very vulnerable. For many times they deal with a past procedure, due to the fact that in the past, this procedure has created a certain feeling of safety. Employees that feel like loosing their identity they usually present sadness and concern. Managers can help them overpass this stage by encouraging them to explore their feelings and helping them to transfer some positive sentiments in the new situation. One manner to make this happen is to help them identify what they liked in the future situation and to show them how it is possible to have the same positive experience in the new situation.

Disappointment is, as well, a reaction that can be found in the case of change. This one is usually expressed by negativism and fury. Destructive behaviors like sabotage and spreading of rumors can also appear. Typical verbal signs that denote disappointment are “This will never function” and “I am leaving from this company, as soon as I can”. The fury of an employee can be directly expressed only within organizational cultures that can allow this type of behavior. In general, the organization sees these expressions of feelings at the place of work, as being inadequate and unprofessional. Within this type of organizational cultures, fury is expressed and appears under the form of a passive-aggressive behavior, just like gossip and initiation of rumors. One of the biggest dangers of disappointment is the fact that is really contagious. Reaching a compromise with employees who are disappointed can be difficult. So, the first step in managing reactions of this type, is to bring employees, from their state of extreme negativism and emotionally loaded, to a neutral state. Neutralizing the reaction does not mean to reject it, but it means to allow individuals to unload the accumulated fury, so that one will be able to lead a normal discussion. The second part of the strategy in the case of employees which are disappointed is that managers should recognize the legitimacy of their fury.

A final reaction is the one of disorientation. Disoriented employees feel lost and confused and most of the times they are not sure of their feelings. The use energy trying to notice what to do instead of thinking to manner to do things. Disoriented individual ask a lot of questions, becoming thus oriented on details. “Paralysis in analysis” is the concept which is characteristic to disoriented employees. They feel that they have lost the contact with the priorities of the company and could wish to analyze the change in a detailed manner before taking any action. Disoriented employees can ask questions like “What am I going to do now?” or “What should I do first?”.

Disorientation is a common reaction among persons who are used to accomplish some clear objectives, lacked of ambiguity. When change is introduced, this one will create an incertitude and lack of clarity. The

managerial strategy to cope with this reaction is to explain the manner in a manner that will minimize the existing ambiguity. Information about the change must be presented in a frame or vision as a whole, in such a manner that the disoriented individual can see where he is situated, which is his position in the new project. Managers can be capable to diagnose these four reactions to change. No universal strategy can help employees to adapt themselves, due to the fact that each reaction brings some different and significant problems. By recognizing each reaction and by applying a corresponding strategy, it is possible to facilitate the process of transition in case of change.

Specialty literature investigates the role of top management in the establishment and implementation of change, neglecting the fact that initiatives of change belonging to middle managers can have some unexpected consequences, especially over the internal frontiers of the organization [1], [3].

Balogun [4] defines middle managers as being the persons situated in the strategic area of the organization (top managers) and in the operational one. When change is imposed by top managers, middle managers are considered “change agents”. As a consequence, middle managers need to classify expected behaviors with their colleagues, have to monitor the application of change and to establish a system of punishments / awards [6]. Even so, the hierarchical report of these ones against the top management as well as their non involvement in the elaboration of the change project, is transforming them in beneficiaries of the change, just like any other employee of the company [4]. So, for Balogun, the role of the middle manager during the process of change can be taken into consideration, being similar with its role in normal conditions (Table 1).

Table 1 – Activities of the middle management connected to change

	Nature of activities made by middle management	
Persons who will make	Grating some significance	Ensuring the functioning of the

activities, at the suggestion of the middle manager	to change	organization
The middle manager himself	Involving a change of personal order	Ensuring the continuity of daily activity
His collaborators	Sustaining the collaborators in order to have a clear image concerning change	Implementing the change in the respective initiative

Source: Balogun J., 2003, pp. 69-83

This table shows that the traditional role of the middle manager is to know to implement change within a unit, having thus the role of agent of change. Balogun adds two roles which are rarely mentioned in specialty literature: to help other to change, maintaining in the same time the continuity of the activity. So, Balogun demonstrates that, middle managers should take part in personal change. This personal change starts with the acknowledgment of change and with the new responsibilities that this one involves. The acknowledgment decision is facilitated by the communication on the horizontal of middle managers, as well as by the communication on the vertical with the superiors. So, Balogun shows that middle managers have to communicate with their colleagues, to gather information, to ask questions, to share experiences while they try to interpret what is expected from them during the change. These informal changes with their colleagues can as well be accompanied by a formal communication, with the direction team, in the scope of discussing the roles and the responsibilities of these one concerning the change inside the organization.

Balogun [4], as a consequence, insists over the need that the top management be aware about the change that has to be achieved by middle managers over themselves. It is as well important that the direction team proves a real implication of the project change. The incoherence of words and actions of top managers can move the process of change, as it is understood within the middle managers, thus resulting in a deviation between the intentions of the management team and what happens, and in fact on the field [5].

In his reflections over the put into application the imposed modifications, Balogun indentifies behaviors and the thoughts of middle managers as being one the main factors that explain the incapacity to achieve change. Due to the fact that these ones deal with a change in which they decided themselves and due to the fact that they have to negotiate the details with other actors of the organization, especially with their colleagues from other departments, middle managers have to involve themselves in a process of construction of sense, which is not under the control of top managers [1].

Balogun and his colleagues [1] refer to a special category of middle managers, that they call “Boundary-Shaking”. These ones act in a deliberate and aware manner in order to manipulate the organizational context and the persons who work within the organization, by the application of some specific tactics:

Regulation of the control system: to encourage people to support change, middle managers will be able to modify either the control system already existing or the change itself;

Control over the development of change: use of meetings, conferences, individual exchange and other means of formal and informal communication in order to increase and to convince people to accept the change;

Application: manipulation of interaction situations in such a manner that the transmitted message will be an efficient one;

Regrouping information: in order to establish connections between preoccupations and problems of some persons (colleagues, collaborators and top managers);

These results underline the importance of an internal network that has the role to put the organization into move. This fact means

that, if such networks do not exist within an organization, middle managers will create their own network to implement change.

In any change process it is very important to give a special attention to processes of social interaction, due to the fact that these ones can produce some unexpected results, unpredictable, of a nature to modify any planned change. Which are these processes and how do they affect change? Balogun [1] makes the distinction between two types of processes:

Vertical processes between top managers and the “receivers” of change (middle managers and employees);

Lateral processes between middle managers.

They distinguish between, as well their form, being different from verbal form, and formal one (meetings, communications, documents, etc.) or informal (exchange of experience, discussions, etc.) to a nonverbal form (behavior, actions, etc.). So, communication, initially identified as a mean of action between personal changes becomes, in an equal way, a manner to modify the coordinates of initial change. In the lack of top managers, middle managers will accentuate lateral changes (between colleagues) due to the fact that these changes involve people with common experiences.

All these processes will produce some unwanted consequences and will modify the result of the change imposed by the top management. On the other hand, processes represent an opportunity for middle managers to construct their own representation concerning change. This capacity of the middle management to modify the results of change by the means of representation that they create, leads to the revision of a certain number of myths concerning the management of change.

Table 2 – Ideas over the behavior in case of change, in Balogun's works

Received ideas or results of previous research	Results of Balogun's research
Change can be controlled and supported by the top management	Top managers can offer a direction of change but they cannot lead it. Actions of the middle management can modify

	the initial intentions of the top management.
Vertical communication of a formal nature allow actors to build a representation concerning the change involved by the top-management	Middle managers build themselves a representation of change during the interaction and informal communication with other persons.
At a certain moment it is important to grant a privilege to written, verbal and formal communication	Communication can take a diversity of forms, including practices that allow the generation of new ideas.
Successive interventions of top management modulate the interpretations of individuals.	Interpretations are divided having in mind the process with a double sense, from the top management to the middle management and backwards
Middle managers apply the plans imagined by top managers	Intermediary managers understand the plans of top management but they try to adapt them to the situation

Source: Balogun, 2006, p. 29

3. Conclusions

For us, these results lead to the creation of a new perspective over the management: To direct change means to impose, but more the understating of the manner in which the middle managers react to this change this is why, top managers must pay attention, must have some detailed knowledge over the environment and to collaborate with the middle management. In the measure in which top managers cannot control the process of adaptation to change of middle managers, and it is necessary that these ones ascertain the need that their subordinates have and to try to offer a certain liberty by the use of means of formal and informal communication. It is important that top managers remain involved in the process of change and do not have to delegate the application of this one so, after the starting of the process of implementation of change, top managers can take part in the discussions between the middle managers. Through his work, Balogun underlines the necessity that the top managers will not imagine the change

just as a process that has to be imposed and controlled, and especially they have to pay more attention to the interaction between the middle managers, that, if it is not monitored in a corresponding manner, and can generate a new change. For Balogun [3], the management of change connects less to the idea of control, this one being considered firstly as a mean of facilitating the process of elaborating change in order to achieve a common representation of all actors. The management of change is focused over the definition of a frame that establishes the limits of change, within the actors of change that will offer a sense to this one.

Internal Audit- More than a Legal Requirement

Susmanschi Georgiana
The Bucharest Academy of Economic Studies
georgiana19iu@yahoo.com

Abstract

Internal audit is a function who aims to support the management of a company in order to add value. Identifying differences in development priorities and management culture of the department or company as a whole and how they are implemented and followed, internal audit represents for companies a certainty and not only in the respect of a requirement under the Companies Law.

Internal audit function is considered to be efficient to the extent that succeeds to help the executive management to reach the assumed targets (objectives) and to give assurance to non-executive management (audit committee or equivalent) on the adequacy and effectiveness of internal control, the process risk management and on compliance with corporate governance best practices.

The present paper follows to highlight internal audit's importance in a company, regardless of any legal requirement concerning the compulsoriness of introducing internal audit as a distinct department.

Keywords: internal audit, management, preventing fraud, detection of fraud.

J.E.L. Classification: M10, M42

1. Introduction

In the past, internal audit represented a sequential number, a routine of compliance audits.

The internal audit was concerned primarily with providing an assurance of compliance with internal and external regulations.

Currently, internal audit is a valuable management consultant.

Internal auditors are focused on

identifying business risk and issuing recommendations in order to improve processes.

Internal auditors face vital issues regarding survival and prosperity of the organization.

The Internal Auditing profession evolved steadily with the progress of management science after World War II. It is conceptually similar in many ways to financial auditing by public accounting firms, quality assurance and banking compliance activities. Much of the theory underlying internal auditing is derived from management consulting and public accounting professions. With the implementation in the United States of the Sarbanes-Oxley Act of 2002, the profession's growth accelerated, as many internal auditors possess the skills required to help companies meet the requirements of the law.

The challenges raised by the economic environment are directly reflected in the auditor's effort to evaluate the impact on the entity's financial position and performance. Understanding the risks to which the entity is exposed to following the economic climate and the methods to manage those risks becomes a key part of the audit engagement contributing to the delivery of quality services, enhancement of business relations based on mutual trust [10].

Risk-based internal audit is defined as the activity that provides assurance on risk identification and management of the structure management. Responsibility of internal audit in risk management is emphasized even in the definition of internal audit.

Internal audit is an independent activity, objective, assurance and consulting, designed to create value and improve an organization's operations. It assists the organization in achieving its objectives by implementing a systematic and disciplined approach in evaluating and improving the effectiveness of risk management, control and governance

processes [2].

Therefore, internal auditing represents a function integrated in the company, when the external auditing represents an independent function whose mission is to certify the accuracy of the accounts, results and financial situations, and more precisely to certify the sincerity and a truthful image of the financial situation and (if we retain the definition of the authorized accountants) to certify the regularization, ingenuity and fair picture of accounts and financial situation.

2. Internal audit role in a company

The role of Internal Audit has changed significantly over the past 5 - 10 years, and Best Practice Internal Audit is an important element of good corporate governance, enhancing the effectiveness of management controls, the risk management framework and business processes.

Although internal audit activity has such an important role in a company, at least an ambiguity can be found in its area of definition. It was brought into discussion the concept of total independency of the internal auditor. With this concept it follows to underline the function independency, the lack of pressures over it. But taking into account that internal audit department is subordinated to managers and that in some institutions mainly public institutions internal auditors are entitled with some quests regarding coordination, conceiving some procedures, etc. can we still speak about total independency? The responsibility of control registers ambiguity.

There are many roles that internal audit can fulfill in respect of the risk management process implemented within the organization.

Today, internal audit assumes at least two important roles in respect of the risk management. First, internal audit can act as an advisor helping the organization in respect of risk awareness. This can be done by improving the management understanding of the major risks facing the organization. It should be mention that the risk management process can be used by internal auditors in identifying areas for review. In these ways the internal auditors can focus their activity on the key systems and controls within the organization [3].

Second, internal auditors can act as

trainers in risk management workshops. In this way internal auditors aid line managers understand better organizational risks and controls. This is how internal audit can help the managers to identify various risks [3].

Nevertheless, it should be mention that the internal audit can't assume and be responsible for effectiveness of risk management. That is the responsibility of the top management and operational management. However, assurance on the risk management process can be provided by the internal audit. During the assessment activities, internal audit can also give advice on this field.

Internal auditors play both roles of evaluators and consultants, depending on the circumstances.

Internal auditors need a wider range of skills, advanced technology support (IT systems) and continuing professional development.

An internal audit function should be:

- Independent and objective
- Proactive
- catalyst for change
- Innovative and consultative
- A valuable resource for the organization

To perform their role effectively, internal auditors require organizational independence from management, to enable unrestricted evaluation of management activities and personnel. Although internal auditors are part of company management and paid by the company, the primary customer of internal audit activity is the entity charged with oversight of management's activities. This is typically the Audit Committee, a sub-committee of the Board of Directors.

3. Internal audit as management assistant

Main points that delimit the internal audit definition are: management assistance, without judging employees, total independency. The internal auditor will assist managers, in that it allows through their opinions and successive approaches, improvement of decisions that are about to be made. The notion of assisting managers finds itself in a permanent evolution. The actual economic crisis excluded any reference regarding affiliation of internal audit and control which was leading to confusions and has been replaced with a proper word:

consultant. In that, internal auditor assists, recommends, conciliates, but not decide.

An internal audit function could be viewed as a first line defense against inadequate corporate governance and financial reporting. With appropriate support from the Board of Directors' Audit Committee, the internal audit staffs is in the best position to gather intelligence on inappropriate accounting practices, inadequate internal controls, and ineffective corporate governance.

Internal auditors' unique full-time focus on risks and controls is vital to sound governance process and to sound financial reporting. According to statistics from international news and information organization Bloomberg News, in more than half of the 673 largest bankruptcies of public corporations since 1996, external auditors provided no cautions in annual financial statements in the months before bankruptcy. Many of bankruptcies in history, including Enron, Global Crossing Ltd., and Kmart Corp., followed annual reports with clean audit opinions from the external auditors. Although external auditors' independence is protected to some degree, they still face many of the same issues as internal auditors when it comes to undue management influence.

In time of challenges, risk management is an essential preoccupation. Companies must identify the significant risks they confront; to evaluate the potential impacts of those risks and adopt the most efficient measures in case of unpredicted events [10]. Managers must analyze which one of the risks were amplified as a result of the economic environment decrease. At the same time, managers must evaluate all the available information regarding significant risks and make sure that the main premises are correctly tested.

To establish and maintain alignment, effective risk management demands the continuous evaluation of risk identification, control, management and monitoring processes, including the Internal Audit function.

Internal Audit is a key element of an effective enterprise-wide risk management structure. Aligning its mission, strategic focus and core processes with stakeholder objectives and risk management priorities is fundamental to achieving a World Class

internal audit function.

Though the role of a skillful risk management it was clearly shown and extolled, many commissions and institutions analyzed the main causes of the outbreak and spread of the crisis reaching to a common point: a faulty risk management had a determinant contribution in generating the actual crisis. So, one of the negative elements identified in companies strong affected by the economic crisis, was the managers failure in managing risks, in identifying them, mainly because of a high complexity of the services provided and the risky nature of the business. Therefore, revising procedures regarding risk management process, in order to improve its effectiveness, becomes an imperative demand.

High performance internal auditing demands broad perspective and capabilities. Today's leading internal audit organizations are no longer limited to hazard avoidance and compliance. They need to demonstrate a command of risk management, business process improvement and knowledge more characteristic of a consultant than of a classic internal auditor. Furthermore, internal auditors are no longer required to focus solely on financial audits. They increasingly need to be able to provide value adding support to management across all areas of operation

4. Detecting and preventing fraud-one of internal audit main objectives

The installing of a system in order to prevent fraud remains in the responsibility of the management within the organization and internal audit provides assistance in assessing risks and strategies for corporate control, suggesting the proposals, recommendations and solutions to diminish the threat of fraud, and improve the control strategy.

Fraud consists in any illegal acts characterized by cheating, dissimulation or betrayal of trust without depending directly on the threat of violence. Frauds are to commit by persons or/and entities in the purpose of obtaining money, goods, services; to avoid any payment or loose of services; to assure a personal or commercial advantage.

Internal auditor must gain sufficient and adequate knowledge in order to identify clues

of a fraud. Fraud represents a series of irregularities and illegal actions committed with the intent to deceive.

Frauds can be committed in the benefit of detriment of an entity, by employees or persons outside the entity.

Internal auditors must have sufficient knowledge to identify clues regarding possible fraud, be alert to situations where the internal control system presents insufficiency, appreciate the need to resort to further research and inform the competent authorities.

The management and internal audit play different roles in terms of detecting fraud.

Internal audit role consists in examination and evaluation of activities provided as a service to the company.

In terms of fraud detection, internal audit objective is to help members of the entity to perform efficient providing them with analyzes, evaluations, recommendations, advices and information about the activities examined.

A study by Ernst&Young reveals a worrying increase trend of accounting frauds, despite all forecasts and normative in the field. The study was performed in 30 countries implicating companies from different sectors from multinationals to SME.

Risk factors underlying the accounting fraud were individualized as follows [1]:

- Increasing complexity of organizations;
- Reduced dissemination of internal audit functions;
- acceptance by companies of a certain level of risk, as typical element of the business;
- an internal control system which does not fully meets the economic demands of companies;
- more aggressive accounting policies.

Therefore, the most effective tools that can be used in fraud prevention proved to be only two: management control and functioning of internal audit.

Economic crises that took place on the European scene, have shown that accounting fraud are assigned to deprivation (or absence) of an internal control, formally referred in external normative and internal regulations of companies. But there are close links between fraud, corporate governance and internal audit. The presence of normative (legal basis)

is not enough to make a company efficient. It should be accompanied by an organizational culture based on ethical principles in order to put to the fore its priorities, transparency of information in accounting and internal control and external efficiency [1].

Besides external normative interventions, special attention should be paid to domestic regulatory initiatives from these economic organizations.

The pressure to achieve certain financial targets exercised over managers and the need to comply with contractual clauses for existing funding lead to an increased possibility of developing fraud.

Risk of fraud apparition is amplified by the existence of three conditions: temptation or pressure to commit fraud; opportunities to commit fraud and possibility to cover fraud. Presumption that there is an opportunity to commit fraud lies in the conviction that the system of internal control can be avoided. These kinds of presumptions/convictions are found especially at persons in positions of influence within society or who possess extended knowledge about operations and weaknesses of the implemented controls.

Abstract

The present development of the market of foods with nutrition and health claims shows some issues with regards to consumers’ understanding and perception. Many items influencing consumer preferences may affect the perception of foods with health-related benefits. In the present study, results of a literature review about factors influencing consumer perception, understanding and use of claims and nutritional labels made on foods are presented. Lastly, some results achieved by the selected papers are analysed and implications are discussed.

Key words: Consumers’ perception, nutrition claims, health claims, labelling, food consumption, food industry;

J.E.L. classification: D18, L66, M39

1. Introduction

The social and economic welfare and the large availability of foods on the market have increased consumption and the daily caloric intake. Nutrition and medical sciences have tried to steer consumers towards food choices meeting the demands of health and wellbeing. This resulted in increased demand for food products promoting health and nutritional value, and in innovating and developing new products with improved nutritional properties by the food industry. Health has been named as the most significant trend and innovation driver in the global food and drink market [1]. It has to be communicated because health properties are typically attributes that must be conveyed to consumers by information, and their best carriers are claims on the package [2]. Foods

with health-related benefits are generally called functional foods. The latter have many definitions, which vary from the simple “foods that may provide health benefits beyond basic nutrition”, to the complex “food similar in appearance to conventional food that is intended to be consumed as a part of a normal diet, but has been modified to subserve physiological roles beyond the provision of simple nutrient requirements” [3]. Many terms expressing health-related benefits – such as fat-free, enriched, with no added sugar – have appeared on food packages in order to support consumers’ choices [4]. Since 2003, the number of new products in the international food market has grown by about 28% per year, with a broad diversification of the suggested health benefits [5]. The recent development of the market of healthy foods shows some issues with regards to the large commercialisation. Concerns refer to the non-homogeneities in regulations about information made on food defined in order to protect consumers, on one hand, and to consumers’ preferences, on the other. In fact, the application of health claims is currently facing difficulties in some countries because, first of all to the approval system, secondly due to delays or slow the process of issuing new permits. As regards nutrition claims, European regulations, in particular, reveal gaps concerning communication that can further confuse the consumer [6]. Issues concerning consumers’ preferences are more complex because food choices have multiple origins [7], related to health habits and status, nutrition knowledge, food label use, cheaper options, which can differently affect the perception of foods with health-related benefits. Most of the latter are based on cultural features, and purchasing

impulses may be originated by internal convictions, namely personal, or external signals [8]. In fact, food preferences are influenced by sensory and non-sensory factors, which concur to shape consumers' perception [9, 10]. This paper aims at identify and systematise all factors affecting the consumers' perception of nutrition and health claims, as well as the understanding of nutrition information, by developing an extensive literature review of the published empirical analyses. This literature review has detected some evident gaps concerning perception of functional foods in terms of heterogeneity in the attitude and response of consumers. Therefore, findings may help the food industry to enhance the nutrition labelling, and governments to create a coherent framework for the mandatory use of nutrition claims and labelling.

2. Methods

The literature review has been developed by using a rigorous protocol for papers selection, which has consisted in searching some keywords in databases. In particular, computer search has taken into considerations EBSCO and Scopus. Keywords have been chosen in order to obtain a large panel of papers. Only one set of primary strings has been applied to databases, without refining the first stage of computer search with secondary keywords. In particular, “consumer perception” has been searched in abstracts by using the Boolean operator AND with “nutrition” OR “health claims”. Furthermore, “consumer understanding” about “nutrition label” has been investigated in databases. Relevance of papers has been assured by limiting results to papers published on Academic Journals. No filter about the date of publication has been applied. The selection protocol has returned about eighty abstracts (81), which have been manually sorted by relevance for the paper objectives. By this way, more than thirty papers (32) have been detected in order to read their complete contents. Lastly, two papers have been discarded because they are literature reviews, while the present study aimed at investigating only empirical work. Text analysis has been related to *objectives*, *methods*, *results* and the *country* of investigation. The latter features have been

summed up in a matrix in order to develop a further quantitative inquiry. The Table 1 shows the above-mentioned matrix without the column of results, which are specifically treated in the following section. In the same Table, the term “NH claims” includes both foods with nutrition and health claims and functional foods. The nutrition label refers to all detailed nutrition information made on foods, different from claims. *Objectives* of the selected articles are mostly classified in “understanding of nutrition label” and “perception of NH claims”, included factors influencing them. In particular, in the present paper the perception is considered as the general attitude of consumers towards foodstuffs with claims, and how this affects consumers' preferences and purchasing behaviour. With regards to *methods* used in the analysed papers, experimental studies include consumers' surveys in which one or more stimuli have been used. Instead, questionnaires refer to simple questions without stimuli administered via direct interviews on points of sales, via Internet, or via phone. At the end, conjoint analysis and projective mapping can be considered as specific experimental methods. Papers are presented in order of publication.

3. Results and Discussion

The computer searches have returned papers published starting from 1996. Most of them (30%) have investigated consumers' perception of nutrition and health claims, closely followed by articles about the perceptions of both claims and nutrition labels (23%) and about factors influencing perception and understanding of nutrition and health claims (20%), and, lastly, by studies concerning the understanding of nutrition labelling (17%). Simple experimental studies have been used in more than 56% of papers, while questionnaires in about 27% of studies. With regards to papers included within the two largest groups, experimental studies – simple and both in form of conjoint analysis and projective mapping – have been mostly applied (82%) in order to analyse perception of claims and labelling. These results are in accordance with one of the most authoritative definition of consumers' perception that is the process by which an individual is exposed to stimuli, and ‘selects, organises

and interprets information inputs in order to create a meaningful picture of the world’ [11]. Indeed, only three articles included within these groups have used simple questionnaires without induced stimuli.

Therefore, experimental studies may properly support the investigation of consumers’ perception, by using adapted stimuli.

Table 1. Analysis of the selected papers

Authors	Year of publication	Objectives	Principal methods	Country
Worsley [32]	1996	Understanding of Nutrition Label	Questionnaire	Australia

Concerning results of the selected papers, before verifying if consumers’ perception of claims and labels affects preferences and consumption choices is needed making a distinction between sensory and non-sensory features of products. Literature has highlighted that physical stimuli, such as sensorial features, typically the taste, are important for food acceptance [12, 13]. Instead, non-sensory features – *i.e.* price, brand and health and nutrition claims [14] – may influence consumers’ expectations, which can be subsequently confirmed or disconfirmed by actual properties of the product, after consumption. The higher the

level of expectation about the product, the greater will be the opportunities for this food of being selected [15]. In this regard, it is noted about health and nutrition claims that veracity of the claim plays an important role. If nutrition labelling and information confirm the claim message, it is likely that consumers’ expectations are satisfied [16]. Conversely, consumers will probably develop a negative opinion about products with claims not validated by nutrition information. Besides, by generating expectations about health benefits, nutrition and health claims could influence the hedonic appreciation, and lastly, sensory factors [17].

However, this result is not confirmed by the perception of nutrition label [4]. In particular, the contemporary analysis of nutrition information or labelling, and NH claims seems decreasing the efficacy of the latter in supporting consumers' food choices [39, 18, 40, 37, 44, 47]. In such cases, information about nutrition properties prevail on messages on the front-of-packages, namely the claims, by diminishing the confidence toward the latter if they result biased by the former, as above discussed. Indeed, Carrillo et al. [14] have also highlighted that although NH claims – as non-sensory features – effectively influence the first buy, only sensory characteristics determine loyalty and repeat consumption. Moreover, two papers show that NH claims do not probably influence food choices, because they seem not drive product evaluations or purchase intentions [43], and they can decrease the perceived naturalness [2]. Anyway, most of papers (about 47%) shows that consumers' perception of nutrition and health claims is positive [45, 47, 48, 38, 29, 9, 28, 4], although it is unclear the effect on food intake generated, in particular, by the low-fat and low-calories products [28, 38]. Many authors consider functional foods or foods claiming health proprieties in general as experience and credence goods, which need high search cost of information about their quality and effectiveness [18, 19, 20]. In this regard, a research of BEUC has highlighted that nutrition and health claims can effectively reduce costs of information about functional food because they are direct and simpler to interpret [21]. However, factors affecting consumers' perception of nutrition and health claims pose uncertainties about the real influence and importance of such claims for food choices, and, in particular, for consumption of products with health-related benefits. For instance, country differences in food habits affect perception of nutrition and health claim [22, 23, 30, 31], which in turn is reflected in the legislation – more or less severe [23]. Other studies have pointed out that perception of functional foods is strictly related to the carrier product, namely it is linked to specific categories and their qualities [22, 24, 26, 42]. Gender, age and educational level are socio-demographic features influencing attitude towards NH claims [27, 30]. Lastly, relevance of

healthiness characteristics [26, 40], the scientific proof of the claim [41], as well as the product involvement [42], and the benefit claimed [31] play an important role. To end, the few articles about the understanding of nutrition labelling confirm that their interpretation is affected by socio-demographics. [32, 36]. Furthermore, nutrition label can support purchasing decisions by reducing search costs of healthier foods [33]. However, consumers find information reported on the nutrition label 'difficult to understand', and there is a general 'lack of understanding as to what nutrients are important to examine' [35]. These findings may explain the low rate of reading the nutrition labelling by consumers, shown by the Aygen's research [25].

4. Conclusions

Previous research have highlighted that numerous items like socio-demographic and cultural features, product involvement and perceived relevance, as well as product category affect consumers' perception of nutrition and health claims and labelling. The general opinion about claims is positive, and nutritional information seems to play a crucial role in purchasing decisions and consumption choices. However, consumers gave little understanding of calories, nutrition principles and contents of standards labels. This can result in misleading perceptions of claims, which affect the future development of the market of functional foods, on one hand, and the consumers' full protection, on the other. Therefore future studies should aim at better assessing consumers' understanding of nutrition information and principles, and its relationship with perceptions of health claims and healthy messages on package of foods in general. Findings could effectively support policy makers in planning of proper measures to improve consumers' knowledge and awareness of links between health and diet. In the meanwhile, food industry and market could continue to innovate and differentiate by developing more attractive functional foods in line with consumers' needs, and without prejudicing to its protection and security. Anyway, it could also be useful developing a wider literature review because the present is only a first step of analysis. The authors intend to extend the investigation to other studies in future

research.

Abstract

Representing a combination of mathematical methods, economic theory and statistical techniques, econometrics has an important role in fields like management, marketing, accountancy, finance, etc. The large number of practicability fields represents the reason for which, in the last decades, econometrics has known a spectacular development, moving from studying macroeconomic phenomena to microeconomic phenomena. This paper aims to present an econometric analysis of the decision to replace a random wear terminal accomplished with the aim of decision substantiation regarding the IT field. within a company.

Keywords: econometrics, the operating probability, the operating curve, the rate of supply

J.E.L. Classification: C01, C60, D80

1. Introduction

Although empirical studies in economy have been made since the 17th century, the field of econometrics is more recent. The first use of the term “econometrics” is assigned to Pawel Ciompa (controller of the Austro-Hungarian bank in Lvov), who in 1910 published the study “Zarys ekonometry i

teorya buchalteryi” about accountancy and econometrics (the term having then another significance than today) [6]. In 1926, Ragnar Frisch (1895-1973), a Norwegian economist and statistician, has used the term “econometrics” for the first time in the sense that is used today.

In 1930 it is founded, at the initiative of Ragnar Frisch and Irving Fisher, the Society of Econometrics, having as publication the magazine “Econometrics”. In 1933, in the first issue of this magazine, the editor Ragnar Frisch noted the fact that econometrics represents a combination of economic theory with mathematical and statistical methods [8]. Therefore, after it is written in mathematical form, the economic theory is analyzed using statistical methods. If the observed data are consistent with the theory predictions, then the theory is considered to be accurate and accepted. According to Monasch University, “econometrics is a set of quantitative techniques that are useful for making economic decisions”.

Thus, econometrics provides the quantitative basis necessary for the economic policies formulation and simulation having as main purpose providing the economic forecasts provision [2].

2. Econometrics analysis

The purpose of this paper is to present an econometrics discussion on a situation to

which the management of the IT department within a company is facing.

Therefore, it is analyzed the case of a company which has 300 terminals. For 10 years, at the beginning of each year, it is registered the number of terminals which are in working order.

If the number of terminals put into operation at the initial moment is denoted by $n(0)$ and the number of terminals which are in working order at t moment is denoted by $n(t)$, $t = \overline{0, T}$, $T = 10$, of the existing $n(0)$, it is issued the calculation and interpretation of the following indicators: the working probability of a terminal after t years of use, the probability that a terminal to be removed from service after t years of use and the probability that a terminal to be removed from service in $[t - 1, t]$ period.

Taking into account the damage probability of a terminal, it is required the determination of the number of terminals which must be purchased in order to perform the activity in optimum conditions and the rate of supply.

From the registrations made, have resulted the following values:

Table 1. The number of working terminals at t moment

t	$n(t)$
0	300
1	300
2	294
3	270
4	255

Source: Data collected by author

Through the time of functioning of a terminal, we understand the time since its implementation (measured in hours) and the considered moment t .

For a terminal put into operation at 0 moment, the working probability at t moment is:

$$P_f(T \geq t) = \frac{n(t)}{n(0)}, t = \overline{0, 10}. \quad (1)$$

Using relationship (1), the probability that a terminal to be removed from service after t years of use is:

$$P(T \leq t) = 1 - P_f(T \geq t) \quad (2)$$

If the company considers that in year t , $t = \overline{2, 10}$ needs a number of working terminals equal to $n(0)$, then, at the beginning of the chosen t year, must be purchase a number of terminals equal to:

$$n(t) = n(0) \cdot P(T \leq t) \quad (3)$$

The probability of removal from service of a terminal in the interval $[t - 1, t]$ is

$$\begin{aligned} P(t - 1 \leq T \leq t) &= P(T \geq t - 1) - P(T \geq t) \\ &= \frac{n(t - 1)}{n(0)} - \frac{n(t)}{n(0)} = \frac{n(t - 1) - n(t)}{n(0)} \end{aligned} \quad (4)$$

notation

$$= P_s(t)$$

Using data from Table 1, the obtained values following the application of relationships (1)-(4) are shown in Table 2.

Table 2. Features values in (1)-(4) relationships

t	P_f	$P(T \leq t)$	$n(0) \cdot P(T \leq t)$	$P_s(t)$
0	1	0	0	-
1	1	0	0	0
2	0.98	0.02	6	0.02
3	0.9	0.1	30	0.08
4	0.85	0.15	45	0.05

The risk of maintaining a terminal into operation, which reached the t operating time, is assessed using the damage probability (defined as probability conditioned that a terminal which operated in good conditions until $t-1$ moment, to have a weakness in $[t-1, t]$ and denoted by $P_a(t)$).

$$P(t-1 \leq T \leq t) = P(T \geq t-1) \cdot P_a(t) \quad (5)$$

$$\Rightarrow P_a(t) = \frac{P(t-1 \leq T \leq t)}{P(T \geq t-1)} = \frac{n(t-1) - n(t)}{n(t-1)} \quad (6)$$

Table 3. Values of damage probability

t	$P_a(t)$
0	-
1	0
2	0.02
3	0.08
4	0.06
5	0.06
6	0.13
7	0.29
8	0.40
9	0.67
10	1.00
>10	-

Source: Own calculation

If we choose to make the above analysis at the moment of time $t = 7$ years, we notice that:

- the working probability of a terminal is that of 0.5;
- the probability that a terminal to be removed from service after 7 years of use is that of 0.5;

- the probability of removal from service of a terminal between the 6th and the 7th year is that of 0.2;
- at the beginning of the 7th year will be purchased 150 terminals if it is desired that in the 7th year to be 300 operating terminals.

We denote by $h(t')$ the number of terminals replaced until t' moment, $t' = \overline{1, t}$, and by $f(t)$ the number of operating terminals at t moment.

Then, the function denoted by $g(t')$ representing the number of terminals replaced between $[t'-1, t']$ will be equal to:

$$g(t') = h(t') - h(t'-1), \quad t' = \overline{1, t} \quad (7)$$

In other words, the $g(t')$ function defines the supply volume.

With the help of the previous notation, we can write the $f(t)$ function as being:

$$f(t) = n(0) \cdot P_f(T \geq t) + \sum_{t'=1}^t g(t') \cdot P_f(T \geq t-t') \quad (8)$$

Using relationship (8) and the data in Table 2, we can assert the fact that if in the third year the company has replaced $294 - 270 = 24$ terminals, then the number of the operating terminals in the 9th year will be:

$$f(9) = n(0) \cdot P_f(T \geq 9) + 24 \cdot P_f(T \geq 9-3)$$

$$= 300 \cdot 0.1 + 24 \cdot 0.7 = 46.8 \approx 47 \text{ terminals}$$

Thus, in order to have 300 operating terminals in the 9th year must be replaced:

$$g(9) = 300 - 47 = 253 \text{ terminals.}$$

3. Conclusions:

Economic decisions are not limited only to those taken by the economists. We can say that any decision affecting the assignment of some limited resources is an economic decision.

The fact that the economic theory's transposition into the real world's economy is greatly influenced by indetermination, leads to the statement that econometrics can not provide perfect patterns for the economy's mechanisms. With all these limitations,

knowing on econometrics help professional economists (not only those working with data), both in increasing their depth of knowledge and understanding of the economy and in developing their capacity of obtaining a perspective on econometric work and make a critical evaluation of it.

Abstract

The National Strategy for Research, Development and Innovation for the period 2007-2013 is based on the vision of the Romanian society on the role of science, technology and innovation for the development of the knowledge society in Romania, for the economical and social progress [1].

The National Plan for Research, Development and Innovation 2007 – 2013, called herein the National Plan II, represents the main instrument used to implement the National Strategy for Research, Development and Innovation.

This paper presents a study which aims to analyse the assessment criteria for the research projects submitted in the competitions from 2007, 2008 and 2011 as part of the Partnership Programme and to highlight the importance of improving the assessment criteria for the increase the quality of research projects submitted in competitions.

Key words: assessment criteria, research, NP II, Partnership Programme

J.E.L. Classification: I23

1. Introduction

The National Strategy for Research, Development and Innovation (RDI) for the

period 2007-2013 is based on the vision of the Romanian society on the role of science, technology and innovation for the development of the knowledge society in Romania, for the economical and social progress [1]. The strategy has the objective to catch up on the gaps in comparison to the level of the European countries and it prepares the RDI system in Romania in order to identify and consolidate, in international partnership and competition, those unique areas in which Romania could excel [1].

In their strife for excellence, the universities, the public institutes of research and development, the other public entities of research play an important role. They are challenged to change into important actors on the knowledge market, attracting and developing human resources of high quality and concentrating on important research facilities.

The involvement on research and the relationship which has become closer and closer to the economical field have turned out to be not only sources of income, but also intrinsic elements in the process of education and training.

In the triangle of knowledge, education-research-innovation, the last element is linked in the closest way to the impact on welfare but at the same time, it is the one which raises most problems as related to complex policies. Innovation, a process with many variables, keeps the collaboration between research and industry at its core.

During the last decade, the developed countries proposed intermediary entities or other forms of interaction and collaboration which could create links between these two sectors, allotting them increasing public financial resources.

The National Plan for Research, Development and Innovation 2007 – 2013, called herein the National Plan II –NP II – represents the main instrument used to implement the National Strategy for Research, Development and Innovation.

NP II aims to accomplish three strategical objectives of the national system of RDI, namely [2]:

1. Create knowledge, respectively obtain certain top scientific and technological results with the purpose of increasing international visibility for the Romanian research followed by a transfer of these results into the social-economical practical activity.

2. Increase competitiveness of the Romanian economy, having an impact on the level of the economical agents and transfer of knowledge in economic practice.

3. Increase social quality, respectively find technical and scientific solutions to support social development and improve its human condition.

The programme *PARTNERSHIPS* estimates original results which refer to the design and accomplishment of original products – prototypes, technologies and innovative services as a result of experimental research with a direct practical purpose and market potential. This kind of programme can achieve, in a logical way, the interface and convergence of fundamental scientific research projects, financed by the *IDEAS* and *HUMAN RESOURCES* programmes, with projects developed in the *INNOVATION* programmes, which finance the undertaking of the prototype products or of the technologies which are expected or accessible on the market, accomplished by the economical agents competent in the nine research fields [3].

The *Collaborative Projects of Applied Research* (CPAR) aim to support and promote applied research in priority areas, inter- and transdisciplinary fields, relevant for the increase in competitiveness in research, development and innovation (RDI) on national level, and in agreement with the

global economy based on knowledge. There are financed different experimental research and technological development projects, undertaken in partnerships and ending up with the design of innovative products, technologies and services targeted to solve and implement solutions to the complex social and economical problems, of national priority and international update [3].

The objectives aimed by CPAR are the following [3]:

1. Join the applied research and the technological progress from Romania to the demands of the national and global, social and economical environment, in the accomplishment of original products, advanced technologies and services in nine priority fields, competitive on international level and with a major social and economical impact;

2. Join the applied research to the priorities of the European Research Area (ERA) for technological progress in Romania, increase visibility and prestige on the international market;

3. Stimulate partnerships (research organizations, economical agents, NGOs and/or professional associations and so on), in order to shorten the way from scientific knowledge to technology having a social and economical impact, aligned with the market needs and evolution;

4. Implement the principle “financing follows the scientific and technological performance” in research generating technological innovation, with an impact on the competitiveness of Romanian economy and welfare;

5. Stimulate the investments in the private sector in RDI, in their own activities as well as in collaboration with universities and research institutes, in order to finish and transfer the results to the market.

2. Empirical support and methodology

The study has the purpose of analysing the assessment criteria in the Partnerships Programme for the research projects submitted in the competitions from 2007, 2008 and 2011 and of highlighting the importance of improving the assessment criteria for the increase the quality of the research projects part of competitions in the Partnerships Programme.

2.1. Assessment and decision criteria used in the ranking of the research projects

One of the questions which is often asked in the project competitions is the following: Which projects should be supported in order to apply the research rules and programme implementation rules and which should be not?

The assessment and decision criteria and the processes related to them certainly hold a key position in the frame policies which are based exclusively on financing. The assessment criteria create the bond between the project aim, programme objectives and the individual projects. The decision-makers for research policies, the programme managers face the fact that they have to correlate the purposes of the research policies with the programmes objectives and the latter with the assessment and selection criteria of the research projects. This means that the applicants are allowed to assess the projects and the criteria (with the meaning of consulting them in order to elaborate these assessment criteria) without understanding the policies which form the starting point of research strategies and financing programmes. Keeping these aspects in mind, there should be considered a number of practical issues when establishing the criteria: the criteria should be as complete as possible (to cover all the relevant aspects of the programmes); the assessment criteria should be in a small number (so as to take into consideration the project and its performance in the assessment process); the assessment criteria should be independent in order to avoid prejudices, their fraudulent use and false interpretation; the assessment criteria should be easily measured and applied.

There are many possible traps which appear in practical work in the conceiving and elaboration of the assessment criteria. The most frequent ones are the following: too many assessment criteria (often as a result of poor management of the assessment criteria elaboration process); assessment criteria which are not adapted to the objectives of the policy / programme; criteria which are interconnected (thus altered by uncontrollable prejudices); changing the assessment criteria from one call to the other

(often as a result of the learning process, mostly ambivalent, hence the applicants tend to perceive the change in criteria as an additional source of uncertainty).

Experience shows that the assessors tend to use a complex set of criteria, as complex as possible, in the process of project assessment.

2.2. Assessment criteria for the Partnerships Programme

For the two competitions from 2007 and 2008 as part of the Partnerships Programme there were submitted projects from the category of *Complex Projects* (CP).

In the competition from 2011 as part of the Partnerships Programme there were submitted Collaborative Projects of Applied Research (CPAR) of two types [3]: *Type I* – The structure of the partnership does not impose the participation of an enterprise. For this type of project, the financing from the state budget could be 100% from the project value. *Type II* – The structure of the partnership imposes the participation of at least one enterprise and the sum of the co-financing should be of at least 7,5% from the project value (project value = financing from the state budget plus its own co-financing) if the participating enterprise/s are small and medium and respectively at least 15% in case one of the partners is a big enterprise, following the provisions of the scheme on state aid.

For the first competition from 2007 the assessment criteria for the research projects in the Partnerships Programme were the following [4]:

1. *Relevance of the project* (max 10 pt): To what extent the project contributes to the development of expertise/skills in the field; The objective is clearly defined?

2. *Scientifically and technically description of the project, incl. the degree of novelty and the possibility of implementation of results* (max 45 pt): The novelty and complexity of the solutions proposed / potential patent; Clarity of the project theme presentation; The degree of correlation with the intended activities; The extent to which results sustain the project objectives and are measurable; How clearly and coherently is presented the scheme of the project (broken down by

activities)?; Highlighting the possibility of transferring the results to potential beneficiaries; The existence of some measures to protect intellectual property; The degree of dissemination of results (int. conferences, fairs, exhibitions).

3. *Project impact* (max 10 pt): The extent to which the project generates clearly social, economic, environmental effects; The extent to which young professionals are attracted to research activities of the project

4. *Project Management. Consortium members* (max 20 pt): Coordinator experience in the field of the project and in management of national / international projects; Partners experience in the field of the project and in national / international projects management; Project coordinator managerial and professional competence; The degree of specialization and complementarity of professional research staff involved in project; Clarity of methods / techniques of management, coordination and communication for the project implementation

5. *Material, financial and human resources* (max 10 pt): The extent to which existing resources ensure that the objectives of the project will be achieved; The extent to which allocation of resources correspond to the implementation plan

6. *Conformity with the Excellence in Research Program* (0 or 5 pt): The project coordinator has a project in implementation / completed within the Excellence in Research Program, Modules I and III and has proposed / participates in FP7? If yes, 5 pt, if not 0 pt.; The project did not participate in Excellence in Research Program, Modules I and / or III - 5 pt is granted by default.

For the second competition from 2008 the assessment criteria for the research projects in the Partnerships Programme were the following [4]:

1. *Relevance of the project* (max 10 pt): To what extent the project contributes to the development of knowledge in the field; The objective is clearly defined and correlated to the output indicator of the Programme

2. *Scientifically and technically description of the project* (max 50 pt): The novelty and

complexity of the solutions proposed; Clarity of the project theme; The degree of correlation with the intended activities; Clarity and coherence of the project implementation plan, broken down by activities; The extent to which results sustain the project objectives and are measurable / potentially patentable; Possibilities of transferring the results to potential beneficiaries; Method of assignation and usage of the research results, in between partners, including the IPR; observation of scientific research ethic issues, if the case; The degree of dissemination of results (int. conferences, fairs, exhibitions)

3. *Project impact* (max 10 pt): The extent to which young professionals are attracted to research activities of the project; The extent to which the project generates well defined social, economic, environmental effects

4. *Project management and consortium members* (max 15 pt): Clarity of methods/techniques of management, coordination and communication proposed for project implementation (project logic diagramme); Coordinator and partners entities expertize in the project field and management of national/ international projects; Project coordinator participation with proposals on FP7 initiative; Project coordinator expertize, including managerial expertize, in other programs / national/international projects; The degree of specialization and complementarity of professional research staff involved in the project

5. *Material and financial resources* (max 10 pt): The extent to which existing resources ensure that the objectives of the project will be achieved; The extent to which the requested resources are correctly adjusted to project activities.

6. *Conformity with the Excellence in Research Program* (0 or 5 pt): Project manager coordinated / coordinates project(s) on CEEX Program, modules I and III and proposed project(s) on FP7; Project manager coordinated / coordinates project(s) on CEEX Program, modules I and III and did not propose projects on FP7 (0 pt) Project

manager did / does not coordinate project(s) on CEEEX Program, modules I and III.

For the competition from 2011 the assessment criteria for the research projects in the Partnerships Programme were the following [3]:

1. Scientific quality (30%/30%): Originality (15%/15%) How original and innovative is the research project? To what extent does the proposed research go beyond the current state of the art?; Approach (15%/15%) To what extent are the methods, techniques and investigation tools adequately selected and/or developed, well integrated, well reasoned, and appropriate to the aims of the project? Does the applicant acknowledge potential problem areas and consider alternative approaches?

2. Implementation (45%/40%): Human resources (20%/15%) How relevant is the expertise of the key team members as derived from their applied research experience, for the proposed objectives? How well do the skills and experience of the team members complement each other, and how well positioned are they to collaborate productively in view of the project objectives and workplan?; Infrastructure (5%/5%) How appropriate is the infrastructure and equipment which is available or to be acquired, in view of the projected objectives, in the given time frame?; Work plan (15%/15%) How appropriate and well adapted is the work plan for achieving the goals of this project, and how likely is it that the goals be achieved within the proposed timescale and resources?; Budget (5%/5%) How adequate is the budget proposed based on the objectives, the workplan and the existing human resources and infrastructure? Please comment and/or suggest possible corrections.

3. Socio-economic impact (25%/30%): Applicative potential (25%/20%) How would you rank the potential of the project objectives to lead to significantly improved quality, performance or efficiency of goods or services? Do the proposed results distinguish enough from products/technologies/services that are already patented or available on the market, internationally? How well positioned is the project to contribute significantly to

solve/improve on a quantifiable social need?; Business case (0%/10%) To what extent is the project well integrated into the business strategy of the enterprise partner, considering its market position and experience? How well positioned is the project to contribute significantly to the business growth of the enterprise partner?

3. Results and Controversy

In assessment practice – an assessor works in front of a computer, makes his assessment, fills in all the forms, including all the comments for each criterion and then discusses in the panel with the other assessors and a consensus there should be reached – we notice that such a complex system is difficult to handle. In situations like these, the assessors have the tendency to use their own criteria.

In the calls from 2007 and 2008 there can be noticed a great number of assessment criteria - 21. This great number of criteria could generate overlaps and misunderstandings in the assessment process.

The criteria is usually interconnected, which might lead to prejudices. For example, the creation of new knowledge issues is required in different chapters with their own markers.

In spite of the great number of criteria, there are some faults. The most relevant aspects which is not included in the assessment criteria refers to the organisations which undertake the project. The most relevant question is if that particular project will contribute to the increase in performance for the organisations undertaking it.

There is a tendency that certain aspects from the project proposals be assessed several times: for example, licencing, patents are assessed twice (criteria 2008: g and i), and the novelty of the proposal is assessed three times (criteria 2008: a, c and g). There is also a tendency that some markers be given more importance, diminishing others. There has been proved that the proposals without an economical relevance (without results which could be put into value economically afterwards) could obtain up to 80 % from the maximum assessment score.

Nevertheless, in the case of the call from 2011 there can be noticed a much smaller number of assessment criteria - 14. They

were structured into 3 sets of criteria (unlike the situation from 2007 and 2008 when there were 6 sets of criteria) clear and concise, thus the assessment could be made much better.

In case of the assessment criteria from 2011 the accent lies on originality (15% in comparison to 6%) and on the social and economical impact (30% in comparison to 10%) of the projects, aiming to reach results which will be integrated in economy.

Also, there is given more importance to the assessment of the human resources and to the financial assessment (25% in comparison to 10%).

4. Conclusions

Taking into consideration the aspects studied in the paper, we can draw the following conclusions:

1. The number of assessment criteria from the practical point of view was too large in the case of the calls from 2007 and 2008.
2. In the case of the calls from 2007 and 2008 there were certain aspects which had been assessed several times in the assessment process.
3. A beneficial element for the project assessment was the reduction in the number of assessment criteria for the competition from 2011 (14) in comparison to the competitions from 2007, 2008 respectively (21).
4. Originality (15% in comparison to 6%) and the social-economical aspect (30% in comparison to 10%) of the project have a much greater importance in the call from 2011 in comparison to the ones from 2007 and 2008.
5. The percentage of the human resources and financial aspects of the projects (25% in comparison to 10%) is much greater in the call from 2011 than in the calls from 2007 and 2008.
6. The assessment criteria change too often from one call to the other. This is certainly the result of a learning process and coming from the wish to improve the assessment system. At the same time, all these changes are perceived as a supplementary source of uncertainty.
7. The assessment criteria should be independent in order to avoid

prejudices, the fraudulent use and misinterpretation.

8. The criteria should be as complete as possible (to cover all the relevant aspects of the programme).
9. An assessment criterion which should be introduced is if the project under study will contribute to the increase in performance of the organisations undertaking it.
10. The assessment criteria should be easily measured and managed.
11. There could be introduced thresholds in the assessment criteria, combined with the reduction in the number and share of criteria with a "heavier load".
12. By improving the assessment criteria of the research projects submitted for the competitions as part of the Partnerships Programme there will be obtained an increase in the quality of the research projects, hence a greater social-economical impact of their results.

Business Models Based on Corporate Social Responsibility: the Case of Global Pharmaceutical Companies

Toma Sorin-George

Faculty of Administration and Business, University of Bucharest

tomagsorin62@yahoo.com

Marinescu Paul

Faculty of Administration and Business, University of Bucharest

paulmarinescu1@gmail.com

Abstract

In the past century, the business models were focused on providing a basic product at a low/very low cost, then charging excessive amounts of money for refills or for associated products/services. In the 21st century, the business models have to take into account not just the new technologies, but also the social responsibility issue. The aims of our paper are to present in brief the concepts of business model and of corporate social responsibility (CSR), and to highlight the emergence of the business models based on CSR in the global pharmaceutical industry. The methodological approach is based on the literature review.

Keywords: business models, corporate social responsibility, pharmaceutical companies

J.E.L. Classification: M14, M19

1. Introduction

Over the years, business models have become much more sophisticated as the human society evolved. In the early 20th century, the business models were focused on providing a basic product at a low/very low cost, then charging excessive amounts of money for refills or for associated products/services. In the 21st century, the business models have to take into account not just the new technologies, but also the social responsibility issue. More and more, business models become sustainable ways of doing business in a highly competitive environment (Nielsen, 2010).

The aims of our paper are to present in brief the concepts of business model and of

corporate social responsibility (CSR), and to highlight the emergence of the business models based on CSR in the global pharmaceutical industry. The methodological approach is based on the literature review.

The paper is structured as follows. The second section outlines in short the theoretical framework related to the concepts of business model and CSR, emphasizing some of the main contributions derived from the literature. The third section of the paper displays a study case regarding business models based on CSR within the global pharmaceutical companies. The paper ends with conclusions.

2. Theoretical framework

During the time, the topics of both business model and CSR have led to a variety of publications and researches by academics, consultants, businessmen, and journalists. There are no widely accepted definitions of the two concepts in the literature.

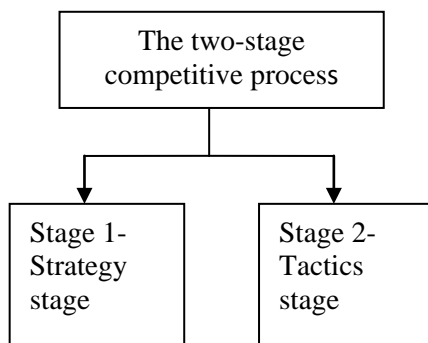

The term “business model” is a relatively young concept. In spite of the fact that the concept appeared in the late 1950s, it became important only towards the end of the 1990s. A business model has been defined in different ways as follows:

- “Business model refers to the logic of the firm, the way it operates, and how it creates value for its stakeholders.” (Baden-Fuller, et al., 2008, p. 1)
- „A company’s business model describes its collaborative portfolio of strategy choices put in place for the handling of the processes and relationships that drive value creation on operational, tactical and executive levels.” (Nielsen, 2005, p. 1)

- “A business model is a conceptual tool containing a set of objects, concepts and their relationships with the objective to express the business logic of a specific firm.” (Osterwalder, et al., 2005, p. 5)
- “Business models describe, as a system, how the pieces of a business fit together.” (Magretta, 2002, p. 6)
- “A business model depicts the content, structure, and governance of transactions designed so as to create value through the exploitation of business opportunities.” (Amit, Zott, 2001, p. 511)

The above mentioned definitions show that there are different understandings of the business model concept. However, several common characteristics of business models can be pointed out. Firstly, business models are strongly linked with the value creation, capture and marketing. Secondly, business models explain how business organizations work and the logic by which they earn money. Thirdly, business models constitute the platform which enables business organizations to select the strategic choices in order to obtain profit. Fourthly, business models are not the same thing as a strategy. According to R. Casadesus- Masanell and J. E. Ricart (2009), the concepts of strategy, business models and tactics can be all integrated within a generic two-stage competitive process framework (Fig. 1). In the first stage, the business organizations choose their business models through they would like to compete against or/and to cooperate with other companies in the marketplace. In the second stage, they make tactical choices that depend on the business models initially chosen.

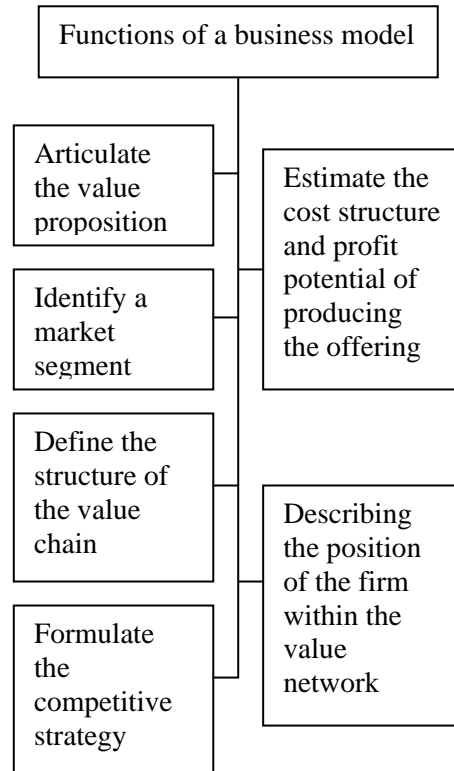

Figure 1. The generic two-stage competitive process framework

Source: adapted from Casadesus- Masanell, Ricart, 2009

There is a multitude of business models in the business world (e.g., multi-level marketing, open source, low-cost). All of them are created on the basis of the functions of business models (Fig. 2).

Figure 2. The functions of a business model

Source: adapted from Chesbrough, Rosenbloom, 2002

In sum, the business model concept is relevant to all companies because it explains what things the business does and how the business makes money doing these things.

On its turn, the term CSR constitutes a multidimensional concept that describes the relationships between business and society. The ancient era of social responsibility appeared very early in the history of humanity. Nevertheless, the First Industrial Revolution brought many economic changes and opened new perspectives on the relationship between wealth and social welfare in the society.

The modern era of social responsibility started in the early 1950s when H. R. Bowen considered CSR as a way of integrating the societal values beyond the interests of corporate shareholders (Toma, et al., 2011). Step by step, CSR has become a concept

debated both by researchers from different fields of study (e.g., sociology, marketing, philosophy, management, law) and by businessmen. There are many definitions of the CSR concept as follows:

- “the way firms integrate social, environmental and economic concerns into their values, culture, decision making, strategy and operations in a transparent and accountable manner, and thereby establish better practices within the firm, create wealth and improve society” (Hohnen, 2007, p. 5);
- “a concept whereby companies integrate social and environmental concerns in their business operations and in their interaction with their stakeholders on a voluntary basis” (Commission of the European Communities, 2006, p. 1);
- “the continuing commitment by business to contribute to economic development while improving the quality of life of the workforce and their families as well as of the community and society at large” (World Business Council for Sustainable Development, 1998, p. 3).

These definitions reveal several responsibilities of a socially responsible business organization. A. B. Carroll (1991) has identified economic responsibilities (“be profitable”), legal responsibilities (“obey the law”), ethical responsibilities (“do what is right and fair and avoid harm”), and philanthropic responsibilities (“be a good corporate citizen”). Built on the marriage between business and social responsibility, CSR encompasses a wide range of commitments and activities pertaining to environmental stewardship, corporate governance and ethics, human rights, health and safety, community involvement, customer satisfaction, accountability, etc.

In the past decades, CSR has significantly influenced the business models towards a more humane and ethical way of doing business. In this respect, the global pharmaceutical industry provides valuable corporate examples.

3. Business models based on CSR in the big pharma

During the last century, the average life expectancy in developed countries increased by approximately 20 years, especially due to

the contributions of the pharmaceutical industry. On the other hand, the industry has been subject to a number of criticisms, revolving around different issues (e.g., profits levels, pricing policies, patient safety, animal testing, environmental concerns).

Since the increasing spread of technological change, the pharmaceutical industry has been characterized by intense competition all over the world (Table 1). In the beginning of the 21st century, the big pharma (large globalised pharmaceutical companies) are feeling “pressure from every direction- from regulators setting the rules for drug effectiveness and safety, from managed care organizations and employers pushing back on prescription drug costs and reimbursement, from competitors coming to market with alternatives brands or generics, and from disgruntled shareholders” (Kandybin, Genova, 2012, p. 3).

Table 1. World’s largest pharmaceutical companies

No	Company	Sales (\$ bil.)
1.	Pfizer (USA)	67.4
2.	Novartis (Switzerland)	58.6
3.	Merck & Co. (USA)	48
4.	Roche Holding (Switzerland)	45.3
5.	Sanofi (France)	43.2
6.	GlaxoSmithKline (UK)	42.5
7.	Abbott Laboratories (USA)	39.8
8.	AstraZeneca (UK)	32.4
9.	Eli Lilly & Co. (USA)	24.3
10.	Bristol-Myers Squibb (UK)	21.2

Source: Forbes, 2012

In the past, the business models of big pharma had certain unique characteristics as follows (Rasmussen, 2003, p. 1):

- highly structured value chains determined by the regulatory process;
- high cost of product development combined with associated high risks of failure;
- focus on innovation.

Facing with many challenges, the big pharma have pursued new business models, based on CSR. Providing customer solutions coupled with direct accountability for the consequences of decisions made have been an increasingly main source of value and

profits for the today's big pharma. For example, the Roche Holding states that it offers value through targeting treatments to patients that would benefit most.

The leading research-based pharmaceutical company of the world is Pfizer. The American colossus was co-founded in 1849 by C. Pfizer and C. Erhart, two German young entrepreneurs in a red brick building in Brooklyn, New York. By continuously investing in research and development, Pfizer has become one of the most diversified corporations in the global health care industry. The American pharmaceutical heavyweight owns a wide range of biopharmaceutical products. In 2011, its blockbuster drugs were Lipitor, Lyrica, Plevnar 13/Prevenar 13, Enbrel, and Celebrex- each delivered at least 2 USD billion in revenues, and Viagra, Norvasc, Zyxov, Xalatan/Xalacom, Sutent, Geodon/Zeldox, and the Premarin family- each surpassed 1 USD billion in revenues.

According to Forbes Global 2000 Leading Companies, Pfizer is ranked no. 34 in the world, respectively no. 103 in sales, no. 39 in profit, no. 135 in assets, and no. 23 in market value (Forbes, 2012). However, Pfizer is not only the most profitable pharmaceutical company, but also a highly responsible one.

Social responsibility represents a key element of Pfizer's business model (Pfizer, 2012). Some of its objectives related to CSR are:

- to integrate corporate responsibility into Pfizer's core business processes;
- to support US health care system reform;
- to improve public health around the world;
- to reduce its impact on the physical environment, etc.

In order to carry out its commitment to participating actively in and improving the societies and/or communities in which it does businesses, Pfizer has striven to develop and implement many CSR programs in the last decade.

In 2007, Pfizer launched „Mobilize Against Malaria” in Ghana. The program enabled more than 660 chemical sellers in 13 districts to provide better malaria education to over 20,000 people, dispense medicines according to national protocol, refer complicated malaria cases, and pregnant women to nearby health centers (Pfizer,

2009). Also, Pfizer launched “Global Health Partnerships” in 2007. The program supported 29 grantees in 46 countries across five continents addressing emerging challenges in cancer and tobacco control (Pfizer, 2009).

In sum, CSR is fundamental to Pfizer's business model, being highly integrated into all of its components. Moreover, Pfizer has achieved its mission of “Working together for a healthier world” through CSR.

4. Conclusions

In the past decade, the topic of business models has become prominent in the literature. In essence, business models constitute the blueprint of how companies do business.

The big pharma have made tremendous contributions to human well-being. They discovered drugs that solve medical problems to a huge number of people around the world. That is why the business models based on CSR are increasingly implemented in the global pharmaceutical industry.

More and more the big pharma have to restructure their businesses to speed decision-making and increase accountability in order to thrive in today's unpredictable environment.

Strategic Planning for NGOs

Turcu Ovidiu Leonard

Ciucescu Nicoleta

„Vasile Alecsandri” University of Bacau, Faculty of Economics

ovidiuturcu@gmail.com, ciucnico@yahoo.com

Abstract

In a competitive and economic environment, ever changing, the key to success is represented not by the quality of operational planning, but by the clarity of strategic thinking, even it is matter of an NGO. Currently, no one may talk about the environmental stability, the only constant is the permanence of changing.

Keywords: NGOs, strategic planning, changing, strategy, management.

J.E.L. Classification: L31

1. Introduction

Strategic planning is the main method of organization and unitarian management, by own management, of the assembly of all resources of the company, in order that it can cope with environmental changes and to be competitive. As a form of performance of professional and strategic planning organization should be conceived as a very complex management activity, which is based on studies, calculations, summaries and so on, and combine closely the current planning with perspective planning.

2. The planning process

Planning, as the central attribute of management, consists in making the forecast of the trajectory that will follow in the future the respective organization, and has the following main purposes:

- establish the conditions under which the organization will work, these are in fact, the objective frame;
- determine the main objectives of the organization, as well as the necessary means of reaching them;

- define the procedures to be followed for meeting the fixed targets.

Planning process consists of a set stage, correlated between them, which aims elaboration and implementation of plans and objectives of the organization.

In the preparatory phase of the planning process it is to formulate goals and mission of the organization, to establish hypothesis and premises of the organizational environment.

Actual planning phase is focused on the elaboration of short-term, medium and long plans, respecting correlations between them.

In the stage of reserve plans, any organization elaborates a reserve strategy to use in case of environmental changes that do not allow the actions launched according to the original plans.

Implementation phase refers to the start of activity in accordance with elaborated plans. Reviewing phase aims to compare achieved results with the organization's mission, and retaking a new planning process.

All these goals and stages are leading to the underlining of the advantages that entails planning, namely:

- help to clarify the direction of NGOs;
- can have a big impact on motivation of individuals working in respective organization;
- help more efficient use of all resources available to NGOs;
- provides a useful tool to assess progress made by NGOs.

3. The importance of strategic planning

As the environment in which the nonprofit organization operates is dynamic and uncertain, as the planning is necessary. In this context, the need to plan arising from consideration of the following *factors*: *a. Complexity NGOs*

In modern society, economic organizations in general, non-profits in particular, have become complex units. This feature is determined not only by size and complexity of operations of NGOs, but also by complicated and numerous interferences that exists between organizational components, by social role that community assigns.

NGO complexity results not only from its dimensions, but also from many other factors, and for that reason the planning is necessary for all kinds of organizations, whether big, medium or small and equally for non-profit organizations.

b. Changes in the external environment
NGO, as economic system, is only part of other larger systems – at regional, national and international level - that is the general environment.

Because the current global environment is dynamic and uncertain, changes occur in an accelerated rate, being difficult to predict and having a strong impact on NGOs. If it is established an appropriate run of future actions, then it helps to maintain in balance the economic system.

c. Transformation duration of resulting decisions

In an external environment, more dynamic and more uncertain, if planning is done for larger time horizons, then the goals, that are established, are ampler. Thus, it appears that the time, between the moment when the decision is adopted and the moment when the results are obtained, increases. In this context, managers need to consider everything possible to not affect the achievement of set objectives, and find ways to minimize uncertainty and risks.

Planning becomes a tool that helps managers to cope with change.

4. Stages of strategic planning in NGOs

John M. Bryson brings to his analysis, significant contributions in improving performance of managers working in the nonprofit sector. He shows that strategic planning is a concept and a new practice in nonprofit and public organizations (only from about 10-15 years).

He divides the cycle of change of strategic planning in NGOs in ten stages, namely:

1. Initiate and agree on strategic planning process.
2. Identify organizational mandates.
3. Clarify organizational mission and values.
4. Assess inner and external environments of the organization to identify strengths, weaknesses, opportunities and threats.
5. Identify strategic issues facing the organization.
6. Formulate strategies to resolve these problems.
7. Review and adopt the plan or strategic plans.
8. Establish an efficient vision of the organization.
9. Develop an efficient implementation process.
10. Reassess strategies and strategic planning process.

Ion Boboc reminds in the work *Management NGOs* same 10 stages, which were initially treated by specialist Bryson in his work *Strategic Planning for Public and Non-profit Organizations*.

In a brief display, these stages are:

1. In the first stage, that can be called also *Initial access* is made an initiation and an agreement on the strategic planning process by involving all stakeholders and negotiating with each other.
2. The second stage, called *Identifying organizational mandates* relates to the needs of that organization, but also to identifying what can make each “managerial player”, according to these needs and the legislation to be known.
3. The third stage, called *Clarifying organizational mission and values (of shareholders)*: clarification of the objectives for which the organization operates, identifying areas of collaboration with other NGOs. A shareholder is defined as “any person, group or organization may request justifiably attention concerning resources or results of an organization or who is affected by these results, examples being citizens, taxpayers, service users, government body, employees, unions, groups of interests, political parties, financial community, companies and various management bodies.
4. Examples of shareholders of a non-profit organization are customers or consumers, taxpayers or auxiliary donors, staff,

executive board, volunteers, other non-profit organizations that provide complementary services or are involved in various projects, as collaborators, banks detaining mortgages of organizations and of providers” (Bryson, 2002).

5. In stage called *Evaluation of inner and external environments of the organization* to identify strengths and weaknesses, opportunities and threats, resources, current strategy and performances.
6. The fifth step, *Identification of strategic problems facing the organization* designed a number of aspects such as focusing on fundamental issues of institutional policy, on what is really important for an NGO, for survival, prosperity and efficiency.
7. Sixth stage called *Formulating strategies to solve these problems* is to ensure the link between rhetoric, choices, actions and consequences, making them consistent and coherent structures at all levels, for all functions and moments.
8. The seventh stage *Review and adoption of the plan or strategic plans* refers to approval and implementation.
9. The eighth stage, *Establish an efficient vision of organization* comprises a set of actions relating to organization description, respectively description of successfully mission, basic strategies, performance criteria, the fundamental decision rules, ethical standards , valid for all.
10. The penultimate stage, *Development of an efficient implementation process* includes detailing of roles and of responsibilities of the Executive Board and managers, specific objectives, expected results and indicators, specific stages of action, programs, requirements of resources and sources, communication process, review, monitoring and correction procedures for determining the responsibilities, setting a budget of the plan.
11. Last stage, *Revaluation of strategies and strategic planning process* is actually the establishing of a prelude of a new round of strategic planning.

5. Strategic planning of NGOs – motivations

After this study, organizations engage in strategic planning for various reasons. Those who propose strategic planning attempts typically to persuade their peers with one or more of the following statements:

“We face so many opposing requirements that we need a process to establish our priorities.”

“We must clarify what we do well in order to make that work better and also we must establish what we might do again.”

We have a total quality management program in progress, now we have to "reinvent "and to "reorganize" ourselves. How can we be sure that all this effort is headed in the right direction?”

“We can expect a severe budget deficit next year if we not totally rethink the way we do business.”

“A number of our competitors in the private sector aimed our customers, we must find a way to win the competition.”

“The X problem presse us. We must find a way to solve it, otherwise we will have losses.”

“Our sponsors (or executive board) asked us to prepare a strategic plan.”

“We need to integrate or better coordinate the services we offer to those offered by other organizations.”

“We know that follows a change in management and want to prepare for it.”

“We want to use strategic planning to educate, engage and revitalize the board and staff.”

“Our organization has a shortage of funds, but we must still consider how we can have the greatest impact, we owe it to our shareholders.”

“Everyone deals with strategic planning today, it would be good to do it and we.”

What can be noted after the analysis of these statements is that any reason for which non-profit organizations do strategic planning, results similar benefits, among which it can be mentioned the following:

- promote strategic thinking and action which leads:
- to obtain information more organized for internal, and external environments, but also to the benefits they can get different target groups / various stakeholders, building the future direction of the organization;

- determining the organization's vital activities etc.
- optimization of the decision process due to focus on the most important problems which has results in:
 - making decisions easier for these problems and difficulties of decision factors;
 - strategies are formulated and communicated more easily;
 - making current decisions that depend on future consequences, and setting up a logical basis for decision making process to help coordination of the decisions resulting in different levels;
 - discretion exercised in different areas being under the control of their organization.
- improved performance and increased responsibility which are resulting from the first two benefits listed above.

6. Conclusions

Although strategic planning can provide all the benefits mentioned above, this does not mean that the organization will take advantage of it immediately, because planning is a set of concepts, processes and tools that help managers to think and act strategically. It can help organizations formulate and solve the major problems faced.

The Role of Foresight on National Economy

Ciprian I. Turturean
„Alexandu Ioan Cuza” University, Iasi
ciupan@yahoo.com

Abstract

The Foresight exercises on national level are often reminded in international practice. The most important reason why these studies have gained is the consumption of available natural resources correlated with the technologies used for processing them. Besides this there are added the globalization process and the concept of durable economy, which is often substituted by a new one, the concept of sustainable economy. All these arguments are meant to sustain the necessity of using the national Foresight Exercises, especially for the countries which have an emerging economy.

Keywords: Economic trends, Forecasting, Globalization, Sustainable Development, Foresight

J.E.L. Clasification: O 30, O 33, O 39

1. Foresight – Definition, Objectives and Functions

One of the first definitions of Foresight's is given by one of its parents, Martin B. R. [7]:

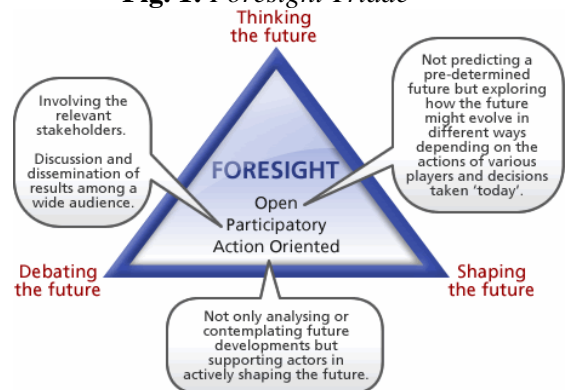

the foresight is the process involved in systematically attempting to look into the longer-term-future of science, technology, the economy and society with the aim of identifying the area of strategic research and the emerging generic technologies likely to yield the greatest economic and social benefits.

Foresight assumes that the future is not predetermined but it can be created or shaped [15]. This entails the assumption that the future can take many forms. Each form represents a possible future which we can access by following a series of more or less correct decisions.

The Foresight can be described as a mixture of Thinking, Debating and Shaping the Future (Figure 1).

Being aware of the importance of decisions and their succession in time, is the first step in trying to shape the future and to direct it into a desired form, called desirable future.

Fig. 1: Foresight Triade

Source: FOR-LEARN, 2005-7

Among the *desirable futures* will be selected a limited number of *possible futures*, called *feasible futures*, from which we will choose the one to be implemented into reality.

What gives the Foresight an action oriented basis (character) is the attempt to coordinate the implementation of decisions?

Foresight exercises can not be conceived without the participation and involvement of representatives, on one hand from the policy- and theory- making, and, on the other hand, from the beneficiaries of these decisions and theories, citizens or businessmen. This gives to Foresight a participative characteristic.

Because the foresight's results are obtained in a joint effort of representatives from different backgrounds, that gives to it mass-media and mediator properties. The mediating function comes from assuming the foresight results' by the participants, and media function is the result of an efficient dissemination in the participants' environment.

Foresight exercises have a multidisciplinary character as it involves

specialists from various fields of expertise, thus giving them a multiple perspective approach to the targeted issue.

Foresight is the term that brings together under its dome a large number of activities, methods and objectives. This forces us to formulate an approach as generally as possible on the Foresight's goals and objectives.

Foresight's goal is to identify, select and implement the developments that may occur in the society, in time, in order to yield the greatest technological, economic and social benefits.

Each of the three components, shown in Figure 1, constitutes three processes that succeed in a well-established order. Each process corresponds to one major objective.

These are the major objectives of foresight:

1. Identification of desirable and possible futures - by exploring the future;

2. Selection of possible and desirable futures, with a major impact on industrial competitiveness, on creating values and quality of life - by debating upon the desirable and possible futures and upon the developments that characterizes them;

3. Active and participatory modeling of the future, giving priority to the developments that have the greatest impact on technology, economy and society, in order to achieve the desirable future.

The *objectives* of a Foresight exercise must be clearly stated, internally consistent and (at least initially) avoid being too specific. This is important to gain widespread support for the exercise early on, although care must be taken not to promise too much to too many players. Ideally, the objectives should be debated by the key players in order to ensure early buy-in to the exercise [15].

The specific objectives of any Foresight exercise are [15]:

1. **Informing the policy-making** so that decisions taken by key actors in the commissioning body are more aware of longer-term developments are liable to interact with current policy decisions.[...]

2. **Building networks** that bring together people from different sectors and institutions involved with shaping the future [...].

3. **Developing capabilities** widely throughout a region or organization and develop a „Foresight culture”[...].

4. **Building strategic vision and creating a shared sense of commitment to these visions among Foresight participants.**[...].

Three functions of Foresight can be identified [15]:

1. *function of diagnostic* - helps us to identify the stage where we are;

2. *function of forecast/ prediction/ future anticipation*: - helps us to anticipate what might happen;

3. *function of advice/ recommendations*: - helps us decide what to do in certain situations.

2. Foresight and the Consumption's Evolution of Available World Natural Resources

The consumption of available world natural resources (CAWNR) has historically known variations based on technologies performance and size of the population. These culminated with the mankind problems about conservation, rationally use of the resources and the how these are distributed in the entire world.

The evolution of human resources consumption can be described by a logistic curve, as shown in *Figure 2*.

The literature mentions three major technological revolutions which have changes the mankind course and its behavior regarding natural resources: the *Agricultural Revolution* with its origins in the Near East (11.000 BC), the *Industrial Revolution* with its origins in Great Britain (1750) and the *Cybernetic Revolution* with its origins in The United States of America (1944).

Any kind of revolutionary technology which contributes to the exploitation of alternative resources, renegotiate [11] the upper limit of the human resources consumption and has as effect the delay of the depletion of available resources. These technologies represent the solution for mankind, but it's difficult to predict and requires a sustained effort from them.

The Foresight's role is to identify and accelerate the evolution of the emerging components designed to provide innovative solutions for our society. Without this systemic approach based on continuous

contact with reality, the evolution of the innovative technology and the environment which should enclose them will be very slow and will not prevent worldwide collapse in the near future.

Figure 2: Cumulative CAWNR evolution and the upper limit negotiated with technologies

Source: Turtorean C. 2011

3. Foresight, Consumption Economy and Sustainable Development

The consumption economy is specific for the third phase, shown in Figure 1. This concept, used for half a century and considered to be the solution to ensure economic growth, begins to show its reverse. Many of natural resources were consumed, due to a low processing efficiency, to produce nonperforming goods. In the second part of the phase IV a new approach is present, more responsible towards environment and resources exploitation. The alarm signal was given by the energy crisis 30 years ago. The term of sustainable development is very new in the international practice and it has been imposed on the Environment and Development Conference organized by United States of America in Rio de Janeiro (1992).

The most popular definition is the one given by the World Commission of Environment and Development (WCED) in the report *Our common future* known as Brundtland Report [14]:

sustainable development aims to satisfy the present needs without compromising the ability of future generations to satisfy their own needs.

However, sustainable development alleviates the oscillatory economic growth and tries to impose a healthy and constant rhythm, taking into account the real needs of

society, conserving resources and protecting the environment (Figure 3).

To give more importance to human desires than to all natural and human resources necessary to address their needs means to expose us to risks and not considering the errors that lead and brought the economy in ruins. [...] If, from false reasons, we prefer comfort to the detriment of the nature and of the agriculture-based economy, sooner or later the nature will put the man in the background [12].

Fig. 3: Scheme of sustainable development, at the confluence of three constituent parts

Source: <http://en.wikipedia.org/wiki/Sustainability>

In this context, Foresight is an important tool to identify the emergent components capable of ensuring a sustainable development. A better integration of foresight exercises can optimize the economic growth process by stimulating its optimal efficient components and by a political and economical support given to the active participants in economic life.

4. Foresight and the Emerging Economies

An economy can be considered emerging if we register a rapid economic growth but whose evolution is volatile [16].

Volatility in economic theory means risk and chance, at the same time.

The emergence of an economy, technology or market provides a favorable environment to identify and implement effective solutions. Emergency in an economy is relative and it relates to standard structures (guidelines) indicated by the industrialized countries [3].

For a trained, informed and experienced player, a volatile market may be, in time, a source of wining, while for a non-trained, non-informed and non-experienced player, a

volatile market may be fatal to him, excepting the case when chance, a fourth random component, chooses him as the winner.

The Foresight’s role in an emerging economy is major, as it ensures the acquisition of all three ingredients – training, information and experience. The fourth component, chance, is random and can act as free will.

By ensuring those three components so necessary to obtain performances in emerging economies, foresight become a necessity and it can reduce the negative effects of volatility specific to emerging environments.

To conclude, we can say that Foresight is a very useful tool for the managers who work in unstable environments.

Emerging economies have some features which can be obstacles for the Foresight’s promoters [13]:

Public administration and governments play an important role in every foresight exercise. The results of Foresight exercises should be included in government actions; otherwise Foresight exercises may not achieve their final goal.[...]

Loyalty is an important tool in the hiring process prior to the professional knowledge and expertise [8]. [...]

Coordination and cooperation between different ministries and governmental agencies is difficult.[...]

The time horizon set by foresight exercises is far beyond the interest of policy makers.[...]

Public administration in most emerging countries, including the CEE countries, deals with RDI in terms of restructuring. Furthermore, the ministries in charged with Research, Development and Innovation (RDI) are not so powerful and their position is very fragile in the government.

As a conclusion, it is difficult to create a coalition between public administration, government and key economic players in order to ensure quality results for the foresight exercises and their effective implementation.

5. Foresight and globalization

Jemala M. [6] makes a documented presentation on the evolution of globalization paralleled to the evolution of Foresight. Below we summarize the most important periods, moments and events of the globalization and Foresight evolution presented by him:

Table 1: Foresight and Globalization

Globalization		Foresight	
Periods (events)	Phase	Periods (events)	Phase
1490 (Chr. Columbus) 1913 (WWI)	1 st <i>Laissez Faire</i>	-----	Era of Forecasts
1913 (WWI) 1990 (www)	2 nd	1914 1956 (1-st HD)	1 st

Source: Jemala M. (2010)

Gheorghiu L. et. al. [5] show some features of the three generations of foresight activities:

- *First Generation: Foresight is here emerging from what are mainly technology forecasting activities, with the analysis driven mainly by the internal dynamics of technology. [...]*

- *Second Generation: Foresight projects seek to grapple with technology and markets simultaneously. [...]*

- *Third Generation: Foresight’s market perspective is enhanced by inclusion of a broader social dimension, involving the concerns and inputs of a broad range of social actors. [...]*

- *Fourth Generation: Foresight programmes have a distributed role in the science and innovation system,*

rather than being “owned” by a single policy sponsor. [...]

- Fifth Generation: A mix of foresight programmes and exercises, also distributed across many sites but in combination with other elements of strategic decision-making. [...]

Most foresight programmes at one time have contained elements from more than one generations [...].

There is no need for countries to gradually go through the five generations of foresight.

The globalization process has a drawback bigger than that of increasing the gap between developed and undeveloped countries and is represented by the stress caused by forcing the human beings to adapt to the speedy changes imposed by globalization [4].

Scholte J.A. [10] defines globalization as the progressive erosion of the relevance of territorial bases for economical, social relations and processes. Thus, globalization is based on 2 components: a technological component which provides the infrastructure for globalization and a political one which ensure smooth circulation of information, goods and people between countries.

Just like to drive at high speeds is necessary a computer assistance for the pilots, in the same way, in order to cope with the shock of change, we must use tools to anticipate what will happen and to allow us to prepare for it. Foresight with his suite of quantitative and qualitative methods can assist society to adapt more easily to the change and to achieve its future goals.

Another drawback of globalization is that the whole process is based on the developed economies which have a leading role and their structure, behavior and efficiency are a model for less developed countries.

Most countries involved in the globalization process will try to converge their own economies to leader economies, thus fixing the main parameters for a desirable future. The same thing happens on technological and social level, this easing the Foresight exercises task of choosing a desirable future.

We can distinguish three categories of Foresight exercises:

1. *Replicated Foresight exercises*-their function is to find ways to reach the level of

the leader economy / society/ technology. Therefore the function of these exercises is to replicate Foresight existing models.

2. *Innovative Foresight exercises*-their function is to create new and desirable futures. Therefore, Foresight function is to create desirable futures pioneering certain areas.

3. *Alternative Foresight exercises* - their function is to control and stabilize the routes to desirable futures already made by a previous replicated or innovative Foresight exercise.

Finally, Foresight is an useful tool for policies in solving the puzzle which helps national economies and technologies to be shaped as needed so that they can integrate in the globalization landscape.

6. Conclusions

As the environment becomes more uncertain, the forecast programs lose the efficiency in advantage of the foresight programs.

It is important to use tools that allow us to anticipate things to come, so the shocks of changes should not surprise us! National foresight programs are such a tool for training the nation for future challenges.

A Pilot Study on Motivation in Academic Research Testing Validity and Reliability of the Instrument

Ursachi căs. Horodnic Ioana Alexandra
„Al. I. Cuza” University, Faculty of Economics and Business Administration
ursachi_ioana_alexandra@yahoo.com

Abstract

This article is a short presentation of the motivation in academic research. It presents the definition of motivation, some studies in motivation in academic field, scales which measure the professors motivation and a pilot study. The pilot study is conducted to test the validity and reliability of the instrument.

Key words: academic motivation, pilot study, validity, reliability

J.E.L. classification: J21, J23, M30.

1. Introduction

Motivation, was initially studied by researchers in psychology, and now, is one factor which has sparked the interest of persons from various fields. Marketers turn to studies motivation in several circumstances: when they want to anticipate consumer behavior, when develop or promote a product, when they want to establish strategies for a product or a company etc.

The word "motivation" comes from the Latin word "movere" which means to move, to do [1], [2], [3].

Currently, the concept of motivation has more than 140 definitions, most of those being centered on the mechanism of activation and supporting the effort to achieve certain needs or aims [4]. However, paradoxically, in the early twenty-first century the domain is considered being atheoretical, contestant and poorly predictive [3].

One of the simplest definitions of the concept is the following: motivation can be defined as a force that makes us move, act or do things [1]. Intrinsic motivation refers to engaging in an activity only for the work

itself. Extrinsic motivation refers to engaging in an activity to get a reward separable from the activity itself [5], [6], [7].

2. Studies in academic motivation

In literature there are some studies that explored the influence of different variables on motivation to research: money and prestige [8]; motivating factors and demotivating factors [1]; the assessment of work done, good working conditions, pay, assistance in case of personal problems, involvement in decision making, job security, loyalty to employees, free choice of subjects to teach, promote and professional development and teaching field [9]; intellectual challenge, social status, career advancement, professional recognition, contributing to the emergence of new knowledge, personal pleasure, material rewards, participation in professional organizations and the development of processes/ products [10].

3. Scales for measuring the motivation of economics professors

The research is part of the job duties of university professors. To investigate teachers' motivation to do research I had identified four adequate scales that measure the motivation at work: WOFO - Work and Family Orientation Questionnaire (Spence & Helmric, 1983 apud. Fairchild et. al. [11], WPI - Work Preference Inventory [12], WTMST - Work Tasks Motivation Scale for Teachers [13], MAWS - Motivation at Work Scale [14].

After analyzing the items of these scales, in accordance with the objectives of the research I chosed WPI scale.

WPI has 30 items. Those items are written in the first person, and respondents are asked to indicate the extent to which each item

describes them (on a four point scale, from 1= never or almost never true about me to 4= always or almost always true about me). For a complete list of items see Amabile et. al. [12]. For translation I used the two-way translation method.

4. The pilot study

The questionnaire was applied to 32 teachers. The sample is one of convenience, non-probabilistic. Using the SPSS 9 software the internal consistency is was tested.

The internal consistency generally range between zero and one, but there are also cases where anomalous results are obtained under zero.

A generally accepted rule is that an α of 0.6-0.7 indicates an acceptable confidence level, 0.8 or greater indicates a good or very good. High levels (0.95 or higher) are not necessarily desirable because it indicates that the elements may be redundant [15].

However, Nunnally (1967) cited in Glynn and Woodside (2009) states that values of Alpha between 0.5 and 0.6 are acceptable for early stages of research [16].

Table no. 1. shows Alpha coefficient values before and after removal of items. According to Alpha coefficient values , there have been proposed for deletion items:

- Challenge - QI22 "I want my work to give me opportunities to develop my knowledge and skills" - after the elimination coefficient increases from 0.32 to 0.55;
- Compensation - QI32 "As long as I can do what I like, I'm not interested how I get paid" - after the elimination coefficient increases from 0.10 to 0.50;
- Social desirability - QI13 "Sometimes I'm litter" - after the elimination coefficient increases from 0.2 to 0.49.

As shown in table 1. the Alpha coefficient values falls into an acceptable range for a pilot study after purification scale.

Table no. 1. Alpha coefficients

Latent variable	Initial Cronbach Alpha	Cronbach Alpha after eliminating items
Pleasure	0.58	0.58
Challenge	0.32	0.55
Recognition	0.69	0.69
Compensation	0.10	0.50
Social desirability	0.20	0.49

(Source: author's calculations)

Confirmatory Factor analysis was used to check the capacity of each indicator to capture dimensions of latent variables.

This aims, once more, increased confidence and validity of the scale. I checked the adequacy of the measurement model before and after exclusion of items proposed for elimination based on coefficient Alpha.

Analysis was performed in the IBM SPSS AMOS 20. For the purposes of this analysis was necessary to establish the type of scale: the formative or reflective. In the present situation we are talking about reflective models where the indicators reflect the latent variable, ie a change in the latent variable will cause a change in each indicator.

The tests most frequently used for testing the adequacy are GFI (goodness-of-fit index) and RMR (root mean square residual). Experts recommend a GFI value of the coefficient at a level greater than 0.9 and a value of RMR as close to 0 [17].

As shown in table no. 2. for latent variables "pleasure" and "recognition" based on coefficient Alpha I decided not to remove any item. However GFI values recorded excellent values of over 0.9. For the other three latent variables GFI values have increased considerably, reaching a level of 0.915 for variable "compensation" and for variables "challenge" and "social desirability" value close to 0.9 (0.897, 0.854 respectively).

Although for the latent variables "challenge" and "social desirability" the results are not excellent (but have a value close to the value 0.9), scales shall be kept because the problems can occur due to small sample.

Table no.3. Reliable analysis and Confirmatory analysis results

Latent variable	Initial GFI	GFI after eliminating items	InitialRMR	RMR after eliminating items
Pleasure	0.905	0.905	0.89	0.89
Challenge	0.779	0.897	0.167	0.157
Recognition	0.963	0.963	0.078	0.078
Compensation	0.876	0.915	0.055	0.053
Social desirability	0.793	0.854	0.075	0.070

(Source: author's calculations)

A more complete analysis of the adequacy of the model will be made in further work on a larger sample.

5. Conclusions

In conclusion, there are many ways to measure teachers' motivation. Choosing between them is a difficult decision. Even after the choice is made, there are many tests to run to ensure the validity of the used instrument. This study presents a summary description of the domain analyzed and some instrument test results.

Characteristics of Quality Management in Tourism Services

Voicu Oana-Luminița

“Constantin Brâncoveanu” University Pitești, Department of Finance – Accounting
voicu_l2003@yahoo.com

Abstract

Quality has become a strategic element of organisations' management, as it is at the basis of product and services competitiveness domestically and internationally.

Quality must be understood by the superlative of excellence, signifying the maximum possible satisfaction of the customer's needs in a dynamic context.

Services represent one of the sectors of modern economy that register significant dynamics.

Achieving customer satisfaction is essential to developing or maintaining business. Thus, current trends in quality management lead to integrated solutions for quality insurance.

We notice the direction towards adopting the concept of total quality management, in which the emphasis is on the participation of the entire staff to achieving and improving the quality of tourism services.

In all tourist service companies we notice the need to align with the EU requirements on quality.

Keywords: tourism, quality, management, certification, competitiveness.

J.E.L. Classification: L83.

1. Introduction

In the context of the growth of the customers' demands, of the society in general, and of the market globalisation, quality has become an important factor of products and services competitiveness.

At macroeconomic level, the quality of products and services is related to the quality of life, determined by the technological development level. Therefore, the increase of the consumers' demands has led to more and more restrictions, regulations and standards related to people's protection of life and

health, as well as to environmental protection.

In the market economy, the credibility of a product or service, namely tourism, becomes even greater if its supplier also has an implemented and certified quality management system as required by the ISO international standards.

2. Vision on quality in tourism services

Services are one of the most dynamic sectors of modern economy, an extensive interface between the individual and the organisation of society. To meet the consumers' needs, services are in constant evolution and diversification.

Knowledge of the structure and essence of the needs met by services are important in defining quality.

The offer of services has certain features given to a large extent by its predominant material character.

The definition of quality should include the fact that environmental issues interferes with the services sector.

In a competitive economy, the quality of consumer services is important for the following reasons:

- increasing customers' requirements;
- showing fierce competition;
- identical attitude of services users with the customer's in general – the need for consideration through offer customisation.

The design of the ISO9004-2 standard states that a service may include two components:

- material;
- immaterial.

The higher the share of the immaterial components is (for example basic service, accommodation), the lower the weight of the material components is (facilities, means of transport, accommodation etc.).

Due to intangibility, the quality of a

service is difficult to assess before the customer's purchase, the delivery and the consumption taking place simultaneously.

What makes it more difficult to assess the quality of services is the approximately 10 times lower number of the quality characteristics as compared to those of a material product [5].

However, the ISO standards highlight two important aspects related to services, namely:

- the quality of services largely depends on the qualifications and motivation of the company's employees;
- unlike the quality of material goods, the quality of services is impossible to check before reaching the customer. Usually the service reaches the customer right in the moment of providing it so that the possible qualitative deviations cannot be corrected.

Moreover, in the field of tourism services, the requirements towards quality register a high level of exigency due to certain features specific to providing the service: [3], [5]

- inseparability of services provision from the provider's human and professional quality;
- continuous adaptation of services provision to the customer's needs and personality;
- increase of the quality level of the tangible components (price, environment, equipment characteristics) accompanying the service provided;
- the price paid by the client when there is a match between his/her expectations and the quality of the services provided, expertise, knowledge, experience, environment, reliability, courtesy, honesty, waiting time, duration of orders and their execution.

The quality of the service depends on the customer's behaviour. The tourist services market can be influenced by the customer's reactions to the quality of the performance, its costs, the conditions and time of the performance, of any intention to change the provider.

Unlike other categories of services, the tourist services consumer's active participation to the service consumption differs depending on the nature and content of the various types of tourism.

The modern businesses have focused their

quality policy on the need for excellence in service.

Currently, the European Union's vision on quality can be highlighted through the following equation: performance + associated service performance = customer satisfaction = confidence.

In tourism services, customer satisfaction includes:

- correct, complete and accurate information;
- a favourable impression at the meeting with the staff of the service provider;
- availability to the customer and prior treatment to customer's requirements;
- a reasonable price and getting the expected result [4].

3. Improvement of service quality - the ultimate goal of quality management in a tourism-oriented organisation

Together with the rapid technological and socio-cultural changes, the methods of insuring the quality of products and services have evolved as well.

Internationally, various approaches have appeared on the place and importance of the quality objective in the evolution of a company's activity.

Thus, the current trends in quality management lead to integrated solutions of quality insurance. We notice the direction towards adopting the concept of total quality management (TQM), whose basic principles are considered the following:

- customer orientation and meeting his/her requirements;
- quality is the first, through preventive activities;
- continuous improvement;
- involvement of the entire staff to achieve and improve quality.

Achieving customer satisfaction is essential for the development or maintenance of the turnover and of the provider's profit.

In this context, every organisation in Romanian tourism should conduct an analysis of the quality of the activities it performs in order to:

- establish the qualitative level of the service provided;
- know the strengths and weaknesses of the organisation;

- formulate decisions to improve the quality of the tourist products offered.

Improving the tourist services quality is closely linked to improving the management of tourism businesses operating on the Romanian market. In the centre of its concerns, quality management should consider the following aspects:

- knowing the customers' expectations;
- teamwork;
- working with partner organisations;
- promoting fair employee motivation;
- knowing the degree of customer satisfaction.

Customer satisfaction must be compatible with the standards and professional ethics specific to the tourist organisation.

In this sense, the human component, the one targeting customer satisfaction, is the focus of quality management. In an organisational approach of the service providing business, relational quality becomes a competitive advantage. In the context of this approach, the entire staff of the organisation (contact staff, operational staff, functioning staff and senior management) must act for the person in the front line, the customer [3].

Continuous improvement is a process of increasing the organisation's efficiency in achieving the policy and objectives in the field of quality [2].

4. Quality management system certification in tourism services

SR EN ISO9001:2001 standard – “Quality Management Systems. Requirements” represents a means of monitoring and controlling of the quality and benefit levels of an organisation [1].

The need for its application is motivated by the fact that it brings benefits to the organisations that wish to certify the quality management systems through customer orientation, requiring a permanent responsibility of the managers, developing a positive attitude of the staff towards the continuous improvement of the activity.

In all types of accommodation, food and entertainment it is necessary to align to the EU requirements on quality. This alignment involves, among others:

- acquisition and harmonisation of the

existing standards in the field of tourism and ecotourism;

- setting certification bodies of the compliance of tourism products and services in the field of tourism and ecotourism;
- developing inspection bodies in this field;
- design, development and implementation of management systems for the quality of services, tourism and ecotourism products in every tourist location;
- quality management system certification for the quality of the services implemented in every tourist location;
- database development for tourism, services and products quality management systems;
- continuous training of the tourism professionals;
- organising experience exchanges;
- implementation of HACCP requirements in all tourist locations and their certification;
- mutual acknowledgment of the Romanian and foreign certification bodies operating in tourism.

In the European Union the quality management system certification and the certification of persons are not required by law but they may become mandatory through the decision of public authorities.

The businesses and organisations in Romania that have trade relationships with the economic agents from the EU countries are recommended to certify the compliance of their products, services and quality management systems with the EU regulations and with the contracts signed with their partners.

5. Conclusions

Tourism is an industry in constant expansion, both nationally and internationally. This requires special attention from the economic agents due to the specific features in which it takes place.

The quality of the services and even the quality of the tourist product, overall, represent weaknesses of the field, also highlighted by the business partners.

Applying the concept of service quality implies the existence of an organisational culture and appropriate management

education.

The multitude of components involved in tourism product development and marketing decisively influence the approach method related to competitiveness. Given that the tourist product is addressed to the customer for a longer period of time, any deficiency of one component affects the overall level of competitiveness.

Therefore, it is important to insure a consistency between the components of the service performed, in order for the quality to be finally total.

It is also necessary to adapt the small providers of tourist services, which provide most of the local tourism offer diversity, to the demands of certain customers much better educated related to their rights as consumers.

Fast Food Paradox: Freedom and Cultural Imperialism

Lelia Voinea

The Bucharest Academy of Economic Studies, Commerce Faculty

lelia.voinea@gmail.com

Alina Filip

The Bucharest Academy of Economic Studies, Marketing Faculty

filip.alina@gmail.com

Abstract

Fast food is often regarded as a form of cultural imperialism. Fast-food products, originating in the U.S.A., are considered by the critics of this phenomenon as responsible for eroding the interest in local food traditions and affecting their continuity. Based on the results of some researches realized at international and national level, the paper highlights the main issues underlying young people preference for fast-food. The consumption of fast food is associated with the idea of independence and fun with friends and also being away from the parents' control. In addition, in food choices, young people are seduced by the sensorial dimension, being less interested in the nutritional benefits. This paper has an educational character for the new generation of consumers, because it presents an analysis of the nutritional profile of fast food products and highlights the imbalances and risks for consumers in case of excessive consumption.

Keywords: fast-food, mcdonaldization, cultural imperialism, new generation of consumers, nutritional value, risks

J.E.L classification: O 14, O32, I 31

1. Introduction

Fast food is not a recent phenomenon. The emergence and further development of fast-food industry is closely linked to hamburger, a product whose popularity has increased over time, so that it is now an integral part of the offer of any fast food restaurant.

The American style of eating hamburgers was officially registered in the U.S.A. in 1904, during National Fair in Saint Louis, and the first pizza shop was opened a year

later in New York. These moments can be considered decisive for the introduction of fast-food style, although occurred fifty years before the McDonald brothers establish fast food system, marking in this way the official debut of the fast food industry, which expanded from North America throughout the world and became a real phenomenon [16].

McDonald's is today the world largest and most popular fast food chain restaurants, having over 32000 restaurants in approximate 120 countries.

The main determinants of the fast-food industry development are considered to be the change of the lifestyle and the habits of the big cities residents, the increasing of buying power, the emergence of a middle class, the development of the modern trade (emergence of hypermarkets and shopping centers).

The paper presents the dominant themes in the process of mcdonaldization and explains the association between the phenomenon of fast food expansion and cultural imperialism all over the world.

Also, in order to explain the preference of the new generation of consumer for fast food, are analyzed the results of some researches which were conducted to highlight the key factors in food choice of the young people.

Finally, is realized an analysis of the nutritional profile of the fast food products which emphasizes the nutritional imbalances and the consumer health risks in case of an excessive consumption.

2. Mcdonaldization and the rise of the American cultural imperialism

McDonald's restaurant is one of the industries whose development had a great influence on the contemporary society, so that today, it talks more and more about the

mcDonaldization of the society. The term "mcDonaldization" is defined as the process by which the principles of fast food restaurant began to increasingly dominate many sectors in American society and the wide world [16].

The assembly band, the Taylorist scientific management and Weberian bureaucracy are the main precursors of the mcDonaldization, which currently affects not only the catering sector, but also other sectors of the society: education, work, health, travel, leisure, diet, politics, family etc.

McDonald's has made its footprint more and more in American society, but also extended its influence beyond, becoming more than a leader, as wanted Ray Kroc, the company founder. McDonald's is exercising now its dominance on the international market of fast food. Thus, the existence of some standardized American networks of fast food in many other countries of the world wide can be considered as one of the most important indicators of mcDonaldization.

In addition, many countries have developed their own versions of the McDonald's restaurant. The success of McDonald's restaurant in Russia, for example, led to the development of an indigenous fast food restaurants named "Ruskoie Bistro", which fits on the lifestyle and local traditions. Another example is India, which has developed a fast food chain, named "Nirula's", offering hamburgers with sheep meat and also another traditional Indian dishes. Thus, the existence of indigenous clones of these systems represents another indicator of the society mcDonaldization.

Ritzer (2003) reveals five dominant themes in the process of mcDonaldization:

- *Maximum efficiency* is the main goal of a fast food restaurant. Efforts in this direction, mainly applied by organizations for their own interest, have resulted in: optimization of various processes, simplifying products and services and the use of customer to perform work that normally would be carried out by the employees.
- *Calculability* is seen in the tendency to transpose in numbers and the production and the services and concentrating on quantity (fast obtaining of large quantities of products) and creating the

illusion of high quality, when in fact quality is poor.

- *Predictability* involves keeping under control of some elements such as: discipline, systematization and standardization, in order to obtain similar products anytime and anywhere. Predictability is provided in various ways: creating predictable environments, realizing predictable interaction with customers, obtaining predictable behavior of the employee, making predictable products and processes and reducing hazards and nuisance. This kind of predictability approach lead inevitably to the transformation of the activities in a series of routine acts, meaning repetitive work, which not involves too much intellectual effort.
- *Control* is achieved by replacing the human being with non-human technology, because man can be a major source of uncertainty, unpredictability and inefficiency. This is true both for those working in the system (employees) and for those served by it (customers). Technology have been developed and applied to increase productivity and reduce costs. Replacing the human being with machines is the control climax over people, who thus can not be unpredictable, because they are not directly involved in the process.

Generally, all mcDonaldized systems have some distinctive features, as follows [16],[17]:

- they provides customer and employee efficiency and predictability;
- they describe themselves through an avalanche of superlatives in supporting their interests (they cultivate the image of an environmental friendly company and they declare its social responsibility);
- affect the habits of the society as a whole by undermining some norms deeply rooted in local cultures (for example, in Japan - undermining the interdiction to eat from standing and to drink from the bottle);
- represent a symbol of cultural imperialism and of the ascendant of American culture on the world.

Critics of fast food are associating the expansion of this phenomenon with cultural imperialism. This is the process by which a

culture, society and nation impose their cultural practices and institutions to another culture, with the aim to erode or even destroy the traditional elements of the other.

Approached from historically perspective, cultural imperialism often supported and also, was supported by other forms of imperialism, such as economic and political imperialism. In the current era, the institutions of colonial occupation by a foreign government are obviously much less frequent than in the late XIX and early XX century. However, the imperialist cultural relations can exist even in the absence of other forms of imperialism, being fueled by the actions of multinational corporations.

The cultures which face with imperialism often feel the erosion of their traditional elements as a deletion of individual identity and a reduction of the distinctiveness. Critics of cultural imperialism and supporters of local cultures have used, over the years, a variety of methods to counter this threat. The example of food products is particularly illustrative. Taking into consideration the importance of foodstuffs in numerous cultures, the efforts to protect them vary from the official government policy to various guerilla actions [9].

Also, there are numerous structural forms of resistance. One of the best known and most important organization, which emerged as a response to the quick spread of fast food culture is SlowFood organization, founded in Italy by Carlo Petrini, which subsequently spread across the world.

Some countries, through the government policy, tried to limit the threatening of cultural imperialism on the traditional foodstuffs. An relevant example was the initiative of the Ministry of Culture from France, which, in 1989, created a separate structure, dedicated to the culinary arts, whose primary goal is to combat the spread of fast food culture, perceived by the French government as a serious threat.

Regarding the fast food consumption, the U.S.A. won the first place. Statistics show an alarming situation, because around 25% of the U.S.A. population are obese (almost 40% of children and adolescents are overweight). This frightening reality can be considered almost an epidemic of obesity, which is probably the consequence of the high popularity of fast food restaurants (over

300000 fast food restaurants in U.S.A.) [10],[19].

In Romania, fast food restaurants have appeared in the '90s and quickly integrated in Romanian landscape, triggering a real phenomenon. Apart from the changing habits and patterns of life style of residents from the Romanian big cities and the increasing of purchasing power, another factor that supported the expansion of fast food has been the development of modern commerce (hypermarkets and malls proved to be opportunities for the expansion of the national and multinational fast food chains). In addition, subsidiaries of famous multinational chains of fast food have appeared in various institutions, train stations or subway stations.

Eating in fast food restaurants became a habit of Romanian contemporary lifestyle, especially among the new generation of consumers, obviously an unhealthy dietary behavior, which, together with the lack of physical activity, is in a perfect accord with the trends of capitalist society [4].

3. Fast-food - a symbol of independence among young people

Fast food style is very popular among teenagers all over the world. Approached in terms of eating behavior, teenage can be considered as a transition from a stage when parents' control prevailed to another, characterized by an absolute personal control over the type of food eaten, their frequency and quantity. Besides, children raised in a single parent families or families with both parents actively involved in work, is "enjoying" a weak monitoring of eating habits.

A study realized by George and McDuffie (2008) [8] highlights the considerable influence that young people have on their food choices. Aimed at identifying decisive factors in guiding the food choice of young people, the study showed that the taste is the characteristic which has the critical role.

This observation is common to many studies (Beasley et al. 2004; Louis et al. 2007; Davis and Carpenter 2009) [2], [5], [11] which demonstrate that in the attempt to change the food behavior, young people are slightly willing to make compromises on taste.

Another study, realized by Popescu et al. (2010) [14] points out that the new generation of consumers tends to generalize the role of sensorial properties and to neglect or even disregard the nutritional profile in the food choice and quality perception. The authors explain this feature of the alimentary behavior of young people by the fact that they have formed the eating habits during the time of the maximum boost in the food industry, being in general accustomed to eat ultraprocessed industrial foodstuffs, which can be characterized by special sensorial properties, but with a nutritional profile often unbalanced. The images of these foodstuffs are stored in the memory of the young generation of consumers. Therefore, the possibility of gaining its knowledge, which implies the comparison between the perceived images of the foodstuff and those from memories, is obviously limited. So, young people prefer foods with artificial taste, because these kind of products compose the prevalent foodstuff offer of today.

Teenagers prefer refined foods, rich in saturated fat and sugar and they are eating fewer healthy foodstuffs. Eating healthy is associated with parents' control and with the idea of "living with parents", while fast-food style is associated with the idea of independence, fun with friends and being away from home [2].

Another explanation of the special attraction of young for fast-food lies in the designing of fast food products in such a way that their consumption is driven directly by hand, without using cutlery, which contributes to a much stronger olfactory stimulation. This, combined with an important mobilization of tactile and visual senses, though it seems to indicate a regression to some childish habits, when contact with food are operating in a more direct way, leads to the conclusion that food fast products simultaneously address to all senses, trying to satisfy in a larger extent [15].

Although fast food products are characterized by high sensorial value, nutritionists point out that they are very unhealthy, exposing first the consumers to a high risks of energy intake and lack of variety.

Fast food products are full of empty

calories, which come mostly from the saturated fat and sugar, giving the feeling of satiety for a while, but not sustaining the effort of the human body throughout the day. This is one reason for that consumer feels the need to eat more and more.

Many of the ingredients composing the typical menus of fast food restaurants contain large amounts of fats, especially saturated fats (French fries, meat, cheese). Nutritionists recommend that up to 30% of daily energy needs to be covered by fat. In general, this limit is exceeded by about 10%, but people who eat fast food usually add to them many other percents. In addition, these products are fried and in this process raw materials incorporate large amounts of harmful fats (trans fats) and other potentially carcinogenic substances resulted from the heating of the fats at the high temperature (acrolein and acrylamide) [18]. Besides, all these dishes are usually heavily salted (salt content of a typical fast food menu is much higher than the daily recommended amount of 1,8 g) and seasoned with spicy sauces. Fat in association with salt make all foodstuffs tasty and palate pleasant and the ubiquitous presence of these components in fast food products explains their universal success.

But, on the other hand, fast food products are poor in vitamins and minerals, because the menus contain only very small portions of fresh fruit and vegetables. In addition, sandwiches, croissants, hotdog, pasta is almost exclusively refined, thus having no dietary fiber and other essential micronutrients (which can be found in whole grains) [18].

Fast-food products contain many of dangerous food additives: coloring, flavoring (one of the most dangerous food flavorings, used widely in fast food, is monosodium glutamate - E 621), synthetic sweeteners (such as saccharin, cyclamat, aspartame, acesulfame K and sucrazit), preservatives, acidity regulators, stabilizers etc.

To support the above statements, we have analyzed the composition and the nutritional value of the Big Mac sandwich, using the information provided on the McDonald's website. Since 1968, Big Mac has become the symbol of McDonald's, being the preferred product of customers. It contains two slices of beef, lettuce, onions, pickles, cheese and Big Mac special sauce. All these

ingredients are arranged in a bread roll with sesame seeds. Food additives included in Big Mac are: the bread roll - Bread improver (E300), the slice of Cheddar cheese - Emulsification salts (E331, E452) and coloring (E160a, E160e), the Big Mac sauce - Stabilizer (E415), the pickled cucumbers - Preservative (E211) and Acidity regulator (E327) [20].

The Big Mac sandwich has 27 g of proteins, 25 g of fats and 40 g of carbohydrates, which resulted in an energy value of 525,8 kcal ($4.1 \times 27 + 4.1 \times 40 + 9.3 \times 25 = 525,8$ kcal).

Taking into consideration that the average daily energy need of a teenager (who is exercising less) is 2500 kcal, we can observe that just by eating a Big Mac sandwich, his energy need is covered approximately 20%. If Big Mac is consumed along with a large portion of French fries and a soft drink (always present in the fast food menus), the energy value can reach over 1200 kcal, thus covering of almost 50% of the daily recommended need. However, while such a menu can be quantitatively cover the energy requirements recommended by nutritionists for the lunch meal, in terms of nutritional quality it is unbalanced, because it not contain the raw materials (such as vegetables, fruits and whole grains) providing the essential micronutrients (vitamins and minerals) and also fibers.

4. Conclusions

Even fast food is one of the most spectacular innovations in history, a type of food for everybody, regardless of age, sex or culture, the excessive consumption is considered by nutritionists as responsible for obesity, which become the second cause of the mortality all over the world, after smoking [15].

Fast-food products are characterized by high sensorial value, due to the widespread use of food additives, but they have a very unbalanced nutritional profile. Fast food products are not authentic foodstuffs, having a very high intake of empty calories that are unable to support the body's effort. Nutritionists unanimously agreed that fast food products have a poor nutritional quality, because, on one hand, they contain large amounts of fat (especially saturated fat), salt

and sugars and, on the other hand, low amounts of vitamins, minerals and fiber.

Although public interest groups have addressed over time many critics (especially related to consumer confusing about the nutritional quality of products, the marketing focused on children, the providing of "super size" offers which encourages overconsumption), when they appeared in another cultural context, American fast food companies have been welcomed by some members of the local culture, being perceived as a symbol of modernization and progress [6], [7]. Especially young people are attracted to this type of food, because they are more vulnerable to the effects of advertising, considering their parents as old fashioned when trying to guide them to a healthy diet.

The technological development, the economy and speed have contributed to the popularity of fast food industry all over the world. But, their misleading offers are misleading the consumers. Under the pretext of saving money, the consumer is encouraged to take an entire menu (for example: a serving of French fries, a hamburger, a carbonated drink and a dessert), being determined, in fact, to add at a meal at least 200-300 kcal and thus, the hypothesis on obesity is confirmed. Unfortunately, the reason to buy cheap foodstuffs such as fast food products, is bringing over time significant financial harm to consumers, because the savings that he would make it is eroded by subsequent expenditure, caused by the serious health damages (obesity, diabetes, cardiovascular disease, cancer etc.) of the regularly consuming of these products with a very unbalanced nutritional profile.

This mindset can be changed only by correct information, taste education and also by orienting the consumers' demand toward traditional foodstuffs, which are able to provide authenticity and nutritional benefits [13].

The Role of Teams as Organizational Structures in a Global Organizational Context

Zoltan Raluca

„Ștefan cel Mare” University of Suceava,
ralucaz@seap.usv.ro

Abstract

The flexibility that modern companies must show in regard to global market entails the recourse to work teams which are multicultural adapted and aware of their role and place in the overall structure of the organization. The technological changes along with the customer needs diversification require the awareness of the influence of organizational structure on team members as well as the influence of teams on organizational structures and organizational context. The present paper aims to point out the importance of teams in the modern organization from the perspective of organizational context and organizational structure.

Key words: teams, organizational context, organizational structure, self-managed teams, team-based organization

J.E.L. classification: L1, L2, M1

1. Introduction

Regardless the approach of team work as a particular type of group, the overwhelming majority of authors agree that all work teams are groups, but not all work groups are teams. Team work is a particular type of small group, along with committees, task forces, departments and councils. Team is a group, but the reverse is not true. [1] A group consists of people working together, but one can work without the other. A team is a group of people who can not work, at least not effectively, without the other members of their team, [2] and team members are held together by their interdependence and their need to collaborate in order to achieve common goals.

These distinctions between work groups and organizational teams necessarily require

the approach of teams in organizational context and not just the focus on team tasks and roles of team members. This means a teams approach as a particular type of organizational component, often temporary, with well determined role in the sequence of processes and activities. We say “temporary” because in the global economic environment the only constant is change and this requires a continuous readjustment of organizational structures taking into account the products, markets and customers in accordance with team members work skills.

2. The influence of organizational context on team functioning

The organizational context has a significant effect on how the teams perform optimally. [3] Teams can be used to improve the organizations operations, but they are sensitive to the organizational environment and require appropriate conditions to carry out successfully their activities.

The context in which team develops may include the organization overall strategy, its structure of authority, technologies, physical working conditions, management practices, formal rules, the quality of management, organizational rewards and penalties. [4] All of this is reflected in the organizational culture and is materialized in the support that organizational culture provides to the teams.

Thus, the probability of teams to be successful is higher in organizations with a supportive culture that encourages open communication and collaborative effort [5], situation in which the power and responsibility are assigned to teams so that they can control their own actions. This is because although the use of teams can help to change organizational culture, this change can be difficult to initiate when the limits are imposed by the existing culture.

Yet, there are companies for whom team spirit and teams building represent even a part of organizational culture being that a powerful culture encompasses team features, respectively: people work together, have common values and make decisions towards achieving the organization goals and objectives. For example, Microsoft employees are empowered to perform duties while the company encourages team spirit and puts less emphasis on hierarchy. [6]

Then, there must be provided to the team different modalities of organizational support in order to help them to operate more efficiently. Hackman and his colleagues concluded that there are six main areas in which teams need support from the organization: purpose, resources, information, education, feedback and technical assistance. [7]

Thus, teams perform their tasks more efficiently when they have clear objectives and well defined tasks, and must be provided, at the same time, with adequate resources, including financial, staffing and training support. Teams need valid information about their organization in order to underpin better decisions, to coordinate their efforts with other organization members and to plan forthcoming changes. Finally, teams must be provided with technical assistance and assistance related to group processes because they need technical support to solve problems and mediation to deal with interpersonal difficulties.

The building of high performance team requires efforts both from the team and the organization. To improve the way in which its members operate, a team needs feedback regarding their performance and a spur for change. To some extent, the team can evaluate itself, and its members can provide mutual support, but a high performing team requires feedback from the organization and rewards for outstanding performance. Without such feedback team members will not focus on the objectives that the organization has set for the team. [8]

Taking into account the perspectives offered by the organizational analyses, we can say that the William Ouchi's "Z" model is the most appropriate for the successful use of teams in the organizations that working nowadays in a highly turbulent global economic environment. „The manager

specific to "Z" theory aims to achieve equalitarian relationships between employees, replacing the hierarchic line management with self-management, generating a strong engagement, loyalty and motivation among employees." [9] Then, the organization of type "Z" "is a culture of consensus, a community of equals who cooperate with each other in order to achieve common goals. Rather than rely exclusively on hierarchy and direct control of the behavior, it is based on commitment and trust". [10] These features will be an essential competitive advantage for the organizations that aim to achieve success in a global market to the extent that they will be found in the relationship between organizations and their teams.

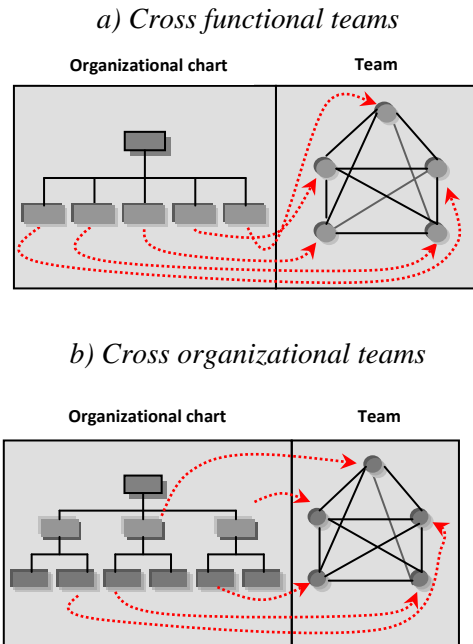

3. Type of teams within the organizational chart

In relation with organizational structure of a company, we emphasize two ways of building teams, frequently found under various names (process improvement teams, autonomous teams, task forces etc.)(figure 1); in this case it is important the mechanism through which employees are selected from different "areas" of organizational chart and the objectives or tasks that must be performed by teams constituted in this manner are less significant: [11]

- a) *cross functional teams*: consists of members who traditionally work in departments located at the same hierarchical level, and this kind of team is called to fulfil a specific task under authority of a formal leader; can be included in such teams also external parties, such as consultants, experts, etc.; teams of this type is characterized by the temporary formation – that means its members will return to the original department – and will be made to resolve unconventional problems etc.
- b) *cross organizational teams*: team members are selected from different hierarchical levels to deal with clearly stated objectives and will work for limited periods of time under the authority of an appointed manager; this team is also found in practice under the name of task force and is build for atypical situations from the organization's life (an accident,

a crisis, a new product or service designed, an advertising campaign etc.).

Figure 1. The organizational chart as a “sum” of “n” teams and ways of building teams for diverse problems

Source: Huczynski, A., Buchanan, D., *Organizational Behaviour. An Introductory Text*, 4th edition Prentice Hall, 2001, p.385 apud Burciu, A. (coord), *Introducere în management*, Ed. Economică, București, p.356

The temporary nature of these types of teams induces a major issue concerning their structure since requires by members to constantly adapt to new work situations. In this case, employees' personal skills influence in a large extent the team development as a necessary step between stage of sufficiency and stage of high performance.

A more common type is inter-functional team. Since this kind of team operates in the same department, does not require major changes in the operational program of its members and does not raise special problems related to adaptation and leadership compared with other two types. Also, unlike the previous types, inter-functional team may have a longer existence, depending on the purpose for which they were formed.

4. Teams as organizational structures

Beyond a simple criterion for classifying the teams, the organizational structure itself can suffer large changes, depending on the complexity of activities and, correlated with this, depending on the need for teams. We consider the Likert's conception of overlapped organizational structures, namely, organizational structures based on overlapping and integrated work groups. The link between these groups is achieved through “linking pin”, that is persons belonging to several groups at once, to their group, but also to the immediately above group on hierarchical scale. The main elements that Likert emphasizes are, on the one hand, the effective communication between group members through “linking pin”, and on the other hand, the interpersonal connections that can be established between members of different groups. [12]

Taking into account the principle of support relations invoked by Likert, we can discuss about organizational structures based on overlapped and integrated teams.

Figure 2 suggests ways of such teams' overlaps, according to basic criteria that differentiate them, and figure 3 seeks to highlight the teams as components of structures such as those proposed by Likert.

Figure 2. Overlapped teams

In figure 2, section **a** represent a team which is a problem-solving, self-managed and inter-functional team, while section **b** represent a problem-solving team, which is neither self-managed, or inter-functional; **c** is a problem-solving and self-managed team, but its members belong to different departments (ie it is not an inter-functional team), **d** is an inter-functional and problem-solving team, but is not self-managed and so

on. Also the letters in the figure 2 may represent members of the organization (or members of subsidiaries located in different countries) which belong to various teams in different times and depending of organization’s needs.

In figure 3, the teams overlapping suggest a team-based organization. Although the chain of command is kept the structures formed by teams are more flexible, communication is facilitated by members simultaneously belonging to different teams (X, Y, K, Z, W, Q are “linking pins”), therefore, their degree of efficiency is higher than in the case of traditional organization, characterized by rigidity and mainly downward communication.

Figure 3. Organizational structure based on overlapped and integrated teams

The membership to different teams can be considered an impediment since every team seeks to attract resources and competes with other teams. It may, however, that precisely this double membership to lead to the attempt to find compromise, the aim being the overall efficiency, at organizational level. In fact, even conflict, between certain limits, may cause the evolution and development, according to Lewin's dynamic theory.

We can consider that this way of functioning of the teams within the organization represents a translations into practice of “adhocracy”, which is specific to organizations with a strong force to adapt, changing “on the fly”, organized on flexible complex team, with self-management competencies. (“Adhocracy” describes a structure that naturally opposes bureaucracy. It is characterized by the existence of small groups or project teams which can operate freely in and across the organization. [13])

Furthermore, in the organization which embraces the work in teams we can find collective structures that revolve around a main management group, influencing and being influenced rather than giving and receiving orders. (figure 4)

Figure 4. A team-based organizational structure

The traditional organization is represented as a chart with reporting lines and hierarchical layers, while the team-based organization looks more like a solar system where planets are governed by the force of the largest (the main team management). The role of leaders is to make sure that the employees will work with efficiency and power of the components of that solar system, thinking in terms of the whole, and not just from the perspective of the component that they represent, and also must always put emphasis on integration and cooperation between groups. [14] Figure 4 suggests such an organizational structure: the two-way dashed arrows indicate open communication between all teams and reporting lines, also represented by two-way arrows, show a permanent feedback from the team management *a*.

5. Conclusions

The teams approach in the organizational context as organizational structures more or less stable over time would be a concern for modern companies since the old structures, based on strict hierarchical lines, can no longer face the actual challenges of global competition.

This approach is necessary given the advantages that teams bring to their organizations compared with traditional

organization:

- teams are more oriented towards goals than the organization as a whole, and they establish more easily their vision and their purpose;
- teams are more flexible than organizational groups because they can be more easily formed, dissolved, reorganized, resized;
- teams are best suited to solve complex problems that require different views and knowledge;
- teams get better value from the resources of each member;
- teams promotes delegation because they provide the security to control the behavior of its members by their own rules etc.

Capitalizing on these advantages by companies impose giving up “prescriptions” for success and the permanent adjustment of organizational structure to the new market requirements. At the same time, they must ensure the necessary conditions for the teams to accomplish their specific tasks with maximum efficacy and achieve outstanding performance. Finally, managers in the global economy need to know when to resort to self-managed teams and to what extent this is beneficial for both team performance and the overall company success.

Abstract

Since banking sectors from Central and East-European countries are currently characterized by high levels of presence of foreign banks, in this article we intended to conduct a costs and benefits analysis on their entry in the banking markets of these countries. The study will begin with a comparative analysis on bank privatization policies used in 5 Central and Southeastern Europe countries (Poland, Slovakia, Hungary, Romania and Bulgaria), because they had a great influence in increasing domination of banks with foreign capital. We will also compare the characteristics and structure of the banking sector in each of the five countries and we'll show that in recent years, in every country, there is a growing governance of foreign-owned banks.

Key words: foreign banks, banking intermediation, solvency and profitability of the banking system

J.E.L. Classification: G21

1. Introduction

Banking sectors in ECSE countries are characterized by very high levels of foreign bank presence. In some countries, the position of foreign capital banks is overwhelming, these banks entering in banking markets from ECSE countries most of the times during or immediately after a crisis and after a reasonable level of stability was restored. Foreign presence (in terms of assets) is held by Austrian, Italian, Belgian,

German and French investors. Greek investors enjoy also a prominent position, especially in South East Europe. The five largest foreign bank owners in ECSE countries are: Unicredito Italiano, KBC Bank, Erste Bank, HVB Group, Raiffeisen, Societe Generale. In the top-5 international banks, classified in 2009 can be mentioned Raiffeisen, Unicredit, Societe Generale, Erste and KBC.

The market entrance of foreign owned banks in ECSE countries was not always that easy. In the early '90, only a few foreign banks have entered the market through establishing of Greenfield institutions. This thing was motivated by two factors: lack of support for foreign banks in ECSE countries and the unattractiveness of these countries before structural reforms. Greenfield banks that were established have developed rapidly and have focused their operations to entities that have followed and exploited opportunities for new local markets. The increasing of foreign banks in ECSE countries has determined as well enlarging the degree of banking market concentration. Some authorities have preferred to recapitalize and to cleanse banks' portfolios, to make them more attractive to foreign investors. On the other hand, in many countries, authorities were skeptical to the foreign investors and have permitted only conditional purchase of institutions, as in Poland. Very often the entry barriers have been relaxed only after the crisis and this was motivated by the need to recapitalization and restorations of normal functioning of the banking system, as it was the case with the Baltic and Balkan countries after the crisis in

Russia, Argentina, after the tequila crisis in Mexico [2]. Foreign banks in Romania,

Slovakia and Bulgaria control more than 80 percent of bank capital.

Table 1. Market share of foreign banks in ECSE countries (1995-2009)

Country	1995	1996	1997	1998	1999	2000	2001
Bulgaria	n.a	n.a	34,8	43,4	46,6	48,1	66,7
Poland	19,24	29,79	41,52	49,7	56,0	56,6	61,3
Romania	14,11	12,84	24,46	35	41,75	53,8	60,6
Slovakia	n.a	39,6	39,2	37,3	24,6	28,1	60,0
Hungary	35,6	45,9	61,2	60,4	62,1	64,0	61,0
	2002	2003	2005	2006	2007	2008	2009

2. Benefits and costs of entering for foreign capital banks in ECSE banking systems

Benefits and costs of entering for banks with foreign capital on the financial system and national economies are extensively investigated in the literature. The main benefits presented in the literature are: the entrance of banks with foreign capital into the domestic banking sector increases efficiency because increased competition leads to lower costs and increase profits, improving the allocation of credit to the private sector as the credit risk assessment becomes more developed, promoting economic growth; the presence of foreign capital banks helps the developing of a national legal framework for banking supervision that will increase overall transparency; it is expected that foreign-owned banks to provide more stable sources of funding because they have access to external funding sources by parent banks, as domestic financial markets become less vulnerable to internal shocks; banks with foreign capital can reduce costs associated with bank recapitalization and restructuring in post-crisis period.

Major costs associated with foreign bank entry shown in the literature are: if the market share decreases with the entry of domestic banks with foreign banks, domestic banks may have an incentive to take greater risks; because foreign-owned banks generally have superior products and services of local banks, they will gain market share including

profitable sectors of the economy and risky sectors will be financed by local banks; through increased presence of foreign banks, the access to some sectors of the economy may be affected; the presence of foreign capital banks increases the systemic risk through the occurrence of contagion effect; because foreign capital banks have different priorities, their lending model tends to ignore the domestic economic priorities.

Claessens, Demirguc– Kunt and Huizinga (1998) have shown that the presence of foreign banks can help increasing the competition, improving the allocation of loans and access to international capital markets. But there are also costs associated with foreign bank entry, costs that may include increased systemic risk caused by increased competition and risk propensity of banks to maintain or increase market share (Hellmann, Murdock and Stiglitz, 2000) [5]. Claessens, Demirguc– Kunt and Huizinga (1998) examine the effects of foreign banks entering the national banking sectors. The authors show that developing countries foreign banks have higher rates of profitability and higher interest margins than domestic banks, while in developed countries the situation is opposite.

Another conclusion is that the profitability and general administrative expenses of domestic banks decrease after the entry of foreign banks on domestic markets [6].

Demirguc– Kunt and Huizinga (1999) shows similar results. They demonstrate that foreign capital banks generally have higher

profit margins than domestic banks in developing countries [7]. Other studies show that the entrance of foreign banks reduce operational costs and profitability of domestic banks, reducing the risk of a banking crisis and lead to higher economic growth by improving the efficiency of domestic banks. Agenor (2001) points out that since investors are not familiar with the specific problems of countries in which they invest, they tend to withdraw immediately and massively to the first difficulty encountered [8]. This can lead to a profound crisis on domestic financial markets.

Foreign ownership may have a stabilizing effect on the banking markets in ECSE countries for the following reasons: first, one of the advantages of foreign ownership is that foreign-owned banks have lower sensitivity to host country conditions; secondly, banks with capital foreign have better access to international markets, international experience shows that parent-banks serve as lenders-of-last resort if their subsidiaries are facing some problems. Meanwhile, foreign banks can contribute to destabilization of banking markets, as they may be affected by business conditions in their home countries and changes in health or strategies of the parent banks. Finally, there is always a fear that foreign-owned banks attract the best customers, leaving to domestic banks riskier customers, which could also lead to their poor performance [1].

Because ECSE banking sector is characterized by the highest level of presence of foreign banks in the world, many specialists have conducted numerous studies on their profitability compared to domestic banks, their impact on the business sector, but also on the host country lending. A recent study [9] conducted by Olena Havrylchyk (2010) analyzes the impact of the presence of foreign banks in Central and Eastern Europe (CEE) (depending on how their entry), on the rate of input and output companies, their size and their likelihood of survival in the early years, but also the impact of foreign-owned banks over the credit supply to small and medium enterprises (SMEs) and finds that

the acquisition of domestic banks by foreign investors has reduced creation and entry of smaller firms, while the exit rate of firms has increased. At the same time, the entrance of banks with foreign Greenfield capital has stimulated the creation of companies but also of their output.

Although foreign capital banks have contributed to increasing the supply of credit in ECSE economy, not all borrowers have received loans equally. Some studies show that foreign banks granted fewer loans to small companies, being concerned instead of crediting large firms (Degryse, Havrylchyk, Jurzyk & Kozak (2009). Olena Havrylchyk demonstrated by the study realized that SMEs are supported in financial terms by local banks and in a lesser extent by foreign-owned banks, which only increase the competitive pressure to amplify their supply of loans to SMEs.

3. Structural evolution and current characteristics of banking sectors in ECSE countries

To highlight the degree of development and structural characteristics of banking systems in ECSE countries, we conducted an analysis evolution of the number of credit institutions, the concentration of banking and banking intermediation, solvency and profitability of the banking system in 2005-2009. Structural developments in the banking sector in ECSE countries during 2005-2009 indicates a decrease in credit institutions in countries such as Bulgaria, Poland and Hungary, but an increase until 2008 of the number of territorial units operating in these countries, except Slovakia (see Table 2). A similar trend can be observed to be manifested throughout the EU and implicitly, euro area-wide. In Romania and Slovakia we observe an increase in credit institutions until 2008, after which their number remains constant in Slovakia in 2009 and in Romania is reduced from 43 to 42 credit institutions.

Table 2. The number of credit and number of local units (agencies) in ECSE countries (2005-2009)

Country	Number of credit institutions					Number of local units (agencies)				
	2005	2006	2007	2008	2009	2005	2006	2007	2008	2009
Bulgaria	34	32	29	30	30	5.629	5.569	5.827	6.080	6.038

Hungary	214	212	206	197	190	3.125	3.243	3.387	3.515	3.551
Poland	730	723	718	712	710	10.074	10.934	11.607	12.914	13.292
Romania	40	39	42	43	42	3.533	4.470	6.340	7.375	6.425

MU16	6.704	6.535	6.391	6.175	6.458	171.846	183.772	186.252	187.679	179.916
EU27	8.683	8.507	8.354	8.090	8.358	214.925	228.648	233.800	238.021	229.532

Source: *EU Banking Structures, September 2010, pp. 35-51* www.ecb.eu.

As what regards the degree of banking concentration, it is observed to be high in most countries. Concentration ratio of top five banks in all countries ECSEE was 50 percent or above this percentage. Only Poland had a concentration level lower than this level. In the period 2005-2009 observed increasing trend of the concentration

measured by Herfindahl concentration index, while the share of assets held by the five largest banks in countries recorded changes ECSEE upward, except for Romania and Poland, countries in which we observe a decrease in 2009.

Figure 1. Evolution of the concentration of the banking system in ECSE countries (2005-2009)

Source: developed by authors based on data from the *EU Banking Structures, September 2010, www.ecb.eu*

Another measure that indicates the degree of banking sector development and public confidence in the banking system is the ratio of bank deposits to GDP. Table 3 shows the

evolution of the loans and deposits denominated in euro ECSEE countries during 2005-2009.

Table 3. Evolution of total loans and total deposits in ECSE countries (2005-2009)

Country	Total loans - mil Euro					Total deposits - mil Euro				
	2005	2006	2007	2008	2009	2005	2006	2007	2008	2009
Bulgaria	9.415	11.701	19.389	25.571	26.470	11.210	14.875	20.520	22.302	22.859
Hungary	45.980	56.298	65.565	76.473	73.087	38.480	47.129	51.150	55.152	56.326
Poland	77.995	96.470	133.590	158.173	175.453	105.818	121.634	147.294	153.789	171.412
Romania	16.583	27.928	42.056	50.823	49.811	21.623	30.175	37.779	40.248	41.331
Slovakia	14.609	21.518	26.547	30.752	31.109	21.889	19.525	21.831	22.626	21.961

Source: processed by *EU Banking Structures, September 2010, pp. 35-51* www.ecb.eu, authors' calculations

The above table reveals both that the credit level in the countries studied and the deposits record an increasing evolution, the growth rate being faster until 2007, after which there was a slowdown in its increase,

mainly due to turmoil and financial instability caused by the financial crisis triggered in 2007.

The soundness of the banking system in ECSE countries is indicated by the ratio of

bank capital adequacy. Evolution of this report shows that over the last six years, there has been an improvement in capital adequacy ratio of banking systems in ECSE countries. Noteworthy in the year 2009 that all banking systems have been considered an indicator of higher solvency level regulated, which means

that the banks were, on average, well-capitalized. The following table shows the capitalization of banks using capital adequacy ECSEE countries during 2005-2010.

Table 4. Capital adequacy ratio in ECSE countries (2005-2009)*

Country	2005	2006	2007	2008	2009	Rate established by law
Slovakia	14,8	13,1	12,8	11,1	12,6	11
Poland	14,6	13,2	12,0	11,1	13,2	8
Bulgaria	15,3	14,5	13,0	14,9	17,0	12
Romania	21,1	18,1	13,8	13,0	14,7	8
Hungary	11,6	10,8	10,0	11,1	12,9	8

*% of assets weighted with the risk rate

Source: processed by the authors after Raiffeisen Research 2010, Country Report IMF 2011

The year of 2009 was characterized by improving solvency, result attributed on one hand, to stagnation in lending (a contribution having the more prudent attitude of banks concerning risk-taking), and on the other hand, to increased capitalization of the banking system as a result of banks efforts to increase capital. From Table 5 it can be seen that the profitability of the banking sector in ECSE countries has improved significantly in

recent years, except the maximum intensity of the crisis – the period of 2007-2008. This was a result of the overall reform of the banking system (eliminating bad loans, privatization of state banks, introduction of modern banking techniques, credit expansion) and the high level of intermediation in these countries.

Table 5. Banking sector profitability measured by ROE in ECSE countries during 1995-2009

	2003	2004	2005	2006	2007	2008	2009
Slovakia	27,2	29,0-	17,7	18,7	16,5	14,1	6,5
Polonia	5,4	17,6	20,8	23,1	22,9	21,2	11,2
Bulgaria	18,7	20,2	21,6	24,4	23,8	15,8	9,3
Romania	15,6	17,0	12,6	10,4	9,4	1,7	2,7
Hungary	21,1	26,5	26,6	24,7	20,1	15,2	10,4

4. Conclusions

Banking system in ECSE countries has grown significantly over the past two decades. Although the banking sector has grown significantly in recent years, there are still many challenges to be answered, especially the banking sector of South European countries, because it is less developed than the banking system in CEE countries. Accession to EMU and the possibility of adopting the euro in the future, implementation of new Basel III treaty, strengthening the regulatory and financial performance are some of the challenges for ECSE countries in banking. Growth potential

in the area will allow financial institutions improve their performance and extend their activities. We believe that the main concern of banks for the future is restoring and maintaining public confidence in the banking sector.

Peculiarities of Romanian Insolvency System

Baciu Elena Cristina

“Alexandru Ioan Cuza” University of Iași
baciu.elenacristina@yahoo.com

Abstract

For a company that has financial difficulties it is best to enter an insolvency procedure. This process offers the possibility to assess the viability of the company and to find the proper solution for its situation. This study examines the peculiarities of the insolvency procedure. The stages of this process present a high significance for all stakeholders, giving the fact that they are all involved in it and the effectiveness of the procedure affects the its final relation with the insolvent company.

An entity that enters an insolvency procedure can be either reorganized either liquidated. Each of these solutions has its effect on the company, on its partners and on the economy in general.

Key words: insolvency law, bankruptcy

J.E.L. Classification: G33, K41

1. Introduction

Bankruptcy law has always had a fundamental role in resolving the situation of firms that were having a period with financial difficulties.

Insolvency law establishes a balance between several objectives. Its purpose is to protect the rights of the creditors, the interests of the shareholders and customers, and avoid potential liquidation of viable companies.

Insolvency law facilitates the recovery or the market exit of inefficient firms. We can identify significant differences between national insolvency regimes that are related to the fundamental considerations of policy, structure and content.

Insolvency proceedings and their effectiveness have significantly variations from a country to another. Some countries have complex insolvency procedures while

others have just a simple procedure of liquidation [1].

To improve and accelerate the insolvency proceedings, the Council of European Union adopted the Regulation no. 1346/2000 on insolvency proceedings, which establishes common rules in this field. These rules do not provide a substantial harmonization of national insolvency laws because there are many differences between these systems. Thus, it can not facilitate the use in practice of a single insolvency proceeding, which may be applicable throughout the European Union. Council regulations contain rules relating to the transfer of the headquarters of a European Economic Interest Group, a European company and a European Cooperative Society [2]. Thus, issues related to how to reconcile the differences in insolvency systems with permanent economic integration increase their importance.

To develop an environment that manages the internal crisis and it increase the effectiveness of the structural measures at an European Union level, it has to be established the extent to which insolvency laws should be harmonized in the European Union's member states. There are only a limited number of issues that need to and can be harmonized. These are broadly as follows:

- a possible common test of insolvency in the insolvency proceedings;
- formal aspects related to the filing and resolution of claims in the proceedings;
- some aspects of structure and content of a reorganization plan;
- the terminal relationship between contractual rights and insolvency;
- administrator's responsibilities.

In order to determine the orientation of the insolvency legislation it should be taken into consideration the peculiarities of national insolvency proceedings that may be then compared with the same elements of the procedure, but applied in other states. For

this purpose, the procedure can be divided into three main stages [3]:

- The opening of the procedure;
- Control and management of the company during the procedure;
- Reorganization plan and results of the procedure.

2. Criteria for filing for insolvency procedures

In Table no. 1 we compared the possibilities for opening an insolvency procedure in some countries from Eastern Europe. In all states the insolvency procedure will open when a companies has no liquidities to pay its debts. Over indebtedness appears when a company has a rate of indebtedness over the limit that is recommended by the experts. The debt of a company, calculated as a report between total debts and total assets, must have a value less than 66% in order to show a good financial position. Only Romania and Hungary do not apply this criterion when filing for an insolvency procedure. Imminent insolvency, on the other hand, was introduced only by the regulations in Romania and Czech Republic.

Table 1. Criteria for filing for insolvency in Eastern Europe

Country	Lack of liquidities	Over indebtedness	Imminent insolvency
Bulgaria	✓	✓	-
Czech Republic	✓	✓	✓
Hungary	✓	-	-
Poland	✓	✓	-
Romania	✓	-	✓
Slovakia	✓	✓	-

Source: Balcerowicz et al., 2003: 12

3. Judicial reorganization and bankruptcy procedure in Romania

The first step in an insolvency proceeding is to hand in an application in order to request the opening of the procedure. This application is introduces in court. This application may be filed by the debtor, by a creditor or by any other person or institution

lawfully entitled to introduce this type of application, such as the Romanian National Securities Commission.

A company that finds at certain point that is insolvent or that this state is imminent, must address the court in whose jurisdiction the debtor is located and request to that effect, within 30 days from the date of the detection of this state. By law, the request must be accompanied by conclusive documents. In this case, the debtor may opt for reorganization or for a simplified procedure of bankruptcy. In any case, if the company has gone through a reorganization process in the last five years, this option is no longer valid.

A creditor has the right to request the opening of a procedure if he has claim against the debtor due for more than 30 days.

The debtor will be announced concerning the demand introduced and he will either question it, either accepts the state of insolvency, within 10 days since the notification. If the state of insolvency is disputed by the debtor, but then the appeal is dismissed, the debtor will enter directly into the general procedure and will not be entitled to the possibility of judicial reorganization. This procedure can be proposed, however, by creditors that have, together, at least 20% of the credits.

By deciding the opening of the procedure, the court will decide the administrator or liquidator that will manage the entity.

If a general proceeding is opened the court will appoint a judicial administrator and if it is decided to open a simplified procedure the court will appoint a provisional liquidator. The right of administration can be taken from the debtor if the intention of reorganization is not announced when the judicial administrator is named. If not, the debtor will no longer administrate the company when it enters the bankruptcy proceeding. During the observation period, the debtor is allowed to perform its daily activities and can make payments, including to its creditors. These operations will be supervised or conducted by the judicial administrator.

The judicial administrator will then proceed to prepare a report on the causes and circumstances which led to the insolvency of the debtor, which will be completed within 60 days from his assignment. This report provides information about the debtor

through a financial analysis of the economic activity undertaken during last three financial years and then it concludes about the causes and events that caused the insolvency or determined the liquidation. The same report states the persons to which the current state of society would be attributable. The purpose of the report is to specify data regarding a possible reorganization or the causes that makes it not be possible.

When the judicial administrator suggests through this report the entrance of the company in bankruptcy, the judge will provide a decision that will be published in the Bulletin in order convening a meeting of the creditors. Creditors will have this opportunity to listen to the creditors' committee opinion on this situation and to vote the proposal of the judicial administrator. For the approval of his proposal it is needed the vote of creditors holding at least two thirds of the claims. Also, when a creditor or several creditors holding together more than 20% of all claims included in the preliminary table of claims announce the intention to submit a plan of reorganization of the debtor in accordance with the law, the judicial administrator's proposal will not be voted, regardless of the outcome.

If the general meeting of creditors approves the proposal of the judicial administrator, it will be decided that for the debtor the bankruptcy procedure will be applied, so the judge will give a sentence to state this.

Third parties will be notified about the opening of the procedure by the judicial administrator.

Employees are the only creditors that must not file a statement of claim. Their claims will be registered by the judicial administrator in accordance with the accounting records. All other creditors holding claims prior to the opening of the proceeding will make an application for the admission of claims. This application must be submitted before the date fixed in the opening sentence of the procedure. This request must be filed even when claims are not specified by a title and include: the name of the creditor, permanent address, the amount of the claim, foresights related to any preference rights or guarantees and supporting evidence attached.

All claims will be subjected to verification. After verification, the judicial administrator or the liquidator will develop and submit in court a preliminary table of claims, which shall include all claims against the debtor, depending on their type: salary, budget, unsecured, secured, with priorities, conditional or not yet due. For each claim it shall be specifies the name of the creditor, the amount claimed by the creditor and the amount accepted. If there are secured claims, the title which supports the guarantee made must be presented. Other elements presented in this table are the type of the claims and why claims were listed in the table or have been partially removed. The table will be displayed at the tribunal, so that creditors with claims enrolled may attend the meetings of creditors.

Claims of any creditor who has a debt to the firm in insolvency procedure can be compensated.

Any interested person may submit written appeals on claims included in the preliminary table of claims by the judicial administrator or liquidator. After resolving the appeals through the courts, the judicial administrator or the liquidator will have to submit the final table of the claims in court and at its headquarters. The table should make clear the amount registered, the priority of the claim and the situation for each one.

Completing the definitive table has as a consequence the participation at the vote on the reorganization plan or in any distributions of money in case of simplified bankruptcy procedure only for holders of claims included in this table.

The judge will decide the entrance of a company in bankruptcy. This decision is taken when: the debtor has declared its intention to enter the simplified procedure; the debtor has not declared its intention to reorganize or, at the request of the creditor to initiate the procedure, the debtor contested this state and the appeal was dismissed by the judge; none of the subjects entitled to propose a reorganization plan have done that or none of the proposed plans were not accepted and confirmed; the debtor has declared its intention to reorganize, but suggested a plan or proposed plan of reorganization has not been accepted and confirmed; payment obligations and commitments are not fulfilled as stipulated

by the debtor's confirmed plan or activity during its reorganization brings wealth losses to the debtor; the judicial administrator's report proposing, where appropriate, the entering of the debtor into bankruptcy was approved.

Opening the bankruptcy proceeding may commence when the debtor fails to operate in accordance with the plan of reorganization or the judge has reasonable grounds to stop the procedure of reorganization and suggests the liquidation of the debtor.

Through the sentence that shall decide on the bankruptcy decision, the syndic judge will decide the dissolution of the debtor company and will dispose: raising the right of administration of the debtor; in general procedure, he will appoint a provisional liquidator and will establish his attributions and his remuneration; in simplified procedure, the confirmation of the judicial administrator as a liquidator; the time limit to give the management of the debtor's property to the liquidator or judicial administrator (including the list of documents and operations that have been made after the opening of the insolvency procedure); preparation of a list of the names and addresses of all creditors and their claims that will be given by the judicial administrator to the liquidator, indicating those claims that were born after the opening of the procedure; notification of entering the bankruptcy proceeding.

The liquidation of debtor's assets shall be made by the liquidator under the control of the syndic judge. To give a maximum value to the debtor's assets, the liquidator will appropriately display on the market the goods subjected to liquidation and advertising expenses will be also paid by the debtor. The liquidator will formulate a strategy for the liquidation of goods, by organizing auctions, advertising, etc. The liquidation of assets can begin immediately after a fully inventory of the debtor's assets inventory. Assets can be sold in bulk (as a whole running) or individually. The general meeting of creditors will approve any method used to sell goods, whether it is public auction, direct negotiation or combination of both, depending on the proposal of the liquidator and the creditors' committee recommendation.

The liquidator may engage, on behalf of

and at the expense of the debtor, an evaluator, a person or entity, or will collaborate, with the prior agreement of the creditors' committee, with their evaluator to evaluate the assets of the debtor, in accordance with International Valuation Standards.

Debtor's assets can be evaluated both individually and in bulk, depending on their specific characteristics. Buildings may be sold directly, to the liquidator proposal, proposal that yet has to be approved by the general meeting of creditors. The securities will be sold according to Law no. 297/2004 on the capital, as amended.

Any sums obtained from sales will go into the liquidation account.

All the funds, made by selling the debtor's assets, will be distributed in the following order:

1. Expenses related to the sale of those goods, including expenses necessary for the conservation and management of these assets and payment of remuneration of employees;
2. Claims of secured creditors, which will include all capital, interest, penalties and other expenses. When the amounts realized from the sale of these assets are insufficient to fully cover the payment of the guaranteed debt, the creditor will have an unsecured claim for the difference remaining, debt which will be included in this category and will be paid in proportional. Creditor holding a secured debt against the debtor has the right to participate in any distribution of amounts made before the sale of guarantees property.

Liquidator will have as a task the presenting to the committee of creditors of a report on liquidation proceeds and collection of receivables and a distribution plan from creditors. The report will mention information regarding the remuneration of the liquidator and its payment and also other expenses with the procedure. This presentation will be done every 3 months.

In the event of bankruptcy, claims will be distributed to creditors in the following order:

1. Liquidation expenses; here we include also the necessary expenses to achieve the conservation and management of the debtor's assets, and to pay salaries of employees;

2. Claims arising from the employment relationship;
3. Claims arising from contracting loans from credit institutions after the opening of the procedure, including interest and expenses; these debts that have arisen because of the debtor’s activity after the opening of the procedure;
4. Budgetary claims;
5. Claims of third persons representing maintenance allowances for minors or periodic payment obligations of amounts paid to ensure livelihoods;
6. Amounts set by the judge to help maintain the debtor and his family;
7. Bank loans, including interest, claims arising from the delivery of financial products or services; this type of claims also include rentals;
8. Other unsecured claims;
9. Subordinated debts, which are covered in the following order: payment to an associate or a shareholder who owns at least 10% of the shares of the company, or to a member of the economic group of interest and, later, claims that arose from gratuitous acts.

When there is money to be distributed and their distribution has to be done among creditors who have the same rank of priority, each will be given a proportional amount to the amount stated in the claims table. A holder of a claim in a given category will receive distributions only after the fully payment of the amount of debt of the creditors with a higher rank, according to the order above.

If the assets of an economic group of interest or of a company whose shareholders have unlimited responsibility are not sufficient to pay the total claims from the final consolidated table, the syndic judge will authorize enforcement against members with unlimited liabilities by giving a final decision, which will be enforced by the liquidator or by a bailiff.

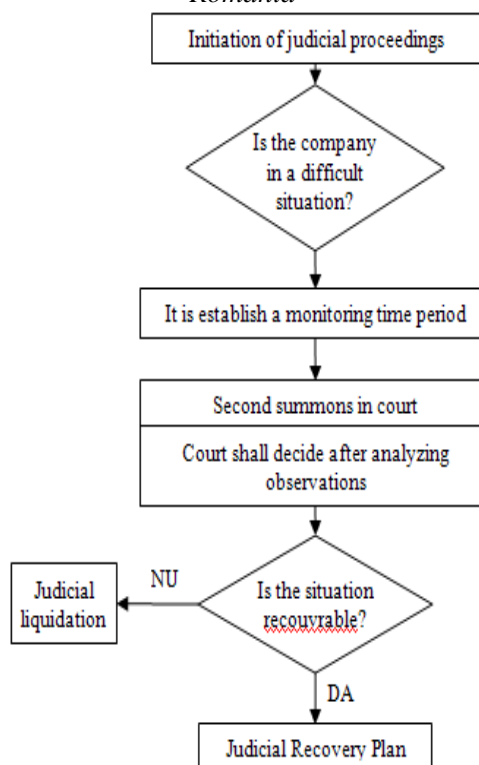

In case of partial distributions, there will constituted provisions for: proportionate amounts due to creditors whose claims are subject to a suspensive condition not yet fulfilled; proportional amounts owed to the owners of bearer notes or securities which have the originals, but they have not presented them; proportional amounts owed as provisionally admitted claims; reserves for

future expenses to cover the debtor's property.

After liquidating the assets of the debtor, the liquidator will prepare and submit a final report in court, together with final financial statements. Syndic judge shall convene the meeting of creditors within 30 days from the posting of the final report, during which creditors may object to this report.

After approving the final report of the liquidator, the procedure will continue with the final distribution of all funds remaining in the debtor's property.

Figure 1: The steps of general procedure of reorganization and judicial liquidation in Romania

Source: Constantinescu, D., Nistorescu, T., *Economia întreprinderii, Sitech, Craiova, 2009, p. 90*

If the situation that the duration of the liquidation procedure exceeds the duration of a financial year, the liquidator is required to prepare the annual financial statements of the company in this situation. The liquidator is also the one that will have to submit mandatory tax declarations, health insurance or unemployment fund etc.

At any stage of insolvency proceedings, provided that it is concluded that there are no assets in the debtor's property or that there

are not sufficient liquidities to cover the administrative costs, the syndic judge is entitled to give a sentence terminating the proceeding. By that, the debtor will be removed from the companies register.

Bankruptcy procedure is closed once the approving of the final report is made by the syndic judge, meaning, with the use of all funds or assets of the debtor. The syndic judge will give a closing sentence for closing the procedure and orders the removal of the company from the register. The procedure can be closed only after the complete liquidation of the assets and after any amounts remaining after the final distribution will be sent to the personal associates accounts.

4. Conclusions

The insolvency system applied in Romania is one that protects more the debtor, but not entirely. In fact, the involvement of courts of law in making decisions on the extent of applying the procedure mostly shows proximity of the insolvency law with the French legislation.

The paper is focused on evaluating the institution of bankruptcy law and insolvency procedures and the effectiveness of their implementation.

Although there is not a common international insolvency frame, the basic principles applied are still the same (market exit of nonviable firms). Due to current economic changes, both nationally and internationally, Romania must continually adapt to international legislation. Because management of economic organizations has a high complexity, is necessary to harmonize Romanian financial accounting legislation and tax legislation to the one used at an international level.

Harmonization has been achieved through cooperation of international institutions such as World Bank, UNCITRAL (United Nation Commission on International Trade Law) or the European Commission, but also because of pressure from partner states. There have been made recommendations in this respect and cooperation agreements or other elements in order to determine the common practices to apply the bankruptcy procedure. The liquidation and bankruptcy legislation is harmonized with UNCITRAL's

recommendations regarding cross-border insolvency.

Together with the Romanian harmonization of accounting with international accounting standards, in the Romanian legislation have emerged new accounting rules or the existing rules have suffered constantly changed. Even with this pressure for harmonization of legislation, international regulations should be adapted to national specificities. However, new accounting regulations and especially the new insolvency regulations corrected unclear aspects of the procedure.

Abstract

This article's goal is to highlight the main reasons and effects of the adoption of the reverse charge for the supply of cereals and industrial plants in Romania in May 2011 on the companies' activity in our country. In an attempt to diminish the VAT evasion related to sale of crops and grains, the Romanian Government introduced simplification measures for the sale of crops and grains that should also provide a cash flow benefit especially for the Romanian firms involved in cereal trading, thanks to the earlier collection of the inputs' VAT from the state.

Key words: tax evasion, reverse charge, Romania, agriculture.

J.E.L. classification: E26, H25, H26

1. Introduction

The financial crisis hit Romania a year after some other European countries, but the effects were severe and caused major changes in the economy.

Romania started implementing measures to fight the effects of the economic crisis and to generate more budget revenues as other CEE countries did.

The Romanian fiscal policy swung between budget deficit pressures and measures to stimulate business activities in 2011.

The reverse charge for the supply of cereals and technical plants is an efficient fiscal measure to reduce VAT evasion.

The Romanian authorities wanted to implement this simplification measure in order to combat the tax evasion in agriculture that reached 60% of the bakery market.

2. Short history

The Ministry of Finance announced in the summer of 2010 that it called for a derogation from the European Commission (EC) on the application of VAT by reverse charge supplies of goods within the country's grain crops, vegetables, fruit, meat, sugar, flour, bread and bakery products.

After being refused by the Commission, Romania submitted the European forum, in December 2010, a letter to summarize the products that require derogation from the normal tax grain and industrial crops, namely maize, wheat, barley, rye, soybean, rapeseed, sunflower and sugar beet. The application relates to a two-year exemption from the principle of applying VAT to cereal trade.

The Secretary of State for Finance Dan Lazăr AFP said in January that Romania has made this approach to the EC not only to prevent and combat tax evasion, but also in response to repeated requests coming from the business.

In response, the Directorate General for Taxation and Customs Union European Commission (DG TAXUD) approved in mid-January Romania's reverse charge call to grain measure, measure also approved later on, in early May, by the EU Council.

The explanatory memorandum of the draft emergency ordinance states that, according to the commitments assumed by Romania in the context of obtaining authorization procedures for implementing this measure, the reverse charge for delivery of goods in the category of cereals and crops applies for a period of two years the entry into force, i.e. up to 31st of May 2013 inclusively. [4]

The Government Emergency Ordinance (GEO) introduces VAT simplification measures applicable to supplies of the cereals

and the technical crops specifically mentioned in the combined nomenclature established through the CEE Regulation no. 2.658/87.

Thus, for the supply of the above-mentioned cereals and technical crops, the person liable to pay the tax is the beneficiary, through the reverse charge mechanism.

The mandatory condition for applying the reverse charge mechanism is that both the supplier and the beneficiary are registered for VAT purposes according to article 153 of the Fiscal code. [1]

3. The reverse charge mechanism for cereals and technical plants

On the 4th of May 2011, the European Commission adopted the decision to authorize the application of reverse charge in Romania for the supply of the following categories of products considered to have a high risk of tax fraud: corn, wheat, rye, sunflower, barley, rape, sugar beet, soy, two-row barley.

These are detailed according to the Tariff and Statistical Nomenclature and Common Customs Tariff:

Table 1: The cereals and industrial plants submitted to the reverse charge mechanism

NC Code	Product
1001 10 00	Durum
1001 90 10	Triticum spelta, for seeding
1001 90 91	Ordinary wheat, for seeding
1001 90 99	Other Triticum spelta and ordinary wheat, not for seeding
1002 00 00	Rye
1003 00	Barley
1005	Corn
1201 00	Soy beans, including those shattered
1205	Rapeseed or wild rapeseed, including those shattered
1206 00	Sunflower seeds, including those shattered
1212 91	Beetroot

Source: the Emergency Ordinance no. 49/31.05.2011 published in Official Journal of Romania no. 38/31.05.2011

Pursuant to this decision, discussions had followed at the level of the member states

within the European Council, the final decision belonged to the latter. The simplification measure was applied only after the communication of the European Council's final decision.

The Official Monitory no. 381/31.05.2011 published the Emergency Order of the Cabinet regarding the modification and the completion of the Law no. 571/2003 regarding the Fiscal Code and other financial and fiscal provisions.

Thus, the supplier of cereals and crops will not mention VAT on the invoice, but "reverse charge according to art. 160 al.2 lett.c", and the client will register the tax due to the acquisition in the VAT statement both as collected tax and as deductible tax, without the right to request the VAT return for the acquisitions of cereals and crops.

The provisions regarding reverse charge mechanism are applied starting the day of June 1st, 2011 until May 31st, 2013, that day included.

Please note that, in order to apply simplification measures for domestic supplies of cereals and industrial plants, the following conditions should be met:

- both the supplier and the beneficiary are taxable persons registered for VAT purposes in Romania;
- on the invoice issued for the supply of goods, the supplier will make a reference to the application of the reverse charge mechanism and he will not disclose the related VAT on the invoice;
- the beneficiary will compute the related tax and he will record it in the VAT return both as collected tax and as deductible tax;
- these measures are applicable only for domestic supplies of goods. [3]

The simplification measure presumes the application of the reverse charge mechanism, meaning that the supplier issues VAT-free invoices mentioning on them the application of the reverse charge mechanism. The buyer will calculate the VAT evidencing it on the invoice and in the sales/purchases ledger and will report it both as input and output VAT in the VAT return. [2]

In accounting terms, the beneficiary will register during the fiscal period 4426 = 4427 with the specific amount.

Registering the tax by the buyer as an

input and output VAT in the VAT return is called the self-liquidation VAT. The VAT collection to the level of the deductible VAT is assimilated to tax payment to the supplier.

In the VAT return the operations will be highlighted as follows:

- the supplier will sign up at line 13 “The deliveries of goods and provision of services exempted with the right of deduction, others then those from line 1-3, and operations subject to the simplification measures” the tax base for the deliveries of cereals and technical plants; the information will be taken from the Sales Journal
- the buyer will sign up:
 - ✓ at line 12 “The acquisition of goods and services subject to the simplification measures to which the beneficiary is obliged to pay the VAT (reverse charge)” the tax base and the collected VAT for the acquisitions of cereals and technical plants; the information will be taken from the Purchase Journal
 - ✓ at line 21 “The acquisition of taxable goods and services with the 24% quota” the tax base and the deductible tax for the acquisition of cereals and technical plants; the information will be taken from the Purchase Journal.

4. The reasons to adopt the reverse charge mechanism for cereals and technical plants

The main reasons to adopt the reverse charge mechanism can be summarized as it follows:

- fight against the tax evasion including for the cereal exportations
- increase in fiscal discipline
- a better tax collection
- cash flow for the manufacturers thanks to the earlier collection of the inputs’ VAT from the state
- increase in the budget incomes
- eliminate the unfair competition, represented by the middlemen, “ghost” firms or agents
- the supply of the merchandise directly to the processor
- the farmers can associate
- the exporters would not be forced to have money tied up in VAT till the Romanian

state returns these amounts

- the cereal price regulation in Romania
 - “Taking into account the urgent necessity to fight the fiscal fraud in the field of cereals and technical plants market through the reverse charge mechanism before the beginning of the harvest period, when the evasion phenomenon appear, the measure will be applied beginning with the 1st of June 2011”, it is shown into the Base Note of the draft law published on the site of the Ministry of Finance.

This measure’s goal is to fight the agricultural tax evasion which is considered to have a share of almost 70 % of the entire evasion at a national level.

According to the appraisals presented by the Ministry of Finance, in the period of application of this Emergency Ordinance, the reverse charge for the supply of some goods from the field of cereals and technical plants market inside the country will determine a plus for the state budget of 240 million lei in 2011, 410 million lei in 2012 and 170 million lei in the first six months of 2013”, this is a total plus of 820 million lei, said the minister Ialomițianu. [8]

“By introducing the reverse charge between the economic agents, the VAT will be applied at the end of the supply chain” said Dan Lazăr.

He said that “ghost” companies are established and function during the agricultural campaign and disappear when they should make tax returns and pay obligations to the state budget, including VAT. The general characteristics of these firms are: most were members or shareholders of foreign residents and non-European countries, so they prejudice the state by not paying VAT and other taxes that can not be recovered. [4]

Ștefan Niculae welcomes the implementation of the reverse charge measure for cereals, that should produce positive effects on the agricultural environment.

„On one hand, the reverse charge should reduce the number of agents in agriculture. As we all know, smart boys use this VAT by making shuttle firms with the purpose to recover the VAT from the state, the goods without moving from place. I hope the new measure will reduce a lot the number of middlemen, and the manufacturers could

supply the goods directly to the processors. In this moment there are too many agents.

On the other hand, the measure should help to combat the tax evasion on the cereal exports. In many cases, at exports, the goods leave only on paper, without the physical movement of the cereals”, explains Ștefan Niculae.

The president of Agrostar hopes that the new measure could produce other positive effects in agriculture. „For example, one of these could be encouraging the farmers to associate and so to capitalize the cereals in better conditions”, says Ștefan Niculae. [10]

The introduction of the simplification measures should provide a cash flow benefit especially for the Romanian companies involved in cereal trading. It remains to be seen whether the projected VAT revenue budgeted by the Ministry of Finance for the application of the measure period will become fact. [5]

„We have demanded the reverse charge for cereals because there are farmers in competition with those who sell on the black market and they are doing so because they are forced to.

I think that the most correct and honest thing the state could do is, the moment it takes the VAT on the 25th of the month, to give us back the VAT on the 25th and then everything will be all right and there wouldn't be any kind of problem. It would have been a more acceptable and efficient measure for us if the VAT was below 10%, and so it wouldn't be very tempting for the ones who want to steal. It could have been made a law that permits us to recover the VAT that we are paying”, said Nicolae Sitaru, the president of the Agricultural Manufacturers Associations League from Romania. [10]

5. The effects of the reverse charge mechanism for cereals and technical plants

The positive effects of the adoption of the reverse charge for cereals and technical plants have already been mentioned, so now we can enumerate the negative ones:

- the mechanism is not applied on the entire supply chain
- the manufacturers must wait between three and six months in order to recover

the VAT paid for inputs

- there are some problems with the manufacturers' cash flow, because they can't use the money collected from the output VAT
- the manufacturers already announced price increases

The processors are saying the bakery black market is diminishing: “The black market has devolved. We can already feel the positive signs of the reverse charge” according to Viorel Marin, the president of the Bucharest National Association of the Milling Industries.

According to Aurel Popescu, before July, when the reverse charge mechanism was introduced, 60% of the bakery market was black market that is 600 million euros of one milliard euros. [6]

The Bucharest Vel Pitar CEO says that the price of bread would have risen with or without the reverse charge.

We must mention that the reverse charge is not an exemption of VAT, but a simplification measure through which the delivery between two taxable persons is made without highlighting VAT on the invoice and without paying VAT between them. Only the final buyer is highlighting the VAT through reverse charge.

In the supply chain in Romania, the last person registered for VAT bills and collects from the final consumer the value of the tax. The VAT is borne by the final consumer, the individuals or the legal entities that are not registered for VAT, and is afferent to the entire supply chain. [9]

Daniel Botănoiu, the CEO of the Romanian National Federation of the Agricultural Manufacturers, declared that this ordinance is successful only if the Fiscal Code will be modified regarding the VAT returns. "It is a good measure, but if the Fiscal Code would not be modified, that is the VAT returns to be paid within 30 days, it would not help the agriculture as it should. In this formula, the manufacturer will be the only one disadvantaged. We all know that the sales of cereals are made only in certain periods of the year, so there will be a greater pressure on the state budget and the VAT returns will delay further. This worries us even more because there are already huge delays with the VAT, and if this adds up, the agricultural manufacturers will be destroyed",

declared for Curierul Național, Daniel Botănoiu.

Considering that the law is not as thorough as they have expected, the agricultural representatives are skeptical about the success of the ordinance. "What the state has given at this moment, for the cereal and technical plants' trade, is a half-law. This ordinance will help the ones that have grain storages in Romania, those who already had a good life. Now they will buy cereals without VAT and they will sell forward to processors with VAT. It is possible for the tax evasion to decrease on the way of the storage owners", declared for Curierul Național, Sorin Minea, the president of Romalimenta.

He also said that for the final consumer, the ordinance would not have any kind of impact. "When the depository will bring to the mill the wheat in order to make flour, the VAT will be applied. So the state provided benefits only for the depositories, they will buy without VAT and will sell with VAT. We can all imagine that at the mill's gate the evasion could increase more, because the depository is tempted to negotiate a certain price with the processor, knowing he will have profit anyway. From this negotiation the processor also gains, and the only ones affected will be the manufacturers. Furthermore, this ordinance does not have anything to do with the final beneficiary, who is the final consumer. They would not feel any price modification, the law would not have any positive impact on them", pointed out Sorin Minea. [7]

"Before the reverse charge, every invoice from the supply chain contained VAT. In this moment, only the first supply chain invoice and the one emitted by the traders do not contain VAT. The rest of the chain stays the same. The mills are the first link that charges VAT. Ideally it will be the reverse charge to include the entire chain, not only the first link - manufacturer/processor. In the first phase, this might bring negative effects, we will probably see a slight increase of prices, but, on the long term, the effects could be beneficial", explained the Bucharest VelPitar CEO for HotNews, Dan Dolghin.

The manufacturers already announced taxes increases, says Dolghin, due to the cash flow problems that they could have. "Up to this point, they were collecting and paying VAT. In this moment they are not collecting

but they are paying VAT on expenses, knowing that will be returned by the state. We all know how easy it is for the state to give back the money. In order not to have cash flow problems, they have announced a raise in taxes. For us, increasing the wheat price means an increase of the expenses without VAT. In prices, these increases will be seen in almost 6 months – this is the interval in which the increase spreads into the market", says Dolghin. [9]

6. Conclusions

Summarizing, we can say that the reverse charge mechanism has both advantages and disadvantages, but, taking into consideration that the positive effects are more numerous than the negative ones, we have drawn the conclusion that the balance tips in its favor.

After a survey among the farmer market operators, we can conclude that some complementary measures can be taken in order to improve the reverse charge mechanism such as:

- eliminate the acquisition schedule
- reduce the cereal VAT at 5%
- the farmers can be included into a low risk class
- the reverse charge can be applied to the entire supply chain
- the VAT return from the state in maximum 30 days;
- a monitoring system of agricultural results

The reverse charge mechanism is clearly a measure to fight against the financial crisis adopted by the Romanian government in order to collect more money for the state deficit budget.

Results of Analysis of Some Theoretical Aspects of Title IX of the Fiscal Code and Points from Methodological Norms of Appliance the Fiscal Code Title IX: Principles for Establishing Local Taxes and Fees, Particularities of Their Calculation

Anton-Florin Boța Moisin,
University of Pitești, Faculty of Economic Studies,
[youmagdar@yahoo.com](mailto:yomagdar@yahoo.com)

Abstract

A content analysis undertaken on Title IX: "Local Taxes" in the Romanian Fiscal Code and on those points of Methodological Norms of Fiscal Code relating to Title IX, entitles us to conclude that there are a number of issues and rules generally valid all applicable for local taxes. These issues generally valid rules aren't grouped in a compact, unitary content of the law, they are scattered in several articles of Title IX and during various points of the Methodological Norms of Fiscal Code provisions to Title IX.

This is the motivation of our analysis, analysis from which we identified three categories of issues and general rules - valid applicable for taxes and fees, as follows: the first category, including points and rules mainly with theory; a second category of issues and rules about the main role of authorities, especially local ones, in local taxes; a third category of issues and general rules - valid applicable for local taxes which is related to budgetary nature.

Keywords: fiscal code, local taxes, local fees, Romania.

JEL Classification: H2, H3.

1. Introduction

An analysis made upon the content of Title IX „Local tax and fees” of the Romanian Fiscal Code and upon those points of the Methodological Norms of applying the Fiscal Code, regarding the Title IX, can lead us to the conclusion that there are some aspects and rules general valid that can be applied for the local tax and fees. Those aspects and rules general valid are not

grouped in a compact unit in the frame of the law, they being all over the articles of Title IX and the Methodological Norms of applying the Fiscal Code regarding Title IX.

As a result of this analysis, we identified three types of aspects and rules general valid, applying to the local tax and fees, such as: the first group is focus on aspects and rules mainly theoretical, a second group is related to the authorities' role – mainly the local ones – in the local tax and fees area, and the third category is focused on budgetary aspects and rules general valid applying to the local tax and fees.

Regarding the first category - issues and general rules - applicable for taxes and fees mainly theoretical - includes three types of issues and rules, including: definitions, principles underlying the establishment of local taxes, the assessment of features and local taxes, as they result from the comparative analysis of art. 247 Fiscal Code 1 to 10,14 and 15 points of the Methodological Norms of Fiscal Code, the provisions of Title IX.

In the following part, we will discuss some aspects related to the principles for establishing the local tax and fees and some specific features of determining them.

2. Principles underlying the establishment of local taxes

In accordance with point 14, paragraph 1) of Methodological Norms of Fiscal Code, applicable to Title IX Fiscal Code "Local Taxes and Fees", to establish local taxes are taken into consideration the following principles:

a) **The principle of transparency**, under which local authorities are required to operate in a manner open to public;

b) **The principle of uniformity**, according to which local authorities shall organize the execution and enforcement, in special, with the provisions of Title IX of the unit of the Fiscal Code and Methodological Norms of the Fiscal Code - Title IX - **is prohibited the establishment of other local taxes or duties other than those provided by Title IX** of the Fiscal Code. **Special fees** established for the operation of local public services created in the interests of individuals (PF) and firms (PJ), are collected only from them, according to regulations approved by local councils, the General Council of Bucharest Municipality or County Councils, as case, as provided by local public finance law.

c) **The principle of local autonomy**, according to which local councils, the General Council of Bucharest Municipality and County Councils, establish local taxes within limits and under Title IX of the Fiscal Code and Methodological Norms and the Fiscal Code. This principle corresponds to the European Charter of Local Self - Government, adopted in Strasbourg on October 15, 1985, ratified by Romania by Law no. 199/1997, published in the Official Monitor of Romania, Part I, no 331 from 26 November 1997.

According to article 1, paragraph 3) of the Fiscal Code concerning tax provisions supersede any provisions of other regulations, in case of conflict between them, is applied the provisions of the Fiscal Code.

Given the provisions of Article 1, paragraph 3), Fiscal Code, provisions relating to local taxes prevail over any provisions of other regulations, in case of conflict between them is applied the provisions of Title IX of the Fiscal Code.

3. Features to calculate local taxes

3.1. Ways of rounding

Annual local taxes are calculated by rounding, meaning that money including fractions below 50 „bani” is neglected, and what is more than 50 „bani” rounds in addition to one RON.

For any **intermediate calculations** on local taxes, other than calculation of annual local taxes (which are calculated by rounding to 50 „bani” - see paragraph above), rounding is made by one ron, meaning that any part of it completes the ron, by adding.

The term intermediate calculations on local taxes (see Methodological Norms of Fiscal Code, Section 15, paragraph 2, regarding Title IX), means:

a) calculations for periods of less than one year;

b) calculation of the rebate provided for payment of advance of the **tax due for the buildings** entire year by the taxpayer (art. 255, paragraph 2, Fiscal Code), **land tax** due for the entire year by the taxpayer (art. 260, paragraph 2, Fiscal Code) and the **tax on the means of transport** due for the entire year by the taxpayer (art. 265, paragraph 2, Fiscal Code).

c) determining the levels / values as a result of application of correction factors or tax rates.

d) determining the levels of local taxes consist of a certain amount in lei, the effect of the annual increase under art. 287 of the Fiscal Code. Article 287 Fiscal Code provides that the local taxes (provided in Title IX) can be increased up to 20% of local councils, county and Bucharest General Council, as appropriate, with the following **exceptions**:

- Tax on vehicles for a freight vehicle with total weight authorized not less than 12 tons (art. 262, paragraph 4, Fiscal Code);

- Tax on vehicles for a combination of vehicles (an articulated vehicle or road train) freight with maximum authorized mass of not less than 12 tons (art. 263, paragraph 5, Fiscal Code);

- Stamp taxes provided by law (art. 295, paragraph 11, letter c, Fiscal Code);

- Non-judicial stamp taxes provided by law (art. 295, paragraph 11, letter d, Fiscal Code);

f) any other unforeseen calculations from above (points a) - e)) and not local taxes to the amounts determined for a year.

Whenever, in acts of measurements or calculations, where appropriate, the area to determine local taxes is expressed in fractions of m² size, this is not rounded.

3.2 Calculation of terms. Payment period

Generally, the calculation time is considering art. 101 provisions of the Code of Civil Procedure, that:

a) by time is understood the days off, not counting the day when it started or ended the deadline;

b) time limits on hours run from midnight the next day;

c) the period beginning on 29,30 or 31 of the month and ends in a month which doesn't have a day like the previous, will be considered fulfilled in the last day of the month;

d) time limits on year ends on the day of the corresponding day of departure;

e) the term that ends on a public holiday or when service is suspended will be extended until the end of the first working day following. Work is not considered as the corresponding weekly rest days.

The **deadline for payment of a tax / fee**, is the date / dates set by law for tax / duty in question. Eg tax / fee on buildings shall be paid annually in two equal installments by the dates of March 31 and September 30 inclusive. In this case, payment terms for tax / tax on buildings is 31 March and 30 September.

All **terms of payment**, under sections 15, paragraph 6, Title IX of the Implementing Rules of the Fiscal Code, is based on the granting bonus payments by anticipation. For example, for advance payment of tax on buildings, due for the entire year by the taxpayer, until 31 March of that year - which is the deadline - is given a bonus of up to 10%, determined by local council decision. In this case, the payment deadline will be March 31 of that year.

If the payout of any local taxes expires on a public holiday, weekly rest or when service is suspended under the law, the payment is considered within if made before the end of the first working day.

According to art. 248 Fiscal Code, local taxes are the following:

- a) tax and tax on buildings;
- b) tax and land tax;
- c) tax on vehicles;
- d) the fee for issuance of certificates, permits and licenses;
- e) the fee for using means of advertising and publicity;
- f) tax on shows;
- g) tourist tax;
- h) special charges;
- i) other local taxes.

4. Conclusions

We can conclude by saying that a good understanding of these aspects and rules that are general valid, regarding the local tax and fees is very important for the local authorities, for an optimal, legal and efficient management of the local tax and fees, but, in the same time, is useful for the public, for the citizens that are paying these tax and fees. That's way, it is important to made this issue more systematic and presenting the problems related to the principles of establishing the local tax and fees as well as the specific features of them represent a first step for a more complex, but needed analysis.

Abstract

Financial system regulation and supervision are exercised in most cases, by national or regional central banks and / or other public entities. These entities may regulate and supervise the various components of financial system (banking, capital markets, insurance and reinsurance market, investment funds market, etc.). This exercise in fact intern regulation or national (regional) regulation. In this article we want to emphasize the importance of a collaborative public - private financial regulation. This was outlined possible meanings of the concepts of public financial regulation public and private financial regulation and the relationship between these two types of financial regulation. Then from the meaning of the concept of public - private partnership we have outlined the application of this concept in financial regulation. The first attempts in this regard have resulted in the banking sector in emerging Europe through Vienna Initiative. However we consider it appropriate to extend this partnership to other sectors of the financial system as well as at geographical level. We consider, also, essential that Public and Private Partnership can rely on cooperation and coordination.

Key words: Financial regulation, Vienna Initiative, Public – Private Partnerships, Banking Sector

Jel clasiffication: B41, G18, G21

1. Introduction

Financial system regulation and supervision are exercised in most cases, by national or regional central banks and/ or

other public entities. These entities may regulate and supervise the various components of financial system (banking, capital markets, insurance and reinsurance market, investment funds market, etc.). This exercise in fact intern regulation or national (regional) regulation.

In times of financial turbulence is found that the structure and content of financial regulatory system is reaching its limits and becomes ineffective in a new context transformed by the financial crisis. The effect is manifested is rethinking a new system of financial regulation and supervision leading to achievement of the financial system as a whole. Thus, the roles of regulatory entities do so. And here we mention the concern of central banks and other supervisory and regulatory authorities to rethink the financial system of financial regulation, in this new context. It will therefore proposes a new model of public financial regulatory.

2. Conceptual delimitations

Periods of financial turbulence and situations present today's financial markets require development of a continuous process of rethinking the concepts of theoretical aspects of financial regulation. In this article we outlined a possible meaning of the concepts of public financial regulation and private financial regulation concept.

In a previous article we established some of the forms of financial regulation act you can know. In the financial system, regulation may consist of several species: deregulation and reregulation, under-regulation and over-regulation, deregulation, micro-prudential regulation and macro-prudential regulation, etc. (Bratu, 2012). In terms of exercise, all these species of financial regulation are from the public level. That is exercised by the

authorities or public bodies authorized to do so: financial regulatory authorities, central banks or similar entities.

A. Public Financial Regulation Concept

We believe that species of public financial regulation requires action to issue rules and regulations by public authorities specific to work in order to achieve financial system stability. From this we can draw some consequences:

- The consequence 1: Public Financial Regulation is superior being positioned in the center of the financial system because of the role of regulatory bodies we have in this context;
- The consequence 2: Public Financial Regulation is exerted vertically from top to bottom, from regulatory bodies for financial entities, depending on the changes taking place in the financial system;
- The consequence 3: Public Financial Regulation may be multiple, where several public entities regulate different components of the financial system;
- The consequence 4: Public Financial Regulation aimed at achieving macroeconomic objectives, such as financial system stability, monetary stability, protect depositors;
- The consequence 5: Public Financial Regulation is official and is disseminated to all financial market participants and the public through official documents state like laws, ordinances, regulations, rules, etc.

B. Private Financial Regulation Concept

Consider private regulation, the regulation which requires that species rules and regulations issued by private financial entities to order its own entity or group activity which includes the achievement of efficiency and effectiveness of such entity or financial holding company. In this regard, consider the following consequences apply:

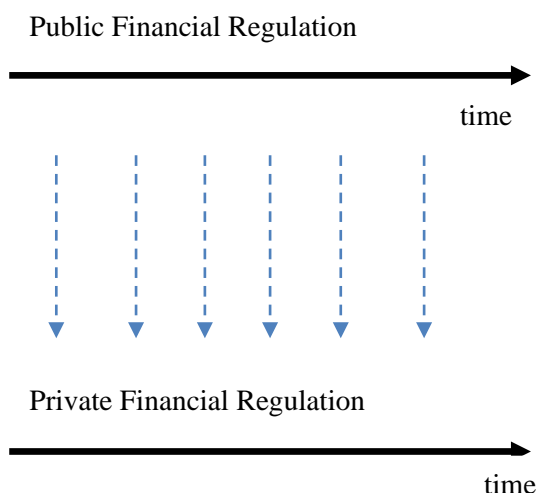

- The consequence 1: Private Financial Regulation is a species of self-regulation. Private financial entities issue rules to themselves;

- The consequence 2: Private Financial Regulation is made horizontally at the base of the financial system, namely the financial entities operating in the financial market in direct relationship with customers of financial services;
- The consequence 3: Private Financial Regulation requires diversity as each financial entity issues its own rules of action in accordance with their own perception of the environment acting;
- The consequence 4: Private Financial Regulation pursue the objectives of individual financial entities, namely the efficiency and effectiveness of activity,
- The consequence 5: Private Financial Regulation may work by professional associations set up by representatives of private financial institutions;
- The consequence 5: Private Financial Regulation is informal to other similar players in the market and is disseminated limited at individual institution or group or financial holding with the national action and / or cross-border, international action.

3. Public regulation and private regulation relationship in the financial system

In the current financial system, public regulation is based and traditional regulation in the field. Exercise public regulatory norms and rules have been started with the advent of central banks and / or creation of public organizations with the purpose of creating conditions for optimal development and functioning of financial markets worldwide. Simultaneously and parallel to withstand market and to realize the objectives initially set, Financials private entities have issued their own financial regulations and the limited scope of action, only at their own.

Scheme no.1.

What we find is that the relationship between the two species is one of subordination financial regulation and taxation. Public financial regulation is imposed in some degree to all financial market participants. Thus, any new financial entity established in the field must respect certain rules of action and subsequent initial lifetime, predictable, that entity, if it wishes to conduct financial activities. (Scheme no. 1.)

Public financial regulation is individual and complete public financial regulatory actions and creates some opportunities for financial institution concerned in relation to competition in the industry as well as highly unpredictable operating environment.

Turmoil in the financial system appearing are available most times due to regulation mode of action of public funds. Offered as a new way of thinking of public financial regulation. The goal is long-term survival and functioning of the financial system. Simultaneously and in parallel private and individual specific financial regulations turns to find a new way of "life" of the financial safer and more benefit entity. This time, the goal is survival and medium and long term operation of the entity's financial statements. From these observations we believe that to survive and to compliance with an roles, while the issue of financial regulation of the two species is analyzed in coordination and collaboration. Every person or party or interest group, the financial market would be to target the same general objectives of the financial system as a whole. To achieve those objectives mentioned parties should behave

in partnership way and / or coordinated cooperation to act in time and space. (Scheme no. 2.)

Scheme no. 2.

Relationship of partnership, cooperation and coordination between the two levels of financial regulation - public and private - could formalize. The stage of discussions between government representatives and representatives of regulatory financial entities of the state official formalization of agreements to highlight joint participation of the two interests to achieve a financial regulatory framework as appropriate existing complex financial system. Thus, financial regulation could be a significant factor in reducing the possibility of raising the financial turmoil and more than a factor considered by many writers to date, which helps to trigger financial turmoil.

4. Public and Private Partnership (3Ps) in Financial Regulation

In terms of realization of agreements or public - private partnerships in finance, the literature is poor in this respect. Until now we have no knowledge of where to end these partnership agreements in the field of financial regulation at public and private.

If we consider the concept of public - private partnership (the 3 "P") will realize that is difficult to achieve this. Because a PPP is a contract by a public authority selects a project that is then developed and applied by a private entity. A Public - Private Partnership is usually defined as a contract development services and government and a

private partner [14]. Governments worldwide have developed Public - Private Partnership as vehicles for delivering a wide range of public services in major areas such as education, construction, transport, health [4]. Meanwhile, other authors consider that the Public - private partnership is collaboration between public and private sectors in an effort to provide a project or service traditionally provided by the public sector. In this case the parties involved in this partnership are governments, investors and creditors [12]. In most cases, contracts for public - private development are underway to taking such form collaborative paradigm for the 21st century. These projects are developed between public actors, private actors, civil society organizations, which provide benefits to each partner and the community itself [18].

Financial system, we believe that a PPP could take the form of agreements between different stakeholders in achieving the common goal of existence of the financial system. Some of the features of a Public - Private Partnership in financial regulation as follows:

- It could be an agreement between public authorities and regulatory oversight (national and / or regional), non-profit civil organizations in the financial (banking associations and / or financial), international financial institutions (Bank of International Settlements, World Bank, European Bank for Reconstruction and Development, International Monetary Fund, etc.), representatives of groups and / or financial holding companies - banking, civil associations of clients in the real economy;
- The agreement aims could be: awareness of the financial system and create a financial regulatory system that contributes greatly to this;
- Cooperation and coordination. Parties should cooperate in developing rules of the game in financial activity and to create specific behaviors to perform coordinate in time and space, to achieve desirable effect of financial regulatory operations.

5. Tests of collaboration between public and private financial regulation

As I stated earlier, the finance is not yet known examples of cooperation agreements or Public - Private Partnership. However, a first step in this direction was made at European level. Public - private partnership agreement signed in the format of coordination in the banking sector called "Vienna Initiative" launched in January of 2009. The essential role of the financial stability arrangements in Central and Eastern Europe. Vienna Initiative aimed to establish a specific action groups international banking activity in the region (particularly those which are systemically important), namely:

- prevent a large scale withdrawals bank exposures (especially in countries where the IMF and EU funding agreements with national authorities, namely: Hungary, Romania, Serbia, Bosnia - Herzegovina and Latvia);
- management of establishing common principles and measures to combat the crisis involving the authorities of host countries and those of countries of origin;
- strengthening cross-border cooperation in the regulatory process, including by exchanging information.

Specific instruments that have achieved these goals have resulted in agreements in the form of bilateral letters with maintaining exposures in the host country (banking groups in Austria, Italy, Greece, France, Slovenia, Germany, Belgium and the Nordic countries and have made commitments to maintain exposures in major host countries of emerging Europe).

In addition to these specific objectives Vienna Initiative aims to investigate possible political and structural problems arising from the regional banking sector. This led to the establishment of two working groups:

- Working Group 1: to analyze the development of financial markets in local currency to reduce foreign currency lending [6];
- Working Group 2: highlighting the role played by credit institutions in attracting European funds [7];

The motivation that led to the conclusion of the Public - Private Partnership was to

provide for coordinated action to maintain financial stability and confidence in local markets and promoting sustainable economic growth. [15]. The parties to the agreement are the regulators in the countries of European banking groups active in national markets emerging Europe. Beside them were and international authorities (European Commission, EBRD, EIB, WB, IMF and the IMF - as observer), bank representatives involved and local authorities in emerging European countries.

So far, "Vienna Initiative" saw two versions – Vienna, Vienna 1.0 and 2.0. Vienna 1.0. is on the other two working groups examining: implications adopting Basel III by banks in emerging Europe, management of bad loans to companies and households. Vienna Currently 1.0. The other is on two working groups examining: Implications adopting Basel III by Banks in Emerging Europe, management of bad loans to companies and Households.

6. Conclusions

Regulation of public - private financial base built on Public Private Partnerships can be found in an early stage at present. To achieve the objective of stability of the financial system and making regulation more and contribute more effectively to this aim we consider it necessary to rethink the paradigm of financial regulation to new theoretical principles (the principle of cooperation, coordination and awareness of financial system stability principle for all parties involved in financial and social life) and practical (end of public - private partnerships between public authorities, private financial entities, international and regional institutions in all sectors of finance). We believe that the Vienna Initiative is only a first step in this process and mechanisms that provide efficient and effective financial regulation will be achieved only through cooperation, collaboration and coordination.

Abstract

Local budgets are characterized by a high dependence rate on transfers from the state budget, without the existence of some intense concerns on the creation of own funds. In the category of transfers from state budget there are included the amounts broken down to balance local budgets, the state subsidies and a series of financial amounts from special funds of the Government. This paper comes to detail the mechanism of local financing by the Fund of reserve and the Fund of intervention used by Government. In the recent years, they have become a support source for communities that fail to survive using their current financial resources. It can be interpreted as a variant of political favor to some municipalities, because there are no set some by the law clear criteria required by distribution of these funds.

Keywords: local budget, Fund of reserve, Fund of intervention

J.E.L. Classification: H 70, H 71, H 77

1. Introduction

The subject of local budgets is complex and difficult to debate in a few pages. Local budgets are the most useful tool to plan and manage the economic financial activity of administrative - territorial units. The structure of local budgets defines the autonomy of local government in relation with the central government. In Romania, there are still discrepancies between the way things should stay in practice and the concrete reality. Local budgets are not based on direct needs identified in the communities, but rather they are made with a greater attention on economic interests and, not even, political. In

a country with a very large geographically diversity, like Romania, it is impossible that all regions to have the same degree of economic development. Budget's balancing mechanism tries to correct these shortcomings and regional inequalities in order to restrict these spreads. No town in Romania is not currently able to survive by its own resources, but is in overwhelmingly dependents on the state budget. [1] This can be achieved by changing the construction of public budgets, reducing the financial dependence of localities on the state budget. Do not overlook the fact that local autonomy and decentralization were the defining principles in the organization of local public administration.

This paper aims to study an alternative of funding local budgets in Romania represented by the mechanism of Government's Fund of Reserve and Fund of intervention. The paper is structured in four parts, as follows: it begins with some general aspects on local budgets revenues, then it continue in the second part by detailing the destination of Government's Fund of reserve, the third part focuses on the amounts received by local communities from Government's Fund of intervention, and finally were outlined several conclusions. The research mechanism of this paper consider seeking qualitative and quantitative research methods, among which can be included: applied investigation on the current state of local financial resources policy in Romania, the systemic literature review, the methods of induction and deduction, the graphic representation of investigated phenomena.

2. Transfers from Government's Fund of reserve

Whatever the degree of decentralization of a country is, the financial relations between state and local authorities are multiple and complex. In all European countries they are seeking for solutions to ensure a balanced distribution of funds as between different levels of administrative organization, taking account of budgetary rigor that is required at all levels of government. Thus, any transfer of responsibilities from state to local communities must be accompanied by an equivalent and simultaneously transfer of financial resources. A good transfer must meet several conditions: first, they must not be sufficient, but in addition, so that local authorities to be encouraged to achieve their revenues and at the same time must be equilibrium between the power of local authorities and decentralized resources. It is desirable that these decentralized resources to be predictable for a period of time, to allow local authorities to make spending strategy as to accomplish long-term investment objectives.

Of all revenues collected from the state budget, local authorities receive funding as allowances deducted from income tax and VAT. These revenues correspond to a system of taxes sharing between the various levels of government. An analysis of transfers from the state budget as VAT and income tax indicates that more than one fourth of the collected resources of state budget are distributed to local communities. These transfers have peaked in 2008 of 32.9 billion lei, representing 33% of tax revenue collected by the State. Along with these types of transfers, there is an alternative financing method represented by the Fund of reserve available at governmental level.

The state budget of Romania includes the Fund of reserve and the Fund of intervention available to the Government. [2] The Government’s Fund of reserve can be allocate, theoretically, to some ministries or local budgets, based on government decisions, for financing expenses or sudden emergencies during the financial year. Basically, the Government’s Fund of reserve became a source of support for communities that fail to survive their current funds as normally. It can be interpreted as a variant of political favoritism to localities, because no clear criteria were set out in law to grant

money from the Fund. But due to the fact that since the creation of this fund were not sufficiently defined the types of costs that local authorities can do with this money, now the amounts are used for any other purposes than those originally provided by this mechanism funding. Analyzing the evolution of the Fund of reserve and the Fund of intervention in the period 1999 - 2011 it was found that they had an upward trend until 2008, with a peak reached in 2006 when the budgetary Fund of reserve (5,573,543 thousands lei, the equivalent of € 1,581.6 million at the average exchange rate of 2006) and in 2007 for Fund of intervention (582,296 lei, the equivalent of € 165 million at average exchange rate of 2007). In 2007, the Fund of reserve was originally approved to the amount of 128.7 million lei. During the year, it was continually increased, more than 22.25 times than the initial provisions. Similarly in 2008, the reserve fund budget was approved with the amount of 6.2 million lei. It increased 593.22 times until the end of the year. [3] in 2009 and 2010, the situation remained disproportionate for the Fund of reserve, it is found that the amount distributed by the fund are 18 times in 2009, respectively 13 times in 2010, higher than the original provisions.

Table 1. Fund of reserve (thousands lei)

Year	Fund of reserve	
	Initial provision	Alocations
2012*	224.909	71.903
2011	200.000	1.921.585
2010	184.750	2.542.197
2009	152.669	2.850.960
2008	6.248	3.224.762
2007	128.709	1.518.413

Source: Data processed from the State Budget Law between the years 2007 - 2012 and the Government Decisions of the years 2007 - 2012 (first quarter I)

But public notification with respect to this problem led to a slowdown in using this method for financing uncontrolled current and capital expenses. For example, in 2011, according to the state budget the Fund of reserve has an initial value of 200 million lei, but according to the 51 governmental

decisions have been used 1921.5 million lei, i.e. 9.6 times more.

Figure 1. Government's Fund of reserve (thousands lei)

Source: Own processing data from Government's decisions and the Laws on state budget

After 2008, allocations from the fund showed a downward trend decreasing by 11.6% in 2009 as compared to 2008 and by 10.8% in 2010 as compared to 2009. 2011 brings a reduction in allocations from the Fund of reserve by 24.4%. Court of Auditors concludes that there are a growing number of decisions of the Government to allocate funds from the budgetary reserve. In 1990 only two allocations were approved by Government decisions, reaching a peak of 386 in 2006 [4], then fell to 58 in 2010 and 51 in 2011. In fact, many beneficiaries were merged into a single government decision.

In 2009 local budgets received additions in VAT allocation by 816.6 million lei through allocations from the Government's Fund of reserve, i.e. 28.6% of the amounts distributed, the difference being given to the ministries. [5] This fund was distributed by 60 governmental decisions, of which 25 targeted local budgets: 14 individual and 6 group allocations. 10.6% of 723.9 million lei have been directed to Capital. The counties receiving the largest amounts from the Fund of reserve are 68.4 million Brasov, 48.6 million Suceava, 41.1 million Arges, and 39.6 million Hunedoara.

Mehedinti is the county with the lowest amount received of 4.5 million, followed by Giurgiu, Calarasi, Ialomita and Teleorman. The county of Sibiu has received funding worth 12.9 million lei, or 1.79% of allocations from the Fund of reserve. In 2010

local budgets funding from the Fund was 645.3 million lei, or 25.4% of total allocations from the Fund. 14 of the 20 government decisions supposed individual allocations to local administrative units, worth 220 million lei to Botosani, Olt County, Suceava, Nasaud, Cluj and Bucharest.

Financing local budgets from the Fund of reserve for the year 2011 amounted to 200.8 million lei value, i.e. 10.5% of a total allocation of 580.9 million lei, the remaining 65% being distributed to the ministries. Funding was achieved through 13 government decisions, including 3 collective government decisions (Government Decision no. 649/2011, Government Decision no. 1001/2011 and GD. 1158/2011) on the way to supplement amounts deducted from VAT to balance local budgets for current and capital expenses, or the realization of investment objectives. An analysis by county of the localities that have completed their revenues by this way leads to the following results: the largest amount received from the Reserve Fund in 2011 were recorded in Mures 9.06 million (4.51 % of all amounts deducted as VAT for balancing), Hunedoara 8.8 million lei (4.4%), Timis 7.98 million (3.97%), Neamt 7.88 million (3.93%) and Prahova 7.18 million (3.58). Instead Vrancea 1.49 million (0.74%), Ialomita 1.6 million (0.8%), Constanta 1.86 million (0.93%) and Braila 1.92 million (0.96%) are the counties that obtained the lowest funding from this source. There are significant discrepancies between extreme, Mures received six times more funds than in Vrancea. In terms of Sibiu, it is positioned in the category of counties that have received small amounts from Fund of reserve of 2.7 million, or 1.3% of the total, ranking 7th in 2011. In the first quarter of 2012, by 10 governmental decisions, were distributed 71.9 billion lei from the Reserve Fund, of which 1.5 billion lei to Mangalia and 0.5 million to Horezu.

Figure 2. Government's Fund of reserve destinationations in 2011

Source: Own processing data from Government's decisions and the Laws on state budget

Regarding other uses of Fund of reserve in 2011 they were concerned to budgets of ministries of health 620.8 billion lei (32.3%), transport 581.8 billion lei (30.3%) and regional development 150 billion lei (7.8%). Other ministries that received funding are education 98.2 billion lei, defense 21 billion lei, internal and external administration lei 79.6 billion, environment 42 billion lei, culture 32 billion lei and work 14 billion lei. Ministry of Finance and the Government has approved for current expenses and capital 71 billion lei in 2011 from the reserve fund. Among destinations with the character "unforeseen emergency" of 2011 falls 23 billion lei for organizing the annual session of NATO Parliamentary Assembly in Bucharest, 100 million for setting up Radio Chisinau by Romanian Radio Broadcasting Corporation, 0.4 million lei to organize national day at Alba Iulia on December 1 or 1 million lei for the National Theatre 'Radu Stanca' in Sibiu for the theater organization in Belgium.

3. Transfers from Government's Fund of intervention

Government's Fund of intervention shall be distributed to the ministries and local budgets, based on Government decisions to finance urgent actions, to eliminate the effects of natural disasters and to support affected individuals. Intervention fund

available to the Government was originally formed in 2007 in the amount of 12.0 million. During budget execution the Fund of intervention was increased by the amount of 571.5 million lei, reaching a total of 583.5 million lei, i.e. it has increased by 48.6 times. Regarding the Government's Fund of intervention in 2008, it was initially created in the amount of 6.7 million to cover expenses caused by natural disasters, then was increased by 220.8 million lei, so that at the end of the year the Fund had a total amount of 227.5 million lei. The increase of Government's Fund of intervention in 2008 was 33.95 times.

Table 2. Fund of intervention (thousands lei)

Year	Fund of intervention	
	Initial provision	Alocations
2012*	7.000	21.000
2011	7.000	0
2010	16.000	14.900
2009	15.000	11.900
2008	6.718	226.832
2007	12.000	582.296

Source: Data processed from the State Budget Law between the years 2007 - 2012 and the Government Decisions of the years 2007 - 2012 (first quarter I)

Transfers from Fund of intervention to local budgets in 2009 were 11.9 million, of which 0.17 million due to the explosion of a city block in Roman, 0.46 million lei in Valcea county for slides land and 11.27 million for 22 counties hit by floods. Investment Fund allocations in 2010 were 14.9 million, of which 2.6 million came to the budgets of localities in Buzau (2 million) and Alba (0.6 million) affected by natural disasters. In the year 2011 there has been no transfer of this fund to finance the local communities, but were paid 874,000 lei to Timisoara municipality due to an explosion in an apartment building. Year 2012 started with two uses of Fund of intervention, i.e. 1 million for people of Holboca (Iasi) following an explosion and 20 billion lei for natural disasters of snow and blizzard in 15 counties (13.2% Buzau, Ialomita 12.9%, 11.8% Vrancea, Galati, Calarasi, Virginia, Bacau, Dambovita, Tulcea, Ilfov, Braila,

3.4%Botosani, 1.3% Giurgiu and 1.2%Constanta).

The Court of Auditors Report for 2009 show that the Fund of reserve and the Fund of intervention should be used as a last resort and only if the other funding options were exhausted for any objective / action. In fact, over the years, the Government appealed to the Fund of reserve for non-urgent situations, as evidenced by the Court of Auditors, which includes data from 1999 to 2009, focusing mainly on the years 2007-2008. The report finds that almost all local governments have received funding from these sources. Court claims that it can be said that requests for funds from the budget reserve / intervention has become a habit that can lead to the idea of parallel financing of the economy, not only by state budget law. Criticism of these allocations rightly concerns the lack of transparency and intervention criteria for granting subjectivity and political interests. This allocation is contrary to that provided by law and it does not show the urgency of these allocations. There is a lack of control both in terms of procedure allocation, but also to control the efficiency of money and amounts received as to not change the money destination. Basically, the Fund of reserve became a source of support for communities that fail to survive with their current funds as normally.

4. Conclusions

We believe that should be eliminated discrepancies between amounts initially established to the two funds and their final annual executions and to eliminate subjective and the clientele destinations of public money. The paper comes to reinforce the finding that while public attention is focused on the destination of these funds, public authorities not intended to enforce the law and to limit the unsubstantiated uses of these amounts.

At local level, building local budget is a major action and an evident complexity to any place that has an impact on the annual economic evolution. There is a breakdown of local communities in two categories: communities with sufficient own resources and communities that lack sufficient funds for operating expenditures of any settlement. At the local level is desirable to make the

transition from an administrative culture to an economic culture. Today the major metropolis becomes economic development poles. For example, local development in France is not considered for a single city, but is focused on developing a network of large, medium and small cities, clustered in urban agglomerations. Formation of large urban cities leads to the formation and strengthening of solidarity. Such logic cannot ignore the competition that exists not only between the major international and European cities, but between the national ones. In France the local competition is manifested both at the metropolitan level, and departmental and regional level leading to better focus and resource allocation.

From our perspective it is necessary a change in thinking and action of central and local authorities. They must give up a Romanian budgetary system that has features of a blotter of added value created by its citizens. Similar to the Romanian society is obvious that the budget is based on consumption of financial resources and not on actual production of financial resources other than fiscal ones, whose production does not require a creative effort. We foresee two solutions to the current situation of insufficient public money in Romania: the first refers to thrift and performance in available public funds, there are money, but their management is inefficient, and the second concerns focus on building activity to create non-tax revenues from dividends and payments of net profits from public companies. We believe that public authorities need to become some better public entrepreneurs, that create added value, create jobs, provide Romanian products on the market. It is a long term solution that does not give the advantage of quick cash resources to the public budget as compared to the version of increased taxes, the easiest by the way. By the attitude of a public economic entrepreneurs we understand the involvement of public authorities in the economy as an economic agent able to deal with national and international competition of the private sector, as a public economic entity which has the advantage of having resources in a strategic sector (all energy, soil and subsoil deposits) and is eligible for European co-financing undertaken activities.

The Impact of Basel III on Romanian Banking System

Busuioc Witowski Irina Raluca

*Business Administration Department, Faculty of Economics
and Business Administration, „Alexandru Ioan Cuza” University, Iasi*
iwitowski@yahoo.com

Abstract

The Basel III framework represents an important step in strengthening financial stability by applying new more complex prudential regulations. At a micro- and a macroprudential level, these standards set higher capital requirements and better quality in view of a better risk management, introducing an additional indicator of capital adequacy - leverage, capital accumulation measures regarding periods of stress and introducing two new liquidity standards. The aim of this paper is to highlight the implications of Basel III on Romanian banking system.

Keywords: financial stability, banking system, Basel III, macroprudential level, microprudential level.

JEL Codes: G21, G32

1. Introduction

The financial crises manifested in recent decades have led to the enhancement of debates between authorities, but also in the specialised literature, on the need for financial stability, which has become an increasingly important goal in the economic decision-making.

The concept of financial stability is a complex one, the economic literature and practice being as yet unable to agree upon a definition or on an evaluation model. Since the purpose of this article is to analyse the impact of introducing the Basel III agreement in the Romanian banking system, I have lingered on the definitions proposed by the European Central Bank and by the National Bank of Romania (NBR).

The European Central Bank defines financial stability as a situation in which the financial system - including intermediaries,

markets and financial market infrastructures - is capable of withstanding shocks and absorbs financial imbalances [3].

The National Bank of Romania defines financial stability in its first *Financial stability report*, as that feature of the financial system of facing systemic shocks on a sustainable basis and without major disruptions, of efficiently allocating financial resources in the economy and of identifying and managing risks effectively [5].

Furthermore, the NBR governor shows that financial stability is, in a broad sense, a situation in which the financial system can ensure efficient allocation of savings to investment opportunities and can withstand shocks without major disruptions. In a more narrow, but at the same time more useful approach, from the perspective of a central bank, financial stability can be defined as a situation characterised by the absence of banking crises and the existence of a certain level of stability in asset prices, including interest rates [4].

For the purpose of ensuring financial stability, authorities use as a general measure the supervision and regulation of the institutional framework. The supervision of markets, institutions and infrastructure can contribute to the rigorous management of financial risks.

In the process of risk identification and analysis regarding financial stability, either microprudential analysis or macroprudential analysis can be used. The microprudential analysis refers to individual developments of financial institutions, aiming at limiting their instability. Unlike the microprudential supervision, the macroprudential supervision targets the financial system as a whole, aimed at limiting instability in the entire system.

Since the banking sector is of particular importance in the stability of financial systems, the concern of the authorities to consolidate the banking system has arisen.

The importance of banking supervision and regulation is evident, since examining the situation of each bank in part allows the supervising body to play an important role in ensuring a stable banking system.

As the evolution of the financial and banking sector was marked by major changes in the business environment, with important implications for the financial stability, it was deemed necessary to rethink the capital requirements of banks, observing at the same time the lack of or failure to cover certain highly volatile segments of the capital market, as well as inadequate risk management practices at bank level.

2. Basel III Agreement - the general framework for ensuring financial stability

In September 2010, the Basel Committee on Banking Supervision (BCBS) has adopted the final proposals to consolidate bank capital and liquidity standards - known as Basel III Agreement. The objective of this agreement is to consolidate the stability of the banking system by applying new more complex prudential regulations.

At a micro- and a macroprudential level, these standards set higher capital requirements and better quality in view of a better risk management, introducing an additional indicator of capital adequacy - leverage, capital accumulation measures regarding periods of stress and introducing two new liquidity standards.

The key elements of the reform imposed by the Basel III Agreement are: quality, quantity and simplification of bank capital.

- **Quality of bank capital**

According to the Basel III Agreement, the quality of bank capital will increase, the banks having to raise the minimum level of common equity from 2%, before applying regulatory adjustments, to 4,5% after applying stricter adjustments. Furthermore, the Tier 1 capital requirement will increase from 4% to 6%. This will be phased in by 1 January 2015. The total capital requirement remains at the current level of 8,0%.

- **Quantity of bank capital**

Under Basel III Agreement, the banks will have to increase the minimum capital ratio to at least 7% in the coming years. In addition, two elements are introduced regarding capital reserves.

The first buffer refers to a fixed target reserve called "capital conservation buffer" of 2,5%, consisting of the minimum capital required, available to absorb losses in times of crisis. Banks with reserves below the target level will face limitations regarding the distribution of capital (e.g. dividends payment, repurchasing shares, bonuses) so as to achieve fixed target reserves.

The second buffer refers to the "countercyclical buffer" that is activated when authorities notice the appearance of the phenomenon of excessive lending, representing a tool of macroprudential surveillance. The role of this countercyclical capital reserve is to protect banks in cases in which the economic cycle changes abruptly and consequently there is a large number of bad loans.

- **Simplification of bank capital**

Under Basel III Agreement, the bank capital will be structured as Tier 1 and Tier 2 capital, level 3 capital being eliminated.

To these capital requirements, an additional indicator of capital adequacy, namely, leverage, is added. Thus, regulators have agreed to test a minimum leverage effect regarding the Tier 1 capital at a level of 3%. Based on the results of the testing period, final adjustments will be made in the first half of 2017. This measure at a macroprudential level will determine the reduction of the systemic risk probability but also the increased resistance of the banking system in face of a crisis.

Not least, the Basel III Agreement provides for minimum global standards for measuring and monitoring liquidity risks. Thus, it is intended to provide short-term (30 days) liquidity necessary for resistance to shock / crisis of liquidity, as well as long-term (1 year), a solid profile of the structural liquidity.

Implementing the new requirements, at a national level, by member countries, will begin on 1 January 2013. They have to translate the principles of the agreement into national laws and regulations before that date.

Therefore, from 1 January 2013, credit institutions will be required to meet the following minimum requirements in relation to risk-weighted assets (RWAs):

- 3.5% common equity /RWAs;
- 4.5% Tier 1 capital/RWAs;

- 8.0% total capital/RWAs.

As approved by the group of observation, preservation of capital buffer can be realized:

- 0.625% in January 2016,
- 1.25% in January 2017
- 1.875% in January 2018
- 2.5%. in January 2019.

Transposing the Basel III Agreement in Europe is in the form of a fourth version of the European Capital Requirements Directive, CRD.

Thus, in July 2009 and February 2010, there were submitted for consultation further amendments of the CRD (CRD IV), concerning: liquidity standards, definition of capital, leverage, counterparty credit risk, counter-cyclical measures, financial institutions of systemic importance, single regulatory framework for the banking sector.

On 20 July 2011, the European Commission adopted a legislative package to consolidate the regulation of the banking sector. The proposal has two parts: a directive regulating the access of accepting deposits and a regulation governing the activities of credit institutions and of investment societies, which will replace the previous directives on capital requirements (2006/48/EC and 2006 / 49/CE).

Through this, the Commission transposes in Europe international standards concerning bank capital agreed at the G20 (commonly known as Basel III Agreement). Furthermore, the Commission also intends to establish a new governing framework, with new prerogatives to closely monitor the banks, as well as a single regulatory framework for the banking sector.

The main implications of the Regulation and Directive covers:

- new requirements regarding corporate governance, including specific limits on the number of mandates for the position of director that a person can hold;
- the financial institutions will have to follow and to actively participate in the activity of the European Banking Authority (EBA) to develop a large number of required technical standards necessary in the implementation process of the Regulation and Directive at a detailed level;
- the financial institutions should closely follow the reporting requirements under the Regulation and to explore the

possibility to integrate these requirements with other changes in the reporting and data management systems;

- liquidity: to improve liquidity for the financial institutions in the short term, the Commission is proposing the introduction of an indicator of immediate liquidity (liquidity coverage ratio, LCR) - the exact composition and parameters of which will be determined after a period of observation and review, in 2015.
- leverage: to limit the excessive growth of the indebtedness degree, the Commission proposes to introduce a leverage ratio to make the object of the supervision, the implications being monitored closely before it becomes a requirement, on 1 January 2018;
- single regulatory framework: a single market requires a single regulatory framework, this way, the regulation is applied directly, without the need to transpose it into national legislation.

3. The impact of Basel III on Romanian banking system

The Romanian banking system is currently preparing to implement the requirements of Basel III, namely, the legislative alignment in what regards the fourth version of the European Capital Requirements Directive Capital Requirements Directive, CRD4.

A first step consists in the fact that, starting with this year, the Romanian banks have gone to new international accounting standards IFRS, 2011 being the last year of reporting bank results, according to Romanian Accounting RAS. This leads to an increased transparency and comparability of the financial reports of banks.

In what concerns the adequacy of capital level, the agreement provides that by 2015 banks must achieve a level of 7% and the own funds ratio must increase from 4% to 6%.

In the Romanian banking system, in mid 2011, Tier 1 own funds account for 80% of the total own funds, and the hybrid capital instruments are missing. Analyzing the structure of Tier 1 funds, we notice that the most important element that has supported them, has remained the social capital. Furthermore, the analysis of own capital (total and Tier 1) shows that the banks in the

system are part of the new Basel III standards on capital adequacy.

The central bank has strengthened the buffer role that Tier 1 play in the total equity funds and the balance sheet of credit institutions respectively, the regulations specifying that Tier 1 should be used at all time, having priority to absorb losses, not to involve fixed costs for the bank and to be effectively available to it, that is, to be fully paid [1].

Table 1. Development of own funds and leverage September 2008 - June 2011 (percents)

	2008	2009	2010	09/2011	06/2011
Percentage of total own funds	100	100	100	100	100
Tier 1 own funds, of which:	72,2	76,4	80,3	81,0	80,1
S o c i a l c a p i t a l	43,7	46,0	50,8	51,7	53,1
S h a r e p r e m i u m s	3,8	4,0	5,7	5,8	5,8
L e g a l r e s e r v e s	24,6	26,4	23,3	30,2	30,2
Current period profit (audited)	-	3,75	2,5	0,0	0,0
Current period losses	-0,7	-2,2	-5,0	-0,5	-2,6
Tier 2 own funds, of which:	22,8	21,6	19,7	19,0	19,9
Revaluation reserves	8,1	6,06	5,6	5,7	5,7
Subordinated loans (net)	15,8	17,2	15,7	15,0	15,2
Subordinated loans (gross)	17,9	20,1	20,3	20,0	20,7
Leverage (Tier 1 own funds / total average assets)	8,13	7,55	8,11	7,96	7,79

Source: NBR Financial Stability Report 2011 and Monthly Bulletins, www.bnro.ro

As regards the solvency ratio, the central bank of Romania (NBR) uses the solvency ratio to assess the capitalization level of credit institutions. The minimum regulated level for the solvency ratio is 8 percent, with consideration of a report of at least 1 between own funds and capital requirements. It should be mentioned that the Basel III Agreement will regulate the minimum levels of the indicators, the monitoring institutions from each country having to meet this minimum level, but they will be free to impose more stringent levels of these indicators based on the specificity of every local market (e.g. Basel II requires a minimum capital requirement of 8%, while the Romanian regulations require that, during the program of financial assistance (until April 2011) [5] concluded by Romania with the IMF and the European Union, banks should hold a capital of 10% minimum).

A too tight link existing between the big banks and the parent banks might have a potential impact on the Romanian banking system - banking in Romania being influenced through lower capital available for investment in subsidiaries of parent banks.

Therefore, a shift is predicted in Romanian banking to new areas which provide the resources necessary to meet the levels of the new indicators (first and foremost) and then to provide loans to the public and private sectors.

Even if the impact of Basel III on the Romanian banking system is considered to be limited, credit institutions have adopted several measures to mitigate the impact of aligning with the new standards. We refer here to:

1. restructuring bank balance sheets
Basel III Agreement is based on integrated management of assets, capital and financing, credit institutions being unable to optimize assets and liabilities independently.

2. restructuring the business model of banks
The competition for retail deposits becomes more and more pronounced, and the bond market issued by credit institutions in Romania tends to increase.

The credit evolution will increasingly depend on the capacity of banks to attract internal resources and especially medium and long term resources avoiding the financing on short-term resources. A visible fact is that banks make fewer long-term financing, avoid high-risk lending conditions, focusing on the most profitable activities. Thus, NBR has come to meet these measures which, through the new crediting rules imposed on banking institutions, have reduced the credit period and limited the credit risk.

Therefore, the new regulations imposed by Basel III Agreement will focus in one way or another on all departments of a banking institution, which would affect all components of business models. We refer to revisions as regards the focus on efficient management of capital, liquidity and funding, but also on operational changes.

All these things will be reflected on the profitability of banks - as reserves / capital shocks will increase the cost of capital and reduce funds available for lending, banks with higher ROA need to deal with risks. So banks will try to reduce the range of products and services to simplify supply,

reduce costs and achieve higher ROE cost of capital.

4. Conclusions

Basel III is an important step in strengthening capital rules, its role being to reduce the probability of a new crisis in the banking and hence would lead to strengthening global financial stability.

In this paper we tried to emphasize the two approaches to capital requirements ie at the micro and macro-prudential. At the micro level reforms are designed to increase the resilience of individual banks at times of stress and macro-prudential reforms are designed to reduce the frequency of financial crises.

In Romania, we believe that the banking system is strong, with high-level prudential indicators and credit institutions have begun to reconsider the work to implement the new standards imposed by Basel III

Abstract

Credit risk is one of the most important aspects that need to be considered by financial institutions involved in credit-granting. It is defined as the risk of loss that arises from a borrower who does not make payments as promised. For modelling credit risk there are two main approaches: the structural models and the reduced form models. The purpose of this paper is to review the evolution of reduced form models from the pioneering days of Jarrow and Turnbull to present

Keywords: credit risk, reduced form models, default intensity

J.E.L. Classification: G30, G32,

1. Introduction

Credit risk is defined as the risk that one of the parties involved in a financial transaction will suffer a loss, due to a decline in creditworthiness, or a default of the counter-party of the transaction. Thus, an efficient credit valuation should result in a debt pricing that is in perfect correspondence with the risks taken. The credit risk modelling efforts have been numerous in the last four decades, and the specific literature is extensive and in constant development. The majority of credit risk models can be divided under two separate approaches: the structural models and the reduced form models.

The first one builds on the classical Merton framework, modelling the evolution of the value of the firm considering that it defaults when the value is lower than a threshold or when the market value is lower

than the value of its liabilities. Besides the study of [1] key extensions and contributions to the structural form modelling can be found in [2], [3], [4], [5] or more modern studies like [6], [7]

The second approach does not imply a theoretical structure of default. In the reduced-form literature, default is assumed to be a random event with a probability given by a known intensity or hazard rate process. Thus, reduced form models accommodate surprise or unexpected defaults. Standard reduced form models assume that the default is driven by an exogenous random variable and that at any time the probability of default is different than zero. In general, reduced models treat defaults as unpredictable Poisson events.

This paper focuses on the second category of credit risk models as presented above, the reduced form models and discusses its evolution during the last three decades.

2. Methodology

In order to achieve the purpose of the paper we consulted academic research ranging from 1990 to present. The research papers were gathered from databases like JStor, EBSCO Publishing, ScienceDirect, Scopus, ProQuest and SpringerLink, as well as from the defaultrisk.com platform after searching key words like: credit risk; default risk; reduced form models, intensity models.

3. The evolution of reduced form models

In a study carried out in 1995 [8] bring a new methodology for the valuation of derivatives under risky conditions. In this paper the default process is modelled like a

Poisson process $N(t)$ with a constant intensity λ and a default time τ . The authors also assume that the recovery rate is constant. Besides the novelty degree for that time, one important disadvantage of the model resides in the fact that it does not consider the possible changes in the credit quality of bonds until the time of default. This inadequacy is solved in future extensions. For example, [9] consider different credit classes and also allow improvements or reductions in credit quality. In the above mentioned study, the authors consider the term structure of credit spreads in a model in which default is modelled as a Markov chain. This is the first contingent claims model that incorporates information on credit rating changes in its methodology. The authors assume that the relation between the term structure in the absence of default risk and the bankruptcy process is statistically independent. The model has a wide applicability in risk management as it is useful in calculating the probabilities of default for bonds belonging to a credit class, for a certain time interval and a certain credit class as starting point. In [9] there are considered $k-1$ credit classes that are characterised by rating, the transition from one class to another being made through a stationary Markov chain. The default moment τ is defined as the moment in which the default state K is reached for the first time. In a discrete time approach the movements of credit rating can be described by the following transition matrix.

$$PM = \begin{pmatrix} p_{1,1} & p_{1,2} & \dots & p_{1,k} \\ p_{2,1} & p_{2,2} & \dots & p_{2,k} \\ \dots & \dots & \dots & \dots \\ p_{k-1,1} & p_{k-1,2} & \dots & p_{k-1,k} \\ 0 & 0 & \dots & 1 \end{pmatrix} \quad (1)$$

Where $p_{i,j} \geq 0$ and $\sum_{j=1}^K p_{i,j} = 1$

The matrix elements $p_{i,j}$ with $i, j = 1, \dots, K - 1$ represent the probability that one i rated bond to get to the j class in the following time step.

The authors decompose risk neutral transition probabilities in an independent time component $p_{i,j}$ and a dependent one $\pi_{i,j}(t)$. The default probability for the $q_{i,j}(t)$ is expressed: $p_{i,j}\pi_{i,j}(t)$. In order to reduce the dimension of the matter, the model

assumes that the proportional adjustment $\pi_i(t)$ of the empirical probabilities $p_{i,j}$ depends only on the current rating (i) being independent of the following rating (j). Given the transition matrix, for each $k-1$ step the risk premiums are needed. In the model these are obtained from the prices of the $k-1$ bonds that mature in the next period.

Besides the issues faced in model calibration, one major problem is the fact that the structure of interest rates for all rating classes is rarely available. The biggest disadvantage of the model is the fact that it describes the transition of credit ratings for a single debtor assuming that all the bonds are characterised by the same Markov chain. In practice, credit applications target mainly bonds belonging to different debtors, and such a hedging procedure is feasible only under the unlikely assumptions that all debtors belonging to a credit class are subjected to identical credit changes.

Another assumption of the model is that the changes in credit spreads are caused only by credit rating shifts as a direct consequence of the deterministic default intensities for a given rating in relation to constant recovery rates. This turns out to be another weakness, as in practice credit spread tend to be very volatile for the same credit class.

One way of bypassing this problem is the use of stochastic recovery rates as for example in the study of [10]. In order to explain to logic behind the above model, [11] uses a recovery rate $\varphi = \varphi(r, x)$ that depends on the interest rate r and on the state variable x . The dependence on the interest rate thus allows [10] to incorporate a correlation between the interest rate risk and the size of the default risk. The x variable is regarded as a firm's specific factor that influences the default. In this context, the recovery rate is given by the equation present below and it is conditioned on the level of the interest rate risk.

$$\Theta(r(t)) = E_t^Q(\varphi(r, x)|r(t)) \quad (2)$$

The authors assume that the interest rate risk is independent of the default moment. Thus, it is clear that $\Theta(r(t))$ is also independent of τ . In this context, the pricing equation for a zero coupon bond belonging to a credit rating class i is the following:

$$v^i(t, T) = p(t, T)E_t^Q \left(1_{\{\tau^i \geq T\}} \right) + E_t^Q \left(e^{-\int_t^{\tau^i} \Theta(r)} 1_{\{\tau^i \leq T\}} \right) \quad (3)$$

On an analysis of the [10] framework, [11] observes that if the default occurs before T the default payment $X(\tau^i) = \Theta(r(\tau^i))$ depends on the default moment τ .

As stated above, the main advantage of the [10] model is the fact that it allows credit spreads to change in time even if the ratings remain constant.

Another study incorporating stochastic recovery rates is [12]. The authors assume that default intensity depends on the evolution of the firm’s stock prices $s(t)$. The intensity is given by the following equation:

$$(s, t) = \frac{a}{\ln\left(\frac{s}{s_{crit}}\right)^2} 1_{\{\tau > t\}} \quad (4)$$

Where a and s_{crit} are constants and s comes from the stochastic assumption $ds(t) = \sigma dz$ where σ is the constant volatility and z a standard Brownian motion.

In order to model the stochastic recovery rate, [12] start with an arbitrary payment $X(t)$ for a default moment t and determine the value of the payment in a future moment T by the following equation:

$$X(T) = e^{\int_t^T r(s)ds} \cdot X(t) \quad (5)$$

In this modelling context the pricing formula for a defaultable zero coupon bond is present in equation (6).

$$v(t, T) = p(t, T) \left(E(\varphi) + (1 - E(\varphi))Q(\tau > T) \right) \quad (6)$$

The above equation depends only on the expected recovery rate $E(\varphi)$ and can be calculated for any parameters present in the model. In practical applications, these parameters are deduced from the available market prices.

[13] considers a modelling methodology in which the default time is seen as a Cox process. The author assumes the existence of a state variable Y that can be characterised by a Markov vectorial process and defines the intensity λ by:

$$Q(\tau > t | Y(t)) = e^{-\int_0^t \lambda(s, Y(s))ds} \quad (7)$$

Unlike [9] and [12], [13] does not consider the independence between the default moment τ and the evolution of the risk-free

interest rate. In his modeling context the interest rate is depending on the state variable Y .

Under the *recovery-of-treasury-value* hypothesis and using a constant recovery rate the author obtains the following valuation equation:

$$v(t, T) = \varphi p(t, T) + (1 - \varphi)E_t^Q \left(e^{-\int_t^T r(Y(s))ds} 1_{\{\tau > T\}} \right) \quad (8)$$

Which can be transformed to:

$$E_t^Q \left(e^{-\int_t^T r(Y(s))ds} 1_{\{\tau > T\}} \right) = E_t^Q \left(e^{-\int_t^T r(Y(s)) + \lambda(Y(s))ds} \right) \quad (9)$$

For $\tau > t$ the equation (9) shows the current value of a dollar paid without considering a default and can be interpreted as the current value of a zero coupon bond with a zero recovery rate.

The author also studies the value of the payment at the default time and the value of the cash flows until the default moment. The remarkable result of this study is the capturing of correlation between interest rates and the default risk.

A study that presents a new approach on the modelling of contingent claims that are subject to default and concentrates on applications on the term structure of interest rates for corporate bonds can be found in [14]. Their approach differ from other reduced form models by the way in which the losses given default are parameterised. The authors follow the framework of reduced form modelling by assuming that the default is an unpredictable event that can occur at any given moment, and they model it through a hazard process.

[14] show that the price of a defaultable claim can be calculated by removing from the foreseen payment the short term rate adjusted to default. This covers both the probability and the moment of default and also stands out for the losses in the case of a default. A key element of the pricing equation found in this study is the fact that the average loss rate is exogenously specified. In other words, neither the hazard default rates nor the fractional recovery depend on the value of the contingent claim.

In comparison to other studies, [14] assume at the default time τ the risky bond loses a fraction of its value equal to $1 - \varphi$. The authors show that this assumption allows them to evaluate a future payment as a

certain payment when applying an adjusted discount rate:

$$R(t) = r(t) + \lambda(t)(1 - \varphi) \quad (10)$$

Where λ is the intensity and φ the recovery rate. Thus the value of the considered zero coupon bond is given by the following equation:

$$v(t, T) = E_t^Q \left(e^{-\int_t^T R(s) ds} \right) \quad (11)$$

In [15] there is offered a methodology for the evaluation of credit default swaps assuming that in the case of default the payment is due to a single entity and there aren't any other claims from counterparties. Instead of using a hazard rate for the default probability, this model incorporates the concept of default density which represents the unconditional cumulative probability of default for a certain period. Assuming an expected recovery rate, the model generates default densities recursively on the basis of data consisting of zero coupon corporate bonds and similar treasury bonds. Thus the structure of default density is used for calculating the premium in credit default swap contracts.

In the model considered in [16] the default time is set by the firm's managers in order to maximize the value of equity. In general, investors can't observe the assets directly and get information only from accounting documents that are characterized by periodicity and imperfections. Thus, the authors start from a Markov process $A = (A_t)_{t \geq 0}$ where A_t represents the value of the firm at the moment t and then expose the process to discrete time adding an independent noise. In this way they obtain a discrete time process $Z_t = A_t + Y_t$ where Y_t represents the added noise and it is observed at t_i moments for $i = 1, \dots, \infty$.

The authors relate the distribution of the firm's assets to the information offered to investors, and from this distribution they model the default intensity conditioned by the assets and the default boundary. The specification of the default moment τ and of the filtration F_t makes possible the generation of an intensity for the default moment.

In [17] the model assumes that the default boundary is random and is represented by a horizontal line described by the equation $y = L$ where L represents a known random

variable. In this context the default moment τ is inaccessible.

In a study that refines the hazard function of [18] by incorporating monthly data instead of annual data, [18] observed that by introducing industry effects the forecasting capacity of the model is greatly improved. The industry specific factors influence both the default probably and the losses given default. Thus the authors report that by estimating the hazard function for each industry the accuracy level is increased. This is consistent with the findings reported in [19].

Moreover, the authors investigate firm specific characteristics using financial indicators like: net income to total assets, total liabilities to total assets, firm size (log of equity market value) relative to the total equity market capitalization on NYSE; and stock return volatility.

The study of [20] starts from a structural model in which investors have complete information in relation to the value of the firm's assets but not about the default boundary. Though considered constant, the default boundary is unknown to investors that have to act under a distribution function of the default boundary. The impossibility of its observation makes the default moment to be an unexpected event. The author also studies the cases in which information is incomplete about both the value of the firm's assets and the default boundary. Unlike the first case, this assumption allows a representation by intensity.

Another interesting reduced form model is [22], aiming at credit contagion, as the propagation of economic distress from one firm to another, assuming it is due to the local interaction of firms in a business partner network. The authors study aggregate credit losses on large portfolios of financial positions contracted with firms subject to credit contagion and provide an explicit Gaussian approximation of the distribution of portfolio losses which leads them to quantify the relation between the volatility of losses and the determinants of credit contagion.

A reduced form model for the processes of recovery rates, is implemented also in [23]. After default, firms continue to operate and the recovery rate is determined by the value of the firm's assets compared to the firm's liabilities. The recovery of the debt may vary

depending on whether the firm defaults or not. Though this process is similar to those used by structural models, the reduced form orientation is given by the use of the informational reduction. The model can offer analytical expressions for the default intensity and also a pricing equation for a zero coupon bond, both before and after default.

The research in [24] introduces an empirical reduced-form model for credit rating transitions. It is a parametric intensity-based duration model with multiple states and driven by exogenous covariates and latent dynamic factors. The model has a generalized semi-Markov structure designed to accommodate many of the stylized facts of credit rating migrations. Parameter estimation is based on Monte Carlo maximum likelihood methods.

The model includes a common dynamic component that can be interpreted as the credit cycle. Asymmetric effects of this cycle across rating grades and additional semi-Markov dynamics are found to be statistically significant. The authors also apply the model to a set of credit rating migrations finding a common risk factor in credit rating migrations. The impact of this risk factor is observed to be higher for downgrades than for upgrades. The authors conclude that this empirical result suggest that upgrades are more subject to idiosyncratic shocks than downgrades.

Both [20] and [25] incorporate the KMV EDF (expected default frequencies) in their reduced form models reporting a mild improvement of the forecasting ability. Furthermore, [25] incorporates the default probability estimation methodology from the theoretic [1] framework reporting a similar result to the above study. Both studies conclude that the reduced form is the most efficient and modern modelling approach to credit risk.

The reduced form model proposed in [26] deals with the pricing of the European style option with credit risk. The authors assume that the interest rate follows the Vasicek model and the intensity of default is a jump-diffusion process. Applying the law of iterated conditional expectation, the authors obtain the expression of the option price as shown in the following equation:

$$C(t, T) = \omega \mathbb{E} \left[e^{-\int_t^T r_s ds} (S_T - K)^+ | \mathcal{F}_t \right] + (1 - \omega) I_{\{\tau > t\}} \mathbb{E} \left[e^{-\int_t^T (r_s + \lambda_s) ds} (S_T - K)^+ | \mathcal{F}_t \right] \quad (12)$$

Where ω is the recovery rate considered here to be constant, K is the strike price and T the maturity.

Then, by changing the probability measures, the authors obtain the valuation of the vulnerable European call option. Applying a numerical analysis, the authors obtain the effects of the recovery rate, the correlation coefficients and the Poisson intensity on the option price.

4. Conclusions

In this paper we showed the evolution of reduced form models from the pioneering days of Jarrow and Turnbull to present.

Reduced form models improved certain deficiencies of structural models by taking changes in credit rating into account besides the actual default. In general these models define the default process and its moment with the help of an exogenous Poisson variable. In this way the default process does not depend on the firm's financial data as in the case of structural models.

In some contexts such as complex credit derivatives the reduced form models appear to be the best modelling choice due to the fact that they can be easily adapted to different conditions and calibrated to arbitrary market data.

Given their characteristics, reduced form models proved successful in practical applications. One of the commercial products that generates reduced form estimations on the default probabilities is the Kamakura's Risk Information Services.

Interactions of Derivatives with Central Bank Issues

Roxana Angela Calistru

„Petre Andrei” University of Iasi, Faculty of Economics
roxdav@gmail.com

Abstract

Derivatives are an important part of the process of financial innovation that swept global markets. The growth of derivatives has so many implications on the economy in general and for the environment in which the monetary policy operates. This paper examines the impact that presence of derivatives markets has on the monetary policy transmission mechanism. The effects of derivatives markets is analyzed independently for each of the main channels of monetary policy transmission: interest rates, exchange rates and credit. The conclusion of this paper is that derivatives have a monetary nature that has to be recognized by central banks and included in its monetary targets.

Keywords: derivatives, monetary policy, central bank

JEL Classification: E52, E58, G15, G32

1. Introduction

During the last decades, the financial systems around the world have undergone a revolutionary change. There has been reached the situation where one can borrow more money at lower interest rates than ever, where one can invest in a variety of tools, appropriate for each risk and profitability profile, and one can share risks with other investors from anywhere around the world. However, although they provide undeniable benefits, all these changes offered by the financial system have a cost, the cost of the savings that have been affected by the current financial and economic crisis.

The extent to which the consequences of the evolution of the financial system could have been anticipated by the monetary authorities or the supervisory bodies of the financial system or the contribution they

might have had in mitigating the effects of the changes suffered by the financial system are topics that have largely been examined and discussed lately. [1]

2. Locating derivatives within the new coordinates of the financial system

Starting with the mid 1970s, the pace and nature of financial innovation have changed substantially. Increased volatility of interest rates, the shift to floating exchange rates, increasing indebtedness and financial deregulation, in particular to liberalize capital movements - all have created a demand for financial innovation. Rapid advances in information and communication, along with the evolution of theory in finance field, made it possible to meet this demand. Although extremely important, derivatives - including futures, swaps and options - are just one example of innovation that changed the behavior of financial markets in recent years. In this light, derivatives can be seen more as a consequence than a cause of increased financial market volatility. [2]

The introduction of derivatives in financial markets allows investors to choose the combination of risk and return that optimizes the resources' allocation. For example, futures are more attractive for investors who want to diversify their portfolio: with a small payment (initial margin) you can open a position in derivatives exploiting the leveraged effect. This effect allows the hedger to invest only a part of his portfolio in derivatives; the other part can be invested in bonds with a certain rate of return. This strategy has, as a result, a combination of risk and return that other financial assets cannot guarantee. This way of using derivatives is useful for a speculator too because it can minimize the cost of opening a position on the market. [3]

Banks and their corporate customers' decisions on using derivatives, either as

traders or as hedgers, are ultimately mandated by the dynamics of the macroeconomic environment that is constantly evolving. The exchange rate, interest rate and credit risk arise from the modification of monetary policy and the resulting movement of these indicators in the market, which in turn alter the asset-liability structure of banks and give rise to the specific risks, duration mismatch or credit exposure.

How derivative transactions affect the overall exposure of a bank is a topic that has aroused the interest of financial analysts since their appearance. Especially, derivatives position in the list of causes that led to the outbreak of the current global financial crisis has increased public interest related to derivative transactions that banks and their corporate customers have developed.

Derivatives in the financial markets provide opportunities for various categories of risk management or are the vehicles for investment and saving, but, in the same time, can alter the desired impact of policy changes on the real economy.

3. Derivatives effects on the monetary policy set up by the Central Bank

The role of monetary authority for banking supervision and control to minimize the overall risk results from implementation of monetary policy. Therefore, monetary policy pursued by central banks affect the health of the banking system and thus the financial system as a whole.

Central bank's monetary policy objective is to maintain price stability and low inflation by controlling the rate of monetary expansion. The central bank uses tools such as monetary issuance, overnight interest rates to ensure control over market liquidity. The monetary policy actions have direct impact on financial markets, changing the price of assets in the entire spectrum of maturities and liquidity. Changing prices of financial assets has a direct impact on saving and investment decisions of economic agents and they, in turn, affect the general level of prices and other macroeconomic indicators.

Derivatives bypass this circuit in some critical nodes of it. The way derivatives affect monetary policy transmission

mechanisms to the financial markets can be viewed from many angles. [4]

First point of view targets the inherent *link between the derivatives markets and the underlying asset markets*. Theoretical relationship determines the steady state of prices and the temporary market imbalances have a rapid impact on the price level in other market, leading relationship back into balance. Studies show that the reaction of the liquid derivatives markets to monetary policy actions is faster than the underlying asset markets. The net result is a time adjustment for the transmission of central bank's impulses to the spot financial markets. For some assets, such as government bonds, the reaction to monetary policy changes is very fast, so using interest rate derivatives have only a marginal impact on transmission speed. But for some less liquid assets, whose prices traditionally respond slowly to monetary impulses, such as bank loans or mortgages, the price changes will be greatly accelerated through derivatives. This increases the impact of monetary policy, for example, on the housing component of inflation rate through rapid changes in mortgage rates.

Secondly, derivatives markets *increase the size of global financial market* by introducing new types of products and providing additional information about the financial assets prices. Expression of financial innovation, derivatives occurred by converting mortgages into mortgage securities had a significant impact on the growth of the market segment represented by assets traditionally considered illiquid and with low sensitivity to price changes.

Thirdly, derivatives *make arbitrage operations cheaper and easier*, modifying substantially the effects of transmission mechanisms. Allowing individual operators to modify their financial exposures rapidly and inexpensively, derivatives have the potential to change the sensitivity to interest rate and exchange rate changes, thus altering the response of economic agents to monetary policy actions. But even if development of derivative markets allows the scope of such actions to be transferred between agents, not all agents globally and simultaneously can escape it, any person wishing to escape the risk must find a partner willing to bear. Therefore, the overall economy can not be

made safe from the effects of changing interest rates or exchange rates through the use of derivatives. As a result, derivatives do not diminish the ultimate control monetary policy has on inflation.

Fourth, derivatives prices should provide more accurate information about the nature of monetary shocks, with *lower information costs*. This information should help agents to differentiate between real and nominal disturbances, thereby reducing the real effects of monetary policy. A reduction of the real effects of monetary policy removes the central bank from its goal of stabilizing prices, providing a more limited role for using monetary policy to stabilize real output. [5]

Although derivatives do not substantially alter the effects of monetary transmission mechanisms, they can change the relative importance of the three channels through which monetary policy operates: the interest rate channel, exchange rate channel and credit channel. They can also affect the speed and degree of transmission of monetary policy actions to the floor consumption and thus inflation.

3.1. Traditional interest rate channel

Interest rate channel is a classical theme of the current economic literature. Interest rate changes are the core of the transmission mechanism of monetary policy highlighted by the well-known Keynesian IS-LM model.

An increase in money supply leads to declining interest rates, which in time reduces the cost of capital, leading to increased investment spending and thus to an increase in aggregate demand and output. Initially Keynes described this mechanism to operate on the investment decisions of enterprises. Further research showed that population decisions on durable goods and the purchase or construction of dwellings are similar to investment decisions. Causal chain described above lends itself to applications on the consumer spending.

Another important feature of the interest rate channel is focusing on the real interest rate as decisive factor in investment decision, not on the nominal interest rate. The special emphasis is placed on the relationship between short-term interest rate and long-term interest rate, the long term being the one

which influences the investment decision. The link between short-term rate, which can be influenced by Central Bank, and the long term is based on expectations and substitution effects. The spread between short term and long term interest rate captures the market expectation of the movement of the future interest rate. For example, an upward sloping term structure, or a positive term spread, means the market expects the short term interest rate to increase in future. Such expectation and the change in this expectation may alter agents or banks' need for hedging.

The existence of derivatives can affect the interest rate channel in two ways, giving its substitution effect and the income and wealth effects.

First, derivatives may increase somewhat faster speed already with monetary policy actions affect interest rates across the maturity spectrum. For example, following an increase in interest rates, agents will prefer saving, and will cap the expenses. Investment decisions are reviewed, requiring higher capital costs. In terms of future investment costs, the effect of increasing interest rates on investment is always negative and can not be easily compensated. It may be possible, however, to cover the negative *impact of the substitution effect* by using derivatives. A hedger can block the current interest rate for potential funding needs in the future. Or, expecting a rising interest rate in the near future, a bank with more interest rate sensitive liabilities may enter into derivative position today to lock in a lower interest rate as an effort to offset the adverse impact of a higher rate on the value of the bank.

However, there still remain elements that can not be provided, like the exact extent of investment and investment may be unknown. So that derivatives can only have a marginal impact on reducing the effect of substitution. In addition, most agents do not act as hedgers and will face higher costs of capital for future investment costs the same, with or without derivatives. Thus, the existence of derivatives does not significantly impede the ability of monetary authorities to set the short-term interest rates to the desired level.

Secondly, derivatives could affect the relationship between interest rates and propensity to consume, because of trading in terms of risk and / or profitability may

change the way monetary policy actions influence *the distribution of income and wealth*. [2] How this connection could be affected depends on whether the counterparties to derivative contracts have varying degrees of risk aversion and different propensities to consume. If those who bear the risks in these contracts are less inclined to spend the current income than those who cover, derivatives may delay or reduce the interest rate change effect. Indeed, temporary income is transferred to hedgers, whose cash flows and spending plans will not be affected by interest rate changes, they are not forced to give up their spending elsewhere. Will be necessary to assess the extent to which risk transfer taking place in derivatives markets can affect the overall propensity to consume, or causes the transmission speed or degree of interest rate changes to the real economy. To the extent that such changes took place, it should be possible to adjust monetary policy in such a manner as to ensure that the desired effect on target variables is achieved.

Concluding, the existence of derivatives does not significantly impede the ability of monetary authorities to set short-term interest rates to the desired level. In addition, changes in interest rates will continue to influence consumer decisions based on marginal costs, as before.

3.2. Exchange rate channel

After switching to floating rates, exchange rate channel has known a continuous attention from policy makers and researchers of monetary policy, especially in terms of the effects of this policy on the exchange rate and through it on exports and economic activity.

This channel also involves changes in interest rate, leading to capital movements and therefore the effects on the exchange rate. This is because domestic interest rates are lower, domestic financial market investments less attractive and therefore in the context of free movement of capital leads to export of capital and depreciation of national currency. The local currency depreciation leads to higher prices relative to import goods at cheaper relative to exports. Assuming that demand is elastic in the price of the goods exported, export demand increase, leading to increased production.

The imports more expensive lead to a change in the consumption structure of local goods, and thus an increase in aggregate demand.

Differential changes in domestic and foreign interest rates can produce far greater changes in the exchange rate, implying a greater role for the exchange rate transmission mechanism.

Derivatives have further expanded economic agents' capacity to transfer the occurrence of exchange rate changes, by allowing hedging in the futures markets against adverse exchange rate movements. This allows, at least partially, protecting current investment and consumption plans of exchange rate changes, weakening the effectiveness of exchange rate channel in the short term, if the currency risk is transferred to agents less reluctant to risk their consumption decisions are less affected by exchange rate fluctuations.

Hedging contracts extending to longer maturities, particularly through foreign exchange swap market, may also mitigate the effect of exchange rate channel. However, on long term, exporting firms can not delineate their production decisions for the changes in relative prices bring by the exchange rate movements.

It is worth noting that the role of exchange rate channel depends on the openness of the economy and the extent to which effective exchange rate flexibility is accepted by monetary authorities. [2] For countries with fixed rate or narrowband modes, an additional problem to be considered is the effect that derivatives have on the ability of monetary policy to maintain exchange rate constant.

There was the temptation for central banks to use themselves foreign exchange derivatives. These cases have generated powerful contradictions. Thus, if the central bank registers losses from these operations, one can say that it speculates with state money. Also, another accusation is that it could give clear signals to the market for the trends it wants to assign. If the central bank makes profits from such operations, it can be accused of using confidential information on the exchange rate. For these reasons, most economists believe that a central bank should use with caution or not to use foreign exchange derivatives, mainly due to possible charges of conflict of interest. [6]

As mentioned above, the exchange rate and interest rate channels interact each other. The extent that derivatives facilitate asset substitution between different maturities, in different currencies, generate the situation in which a monetary policy decision with concern to the yield curve of a currency can affect the yield curve of other currencies. This could alter the exchange rate channel of international transmission of monetary policy actions, adding another dimension, perhaps, to the channel - a direct link between interest rate expectations of participants from different national financial markets. If derivatives could be causing this relationship expectation, they could certainly be a highlight.

3.3. Credit channel

This transmission channel emphasizes the role of banks in the financial system and the special relationship between central bank and all banks in the system. It is important to note that the importance of this channel of transmission depends on the share of the banking system in the whole financial system. Credit channel is considered as complementary to traditional interest rate channel and its effects are as a supplement to the effects arising from interest rate channel.

Transmission efficiency of this channel increases as the reserve requirement from Central Bank is higher as a share of deposits. Also as the commercial banks are more dependent on financial resources from the Central Bank, the probability that this channel of transmission is very is more important. The more a bank intends to hold more cash as a share in the asset, it is much more sensitive to changes in monetary policy and therefore more adaptive has to be its lending policy. This is the case of small banks, very vulnerable to the problems posed by information asymmetry, which have high cash reserves to offset the possible problems due to problem loans.

Banks are using financial derivative instruments to complement their traditional lending activities and to hedge risk-exposure resulting from their lending and deposit taking activities. Thus, derivatives provide incentives for banks to increase their lending activities. [7]

Banks are facing many types of credit risks due by their credit portfolio including different kinds of loans, from large corporate loans to loans to smaller companies, even counterparty credit risks on over-the-counter derivatives. They have used credit derivatives in order to tailor risk in several areas of their credit portfolio. Banks can transfer the credit risk of a portfolio of exposures to investors via securitization transactions, such as collateralized debt obligations (CDOs). In the same time, they can use CDS to get rid of the credit risk of issuers to whom they have a large exposure.

In banking, CDSs are the result of banking regulations such as Basel Agreement, which states that banks must hold capital based on risk assets they hold. For example, for an asset AAA-rated, bank capital requirement that must hold is significantly lower than for a regular mortgage. Consequently, the CDS became increasingly popular among banks which realized they need to sell traditional assets and buy massive securities such as mortgage-based securities (MBS) which, together with the related CDS, receiving the maximum ratings. Demand for credit default swaps has grown exponentially, but this has to mean better targeting of risk as recent events have shown.

However, the concerns of regulators are that these derivative instruments substitute for lending, increase the riskiness of banks, and therefore, increase their reliance on safety mechanisms designed by the authorities.

4. Conclusions

The growing use of derivatives, as off-balance sheet instruments, has reduced the transparency of firms and banks' balance sheets. The reduced transparency affected mainly the financial sector, proving the acute need to improve the central bank responsibility for banking supervision, through a better accountancy conducted or disclosure standards imposed.

Introduction of derivatives in monetary objectives, or at least, in the balance sheets of financial institutions holding them, would be one of the most important contributions to defining the new architecture of international financial system.

The Role of Stock Exchange in Romanian Market Capital Development

Oana Calîtoiu
University of Craiova
Oana.Calitoiu@yahoo.com

Abstract

It is known that the stock is represented as a “barometer” for the economic and financial life in a country or on international basis, an indicator of world status for business and economic perspectives. Through this role, this becomes a symbol of market economy and an interest object not only for the business circles but also for the whole community. Without stocks, the possibilities of transactions might reduce to direct negotiations between business partners, in the detriment of small agencies. We only need to prove the role of stocks in market economy and especially in financing economy.

Key words: stock market, capital, financial crisis

J.E.L. Classification: G10 ,G01

1. Introduction

Romanian stock traditions, even if they are not as the ones from western European states and were interrupted for well of fifty years, represent for the present day a rich river of knowledge referring exclusively in the institutional field of Romanian market capital.

Recommencing the stock activities in Romania and analysing the evolution of its main components from refunding to present day, has proved the interdependency with Romanian economic environment evolution as a whole or performance indicators of market stocks being tightly correlated with the macroeconomic ones.

Starting up from a wide documentation, I have found that, in emerging market economy, the market capitals are urged to contribute to fulfilling a supplementary objective: the one of private capital forming. This is the reason for which I chosen to identify together the interaction between the

stock market and the process of privatizing in Romania[1].

2. Privatizing of the capital market in Romania

The privatizing of the capital in Romania was designed as an integrated schedule, which included both the component with a free title and the one with private property transfer through selling the actions portfolio withheld by the state and in tight links with the build-off of an capital market which will represent a support and a catalyst for this respective process. The degree of reporting on Romanian stock market to the process of privatizing its self stands out as a modest one, in conditions in which the advantages of privatizing through the stock mechanism have not integrated into the opportunities and conditioning system generated by the Romanian economic environment from that period. And have seemed limited compared with the advantages of using direct negotiations, auctions, the MEBO method, etc.

The market capital insures the realization of capital transfer between investors-owners by multiple coordinates: national, regional or worldwide, inside the same industry or between different ones. The Romanian stock market insured the transfer of capital flows, both for internal and for external coordinates, and by that, contributed to the consolidation of Romanian capital.

The way in which Romanian stocks insured the capital flow transfer, both for internal and external coordinates were tributary to the economic premises and by structure to the capital which found self-commissioned in the mid ‘90s. In this context the stock market has become an economic concentration arena for the ones that had an extra vision, of financial resources and economic knowledge. By own means to the stock market, have been created capital flow between term shareholders and strategic

investors which created strong and profitable businesses. The stock market has stimulated the capital flows on two major directions: the one of the internal transferring to concentrate economic power and the one of international capital allurements. As for the international flow allurements of capital belonging to portfolio investors, but also to the strategic ones, the stock market had a contribution based upon capitalization and termination of the registered throughout time, meaning it was reduced in the first years of evolution and increased with the first years of the new millennia.

3. The stock market and the financial crisis

The topicality of the investigated theme precedes the tsunami which shocked-up the global economy, the economic and financial crisis which monopolized the economy throughout the world in the last years, having an unwanted impact over the stock markets evolution. Thus, the quotations of actions of the great companies listed at the stocks dropped dramatically, the termination from stock market was reduced too much and on this basis, the volume of transactions decreased due to the manifested interests of investors and speculators. The stock indicators have known a decrease as a whole and a distortion to the given information for the potential investors because of the disturbances occurred in the structure of participant companies to their forming basis[2].

The important role that stocks have in the market economy has generated a concern among academics and practitioners to deepen the knowledge area in improvement and expansion of markets and operations to specific adaptations granted to conditions of economic instability caused by economic financial crisis.

As "extremely accurate stock market reflects the overall situation of an economy, and trends and perspectives", the global financial crisis has caused significant fluctuations of market economy in Romania, affecting the stock market. The capital market development is today an important indicator that can provide details regarding the progress of a country's economy.

As the Romanian economy has gone from being an emerging market economy, and getting closer to the status of functional market economy, expectations regarding the outcome of engaging in capital market operation mechanism of the economy register the new coordinates. Rapid mobilization and cost of capital for large projects should become the primary function of our capital market.

Strictly theoretical, the role of stock exchanges is to facilitate the performance of financial instrument transactions that were issued on the primal capital market in order to provide mobility and liquidity investors. The primary market is that segment of capital market where securities are issued for the first time. After issuing and placing titles on the market, they can be traded on the secondary market; the largest segment of the secondary market represented by securities exchanges. In terms of issuers, the role of scholarship is to provide access to financial resources through equity or loan increase. Thus the picture is emerging the financing economy in Romania through the stock market. Bucharest Stock Exchange in recent years has been the scene of both initial public offerings of bonds and shares, both issued by municipalities and by corporations. Loaning by issuing loan stocks and bonds are the two main axes of this alternative financing. Initial public offerings are the first steps towards the success of a company financing through capital market mechanisms.

Main functions of stock exchanges helps to aggregate demand and supply of securities, to make securities transactions, in determining the fair trading and listed securities quotations, and to promote legal and economic security contracts signed and provide official information on the amount of securities traded. Stock exchange offers investors the opportunity to participate in profitable activities of large companies, securities and provides liquidity and portfolio diversification, which can offer companies the ability to obtain long-term financial resources and free advertising. In terms of organization, BSE is established as a non-profitable public institution, operating on the principle of self-activity, and which aims to provide an organized and legal framework for meeting demand and supply in the medium term capital and long.

Conduct of operations in the stock market comes after a rigorous organization, including location and participants in transactions and trading rules. Stock exchange transactions take the form of sale contracts as primary securities or other financial assets, which end in accordance with banking institution rules through authorized stockbroker performing these operations. The primary financial securities categories enter shares and bonds and derivative securities that are exemplified frequently contracts with new financial instruments, operations spot and futures.

As a market economy the corporation becomes important only if stocks and bonds are allowed to be traded, the issue at stake is not the economic motive that causes a corporation to introduce the scholarship, but the possibility of meeting conditions imposed by national legislation to be able to stock and bond in the primary market and then stocks can be bought and sold. Listing requires certain regulations that relate to requirements for admission, maintaining and promoting the stock exchange, in this case the necessary documentation, the obligations of the company issuing the dissemination of information necessary for the proper conditions of trading.

Portfolio investments involve the acquisition of securities organized and regulated capital markets without winning a right to decide and control the concerned company management. However most of the investment portfolio is made by individuals or institutions without legal personality.

In investment portfolio and the ability of labor cost, infrastructure condition, geographical position of the host country in relation to target markets, existence of bilateral, regional or international agreements of the other countries, local market size are practically irrelevant issues and not evaluated. The interest to a potential investor portfolio is: the local market capitalization, its growth potential, quality accounting standards, their level of transparency. Due to globalization transnational corporations expand their foreign direct investment subsidiaries becoming international. To ensure their sustainable growth they will be dependent on sources of funding provided by the actors themselves in the international

market in the form of portfolio investment in securities.

Some states do not strongly encourages investment portfolio, or impose

restrictions given their high mobility compared with direct investment. Indeed the capital of this sort can "escape" from a country just when it needs it, as happened in the mid-90s in Mexico and to the end of the decade in Russia. Romania due to inspired precautions such as discouraging investment portfolio, increased foreign reserves and the creation of a leu-currency balance being managed at that time to avoid the trap.

The correlation between markets is becoming increasingly strong as the market matures our capital, and starts being perceived as foreign institutional investors Central and Eastern Europe, hitherto dominated the markets in the Czech Republic, Hungary and Poland (the latter, in turn, beginning the reconciliation to increasingly significant with more developed markets).

Challenges posed by the economic environment at the stock market to succeed in a dynamic, fast and effective contribution in the stock market and reforming the economic climate business administration are becoming increasingly important. The stock exchange is now called to be a pole of development, dissemination and implementation of a set of policies, rules of conduct and codes of good business practices based on new principles of business administration, likely to respond to recent challenges in creating economic climate effectiveness.

BSE is involved in extending these new Admin business principles to all categories of economic actors, whether they participate directly or indirectly in the stock market. Forms of involvement of the Romanian stock market in reforming the business administration in Romania range from working with international institutions, to their own efforts undertaken to first issuers market exchange rates artificially maintained, respecting the rights of all shareholders, board involvement administration in equidistant representation of all shareholders and all interested parties (stakeholders) in the economy, or the training of managers and administrators based on new principles of business administration.

4. Advantages and disadvantages of the capital market investments

Capital market investments have advantages and disadvantages. The advantages of investing in BSE mention:

- Acquisition of superior returns compared with bank deposits, or units. The best argument for this assertion is in stock indices. A stock index is a statistical indicator that reflects the evolution of market prices of shares making up;
- The opportunity of rapid liquidation of the investment, through this understanding that an investor may at any time sell shares and collect money, which is not possible with real estate investments where the investor is locked to new buyer;
- The opportunity of revaluation of the investment at any time;
- The direct control over own investments;
- The opportunity to use derivatives to call the complex investment strategies;
- The possibility of diversifying risk by investing in more issuers;
- Investment in shares is much more accessible to the investment in real estate assets where the amounts are considerably higher and the potential liquidation of the investment is much lower;
- Cheaper financing opportunities on capital market, increasing the number of investors and market capitalization, beginning to draw attention to large companies;
- Development of new products and financial instruments and their implementation by the scholarship. These include derivatives and stock indices, options, government securities, structured products such as certificates on indices, commodities, currencies.

In conclusion, an investment in stocks done inspired investors to make significant gains and varied:

- Dividends paid annually by companies where you are a shareholder;

- Capital gains;
- Increase in capital gains from free action;

The disadvantages of investing in the capital market note:

- Investment in shares is risky and can result in the diminution or loss of original capital invested. Risk can be reduced by using investment strategies appropriate to resort to financial derivatives, but the risk cannot be removed. A stock market investor must be aware that they may lose;
- Political risk, capital market is very sensitive to political events;
- Economic risk, which can be given by the negative evolution of the economy or negative evolution of the issuer (reporting financial losses from one quarter to another, loss of contracts, reduced turnover, etc.)
- Risk of failure of the issuer;
- Risk and correlation given the globalization of financial markets.

The strategic orientation of the Romanian stock market and progress towards the objectives of this strategy surging precede the final conclusions of this thesis, say their findings in summary:

Regarding the transfer of capital flows, the internal coordinates, and Romanian Stock Market was rather used as a mechanism of concentration of economic power than as a capital transfer mechanism caused by structural or conjuncture economic factors.

5. Conclusions

Portfolio investment capital attracted from the international circuit is promising but modest compared to the induced current international opportunities, limits are given in the main appeal, capitalization and liquidity of Romanian stock market is still low compared with exchanges in the region. Local stock market was heading towards achieving the market maturity through initial steps to finance economic activity. Reaching this stage depends on the consistency with which they will perform this function shortly.

Romanian stock market is concerned and is expected to play a major role in further reforming of business administrations and in

promoting a sense of the term enriched efficiently in the economic climate.

Abstract

The article theme is part of the area of financial investigation processes and phenomena occurring at the micro level that focus on effective financial bank interest expenses. Throughout the article we try to show ways of influence and effectiveness of these expenditures that may influence to some extent, but also decisive the economic and financial results of company.

The purpose of this article is to highlight the usefulness and applicability of the methodology for analyzing the effectiveness of bank interest costs from 1,000 lei turnover in the firm.

We all know that debt was always a risky method, both for the borrower and the lender. In our case, interest are those financial costs that make the cost of borrowing and are the most important component of these expenses that contribute to building capacity to mobilize financial resources.

Key words: efficiency, expenses, interest, turnover, operating assets.

J.E.L. Classification: D61

1. Introduction

For an economist, the efficiency of spending is not the ease with which it was reduced. Whether it is the manager of a large company or a budding entrepreneur, the main problem which arises is how to obtain an acceptable profit under cost reduction. And one of the issues involved in this important aspect is the reduction of bank interest costs.

To finance the productive and investment activity the economic agents may use the borrowed sources, i.e. bank loans that bear interest. Capital loan usually has a positive impact on the development of financial and economic activity of economic agents, but by its specific form generates interest expense that may sometimes major implications on the level of financial expenses and accordingly on the total costs.[5]

In examining these charges it should be assessed their progress compared with the one from previous period, and to certain provisions, highlighting their changes through the factors influencing them.

Considering the fact that interest result from loans obtained, we can say that they represented and still represent an important component of permanent financial resources attracted by a company with the purpose of developing in normal conditions of its financial and economic activity.

The company that always call for loans would know or should know that debt will always behave the risk of not coping with payment obligations to creditors (repayments and interest), and a large amount of outstanding and unpaid debts can make it insolvent, leading it to bankruptcy. This can certainly occur when the borrowed capital and interest are higher, and economic profitability is lower.

Borrowing capacity in the context of everyday economic life is one of the key elements of financial mobilization capacity of companies because of the role and importance of credit in general, bank lending especially, within the economic-financial mechanism applied in countries with established market economies.

2. Theoretical approach regarding the analysis of bank interest costs

Interest is included in financial expenses, representing a component of cost of borrowing. Under IAS 23, they should be recorded as an expense in the period they are incurred, except those which are capitalized. The analysis indicator used is the effectiveness of the interest costs.[4] Borrowing costs relate primarily to interest, but not limited to them, they also contain other costs incurred for loan funds.

Borrowing costs are interest and other costs incurred by an entity with the borrowing of funds. Borrowing costs may include: [7]

- total interest expense calculated using the effective interest method as described in IAS 39 *Financial Instruments: Recognition and Measurement*;
- financing costs related to finance leases recognized in accordance with IAS 17 *Leases*;
- exchange differences on foreign currency borrowings to the extent that they are regarded as an adjustment to interest expense.

Financial expenses include amounts paid for capital used, whether from their own or borrowed. In the case of equity, their cost is represented by the expected earnings to shareholders for the amounts contributed to the company, materialized in dividends or in increase of the value of their shares. If borrowed capital, the cost is reflected as interest paid.[3]

Interest coverage ratio reflects the ability of firms to obtain enough profit to sustain interest on loans. Essentially it indicates how many times the company's profit before paying taxes and interest cover interest expenses.

Companies to complete the necessary financial resources are resorting to short, medium or long term bank loans or loans from other companies. Basically these loans are:

- a) long and medium term financial liabilities;
- b) cash loan (current liabilities), which are usually necessary to supplement working capital and to ensure the company's liquidity.[2]

3. Methodology for analyzing the effectiveness of bank interest expense from 1000 lei turnover

Interest expenses represent the most important component of the financial expenses of a company. Causal analysis of interest expense uses the chain method substitution in explaining the reasons behind the evolution of these costs, using the absolute amount of interest expense and the indicator “interest expense from 1000 lei turnover”. [2]

For the analysis of the interest expenses efficiency we use the following analysis models:

$$\frac{Sd}{CA} \cdot 1000 = \left(\frac{D}{CA} \cdot \frac{Sd}{D} \right) \cdot 1000$$

where:

$\frac{Sd}{CA} \cdot 1000$ - interest expense from 1000 lei turnover;

$\frac{D}{CA}$ - participation share of resources attracted to the formation of turnover;

$\frac{Sd}{D}$ - average interest rate

The average interest rate measures the percentage of the interest paid by the company for all loans and loans made. If it is computed at the outstanding debt it has to be compared with the rate obtained during the comparison, and if it is calculated on the amount of credit used in a certain period of time then it should be compared with the average interest rate on the market.

I.Deviation of expenses with bank interest:

$$\Delta \frac{Sd}{CA} \cdot 1000 = \left(\frac{Sd_1}{CA_1} - \frac{Sd_0}{CA_0} \right) \cdot 1000 = \left[\left(\frac{D_1}{CA_1} \cdot \frac{Sd_1}{D_1} \right) - \left(\frac{D_0}{CA_0} \cdot \frac{Sd_0}{D_0} \right) \right] \cdot 1000$$

II. The influence of elements:

1. The influence of the share participation of sources attracted in the formation of turnover:

$$\Delta \frac{Sd}{CA}^{CA} \cdot 1000 = \left[\left(\frac{D_1}{CA_1} - \frac{D_0}{CA_0} \right) \cdot \frac{Sd_0}{D_0} \right] \cdot 1000$$

2. The influence of the average percentage of interest rate:

$$\Delta \frac{\frac{Sd}{CA}}{\frac{Sd}{D}} \cdot 1000 = \left[\frac{D_1}{CA_1} \cdot \left(\frac{Sd_1}{D_1} - \frac{Sd_0}{D_0} \right) \right] \cdot 1000$$

III. To verify we use the following relationship:

$$\Delta \frac{Sd}{CA} \cdot 1000 = \Delta \frac{Sd}{CA} \cdot 1000 + \Delta \frac{Sd}{D} \cdot 1000$$

$$\frac{Sd}{CA} \cdot 1000 = \left(\frac{Ae}{CA} \cdot \frac{D}{Ae} \cdot \frac{Sd}{D} \right) \cdot 1000$$

where:

$\frac{Ae}{CA}$ - efficiency of operating assets;

$\frac{D}{Ae}$ - share participation of loans and debts

to finance operating assets

I.Deviation of expenses with bank interest:

$$\Delta \frac{Sd}{CA} \cdot 1000 = \left(\frac{Sd_1}{CA_1} - \frac{Sd_0}{CA_0} \right) \cdot 1000 =$$

$$= \left[\left(\frac{Ae_1}{CA_1} \cdot \frac{D_1}{Ae_1} \cdot \frac{Sd_1}{D_1} \right) - \left(\frac{Ae_0}{CA_0} \cdot \frac{D_0}{Ae_0} \cdot \frac{Sd_0}{D_0} \right) \right] \cdot 1000 =$$

II. The influence of elements:

1. The influence of efficiency of use of operating assets:

$$\Delta \frac{\frac{Sd}{CA}}{\frac{Ae}{CA}} \cdot 1000 = \left[\left(\frac{Ae_1}{CA_1} - \frac{Ae_0}{CA_0} \right) \cdot \frac{D_0}{Ae_0} \cdot \frac{Sd_0}{D_0} \right] \cdot 1000$$

2. The influence of the share participation of the attracted sources in financing operating assets:

$$\Delta \frac{\frac{Sd}{CA}}{\frac{D}{Ae}} \cdot 1000 = \left[\frac{Ae_1}{CA_1} \cdot \left(\frac{D_1}{Ae_1} - \frac{D_0}{Ae_0} \right) \cdot \frac{Sd_0}{D_0} \right] \cdot 1000$$

3. The influence of the average percentage of interest rate:

$$\Delta \frac{\frac{Sd}{CA}}{\frac{Sd}{D}} \cdot 1000 = \left[\frac{Ae_1}{CA_1} \cdot \frac{D_1}{Ae_1} \cdot \left(\frac{Sd_1}{D_1} - \frac{Sd_0}{D_0} \right) \right] \cdot 1000$$

III. To verify we use the following relationship:

$$\Delta \frac{Sd}{CA} \cdot 1000 = \Delta \frac{\frac{Sd}{CA}}{\frac{Ae}{CA}} \cdot 1000 + \Delta \frac{\frac{Sd}{CA}}{\frac{D}{Ae}} \cdot 1000 + \Delta \frac{\frac{Sd}{CA}}{\frac{Sd}{D}} \cdot 1000$$

2.3. Case study on implementation of the analysis methodology of the interest expense effectiveness from 1000 lei turnover

In order to illustrate the methodology for cost effectiveness analysis of bank interest we analyze a hypothetical case which highlights the effectiveness of these

expenditures. For this we use the data in the table below:

Table 1:

Current No.	Indicators	P ₀	P ₁	Deviation
1.	Turnover (CA)	13.750	16.720	+2.790
2.	Amount of interest paid (Sd)	1.540	1.760	+3.300
3.	Loans, credits and payables (D)	7.480	7.920	+440
4.	Operating assets (Ae)	4.620	4.840	+220

To analyze the effectiveness of the interest costs of analysis we use the models above.

$$\frac{Sd}{CA} \cdot 1000 = \left(\frac{D}{CA} \cdot \frac{Sd}{D} \right) \cdot 1000$$

I.Deviation of expenses with bank interest:

$$\Delta \frac{Sd}{CA} \cdot 1000 = \left(\frac{Sd_1}{CA_1} - \frac{Sd_0}{CA_0} \right) \cdot 1000 =$$

$$= \left[\left(\frac{D_1}{CA_1} \cdot \frac{Sd_1}{D_1} \right) - \left(\frac{D_0}{CA_0} \cdot \frac{Sd_0}{D_0} \right) \right] \cdot 1000 =$$

$$= \left(\frac{1760}{16.720} - \frac{1.540}{13.750} \right) \cdot 1000 =$$

$$= \left[\left(\frac{7.920}{16.720} \cdot \frac{1.760}{7.920} \right) - \left(\frac{7.480}{13.750} \cdot \frac{1.540}{7.480} \right) \right] \cdot 1000 =$$

$$= (0,105263 - 0,111999) \cdot 1000 = -6,736 \text{ lei}$$

II. The influence of elements:

1. The influence of the share participation of sources attracted in the formation of turnover:

$$\Delta \frac{\frac{Sd}{CA}}{\frac{D}{Ae}} \cdot 1000 = \left[\left(\frac{D_1}{CA_1} - \frac{D_0}{CA_0} \right) \cdot \frac{Sd_0}{D_0} \right] \cdot 1000 =$$

$$= \left[\left(\frac{7.920}{16.720} - \frac{7.480}{13.750} \right) \cdot \frac{1.540}{7.480} \right] \cdot 1000 =$$

$$= -14,476 \text{ lei}$$

2. The influence of the average percentage of interest rate:

$$\begin{aligned}\Delta \frac{\frac{Sd}{CA}}{\frac{Sd}{D}} \cdot 1000 &= \left[\frac{D_1}{CA_1} \cdot \left(\frac{Sd_1}{D_1} - \frac{Sd_0}{D_0} \right) \right] \cdot 1000 = \\ &= \left[\frac{7.920}{16.720} \cdot \left(\frac{1.760}{7.920} - \frac{1.540}{7.480} \right) \right] \cdot 1000 = \\ &= +7,7399 \text{ lei}\end{aligned}$$

III. To verify we use the following relationship:

$$\begin{aligned}\Delta \frac{Sd}{CA} \cdot 1000 &= \Delta \frac{\frac{Sd}{CA}}{\frac{D}{CA}} \cdot 1000 + \Delta \frac{\frac{Sd}{CA}}{\frac{Sd}{D}} \cdot 1000 \\ -6,736 &= (-14,476) + 7,7399\end{aligned}$$

The main conclusion from this analysis is to reduce current interest expense during the previous period.

This analysis model highlights two factors of influence, and explaining the transmission mechanism of their action on bank interest expense from 1000 lei turnover consists in the fact that reducing these costs by - 6,735 lei was mainly due to the reduction in the participation weight of the attracted sources (loans and debt) in forming the turnover, even if their value increased by 440 lei in the current period compared to the previous period.

From the second influence we observe that the average interest rate negatively influenced the interest expense from 1000 lei turnover leading to their increased 7.7399 lei.

$$\boxed{\frac{Sd}{CA} \cdot 1000 = \left(\frac{Ae}{CA} \cdot \frac{D}{Ae} \cdot \frac{Sd}{D} \right) \cdot 1000}$$

I. Deviation of expenses with bank interest:

$$\begin{aligned}\Delta \frac{Sd}{CA} \cdot 1000 &= \left(\frac{Sd_1}{CA_1} - \frac{Sd_0}{CA_0} \right) \cdot 1000 = \\ &= \left[\left(\frac{Ae_1}{CA_1} \cdot \frac{D_1}{Ae_1} \cdot \frac{Sd_1}{D_1} \right) - \left(\frac{Ae_0}{CA_0} \cdot \frac{D_0}{Ae_0} \cdot \frac{Sd_0}{D_0} \right) \right] \cdot 1000 = \\ &= \left(\frac{1760}{16.720} - \frac{1.540}{13.750} \right) \cdot 1000 = \\ &= \left[\left(\frac{4.840}{16.720} \cdot \frac{7.920}{4.840} \cdot \frac{1.760}{7.920} \right) - \right. \\ &\quad \left. - \left(\frac{4.620}{13.750} \cdot \frac{7.480}{4.620} \cdot \frac{1.540}{7.480} \right) \right] \cdot 1000 = -6,736 \text{ lei}\end{aligned}$$

II. The influence of elements:

1. The influence of the efficiency in using the operating assets:

$$\begin{aligned}\Delta \frac{\frac{Sd}{CA}}{\frac{Ae}{CA}} \cdot 1000 &= \left[\left(\frac{Ae_1}{CA_1} - \frac{Ae_0}{CA_0} \right) \cdot \frac{D_0}{Ae_0} \cdot \frac{Sd_0}{D_0} \right] \cdot 1000 = \\ &= \left[\left(\frac{4.840}{16.720} - \frac{4.620}{13.750} \right) \cdot \frac{7.480}{4.620} \cdot \frac{1.540}{7.480} \right] \cdot 1000 = \\ &= -15,5087 \text{ lei}\end{aligned}$$

2. The influence of the share participation of the attracted sources in financing operating assets:

$$\begin{aligned}\Delta \frac{\frac{Sd}{CA}}{\frac{D}{Ae}} \cdot 1000 &= \left[\frac{Ae_1}{CA_1} \cdot \left(\frac{D_1}{Ae_1} - \frac{D_0}{Ae_0} \right) \cdot \frac{Sd_0}{D_0} \right] \cdot 1000 = \\ &= \left[\frac{4.840}{16.720} \cdot \left(\frac{7.920}{4.840} - \frac{7.480}{4.620} \right) \cdot \frac{1.540}{7.480} \right] \cdot 1000 = \\ &= +1,0319 \text{ lei}\end{aligned}$$

3. The influence of the average percentage of interest rate:

$$\begin{aligned}\Delta \frac{\frac{Sd}{CA}}{\frac{Sd}{D}} \cdot 1000 &= \left[\frac{Ae_1}{CA_1} \cdot \frac{D_1}{Ae_1} \cdot \left(\frac{Sd_1}{D_1} - \frac{Sd_0}{D_0} \right) \right] \cdot 1000 = \\ &= \left[\frac{4.840}{16.720} \cdot \frac{7.920}{4.840} \cdot \left(\frac{1.760}{7.920} - \frac{1.540}{7.480} \right) \right] \cdot 1000 = \\ &= +7,7399 \text{ lei}\end{aligned}$$

III. To verify we use the following relationship:

$$\begin{aligned}\Delta \frac{Sd}{CA} \cdot 1000 &= \Delta \frac{\frac{Sd}{CA}}{\frac{Ae}{CA}} \cdot 1000 + \Delta \frac{\frac{Sd}{CA}}{\frac{D}{Ae}} \cdot 1000 + \Delta \frac{\frac{Sd}{CA}}{\frac{Sd}{D}} \cdot 1000 \\ -6,736 &= (-15,5087) + 1,0319 + 7,7399\end{aligned}$$

As observed in previous model the sum of interest expenses in 1000 lei turnover decreased by 6,736 lei in the current period compared to the previous period.

Given this analysis model this is due to

increased operating efficiency of the company's assets, which resulted in reduced bank interest expenditure from 1000 lei turnover by -15.5087 lei.

Given the other two factors of influence, the participation weight of the attracted sources in funding the assets and the average percentage of interest we observe:

- both factors negatively influenced the evolution of interest expense in 1000 lei turnover;

- the participation share of loans and debt to finance operating assets determined the increase banks interest expenses from 1000 lei turnover by 1.0319;

- the average interest rate resulted in an increase of interest expense from 1000 lei turnover by 7.7399 lei.

3. Conclusions

Throughout the planning, management and control process, in determining the strengths and weaknesses, in identifying and creating competitive advantages, in developing and controlling budgets, etc., the factor analysis method provides a suitable instrument for detailing and quantifying the causes of conditions and developments of phenomena. Factor analysis also provides information necessary to deepen their methods and those obtained by others.[5]

Increased self-financing capacity of the entity while simultaneously reducing the level of bank interest costs 1,000 lei turnover will be possible as long as turnover index is greater than index of borrowed capital or in other words, growth in turnover to exceed the growth rate of capital borrowed: [3]

$$I_{CA} = \frac{CA_1}{CA_0} > I_{CI} = \frac{CI_1}{CI_0}$$

For increasing the efficiency of interest expense is necessary that the dynamic index of turnover exceed the dynamic index of the interest expense:

$$I_{CA} = \frac{CA_1}{CA_0} > I_{SD} = \frac{SD_1}{SD_0}$$

Also in the case of a high cost of borrowed capital, so a high interest rate, it can be obtained a positive leverage by choosing effective actions financed by debt, thus ensuring the use with maximum efficiency and speed of rotation of the entire capital.

Based on the study we can retain some

measures to reduce bank interest expenses such as:

- reduction of the share participation of loans and debts assimilated to the financial coverage of current assets would help banks reduce interest costs to 1000 lei turnover and thus increase their profit;

- increase efficiency of operating assets by reducing the ratio of operating assets and turnover that will be a good situation in the economic and financial performance, situation that will be reflected in reduction in bank interest costs;

- avoid situations that require immediate liquidity shortages, which causes the company to call for interest-bearing bank loans;

- transform the facility of credit line attached to the current account, which allows each collection to be repaid in outstanding credit line with a bank, which may reduce interest;

- avoid contracting loans without any preliminary analysis of their actual return relative to the economic and financial situation of the company;

- lack of real and effective measures to reduce the firm's total costs and hence the bank interest costs;

- increase self-financing capacity of the entity;

- increase the efficiency of bank interest expenses from 1000 lei turnover by bringing forward the dynamic index of turnover on the interest expense.

Advantages of cost reduction measures must be maintained long term in order to ensure competitiveness of the company on short, medium and long term.

Critical Analysis of the Budget Process

Căruntu Roxana Corina

“Constantin Brâncuși” University of Târgu-Jiu
r_caruntu_28@yahoo.com

Abstract

The budget process has an important role in planning the economic and financial activity for the future. It consists in formulating a plan that contains elements that are connected with the main objectives of the company. To meet these objectives it is required a precise specification of them and careful monitoring during the year in question.

The budget is done with the purpose to show and control the financial resources available to the company. Budget is important to acknowledge the changes that occur in the economic environment so that decisions on business performance to be based on real data.

Key words: budget process, budget.

J.E.L. Classification: G31

1. Introduction

A profitable activity requires a balance between revenues and expenses but also a time prediction of expenditure, receipts and payments. [1]

Conducting the company's business must be based on the budget process that involves specifying the expected income, the capital to be invested, the expenses involved and their expectations according to the company's investment plans.

Budgeting differs from company to company. Each company uses different techniques which require time spent differently. The management team responsible for carrying out the budget process has to coordinate and direct this process so as to be in correlation with the company's strategic plan. The team sets budget targets, follows their fulfillment, finds solutions for any differences that arise and monitors company's performance over the

period covered by the budget.

2. Necessity, content and structure

The existence of a trader is characterized by financial flows that occur during its evolution. Stage of its development is based on correct identification of weaknesses and strengths and knowledge of the outside.

So that the company to maintain and develop there must be developed an appropriate policy for the economical environment in which that company operates.

This policy is closely linked to the establishment of financial objectives and precise sizing of capital needs so that the company's activity to be profitable.

The budget process is based on realistic targets established by the company regarding the future activity of it and on presenting the policies and programs to be used in order to lead to better achievement of the objectives. This process is mainly intended to check the effectiveness of the usage financial resources available to the company.

Budgeting the activity or action taken by company's management is important because the budget has an essential role in leading and organizing the company. The budget is a tool for analysis and control of the economic and financial activity.

In time, the results for each type of activity of the company are compared to the objectives set out previously to analyze the performance of the company and employees. This comparison is intended to limit the expenses that have not been established.

The budget period is represented by the fiscal year but to have a full and effective control the annual budgets are divided into quarters, months or even weeks.

The budget process begins several months before the year in question and is made by a budget committee consisting of the Director of Budget and line managers (chief accountant, financial manager, sales

manager). Its implementation is monitored by the accounting department which subordinates to the budget committee.

The principal budget of a company has the following components: [2]

- a) sales budget;
- b) costs of goods sold budget:
 - the production budget:

In developing a profitable activity, the company should establish its production in accordance with the sales budget because it may appear the situation when the production does not cover sales forecast. Production budget shows the number of pieces whose production meet the budgeted sales and also the final stock of each product.

- direct materials purchases budget:

In determining the required quantities of direct materials the production budget has an important role. To calculate the total cost of these direct materials we multiply the purchased amount by the unit purchase price forecast. Direct materials purchases budget plays a role in maintaining stocks at a reasonable level.

- direct labor costs budget

As well as in the case of direct materials purchases budget, the direct labor costs budget is prepared based on the production budget.

- indirect expenses budget:

This budget includes the estimated total cost for each administrative cost (maintenance costs, insurance and local taxes, etc.) For companies with complex business, this budget is drawn up for each department and can be divided into fixed and variable costs to better analyze them.

c) selling and administrative expenses budget:

This budget is based on achieving its sales budget because a growth in it entails an increase in advertising spending.

- d) profit and loss forecast:

In preparing the profit and loss account it is needed information coming from:

- sales budget;
- costs of goods sold;
- selling and administrative expenses budget;
- information regarding other types of income and expenses that arise such as the income tax

It is believed that budgeting is based on respecting two basic functions, planning and

control, which depends on company size. Thus, the planning function should be closely correlated with the strategic planning process and it addresses to small sizes companies while the control function is addressed to large companies.

Making it allows management to observe and analyze the effects of individual budgets on annual profit. If the profit margin is too small, the management can make changes in the operational plans so as to improve the budget.

3. Characteristics and effects of the budget process

The budget process is different from the notion of forecasting because it involves establishing a plan that is intended to be followed during the next targeted period.

The budget process of a company has several characteristics:

- enable a control over the management of resources of the company. It is important that both employees and company's leaders to know their rights and duties regarding all resources of the company;

- the implementation of this process involves a firm orientation to a goal: increase sales, reduce costs and increase profitability. It turns out to be important the achievement of a budget as if it were considered only the achievements of previous periods then it would not make good decisions as their accuracy would be missing by the fact that these results are based on past data that may change in future;

- the budget process requires the involvement of all departments of the company in achieving the organizational objectives. It follows an analysis of efforts and results of each department to see the balance between them and the general ones;

- also, this type of process allows the appropriate allocation of resources for every investment project as well as the monitoring of the business performance.

The budget must be finalized until the new fiscal year beginning because it works like a guide for company personnel and warn them about the inconsistencies that may occur.

The budget process involves establishing targets both at the level of the company and of the employees. Human behavior can cause problems if the objectives are too difficult or

easy to reach or if they conflict with those of the employees.

In the case of difficult budgetary goals to achieve, employees tend to feel discouraged by this because they think they will be rewarded according to their efforts. In this case, a viable solution is to involve employees in setting budgetary targets leading to better performance of tasks by them and hence a better achievement of objectives.

In planning the objectives, managers must establish goals that can be achieved but this does not mean setting them below those achievable in a realistic way. In this situation we include budgets that assume personnel higher than what is normally used. This solution is chosen to avoid situations where some staff is missing.

Thus, there are additional costs in an effort to meet budget because if at the end of the budgetary period the budget amount was not spent entirely then different acquisitions could occur to avoid the next budget to be consistent with current expenses.

Also, there may be a conflict of interest at the enterprise level when employees have different objectives compared to the ones of the company.

Using the budgeting by the company has positive effects on its activity if the situation is managed closely. Thus, the budget measures the performance by providing the necessary information to underpin management decisions during the year but also by monitoring the activity making an analysis of the differences that occur by comparing the current revenues with the budgeted revenues.

Once completed, the budget should not remain a fixed plan to be followed as economic conditions change constantly. It is preferable to be reviewed at regular intervals in order to be updated and to maintain a reality base from which to start making decisions.

The budget utility is provided by the fact that it controls the expenses and monitors if the target is met. But it may appear the situation when its effects are not desirable because the budget was prepared wrong. This occurs when drafting the budget focuses on investments that are not important for the proper development of company activities as it does not allow returns.

4. Aspects regarding budget preparation

4.1 Difficulties in creating the budget

Taking into consideration the fact that the budget preparation represents a complex process it may appear certain difficulties that may be corrected if the ones who prepare the budget give proof of attention and seriousness.[4]

To highlight the difficulties mentioned previously I present some as follows:

- the period of preparing the budget is expanded as the people involved in the project lose a lot of time and energy;

In this situation it is important to establish some general strategic lines to help reduce the steps in the achievement of budgets. There is also the possibility of creating partial budgets that contain complex calculations necessary to the general budget to avoid the lost time later with the situation.

- the analysis period of the budget targets is extended as the department heads delay decisions on data to be introduced in the budget and negotiations between departments and held with difficulty;

Changes made by the company's managers are applied with difficulty as they were hardly to agree upon.

In this case, it is possible to make different choices to be considered alternatives to the initial budget so that the decision regarding it to be made easier. Thus, shareholders or members may choose one of the proposed variants without wasting time applying the proposed changes to the budget and bring it every time.

In the case of specific budgets, they are analyzed separately and if the General Meeting of Shareholders is not happy with long term budgets then it is chosen the short-term budgets variant.

- the control made on the budget focuses on minor differences and not on the causes that rise to major problems

For a good review of the budget it is necessary a control over all its elements. Because it is impossible to analyze the entire budget in a relatively short time it is chosen a control over the elements where it may appear high financial implications.

- the created budgets may be considered too optimistic or too pessimistic;

As a comparison between the optimistic and pessimistic budget, we can say that it is better the second one because the management company would prefer to give consent on additional resources than on reducing the budget.

- the obtained budgets are difficult to be reviewed and can be considered to be restrictive;
- budgets require high expenses and time in their achievement;
- strictly respecting the budget it is reached the situation when employees focus more on meeting the requirements of the budget than on customer satisfaction.

4.2 Tips in budgeting

Budgeting is a complex task that must take into account certain recommendations, including:

- more realistic estimate of revenues and expenditures;
- good communication and cooperation between business departments;
- collection of useful and realistic information
- use Excel to shorten your time calculations.

Achieving the budget is done by following the necessary steps (information gathering and analysis, budgeting) and may appear the situation when a company decides to form 2-3 variants. Ideally it would be that the start of achieving the budgetary process to take place 3-6 months before.

Also, data to be part of the budget must have a correspondent in the chart of accounts required by accounting legislation. These data must be sufficiently detailed to be comprehensible at the time of analysis. [3]

Previous year's budget should be considered only a starting point in budgeting for next year as a number of changes may occur in the future, such as changing legislation, purchasing power and preferences of buyers. Budget items should be examined thoroughly before being placed as it may appear several sources for the same information.

Although initially the budget is done globally, in the last stage, revenues and expenses are broken down by quarters and months because if they sell seasonal products revenues differ depending on the period.

It is important that in the case of costs to be specified all categories of expenses that may arise in the coming year to avoid the situation of not having funding for those omitted.

The most frequently missed expenses to be introduced in the budget refers to

- costs regarding the staff: recruitment, training etc;
- legal expenses: appears when a company is seen involved in a process;
- launch costs: occur when the company wants to make an investment and should investigate emerging market and other factors.

Is it possible that those who prepared the budget to predict that there may rise unexpected expenses in the future that can not be named at the time when preparing the budget and therefore choose to introduce in the budget an article entitled “Unexpected costs”.

5. Conclusions

Based on the above it can be concluded that the ideal budget should be done in close liaison with the company's strategy, should provide solutions of activities to meet the objectives and, most importantly, it should offer high revenues in relation with reduced costs.

The budget utility is to provide information for decision making and measurement of business performance of the company. The main disadvantage is the budget period referred to by the fact that business is in constant change and a medium or long term plan can not have results unless it is updated constantly.

We say that a proper development of economic activities require the presence of a budget as the most important problem that managers would face on it would be the situation when there is no budget.

Abstract

Each state of the world has been always established the taxes in order to exhibit both the political and fiscal sovereignty. The state has been able to create its fiscal politics, its fiscal system, which do not contravene to the general international rights, do not favor some countries and do not oblige the states to the international double assessment.

As regards the direct taxes, the financial flows amongst states or between states and bodies, regional or internal institutions do not manifest directly under the form of amount transfers over the border, by being subservient to a state or another. The state has not transferred abroad and hasn't received amounts from incomings that signify direct taxes, income taxes or wealth taxes.

Key-words: The double international assessment, The tax, Fiscal politics, Fiscal credit, Taxes exemption;

J.E.L. Classification: H21, H23, H25, H27, H30

As result of the contemporaneous cross-border mobility, as regards the persons and capitals, the phenomenon of double international assessment has been emphasized. The double international fiscal assessment signifies the tax submissiveness of the same chargeable matter, and for the same period of time, concerning the same taxpayer related to the two fiscal authorities of different countries. The double international fiscal assessment appeared to only direct taxes (taxes on income and taxes on wealth), no matter the system of perception used: the direct assessment,

source stopping, overtaxes, or additional quotas.

Giving a more complete definition and of large perception met within the fiscal doctrine, “the double assessment signifies the imposing to two (or more) taxes, which are similar over to same topic of the assessment, for the same chargeable matter and as regards the same period of time”. This can be exhibited as either double economic imposing, respectively the submission of the same income or of the same wealth to more taxes within a country; this is related to either judicial assessment or imposing the same chargeable matter twice, in different countries.

The double international assessment is in this way the result of superposing the two fiscal sovereignties, which exercise their right of assessment over the residents of that country.

The need of eliminating the double assessment

The occurrence of double international assessment has been determined by the diversity of national fiscal systems, of the fiscal politics particularities, as well as by the way of using the taxes and duties at the level of each state. The contracting states had no obligation in order to eliminate the double imposing, where the conventions established were limited to consent the fact that there were interests on eliminating it.

Eliminating the double international assessment represents a need on ensuring the free development of the international economic relationships. The double imposing has become a barrier difficult to exceed to get

in the way of the external trade development and on the permanent extension of the economic, financial and technical-scientific cooperation, so that the elimination or its limitation has achieved an especial importance for ensuring the ascendant progress of the cooperation between states.

The progress of the external changes between goods and the economic cooperation between states have foreseen the discovering of measures and means necessary to avoid the double assessment on its income or on the wealth achieved on the territory of another state, in the view of supporting the international economic relationships.

Means of avoiding the double assessment

In the running on avoiding the double assessment, Romania concluded fiscal agreements that aim the mean of sharing the assessment rights, wither by offering this rights in totality to one of the states or by sharing it between states for various taxes, which derive from those on the income or wealth.

The means necessary on avoiding the double assessment used within the conventions concluded between states, at which Romania is also part of, are the following:

- The method of exemption, by two admitted variants: the method of total exemption and the method of progressive exemption;
- The method of offering credits, by two particularities: the method of total crediting and the method of limited crediting.

In order to make a comparison of data provided by each member state as regards the taxes, The European System of Accounts was created in 1995, also known under the abbreviation of ESA951, by which finding a common denominator was carried out on classifying the national accounts and, within their frame, of the taxes and duties in the European Union.

The method of exemption (exception)

In accordance to this method, one might mention that the incomes or the residents' capital specific to a contracting state, which were imposible within the source state, will

be exonerated from the taxes within the residence state.

Regarding the first variant of this method, *the method of total exemption*, the incomes and wealth of a resident submitted to the taxation in the other state will not be imposed anymore within the residence state.

The incomes carried out in the other contracting state, and for which the taxes are owed and excise taxes are paid in the other contracting state, will not be included in the calculation basis of the residence state taxes, and will not be taken into consideration on determining the assessment quota in the residence state.

In accordance to the total exemption method, the tax owed in the residence state is calculated in the following way:

$$ISR_{mst} = VSR * CI_{sr}$$

where,

ISR_{mst} – signifies the tax in the residence state, determined in accordance to the total exemption method;

VSR – shows the incomes achieved in the residence state;

CI_{sr} – signifies the assessment quota in the residence state, for the incomes achieved in the residence state.

As regards the second variant, *the method of progressive exemption*, the wealth or the incomes achieved in the other contracting state will not be imposed anymore in the residence state, but this is taken into consideration on establishing the assessment quota applicable for the total amount. The assessment quota calculated in this way is applied for the incomes or wealth achieved in the residence state.

In order to meet the progressive exemption requirements, the next calculation is used, in order to determine the taxes in the residence state:

$$ISR_{msp} = VSR * CI_{sr}(v_{sr} + v_{so})$$

where,

ISR_{msp} – signifies the taxes in the residence state, determined in accordance to the progressive exemption method;

VSR – shows the incomes achieved in the residence state;

$CI_{sr}(v_{sr} + v_{so})$ – signifies the assessment quota in the residence state for the achieved incomes.

The method of crediting

The method of crediting has taken into account, as regards the determination of the taxes owed in the residence country, the plurality of incomes achieved in the contracting countries. In this way, the taxes owed in the resident state will be calculated as difference between the established excise taxes for all incomes and the taxes paid in the source state for the incomes.

Concerning *the method of limited crediting*, the residence state allows the deduction with tax standard paid abroad, and only up to a lower value or equal to the value paid in the source state. The tax paid abroad will be only deducted up to the limit of internal tax, which might be owed for incomes equal to those achieved abroad. The method of limited crediting is mostly met in the fiscal conventions concluded between Romania and the contracting states, in order to avoid the double assessment.

In accordance to this method, the tax owed in the residence state will be thus calculated:

$$SR_{mcl} = I_{tdr} - VSR * CI$$

where,

ISR_{mcl} – signifies the taxes in the residence state, in the situation of using the limited crediting method;

I_{tdr} – shows the total taxes owed by a resident for the total income of its capital;

VSR – signifies the assessment quota within the residence state.

Concerning *the method total crediting*, the residence state allows the deduction from the total taxes owed abroad, without taking into account its volume.

The tax owed, in accordance to this method, will be therefore determined:

$$ISR_{mct} = I_{tdr} - I_{ps}$$

where, I_{ps} – illustrates the excise tax paid abroad.

Instead of the crediting method, one might use the method of progressive exemption, when “in accordance to any arrangements of the convention, the incomes achieved by a resident within contracting state, or the wealth own will be exempted from excise taxes in that state; though, in order to calculate the excise tax over the rest of incomes or the wealth of this resident, the incomes and the exonerated wealth will be taken into account”, or when “in accordance

to any arrangements of the convention, the incomes or the wealth achieved by a resident of any contracting state will be exempted from the excise taxes in that state; this might also take into account the exempted incomes (or the wealth), in the view of calculating the incomes (or the wealth) related to the resident”.

Means of avoiding the double assessment on international level

National mechanisms have been carried out in each state, by protecting the contributors of double assessment, and which do not depend upon the existence of the fiscal conventions. As regards the international practice, there are three basic ways on eliminating the double imposing, meaning:

- A. Taxes exemption – by excluding from the chargeable basic those incomes achieved from abroad sources;
- B. The fiscal credit – by taking into account the foreign excise tax credit;
- C. Passing the fiscal commitments paid abroad into the account of the expenditures carried out by the economic agent, also known under the tax deduction terms;

The first mean of tax exemption emphasizes the assessment exemption of the incomes or wealth, achieved on a territory different from the resident’s one.

The fiscal credit was applied, in contradistinction to taxes exemption, to only the excise taxes. The contributors, resident physical persons, which carry out incomes abroad and for which, in the running of the same period under taxation, have to respect the excise taxes in both the Romania’s territory, as well as abroad, benefiting of the right on deduction, from the excise tax owed in Romania and of the tax paid abroad, in the limit of the external fiscal credit.

Simplifying such definition, one might affirm that the fiscal external credit represents the amount paid abroad with excise tax standard, and recognized in Romania. The incomes achieved abroad by the physical resident persons, as well as the afferent excise taxes, expressed under the form of specific monetary units, but which are not quoted by the National Bank of Romania, will be therefore transformed:

- a) from the currency of the source state into an international circulation currency, such as USA dollars or Euros, using the currency exchange of the source country;
- b) the international circulation currency in lei, using the year mean currency exchange of it, communicated by the National Bank of Romania, from the year of carrying out those incomes.

The external fiscal credit is offered if the following conditions are met:

- the excise tax related to the incomes achieved abroad was paid directly or by source retention, fact proved by documents that attest the payment;
- the tax owed and paid abroad has the same type with the incomes owed in Romania.

Conversion in the national currency of the excise taxes on profit paid abroad will be carried out at the currency exchange communicated by The National Bank of Romania, starting with the calendar year date when payment was performed.

Deduction for the excise taxes paid to a foreign state in within a fiscal calendar year cannot exceed the excise tax on profit, calculated by applying the excise tax quota of 16% to the chargeable profit achieved in the foreign state, or to the incomes achieved in the foreign state.

The incomes for which the fiscal credit is offered are part of the following classes on incomes:

- independent activities;
- wages;
- cession on goods using;
- investments;
- agricultural activities;
- prizes and games of change;
- activities of trade arbitrage.

As regards the excise taxes, the external fiscal credit is determined by the fiscal institution, separated on each class of incomes and by reporting to the world incomes.

Conclusion:

The world revenues signify the totality of impossible earnings of Romania and of all countries that include revenues of independent activities, wages cession of goods using, accomplished by Romanian physical resident persons.

The external fiscal credit is calculated individually for the incomes carried out in each country. The physical persons of Romanian nationality can justify the achievement of revenues abroad, and the afferent excise taxes, if they prove by documents issued by the fiscal institutions of abroad, by the employer or by any other foreign person that pays revenues taxes.

In the situation when a person achieves earnings and afferent taxes from more countries, the external fiscal credit will be calculated separately for each state, in accordance to the procedure previously mentioned.

The fiscal practice foresees more possibilities on avoiding the double assessment, amongst which: the national regulations, bilateral or multilateral agreements, the jurisprudence, the customary and the doctrine.

The modernization process of the internal fiscal legislation has been directed towards both the plan of perfecting the general system on excise taxes and dues, by comprising the issues related to the international taxation, as well as the way of redefining and updating some specific terms used within the international fiscal legislation, meaning: resident, permanent residence or external fiscal credit etc.

Social Insurance(s) versus Social Assistance

Ciuraru-Andrica Cristina

cristinaciuraru@yahoo.com

Abstract

The economic crisis Romania has been going through strikes heavily the revenues of the general consolidated budget, causing a growing deficit as a result of the imperative expenses which need to be effected. In this category we find social insurance benefits and social assistance benefits which are unavoidably guaranteed by the state, by virtue of its role in economy and of the attributions it holds. Hence, this paper intends to distinguish the different significations and implications of the two concepts, so that, in the future, no foundation for their equivalence could be possible.

Key words: Social insurance, social assistance, social insurance benefits, social assistance benefits and services

J.E.L. Classification: H55

1. Introduction

The satisfaction of needs which are of general interest involve a redistribution of collected funds at the disposal of the state, by means of public finances, under the form of public expenses. According to their functional structure, a rather important share, in most developed countries, is represented by socio-cultural expenses. These constitute an essential component of social policy supported by the state (the welfare-state) with the purpose of accomplishing three extremely important objectives [2]:

- guaranteeing a minimal income for all the members of the society, no matter the size of the property owned;
- diminishing the insecurity area of the individuals and offering them possibilities of protection in cases of unemployment, disease, old age;

- ensuring, for all the members of the society, some minimal standards of living by way of general public services.

These objectives attribute a social role to expenses targeted at social-cultural activities, which, taking account of their economic role (related to their influence on consumption and, consequently, on the goods and serviced production), activate as real instruments in the organisation and functioning of the national economy.

In Romania, the structure of public expenses for socio-cultural events, as presented by OMPF no. 1954/2006, with its subsequent amendments and additions, is as follows: a) education; b) medical sector; c) culture, leisure and religion; d) social assistance and insurance [12].

In specialized literature [6], the last ones also appear with the denomination of expenses for social security. The concept, used in the European Code of Social Security (ECSS), includes both social insurances and social assistance, and it refers to nine social domains: medical care, sickness benefit, unemployment benefit, old age benefit, employment injury and professional sickness benefit, family benefit, maternity benefit, invalidity benefit and survivors' benefit. The European Code of Social Security is a judicial instrument adopted by the member states of the European Council, in Strasbourg, on April 16, 1964, entered into force on March 17, 1968 and signed by Romania on May 22, 2002 (ratified by law no. 116/2009, published in O.M. no. 331/2009) [14]. It was elaborated on the basis of the provisions in Convention no. 102 of the International Labour Organization (ILO) [15], referring to minimal standards of social security, adopted in 1952. For each of the nine domains listed above, the Code establishes the risk covered, protected persons, benefits granted, eligibility criteria, amount of benefit, period of benefit allowance, and duration of waiting periods.

The Code also establishes certain percentages of social security benefits which must be granted in proportion to the anterior income of the beneficiary prior to the appearance of the social risk.

According to simple definitions, social security designates the corpus of measures, financial benefits or benefits in kind, given with the purpose of protecting the income in case of social risk [16], or social security represents the total amount of institutional methods aiming at repairing (eliminating or diminishing) the damaging consequences produced by different social risks [5]. Social risks can include: sickness, maternity, invalidity, old age, employment injury and professional sickness, death, unemployment, family allowances (according to ECSS).

Hence, social security can be defined as the collection of institutions and regulations, norms and measures which are activated once the social risks appear (or even for their prevention).

More than that, UNO General Assembly qualified the concept of “social security” as an inalienable human right, on the occasion of the adoption and proclamation of the Universal Declaration of Human Rights, on December 10, 1948, which stipulates, in article 22, that “*anyone, as a member of society, has the right to social security*”.

The same right is stipulated by the Romanian Constitution, article 47, alignment 1: “*The state shall be bound to take measures of economic development and social protection, of a nature to ensure a decent living standard for its citizens*” [7].

The concept of “social security” is often assimilated with the concept of “social protection”. An article with a very suggestive title [4] presents an extremely pertinent analysis related to the “connection” between the two notions, resorting to definitions from the judicial area, as well as the national and international theoretical areas. As a conclusion, the author remarks that by using the social protection notion, in a narrow sense, we plead for the synonymy between social “protection” and “security”, making reference to the system of social insurance and assistance, and by using this concept in a broad sense, besides social security, we also refer to labour protection, moral, cultural, civic protection, etc.

Therefore, in a narrow sense, social protection or security includes the institutions, regulations, norms and measures referring both to social insurances and to social assistance, incorporated into a national system of social protection.

In daily activities, these concepts (social insurances, social assistance) are often taken one for another. The gravity of the situation is even greater as it does not appear only in case of uninstructed persons, but also in case of professionals in the field.

The Romanian Constitution itself, in the same article mentioned above, but in alignment 2, records the following differentiation: “Citizens have the right to pensions, paid maternity leave, medical care in public health centres, unemployment benefits, and other forms of public or private *social insurances*, as stipulated by the law. Citizens have the right to *social assistance* according to the law” [7]. Therefore, social insurance and social assistance constitute two of the means to guarantee and respect constitutional rights with the aim to accomplish the objective of social welfare (social protection in the broad sense).

To conclude, after trying to locate the concepts in the social background, we will proceed to clarify their signification starting from some relevant criteria.

2. Social insurance

The present-day uncertainty, of almost every step we take, determines us to resort, voluntarily or involuntarily, to a corresponding solution, which is almost indispensable nowadays: insurances.

In general, insurances represent protection instruments while facing risks, which are sometimes inevitable (this entails preventing, removing and repairing their negative consequences), offered by various specialized institutions, in exchange for payment as contribution (insurance premium in the private sector). If these risks are of a social character (involving the state’s intervention), then insurances also acquire the same connotation.

According to a definition [6], social insurances represent those components of financial socio-economic relations which assist – in the process of gross domestic product distribution – in forming, allocating,

managing and employing monetary funds necessary for compulsory protection of employees and retired persons (...) as well as protection of their family members. In other words [1], social insurances constitute an economic contract between generations, the management of its development and the supervision of mutual compliance with the contractual provisions being the duty of the state.

The urgent necessity of social insurances, in a market economy, gives them an objective character. Nevertheless, their existence is strictly dependent on, for the most part, the contributions of those who benefit from them (in exceptional cases they are supplemented by subsidies from the state budget or revenues from various sources).

As a result, they are based on a contributory system due to which the various types of beneficiaries take advantage of a range of social insurance benefits if they comply with some criteria. The types of social insurance benefits include: pension (for age limit, early retirement pension, partial early retirement pension, disability pension, survivors' pension), allowance for temporary labour incapacity caused by employment injury and professional sickness (according to some conditions), death grant, quarantine allowance, unemployment allowance, medical care, allowances for social health insurances etc.

These social insurance benefits are guaranteed by law. The pensions' law, with its subsequent amendments and additions [8], stipulates that the right to social insurances is guaranteed by the state and it is applied by means of the *public system of pension and other rights of social insurance*, and the updated unemployment law [9], in article 1, demands that each person is guaranteed the right to *unemployment insurances*. The major system of financing the protection of the population's health is added to this, and it ensures access to a basic services package for the insureds, represented by *health social insurances* [10].

Most of the social insurance benefits have an unproductive character, representing the so-called “passive benefits”, namely a final expenditure from GDP. Nevertheless, lately, the “active benefits” have started to be used on a large scale, whose aim is, for instance, that of creating new jobs, professional

retraining, offering facilities for those hiring unemployed people, applying measures to prevent unemployment and sickness etc. This entails a growing effectiveness of funds for social insurance benefits, with a double effect: on the one hand, their pertinent usage and, on the other hand, creating added value (productive character) and, implicitly, economic and social development.

3. Social assistance

By virtue of the principles which govern our society, in general, (namely social solidarity, equity, reciprocity) and of the role of the state in taking particular “care” of its citizens, social assistance represents a “consolatory form” for those community members who are “less lucky”.

According to law no. 292/2011 [11], social assistance comprises social services and social benefits conferred with the purpose of developing individual or collective capacities so as to ensure the accomplishment of social needs, the enhancement of life's quality and the promotion of the principles of social solidarity and inclusion. Hence, social assistance is also guaranteed by law, each of its components being regulated with special concern.

The law also asserts that social benefits represent means of financial redistribution, while social services constitute the complex collection of measures and actions carried out in order to meet the social needs of persons, families, groups or communities, with the aim to prevent and surpass situations of difficulty, vulnerability or dependence.

Therefore, social assistance endorses the material protection and support for persons, families, groups or communities with special problems, who find themselves in difficulty as a result of economic, physical, psychic or social circumstances, without having the possibility to ensure, through personal means and efforts, a decent living for themselves.

The suppliers of social services and, implicitly, of social benefits, can be the state – by means of central and local public administration – the local community and the civil society.

The right to social assistance is conferred to persons or families who meet the eligibility criteria stipulated by the law, generally, without a monetary contribution

(there are situations when the beneficiaries, depending on their income, can contribute to the financing of social services given to them, or, in exchange, they can perform activities or jobs of local importance for the community, on a monthly basis). As a result, the supply of social services and the granting of social benefits (monetary or in kind), is not based on a contributory system which is especially designed, but it relies on funds allocated, with this purpose, mostly by the central and local public administration (from the state budget, local budgets, collections from various sources etc.), but also by the approved local communities and civil societies.

The system of social benefits, forms of financial transfer, comprises family allowances (state child allowance, complementary family allowance, child raising allowance etc.), social aids (minimal guaranteed income, aid for home heating etc.), allowances and facilities (monthly allowance for seriously disabled adults, monthly food allowance for disabled children with HIV/AIDS etc.), as well as other forms of support (financial support for new families etc.) [16].

From an economic viewpoint, expenses with social services and benefits are considered to be unproductive as of revenues, “overburdening” the state increasingly, in proportion to their growth. More than that, these expenses can slow down the rhythm of

economic growth due to some effects which are contrary to the expected ones (for instance continuous poverty, the growing number of divorces – as a result of social aids given to mono-parental families – etc.). Therefore, it is considered [6] that direct social aids must be conferred in a limited amount, so as not to encourage non-work or to transform the helped persons into permanent assisted people. This is why it is vital that social assistance measures should be corroborated with prevention measures (if they are less costly and in where it is possible) for difficult situations which could lead to allocating funds with this purpose. This needs even more consideration since expenses for social assistance are constantly increasing, from year to year.

4. Conclusions

In order to ensure social welfare, social assistance and social insurances constitute an objective necessity which requires to be accomplished and, at the same time, they attempt to become (and they sometimes succeed) a method of eliminating the “black stains” which block the progress of society in general, and of the individual, in particular.

In order to get an overview of the two concepts explained above, below we include a comparative table based on the criteria we have mentioned.

Table 1. Social insurance(s) vs. social assistance

Comparison criteria	Social insurances	Social assistance
1. Nature	Expenses for social security	Expenses for social security
2. Purpose	Ensuring social welfare	Ensuring social welfare
3. Objectives	<ul style="list-style-type: none"> - Constituting funds with implicit destination - Protecting insured categories so as to prevent, remove and repair negative consequences of social risks - Transforming a part of these expenses in investments under the form of human resources (active benefits) - Finding viable solutions for covering budget deficits. 	<ul style="list-style-type: none"> - Protecting, motivating and integrating underprivileged categories - Satisfying (at least at a minimal level) their basic social needs - Finding solutions so that the amount of these expenses should decrease, in favour of solutions for the prevention of difficult situations
4. Definition	That component of monetary socio-economic relations supporting the formation, distribution, management and employment of monetary funds necessary for the compulsory protection of employed and retired persons, as well	Material protection and support for persons, families, groups, communities that face special problems, or are in temporary difficulty because of economic, physical, psychic or social reasons,

	as of their family members.	without any possibility to ensure, by their own means and efforts, a decent living.
5. Suppliers	The state	The state, the local community and civil society
6. Beneficiaries	The insured persons (when they meet the required criteria)	Categories of people meeting the eligibility conditions according to the law (assisted persons)
7. Financing system	Contributory	Non-contributory
8. Financing sources	Social insurance state budget, unemployment insurance budget, national unique fund for health social insurances, constituted on the basis of contributions and, exceptionally, on subsidies from the state budget or other collections from various sources	The state budget and local budgets, funds of civil societies and local communities and, exceptionally, from contributions or other collections from various sources
9. Forms of manifestation	Social insurance benefits (pensions, indemnities for temporary work incapacity, death allowance, quarantine indemnities, unemployment indemnity, medical care, indemnities for health social insurance etc.)	Social services and social benefits (family allowances, social aids, indemnities, facilities and other type of support)
10. Guarantee method	By the Constitution and other specific laws	By the Constitution and other specific laws
11. Economic character	Passive benefits – unproductive character Active benefits – productive character	Passive benefits – unproductive character
12. Financial character	Parts of GDP as a result of its process of distribution	A part of GDP as a result of its process of distribution
13. Social-economic utility	- It influences consumption and, as a result, the production of goods and services - It provides assistance for the individual's “wellbeing”	- It influences consumption and, as a result, the production of goods and services - It provides assistance for the individual's “wellbeing”
14. Current trends/tendencies	Great deficits are recorded, and they need to be covered at the expense of other economic objectives	The growing number of assisted persons and, implicitly, of the amount of social benefits granted.

Ways to Increase the Effectiveness of Financial Control in Local Public Administration

Ciurlău Loredana
„Constantin Brâncuși” University of Târgu-Jiu
lciurlau@yahoo.com

Abstract

Financial control in local public administration must be efficient and effective. Now the question arises whether it should be cost-effective. When it discusses the effectiveness of financial control, place, often equate efficient and cost-effective, which give rise to perplexity among those involved in the Organization and functioning of the control. Up to a point, the two concepts have the same content, the efforts made for the Organization, operation and control of the financial cover with revenue and remain and a profit. For financial control work yield can be calculated only if the two pointers, one that refers to the efforts and the size effect of concrete, you can quantify and accurately.

Key-words: public administration reform, quality management, strategies for reform, convergence.

JEL Classification: H83, O47

1. Introduction

In the case of financial control, the efforts may designate, but the effects are of two broad categories: direct effects, that you can individualize the control activity in order to compare it with the efforts of such individual (supervisor personnel costs, transport costs, accommodation and subsistence expenses, etc.), and indirect effects, which are propagated or induced into the system without having to be located at the level of financial control.

An attempt was made to quantify the effectiveness of financial control by the rise in this period to some performance indicators, including the amount brought in.

Only to the efforts and direct effects can calculate directly the profitability of financial control, actions for the rest of the following

to apply a general assessment of its effectiveness. It is necessary that the actions of the control to be placed in category efforts and direct effects.

It is necessary that the actions of the control to be placed in category efforts and direct effects.

2. Improve the efficiency of financial control

Increasing the efficiency of financial control in local public administration shall remain a coordinated.

Financial control work depends crucially on the determining factor and absolutely indispensable, in implementation of its human element. „In no other human activity plays a role not so important in achieving optimal conditions and efficiency objectives, as in control. This is because by its very nature, general activity and particularly financial control, provides the exercises up to the position of the control, which can be particularly harmful if used improperly or destructive. On the other hand, the system of interests in which automatically and involuntarily almost any financial controller is involved, regardless of the structure and level of verification would have on his influences such as to harm the performance of control under conditions of legal provisions and in accordance with the requirements laid down by the a priori control programmes”(Pereş, 2005, p. 322).

A practical way of increasing efficiency of financial control in the local public administration is switching on a wider scale to control performance, which is a great alternative perspective.

Monitoring performance is fundamental objectives:

- efficiency;
- the degree of economics, involves minimizing the cost of the resources

allocated to achieve the expected results of an activity, maintaining quality passes those results;

- the effectiveness of programmes and activities that public authorities have to be carried out for the benefit of local communities.

Control performance boosts creativity, performance and progress.

Figure no. 1

Another condition for improving financial control in the local public administration is to *ensure the stability and clarity on the regulatory framework under which it is held.*

Frequent amendments and completions of normative acts in the field of finance, at short intervals, hamper and even distort financial control work which must adapt to the changes in legislation that targets were made during that period.

In Romania the instability of legislation, in particular the tax became a phenomenon observed with chronic, and criticized both at home and overseas investors. The new tax Code, in a period of a year and a half, has been changed ten times and still calls for amendments thereto. Fiscal procedure code at the same time, has been amended several times.

Legislative instability affects negatively the work of control by the fact that:

- the lists of themes and objectives must always check amended;
- training of control bodies must be repeated and always adapted to new conditions imposed by legislative changes;

- the risk to err in the control grows, whereas rules are different for the same objective within the period under examination.

Quality of normative acts establishes that texts are written concisely and precisely, no doubt to different interpretations and endless discussions between control bodies and establishments, or persons controlled compartments.

Rigorous selection and training of personnel engaged in continuous structures or in bins with powers of financial control is a new direction for action for improving financial control.

Financial control work which does not require professional competence can be achieved without thorough education and training specialist continues those exercises, permanent changes in the law, business law and controlled activity for learning new tools, processes and methods of activity of financial control.

Without people well prepared professional and competent, the activity control does not have the necessary effectiveness and contribution of the financial control efficiency in the use of financial resources is low. At present, this activity of financial control are assigned appropriate training unemployed persons with secondary education, sometimes the other.

Financial stability-control system has influence on the improvement of financial control and efficiency gains. Frequent changes that have occurred in the last period of the control bodies of the competence of a body to another work influenced negatively. Financial Guard, the customs authority, the body of Government Control, once they are subordinated to the Ministry of public finances or the Government, other time under the control of the national authority for Control, and back to the Ministry of Public Finances or from the Government. So, instead of having to deal with the activity control and to refine, these institutions are all organized and reorganized at the expense of quality.

Another direction of action that leads to the improvement of financial control activities is *to increase the responsibility and liability of the persons carrying on activities in this area.* Self-employed financial control independence must be compared with the

controlled structures and personnel to be able to analyse, propose or take the necessary steps to remedy the causes that generate or contribute to deviations from the legal rules or objectives.

Increase accountability should be accompanied by increased accountability on the use of time affected the actions control on the measures proposed or taken and, when necessary, and to respond to the damage that they bring to the authorities or control.

Collaboration and cooperation between the powers of control bins and other compartments of the local public authorities contribute to enhancing the efficiency of the activity of financial control. Bins of agricultural taxes and fees, budget, financial accounting, legal can provide useful information for stock control. In many local public entities there is no collaboration between organizational divisions involved in the assessment, management, evidence collection, financial resources, a fact that is missing the financial control bodies of a database of documentation necessary for control and efficiency gains. This situation is the lack of manual and the circulation of documents.

Avoid comparisons and overlays in the activity of financial control is another direction which can improve the efficiency of financial control. In practical activity of financial control is manifested in some analogies and overlapping organs of control. Duplication in financial control work occur when two or more bodies were established by different rules, tasks of same or similar verification. Duplication in financial control activity arise when the same taxpayer, public entity or the same bin meet two or more financial control bodies or they are very short intervals of time. Overlays and comparisons have negative effects on both the control and supervisory body.

On the changes and update the legislation on various financial control bodies must follow to avoid and kind of parallelism of tasks of a supervisory body.

The flexibility of financial control is one way of improving the activity of financial control. Monitoring programs developed by the Court of Auditors, by the local public administration authorities through specialized services, the Ministry of public finances are

useful and are a tool for planning and management which helps to conduct an activity organised. These programs must be flexible, in view of the changes that occur.

In situations where the control programs do not give an opportunity to the adaptations or changes in management instruments are converted into instruments of braking.

Financial control in local public administration can improve with *improving accounting activities*. The accounts and records of the technical-operational and accounting is the most important source of information for financial control and represent the object of control activity.

Accounting is a special activity, knowledge measurement, evaluation, management and control of assets, liabilities and capital and reserves as well as the results of the work done. It must ensure the chronological and systematic registration, processing, publishing, and preserving information about the financial position, financial performance and cash flow for both domestic customers and in dealing with creditors, clients, public institutions and other users, including organs of control. Accounts of public institutions provides information officers with regard to the implementation of the budget of revenue and expenditure at the heritage, as well as the preparation of the general account budget execution. For improving the quality of accounting information, documents, records, accounting and technical-operative they make available to financial control, it is necessary that in all public entities to accounts result in double, economic-financial operations to be recorded in the accounts on the basis of the principles of rights and obligations in accounting (at the time of the creation, transformation or disappearance/an economic value, of a debt or obligation). Are required, the establishment and improvement of the rule by the public entity for all operations conducted, starting from the preparation of supporting documents pending completion of quarterly and annual financial statements.

Another direction that leads to the improvement of financial control in local public administration improvement Act is a Court of law courts. Against some of the measures ordered by the acts of financial control, those who make complaints to the Court.

Combat and prevent the phenomenon of corruption among the self-employed financial control contributes to improving such checks with the local public administration. Media in the face of public opinion brings numerous cases of officials of financial control departments involved in cases of corruption (hold assets with values much higher than the income of the salary and other sources of income have not). This phenomenon of corruption in public administration is noticed and criticized by Romanian citizens and foreigners, is critical in all presented country reports drawn up by the Commission of the European Union which relate to our country, but the remedies are timid.

Promoting good governance and a trustworthy public administration entails:

- strengthening national legislation and procedures relating to procurement, in order to promote an effective process, open and transparent procurement to align with European and international standards;
- improving the efficiency, transparency and accountability in the preparation, implementation and monitoring of budget implementation for compliance with international practices laid down by the European Community;
- the establishment of professional and stable public services, with personnel and the maintenance of legality, integrity and transparency through effective legal frameworks, as well as legal review of administrative decisions in accordance with international practices and to promote the implementation of the recommendations of the public service ethics and codes of conduct;
- the establishment of effective external audit institutions and practices at the level of international practices and standards established by the European Court of Auditors and the Member States of the European Union;
- strengthening parliamentary supervision by the Ombudsman institutions and provision of organs investigatoare with sufficient human and financial resources and to ensure transparency with regard to

sponsoring of political parties and electoral campaigns.

Increasing the prestige of the financial control bodies in the local public administration and their contribution to the efficient management of public patrimony cannot be financed only with people who have a moral obligation and a flawless, beyond doubt thorough training. Persons working in financial control are compromised and must be removed from the control system.

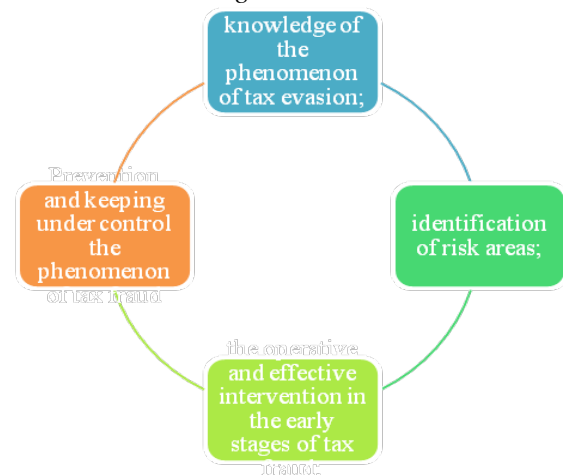

Financial control is able to bring a high contribution *to improve the forced execution of claims by local budgets*. Year by year, not to collect certain percentages of their own local budgets incomes.

Financial control, in particular the tax inspection as part of its public administration has as its main task *the prevention and limitation of tax evasion* and, thereby, increasing the incomes of the county or local budgets. Where evasion is detected, it is most often fails to recover at least part of the budgetary losses. The number of cases of tax fraud is dependent upon the ability to control.

In this case, the question which must be herd people in local public administration to deal with detecting and sanctioning tax fraud?

An excessive number of them would produce a pressure control taxpayers unbearable, hitting directly in their good economic activity went. A number insufficient provision would lead to excessive freedoms intended to contribute to the growth of the phenomenon of fraud. Optimizing control in the financial control of local public administration may constitute a measure likely to lead to (figure no. 2):

Figure no. 2

In addition to the existence of clear, stable regulations, applied fairly and effectively, awareness, reducing fiscal pressure on taxpayers, financial control has a special role in *the prevention and keeping under control of tax fraud*.

Tax avoidance detrimental to society as a whole, through the allocation of the budget incomes, which leads to insufficient financing of social and economic policy of the State, but also by practicing unfair distortion of competition and the business environment.

To ensure the equality of citizens in the face of tax and for maintaining a healthy business environment in which competition to be held correctly, National Tax Administration Agency leads a dynamic and constant struggle to identify and reduce tax evasion.

A direction of action important National Tax Administration Agency is a brisk actions for taxpayers, bad company, while reducing fraud in the collection phase, meaning a reduction in force or to the disposal of assets. Thus, taxpayers with debt outstanding to be notified, you will be able to prevent forced to evade the goods to be valued.

Through its objective of strengthening financial control to businesses that use public funds, National Tax Administration Agency guarantee in relation to the company, financial discipline and compliance with the law by them.

3. Strengthening financial control

The use of public funds is a range of risk from the point of view of financial times and evasion of indiscipline. Therefore, subsequent financial control exercised by the State shall be carried out on the basis of annual programs and monthly, quarterly, National Tax Administration Agency continues to follow with great attention to the use of public money in the businesses involved.

The guidelines, which will lead to strengthening financial control in the future, to better management of this activity, through the following actions:

- development of instruments for the management of the business;
- development of a rating system on the basis of indicators of financial controls or

themed background;

- development of methodologies and procedures for financial control adapted to the diversity of operators control;
- development of informative guides for internal use;
- implementation of computerised procedures for the preparation and the grounding of financial control, and on the basis of the taxpayer from the tax.

4. Conclusions

Improving financial control in the activity of local public administration is reflected in the contribution brought to the local budgets income growth and increase efficiency, effectiveness and cost-efficiency in the management of administrative-territorial units patrimony.

However local authorities creates the opportunity to provide local communities more public services and at the same time better quality.

It is necessary to optimize control measures to ensure that the economic effect (attracting additional amounts to the budget) to be as safe and effective, and to have obtained the result to avoid transgressions in the future.

Also, the pursuit of the activity of the inspectors should lead to a better use of working time (efficiency).

The lines of action for the implementation of this strategic objective are:

- preparation of quarterly and annual programmes, to organise and conduct monthly business tax inspection based on the results of risk analysis of taxpayers and the degree of risk of territorial areas;
- achievement of fiscal auditing actions for checking the activity of the territorial structures with tax inspection tasks, including how they are fulfilled the objectives set out in the programmes of activity

Are there any Solutions for Improving the Quality of Life in Romania?

Codreanu Carmen Mariana
"Petre Andrei" University from Iasi, Faculty of Economics
codrcarmen@yahoo.com

Abstract

This is a paper that draws the attention on the possible solutions needed to improve the quality of life. People's quality of life should be studied in terms of the social facets of the concept, which combine the micro, mezzo and macro – social levels; it starts with the individual and then moves on to different social groups and human communities.

In the past, the attention was focused on a few important economic indicators: GDP, CPI, unemployment rate, level of household income, etc. Now, the quality of life has become an attraction for policy makers.

A sustainable high-level quality of life and wealth for all the members of the society is the ultimate goal of the public policy. The attention is currently focused on fostering economic growth and creating more jobs. But will this be enough for achieving a better quality of life and more wealth on the long run?

Key words: quality of life, technology, GDP, CPI, unemployment rate.

J.E.L. Classification: O11.

1. Introduction

The quality of life can be defined as the value of a man's life, provided that the conditions of human life offer the opportunity to meet many of his needs, the degree to which life is satisfactory to humans; therefore, the quality of life can be seen as a relationship between the existing state and its assessment by the population [1].

The quality of life embraces the multiple dimensions of human experience that affect wealth. The quality of life is expressed through both objective and subjective indicators. The objective indicators are those indicators which are external to the individual and encompass the measures of

material living levels and their components, as well as family life, physical and mental health, work, environment, and so on. The measures relate both to the factors whose increase raises the level of the quality of life, such as the level of nutrition or life expectancy, and to the negative factors, such as pollutants and crime, whose increase lowers the level of the quality of life. The subjective measures are self-reports of personal wellbeing, obtained through surveys regarding happiness, general life satisfaction, prevalence of positive and negative moods [2].

The quality of life indicators attract more and more the attention of policy makers. In the past, the attention was focused on a few important economic indicators, such as: the GDP, the CPI, the unemployment rate, the level of household income, etc. Now, the quality of life has become an attraction for policy makers.

Training, education and culture are indicators of great importance in evaluating the standard of living and the quality of life. The degree of training, education and culture depends on the quality of labor, the quality of the goods and services created, the quality of social and inter-human relationships, the intensity of participation in the scientific, cultural and artistic life, the way social institutions function, management efficiency.

The quality of the socio-political environment depends on the way the conditions for achieving civic freedoms, according to which people can think freely, express their views, capitalize their physical and intellectual skills according to their own belief and manifest themselves freely in all the areas of social life are provided.

People's quality of life should be studied in terms of the social facets of the concept, which combine the micro, mezzo and macro – social levels; more exactly, it starts with the individual and then moves on to different social groups and human

communities, in order to reach the society as a whole. Since the contemporary development “acts as the establishment of two processes, sustainable development and human development”, the quality of life can be considered to be the effect and measure of the economic and social progress [3].

A sustainable high-level quality of life and wealth for all the members of the society is the ultimate goal of the public policy. However, the attention is currently focused on fostering economic growth and creating more jobs. But will this be enough for achieving a better quality of life and more wealth on the long run?

2. The Romanian reality

60% of Romanians live on less than 800 RON (Romanian (New) Lei) (around 160 pounds) per capita each month, around 2400 RON monthly for the statistic household, but life is also much cheaper than in other countries. Overall, the GDP PPP/capita is around 45% of the European average, but there are many disparities between the rich and the poor, the urban and rural area and so on. Unfortunately, a lot of people do not have enough money to buy what they need and a significant part of the population has problems covering even the basic needs. Services are, on average, under the Western level, but they are functional. However, if one has enough money, living in Romania is not so bad, especially in the big cities.

Public transportation in big cities is quite good and relatively cheap. Trains are quite expensive and slow. The main roads are usually crowded.

The public health system is not very good (you need to pay for certain services and to tip the doctors and nurses in some cases); in the big cities, private health is a better alternative. Regarding the beautiful regions, all the mountain, hill and plateau regions are extremely beautiful, especially the south of the country. Bucharest is the capital and the biggest city and, like any other big city in the world, has pros and cons; but one should not avoid it.

3. How can the quality of life be measured?

The success of a national economy must be measured by the affluence and the quality of life of the citizens. The traditional method of measuring economic success is basically based on one single material parameter, expressed by the GDP. The aspects beyond the pure success measured by production such as the quality of life, environmental richness, the aspects regarding social assets and distribution, are still not sufficiently taken into consideration.

International comparisons of the quality of life conditions almost always point to a strong positive association with the real GDP per capita [4].

The GDP measures the gross domestic product of a nation, which is the market value of all final goods and services produced during a given period. Because the production of goods and services indicates that people are working, earning money and making a living, an increasing GDP shows an increased economic activity, meaning more funds for social programs and more incomes and that people have to increase their own standard of living [5].

The GDP is a good indicator of the quality of life improvement for a large number of people, because it measures productivity.

A country's GDP growth is an excellent indicator of the quality of life improvement, simply because it measures the amount of work that is being done and the productivity resulting from that work. The higher the GDP is, the better is the economy and, therefore, the better is the quality of life.

The GDP is but one factor in an extremely complex world economy. However, in general, even in reductionist terms, GDP growth can indicate a strengthening economy, more jobs and, therefore, more incomes for the individuals. This does not necessarily improve the quality of life, at least not right away. A better job (or any job) is a good thing, but if an individual is thoroughly in debt, it might take some time to improve the quality of life.

A number of other factors influence the quality of life as well: for example, the access to healthcare, vacation or leisure or a healthy environment.

Sometimes, as in the case of happiness and

life satisfaction, the quality of life indicators remain unchanged, even if the real GDP per capita doubles or even more than doubles. In contrast to the results of simple international point-of-time comparisons, history suggests that improvements in many realms of life are not an automatic result of economic growth [6].

4. Measures of preventing the deterioration of the quality of life

Among the measures that should be taken for preventing the deterioration of the quality of life, in order to introduce a better allocation of the public budget, that is mainly orienting to social sectors, given that, according to EUROSTAT, in 2007 Romania was allocating only 12,8% of the GDP to social policies, compared to the EU average of 26.2% (according to the methodology of EUROSTAT, education expenditures are not considered social expenditures and therefore are not included in these values) we mention [7]:

1. Supporting public policy decisions, recently adopted for vulnerable population categories: introducing social pensions, subsidies for stimulating the employment of different categories of people.
2. Budgetary expenditures, oversized in relation to the existing resources.

a) Social "luxury" non-contributive benefits (or with insignificant contributions):

- Subsidies for some students in public higher education and, in addition, providing scholarships for students with a good and very good situation;
- Service pensions determined at 85% of the last monthly salary income;
- The child-rearing leave until the age of 2 years, granted to one of the parents, plus the excessive values of some allowances of those who have high incomes (up to 4,000 lei);
- Favoring women regarding five years earlier retirement in comparison to men, which is acceptable, given their social role; however, the formula for calculating the pension, which leads to a higher pension income for women corresponding to an equal assured income is not acceptable (for example, according to Law 19/2000, in 2001 the retirement age for women was 57 years and 62 years for men and full contribution stages were of around 25 and respectively 30

years. In these conditions, a 57 year old woman and 62 year old man with 30 years seniority and an assured income equivalent to the average salary at national level had a different treatment regarding pensions, meaning that the man had one pension point while the woman had 1.2 pension points. If we consider the ages and maximum stages under the respective law - five years higher for men - and we consider 40 years of activity for women and 45 years of activity for men, with an assured income equivalent to the average salary at national level, women would get 1.33 pension points while men would get 1.28 points, even if they work for five more years).

b) Budget allocations for institutions and oversized activities:

- National radio and television companies;
- Secret services;
- The ministerial apparatus, including activities abroad;
- The army - based on the employment contracts of the military;
- Participation in international sports competitions;
- Investment and public acquisitions that are not always justified (based on needs) and have excessive costs, various donations and grants.

3. What should there be done in the immediate future in order to improve the living conditions of the population:

- Increasing the absolute level of the budget revenues as well as their share in the GDP, primarily by collecting the amounts owed by taxpayers without exception, by eliminating undeclared work, including the contracts that declare only part of the salary (practiced in the private sector). The state could also obtain resources from its owned properties, including through privatization. It is expected that, without increasing taxes, budget revenues should reach up to 40% of the GDP, compared to around 30% today. In these conditions, the respective value would remain amongst the relatively low ones within the European Union.
- Prioritizing the allocation of budget expenditures for education and research (an absolutely necessary measure in the knowledge society), for

health services and social assistance; Reducing the wages in the budget system by 25% will increase the migration of the professionals from the healthcare system, which is already facing a severe lack of qualified personnel.

- Resizing and possibly redistributing the number of employees from the central and local government towards the areas of the system that are facing deficit;
- Avoiding limiting and homogenizing salaries in the public system (Law 330 considers a ratio of 1 to 12, although in reality this ratio is of 1 to 8, with a very low value for the contributions of the specialists in all the areas to the country's development, the last four levels being reserved for a small number of functions in the public authorities system).
- Monitoring the evolution of school enrolment in general and higher education, preventing school dropout, early school leaving, providing appropriate conditions of study in the rural areas as well (closing schools does not solve the problems of children);
- Strictly applying the principles of the unique retirement system, generalizing contributions, assuring the payment of the farmers' special pensions and social pensions from the public budget and not the social insurance budget. It is necessary to consider the legally obtained pension as a right earned for having a decent life, without sacrifice curves; introducing additional amounts to the pension from the public insurance system for service pension beneficiaries (in fact, occupational pensions). With time, the latter should be generalized to all state employees as a motivational bonus for quality work. The minimum target for the level of old-age and full seniority pension should be 50% of the assured income, updated by the average salary at national level from the year of payment (the value of the pension point), in order to get as close as possible to what is practiced in many countries of the European Union. (As a measure of slowing down the growth of high

pensions, one may enter a maximum limit, such as, for example, a limit of eight times the average pension); fully collecting the social contributions due to the extended social insurance coverage; avoiding early retirement, including retirement pressure on the people who can and want to work, even if they have the transitory or standard retirement age.

It is unacceptable that, on the one hand, early retirement is forced and, on the other hand, the lack of funds for decent pensions, obviously, eliminating the unjustified pensions, is being claimed. One should not ignore the fact that some of the contributions of the young insured persons are now already passing to the mandatory private insurance system (3.5% - currently and up to 6% of the assured income - in the future), which calls for supporting the social insurance budget from the public budget. It is expected that in Romania pension expenditures will have a share of at least 10-12% of the GDP, compared to about 8% today, since the retired represent at least one quarter of the country's population, respectively one third of the adult population [8].

A general measure expected to be implemented in the Romanian society refers to eliminating the appointments in various economic executive positions and public institutions or in the boards of directors made on political grounds. This measure would eliminate one of the sources that lead to the image of privileging politicians in Romania [9].

5. Conclusions

Europe 2020, a strategy for jobs and smart, sustainable and inclusive growth, is based on five EU headline targets, which are currently measured by eight headline indicators (see table 1) [10].

The financial crisis has had a major impact on the capacity of European businesses and governments to finance investment and innovation projects. To achieve its objectives for Europe 2020, the EU needs:

- A **regulatory environment** that ensures effective, secure financial markets,

- Innovative instruments to finance the necessary investment - including public-private partnerships.

These long-term growth priorities have been taken up in the Commission's proposals for the next multi-annual financial framework (2014-2020) of the EU.

At present, the European Regional Development Fund, European Social Fund and Cohesion Fund together account for more than one third of the EU's overall budget.

These tools help to ensure that money is invested effectively in order to support smart, sustainable and inclusive growth.

Table 1 – The EU’s headline targets and the headline indicators for jobs and sustainable growth

Headline targets	Indicators
75 % of the population aged 20-64 should be employed	Employment rate by gender, age group 20-64
3% of the EU's GDP should be invested in R&D	Gross domestic expenditure on R&D (GERD)
Reduction of the greenhouse gas emissions by 20% compared to 1990 Increase in the share of renewable energy sources in final energy consumption to 20% 20% increase in energy efficiency	Greenhouse gas emissions, base year 1990
	Share of renewable in gross final energy consumption
	Energy intensity of the economy (proxy indicator for <i>Energy savings</i> , which is under development)
The share of early school leavers should be under 10% and at least 40% of 30-34 years old should have completed a tertiary or equivalent education	Early leavers from education and training by gender
	Tertiary educational attainment by gender, age group 30-34
Reduction of poverty by aiming to lift at least 20	People at risk of poverty or social exclusion (<i>union of the three sub-indicators</i>)

million people out of the risk of poverty or social exclusion	<i>below)</i>
	People living in households with very low work intensity
	People at-risk-of-poverty after social transfers
	Severely materially deprived people

Source: European Commission, Europe 2020

EU funding is helping to support:

- More and better jobs
- The development of new technologies
 - Cutting edge research
 - High-speed internet access
 - Smart transport and energy infrastructure
- Energy efficiency and renewable energies
 - Business development
 - Skills and training
 - Reaching the goals
 - EU tools for growth and jobs
- The Gross National Product (GNP) is the market value of all the products and services produced in one year by the residents of a country. The GNP is widely used for measuring the financial activity of a nation and is also thought to be a measurement for the standard of living. We know that the GNP includes the activities that do not improve the quality of life, such as the costs caused by accidents, criminal actions and natural disasters. This is a reason for creating other measurement systems such as the Index of Sustainable Welfare (ISEW), the Genuine Progress Indicator (GNI) and the Human Development Index (HDI). Some governments are discussing the benefit of moving over to some of these systems.

- Europe 2020
- Reaching the goals

Government intervention should be simultaneous, both in favor of the accession and integration into the EU, and of human development, creating a new dynamic of change in Romania, which would solve the profound inequalities at the human level and creating a fair, competitive and productive society. The human development policy

should include a wide range of targets, such as the per capita income growth, improvement of health services, developing opportunities for education, citizens' access to resources, promoting the participation in public life at a more widely level and creating a clean environment [11].

The strategy for human development in terms of accession and integration into the European Union strengthens the link between economic growth and human development. This strategy highlights, on the one hand, the way in which economic growth can promote human development, and on the other hand, how human development can promote economic growth. Therefore, any response that supports the economic integration process must include two key objectives: equitable distribution of wealth and optimal use of available resources.

The Origins of the New York Stock Exchange

Sorinel Cosma

Faculty of Economics, „Ovidius” University
sorinelcosma@yahoo.fr

Abstract

The origins of the stock market go back to the early 1600s, when the first stock (primarily involving the shipping and spice markets) was issued. Later on, the governments of the time decided to sell bonds to raise money for the wars they were involved in. That is precisely what the new U.S. government did during the Revolutionary War. Since they did not have the funds to pay for the war effort, they issued bonds with a promise of repayment in the future. After the war, those in control of the bonds began trading them for immediate compensation. Also, the nation’s first banks started selling shares of their own companies in order to raise money. Merchants recognized the need for a place to exchange these bonds and shares, as well as commodities, which brought about the set up of commercial centers that eventually became the stock exchanges of America. The largest and more powerful stock exchange in America, though not the first one to be created, is the New York Stock Exchange. Since its inception in 1792, the NYSE has set limits and other requirements for the corporations that wished to have their stock traded on the exchange. This very exclusive nature of the exchange led to its becoming the premier exchange in America and one of the most powerful in the world.

Key words: stock exchange, bonds, shares, brokers, banks.

J.E.L.: N21, N22

1. Introduction

The largest organized securities market in the world, the New York Stock Exchange has got a long and fascinating history dating back to 1792. The NYSE is known throughout the world as capitalism’s main home in the United States.

But many European countries had a well developed stock trading system long before

the United States of America were settled, with direct links to the shipping and spice trade. The very first official market exchange – the London Stock Exchange – opened in 1698 after having spent its first years as a coffee house.

The NYSE is one of the three main American Stock Exchanges located at 11 Wall Street in lower Manhattan, New York, USA. In terms of market capitalization (the dollar value you arrive at when you multiply each listed stock by the number of outstanding shares), it is the largest stock exchange in the world.

The role of the NYSE in the growth of the US as an economic power is so important that the history of the country itself cannot be fully understood without reference to that of the NYSE.

Being the leading securities market of the world’s largest national economy and listing securities of firms headquartered in other countries still do not make it the most international market in the world.

2. Origins of New York City

The city of New York owes its origins to common stock, more precisely to two tradable equity share-issuing companies – the Dutch East and West India Companies in search of economic potential on the North American continent. At the beginning of the 1600s, the Dutch established a few settlements around the mouth of the Hudson River. Henry Hudson, an Englishman employed by the Dutch East India Company in search of a westerly passage to Asia reached this region and noted the abundant beaver population. Since beaver pelts were in fashion in Europe, this was a good opportunity for a lucrative business in the area. The Dutch fur trading post was called New Amsterdam. Later, the Dutch West India Company brought African slaves as laborers. They were the ones to build the wall that defended the town from English and Indian attacks. This wall is believed to have given the name of what is nowadays the well-

known Wall Street. The Dutch colony known as New Amsterdam was later surrendered to the English (1664), who renamed it New York. These dual national origins helped the city become a world financial center by drawing benefits from the Dutch financial revolution and the expansion of the British Empire.

3. The American Financial Revolution

The financial system of the American colonies had a path of its own because of several obvious reasons. The population was mostly farmers who had a lot of land and natural resources and no market orientation whatsoever. Still, they were short of capital. But, as British subjects, the Americans had access to Britain’s modern financial system for short and mid-term credit.

After the War of Independence, the members of the Continental Congress had no experience in modern finance and were faced with a large national debt, both domestic and foreign and no means of paying it since the Congress lacked powers of taxation. In 1787 the Constitution was drafted and in 1788 it was ratified. This led to the creation of a new federal government which took over in 1789. After that moment, a financial revolution was launched in the United States very much similar to the Dutch one two centuries earlier and the British one a century earlier. In 1790 the Congress approved a debt-restructuring plan that meant the birth of the US securities market. It meant for the public debt to be converted into 6 and 3 percent bonds. One year later, another plan was approved – that for a Bank of the United States. The idea behind these plans was for the national debt and the bank to support each other. In the same year, the US convertible dollar joined the world’s major currencies.

Thus, from 1789 to 1791, three key elements of a modern financial system were installed in the United States: sound public finances and public debt management, a central banking institution, and a stable currency.

Alexander Hamilton is a name closely related to the creation and early development of the stock market in the US. He is credited mostly with bringing order and respectability to the finances of the new federal government during his tenure as the nation’s first secretary of the treasury from 1789 to 1795. In truth, Hamilton as treasury secretary did much more than stabilize the finances of the

government. When he took up his duties in 1789, the United States had none of the elements of a modern financial system. When he left office in 1795, it had all of them. Hamilton planned and executed what economic and financial historians later would call a “financial revolution.” It is a term they use to describe the creation, during a relatively brief period of history, of a modern financial system.

During the War of Independence Congress had no power to tax; it could only requisition money from the states, which often did not comply. Money borrowed could not be repaid, making further borrowing problematic to impossible. Continental paper currency had become worthless.

Alexander Hamilton, the first Secretary of Treasury, recommended several financial reforms to Robert Morris, Superintendent of Finance (1781-1784) and other national leaders. They included sound public finances (tax revenues to pay public expenses including the army, as well as interest on old public debts, which would make it possible to borrow more), a stable currency, a banking system, a central bank he already called the “Bank of the United States,” securities markets, and corporations.

At the time only the English and the Dutch had the key components of all modern financial systems. The Americans, Hamilton deduced, needed to institute them if they wanted to secure and maintain their independence, and if they wanted to have a strong government and a prosperous, growing economy.

4. The Early Days of the NYSE

New York was the U.S. national capitol from 1785 until 1790 and Federal Hall was built on Wall Street. George Washington was inaugurated on the steps of this building.

In 1793 the Tontine Coffee House, in Wall Street, was dedicated as the New Yorkers exchange. Before the construction of the Tontine Coffee House the brokers of the Buttonwood Agreement and others did trade at the Merchant's Coffee House just across the road. The Tontine Coffee House was built by a group of brokers to serve as a meeting place for trade and correspondence. In its prime, the Tontine was among New York City's busiest centers for the buying and selling of stocks and other wares, for business dealings and discussion, and for

political transaction. Having had a dual function as a combination club and a meeting room, the coffee house played host to auctions, banquets, and balls, among others. After hours, gambling and securities dealings were practiced that were then deemed less than honest. The coffee house also provided a place for the registration of ship cargo and the trading of slaves. The Tontine was noted as classless; individuals from all social strata met there and collectively engaged in the many civil and economic affairs.

Political demonstrations and violence were not uncommon at the Tontine Coffee House. In the wake of the French Revolution, fistfights between those respectively sympathetic to the British and the French broke out on a daily basis.

Trading at the Tontine Coffee House continued until 1817. The growth of the Tontine's trade proceedings had effected the creation of the New York Stock and Exchange Board (NYSEB), a very important step in NYSE history, and necessitated a larger venue. The NYSEB is recognized as the precursor to the present-day New York Stock Exchange, the largest stock exchange in the world. The Tontine itself was transformed into a tavern in 1826, and a hotel in 1832.

In 1792, the forerunner of the New York Stock Exchange appeared and became part of the securities-market component of the Federalist financial revolution. But the securities market was not confined to New York. Philadelphia and Boston also had securities markets, and the three cities quoted and traded the federal debt issues and bank stock. But New York was the leading market even at that time. New Yorkers, probably because of their Dutch and English descent, seemed to be more speculative and risk-taking participants than Boston and Philadelphia ones. Plus, most of the foreign trade in securities was executed in New York. These initial advantages of New York grew over time.

The securities business was new and had a rather unclear status, with no explicit rules to govern conduct and regulate the new trade.

In 1792 Wall Street suffered its first crash and the New York investment community was devastated. A group of merchants and dealers in stocks in the City of New York met in view of finding ways to properly regulate transactions. The New York legislature passed an act banning public auctions of

securities and making time bargains unenforceable, unless the securities were owned by the seller of waggerer. This was a major setback to securities professionals – brokers, dealers, auctioneers. In order to stay in business and avoid being sanctioned, they had to do something. The legend says that a group of twenty-four met under a buttonwood tree in Wall Street and made an agreement to give preference to each other in their dealings and to fix brokerage commissions at a minimum of one-quarter percent. In other words, they agreed to do privately what the law no longer allowed them to do in public. It is claimed that the NYSE grew out of this 1792 Buttonwood Agreement. Whether this is true or not is quite trivial. What is important to remember is the fact that the initial trading system for securities was flawed and this agreement and maybe others like it managed to correct these flaws and allowed the markets to carry on and to start flourishing.

Twenty-five years later, in 1817, twenty-four brokers (probably a successor of the group of the Buttonwood signers) met, this time in view of constituting an association or a board of brokers that was named New York Stock and Exchange Board. They adopted a set of nineteen rules that all the members were to observe. This formal self-regulation was meant to help them carry on their expending business. Brokers who wanted to join the exchange had to be vetted, and they had to pay a membership fee for their seats. In exchange, members had substantial benefits: access to orderly price-discovery procedures, other brokers, low transaction costs, current securities price information or other valuable “inside information”. Moreover, the members were joined by mutual trust and that attracted customers to the exchange.

Another important event was the construction of the Erie Canal with bond funding. So, during and after the 1820s New York banks became larger and more numerous and kept on employing their funds to finance securities trading. This enhanced the liquidity of New York securities trading, and helped the New York Stock and Exchange Board to solidify its lead over other city securities markets. The banks of New York had their share of advantages and so did the US banking system. The relationship between these three entities was indeed to the benefit of them all.

In the decades subsequent to the 1820s, New York was in the best possible position: it was the largest city in population, it was the nation's leading port, it had the largest banks, and it had the NYSE. Nevertheless, there were hard times along the way. For example, the Black Friday Panic of 1869, the Great Chicago Fire of 1871, and the outbreak of the equine influenza of 1872 would lead to the Panic of 1873, when the NYSE closed its doors for ten days. But after this depression ended in 1879, the stock market began experiencing record growth and the NYSE continued on its path to asserting the position that it has nowadays.

However, in 1835 The Great Fire in New York City destroyed over 700 buildings in downtown New York including the New York Stock and Exchange Board building on Wall Street. This forced NYSE to find temporary space until it could be rebuilt. After rebuilding, the board continued until 1863 when the name was changed to the New York Stock Exchange, which is still in effect today, and in 1865 moved to new location on Broad Street.

Over the next several decades the NYSE experienced both highs and lows, but the most devastating event occurred on Black Thursday, October 24, 1929. This was the start of the Stock Market Crash of 1929, an event that was devastating not only to the NYSE but to the world. The crash was one of the major events that led to a Great Depression where millions of people lost jobs when businesses closed, lost money when the market crashed and lost their homes. The Depression remained for most of the 1930's and not until the beginning of World War II did the country start to come out of the economic difficulties.

5. Post-War Development of the NYSE

After the end of the War and the Great Depression, the country started to enjoy another era of growth and prosperity. The post war Baby Boom led to new businesses starting, a growth in the housing industry and a period of prosperity. This new era led to a steady growth in the New York Stock Exchange. This steady growth has continued until today, but not without periodic downturns. One of the most notable downturns was in October 1987 when the NYSE experienced its second largest one day drop. However, for every drop, the New

York Stock Exchange has rebounded, and it still continues to be the largest and most watched stock exchange in the world.

In 2005, NYSE and Archipelago Holdings (possessing highly regarded market technology at the time) merged with the intention to bring automated trading to NYSE markets and increase efficiency. For the first time in its 213 year history, the New York Stock Exchange became a for-profit company, and began trading publicly on its own stock exchange under the NYX ticker.

The ownership structure of the NYSE changed in March 2006 with the formation of the NYSE Group, Inc., a publicly held company. In anticipation of that change, the last seats on the exchange were sold in December 2005 (some selling for as much as \$4 million). All seat holders became shareholders of the NYSE Group. A merger with Euronext N.V., a group of European securities exchanges, created the holding company NYSE Euronext in 2007. In 2008 NYSE Euronext acquired the American Stock Exchange (subsequently renamed NYSE Amex Equities). Three years later it was announced that NYSE Euronext would merge with Deutsche Börse, operator of the Frankfurt Stock Exchange.

The influence of the NYSE on world finance does not stop with the central NYSE, it has branched out into its NYSE Euronext market with five market places worldwide including New York, Paris, Lisbon, Brussels and Amsterdam. NYSE Euronext handles over 40 percent of trading in world equities. It lists over 950 companies with capitalization above 2.2 billion Euro. The NYSE Euronext is a well-regulated market and is capable of managing many crisis situations and unusual financial circumstances.

6. Conclusions

The New York stock Exchange, currently one of the most powerful nongovernmental bodies in the world, was built from scratch by a number of early 19th century New York stockbrokers who managed beautifully to regulate their activity in order to create wealth and capture wealth from nonmembers.

Billions of dollars are changing hands every day right now at the New York Stock Exchange, thousands of companies are being traded, and millions of people are being affected in one way or another. We can trace

the roots of the New York Stock Exchange when it started out as dirt path in front of Trinity Church in East Manhattan 200 years ago, when there was no paper money changing hands and little idea of stocks). At that time, they traded silver for papers saying they owned shares in cargo that was coming in on ships every day. From there the trade flourished.

1792 was the first time that the beginnings of the NYSE could be seen. There were only five securities being traded, along with a couple of bank stocks and three government bonds. In 1817, the NYSE & Exchange Board was formed, and trading became more regulated. The market has grown and rules have changed, but many of the same principals that were established in the beginning remain today.

The Romanian Banking System in the Context of the Actual Financial Crisis

David Delia

“Vasile Goldiș” Western University of Arad
david_delia2003@yahoo.com

Abstract

The performance of the Romanian banking industry represents a true picture of the macro-economic climate, and at the same time it sets the position of the Romanian banking system in the context of current European financial trends. This paper aims at presenting the trajectory of Romanian banks throughout the global financial crisis and the impact they have suffered. Also, it highlights the efforts made by the National Bank of Romania and the European supervisory institutions in terms of ensuring a climate of financial stability.

Keywords: global financial crisis, the Romanian banking system, National Bank of Romania, financial stability.

JEL Classifications: G01, G21, G28.

1. Introduction

The way in which the European banks evolved affects Romania in a way never seen before, because the internal market is an open field for the foreign investments being at the same time pretty vulnerable and interdependent to the fluctuations of the economies that it interferes with.

The governor of the National Bank of Romania, Mugur Isarescu, asserts that the crisis existent in the USA's mortgage market was the thing that triggered the global financial crisis.

Its causes were profound and they were both macroeconomic and microeconomic. The world economies' impairment degree was caused by a crisis based on the vulnerability of each economy and their exposure to toxic assets.

The way in which people respond to the crisis depends on the fundamental principles which they believe in, on the institutions and the tools they use.

The globalization of the financial markets and of the nations within a global economy will lead to an even higher interdependent economy; in this situation it would be inappropriate for the institutional and political arrangements not to be submitted to changes with the purpose of a higher compliance with the requirements of the power and of the different preferences of those entities existent in the financial markets. (Dumiter F., 2011).

The objective of this work is to emphasize the way in which the Romanian banks were affected once with the global financial crisis. The economic crisis was triggered by the bankruptcy of the Lehman Brothers ' Investment Bank, in the autumn of 2008 and its effects were felt at the level of the European financial markets, a series of cross-border groups claiming interventions of the state in order for them to be saved. The intensity of the crisis was felt and it affected many states, the impact of these ones being influenced by a series of specific factors which outlined the situation of their financial system, at the moment of the crisis release. At the level of the European Union, a series of measures have been established in order to extinguish the identified dysfunctions at a financial field level, among which we mention: the improvement of the surveillance framework of those financial institutions having cross-border activity, the expansion of the communication and cooperation among the EU surveillance authorities and the ones outside the Union, etc.

2. The impact of financial crisis upon the romanian banking system

In the context of the financial crisis, the international community supported the reorganization of the financial surveillance framework at a global level, by improving the micro-prudential surveillance standards and by placing a new approach from a macro-prudential perspective. In this direction, at the European level, the Basel III agreement was issued in 2010.

This represents the regulatory framework at a global level for banks and more resistant banking systems (2010) respectively the international framework for the quantification, standardization and the surveillance of the risk of liquidity (2010). The new Basel III standards are different from the standards belonging to Basel I and Basel II by the fact that they have a more expanded coverage and the measures are both micro-prudential (they address to the banks' individual risks) and macro-prudential (they are designed for the risks manifested at the level of the entire banking systems).

Before the admission of the new standards of liquidity and capital into the national legislation, these would benefit from an observation period.

Hence, the requirements for the adequacy of the capital will be valid starting from the 1st of January 2019 (respectively on the 1st of January 2018, in the case of the requirement concerning the leverage effect) after a transition period which will start in 2013. In a similar manner, within Basel III, the observation period is defined and the liquidity requirements starting with 2011; the dates at which the two liquidity indicators will be valid are the 1st of January, 2015- for the short term liquidity indicator (LRC) and respectively, the 1st of January 2018, for the structural liquidity indicator (NSFR).

The gradual implementation of the new standards, which was mentioned within Basel III and CRD IV178 can diminish the impact, banks having the possibility to adapt, through the capitalisation of profits, issuing shares, changing the liabilities' structure etc. Regardless of the duration of transition, the measures of consolidation of the capital and liquidities' categories can strengthen the confidence in the stability of the financial system on long term, at the same time

offering to the banks the possibility to diminish any side effects of the crediting conditions and the ones coming from complex activities.

The National Bank of Romania's measures regarding the resistance of the banking system to shock corroborated with the efforts of the credit institutions' shareholders regarding the increment of the capital ground, have assured the maintenance of a high level in the adequacy degree of the capital's banks in Romania.

The National Bank of Romania uses the solvability indicator as the only indicator regarding the level of capitalisation of the credit institutions.

The premises of the impairment capital base were created having as background the increase of the non-efficient loans in 2010, which had direct impact on the impairment of the financial situation and which needed the intervention of the surveillance authorities in order to preserve an adequate level for the solvability indicator.

As it results from presented graphic at aggregated level, it varied around 14% (recording a maximum of 5% in December, 2010).

Figure 1: The indicators evolution of capital adequacy

Source : BNR

Taking into consideration that the minimum accepted level for the solvability indicator is 8%, the level mentioned is considered convenient. The important factors which contributed to this favourable contribution are:

- The maintenance of a minimum level of banking caution adding up to 10%, during the process of banking surveillance, for the solvability indicator established at the beginning of the period of manifestation of the international financial crisis' effects in Romania.

- Fulfilling the commitment of supplying ex-ante extra capital for the banks-mom of the nine main nine credit institutions with foreign capital. In this way, the adequacy rate of the capital must be maintained at a level of over 10% during the entire period of availability of the agreement signed by Romania with UE, FMI and other IFI.

- The solvability indicator influenced favourably the slowing down of the crediting and the placement of the banks' liquidities with priority in state securities. This fact determined the diminishment of the risk weighted value of the assets and element of the balance sheet.

The changes showed up in 2009 within the prudential regulatory framework were underlined not only by the immediate effects of the crisis but also to assure the stability of the financial system on long term. Hence, the National Bank of Romania changed the calculation manner of the liquidity indicator. The methodology entered by the NBR's Norm no. 7/2009, determines for the 31st of December, 2010, a decrease of the liquidity indicator.

This is calculated as a report between the actual liquidity and necessary liquidity, which adds up to 1,38 in comparison with the level of 2,47 correspondent to the year 2008, superior still to the minimum accepted limit(1), mostly by the new calculus methodology.

Figure 2 : The liquidity of the romanian banking system

Source : BNR

At the end of June, 2011, according to the report of stability published by the NBR, the indicators of liquidity reveal convenient values. Hence, the indicator of liquidity calculated according to the actual regulations adds up to a level of 1, 37 superior to the

minimum accepted degree of 1. As far as the immediate liquidity is concerned, its value is of 36, 6 % in decrease in report with the one from December, 2010, with 0,6 %. In analytic purpose, the National Bank of Romania uses the lever effect, as a measure for the degree in which the own resources of the credit institutions finance the banking activity.

According to the Basel III, the requirements related to capital, the indicator will be included within the prudential regulatory framework, applicable at a community level. The analysis of this indicator on groups of banks regarding the criterion of the size of the held assets reveals the following: the maintenance of an auto-financing degree more reduced than in the case of the big banks (7,1% in June, 2011) and the equalization in the case of the small banks and medium banks(approx. 10% during the current year). The indicator's evolution was influenced among others, by the increase of the 1st level equities and the tightening of the banking assets' volume in the case of many banks from the system in the context of the maintenance of uncertain conditions during the analysed period.

A comparative analysis of the „Lever effect” indicator with the one of countries from the UE indicates that this is comparable recording a level of 8%. It can be noticed the fact that in the graphic presented below the credit institutions from countries of the same origin like the ones of the mom bank which performed an activity in East Europe continue to finance themselves in a smaller degree with their own resources.

Figure 3 : The comparative evolution of the „Lever Effect” indicator in a series of countries from the E. U.

Source : BNR

As far as the globalisation tendency is regarded even though a more correct term for it would be „regionalisation” as the foreign capital found on the Romanian market comes

from E.U. countries we can state that we are more integrated than other countries, the share percentage of the foreign shareholding in the structure of the Romanian credit institutions was of 76,9% in accordance with the National Banks of Romania.

In conditions of risk and incertitude manifested abroad the following conclusions can be reached:

- In Romania the financial stability continued to be robust;
- The levels of capitalisation, provisioning and liquidity maintained at adequate levels through the exclusive level of the banks. Testing in stress indicates the resistance of the credit institutions at important economic and financial shocks.

3. Measures performed by the National Bank of Romania regarding the assurance of the financial stability

In regards to the financial stability, our country confronted major challenges in the last years. Its level maintained still stable due to the efforts made by the credit institutions, the NBR's requirements in this direction as well as the financing agreement signed by the E.U.'s authorities and the International Monetary Fund, next to the agreements assumed within the European Initiative of Banking Coordination of the main 9 countries activating in Romania.

On the background of the crisis, the National Bank intensified its actions, similar in a certain measure with the ones performed by European authorities, in the plan of the diminishment of the vulnerability in assuring liquidity and capital adequacy.

The changes brought by the regulatory framework regarded controlling the effects of the crisis and maintaining the stability of the banking system. All these changes were linked to the technical requirements assumed by the Stand By Agreement signed with the IMF, which regarded the strengthening of the NBR's position in managing the crisis, in order to assure a fast and efficient intervention in the case of banks with financial problems and assuring premises for forming new credit institutions appropriately capitalized whose share holders to have an appropriate financial situation. (The Government Emergency Ordinance no. 26/2010 meant to complete The Government

Emergency Ordinance no.99/2006 regarding credit institutions and the adequacy of the capital and other normative documents).

In order to correct the accumulated macroeconomic out-balances before the release of the crisis, especially of those from the budget sector becoming necessary to go for the external financing from international financial institutions.

The financial support received by our country on the behalf of a stand by program, for a period of 24 months (May, 2009- May, 2011), adds up to milliards of euro and it has the following structure:

- 12,95 milliards of euro from the IMF;
- 5 milliards of euro from the E.U. representing the facilities for financing the payment balance;
- 2 milliards of euro from the World Bank and BERD.

We mention that granting this finance entailed respecting some conditions which in regards to the banking system were fulfilled. One of important conditions refers to the assurance of an appropriate external finance through the improvement of the trust, this being acknowledged under the name: Vienna initiative. This was entered in 2009 and it obliged the Western European banks (including the Greek ones) to maintain their finance in the CEE countries (including Romania) in order to help the local economies to surpass the crisis. This Initiative supports the Romanian banking system to protect against the bankruptcy risk which could have been generated by the incapacity of Greece to pay their duties to the creditors.

According to the NBR's report, at the end of 2010, from the perspective of the countries which hold investments to the social capital of actual banks and to the subsidiaries of foreign banks, that the first 3 positions within the aggregated capital, where occupied Greece with 25, 5%, Austria with 16, 3 % and at high distance, Holland with 11, 8 %.

The severe economic situation which Greece confronts with at the moment generates panic among the investors in Romania taking into consideration the high holding degree of the Greek banks within the actual banks' capital.

Also, the NBR cooperates with the supervisors signers of the regional

memorandum from countries from East and South-East Europe. Its role is to support the efforts for reaching the surveillance and convergence practices, to coordinate the surveillance process at the level of each banking group from the region, to determine the capital requirements at a consolidated level taking into consideration the risk profile of each banking group but also the important of each cross-border entity for the banking system existent in the host country.

In the case of our country, the NBR as a surveillance authority from the host-country for five subsidiaries of some banking groups with Greek capital (Alpha Bank, ATE Bank, The Romanian Bank, member of the National Banking Group of Greece, Pot Bank, Piraeus Bank) and for other two belonging to certain banking group from Cyprus (Marfin Bank and Bank of Cyprus Public Company Limited Nicosia), while status of surveillance authority from the country of origin is just for one banking group which holds the subsidiary from Cyprus (Transilvania Bank).

The main objective of Romania is to adopt the euro. According to the NBR's governor, Mugur Isarescu, in regards to the economic situation in Romania and the role which the banking system has in the economic development of the country, the Romanian authorities set as a strategic objective of economic politics the achievement of an economic increase on long term through which to „ to regain as fast as possible the socio-economic development gaps in comparison with the E.U.” one of the objectives being the fulfilment of all the conditions which allow the adoption of the Euro as a national currency in 2014.

This is an objective which can be achieved with the condition to adopt and maintain a mix of coherent economic politics, meant to support both the nominal convergence and the real convergence from countries from the euro area. The achievement of the nominal levels and the subscription into the convergence criteria established by the Maastricht Treaty (stabilizing the course, low inflation, interest rates close to the ones from the Euro Area, budget deficit and balances of the mild public debt) represent at the moment, objective which can be reached difficultly in the context of the economic crisis which has already reached the Romanian economy.

Also, the year 2014 should be reconsidered, even if the levels set by the Maastricht Treaty would be resized, all as a consequence of the crisis.

4. Conclusions

In this economic unstable context, it is difficult to quantify certain tendencies of the banking system's evolutions globally as well as nationally.

The evaluation of the evolutions concerning the interdependencies between the states of the world, especially from the perspective of Romania, is difficult to evaluate, as this country is in full development process but still dependent on foreign investments.

The main challenges for the next period can be resumed as it follows:

- Managing the contagion risk which could manifest due to the evolution from the international markets, as a consequence of the sovereign duties' crisis;

- Improving the quality of the banking assets;

- Balancing the structure of the crediting on currencies;

Also, the action directions of the NBR must be oriented towards:

- The continuation of the efforts with the purpose of maintaining the solvability, the provisions and liquidities of banks at adequate levels (inclusively after the IFRSs' implementation);

- Identifying new solutions for a more balanced retaking crediting on currency categories, at the same time with the assurance of a more sustainable debt degree of the debtors;

- The development and the improvement of the management solutions applicable to the credit institutions in difficulty;

- The new agreement signed between the E.U., IMF and WB next to the commitments of the authorities existent in national programs, represent supports for the consolidation of the obtained economic results and of the financial stability and for the continuation of the structural reforms.

The perspectives of the banking sector and of the national financial system depend generally and mainly on rebuilding the trust,

the economy's success in a sustainable release and not at last on the international evolutions.

Estimating Potential Output in Romania using Univariate Statistical Filters

Dedu Vasile

Abstract

In this paper, we determine the potential economic growth in Romania using three statistical univariate filters. The techniques used are Hodrick-Prescott (HP), Christiano-Fitzgerald (CF) and Baxter-King (BK) filters. According to our calculations, HP outperforms the other two filters for the pre-crisis period but offers poor end-sample estimates as expected. During the economic crisis, all models indicate a slowdown of the potential growth in Romania. The most reliable estimate for 2011 is offered by CF band-pass filter. BK filter performs poorly in the sample period with the exception of the estimate for 2008 and does not provide.

Key words: potential output, univariate filter, band-pass filter, business cycles.

JEL Classification: C32, E32.

1. Introduction

Potential output is defined as the maximum level of durably sustainable production, without tensions in the economy, and more precisely without acceleration of inflation. The difference between the actual output and the potential output, called the output gap, provides information whether the economy is operating above or below a sustainable level. Using this information, policymakers are able to do fine-tuning operations in order to bring the actual economic growth as close as possible to its potential. Although the potential output is a supply-side indicator, the output gap indicates the inflationary pressures in the economy, being a key indicator for monetary policy analysis. The potential output is a

theoretical concept and therefore can not be observed directly. Measuring the potential output is not an easy task, as economists have tried different statistical and mathematical methods in order to obtain reliable results.

The calculation of the output gap depends on the model specification, the method of estimation and the time horizon. There are two basic approaches for estimating the potential output (univariate methods and multivariate methods). The univariate methods for estimating potential output are: Deterministic trend, Hodrick-Prescott (HP) filter, Baxter-King (BK) band-pass filter and Christiano-Fitzgerald (CF) band-pass filter. The multivariate methods for estimating potential output are Structural VAR (SVAR) with long-run restrictions, Production function (growth-accounting approach) and Dynamic Stochastic General Equilibrium (DSGE). In this paper we calculate the potential output in Romania using univariate statistical filters, the models implemented being HP, BK and CF.

2. Filtering methods

The filtering methods employed to determine potential GDP are easy to be implemented and do not rely on the tight assumptions of economic theory. The filters assume that the registered output fluctuates around a long-term trend. This approach presents several disadvantages. The filtering methods need long datasets and do not incorporate economic theory. The final results depend on certain model parameters that quantify the permanent and transitory components and they are not precisely indicated by the economic theory. Certain filters perform poorly at the end of the samples (so called end-point problem).

Baxter and King (1995), Christiano and Fitzgerald (1999, 2003), Morrow and Roeger (2001), van Norden (2002), Araujo et. al (2004), Benk et al. (2005), Gălăţescu et al. (2007) and Lemoine and Pavot (2009) provide detailed descriptions regarding statistical filters. Azevedo (2007) proposed a multivariate band-pass filter.

3. Hodrick-Prescott filter

HP filter is a widely-used statistical method for determining potential output. HP is the oldest statistical filter for calculating potential GDP, as it was first indicated in a paper that circulated in the 1980s and then published in 1997 by Hodrick and Prescott.

The main idea of this smoothing technique is that output evolution is separated in a cyclical component and a trend component by minimizing a loss function. As it was stated in different research papers, HP filter faces end-point (end-sample) problems as the latest data regarding output could be revised. A possible solution is to extend the datasets by introducing forecasts.

4. Band-pass filters

An optimal statistical filter requires an infinite dataset (van Norden, 2002; Christiano and Fitzgerald, 2003). This assumption is impossible as the macroeconomic indicators are finite time series. However a reliable filter should tend to an optimal filter according to van Norden (2002) and CF (2003). The main idea of the band-pass (BP) filter is that the business cycles could be defined as fluctuations of certain frequencies (Benk et al., 2005). Therefore GDP evolution could be decomposed into low-frequency, medium-frequency and high-frequency series. Higher-frequency components are considered irregular or seasonal movements while low-frequency components could be seen as long-term trends. BP extracts information within a specified frequency range for the time series. Therefore to implement a BP filter we must first set the considered length of the business cycles (lower and upper limits). The duration of the business cycles is generally indicated by the economic theory. Burns and Mitchell (1946), Baxter and King (1995) and Christiano and Fitzgerald (1999, 2003)

consider that business cycles generally last between 2 and 8 years (8 and 32 quarters). Generally BP filter outperforms HP filter in determining potential output. BP is a linear filter that computes weighted moving averages. BP filters differ depending on the method used for calculating the moving averages. The fixed length filters use the same lag/lead, while the asymmetric filters use time-varying weights. One important limitation of BP technique is that it cannot handle non-stationary time series.

5. Database and parameters

The models implemented use quarterly data regarding real GDP evolution from 2001 Q1 and 2011 Q4. The dataset was taken from Eurostat. The λ parameter in HP filter was set at 1,600 as indicated in most working papers for quarterly data. We assume that the length of a business cycle in Romania ranges from 1.5 years to 8 years (6 and 32 quarters) in BP filters. We have set the lower limit of the business cycle at 1.5 years and not at 2 years as indicated in other papers because we consider that Romania faces more frequent structural breaks. BP filters implemented are asymmetric (time-varying) CF filter and fixed length symmetric BK filter.

6. Results

In this paper we estimate the potential GDP evolution in Romania using HP and band-pass filters (BK and CF). The calculations were made in E-views 5. We also compared the final results to the ones provided by Gălăţescu et al. (2007) in an NBR research paper. The results of the estimation are presented in the graphs and table bellow.

Table no.1. Estimated potential economic growth In Romania using different statistical filters

Time	Hodrick-Prescott Filter	Christiano-Fitzgerald Filter	Baxter-King Filter
2001	5.30	1.97	-
2002	5.69	0.22	-
2003	6.05	-0.95	-
2004	6.27	0.15	1.50
2005	6.19	-2.52	-1.57
2006	5.69	1.25	1.81
2007	4.61	1.99	2.13
2008	2.99	3.85	3.68
2009	1.24	-6.36	-
2010	-0.02	-1.41	-
2011	-0.81	2.71	-

Source: authors' calculations

According to the results, HP filter outperforms the frequency (BP) filters during 2001 – 2009. As expected, CF filter offers better end-sample estimates. We consider that those results should be seen with great caution due to several problems. The dataset used is very short (only 44 registrations) as there were not available registrations for longer periods, while the business cycle length specified in BP models could be inadequate. During 2001-2007, the annualized potential economic growth ranged between 4.6 % and 6.3 % according to HP estimates. In the same timeframe, we consider that CF filter provides unreliable results as it indicates a potential growth between -2.5 % and 2.0 % year/year. The severe domestic crisis as well as the unfavorable conditions in the global economy affected negatively the potential growth. In 2008, the potential growth decelerated at 3.0 – 3.8 % according to the results provided by the three filters, while in 2009 the potential output growth was only 1.2 %. In 2010, potential output growth continued the downward trend according to HP filter, standing at around 0 %. As for 2011, CF filter estimates better potential output evolution in Romania as compared to HP filter. CF indicates a potential growth in 2011 of 2.7 % as compared to the -0.8 % estimate provided by HP. We also noticed that the results indicated by HP filter for the period of significant economic growth are similar to the ones found by Gălățescu et al. (2007). The BK filter does not provide results at the beginning and at the end of the sample. As for the period ranging between 2004 and 2007, we consider that the estimates provided by BK filter are not compatible to the economic theory.

7. Conclusions

In this paper, we determine the potential economic growth in Romania using three statistical univariate filters. The techniques used are HP filter and the band-pass filters (CF and BK filters). According to our

calculations, HP outperforms the other two filters for the pre-crisis period but offers poor end-sample estimates as expected. HP indicates an average potential growth of 5.35 % for the period 2001-2007. CF filter provides unreliable results for the mentioned period. During the economic crisis, all models indicate a slowdown of the potential growth in Romania. The most reliable estimate for 2011 is offered by CF band-pass filter, indicating a potential growth of 2.7 %. BK filter performs poorly in the sample period with the exception of 2008.

Transfer of Money Abroad

Din Alina-Valentina
University “Lucian Blaga “of Sibiu -Romania
alinavdin@yahoo.com

Popescu Luigi
University of Pitesti-Romania
luigi.popescu@yahoo.com

Abstract

In most of the cases, the first concern after committing the basic infraction is to transfer money abroad. The basic rule is that the person whose funds have to be transferred should not assume this risk. At the international level there are networks of professional couriers who take over the transfer action and provide the delivery of money abroad, at the established place. In certain money laundering schemes one may choose to create a foreign trust. The advantage in this case is that the owner of the capital may irrevocably transfer his property right to the trust, thus preventing the confiscation of the capital. The practice of money launderers has proven that these aspects are disadvantages which may be annihilated.

Key words: money laundering, underground bank systems, infraction.

J.E.L. classification: G

1. Introduction

Stratification (or investment) represents stage of money laundering in which the money circulates within different companies, corporations and financial institutions, physically, by deposit or electronic transfer. One aims to physically move the money to other entities in order to separate it from its illegal source in an attempt to disguise its origin. Stratification may involve the following techniques: deposit of cash (taken out of the country by smuggling) in an abroad bank; combining illegal money with legal money; creation of a fictitious account abroad, in order to receive funds and perform

payments with those funds; electronic transfer of money from a national bank account into an abroad account; electronic transfer of money from a bank account A into a bank account B and then into a bank account C etc.; movement of money from company A to company B, and then to company C etc.; sale of different forms of financial instruments (bank cheques, payment orders etc.). A considerable number of operations are performed through off-shore companies.

On the whole, the transfer techniques may be performed (1) by avoiding the bank system or (2) by the official bank system.

(1) When one decides to avoid the official bank system, the most used methods are:

- **physical transfer of money** (bulk cash). Previously, the low value banknotes are transformed into higher value banknotes. In the countries where the national currency is not convertible or it has a limited international circulation, it is changed into currency known and universally accepted by any bank: American dollars, euros, pounds, Swiss francs. The physical transfer takes place in the most unexpected ways: in containers, inside which the money packages are mixed with common goods, having the same packaging; in diplomat suitcases; in personal luggage, especially in the case of passenger ships; by incorporating the money packages in certain goods whose structure allow this type of operations (washing machines, vehicles, fridges etc.).

- **compensation** is considered a collateral international transfer scheme. This technique is based on the debt compensation principle which is practised within the legal international commerce. As a technique it is mainly used to transfer money from the

countries where there is a strict currency control or which have non-convertible currency. In such countries, the receipts in the local currency (for example from selling drugs by retail) cannot be always converted in currency, in some cases they cannot be officially converted at an exchange agency or at a bank. For example, the mafia group 1 within the country A owes USD 100 million to group 2 within country B, and this, in its turn, owes the same amount of money to group 3 which is situated in country A. If the international funds transfer had been operated, there would have been necessary two international transfers (group 1 to group 2 and group 2 to group 3) and four bank operations: two for payments and two for receipts. Resorting to compensation one does not operate an international transfer but there are performed two bank operations, a payment operation and a receipt operation. In practice, it is obvious that the amounts of money owed among the parties are rarely integrally compensated. In most of the cases the mechanism is multilateral, respectively several groups from several countries take part in a compensation. In such countries there are companies set up and operating within the law which have the purpose to disguise the amounts of money which were illegally obtained, giving them a legal source through transfers they make from one to another.

- **underground bank systems.** The appearance and development of these systems took place at the same time as the diaspora of different ethnic communities increased. Originally, the underground bank techniques evolved for perfectly legal purposes, reflecting the institutional underdevelopment and /or the lack of knowledge or trust in the official bank systems.

The underground bank systems are based on the same balance compensation principle. The person within country A, who wishes to transfer funds abroad, contacts the underground “banker” and deposits the amount of money. The underground banker transmits a coded message to his correspondent abroad to credit, with the equivalent in currency for the deposited amount, an account at a foreign bank, whose owner is the person who wanted to transfer the money outside country A. In fact, funds

must not be transferred. The transaction balances when a person from abroad wishes to bring money in country A. The operation is clean and it cannot be discovered, especially when it is based on extended family relations, typical for certain ethnic communities who live and carry on different businesses abroad. Transfer of money resulted from infractions **by using the official bank system** involves numerous protection measures. Although the jurisdiction differs from a country to another, it mainly refers to the automatic information with regard to the amounts of money deposited in a bank which exceed a certain limit legally established (USD or €10,000) or/ and information with regard to any suspicious bank transaction.

Until the period 1980-1985, the banks usually accepted large packages of sums in cash from unknown parties without too many formalities, and they either send them abroad, or they converted them into bearer financial instruments. After 1990 the conditions in which the banks develop operations of large values and for unknown people have become stricter and this determined proliferation of new techniques:

- **deposit division.** Illegal funds are divided into small amounts, below the bank’s report limit and deposited in accounts by people specialized in this activity. The money is withdrawn from these accounts through cheques or other payment and credit instruments;

- **obtaining exemption from reports** (for the amounts which exceed the report limit) associated or not with the bribing of the bank personnel, allows deposit of larger amounts of money, whose use subsequently becomes legal;

- **facade companies.** There are created companies within the law for which there are made up plausible explanations regarding the bank deposits which they constitute and, similarly, for their transfer abroad. Generally, the façade companies, are based on activities through which they can mix legal money with illegal money, on the one hand and on the other hand, they have international commercial operations with goods and services in order to perform transfer of funds; the payment amounts are divided between the “suppliers” within several countries; the amounts, in decimals, are transferred resorting to different transfer techniques -

telegraphically, SWIFT; the prices for the imported products are less than the prices for which the same products are re-exported etc.

Once the money get abroad, the first stage is finalized – separation of money from the basic infraction which generated it – and then one goes to the second stage of the money laundering cycle – hiding and disguising its nature, with the purpose to cover its tracks (the country and source).

Therefore, “covering the tracks” implies, in the main, two actions carried out in two different countries, chosen according to pre-established criteria which meet the objective:

- **choosing the country for financial refuge**, usually, where the legislation and bank secret provide trust, safety and confidentiality of the deposit (banks from Switzerland, Austria and Luxemburg are generally preferred);

- **choosing a country with a less strict legislation (often, non-existing) regarding the establishment of foreign companies**. From this point of view, there are two types of countries: those where the establishment of a company may take place ad-hoc by paying a tax and concluding simple formalities regarding the identity of the person and the source of funds, which often represent a statement and presentation of an identity document (Cayman Islands, Virgin Islands, Panama etc.) and countries which “specialized” in selling “foreign” companies authorized to carry out businesses abroad only, and the established companies are protected by laws regarding corporation secret.

In the past, Liechtenstein was the favourite place to create this type of trusts. Laws which provide the “protection of the trusts’ capitals” are mainly found within the territories which were or continue to be British colonies.

2.Return of clean money to the person who committed the infraction

Integration is the final stage of the money laundering process, in which the money representing the profit from the criminal activity is now used within financial transactions which seem to have a legal character. Within this stage there are made investments in businesses, there are granted personal loans, assets are purchased, so that all the transactions performed should seem

legal. The three stages may take place distinctly, but they also might be carried out simultaneously or, more often, they might overlap.(1)

The following might be considered **basic rules for money laundering**:

a. Anonymity through which the transaction with values obtained from infractions has to be similar to other legal transactions within the environment or the place where they take place. In essence, the cash should not leave any tracks which might lead to its origin. Within the economies in which cash is often used for acquisitions of lower or higher value, the disposal of the cash does not represent a risk for the offender.

b. Speed, respectively the rapid circulation of values, in order not to be discovered. Once the cash has entered the fiscal system, either it is or not within the origin country, the money launderer may use the advantages created by the progress of information technology, modern methods of transmitting the money, in order to rapidly put it into circulation. The electronic bank transfers may transfer large amounts of money almost everywhere around the world within a few minutes, without its owner being forced to go to the bank or involve bank’s employees.

c. Complexity. By dividing his funds into several transactions and because of the speed of these operations, the money launderer makes it difficult or impossible for the investigators to reconstruct the track of the money. Transfers from an account to several accounts within other countries and the subsequent re-directing from those countries creates a multinational complex circuit, which makes it difficult for the investigators to track them.

d. Secret. Despite the fact that the bank secret has a legal purpose and a commercial justification, this might lead to the appearance of different financial paradises, which offer protection for the offenders.

The main **techniques to dissimulate the illegal origin of the profits** are:

-**overestimation of the price for different goods** by means of an invoice whose value is higher than its real value or by a partially or totally false invoice;

-**false commercial transactions** integrated within a legal business by means

of: repeated and rapid transactions in cash from a currency to another, use of multiple bank accounts, repeated opening and closing of accounts, electronic bank transfers from the account of a legal person into the account of a natural person, performing external transfers of large value using multiple monetary instruments, bank or traveller's cheques, credit operations, investments, fictitious collaterals;

-returned loan method. A part of the funds illegally transferred abroad return to the offender or the company he manages in the form of loan. This operation is then followed by the return of the amount borrowed, plus the interests agreed by the parties and possibly different delay penalties, leading to larger and larger amounts, which enter the legal circuit;

-insurance policies, by frequently changing the beneficiaries, payment of bonuses larger than the usual ones and the subsequent request that the reimbursement should be made by a third party, receipt of insurance bonuses by brokers or financial intermediaries within off-shore centres who do not comply with the publicity or registration rules, to which they are not contractually obliged.

The most well-known systems used money laundering are:

a) Off-shore destinations, respectively those countries or territories which accept fictitious implants of companies, areas with flexible regulations regarding control of currency exchange and freedom with regard to taxes and which offer, at the same time, almost without exception, an impenetrable bank secret and a lot of rights to the private companies. When the money is transformed into a form which can be transferred or can be used for smuggling, in most of the cases, it is transferred to an off-shore centre. Fiscal paradises represent one of the most utilized procedures for fraud fiscal evasion at the international level.

b) Shell companies are those companies which do not have independent assets or own commercial operations and are used by their owners in order to carry out their businesses or to maintain control over other companies. A company of this type is registered within the country where it is set up, but it is not transacted within the capital market and it does not operate independently.

Because these companies are not illegal, the money launderers, tax evaders and terrorism financiers can easily convert them and use them in order to hide the illegal source of incomes. It is easy to set up these companies and they can be connected with other fictitious companies throughout the world. If a company is set up within a jurisdiction with a strict legislation in order to have the bank secret protected, it is almost impossible to identify the real owners administrators of the company and, that is why, it is impossible to track the illegal funds which are returned to the real beneficiary.

c) Freelances, respectively lawyers, notaries, accountants etc., who carry out a significant number of activities in order to support their clients, organizing managing their financial and commercial businesses. First of all, they provide assistance to natural and legal people within domains such as investments, company establishment, administration, management etc. Some of them tend to be specialized in identification of different commercial companies or off-shore locations in order to use them in money laundering schemes, drawing up all the necessary documentation, which gives a legal appearance to the businesses.

d) Alternative money transfer systems which allow the money to circulate around the world without using the conventional bank system. They might be used for legal or illegal purposes, in various forms. For obvious reasons, these systems are attractive, being used on a large scale by the organized crime networks and dangerous offenders, for laundering the profits from infractions, as well as to avoid fiscal taxes customs' obligations.

e) Casinos are vulnerable to being manipulated by the money launderers due to the speed and intensive nature of games with cash, and also due to the fact that within a great number of countries, the casinos provide clients with a wide range of financial services. The services available within the casinos are similar, in many cases, to those provided by banks and they can include debit accounts or charge accounts, facilities for transmitting or receiving of funds directly from other institutions, currency exchange services and cash receipt services.

f) Internet. The risk of money laundering is very high due to the fact that the Internet

provides easy and almost universal access; it eliminates face to face contact and it is extremely rapid and efficient in eliminating frontiers.

g) Non-profit organizations which collect hundreds of billions dollars annually from donators and distribute this money to beneficiaries. Both their administrative expenses, as well as the amount and necessity of making expenses may be exaggerated and their utility might be difficult to estimate.

3.Conclusions

Although the mechanisms within this domain are often very elaborated by the multitude of the performed operations, in essence, the mechanism of “covering the tracks” is based on a simple scheme. Before depositing the money into an account, the professionals in money laundering resort to certain preparatory activities. These actions take into account the fact that, after 1990, in the case of certain official investigations regarding the source of large amounts deposited in a bank, there is an increased risk for the bank to no longer keep the bank secret and support the researches carried out by the authorities. For these reasons, the funds are not kept in the account of a single person, but in the account of a company. Generally, the professionals in money laundering prefer buying a company which has a background of the current activity in order to increase the source of money from a legal business. Therefore, during the first stage, the company is set up under a less strict foreign jurisdiction, and then a bank deposit on behalf of the company is created in a country chosen as a financial refuge. Thus, between the money launderer and the authorities involved in tracking this type of infraction appear certain barriers: one with regard to the bank secret, and the second, at the level of corporation secret and, in some cases, a supplementary protection may be created, as the third barrier, represented by the lawyer designated to set up and manage the company, lawyer who benefits from the privilege of being the client’s lawyer. In practice the track followed by the money is more and more sinuous: the companies may be capitalized through shares to bearer, thus there are no mentions regarding the owner, the people who physically own the shares or

the company’s owners; one resorts to successive bank transfers from country to another, each of them having its own jurisdiction; the money is cashed from a bank and deposited in another bank within another geographic space etc. This type of operations takes place on a regular basis, up to the moment when it is appreciated that the sources of money would be extremely difficult, if not impossible, to be identified, respectively “the track was covered”. Among the integration techniques we mention: setting up a foreign company (generally within the fiscal paradises) and opening a bank account for it, so that, later on, the money should be transferred from this account as loans, payments, based on letter of credits, consultancy fees, wages, commissions etc.; deposit of money in cash in a bank account, giving it the appearance of resources from sales; payment of wages, commissions or fees to a company or a natural person, performed by companies which received money which was stratified by foreign or national companies; receiving money from a casino or the lottery to make the funds seem legally obtained from gambling. Nevertheless, in most of the countries, almost all the transactions of large amounts are not performed in cash, but by using other payment instruments (cheques, credit cards), that is why the expense or deposit of large amounts in cash leads to suspicions. For this reason, the offenders have created various techniques and methods of inserting the cash into the financial system, namely:

- dividing large amounts of money into smaller ones and deposits made by several people into different bank accounts or using the respective amounts in order to purchase other payment instruments, such as bearer bonds payment orders;

- cash smuggling, by illegally taking out of the country an amount of money in cash and introducing it into another country, generally having less strict rules, usually by couriers;

- combining illegal funds with those which come from a legal business with cash, amounts of money which then are deposited together.

Abstract

Drawing on the lessons learned during the last crisis, started in mid of 2007, on the global economy, and especially the negative impact over the international banking system, was issued by the Basel Committee on Banking Supervision a set of principles for enhancing corporate governance practices for banking organizations.

Enhancements to the framework and mechanisms for corporate governance in banks should be driven by such benefits as improved operational efficiency, greater access to funding at a lower cost and an improved reputation. In Romania, National Bank of Romania has an important role in in order to increase the enhancement of the corporate governance in banking system.

A core role was played by the implementation of the International Financial Reporting Standards in Romanian banking system in order to support o sound corporate governance.

Key words: corporate governance, banks, supervisors, Basel Committee.

J.E.L. classification: E42, E58

1. Introduction

To address fundamental deficiencies in bank corporate governance that became apparent during the financial crisis, the Basel Committee on Banking Supervision has issued a final set of principles for enhancing sound corporate governance practices at banking organizations. Given the important financial intermediation role of banks in an economy, the public and the market have a

high degree of sensitivity to any difficulties potentially arising from corporate governance shortcomings in banks.

Corporate governance presents a great relevance both to individual banking organizations and to the international financial system as a whole, and merits targeted supervisory guidance.

The Committee's guidance assists banking supervisors and provides a reference point for promoting the adoption of sound corporate governance practices by banking organizations in their countries. The principles also serve as a reference point for the banks' own corporate governance efforts.

The principles also emphasize the importance of supervisors regularly evaluating the bank's corporate governance policies and practices as well as the implementation of the Committee's principles.

An important role in implementing corporate governance in banking is played by the internal audit in banks. In this case on 2 December 2011, the Basel Committee released its consultative document “*The internal audit function in banks.*”

In this paper are presented: an overview of bank corporate governance, the principles for enhancing corporate governance issued by Basel Committee on Banking Supervision, the role of supervisors in enhancing corporate governance in banks in Romania and the importance of implementation of the International Financial Reporting Standards in Romanian banking system in order to support o sound corporate governance.

2. Overview of bank corporate governance

Effective corporate governance practices are essential to achieving and maintaining public trust and confidence in the banking system, which are critical to the proper functioning of the banking sector and the economy as a whole.

From a banking industry perspective, corporate governance involves the allocation of authority and responsibilities, for example the manner in which the business and affairs of a bank are governed by its board and senior management, including how they:

- set the bank’s strategy and objectives;
- determine the bank’s risk appetite;
- operate the bank’s business on a day-to-day basis;
- protect the interests of depositors, meet shareholder obligations, and take into account the interests of other recognized stakeholders; and
- align corporate activities and behaviour with the expectation that the bank will operate in a safe and sound manner, with integrity and in compliance with applicable laws and regulations.

Supervisors have a keen interest in sound corporate governance as it is an essential element in the safe and sound functioning of a bank and may adversely affect the bank’s risk profile if not implemented effectively. Moreover, governance weaknesses at banks that play a significant role in the financial system, including systemically important clearing and settlement systems, can result in the transmission of problems across the banking sector.

Well-governed banks contribute to the maintenance of an efficient and cost-effective supervisory system. Sound corporate governance also contributes to the protection of depositors and may permit the supervisor to place more reliance on the bank’s internal processes. In this regard, supervisory experience underscores the importance of having the appropriate levels of accountability and checks and balances within each bank. Moreover, sound corporate governance practices can be helpful where a bank is experiencing problems. In such cases, the supervisor may require substantially more involvement by the bank’s board or those responsible for the control functions in seeking solutions and overseeing the implementation of corrective actions.

Good corporate governance requires

appropriate and effective legal, regulatory and institutional foundations. A variety of factors, including the system of business laws, stock exchange rules and accounting standards, can affect market integrity and systemic stability. Such factors, however, are often outside the scope of banking supervision. Supervisors are nevertheless encouraged to be aware of legal and institutional impediments to sound corporate governance, and to take steps to foster effective foundations for corporate governance where it is within their legal authority to do so. Where it is not, supervisors may wish to consider supporting legislative or other reforms that would allow them to have a more direct role in promoting or requiring good corporate governance. [1]

3. The principles for enhancing corporate governance issued by Basel Committee on Banking Supervision

The primary responsibility for good corporate governance rests with boards (supported by the control functions) and with senior management of banks. In addition, banking supervisors have an important role in developing guidance and assessing bank corporate governance practices.

There are also many others entities that can promote good corporate governance, including:

- shareholders - through the active and informed exercise of shareholder rights;
- depositors and other customers - by not conducting business with banks that are operated in an unsound manner;
- external auditors - through a well-established and qualified audit profession, audit standards and communications to boards, senior management and supervisors;
- banking industry associations - through initiatives related to voluntary industry principles and agreement on and publication of sound practices;
- professional risk advisory firms and consultancies - through assisting banks in implementing sound corporate governance practices;
- governments - through laws, regulations, enforcement and an effective judicial framework;

- credit rating agencies - through review and assessment of the impact of corporate governance practices on a bank’s risk profile;
- securities regulators, stock exchanges and other self-regulatory organizations - through disclosure and listing requirements; and
- employees - through communication of legitimate concerns regarding illegal, unethical or questionable practices or other corporate governance weaknesses.[1]

Other institutions such as the OECD, the World Bank and the Basel Committee on Banking Supervision are involved in corporate governance, with the latter formulating a set of principles such as ethics and transparency, as well as accountability.

Each bank should implement the principles for enhancing corporate governance issued by Basel Committee on Banking Supervision, which are presented briefly below:

“1) Board practices

The bank’ board should actively carry out its overall responsibility for the bank, including its business and risk strategy, organization, financial soundness and governance. The board should also provide effective oversight of senior management.

(2) Senior management, should ensure, under the direction of the board, that the bank’s activities are consistent with the business strategy, risk appetite and policies approved by the board.

(3) Risk management and internal controls

A bank should have a risk management function (including a chief risk officer or equivalent for large banks and internationally active banks), a compliance function and an internal audit function, each with sufficient authority, stature, independence, resources and access to the board. At the same time all risks should be identified, assessed and monitored on an ongoing firm-wide and individual entity basis.

An internal controls system which is effective in design and operation should be in place.

The sophistication of a bank’s risk management, compliance and internal control infrastructures should keep pace with any

changes to its risk profile (including its growth) and to the external risk landscape.

Effective risk management requires frank and timely internal communication within the bank about risk, both across the organisation and through reporting to the board and senior management.” [1]

4. The role played by National Bank of Romania, in its capacity as supervisory authority for credit institutions, non-bank financial lenders and payment institutions, in enhancing corporate governance in Romanian banking system

Supervisors have a keen interest in ensuring that banks adopt and implement sound corporate governance practices. The Basel Committee on Banking Supervision sets forth several principles that can assist supervisors in assessing bank corporate governance.

These principles were implemented in Romania by the National Bank of Romania, as follows:

Principle 1 “Supervisors should provide guidance to banks on expectations for sound corporate governance.”

National Bank of Romania requires to all Romanian banks to have robust corporate governance strategies, policies and procedures, adopted, in these sense was adopted the Government Emergency Ordinance No. 99 of 6 December 2006 on Credit Institutions and Capital Adequacy and the Regulation no 18/2009. At the same time National Bank of Romania share industry best practices and emerging risks that are relevant to the bank’s business practices through the regulations issued in this sense.

Principle 2 “Supervisors should regularly perform a comprehensive evaluation of a bank’s overall corporate governance policies and practices and evaluate the bank’s implementation of the principles.”

National Bank of Romania evaluates the Romanian bank’s overall corporate governance policies and practices on a regular basis, at least once a year, through on-site inspections and off-site monitoring. At the same time National Bank of Romania communicates periodically with a bank’s

senior management, board, those responsible for the internal control functions, internal auditors and external auditors in order to fulfill its tasks and to maintain the financial stability of the entire Romanian banking system.

Principle 3 “Supervisors should supplement their regular evaluation of a bank’s corporate governance policies and practices by monitoring a combination of internal reports and prudential reports, including, as appropriate, reports from third parties such as external auditors”.

National Bank of Romania collects and analyses information from banks with a frequency commensurate with the nature of the information requested, and the risk profile and significance of a bank (at least once a year).

In this sense, for monitoring and evaluation purposes, the National Bank of Romania periodically reviews key internal reports of the banks.

Principle 4 “Supervisors should require effective and timely remedial action by a bank to address material deficiencies in its corporate governance policies and practices, and should have the appropriate tools for this”.

National Bank of Romania has a range of tools at its disposal to address material corporate governance deficiencies of a bank, including the authority to compel appropriate remedial action these tools are presented in Law no 312/28.06.2004 – the National Bank of Romania’ statute and Government Emergency Ordinance No. 99 of 6 December 2006 on Credit Institutions and Capital Adequacy The choice of tool and the timeframe for any remedial action are proportionate to the level of risk the deficiency poses to the safety and soundness of the banks or the relevant financial systems surveyed by the National Bank of Romania.

Principle 5 “Supervisors should cooperate with other relevant supervisors in other jurisdictions regarding the supervision of corporate governance policies and practices. The tools for cooperation can include memorandum of understanding, supervisory colleges and periodic meetings among supervisors.”

Cooperation and appropriate information-sharing among relevant public authorities, including bank supervisors, central banks,

deposit insurance agencies and other regulators, not only for issues related to corporate governance but also more broadly, which can significantly contribute to the effectiveness of these authorities in their respective roles are realized by concluding the next Memorandums of understanding by the National Bank of Romania:

- Memorandum of understanding between the National Bank of Romania and the National Bank of Moldavia in the field of banking supervision;
- Memorandum of understanding between National Bank of Romania and Banking Regulation and Supervision Agency – Turkey;
- Memorandum of understanding between the National Bank of Romania and the Central Bank of Cyprus concerning their co-operation in the field of supervision of credit institutions;
- Memorandum of understanding between Banca D'Italia and the National Bank of Romania concerning their co-operation in the field of supervision of banks;
- Memorandum of understanding between Bank of Greece and National Bank of Romania concerning their cooperation in the field of banking supervision;
- Memorandum of understanding between the National Bank of Romania and the Bundesanstalt für Finanzdienstleistungsaufsicht in the field of banking supervision;
- Memorandum of understanding between De Nederlandsche Bank N.V and the National Bank of Romania in the field of banking supervision;
- Agreement between the Commission Bancaire and the National Bank of Romania regarding mutual co-operation and exchange of information in the performance of banking and prudential supervision;
- Memorandum of understanding between the Hungarian Financial Supervisory Authority and the National Bank of Romania in the field of banking supervision;
- Memorandum of understanding between the Federal Ministry of Finance of Austria, the Austrian Financial Market Authority and the National Bank of Romania concerning their co-operation in the field of supervision of credit

- institutions;
- Memorandum of understanding on high-level principles of co-operation among the banking supervisors of South Eastern Europe;
 - Memorandum of understanding on cooperation between the financial supervisory authorities, central banks and finance ministries of the European Union on cross-border financial stability;
 - Memorandum of understanding between the Banco de Portugal and the National Bank of Romania concerning their co-operation in the field of banking supervision;
 - Cooperation Agreement between the Banco de España and the National Bank of Romania.[7]

Another key role in enhancing good corporate governance in bank is played by the system of business laws, stock exchange rules and accounting standards that can affect market integrity and systemic stability. In this sense the National Bank of Romania, under its regulatory scope implemented the European regulations regarding banking activity in Romania.

In this purpose National Bank of Romania took the necessary legislative and administrative measures for the direct application of such EU documents.

As part of the arrangement signed with the International Monetary Fund, the European Commission and the World Bank in 2010, the Romanian authorities committed themselves to introducing the International Financial Reporting Standards in the banking sector as of 1 January 2012. The adoption of the new standards is in line with the global trend of harmonising national standards with international financial reporting ones, given the current economic and financial developments, which point to the globalisation of banking operations and hence to an increased need for consistency worldwide of the accounting rules underlying the released financial information.

The IFRS implementation took by National Bank of Romania, in its capacity as regulatory authority, laid down in Order no. 27/ 27 dec.2011, in Order no. 28/27.12.2011 and in Order no. 29/28.12.2011 provides the following key benefits: (i) accurate perception of financial reports, regardless of the users' origin; (ii) avoiding competitive

disadvantages for credit institutions operating in the global marketplace, also in terms of access to international capital markets; (iii) ensuring a higher degree of transparency and comparability of financial statements; (iv) ensuring the consistency of accounting treatments and disclosed information by applying unitary accounting standards across all credit institutions both individually and at a consolidated level; (v) warranting comparability between the information disclosed in publishable annual financial statements, at consolidated and individual levels, and – if applicable – between such information and the data disclosed for prudential supervision purposes.

Major novelties inspired by IFRS-compliant accounting standards consist of: (i) using expert judgment in estimating the value of impairment losses; (ii) a financial asset or a group of financial assets is deemed to be impaired in case of objective events that have an impact on future cash flows and that can be reliably estimated; estimated losses as a result of future events, regardless of their probability of occurrence, shall not be recognised; (iii) the effective interest rate method shall apply to the deferred payment of the amounts representing the effective remuneration of a financial instrument; (iv) the introduction of new accounts (such as: for the distinct disclosure of adjustments related to the impairment of groups of insignificant financial assets and of collective adjustments related to generated, yet unidentified losses from the impairment of both significant and insignificant financial assets; for disclosing the amounts, other than receivables and related payables, taken into account when calculating the effective interest rate – e.g., commission fees received and paid respectively – and which need to be amortised via the effective interest rate method); (v) account restructuring (e.g., the accounts covering the three categories of securities, namely trading, placement and investment securities, shall be restructured in line with the types of financial assets laid down in the IFRS; the income statement shall be renamed according to asset and liability accounts; derivatives accounts shall be restructured in line with IFRS classification and disclosure requirements); (vi) the elimination of several accounts (such as *Receivables written-off, still followed up* and

Penalties claimed, considering the asset recognition criteria; off-balance-sheet receivables shall be assessed in terms of fulfilling the asset recognition criteria, so as to be reincorporated in the balance sheet, where they will remain until such assets no longer generate future benefits); (vii) harmonising the terminology with the IFRS.[3]

The areas identified by the National Bank of Romania as being influenced by the conversion to the IFRS refer to provisioning, solvency, currency position and Tier 1 capital.

4. Conclusions

Drawing on the lessons learned during the last crisis, started in mid of 2007, on the global economy, and especially the negative impact over the international banking system, made the necessity to be set on global economy principles for enhancing corporate governance practices for banking organizations.

These principles were issued by the Basel Committee on Banking Supervision in order to assist supervisors in assessing bank corporate governance.

In Romania, a core role in enhancing corporate governance practices issued on international level is played by National Bank of Romania, in double status: as supervisory authority and as regulatory authority.

National Bank of Romania has also an important role in maintaining financial stability, attributable to its capacity to act as a monetary and supervisory authority.

Risks and vulnerabilities identifying and assessing is an ongoing process for the financial system as a whole and its component parts, because the financial stability monitoring has a preventive scope. The occurring and development of malfunctions, inappropriate risk assessment and inefficient capital allocation can affect the economic and financial stability.

In the same time, the implementation of the International Financial Reporting Standards in Romanian banking system had an important role in order to support a sound corporate governance.

National Bank of Romania drafted in 2011 the necessary rules to be enforced for IFRS

implementation, so as to maintain a prudent approach in 2012, as well, across credit institutions applying the standardised approach to credit risk. In this purpose, the accounting records shall incorporate the impairment adjustments determined exclusively in line with IFRS treatment. If their level is insufficient from a prudential perspective, own funds and prudential indicators – whose calculation requires the use of the net value of related exposures – shall be adjusted accordingly.

Macroeconomic Developments in Romania in the Period 1991-2011

Dobrotă Gabriela

*Constantin Brâncuși University of Târgu Jiu, Faculty of Economics and Business
Administration, Romania
gabi.dobrota70@yahoo.com*

Abstract

The issue of economic growth and determinant factors has been intensively debated, constantly being topical, especially in the conditions of the world financial and economic crisis.

The purpose of this work is to analyze the evolution of the main macroeconomic variables acting on the level of economic growth and the correlations between them.

Key words: economic development, unemployment rate, inflation rate, budgetary expenditures

J.E.L. Classification: G38, H68, O11.

1. Introduction

International financial crisis were felt inevitable the Romanian economy, being broadcast on banking, financial, currency, investment or mortgage channels, materializing its influence in economic development. Romania was deeply affected by unfavorable economic situation recorded worldwide, which results from the analysis of important indicators presented in the paper.

Economic growth is an important objective of economic policy mainly due to the fact that it is focused on improving grade satisfy of human needs and wider society. Economic development can be considered fundamental to human existence. It is given by the highlighting and employment, although, in the situation of the manifestation of structural rigidities in the economy, there may be a high unemployment, economic growth amid.

Unemployment became a feature accompanying all economies, being recognized both existential but and from point of view of negative effects on the economy and individuals. From the studies

effectuated result that between the economic growth and unemployment there is a reverse conditioning: when there is a period of growth, the unemployment rate declines, and if it is a phase of recession, the unemployment is rising. In the crisis period the phenomenon of unemployment is largely, being affected a great many people. At EU level there is an increase of almost two percent compared to 2008, a trend that was registered in Romania. The negative effects are evident on the labor market and worsening employment conditions in other European countries have increased the unemployment. The impact of global economic crisis on the labor market in Romania has materialized in the loss of job, temporary, as unemployment due to technical or permanently by termination of employment contract, which generated an increase in unemployment. To highlight these issues, we analyzed quantitative indicators reflecting the degree of labor unemployment.

The analyzed period has imposed a structure on the intervals 2000 - 2008 and 2009 -2010 because economic development and its influence on the elements specified was different. In the first period, there was a positive growth, with falling unemployment and rising incomes earned in the state budget. Subsequently, Romania experienced two consecutive years of economic contraction (2009 and 2010) which caused a substantial decrease in real income from taxes collected.

The purpose of this study is to identify and analyze the impact of global financial and economic crisis on economic growth in Romania, with direct influence on labor market and on budget revenues and the correlation between the macroeconomics indicators.

To meet this goal, the paper is structured as follows:

Section 2 The evolution of the economic growth's, unemployment, income and

expenditures of general consolidation budget in Romania from 1991 to 2011

Section 3 Correlations between macroeconomic indicators

4 Conclusions

2. The evolution of the economic growth's, unemployment, inflation rate, incomes and expenditures of general consolidation budget in Romania from 1991 to 2011

Economic growth, reducing inflation and unemployment, reducing the budget deficit and the meet of public needs are some of the most important objectives of any savings. Of most times, attaining of the design parameters is subject to the combined action of a set of macroeconomic factors. Identify them and the interdependencies between them does not imply considerable difficulties, however, the empirical tests have revealed that, most of the time, exist and factors by other nature than economic (by most often, the interference of politics in the economic sphere determines a deviation from normal economic laws, actually which reduced the applicability of the econometric modelling). However, should not be neglected the foundation of macroeconomic policy on medium and long term, using the models of sustainability known. Assessing the macroeconomic developments in our country can be achieved on the basis of a presentation of the abovementioned indicators, for a significant period.

The economic growth is sized at the real GDP level, determined according to practice economic, with the help of the next relationship:

$$PIB_1^r = \frac{PIB_1^{ert}}{D_{PIB}}$$

where: DPIB is the deflator of the gross domestic product.

In the period under review, there is an alternation of intervals that marks a positive or negative economic growth. The first two years of study interval reflected a difficult period from economically point of view, due to the transition from centralized economy to market economy. The 1993-1996 period reflects a moderate increase in GDP, difficulties recorded between 1997 -1999, after which the trajectory of the national

economy it changes by 2008. Obviously, the economic and financial world-wide crisis, has not avoided Romania, fact highlighted by the dramatic transition from a positive trend of 7.9% in 2008, to a negative trend, by 8% in the next year. It is considered that Romania entered into recession since 2009, fact marked by the reducing of GDP for two consecutive quarters (by noted however that in that year was registered a decrease in imports by 11.1%, obviously, not because of measures taken, and a increase exports by 2.9%). A graphic reflection of the trend growth is suggestive (figure 1).

Figure 1 The evolution of economic growth in Romania during 1991 - 2011

Source: own processing of the data recorded on table

From the analysis of economic growth cannot be omitted and a correlation with unemployment rate (although, the manifestation of rigidities by structural ordin may determine the existence of a high unemployment rate and in economic growth periods). Spre exemplu, în anul 1995, o rată de creștere economică de 7,1% a fost însoțită de o rată a șomajului de 10%. For example, in 1995, a growth rate of 7.1% was accompanied by an unemployment rate of 10%, while in the year 2009, a negative economic growth rate (-8%) was accompanied by an unemployment rate of 6.3%. In the first four years from the analysing period is an increase in unemployment, and the positive evolution of economic growth from 1993 - 1994 has not led than only a slow-down in the growth of rate of unemployment. Restructuring of economic branches, permissive rules on collective redundancies, but the economic fluctuations and the intensification of economic and financial crisis are a few

factors that have determined the evolution of unemployment rate (figure 2).

Figure 2 Unemployment rate in Romania between 1991 - 2011

Source: own processing of the data recorded on table 1

The evolution of general consolidate budget revenues, expressed as a percentage of GDP, shows a decrease of approximately 21% in the analyzed interval. The highest rate recorded in 1991 (41.7%) while the lowest level corresponds to 2002 (29.7%). The trend of the total expenditure is approximately similar to that of income, which resulted in maintaining the budget deficit within acceptable limits (except interval from 2008 to 2011, when there was a significant increase – figure 3).

Figure 3 The dynamics of incomes, expenditures and consolidated general budget deficit in Romania

Source: own processing of the data recorded on table 1

By the way, in 2011 Romania has ranked 9th among countries with the largest deficit, expressed as a percentage of GDP after Ireland (-13.1%), Greece (-9.1%), Spain (-8.5%), the United Kingdom (-8.3%), Slovenia (-6.4%), Cyprus (-6.3%), Lithuania

(-5.5%) și France. In contrast, the lowest deficits were recorded in Finland (-0.5%), Luxembourg (-0.6%) and Germany (-1.0%) while Hungary (+4.3%), Estonia (+1.0%) and Sweden (+0.3%) registered a government surplus.

Obviously, the trend of the two indicators is influenced not only by factors such as changes in legislation, taxation, conduct of electoral processes, improving tax revenue collection but also for the inflation level. The rising inflation leads to lower real level of income and expenditures, which leads to increasing of the deficits in real size.

The inflation rate had a favourable evolution in the sense of reducing the range studied (a point of inflection was recorded in 1997, continuing the trend of reduction the year 2005 being the first in which it was under 2 figures. The lowest level corresponds to year 2011, while in 1993 there was a record level by 256.1%.

The evolution of presented indicators is shown by the data from table no 1.

Table 1. The evolution of the macroeconomic variables in Romania between 1991 - 2011

Year	Ce (%)	VBc %GDP	CBc %GDP	Rs (%)	Ri (%)
1991	-	41,17	38,1	3	170,2
1992	-8,8	36,77	41,43	5,4	210,4
1993	1,5	33,44	33,79	9,2	256,1
1994	3,8	31,47	33,44	11	136,7
1995	7,1	32,13	34,74	10	32,3
1996	3,9	29,95	33,8	7,8	38,8
1997	-6,1	30,35	33,86	7,5	154,8
1998	-4,8	31,52	35,08	9,3	59,1
1999	-1,2	32,82	34,67	11,4	45,8
2000	2,1	31,5	35,1	11,2	45,7
2001	5,7	30,5	33,8	9	34,5
2002	5,1	29,7	32,3	10,2	22,5
2003	5,2	30	31,7	7,6	15,3
2004	8,3	29,6	30,7	6,8	11,9
2005	4,2	30,49	31,29	5,8	9
2006	7,9	31,8	33,5	5,4	6,56
2007	6,3	32,5	34,9	4,3	4,84
2008	7,9	32	36,9	4	7,85
2009	-8	31	38,2	6,3	5,59
2010	-1,3	33	39,5	7,91	6,09
2011	2	32,5	37,5	7,4	3,14

Where: Ce represented the economic growth; VBc – the revenues of consolidated general budget; CBc – the expenditures of

consolidated general budget; R_s – unemployment rate; R_i – inflation rate.

3. Correlations between macroeconomic indicators

To the analyze correlations between the presented indicators we use the regression method, the regression function allows estimation of the independent variable explains some evolution to the dependent variable. The general regression equation is:

$$y_i = b + a x_i + \varepsilon$$

where: y is the dependent variable; x – the vector of independent variables; a – parameter reflecting the influence of the independent variable; ε - random variable, interpreted as an error.

With the help to the SPSS programme can be determined the regression equation for the identify the correlation between economic growth and unemployment:

$$y = 0,187 x + 0,074$$

The standard error of estimate is 2,5284. The coefficient of multiple determination shows that the variation of unemployment rate is the result of variation to economic growth rate in proportion by 35% (I mentioned before that can be recorded and deviations from normality, under the action of factors other nature than economic, fact which can identify by the correlation matrix between economic growth and unemployment rate – table 2).

Source: own processing of the data recorded on table 1

A study effectuated in the most powerful 10 states from USA present the relation between economic growth measured by GDP and output gap and employment, the author establishing an interval of 0.31 to 0.16 (by 0.47 for the U.S. as a whole) to quantify the intensity of employment, concluding that

there is an immediate impact on the growth of employment but it generates effects continue for several quarters [7].

An interdependence that is manifested in the cadre of economic cycle is that between the unemployment rate and budget deficit.

The researches effectuated has shown that an increase in unemployment rate, amid an economic recession leads to increase the budget deficit as a result of increased unemployment benefit costs and to the reducing of the tax revenues by reducing the number of taxpayers [3; 5]

From the analyzing of presented dates , it observed that in Romania rising unemployment does not lead to immediate increase in the budget deficit (is differences recorded 2-3 years), even as reduction in the rate of unemployment does not correspond to a reduction of the deficit, which shows the action of several factors on its (interest rate, inflation rate, fiscal policy measures, exchange rate, the manifestation a strong financial and economic crisis).

Figure 4 The evolution of unemployment rate and the consolidated general budget deficit in Romania in the period 1991 - 2011

Source: own processing of the data recorded on table 1

It is found that an increase in the unemployment rate does not to the increase of expenditures budget, as would be logical and vice versa. Such a situation may correspond to restrictive budgetary policies or any neconcordance between the statistical dates and economic reality.

The budget deficit is an indicator that influence the economic growth on long-term. Thus, the increasing of the budget deficit negatively influences the volume of investments, and thus the volume of capital, with direct repercussions on the production capacity. Therefore, the maintaining such a

situation on more period will generate the reducing the supply of goods and services. At the same time, to reduce the deficit, it can act either in the increasing sens of incomes (obviously increase taxes remains the first option, with further implications on the volume of economic activity) be in order to reduce costs (Regardless of the category established for diminuation, its will record negative effects). The empirical studies on the impact of budget deficit on economic growth did not lead to clear results (were confirmed and short or long term effects and neutrality hypothesis).

Cashin, using dates for 23 developed countries from the period 1971 – 1988, has concludet that between government transfers, public investment and growth is a positive relationship and between distortionary taxes and groth is a negative relationship [1].

Consequently, the maintenance of budget deficit under control, strengthening mechanisms and improving tax revenue collection can contribute to economic growth.

4. Conclusions

The effects of financial and economic crisis were felt in Romania, fact marked by the evolution of macroeconomic indicators. From the analysis effectuated, we draw some conclusions, presented below.

Sizing budget deficit impact on economic growth requires identifying to the indicators containing relevant information, corresponding for the period analyzed, the aim to the analysis and the real macroeconomic conditions.

Deficit financing in Romania was made frequently on account of state loans, which require a careful management of public debt.

Fiscal and budgetary policies play a fundamental role in stimulating economic growth in macroeconomic policy mix.

Unemployment, inflation, budget deficit, current account balance, and growth are variables that are interrelated but are subject to influence and political factors, legal, military, social, i.e.

Reducing the budget deficit enables macroeconomic stability, reducing inflation and a sustainable level of current account deficit.

Romania's case shows that the policies

implemented to mitigate the economic crisis - financial crisis, contained many errors (actual data shows many anomalies in terms of economic laws).

The implementation of integrated policies and not structured for individual goals can generate real growth, an adequate standard of living requirements comparable to other European countries.

Accounting Risks of the Entity and the True and Fair View

Ducu Corina

"Constantin Brâncoveanu" University Pitești

corina_ducu@yahoo.com

Abstract

The objective of the financial situations is to provide a true and fair view of the entity. The failure in adequately representing the accounting information highlights the accounting risks. Therefore, an increased attention should be paid to remove the threats that risk activities face within the entity. Accounting risk management can be achieved only by conducting financial audit missions that contribute to their reduction and present an accurate picture.

Key-words: accounting risks, financial audit, financial situations, true and fair bview, accounting report.

J.E.L. Classification: M42

1. Introduction

In the context of globalization everybody desires harmonization that could contribute to bringing the international accounting rules by which to develop a set of standards and principles of coherent and converging to the improvement of accounting. More than that, we want a common financial reporting which generates a series of effects for the entities such as greater transparency; facilitating decisions by developing a common information system for certain sectors of activity, reducing compliance costs.

Ensuring an appropriate balance between the fundamentally qualitative and the information strengthening characteristics presented in the financial statements is a prerequisite to produce useful decisions. The financial statement users need clear data, explanations, words and relevant information when making decisions regarding an investment, a sector development and credibility they have with a particular entity.

2. Threats of the true and fair view

The scandals occurred in America as a result of some famous failures, we mentioned here the cases of Enron, WorldCom, Xerox, and the use of creative accounting led to lowering the confidence of users of the financial statements in the activities developed by the accounting experts and of the data presented in the financial statements. Due to the perception that the public had on the accounting profession, on the 30th of July 2002, one of the most important laws with special impact on the profession, known as the "Sarbanes-Oxley Act" was developed

Sarbanes-Oxley requires all publicly traded companies to implement internal control systems whose ultimate goal is the accuracy of financial reporting, and increasing the potential investors' confidence. More than that, the application of Sarbanes-Oxley wanted to place the accounting profession on the first position for the audit of the financial statements in accounting services designed to endorse a true and fair presentation of the financial position, of the entity performance.

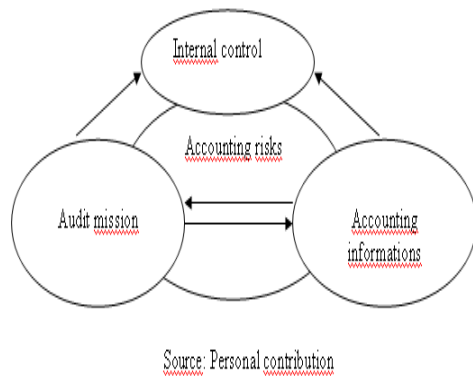

The true and fair view, objective of the financial situations, could be defined through the honest, complete, correct (no errors) situations.

Achieving the goal of fair presentation is often overshadowed by the production of risks in the financial reporting process hazards that could lead to a less credible representation of information in financial statements. Among these we could mention: the difficulties in the accounting activities, sometimes lack of regulations for accounting recognition of economic events, activities performed improperly accounting, accounting personnel involvement in activities without adequate powers, proper separating responsibilities of employees in a

entities, inadequate allocation of duties for accounting activities, etc..

The identification and the management of the accounting risks to limit them can be achieved by implementing the internal control system, performing various audit missions and the proper use of the accounting information.

Figure 2.1 Interconditioning scheme for the true and fair view

3. Risks of the process of accounting reporting

The accounting reporting should include accurate accounting information to reflect the exact situation in which the economic entity is. The accounting information that represents the object of the reporting is subject to risks. It is therefore necessary to identify the accounting risks in order to reduce them to an acceptable level for the reporting to make an accurate reporting.

Accounting risks are generated starting with the application of the accounting principles, as follows:

a) The principle of the activity continuation;

It implies that the entity operates in the best conditions, without going into liquidation or reduction of activity.

As a result, there are a number of accounting practices that generate a number of risks, as follows:

- The delimitation of some financial and accounting exercises along the entity's life, according to which the following items are determined: the financial position, the financial performance and the cash flows of the entity. The

risk arising from misunderstanding or misinterpretation of this principle can lead to an erroneous image of the financial position, of the financial performance that can influence the economic decision of the users of financial statements.

- The usage of the historical cost and current value (of utility) in evaluating assets, equity and liabilities, income and expenses. The evaluation of the balance elements using the historical cost and the current value (of utility) creates a risk of undervaluation of assets and expenses and the overestimation of the risk elements of equity, debt and income.
- The separation in time of the revenues and expenses. This type of activity generates the possibility of erroneous recognition of the above elements in a time when they should not be recognized, and thus appears the risk of assessment and presentation of the results of the entity that do not reflect a true and real picture.
- The impact of the inflation on the accounting activities.

The inflation risk can influence the reduction of the purchasing power, which is reflected in the procurement of goods and services of the entity.

b) The principle of consistent accounting methods and of accounting evaluation. It consists of the continuity of applying the accounting rules and standards regarding the correct accounting and evaluation of the balance sheet items. By applying this principle they ensure a proper presentation of the financial position as well as time comparability of the accounting information.

The failure or the misinterpretation of this principle generates a risk assessment that is where the financial statement users are affected due to the failure criterion of comparability resulting in an assessment that affect their decisions.

c) The principle of caution. It involves the accurate assessment of assets, equity, liabilities, income and expenses to avoid overestimation or underestimation of the result.

According to this principle, it is not allowed to overstate the assets and income, respectively the understatement of the debts

and expenses elements taking into account the depreciation, the losses and the possible risks of the activity generated by the activity developed in the current exercise or the previous exercise. Thus, the risk of transfer of uncertainties in the future exercise will be avoided.

The failure or circumvention of the principle leads to form a distorted image of the financial position and the presentation of an inaccurate image of the entity performance.

d) The principle of exercise independence. It means that the transactions and other events are taken into consideration only when the payment as well as the collection of cash is made. According to the regulations in Romania, this principle regards the delimitation in time of the revenue and expenditure for the financial exercise for which the reporting is made, without taking into account the date of receipt of payment amounts.

The consequence of the application of this principle is the allocating revenue for the year in which they were engaged, respectively their registration at the time of acquisition and expenses as they are engaged.

The risk of not applying this principle is the annual presentation of a performance higher or lower depending on the success or the failure to record in accounting some income and expenses. Tracking certain documents (invoices from suppliers and invoices from customers) via certain non-accounting instruments (cash flow, treasury flow table) reduces the risk of going into payment default.

e) The principle of separate evaluation of assets and liabilities. According to this principle it is necessary to separately evaluate assets and liabilities. The failure to observe this principle generates an erroneous evaluation of the components of financial statements, which affect the financial position and the financial performance of the entity.

f) The principle of intangibility. It refers to the fact that the opening balance sheet for each financial year must correspond with the closing balance of the previous financial year. The failure to observe this principle entails the loss of all the qualitative characteristics of the information drawn from the financial statements. It also automatically

lead to the failure of the other accounting principles.

g) The principle of netting. According to this principle, compensation is not accepted between assets and liabilities or between the items of income and expenses. Therefore, all assets and liabilities should be recorded separately in the accounts based on justifying evidence. However, any offset between assets and liabilities of the same body may be registered only after proper accounting of the revenues and expenditures and compliance regulations. The failure to observe this principle leads to a wrong position and financial performance of the entity. In this case, the calculation of any performance indicators is questionable in terms of relevance of results.

h) The principle of the economic prevalence over the juridical one. It states that the disclosure of the component elements of the balance sheet and profit and loss account is made taking into account the economic operations, not only their legal form. The misinterpretation of this principle leads to an inaccurate presentation of the economic rights and obligations of an entity in the financial statements.

i) The principle of materiality. It requires that the financial statements present all important information which may affect the external users' decisions. The risk of failure of this principle can generate unnecessary costs, which affect the entity's financial performance. When applying the accounting principles, one should know the rules and the regulations well enough in order to avoid such risks, because the information in the financial statements would suffer.

The registration of the financial and economic operations in accounting is not possible without their priory recording certain documents that certify their accomplishment. Therefore, the data recording books (the journal ledger, the stock ledger and the general ledger) is subject to certain risks such as [7]:

- The inexistence of some written procedures on how to draw up the journal ledger, the stock ledger and the general ledger;
- The lack of timely update the documents mentioned above;
- The lack of a person responsible for preparing the accounting records;

- These documents are incorrectly filled out.

With regard to the archiving activity of the financial and accounting documents here we find a number of risks, such as [7]:

- The lack of procedures for archiving the financial and accounting documents;
- The failure to designate responsible persons regarding archiving;
- The lack of training people on how to archive documents;
- The lack of providing an adequate space for archiving;
- The inadequate preparation of the financial and accounting documents for archiving;

Retrieving the accounting information and recording them in justifying evidence can be achieved with the help of some software programs. The risks arising out from this activity are [7]:

- The lack of some written procedures regarding the operation of the information system within an entity;
- The lack of providing responsibilities to the persons who have the right to operate and consult the information system;
- The lack of protection against access by unauthorized persons through a system of passwords;
- The separation of powers of the users with role of control from those with executive role;
- The lack of systematic training of the staff responsible for the system use;
- The unauthorized access to the financial and accounting information from the database.

We mentioned at the beginning of the paper that because of the risks of the accounting activities, the credible presentation suffers. The usage of the balance sheet items, their accounting generates risks that affect the efficiency and effectiveness of the entity, both of them influencing the objectives. Thus, **using and recording the assets generates risks such as [7]:**

- the inexistence of some written procedures regarding the accounts of the aforementioned balance sheet items;
- the accounting procedures is not known by the staff assigned to this task;

- the failure to designate the persons responsible for establishing accounting;
- the existence of some people responsible for the assets accounts but who do not have the necessary studies to accomplish this task;
- the erroneous highlight of the payments / expenses incurred to purchase corporate property or building them;
- the erroneous highlight of the costs of acquisition, production and output value by non-respecting the principle of consistent evaluation methods;
- non-updating the receivables from claims in the justifying documents;
- misstatement in costs other than those related to the nature of these operations;
- the lack of some written procedures regarding the work organization and operation of the cashier;
- the lack of some written procedures regarding the accounts of cash and bank transactions;
- the misstatement in other accounts of the amounts carried by bank or cashier;
- the lack of systematic control of those responsible for treasury activities;
- the failure to ensure the security space for cashier;
- the inexistence of some written procedures regarding the accounting costs for the entity staff;
- the failure to currently inform the staff;
- the placement of the staff in nonspecific professional activities.

If we focus our attention on the capital entity, we can identify risks such as:

- The failure to identify all related parties;
- The failure to establish the correct balance sheet value (the amount of the subscribed and paid capital; the amount of legal reserves and other reserves; the amount of profit or loss) at the end of the year;
- The failure to verify balances at the opening and closing of the exercise of capital elements;
- The failure to identify those responsible for managing the operations of capital (authorized persons legally entitled to sign, the person authorized to record the actions taken, the persons responsible for distribution of dividends and the persons authorized to seek

contributions of capital to new issues of shares);

- The changes in the structure and the volume of equity (increase or decrease of capital, issuing shares, the distribution of profit) have not been known by the entity members and shareholders.
- The possibility of not having correctly recorded the entity reserves in the balance sheet;
- The failure to correctly present the financial statements, in accordance with the accounting regulations of the reserves;
- The current accounting regulations regarding the entity reserves that are not consistently applied;
- The procedures regarding the accounting of liabilities are not known by the assigned staff;
- The impossibility of repayment of the loans contracted at the established times.

The risks regarding the provisions and the contingent liabilities are generated by the fact that the managers must correctly estimate these elements. Thus, there appear the risks involved in making the best estimate. Also, the staff involved in this activity, without having the right skills, can lead to a wrong estimate of the provisions and the contingent liabilities. It should be noted that the estimate is made without being based on justifying evidence and hence a number of risks for the users of the financial statement.

Also, there is a link between the risk and the caution principle, namely that the risks may involve increasing the value of the debt, of the results, of the expenses incurred but the economist must take into account the caution principle in order not to overestimate the elements of equity, debt and income, respectively not to undervalue the assets and the expenses.

Consequently, in accounting there is a multitude of risks generated by the elements of balance sheet that must be taken into consideration and develop a series of measures to reduce them. Moreover the national and international laws must be respected with regard to the correct accounting of all balance sheet items to have a credible image. The conduct of the financial audits helps to identify the risks

mentioned above. The procedures applied by the auditors point out the elements of the balance sheet presented in the financial statements, the removal of the irregularities where they were identified and providing recommendations that regard the accuracy of the situations and the risk reduction to obtain a true and fair view.

4. Conclusions

Accounting quantifies, processes and transmits the financial information of an entity, makes the connection between the developed activities and decision factors. But, in spite of all this, there is a series of risks arising from the activities, risks affecting the smooth running of the entity where appropriate action is not implemented in terms of minimizing them.

The reduction of the accounting risks has an impact on the way in which the financial situations are presented, situations which present the overview of the entity.

The contribution of the audit to reduce the risks will be reflected primarily in the reliability of the financial statements and then in the specific objectives of the entity.

The elaboration of some strategies regarding the management of risk accounting is considered to be the main wish to get a true and fair view.

cameliachirila2004@yahoo.com

Abstract

The internal audit through its characteristics, area of applicability and objectives contributes to the improvement of the developed activities adding extra value to the entity. The proper planning and implementation of the internal audit will contribute to the smooth running of the entity even during the economic crisis. Moreover, the reorganization of the internal audit taking into account the emerging trends and the new directions certifies that this sector brings benefits to the entity, benefits embodied in the performance of the operating entity.

Key-words: internal audit, management, threats, performance.

J.E.L. Classification: M42.

1. Introduction

The need to react promptly to the market conditions today, characterized by technological development and globalization, requires an entity to be fast, flexible and responsive to changes in order to be able to achieve its strategic objectives.

In this context, entities must pay particular attention to the threats that are subject to, threats that generally affect the smooth running of activities. This requires the implementation and operation of the internal audit department, which contributes to their identification and reduction to the lowest possible level.

2. Management counseling

The internal audit function has seen numerous evolutions so far, since its appearance until today, a reason for which we present various aspects that represent the basis of its performance within an entity.

The internal audit is a function of assistance offered to the manager in order to carry out the activities in the best conditions by: finding shortcomings in the processes undertaken by the entity, informing the management and proposing solutions to correct them.

The internal auditor, through his activity, tries to find solutions to the problems arising in one entity, solutions that aim at: implementing an advanced control system, risk management for the operational activities and improving the process of management.

Consequently, according to the above, we observe that the internal auditor acts from the position of an advisor, consultant, specialist who possesses a range of qualities, meaning that:

- he has professional standards under which he operates;
- he uses techniques and tools that provide efficiency and effectiveness in the work done;
- he has independence and authority;
- the activity he develops is not subject to daily pressures derived from work obligations.

A study conducted in 2010 by one of the largest auditing firms named Deloitte decided to interrogate 70 entities via an online questionnaire, which was granted in the second half of 2009.

Deloitte Touche Tohmatsu Limited (DTTL) is a British company with a liability limited by guarantee and "Deloitte" is the brand under which many specialists belonging to worldwide independent entities

(all of which are members of the group) collaborate to provide audit services, financial counseling, risk management and further fiscal services to some carefully selected clients.

After questioning three samples (members of the audit committees, internal auditors and executives), the study intends to identify the main directions of internal audit activity over the next five years[1].

Following this study, we identified the key elements for the management of the internal audit activity, namely: the role and the focus of the future function of internal audit, the areas of interest for the internal audit and the size of the internal audit department.

In what the role and the focus of the audit are regarded, we revealed that the internal audit function will evolve to the role of management consultant.

Source: Adapted from Deloitte (2010)

The results obtained from carrying out this study emphasized the idea that the role of the internal audit function may take different aspects, starting from an independent insurance function to a basic management advisor.

But, in spite of all this, we believe that the audit function must find a balance between the two roles based on the achievement of the entity objectives if we want to create performance.

3. Aiding the employees without judging them

The internal audit is a function that plays an important role in controlling the activities developed within the entity, in order to add a value.

The recommendations arising from the audit help the employees to optimize the operations they develop. Therefore, the internal auditing is not auditing persons, but it focuses on the processes undertaken by the entity. In the report issued by the auditor it is clearly stated that there should be no names of people, which means that the auditors' recommendations could have some effect on the employees.

Consequently, the internal audit contributes to the improvement of the activities and not to the judgment of the actions made by the persons in the entity.

4. The auditors' independence and objectivity

The internal audit function is aimed at monitoring, detecting and reporting the main irregularities occurred in an entity as well as making recommendations that will contribute to the smooth running of the activities.

Throughout the course of the mission, the auditors must show both independence and objectivity. The auditors' efficiency consists of the organizational independence to the management system, which allows an objective assessment of the activities subject to the audit.

The auditor's objectivity represents a neutral attitude, independence of mind and judgment, lack of compromise and removal of any constraints that restrict the smooth running of the activities they perform. In other words, the auditor should see things as they are and make his own opinion which clearly must reflect the current situation. Independence means honesty, sincerity and trust.

According to the Professional Standards for Internal Audit, the principle of independence is viewed from two perspectives:

- the independence of the internal audit compartment, according to which it must be subordinated to the highest hierarchical level in the entity, without any subordinated operational service;
- the internal auditor's independence, according to whom any auditor must be independent from the processes he audits.

The activities developed by the auditors under the principle of independence and

objectivity are nothing but their professionalism.

The internal audit areas of interest, identified through the research conducted by Deloitte in 2010, are considered to be:

- from the executives' perspective, they mention: operational audits, both in computerized processes and in the non-computerized ones;

Thus, we support the idea that operational audits and IT and non-IT processes will be areas of audit in 2015. Moreover, a KPI (Key Performance Indicator) will be implemented for each audit function performed within an entity.

- from the audit committee's perspective, they mention: the attention focused on the financial sector (expenses, costs and revenues).

audit) enhances the entity's performance, as it consists of verifying the procedures and the methods applied to determine efficiency and timeliness.

With regard to the dimension of the internal audit department, most internal auditors consider that it will increase in the future due to the increasingly important role within an entity. While the executives' opinions are divided, some of us believe that the department will be developed, and others believe that it will remain at this stage.

Therefore, the internal audit must have a tendency to meet the needs of the entity. Through the activities it carries out, the internal audit must prove that it has a series of tools to provide added value to its operating environment.

5. Conclusions

The internal audit activity is considered to be an activity used to improve the operations within an entity. This can only be achieved through a disciplined approach of the control processes, and the processes of risk management and entity governance.

According to the labor they perform, internal auditors are considered “the key to the success of an organization”. Their goal is to solve the toughest problems that the entity must face. They constantly struggle to find the best ways to meet the objectives of the entity by improving their skills continuously. They not only offer advice only for the encountered problems, but they also anticipate them, playing an important role in avoiding disasters.

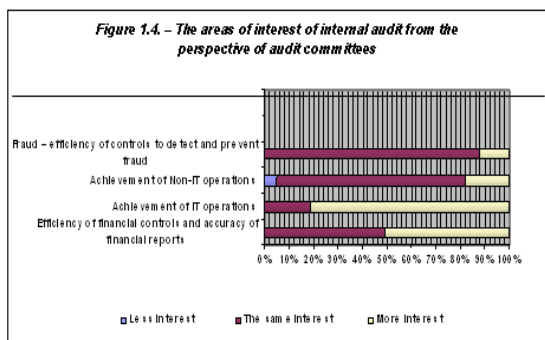

Education and professional experience should make the auditor a competent person, informed with all trends in business, thus ensuring independent, objective and professional counseling for managers.

From the things presented here, some special attention should be given to the financial resources, given the current environment, as if there is a correlation between the three elements (expenses, costs, benefits) the entity will be able to operate without being affected by the economic crisis.

Historical Highlights of the Capital Flows Evolution in the Romanian Economy

Cristina Duhnea

Ovidius University of Constanta, Faculty of Economic Sciences

cristina@duhnea.net

Abstract:

In the last few decades everyone agreed that capital inflows benefit the recipient countries, contributing effectively to economic growth and sustaining the investments in the real economy with long term positive effects but in the same time it was observed that the import of capital represents an import of risk, and this risk tend to growth exponentially in time of crisis. The analysis developed in this work has a start point in the vast existing literature trying to explain what drives the capital flows especially into and from the emerging countries. This paper discusses Romania's experience regarding the financial flows, the evolution and the changes in the profile of capital flows to and from Romania. The conclusions include aspects of the financial integration's growing impact on capital flows and level of capital flows in time of crisis in the Romanian economy.

Keywords: capital flows, Romania, foreign direct investments, portfolio investments, others investments

JEL classification: E22, E44, E58, G01

1. Introduction

The present global financial crisis demonstrates clearly that liberalization of capital flows and globalization also present side effects. The '90s were mostly dedicated to the financial deregulation and the globalization of financial markets. Everyone agreed that capital inflows benefit the recipient countries, contributing effectively to economic growth. At the same time it was observed that the import of capital represents an import of risk.

The dramatic increase in capital inflows, especially the short-term, volatile ones, will

exert high future pressures on the capital outflows. In these conditions, a major concern for any economic policy decision-makers of a country is how to effectively manage the capital flows. Understanding the factors underlying these contradictory flows represents the key to select the correct solutions for an optimal legal framework.

This paper discusses Romania's experience in attracting and managing financial flows and the challenges that have emerged following the increase in the level of financial integration.

The conclusions include aspects of the financial integration's growing impact on capital flows and the implications of financial integration on monetary policy and other types of policies regarding the financial market stability.

2. The drivers of capital flows

There is extensive literature dealing with the issue of capital flows to and from emerging countries.

Some authors believe that the capital flows are determined by external factors, also known as "push" factors, business cycles in the developed countries having an important role ([7],[12]). Other authors advocate in favor of the internal factors, also known as "pull" factors, considered essential in attracting capital flows ([5], [6], [8]).

There are also studies that analyze the role of trade liberalization and financial liberalization of capital movements. Also, a considerable number of authors focus on institutional quality in emerging countries, which along with trade liberalization would represent important drivers of capital flows ([1], [11], [19]).

Undoubtedly, we can state that both internal factors and external ones matter when talking about capital flows entering and leaving a country.

Interestingly, while FDI is the least volatile segment of private capital flows as a whole, - the so-called cold money (there are also empirical studies in this regard:[2], [3]), the portfolio investments are often pro-cyclical.

The current financial crisis, as well as those of the '90s, has raised questions about the effects of financial integration. [13], [14] investigated whether the emerging countries that have, sometimes prematurely, opened their markets, , benefit from financial integration or, on the contrary, are more exposed, exhibiting very important disadvantages.

The key features identified by the literature as determinants of a successful financial integration are macroeconomic policies, development of financial markets, institutional quality and corporate governance ([13], [16], [17]).

Both the Asian crisis and the global crisis have shown that, while FDIs have remained relatively stable in a country, being determined by the fundamental characteristics of that country, the areas of banking market, money market and capital market have recorded a significant volatility.

3. Historical highlights of the capital flows evolution in Romania

In order to realize the analysis of the evolution and changes in capital flows, the influence of these flows on the Romanian financial market we collected data from several institutions - National Institute of Statistics - data on Gross Domestic Product, balance of payments;- National Bank of Romania - data on balance of payments and banking assets structure of the Romanian banking system;- Bucharest Stock Exchange

Romania is a country with a gross domestic product in the past five years ranging between 120 and 140 billion €, and a present gross domestic product per capita around 7000 €. Having an international currency reserve that has constantly increased, currently being placed between 35 and 37 billion euros and an external debt reaching 84-85% of GDP, Romania manages to fit into the accepted limits of the convergence criteria established by the Maastricht Treaty, striving hard to keep its budget deficit below 3% of GDP. In terms of

the balance of payments situation, Romania recorded a trade deficit of 11%, while the current account deficit remains close to 4% of GDP. On the background of crisis, these gaps have been reduced due to lower consumption and economic slowdown.

The global crisis has affected the world economy and effects such as the rising unemployment, the increase of inflation, the decrease of purchase power have determined an augmentation of the level of anxiety perceived by consumers, leading to a reconsideration of their priorities [15] and, on a global level, the slowdown of all economic activities had an impact on the capital movements.

In these conditions, Romania has managed to attract, in the last 10 years (2002-2011), an investment flow of 99.65 billion euro and to export investments of 53.74 billion euros, recording a positive difference of 45.92 billion euros of direct foreign investment. In terms of portfolio investment Romania registered inflows of over 27 billion euros, while the outflows were approximately 23 billion euros, with a plus of over 4 billion euros.

Most of these capital flows were in the other investment category, with inflows over 346 billion euros, while the outflows summarize 294 billion euros and with a difference of 52 billion euros.

Taking into account all capital flows, 473,521 billion euros entered Romania, and 370.574 billion euros came out, the net difference attracted being 102,967 billion euros.

This was the case of the past 10 years since Romania started to be attractive to investors, with the economic situation stabilized after 2000, and a real and consistent improvement of the country's economic indicators. In addition, from the economic and political point of view, Romania has become attractive in terms of its accession to NATO (2004) and EU (2007).

Historically, the direct foreign investment in Romania was the main concern of the authorities, their growth being permanently lauded by the governors, a higher level of foreign direct investment an element of pride for any prime minister.

At the same time, portfolio investments have started to grow in importance,

especially after Romania joined NATO, a fact registered by investors as a safety element. Despite the increasingly intense worldwide competition, by 2008 there was a growing net flow of investments, as Romanian investors increased their activities as exporters of capital on the international markets.

The evolutions shown in the figures below highlight the increasingly intense presence of Romanian companies as investors on international markets, which showcases their ability to diversify their operations, and is in line with the government’s policy to promote Romanian players, both regionally and globally.

Figure no. 1 The evolution of direct investments flows between 2002 and 2011

In 2002, the first year of the period analyzed, the world economy experienced a moderate revival, amid the growing U.S. private consumption, the economic expansion of the Asian countries and the European Union candidates.

Romania managed to catch this wave of widespread economic growth, as the private consumption in Central and Eastern European countries was driven by the foreign direct investments, the real wage growth and the prospects of EU accession. With an annual GDP growth of 6%, Romania managed to take the second place in the area, after Slovakia. Along with other countries in the region, Romania has benefit of improving conditions to access the international capital markets and the increasing interest of non-residents for the domestic capital markets, leading to increased net inflows of investment, both direct and portfolio investments.

For the first time, Romania benefited from the greatest opening up in terms of economic access to foreign loans and credits to date, that could be used mainly to strengthen the official reserves, given the fact that the current account deficit was fully financed by foreign direct investments and portfolio investments. From this moment forward, the direct investments began to rise to significant amounts over 1 billion euros, with a similar situation in other capital investments, which was close to 6 billion euros, and an important value recorded at long-term loans and credits, of almost 4 billion euros. We can say that was the historical moment from which the foreign direct investments, the portfolio investments and the other capital investments have started to matter to the Romanian economic balance and recovery (see Figure 1 (FDI), Figure 2 (portfolio investments), Figure 3 (others investments))

Figure no.2 Annual evolution of the portfolio investments flows between 2002 – 2011

If in general the investment volumes registered an upward trend with some short term adjustments, the evolutions of each of the three components: direct investments, portfolio and other investments, were very different.

Both the magnitude and the volatility of the investment flows to and from Romania have grown together with the intensification of integration process into the global financial system but each component presented particular features, different maximum and minimum points and different inflection points, depending on various internal and external factors.

Thus, foreign direct investments grew almost explosively during 2002 - 2008 due to continued privatization process, with short intermittent episodes of decline, the most pronounced of which was in 2007, due to the reduction on share holdings, caused by the absence of large privatizations and reinvested profits.

2008 was the year in which Romania registered a premiere: the direct investment recorded net inflows of almost 9.5 billion euros, compared with 7.5 billion euros in 2007, the increase reflecting the growth of the net debt inflows due to increasing global aversion to high risk financial instruments, the liquidity needs and the short term interest differentials, and the efforts made by the global investors trying to modify their investment portfolio in favor of countries of residence. FDIs in Romania recorded, at the end of 2008, the value of 48.798 billion

euros, up 14% from the balance at the end of 2007. 2008 was actually the peak year in terms of volume of the FDI in Romania, which was called “the Balkans dragon”, representing the only EU country in which the foreign direct investments increased as a share of GDP.

Unfortunately, given the dramatic economic decline of 4.1% in the euro area recorded in 2009, due to lower private capital expenditures and a tightening of the international trade, the foreign direct inflows declined significantly compared to 2008 in eight states that joined the European Union after 2004, including Romania.

In 2009, the net direct investments in Romania amounted to only 3.5 billion euros, down by 61.9% compared to the previous year, a compression trend which persisted in 2010 and 2011. Showing high volatility, the foreign direct investments in Romania contradict the general principle according to which the flow of direct investments is less dependent on the economic crisis situations. It demonstrates, in the case of Romania, but also for other countries in the region, that the emerging Central and Eastern countries are still considered high risk regions. If, in terms of direct foreign investments the developments in recent years are trending down, not the same can be said about portfolio investments (Figure 2).

Showing a considerable magnitude and volatility, the portfolio investments exhibited significant growth in 2005 and, paradoxically, during the economic crisis in

2010-2011. Moreover, the historical maximum for this type of investments is recorded in 2011, at nearly 8 billion euros. If in 2004 a significant increase in portfolio investments was due to bond issues made by the City Hall of Bucharest (500 billion euros on the Luxembourg market) and the Romanian Commercial Bank (500 billion euros on the London market), the portfolio investments in 2011 of about 1.9 billion euros, 2.1 times higher than in 2010, came mainly from the bonds issues of 1.5 billion euros made by the Ministry of Finance on

foreign markets. The difference is attributed to the transactions with government securities made by the banking sector on the secondary market. We remark that the investor interest for government securities has maintained level, supported by the slight improvement of the BBB country rating – corresponding to a reduced investment risk category as recognition of the continuing efforts for economic stabilization, resulting in lower inflation, reduction of the budget deficit and keeping the current account deficit at a moderate level.

Figure no.3 Annual evolution of other investments flows between 2002 and 2011

Regarding other foreign investments, we find a historic maximum value of inflows (60 billion euros) and outflows (57 billion euros) in 2009, as a result of the movement of “hot money” in the economy, as high levels of credit for the bank subsidiaries by parent banks was maintained due to the Vienna Agreement (figure 3).

4. Conclusions

The analysis undertaken on the capital flows targeting Romania showed the opportunities they brought, but also their volatile nature. In these circumstances, the authorities have been subjected to various challenges, primarily in an attempt to decouple the benefits of these new investment flows to the potential dangers of triggering speculative bubbles.

In a globally integrated economy, this process of decoupling a country from the financial stress and the risks emerging from

other economies is extremely complex. The benefits arising from the liberalization of markets can turn quickly in disadvantages, but we must admit that, at least during certain periods, the existence of these investment flows has proven beneficial.

There are no major differences between Romania's experience and that of other countries. Romania tried to attract, on a background of increasingly intense competition, foreign direct investments and other types of investments, and to maintain and develop these investment flows, in the hope they will provide the necessary funds to reduce the existing gaps.

Romania lost substantial flows of foreign direct investment, failing to remain an attractive destination for these types of capital flows. In these conditions, in the absence of investments, Romania was forced to find new solutions to finance the deficits, which led to the need to adopt radical solutions: cutting spending and foreign loans,

resulting in increased population poverty, reducing consumption, increasing the country's indebtedness and deepening the recession.

Abstract

The economic literature regarding central banking and monetary policy suggest that the response of a standard monetary policy as a response to an inflationary bias, caused by a discretionary monetary policy represents the delegation of a monetary policy to an independent institution, which is directly linked and subsequent connected with the accountability concept. As we can notice, the accountability and responsibility terms are, ceteris paribus, supplementary. An individual person which is in charge of a task in his domain becomes, sequi, responsible for fulfilling it. An institution is responsible over the law for the fulfillment of a task an it's accountable in the situation in which she need's to justify it's actions. The central bank is entrusted with the monetary policy process, which, in the first place, becomes responsible, and, subsequent, becomes accountable for it's actions.

Key words: central bank independence, monetary policy transmission mechanism, inflation expectations, ex ante control, communication process.

J.E.L. Classification: E50, E52, E58.

1. Introduction

In the literature regarding central banking and monetary policy the concept of central bank accountability emerged in different ways. Some authors identify in the agent – principal relationship a *de jure* accountability and a *de facto* accountability [1]. The *de jure* accountability represents the enrichment in

the law, especially central bank's statue, a formal contract between central bank and the executive branch. This definition requires, consequently, not just the objective accountability in the contract, but also the reports regarding the accountability evaluation, the central bank tasks reporting and the sanctions applied in case of failure.

Other authors made distinction between *ex ante* accountability and *ex post* accountability, in which the first one is defined as the act throughout the democratic government outlines the obligation over from which the delegated institution is accountable [2]; throughout this the authors refer to the objectives accuracy which is attributed to the central bank.

The concept of central bank accountability has three major dimensions: (i) the decisions regarding the monetary policy final objectives; (ii) the current monetary policy transparency; (iii) the authority which holds the final responsibility regarding monetary policy [3].

Central bank transparency represents the second essential characteristic for central bank transparency, this being part of accountability because, without the public disclosure of the information by the central bank, the wide public, the civil society and the mass-media won't be able to evaluate the monetary policy performances.

Accountability suppose that the central bank need's to explain and justify the monetary policy actions, as well as the undertaken actions in exercising it's responsibilities [4]. Regardless the existence or not of some arrangements regarding the democratic accountability, it can be noticed their limited purpose, in the lack of

transparency, because the information *vis – á – vis* the central bank behaviour is crucial for the evaluation of its performances [5]. In the *core* of a democratic society, all the public policies must have a high degree of openness with the exception in the situation in which such a forum does not impede the primary function designated to an institution [6].

According to other author, the accountability concept must be divided into three categories [7]:

- *accountability upon objectives* – the clarity and precision in which the monetary policy objectives are enriched and/or communicated;

- *procedural accountability* – the degree and forms of communication of the monetary policy strategies and decisions for the fulfilment of the statutory objectives;

- *informal accountability* – the situation in which the central bank is required to respond over the past decisions, the form of these decisions, the entity nature from which the central bank Governor is accountable.

2. The trade of between central bank accountability and central bank responsibility

National Bank of Romania is the romanian central bank entrusted with legal power and an independent public institution of which the price stability objective is the fundamental objective of monetary policy [8]. This suggest that central bank independence is an important feature in modern central banking and modern monetary policy but it is the problem between the optimal trade of central bank accountability and independence.

Regarding the central bank responsibility we can suggest that because of the multiple subjects of the monetary policy delegation, with a special focusing on the whole society, occurs a problem regarding the definition of the objectives, because of the authority which will decide upon the final objectives of the monetary policy.

On one hand, we can remark the Parliament, the most democratic institution, and on the other hand, we can remark the central bank (especially the Board), institution which is chosen in an indirect manner (through the delegation process) over the society representation, i.e. Parliament.

The first one takes decision in compliance with the society desires, while the second one can deviate from the direct interest of the society. The responsibilities delegation process, implies, *stricto sensu*, the conflict resolution between the democratic deficit, in case in which the central bank establish the final objective of monetary policy, and the central bank transformation in an executor of the government's will and preferences.

Regarding the central bank accountability we can suggest that its importance derive upon the individual and collective costs attached to the choice of the delegation process, process that can confer the central bank's officials which needs to have different preferences from the rest of the society.

Being aware of these generated costs in a formal requirement of responsibility, some authors sustained that: responsibility is an essential and constituent element of the democratic order of politics. In this order, the institutions and the entities which hold the influence power of the welfare and living standard of the community must constitute the subject of a scrutiny by the constituents or their representatives [9].

This fact is, especially, relevant in some monetary policy domains – like central banking – in which the decisions are systematically removed by the *political arena* daily influences. However, accountability requires, *ceteris paribus*, the existence beyond the *political arena* of a moral and civil inherent obligation, but indirect correlated with the so-called *economical order*.

An additional aspect of accountability represents the relationship between the expected results and the current results. If it is supposed that in the monetary policy formulation process of the monetary policy objectives are designated in the paretian sense, some efficient targets, using all the available information at the moment; in this sense, the central bank's performances can be evaluated by comparing the expected targets with the current one – this operational framework will be very important for the central bank. As it can be noticed, some monetary policy frameworks promotes, inherent, a high level of central bank accountability: for example, in case of *inflation targeting*, the target level, the level from which are evaluated the central bank's economical performances is well known by

the society. In exchange, in other monetary policy frameworks didn't realise this fact, being very difficult the identification of some adequate targets for monetary policy.

3. Accountability – reputation

Some of the problems created by central bank accountability is the situation in which the public's opinions and preferences coincided with those of the entities from which they are responsible. Conformity is the cognitive decision taking process, because it allows the people to engage in the argumentation process, and engaging in a cognitive effort to generate a defensive position.

The evaluable audiences will prefer those who are agreed one with another and less the disagreement one's with their preferences, evaluating those which are agreed to be more intelligent and preferable [10]. Moreover, the decision-making entity will be congratulated and rewarded by those persons from which they are accountable. Indeed, in case in which the judging audiences hypothesis are known before people must express their opinions, these will present, usually, a higher conformity level [11].

These reactions of the conformity occur because of two reasons, which are corresponding to the classical distinction between *normative influence*, in which people express public their position for maximizing the group rewarding and minimizing the group punishments, and *informal influence*, in which people expresses privately their positions, because of the modifications in their beliefs regarding the correct solution. The strategic opinion occurs, frequently, because of such dispatches, since people modify their perceptions in the approval, acceptance of the audience, and other rewards, as well as the promotions and payments increases. Some normative modifications are adopted in a conscious manner, and, sometimes, even in a conscious manner.

Most of the time, these modifications seem to be the non-conscious, occurred as a response to social pressures [12], [13], [14], [15]. Such normative pressures generates a behavioral modification as well as the decisional organisms anticipate the explaining necessity of their preferences

before the audience. However, if accountability is canceled in the last minute, for example – in case of an anticipated reunion which cannot be held without audience – the people often recourse at their's original attitudes upon the problem, excluding the conformity effect.

People can modify their position because of informational motives, due to the fact that the audience can induce to them a modification in the way of surprising the fact as a whole. The audience can make the people to change, promptly, their perceptions regarding several problems – the preferences of an audience can make people:

- *engage in a bifocalisation of information* – disproportional bifocalisation upon information sustained the conclusion of the preferred audience;
- *modifying the modality in which they perceive and define the problem* – modelates the framework which is congruent with the audience hypothesis and objectives;
- *modifying the evaluation standards for using the results evaluation* – overestimation of the standards and the audience objectives.

These results suggest that accountability will lead to an increase in the objective importance of living in good conditions with those persons from which we are accountable. People focalized their attention upon the way in which the decisions are perceived and explained, conforming to the action course which they consider to be accepted by others. Although the mutual understanding objective with each other is extremely important, nowadays, it is the only objective that guides the people's behaviour.

4. Central bank accountability – some empirical evidence

In this section we started to measure central bank accountability in 20 developed and 20 emerging countries in the period 1990-2009. In order to measure central bank accountability we have taken into account Dumiter (2009) index and methodology [15].

The accountability and transparency index measured by the authors' has taken into consideration the following central bank characteristics:

- the formal statutory of the objective/objectives with an explicit prioritisation in case of multiple objectives;
- quantification of the primary objective;
- public availability of the economical data;
- the existence of explicit contracts beneath some arrangements between government and central bank;
- public availability of the central bank’s macroeconomic model(s);
- regular publication of the own macroeconomic projections;
- the promptly announcement of the monetary policy decisions;
- auditing central bank financial activities by independent auditors;
- explaining and justifying the monetary policy decisions;
- central bank’s Governor accountability;
- quarterly evidence of the explicit direction of monetary policy;
- regular evaluation of monetary policy;
- results evaluation over the macroeconomic objectives;
- regular information upon the main macroeconomic disturbances which affect the monetary policy transmission mechanism.

Table 1 reveals the results of measuring central bank accountability and transparency in twenty developed countries. As we can notice, at the top of the hierarchy are: Canada, Greece, New Zealand and Sweden with maximum points because of some features as: explicit statutory objective of price stability, public availability of the quarterly time series and macroeconomic models, presenting and explaining the monetary policy actions, decisions and measures adopted or which need to be adopted in the future.

Other countries with a high degree of central bank accountability and transparency in the developed country group are: France, Germany, Ireland, Ireland, United Kingdom, Norway, Spain (9.64 points), Belgium, Switzerland, Israel, Malta (9.29 points), Austria, Denmark and Luxemburg (8.93 points). These countries practice a transparent and accountable monetary policy, offering to the wide public several means of perceivind and understanding the monetary policy transmission mechanism.

At the bottom of the hierarchy are countries as: Iceland (8.57 points), United

States (8.21 points) and Japan (5.71 points). We can observe that Japan has the lowest score as a consequence of avoiding the communication with the wide public, avoiding the presentation of the curent and future monetary policy actions, and the lack of the public availability of the quarterly time series and macroeconomic models.

Table 1 Central bank accountability and transparency in developed countries

<i>Country</i>	<i>Central bank Accountability And Transparency</i>	<i>Country Ranking</i>
Austria	8.93	4
Belgium	9.29	3
Canada	10	1
Denmark	8.93	4
Switzerland	9.29	3
France	9.64	2

United States	8.21	6
Sweden	10	1

Source: Measuring central bank accountability and transparency was made by analyzing central bank websites, central bank statutes, different norms and regulations, reglementations and publications available on the central bank websites, as well as the real practices of the central banks’ from the developed country group in the period 1990-2009.

Table 2 reveals the measuring of central bank accountability and transparency in the emerging country group. At the top of the hierarchy are countries as: Serbia and Turkey (9.64 points), Slovakia and Turkey (9.33 points), Albania, Armenia, Moldova, Poland, Czech Republic, Romania (8.93 points) and Russia (8.57 points). Most of these countries exhibit the inflation targeting strategy which has lead to a great responsabilisation of monetary policy, a better communication process with the public and financial markets, publishing and presenting the projections and forecasts of inflation and

output, and the public availability of the quarterly time series for the main macroeconomic indicators.

Table 2 Central bank accountability and transparency in emerging countries

Country	Central bank Accountability And Transparency	Country Ranking

Ukraine	4.64	9
Hungary	9.64	1

Source: Measuring central bank accountability and transparency was made by analyzing central bank websites, central bank statutes, different norms and regulations, reglementations and publications available on the central bank websites, as well as the real practices of the central banks' from the emerging country group, in the period 1990-2009.

At the bottom of the hierarchy in the emerging country group are: Macedonia (7.50 points), Belarus (7.14 points), Bulgaria and Estonia (7 points), Bosnia – Herzegovina and Lithuania (5.36 points), Croatia, Latvia and Ukraine (4.64 points). All these countries are characterized by a monetary policy whose parameters are not available for the wide public, it can be observed the lack of publishing the main macroeconomic models used for policy analyses, a low communication process with the mass-media, wide public and financial markets and the lack of explication and justification of the monetary policy actions and decisions.

5. Conclusion

Central bank accountability represents the responsibility of the monetary authority for the undertaken decisions. Being accountable, the central bank will become, *mutadis mutandis*, the subject of a failure subject, in the purpose of maintaining it's final responsibilities. From this point of view, accountability implies, throughout definition, some compromises regarding central bank independence. However, we consider that accountability represents an important way in assuring that the central bank operates in such manner that is in compliance with democratic ideas, as well as that the central bank operates under the auspices of it's legislative mandate regarding the monetary policy area. On the other hand, the ways in which it could be increased the central bank transparency, will create opportunities for producing some political interferences.

Another source of conferring a high degree of central bank accountability represents the five year or even less tenures of the central bank Governor, especially in cases in which the Governor and other Board members can be reappointed by several additional procedures, than it may throughout this appointment procedure to be established a more rigorous control upon the central bank's activities, and the Board members to be more responsible over the undertaken monetary policy. This fact can be seen as an unequivocal example of the *trade off* between central bank independence (facilitated by the existence of long-run tenures of the central bank officials without any potential reappointment procedures) and central bank accountability (facilitated by the short-run opportunities generated by the possibility of the reappointment of the central bank's officials).

Abstract

Today's internal audit activity provides assurance that internal controls in place are adequate to mitigate the risks, governance processes are effective and efficient, and organizational goals and objectives are met.

As technology, globalization, organizational governance, and such trends as mergers and acquisitions have evolved, so has the internal audit profession. Higher expectations for increased accountability, more transparency, greater due diligence, and enhanced oversight have all contributed to growing professional opportunities in internal auditing. There is an overall movement toward solid organizational governance, to which internal auditing is essential.

One of this profession's challenges is clarifying for all stakeholders the internal auditors' roles, responsibilities, and true value. In actuality, they serve as management's and the board's safety net. The internal auditors provide assurance that policies and procedures are being followed. They monitor the ethical environment, corporate culture, and "tone at the top."

Key words: internal auditing, risks, internal controls, governance, objectives

J.E.L. classification: M42

1. Introduction

Definition of internal auditing says: the function as an independent, objective assurance and consulting activity designed to add value and improve an organization's

operations. In June 1999, the Institute of Internal Auditors (IIA) officially adopted a new definition of the internal auditing function. The new definition was developed by the Guidance Task Force (GTF) and defines the internal audit function as: internal auditing means an independent, objective assurance and consulting activity designed to add value and improve an organization's operations. It helps an organization accomplish its objectives by bringing a systematic, disciplined approach to evaluate and improve the effectiveness of risk management, control, and governance processes.

This definition shifts the focus of the internal audit function from one of assurance to that of value added and attempts to move the profession toward a standards-driven approach with a heightened identity. The IIA Research Foundation (IARF) is working every day to gauge best practices, business cultures, governmental activities, and other forces that shape the global profession and environment in which internal auditors practice. All of them research to date has resulted in guidance that helps internal audit practitioners learn from others and become more proficient, efficient, and effective.

2. IIA around the world

The IIA represents more than 120,000 professionals around the world. With 246 affiliates in 90 countries, this professional body works to bring together internal auditors from all around the world to share information and experiences. The challenge is not only to communicate the new information gained, but also to share

collective wisdom, overcoming the barrier of language, culture, and geography.

The IIA has set some clear priorities, including a greater emphasis on the importance of a balanced scope of work. Over time, the pendulum of focus has swung from financial to operational, and back to financial. The IIA, though, understands how important it is to utilize the internal auditors' expertise across the entire organization so that all risks, not just those with financial repercussions be assessed. This requires management and the audit committee to have serious discussions about the resources that will be devoted to internal auditing.

Professional internal auditors practice in accordance with *the Code of Ethics* and *International Standards for the Professional Practice of Internal Auditing* and obtain the Certified Internal Auditor (CIA) designation, which demonstrates internal audit knowledge and competency, personal character and integrity, education, and experience; implement and maintain a quality assurance and improvement program; and participate in professional development opportunities for enhancing expertise.

3. Internal auditing is at a cross-road

The profession of internal auditing is at a critical and exciting cross-road. Never have the challenges been greater or the stakes higher. The way that the profession respond to the opportunities on the horizon will determine the overall destiny for years to come.

The 21st century presents unprecedented growth opportunities for the internal audit profession. Advances in technology, the confluence of the Information and the Internet Age, and the sheer speed and expansion of communications capabilities have significantly accelerated the pace of globalization.

Governance, risk, controls, and compliance processes within organizations have undergone significant change to manage the increasing complexity and sophistication of global business operations. All of these developments offer a huge opportunity for internal audit functions, whether in-sourced, co-sourced, or outsourced, including the potential to add even greater value to their respective organizations.

To ensure that a body of knowledge is systematically built up, developments in practice in a dynamically changing environment must be carefully monitored and continually analyzed to reveal critically important insights. Key lessons learned from the experience of the profession must constitute part of the historical record and be transmitted to current and future generations of internal audit professionals for optimal outcomes. Not only must we strive to secure a robust portrayal of the current state of the profession, but encourage practice-relevant research to inform and push the boundaries of practice.

The IIA Research Foundation undertakes large-scale studies of the global internal audit profession. The inaugural Common Body of Knowledge (CBOK) survey under William Taylor's leadership occurred in 2006 and for this moment there is an another second iteration. Based on the responses from The IIA's Global Internal Audit Survey from 2006 and second in 2010, it is possible to compare results and perform high-level trending.

Five reports cover the full spectrum of a wide range of the survey questions (carefully designed to allow for comparison between the 2006 and 2010 survey data). These reports cover topical content from characteristics of an internal audit activity to implications for charting the future trajectory of the profession. The cooperation and sharing among the five report-writing teams representing the Americas, Asia, Europe, and the Middle East have made this project a truly global and collaborative effort.

This collection of reports describing the expected influence of major themes about, and developments in, the profession as extracted from the survey will provide a comprehensive snapshot of the profession globally, offer helpful insights and actionable intelligence, and point the way forward to maintaining the profession's continued relevance and value-added contributions.

4. What's next for internal auditing?

The 2010 IIA Global Internal Audit Survey is the most comprehensive study ever to capture the current perspectives and opinions from a large cross-section of practicing internal auditors, internal audit

service providers, and academics about the nature and scope of assurance and consulting activities on the profession’s status worldwide. This initiative is part of an ongoing global research program funded by The Institute of Internal Auditors Research Foundation (IIARF) through the William G. Bishop III, CIA, Memorial Fund to broaden the understanding of how internal auditing is practiced throughout the world.

A comprehensive database was developed, including more than 13,500 useable responses from respondents in more than 107 countries. The five reports derived from analysis of the survey responses provide useful information to internal audit practitioners, chief audit executives (CAEs), academics, and others to enhance the decision-making process involving staffing, training, career development, compliance with The IIA’s *International Standards for the Professional Practice of Internal Auditing (Standards)*, competencies, and the emerging roles of the internal audit activity.

Characteristics of an Internal Audit Activity (Report I) examines the characteristics of the internal audit activity, including demographics, staffing levels, and reporting relationships.

Core Competencies for Today’s Internal Auditor (Report II) identifies and discusses the most important competencies for internal auditors. It also addresses the adequacy, use, and compliance with The IIA’s *Standards*.

Measuring Internal Auditing’s Value (Report III) focuses on measuring the value of internal auditing to the organization.

What’s Next for Internal Auditing? (Report IV) provides forward-looking insight identifying perceived changes in the roles of the internal audit activity over the next five years.

Imperatives for Change: The IIA’s Global Internal Audit Survey in Action (Report V) contains conclusions, observations, and recommendations for the internal audit activity to anticipate and match organizations’ fast-changing needs to strategically position the profession for the long term.

The 2010 survey builds upon the baseline established in prior Common Body of Knowledge (CBOK) studies (i.e., 2006), allowing for comparison, analysis, and trends

as well as a baseline for comparison when The IIA’s Global Internal Audit Survey is repeated in the future.

5. Benefits to the Profession

Maximizing the internal audit function is imperative to meet the challenges of today’s business environment. Globalization and the rapid pace of change have in many ways altered the critical skill framework necessary for success at various levels of the internal audit function. Internal auditing’s value will be measured by its ability to drive positive change and improvement. It is imperative for internal auditing to examine current trends within the profession and thus be able to make recommendations for changes within the internal audit activity. This should help internal auditing to:

- Anticipate and meet organizations’ needs
- Strategically position the profession for the long term
- Deliver the greatest value to its organization.

6. Expected evolution of the roles of the Internal Audit activity

The role of the internal audit activity in risk management and governance will continue to increase to become accepted from the perspective of internal audit practitioners as the two most important cornerstones of the profession.

Respondents expect an increase in the next years in the role of the internal audit activity in:

- An advisory role in strategy development.
- An education role for the organization’s personnel.
- Training audit committee members.

The proportion of CAEs and managers that expect increases in involvement in strategy development and training to audit committee members is higher than in the other groups of respondents.

Respondents indicate that adopting a more intensive role in risk management and governance necessitates the allocation of additional resources to the internal audit activity (i.e., increase in staff size, audit tools, and techniques).

The top five activities that respondents’ internal audit activities performed in 2010 were:

- An education role for the organization’s personnel.
- Operational auditing (89 percent of respondents).
- Audits of compliance with regulatory code (including privacy) requirements (75 percent of respondents).
- Auditing of financial risks (72 percent of respondents).
- Investigations of fraud and irregularities (71 percent of respondents).
- Evaluating the effectiveness of control frameworks (i.e., using COSO and COBIT) (69 percent of respondents).

The top seven activities that respondents expect to be performed in the next years are:

- Corporate governance reviews (23 percent of respondents).
- Audits of the enterprise risk management process (ERM) (20 percent of respondents).
- Reviews addressing linkage of strategy and company performance (e.g., balanced scorecard —20 percent of respondents).
- Ethics audits (19 percent of respondents).
- Social and sustainability audits (19 percent of respondents).
- Migration to International Financial Reporting Standards (IFRS) (19 percent of respondents).
- Disaster recovery testing and support (18 percent of respondents).

7. Audit tools and techniques

The top five audit tools and techniques that are predicted to be used more in the next years are:

- Computer-assisted audit techniques (CAATs) (63 percent of respondents).
- Electronic workpapers (55 percent of respondents).
- Continuous/real-time auditing (54 percent of respondents).
- Data mining (52 percent of respondents).
- Risk-based audit planning (52 percent of respondents).

The top five responses indicate an expected trend to improve the efficiency of internal audit work consistent with the

growing importance of risk management as one of the two cornerstones of the profession. In line with the need to optimize internal audit resources, those internal audit activities that expect an increase in their staff size in the next five years also expect the highest increase in the use of all five tools and techniques. This report provides a portrait of emerging trends in the internal audit profession by understanding the functions internal auditors perform today and expectations for the future.

By shaping the perceptions of internal auditing its purpose, its intended focus, its differentiation from other professions we will demonstrate where we can add the most value. Because we are involved in all areas of the organization, we understand the employees, their processes and their objectives. Internal auditing brings to the table a composite of not only good business sense, but also in-depth knowledge of good internal controls and risk assessment. It is critical to effective operations, a proactive approach to problem-solving, and achieving organizational goals and to build a broad understanding of this, indeed, is an ongoing educational challenge. The good news is that, today, management and boards and other stakeholder are more aware of internal auditing's value than ever.

8. Conclusions

The role of the Internal Audit function evolving towards an active Management Advisor, participating in the organization, the Internal Auditors will perform a traditional audit, but with a better and more thorough risk analysis and this allows the Internal Auditor to free up some time and effort to assist management in making the audit recommendations happen, also will be expect an increased focus on the assurance function of Internal Audit, paying attention to monitoring, detecting and reporting.

Especially operational audits will become more important in the future, as well in IT as in non-IT processes. On average, no extra focus is expected on the financial processes. This view corresponds with the one of the Internal Auditor him/herself. For quite some people, IT has always been harder to grasp. This is clearly reflected in the answer of the organization’s Audit Committee members.

They expect much more focus on IT. This is also triggered by the fact that IT is often experienced as a black box and often the related issues in these areas are brought to their attention in a complex or technical language. The organization’s Board members recognize the increasing importance of IT and wants to be better informed. In addition, contrary to the organization’s Executive Management members who seem better informed by their (own) Finance department, the organization’s Audit Committee members expect more focus by Internal Audit on the financial processes, potentially driven by the current financial and economic crisis, with an increased focus on the financials (costs, expenses, revenues...).

The one skill the Internal Auditor should focus more on in the future is business insight. All parties, including the Internal Auditors, recognize this. Real business insight is still found to be lacking. This is the most important framework the Internal Auditor should benchmark his observations/recommendations against (next to the Internal Audit standards of course). Communication skills (orally and written) in terms of final reporting (to Executive Management and Audit Committee) but also during the project/audit (to convince and gain respect from operational management) and focus on a limited number of real business risks, is something Executive Management and Audit Committee members consider very important and should get more attention towards the future. Finally, more focus on IT skills (whether or not outsourced) is a common view of all included parties. The added value of the Internal Audit function in 2015 will more and more be determined by its ‘impact’ on the organization, which is amongst others reflected in the increasing importance of the number of action plans implemented and of focused and actionable audit results.

The role of the Internal Audit function can take on different appearances, going from an independent assurance function to a real management advisor. The future Internal Audit function will need to find an equilibrium between both roles, respecting the expectations from the different stakeholders. Independently of which role is selected, the ability to have impact within the organization will be important for every

future Internal Audit function. More added value at minimum cost.

The Impact of Family Policy Expenditures on Fertility in European Countries

Enache Cosmin

West University of Timisoara, Faculty of Economics and Business Administration
cosmin.enache@feaa.uvt.ro

Abstract

The paper intends to check if there is a long-term equilibrium relationship between family and childcare support public expenditure and the total fertility rate, using a sample of 30 European countries, and to evaluate its magnitude.

The results obtained using recent techniques for panel data analysis confirm the theoretical predictions that family and childcare public spending has a positive long-term effect on total fertility rate.

Keywords: Social Security, Fertility, Panel Cointegration

JEL Codes: H55, J13, J18, C23

1. Introduction

In the past decades, the low level and the downward trend of the total fertility rate have been a serious concern both for researchers and policy makers. There are two reasons for these concerns.

First, in most countries fertility reached such low levels which are far below the necessary replacement levels. Coupled with an ageing population, such demographic dynamic could have significant negative implications for countries with PAYG public social security systems, affecting the future sustainability of the welfare state [11], [14], [15]. Higher imbalances in public social security system due to the increasing dependency ratio translate either in crowding out of other desired public expenditure either in higher public debt [7]. These possible outcomes affect both the assumed purposes and financial soundness of the welfare state.

Either way, government intervention through pro-natalist policies is needed. Also, the resulting reduction in labour supply of young skilled workers could affect economic

growth if a corresponding increase in productivity does not offset it [2].

Second, another problematic issue related to observed low-level fertility is that is smaller than the ideal fertility desired by the population. The latest Eurobarometer [6] on this issue showed that, for most European countries, the two child norm is still in place. In a paternalistic approach, this could lead to the idea that government authorities should intervene, putting in place policies aimed at removing the barriers to childbearing and child rearing perceived by the population. In European countries, population replacement is achieved by a total fertility rate a little higher than two children per woman. In this context, only Nordic countries (Denmark, Sweden, Norway, Finland and Iceland), non-continental Anglo-Saxon countries (United Kingdom and Ireland) and France experienced in the past decade fertility levels close to the ones required for population replacement.

The population replacement could be a serious problem especially for Southern European countries (Italy, Spain, Portugal, Greece, Cyprus and Malta) and for Central and Eastern European countries (Bulgaria, Czech Republic, Estonia, Latvia, Lithuania, Hungary, Poland, Romania, Slovenia and Slovakia) which experienced a total fertility rate with more than 0.5 lower than the required level for population replacement.

Having a look at current available data, one could observe for most of the European countries an upward trend in total fertility rate [8].

Histogram for the whole sample of 30 European countries, for the 2000-2008 period, is given in figure 1.

A consistent part of this cross-national variation in European countries fertility rates has often been explained in terms of family and childcare support policy. For instance, Adsera [1] showed that a combination of

public employment and generous maternity benefits boosted young Scandinavian women fertility. Bonoli [3] highlights the importance of childcare and the level of family benefits as determinants of fertility rates. D’Addio and d’Ercole [5] emphasizes the role of wider childcare availability, lower direct costs of children, higher part-time availability and longer maternity leaves for a boost of fertility in OECD countries.

Figure 1 Total Fertility Rate Histogram for 30 European Countries for 2000-2008 period

This paper provides new empirical evidence regarding the existing relation between family and childcare policies and fertility. It will introduce new estimates of the impact of family and childcare public expenditure on fertility for a sample of 30 European countries and it will answer the basic empirical question of whether higher family and childcare public expenditures are associated with increasing total fertility rate.

2. Methodology and Results

In this context, the paper intends to test the validity of the following hypothesis:

H0: Family and childcare support public expenditures (FCSPE) have a positive impact on the total fertility rate (TFR)

In order to test this hypothesis, we built a panel (N=30, T=9), using as variables:

- The total fertility rate (TFR)– the average number of children born by a woman during her entire life;
- Family and childcare support public expenditures (FCSPE) – as a percentage of GDP.

The sample used was composed by 30 European countries (the 27 EU member states along with Iceland, Norway and

Switzerland). The available time-span for the data used was 2000-2008. The source of the data used is Eurostat statistical database.

Descriptive statistics for both variables is given in Table 1:

Table 1 Descriptive Statistics

	TFR	FCSPE
Mean	1.519037	1.974061
Median	1.420000	1.685404
Maximum	2.150000	3.970579
Minimum	1.140000	0.216419
Std. Dev.	0.252177	0.844279
Skewness	0.581172	0.478928
Kurtosis	2.073765	2.192719
Jarque-Bera	24.85076	17.65339
Probability	0.000004	0.000147
Sum	410.1400	532.9964
Sum Sq. Dev.	17.10655	191.7451
Observations	270	270

The chosen research methodology is represented by recent panel data analysis methods, and was applied in three steps.

First, we run some unit root tests in panel: LLC test [12], IPS test [9] and two Fisher-type tests which use ADF and PP tests [13], [4].

All the four test employed have as a null hypothesis the existence of a unit root. But, only the LLC test uses the null hypothesis of a common unit root for all the cross-section of the panel, while the IPS, ADF-Fisher and PP-Fisher tests drop this homogeneity hypothesis.

Empirical specification for the unit root tests was chosen having in mind that both variables have only non-negative values and also have a natural upper bound.

The number of children born by a woman during her entire life is a finite, low number, constrained by biological and time factors.

The amount of family and childcare support public expenditures is also limited, given the public budget constraint. In this context, no trend was included in the empirical specification used for all panel unit root tests.

To account for country heterogeneity individual effects were included in the specification:

$$\Delta y_{it} = \alpha_i + \rho y_{it-1} + \varepsilon_{it} \quad (1)$$

LLC test impose a homogenous autoregressive root for all cross sections of the panel ($\rho_i = \rho_j = \rho$ for $\forall i, j$).

This homogeneity limitation is overcome by IPS test which drops this hypothesis, allowing for auto-regressive root heterogeneity ($\rho_i \neq \rho_j$ for $\forall i, j$).

ADF-Fisher and PP-Fisher tests are non-parametric Fisher-type tests based on a combination of significance levels given by p-values of individual unit root tests for all the panel cross-sections.

To start, we run the panel unit root tests for the time-series of both variables in levels.

Table 2 Panel Unit Root Tests – Variables in Levels

Test	TFR	FCSPE
LLC t*	1.16	-3.47***
IPS W-stat	3.66	0.57
ADF-Fisher χ^2	48.14	61.00
PP-Fisher χ^2	50.26	86.12**

(***), (**) and (*) denotes rejection of the unit root hypothesis at the 1%, 5% and 10% levels, respectively

The results show that time series for both variables are not-stationary in levels. Nevertheless, it should be mentioned that for family and childcare support public expenditures variable, two out of four unit root tests were unable to reject the null hypothesis of a unit root. Given that in panels with short time dimension as in our case (T=9) panel unit root test have low power, we accepted the non-stationarity of family and childcare support public expenditures variable in levels.

Next, we re-run all the unit root tests for the first difference time series for the two variables.

Table 3 Panel Unit Root Tests – Variables in First Differences

Test	Δ TFR	Δ FCSPE
LLC t*	-13.01***	-7.28***
IPS W-stat	-3.44***	-1.64*
ADF-Fisher χ^2	116.17***	83.50**
PP-Fisher χ^2	183.64***	121.21***

(***), (**) and (*) denotes rejection of the unit root hypothesis at the 1%, 5% and 10% levels, respectively

The results show that the first differences

series for both variables are stationary (i.e. are I(1) processes).

Next, we ran panel cointegration test developed by Pedroni ([16], [17]), in order to check if there is a long-term relation between total fertility rate and family and childcare support public expenditures.

To derive the test statistics, the following long-term relation is estimated:

$$TFR_{it} = \alpha_i + \delta_i t + \beta_i FCSPE_{it} + \varepsilon_{it} \quad (2)$$

where: $i = 1 \div 30$, $t = 1 \div 9$.

The residuals from previous regression are used to estimate the following relation:

$$\varepsilon_{it} = \rho_i \varepsilon_{it-1} + u_{it} \quad (3)$$

Pedroni proposed seven tests, four based on the within dimension and three on the between dimension. For all seven tests, the null hypothesis is no intra-individual cointegration ($\rho_i = 1$ for $\forall i$). Under the alternative hypothesis the existence of a different cointegration relation for each cross-section is considered. For the four tests based on within dimension, the alternative hypothesis is given by $\rho_i = \rho < 1$ for $\forall i$. For the three tests based on between dimension, the alternative hypothesis is given by $\rho_i < 1$ for $\forall i$.

The Pedroni test (see Table 4) validates the existence of a cointegration relation between the fertility rate (TFR) and family and childcare support public expenditures (FCSPE) in the situation in which this relation includes a constant and a trend (four out of the seven test reject the null hypothesis of no cointegration between the two variables). More, Pedroni [16] indicates that in small sized samples (T<20), as it is in our case, the Group ADF Statistic test, followed by the Panel v-Statistic test are the most relevant. Both of these tests reject the null hypothesis of no cointegration between the two variables.

Table 4 Pedroni Test for Panel Cointegration

Test	H1	H2	H3
Panel v	1.08	5.65***	-3.51
Panel rho	1.70	1.82	-0.45

Test	H1	H2	H3
Panel PP	1.75	-4.48***	-1.98**
Panel ADF	2.37	1.35	-2.41***
Group rho	2.92	3.60	3.68
Group PP	0.07	-7.64***	-0.67
Group ADF	2.14	-2.74***	-3.29***

H1 - Constant and no trend ($\delta_i = 0 \forall i$); H2 - Constant and trend; H3 - No constant and no trend ($\alpha_i = 0, \delta_i = 0 \forall i$).

(***), (**) and (*) denotes rejection of the no cointegration hypothesis at the 1%, 5% and 10% levels, respectively

Finally, in order to estimate the intensity and the sign of the relation between the total fertility rate and the family and childcare support public expenditure, we employed the panel Dynamic OLS (DOLS) estimation procedure. In a study of finite sample properties of OLS, FMOLS and DOLS estimators, Kao and Chiang [10] showed that DOLS estimator is superior to both OLS and FMOLS.

Assuming complete homogeneity of the cointegration vectors, the following regression is estimated:

$$TFR_{it} = \alpha_i + \beta FCSPE_{it} + \sum_{j=-k_1}^{k_2} \gamma_{ij} \Delta FCSPE_{it-j} + \varepsilon_{it} \quad (4)$$

where: k_1 is the number of lags and k_2 is the number of leads.

In order to determine the appropriate number of lags (k_1) an iterative procedure was employed. First, the regression was initially run with n lags. If the n -th lag was found to be insignificant, than the lag was deleted and the regression was run again. The procedure was repeated until the last lag was found to be significant. The same procedure was used to determine the appropriate number of leads (k_2). In our regression two lags and two leads were used.

The estimation result for the relation between family and childcare public expenditures and total fertility rate confirms the existence of a direct long-run equilibrium relation between the two variables, in accord

with the theoretical predictions.

The coefficients of the first difference variables are of no economic interest and therefore are not listed in Table 5.

Table 5 Panel DOLS

Variable	Coefficient
FCSPE	0.18***
R^2	0.90
Wald χ^2	7.38***

(***), (**) and (*) denotes statistical significance at the 1%, 5% and 10% levels, respectively.

The results show that an increase of 1% of gross domestic product in family policy expenditures could lead to an increase with 0.18 of the number of children born by a woman during her entire life.

3. Conclusions

The hypothesis tested has been confirmed for the sample of 30 European countries, for the period 200-2008.

Family and childcare support public expenditure have a positive long-term effect on the fertility rate ($\beta=0.18$).

This result indicates the fact that in the sample European countries, the public authorities' policies for family and childcare support are efficient and contribute to increasing fertility rate. This is a very significant result for countries with a low fertility rate. In order to boost fertility, government authorities could increase the share in gross domestic product of public expenditures targeted at families and childcare support.

Risk Typology in Foreign Investment

Ene Sebastian George

dan_chilarez@yahoo.com

Abstract

The paper highlights the main categories of risks that transnational companies can face when implementing foreign investment. These risks affect the company's performance and therefore they must be properly managed. Risk factors, risk categories and risk control measures are analyzed here. We also propose a conceptual model of risk measurement that can effectively establish to which specific class of risk belongs the national economy.

Key words: risk, foreign investment, conceptual model, indicators

Jel classification: F21, G30

1. Introduction

In today's economy, the risk is an ever present element with profound implications at the micro and macroeconomic level. For multinational companies, risk analysis is an indispensable factor in the investment analysis. Any company will perform risk analysis regardless of its typology. The detailed knowledge of the risks that the company is exposed to allows it to adopt decisions that can lead to risk elimination, reduction and effective management. When making an investment, the multinational company will must take into consideration a multifactorial analysis directed to three dominant aspects: the size of the investment, the size of the profit generated by the investment and the risk associated with the investment. The investment return deadline and the investment cost get to a second importance as there is no question of payback unless the investment generates the profit expected by the investors or the risks involved are so large that they cannot be

quantified or managed, damaging thus the return on investment and the profits generated by it. Knowing the typology of risk in foreign investment, of risk factors, of the methods of identification, quantification and management will enable the company to easily adopt investment decisions, based on the deep knowledge of the environment in which the investment is made.

2. Risk and foreign investment – literature review

The theories about risk and its implications were developed at the beginning of the twentieth century, when the economic and financial relations started to develop at an accelerated pace, and economists and other categories of professionals involved in the economic and technological process began to raise questions regarding the possibilities of accomplishing precisely planned activities. The first theories about risk as it is currently defined were elaborated by Frank Knight [1], who talked about the association between the probability theory with risk. Two different meanings of risk, a subjective and an objective approach, are highlighted. According to Knight, the term risk designates in a subjective approach the possibility of measuring uncertainty.

Subsequently, the theories about the risk have taken new values, much more complex. Risk analysis and risk management started to be the concern of more and more specialists in various fields. Investment portfolio management gets a new dimension along with portfolio theory developed by Harry Markowitz [2]. Although Markowitz does not strictly define risk, his theory explicitly exposes the investors' decisions and their perception of risk. It makes the connection between the return on investment and its risk.

Risk complexity and its multiple meanings are also highlighted by Glyn Halton [3] who makes an insight of the literature. The findings reveal the complex nature of risk, the multiple ways of approaching different authors and the various perceptions of risk depending on the individual and situation. In spite of all this, two keywords are found in most approaches: probability and uncertainty. The varied meanings of risk are also noticed by Ilan Kelman [4] who makes a presentation of risk definitions. Thus, for Blong [5] risk implies the existence of three elements which are found in a simplified form, while for Crichton [6] or Granger [7] it represents hazard, vulnerability and exposure or elements at risk, which may be expressed or quantified mathematically. According to Sayers [7], risk is probability x consequence.

The American authors [8] define risk: “the possibility of suffering harm of loss, or a course involving uncertain danger or hazard.”

In another sense, the Romanian authors [9], define risk as being “*a possible prognosticable and partially quantifiable phenomenon that can affect the entity’s activities*”. Depending on the type of work and form of risk, the authors mentioned above identify eight major categories of risks that a company can face:

- The operational risk – reflects the company’s incapacity to earn income to cover expenses. Basically there is no correlation between the workload and the structure of costs in a variable business environment.
- The financial risk – characterizes the variability of the indicators under the company’s financial structure.
- The risk of bankruptcy - involves the assessment of the company’s ability to adjust its financial obligations in due time. Basically it analyzes and verifies the company’s solvency that means the capacity to cope with the overdue obligations arising either from the previously contracted commitments or from the current operations whose performance is a condition to continue the activity, or from compulsory sampling.
- The technical risk - adequately appreciated for the operating probabilities of the technical and

technological system components.

- The social risk – generated by the appearance of some inadvertences regarding the personnel or the labor force.
- The cultural risk - caused by the changes in company culture and the impact it creates on its economic system.
- The country risk - provides a snapshot of the way in which the national economic climate is perceived by the international environment.
- The investment risk - generated by the investment made and its ability to cover the investment costs, its depreciation and the profit expected by the investor.

In terms of foreign direct investment we should follow the motivations and the determinants that the investment decision is based on. In what motivations are regarded, Dunning J. [10] makes the best identification of the resorts that represent the basis of the investment decision of multinational companies in this regard. Thus, firms make direct foreign investment:

- to procure the resources necessary to develop their activity. In this respect material resources (minerals and fuels) are particularly sought.
- to be able to spread their products on other markets. The expansion on other markets has the effect of increasing sales and counteracts competition.
- to increase efficiency. Increasing efficiency practically means making a larger gap between the selling price of products and the production cost.
- to acquire strategic assets. This operation aims to expand the production capacity and to locate it on new markets or counteract competition.
- for other reasons such as: the identification of the countries with permissive laws from some points of view (escape investments), parent company support through various activities and products produced abroad (support investments).

The determinants of FDI reveal some aspects regarding the conditions that favor foreign direct investment, conditions that attract a certain host country. The categories of determinants and their aspects are

highlighted by Sanjaya Lall [11] who speaks of three major categories of determinants: the economic conditions generated by the market characteristics, resources and competitiveness found in the host country, the host country policies that include: the macroeconomic policies, the private sector policies, trade and industry as well as the policies of foreign direct investment, and the third category, the transnational corporate strategies including risk and its perception and the multiple strategies adopted by these companies. Besides these categories of factors, we can add a new one, namely that of the factors particularly related to behavior and habits: corruption, nepotism.

The knowledge of the motivations and the determinants of FDI is very important in risk analysis as each category is associated with one or more risks or risk categories.

3. Typology of risk for foreign investment

At company level, the investment strategy is elaborated and fundamented by the company experts, who analyze all the aspects regarding: the identification of the best business opportunities, the implementation and evaluation of the investment project, the analysis of the project cost and its profitability, the identification and selection of financing sources, the analysis and management of possible risks. Each of these components is bearing risks that must be analyzed and managed.

The identification of the best business opportunities – the panel of business opportunities is not properly identified. The analysis and the selection of the best business has not been made in the best parameters. An analysis of the business environment in the country where the investment will be has not been properly conducted. *The implementation and evaluation of the investment project* - the project has not been properly evaluated from the technical, financial point of view and regarding its resources, time of execution and commissioning service.

The analysis of the project cost and profitability – the improper fundamentation of costs (lower costs or higher than the real ones). The profitability rates differ from those initially planned, threatening the payback times or the estimated profits.

The identification and selection of financing sources – the selected financing sources are not the best for the company (cost, extensions, and repayment terms).

Identification, analysis and management of potential risks - not all risks are identified for the investment and the methods of analysis and management of potential risks are not established.

These issues concern risks that regard the company’s internal strategy. We can consider them internal risks. Besides these potential internal risks, in the investment or investment operation process, multinational companies also face a number of risks that are not strictly related to the internal strategy of the company, they are external risks.

The specialized literature[8] classified the risk of foreign investments into three categories: firm-specific risk (micro-risk), country-specific risk in which the investment is made (macro-risk) and global-specific risk (mondo-risk).

The firm-specific risk category includes: business risk - sales, costs, profits, foreign exchange risk - transaction exposure, operating exposure, accounting exposure, governance risk - goal conflict, ownership structure, human resource.

The host country-specific risk category includes: transfer risk - blocked funds, macroeconomic disequilibrium, economic infrastructure, sovereign credit risk, war and ethnic strife, cultural differences, ownership structures, human resource Norms, Religion, Corruption and nepotism, intellectual property rights; protectionism - defense industry, agriculture, the infant industry.

The global-risk includes: terrorism - potential terrorist attack generated by the host country’s foreign policies, e.g. the U.S.A., the U.K., anti-globalization movement; environment concerns; cyber attacks; poverty. The American authors mentioned above also suggest a number of risk combating strategies. (Table. No. 1)

Table no. 1
Strategies of combating risk

Sensitivity analysis	Minimize assets at risk
<ul style="list-style-type: none"> • simulating business plan • adjusting 	<ul style="list-style-type: none"> • minimize equity in subsidiary • borrow

discount rate • adjusting cash flows	locally
Diversification	Insurance
• plant location • source of debt and equity • currency of denomination • supply source • sales location	• hedging currency risk • risk sharing agreement • country investment agreements • investment guarantees

source: (Moffet, Stonehill, Eiteman, 2003)

One may observe that these strategies cover a range of distinct methods through which risks are reduced. Sensitivity analysis involves interventions that are particularly linked to the way in which the investment strategy is conceived (rates, revenues, expenses, cash flow). Assets are managed in such ways that especially aim at their size and control. Diversification is, in our view, a much more complex and expensive strategy than others. If the strategy proves to be wrong, the risks are much higher. The method of reducing risk through various insurance forms is increasingly used at international level.

4. A conceptual model of risk analysis in foreign investments

The model that reflects the way in which the risk for foreign investment is perceived involves several steps such as:

1. identification of the relevant risk-related elements
2. realization of a model to quantify risk
3. creating a system of risk interpretation.

According to our opinion, the significant elements that belong to the risk analysis of FDI are:

- a. The indicators of macroeconomic performance. This category includes: the rate of inflation, the rate of gross domestic product, the rate of public

debt and budget deficit.

- b. The economic freedom offers a valuable starting place from which to reflect on the fundamental principles of the free-market system and the lasting value of economic freedom. The index is formed on the basis of ten indicators representative for a free market: the corruption level, property rights, governmental and fiscal and public expenditure policies, the monetary policy, the labor force policy, the freedom to make business, trade, investment policies, and financial policies.
- c. The country risk classifications are meant to reflect the country risk. Under the participants’ system, country risk is composed of transfer and convertibility risk (i.e. the risk a government imposes capital or exchange controls that prevent an entity from converting local currency into foreign currency and/or transferring funds to creditors located outside the country) and cases of force majeure (e.g. war, expropriation, revolution, civil disturbance, floods, earthquakes). The country risk classifications are not sovereign risk classifications and should not, therefore, be compared with the sovereign risk classifications of private credit rating agencies (CRAs). Conceptually, they are more similar to the “country ceilings” that are produced by some of the major CRAs. The Participants’ country risk classification system uses a scale of eight risk categories (0-7).
- d. The global competitiveness index allows assessing and comparing a country’s economic performance. The composition is a composite index which includes 12 components: the institutional environment, infrastructure, macroeconomic environment, higher education and training, goods market efficiency, technological readiness, labor market efficiency, financial market development, market size, business sophistication, innovation, health and primary education.

The proposed theoretical model is based

on the arithmetic average of the indicators that are part of the model.

$$Y = \frac{\sum_{i=1}^4 Indi}{4}$$

where:

Indi = indicators that are part of the model
and I = 1- 4 represents the number of indicators

The classification of Y (the phenomenon) between certain parameters allows its qualitative characterization. The economic theory captures either the intervals with limit $Y \in (k, z)$ or intervals with upper or lower limit $Y \leq K$ or $Y \geq K$.

In our case the equation becomes:

$$Ir = (PE + EF + CR + CG)/4$$

where: Ir – risk index; PE – macroeconomic performance, EF – economic freedom, CR- country risk, CG- global competitiveness.

The methodology for calculating the indicators is similar to the methodology used by PNUD in calculating the human development index (HDI).

Thus the indicators are calculated as follows:

$$\frac{V_i - V_{i \min}}{V_{i \max} - V_{i \min}}$$

Vind.I = $\frac{V_i - V_{i \min}}{V_{i \max} - V_{i \min}}$, where:

V_i – value of the “I” indicator at the country level

$V_{i \min}$ – minimum value of the “I” indicator at the level of the countries that are evaluated with this indicator.

$V_{i \max}$ –maximum value of the “I” indicator at the level of the countries that are evaluated with this indicator.

For inflation and public debt we use the following formula:

$$\frac{V_i - V_{i \min}}{V_{i \max} - V_{i \min}}$$

Vind.I = $(1 - \frac{V_i - V_{i \min}}{V_{i \max} - V_{i \min}}) \times 100$

For the criteria where there are differences between the maximum and minimum values, the values are converted into logarithms.

According to the methodology, all values can have a position in the interval 0-100. The values that go towards zero indicate a very low risk, while the values going to 100 indicate a high risk.

To facilitate classification with a particular area, we offer the following classes of risk:

Table no. 2
Classes of risk

Class	Scoring	Risk category	Recommendation
A	0 - 20	Very low risk	Recommended for investments
B	21 - 40	Low risk	
C	41 - 60	Medium risk	Caution
D	61 - 80	High risk	Not recommended for investments
E	81 - 100	Very high risk	

Source: made by the authors

The classes from A to E reflect the economic position towards risk. At the same time, it indicates, as a recommendation, the position towards risk. The indicator presented in this form can be a very useful tool and easy to interpret for the companies that want to invest in a particular country.

5. Conclusions

Risk is a possible element that we can encounter in any activity. Knowing the risk, its analysis and interpretation, the adoption of some measures of prevention and control represent key-elements to risk management at company level. The study highlights the presence of three major categories of risks that a company can face when deciding to make an investment in a different country than the country of origin. The proposed indicator together with the presented classes of risks constitutes various risk analysis tools that can be used and developed by any company.

“This work received the financial support by the project ‘Post-Doctoral Studies in Economics: Training program for elite researchers – SPOD’ co-funded by the European Social Fund through the Development of Human Resources Operational Programme 2007-2013, contract no. POSDRU/89/1.5/S/61755.”

The Foreign Direct Investment - Investment Environment Relationship

Ene Sebastian

Universitatea Constantin Brancoveanu Pitesti

george_sene@yahoo.com

Abstract

This paper aims to identify the relationship between foreign direct investment and the investment environment. The major investment environment variables are highlighted, the strength and correlation between them. The scientific approach highlights the main motivations of international companies to invest in different countries' economies, other than the origin ones, as well as the elements specific to the investment environment found in the acceptance of various international organisations and institutions. The model build is based on a multiple regression function and four variables that characterise the investment environment. The regression equation obtained, as well as the statistical analysis highlight how foreign direct investments are influenced by the model's variables.

Key words: variables, model, foreign investment, investment environment

JEL Classification: C30,G 30

1. Introduction

Attracting foreign direct investment has been and continues to be a central concern of any government due to the many implications that this type of investment generates within an economy. Investment theories put foreign direct investment motivations and determinants in the spotlight, but without putting special emphasis on the relationship between investment and the investment environment. However, the above mentioned theories, capture, without explaining, a series of elements constituting the investment environment variables. The investor is undoubtedly concerned with the investment – efficiency relationship. He will be guided according to the organisation's specific needs

to those locations which enable business growth and profit maximisation. The choice of the investment location requires a double analysis: identifying the internal motivations underlying the business expansion and the investment environment specific to the host country. Most often, the investment decision involves creating a matrix showing the advantages and disadvantages arising from the host country's policies, freedom of action, tax system, property right or other elements related to the firm's external environment, more or less controllable elements.

2. Theories specific to foreign investment and investment environment

The theories on foreign direct investment have diversified over time, as financial relations have developed, national companies have become transnational corporations and global economy has entered the age of globalisation.

Over time important authors have expressed their views on foreign investment, on their role, on the business internationalisation stages. Among the most important theories there are: production cycle theory [1], market imperfections theory [2], Porter's competitive advantage theory [3] if we refer to the representatives of the North American continent; but also Anglo-Saxon theories, such as the representatives of the oligopoly theory [4] or the eclectic theory [5] – a theory very present in the scientific community today. According to Vernon, the internationalisation of business involves four stages: 1. consolidation in the country of origin; 2. export to the country of destination (which will become the location for investment); 3. localisation of production in the host country; 4. export from the host country. Hymer identifies among the motivations at the basis of business internationalisation the benefits achieved by

the market (fiscal policy, ratio between profitability and cost, access to resources). He is the first author who includes among motivations the variables of the investment environment. The “Porter Diamond” shows which are the factors at the basis of the competitive advantage: the companies’ strategy, the state of the factors, the demand parameters, and the nature of related industries. The oligopoly theory highlights the advantages multinational companies can benefit from due to the oligopolistic characteristics that can develop or generate them as a result of localisation in a particular country.

The OLI paradigm developed by J. Dunning is the current dominant opinion today. There are three essential aspects of the foreign investment theory that are highlighted: the investor’s benefits, the advantages of the location and the internationalisation benefits. Dunning also identifies five categories of motivations behind transnational corporations’ investment decision. Thus, transnational companies are turning to natural resource-rich countries or to countries where they can get an advantage due to cheap and relatively qualified labour. Thus, they direct towards the poor countries which have ores and fuels or towards emerging countries whose labour is paid less than the workforce in the country of origin. This can create a significant gap between the production cost and the selling price, a gap representing a major advantage for the company over the competitors.

Selling to other markets is a way to maximise the turnover and therefore the profit. The markets from the developed countries that have a high absorption rate are targeted, the products offered being special in terms of quality, but also the markets from the developing countries, which have great potential and which generally absorb products that are not really state-of-the-art.

Transnational companies seeking to increase efficiency are based on three major objectives: rationalisation of production, extended economies and risk diversification. Efficiency is measured as the optimal ratio between the company’s income and expenditure.

The acquisition of strategic assets involves the extension of the production capacity in the host country to produce for the local

market at lower costs, thus achieving a closer relation with the customers on the one hand, and a cost saving on the other. Another objective at the basis of strategic assets acquisition is counteracting competition, to stop its expansion.

In terms of motivations generated by the permissive legislation or by the parent company’s support, the scope of these motivations can be generated precisely by a number of variables specific to the friendlier investment environment than at home or in other countries that could become locations for investment.

The analysis of these motivations allows the identification of the internal scope of the multinational company that decides to make an investment in a certain country that becomes the host country. But the investment decision does not only involve exploring the internal motivations. The investment environment is a landmark of great importance in the investment analysis. We can say that an investment decision, respectively the achievement of the investment involves the exploration and analysis of the needs generated by the motivations specific to the company that we call internal motivations, but also by the conditions encountered in the host country that we call external motivations generated by the investment environment conditions specific to the host country.

Regarding the investment climate the World Bank states: *“the investment climate represents the economic and financial conditions in a country that affect both the country’s population and the investors”* [6]. This climate should provide business opportunities for all businesses regardless of their size. *The investment climate contributes significantly to the economic growth and to poverty reduction* [6]

There are concerns about creating an attractive investment climate in the European Union as well to enable the achievement of sustainable investment designed to pull Europe out of recession. In this respect the European Commission states: *“the setting up and development of an enterprise is not only an exciting adventure, but also a real challenge. To help entrepreneurs meet this challenge, it is necessary to create a favourable business environment. Facilitating the access to financing, clearer and more*

effective legislation, development of an entrepreneurial culture and business support networks are all essential for the setting up and development of enterprises. However, creating a favourable business environment does not only mean improving the companies' growth potential. It also means making Europe an advantageous place to invest and work. Thus, promoting corporate social responsibility contributes to increasing the attractiveness of European business. Small and medium enterprises (SMEs) represent 99% of European companies. Their small size makes them very sensitive to the changes in industry and in the operating environment. It is therefore extremely important to pay special political attention to their welfare” [7]

There are five courses of action mentioned that will lead to a favourable investment environment: 1. Small and medium enterprises – because they represent 99% of European companies; 2. Entrepreneurship; 3. Business support; 4. *Improvement of the business environment*; 5. Social responsibility of the enterprise.

3. Analysis of the business environment – foreign direct investment relationship

The analysis of the relationship between foreign direct investment and the business environment involves identifying a model and the specific variables allowing the quantification of the relationship between the two components analysed.

The elements targeted by various organisations or financial institutions to characterise the investment environment differ in most cases, but there are also common elements.

In the case of the World Bank the following elements are targeted and analysed: stability and security, regulation and taxation, finance and infrastructure, labour market (WDR 2005).

International Finance Corporation characterises the investment environment of a country using the following elements: business environment, infrastructure, regulations, taxes and licenses, corruption, crime, finance, innovation and employment.

International Bank for Reconstruction and Development (IBRD) in the annual reports – Doing Business – uses the following

attributes in determining the ranking of a country's investment/business environment: ease of business start-up, permits, employment terms, company and property registration, getting credit, taxes, international trade, enforcing contracts, closing business.

As it can be seen there are certain different elements that are targeted and which compose differently the investment climate. It may be noted that the above mentioned institutions and organisations do not use macroeconomic performance indicators in characterising a country's investment climate. We consider it imperative that these macroeconomic performance indicators be part of the model characterising the relationship between the investment climate and foreign direct investment.

In this context the model that captures the relationship foreign direct investment – investment environment is written as follows:

$$FDI = (\text{investment climate variables}) \\ \text{is extended to} \\ FDI = (RL, LG, RE, OM)$$

where *the investment climate variables* consist of: **Rule of law** (property rights, freedom from corruption); **Limited government** (fiscal freedom, government spending); **Regulatory efficiency** (business freedom, labour freedom, monetary freedom); **Open markets** (trade freedom, investment freedom, financial freedom).

In this context one can use a multiple regression function to characterise the phenomenon.

$$Y_t = a_0 + a_1X_{1t} + a_2X_{2t} + \dots + a_kX_{kt} + e_t, \quad t = 1, 2, \dots, n$$

where: a_0 – is the constant value, $a_1 - a_k$ equation parameters, and $x_{1t} - x_{kt}$ variables of the function, e_t – standard error.

In our case the function is written:

$$FDI = a_0 + a_1(RL) + a_2(LG) + a_3(RE) + a_4(OM) + e_t$$

Where:

RL = rule of law containing property rights and freedom from corruption.

This indicator is calculated as average of the two indicators that compose it.

LG = limited government includes fiscal freedom, government spending. The indicator is calculated as average of the two indicators that compose it.

Table no. 2

RE = regulatory efficiency includes business freedom, labour freedom, monetary freedom. The indicator is calculated as average of the three indicators that compose it.

OM = open markets includes trade freedom, investment freedom and financial freedom. The indicator is calculated as average of the three indicators that compose it.

The statistics used in the model are presented in Tables no. 1 and 2 as follows:

Table no. 1

The FDI value and the indicators that characterise the business environment

Year	Foreign direct investment (mil. euro)	Rule of law	Limited government	Regulatory efficiency	Open markets
2011	1917	39	72,2	69,06	72,53
2010	2220	39	72,8	68,73	70,83
2009	3488	36	78,5	69	65,26
2008	9496	30,5	78,2	67,9	65,33

2006	9059	29,5	78,2	66,23	56,13
2005	5213	29	69,5	57,7	50,13
2004	5183	28	72,35	55,9	45,86

Source: www.bmr.ro.

<http://www.heritage.org/index/explore> and processing of the author

Due to the very large differences in value between foreign direct investment and business environment indicators it was needed to find the logarithms of these values.

The statistical analysis shows a very slight standard deviation located between 0.02 and 0.27 for limited government and 0.27 for FDI. In terms of skewness analysis, it shows their distribution to the median. Thus, the positive values indicate a distribution concentrated on the left while the negative values indicate a distribution concentrated on the right. Statistically, one can notice “the length of the series tail” and its orientation. In the case of the analysis of the variables within the model presented, one can notice that only the rule of law has a positive value indicating a left-oriented distribution, while foreign investment, limited government, regulatory efficiency and open markets have negative values, thus a right-oriented distribution.

The logarithmic values of the indicators presented in Table no. 1

Year	Foreign direct investment (mil. euro)	Rule of law	Limited government	Regulatory efficiency	Open markets

The relationship between the variables is highlighted by the Correlation Matrix. This highlights the strength of the links between variables. The standard values are included in the [- 1, 1] range. If the values tend towards - 1 or + 1, then the correlation is strong. On the other hand, for the values that tend towards zero we consider a weak correlation and for the zero value the variables are independent. In Table no. 4 we notice the intensity of the links between the variables. Regarding foreign direct investment we find out that they are strongly correlated with rule of law and averagely correlated with limited government and open market. Surprisingly, the correlation is weak with regulatory efficiency.

Table no. 4

In terms of the equation resulting from the application the model is the following:

$$FDI = -5,848673RL - 0,237419LG + 6,373131RE - 0,864731OM + 8,932540$$

Table no.5
Equation

Variable	Coefficient	Std. Error	t-Statistic	Prob.
RL	-5.848673	1.199431	-4.876205	0.0165
LG	-0.237419	3.557490	-0.066738	0.9510
RE	6.373131	4.661623	1.367149	0.2650
OM	-0.864731	1.847348	-0.468093	0.6716
C	8.932540	3.537073	2.525404	0.0858

R-squared	0.968877	Mean dependent var	9.668251
Adjusted R-squared	0.927380	S.D. dependent var	0.275576
S.E. of regression	0.074262	Akaike info criterion	-2.093254
Sum squared resid	0.016545	Schwarz criterion	-2.043604
Log likelihood	13.37302	F-statistic	23.34811
Durbin-Watson stat	2.364278	Prob(F-statistic)	0.013470

Source: processing of the author

For this equation R – squared is 0.968877 very close to the standard value 1, and adjusted R – squared is 0.927380, a value very close to R – squared. In these circumstances we can validate the model; moreover, it shows strong links between components.

4. Conclusions

Between the foreign investment and the investment environment there is a direct and stronger link. The investment environment in a country together with the transnational company’s internal motivations is at the basis of the investment decision in a particular location. The investment climate variables characterise the economic environment

specific to the host country: ownership, corruption, fiscal and monetary policy, trade freedom, government spending, regulations on investment, labour market all are the pros and cons of investing. The model presented allows identifying the relationship between foreign direct investment and the business components, the intensity and correlation of these links.

Importance of Assessing and Managing Credit Risk in Banking Institutions

Florea Dragos,
Valahia University of Targoviste
floreamdragos73@yahoo.com

Abstract

Credit market is in a continuous and complex process of adaptation of offered products and services, due to the competition between banks, competition generated also by the globalization effects of economic activities.

In these terms, the banks are obligated to consolidate their position on the market by identification the ratio between risk and profit, so that it can be assured business continuity.

For the banks to be able to maintain on the market it is necessary that they comply with the standards and the regulations on credit risk assessment and management.

A performance banking strategy should include clearly defined programs and measures for assessing and managing credit risk, measures that have to minimize potential exposure to bank risk and maximizing the profits.

Keywords: credit risk, identification of risk, assessing the risk, managing the risk, banking performance.

JEL classification: G21, G32.

1. Introduction

Evaluation and management of credit risk is a complex process involving major resources and knowledge. The success of these assessment activities and credit risk management in banking institutions is dependent on managers' ability to correctly identify the potential risks they face when they decide a company credit.

This stage is actually initiating the risk assessment process, after establishing the right context in which the company will work in the future.

If a banking institution assesses a request for funding companies it will try to identify in advance all the threats that could affect both the activity of the bank and the company that require funding.

Credit risk is a challenge for every financial institution in that it can not be eliminated entirely from lending activities. This risk is assumed by the difference of each banking institution based on behavior and different attitudes from risk.

2. The need and the role of assessment and management of credit risk

It is known that a banking strategy should include both program performance and clear procedures for assessing and managing credit risk, which aim to minimize the likelihood of such risks and potentially expose the bank. The main objective of these programs and procedures is to minimize the additional costs incurred by the bank.

In some cases the bank's strategy may involve more risk taking or risk us. In this case the decision must be made considering the additional costs necessary to ensure greater protection.

As a general principle, the main objectives of assessment and managing credit risk are:

- maximizing profitability;
- minimize exposure;
- compliance with banking regulations in force both internal and external.

Often the importance of assessing and managing credit risk is not limited to minimize costs. The constant preoccupation of bank management or top management, to minimize exposure to risk has positive effects on the behavior of bank employees who become more rigorous and conscientious in fulfilling their duties. [9]

Assessment and effective management of credit risk and its toll on the public image of

the bank. Customers want a secure bank and shareholders alike.

By monitoring risk in lending and exposures by industry, banking companies aim to maintain a constant balance between its objective of risk dispersion and the interest which aims to develop the national economy as a whole, with the support of sectors considered priority strategic or competitive potential domestic and foreign. [2]

With the assessment and management of credit risk for the banks lending has become an issue of growing importance and also more pressing. In this time of economic crisis and financial instability, commercial banks in Romania have to bear higher credit risks under the fierce competition erodes their profit margins high. In these conditions, increased vulnerability to negative shocks successive banks, leading for mismanagement of credit risk in bank failure. To survive these conditions and to thrive and policy banks need new models of assessment and credit risk management, credit market conditions always adapted. In these circumstances, bank management, implementation of appropriate policies assessment and risk management becomes a necessity, as well as assimilating the employees of some new techniques and tools for risk management.

Romanian banking sector growth has become an essential attribute of banking performance. It is not an end in itself but is imposed by the profitability of investments in new technologies, possible only in conditions of effective assessment and management of credit risk.

Economic and financial environment in which they operate both banks and their clients (companies) generate new business opportunities for both sides, involving also the most complex and diversified risks, which represents a new challenge to traditional approaches to assessment and management of credit risk that banks must manage it as adequate to survive competition and to support its overall national economy.

Risks are well administrate when they can be understood, measured and controlled and when the bank is able to resist their negative impact. [8]

Credit risks are a source of unexpected expenses, assessment and appropriate

management can stabilize their income while having as a shock absorber. All banks should improve their understanding and practice of assessment and credit risk management to be able to successfully manage the diverse range of products it promotes.

A performance evaluation and risk management results in obtaining a bank as profitability. Profitability is one of the essential objectives of a banking company, for which in all cases will be like a maximization of profit, as achieving a high return on equity. [6]

Banks will be able to successfully assess and manage risk in lending, if they recognize and understand the strategic role of assessment and risk management to increase efficiency, if they adopt specific measures to adapt to risk and performance if they create mechanisms according to risk reporting.

If credit is one of the "principal products of the financial institution, the organizational structure and management systems of all product components should reflect this. A bank can quickly become unprofitable or insolvent as a result of poor decisions on loans, resulting in non-performing assets. [5]

3.Corelation between assessment and management of credit risk

Bank risk management problem is approached from a narrow perspective, the types of risks. This is because banks are diverse and complex risks. Among the most important risk is credit risk, but should not overlook the fact that all risks, the bank's exposure is more risk and also are in interdependence. Global management of these risks in entering and credit risk a necessity and be organized at the plant each bank. An appropriate credit risk management should ensure the bank's ability to identify, assess, eliminate, prevent and finance risks.

All these steps to identify, assess, eliminate, risk avoidance and financing are part of the management of credit risk.

Often risk is an economic category complex, difficult to assess and manage, especially since it is conducted in the banking operations. [3]

In the evaluation phase of credit risk priorities that should be taken into account are: anticipating losses, establishment, transfer any credit risk.

Integration of credit risk assessment process both credit risk management in strategic planning and ensure efficient management of bank credit risk and risk profiling current and future. To integrate the identification and risk assessment process both bank risk management and planning process, the bank has to first identify the main business lines, business lines including internal lending standards and procedures regarding employee duties involved in this process and tasks associated ancillary activities.

Identification and management of banking risks is both a philosophical problem and a problem running the banks. Philosophical problem is the attitude of banks towards risk and strategies adopted in relation to risk. Malfunction as it is risk identification, risk classification and the methods and procedures used for measuring, monitoring and control. The two approaches are not independent of each other. Attitude to risk is creating guidelines for monitoring, measuring and controlling risk. [7]

The credit risk management begins with determining the risk profile for each product type loan that the bank that wants to promote. The risk profile should be compared with the bank's risk profile. To identify and assess the risk of a credit bank product type, managers must identify all situations that can cause significant financial loss for the bank.

Misidentified risk can not be intelligently managed. However a risk was identified and quantified with precision, its treatment program is quite natural. [4]

Methodologies for identification and risk assessment can provide an estimate of the risk profile for both bank branches and agencies and the entire bank. In the absence of clear risk assessment methodology, a bank has not Niciu a means to reduce expenses related to credit risk through rigorous control and a more appropriate risk financing.

It is generally difficult to manage risk, if he was not identified, assessed and properly quantified. Credit risk as any risk can be eliminated by removing the cause that produces it.

When credit risk is identified and assessed in time, managers can redesign products and activities that generate credit risk by product and associated activities in order to minimize credit risk identified initially.

Eliminate and prevent credit risks on time can have an effect on cost reduction totate the bank if the bank has correctly assessed the risks associated costs and revenues adjusted for credit risk associated with each product separately.

Risk assessment is the process of comparing the results of risk analysis with risk criteria to determine if the risk is acceptable or tolerable. [11].

Credit risk assessment involves comparing the level of both risk tolerance criteria, and determine priorities for the initial treatment phase ulteriora risk.

Risk treatment is the application of policies and methods to influence and control credit risk.

At this stage follows: [11]

- avoid risk by deciding not to initiate or continue resulting in increased risk;
- looking for an opportunity by deciding not to initiate or continue to create or increase risk;
- relocation of risk source;
- change the probability of risk;
- change consequences;
- distribution, transfer or separation of risk in many parts;
- withholding or stopping credit risk through the use of choice.

When risk assessment is carried out improperly and recorded negative consequences, it follows:

- reduction or risk reduction;
- eliminate the risk;
- preventing the risk;
- management, suppression or managing risk;
- correction of risk.

All these are measures to control or change in credit risk.

If we consider that most bank assets take the form of loans, credit decision is a very important banking function.

In terms of financing through a loan of economic entities of the most important analysis is the primary risk analysis. Dynamic efficiency of banks can be reduced, if the bank is not organized to deal with immediate risk in the event of irregularities on lending.

Credit risk assessment takes into account the six "C" of credit and includes: [1]

- Character (willingness to pay)
- Capacity (ability to pay)

- cash
- Collateral (insurance if necessary)
- Foreign and economic conditions;
- control and audit, preparation of documentation according to internal regulations of bank credit.

Character - in customer credit analysis, bank wants to convince the good intentions in the loan and its repayment.

Capacity - the bank must verify the client's legal ability to request credit, if legally competent to request a loan and offer legal status of his signature on a credit agreement.

Cash - refers to the client which can generate enough cash (cash) in the form of income or cash flows to repay the loan.

There are three sources of funds that a trader can use to reimburse a loan:

- cash flow;
- sale of fixed assets;
- issuance of equity or credit;

Any of these sources of liquidity can provide sufficient funds to repay a bank loan. Banks prefer a loan repayment source to be cash flow from current activity, because the sale of fixed assets may jeopardize current client activity and a new loan may be less secure position as a creditor bank.

Collateral - To assess collateral, the bank must consider the client assets, not only to assess the feasibility of possible guarantees that the client will provide in exchange for credit, but also to estimate the capacity of these assets continue to support client activity.

Conditions - The bank customer evaluation must consider:

- Client's position in the industry and market that covers;
- Economic and financial performance compared to firms the same activity;
- On labor market conditions, environmental factors and the policies;

Control and audit - the last essential factor in assessing client. Control involves ensuring that the bank loan to meet standards and the regulatory authorities in terms of credit quality, and express an audit opinion on the accuracy of financial reports.

4. Conclusions

Avoiding credit risk require thorough analysis and multilateral banks to the debtor (solvency, liquidity, profitability, human

competence, economic situation and internal and external financial, etc.), but also to ensure adequate safeguards. [10]

Credit risk management in terms of commercial banks is identifying and assessing all accounting procedures and methods of bank credit risk management in order to limit, division and their financing, and mitigate risk exposure of each bank.

In this context, credit risk should be assessed in comparison with the benefit that the bank is expecting to obtain the loans, the most important function is the management of credit analysis and credit risk assessment because poor credit is the main cause of bank failures.

The New Approach of Qualitative Characteristics of Accounting Information in Financial Reporting

Gădău Liana
Spiru Haret University, Bucharest
lianagadau@yahoo.com

Abstract

The qualitative characteristics are those features that give utility and value to the information presented in the financial statements. They are features derived from the normalization of a conceptual framework and a chart of accounts. These qualities, which are supposed to be general for all accounting data, connect the objectives of the financial reporting and the requirements from accounting standards, by separating the useful information from the unnecessary ones, information which are going to be presented in the financial statements.

In this paper, we will conduct a research in order to find out the useful characteristics of accounting information presented in the financial statements. The research will be conducted by analyzing and comparing the information in diverse accounting framework, especially the American and the international one, both before the changes brought by the Conceptual Frameworks in 2010 and at the present time.

Keywords: fundamental qualitative characteristics, the relevance, the faithful representation, enhancing qualitative characteristics, comparability

JEL Classification: M40, M41

1. Introduction

The American referential, FASB, and the international one, IASB, work together to develop a common financial reporting framework.

Therefore, FASB and IASB launched the first phase of the project on 28 September 2010, as result, the International Conceptual Framework and the American one (SFAC no. 8/2011), issued by January 2011 regarding the “Qualitative characteristics of the

information presented in the financial statements” agreed on the competency, definition, hierarchy of the qualitative characteristics, but also agreed on the restrictions necessary in order for information to be considered useful.

Thus, *the relevance* and *faithful representation* are considered **fundamental qualitative characteristics**.

Enhancing qualitative characteristics are considered the following: *comparability, verification, opportunity, intelligibility*, who amplifying, helps to improve the fundamental characteristics.

2. The fundamental qualitative characteristics

If not so long ago we considered the relevance and the credibility as core qualitative characteristics, presently the accounting frameworks IASB and FASB tend to agree upon a common denominator, by keeping the relevance and replacing the credibility with the exact representation.

■ The information relevance

Is the essential quality of accounting information because it refers to the ability of influencing the decisions of investors, creditors and other users of financial statements.

A relevant information also helps the users to evaluate the past, present and future events and to correct eventual mistakes from the past.

The relevance must be evaluated taking into account not only the principal objective of the financial situations, namely to help the users make decisions, but also has to consider the context in which the financial statements were elaborated.

Regardless of the conceptual framework used, the relevance of information is

influenced by *the nature of the information and its threshold of significance*.

The nature of the information – refers to the descriptive aspect of the information (for example the re-evaluation of a new sector of activity of an enterprise, or of an tangible/intangible asset) and *the threshold of significance* refers to the size, value of the information (the value obtained by the new sector of activity, the value of the tangible/intangible asset). The two factors can together or separately ensure the relevance of information.

If until the revision from 2010, the American framework presented separate the threshold of significance from the qualitative characteristics, more precisely *as restriction* of them for establishing the utility of information, with the new changes brought by the convergence process, the threshold of significance is presented *as a feature of relevance*. The conceptual frameworks consider that the relevance plays a double role in its relation with the users.

First, *has a predictive value* – for example the current and even the past information regarding the level and structure of the owned capitals - which guides the investors in their forecast of the enterprise’s reaction capacity to avoid unfavorable situations.

Second, *a confirmation value* which compares the effects of decisions taken based on the forecasted financial situations, and those based on the present financial situations.

The two values of financial information are connected.

■ The accurate representation

The conceptual frameworks consider that in order to be useful, the accounting information must *represent with accuracy the respective events*.

The accurate representation has three features: the information must be **complete**, **neutral** and **without errors**.

In the previous version of the conceptual framework, *the complete* and *neutral* features of accounting information were aspects of credibility, characteristic that is not known anymore under this name.

However, we notice that the credibility’s features (defined in the previous conceptual frameworks), namely the accounting

information mustn’t contain errors, omissions or elements which might lead to wrong interpretation – are founded in the explication given by the new version of the conceptual framework **“without errors”**, which completes the accurate representation.

The second feature of the accurate representation is that the information presented in the financial situations must be **complete**.

We observe that in the previous version, the American conceptual framework not clearly defined this feature through SFAC2, that IASB conceptual framework however this feature could be understood. In the new version, this drawback is eliminated through *SFAC 8 Qualitative Characteristics of useful Financial Information*.

A complete description of the phenomenon must include all the information necessary in order for the user to understand the event. For some elements, this description must be completed with explanations regarding the significant facts on the quality and nature of the elements, factors and circumstances which might affect their quality and nature.

Nevertheless, the accurate representation of the information presented in the financial statements must be done in the reasonable limits ensured by the conceptual frameworks, limits which refers to the cost/benefit report, but also in the limits imposed by the inaccuracy of the estimation, the professional reasoning of the specialists, the limits of the evaluation bases etc. (IASB and FASB consider the cost as the unique restriction of the financial reporting, **cost** which must be justified by the **benefits** of the reported financial information).

The neutrality - is another characteristic which according to the accounting conceptual framework completes the accurate representation, where that accuracy is provided when the selection and the presentation of the information from the financial statements does not influence the decisions that lead to a predetermined result. Additionally, the information must be equally used by all categories of users, without giving advantages to some and to other being harmful.

3. The qualitative characteristics which amplifies the information

If previous versions of the conceptual frameworks of International and American had different views to present qualitative characteristics, meaning that the international referential consider the relevance, credibility (reliability), comparability, intelligence as all the main, and the American referential are distinguished by their hierarchy first two being the main and the last two secondary, currently the two conceptual frameworks have the same view: the present the hierarchy of *fundamental characteristics* which were described above and *features which amplifiers*, meaning they aimed at improving, enhancing the usefulness of relevant information and accurate representation.

In this category of secondary features, the following are included: comparability, verifiability, opportunity and intelligibility.

▣ Comparability

The static information of the financial reporting related to a given year, most often are not relevant and do not influence the economic decisions of users, but they may be seen by comparing the same enterprises in different context; this is when its valences regarding the usefulness are achieved. **Therefore**, *comparability of accounting information is a necessary feature in order for it to be considered useful.*

We consider that the necessity to subscribe the financial reporting to a conceptual framework, completed with international standards, is best highlighted by the characteristic comparability for accounting information.

Regardless of the conceptual framework, we noticed the same details for comparability, namely it allows users to identify and understand similarities and differences between elements. But, the comparability *is not to be confused with consistency*, the latter only helps to improve the comparability. Consistency refers to using the same methods, accounting policies as far as possible without distorting the accounting information for the same elements, to ensure comparability from period to period for the same company, or for the same period but for different companies.

Also, the comparability must *not be confused with the uniformity*, and for

ensuring the comparability of the information, similar aspects must be similarly presented, and different aspects must be differently presented.

▣ Verifiability

If in the previous American accounting framework, the verifiability was defined as a feature of credibility, aspect which is more deducted in the international referential, both frameworks define and present this secondary characteristic the same way. The purpose of the verifiability is to ensure the users that the information presented in the financial situations represent accurately the economic phenomenon. These assurances are given by independent evaluators, by confirming the correspondence between the image presented and the intended purpose of events and transactions carried out.

After the measurements done by the independent evaluators, it is easy to agree on the value of liquidities, but more difficult in case of stocks and depreciable assets because of the multiple assessment methods, and much more difficult for provisions, especially those for litigation.

▣ Opportunity

Both, the current international and American conceptual framework define *opportunity* as a feature that enhances the usefulness of accounting information relevant and accurate representation.

In previous versions of conceptual frameworks, in *the international* one the opportunity *was classified as restriction* (limit) of the qualitative characteristics with a certain balance between the need of quality, fair representation and an advantage of cost - benefits, and in *the American* was presented as a feature *that complete the relevance* of accounting information.

Regardless of its hierarchy and framing, its significance remains the same, namely that the information is available when decisions are supposed to be made. Delays in producing them may result in loss of relevance, but at the same time a fast presentation can affect its accurate representation.

The following intervals influence the opportunity: the period between the date of

recognition, measurement and presentation in the financial statements and the date by which information is considered and the moment when the financial statements are published, but also the period elapsed between their publication and the use of information when decisions are made.

☐ **Intelligibility**

Another feature that can enhance the qualities of relevance and the accurate representation is *intelligibility*, whose purpose is to understand the information provided by the financial statements.

The conceptual frameworks, American and International ones believe that information should be presented as understandable as possible, classified and described in a clear and concise manner. **This feature relates the information generated by the financial statements and the user's need for this information.**

The conceptual frameworks specify that the financial reports are prepared for those users who have sufficient knowledge on economic and business activities, although sometimes they may need the help of an expert to understand information about complex economic phenomena.

We believe that, the intelligibility must be considered by the accounting referential as a link point between the quality of the information provided through the financial situations and the level of training and understanding of the decision makers, by sustaining a common language between those who prepare the financial statements and those who use them, and not address firstly to that category of users (investors, shareholders, creditors) who have the financial power.

Therefore, it is important to find equilibrium through language. To support this aspect both the conceptual frameworks and the standards have a section which defines the terms. Finding the most efficient method to define the terms, sustains the intelligibility as a characteristic of the financial situations, but also broadens their usefulness.

4. Qualitative characteristics of accounting information in the Romanian referential

In the national accounting regulations - **OMPF 3055/2009 for approval of accounting regulations harmonized with European directives**, the usefulness of the accounting information is explained by the following features of qualitative characteristics: understandability, relevance, reliability and comparability, with all four compulsory. We observe that the definitions, characteristics and limits (restrictions) related to these qualitative features are just like those internationally treated by IASB, but prior to its amendments (September 2010) regarding the convergence with FASB.

We believe it is time that Romanian accounting regulations also should align to the last amendments of IASB in terms of qualitative characteristics of accounting information, especially from 2012 as the international reference system (IASB conceptual framework and IAS / IFRS) becomes predominant basis for banking, insurance-reinsurance in individual financial statements.

We conclude that the conceptual framework defines and characterizes each quality of accounting information, **but what is important is that it does not indicate how these features should be used.**

This influences the activity of company's management, because when they need to make a decision, they must identify every opportunity available, and then consider which option is most useful, in this way comparing the qualitative characteristics. This analysis is a matter of professional judgment, which discusses the importance of comparing the qualitative characteristics.

5. Conclusions:

We are witnessing a rearrangement of the characteristics at conceptual level, with IASB and FASB having as objective a common base for the qualitative characteristics of the information presented in the financial statements.

Thus, they agreed on the components, definition, hierarchy of the qualitative characteristics, but also on the restrictions that must be respected in order for the characteristics to be considered useful.

We consider that the hierarchy of the fundamental characteristics is not justified, and even more, the comparability and

intelligibility should not be considered secondary characteristic, especially the comparability.

The relevance of information is linked to their comparability, and also everything that IASB and FASB have done to accomplish a convergence process is connected to the comparability of information, which makes us wonder why it has not been included in the fundamental category of characteristics.

Another aspect which must be necessary mentioned refers to the fact that, even with all the changes brought to the qualitative characteristics in their definition, hierarchy, components, the way they must be used is not specified at all. This represents an obstacle for the company's management; especially when it has to make a decision, and identify all the opportunities, analyze the useful alternative, by comparing some qualitative characteristics with others, which might lead to a subjective evaluation.

The Present Requirements on Bank Prudence. Publicity Requirements and Sanctions

Gheorghe Carmen Adriana
Transilvania University Brasov, Law Department
carmenghe2003@yahoo.com

Abstract

Requirements on banking activity impose regulation of specific issues concerning both the authorisation and the operation, and also ceasing the bank activity. This enforcement originates from the objectives pursued by the National Bank of Romania as own policy, but also as a separate member of the European financial structures. The analysis aims to identify, without exhaustive study, the intrinsic correlations of essential notions for banking field - prudence, prudential supervision, international publishing and sanctions, quartered obviously in risk area. We mention that risk, as related to surveillance and caution, represents the possibility of potential, expected or unexpected events to have a negative impact on bank capital or bank revenue.

Key words: bank, requirements, bank prudence, publicity, sanctions

J.E.L. Classification: K29

1. Introduction

Commercial banks are autonomous entities that carry out an activity for profit within the laws of the country. Unlike other types of banking business, banks are entrusted with money resources by other companies and by population, so regulations for banks is more severe, more rigorous, but apply the general principles governing the market economy. Requirements on banking activity impose regulation of specific issues concerning both the establishment and the operation and ceasing the bank activity. This enforcement originates from the objectives pursued by the National Bank of Romania as own policy, but also as a separate member of the European financial structures. The analysis aims to identify, without exhaustive

study, the intrinsic correlations of essential notions for banking field - prudence, prudential supervision, international publishing and sanctions, quartered obviously in risk area. We mention that risk, as related to surveillance and caution, represents the possibility of potential, expected or unexpected events to have a negative impact on bank capital or bank revenue. We will not use the notion of control, which seems included in that broader surveillance, but we remind that a prudential supervision aims at preventing internal or external risk at a credit institution level, and avoiding their spread. Macroeconomic prudential supervision is an internal management activity, given the evolution of constraints that come from outside, the change of activity place or re-defining prudential rules at national and international level. The Central Bank remains the supreme authority in banking supervision, performing this activity through Supervision Committee and the Department of Surveillance of National Bank of Romania. This is the case of the supervision of central banks, along with supervision performed by each bank at internal level. The Supervision Committee is a permanent structure, deliberative and decision-making nature composed of ten members and led by the Governor of the National Bank of Romania. His duties and powers aim at monitoring and evaluating the credit institutions' activities of functioning in terms of asset quality, financial performance and their classification in the regulated level of bank prudence indicators, but also ensuring regulatory base, according to specific legislation and international practices in the field.

2. Measures on Bank Prudence

With the beginning of reform, the National Bank has developed a set of rules necessary

for establishing prudence in banking filed, regulations that relate to capital adequacy, large exposures, currency exposure, a bank ownership, ownership of non-banking companies, classification of loans according to risk, general reserves, large loans, training and professional experience of bank managers. The bank prudence, when there is no doctrinal definition, is imposed by measures and indicators that define it. Requirements on capital adequacy (solvency) require that the own funds of a banking company, consisting of capital and additional capital, to represent at least 8% of total assets and the, elements outside the balance sheet, weighted depending on their degree of risk. Then the bank will keep the large exposures, which means that the granting of loans towards a single debtor can not exceed, cumulatively, 20% of the bank's own funds. In accordance with the Regulation on lending to borrowers who are in special relationships with banks, loans to these persons may not exceed, in total, 20% of the bank's own funds. At the end of each working day, the currency exposure will be so that the total currency position may not exceed 10% of the bank's own funds. The *participation* of a banking company in the capital of non-banking companies may not exceed 20% of the capital of an entity that is not related to banking, and participation of a banking company in the capital of another bank will be up to maximum 5% of capital, with the condition of participation of a banking company, a foreign juristic person or an international financial institution. We add to this list of legal requirements *criteria for classification* of granted loans (loans). Thus, depending on their risk, loans are highlights of the five categories: *standard, under observation, substandard, doubtful and loss*. Bank *insurance* needs against risks of loans are covered by general reserves for credit risk and specific risk provisions. And finally, *liable persons* to run a credit institution which takes the form of a bank shall be subject to the rules on training and professional experience necessary to ensure quality and effective business leaders of the bank. In another form, we can speak of prudential indicators that Member States of the European Union measure the bank prudence: bank solvency, high risk factor, the adaptation rate to market

risk, the minimum capital, the financial participations.

2.1. Prudence in the stage of bank function

The supervision performed by the National Bank of Romania can take different ways: a) through periodic reports that banks have to submit in accordance with relevant regulations; b) on the occasion of the presentation of changes in the bank status in order to be authorized; c) by inspections that specialized personnel of the Central Bank perform at the bank and in secondary offices, both in the general topics applicable to all entities in the system, and the periods known for verification of how the regulations practically are applied in matters by the supervised bank. Prudential rules governing the authorization of banks and their supervision are imposed by the need to avoid panic, crisis and reflects the concern for security of the public savings deposited in these banks. Although the bank supervision is the concern about the financial safety and health of the banking institutions, taken individually, the main reason of prudential regulation of banks is the concern for the security of the banking system as a whole and, ultimately, the national economy. National Bank provides prudential supervision of credit institutions, Romanian legal persons, including their branches established in other Member States or in third countries, by establishing prudential rules and indicators and monitoring their compliance and other requirements of law and regulations, both individually and on a level consolidated or not, as appropriate, to prevent and limit the risks of bank activity. Monitoring the compliance of credit institutions, Romanian legal persons, of prudential requirements and other requirements provided by Government Emergency Ordinance no.99/2006 on credit institutions and capital adequacy, is made by the National Bank of Romania through the reports submitted by credit institutions and checks carried out at the credit institutions and their branches in the country and abroad.

To establish and facilitate an effective supervision, the Central Bank, as the authority responsible for consolidated and / or individual supervision, signs written

agreements on coordination and cooperation with competent authorities in other states.

2.2 Prudence in the stage of bank function

The supervision performed by the National Bank of Romania can take different ways: a) through periodic reports that banks have to submit in accordance with relevant regulations; b) on the occasion of the presentation of changes in the bank status in order to be authorized; c) by inspections that specialized personnel of the Central Bank perform at the bank and in secondary offices, both in the general topics applicable to all entities in the system, and the periods known for verification of how the regulations practically are applied in matters by the supervised bank. Prudential rules governing the authorization of banks and their supervision are imposed by the need to avoid panic, crisis and reflects the concern for security of the public savings deposited in these banks. Although the bank supervision is the concern about the financial safety and health of the banking institutions, taken individually, the main reason of prudential regulation of banks is the concern for the security of the banking system as a whole and, ultimately, the national economy. National Bank provides prudential supervision of credit institutions, Romanian legal persons, including their branches established in other Member States or in third countries, by establishing prudential rules and indicators and monitoring their compliance and other requirements of law and regulations, both individually and on a level consolidated or not, as appropriate, to prevent and limit the risks of bank activity. Monitoring the compliance of credit institutions, Romanian legal persons, of prudential requirements and other requirements provided by Government Emergency Ordinance no.99/2006 on credit institutions and capital adequacy, is made by the National Bank of Romania through the reports submitted by credit institutions and checks carried out at the credit institutions and their branches in the country and abroad. To establish and facilitate an effective supervision, the Central Bank, as the authority responsible for consolidated and /or individual supervision, signs written

agreements on coordination and cooperation with competent authorities in other states.

3.Publication.Publicationrequirements

To ensure uniformity and comparability of published information, the European Committee of Banking Supervisors, CEBS has developed a web structure standardized disclosure requirements, addressed to the supervisory authorities of Member States, and published general instructions necessary to implement this common approach (CEBS Guidelines on Supervisory Disclosure). From January 1, 2011, the European Banking Authority, EBA, established by Regulation (EC) nr.1093/2010 of the European Parliament and the Council from 24 November 2010, took over all responsibilities of the Committee of European Banking Supervisors. Thus, the important role of prudential supervision transparency was emphasized both by the Basel Committee on Banking Supervision and the provisions of the new European legislation (Directive on the taking up and pursuit of credit institutions - 2006/48/EC and Directive on capital adequacy of investment firms and credit institutions 2006/49/EC). Article 144 of Directive 2006/48/EC stipulates explicit disclosure requirements for supervisory authorities of Member States.

The legal instruments that ensure bank prudence in publication are contained in the following regulations:

- Laws and regulations that ensure adoption of the provisions of Basel II in Romania, gathered in Directives 2006/48/EC and 2006/49/EC. These documents present the legislative and regulatory in the prudential field, subject to prudential supervision of credit institutions in Romania.
- Specifications and instructions issued to establish a unitary application of new legal provisions by the supervised institutions.
- Guidelines that include explicit requirements of transparency provided by the two directives, and detailing the application and compliance with new legal provisions.
- Reporting requirements that include information on key issues of implementation of financial reporting (FINREP) and prudential reporting system (COREP)

In addition, Directives 2006/48/EC and 2006/49/EC contain a significant number of

options (to the supervisory authorities or institutions subject to supervision in a Member State) the exercise of which depends on each country. Central Bank shows how to exercise, in the national regulators frame, of national options under Directives 2006/48/EC and 2006/49/EC and cases of mutual recognition of various treatments related to the exercise by the other Member States, of these options. In addition, the supervisory authority provides tools for performing the prudential supervisory, the general criteria and methodologies used in Romania, in the process of verification and evaluation (SREP), minimum requirements for the internal processes for assessing capital adequacy to risks (ICAAP s) that must be held by the supervised institutions and policies on supervisory measures for certain situations and / or institutions. The obligation to publish the bank will be made through reporting statistical data. They refer to aggregate statistical data on the implementation of prudential regulatory framework in Romania. Tables to be published will include information on Romania's banking sector, credit risk, operational risk, market risk and brief information on actions and measures taken by supervisory authorities. BNR reserves the right to omit certain items from publication if it they are private or confidential.

4. Prudence and International sanctions

National Bank has the following powers in relation to international sanctions, the financial-banking incidents:

- supervises the implementation of international sanctions, in accordance with Article 17. paragraph (1) of the Emergency Government no.202/2008 on the implementation of international sanctions, approved by Law no. 217/2009;
- publicizes documents which establish binding international sanctions in Romania, in accordance with article 5. paragraph (1) of GEO nr.202/2008;
- adopts specific regulations for monitoring the implementation of international sanctions;
- provides specific measures and penalties for non-compliance legislative incidents;

- participates, through appointed representatives, to the Inter-institutional Council working sessions, established under the provisions of Article 13 of Government Emergency Ordinance nr.202/2008 on the implementation of international sanctions

Sanctions to impose restrictive measures within the areas of activity are established by legal instruments adopted by the Security Council of United Nations (UN), the European Union (regulations and decisions), other international organizations or by unilateral decisions of Romania or other countries and aims, in blocking funds and economic resources, trade restrictions, restrictions on operations with products and technologies with dual travel restrictions, restrictions on transport and communications, diplomatic sanctions, or scientific and technical fields, cultural or sports. European regulations on institutions in the area of regulatory/oversight of the central bank have the regulating purpose of imposing restrictive measures against certain persons and entities under a state or not. Updated list of states, individuals, groups and entities subject to sanction regimes adopted both by UN and the EU is available on the Ministry of Foreign Affairs website. We exemplify by the following acts in the field: NBR Order no.340/2010 on the unitary model of reporting blocked funds and economic resources or Order no. 95/2011 of the President of the National Office for Preventing and Combating Money Laundering on approving the methodological norms for making notifications and processing requests for authorization to carry out financial transactions. The supervision activity of international banking groups, NBR cooperate with other supervisory authorities through working structures established at European level and relevant substructures within them. They are BSC - Banking Supervision Committee, established by the ECB European Central Bank, CEBS Committee of European Banking Supervisors, established by the European Commission under the Lamfalussy structure, Moneyval - Committee of Experts on-the Evaluation of Anti-Money Laundering Measures and the Financing of Terrorism established by the European Council. Banking supervision, in general, is the system used by the state to ensure financial

system stability. To have an effective banking supervision, it has to propose some well-defined goals, explained, that will determine economic policy, and those who directly perform banking supervision.

5. Conclusions

There are two tasks underlying all banking supervision systems: ensuring balance banking sector, to enhance and support the economic growth of the country, protecting the funds paid to the bank. Thus, prudential regulation (preventive) and surveillance remain essential elements of banking. Supervision, as monitoring activity of credit institutions and checking how banking regulations are respected and applied aims, through prudential regulation, to ensure efficient allocation of resources, minimize risks and ensure stability and financial health of each bank and banking system as a whole.

Does High Corporate Tax Rates Attract Foreign Direct Investment?

Mihaela Göndör,

paaulan@yahoo.com

Abstract

A part of the empirical literature seems to support the view that international differences in corporate taxation are important determinants of FDI location, while another part argue that FDI are attracted by the business environment, without taking into consideration any directly or indirectly influence of fiscal policy. In this context, the aim of the present paper is to analyze the relation between corporate tax rates competition and Foreign Direct Investment location and to offer conjectures as to the reasons behind. In this purpose the paper analyze the evolution of FDI in European Union, in the developed and emerging economies together with the national differences in corporate taxation, for the period 2005-2010. The study's results suggest that fiscal competition between governments for FDI is not necessarily a corporate tax rates competition, but a business environment one, which is determined primarily by fiscal policy.

Keywords: Fiscal Policy, Fiscal Competition, Foreign Direct Investment, Business Environment.

J.E.L. classification: H32, F23, P45

1. Introduction

The contemporary reality demonstrates that most countries, irrespective of their stage of development, employ a wide variety of incentives to attract the foreign direct investments. As beyond World Trade Organization (WTO) and European Union (EU) rules, governments have lost many of the instruments traditionally used to promote local competitiveness in order to attract FDI,

the fiscal policy becomes an important instrument. The Role of the fiscal policy in attracting FDI is a very controversial issue both at scientific research and political level. The literature on the subject of corporate taxation in European Member States, as a determinant for Foreign Direct Investment (FDI) location, is centered on the question of tax harmonization vs. tax competition as a solution to the awkward state of asymmetric tax rates that currently exists in the European Union for creating a better business environment. The existing viewpoints run the gamut from entirely pro-harmonization to pure pro-competition stances as it is shown in the literature review. Moreover there are some opinions that fiscal policy does not influence the FDI, or its influences are rather small.

Based on the reality that FDI has positive effects on economic growth in both developed and developing countries, the present study is started from the need to understand and demonstrate the relation between corporate tax rates competition and Foreign Direct Investment location and to offer conjectures as to the reasons behind.

2. Literature review

The literature indicates the important role played in attracting FDI by elements such macro-economic stability (growth, inflation and exchange rate), institutional stability such as policies towards FDI, tax regimes, the transparency of legal regulations, the scale of corruption and political stability[1], [2], [3]. The political and economic factors, the form of the privatization process and the need to secure market access have been the determinants of allocation of FDI across the world [4], [5], [6], [7]. The determinants of

FDI inflows are very various: country risk, unit labor cost, host market size, private sector development, industrial development, the government balance, corruption, policies [5], [6], [8]. Some of researchers argue that policies matter for FDI inflows [9]. A predictable policy that promotes macroeconomic stability stimulates the FDI inflows [10], this is most often the case of trade policies and tax policies. Some work papers show that low tax rates attracts FDI inflows [11]. Other studies demonstrate that a simple tax system tend to be more attractive for FDI [12]. A large part of the empirical literature seems to support the view that international differences in corporate taxation are important determinants of FDI location [11], [13], [14], [15], [16].

Some researchers consider that FDI are attracted by the business environment, without taking into consideration any directly or indirectly influence of fiscal policy [17], [18]. In its 2000 Conference on Trade and Development, United Nations states that, as a factor in attracting FDI, fiscal policy is “secondary to more fundamental determinants, such as market size, access to raw materials and availability of skilled labor” [19]. Contrarily, other studies conclude that fiscal policy is an important tool [20], the central administration can utilize to influence the economy and attract FDI. Based on the fiscal policy, the government is able to control the macroeconomic variables [21], such as aggregate demand, disposable income and economic activity as a whole. Many studies are focused on the fiscal FDI incentives as exceptions to the general tax regime [22], [23], [24], [25], [26], very few been focused on general fiscal regime [24], [25], [9], [12].

Regarding the central question i.e. fiscal competition vs. tax harmonization as the best solution for a better business environment, the researchers’ points of view are very different. Some of researchers argue that tax competition will harm the efficient supply of public goods, and should therefore lead to tax regulation/harmonization. [27], [28], [29]. According to Mitchell [30] tax competition generates responsible tax policy. Lower tax burden of business subjects creates the fertile soil for higher economic growth. Without the tax competition the governments could behave as the monopoly, to levy the

excessive taxes. As the mention [30], the tax competition always results in decrease in the statutory tax rates. As quotes Smith, in case that the fiscal competition process would be stopped by the tax harmonization, the European Union would be less converged than ever before [31].

Despite serious study and debate, no optimal solution to the tax question has surfaced and the relation between corporate tax rates and the FDI location still remains controversial.

3. Hypotheses, research’s goal and methodology

This study is based on the following assumptions:

- International differences in corporate taxation are important determinants of FDI location [11], [13], [14], [15], [16];
- In order to achieve the goals of Lisbon Strategy, Europe must improve European and national fiscal regulation. Although creating a better business environment is a priority for the European Commission, there are still ample possibilities to improve fiscal policies which vary in the European Union countries. The questions raised from such hypotheses are:

1. In which way the fiscal policy influence the FDI inflows, i.e. the FDI will be attracted mainly by the countries with lower overall tax ratios or contrarily or this aspect doesn’t matter?
2. Which are the countries characterised by significantly lower overall tax ratios, the developed countries or the emerging economies?
3. Which is the effect of tax competition on the business environment and on the EU market integration, in order to take full advantage of the single market?

In this context, the aim of this paper is to study and analyze the role of fiscal policy in determining the destination of Foreign Direct Investment in emergent and developed countries in European Union. For this purpose, the study use a pooled dataset consisting of annual observations over the period 2005-2010 for the actual EU Member States regarding the corporate tax rates and the FDI inflows. For comparing purposes the study analysis focuses on six actual European Union countries considered “Emerging

European Economies”, Bulgaria, Hungary, Latvia, Lithuania, Poland and Romania (BHLLPR).

The data sources are only official ones, i.e. Eurostat, governmental statistics for the fiscal policy, International Monetary Fund and World Bank for the foreign direct investment. As regards the FDI, it is important to note that practically all of UNCTAD and World Bank’s data have been presented in USD as it was converted from national currencies in the official statistics. Although the considered states for the present study are European Members states, we preferred to not denominate the FDI indicators in EUR terms for not reducing their accuracy by the possible effect of currency fluctuations, which is a very important issue in particular when analyzing time series for making comparisons across different countries.

The present paper includes further work based on our latest research, unveiling the fiscal policy as an important determinant for the Foreign Direct Investment, which directly or indirectly influences all the other factors that determine the investors behaviour [32], [33], [34], [35], [36].

Being focused on empirical, contextualized analysis, this study highlights the overall empirical relationship between FDI and fiscal policy and only offers conjectures as to the reasons behind this relationship. Future research will study the effects of specific categories of fiscal instruments on FDI as well as the channels and mechanisms through which these effects take place.

4. Analyses and results

As it results from the table 1, in 2007 the FDI inflows exceed the level from 2005. The global economic crisis from 2008 temporarily stopped this trend. The developed economies have attracted almost seven times more foreign investment. As it can be seen in the table 1, foreign direct investment has been clearly more oriented to the developed countries than to the emerging countries. To note that in 2008, because of the global financial crisis, the decline was really high both for developed and emerging countries. The year 2010, still affected by the

global financial crisis, brought new decreases of the FDI inflows.

Table 1. The Foreign Direct Investment Inflows between 2005- 2010 in the EU economies (billion dollars)

Source: Made by authors based on the collected data [38] and on the author’s calculations

According to UNCTAD report, FDI inflows will continue to recover to the pre-crisis level in 2011. They are expected to rise again in 2012 and in 2013 to the record achieved in 2007. The multinational corporations’ liquidity, the restructuring of corporations and industry, the increasing stock value, established as support measures during the crisis, creates new investment opportunities for the worldwide companies [37]. However, in crisis times the business environment is doubtfull. The risk factors such as the unpredictability of global economic governance, a potential crisis of

sovereign debt and the instability of financial and fiscal sectors in some developed and emerging economies, can slow down the recovery of FDI.

As it regards the evolution of foreign direct investment inflows during 2005-2010 in European Union the study reveals the following relation:

$$FDI1 > FDI2 \quad (1)$$

FDI1 represents the average FDI inflows at European Union level and FDI2 represents the average FDI inflows at BHLLPR group level.

The data suggest that the New Member States are generally characterised by low level of FDI inflows, most of FDI inflows being still oriented to the developed economies from the European Union.

A question raise from such a study: In which way the corporate tax system determine the investors decisions, i.e. the firms will choose to locate their investment in countries with lower taxes or contrarily?

In this respect, the Table 2 presents the average CTR at European Union (CTR1) level and the average CTR at BHLLPR (CTR2) group level during the entire analyzed period.

By comparing the two series of indicators for each year of the considered period, the study reveals the following relation:

$$CTR1 > CTR2 \quad (2)$$

Source: Made by authors based on the collected data [38] and on the author's calculations.

The study suggest that the New Member States (including the analysed group) are generally characterised by significantly lower overall tax ratios. From such evidence we can conclude that most of FDI inflows are still oriented to the developed economies despite their higher level of taxation.

5. Conclusion

According to the present study, FDI is concentrated mainly in the developed economies compared with the emerging

economies, despite the higher level of taxation of the developed economies. In this way the present paper contradicts the studies according to which FDI are mainly attracted by the countries having low corporate tax rates. Moreover, based on the above presented researches which state that FDI are attracted by the business environment the present paper logically conclude that higher tax rates create better business environment.

Using data for 6 actual European Union countries considered “Emerging European Economies” i.e. Bulgaria, Hungary, Latvia, Lithuania, Poland and Romania, for the period 2005-2010 and by comparing it with the rest of European Union Member States, the results suggest that fiscal competition between governments for FDI is not necessarily a corporate tax rates competition, but a business environment one, which is determined primarily by fiscal policy. A low corporate tax rate will not attract the FDI if the fiscal policy generates an unfriendly business environment marked by unpredictability, lack of transparency, fiscal ambiguity, tax avoidance and tax fraud; a high corporate tax rate will stimulate the FDI flows if the revenue is used to provide public goods that improve the environment in which investors operate.

In our future research we intend to study the effects of specific categories of fiscal instruments on FDI as well as the channels and mechanisms through which these effects take place.

Romania's Economic Recovery Strategy in 10 Years

Gradea Cristina

Romanian University of Science and Arts "Gheorghe Cristea"
cristina_gradea@yahoo.com

Abstract

Globalization, by its proportions, changed the basis and the perspective of the economic life as a fundamental change in human history. Involving major implications, it determined redefining our possibilities and limits of acting at local action.

Globalization is a system where the objective function aims the whole in order to eliminate adversity and competition, to generate creative destruction.

Keywords: Globalization, competition, international market prices, confrontation with reality, strategies

J.E.L. Classification.: G0, G24

1.Introduction

The increase in value of world exports (in current prices) is due to several causes: the increase in this period of the physical quantity of exports, increase of international market prices, profound changes in the structure of world economy mainly due to modern scientific and technological progress, deepening of global division of labor, changes produced in the world market price formation mechanism, the absence of great economic crisis as in the not too distant past.

In the dynamics of globalization there is faster growth of world trade compared to world output of goods and services, increasing the share of export or import that is of the coefficient of dependence of the economy of a nation on the world economy. Growing importance of foreign market for a nation inevitably requires states to adopt measures to liberalize bilateral trade.^[1]

Transnational companies (STN) are now a key factor in globalization. They appeal to different mechanisms (transfer pricing, manipulation of international interest, influence of the exchange rate, autonomy of

tax setting that these companies pay states by transnational corporations and subsidiaries spread registration in different countries of the world with low taxes) affecting the economy of various countries or groups of states.^[2]

2.Strategy for revival in 10 years

Economic globalization is an objective and necessary step that has several forms, from simple to most complex ones, including the organization of over - national integration tools. Creation of common institutions and international bodies such as global, regional and sub-regional ones, both public and private is an objective process that leads to globalization. An objective process is the adoption by States of international economic integration measures.^[3]

Characteristic of globalization is that it is carried out with unprecedented intensity and speed. The experience of recent years shows that the processes and critical phenomena in a given country quickly come to affect economic and social developments in different countries.^[4] Some of these phenomena can have predictable causes and others not (e.g. financial crises). One such event occurred in the winter of 2008 when real estate housing crisis broke out in the United States and dramatically influenced the banking system, destabilizing it. The crisis has spread rapidly in Europe too, affecting all European countries, but mainly Greece (where social conflicts have been reported) and Spain. Romania is still affected by this process. Romania is currently going through a period marked by the onset of several crises to which it must find solutions for the lowest costs possible.

This paper proposed a strategy for revival in 10 years based on the principles of excellence in business, principles drafted by a team of researchers from the United States of America led by Jim Collins. In 1990-2000,

Jim Collins led a team of researchers to answer the question: "What are the measures that have allowed some prestigious American companies to increase their shareholder value significantly above the overall increase in capital market?"

In the book "Business Excellence" during the first 9 chapters, Jim Collins and his colleagues come to define a set of concepts and principles that have allowed the leap from good to excellent business. [5] In essence, these principles are presented in the figure below:

Fig.1 Principles which have allowed some American companies to make the leap from good to excellent business.

Source: IMF: Jim Collins, "Excellence in Business", Bucharest, 2009.

The meaning of key terms presented in the figure above is:

table no 1

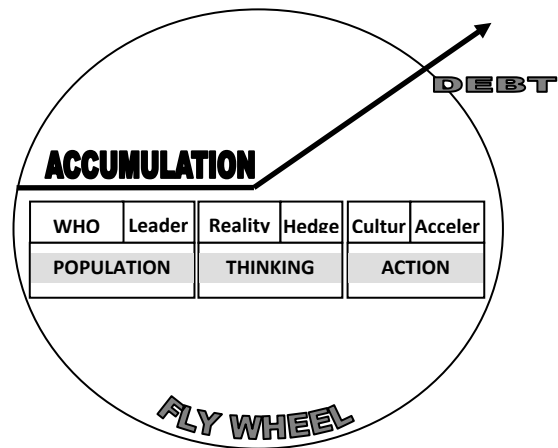

1. Leader of level V	there are leaders who have had outstanding results in the management of companies they lead, they are quiet, reserved, even shy, they are a paradoxical blend of personal humility and professional will.
2. First	In the management

„who”then „what”	of companies are chosen the right people for the job first and then determine "who" have done in the "what" conditions.
3. Disciplined men	Are those people who can maintain unwavering faith that they can and will eventually succeed against all odds.
4. Confrontation with reality	At the same time they have discipline to face the brutal facts of current reality, whatever it may be
5. Concept of hedgehog	To go from good to excellent, it is needed an understanding of three circles which intersect and lead to a simple clear and concrete concept.
6. Disciplined thinking	Positive education; thinking always in favor of the company, perceive what is good and bad.
7. Culture of discipline	All companies have a self culture and discipline. When a company has

	disciplined people, they do not need hierarchy and bureaucracy any more. They also do not need excessive control.
8. Tehnologic accelerators	Technology is never the main means of raising the performance transformation of society. In different companies, the role of technology is designed differently.
9. Disciplined action	– It is aware that the company's prosperity depends on activity, acting for the company, perceives when something brings negative consequences for society and strives to act or to report a wrong thing to a higher authority.
10. Flywheel and the decline chain	- leap to excellence never happens in a single shot. It takes perseverance to use centrifugal force of a flywheel. The people that trigger programs of dramatic change, revolutions and forced restructuring will not succeed to move to excellence.
11.	Sustainable

Accumulation and breakthrough	transformation follows a predictable pattern of accumulation and vulnerability. Pushing a giant heavy flywheel requires a huge effort to incite, but a persistent movement in a consistent direction over a long period of time, the flywheel creates momentum, eventually reaching the point of breakthrough.
--------------------------------------	--

Fig. 2. Principles to enable the strategy to revive the Romanian economy in order to pay off IMF and significantly reduce the external debt in ten years

Source: processing by Jim Collins, op. cited, page 182.

The meaning of key terms presented in the figure above is:

Table no. 2

1. First „who” then „what”	It is set up the school "V level political leaders". Each recognized
-----------------------------------	--

	party shall appoint a number of persons in proportion to votes obtained in the last campaign to attend school-level political leadership.
2. Politic Leader of level V	They are leaders who have left the school of political leaders with a "magna cum laude".
3. Disciplined Population	TVR1 program, will organize a set of programs that lead to increase people's knowledge in areas such as democracy, entrepreneurial culture, the management of NGOs.
4. Confrontation with reality	People need discipline to confront the brutal facts of current reality, whatever they might be
5. Concept of hedgehog	To go from good to excellent, it is needed an understanding of the three circles which intersect and lead to a simple,

	clear and concrete concept.
6. Disciplined thinking	Positive education, always thinking in favor of your company, perceive what is good and bad.
7. Culture of discipline	All companies have a self culture and discipline. When a company has disciplined people do not need hierarchy and bureaucracy any more. They also do not need excessive control.
8. Technologic accelerators	technology is never the main means of raising the performance transformation of society. In different companies, the role of technology is designed differently.
9. disciplined action	is aware that the company's prosperity depends on activity, acting for the company; perceives when something brings negative consequences for society and strives to act or to report a wrong thing to a

	higher authority.
10. Flywheel	The jump to excellence never happens in a single shot. It takes perseverance to use centrifugal force of a flywheel. The people that trigger programs of dramatic change, revolution and forced restructuring will not succeed to move to excellence.
11. Payment of debts	Economic conditions are created for the gradual payment of debt so that people do not feel this effort. It requires the cultivation of a specific education for an indebted country towards "feasible" sacrifice, acceptable to be better for us tomorrow

A main conclusion in the analysis of financial flows in the last two decades is that they have no money and therefore public sector funding stagnated and private funding and other sources increased.

External debt is fueled by financial resources resulting in market conditions, most of the loans represented by transnational banks. Without exception, all commercial banks to hedge against credit default risk, claim interest on the international market plus a margin calculated by rating the country.

IMF (International Monetary Fund) is an international organization which has 186 member countries, established to promote international monetary cooperation, exchange stability and systematic exchange agreements to boost economic growth and high levels of labor use and provide temporary financial assistance to member countries under the right conditions to help the balance of payments adjustment.

3. Conclusions

The article proposes a strategy for revival of Romanian economy in a period of ten years, based on the principles of business excellence, developed by a team of researchers led by Jim Collins.

The strategy also created, by default, the economic conditions for the gradual payment of debt, so that people are not severely affected by this effort. It is necessary to cultivate a specific education in the country indebted towards accepting the sacrifices to be better for us tomorrow.

Abstract

In Romania, the increase of the population's real incomes, of their trust in national currency and, generally speaking, the economy's stabilization during the first decade of the 21st century have made the saving process record a certain recovery. Furthermore, the inflation which had reduced saving in the 90's has slowed down and thus deposits' growth has started to enjoy positive dynamics.

From the economic perspective, saving's growth is the basis of sustainable development, a solution for the society progress that could rely on domestic resources, and it signifies the decrease of dependence on foreign funding.

The present paper aims at examining saving from the point of view of marketing, the evolution of such a phenomenon in Romania as well as certain applicable reporting standards.

Key words: deposits, saving, interest, evolution, standards.

J.E.L Classification.: G21

1. Introduction

Saving is not only a concept emerging in macroeconomic policies, but also one of the permanent concerns of banks, as it is the foundation of banking operations' amount increase.

In order to raise saving, specialists recommend the diversification of saving products. The more the latter are, the more beneficiaries they may attract. Diversification

can take place by two main techniques, terms and prices.

During the years previous to the financial crisis in Romania, although present, the saving process did not reach the necessary level to support the funding of banks which had to resort to financial aids from mother banks (open-end credits). This aspect has become at times of crisis a factor of financial stress with the risk of fund outflows (namely the open-end credits previously granted by mother banks cannot be renewed) which might have augmented the pressures on foreign currency market leading to Leu value loss.

Since the crisis emerged, the reasons related to prudence, or the uncertainties for "tomorrow" have made the saving process improve and its dynamic, although not very high, is still encouraging.

2. Amount of deposits and quality-price ratio

Attracting resources from the population is one of the major goals of a bank, even if the reason is that they represent the cheapest of the funds used to support financial intermediaries [1].

If a bank maximized the price provided to its clients who are willing to acquire saving products (deposits), the additional funding sources would grow, but the profitability allowance would implicitly lessen. The same impact ensues from the increase in the quality of such products.

It is recommended that while setting the prices of saving products various variants of prices provided (interests) should be simulated, so that to attract the maximum

amount of resources. A high level of deposit prices (interests) granted to clients is not always the best thing a bank can do. This happens because a maximum price level brings about a number of low amount deposits whose costs may affect the overall bank profitability.

Moreover, it should be taken into account that a maximum price to each consumer can have different values. Thus, a maximum price can be compensated for high income retail clients by secondary services (counselling regarding investments, services to alert deposits' maturity, fixed interests on long terms etc.) and the quality of these products can be improved as this type of clients tend to appreciate secondary services rather than deposit interest maximization. On the contrary, the clients whose incomes are modest always appreciate a maximum interest and think secondary services are useless.

An optimal ratio between cost and quality of saving products can be achieved by cutting banks' operational costs. Operational costs are directly proportional to the number of deposits and inversely proportional with the amount of an average deposit. A way to cut operational costs can be the alternative distribution channels (ability to make deposits in ATM's or by I-banking or e-banking services).

The increase in banking culture level has made more and more clients concerned not only with the nominal value of the interests charged by banks, but also with other secondary aspects: commissions and fees paid for acquiring a product, facilities provided, and with factors related to the quality of banking products.

The commissions and fees paid for a product actually reduce the price received by a depositor. There are opinions that it would be better to display or communicate the interest real level to depositors, especially when these interests' taxation is higher and higher and many depositors do not know that [2].

Facilities provided. Many clients have began to pursue aspects such as: whether an interest is fixed or variable, whether interest bonuses are granted according to deposition term or deposit size, method of interest calculation, whether it is transferred into a deposit account or another account etc. It is

recommended the promotions for these products should attach various facilities to attract the clients segment which the respective product addresses to the interest level (which must necessarily be indicated).

More often than not, factors such as: account administrators' kindness, counters' number, place and schedule etc. may compensate the lower prices granted by financial intermediaries for saving instruments.

The brief enumeration above indicates that the price of saving instruments is one of the basic elements in their marketing, as this price largely generates the amount of deposits attracted by banks, therefore the resources the latter take their funds from.

3. Romanian evolutions in the field of bank deposits

Between 2000 and 2008, demand deposits and time deposits rose from 15 billion Lei (RON) to almost 220 billion Lei. In other words, they rose by about 16 times, yet it was a nominal increase because inflation was still high in the early 21st century [3].

Table 1. Dynamic and structure of bank deposits in Romania

Year	Available at demand	Time deposits			Financial enterprises' deposits
		Total	Of which:		
			Lei	Foreign currency	Lei

A better evaluation of deposits' size is rendered by their share of GDP. Thus, the total of deposits rose between 2000 and 2008 from about 20% to 45%, namely they more than doubled in eight years. After 2008, the financial crisis, job losses, prudence-related reasons, uncertainties about the future have made time deposits rise by around 11 billion Lei (in just three years) whereas demand deposits have decreased their size (against a reduction of economy liquidity, optimization of liquidity capitalization, and demand deposits' taxation).

From the perspective of deposits' structure, the following remarks can be made:

- most deposits are in the form of time deposits (meaning a funding source of bank investments, including the loans they offer);
- about half of time deposits are made in foreign currency, with the specification the share of those in Lei is rising. This aspect shows that some Romanians do not trust national currency too much (although some change their opinions) and because of foreign financial pressures, to save foreign currency means an alternative to saving national Lei which relies on insecure economy and is dependent enough on foreign economies.

Table 2. Structure of population's and non-financial companies' deposits

Year	Total	Of which:	
		Lei	Foreign currency
a. Population's deposits			
Absolute values – billion Lei

The analysis of deposits' structure in the two categories of depositors: population and non-financial companies indicates the following orientations:

- the saving process has been more pronounced as far as the population is concerned, according to the increase in their real incomes (which was felt until the crisis) and more obvious prudence behaviours (after the crisis began). Thus, the population's time deposits have a level that is almost close to that of the same deposit type as far as companies are concerned;
- non-financial time deposits had much more modest increases after the crisis beginning and even a decline after the year 2010, proven by the hardships they have faced over the last years and by the increase in their number as a consequence of insolvency and failure;

- whereas in 2000 time deposits denominated in foreign currency meant about 40% of all time deposits and 70% in the segment of non-financial companies, in the end of the period subject to analysis they were between 30% and 40%. Therefore, in terms of companies, the saving of foreign currency has reduced its proportions as a result of the full liberalization of foreign currency market, easier conditions for economic agents to access foreign currency. As a matter of fact, companies' time deposits in foreign currency have lessened since 2010, evolution confirming the difficulties they have been running;
- companies' time deposits stabilized after 2008 at 12% of GDP, of which about 8% were deposits in Lei and another 4% in foreign currency;
- population's time deposits continued their ascending trend after the crisis had started, that is they progressed from 16.1% of GDP in 2008 up to 21.1%, so they had a 5% increase. The increase mainly occurred for the component of Lei time deposits. Between 2010 and February 2012, the population's foreign currency time deposits recorded a slight decrease (in terms of their share of GDP), probably as an effect of decreasing transfers in foreign currency from family members working abroad.

From the accounting perspective and as a an approaching way, the deposits attracted by loan institutions are financial instruments. The recent regulation of loan institutions is worth emphasizing in its historical background. Order no.13 of 19 December was approved in 2008 agreeing upon accounting regulations in compliance with European directives applicable to loan institutions, non-banking financial institutions and the Fund for guaranteeing deposits in the banking system. This Order was later revoked by Romanian National Bank Order no.27/2010 for the approval of accounting regulations compliant with the International Standards of Financial Reporting applicable to loan institutions. International Standards of Financial Reporting also known as ISFR are standards adopted in accordance with the procedure provided by Article 6, second indent, of Regulation no.1.606/2002 of the European

Parliament and Council of 19 July 2002 concerning the application of international accounting [4].

Since the beginning of tax year 2012, loan institutions have been submitting an annual report drawn up according to the data in their accounting registers to the Ministry of Public Finance. When transposing the balances of accounting accounts in the trial balance made up for 31 December 2011 into the accounts opening tax year 2012, loan institutions must prepare statements including the differences between the values registered in the trial balance of 31 December 2011 and those registered in the accounts to begin tax year 2012, along with details about their nature and the method of amounts' transfer. Additionally, there should be the amendments of accounting policies generated by the transition to ISFR application.

The above explanations are needed to clearly define the regulations applicable to loan institutions and implicitly the way of evaluating and recognizing deposits in financial statements. However, loan institutions are familiar with this approach as they already prepare consolidated financial statements in compliance with ISFR (International Standards of Financial Reporting).

As far as the evaluation and recognition of financial debts are concerned regarding the deposits attracted from clients and the deposit interest-associated expenses for the financial statements made up for 2011, they used to be treated and registered according to European Directives as such:

- the deposits made, irrespective of their type (time, demand deposits etc.), were regarded as debts of an entity and evaluated at the nominal value these deposits had at the end of the tax year;

- the interest-related expenses were recognized and evaluated at the level of amounts regarding the deposits' interests paid or payable.

Since the beginning of tax year 2012, current accounts and clients' deposits have been recognized at depreciated costs and in addition, the deposits created and revenues/expenses associated with interest revenues and expenses have been registered in accounts of profit and losses for all the instruments evaluated at depreciated costs, by means of the effective interest method.

Interest-related revenues include the coupons of fixed-income securities, discounts and bonuses accumulated in treasury certificates.

Effective interest method is the method of calculation of the depreciated cost of a financial asset or financial liability and allocation of interest-associated incomes and expenses during a relevant period. Effective interest rate is the one that precisely updates future estimated cash payments or payments during the estimated existence of a financial instrument, or, if necessary, during a shorter period, at the net accounting value of a financial asset or financial liability.

For the calculation of effective interest rate, treasury flows are estimated taking account of all the contract circumstances of a financial instrument (for instance, payments made beforehand). In order to calculate a depreciated cost, first the real interest rate should be set taking account of all the cash flows associated with a deposit.

Example: in the end of a tax year, an institution must evaluate a two-year time deposit of 100,000 Lei, with a fixed interest rate of 5%/year, where the interest is entirely paid on maturity date.

The deposit is evaluated at its depreciated cost in the end of the tax year. In order to set the effective interest rate, the following equation is required:

$$100,000 = \frac{110,000}{(1 + R_{def})^2}$$

which leads to the effective interest rate = 4.881%.

Table 3. Setting a depreciated cost in the end of the first tax year

Year	Initial cost	Cash flow (interests paid)	Effective interest	Final depreciated cost	Difference to be entered
0	1	2	$3 = 1 * R_{def}$	$4 = 1 - 2 + 3$	$5 = 4 - 1$
1	100,000	0	4.881	104,881	+4881
2	104,881	10,000	5.119	100,000	-4881

Source: Authors' calculations

In the end of the first tax year, the deposit value to be included in financial statements according to ISFR is 104,881 Lei, whereas if

the old regulations compliant with European Directives had been applied, the deposit value would have been 100,000. In the authors' opinion, the end of 2012 shall bring great differences in loan institutions' financial statements regarding the evaluation method of financial instruments in compliance with the new regulations (ISFR) as compared to old rules.

In conclusion, it can be stated that there is a contradictory evolution of the bank saving process influenced by changes in the economic context and progress both at national and international level, and last but not least, by the policies promoted by the banks in our country. As far as the latter aspect is concerned, it should be added that Romanian banks' policies meant to attract resources have changed after 2008.

Thus, getting liquidities from mother banks was easy and inexpensive before the crisis (in the context of liquidity excess on foreign markets) whereas after 2008, restraining the liquidity on foreign financial markets has made Romanian banks raise their deposit interests in order to refund their loans granted and investments made, therefore the saving process has grown. Saving has also been encouraged in Romania after 2008 by the more obvious restrictive nature of the monetary policy of the Romanian National Bank which has increased monetary policy interest thus making banks resort to fewer deposits because they have lower costs [5].

The Economic Crisis and its Effects on the Evolution of Economic Performance

Guni Claudia Nicoleta
“Spiru Haret” University, Constanta
borsanclaudia@yahoo.com

Abstract

This paper attempts to provide an estimate of how the Romanian economy can develop in 2012. This prediction is made based on an analysis of the evolution of the market value of the main companies operating on the financial markets, in the industry, on the energy market, on the consumer market, in real estates, in agriculture. The conclusion is that there is no evidence of a trend and common to all sectors analyzed, but we can provide some answers to the question: Which of the economic sectors will have a positive trend this year?

Key words: economic crisis, share value, economic sectors.

J.E.L. Classification: G3; G32; G34

1. Introduction

“This is a nightmare, which will pass away with the morning. For the resources of nature and men’s devices are just as fertile and productive as they were. The rate of our progress towards solving the material problems of life is not less rapid. We are as capable as before of affording for everyone a high standard of life—high, I mean, compared with, say, twenty years ago—and will soon learn to afford a standard higher still. But to-day we have involved ourselves in a colossal muddle, having blundered in the control of a delicate machine, the working of which we do not understand. The result is that our possibilities of wealth may run to waste for a time—perhaps for a long time.” (John Maynard Keynes, *The Great Slump of 1930*).

Today, after 80 years of the Great Depression of the 1930s, most industrialized countries face a severe recession. Euphoria credits extended for a period of almost 50

years has led to excessive price increase, especially in the United States, and finally the situation turned into a contraction of the market. Economists believe that the current recession is even more severe than the Grand crisis of 1930 and are concerned that the end of it is not in the near future, but sometimes after 2012.[1]

The signs of the economic crisis are:

- A sharp decline in industrial production in countries that rely on export;
- Unemployment, especially in constructions, real estates and financial services;
- High degree of market volatility;
- The crisis in financial markets emphasized by significant decreases in the share value;
- The decline in business travel - hotels respond to this situation by reducing prices, making more special offers etc.
- Political instability – as can be seen in the violent protests in Greece, the protests of thousands of people in France and the Great Britain, all aimed against the economic policies.
- Overall, we can notice that the current global recession forces all investors to revise their business plans and also constrains the consumers to cut on their expenses.

It is obvious that Romania is affected by the current economic crisis. Whether faster or slower, all economic sectors have been affected. This paper portrays the evolution of stock prices for the major companies on the market, broken down by sector of activity, according to statistics provided by BSE.

2. Data regarding the evolution of companies share value

We have analyzed the evolution of the following economic sectors:

Financial market – its evolution was studied based on an analysis of the changes in the share value for some of the most representative companies belonging to sectors such as banking, insurance, brokerage, mutual funds. The study included a total of nine companies and the results are as follows:

Company Name	Share Value May 2008	Share Value May 2011	Share Value Evolution
BRD	22	14,91	-32,22%
Banca Transilvania	4,3	1,57	-63,48%
Erste Group Bank AG	160	141	-11,87%
Banca Comerciala Carpatica	0,2	0,07	-60,00%
SIF 2	2,5	1,56	-62,66%
SIF 5	3	1,56	-48,00%
SIF 3	1,5	0,58	-61,33%
SIF 4	1,7	0,85	-50,00%
SIF 1	2,7	1,27	-52,96%

Energy – this area of economic activity was analyzed in terms of developments in the oil, natural gas and electricity production market.[6]

The results provided by the five companies are shown in the table below:

Company Name	Share Value May 2008	Share Value May 2011	Share Value Evolution
Transgaz	240	255	06,00%
Transelectrica – Transporting electrical energy	27,2	21,00	-22,79%
Romp petrol – crude oil products	0,6	0,37	38,33%
Petrom – petroleum extractions	0,43	0,43	0,00%
Dafora – petroleum and natural	0,3	0,12	-60,00%

gas extraction			
----------------	--	--	--

Industrie – the existing data in this area were numerous, but we selected as representative the data from 21 different companies belonging to the manufacturing industry, metallurgy, furniture industry, pharmaceutical and chemical industry, textile industry etc.

The results were as follows:

Company Name	Share Value May 2008	Share Value May 2011	Share Value Evolution
Zim tub S.A. – producing steel tubes	4	1,35	-66,25%
Biofarm S.A. – pharmaceutical products	0,3	0,20	-33,33%
Azomures S.A. – producing fertilizers	0,2	0,68	240%
Alro S.A. – aluminum processing	7,6	1,66	-78,16%
Teraplast S.A.- plastic processing	0,83	0,51	-38,55%
Altur S.A. – producing vehicle pieces and accessories	0,06	0,04	-33,33%
Zentiva S.A. – pharmaceutical products	0,6	1,5	50,00%
Amonil S.A. – producing fertilizers	0,06	0,01	-83,33%
Turbomecanica	0,4	0,08	-80,00%
Antibiotice S.A – pharmaceutical products	1,4	0,57	-59,28%
Oltchim S.A. – chemical products	0,8	0,41	-48,75%

Alumil – aluminum processing	5,7	1,38	-75,78%
Artrom – producing steel tubes	12	1,4	-88,33%
SNO – naval constructions	10	4,5	-55,00%
Siretul Pascani – textiles	0,06	0,2	233,33%
Aerostar – aircraft constructions	1,4	1,01	-27,85%
Electroputere	0,8	0,07	-91,25%
Statusmob – mobile	0,1	0,04	-60,00%
Mobam-furniture	4	2,8	-30,00%
Faimar – ceramic products	0,25	0,04	-84,00%
Pantex – textiles	30	6,1	-79,67%

Constructions – the construction economic sector was studied by means of changes in the share values of real estate developers, construction firms and construction and real estate brokers.[1]

The results are as follows:

Company Name	Share Value May 2008	Share Value May 2011	Share Value Evolution
Condmag	0,8	0,36	-55,00%
Impact Developer – Real Estate Developer	2,5	0,4	-84,00%
Transilvania Constructii	350	36,5	-89,57%
Edil Constructii	0,8	0,05	-93,75%
SCT SA	24	4,6	-80,83%
Forconcid SA	150	60	-60,00%
Cocor SA	400	299	-25,25%

Retail - Consumer goods market has been analyzed based on changes of the value of shares belonging to companies representative of the electrical trade, alcoholic beverages,

pharmaceuticals, auto parts trade.

Company Name	Share Value May 2008	Share Value May 2011	Share Value Evolution
Flamingo	0,3	0,04	-86,67%
Bermas	1,7	0,81	-52,35%
Farmaceutica	0,35	0,17	-51,43%
Automobile Craiova	25	14,5	-42,00%
Medimfarm	0,35	0,3	-14,29%
Dorolux	0,16	0,7	337%
Uzinexport	0,6	0,5	-16,67%
Petrom Aviation	0,14	0,25	78,57%
Centrofarm	8,5	5	-41,18%

Services – The tertiary sector is represented in this paper by the evolution of the share value in the tourism sector (hotels, travel agencies) and by the market developments in passenger and freight transport.

Company Name	Share Value May 2008	Share Value May 2011	Share Value Evolution
Turism Felix	0,6	0,17	-71,66%
Casa de Bucovina	0,2	0,05	-75,00%
Durau SA	0,3	0,65	116,67%
Bucuresti Turism	20	3,5	-82,50%
Bat Medias	0,6	0,49	-18,33%
Trameco	30	8	-73,33%
Dorna Turism	6	2,7	-55,00%
Tusi Prahova	0,2	0,11	-45,00%
Intercontinental	0,18	0,07	-61,11%
Mondotrans	0,8	0,84	5,00%
Herculesc	0,4	0,4	0,00%

Agriculture – The evolution of the agricultural sector is presented based on the way in which the share value has evolved for companies dealing with selling cereal, for those in the meat, dairy and bakery industry.

Company Name	Share Value May 2008	Share Value May 2011	Share Value Evolution
Titan	0,35	0,37	5,71%
Comcereal	35	15	-57,14%
Graul SA	0,25	0,19	-24,00%
Coreal	10	5,4	-46,00%
Avicola Buzau	0,07	0,02	-71,43%
Unisem	0,07	0,03	-57,14%
Albalact	0,5	0,22	-60,00%

Summarizing the data obtained, we will now present the growth rate for the period between May 2008 - May 2011, for each of the economic sectors considered, based on the average value of shares evolution in the companies that we considered representative for the areas that we took into account.[4]

Economic Sector	Average value of the evolution	Standard Deviation
Financial Market	-67,21%	0,17
Industry	-52,05%	0,68
Energy	-61,23%	0,16
Constructions	-73,59%	0,24
Retail	-23,67%	0,51
Services	-36,84%	0,58
Agriculture	-44,29%	0,26

From the data herein presented we can conclude the following:

- All economic sectors registered a fall in the market value their shares;
- The narrowing of the market is significant (only three of the sectors analyzed presented a decrease below 50% - services, retail and agriculture), thus excluding the hypothesis of a conjunctural negative situation and creating all the prerequisites for a similar development on the long term;
- The most affected of the economic sectors considered is the construction sector, a situation mainly caused by stopping the funding for such investments;
- The least affected sector is the consumer goods market, situation which may be generally explained by the fact that

products are generally low-cost, are products of prime necessity, some of them less elastic depending on the income;

- The development of services, analyzed, as we have already mentioned, mainly in terms of tourism services, can be considered less than relevant because the analysis involves a period affected by the economic crisis, less favorable to the demand for tourism services.

We will further present the consequences that we forecast, as a result of the national economy previously outlined.

The financial market, which is the second, according to our analysis regarding the rate at which the value of shares decreases, is in turn divided into: banking, insurance, the leasing, brokerage houses. The expected evolution for this economic segment is characterized by certain relevant aspects, as follows:

- A consolidation of the market position of the strongest banks based on mergers and acquisitions and not based on competitors going bankrupt;
- A slowing down of the expansion of banking networks and of the addition of bank assets;
- A deceleration of both the contracting and the lending of credits, for the population and for the companies alike;
- An orientation for loans in lei;
- A decrease in the spread of interests;
- The insurance market will suffer losses due to the fact that, in these times, companies mainly wanting to save will reduce the budgets allocated for purchasing insurance products;
- The collapse of stock prices and of the trading volume will drastically affect the profits of brokerage houses, which in turn will have negative effects on wages and employment in this market segment;
- On the leasing market also we can also assume there will be a stagnation in the increase of profits and wages.

The industry, with a decrease in share value during the period between 2008 - 2009 of about 50%, is a very heterogeneous sector, which makes a global assessment less relevant or important than as a trend. Therefore, this sector should be carefully analyzed, taking into account the sectors it is made up of.

The steel and metallurgical sector will be subject to different pressures. On the one hand it is expected that the export demand will fall, on the other hand, in times of economic crisis, infrastructure projects, which would increase the domestic demand, are initiated.

The manufacturing sector, itself a heterogeneous sector, will be characterized by significant variations in terms of turnover, profits and wages according to the markets analyzed. There are market segments that benefit from EU funding (such as those related to irrigation equipment, sewage, etc.), but there are also market segments such as the shipyards which, due to restricted activities of the ship-owners, will see significant cutting down of their activity.

As far as the *furniture market* is concerned, expectations are related to the fact that there will be no market growth recorded and that low price segments will be preferred. As a result of the decrease in the demand for furniture one can expect lowered prices for furniture.

The automotive industry is one of the most affected by the current economic circumstances. While there's a significant decrease in the number of cars produced, there will also be a decrease of profits and wages. In response to this situation companies that operate on this market segment will focus on after sales services.

The pharmaceutical industry has a more special situation because this market, unlike others, is characterized on the one hand by lower elasticity towards income, on the other hand is a regulated market as far as price is concerned. Although it is doubtful that it will have a development parallel with the economic crisis, impact will be one generated indirectly by the government's health policy which regards, among others, the modality of calculating the price of drugs.

The chemical industry, respectively the chemical fertilizers market will be largely dependent on the agricultural policy measures adopted. Specialists think however that there will not be significant increases in the market, while wages and profits will remain constant,

Regarding the *light industry* one can say that it will be one of the most affected sectors, to the extent that this downward trend had begun before prior to this period,

respectively since 2005. Specifically this will translate in a significant decrease in the market, lay-offs of at least 20% of the employees, lack of demand, bankruptcies, lower prices.

Energy, namely the petroleum natural gas and electricity market, decreased by about 60% in value of the shares for the period analyzed. The main players in this market appreciate that the evolution will be characterized by the following:

- Stagnation or even contraction of the market, both in quantity and in value;
- Maintaining the same level of the salaries or even lowering them by 5%;
- Lay offs;
- Maintaining the profits or reducing them in a small proportion.[6]

Construction, the sector most affected by the economic crisis characterized by aspects specific to the segment that they make reference to. Thus we can talk about a fall in homes prices - but to a greater extent for old houses, the rents for commercial spaces, land prices especially in non-central areas and about keeping rents for office accommodation at a stable level. Concomitantly, a slow down in earnings of about 10% is expected, as well as a comparable reduction in profits, the bankruptcy of small businesses, difficulties for construction firms in contracting new clients, decreasing the growth rate on the construction materials market. Ultimately, the evolution of this market will be influenced by the extent to which funding can be obtained, mainly for infrastructure works, by the credit-worthiness of customers and by the banks' lending policies.

The effects of the economic crisis on the **consumer goods market** will be reflected especially in the changing of the consumer habits. It's about consumer becoming oriented towards commodities which are basic and cheap, which will increase the market share of discounters. It is also appreciated that there will be a significant decrease in the market for consumer electronics, otherwise there will be no significant reductions (non-food consumer goods) or we might even record some increases (cosmetics, alcoholic beverages and soft drinks). As far as wages are concerned, we cannot talk about significant increases, in a context where the same number of

employees will be maintained or the layoffs are less relevant than in other sectors.[3]

The tertiary sector, one of the most flexible to incomes and prices, will be one of the most affected. The hotel services are expected to register an increase in the demand for average-quality services to the expense of five stars services, in search of a smaller price, reduced lengths of tourists sojourns, lower occupancy, maintaining relatively constant profits and wages. A similar trend will be recorded for the restaurant market. Customers will migrate from the top restaurants to those that fall within the medium-economy class. This level is also expected to have an increase in sales of up to 20%, which will determine a profit raise of about 10% and wages which are 6-7% higher. Structural changes are also expected in transportation. As there will be less demand for freight and passenger transportation, it is expected that road and air transportation will be preferred to the rail one. Overall we can expect a slight increase in sales and profits and a stagnation of the wages.[2]

The evolution of the agricultural sector will be largely dependent on state intervention and on the extent to which farmers will have access to funding. As far as the food industry is concerned we expect stagnation or a slow growth in sales, a constant level of profits, customer orientation to cheap and basic products, an increase of prices for raw materials and even the bankruptcy of small businesses.

3. Conclusions

Making an estimate of the economic development in the near future is a big challenge given that, as it can be seen, apart from the general trend of lower share prices, we cannot talk about a specific evolution on various markets. However, from all of the above we may conclude that we can expect stagnation of wages and profits, especially in banking, sales decreases, notably on the auto market, electronics and brokerage houses, a reducing of the rate of economic growth and foreign investments, deflation, larger unemployment, bankruptcies on one hand, and consolidation of the already powerful companies on the other hand, increased macroeconomic imbalances and a general

decrease of the confidence in the Romanian economy.

Abstract

In Romania, in recent years, bank credit has seen explosive growth, which has not been left without consequences. On one hand, credit growth has meant economic growth, raise of quality of life and living standards. But on the other hand, the same phenomenon has meant an increase in risks facing the Romanian economy and banks in our country. This communication aims to analyze bank lending in Romania, seen as a marketing element, and its developments and the risks that it determines.

Keywords: credit, interest, commission, structure, risks.

J.E.L. Classification: G21

1. Introduction

Bank credit was and is one of the controversial issues in the analysis of Romania's progress in the last decade. Thus, on the one hand, it is quite obvious its contribution to economic growth in the first decade after 2000 or in terms of raising the quality of life and living standards of many Romanians.

On the other hand, bank credit, but also its strong increase within the period 2005-2008 was one of the channels through which economic and financial crisis broke in Romania and additionally amplified the risks facing the economy, businesses and population.

2. Marketing of bank credit

Although at first glance, it seems that the typology of bank loans would be the same, there are a number of features, due to the economic environment, geographic areas in which banks operate, the standard of living of applicants, banking culture etc. Also, in

many countries such credit products are related to other products such as savings instruments, making it difficult to separate credit analysis services that are dependent. Credit is considered as a product in strategic marketing of financial-banking services. Credit is a strategic product because [1]:

- it allows the sale of other financial and banking products. Thus, often the bank will make a loan provided that the debtor is to transfer the salary into an account at the bank or credit card account. Furthermore, the existence of these accounts makes it possible to pay utilities, telephone bills through the bank or ATMs, so on and so forth;
- it allows the sale by banks of packages of products and services. So far most banks when granting a loan to maximize sales, attach also a card (with which they can use the credit), insurance products (nearly every bank has as subsidiary an insurance company, where they conclude insurance policies or, if it does not have one, it acts as a broker in selling insurance policies of companies in the field), payment of credit purchases to be made through bank accounts, property valuation services by guaranteeing loans made by bank staff etc;
- as bank loans require a detailed analysis of the applicant, they can be used in developing complex databases of clients, which, in turn, may find use in the marketing process, to monitor population needs and behaviors;
- in some cases, credit may be a byproduct of other bank services. It is recommended in order to increase sales and bank income (as loans bring some of the largest bank revenues), to try the distribution of credit type products, even when the client is at the bank for another product. It is exemplified by overdraft facilities to debit

cards as banks offer to credit card depositors, which are guaranteed by collateral of deposit accounts.

In the bank marketing, credit costs play a very important role, so it is necessary to examine the elements that determine it.

Interest is the essential element of credit cost and at the same time, the main characteristic of a comparative analysis that customers make when purchasing such a product. However, due to competition, which caused an equalization of the levels of interest, the importance of this element began to decline significantly.

Hidden costs (a series of maintenance fees, insurance, management, etc.) are those that recently customize loans from bank to bank. Banks, faced with lower interest income in recent years have tried to counter this situation, by attaching to credit type products a series of commissions, justified by covering all costs that were made when granting a loan. Since the levels of interest were becoming smaller and smaller and hidden costs increasingly larger and to enable customers to make fair comparisons, taking into account both interest rates and hidden costs, regulators in many states have imposed financial intermediaries to calculate the full cost of credits (a sort of compound interest annually, as is in Romania the effective annual interest). Imposing publication of these annual effective interest was generated by the market entry of non-bank intermediaries on the financial products market, or even traders, who, in trying to win the important parts of the market carried extensive promotional campaign about the "0% interest" practiced. In fact they sold goods at increased prices that represented exactly the amount of the interest and other commissions. As seems to be true the idea that publication of the annual effective interest was a fair measure to protect customers by ensuring the transparency of operations, given that for many consumers financial services terminology of the elements (flat, free, etc..) or techniques for calculating interest or maturities, due to reduced banking culture had no relevance. In addition, the annual percentage rates had the advantage of increasing competition in financial markets and banking.

Undoubtedly, these types of interest influence very much interest on loans.

Consumers of financial-banking services, insufficiently clear on the mechanisms underlying interest, consider that any fall in the first category of interest, should also determine reduced lending rates. In reality, any bank, when reducing interest on loans, do so not from a cyclical influence or imitation of competition, but after analyzing a variety of environmental factors, some internal and external of the bank and, not least, due to the evaluation of the impact which generate amplification in volume of bank operations.

Risk [2] is another element that affects the interest rate on loans. In principle, if the analysis made by the bank at granting the loan is casual, (see slogans "credit with ID only", or based on the certificate of employee), the higher the interest, because it can interfere with many uncertainties for banks. Conversely, a long term loan, mortgage or real estate like, with guarantees and insurance, with a thorough analysis of the creditworthiness of the applicant, will have a much lower risk and therefore will have less interest. Loans in foreign currency, in principle, have higher levels of interest in relation to the reference rate in the country issuing the currency, because it is dependent on the volatility of currency markets, on the international financial market creditworthiness of the bank to attract resources, on one hand, and gives credit on the other hand.

Reserve requirements are another element that "raises" the interest on loans. The fact that for any resource of bank financing, except equity category, they must restrain some accounts the central bank, while the cost of attracting and involving not only make very small income, they must be supported by the interest charged by banks on loans. Studies in Romania indicate that approximately 30-35% of the interest margin charged by banks is the cost of minimum reserves held at the National Bank of Romania.

A portion of bank loans (small - approx. 3% - for loans to individuals and higher for business loans - about. 5-7%) do not return to the bank, borrowers entering default. These banks have incurred losses for the banks and the amounts they are spending on their own account, meaning on account provisions that do nothing but increase the interest on loans.

Distribution cost loans. Levels of interest

on loans to retail customers is higher than the interest on loans to corporations and that the first volumes were much lower than those for businesses and therefore the fixed costs of lending (usually commissions) distributed over much smaller amounts. In addition, most loans to individuals are distributed through the network of counters, which is a relatively expensive means of distribution. In recent years, banks, just to avoid these costs and therefore to reduce the level of interest for credits, prefer to allow credits of small volumes, for individuals, in the revolving system and through the cards.

We notice that many of the factors that determine the cost of credit are not one-off factors, but rather structural, which banks often have no way to control, in order to reduce the levels of interest on loans. Therefore, to balance their level it is recommended, in terms of marketing, emphasizing secondary services such as facilities provided (payment terms, grace periods, the fact that the interest rate is fixed, when there appears a trend of increase or variability on the market, when the trend is downward, has no specific destination, early repayment is allowed, rates can be paid at any counter or through any channel, etc.), service quality is high, response time credit application is short (see the slogan "credit in an hour"), the product can be contracted through alternative channels (call centers) etc.

3. Romanian developments in credit and related risks

Non-government credit (for population and business) has registered an explosive increase, in 12 years, it grew almost 30 times. However, in its evolution there are two distinct periods (table no. 1):

- one prior to the crisis in Romania, 2001-2008 (but especially, between 2005-2008, in which the non-government credit rises strongly, from about 7.5 billion lei (RON), to 194 billion lei (RON). Accelerated dynamics of the non-government credit in this period can best be captured by the ratio of it and the gross domestic product of Romania, indicator which from 9%, as it was in 2000, reaches 38% in 2008;
- the second beginning with the year 2009, after the crisis struck, in which the increase fades, and in some parts of the

credit we can even speak of decreases. Thus, non-government loan, as a share of GDP, evolves in this period from 38% to 40%, provided that this increase is due to foreign currency component, namely the process of currency depreciation of the leu (against the euro, dollar or other currencies in which the loans were denominated) recorded in relation to 2008 (table no. 2).

Table 1. Credit dynamics in Romania

Year	Government credit		Non-government credit	
	billion lei	% of GDP	billion lei	% of GDP
2000	3,4	4,2	7,5	9,3
2001	2,5	2,1	14,4	12,3
2005	3,3	1,1	60,6	21,0
2006	3,5	1,0	93,3	27,3
2007	9,6	2,3	144,4	34,7
2008	17,2	3,3	194,0	37,7
2009	47,0	9,4	196,4	39,2
2010	61,0	11,7	209,0	40,0
2011	70,1	12,8	219,8	40,0
2012 feb	77,1	14,0	218,9	39,9

Source: NBR monthly data from January 2000 Bulletins - February 2012 and author's calculations

Non-government credit growth, theoretically, should have beneficial results for the economy, but the dynamics that this process took place in Romania and a very short period of time that has happened is rather risky and unfavorable: amplification of inflation, of the real estate prices, amplifying the current account deficit, excessive debt [3] etc.

Table 2. Currency structure of credit

Year	Non-government credit			
	RON		in currency	
	billion lei	% of GDP	billion lei	% of GDP
2000	3	3,7	4,5	5,6
2001	4,7	4,0	9,7	8,3
2005	27,9	9,7	32,7	11,4
2006	49,5	14,5	43,8	12,8
2007	66,2	15,9	78,2	18,8
2008	82	15,9	112	21,7
2009	78,1	15,6	118,3	23,6
2010	77	14,8	132	25,3
2011	79,8	14,5	140	25,5
2012 feb	78,4	14,3	140,5	25,6

Source: NBR monthly data from January

2000 Bulletins - February 2012 and author's calculations

It should be noted that non-government credit growth stop since 2008, is accompanied by a rapid expansion of government credit (for state authorities), which from a value of 9.6 billion lei at the end of 2007, reaches 77.1 billion in February 2012, so an increase of almost 9 times in four years, or as a share of GDP from 2.3% to 12.8%. This last point explains the fact that reducing lending rates in recent years, despite efforts of the central bank to reduce policy rate, is a slow process: demand for loans for people and businesses is at historical minimal, the state credit appetite is very high.

Table 3. By debtor credit

Year	Non-government credit			
	business		for the population	
	billion lei	% of GDP	billion lei	% of GDP
2000	7,1	8,8	0,4	0,5
2001	13,4	11,5	1	0,9
2005	31,4	10,9	29,2	10,1
2006	54	15,8	39,3	11,5
2007	72,9	17,5	71,5	17,2
2008	94,6	18,4	99,3	19,3
2009	96,1	19,2	100,3	20,0
2010	105	20,1	104	19,9
2011	115,6	21,1	104,2	19,0
2012 feb	114,5	20,9	104,5	19,0

Source: NBR monthly data from January 2000 Bulletins - February 2012 and author's calculations

An analysis of loans by currency of denomination (table no. 2) indicate a prevalence of Romanians and Romanian companies to borrow in foreign currency, it fully justified given that interest rates on foreign currency loans were significantly lower than for loans in lei (although by the financial crisis monetary authority - NBR - tried, without much success, to discourage the loans in foreign currency). Statistics indicate an increase from 3 billion lei to 82 billion lei for loans in lei (or as a share of GDP from 3.7% to 15.9%) in 2008, after which a slow decline to 78 billion lei in February 2012. Regarding the currency component, it increased throughout the period under review, the increase being over 135 billion, noting that the phenomenon undergoes the biggest development prior to the crisis (115 billion), due to new loans and slower growth

after 2008 (22 billion lei), explained, mostly, as I said earlier, more through the depreciation of the leu against foreign currencies in which denominated loans that were already granted.

As a share of GDP non-government credit in currency represented about 25% of GDP and it must be said that it introduces a strong risk in the economy, any depreciation of the currency increases the borrowers debt and in the conditions of income restrictions the risk of insolvency increases of the borrowers, which through propagation strikes even the creditor banks. Is to note that most of foreign currency loans granted by banks were a source of credit lines granted by foreign parent banks or financing from international financial markets, these adding to the foreign currency deposits of non-residents, because savings in foreign currency is relatively low [4].

Table 4. Term structure of credit

Year	Non-government credit		
	Short-term	Mid-term	Long-term
Business			
2000	5,3	1,3	0,5
2001	10,7	2	0,7
2005	12,6	12,2	6,6
2006	26,9	15	12,1
2007	30,4	21,8	20,7
2008	39,6	27,4	27,6
2009	39,4	26,6	30,1
2010	40	30	35
2011	45,4	32,1	38,1
2012 feb	47,3	30,1	37,1
For population			
2000	0,1	0,2	0,1
2001	0,4	0,4	0,2
2005	10,1	10,1	9
2006	4,6	10,7	24
2007	3,9	11,7	55,9
2008	5	13	81,3
2009	5,4	12,2	82,7
2010	6	12	86
2011	6,3	10,8	87,1
2012 feb	5	12,1	87,4

Source: NBR monthly data from January 2000 Bulletins - February 2012

The analysis of loans structure by borrower (table no. 3) indicates a greater progression of credit to households. Thus, if at the beginning of the period analyzed credit for businesses was overwhelming, and that

for population was of insignificant size, it comes that in 2008 the one for population to surpass the one for companies (credit for the population grew from 0.4 billion lei in 2000 to 99.3 billion lei in 2008, and the one for companies grew from 7, 1 billion lei to 94.6 billion lei). Since 2009, we are witnessing a change, that population loans increase more slowly in relation to the business loans, the latter amounting to 10% higher compared to the first. At the end of the period under review the credit for the population represented 19% of GDP and the one for companies 21%. Risks induced by such a structure of the credit relate to its purpose. Thus, if loans to companies lead to economic growth, which are used mostly to increase operating parameters and investment activity, those for the population are intended to finance consumption (table no. 5.), in other words they do not contribute to create new value.

The structure of non-government loans by maturity indicates new risks in banking (table no. 4).

Table 5. Purpose of credit to households

Year	consumption	housing	more
2007	55,1	14,2	2,2
2008	73,7	20,9	4,6
2009	72,8	24,2	3,2
2010	65	29	10
2011	62	33,4	8,9
2012 feb	70,9	33,5	-

Source: NBR monthly data from January 2000 Bulletins - February 2012

Thus loans granted to companies show a concentration towards short term granting (up to a year), because at the end of the range, medium-term loan amount (between 1 and 5 years) and the long term (over 5 years) to be higher than short-term (in February 2012 those being of 47 billion lei in the short term, medium term 30 billion lei, 37.1 billion long term). However, for individuals, loans with terms longer than one year were always higher compared to the short term, the last with very low values compared with the medium and long term (in February 2012 those being of: 5 billion lei in the short term, medium term 12 billion lei, 87 billion lei for long term). Risks that arise from the term structure origin from the origins of sources of finance from which lending banks finance the

loans. Thus the dominant sources of financing the Romanian banks are term deposits up to one year and credit lines obtained short term and, hence, a mismatch in terms of the two categories: the sources attracted from short term loans are funded medium and long term loans. Additionally the maturity structure of loans to households induce additional risk meaning that the loans to this category, given the majority consumption (table no. 5), results that individuals are indebted medium and long term time to acquire goods that are morally and physically worn in a short period of time. At the enterprise level, the prevalence of medium and long term loans can be good, equivalent to financing investments of smaller or larger scale, which eventually lead to economic growth.

Table no. 5 provides an overview of the destination of loans granted to households. Observation is that throughout the period analyzed the destination of this type of loans was consumption, those for real estate (housing), being much smaller. As I said earlier risks assumed to this structure have funded in a smaller rate less durable goods, being financed mainly consumer goods with short-life, rapidly depreciating.

4. Conclusions

Romanian government credit granted by banks was one of the channels through which the bank has become an active presence in the lives of our citizens, a simple marketing tool that they have increased your profits.

At the same time, credit, and more specifically, its rapid expansion has meant less economic and more risk and uncertainty for millions of Romanian. Unfortunately, what I consider as having a greater negative impact that the credit is increased governmental and global risks that affect the economy in general and all the inhabitants, not only those who have taken this loan.

The Financial System, the Direct Foreign Investments and the Economic Growth

Halmi Mirela,
Romanian Academy Bucharest, Romania,
mirelahalmi@yahoo.com

Abstract

This paper aims to synthesize the debates concerning the development of the financial systems and the direct foreign investments in promoting the economic growth.

The present work wants establish a connection between the development of the financial systems and the economic growth. Recent studies have marked out the correlation between the financial system, the catalyst factor, and the economic growth.

The actual stage of the financial system from Romania, as well as the connection with the banking system and the financial institutions are also taken into account. The most recent structural changes of the financial system from Romania after the adherence to the European Union, as well as the evolution of the direct foreign investments are also presented.

Key words: financial system, direct foreign investments, economic growth, impact

JEL Classification: E20,G32

1. Introduction

Theoretical approaches regarding the financial system and its impact on the economic growth are found as early as the 19th century and they target, through for and against arguments, debates that want to elucidate if the financial system, and implicitly its structure, really leads to the durable development of a country.

There are also approaches according to which the structure of the financial system does not induce effects on the economic development in the specialty literature. It is author's J. Robinson's opinion that considers that the financial system doesn't have an impact on the economic growth, because finances either follow, either reflect the

economic amplitude, the investors anticipating the evolution of the economy.

Impact effects on the evolution of the economic system in its whole can also be attributed to the financial system implicitly in the actual context in which the finances are recognized for the specific function to stabilize the economy and implicitly their demator role in boosting the economy .

2. Approaches regarding the impact of the financial system on the economic growth

In 1969 J. Hicks considers that the economic system played an important role in the industrialization on Great Britain, acknowledging itself as capital mobilization factor. J. Schumpeter marked out the positive impact of efficient banking activity on the financial innovation, in the same context, at the beginning of the 19th century. The banks only finance the profitable projects, with positive effect on the canalization of capitals towards the investments that contribute through innovation and to the economic growth by choosing the investors.

The economic literature most often identifies 2 main sources of the economic growth, and that is the technological progress, as propelling factor of the economic growth on one hand, and the innovation which induces effects including on the first factor, extending the frontier of the technologies, implicitly of the financial-banking ones, as objective basis in amplifying the real ones, on the other hand. The durable development appears as a result of the technological progress, approached as exogenous factor, in this context

The role of the financial system, and, implicitly of the finances, in the economic growth is ignored in some authors' opinion. Moreover, neither the neoclassical theory of the economic growth brings the financial

system into discussion, but it appears as being justified, because the money fulfill a neutral role within it. Also, the financial-monetary elements from the financial system are exogenous and without influencing capacity of the real actives, so they do not concur to the economic growth, also in the context of the classical liberal doctrine.

A series of economists consider that the possible connection between the financial system and the economic growth is not relevant. R. Lucas synthesizes that some economists exaggerate the role of the finances and of the financial system as basis of the economic growth, while others ignore the possibility of influencing the development in the basis of financial factors.

Most of the theoretical studies, but also the conducted statistical studies mark out a strong positive connection between the development of the financial system, the quality of the financial services and the economic growth as author R. Levine also synthesized .

3. Interrelations between the direct foreign investments, the financial system and the economic growth

The contribution of direct foreign investments to the economic growth is deeply debated upon in the economic literature, the emphasis being on the transmission channels of the effects on the countries in which these investments are realized. It is considered that the direct foreign investments can lead to the introduction of new technologies, new knowledge and they lead to the creation of new production capacities that will amplify the economic development.

A series of authors consider that the impact of the direct foreign investments is strongly dependant on the development of the financial system of the country that receives the considered financial resources. The literature that tackles the economic growth mark out the importance of the new technologies, the growth degrees from the less developed countries proving to be strongly dependant on their adoption and implementation. The new technologies together with more performing production capacities and the managerial techniques initially used only by foreign multinational corporations that invest, are considered to be

subsequently adopted also by inland companies, being a factor that propels the economy.

The development degree of the financial system as factor with a strong influence is approached more and more often, together with a series of other factors amongst which the development of retail sale markets, of the training of the workforce, of the education level. A strong financial system determines the success chances of the inland firms, influencing the efficient allotment of the financial resources towards trustworthy investments projects. The development degree of the banking system and of the financial market becomes relevant in this background, the capacity of the financial intermediates and of the specialized actors to reduce the risks associated with these investments being of the utmost importance.

So, it can be considered that the direct foreign investments, the financial markets, the banking system and the financial system in general are complementary elements in the implementation and new technologies dispersion process, as basis for the economic growth.

4. The financial system, the direct foreign investments and the economic growth in Romania

Romania's adhesion to the European Union encouraged the credit development and the foreign investments in the financial sector. The structure of the financial intermediary sector indicates an orientation towards the banking system, while the investments on the capital market hold a reduced weight. The capital market can only take over the role of sponsor of the real economy in the case of some imbalances of the banking sector in a limited measure. The societies of services au financial investments have a significant role as far as the intermediation on the stock exchange market. The insurance societies registered a positive evolution in the last years, but the life insurances component, oriented towards the long term investments, is reduced.

Table 1. The number of active financial institution from Romania

	2008	2009	2010
Credit institutions	43	42	42
Insurance companies	44	45	43
Insurance brokers	459	510	567
Private pensions funds	23	25	22
Open investments funds	54	52	58
Close investment funds	-	15	18
Financial investment companies (Rom.: SIF)	5	5	5
Financial investment service companies	66	64	55
Non-banking financial institutions (General Registry)	238	228	207
Non-banking financial institutions (Record Registry)	4513	4802	5009

Source: BNR, CNVM, CSA, CSSPP

The financial societies activated on the market of non-banking financial institutions and on that of insurances intermediaries and of investments in real estate values, indicating a high competition level, but also a significant dispersal of the actives. The other components of the financial system registered a more reduced number of investments because of the nature of the activities that impose a substantive volume of capital. An increased interest of the financial institutions aiming at the access on the financial market from Romania was determined, many of them receiving favorable notification from the surveillance authorities in the basis of the unique European passport.

The degree of financial intermediation slightly restrained in 2010 because of decreasing economic activity and of the tensions from the international financial markets. The credit institutions represent the main component of the financial sector, and their exposures to the banking institutions from Romania, as well as the resources attracted from these financial institutions are

limited and do not present a significant direct contagion risk within the financial system.

The weight in the Gross Domestic Product of the actives detained and administered by the financial institutions that represent an evaluating coefficient of the degree of financial intermediation in economy slightly decreased in 2010, the increasing evolution from the previous years being broken by the decreasing economic activity and by the tensions from the international financial markets.

As far as the structure of the financial system is concerned, a decrease of the weight of the non-banking financial institutions in the period 2008-2010 is observed because the high degree of the non-payment risk associated to their portfolio lead to the restrain of the credit activity in this sector and implicitly to the reduction of balance sheet actives. This evolution was accompanied by increases of the weights of the other segments of the financial sector. The most important advance was that of credit institutions (the main component of the financial system) and the open-end investment funds; the private pensions funds continued to extend their value of the administered actives, reaching the level of 0,9% from the Gross Domestic Product at the end of 2010.

The risk of internal contagion, evaluated both by the exposures of the credit institutions towards the financial institutions from Romania, and by the resources attracted by these from financial institutions from Romania is low. A decrease of the weight of exposures and of the attracted resources from the financial institutions from Romania during 2010 is noticed analyzing the balance sheet of the credit institutions. They are monitored in order to identify some potential risk sources, the implementation of some retrieval measures not being necessary. The analyses regarding the intersectoral exposures did not identify risks that could affect the stability of the financial system. The financial regulation does not fully solve the problem of the internal contagion. Still, the sectoral regulations foresee limits of the exposures to reduce intersectoral exposures.

The evolution of the number of financial institutions during 2010 does not mark out important changes in the case of the institutions that administrate the greatest part

of the actives from the financial system. The significant slow down of the decrease of the economic activity allowed the deployment of the activity of financial intermediation without a high volume of Mergers & Acquisitions, the risks being administrated within the financial institutions or within the financial groups that they are part of. An increase of the insurance brokers and open-end investment funds, but also a restrain of the number of societies of financial investments services are noticed. Although the capital market suffered important corrections in the period 2008-2010, mainly determined by the international financial crisis, the recovery of the stock exchange quotations from the last period increased the investors' interest for placements in investment funds.

The evolution of the economic growth in the last years, approached by the evolution of the Gross Domestic Product is reflected in the following table:

Table 2. The economic growth in Romania (the modulation Gross Domestic Product – USD millions)

Year	2006	2007	2008	2009	2010
PIB (GDP Value)	122696	170617	204339	161109	159338

Source: UNCTAD

A series of factors have to be taken into account for the development of the financial system in the context of the economic growth:

- the strengthening of intellectual property rights because it encourages the productive investments;
- the strengthening of the legal system – a system that clearly contours the rights and respectively the contractual statements and that guarantees the property right leads to an increase of investments;
- the reduction of corruption – it is considered that it appears as an inhibitor factor for the economic development;
- the implementation of prudential or supervision or regulation rules in the banking system – a good canalization of the financial resources through credit leads to economic growth;

- the improvement of the corporate government – being considered that a more efficient management leads to positive results including in the real production plan, but also increases the interest to acquire the issued financial titles.

The evolution of foreign investments in 2010 was characterized as being disappointing and significant changes are not expected next year because of the uncertainties that are characteristic to an elective year and because of the fact that the international markets will probably continue to be tense.

Figure 1. The evolution of direct foreign investments in Romania

Source: UNCTAD 2010

On medium term, respectively the period 2012-2014, the prognosis scenario foresees the acceleration of the economic growth with rhythms between 4,0-4,7% to recover from the decreases from the years 2009-2010 due to the economic-financial crisis and to assure the reductions of the gaps towards the more developed countries of the European Union (*catching-up*). The scenario is based on the improvement of the activity in all economy sectors, especially in the industrial branches with high export potential, as well as in the construction sector that can capitalize the required infrastructure that exists in all domains.

The main risks that Romania will face in 2012 refer to the stint of the access to finances and those regarding the autumn elections. The failures concerning the attraction of structural funds can have a negative perception amidst the business people, a thing that should be avoided. The surveys show that the direct foreign investments will decrease by 20% in 2012, whereas the exports dynamics will be

decelerated to an increase of approximately 10%.

The main external vulnerabilities of Romania's economy at the moment of the crisis start tempered considerably. Firstly, the current account deficit continued to maintain itself at a moderate and sustainable level (4,1% of the Gross Domestic Product in the year 2010, the prognosis for the 2011-2012 period being under 5%, in comparison to the level of 11,6% registered at the end of the year 2008), and the exports performed above the region medium. The keeping of the sustainability of the current account deficit also in the context of the reprise durable economic growth asks for the continuation of the fiscal consolidation and for the correlation of the income policies with the evolution of the work productivity. The external debt on short term, another important vulnerability existent in the previous years, decreased its negative potential on the financial stability.

The companies with external debt have an installment of un-performing credits inferior to the system medium.

The vulnerabilities linked to the Romania's potential of economic growth had mixed evolutions. On one hand, the absorption degree of the structural and cohesion funds (calculated on the basis of the reimbursements received from the European Commission) remained reduced, and the innovation expenses maintained themselves modest (compared to the regional values and Romania's commitments in the strategy Europe 2020). On the other hand, the workforce market is the object of some ample reforms whose aim is the improvement of competitiveness of the Romanian economy. The fiscal consolidation – key element of the reform programs and one of the essential criteria in forming the investors' perception regarding the evolution of the country risk- continued. The fiscal deficit retrenched to 6,5% from the Gross Domestic Product in 2010 according to the national methodology (6,4% from the Gross Domestic Product respectively) and the fiscal structural deficit diminished at 5,2% from the Gross Domestic Product in 2010 (compared to 8,3% from the Gross Domestic Product in 2009). The continuation of the structural reforms and of the measures of fiscal adjustment, including in the direction of the

reduction of arrears and the improvement of the financial situation of state companies with problems, remains the central point of the authorities' preoccupation in 2011. The start of a new elective cycle in 2012 can generate though the risk that these reforms be implemented with a certain delay.

5. Conclusions

The economic stability in Romania remained robust despite of the difficult internal and external economic context from the previous year. The risks aiming at the banking sector were set off by the credit institutions through own efforts undertaken in the context of the activity that deployed by the National Bank of Romania regarding the prudential regulation, the surveillance and the adequate handling of the risks from the system, efforts that were materialized in the consolidation of the solvability, provision and liquidity levels.

The difficult international context represents a challenge concerning the financial stability from Romania.

The main challenges for the next period: (i) the handling of the contagion risk that could manifest itself in the case of opposed evolutions on the international markets as a result of the sovereign debt crisis or of the significant slow down of the economic growth in the developed economies; (ii) the quality improvement of the banking actives; (iii) the balancing of the structure on coins of the influxes of new credits and (iv) the improvement of the tools to rapidly intervene in the case of the credit institutions that are potentially in difficulty asks for the continuation of the efforts to maintain the solvability, provision, liquidity at adequate levels, and for the adoption of new prudential measures.

The global economy could be affected by a decrease of the growth rhythm, mainly at the level of developed economies. Also, the translation by contagion of the negative effects generated by the sovereign debt crisis at the level of some states from the European Union and from USA as well as the maintenance of vulnerabilities in certain European banking sectors can have consequences on Romania's economic growth, on the capacity of the banking

system to access finances and on the quality of the bank actives.

The answer of the authorities from the European Union for the maintenance of the financial stability and the improvement of the system of economic government at European level had no precedent. The ample package of measures regarding the improvement of the European economic government and the implementation of a new macro-prudential and micro-prudential supervising architecture within the European Union, together with the permanent mechanism of supporting the financial stability, will take part at the potential increase of economic growth in the European Union and to the decrease of the vulnerabilities of the European financial system that the crisis marked out.

The Fiscal Facilities to Stimulate the Investments Implemented in Romania and Their Occurrence

Halmi Mirela

Romanian Academy Bucharest, Romania,

mirelahalmi@yahoo.com

Abstract

The fiscal competition and the differential of the imposition quotations can be viewed from various perspectives: for certain countries (especially for those that are disadvantaged from the point of view of the resources, of the geographical location) a favorable taxation system can be viewed as a financial mechanism to attract new investments, while others consider it harmful, hijacking the investments from one country to another. It is then obvious why the internationalization determined globally the reconsideration of the fiscal policies regarding the direct foreign investments. Currently, a special attention is paid to the efficiency of the administration of the excise taxes in the host country, to the fiscal facilities, subsidies and the benefits offered to the contributors because the investing companies are directly influenced by the taxation applied in each country separately.

Key words: direct foreign investments, fiscal facilities, fiscal competition, impact

JEL classification: E20,F21

1. Introduction

The fiscal policy remains profoundly national in the conditions of the unique European space, the government of each country being responsible for the elaboration and the specific procedures to this domain, despite the efforts to harmonize the fiscal practices. From these stipulations, in the conditions of the obvious fiscal competitiveness, the biggest problems are the settlement of the imposition quotations taking into account that they are a variable taken into account by the foreign investors when they prospect the possibility of the deployment of a tangible or intangible

business in the host country. This is even more so, as the removal of the commercial barriers, the development of trans-boundary activities, the development of the economical areas determined an increased sensitivity of the influxes of capital at the differential of the taxation quotations.

The globalization of the monetary, financial and property influxes generated an ample debate as well as controversies amongst the researchers of the fiscal phenomenon, especially regarding the fiscal competition. The reason of the debate is the fact that the stipulations established by the fiscal legislation from various countries are meant to attract direct foreign investments by forcing the reduction of the imposition quotations, even starting a contest in setting quotations as low as possible.

The empirical studies regarding the impact of the tax excise on the economic growth pointed to the negative relation between these, but it is difficult to measure the potential benefits of the expenses financed from the collected fiscal incomes – the combined effect of distorted tax excises and the benefits of public expenses could lead to a net improvement of the private sector. But the fiscal incomes are not necessarily used for those expenses that could lead to economic growth, maybe because of the insufficiency of the political system or because of the redistribution policies by means of which the society benefits, but they are not reflected in the Value Added Tax increase rate.

2. The fiscal competition and the influxes of direct foreign investments

Comparing the evolution of the taxation quotation of the incomes of the companies and the level of the taxation with the influxes of direct foreign investments, it can be appreciated that there is a direct connection

between the fiscal competitiveness and the attraction of direct foreign investments.

The small companies are more sensitive to the fiscal policy than the big ones because the excise taxes and the taxes have a significant weight in the structure of their costs, having at their disposal fewer elaboration instruments of some decrease strategies of the fiscal burden. In exchange, the big companies are capable to negotiate the fiscal treatments and the samples that they pay to the public budgets. In this situation, the multinational companies have a few reorganization and finance of the investments alternatives, depending on the characteristics of the host country. A very important element of the excise tax refers to the fact that the multinational companies can open subsidiaries in countries that are weakly taxed, finding strategies to avoid taxation in this way; the companies are tempted to declare a bigger profit in the weakly taxed countries or to adjust the repatriation of the dividends depending on the fiscal legislation from the provenience country. This possibilities being given, the agreements regarding the double imposition become very important for the fiscal regime of a country.

Another approach of the empirical analyses is separate consideration of the effects of the excise taxes on the disintegrated elements from the relation of determination of the economic development rate (the workforce, the human capital, investments and technological development) and the combination of these effects to see the total impact of the taxation; this method has the advantage that it allows the more correct measurement of the agents' way of reacting to taxation elements, but it has the disadvantage that the effects on the accumulation of physical and human capital are not taken into account.

In the specialty literature, it has been proven that the marginal taxation rates affect more the increase rate than the medium taxation rate.

In the analysis of the impact of taxation on the economic growth rate the question arises if a fiscal reform generates effects of profit on the economic activity, if the decrease of the excise taxes won't generate the stimulation of economic growth, the fiscal revenues decrease, increasing the pressure on the deficit, decreasing the national level of

aggregated economy, generating gaps in the economic growth.

Many economists agree that high excise taxes damage the economic growth, a thing that doesn't always come true in practice – the decrease of excise taxes has positive but modest effects on the economic growth, but contributes at differences at the level of economic activity and the standard of living, especially on long term.

The phenomena of the development of the **underground economy** and of encouragement of **fiscal evasion** generated by the application of too high taxing rates must not be ignored in the demarche of the analysis of the impact of governmental policies on economic growth – Tanzi analyses the effects of a taxation system with arbitrary exceptions and other disintegrated elements: the corruption degree increases, so the production and so the human capital stock decreases; the corruption decreases the rate of economic growth by the produced distortion on the allotment of resources, destroying the relation between the social capitalization and the financial capitalization of an investment.

On the other hand, it is interesting to analyze the effect of the structure of the fiscal system on the economic growth – empirical studies regarding the effects of the various structures of the taxing system on the growth are few, because of the difficulties to collect the dates regarding the taxing rates – Mendoza, Milesi-Ferretti and Asea conclude that the structure of the excise taxes has low effects on the growth on long term; the mix between the direct and the indirect excise taxes play an important role in theory, but practically the plausible changes in the taxing rates don't affect the growth on long term in an economically significant measure, even if they have an important effect on investments. On the contrary, many studies focus on the structure of the taxation at the level of the workforce and show that high values of the contributions to social insurances would have an unfavorable effect on the level of the occupation the workforce and on production.

The realization of fiscal adjustments is necessary to obtain a sustainable economic growth. The taxation creates distortions, generally because it modifies the relative prices both of the final goods, and of the

production factors, in these conditions, the main objectives of the fiscal policy are:

- the construction of a system meant to generate the sufficient incomes increase to the target level, minimizing the level of the afferent distortions at the same time; its contribution to the economic growth apart from its contribution to the macroeconomic stability should be realized by minimizing the difference between the actual production and the potential production and by stimulating the productive investments from the private sector.

An ideal **taxing system** is described by Stosky (1995) as being characterized by:

- an accent on taxes on sales (Value Added Tax), preferably with a single rate and with minimum exceptions, excise taxes on oil products, alcohol, tobacco, luxury goods;
- the absence of export taxes;
- import taxes only for protectionist purposes;
- a simple administrative of the income tax, with a superior moderate rate marginal rate and with a sufficient exemption limit to exclude the persons with modest income.
- excise tax on corporate incomes based only on a low moderate rate, with amortization and other uniform deductible expenses amongst sectors.

The governments have a few fiscal instruments at their disposal that can be used to influence the effective imposition quotations and for the local orientation of the multinational corporations. Traditionally, the specialty literature identifies the following instruments as being useful in attracting direct foreign investments: the reduction of the taxing quotation of the corporations at a competitive level; deferred taxes or exception, exemptions from the taxing of the corporation; exemptions of local or customs excise taxes. These instruments are used on a large scale but their applicability is limited by international conventions. There are also ingenious tactics by which the investor buys the right to maintain the taxing quotation at a certain level even if the taxing regime will change in the future.

The multinational corporations interested to extend themselves take a mix of elements

into account to ensure the best conditions to recover the investments and to obtain the foreseen profit. Starting from these considerations, the researchers showed that most of the companies consider the excise taxes as essential for the location of their investments, under the provision that stability conditions be accomplished: the property guarantee, the financial stability, the development of the finance banking system, the political stability. The host countries are classified as less attractive, attractive and very attractive according to the Purchasing Power Parity / per capita, from the investors' point of view.

3. The stimulation fiscal facilities of the investments practised in Romania and their incidence

The stimulation of direct foreign investments represents one of the main preoccupations of the public authorities from all countries. This is even more striking in the case of the emerging countries, that have to resort to actions meant to reduce the gap in comparison to the developed countries. The investments are the most appropriate instruments to realize this desideratum through their admitted multiplying impact. Romania is not an exception from this economic law, the public authorities frequently appealing to various instruments of fiscal policy meant to stimulate the companies in the direction of assuming investments as dense as possible.

The level of the taxing quotations has an important role in the decision process regarding the deployment of an investment from abroad, but their significance is different. The imposition statutory quotations (nominal) announced by the authorities to impose an activity are analyzed on one hand, and, the effective imposition quotations resulted after the application of deductions, exemptions, exceptions, facilities, delay on the other hand.

In the context of this problem, the income tax holds the most important place because it has an immediate effect on the measure of the net profit, although other samples in taking the decisions regarding the destination of the investments are relevant: the contributions to the social insurances, the imposition of nonprofit organizations, the

Value Added Tax, the imposition of the incomes of physical persons.

Starting from the whole exemption of profit tax until the possibility of the application of accelerated amortization without the prior agreement of the fiscal authorities, the stimulating effect of these facilities is transmitted, mainly, by means of the fiscal economies realized on the line of the profit tax. In the dimensioning of these fiscal economies, besides the profit tax quotation, the amortization regime applied by the company also exerts influence, their accumulated incidence being resumed at what the specialty literature calls user cost of capital and that represent the minimum rate of capitalization that the company has to realize following the investment to cover its costs (the costs regarding the amortization of the actives, the excise taxes and the payment of the investors that furnished the capitals necessary to the investment).

The determination of the effective imposition quotations can be accomplished using two main methods: the method that uses historical dates and the forecast (or anticipatory) method. The effective quotations obtained on the basis of the historical dates is based on the macro-economical pieces of information obtained from the national accounts or by aggregating the pieces of information obtained from the companies. On the contrary, the anticipatory method takes the excise taxes foreseen to be paid in the future into account, according to the development plans of the company. Synthetically, the evolution of the imposition statutory quotations in Romania are the following:

Figure 1. The evolution of imposition statutory quotations
Romania – corporate income tax

Source: Eurostat

Having in view the way of expressing the cost of capital use, the main advantages and

disadvantages of different fiscal stimulations for investments can be synthesized:

Table 1. The advantages and the disadvantages of the main types of fiscal stimulations on the line of the profit tax

The fiscal stimulus	Advantages	Disadvantages
The tax holiday (exoneration)	<ul style="list-style-type: none"> - the reduction of the costs of fiscal administration; - the simplification of the procedures of fiscal evidence for companies; - the neutrality regarding the relative rapport of using the production factors (work-capital); 	<ul style="list-style-type: none"> - the beneficiaries are also the companies that realise very big profits and that would have realised the investment also in the absence of the facility; - the increase of the inclination towards activities that determin the avoidance of the payment of the excise taxes by closing some activities and their retrieve (with the same actives) under another name or by the transfer of teh profits to entities that benefit from the exemption; - the stimulation of short term investments to the exclusion of long term investments, considered as having a more powerful stimulating impact on the economy; - the loses of budget revenues are unknown most of the time; - reduced

<i>The fiscal stimulus</i>	<i>Advantages</i>	<i>Disadvantages</i>
		transparency;
The reduction of the profit taxing rate; (preferential rates)	- generally the same as in the previous case with the determination that the company has to make proof of the framing in the conditions of the taxation at preferential rates (which can determine a slight increase of the costs of fiscal evidence), respectively the reduction of the neutrality in the situation in which the rate reduction is conditioned upon the investment in performing equipments (the increase of the preference for capital);	- the same as in the previous case, but with more reduced and transparent budget costs (because the companies remain in the imposable sphere)
Investment allowance	- they serve better at the promotion of certain types of investments, in certain sectors (usually in equipments); - reduced budget costs and higher transparency;	- they privilege the investment in actives with short functioning duration; - they can lead to repeated buy-sell of actives between companies to repeatedly benefit from the fiscal deduction; - they don't advantage the investments that produce incomes with

<i>The fiscal stimulus</i>	<i>Advantages</i>	<i>Disadvantages</i>
		delay, if the reporting system of the future losses is inappropriate; - high administrative costs;
Investment tax credit	- generally the same as in the previous case, with the determination that they directly reduce the payment profit tax and not the taxable profit;	- the same as in the previous case, still with lower administrative costs;
The accelerated depreciation	-it stimulates the investments in real estate actives with a big functioning duration, compared to the deduction and the fiscal credit - it doesn't encourage the company for a wrong fiscal behaviour that would bring it fiscal advantages;	- it doesn't always take the economic life duration of the active and the real incidence of the physical and moral depreciation into account; - it doesn't advantage the investments that produce incomes with delay, if the reporting system of the future losses is inappropriate;

These types of fiscal stimulations are directly correlated with the profit tax paid by the company, because they either influence directly its measure, or they have indirect effects by means of the cost accounting basis or the rate of the excise tax applied to it.

A special attention has to be given to the fiscal stimulations which link the measure of the advantages for the company to the measure of the invested gross profit, because in this case the incidence is also transmitted on the finance decision of the investments project. Their maximization is conditioned upon the allotment of a great part as possible from the profit as finance source of the

investments because the fiscal advantages directly depend on the size of the reinvested profits.

These types of fiscal stimulations are directly correlated with the profit tax paid by the company, because they either influence directly its measure, or they have indirect effects by means of the cost accounting basis or the rate of the excise tax applied to it. No matter of the applied fiscal stimulations, the authorities' option has to be underlined on reasons that are linked to the assurance of the absolute functionality of the national economy. At the same time, the fiscal stimulations have to be oriented to those investments that mostly generate positive externalities that as many contributors as possible may benefit from, so that the total benefits induced in the economy and in the society surpass the associated costs.

4. Conclusions

The fiscal competition is good both for the contributors and the state. The first activate in a fiscal environment that allows them to obtain bigger profits and a more reduced fiscal pressure, and the state gets bigger budget revenues in the conditions in which the taxation basis increases.

The fiscal competition obliges the authorities to work in conditions of budget restraints (diminished tax quotations) and, in this way, to promote an efficient administration of the excise taxes. Moreover, the business environment also takes into account the quality of the fiscal administration that can be perceived as open or opaque for the investors, requiring more and more predictability, transparency, accordance with the economic legislation and the development stage, apart from the fiscal elements

Most of the countries adopted a philosophy to impose profits meant to sustain the growth and the structural changes in the imposition systems contribute to the reduction of progress, but not necessarily to the reduction of fiscal equity. This could lift the problem of the redistribution of excise taxes at the governments' level, these being amongst the few instruments that the governments have at their disposal in the sharing of the costs and the benefits of globalization.

The competition will accentuate taking into account the new models of business that appear, despite the efforts to adjust the fiscal systems.

Comparing the evolution of the taxation quotation of the incomes of the companies and the level of the taxation system with the influxes of direct foreign investments, it can be appreciated that there is a direct connection between the fiscal competitiveness and the attraction of direct foreign investments.

The Systemic Risks – A Main Cause of the Financial Crisis

Dorin Hoarcă,

Constantin Brancoveanu University of Pitești

hdc77ro@yahoo.com

Abstract:

In this article we attempt to set a starting point for a more comprehensive analysis of systemic risk as the primary ingredient to understand financial crises and as the main rationale for financial regulation, prudential supervision and crisis management.

The author try to explain why the failures of financial firms are more likely to pose systemic risks than the failures of nonfinancial firms and discuss possible remedies for such risks.

An economic recession on the scale predicted should lead to radical and comprehensive reform of the financial industry. Certain regulations, structures and procedures need to be put in place to ensure that a crisis of this kind never happens again.

Keywords: systemic risk, banks, financial crisis, financial system

JEL classification: E44, G01, G21

Introduction

Systemic risk is a relatively new term that has its origin in policy discussions, not the professional economics and finance literature. The first appearance of the term systemic risk in the title of a paper in professional economics and finance literature was in 1994. That appearance was in a review of a book written by a World Bank economist.

Given its origin in policy discussions, perhaps it is not so surprising that the term "systemic risk" often is used with no apparent precise definition in mind. If it arose from a theoretical analysis as did a term it sometimes is confused with—systematic risk— there would be a very precise definition.

Regular financial stability assessment and the identification of macroprudential leading indicators signaling coming risks to the banking system are of major importance for central banks and supervisory authorities. A safe and sound banking system ensures the optimal allocation of capital resources, and regulators therefore aim to prevent costly banking system crises and their associated adverse feedback effects on the real economy.

In the recent financial crisis, the most important type of risk to the financial system has been “counterparty risk,” which is also known as “default risk.” Counterparty risk is the danger that a party to a financial contract will fail to live up to its obligations.

Counterparty risk exists in large part because of asymmetric information. Individuals and firms typically know more about their own financial condition and prospects than do other individuals and firms. Much of the recent concern about systemic risk has focused on investment banks that deal in complex financial contracts.

Of course, financial firms can protect themselves to some degree in such simple situations. The logic of self-interested behavior combined with market clearing would lead to an appropriate pricing of risk; but in actual financial markets, arrangements are so complex that the nature of risk that firms face might not be obvious. In addition, the value of collateral fluctuates and thus even carefully collateralized deals are subject to some risk.

At the base of systemic risk are contagion effects, various forms of external effects. The concept also includes financial instabilities in response to aggregate shocks. The quantitative literature studying systemic risk is surveyed in the viewpoint of this concept.

In this study we attempt to set a starting point for a more comprehensive analysis of systemic risk as the primary ingredient to understand financial crises and as the main rationale for financial regulation, prudential supervision and crisis management. In the first stage we bring together the most important elements of systemic risk and integrate them into a coherent working notion, which could be used as a base line for monetary and prudential policy decisions to preserve the stability of financial systems. While the “different” character of banks plays a major role, we stress that systemic risk goes beyond the traditional view of single banks vulnerability to depositor runs. At the base of the concept is the notion of “contagion,” a particularly strong propagation of failures from one institution, market or system to another. Especially nowadays the

way in which large-value payment and securities settlement systems are set up as well as the behaviour of asset prices in increasingly larger financial markets can play an important role in the way shocks may propagate through the financial system. While in the presence of rapidly evolving financial institutions and markets and the particular characteristics of each financial crisis it might be futile to look for a single, ultimate definition of systemic risk, it may still be useful to give some general structure to our thinking in this area in order to help avoiding the base of policy making.

1. Systemic risk – the key of the problems

Systemic risk can then be defined as the risk of experiencing systemic events in the strong sense. In principle, the spectrum of systemic risk ranges from the second-round effect on a single institution or market (column “single systemic event” in Table 1) to the risk of having a systemic crisis affecting most of the (or even the whole) financial system at the upper extreme (column “wide systemic event” in Table 1). The geographical reach of systemic risk can be regional, national or international.

Table 1. Systemic events in the financial system

Type of initial shock	Single systemic events (affect only one institution or one market in the second round effect)		Wide systemic events (affect many institutions or markets in the second round effect)	
	Weak (no failure or crash)	Strong (failure of one institution or crash of one market)	Weak (no failure or crash)	Strong (failures of many institutions or crashes of many markets)
Narrow shock that propagates				
- idiosyncratic shock	-	contagion	-	- contagion leading to a systemic crisis
- limited systematic shock	-	contagion	-	- contagion leading to a systemic crisis
Wide systematic shock			-	- systemic crisis

Source: Oliver De Bandt, Philipp Hartmann, European Central Bank, What Is Systemic Risk Today

The key element in this definition of systemic risk, the systemic event, is

composed of two important elements itself, shocks and propagation mechanisms.

Following the terminology of financial theory, shocks can be idiosyncratic or systematic. In an extreme sense idiosyncratic shocks are those which, initially, affect only the health of a single financial institution or only the price of a single asset, while systematic (or widespread) shocks—in the extreme—affect the whole economy, e.g. all financial institutions together at the same time. An example of an idiosyncratic shock to a national financial system is the failure of a single regional bank due to internal fraud. The sudden devaluation of a noninternationalised currency due to an unsustainable domestic budget deficit can be regarded as an idiosyncratic shock to the world financial system. Examples of systematic shocks to national financial systems are general business cycle fluctuations or a sudden increase in the inflation rate. A stock market crash in itself acts as a systematic shock on most financial institutions. The same applies to a liquidity shortage in an important financial market, which can be related to a crash or to some other event throwing doubt on the financial health of counterparties usually trading in this market.

There is a continuum of intermediate types of shocks (e.g. sectorwide or regional) between the theoretical extremes of idiosyncratic and wide systematic shocks. It is important to note that idiosyncratic shocks that do not propagate widely are “insurable,” in the sense that an investor can protect herself against them via diversification, whereas wide systematic shocks are “uninsurable” or non-diversifiable. Negative systematic shocks, such as a severe recession, will—when they reach a certain strength—always adversely affect a wide range of financial institutions and markets, so that they have been included in the broad concept of systemic risk.

The second key element in systemic events in the narrow sense is the mechanism through which shocks propagate from one financial institution or market to the other. In our view, this is the very core of the systemic risk concept. Systematic shocks are equally important for the non-financial sectors in the economy.

The propagation of shocks within the financial system, which work through physical exposures or information effects (including potential losses of confidence), must be “special.” In what follows we shall look at the various propagation chains in banking and

financial markets in much detail. However, from a conceptual point of view it is important that the *transmission* of shocks is a natural part of the self-stabilising adjustments of the market system to a new equilibrium.

What one has in mind with the concept of systemic risk (in the narrow sense) are propagations that are not incorporated in market prices *ex ante* or can lead to general destabilisation. Such propagations, including those taking the form of externalities, may show particularly “violent” features, such as cumulative reinforcement (“non-linearities”), for example through abrupt changes in expectations.

Obviously, both the occurrences of shocks as well as subsequent propagations are uncertain. So the importance of systemic risk has two dimensions, the severity of systemic events as well as the likelihood of their occurrence. Strong systemic events, in particular systemic crises, are low probability events, which might lead some to consider them as less of a concern. However, once a crisis strikes the consequences could be very severe.

This leads to another dimension of the concept of systemic risk, namely the impact of systemic events occurring in the financial sector on the real sector, more precisely on output and general welfare. One may distinguish horizontal systemic risk, i.e. the concept which is limited to the financial sector alone (through the bankruptcy of financial intermediaries or the crash of financial markets), from vertical systemic risk, where the impact of a systemic event on output is taken to gauge the severity of such an event. In order to keep the scope of the paper manageable we have to concentrate on horizontal systemic risk in the first place.

Banks and other financial institutions are important sources of capital. Therefore, their failure, especially in large numbers, can deprive society of capital and increase its cost. Increases in the cost of capital, or decreases in its availability, are the most serious direct consequences of a systemic failure.

The classic example of systemic risk in this context is a “bank run,” in which the inability of a bank to satisfy withdrawal-demands causes its failure, in turn causing other banks or their creditors to fail. The original failure can occur when depositors panic, converging on the bank to quickly withdraw their monies. Because banks keep only a small fraction of their deposits on hand as cash reserves, a bank may have

insufficient cash to pay all withdrawal-demands, causing it to default and ultimately fail. The chain of subsequent failures can occur because banks are closely intertwined financially. They lend to and borrow from each other, hold deposit balances with each other, and make payments through the interbank clearing system (whereby banks with equity and deposit accounts exceeding their liabilities can offer these excess funds to other banks who wish to increase loans to their customers). Because of this interconnectedness, one bank’s default on an obligation to another may adversely affect that other bank’s ability to meet its obligations to yet other banks, and so on down the chain of banks and beyond.

Sometimes all firms in an industry are “affected by the same cause” and one firm’s failure leads investors to shun an entire industry. Why should the failure of a single firm cause the public to suspect an entire industry? The answer is related to the fact that people have imperfect information. Because depositors lack complete information about the condition of their bank, the failure of one bank can trigger mass withdrawals by depositors of other banks to avoid losses in the event their own bank fails. Indeed, even if a particular depositor believed that his bank was fundamentally sound, it would still make sense for him to withdraw his money if he thought that withdrawals by other depositors might cause the bank to fail. Banking panics are especially dangerous because large-scale deposit withdrawals can make bank failures more likely, as well as cause banks to reduce their lending in an effort to boost liquidity.

The dramatic declines in trading volume and liquidity in the markets for mortgage-related securities during the recent financial crisis also reflected investor panic.

Heavy reliance by investors on the evaluation of mortgage instruments by the rating agencies may have exacerbated swings in market liquidity. For example, a ratings downgrade, specially of a previously highly rated security, could induce panic selling by signaling possible downgrades or losses on similar securities. Ratings downgrades and declining asset values can also force borrowers to post additional collateral to maintain a given level of borrowing.

In general, deterioration in the collateral value of borrower assets was an important amplification mechanism during the recent financial crisis. Falling asset prices caused lenders to demand more collateral, which caused borrowers to dump risky assets, thereby exacerbating declines in their market values and leading to further demands for more collateral.

2. Aspects of systemic risk – a short description

Many aspects of systemic risk are not unique to financial institutions or markets. The failure of a nonfinancial firm, such as an phone manufacturer, will affect the firm’s suppliers and dealerships, as well as the local economies where manufacturing plants and other operations are located.

The failure of a nonfinancial firm would rarely threaten the solvency of a competitor, let alone significantly affect the economy more broadly. Instead, the failure of a large firm could increase the market shares and profitability of the remaining firms in an industry, as well as provide opportunities for smaller firms to enter previously inaccessible markets.

Why do we think the failure of a large financial firm presents systemic risks that the failure of a nonfinancial firm does not? There are at least three reasons.

The first is interconnectedness. In the normal course of business, large commercial and investment banks lend and trade with each other through interbank lending and deposit markets, transactions in over-the-counter (OTC) derivatives, and wholesale payment and settlement systems.

Settlement risk—the risk that one party to a financial transaction will default after the other party has delivered—is a major concern for large financial institutions whose daily exposures routinely run into many billions. The high speed of financial transactions and the complex structures of many banks and securities firms make it especially difficult for a firm to fully monitor the counterparties with which it deals, let alone the counterparties of counterparties. The rapid failure of a seemingly strong bank could potentially expose other firms to large losses. Even firms that do not transact directly with the affected bank can be exposed through their dealings with affected third parties.

A second reason why the financial sector is especially vulnerable to systemic risk is leverage.

Compared with most nonfinancial firms, banks and other financial institutions are highly leveraged that is, they fund a substantial portion of their assets by issuing debt rather than selling equity. During the housing boom, many banks, hedge funds, and other firms that invested heavily in mortgage-related securities financed their holdings by borrowing heavily in debt markets.

Investment banks were especially highly leveraged before the crisis, with debt-to-equity ratios of approximately 25 to 1. By comparison, commercial banks, which are subject to minimum capital requirements, had leverage ratios of approximately 12 to 1.

High leverage meant that financial firms enjoyed high rates of return on equity when times were good but also a high risk of failing when markets turned against them.

A third reason why the financial sector is especially vulnerable to systemic risk is the tendency of financial firms to finance their holdings of relatively illiquid long-term assets with short-term debt. Not only are financial institutions typically highly leveraged, but the nature of their business entails an inherent mismatch in the maturities of their assets and liabilities that can make them vulnerable to interest rate or liquidity shocks. Most financial intermediaries borrow short and lend long—that is, they fund long-term, relatively illiquid investments with short-term debt.

Many investment banks and securities firms rely heavily on commercial paper, repurchase agreements (repos), and other short-term funding sources to finance long-term investments. If depositors suddenly pull their funds from a commercial bank or lenders refuse to purchase a securities firm’s commercial paper or repos, the bank or securities firm could be forced into bankruptcy.

Recognizing the problem of systemic risk, financial firms have long cooperated to limit risks associated with the failures of other financial firms. Cooperative arrangements, such as clearing houses and exchanges, are one way of reducing systemic risks. However, in many circumstances private measures might be insufficient to ameliorate systemic risk.

3. Regulation and supervision – causes and effects

The recent financial crisis has prompted numerous proposals for enhanced government regulation and supervision of large financial firms and markets to address systemic risks. Many proposals call for increased supervision of systemically important financial institutions, as well as new rules for resolving insolvent firms.

On 20 July 2011, the European Commission (the “**EC**”) published its much-anticipated proposals to implement in Europe the international standards on bank capital recommended by the Basel Committee on Banking Supervision (the “**Basel Committee**”), commonly known as Basel III. The EC’s proposals comprise a draft regulation (in three parts: regulation I, regulation II and regulation III) and a draft directive (together, “**CRD IV**”). In putting forward these CRD IV proposals, the EC observed that “banks have been at the centre of the financial crisis” and that “lessons have been drawn from this and mistakes of the past should not repeat themselves”.

This paper analyses some of the CRD IV proposals relating to the nature of bank capital instruments and in particular focuses on:

- certain notable differences between the prudential capital requirements in Basel III and those in the CRD IV proposals; and

- the potential impact of the CRD IV proposals on tier 1 and tier 2 issuance structures and the emergence of a new breed of subordinated principal loss absorption instruments (including “contingent capital” or “CoCos”) which will become eligible for inclusion in a bank’s “additional tier 1” (“**AT1**”) capital resources (which can comprise up to 25% of a bank’s overall minimum tier 1 capital requirement), tier 2 capital resources (which can comprise up to 25% of a bank’s overall minimum total capital requirement) and, for some banks, national “finishes” imposed on them by national regulators (the scope for which is discussed further below). According to the EC, CRD IV will apply to more than 8000 banks, amounting to 53% of global bank assets, and is estimated to lead to an extra €460 billion of new capital having to be raised by 2019. Other proposals recommend regulation to limit risk-taking and to ensure ample liquidity in financial markets.

Many reform proposals call for the creation of a systemic financial regulator with responsibilities for “macroprudential” oversight

of the financial system. A macroprudential regulator would consider broad economic trends and the impact of a firm’s actions on the entire financial system, not just the firm’s own risk of default. To some extent, regulators already consider broad economic trends and effects, but several proposals argue for bringing all large or systemically important financial institutions under the umbrella of a systemic regulator.

One justification for the regulation and supervision of systemically important firms is that governments are unlikely to permit such firms to fail, or if they do fail, the government will substantially protect many, if not all, of the firm’s creditors from loss. Such a government guarantee - either explicit or implicit - can encourage firms to take greater risks than they otherwise would, which increases the likelihood of their failure. Consequently, regulation and supervision is required to offset the incentive to take excessive risk.

One of the more hotly debated issues surrounding the recent financial crisis is the extent to which fair value accounting rules contributed to the crisis. In textbook financial markets, valuations are the considered outcomes of the views of rational, relatively risk-tolerant speculators with deep pockets. In the real world, however, imperfect information and limited risk tolerance are facts of life that can inhibit the rational speculation necessary to drive prices back to long-term fundamental values. Trading in certain assets might cease during a crisis or trades might occur at widely disparate prices, making the determination of their market value problematic just when the value of transparency is greatest. In addition, by forcing financial firms to realize declines in asset prices immediately, mark-to-market rules might exacerbate a crisis by encouraging asset sales when prices are already falling, leading to further write-downs and financial losses.

Conclusion

In this study we discussed the various elements of systemic risk with a view to, first, developing a broad concept of this risk, which underlies the understanding of financial crises and which can be used as a baseline for financial and monetary policies to maintain stable financial systems.

The financial system is composed of intermediaries, markets and the infrastructure of payment, settlement and trading mechanisms that support them.

Intermediaries are connected with each other through direct transactions, as in interbank markets, and through similar investment and financing decisions with third parties such as other intermediaries or end investors.

Financial markets, in turn, are connected with each other through the trading activities of financial intermediaries and through end investors active in more than one market. Systemic risk within the financial system relates to the risk that these inter-connections and similarities render emerging financial instability widespread in the system. Even if the original problem seems more contained, important amplification mechanisms can be at work.

This complex network of financial connections is extended through the savings and financing needs of all economic sectors, notably non-financial firms, households and the government. By reallocating savings from individuals and sectors with a surplus of funds to individuals and sectors in need of funds, the financial system plays a central role in the economy. So, systemic risk, in a broader sense, relates to the risk that widespread instabilities in the financial system translate into adverse effects on growth and welfare in the economy at large.

Analysts have proposed regulatory reforms to reduce the danger from systemic risk in the future. In particular, some advocate the creation of a powerful macroprudential regulator that considers a firm's impact on the stability of the entire financial system.

Other ideas for reducing systemic risk include limiting the use of leverage and short-term debt and revising market value accounting rules.

It is too soon to fully determine the causes of the recent financial crisis. Asset price booms and busts that impair the financial system and the entire economy have occurred before. However, the complex nature of recently developed financial instruments has transmitted the consequences of the housing bust to the entire financial system and, ultimately, to the overall economy.

Accordingly, many analysts favor measures to increase the use of organized exchanges for trading derivatives. An improved regime for resolving large insolvent financial firms would limit systemic risk and excessive risk-taking. When the government has intervened to protect

the economy from the failure of a large systemically important financial firm, the shareholders of these firms usually received little or no value for their equity and their senior managers were dismissed or subject to compensation limits.

In conclusion, systemic risks drive most crises, and pose a challenge for several reasons. First, they are not easy to detect with confidence, and are even more difficult to prove.

Mergers, Acquisitions and Taking-Over in the Banking System from CEE Countries

Humă Elena

Institute of Phd Studies Academy of Economic Studies, Bucharest

buduioana@yahoo.com

Abstract

The present article tackles with the mergers and acquisitions in the Central Eastern Europe countries. The financial domain is dominated by the banking sector and this involves very much the legal aspects to be followed and respected in these kinds of transactions. The mergers and acquisitions have had an upward direction in the context of the economic crisis. Many banking entities are struggling to consolidate their position on the market, and this leads to more and more mergers and acquisitions.

Key words: squeeze-out procedure, pure asset, merger by acquisition, merger by formation, sell-out, cross-border merger

J.E.L. Classification: G34

1. Introduction

The financial sector in Central Eastern European countries is, in its majority, composed by banking, insurance and consumer finance; while other financial segments (such as asset management funds) are still in development.

The financial sector M&A transactions in CEE currently involve banks or insurance companies. Privatizations of state-owned banks and insurance companies are coming to an end in most CEE countries.

There are considerable differences in the regulatory frameworks in CEE countries which are members of the EU and those applicable in Russia for example.

2. Regulatory requirements

Financial institutions M&A transactions will require approval of, or at least consultation with, the regulators (competition and financial regulator/National Bank). The financial sector is often considered a strategic sector, meaning political interference is more likely than in other sectors; even, as recent practices have shown, in “old” EU member states.

In a share purchase ^[1], the acquisition of substantial shareholdings in banks and insurance companies’ institutions will, in most CEE countries, require a notification to, or consent of, the relevant regulatory authority. This is in addition to general disclosure requirements of significant shareholdings in public listed companies. Based on the EU Banking Directive and Insurance Directive adopted by EU member states, a home state regulator must be notified of the direct or indirect acquisition or disposal of a “qualifying holding” (i.e. a holding which represents 10% or more of the capital or voting rights or which enables the acquirer to exercise a significant influence) in a bank or insurance company. Notification is also required if a qualifying holding changes through thresholds of 20%, 33% and 50% or when the target becomes a subsidiary. The regulator, generally, has three months to oppose the intended transaction if, in view of the need to ensure sound and prudent management of the target, it is not satisfied as to the suitability of the purchaser.

Companies participating in a merger will also normally require the prior permission of the regulator and any new entity will require a new authorization (licence). Where the transaction involves companies from EU member states, passport rights may eliminate the need for a local licence, but the consent of regulators in jurisdictions where the target has its branches may also be needed.

For example, in Russia the total foreign participation is limited by law to 25% of the combined share capital of all Russian insurance companies and, once this threshold is reached, it will only be possible for a foreign purchaser to buy a minority stake in an insurance company, but not a majority stake. The prior consent of the Ministry of Finance is required for any acquisition of shares in an insurance company by a foreign purchaser. The prior approval of the Central Bank of Russia is required for any foreign investment in a Russian bank; and the acquisition of over 20% of the shares in a Russian bank will require a further approval from the Central Bank as well as the Competition Authority.

Under EU legislation, acquisitions may also have implications for consolidated supervision of banking or insurance groups under the Banking Directive and the Financial Conglomerates Directive.

3. Share acquisition

Acquisition of a controlling shareholding in the target has, to date, been the prevailing acquisition structure in CEE transactions. The effect of a share acquisition is that the target becomes a subsidiary of the purchaser. It can then depend on the commercial and operational policy of the purchaser whether the two entities will remain formally separate or will be merged e.g. through a subsequent merger procedure^[2].

There is a difference between acquiring shares in a listed bank or insurance company (by way of a public takeover bid) and acquiring shares of a privately owned entity, which takes the form of a private transaction (the latter remains the most popular in the region, except for

Poland where all the major banks are listed on the Warsaw Stock Exchange).

In the case of listed banks and insurance companies, the acquisition of a shareholding above certain thresholds will trigger a requirement for a public offer for the balance.

Further, based on the EU Takeover Directive (which has yet to be consistently adopted in all EU member states), where the target is a listed company in an EU member state, a mandatory bid will always be required after the purchaser has acquired control of the target. The percentage of votes deemed to constitute control varies among the EU members (for example 40% in Lithuania, 66% in Poland, with no exact threshold in Czech Republic, where a mandatory tender offer is triggered when actual control is acquired and also each time 2/3 or 3/4 of all votes are exceeded). Minority squeeze-out procedures may also be available to help to acquire all the shares of the target, particularly where there are hundreds or thousands of small shareholders (common to many CEE banks and insurance companies as a result of initial mass privatizations). Based on the EU Takeover Directive, a minority squeeze-out (as well as sell-out) should be available in all EU member states at shareholding thresholds ranging from 90% to 95%.

4. Business/Asset acquisition

The business of the target may also be acquired through the purchase of its assets and the assumption of certain liabilities (including deposits for example^[3]). Although a purchaser may wish to structure the deal as a pure asset sale (which leaves behind any corresponding liabilities), this is not likely to succeed where it is clear that what is being purchased is not only assets, but the entire business, or a stand-alone part of the business. When a business is acquired, it is usually the case that the relevant CEE law will deem that all related liabilities are transferred with the business. This may include liabilities which are not specified in the transfer agreement, or not identified at all. Disadvantages of asset acquisitions include the need for third party consents,

the limited transferability of licences and the permits and the application of transfer taxes.

5. Mergers

Local CEE laws may permit statutory mergers between financial institutions but such procedures have not been common to date. Due to existing limitations there is very little scope for cross-border mergers and mergers are predominantly used in transactions between entities in the same jurisdiction.

As a general rule, the effect of a merger will be that all the assets and liabilities of the vesting entities are deemed transferred to the successor entity and vesting entities are dissolved without going into liquidation. This operation may take the form of a merger by acquisition (one or more entities are absorbed by another existing entity); or a merger by the formation of a new entity (two or more entities are consolidated into one new entity).

However, both methods are not always available – for example, in Poland banks may only be merged by acquisition^[4].

A merger has the advantage of relative ease with which the contracts, assets and liabilities of the vesting entities may be transferred to the succeeding entity. This is particularly relevant for retail banking – no consents of individual customers (holders of deposits, bank accounts etc.) are required in case of a merger. Merger documentation typically involves a merger plan or agreement between companies participating in the merger, normally requiring the approval by a qualified majority of shareholders of the merging companies, a report by the board or management body and an expert evaluation.

The purchaser will normally have to be authorised to carry on the relevant financial sector business in the target’s jurisdiction (though, in EU member states, passport rights may be available). In addition, the delays and complications associated with the numerous registration requirements for the transfer of some assets (such as real estate) significantly

outweigh the relatively simple transfer requirements for shares.

Despite its disadvantages, an asset acquisition may sometimes be the only suitable acquisition method, for example where only one or more branches or a distinct and discrete part of the business is to be acquired.

Simplified rules apply in EU member states to transfers of insurance portfolios under the EU Insurance Directives. Insurance companies with head offices in an EU member state are able to transfer portfolios of insurance contracts under the single passport regime to another insurer established within the East European Areas. Similar provisions apply to transfers between EU branches of insurers established outside the EEA.

Issues which commonly arise in CEE transactions include the troublesome minority shareholders (including shareholder litigation); in smaller companies, a lack of proper record/minute taking (making it very difficult to determine whether mandatory procedures have been followed in some general meetings or board meetings); the structural errors embedded in standard form documentation (for example standard loan agreements, standard security documents, standard policies, local derivatives contracts, or other standard contracts not having been drawn up in accordance with international market standards); the incorrect contractual arrangements with directors or other key employees of the target; and the uncertain provenance of title to real estate assets.

6. Due diligence and commercial issues

As in any M&A transaction, it is essential at the outset of any acquisition of a financial institution in CEE to conduct a thorough due diligence exercise. In CEE, financial institutions have strict rules concerning banking secrecy (or data protection in general^[5]), which may present certain obstacles to the amount and quality of information available during the due diligence, making it difficult to establish the quality of the credit portfolio of the target.

7. Conclusions

Other significant issues to be considered in financial institution M&A transactions in CEE countries often include the merger control. This should be examined under the EC Merger Regulation (where there is a Community dimension) and/or under applicable local regimes.

Notably, Russia applies a separate control regime to mergers of financial institutions (including branches) on the basis of the Law on Protection of Competition in the Financial Services Market.

Tax implications refers, in particular, to the availability of tax relief for cross-border restructuring following a merger (for example on the basis of EU Mergers Taxation Directive), taxation of income flows between associated companies following the transaction, treatment of accumulated losses, implications of double taxation treaties, etc. The post-transactional integration and management of the target is also an important issue to be considered. This will become the responsibility of the new management who will takeover, but this aspect of the merger is often underestimated objectively. This aspect of the problem can be controlled by a fair and honest study upon the employees and employment conditions.

Measuring Enterprise Performance: Financial and Non-Financial Indicators

Ionescu Alexandra
„Ovidius” University of Constanta
al3xandra_ionescu@yahoo.com
Stefanica Virginia
Burlacu Valentin

Abstract

The economic environment and businesses, in particular, have evolved significantly over the past decade, becoming increasingly competitive and complex. Under these circumstances, companies have to meet a heavy burden: they need to continuously adapt their activity to dynamic market developments and develop sophisticated performance measurement instruments. Traditional methods used over time have proved to be inadequate to assess the complex activity of enterprises in these dynamic environments.

In this context, by reviewing the literature in the field, I intend to analyze the present perspective on enterprise performance measurement. This paper aims to highlight the importance of a multidimensional view on enterprise performance, by showing that performance can be measured using both financial and non-financial indicators, in order to obtain a clear view on overall enterprise performance.

Key words: enterprise performance, financial indicators, non-financial indicators.

J.E.L. Classification: M21.

1. Introduction

There are many ways of measuring business performance. Conventional approaches use financial ratios to assess the performance of an enterprise, while modern approaches bring the issue of calculating the non-financial indicators, in addition to the financial ones. The need for the latter approach is determined by the fact that non-financial indicators „better characterize business performance, as they identify sensitive points of the organization”. Thus,

the literature shows that non-financial indicators are important for a correct assessment of performance, whereas the use of financial data imposes certain limitations in assessing the total value of the company.

Addressing the different dimensions of performance were, and still are, major concerns of researchers, managers and stakeholders. This concern is motivated by the fact that, naturally, many companies want to improve their performance evaluation systems, aiming to capture the multitude of factors determining their performance. Secondly, multidisciplinary perspectives of performance measurement, such as the balanced scorecard, point out the importance of non-financial measurements of performance, where relevant non-financial indicators should be included.

I will further detail the significance of both types of indicators – financial and non-financial ones, and rationale for their use in evaluating business performance. I will start by addressing the financial dimension of enterprise performance, and continue with the new approaches in the field, respectively , the non-financial view on business performance, pointing out their strengths and limits.

2. Financial dimensions of enterprise performance

Enterprise financial performance is measured using financial indicators. Still, there is no specified set of indicators to assess performance in financial terms. Thus, by reviewing literature, it can be noticed that there are many and various ways of measuring the financial performance of the company. (Kedia and Kuntz, 1981, Kohls, 1985; Newgreen et al., 1985, Davidson and Worell, 1990).

Previous literature addressed the financial

performance of a company by measuring its profitability through several financial indicators, such as the percentage of sales resulting from new product sales, the earnings per share (EPS), the profit margin, the return on assets (ROA), return on equity (ROE), or return on capital invested (ROCE) (Salawu and Akinlo, 2005; Selvarajan et al, 2007, Hsu et al, 2007 ; Yang et al, 2010). In addition, return on investment (ROI) and the net income after taxes (NIAT) were also used as indicators to measure financial performance (Grossman, 2000). Interestingly, researchers have developed over time a series of benchmarks for managerial accounting, showing the six dimensions of a business activity, respectively the “individuals’ reward” (salary expenses related to total sales), , “quality” (the number of production errors), “contraction” (for example, the loss of inventory, product defects, sales’ return), “productivity” (payroll expenses reported to outputs), “operating expenses” (total operating expenses related to sales) (Wright et al, 2005).

Financial indicators are often the only instrument used in performance valuation as they translate the whole activity of a company in terms of profitability. The capital market perspective on enterprise performance considers profitability as the only relevant financial indicator reflecting the business performance. Commonly, financial ratios are used as financial indicators of performance. Anghel (2002) shows that the most representative financial ratios of a company are return on investment, indebtedness, capital efficiency, liquidity, cash-flows, inventory turnover, receivables turnover. [2]

Critics of the financial approach to performance show that not all aspects of business activity may be expressed in monetary terms, arguing that information from earlier stages of preparing the annual accounts are in fact only one dimension of the business. In other words, to measure the performance of an enterprise, not only the financial results count, because “it’s like you bring a team to a championship by its past results”, not the present ones; therefore, “a global vision on the interdependence of internal and external, quantitative and qualitative, technical, human, physical and financial parameters”[2] is needed.

Recent approaches to enterprise

performance in terms of value creation have led to the construction of new indicators, such as Economic Value Added (EVA, property of the consulting firm Stern Stewart), Market Value Added (MVA), Liquid value Added and Total Return to Shareholders. These new indicators imposed an active implication of both managers and accountants in the planning, decision making and performance assessments. Therefore, solutions are sought to link earnings and investments, not only across firms, but also at all enterprise units. Moreover, the implementation of new methods of performance measurement intends to resolve the eternal conflict between managers and owners – the agency theory.

3. Business performance – the non-financial view

Unlike traditional approaches to enterprise performance, which evaluate performance only through financial calculus, the modern approaches highlight the importance of estimating several non-financial indicators. In this perspective, non-financial indicators are often used in performance evaluation; they are a central element of the Kaplan and Norton's balanced scorecard. Non-financial indicators such as customer satisfaction, product quality and employee turnover are particularly relevant if the total value of a company cannot be determined through capital market performance evaluation, namely, if a company is not listed.

In the ‘80s and early ‘90s various authors have suggested different systems to manage business performance, such as the performance measurement matrix (Keegan et al., 1989), the performance pyramid (Lynch & Cross, 1991), the results and determinants matrix (Fitzgerald et al., 1991), the above mentioned balanced scorecard (Kaplan and Norton, 1992), the performance measurement process developed at Cambridge University (Neely et al., 1995) and the recent performance prism (Neely et al., 2001, 2002).

Modern approaches to business performance no longer focus on accounting measures solely, but take into account other factors considered to be determinants of future economic performance. One of the best known such theory is the so-called “balanced scorecard”, developed in the ‘90s

at Harvard Business School. However, it should be noted here that there are other similar approaches, such as the European Institute for Quality Management scheme, which has many similarities to the model proposed by Kaplan and Norton. Moreover, this approach is very similar to the performance metrics system developed in the '50s by General Electric.

The latest theories regarding enterprise performance refer to the importance of human resources (Pfeffer, 2010). In this perspective, employees' satisfaction is crucial. The main idea of this theory is that performant businesses have an orientation towards people, and should place people on top of their activity. Indeed, employees' satisfaction leads to higher productivity and product quality, lower costs and reductions in product prices, therefore, higher customer satisfaction, resulting in higher profits and a better position of the enterprise on the market.

According to a new perspective on business performance, namely the one based on the customer satisfaction, organizations achieve their goals - perform, by satisfying their customers more efficiently and effectively than their competitors. Effectiveness refers to the extent that customer requirements are met, while efficiency is a measure of how a company's resources are used to provide a certain level of customer satisfaction. This view is important, not only by the fact that it identifies two fundamental dimensions of performance, but also emphasizes that there may be more than internal factors that influence a company's performance.

On the other hand, firm performance can also be measured by referring to the so-called “pursued performance” (known as a subjective method for measuring performance); from this point of view, enterprise performance can be measured in terms of top management by using a Likert scale (Selvarajan, 2007). Therefore, subjective assessments of management can also be considered in order to assess overall performance.

However, non-financial indicators are not a measurable intrinsic value, in absolute terms. They are rather basic indicators that provide information about future performance of the enterprise, information

that is not found in current accounts. Still, this orientation towards the future has great merit: the past can not be changed and is useful only to the extent that analysis can improve future performance.

Empirical studies in this direction conducted by Ittner et al. (1997), Ittner and Larker (1998b) and Banker et al. (2000) confirmed the role of non-financial indicators as key determinants of future financial results. This type of indicators “are especially needed to measure performance and reward management when current management actions affect the financial long term profitability of the company, but are not reflected in contemporary accounts”[4] (for example, delaying expensive maintenance activities at the cost of future availability of equipment, and therefore bearing the cost of a lower financial returns).

4. A proper approach to enterprise performance

Certainly, in order to reflect the overall activity of the company, as a sum of activities of all actors involved, performance should be addressed by its many facets, being influenced by internal factors, such as management, employees, product quality or production costs, but also by external factors, such as customers' preferences and expectations, competition, access to information.

Neely (1998) considers that an appropriate performance measurement system consists of three interconnected elements:

- individual indicators that measure efficiency and effectiveness of business activities;
- A set of indicators that are combined to measure overall performance of the enterprise;
- an infrastructure through which information is collated, sorted, analyzed, interpreted and disseminated.[5]

A study conducted in 2006 by Chow and Van der Stede [3] on a sample of 128 companies reveals the fact that they use both financial and non-financial indicators to assess overall enterprise performance, but also subjective assessments on performance. Thus, they show that, given their sample, the performance measurement system includes a

variety of indicators: indicators based on internal factors - 26%, financial indicators - 25%, subjective assessments of management - 19%, employee-oriented indicators - 15 %, and customer-oriented indicators - 15%. On average, the firms' investigated performance evaluation was determined by financial indicators - 49%, non-financial indicators of 30% and subjective management assessments on performance - 21%.

Thus, an accurate assessment of overall enterprise performance requires consideration of financial indicators, as well as non-financial ones. However, as we have discussed previously, enterprise performance is often measured using financial indicators; undoubtedly, financial indicators are necessary in business performance analysis. However, taking into account their reliance on past evolutions of the firm and the fact that they do not offer the possibility of predicting future performance, financial indicators are considered to be insufficient for a meaningful assessment of performance. Consequently, they neglect those aspects of the company that can not be quantified in monetary terms. Non-financial indicators, on the other hand, can provide useful information for future performance of the company (Anderson, Fornell, & Lehmann, 1994, Banker, Potter, & Srinivasan, 2000; Behn & Riley, 1999, Ittner & Larcker, 1998b), but they can never be used separately in assessing performance.

5. Conclusions

Financial indicators used in performance evaluation lack in predicting the future, offering only one view of a company's activity and focusing on the past. Non-financial indicators, on the other hand, are used to provide information about future performance of the enterprise, solving, to a certain extent, the limitations imposed by the financial indicators' calculus. Hence, it is obvious the need of combining the two types of indicators, resulting in a proper evaluation of the overall performance of a company.

Summarizing, in order to determine relevant business performance, a balanced multidimensional system is required, which must include both financial and non-financial dimensions of performance, which can reduce the limits of the two categories of

indicators.

The specifics of each activity, especially individual business objectives, require different proportions of indicators to be included in the performance evaluation system, and even different indicators from one company to another. Thus, in determining the overall performance of a company, the quality of the indicators chosen is very important. However, the number of indicators to be taken into consideration should be limited in order to ensure a clear, overall, past and future performance.

Abstract:

This paper provides an overview of local budgets, or otherwise highlights the importance of these tools - local budgets, in the financial autonomy mechanism. Local communities know better than central authorities, their possibilities of obtaining financial resources and needs on expenses for providing local partner services. All these resources and needs are identified in local budgets.

Keywords: budget, local budget, financial decentralization

J.E.L. Clasification: H6,H61, H72

1 Local finances organisation

Public finances are rooted in the empowerment of local authorities in managing these communities.

Local communities are state separate human communities that have public authorities other than those of the state. This is an absolutely necessary condition of financial autonomy as administrative autonomy would not be possible without financial autonomy, which provides material support (funding) of operation.

There is a strong argument, namely that the local communities have the resources money to perform its origin and especially public expenditure needs to be covered for the production of local public services.[1]

Distinct organization of local finances, based on their financial autonomy allows relieving central finance a number of

expenses, reducing the number and magnitude of cash flows between the two structural levels of public finances and a clearer track how funds are used up. After all, the separation of local and central finance, as in other fields, is determined by economy reasons. Local finances better and more effectively meet the requirements of public utility land.

Degree of financial centralization varies depending on concentration of country administration, on whether the local authorities are subordinate to central government. However, major issues of national interest, strategic, those that affect all citizens, belonging to central funding, another method not possible (defence, public order state, state administration, external relations, environmental and citizen protection, art, health , education, science) and macro policies of reconciliation, stability and welfare are financed from central funds.

Financial decentralization begins to operate beyond the limits from which the use area of national interest public goods and services begins to shrink and the cost comparison of decision-making at central level is too high. These are some utilities such as roads construction, public lighting, municipal services, local transport, schools etc. There are also differences in the demand for public utilities and their possibilities of providing an administrative - territorial unit to another. In addition, local communities are open, have different relationships between them. All this implies local self-financing. [2].

Regardless the autonomy degree of local communities, it is considered that at the financial decentralization should be considered certain principles, as the stability requirements of country's public finances, as follows:

a. The principle of diversity, explained due to the forms variety and extent of requests for goods and services;

b. The principle of equivalence in public services financing, explained regard geographical benefits that they bring citizens;

c. The principle of accepting cost decentralization, determined by regional tax differences, which interferes with the spatial distribution of economic relativity;

d. The principle of centralized redistribution and stabilization imposed by the reality that local communities do not have the tools for achieving their macroeconomic or political perspectives;

e. The compensation principle of financial flows between communities caused by income involuntary transfers on behalf of economic differences and that are detrimental for the achievement of spending programs for some of these. For preventing such situations require government intervention with corrective measures;

f. The principle of insurance for vital social services, according to which this task is the responsibility of central authorities. Government should provide all citizens minimum essential public services (health, education, social security);

g. The principle of equitable access to public financial resources, determined by the situation of local communities whose balance between needs and fiscal capacity is defective, requiring resources minus compensation through government transfers on account of predetermined scheme;

h. The principle of financial balance, according to which the distribution between public authority's levels must ensure management performance within the limits duties and powers of each. This means that public financial resources to be redeployed for covering the costs with public sector operation in state administration and local communities alike.

Operation of local finances based on financial decentralization has common techniques of public finance.

Effects obtained in the operation of local finance refers first at the assumption of some state finances duties, and at local resources and expenditure increase, which recently led at the acquisition of the right to borrow debt capital market. Also, local finances have gained wide expertise in legal and budgetary control, local authorities having a proper accounting system.

2 The concept of local budget - an instrument of local financial autonomy

Local public finance delimitation is the result of financial empowerment of local public authorities. Organic growth is related to their role within the budget decrease of public budgets.

Separation of local and central government finances are based on reasons of efficiency in using public funds. Local finances better and more effectively meet the requirements of public utility land. Thus, financial decentralization is warranted to operate beyond the limits of the area from which the use of public goods and services of national interest begins to shrink and the cost compared to central decision-making increases, becoming too high. Moreover, the demand and the possibilities of providing and adaptation public utilities are different from an administrative - territorial to another. These conditions require the use of local funding of local public goods. [3].

In Romania, local public finances are organized in close connection with the administrative - territorial. Hierarchical levels which institutionalize financial structure of the local public are: county, city, town, village.

In its simplest form, the budget concentrates an estimate of proposed expenditures and necessary revenue to finance them, being a powerful tool for allocating limited resources to needs that have the same importance in the community.

By local budget we understand that it is a document in which is enrolled income and

costs as part of local, over a period of one year. Local budgets are budgets of territorial - administrative that has legal personality. Each village, town, municipality, district of Bucharest, respectively Bucharest, prepare its own budget, under conditions of autonomy.

Local budgets are planning tools and financial management activities of the territorial - administrative. Its structure reflects the autonomy degree of local government to central and regional links between the various administrations. Also, local budgets reflect income flows and local government costs, how to finance the expenditures by purpose and coverage of deficits.[4].

Local budget is often called operational plan being used in planning and guiding the local community in the next fiscal year and serves as the basis for financial reporting by the City Council, Ministry of Finance and citizens.

The significance of the local budget has grown as local government is increasingly placed in a position to increase resources and improve productivity and managerial responsibility.

3 Legislative aspects on local budgets

The general legal framework in the financial and budget in Romania is provided by the Constitution of 1991 revised following the 2003 referendum, public finance nr.500/2002 Law, Law no.273/2006 on local public finances, the State Budget Law and Law on state social insurance budget (annually adopted), special laws establishing special funds and other specific normative acts.

Concerning things from the perspective that Romania has joined the European Union, it took many negotiations in the pre-accession in terms of Chapter 29 (Financial and budgetary provisions) from the chapters list where the acquit is divided. Closing this chapter has been possible mainly due to developments related to other relevant chapters of the financial-budget and the

adoption by our country of harmonized legislative acts with European legislation.

Thus, the Law on public finances (500/2002) is aligned with the Council Regulation on the Financial Regulation nr.1605/2002 budget of the European Community and provides budget principles and construction rules, responsibilities of the institutions involved in the budget process, budget calendar, the budget process stages, rules according to which budget implementation takes place, the penalties applicable to infringements of the law.

Law no.273/2006 on local government finance establish the principles, framework and procedures for training, administration, employment and local public funds and responsibilities of local authorities and public institutions involved in local public finance.

The main institutions involved in the budget process in Romania are the Parliament, Government, Ministry of Finance, the principal loan. The principal officers of the local budgets are presidents of county councils, the mayor of Bucharest and the mayors of other administrative units. Those under the subordination of the main credit are called secondary and tertiary. The main responsibilities of authorizing officers in developing and implementing the local budget include:

- draft its own budget;
- budgetary credits distribution on lower hierarchical units;
- revenue collection following up;
- accounting organization and updating

4. The content and structure of local budgets .

Local budgets consist of two main sections: localities income and expenses.

According to local public finance law, revenues and expenses are classified based on budget classification approved by the Ministry of Finance. The main types of income that are included and charged in local budgets are provided in the annex at the local public finance law but also in the annual state

budget law with any amendments thereto for the respective year.

In the main, local budgets income are structured as follows [5]:

Own revenues consist of:

- local taxes
- increment tax from the subordinate local companies
- taxes from the population (tax on land, buildings, tax on vehicles owned by individuals and others)
- buildings and land tax from legal persons
- other direct taxes (tax on vehicles owned by legal entities and others)
- tax on shows
- other indirect taxes (taxes and fees for licensing and operating permits, legal fees, stamp duty, stamp duty for notary activity and others)
- payments from public institutions (other income from circulation on public roads, the monthly contribution of parents or legal advocates for children in nursery maintenance, contributions payable by beneficiaries of social services canteens and others)
- miscellaneous income (income from recovery of costs, imputations, damages, fines, penalties, penalties under the law)
- capital income (income from the assets sale of public institutions, sale of state housing funds, income from sale of property belonging to private sector, privatization proceeds)

Deducted from the income tax rates:

- Amounts deducted from income tax to balance local budgets
- Amounts allocated by the County Council of the income tax to balance local budgets

Amounts deducted from value added tax (to fund decentralized spending and balance the budgets of local municipalities)

Grants:

- Subsidies from state budget, current and capital
- Subsidies from other governments

Classification of public expenditure by different criteria enables economy content knowledge and the role of various

expenditure categories and their structure within appropriate budget classification. The main general criteria for the public expenditure classification are of two types namely: administrative and economic.

Especially in the budget plan, states financial practice and international organizations held different types of classification, known as budget classification, namely: administrative, economic, operational, financial.

Administrative and departmental classification is based on institutions criterion where through public spending, ministries, public institutions autonomous administrative units, being useful because budgetary allocations are determined on these beneficiaries. It has however the disadvantage that a ministry, government department, agency, county, city, town, meet varied destinations expenses. In addition, the ministries structure (other central structures and departmental), respectively, public institutions subordination changes periodically, making the public expenditure grouping under this classification does not ensure over time comparability. Usually, this criterion is used to allocate public spending budget authorizing officers.

Economic classification is based on two criteria: the first considers the content consumption process expressed that the costs are divided into: current expenses (operating) and capital expenses (for investments), the second has in view the nature of actions financed and divide the expenditure in : public service expenditures and transfer expenditures (cash resources).

Current expenditures are those that ensure the proper operation and maintenance of public institutions. They represent a determinate consumption of financial resources and spending must be annually renewed, having the largest share of total public expenditure. [6]

Capital expenditure (investment) is reflected in the goods procurement for the material production sphere or the immaterial endowment sphere (public institutions) with fixed assets, leading to the development and modernization of public patrimony.

The expenses for public services, generally, includes, staff remuneration, other benefits cost items, including supplies for the public institutions proper functioning or furniture, appliances and equipment acquisition.

Transfer expenses objectifies into passing money operations from the budget to legal persons (institutions with self-financed activities, productive enterprises) or individuals (retirees, unemployed, students, pupils, etc.). From this point of view, they can have an economic character (subsidies, restructuring of some economic activities, etc.) or a social character (scholarships, pensions, other benefits).

Functional classification used as criteria (in expenditures grouping) areas of activity that are directed toward public financial resources or other destinations, related to the performance of transfers between different levels of public administration, interest payments on public debt and provisioning at the disposal of executive authorities.

Financial classification takes into account when payments are made, i.e. how to use public funds. According to this classification, expenditures are grouped into:

- a) permanent;
- b) temporary or treasury operations;
- c) virtual or pos.

Expenses are provided in local budgets according to budget classification and materialize the financing ways of specific operations carried out locally.

Because currently this structure of local budgets expenditure is aligned to the international, we can present the list of those expenses as given in Annex 2 of the local public finances law, placing them in specific categories of functional classification:

- Executive authorities (general public services);
- Defence and public order, education, health, culture and religion, social;
- Services, public and residential development;
- Transport, agriculture and other economic activities;
- Others actions;

- Transfers;
- Loans;
- Interest payments and other expenses related to public debt;
- Loans repayment;
- Reserve funds.

In the economic classification, local budgets expenditures are grouped as follows:

I. Current expenditure

- Staff costs;
- Expenditure on goods and services;
- Subsidies;
- Transfers;
- Interest on internal and external public debt;
- Reserves

II. Capital expenditure

III. Loans

IV. Credits refund and interest payments and loans fees

Economic classification shows the nature of financed expenses due to public funds and with it can determine which shares have different types of expenditure in total budgetary expenditure

5. Conclusions

Local public finance plays an essential role in the transformation process of modern societies, corresponding with the responsibilities appropriate increasingly larger local granted.

So if local budgets were allowed more time on a secondary place, they have become vital to the entire public sector. They are primarily for local collectivises, but also for the central authorities. A local budget that has sufficient resources does not need transfers from the central budget.

Professional Judgement and Risk Propensity in Financial Audit

Iancu Octavian Ionescu
University of East Anglia, United Kingdom
O.Ionescu@uea.ac.uk

Abstract

During the course of an audit mission, the quality of the auditor's work is intrinsically linked to two main determining factors: the auditor's professional judgement and the auditor's risk propensity. This paper examines professional judgement and risk propensity from an audit perspective and from an academic perspective. The emphasis is on explaining the concept of professional judgement in audit and on the managerial risk behaviour in a decision making context. The research objective is to identify the extent to which theories on the determinants of risk behaviour address the critical importance of risk in business decision making and the link with the auditor's professional judgement. It is discovered that there are two main risk behaviour theories that explain the risk propensity of business decision makers and that risk propensity can influence professional judgement.

Key words: audit, professional judgement, risk behaviour, decision making .

J.E.L.: M10, M41, M42.

1. Introduction.

We live in a world where risk is present in every decision that is made. The external financial auditing industry sector is no exception. Financial audits exist to add credibility to the implied assertion by an organization's management that its financial statements fairly represent the organization's position and performance to the firm's stakeholders and to consolidate trust in the business world. The financial statements must present information that are true and fair, that reflect the economic reality of the transactions, that are impartial, prudent, relevant and credible. As a professional and an expert in accounting, the financial auditor and his work, respecting laws and

International Standards on Auditing, adds credibility to the financial statements.

The financial auditor is required to make decisions that will imply a certain degree of risk that will impact on the firm's profitability and reputation. The concept of risk taking has played a central role in business research in the last few decades. Risk is a concept whose definition has not generated a consensus in the academic or business circles but is generally accepted that it relates to issues of unpredictability, decision making and potential loss. Risk is intrinsically linked with decision-making and every decision made in business implies a certain degree of risk. The importance of risk to decision making is attested by its position in decision theory, by its standing in managerial ideology and by the high level of interest in risk assessment in management. This paper will look into risk behaviour theories from a managerial perspective building on previous research done by many scholars.

All these facts prompt to a more considerate approach towards the use of professional judgement in every stage of an audit and to allocating a greater importance to the issue of risk propensity.

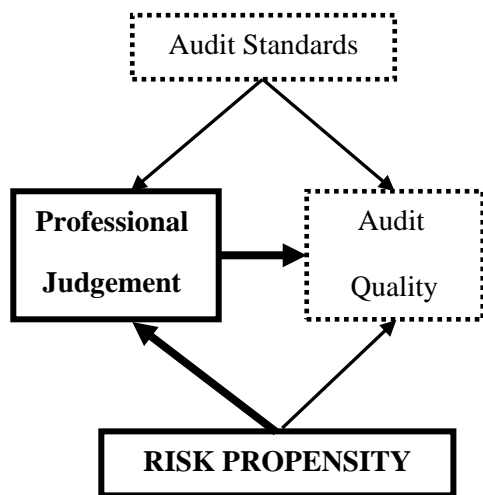

2. Professional judgement in audit.

Throughout his work, the financial auditor uses an important and central element: professional judgement. Professional judgement is the cornerstone for the audit profession and is applied in all stages of an audit, from planning stage to the audit opinion.

Professional judgement in auditing is the application of relevant knowledge and experience, within the context provided by auditing and accounting standards and the rules of professional conduct, in reaching decisions where a choice must be made between alternative possible courses of action [1]. By referring to professional standards, concepts like independence and

objectivity, professional competence, integrity, professional scepticism and responsibility are implicitly incorporated in the definition of professional judgement. It is clear that professional judgement takes place in the context of professional standards reflecting the collective judgements of the profession. Professional standards are therefore important in exercising professional judgement as they act as references and lighthouses for auditors. The absence of comprehensive professional standards combined with factors such as the increased frequency of business failures and the inability to meet public expectations have increased auditors' exposure to liability claims. The quality of professional audit standards will definitely impact the professional judgement of the auditor and both will impact the quality of the audit work. However, the auditor's risk propensity plays an important part and directly influences the professional judgement of the auditor as well as the quality of the audit work (see Figure 1.).

Figure 1. The relationship between professional judgement and risk propensity.
(Original conception of the author)

3. Behavioural aspects of risk taking

Academic theories which attempted to explain the risk behaviour of decision makers date back as far as 1738 [2] and there are a significant number of empirical studies in the area of risk taking behaviour. However, these studies have not produced uniform findings.

Some scholars underline the importance of understanding the personal attitudes to risk and considers the attitude and behaviour dimension one of the key dimensions to understanding risk. The rationale of the importance of understanding the decision makers' risk behaviour is that, to a certain extent, the strategies of an organisation reflect the dispositions of their managers in terms of their background, beliefs, attitudes and problem-solving styles [3]. This behavioural aspect of managers' risk taking in decision making introduces the fundamental question about the determinants of risk behaviour. What exactly determines or influences a manager's risk behaviour when making a decision? There are currently several views accepted. The theories of risk taking behaviour are split into two major competing paradigms: one which emphasizes the importance of individual dispositional differences, which is called the dispositional view, and one which emphasizes the importance of situational factors, called the situational view. There are also views which try to integrate the dispositional view and the situational view, called integrative views.

4. The dispositional view

The individual dispositional view focuses on the individual differences in risk taking behaviour. For this school of thought, the general traits and general dispositional tendencies of the decision makers are believed to dictate their risk taking attitude. It argues that some people have a natural predisposition to be more risk-seeking or more risk-averse than others, irrespective of the situation or the context of the problem. In support of this theory, a significant number of empirical studies have reported on individual differences in risk taking behaviour. In 1970, Alderfer and Bierman [4] use two questions from Kogan and Wallach's Choice Dilemma Questionnaire [5] relating to financial investment, alongside other types of questions, to substantiate considerations regarding individual differences in attitudes towards risk choice in financial investment. In a study that directly examined the consistency of dispositional risk taking behaviour in two groups, one risk-seeking and one risk-averse, Schneider and Lopes [6] found that the risk-seeking group tended to

prefer riskier choice on a consistent base when compared with the risk-averse group. Other scholars [7] observed that some people were more tolerant towards risk than others and found that individuals tend to be consistent in their attitudes towards risk. In an experiment in which the roles of risk attitude and tolerance for ambiguity in predicting choice were jointly assessed, Ghosh and Ray [8] found that both risk attitude and ambiguity intolerance determined choice behaviour.

5. The situational view

Many empirical studies suggest that situational factors such as the framing of the problem and the context in which the decision on risk is taken have a greater influence on risk taking behaviour. Slovic [9] argues that high correlations between risk-taking measures in structurally different settings are highly unlikely, suggesting that different settings in which decision on risk is made will have different decisional outcomes. March and Shapira [10] find that managers, as decision makers, make a sharp distinction between taking risk and gambling, which implies that the context or situation of the decision plays a major role in risk taking behaviour. In line with these findings, a very strong argument in favour of the situational view of risk taking behaviour comes from a seminal study conducted by Kahneman and Tversky [11] in which the authors advance an alternative theory of choice under risk – the prospect theory. Essentially, the prospect theory suggests that individuals tend to interpret the outcomes of a risky decision according to a reference point – such as the status quo - which changes depending on whether the outcome is framed as a gain or as a loss.

6. Conclusion.

The possibility of human error in decision making is a critical reason why the study of risk in decision making tasks and, in particular, professional judgement is important. Since scholars first articulated the fundamental question about the determinants of risk behaviour in terms of whether they are dispositional or situational, the issue remains unresolved. However, there have been

attempts, along the years, to resolve this issue by researchers who advanced the integrative theories but with little or no success at all. The most popular theories about the determinants of risk behaviour are those articulated by Kogan and Wallach: the dispositional view, which considers the personal characteristics of a decision maker such as natural predisposition towards taking or avoiding risk to be determinant of the type of decision taken and the situational view, which considers the context in which the decision is taken to be determinant of the decision maker's risk behaviour, irrespective of dispositional preferences. There seem to be a contradiction between the two views. However, the professional auditor has a powerful tool at his/her discretion: professional judgement. The current challenge of financial auditors is to gain an understanding of how risk propensity affects the decision making process and how to make the best use of auditor's most important tool - professional judgement.

Some Accountancy Considerations Over the Cession of Claims

Lenghel Radu Dorin

*Faculty of Economical Sciences Cluj-Napoca, Finance and Accountancy Department,
Christian University “Dimitrie Cantemir” Bucharest*

radu.lenghel@cantemircluj.ro

Abstract

The assignment of debts is the operation in which the creditor (assignor) transmits voluntarily, for value or with voluntary disposition, the right of debt to another person (assignee) who becomes in this way the creditor instead of him and can cash from the debtor the given debt.

The accountancy of the contracts of assignment of debts to the assignee (the person who took over the debts) must be done according to the specified clauses of each contract. Through the assignment of debts, the right to debt of the cessionary is transmitted to the assignee for the nominal value of the debt, even if the transmission was done at a lower price.

According to the accountancy regulations, in the case of claim assignment, the difference between the value of the assigned debt and the sum paid to the assignor represents income at the date of the report of rights and obligations, based on the contract clauses.

Key words: cession of claims, doubtful debts, cessionary, releaser, adjustments for debts depreciation

Jel Code: M40, M41

1. Introduction

The accountancy of the contracts of assignment of debts to the assignee (the person who took over the debts) must be done according to the specified clauses of each contract. Through the assignment of debts, the right to debt of the cessionary is transmitted to the assignee for the nominal value of the debt, even if the transmission was done at a lower price.

According to the accountancy regulations, in the case of claim assignment, the

difference between the value of the assigned debt and the sum paid to the assignor represents income at the date of the report of rights and obligations, based on the contract clauses.

2. General aspects regarding the assignments of debts

The assignment of debts is the operation in which the creditor (assignor) transmits voluntarily, for value or with voluntary disposition, the right of debt to another person (assignee) who becomes in this way the creditor instead of him and can cash from the debtor the given debt.

The accountancy of the contracts of assignment of debts to the assignee (the person who took over the debts) must be done according to the specified clauses of each contract. Through the assignment of debts, the right to debt of the cessionary is transmitted to the assignee for the nominal value of the debt, even if the transmission was done at a lower price.

The transmission of the claim takes place at the date of the closure of the contract, if there are no other provisions.

The doubtful debts are registered distinctively in the bookkeeping (account 4118 “Doubtful clients or in contention” or in the analytical accounts of the debts accounts, for other debts aside from clients).

Taking out of the bookkeeping of a claim can be done by giving it to another creditor. According to the accountancy regulations, in the case of claim assignment, the difference between the value of the assigned debt and the sum paid to the assignor represents income at the date of the report of rights and obligations, based on the contract clauses.

Together with the right for claim, the assignee gains through the effect of conveyance and the lack of any given stipulation in this manner, all the rights,

accessories and guarantees of any nature of the assigned claim.

If it was not conveyed otherwise, the interests and any other income of the claim, become mature, but uncollected yet by the assignor, revert to the assignee starting with the date of cession.

3. Particularities regarding the organization of accountancy in claim cession

a. At the assignee, the specialized company in retrieving claims [1]

1. Taking over of the claim according to the contract of cession of claims:

- cession price is lower than the nominal value:

461/4111 Clients	=	%
“Various debtors”		462
		“Various creditors”
		704
		“Income from providing services”

2. Registering the payments performed by the entity, representing the price of the cession:

462	=	5121
“Various creditors”		“Bank accounts in lei”

3. At the end of the year, while unfolding of the closure work of the financial year, the entity noticed that it can take back only 90% of the value of the assigned debts. As a consequence of noticing the risk of not payment for claims of 10%, it constitutes an adjustment for depreciation:

6814	=	496
“Operating expenses regarding adjustments for depreciation of current assets”		“Adjustments for depreciation of claims- various debtors”

4. At the payment date there can be receive a percent of 90% from the value of taken claims:

5121	=	461
“Bank accounts in lei”		“Various debtors”

5. In the same time, there will be proceeded to the renewal of income of adjusting the balance by depreciation of the taken claims through cession:

496	=	7814
“Adjustments through depreciation of claims		“Income through adjustments for

– various debtors” depreciation of circulating assets”

6. Recording in accountancy of the sums that cannot be cashed, according to the court order – 10%

654	=	461
“Losses from claims and various debtors”		“Various debtors”

b. At the assignor [1]

1. Passing of the claim to uncertain clients:

4118	=	4111
Uncertain clients or in litigation		Clients

2. Recording in accountancy of the cession claim

%	=	4118
461		Uncertain clients or in litigation
Various debtors/ Retrieval		654

Loss in claims and various debtors

3. Collecting the equivalent value of the cession, from the retrieval company:

5121	=	461
Bank accounts in lei		Various debtors/Retrieval

4. Case studies regarding the accountancy of claim cession

4.1 Case study number 1 regarding accountancy of claim cession

S.C. Student A S.R.L. sells to S.C. Student B S.R.L. at the date of 1st November 2010 goods in value of 500.000 lei. According to the contractual clauses, the payment of the equivalent value by S.C. Student B S.R.L will be done until at least 30th December 2010. Because S.C. Student B S.R.L is facing certain financial problems, it has not made any payment to S.C. Student A S.R.L until the due date mentioned in the contract.

At the beginning of the year 2011, the court gives an order entrance for S.C. Student B S.R.L in the procedure of insolvency, and at 1st March 2011, the entity S.C. Student A S.R.L concludes an agreement of cession of claims with the entity S.C. Debts S.R.L., entity specialized in debts recovery. After the contract of claims cession, all the rights and obligations of S.C. Student A S.R.L are taken over by S.C. Debts S.R.L. According to the contract of claims cession, the price of cession is 490.000 lei. All the companies are not VAT payers.

a. Bookkeeping of the operations at entity S.C. Student A S.R.L – assignor

a1. – Registering in bookkeeping of the operation of sale of the goods in 1st November 2010

4111	=	707	500.000 lei
Clients		Income from goods sale	

a2. – At 31st December 2010, on occasion of the stocktaking, the claim is valued at the probable value of cashing and it is recorded in accountancy an adjustment for depreciation for the entire value of it. Based on the analysis done by experts and jurist, it is appreciated that taking into consideration the financial problems of the client S.C. Student B S.R.L, the probable value of cashing the debts is zero.

Consequently it is decided to reflect in the books of a provisory adjustment to the level of the entire value of the debt:

4118	=	4111	500.000 lei
Uncertain clients or in litigation		Clients	

and

6814	=	491	500.000 lei
Expenses for exploiting regarding adjustments for depreciation		Adjustments for claims depreciation-clients	

a3. – At 1st March 2011, entity S.C. Student A S.R.L records in its books the cession of claims:

%	=	4118	<u>500.000 lei</u>
461		Uncertain clients or in litigation	490.000 lei
Various debtors S.C. Recovery S.R.L.			
654			10.000 lei
Loses through claims and various debtors			

and together with that, it goes back to the income the adjustment for depreciation made beforehand:

491	=	7814	500.000 lei
Adjustments for depreciation		Income from adjustments for depreciation	

a4. Cashing the equivalent value of cession from S.C. Recovery S.R.L.:

5121	=	461	490.000 lei
Bank accounts in lei		Various debtors/ S.C. Recovery S.R.L.	

b. Accountancy of operations at entity S.C. Recovery S.R.L. – assignee

b1. Taking over the debt, according to the contract of claim cession from entity S.C. Student A S.R.L.:

461	=	%	<u>500.000 lei</u>
Various debtors/ S.C. Student B S.R.L		462	490.000 lei
		Various clients/ S.C. Student A S.R.L	
		704	10.000 lei
		Income from providing services	

b2. Discharge of claim payment to S.C. Student A S.R.L.:

462	=	5121	490.000 lei
Various creditors/ S.C. Student A S.R.L.		Bank accounts in lei	

b3. After that the debt is followed by S.C. Recovery S.R.L. and according to the evolution of the financial situation of S.C. Student B S.R.L. there can be made adjustments for depreciation in the bookkeeping of the entity that has taken over the claim, in this way:

6814	=	496	
Working costs regarding adjustments for depreciation of circulating assets		Adjustments to depreciation of claims-various debtors	

4.2 Case study number 2 regarding the accountancy of claim cession

S.C. Student A S.R.L. has to get from S.C. Student B S.R.L. the sum of 200.000 lei. According to the contractual clauses, the payment of the equivalent value of the goods by S.C. Student B S.R.L. is to be done in 90 days. Because S.C. Student B S.R.L. has some financial problems, it has not made any payments to S.C. Student A S.R.L. until the due date stipulated in the contract. Because the debit has an ages older than 200 days, the entity S.C. Student A S.R.L. has entered into a contract with the entity S.C. Debts S.R.L., entity specialized in debts recovery. After the contract of claims cession, all the rights and obligations of S.C. Student A S.R.L are taken over by S.C. Debts S.R.L. According to the contract of claims cession, the price of cession is 190.000 lei. All the companies are

not VAT payers. The company S.C. Student B S.R.L. has been announced by this contract of claim cession.

a. Accountancy of operations at entity S.C. Recovery S.R.L. – assignee

a1. Taking over the debt, according to the contract of claim cession from entity S.C. Student A S.R.L.:

461	=	%	<u>200.000 lei</u>
Various debtors/ S.C. Student B S.R.L.		462	190.000 lei
		Various clients/ S.C. Student A S.R.L.	
		704	10.000 lei
		Income from providing services	

a2. Discharge of claim payment to S.C. Student A S.R.L.:

462	=	5121	190.000 lei
Various creditors/ S.C. Student A S.R.L.		Bank accounts in lei	

a3. After that the debt is followed by S.C. Recovery S.R.L. and according to the evolution of the financial situation of S.C. Student B S.R.L., at the end of the financial year notices that it can get back only 90% so it will make a depreciation adjustment, in this way:

6814	=	496	20.000 lei
Working costs regarding adjustments for depreciation of circulating assets		Adjustments to depreciation of claims–various debtors	

a4. In the next year, it cashes from S.C. Student B S.R.L., the sum of 180.000 lei:

5121	=	461	180.000 lei
Bank accounts in lei		Various debtors/ S.C. Student B S.R.L.	

a5. In the next year, it is retaken at income the adjustment for claim depreciation:

496	=	7814	20.000 lei
Adjustments for claim depreciation – various debtors		Income from adjustments for depreciation of circulating assets	

a6. In the next year, it is recorded as losses the unpaid difference, as following the bankruptcy of S.C. Student B S.R.L.:

654	=	461	20.000 lei
Losses from claims and various debtors		Various debtors/ S.C. Student BS.R.L.	

b. Accountancy of operations at entity S.C. Student A S.R.L – assignor

b1. After 200 days the passing of the debt to uncertain clients:

4118	=	4111	200.000 lei
Uncertain clients or in litigation		Clients	

b2. The entity S.C. Student A S.R.L records in bookkeeping the claim cession:

%	=	4118	<u>200.000 lei</u>
461		Uncertain clients or in litigation	190.000 lei
Various debtors S.C. Recovery S.R.L.			
654			10.000 lei
Loses through claims and various debtors			

b3. Cashing the equivalent value of cession from S.C. Recovery S.R.L.:

5121	=	461	190.000 lei
Bank accounts in lei		Various debtors/ S.C. Recovery S.R.L.	

5. Conclusions

In connection with the theme tackled, there can be drawn the following conclusions:

- the income from or connected to the claims cession are taxable incomes;
- the losses registered at the taking out of evidence at the unpaid debts are deductible, only in the following cases [3]:
 1. the bankruptcy procedure of the debtors was closed based on a court order;
 2. the debtor has deceased and the claim cannot be recovered from the heirs;
 3. the debtor is dissolved, in the case of a limited company with a sole associate or liquidated with no successor;
 4. the debtor has major financial difficulties which affects the entire patrimony.
- the accountancy of the contracts of claim cession to the cessionary (the person who took over the debts) must be done according to the specific clauses of the contract;
- together with the right for claim, the cessionary gets, through the cession effect and in the lack of any specific stipulation in this way, all the rights, accessories and guarantees of any nature of the cession claim;

- if it was not conveyed otherwise, the interests and any other income of the claim, become mature, but uncollected yet by the assignor, revert to the assignee starting with the date of cession;
- in the situation in which according to the contract, the purpose of the operation is not the recovery of debts, the taking over company of the correspondent claims of a credit given takes the position of the creditor, the operation is exempted from VAT;
- in the case, in which the analysis of the contract says that the operation represents the recovery of the claims, this is considered for the person who takes over the claims as a service made with payment, taxable from the VAT point of view, regardless of the fact that the person who takes over the claims, takes or not the risk of not cashing them;
- the expenses regarding the value of the alienated commercial debt are deductible expenses;
- in what it concerns the income of the recovery society, we consider more adequate the usage of account 704 instead of account 7588 [2], the way the MPF regulations provide, because the activity of recovery of debts represent an activity of services.

Some Considerations Over the Simplification of Costs Calculation for Small and Medium-Size Entities

Lenghel Radu Dorin

*Faculty of Economical Sciences Cluj-Napoca, Finance and Accountancy Department,
Christian University “Dimitrie Cantemir” Bucharest
radu.lenghel@cantemircluj.ro*

Abstract

However small and medium companies can easily use the extra accounting method, which is based on a table, where the production cost components are found. Nevertheless, small and middle-size entities can easily use the off balance sheet method, which has at its base a table in which are found the components of the production costs. Using the accounts from the new class is not mandatory; the costs calculation can be made in off balance sheet, with the help of Excel tables or with the help of cumulative documents.

Key words: cost calculation, classification of costs, distribution of indirect expenses, rational charge, off balance sheet method.

Jel Code: M40, M41

1. Introduction

Nevertheless, small and middle-size entities can easily use the off balance sheet method, which has at its base a table in which are found the components of the production costs. Using the accounts from the new class is not mandatory; the costs calculation can be made in off balance sheet, with the help of Excel tables or with the help of cumulative documents.

2. Legal provisions on management accounting

According to the Accounting Law no. 82/1991, as amended and supplemented (GO no. 37/2011), legal persons under the law (commercial companies, national companies, stand-alone units, national research and development institutes, cooperative societies

and other legal persons, public institutions, associations and other legal persons, profit or non-profit, unincorporated subdivisions, based abroad, based in Romania, and unincorporated subdivisions in Romania, owned by legal entities registered abroad, collective investment structures that are not represented by the articles of association, as set out in the capital market law, pension funds, private pension funds and other entities organized under the Civil Code), are required to organize and run their own accounting, including management accounting adapted to the specific activity. According to the same bill, also responsible for management accounting organization, is the manager, officer or other person bound to the management of such entity.

On the other hand OMFP no. 1826/2003, on some measures on the organization and administration of management accounting provides a number of provisions concerning the organization of management accounting, among which: according to the specific of the activity, management accounting will provide mainly for recording operations on the collection and distribution of expenditures by purpose, i.e. activities, departments, stages of manufacture, cost centers, profit centers, as appropriate, and costing of acquisition, production, processing of incoming goods, work performed, services provided, running production, current assets etc., in the production units, commercial, service, financial and other fields; accounting management is organized by the administrator of the legal entity either by using specific accounts or accounts by developing of financial accounting, either with their own operational and technical evidence; the use of accounting accounts and their symbols shall be such that the storage and access system of the information

obtained to be flexible and allow a wide range of options; the list of management accounts is adapted to the purposes, namely: emphasizing cost flows, determination of inventory costs, determining revenues and results according to the activity that generates them, making predictions, etc.

Also, OMFP no. 3055/2009 contains some rules on management accounting, but the references made are done through the rules for evaluating the cost of production; these rules include: the production cost of an asset comprises the purchase cost of raw materials and supplies and the production expenses directly attributable to the asset; the cost of production or of processing the inventory and the production cost of fixed assets include the direct costs related to production, namely: direct materials, energy consumption for technological purposes, direct manufacture and other direct production costs, design costs and share of indirect production costs allocated as rationally related to their manufacture; in the production of property, examples of expenditure within other directly attributable costs are: costs of site development; initial delivery and handling costs, installation and assembly costs, costs of testing the correct operation of the asset, professional fees and commissions paid in connection with the asset etc.; the cost of inventories of a service provider includes labor and other expenses directly related to the personnel engaged in provision of services, including the staff responsible for supervision and appropriate private utility; the production cost can include a reasonable proportion of expenses that are indirectly attributable to the property, insofar as they relate to the period of production; including in the cost of inventories overheads may be appropriate if they represent the cost for bringing the inventories to the desired place and form; examples of costs that should not be included in the cost of inventories, but are recognized as expenses in the period in which they occurred, are the following: loss of materials, manufacture or other costs of production recorded beyond normally allowed, including losses due to wastage; storage costs, except where such costs are necessary in the production process, before passing into a new phase of manufacturing; storage costs are included in the cost of production when

necessary to bring inventories in place and condition in which they are situated; overheads (expenses) generated by the administration, not involved in bringing inventories to final form and place; bargain sale, unallocated fixed costs, which is recognized as an expense in the period in which it appeared, the allocation of fixed costs is based on normal production capacity (activity); production fixed costs consist of indirect production costs which remain relatively constant regardless of production volume, such as: depreciation, maintenance of departments and equipment, and management and administration departments costs; the normal capacity of production is the estimated production to be obtained on average over a certain number of periods, under normal circumstances, taking into account the loss of capacity resulting from planned maintenance of equipment..

3. Cost calculation

The information presented in the OMPF. 3055/2009 can be classified into the following categories: cost classification, allocation of indirect costs, reasonable charging, cost of borrowing, losses, production in progress [2].

a. Costs classification

According to OMFP no. 3055/2009, entities classify costs on the following criteria:

- according to the functions of the entity, costs are classified as: acquisition costs, production costs, selling costs, administration costs;
- according to the identification within the object of calculation, costs are classified as direct costs, which are identified within an object of calculation, and indirect costs that are related to multiple objects of calculation;
- according to their behavior in relation to production volume, we have variable costs, which vary in proportion to the production volume and fixed costs that do not change with production volume.

In the calculation of production cost, entities must identify and analyze the costs, according to three criteria. The OMPF no. 3055/2009 provides that the stock

assessment is achieved at the cost of production, which includes direct costs and a share of indirect production costs; hence the use of a method for calculating the full cost, i.e. the cost of production includes direct and indirect costs, both variable and fixed.

b. The distribution of indirect costs

Using the methods of calculating the full cost (global, per phase, on order, standard, on activities, etc.), involves the use of distribution databases on cost objects, of indirect cost. OMFP no. 3055/2009 does not refer to the way in which distribution bases are chosen, only stating that the production cost can include a reasonable proportion of expenses that are indirectly attributable to the property, insofar as they are related to the production period.

The OMFP no.1826/2003 further mentions that when the costs of production, of processing cannot be identified separately for each product, they are allocated on the basis of rational procedures consistently applied (simple division procedure, the quantitative procedure, indicators of equivalence procedure, quantitative equivalence of the secondary product with the primary product procedure, the value deduction of the secondary products procedure etc) [3].

Among the bases of distribution, according to which indirect costs of cost objects are allocated are the following: consumption of raw materials, direct wages, product number, batch number, direct costs, total revenues, etc. [1]. They will choose the distribution base that significantly affects the cost of cost objects and its profitability.

c. Rational imputation

The OMFP no. 3055/2009 requires a rational allocation of indirect costs, so in the production cost is included only part of the fixed indirect costs (depreciation, maintenance of equipment and departments, management and administration costs, etc. sections), and their allocation is carried out based on normal production capacity. Rational imputation is explained by the fact that because fixed costs are the same regardless of output, their imputation on product must be made depending on the use of normal production capacity.

Normal production capacity is the estimated production to be achieved on average over several intervals in normal

circumstances, taking into account the loss of capacity resulting from planned maintenance of equipment.

d. Cost of Borrowing

The OMFP no. 3055/2009 underlines a series of clarifications to the cost of borrowing, among which: borrowing costs that are directly attributable to the acquisition, the construction or production of an asset with a long manufacturing cycle may be included in the costs of that asset, for example, borrowing costs may include the interest on the borrowed capital to finance the purchase, the construction or production of assets with a long manufacturing cycle and commissions for these loans; borrowing costs may be included in the production costs of an asset with a long manufacturing cycle, insofar as they relate to the period of production; the borrowing costs incurred by the entity in connection with the loan funds may be included in the cost of goods or services with a long manufacturing cycle; capitalizing borrowing costs should cease when making most of the activities necessary to prepare the asset with a long manufacturing cycle, for the use of default or sale; in respect of including such borrowing costs in the value of assets, they must be presented in the notes.

e. Losses

OMFP no. 3055/2009 states that should not be included in the cost of inventories, but are recognized as expenses in that particular period, the loss of materials, manufacture and other production costs recorded above the normal permissible variation, including losses due to wastage.

Losses are consumed resources, which are not present in the final product.

f. Production in progress

The OMFP no. 3055/2009 offers a series of clarifications to the production in progress, among which: the production in progress, representing production, which has not passed through all stages of processing, set in the technological process and the products not subject to tests and technical reception or unfinished, within the production process services and studies in progress or unfinished are also included; the value of products and services under execution is determined by the inventory of unfinished production by the end of the cycle, by technical means of ascertaining the degree of completion or

execution stage of technological operations and its assessment at production costs.

Given the production in progress, the cost of finished goods is determined by the following formula: production cost + the cost of the initial stock of production – the cost of the final stock of production in progress.

4. Organization of costs calculation through the off balance sheet method

In what concerns the ways of organizing the management accounting, only OMFP no. 1826/2003 makes some specifications, from which we mention: management accounting

Expenses	Producti- on	Auxilia- ry	Administ- ration	Distribut- ion
-raw material s (601)	P1: 15.000 P2: 10.000			
-supplies (602)	2.000	1.000	500	500
-power and water (605)	4.000	2.000	1.000	1.000
-wages (641)	P1 : 1.000 P2 : 1.200	1.000	4.000	2.500
-amortiza- tion (681)	10.000	1.000	500	5.000

it is organized by the administrator of the legal entity, either by using specific accounts, or by developing accounts from the financial accountancy, or with the help of its own technical and operative bookkeeping (the off balance sheet accountant). Nevertheless, small and middle-size entities can easily use the off balance sheet method, which has at its base a table in which are found the components of the production costs. Using the accounts from the new class is not mandatory; the costs calculation can be made in off balance sheet, with the help of Excel tables or with the help of cumulative documents. The entities have in hands advanced programs for costs calculation, without using the accounts from class 9, the calculation algorithm being the same, the spending elements being centralized with the help of tables (spending synoptic tables). In order to ensure the accuracy of the processed information there will be a confrontation with the expenses from the financial bookkeeping. This off balance sheet method of organizing the calculation is proper for small and middle-size entities, which do not have indirect costs localized in many production divisions.

In the matter of organizing the management accounting and the calculation of the production cost, through the off balance sheet method there will be presented the following case study.

5. The case study regarding the organization of costs calculation through the off balance sheet method

An entity gets two products A and B. The organizational structure is formed by: a productive center (production division), an auxiliary center (a maintenance and repairing workshop), an administration center and a sale center. The standard cost of the finite products were of 27.000 lei for A and 19.000 lei for B. The auxiliary division has worked 300 hours for production and 200 hours for distribution. The indirect costs divided considering the number of hours of direct labor, 350 hours for A and 250 hours for B. The administration and sale expenses are divided according to the effective cost of production. The production expenses are presented in the following table.

Table no. 1 Expenses elements -lei-
Source: prepared by author

Requirements: To be established **the effective cost of production and the total cost** using **the method of own technical and operative bookkeeping (the off balance sheet)**.

For solving there will be done the following **preliminary calculations**:

a. allotment of the auxiliary costs to the main centers:

- the allotment coefficient -k 922 :
Auxiliary

$$(k_{922}) = \frac{\text{Expenses}}{300 + 200} = \frac{5.000}{500} = 10$$

- the allotment of these for production, and for sale:

$$\text{Cauxprod.} := 300 \times 10 = 3.000 \text{ lei}$$

$$\text{Cauxdes.} := 200 \times 10 = 2.000 \text{ lei}$$

b. allotment of indirect costs on the products:

- the allotment coefficient -k 923 :
Indirect

$$(k_{923}) = \frac{\text{expenses}}{350 + 250} = \frac{16.000 + 3.000}{600}$$

$$k(923) = 31,666666$$

- allotment for each product:
 $Cir_a := 350 \times 31,666666 = 11.083lei$
 $Cir_b := 250 \times 31,666666 = 7.917lei$
- c. allotment of administration costs and sale of the products:
 - the allotment coefficient-k 924,925 :

$$(k_{924,925}) = \frac{6.000 + 10.000 + 2.000}{27.083 + 19.117}$$

$$(k_{924,925}) = 0,3896103$$

- allotment for each product:
 $Cra := 0,3896103 \times 27.083 = 10.552lei$
 $Crb := 0,3896103 \times 19.117 = 7.448lei$

d. The effective cost and the total cost will be determined according to the following table:

Table no. 2 Synoptic table of expenses -lei-

Expenses	Direct Costs		Auxiliary costs	Indirect costs	Administrative costs	Sale costs
	P1	P2				
Raw materials supplies	15000	10000	1000	2000	500	500
Power and water			2000	4000	1000	1000
Wages	1000	1200	1000		4000	2500
Amortization			1000	10000	500	5000
Advertising						1000
Total	16000	11200	5000	16000	6000	10000
Allotment of auxiliary expenses				3000		2000
Allotment of indirect expenses	11083	7917				
Effective cost	27083	19117				
Allotment of administrative/sale expenses	10552	7448				
Total cost	37635	26565				

Source: prepared by author

6. Conclusions

In what matters the organization of management accounting and the calculation of production cost there can be drawn the following conclusions:

- in terms of how management accounting is organized, only OMFP no. 1826/2003 offers specifications, among which: management accounting is organized by the

administrator of the legal person, either by using specific accounts or by developing accounts in financial accounting or using their operational and technical evidence (extra accounting);

- but for large firms, where direct and indirect costs are localized in several centers (departments) it is required the rational use of the new class of accounts, using computer software to facilitate work;
- in no accounting regulation mentioned, one finds rules of operation of management accounts, of the new class;
- also, in any mentioned accounting regulations there is no presentation of the adaptation of management accounting and accounts of the new class in production, trade and services;
- in all accounting regulations mentioned, one could not find in detail the methods of calculation, being listed only in the OMPF no. 1826/2003 (standard cost method, the method of controls, the phase method, the comprehensive method, direct costing method or other methods adopted by the legal person according to the organization of production, the specific activity, the characteristics and needs of the technological process);
- GO no. 37/2011 does not present further details on the organization and management of accounting management, but only increases the number of legal persons entitled to apply it;
- regardless the organization of management accounting, accounting or extra accounting, the manager must choose the most appropriate calculation method and system of organization, depending on: the type production, technological process, manufacturing classification, the objectives of management, business seasonality, production cycle, object of activity etc.;
- the lack of a rigorous cost calculation, regardless of its

organization, leads to a wrong setting of selling prices, with direct influence on profitability;

- using the accounts from the nine class is not mandatory, the costs calculation can be handled in the off balance sheet, with the help of Excel tables or with the cumulative documents;
- nevertheless the small and medium size entities can easily use the off balance sheet method, which has at its basis a table in which there are found the components of the production cost;
- the entities have advanced programs for costs calculation, without using the accounts from class 9, the calculation algorithm being the same, the spending elements being centralized with the help of tables (spending synoptic tables);
- in order to ensure the accuracy of the processed information there will be a confrontation with the expenses from the financial bookkeeping;
- this off balance sheet method of organizing the calculation is proper for small and middle-size entities, which do not have indirect costs localized in many production divisions.

The Contemporary Conditions, Limitations and Trends in Situations of Fragility for Romania

Oana-Ramona Lobont

West University of Timișoara, Faculty of Economics and Business Administration, Finance Department

oana.lobont@feaa.uvt.ro or lobont_oana@yahoo.com

Abstract

Situations of fragility, triggered by gaps and failures in governance, is both, an important obstacle in the way of a country sustainable development and to regional stability and international security, creating, also, security risks worldwide and uncontrolled migration flows. The socio-economic, environmental and political conditions that have arisen, as a consequence of UE integration for Romania, presents some major challenges to contemporary democracy, both in terms of how to structure institutional responses in ways that effectively deal with UE strategies, and how to include a variety of actors in decision making processes, as are enfranchising civil society and other non-state actors.

This paper try to provide a evaluations of contemporary conditions, qualities, and trends over time in the four fragility dimensions (political, security, economic and social) of societal-systems analysis for Romania, for 1995-2010 period, using five different fragility measurement indices.

Keywords: state fragility, fragility measurement indicators, Romania.

J.E.L. Classification: C82, E02, H12

1. Introduction

In many countries, with developing economies, fragility is a constant, because it has as a foundation societies structurally unstable, vulnerable to crises, external shocks, epidemics, drug trafficking, natural disasters or environmental degradation, societies in which cultural heritage and cultural diversity are endangered.

As the paper title implies, I consider that a

macro-comparative evaluations of contemporary conditions, qualities, and trends in Romania State Fragility need to be integrated into the making of public policy, both nationally and internationally level.

The concept of state fragility is related to the concept of security, in terms of conflict prevention and this phenomenon is specific to transition economies, over the last decade, mainly in integrating themselves into the world economy.

Of course, such an approach involves three core dimensions of societal-systems analysis: conflict, governance and development dimension, but, in this paper, I will summarize that analysis of national security level.

Following the introductory part, related literature was overviewed in the second part and the methodology, data and results were put forth in the third part and finally the findings were interpreted and a general review was made.

2. Theoretical background

Literature fails providing a unique and comprehensive definition of "state fragility". Failure, weakness and vulnerability have often been used as synonyms for state fragility, so, this concept has been associated with various combinations of dysfunctions, such as:

- inability to provide basic services;
- unstable and weak governance;
- a persistent condition of poverty;
- lack of territorial control, and
- high propensity to conflict and civil war.

Analyzing state fragility may consider both the determinants of state fragility and a short summary of the current fragility indices, with their limitations and delineates.

In an attempt to make the concept of

"fragile states" operational for development policy, Stewart and Brown (2009) [1], proposes a three-pronged definition of fragility: authority failure, service entitlement failure or legitimacy failure.

Similar definitions of "fragile states", or "fragility" can be seen in a lot of studies, reports or working papers made by international organizations or development agencies, but there are debates about the term's definition, accuracy, usefulness, and indicators.

A well known definition is that of the British Department for International Development, which defines fragile states as states in which the government is either unable or unwilling to deliver basic functions, such as service entitlements, justice and security, to the majority of its people, including the poor.

McLoughlin (2012) [2] presents a critical perspectives on the evolution and usage of terms used to describe and typologise "fragile states" as is the The Centre for Research on Inequality and Social Exclusion, definition: fragile states as "failing, or at risk of failing, with respect to authority, comprehensive service entitlements or legitimacy".

The World Bank uses the term "low-income countries under stress" (LICUS) as well as fragile states, and defines them as states characterised by a combination of weak governance, policies and institutions which undermine the state's capacity to deliver services, control corruption and provide for voice and accountability. They are also states at risk of conflict and instability.

The term "fragile states" has undergone conceptual interpretations and changes to avoid pejorative label it provide, such as, from the notion "fragile states" has been the notion "state fragility" or "situations of fragility".

Many question emerges about how far is it possible to define and measure a fragile states, and to distinguish between different types and processes of state fragility?

Both in the academic literature and in official documents five indices are recurrent, (Newman, 2009) [3] the Failed States Index, the Global Peace Index, the Human Development Index, the Index of State Weakness, and the State Fragility Index.

3. Methodology, data and results

So, there is already a policy framework to address various dimensions of fragility and to the diversity of its measurement indicators, which is why, it is necessary to specify some technical notes:

1. *The Failed States Index*, produced by The Fund for Peace in collaboration with the Foreign Policy Journal is a critical tool in highlighting not only the normal pressures that 177 states experience, but also in identifying when those pressures are pushing a state towards the brink of failure. *The Failed States Index* is rated on a 1 to 10 scale with 1 (low) being the most stable and 10 (high) being the most at-risk of collapse and violence, for 12 indicators: (i) *Mounting Demographic Pressures*, (ii) *Massive Movement of Refugees or Internally-Displaced Persons*, (iii) *Vengeance-Seeking Group Grievance*, (iv) *Chronic and Sustained Human Flight*, (v) *Uneven Economic Development*, (vi) *Poverty and Sharp or Severe Economic Decline*, (vii) *Legitimacy of the State*, (viii) *Progressive Deterioration of Public Services*, (ix) *Violation of Human Rights and Rule of Law*, (x) *Security Apparatus*, (xi) *Rise of Factionalized Elites*, (xii) *Intervention of External Actors*. Think of it as trying to bring down a fever, with high being dangerous and low being acceptable.

Table no. 1. *The Failed States Index for Romania in 2006-2011*

The Failed States Index for Romania	2006	2007	2008	2009	2010	2011
Demographic Pressures	6.5	5.5	5.3	5.6	5.4	5.1
Refugees and IDPs	3.9	3.8	3.5	3.4	3.2	3.2
Group Grievance	5.4	5.2	5.2	5.5	5.6	6.0
Human Flight	5.5	5.2	5.2	5.1	4.9	5.0
Uneven Development	6	6.1	6.1	5.8	5.6	5.8
Poverty and Decline	5.9	5.7	5.2	5.3	5.6	5.8
Legitimacy of the State	6.2	6.1	5.9	6.2	6	5.9
Public Services	5.3	5.2	5.2	5	4.8	4.5
Human Rights and Rule of Law	4.8	4.8	4.8	4.5	4.3	4.0
Security Apparatus	3.5	3.4	3.4	4.3	4.1	4.1
Factionalized Elites	4.1	4.5	4.7	5.1	5.2	5.2
External Intervention	5.5	5.4	5.4	5.5	5.5	5.2
TOTAL SCORE	62.6	60.9	59.9	61.3	60.2	59.8
RANK	102	126	128	129	128	126

Data from *The Fund for Peace*, available on line at <http://www.fundforpeace.org/global/>

2. *The Global Peace Index* is published by the Institute for Economics and Peace in collaboration with the International Institute for Strategic Studies, The World Bank,

various bits of the UN Institute of Peace and the Economist Intelligence Unit and an international team of academics and peace experts. The Global Peace Index supplies an overview of the trends in armed conflicts in 153 countries by measuring 23 macro-indicators, ranging from a nation's level of military expenditure to its relations with neighbouring countries and the level of respect for human rights and tries to measure peace or to rank countries around the world according to their peacefulness.

Table no. 2. The Global Peace Index for Romania in 2007-2011

The Global Peace Index for Romania	2007	2008	2009	2010	2011
TOTAL SCORE	1.682	1.611	1.591	1.749	1.74
RANK	26	24	31	45	40

Data from the Institute for Economics and Peace, available on line at <http://www.visionofhumanity.org/>

3. The Human Development Index is a composite statistic used to rank countries by level of "human development" developed by UN Development Programme (UNDP) since the beginning of the 1990s. The HDI aggregates the three principal health indicators, education indicators and income or living standard indicators. It measures the development of countries throughout the world, assessing a state's capacity to supply fundamental public goods or to distinguish whether a country is a developed, a developing or an under-developed country, and also to measure the impact of economic policies on quality of life.

Table no. 3. The Human Development Index for Romania in 2007-2011

The Human Development Index and its components for Romania	Dimensions	2006	2007	2008	2009	2010	2011
Life expectancy at birth	Health	72.700	73.000	73.300	73.500	73.800	74.000
Mean years of schooling	Education	10.200	10.300	10.300	10.400	10.400	10.400
Expected years of schooling		13.900	14.200	14.700	14.900	14.900	14.900
Gross National Income (GNI) per capita	Living standards	9.870	10.733	11.722	10.985	10.863	11.046

4. The Index of State Weakness in the Developing World was designed to provide

policy-makers and researchers with a credible tool for analyzing and understanding the world's most vulnerable countries. The Index considers four critical spheres: economic, political, security, and social welfare, based on 5 indicators in each basket. Taken together, the 20 indicators yield a balanced picture of how developing countries perform or fail to perform along multiple dimensions. Within each basket, the indicator scores are standardized and aggregated, creating individual indicator and basket scores ranging from 0.0 (worst) to 10.0 (best). The 4 basket scores are then averaged to obtain an overall score for state weakness, ranging from just above 0 to just short of a perfect 10, to produce a ranking of states on the basis of their relative weakness Rice and Patrick (2008) [4].

Table no. 4. The Index of State Weakness for Romania

The Index of State Weakness for Romania			
ECONOMIC BASKET	7.91	GNI per capita	4.38
		GDP Growth	4.50
		Income Inequality	8.92
		Inflation	6.20
		Regulatory Quality	7.45
POLITICAL BASKET	6.77	Government Effectiveness	6.23
		Rule of Law	6.45
		Voice and Accountability	7.74
		Control of Corruption	5.16
		Freedom	8.33
SECURITY BASKET	8.42	Conflict Intensity	10.00
		Gross Human Rights Abuses	6.39
		Territory Affected by Conflict	10.00
		Incidence of Coups	10.00
		Political Stability and Absence of Violence	7.06
SOCIAL WELFARE BASKET	8.54	Child Mortality	9.56
		Access to Improved Water and Sanitation	4.79
		Undernourishment	10.00
		Primary School Completion	9.93
		Life Expectancy	8.36
Overall Ranking			121
Overall Score			7.91

5. The State Fragility Index and Matrix, developed by Center for Systemic Peace in collaboration with Center for Global Policy covers 162 countries with populations greater

than 500,000 and it is based on four performance categories: conflict security, political governance, economic development and social development.

Table no. 5. The State Fragility Index and Matrix for Romania in 2006-2011

The State Fragility Index for Romania	2006	2007	2008	2009	2010
Effectiveness Score	2	1	1	1	1
Legitimacy Score	4	4	4	4	3
Security Effectiveness	0	0	0	0	0
Security Legitimacy	1	1	1	1	1
Political Effectiveness	0	0	0	0	0
Political Legitimacy	2	2	2	2	2
Economic Effectiveness	2	1	1	1	1
Economic Legitimacy	0	0	0	0	0
Social Effectiveness	0	0	0	0	0
Social Legitimacy	1	1	1	1	0
Region	5	5	5	5	5
TOTAL SCORE	6	5	5	5	4

Data from The Polity IV Project, available on line at <http://www.systemicpeace.org/polity/polity4.htm>

Of course, in agreement with Mata and Ziaja (2009) [5] it can identify other indicators that can measure a state fragility, including Country Indicators for Foreign Policy Fragility Index developed by Norman Paterson School of International Affairs (Carleton University), Peace and Conflict Instability Ledger developed by Center for International Development and Conflict Management (University of Maryland), Political Instability Index developed by Economist Intelligence Unit or World Governance Indicators, Political Stability and Absence of Violence developed by The World Bank Institute.

It should, therefore, choosing the most appropriate indices for a certain application, because any application, requires detailed awareness about an index's capability, so, it is important to make a distinction between intended and real usage of an index. The range of possible uses for fragility indices, mainly revolving around early warning and early action information, evaluation of interventions, policy guidance, public awareness, research or risk analysis.

4. Conclusions

A simple comparison of the rankings of Romania fragility, using different indices indicates some discrepancies. But, these results should not be surprising because, as evidenced by Mata and Ziaja (2009) [5], Fragility indices are used for different

purposes, by:

- development practitioners and government officials in order to guide future action and for investigating the dynamics of state fragility;
- researchers to investigate causes and consequences of state fragility;
- media and the public to keep track of risks to human wellbeing;
- international organizations to monitor larger trends of global political stability and for determining which countries need a different aid approach.

Over time The European Union has criticized Romania for failing to reform their courts, reduce corruption and fight organized crime. But more serious is that Romania's government collapsed this days, following weeks of protests against austerity measures. I suspect that protests and civil unrest in Romania and in Europe also, will be factors in the actual rise of fragility.

iulia.s.lupu@gmail.com

Abstract

Information is an essential element of the transactions and financial markets, but it can access various forms (usually named soft and hard information). The new technologies modify the pattern of communications and thus substantially changing the performance of the markets and financial institutions. The financial institution that provides credit used to obtain the soft information only if the hard information generates contradictory signals or if it is difficult to apprehend. One of the great advantages of hard information is the reduction of trading costs by using less specialized employees or computers. When soft information is substituted with hard data, appear a concentration, the loss of information being imminent. The question that arises is how much information is lost and what is their quality. Dependence of investment decisions of the others' is often why stock market problems appear.

Keywords: soft and hard information, financial markets

JEL Classification: E61, F36

1. Introduction

For financial markets and financial institutions the action of collecting, processing, and transmitting information is one of the main goals. This primary component of the transactions and financial markets can access various forms.

Hard information is quantitative, simple to store and to communicate, and usually their content is independent of the gathering procedure. Soft information is considered information that is difficult to centralized and expressed numerically. Frequently, the soft information is often sent forward in script format and may include opinions, ideas, predictions of economic development, plans

of managers and market reactions [1]. Eventually, the soft information can be also stored, interpreted and converted into a numerical code. The problem lie in how much original information may be lost through this process, at what expenses and how useful it can be.

Ultimate for information transmission is its meaning that can be independent of person or collection method. According with Kirschenheiter (2004), hard information is when everyone agrees on its meaning. Honest disagreements arise when two people perfectly observe information yet interpret this information differently (i.e. soft information) [2]. The type of information is fundamental in economic research because it helps to understand markets and institutional design.

Because the soft information is difficult to capture, there are more sources of hard information in use.

The type of information affects the quality of financial reporting that further influences the cost of equity capital for firms. In the economic literature there are studies (for example the works of Amihud and Mendelson (1986) and Easley and O'Hara (2004)) that suggest the fact that, increasing the quality of financial information reduces the information asymmetries and hence lowers the cost of capital [3,4]. Botosan (1997) documents a negative association between the cost of equity and voluntary disclosure level for firms with a low analyst following and no association between these variables for firms with a high analyst following [5]. In addition to Botosan (1997), Botosan and Plumplee (2002) address another question: Does type of disclosure matter? The answer is clear and starkly – the type of disclosure is critical [6].

Cohen (2006) demonstrated that there is a positive relation between investors' enquiry for some specific information and the quality of financial reporting. This is his answer to

the question: *does information risk really matter?* [7]

2. The Role of New Technologies

The new technologies modify the pattern of communications and thus substantially changing the performance of the markets and financial institutions, these being skilled in transmitting and processing information that are reduced to numbers. One of these changes is, therefore, an increase confidence in the hard information in the disadvantage of the soft information, the first one being more used in the financial transactions.

In the last years the society is faced with other problem – the abundance of information, partly as a reaction to an easy access to storage. But information growth can increase the difficulty of data management and data protection. An increased storage space, as a result of technology evolution, can encourage data redundancy.

3. The Analysis of Hard and Soft Information

The transformation of the banking system in the last decades was partly driven by different types of information used for lending decisions. On the other hand, in the last decades, the firms developed from small family business to large corporations. This change influences both, the entities that collect the information and the entities that are investigated.

Banks have been created along time deposits of information about credited institutions. This information was first collected by frequent personal contact, so that in time banks assembled more detailed images than what was available in public records.

The empirical studies support the idea that the large banks are more impersonal and less efficient at making relationship loans and growing bank size may lead to credit rationing.

Because banks were focused on those who were most difficult to observe and monitor (e.g. SMEs), most of the information that was collected was soft information. With technological advances and increased pressure from competitors (which led to cost

reduction), increased the use of hard information. The utilization of hard information brings smaller transaction costs, access to a broader market and also assures the lasting of information.

Soft information (Stein - 2002) is difficult to record [8]. Registration cost is very high. The financial institution that provides credit used to obtain the soft information only if the hard information generates contradictory signals or if it is difficult to apprehend. If the loans are securitized the lender is the investor in a security, represented by a portfolio of borrowers. Since soft information cannot be verified by an independent observer, it may not be claimed by the creditor investor. Therefore, the price they gave it to financial instruments (securitized loans) depends only on hard information. This creates a problem of moral hazard for creditor investor.

One of the great advantages of hard information is the reduction of trading costs by using less specialized employees or computers. Hard information is more conventional; it reached the same configuration and is processed in the same way for each application or transaction. This standardization produces savings in the production process through economies of scale.

Once the computer system is designed to provide credit scores, the added cost of new applications in the system is insignificant. This is one argument why loans based on hard information have become preponderant. The increased use of this information in the crediting process can lead to an increased competitiveness of these markets. First, the standardization of information and thereby the reduction of trading costs can increase the market size. The volume of consumer loans and loans granted too small companies is not high and therefore, the existence of high fixed costs may make these loans very expensive. The standardization of information through automation can reduce transaction costs enough to make these loans profitable.

Mortgage loans and credit cards (initially called credits by signature) were made in the 50s based on soft information obtained through personal contact, as then it was a local market. Now it became a national market based on hard information, often obtained through impersonal contact. This

led to a greater availability and undisputed cheaper capital for the middle class (Nocera - 1994) [9].

The quality of information can increase the market competitiveness. Once that information is systematic and easy to propagate (*hard* information), it becomes very difficult to master. In the early emergence of rating agencies, they published in their quarterly reports just a summary of the information they had about the institutions requiring credit. Quantitative information was made public and easily comparable. Those who needed detailed reports on some customers bought them. By keeping information in a way difficult to transmit and maintain the quality of soft information, the rating agencies hoped to maintain the control of them and thus obtain higher revenue from collected information.

Once that information is hard, its transmission and estimating become easier. The electronic information can be easily understood and transmitted, independent of its collector.

The information's durability is also higher when the information is hard. The fact that it can be easily stored means that its preservation for future decision is made at low cost. The fact that information can be read out of context means that it can be transmitted to people working in different parts of the organization (Stein - 2002) [8].

One reason for the lower cost of delivering hard information is that there is less information. Replacing soft with hard information inevitably results in loss of information.

The constriction of information is not desirable, mainly when there are no processing costs. Most of the soft information is obtained from lengthy discussion with the person who takes the credit. In reality, persons that are lender or are working in the risk management department have allocated a limited time for each decision. Thus, to prevent an information overload, it is necessary to reduce them to what is most important. As the organization is greater and the more we advance in the hierarchy, the more the information must be better concentrated (or decisions should be delegated).

When soft information is substituted with hard data, appear a concentration, the loss of

information being imminent. The question that arises is how much information is lost and what is their quality. The concern emerge for small companies and individuals under the increasing consolidation of banking and increasing of credit decisions based on scores for credit granting. There may be very good company but they can look bad on paper (when we look only at hard information), and they are being denied from credit.

Empirical evidence so far is mixed. It is clear that many small companies are abandoned when their banks merge, but also new small banks can cover this gap.

Rajan, Seru and Vig (2008) have shown that a model to estimate the probability of bankruptcy has been calibrated for a period with a securitization regime at a small scale, will underestimate the probability of bankruptcy in a period of massive securitization. Therefore, models used by S & P, Moody's and Fitch do not account for a variable that proved to be important - the extent of securitization phenomenon. In a market with small scale securitization developments we do not have the same type as on the market with "massive" securitization. Their study concludes with the proposal of another model, another vision of how the market progress and demonstrate the fallibility of the current models. It's not a condemnation of mathematical models but a widening of their application framework by including a broader range of variables [10].

Often, investors' losses on stock markets appear because their decisions are subjective and influenced. One of the common errors made by investors everywhere is about the fact that their investment decisions are the result of the herd effect; their decisions are similar to each other. Dependence of investment decisions of the others' is often why stock market problems appear. So, often, investors cease to invest according to their own strategies based on evidence and accurate and prefer to follow the path imposed by other investors. According to behavioural finance, the more an investor knows less the more easily it is affected by group mentality. The investors are more ignorant, the faster fall in panic, creating the premises of real stock collapse.

Looking at the role of soft and hard information in bank-firm relationships, Fredrikson (2012) argues that an information

deficit of hard information regarding a firm’s reporting conservatism is balanced with soft information obtained by using relationship lending technology [11].

4. A Final Remark

On the financial markets, the price of assets is driven by various factors that are simple and correct transformed in some numeric codes. We can say that the market convert the soft information in hard information which actually is the assets’ price. Unfortunately, the academic research is still looking for a way riddle this issue.

The Usefulness of Mathematical Tools for Economic Analysis

Lupu Radu

Academy of Economic Studies, Bucharest
radu.lupu@rei.ase.ro

Abstract

The current financial crisis generated a large debate for the degree to which the mathematical models are relevant for decision making in business and macroeconomic analysis. Instruments like Value-at-Risk, Copula functions and regressions were almost “negotiated” in the non-specialized literature.

The use of the mathematical tools in the economics profession and research probably started with the creation of the Econometrics Society in the 1930s and the foundation of the journal Econometrica, which, according to ISI Thomson Relative Influence Score, is the most prestigious journal in the field of Applied Mathematics.

This paper takes into account the ideas of normal distributions and the concepts of regression and factor analysis to present the way in which these mathematical models succeeded to create new ways of development in the field of economics.

Keywords: mathematical models, normal distribution, regression analysis, factor analysis

J.E.L. codes: A12, C10, C20

1. Introduction

The current financial crisis generated a large debate for the degree to which the mathematical models are relevant for decision making in business and macroeconomic analysis. Instruments like Value-at-Risk, Copula functions and regressions were almost “negotiated” in the non-specialized literature.

Some theoretical trends in economics are trying to provide arguments against the use of the mathematical tools in decision making at the micro and macroeconomic levels. However, the main research literature

provides powerful support of these instruments and document all the research questions by using the standard regression-like approaches.

The use of the mathematical tools in the economics profession and research probably started with the creation of the Econometrics Society in the 1930s and the foundation of the journal Econometrica, which, according to ISI Thomson Relative Influence Score, is the most prestigious journal in the field of Applied Mathematics.

This Society was founded as a result of the initiatives of Irwin Fisher and and Ragnar Frisch and the journal Econometrica was issued for the first time in 1933. Since then, the products created in this journal and others developed in the field of quantitative economics developed the tools that economists need in order to make better decisions and to better understand the complexity of the factors that characterize this sophisticated system.

This paper takes into account the ideas of normal distributions and the concepts of regression and factor analysis to present the way in which these mathematical models succeeded to create new ways of development in the field of economics.

There are a few ideas that are presented: the fact that mathematical tools are in continuous development both in the mathematical disciplines and in economics, the constant treatment of the non-normal phenomena that are studied in the main economic analyses and the way in which a very simple model, like for instance the regression analysis, may induce new paradigm in the interpretation of the economic phenomena.

The arguments presented in this paper are meant to support the use of mathematical tools in economics and defend from the critiques of the “heat” of the moment.

2. The constant development of mathematical tools

Following the important stream that supported the use of mathematical models for decision making at the macroeconomic level, an important migration of mathematicians and physicists was felt in the second half of the last century. In my opinion there were two arguments for that: the availability of the data and the importance of prediction.

The main tools used for the economic analysis of the data started with the use of the instruments created under the framework of time series analysis. In a nutshell, this means the use of statistical tools for the characterization of variables that change with time. In time the data started to be available, first at the macroeconomic level and after that at the microeconomic one. The concept that "history repeats" was at the root of all these developments. However, since everybody needed good tools for decision making, the very idea of the way in which the fact that history repeats can allow us to make conjectures about the future was conceptualized. Therefore, ideas like ergodicity and stationarity gained momentum and their introduction in the set of assumptions started to be considered part of any standardized procedure.

The system that is stationary is a system that has stable properties and therefore at any moment in time these properties are found again and again. If this happens then we can provide information about the probabilistic behaviour of any stochastic variable. On the other hand, an ergodic variable is the one for which the properties in a sample are the same as the properties of all the population of possible realizations of the variable. This means, in a common language, that on average, the variable follows a certain track for a large period of time and for any sample it has properties that are found in any other sample.

There are tools for the analysis of these properties. As we know, econometricians develop statistical tests that may provide us with information about the fulfilment of each of these two properties. They are important because any statistical conjecture that may be formulated on time series data relies on the accomplishment of these two important properties. Actually, in case they are not

fulfilled the statistical results of any kind of analysis are false and therefore, have no economic value.

The use of this kind of analysis for all studies in economics is now a standard and it is mentioned in any book of econometrics. However the test for these properties evolved in time. The standard Dickey-Fuller test for stationarity was developed in 1979, but the standard statistical nowadays use the Augmented Dickey-Fuller test, which has been developed further on in paper in the 1980s and 1990s. The Phillips-Peron test, which also provides information about the stationarity of a time series, was developed in 1988. There are, of course other tests of stationarity that were developed after these moments. In many instances econometricians showed that the standard Augmented Dickey-Fuller test performs better in finite samples than many other tests.

This is a very simple proof of the fact that the mathematical tools are developing as time passes into more and more complex instruments that allow for better approaches to the analysis of these matters.

There are many examples of the development of these tools for economic analysis. The mathematical models are not only mere applications of mathematical tools, i.e. instruments that were previously created in mathematics, but actually a standalone discipline with the objective to create better tools needed in the process of a better understanding of the economic phenomena and useful to support the theories formulated by economists. The field of mathematical finance, for instance, is one example for this stream of arguments. On one hand it produces mathematical models in support of financial theories and asset pricing (the field of stochastic processes initiated by Merton and Black and Scholes) and on the other hand it provides instruments for the empirical analysis and measurement of the economic phenomena, useful in the area of risk management.

The creation of knowledge in this area started with a simple approximation of the reality under the form of the assumption that the central forces that generate the dynamics of prices in the market are the result of many pieces of information that impact these prices and generate the random perspective that can be observed in general, irrespective of region,

industry or cultural settings. This is translated in the assumption that the returns are normally distributed. However, since the introduction of this assumption in the finance theory, the main work realized in research dealt with the efforts to understand the errors of this approach and generate better assumptions for the characterization of the data.

Another important approach is the development of the Bayesian framework of analysis. In this respect there is need to mention the fact that this field is continuously developing and it generates a higher level of sophistication that is founded by the mainstream research results. For instance, the Capital Asset Pricing Model developed by Sharpe and Litner in 1964 is based on the Markowitz model of 1952 and is developed further by the model of Black and Litterman in 1990 in a Bayesian framework. The model turns out to have the roots in the classical CAPM model but it extends the approach further on by generating a powerful and sometimes better (i.e. supported by empirical analyses) instruments.

We should consider this stream of research as being an important proof of the fact that the research literature does not stand still. It produces new results in a continuous manner.

Therefore, the plain argument that the mathematical tools are not to be used by economists does not stand since the mathematical tools are in a continuous development. If we say that both the methods developed until now and the methods that will be developed further on are of no use then we actually disregard the progress realized until now in this field and disconsider the work of many researchers that provided tools that are used both by macroeconomists and by the entrepreneurs, since they are willing to pay for this type of research, either by hiring specialists or by contracting consulting companies able to produce such analysis (the RiskMetrics company is merely one of the many such entrepreneurs).

3. The normal distribution – a simple assumption

As mentioned before, the normal distribution is a simple tool situated at the root of most of the economic analysis in the

mainstream approach. As we know, the use of this assumption is motivated by the fact that the dynamics of economic variables are the result of news appearing in the market. As such, the Law of Large Numbers shows that if the realizations of a certain variable are independent and drawn from the same distribution, then the random variable migrates asymptotically towards the normal distribution. This is actually the result of news that are influencing the values of the economic variable to go up and down according to the opinions of market participants with respect to the quality of the news.

This approach was first used by Bachelier in 1900 to generate the first asset pricing model. He considered the market price of a financial instrument to behave like a simple random variable for which the changes in the value are determined by numerous small impacts of both positive and negative signs and with various intensities. The approach is a simple extension of the physical model developed by Einstein in 1905 for the characterization of molecules that are impacting a small particle in a glass of water, according to the observations made by the botanist Robert Brown. This generated the mathematical model called the brownian motion or the simple normal diffusion process. The importance of this model for mathematical finance is extraordinary due to the fact that it introduces the possibility to characterize the economic variables by simply assuming that the factors that are influencing a variable are many, of different intensities and with different signs.

The normal distribution assumption was invalidated shortly after it was used by the Black and Scholes on one hand and Merton on the other hand. Their papers were published in 1973, but in 1976 we already witnessed the introduction of the diffusion with jumps. This is a simple model that takes into account one of the most important properties that were empirically observed in the dynamics of the returns of financial instruments – the “fat tails” effect.

Even though the normal distribution was used in his model, Merton knew that the normal distribution is the one that governs the behaviour of returns on the financial markets. Empirical evidence, acknowledged from the 1970s until the 2000s

showed that the stock market returns are not normally distributed. Cont provides important evidence in this field in a paper in year 2000. He collects all the statistical properties of the returns and call them “stylized facts”, showing that they can be found in almost all financial instruments irrespective of nature (equity, debt or foreign exchange), region, industry or national culture. Maybe there are differences in their intensities that may also change in time, but for sure they are present more in a subjective manner.

The “fat tails” effect mentions the fact that the stock market returns have higher frequencies of appearance than predicted by the normal distribution. It is a way of saying that the normal distribution underestimates the magnitude of the returns when they are very large both in the negative and the positive directions.

The very early approach to this observation was done by Merton in the jump-diffusion model but a later paradigm was generated by the GARCH (Generalized AutoRegression Conditional Heteroskedasticity) family of models in the 1980s. This is a further proof of the fact that these models are not the same as the mathematical models created at the beginning of the last century and also of the fact that there is a great deal of research in the field of relaxing the normal distribution assumption.

For instance the Value-at-Risk indicator that is used as a standard foundation for the computation of the amount of capital to leave in a current account to cover for potential losses, may be easily computed under the framework of the normal distribution but it is far more sophisticated in case we decide to compute it in a non-normal framework. In case a company decides to use the normal distribution manner of computation, then the results can be devastating in case we have a -23 sigma event (i.e. an event that is basically impossible under the normal distribution but which can be observed in the market in case of a crash similar to the one from October 1987 or the one on September 2008). We can not predict such events as they are generated by uncertain phenomena, but the risk management discipline teaches us that we can protect ourselves against them by using the correct mathematical tool for the

computation of the capital needed as a provision.

The constant focus of the literature in the field of mathematical finance to generate better instruments borrowed from mathematics or physics and adapted to finance is more than obvious. Actually all the researchers are basing their analysis on the previous works of other analysts and they made clear efforts to provide better tools.

4. The regression paradigm

The regression is probably the mostly used instrument in the field of economics. It is now considered a basic tool that is present in all the books of econometrics in their first pages. The regression is part of many analyses from the empirical use of the CAPM and APT (Arbitrage Pricing Theory) models to more sophisticated uses like the Altman model which provides the rating grade for a company in the attempt to measure the risk of default and the computation of the hedge ratio in the field of derivatives.

The regression generated a new way of understanding the economic realities. Trying to find the factors that are influencing the dynamics of a certain economic variable, we can assume the fact that this variable is determined by some (usually few) factors that may be more important and by many others that are numerous, have small impact and manifest both positive and negative effects on the respective variable. This produces the phenomenon of compensations that are common in the impact of factors on the dynamics of the economic variables in general. According to a standardized statistical result, these compensations converge asymptotically to the normal distribution, which is a mathematical tool that we can easily understand.

Starting with the use of regression, we can base all the analyses realized in economics by the fact that the random variables are influenced by some factors and, if we can identify these factors, then we can explain part of the behavior since the rest of the variation of the respective random economic variable is characterized by the normal distribution because each of the rest of the factors have the tendency to influence the variable in a lower extent.

This made way for a better approach to

analyze the behaviour of random economic variables. If we understand that each of these variables may be the result of some other factors then we can find their implications and we may determine the economic forces that are generating these dynamics. The paradigm of factor decomposition is not supported by any other approach and it is suitable for the statistical techniques developed in mathematical finance.

5. Conclusions

If there is a problem in the use of mathematics it is actually in the fact that the people using these tools are not using the correct ones. The history of the use of mathematical tools for economic issues shows a great deal of efforts in the direction of the development of better instruments that cover a wider set of possibilities and that relax the set of assumptions. The mathematical construction of any kind of argument is a powerful one and relies in the field of logic. If there is a problem in the reasoning then this problem is necessarily a break in the logic.

The Impact of IFRS Conversion in the Romanian Banking System

Matei Simona Elena
Academy of Economic Studies Bucharest
Matei.Simona@yahoo.com

Abstract

Globally, the recession has forced an important rethink on the banking industry, with banks having to reconsider the fundamentals of their ways of doing business. This is all the more so, given the high profile bank failures in 2008, and the subsequent negative publicity as governments were forced to intervene to protect the sector from collapse. But, currently, they face a challenging future due to the fact that National Bank of Romania (“NBR”) and the Ministry of Public Finance committed to adopting the legal framework necessary for the implementation of IFRS by Romanian banks starting with the financial year ending 31 December 2012.

Key words: banking, conversion, IFRSs, loans, provisions.

J.E.L. Classification: G21

1. Introduction

The objectives of the present paper are to identify the most important accounting change impacts on business processes, systems and data resulted from the IFRS conversion of Romanian Banking System starting with 1st January 2012.

National Bank of Romania issued the Order 27/ 2010 “Accounting regulations in accordance to international reporting standards for credit institutions” and a new IFRS chart of accounts.

Romanian banks will need to adapt to the new legislation, and therefore to commit significant capital and human resources for this purpose. Introduction of global standards will help many banks to make savings and

Improve the efficiency of the finance function.

Many developed countries, including the European Union and Australia implemented

IFRS in 2005. This was a big step which involved many challenges, but it has also brought significant benefits on the long run.

2. Content

The first difference between IFRS and the local reporting standards is that the IFRS includes a conceptual framework. The principles set out in this framework provide a basis for setting accounting standards, and a point of reference for the preparation of financial information where no specific guidance exists.

Under IFRS, financial information must possess certain characteristics for it to be useful. The IFRS Framework requires that financial information should be understandable, relevant, reliable and comparable.

Romanian GAAP information disclosed in financial statements must be understandable, reliable, and comparable and is considered from the viewpoint of materiality (comparable to IFRS). A general rule applies that entities are required to maintain their accounting records correctly, completely, conclusively, understandably, in a clear format and in a manner ensuring permanence of accounting records.

3. Amortized cost valuation

Under IAS 39 loans are carried at amortized cost with the use of effective interest rate, the method not used under RAS by the Banks, where the commission are deferred mainly using the linear method.

In accordance with par. 9 of IAS 39 the amortized cost of a financial asset or liability is the value of the asset or liability measured at initial recognition minus principal repayments plus or minus cumulative amortization using the effective interest rate method of any difference between the initial amount and the maturity amount and minus

any reduction (directly or through the use of an allowance account) for impairment and uncollectibility.

Therefore, to determine the amortised cost of a financial asset or liability (or a group of financial assets or liabilities) and allocating the interest income or expense to appropriate periods it is necessary to use the effective interest rate method.

The effective interest rate is the rate which discounts exactly the estimated future cash flows or payments made in the expected period to maturity of a given financial instrument and in justified instances in shorter periods – to the net carrying amount of a financial asset or liability. Calculating the effective interest rate requires the Bank to estimate the future cash flows, accounting not only for interest and principal payments but also for all commission received and paid which in accordance with IAS 18 constitute an integral part of the effective interest rate, transaction costs, premium or discount and other cash flows resulting from the provisions of the financial instrument contract, including advances, call options etc. Future cash flows should not, however, take into consideration potential future losses related to the uncollectibility of loans.

In order to comply with IFRS requirements, the banks should first revise their accounting policies with a change in the method of loans valuation, including the description of effective interest rate calculation algorithms and the list of commission, if any, to be included in the effective interest rate.

Upon conversion, the Bank should produce a complete list of loan related commission income together and decide for each item on the appropriate accounting treatment under IFRS.

Also, the banks should update accounting the monographs with respect to booking of commission amortization but also to revise their internal chart of accounts from internal systems, in order to include new accounts for booking deferred commission.

4. Impairment model

IAS 39 contains specific requirements for impairment of financial assets. The basis of the measurement of the loans is the present value of the future cash flows expected to be

generated by the loans. Under RAS the Banks used to apply to loans prescribed coefficients in order to calculate provisions.

The Banks needs to adjust the accounting policy with respect to impairment rules as defined by IAS 39. It is recommended that the general accounting approach is described in the accounting manual.

Chart of accounts should also be revised to include new accounts for booking impairment allowances.

5. Unwinding interest

IAS 39 requires recognition of interest income on impaired loans calculated with the use of effective interest rate on the net exposure; under RAS the Banks stops accruing interest income on loans 180 days past due and for loans below 180 days past due interest income is accrued but provisioned with the use of the same coefficients used for provision calculation.

In this respect, new accounting policies with related to recognizing interest income on impaired loans need to be revised.

6. Write-offs for loans

Under IAS 39 the assets can be written off only if they meet the derecognition criteria as specified by IAS 39 or the asset does not meet the definition of an asset anymore i.e. it is not probable that future economic benefits will flow to the entity.

Although the current treatment of the Banks with respect to writing-off loans falls within the derecognition criteria of IAS 39 (as RAS rules are more strict than IFRS), it is recommended that the Banks revises their approaches and updates the accounting policies accordingly.

Establishing criteria for write-off should be aligned with the development of impairment methodology and should take into account the current collection process.

7. Disclosures

IFRS contain broader disclosure requirements relating to financial assets than RAS.

Therefore, disclosures relating to loans and loan impairment need revision compared

to the prior years financial statements. Also the changes in the IT systems will have an impact on the source data for disclosures.

8. Accounting for AFS revaluation

Under IAS 39 any gain or loss on AFS (available for sales financial instruments) shall be recognized in other comprehensive income except for impairment losses, interest accrued and foreign exchange gains and losses on monetary assets. Under RAS unfavorable differences to fair value are recognized in the current profit and loss account, while favorable differences to fair value are not recognized.

Accounting policies with respect to revaluation of AFS securities to fair value need revision, so that gains and losses from revaluation are recognized against other comprehensive income and accrued interest, FX differences on debt securities and impairment losses are recognized through profit and loss account.

9. Fair valuation of debt securities

IFRS contain guidance on the fair valuation, including the following: if the market for a financial instrument is not active, an entity establishes fair value by using a valuation technique; if there is a valuation technique commonly used by market participants to price the instrument and that technique has been demonstrated to provide reliable estimates of prices obtained in actual market transactions, the entity uses that technique.

In order to implement this requirement, a new process of assessing whether the market for securities is active or not active needs to be put in place in the banks. . According to IAS 39 published price quotations in an active market are the best evidence of fair value , therefore it is recommended to be used directly market quotations based on an established procedure e.g. market prices are taken directly from the source (e.g. Bloomberg, Reuters) at a certain hour on the last day of the month. Documentation of this procedure needs to be established e.g. archiving print-screens from the source of market quotations.

10. Embedded derivatives

Under IFRS an embedded derivative should be separated from the host contract and accounted for as a derivative. RAS does not mention embedded derivatives. There might be differences in interpretation whether there is or not a financial instrument with embedded derivative.

The solution would be to design and implement a documented process for embedded derivatives identification. Verification of the existence of embedded derivatives should be performed when a new product is offered to clients, through a review of the implications of contract clauses.

Upon conversion to IFRS for statutory purposes the Banks might also reviews existing contracts (financial instruments and non-financial contracts) in order to identify any existing embedded derivatives.

11. Fixed and intangible assets

Moment of starting the depreciation under IFRS shall begin when the asset is available for use, i.e. when it is in the location and condition necessary for it to be capable of operating in the manner intended by management; under RAS the practice is to start depreciation in the month following bringing the asset into use.

Impairment under IAS 36 requires assessing at each end of the reporting period whether there is any indication that an asset may be impaired. If any such indication exists the entity shall estimate the recoverable amount of the assets. IAS 36 defines to thresholds for the impairment test (recoverable amount and value in use) which is distinct to the RAS requirements.

Bank may prepare a procedure for impairment testing under IAS 36, containing a documented assessment at each balance sheet date whether there are any indications of impairment and carrying out impairment test if there are such indications. E.g. a decline in the value of market prices of property could be defined as an indicator for carrying out impairment tests on property.

Useful lives under IFRS are strictly defined as are currently under Romanian legislation. Therefore, the banks should review the amortization rates to ensure that they follow the expected useful economic

lives of the assets. Specifically if there are assets which are fully depreciated and still in use it may suggest that the depreciation rates applied are too high.

Residual value – under IAS 16 depreciable amount (i.e. the amount actually charged to profit or loss over the life of the asset) is calculated by deducting the residual value from the cost or valuation of the asset. IFRS also state that an entity must review the residual values of all its items, and therefore all parts of them, at least at each financial year-end. Upon conversion to IFRS for statutory purposes it is recommended that the Banks review existing fixed assets in order to verify their residual value and if applicable, introduces these values in the fixed asset register. Also, a new process should be put in place of documented assessment at each financial year-end whether there are any changes to the residual value of fixed assets.

12. Deferred tax

Under IFRS, for temporary differences, differences between the carrying amount of an asset or liability in the balance sheet and its tax base the entity should create deferred tax asset or liability, while under RAS deferred tax is not recognized.

Additionally, IAS 12 restricts the recognition of deferred tax assets to the extent that it is probable that taxable profit will be available against which the underlying deductible temporary differences can be utilized.

IAS 12 also requires a disclosure on the reconciliation of the nominal tax rate and effective tax rate.

In order to adapt to the change above, the Banks may prepare a pre-defined schedule for the calculation of deferred tax assets and liabilities, which should include for each item of the Bank's balance sheet a comparison of the carrying amounts with their tax base with the reconciliations of these amounts to the accounting and tax records. In addition, as a control procedure and for the purpose of preparing the required disclosure in the financial statements, there should be a procedure implemented of reconciliation of effective tax rate to nominal tax rate

13. Definition of IAS 24 and scope of related party disclosure

While IAS 24 has specific guidance about when a person/ company should be recognized as a related party, RAS has no guidance related to this; disclosure scope is also different. I point out that close family of key management and companies controlled by banks should be identified as related parties. The related parties disclosure note to financial statements under IFRS should include in particular the presentation of the amount of the transactions e.g. the volume of loans granted to related parties or the volume of deposits received from related parties during the reporting period (not only outstanding at the balance sheet date as presented in the previous financial statements) and disclosing the fact whether these transactions are secured (if applicable); the presentation of guarantees given or received; describing the terms and conditions of the main related parties transactions.

Presentation of the balance sheet, profit and loss account and the statement of other comprehensive income – IFRS contain specific requirements to the presentation or the main statements which is different to RAS.

The main points to be taken into account are, among others: presentation of the balance sheet should be made in order of liquidity (improvements to the previous presentation in the IFRS financial statements recommended); separate presentation of assets/ liabilities arising on derivatives and current tax receivable/ liability; Interest accrued and EIR adjustments presented together with the related assets/ liabilities carried at amortized cost; No items of income and expense are presented as “extraordinary”.

14. Conclusion

The papers aim is to outline some of the main changes brought by the IFRS conversion taking place in the Romanian banking system.

These changes are significant, and the best way to reduce the burden of implementation and gain the most benefits is to act early and to perform periodically testing procedures. The convergence of IFRS is currently implemented in most of the banks.

Virtualisation the Accounting Information System Infrastructure

Mihalache D. Arsenie-Samoil

*"Alexandru Ioan Cuza" University - Iași, România - Faculty of Economics and Business
Administration - Doctoral School of Economics
arsenie_samoil@yahoo.com*

Abstract

Cloud Computing is a form of globalising IT&C services and represents one of the main solutions to the current issues of global economy with a view to cutting operational costs and focusing on IT&C services in several global conglomerates. Cloud solutions save companies costs on servers, licences, software, hosting, collocation, maintenance, highly specialised technical personnel, updating and upgrading of all kinds, by using a single service. This paper aims at presenting the current issues of increasing the efficiency of the computing system infrastructure which assists the accounting of companies. We have analysed aspects related to concepts such as Cloud Computing, Infrastructure as a Service (IaaS) and Virtualisation. Moreover, the essential features, the models associated to the cloud computing concept are highlighted as well as the advantages of the virtualisation of the accounting information system infrastructure.

Cuvinte cheie: Cloud Computing, IaaS, PaaS, SaaS, Virtualisation

1. Introduction

Recession starting in 2008 has determined companies to face pressure related to making costs more efficient. Such companies understood that Cloud Computing technology brings along flexibility, scalability, and a significant reduction of operational costs. Along with Cloud Computing, virtualisation represents a technique to create a virtual version of the features of a computer, such as its hardware components, the operating system, the storage environment, etc.

Therefore, companies are no longer interested in purchasing licences, hiring specialised personnel, in their hardware redemption, maintenance, and upgrading. Motivation to purchase IT&C solutions is increasingly dependent on cutting costs, the infrastructure security, and efficient management of resources. Many companies are sensitive to security needs, confidentiality, and selective access. There is an increasing number of companies with employees working from remote locations or who are travelling, or sub-contracting companies. In both cases, the need for security and confidentiality is an absolute priority. Therefore, the lines below deal with the concepts of Cloud Computing and Virtualisation and their impact on the accounting information system infrastructure.

2. Cloud computing

Cloud Computing System is a solution to using external computing resources, which can be configured to meet the customer's needs: servers, storage space, applications, and services. Cloud can be used on demand and in elastic quantities. Cloud Computing System represents a model of on-line service and application supply and does not require own infrastructure or software licenses, such resources being accessed via the Internet from a simple terminal or by means of mobile devices. AppNor definition [08]

The United States National Institute for Standards and Technology (NIST), an authority in the field, defines cloud computing as a model of access services via network (Internet) to distributed computing resource systems that can be configured on demand (servers, storage space, applications, and services). Such systems can be made quickly available requiring minimum management and intervention efforts from both the customer and the provider. Access is

convenient and can be made from anywhere and the user does not need to know the location or configuration of the systems supplying such services. Or more simply expressed, applications and data run and are stored elsewhere than the servers of the user who can have remote access to them (e.g., via the Internet but not necessarily). [07]

The essential features of Cloud Computing System:

- Resources are available on demand. A consumer can secured unilaterally computing capacities such as server-time and storage capacities (e.g., network storage), according to their needs, automatically, not having to conduct human interaction with each of the services providers;
- Access to broad band network. Capacities are available in the network and accessed via some standard mechanisms, which promote the use of a heterogeneous platform (i.e., mobile phones, laptops, iPads or work stations);
- Resources are shared. The computing provider’s resources (i.e., network storage, processing capacities, memory, and network band) are reunited to serve more consumers by means of a multi-tenant model (i.e., more so-called tenants), with different physical and virtual resources dynamically assigned according to the consumers’ demand. The term of independence of location where resources are available is introduced;
- Elasticity / Scalability. Capacities are “elastic” in order to secure a fast scaling “upward” or “downward” according to the demand of resources. To the consumer, the available computing capacity seems to be unlimited and can be assigned in any quantity, at any time;
- Measuring the services. Control systems in Cloud control and optimise automatically the use of the resources by means of measuring mechanisms at an abstract level tailored to the service type (e.g., data storage, processing, band width, and the number of accounts of the active users). The degree of the resources use can be monitored, controlled, and reported to ensure transparency both to the provider and to the consumer of the used services. [05]

Cloud Computing Implementing Models:

- Private Cloud. The cloud-type infrastructure is designed to the exclusive use of a single organisation which has many consumers (business units). It can be owned, managed, and operated by an organisation, a third party company, or a combination thereof and can physically exist ‘on-premises’ or ‘off-premises’;
- Community Cloud. The cloud-type infrastructure is designed to be exclusively used by a specific community of consumers in organisations that share preoccupations or interests (e.g., mission, safety requirements, policy or compliance issues). It can be owned, managed, and operated by an organisation, a third party company, or a combination thereof and can physically exist on-premises or off-premises;
- Public Cloud. The cloud-type infrastructure is designed to the open use of the public. It can be owned, managed, and operated by an organisation, a third party company, or a combination thereof. It is located on the Cloud Computing provider’s premises;
- Hybrid Cloud. The cloud-type infrastructure is a combination of two or more distinct Cloud infrastructures (e.g., Community, Private, or Public), which remain single entities but are connected by a propriety or standardised technology that allows for the portability of data and applications on demand. [05]

Models of usual Cloud Computing-based services:

- Software as a Service (SaaS). Customers use applications made available to them by the provider and such applications are hosted on a cloud-type infrastructure. Applications are available “on demand,” from various devices, via a web-browser-type of interface (e.g., web mail), or via the interface of a dedicated application. The consumer needs neither to administer or control the basic infrastructure behind the applications (including the network, servers, operating systems, data storage) nor the application itself, except for the limits imposed by the settings of the application based on the types of users;
- Platform as Service (PaaS). The capacity provided to the consumer to implement,

install, and use on the Cloud infrastructure of the provider’s applications created or purchased by the customer, by using programming languages, libraries, and tools supported by the provider. The consumer does not administer and control the basic infrastructure, including the network, servers, operating systems, data storage – but is in control of the applications installed and configuration settings and, possibly, of the host environment of such applications;

- Infrastructure as Service (IaaS). The capacity provided to the consumer by ensuring the computing power, storage space, connectivity as well as other fundamental resources. In this case, the consumer is able to implement and run their own client-software, which includes the choice of the operating systems and applications they are to use. The consumer neither administers nor controls the basic infrastructure but is in control of the operating systems they installed as well as a possible limited control over the selection of the network components. [05]

Benefits of Cloud Computing System:

- Low costs. Costs incurred by IT necessary to a business can be cut down to 30% - 40% over a three to five year span. On a medium to long term, investment costs (CAPEX - Capital expenses) will turn into operating costs (OpEx - Operating expenses) which is beneficial to most companies. IT costs which can be cut down and redistributed are those costly investments in infrastructure (e.g., servers, network equipment, equipment mandatory to set up a data-centre or server-room facility), licences, maintenance and repairs, operating / administering, data archives, and redundancy;
- Performance. The computing power, or MIPS, as performance indices can exceed by far the capacity of the infrastructure in an ordinary company. But the real benefit in terms of performance comes from the fact that all systems in a Cloud are constantly monitored for the best distribution of resources and for hardware breakdown likely to occur to have no

consequences and to be able to be repaired without bringing the systems to a halt;

- Security of data. Cloud computing providers implement highly updated solutions for data backup and redundancy. The prevent data loss and a client will most often not be affected in case a storing unit has broken down. Moreover, the same provider may have more data centres in different geographical locations and will use more Internet providers and utilities (power supply, for instance), as the end goal is protection against disaster (irrespective of their nature) and securing the on-going development of the business;
- Scalability / Elasticity. Most companies size their infrastructure so that they can withstand peaks. Consequently, the average use is far below their real power. Cloud computing allows for a dynamic distribution of resources and proportional payment for services. This means that a company can distribute a larger amount of supplementary resources for a strictly limited time without incurring significant supplementary costs.
- Security of information. All cloud providers should implement a set of standards so as to cover all customers’ protection related issues. Most providers have already complied with known and accepted standards such as ISO 27001, PCI DSS, COBIT, and the solutions they offer are better than what their customers can implement. To mention only a few, physical protection of the infrastructure, encrypting, powerful authentication mechanisms, warning and alarm systems in case of unauthorised access;
- Mobility. In Cloud, data can be accessed at any given time and from anywhere, from any device connected to the Internet. This means that users and customers can access data via a web-browser from their office, from home or when travelling by using the laptop, an iPad, or a smart phone. [04]

3. Virtualisation the accounting information system infrastructure

Virtualisation is an IT&C architecture concept which allows sharing and assigning hardware resources of a server in more virtual machines (VM). Thus, the possibility of more operating systems running simultaneously on a single hardware platform is created. Virtualisation involves the running of an operating system on virtual machines (computers) simulated with the help of a dedicated software application. Such applications can emulate the operation of all components of a real information system (e.g., FDD, CD-ROM, HDD, memory, CPU, USB devices, network board). The virtual machine consists essentially in a folder of variable dimensions which simulates the hard disk and other several folders that contain the configuration of the respective machine. The computing power and the RAM memory are shared from the real machine resources whereon the emulation application is installed. [11]

Virtualisation allows for more virtual machines - with heterogeneous operating systems - to run separately, one beside the other, on the same physical machine. Each virtual machine has its own set of virtual hardware whereon an operating system is loaded together with and applications as well. One can copy, move, or save very fast a virtual machine so that in case of disaster the entire system can be restored even in a few seconds. Virtual machines are isolated from the host-machine or from other virtual machines and, should one virtual machine block, the rest are not affected. [10]

Virtualisation allows the users to maximise physical resources most efficiently. The functions of the virtualisation server allow more systems to run independently on a single computer. Virtualisation of the server transforms the hardware into software, creating thus a virtual hardware resource on a server which incorporates CPU, RAM, and hard disks. The computing resources of the physical server are gathered and used by the virtual server in a controlled manner. By virtualisation, the data (i.e., information), do not leak beyond the virtual server and the applications can only communicate over the internet connections.

There are two types of virtualisation:

virtualisation based on software and virtualisation based on hardware. In a software virtualisation environment, virtual machines actually share the same kernel and use the resource of the main node. As a rule, this type of virtualisation has very many benefits in the field of hosting as resources can be assigned dynamically in real time without the need to restart the node. In a hardware virtualisation environment, the virtualisation mechanisms partition exactly the hardware resources. Limitations are hardware and can be modified only if the instance of the virtual machine is restarted. It is commonly used in the enterprise/commercial environment.

Advantages of AISI virtualisation:

- Cutting down the administration and IT&C infrastructure costs;
- A greater flexibility by introducing some new software applications in a very short time;
- Cutting down costs incurred by technical human resources by means of a simpler administration of the servers;
- Increasing efficiency of the physical resources existing on the server;
- Reducing non-operating time in case of errors or unexpected interruptions;
- Reducing power consumption by the necessary reducing hardware resources;
- Increasing the employees' productivity by means of automatic installation of software and applications in the virtual environment and their dynamic updating;
- Increasing efficiency of the IT infrastructure by means of a better use of physical resources available on the server and, depending on circumstances, their sharing with all servers in the company;
- Cutting down the number of incidents triggered by the incompatibility of software resources.

Depending on the needs and characteristics of your company, virtualisation services rely on Beck et al. applications.

4. Conclusions

Cloud computing will have an impact on organisations, companies, and private users and will change the meaning of the concept 'computing power' as we understand today.

Benefits such as speed, collaboration, scaling, and availability, combined with possibilities to reduce costs by means of optimised and efficient calculation are attractive to many providers but mostly to potential beneficiaries. Therefore, Cloud Computing and Virtualisation respond to the market demands with respect to cost reduction and flexibility at economically insecure times. If by virtualisation multiple virtual machines, with heterogeneous operating systems can run separately, one next to the other, on the same physical machine, by means of cloud computing almost all necessary resources can occupy a position on the Internet and share, sometimes, even among users who are completely independent from one another: software (programs) and data/information are downloaded from the Internet on the user's computer on demand, as if they were mere utilities such as water or electricity. Companies with dynamic, adaptable, and flexible infrastructures can focus on cost reduction, risk management, and improvement of service quality. A critical component of dynamic infrastructure is virtualisation. Created to simplify, consolidate, and improve flexibility and performance in server clusters, solutions for data storage and information networks, virtualisation can improve the use of company resources; it can reduce the operating complexity and related costs; it can help a company respond faster and more efficiently to the changes in the economic environment.

Administration - Doctoral School of Economics*

arsenie_samoil@yahoo.com

Abstract

Why Infrastructure as a Service? Because by finding an answer to this question, we will find solutions relevant both to the reduction as much as possible of initial costs incurred with the IT&C infrastructure and to a better control of the operational costs such as services delivered very fast and meeting the contract requirements in terms of quality, security in continuing the business and control over investment. The paper aims at presenting the current issues related to increasing the efficiency of IT&C services which assist the company accounting. The paper analyses aspects referring to the concepts of Infrastructure as a Service and outsourcing IT&C services related to such infrastructure. Moreover, the paper highlights the advantages, the disadvantages, and the risks associated to the concept of Infrastructure as a Service as well as the benefits of applying these new technologies to the process of outsourcing IT&C services assisting the company accounting.

Cuvinte cheie: Cloud Computing, IaaS, Virtualisation, Outsourcing

Clasificare J.E.L.: M4, F3, H8, Q56, D8, G1, L8, C6, C8, D5, L6,

1. Introduction

The current issues of global economy have prepared the ground for the new trends in information technology and communication, highlighting now outsourced services, a concept of a major interest from the point of view both of reducing IT&C infrastructure costs and of environmental protection. In the current globalising context, information has become the bridge built to help business sustenance and competitive advantages. Besides the trends in the field of information

technology and communication, the importance of being informed and knowledgeable outlines the necessity of extending and modernising the computing infrastructure of the companies. But as the world continues to develop IT&C technologies, as the world becomes increasingly interconnected and more intelligent, the ability to manage and deliver reliable information and knowledge, as strategic resources, becomes the critical element which makes organisations more intelligent and more competitive. The explosion of information can truly be turned into a business opportunity form many organisations. Lacking a dynamic information infrastructure, many people will realize that they face higher operational costs and a greater exposure to business related risks as they try to obtain new visions in order to make better business decisions. The following lines present the analysis of the concepts of Infrastructure as a Service (IaaS) and outsourcing services used to assist company accounting.

2. Accounting information system infrastructure as a service (AIS-IaaS)

Accounting information system infrastructure the AIS-IaaS provides represents the outsourced services of the companies' IT&C infrastructure – including “on demand” dedicated servers and virtual servers meant to address companies. Thus, companies can benefit from the latest generation equipment and services infrastructure without having to purchase and “in house” administer such infrastructure. This service addresses mainly the large and medium-sized companies which need a dynamic scalability of the infrastructure, i.e., an increase or decrease of IT&C resources in real time according to the development of the business.

Companies oriented toward a fast response to the market requirements can opt more easily for investing in key competencies, in extending their operations on other markets or in their solution portfolio while reducing their IT&C infrastructure-related costs by 40% by means of outsourcing such services.

The provider can offer high-performance hardware, on-going monitoring of the service by a specialised team, support via telephone or e-mail, a high level of security, network speed and availability, guaranteed connectivity via VPN or Internet for an unlimited traffic volume based on a monthly subscription. [02]

A dedicated server means a server tailored to the beneficiary's needs the provider makes available for the customer and that operates only for such customer. A dedicated server means increased security, flexibility, speed and stability, the beneficiary being the only one to have access to such server. A virtual server offers the power and freedom of an environment similar to the one provided by a dedicated server at a much lower price. The highly advanced hardware configurations of the server ensure maintaining and almost instant response time at an amazing peak transfer rate. The virtual server offers an unparalleled level of freedom allowing for full control and access route at all levels of the environment assigned to the beneficiary on the server. [05]

Infrastructure as a Service (IaaS) or Hardware as a Service (HaaS) provides hardware so that the customers can install what they may want and instead of purchasing servers, software, racks and paying to the data centre for the space assigned, the beneficiaries of such services rent such resources (i.e., space on the server, network equipment, memory, CPU cycles, storage space). The IaaS or HaaS requirements are: agreements at the service level (SLA), available hardware, network, internet connectivity, virtual environment, and utility-type payment. We should also add that SaaS and PaaS provide applications to beneficiaries whereas HaaS does not. [06]

The main benefits of AISIaaS, besides cutting down costs by 40% of total costs of having expensive technologies, are: • cutting down personnel-related costs (especially in cases requiring advance technical expertise); • increasing productivity; • support and

expertise specific to the business; • equipment / resources procurement is less time consuming; • based on SLA (service level agreement), the system ensures a high level of inter-operability and availability • Infrastructure can be dynamically scaled upward and downward, based on the needs for resources required by the applications; • equipment can serve to more customers at the same time (multi-tenant); • resource consumption is paid as utility, hence, the providers cash as resources are used; • Providers offer a higher level of availability of data and a better protection against disaster, at lower prices, for an increased redundancy and reliability; • elimination of costs related to data-centre (or server-room, in its traditional meaning): cooling equipment, physical access protective systems, utilities, fire-prevention measures.

3. Services of the accounting information system infrastructure

The main services of the accounting information system infrastructure (AISI) can be outsourced, together with their related problems and the benefits which may be generated as a result of their outsourcing. Such issues are dealt with below:

- IaaS (Infrastructure as a Service) - Infrastructure that adjusts to the beneficiary's business - the provider undertakes to provide high quality services in the field of data and applications protection and management. The provider has the latest technologies to enable them provide the best services of dedicated servers, virtual servers, storing on demand and data protection. For all such services, the provider makes available for their customers a wide range of configurations and equipment from the best manufacturers, hosted on the provider's own Data Centre. Benefits: • cutting costs, scale savings - by using efficiently the resources made available by the Provider; • On Demand - the provider's infrastructure is permanently and promptly available to ensure the needs to supplement resources, as per the customer's business needs; • "Pay as much as you use" - the provider offers their customers the optimal costs/benefits ratio; • transfer of responsibility for the

- administration of the infrastructure to the provider’s experts, based on a strict SLA;
- monitoring and technical support are ensured on a 24/7 basis by a specialised team;
 - a high level of security and availability of the infrastructure hosted by the Data Centre;
 - Eliminating investments in a Data Centre, equipment and licences as they are made available by the Provider. Thus, the infrastructure becomes an operational expenditure;
 - predictable budget, depending of the existing needs, based on fixed monthly costs which leads to eliminating redemption of investment.
- VPN Connectivity & Internet - The performance of connectivity services supplied is ensured by the presence of the largest connectivity providers in the country. Redundancy is ensured via different access ports to the Data Centre for each communication provider. Numerous methods and channels to access technologies allow the provider to guarantee both the security of the network and their flexibility. The data centre is connected via optic fibre to the national and international providers’ networks by using a multitude of links, which secures significant band capacities. Benefits: • fixed monthly cost including unlimited traffic, connection administration, and monitoring by means of appropriate equipment; • an IP platform allowing the beneficiary free communication even if document exchange, IP voice or even video conferences is involved; • the possibility to organise the applications which are used by the beneficiary for certain groups in order to operate more easily and to prioritise according to their needs; • the possibility to centralise expensive resources within the network whether one or more locations are involved without imposing distance-related limits; • the ability to choose that more working stations communicate among to one another directly or only via the central office; • the certainty that the provider is close by in case the installation of a new presence point is required to extend the business; • Service Legal Agreement to be signed by both parties as a warranty for the provider’s services.
 - Hosting and collocation - Collocation Services shall secure hosting for equipment in the provider’s data centre, releasing the beneficiary of such costs and the effort involved in developing an in-house storing area, including specific requirements related to security, fire-prevention, and cooling. Benefits: • specific storing areas for one or more servers; reduced fixed costs - without supplementary expenditure for power supply, air conditioning, or security; • fast installation; • high security level data centre and networks; • the provider can secure cabling services from the chosen server; • permanent, i.e., 24/7/365, support within the data centre; • access to the provider’s data centre resources; • ownership over hardware and all components in the life cycle of the equipment; • on demand, the Provider can offer professional services or Managed services.
 - Hosted Storage Space - Hosted Storage Space services are designed to help the beneficiary simplify the process and cut costs related to storing data and to meet the needs for increased security of the data handled within the organisation. Benefits: • a high degree of availability and scalability without massive capital investment; • sizable reduction of costs for premises, equipment, and administration; • increase of efficiency and retrieval of data in case of disaster/continuity of business; • saving and keeping data in a secured environment - Data Centre; • dynamic dimensioning of the storing area and contracting thereof depending on current needs at a given time; • compliance with regulations in force in the organisation’s operating field; • the beneficiary’s servers will use the storing services as on any other disk and can access the storing capacities of hundreds of TB; • consulting and support on a 24/7 basis offered by a professional team based on a SLA; • support for multiple storage tiers; • no time consumption on negotiations with storage services providers; • Transparent, easily predictable and budgeting costs.
 - Virtual Tape - replication services for the

data saved in virtual tape libraries (VTL – Virtual Tape Library), in the Provider’s Data Centre, can be used by beneficiaries depending on the storage space required at a given time, on the availability degree required for VTL equipment, and on the number of subsidiaries for which centralising data saved is desired. Benefits: • high level of performance, higher than tape storage technologies, secures the reduction of back-up windows and restoring the duplicate data; • efficient use of storage space by eliminating duplicate data; • a high degree of availability, scalability, and reliability of the duplicating infrastructure; • protection of data against unauthorised access - data encryption; • efficient use of data connection for duplication, by data de-duplicating and compression before duplication; • reduction of costs related to communication lines for duplication by using standard IP VPN connections; • elimination of costs related to physical storage and moving tapes to other locations with a view to securing the data saved in case of disaster; • reduction of costs related to premises, equipment, administration, and maintenance services and hardware support; • saving and keeping data on virtual tapes within a secured environment - Data Centre; • dimensioning and contracting the storage area depending on the needs and dynamic development of the storage capacity and of the performance level and availability, on demand; • compliance with the regulations in force in the field; • support for multiple storage tiers; • a single fee, a single contract, including support services; • Duplicating Services on Virtual Tape helps the beneficiary plan, design, implement, integrate, administer, and optimise storage infrastructure for back-up depending on the need at a given time.

- Secure Remote Replication - By using duplicating services, the beneficiary’s data are saved continuously, synchronously and asynchronously, in a data centre built to meet the latest technological standards, and the critical production applications will be restarted in case of disaster in this data centre in

the shortest time possible, on dedicated back-up servers. Benefits: • high degree of availability, scalability, and reliability of the duplicating infrastructure; • securing consistency of duplicate data by integrating them with the production applications; • minim impact on the application performance during data duplication; • reduction of costs related to area, equipment, and administration; • securing retrieval of data in case of disaster/continuity of business; • duplicating and keeping data in a secured environment - Data Centre; • dimensioning and contracting the storage area depending on the needs and dynamic development of the storage capacity and of the performance level and availability, on demand; • compliance with the regulations in force in the field; • consulting and support on a 24/7 basis offered by a specialised personnel; • support for multiple storage tiers; • a single fee, a single contract, including support services; duplicating service helps the beneficiary plan, design, implement, integrate, administer, and optimise the primary storage infrastructure for data duplication depending on the needs at a given time.

- Cloud Back-up & Recovery - Availability, security, and flexibility to protect the most important data of the company by means of Cloud Back-up & Recovery. Benefits: • facilitates managed-type protection of critical data both on-site and off-site in order to enhance availability; • allows for the reduction of total costs by choosing a cloud back-up solution; • facilitates management of regulations in certain industries; • facilitates installation process; • a high security level, as this is one of the most secure platforms of security data in the industry; increases profitability and reduces risks; • Continuous Data Protection (CDP), which refers to the fact that the data are automatically protected whenever change is operated thereon (asynchronous back-up).
- Hosted Video Monitoring & Archive (HVMA) - live access to footage recorded in remote locations via Hosted Video Monitoring & Archive (HVMA).

Benefits: • video surveillance over the Internet is an attractive and efficient method from the point of view of costs as compared to traditional alternatives; fixed monthly costs for SaaS service and eliminating initial and operational costs • easy integration to any IT infrastructure; • possibility to visualise live directly in the browser of the video content at quality standards that can be customised; • programmed recording of footage; movement detection/recording; • saving footage in archive via browser; • storage / back-up for recordings; • various level of accessing video cameras / recordings; • e-mail alerts; fast and easy capability to scale; • Independence from special network cables or other analogical equipment; • much larger volume of digital images that can be gathered; • higher efficiency as compared to tape recording; • faster auditing when incidents are reviewed; • monitoring can be conducted from anywhere via web-based applications. [08]

4. Conclusions

Outsourcing services of the accounting information system infrastructure will determine a dramatic change of business over the following years. The higher and higher pressure put on increasing operation efficiency and implicitly the sharp reduction of costs is only one factors f change. The development of the technological complexity, the need for automation, standardisation, and simplifying operations efficiently as well as the orientation toward dynamic, scalable resources are only a few of the trends that influence the way companies will approach the issues related to the accounting information system infrastructure. On the other hand, the possibility of using the infrastructure and the applications as services without making any significant investments (IaaS – Infrastructure as a Service) makes outsourcing such services one of the strategic options more and more frequently adopted by the top management. Outsourcing IT&C services represents a safer and less costly alternative than developing and maintaining the company own infrastructure, in-house developed applications, or purchasing licensed applications. Such scenario requires

considerable financial and human resources. Moreover, costs are minimal and predictable and the company resources can be focused on strategic functions.

Influence of Tax Pressure over Tax Evasion

Mihu Stefan

“Spiru Haret” University of Constanta

stefan.mihu@yahoo.com

Abstract

The development of the civilisation leads to the increase and diversification of human needs, and implicitly, to increase of the demand for public goods and quasi – public goods. In consequence, the financial effort claimed by their fulfilment increases from one period to another, leading to over – dimension in the demand of public financial resources, which are nevertheless restricted and most often, insufficient. Given this context, a problem arises regarding the identification of an efficient solution to procure greater and greater public financial resources. May it be the monetary emission without coverage to this regard? Taking into account the harmful effects on the long and average term of such a measure over the stability of macroeconomic indicators (and here we take into account, first of all, the amplification of inflation trends), we appreciate that the answer can only be negative. May the effective solution be represented by contracting State loans or increasing the general taxation level? Taking into account that the State loans are assimilated, most of the times, to certain “postponed taxes”, it is obvious that in certain cases, the effect is the same: increase of the taxpayer’s tax burden (either immediately, or in a future period). Although the effect of the two action driven directions is non – popular, they are certainly preferred to a monetary emission without coverage. There is a single amendment: the public authority should resort to their application in practice only when the disproportion between the demand and supply of public financial resources is obvious and prior public expenses were reduced to a minimum level, under which there is no other “limit”.

Key words: tax pressure, public financial resources, unique taxation rate, inflation, taxation basis/grounds, tax evasion

J.E.L. classification: E62

1. Introducing - Tax Pressure

Starting with the definition of tax as being a necessary bad, the taxation is undoubtedly approached as a coercion factor for the taxpayer, especially that the respect for the law and tax culture are more reduced. Nevertheless, irrespective of the tax civility of the taxpayer, the tax charges shall be perceived as follows: the more uncomfortable and unjustified the tax burden is, the greater the tax pressure or the more the management of public financial resources assimilated to political, discrete and incorrect decisions. Within the context of such an analysis, we have to mention that the public authority may use the tax and fee system to influence the stages of social reproduction process, since the taxes and fees stand for an efficient lever at disposal of public authorities to perform different objectives that they have proposed through the governing system (irrespective if they are economic, political, social, demographic, etc). This conception that potentiates the interventionist role of the State in economy was formulated by John Keynes and found a series of advocates all over the world, especially after the great economic crisis of 1929 – 1933, when it was appreciated that the free mechanisms of the market cannot correct its imperfections from itself.

A general degree of taxation not necessarily very high (from the strict mathematical point of view, relating it to other countries), but with an emphasized seizure aspect, conjugated with a hostile business environment and an obvious normative volatility, may generate the taxpayer’s “orientation” towards the economy’s informal side, justified by the need to survive. Even if we do not intend to

bring pro and against arguments to the morality of underground economy (although the subject may not have lacked interest), we cannot stop from noticing that the economic agents claimed many times the excessive character of the taxation in our country, which does not correspond to the capitalization requirements, generating – at the same time – an acute lack of capital that the Romanian economy copes with, which obviously aggravates the sustainable economic growth. More than that, the present situation passes through an acute liquidity crisis internationally speaking, and the effects of such a case are also felt in the Romanian economy (to analyze the growth of interests granted by the bank institutions when opening deposits, and implicitly, the growth of the financing costs pertaining to the activity of economic agents based upon the sources attracted).

1.1. Unique taxation rate

Although the European directives in the taxation field of activity strictly regulate the indirect taxation, in case of direct taxation, there is a certain freedom in at the level of each Member State. Starting from this fact, our country should orientate itself towards the valorization of a competitive advantage in the competition to attract capitals, especially by relating them to emergent markets.

Certainly the unique taxation rate of 16% (inserted on January 1st, 2005) is appreciated as being capable to ensure the premises of such fact and to lead to the sensitivity of the taxpayers’ tax related consciousness, significantly reducing their motivation to resort to evasion practices. Nevertheless, the introduction of the unique taxation rate does not have to be accompanied by the introduction of other taxes of fees or by the increase of the already existent unique taxation rates, but by a superior and more efficient collection of tax liabilities that are granted on a preferential basis (such as exemptions, postponements or installments of due tax obligations), as well as by the fixed and unitary application of the coercive measures in order to prevent and sanction the tax evasion.

Within the context of such an analysis, we can clearly identify that as of January 1st, 2007, the substance modifications brought to

local taxes and fees (especially in the way they are arranged) led to their significant increase, standing for, at the same time, obvious additional expenses for the taxpayers individuals and legal persons (and here we take into account the taxes related to means of transport). On the other side, nevertheless, the related taxes shall represent an important local finance source, which may ensure the functional grounds for the decentralization process through increase of the local communities’ financial autonomy, which is a necessary measure especially from the perspective of the Romanian adherence to the European Community. At the same time, we have to notice that in the field of local taxes and fees, the possibilities to shirk from the taxation (practically, tax evasions) are low.

Criticized by part of the political class, promoted and supported by the other part of the political spectrum, the unique taxation rate of 16% represented an efficient approach in promoting a new tax perspective. The pessimism generated by the introduction of a unique taxation rate was only reported in documents, as the statistic figures are encouraging in this respect. Not only that the public financial resources were not diminished, but the State budget income recorded a nominal increase (in 2005, as opposed to 2004) by 16.2%, which means (taking into account the inflation index) a real growth by 6.6%. For the objectivity of the analysis, we must take into account the structural evolution of the taxes and fees related to the State budget and we must nevertheless accept that when it comes to income and salary taxes (the most “affected” by the relinquishment of taxation in progressive rates on income installments), a decreasing trend of 5.4% was recorded (in nominal terms), respectively 13.2% (in real terms). This drop was nevertheless compensated (at the State budget) by the increase of VAT collections, by 36.1% (in nominal terms), respectively 24.9% (in real terms). The explanation is relatively simple and it is structured on the essence itself of such a tax policy: by relaxation of direct taxation the population’s available income increased, which were oriented (in part) towards the encouragement of consumption and, in consequence, towards the stimulation of the economic activity, with a direct quantifiable effect in the economic growth.

Given such conditions, important mutations took place in the structure of the incomes pertaining to State budget (by reversing the weigh related to direct taxes in relation with the indirect taxes).

The famous American economist A. Laffer asserted about the unique taxation rate practiced in our country the idea according to which “what is simple and small is beautiful and benefic”. Behind this value related judgment, we can decode that a low taxation rate aims to reduce the diminishing risk of productive efforts, refreshing, at the same time, the investment and savings process. We don't have to forget about the inflation risk by taxation, in the sense that an increase of taxes and fees related to salary rights leads to increase of the production cost and in consequence, of the general price index, and implicitly, to inflation. On the other side, nevertheless, many assert that an increase of taxation in the field of indirect taxes leads to the diminishing of solvable request caused by decrease of purchase power and implicitly to the consumption discouragement and the limitation of inflationist phenomena. Taking into account the evolving trend of public financial resources after the insertion of the unique taxation rate, compared to the existent case prior to its insertion, both from level and structural point of view, we must admit that in parallel to the insertion of such a rate, new taxes were inserted or the level of those existent at that time increased. Even we cannot state that the measure of applying the unique rate discouraged the social categories with modest income, it certainly favored the social categories with income above average. Nevertheless, if we make a comparison, the increase of certain existent taxes (especially in case of indirect taxes from the excise category) triggered the same affects at the taxpayers, irrespective of the income that they register (even in such a case, the effects are more felt among those that record small income). In addition, the considerable increase of local taxes and fees after January 1st, 2007, determined a considerable financial effort from the taxpayers, non – differentiated according to the income they record, but correlated with the fortune held by each of them (even such a measure has a logical justification, that is the necessity of financial autonomy growth of local public authorities). Due to such reasons, those that claimed the

unique taxation rate bring in the first place the idea of noncompliance with the principle of tax equity. On the other side, we don't have to forget that the insertion of the unique taxation rate for the income related to salary rights was accompanied by the grant of personal deductions (tax relief), grant that is correlated to the level of gross income recorded and to the number of persons supported (in the idea of complying with the principle of tax equity). In addition, many assert that, given the conditions of maintaining the taxation state in progressive rates per income installments, the growth rhythm of public financial resources would be superior to the one recorded after the insertion of the unique taxation rate.

According to an objective inventory, both strong and weak points generated by the insertion and subsequently, the step – by – step generalization of the unique taxation rate of 16%, we must admit that we cannot say that everything is only black and white, as the truth is somewhere in the middle, and at the same time, we cannot conclude without saying that the measure of the unique taxation rate of 16% represents the premise for efficiency measures in the Romanian tax system, and on the long term, the useful effects shall be gradually amplified, especially from the perspective of restricting the evasion related trends (by disappearance of the “motivation”) and of restricting the dimensions of the phenomenon in itself.

1.2. Maximum tax efficiency

The economic analysts sought to identify the maximum level of tax efficiency, which is that tax level that the taxpayer is ready to accept voluntarily and thus, to pay his tax duties, ensuring a conciliation between the maximum of public financial resources and the maximum of bearable point from the taxpayer. Many economists share the thesis related to “the tax that kills the tax”; in other words, the insertion of a new tax or the increase of the already existent tax diminishes the bearable point level of tax charges, and thus, the economic agents have in mind the main objective represented by the “escape” from the new tax constraint to which they are subject to (obviously, by means of more or less ingenious methods, more or less legal or moral). It is useful to

mention in such a context the theoretical grounds that can be identified in Laffer curve.

The theoretical essence of Laffer's curve is based on the principle “too much tax, no tax”, according to which when the taxation level is null, the budget income is null and in addition, when the taxation level is 100%, the budget income is null. Between the two extreme limits, we must identify the optimal taxation level that ensures a maximum of satisfaction for both State budget and for the taxpayer. To this regard, the tax specialists reached to the common conclusion that the more fearful the tax evasion is, the higher the taxes are. This is the reason why any State, for the fulfillment of its income, needs to dimension and distribute its public duties in such a manner that any taxpayer could fully pay his taxes in due time. If such a thing is not taken into account, it leads to a lack of efficiency of the tax system. Thus, irrespective of the training of the tax inspector or the size of the sanctions applied, it is possible that the State fails to cash from the taxpayer the requested taxes. Given such circumstances, any taxpayer would do his best to escape such unbearable rigors, and one of the methods is the “tax fraud”.

Although Laffer's initiative is praiseworthy, its application in practice is debatable, since the identification of an optimal size of the taxation threshold is more theoretical, especially if influenced by a series of economic, political, psychological factors that vary from one country to another (and first of all we have to take into account the development level of each country, which is reflected in the size of gross domestic product per capita, as well as the structure of public expenses specific to each country). In addition, the structure of public financial resources differ very much according to the development level of each country (as the destination it has when public expenses are involved).

Given the circumstances according to which the general taxation degree is high, in order to cope with eventual claims from the taxpayer regarding such measures, a theoretical approach is imposed regarding the efficiency of public expenses that are about to be involved, putting the emphasis on social compensation of facilities (which is structured in its turn, from theoretical point

of view, on Hicks – Caldor theory regarding the consumer's surplus).

The central point of Laffer's theory is represented by correlation of the level of mandatory take-offs to the dimensioning of informal economic sector, opinion that we totally agree upon. Laffer's argument does not take into account and it does not make the distinction between the short-term and long-term evolution of the curve. For example, in the periods of economic growth, the reduction of the general taxation level is normally sufficient to generate useful effects. We cannot assert the same thing for the periods of economic recession, in which the tax stimulation is most of the times not enough to encourage the investment process and most of the times speculative behaviors occur.

The theory promoted by Laffer's curve has met a considerable practical impact in many countries, and the most suggestive examples to this regard is United States of America and France. On the other side, it is true that in France existed certain criticisms to the address of practical applicability of Laffer's theory, starting from the premise that the elasticity of taxable income opposed to the superior taxation rates is very low. The theory formulated by Picketty is based upon the ideology of the economic doctrine pertaining to supply theory, since it aims towards the analysis of the activity through the prism of the supply and less through the prism of demand (specific to economic policies of Keynes's type). In addition, Picketty brings in discussion the problem related to the population's effective contributive capacity, according to its purchase power. From those hereinabove mentioned, it results that the when the political decision was taken regarding the taxation tightening, the short, average and long term effects must be objectively compared to the objective proposed (maximization of public financial resources), because an uncontrolled growth of taxation (over a certain level) discourages the initiation of savings and investments, in shortens the taxation grounds and it cancels certain benefic effects regarding the level of budgetary income brought by the increase of the taxation rate. For example, the exaggerated taxation of the work factor shall lead either to abstinence from working, or to

redimensioning (obviously, in the sense of growth), of the work carried out on the black market. An excessive taxation of profits shall determine the exclusion of certain competitors or, more seriously, their gliding towards the non – inventoried stream of informal economy. To this regard, the promoters of the economic liberated school support the reduction of the tax pressure as a determining factor to refresh the economic activity. Michel Albert considers the excessive taxation as a brake in front of the economic growth and development, since it has a discouraging effect over the initiatives carried by the daring ones and by the entrepreneurs. On the contrary, the reduction of the taxation degree leads to limitation of direct intervention of the State in the economy (due to lack of financial resources) and thus, the following is restrained: the possibility to promote in practice certain discretionary measures, taking part in the unchain of the society’s creating energies.

Laffer’s conceptual model undoubtedly contributed to the evolution of the economic doctrine that tries to explain the correlation between the growth of tax pressure and the extension of the non – inventoried economy.

The model in itself did not manage though to answer the following question: why do the mandatory take-offs increase if such a fact is quantified in decrease of the State’s tax incomes?

The answer to such an antagonistic situation has been decoded, even if partially, by means of the model grounded by J .M. Buchanan and D. B. Lee, which starts from the premise that the modification of the taxation level only causes average or even long term effects. From theoretical point of view, we make the distinction between the short term and the average or long term behavior. To this regard, a certain taxable matter corresponds to a certain function of tax collections (in relation to the general taxation level existent at that time). When the taxation rate grows, the public authority places its stake on the growth of tax income, since it considers that the mass of taxable matter is not modified, although, given the conditions of tax pressure growth, part of it is dissipated. Moreover, the “leakage” rhythm of the taxable matter is most of the times more emphasized than the one related to increase of the taxation rate and in

consequence, a series of tax income disappear.

Most of the times, when the public authority takes into account the taxation growth, it places its stakes on tax illusion phenomenon (which is known in the economic doctrine under the term of tax anesthesia). This fact supposes an increase of mandatory take-offs under the form of taxes and fees, without the simple taxpayers effectively perceive the additional tax burden that comes to their duty. As a rule, the tax illusion phenomenon does not suppose modifications of the taxation rates or the insertion of new rates, but modifications in the way in which the already existent taxes are arranged (and sometimes, perceived). It is obvious that the phenomenon is encouraged by a tax structure as complex as possible (and even ambiguous), which does not allow the determination of reliable data regarding the price of taxes owed by the taxpayers. When the increment intent regarding the tax burden becomes perceivable among a great mass of taxpayers, the public authority shall proceed, with the purpose of minimizing the political – electioneering costs of the measure, to generalization of the compensations induced by the increase of tax burden; in consequence, it shall seek to justify that only the new taxation level is capable to ensuring the public financial resources necessary to finance as many public goods as possible, thus satisfying, the society’s collective needs.

Starting from those hereinabove mentioned, we propose top identify the causes that determine the amplification of the tax pressure. Certainly, an active implication of the public authorities in the economic environment leads to expansion of public expenses and to a greater and greater demand for public financial resources. To this regard, the famous economist Peter Drucker formulated the hypothesis according to which “the State makes the rules, the State makes the standards, the State supplies, but the State does not execute”.

The undesirable attitude of the taxpayers towards the taxes is indissolubly correlated to the stability and accuracy of the legislative frame and the institutional frame, as well as to the efficiency that the taxpayer perceives over the methods regarding the management and usage of public financial resources. The legislative inconsistencies in the tax field as

well as the asymmetry and the normative volatility shall increase the taxpayer's "interest" in exploiting such dysfunctions and in identifying new tax evasion related methods, and given such conditions, the tax riots tend to amplify more and more, and the tax evasion will finally become a "national sport". The adversity towards taxes may be significantly reduced if the related legislative frame is coherently structured, and if the tax representativeness apply the legal regulations in the field to their professional spirit, in good – faith and equidistantly from all taxpayers, without making discriminations between them (according to their financial position, social position, political affiliation). To this regard, the financial – tax related performance control must not create to the taxpayer the image according to which the control institutions are obsessed with the idea of tax sanctions. The administrative structures with assignments and skills in the financial tax field must ensure an appropriate behavior for the unitary application, without resorting to bribes to make sure everything is in place. In those previously mentioned, one idea stands out, that is a growth of the tax pressure shall be felt by the taxpayers as a form of aggression (more or less justified) over the income that they regulate. Given such circumstances, their preoccupation shall be deviated from a permanent performing economic management to an efficient tax management, which allows them to identify "the escape doors" from the rigorous tax regulations. Most of the times, the problem regarding excessive taxation is reduced to limitation of costs engaged, by means of an efficient approach of a tax optimization, which also include the transfer of the taxable matter to another jurisdiction, which supposes a easier tax charge. Given such context, the self – generation of the underground economy occurs, in the sense that the refrain from paying the taxes by certain taxpayers hinders the taxation grounds and the level of public financial resources, which engenders a harsh taxation, which, in its turn, shall "motivate" the inclination of other taxpayers to the informal side of economy. When the legal, transparent system of market economy blocks, a spontaneous and more advantageous distribution of resources occur, although by hidden ways. When such an "avalanche

effect" occurs, the continuous and constant diminishing of the taxation grounds cannot be compensated by the growth of the taxation level anymore, and the rearrangement of the functional "game rules" can only be performed by removing the causes that led to this state in the tax evasion behavior encountered at the economic agents.

Even so, we can quantify the obtaining effects of an eventual decrease of the tax level, taking into account the taxation modalities to avoid the prohibited aggravation and depth of the budgetary deficit (even if on the short term, until the materialization of useful effects generated by a tax relief). Finally yet importantly, the public authority must operate such a tax reduction according to the stages of business cycle, taking in account a functional modification of the tax structure, as well as the curve pertaining to relatively marginal advantage distribution of the tax burden per sectors of activity with the economic potential (without transgressing the neutrality tax principle)

2. Conclusions

Although the tax policy promoted by the public authorities aims to reply to a series of objectives, we consider that it must take into account, first of all, the limitations of tax pressure, since the taxation must be regarded not only as an attribute of the State, but as a lever that is necessary to take into account the taxpayers' will and consent to the tax that is structured on the principle of the taxpayer's positive influence. From such perspective, the efficiency of a tax system is not only appreciated by the absolute size of the collected income, but also by the level of bearable point of the taxpayers, as a guarantee of his lack of motivation to transgress the tax legislation

Starting from the three roles of the taxes (financially, they represent the components of the most important financing source of the social welfare. Due to them, the financial resources available to the State are accumulated and distributed, but they also represent tools used in the macroeconomic management with direct influence over the economic environment.

On the other side, given the fact that the national offer of goods and services is under

– dimensioned and undoubtedly characterized by a somewhat rigidity, we recommend the decrease of the average tax pressure, as a useful and even necessary approach in stimulating the real economy, given that the elasticity of such an offer, upon fluctuation of average taxation rate, is not negligible. The practical promotion of certain compatible compensatory complementary policies may determine the over – dimensioning of the taxation grounds when the general tax degree is reduced and thus the forecast shocks in collecting public financial resources may be attenuated (or even avoided).

Starting from the most visible effect of tax evasion, that is the delocalization of certain financial resources from their natural scope (and legal scope) to supply funds to the consolidated general budget, we consider that the circumscription of the phenomenon in itself within certain controllable limits must represent a priority of the tax policy and to this sense, the reduction and restriction of the tax pressure represent an efficient means in preventing and combating the tax evasion, since it aims to the cause, and not to the effect of such a phenomenon, respectively to

the premises that motivate the taxpayer’s evasion related behavior. The tax legislation must take into account not only the punitive measures, but also those measures that may generate a correct tax behavior of the taxpayers, which aims to restriction of the tax evasion phenomenon.

Abstract

The purpose of this approach is to identify the reserved place for state action in economy and its priorities in the new global environment. The major objectives subordinated to the approach intend to point out the characteristics of the thinking currents in order to emphasize that these were strongly influenced by the system of economic and social relations, by the development level of the economies and the major disequilibria from their elaboration moment and subsequently to analyze the current impact of public decisions on the competitiveness of the companies, countries economies and the state place in the new global economy.

Keywords: economic theories , fiscal policy, economic competitiveness.

J.E.L. Classification: B2, E6, H2.

1. Economic theories and public policies

Through the human society evolution the philosophical currents and economic theories which focused on the competences of the public decision-makers have exercised a significant impact on the tax policy evolution, and respectively, on the way in which this one was and is used in order to achieve the political, economic and social-type goals aimed by them. If what we call as tax policy nowadays, initially had to provide the maintenance of the state order, subsequently it focused on guaranteeing the developed activities and then on the services

and advantages provided and guaranteed by state, and more recently on the fulfillment of its coming functions and tasks.

Thomas Hobbes, the founder of the „social contract theory” which was subsequently developed by Jean-Jacques Rousseau, asserted that, state represents a way of free association of the people who give up to a part of their freedoms and make sacrifices by paying the taxes in exchange for the performance of certain activities. For the classicists of the German philosophy (Hegel, Schelling, Fichte), the founders of the „organic theory”, state is a product of the human society and taxes are necessary for providing the pecuniary funds designed to maintain the state order. According to Adam Smith, the founder of the „equivalence theory”, which was also supported by Montesquieu subsequently, the value of the taxes determined by state depends on the price and size of the services performed by it. In the „sacrifice theory” as opposed to the „social contract theory”, state does not longer represent a social organization based on the will of its citizens, but a product which is necessary for the historic development of human societies, their members having the duty of paying the taxes taken up by state for the fulfillment of its coming functions and tasks.

If the classical economists - the supporters of the liberal doctrine such as Adam Smith, expressed themselves in favour of limiting the state functions to the traditional ones, considering that the optimal resources allocation implied the free competition protection by it, the neo-classic economists asserted that in order to ensure a pure and perfect competition, the public authority

interference was necessary. „The organic theory of the state” developed by the German school radically impugns the classic and neo-classic approaches, justifying the necessity of the state interference on the grounds that it represents the society interest. The interference dimension generated two currents; the one whose promoter was Wagner supported the interference in all domains of economy according to the economic development, while List was the supporter of the interference in certain periods in order to support the new industries.

The positive (research) or negative (pollution) externalities in the view of the welfare economy supporters (Marshall, Pigou) are only a few of the reasons asserted in order to justify the state interference through taxes. A radical attack of the state and capitalism role may be found in „Marxist theory” which asserted that the state functions must be reduced to the maximum and that it must provide the transition from the capitalist society to the communist one without classes and finally, without state.

Supporting the economic development and the encouragement of the full labour force occupation by the state are necessary in Keynes opinion, because market does not have self-adjusting mechanisms which should be capable to provide the optimal resource allocation. As opposed to the neo-classicists who consider that disequilibria are due to the external interferences disturbing the spontaneous market adjustment, the Keynesian supporters assert that these are due to a structural crisis of demand and accordingly, state must interfere in order to relaunch consumership and investments, using as instruments the rate of interest in order to influence investments, the offered money supply in order to interfere in the saved money supply, inflation in order to act in the unemployment level (influencing the income which in its turn, influence the saving and thus, the investments). Confronting the ideas expressed by Keynes, the economists of the Supply-Side Economics (Laffer, Gilder, Bartlett) stated that companies must be encouraged to enter new markets by decreasing the taxes they pay, must be helped to produce goods and services by granting subventions directed towards certain fields of

interest, and the employee incomes may be increased by reducing the social fees.

Considering state as a whole of individual compromises, “regulation theory” (Aglietta, Lipietz, Boyer) takes over some of Keynes and Marx ideas, stating that crises are generated by either dysfunctionalities of capital accumulation or dysfunctionalities of money constraint management, or the salary proportions, or the way of insertion into international economy, or the type of the state interference. In their opinion, state must do a crises analysis and to interfere in the causes in order to provide the economy stability. The gradation of the state and market role may be found in „neo-institutional theory” (North, Coarse) which identifies its interference, only if it participates to the achievement of an optimal one which should satisfy the individual interests in the conditions of protecting the ownerships and acknowledgement of their structures.

Asserting rationality of the human being and individualism of the companies, but also the market capacity of adjusting the economic activity effectively, as basic truths which appear as obvious, the classical liberal current rejects the state interference since the general interest cannot be place above the private interests, considering that it would generate undesired effects. The classical liberalism states that the economic system based on the economic freedom naturally aspires to balance, without affecting the economic freedoms and the best guarantee of freedom is the private property and the production means.

Starting from the hypothesis of the fellow rationality, the neo-classical liberal current intends to explain the consumer and producer behaviours as well as the economic phenomena. The neo-classical liberalism identifies the existence of four markets (goods and services market, money market, capital market and labour market) among which there are interdependencies and the general balance depends on creating a balance price for each of the markets, taking into account the hypotheses (information circulation and availability to all, the atomicity of demand and offer, the homogeneity of products and the absence of the access barriers) which determine the

behaviour rationality. The only way of assuring the political and economic freedom is the reduction of the state role, according to the vision of the monetarists from the School of Chicago.

It is obvious that there is a close connection between the economic theories and the state-applied policies, the states trying to justify their actions by appealing to the economic theory. The public policies intended to encourage competitiveness have as motivation the achievement of certain purposes consisting in the maximization of welfare and per capita income, the avoidance of sudden poverty and the full use of the labour force.

However, at the European Union level, the economic decisions begin to be no longer of a state competence strictly, but especially of all, such as the case of the competitiveness encouragement. Which is the company place in relation with state and society? It is obviously that in a globalized environment, companies have more possibilities of development and movement, but the competition increases too. We need to show prudence in regard to the states and European institutions role on the regulation line, because it's not very delimited and the effect of the public actions is not very transparent in regard to those of the private environment on the line of the competitiveness increase and providing a social optimum. As a matter of fact, we don't even have the certainty that competitiveness encouragement is easy to be institutionalized. At this phase of the research we consider that the efforts for supporting competitiveness remain in companies' competence, state having rather the role of supporting and encouraging the achievement of the desired goals.

2. Building a advantageous environment for the company competitiveness, a priority of the public decision

If we take into consideration the current dynamics of the economic environment, then it would assert the remark: while the theories regarding the state role were underlain on the traditional model of economy, the globalization process interconnected the national economies in a world multi-

dimensional economy. Globalization takes down the approaches of the Keynesian, neo-Keynesian and Marxist currents, bringing into focus the state functions which are supported by the neoclassical liberal doctrine. This involves the obligation of supervising the big economic balances and building an advantageous climate for the effective private initiative, creating the competitiveness. As a matter of fact, the contemporaneous economists took over the philosophical and scientific theories of Nietzsche (hero's importance), Darwin (natural selection), Spencer (survival of the fittest), Hobbes (man is a wolf to man), ideas for explaining the laws upon which the contemporaneous market economy operates. According to Michael Porter, competitiveness is indivisible, those who have it will pull through, and those who don't have it will disappear, no matter if it's about companies or the economic system on the whole.

In economic theory, competitiveness is but a behaviour method of the economic entities on the competitive market, where every company seek to achieve and maintain competitive positions and advantages, observing the rules established in equally supposed conditions for all. Actually, competitiveness ceased to represent a method of existing, becoming a main goal for companies, state and society on the whole. If on the long-term, profitability remains the reason of existence, on the short-term instead, competitiveness is the main goal aimed by the economic entities.

For any public power, the state competitiveness became a national strategic goal of a primary importance for assuring the sovereignty, independence and autonomy of the country, for its international position, the labour market policy, the access to the global technology, the national solidarity financing and the social peace maintenance.

Gradually, as the economies were entering the structural crisis and unemployment, competitiveness began to be related to privatization, liberalization, deregulation, flexibility, mobility and excellence. Notwithstanding, the measures taken towards the adaptation to the new rules of the market economy neither led to the economic growth nor to the unemployment reduction. But we notice that the

internationalization and globalization processes of the companies and economies, the internal organization of the companies and the global and local relations between businesses – network were disturbed by the cooperation under the shape of alliances and strategic agreements concluded in order to support competitiveness. In the current context, in which the grant of resources is done at the international level, states lost their capacity of being able to act on the processes of grant restructuring due to the strategies and powers of the big economic and financial companies action on the world level. The state power decline in the countries of origin or implantation of the large corporations represents a threat for the national independence. State ceased to be the political expression of the public interest, being degraded to the role of actor being responsible for building an advantageous environment for the companies' competitiveness.

Globalization structurally changed the way of approaching the national and foreign investors. Discrimination applied in favour of the national investors in order to protect the national sovereignty by establishing the forbidden activities, limiting the participation to share capital, compensating imports through exports in different proportions, ensuring the transfers of technology to the national companies and research institutions started to prove itself ineffectual for the foreign investors due to the costs increase and competitiveness reduction generated by the total administrative restraints with negative impact on their performance. As integrating on the implantation markets, the national providers invested on the foreign implanted companies and the foreign investors began to request a protection against other foreign competitor companies, so that states became their partners without wanting it.

In the current global economy the investors' nationality and the place of implantation ceases to be relevant anymore, necessitating to give up to the temptation of promoting discriminating policies encouraging either the national sectors being deemed as strategic, or the foreign investments exclusively, in favour of ensuring an economic, social and politic

environment being able to attract investments bringing new technological capacities and work places. No matter if the spatial reference has a national or regional character, the priority has two major coordinates. The first one needs to settle the permanent flows as much as possible; consisting in the transfer of activities, and the second one concerns the provision of the conditions encouraging the best investment decisions. There is obviously coming the question related to the state role and if this one, by means of the applied policies, may contribute to the building of an advantageous environment for the competitiveness encouragement.

If we take as reference the approach of nations competitiveness suggested by Porter, then in order to settle the companies on a market, no matter if it is a national one or the consequence of the regional integration, the following requirements should be provided: to exist a solvable and sophisticated demand which should force the manufacturers to permanently increase goods and services quality and their diversification, the large companies to be capable to cope with competition, the industrial structure to consist of a large number of small and medium effective enterprises which should efficiently respond to the controls coming from the large companies, to ensure the offer of qualified labour force, the necessary communication systems and infrastructures so that the environment in which companies operate be productive.

Which would be the counterarguments for those who support the protection of the new industries and the large national business groups? Such policies are no longer timely because the protection for the new activities should be temporary, and the large business groups which dominate in the developed economies, being confronted with the market saturation and costs increase in the countries of origin, have already built international networks as a result of the delocalization strategies at the global level. While certain companies delocate the large labour force consumer activities, others, through implantation, try to get close to the commodity markets or to eliminate certain tax costs. Governments in the implantation countries try to grant tax exonerations and/or subsidies to foreign investors, wishing to

maintain the market attractiveness and avoid their departure. However such practices are not deprived of side effects from the member states of the Union or those from OMC. Globalization eliminated the hierarchy between national and international, carrying an accelerated decline of the states power of governing the economic policy from the moment of activities deregulation and public companies privatization. Consequently, the question arises concerning the level to which we should act in order to bring under regulation the economic environment in the globalization age and which instruments would we use to ensure the optimal allocation of the resources, the increase of the economic environment attractiveness and the corporations' stabilization.

A possible solution would be regionalization as an intermediate level between the global and the national economy. The multiplication of regional integration forms corresponds and has an effect on the determinant factors of the competitive advantage, which were stated by Porter. In the present moment globalization confronts European Union and the member states with a new reality because of the geographic polarization of the direct foreign investment flows, the competition development and the primacy of the financial strategies over the productive strategies.

The economic disequilibria have compromised the achievement of a balanced and lasting development model based on competitiveness making the European Union the most competitive economy in the world. The measures taken (based on White Paper and Lisbon Declaration of the head of states and prime ministers) have determined the reduction of the salary costs, activities of privatization and deregulation of economy, the reduction of the public expenditure intended for social protection and security, the detaxation of the salary bases, the reduction of the state role in infrastructure financing, the building of an advantageous environment for the improvement of the private corporations competitiveness, the encouragement and support of the private investments, and the liberalization of the national markets. The failure of achieving the intended goal determines us to ask ourselves about the usefulness of the taken measures.

In order to consolidate the competitiveness of the European Union economy and the member states economies implicitly in the globalization conditions, these must become attractive.

3. Conclusions

Researching the economic theories emphasize two important aspects. The first one is related to the fact that the economic thinking currents approach state interference differently, and the second aspect is related to the impact which the economic environment dynamics has on the economic thinking evolution and the issuance of new approaches.

In the globalization conditions, the consolidation of the member states economies and the European Union economy implicitly needs an increase of their efficiency on the worldwide market. We believe that it's not longer relevant to analyze the balances between the incoming and outgoing flows of the goods and services at the level of a state, as in a globalized environment we must take into account the exports of the national companies' subsidiaries on third countries inclusively, as well as the sales on the implantation markets, the purchases made from other subsidiaries of the group either from the countries of origin or from other countries. In fact, we must take into account the segment of the global market which is controlled by the national companies and the flows within the group of the company subsidiaries. If we aggregate these flows, we may have a real image on the competitiveness of a country which exceeds the national borders and we reach the conclusion according to which delocalization carries the production decrease and the use at the level of field simultaneously with their increase at the level of another field, without existing an equality between the two quantified flows. In order to consolidate their competitiveness through price, companies appeal to delocalizations for minimizing their costs and by adapting the products to the consumers' preferences on the markets where they are implanted they seek to consolidate their competitiveness outside the price. For states and companies, the competitiveness key is now related to the

skill of using together globalization of the financial circuits, production delocalization and goods and services exchanges.

European Union Concerns Regarding the Modernizing of the European Customs Legislation

Muntean Mircea

„Vasile Alecsandri” University of Bacău, Faculty of Economics

Mircea.Muntean.BC@mfinante.ro

Abstract

Customs taxes are indirect taxation having an important share within the European Union budget and implicitly within the budget of each component state. Due to this reason there is a permanent preoccupation from the part of the European Union Council to modernize the customs legislation for the communitarian area. In order to prevent the tax evasion and in order to enlarge collections, the European Union Council imposed a system of customs tax exemptions for the imports and exports capable to facilitate the circulation of goods inside the communitarian area. The customs tax exemption was settled by the Regulation (CE) no.1186/2009 of the European Union Council and refers to a multitude of groups of products, solving thus many problems linked to the circulation of goods inside the communitarian area and the tertiary countries bordering it.

Key words: communitarian area, customs area, customs taxes, submitted products

J.E.L. Classification: H26, H30, K34

1. Introduction

The customs taxes constitute a field regulated through a multitude of norms of law: internally, European and internationally, due to Romania adhering to the European Union and to the international treaties and conventions. By signing the adhering treaty to the European Union and to the divers international treaties, according to the Romanian Constitution, our country is forced to respect the provisions of these treaties which become sources for the internal law once their ratification have been done by the Parliament. Thus it has been created the European Union customs tariff represented

by a classification of the products submitted to customs taxes and the level of these taxes applied for each product or group of products.

At the same time there has been created the customs regime of the European Union, comprising the specific customs law of this customs territory, needed to be unitary applied by all member states. The constitution of the customs union on the customs territory of European Union has led to dissolution of the customs barriers, the settling of a new common taxation system, and also the settling of a Unitarian trade policy system in connection with the tertiary parts. There has also been settled, by the European Union legal organizations, the customs tariffs, taking into consideration the specificity of each member state.

The basic preoccupations of the European Union materialized in supervising the circulation of goods inside the customs territory especially for the goods submitted to duty, referring to products such as tobacco, alcohol and energetically ones. The modernizing of the customs legislation constitutes a priority objective for the European Union, because it aims to prevent the tax evasion by putting into evidence and collecting to the communitarian budget and implicitly to the budget of the communitarian countries the customs taxes and other taxation and duties.

In order to prevent the tax evasion The European Council adopted the Regulation (CE) no. 1186/2009 which simplifies and exempts from tax some customs operations. By applying the Regulation (CE) no. 1186/2009, the European Union Council did not put a limitation to the respect from the part of the communitarian countries of the provisions existing within the international treaties and conventions to which they are parts. Within the regulation a special attention was given to the customs tax

exemption for the import – export of equipment for the scientific research and for the public education institutions. For each group of products to which Regulation refers, there have been imposed conditions in order to justify the customs tax exemption, the failure to respect them leading to the taxation of such kind of goods.

2. The communitarian regime of tax exemption

Customs taxes are indirect taxation which are generally paid to the customs offices and are generated by some operations linked to the: import, export and the transit of goods. Because customs taxes are a considerable source for incomes to the budget of the European Union and implicitly for the incomes of each member state, there exist permanent preoccupations from the part of the communitarian organisms for the improvement of the customs system. In this direction the European Union has constituted the customs territory and the customs union, where it comprised all the member states. As a result the customs barriers there were dissolved and there was introduced a common taxation system, and in the relations with the tertiary parts there was settled a common commercial policy and an external common tariff.

The main preoccupation of the European Union Council is the actualization of the customs tariff and regime. Referring to the customs tariff, the nomenclature is permanently re-actualized for the products suffering customs taxes, and also the level of such taxes in order to exist a harmonizing of the European Union customs policy in accordance with the specific norms which regulates the customs policy of the member states.

In order to simplify the customs activity and preventing tax evasion, the European Union Council has adopted the Regulation (CE) no. 1186/2009 through which there is settled communitarian regime of tax exemption, both goods import and export. As a general rule, tax exemption is applied to goods having free circulation, which are then exported outside the customs territory of the Community.

Imports customs exemptions refer to:

- Personal goods imported by private persons moving location from a tertiary country on the customs territory of the Community on condition the respective goods be at least six months in the possession of the respective person at his/her ancient address. The respective tax exemption is conditioned by the intention and the existence of a period of at least 12 months, when the person lived in a tertiary state of the European Community. As well as, the exemption is conditioned by the putting into circulation of the respective goods during a period of at least 12 months and by the interdiction that the goods be freely transferred or sold to other persons. The goods submitted to the customs tax exemptions regime can not be lent, rented or be a guarantee in different situations.
- Goods imported on the occasion of a wedding, constituted from trousseau and household goods belonging to a person who transfer his/her usual residence from a tertiary country on the European Union customs territory. The condition of approving import customs tax exemptions is imposed by the fact the respective person make the proof of his/her marriage, and the usual residence from the tertiary country be held minimum 12 months. The goods having customs tax exemption be entered in a regime of free circulation at least two months before the marriage and not late than four months from the date of the wedding. As well as these goods can not be lent, transferred with payment or for free, rented or constitute guarantees for a period of at least 12 months.
- The personal goods acquired on a heritage way, except the commercial means of transport and the articles used in exercising different jobs or professions, others the portable instruments used in the applied or liberal arts, which where necessary in exercising the job or the profession of the dead person. He respective goods can be imported in many transports, but the condition of approving customs tax exemptions is determined by the entrance of the goods in free circulation in maximum two years.

- The means of production and other imported equipments in the same time with the transfer of the activity from a tertiary state inside the Community, if they are used for similar activities on the communitarian customs territory. The granting of the exemption is conditioned by the use of means of production and equipments at least 12 months at the company that ceased its activity within the tertiary state. There exists no tax exemption for the enterprises of which transfer on the customs territory of the Community is the result of a merger or acquisition from the part of an enterprise set up on the customs territory of the Community, without changing the style of activity. As in the previous situations, granting customs tax exemptions is conditioned by the free circulation of the respective goods. As well as in the case when these goods can not transferred by paying or for free or be lent or standing as a guarantee at least 12 months from their entry on the customs territory.
- Products obtained by the communitarian farmers out of their properties situated in a tertiary country, materialized in agricultural, zootechnical, bee, horticulture, or forest products. The products must be harvested from their own properties situated in tertiary countries bordering the communitarian customs territory. In order to apply the customs tax exemption the zootechnical products must be derivatives from the animals originated within the communitarian countries or have already entered in free circulation on its territory. The exemption also applies if the respective products did not suffered special treatments, but only the ones necessary for the harvesting or production and are brought in the customs territory of the Community by the agricultural producer or their representatives.
- The seeds, fertilizers and products used for soil treatment and imported harvests from the tertiary countries in order to be used on neighborhood properties. The customs tax exemption applies only to the quantity of seeds, fertilizers and other products necessary for the exploitation of the property and must be imported on the communitarian

customs territory by the agricultural producer or their representatives.

- The educational, scientific or cultural materials, the instruments and scientific equipments are exempted from the payment of customs taxes if they are used by the organizations or the educational, scientific or cultural institutions or other public institutions having as main responsibility the teaching or research activity. The same regime is applied to spare parts, accessories and the measuring equipment used for the quality control of the educational, scientifically or cultural materials on the condition they have the approval of the beneficiary state realizing the import in order to be customs tax exempted. The imported products submitted to customs tax exemption can not constitute the object of any lent, paid or free transfer, renting or guarantee, without informing the legal authorities.
- Instruments or apparatus meant to the medical research, sting up diagnosis or realizing medical treatments are also exempted from the import customs taxes, if they are offered as donation by a health organism having a charitable or philanthropic character or by a private person to the health organizations, hospital services or medical research institutions designated by the legal authorities of the member states to receive such kind of objects or which are bought under the above mentioned circumstances exclusively with funds of the supplying organism having the philanthropic or charity character or by voluntary contributions. The customs tax exemption is conditioned by the fact that the respective donation does not constitute the object of a commercial transaction or there must not exist a link between the producer of such a product and the donator.
- Goods for the charity organizations or philanthropic ones: articles for the blind or for other people with handicap, are exempted of import customs taxes. These goods must be distributed freely by the state organizations or other philanthropic organisms and associations legally authorized. Such kind of goods can not constitute the object of any commercial transaction, paid or free

transfer or guarantee. It is the same procedure in the case of products used by handicapped persons or of the victims of a catastrophe.

- The carburetors and the lubricants existing on board of vehicles, on land and on containers having special destinations, under the conditions they be stored in normal reservoirs or portable ones, and the automobiles be used for tourism. The respective fuel must be used that only purpose its trade or storing being forbidden. By the Regulation (CE) no. 1186/2009 of the European Union Council there has also been set up other facilities for the automobiles of persons having their residence in a border area.

The materials used for the building up, maintaining or ornamenting memorials or war victims cemeteries, if they are imported by legally authorized organizations and consisting of: coffins containing bodies or urns with ashes of some dead people, and also flowers, wreaths and other ornamental objects brought by persons having their domicile in a tertiary state but taking part to a funeral or to the decoration of a monument situated on the European Union customs territory.

Within the regulation (CE) no. 1186/2009 of the European Union Council there have been settled other fields for the application of the customs tax exemption for the import of goods, such as: alcoholic, tobacco or their derivatives and means of transport.

The European Council through its Regulation (CE) no. 1186/2009 has mentioned customs tax exemption for the export of goods as follows:

- Sends with no significant value by mail or parcel post containing goods of a total value not bigger than 10 Euros.
- Domestic animals component parts of cattle farm which stopped functioning on the customs territory of the community and transfers its activity in another tertiary country. The condition applies for a certain number of domestic animals adequate to the nature or dimension of the agricultural enterprise.
- Products obtained by the agricultural producers with activities on properties situated in the Community, on properties bordering a tertiary country, led by persons having the quality of owners or

concessionaires having their main enterprise in a tertiary country, bordering the customs territory of the Community. The condition of export customs tax exemption being that the respective products be obtain as derivatives of the animals which are originally of the tertiary country to the customs community territory or satisfy the requirements for free circulation in the tertiary country. Customs tax exemption is also applied if the respective products did not suffered any treatment, except those that follows normally the harvesting or their producing.

- Seeds exported by the agricultural producers for the use on the properties situated in tertiary counties are exempted of export customs taxes if they are used in countries bordering the customs territory of the Community by the owners or concessionaires of the respective grounds. At the same time the respective products must be exported in the name or directly by the agricultural producer and their main enterprise be situated in the immediate proximity of the customs territory of the European Community.

The application of the Regulation (CE) no. 1186/2009 of the European Union Council does not prevent the member states from customs tax exemptions settled by:

- Viena Convention regarding the diplomatic relations from April 18 1961;
- Viena Convention regarding the consular relations from April 24 1963 or other consular conventions;
- New York convention regarding the special missions from December 16 1969;
- The provisions of the international conventions or the agreements regarding the settlement of headquarters at which they are contracting parts or a tertiary country or international organization where the component countries of the European Union obtained privileges;
- Cultural, scientific or technical cooperation agreements at which the member states of the European Union are parts, for the obtained privileges;
- Agreement settled with the tertiary countries stipulating common measures for the protection of persons or the environment, for the obtained privileges;

- Chicago Convention regarding the agreements settled on a mutual basis regarding the international civil aviation from 1944.

The modernizing measurements of the customs legislation, settled by the European Union Council are influenced by the customs policy of each member state. Thus, each component state is obliged to inform the European Union Council about the settled conventions and treaties in order to take into consideration the settling of the communitarian customs policy.

3. Romania's preoccupations for modernizing the customs system and the control of tax evasion

Romania as European Union member state is obliged to respect the provisions of the Regulation (CE) no. 1186/2009, especially due to the fact that it is situated at the border of a customs territory. In order to prevent the tax fraud by The Emergency Ordinance no. 54/2010, the Romanian Government has settled a series of measures for the control of tax evasion and collecting to the budget of the state of customs taxes, of the value added tax and of the excise duties of the merchandise resulting from the imports or intra-community transfers.

In this direction there has been settled the introduction of the intra-community Operators Register comprising all the persons submitted to taxation and the juridical persons which are not submitted to taxation and which make intra-community operations. In the absence of registration in Register these persons do not have a valid VAT code for intra-community supplies. There have also been settled extra rules for the inverse taxation regarding the value added tax of some categories of products such as: cereals, technical plants, vegetables, fruits, meat sugar etc., and the level of the excise duties for cigarettes.

By the normative act mentioned above there have been made some specifications concerning the trade of merchandise in a duty-free regime, thus obliging economic operators to introduce goods into the shops in order to be sold, only after the payment of the excise duty, value added tax and customs taxes, according to the situation of the respective products.

4. Conclusions

The preoccupation of the European Union for tax evasion control by modernizing the customs legislation leads to the growth of the incomes to the budget of the Union and implicitly to the budget of the member states. Because customs taxes, the value added tax and the excise duties are consistent sources to the budget of the member states, the decisional boards of the European Union have considered that the applied measures lead to their growth and implicitly to the control of tax evasion. Romania in its quality of member state of the European Union, being geographically situated to the border of the customs territory of the Union, has the obligation to apply the respective legislation and prevent tax evasion.

From Basel II to Basel III — Changes, Improvements and Proposals

Munteanu Irena
Faculty of Economic Sciences
„Ovidius” University of Constanta
irena.munteanu@yahoo.com

Abstract

BASEL III is a global regulatory standard on bank capital adequacy, stress testing and market liquidity risk agreed upon by the members of the Basel Committee on Banking Supervision in 2010-11. [1]

The third installment of the Basel Accords was developed in response to the deficiencies in financial regulation revealed by the late-2000s financial crisis. Basel III strengthens bank capital requirements and introduces new regulatory requirements on bank liquidity and bank leverage.

For instance, the change in the calculation of loan risk in Basel II which some consider a causal factor in the credit bubble prior to the 2007-8 collapse: in Basel II one of the principal factors of financial risk management was out-sourced to companies that were not subject to supervision, credit rating agencies. Ratings of creditworthiness and of bonds, financial bundles and various other financial instruments were conducted without supervision by official agencies, leading to AAA ratings on mortgage-backed securities, credit default swaps, and other instruments that proved in practice to be extremely bad credit risks. In Basel III, a more formal scenario analysis is applied (three official scenarios from regulators, with ratings agencies and firms urged to apply more extreme ones).

Cuvinte cheie: banking regulation, liquidity requirements, bank capital requirements, interest rates

Clasificare J.E.L.: G21; G28

1. Introduction

The Basel Committee on Banking Supervision (BCBS)[2] is a committee of banking supervisory authorities that was

established by the central bank governors of the Group of Ten countries in 1974.[2] It provides a forum for regular cooperation on banking supervisory matters. Its objective is to enhance understanding of key supervisory issues and improve the quality of banking supervision worldwide. The Committee also frames guidelines and standards in different areas - some of the better known among them are the international standards on capital adequacy, the Core Principles for Effective Banking Supervision and the Concordat on cross-border banking supervision.

The Committee's members come from Argentina, Australia, Belgium, Brazil, Canada, China, France, Germany, Hong Kong SAR, India, Indonesia, Italy, Japan, Korea, Luxembourg, Mexico, the Netherlands, Russia, Saudi Arabia, Singapore, South Africa, Spain, Sweden, Switzerland, Turkey, the United Kingdom and the United States. The Committee's Secretariat is located at the Bank for International Settlements (BIS) in Basel, Switzerland. However, the BIS and the Basel Committee remain two distinct entities.[3]

2. Basel II, 2.5 and III

Basel II is the second of the Basel Accords, (now extended and effectively superseded by Basel III), which are recommendations on banking laws and regulations issued by the Basel Committee on Banking Supervision.

Basel II, initially published in June 2004, was intended to create an international standard for banking regulators to control how much capital banks need to put aside to guard against the types of financial and operational risks banks (and the whole economy) face.

One focus was to maintain sufficient consistency of regulations so that this does not become a source of competitive

inequality amongst internationally active banks. Advocates of Basel II believed that such an international standard could help protect the international financial system from the types of problems that might arise should a major bank or a series of banks collapse. In theory, Basel II attempted to accomplish this by setting up risk and capital management requirements designed to ensure that a bank has adequate capital for the risk the bank exposes itself to through its lending and investment practices.

Generally speaking, these rules mean that the greater risk to which the bank is exposed, the greater the amount of capital the bank needs to hold to safeguard its solvency and overall economic stability.

Politically, it was difficult to implement Basel II in the regulatory environment prior to 2008, and progress was generally slow until that year's major banking crisis caused mostly by credit default swaps, mortgage-backed security markets and similar derivatives. As Basel III was negotiated, this was top of mind, and accordingly much more stringent standards were contemplated, and quickly adopted in some key countries including the USA.

The Financial Stability Institute (FSI) has conducted surveys in the past on subjects of supervisory interest and shared the findings with the supervisory community. The FSI conducted a survey on Basel II implementation in 2004, which was followed by updates in 2006, 2008 and 2010.

In 2012, the FSI carried out a survey on the implementation of Basel II, 2.5 and III in jurisdictions that are neither members of the Basel Committee on Banking Supervision (BCBS) nor members of the European Union. The methodology used in this survey is similar to the one adopted by the BCBS in October 2011 for its progress report on Basel III implementation. The FSI sent out an email to banking supervisory authorities in selected jurisdictions asking them to submit their responses to the enclosed questionnaire.

In line with the BCBS's approach, the FSI is publishing the results of its survey by disclosing the information received from 70 countries. Therefore, the results of this survey are being treated differently from those of past surveys, where the FSI published only the aggregated results.

The FSI will be updating the results of this survey every year from March 2013 onwards so that the jurisdictions (which are not members of the BCBS and/or the European Union) can provide up-to-date information regarding the status of their implementation of Basel II, 2.5 and III.

3. From Basel II to Basel III – Changes and Proposals

Calendar of major decisions that led to the transition from Basel II to Basel III is:

June 30, 2006

- Basel II: International Convergence of Capital Measurement and Capital Standards: A Revised Framework - Comprehensive Version

July 13, 2009 – Package

- Enhancements to the Basel II framework, “Enhancements”
- Revisions to the Basel II market risk framework, “Market Risk Revisions”
- Guidelines for computing capital for incremental risk in the trading book, “IRC Guidelines”

December 17, 2009 – Proposals

- Strengthening the resilience of the banking sector, “Capital Proposals”
- International framework for liquidity risk measurement, standards and monitoring, “Liquidity Proposals”

June 18, 2010

- Adjustments to the Basel II market risk framework announced by the Basel Committee

July 16, 2010 – Proposals

- Countercyclical capital proposal, “Countercyclical Capital”

July 26, 2010 – Agreement

- Capital and liquidity agreements

August 19, 2010 – Proposals

- Proposal to ensure the loss absorbency of regulatory capital at the point of non-viability

September 12, 2010

- Group of Governors and Heads of Supervision announces higher global minimum capital standards

October 18, 2010

- The Basel Committee’s response to the financial crisis: report to the G20

November 10 – 11, 2010

- G-20 Meetings in Korea

December 16, 2010

- Comprehensive documentation and proposals [4]

4. The new Basel III capital requirements

The new Basel III standards are fundamentally different from the Basel I and Basel II standards in that their scope is much broader and the measures they propose are both micro-prudential (addressing bank-level risks) and macro-prudential (system-wide risks that can build up across the banking sector) in nature. [5]

Micro-prudential standards refer to [6]:

(i) raising the quality of the capital base by increasing the regulatory equity requirement (common stock and retained earnings) and the required ratio of Tier 1 equity (own capital and hybrid instruments), as well as by introducing stricter eligibility criteria for the instruments that may be taken into consideration upon determining Tier 1 equity;

(ii) enhancing risk coverage, with a focus on the risks highlighted by the crisis, such as trading book exposures, counterparty credit risk (CCR), securitisation exposures and securitisation positions;

(iii) supplementing the risk-based capital requirement with a leverage ratio;

(iv) introducing global liquidity standards meant to ensure short-term (30 days) resilience to shocks/liquidity disruptions and to address longer-term (1 year) structural liquidity mismatches (by funding long-term assets with at least a minimum amount of stable liabilities).

Basel III will require banks to hold 4.5% of common equity (up from 2% in Basel II) and 6% of Tier I capital (up from 4% in Basel II) of risk-weighted assets (RWA).

Basel III also introduces additional capital buffers:

(i) a mandatory capital conservation buffer of 2.5% and

(ii) a discretionary countercyclical buffer, which allows national regulators to require up to another 2.5% of capital during periods of high credit growth. In addition,

Basel III introduces a minimum 3% leverage ratio and two required liquidity ratios. The Liquidity Coverage Ratio requires a bank to hold sufficient high-quality liquid assets to cover its total net cash outflows over 30 days; the Net Stable Funding Ratio

requires the available amount of stable funding to exceed the required amount of stable funding over a one-year period of extended stress. [7]

The proposals in summary:

- ✓ Tightening the capital requirements
- ✓ Raising the quality, consistency and transparency of the capital base through stricter rules on eligibility of instruments to be included in capital and introduction of a new core Tier 1 ratio, “Common Equity Tier 1” (CET1)
- ✓ Enhancing risk coverage through ‘strengthening’ counterparty credit risk capital requirements arising from derivatives, repurchase transactions and securities financing
- ✓ Supplementing risk-based capital requirements with a non-risk-based leverage ratio Reducing pro-cyclicality and promoting countercyclical capital buffers
- ✓ Introducing a global liquidity standard comprising a stressed liquidity coverage ratio and a longer-term structural liquidity ratio
- ✓ Addressing systemic risk and interconnectedness, with more specific proposals promised.

5. Conclusions

The Basel Committee on Banking Supervision has received a number of interpretation questions related to the December 2010 publication of the Basel III regulatory frameworks for capital and liquidity and the 13 January 2011 press release on the loss absorbency of capital at the point of non-viability.

As regards the global nature of the _ nancial system, banks are internationally active, supervisory authorities are con_ ned to national jurisdictions, while risks in a particular country are not necessarily linked to risks in another country, even assuming similar competitiveness conditions among banks.

For these reasons, it was decided to comply with national authorities’ decisions on the measures to maintain _ nancial stability at a national level. Thus, the level of the countercyclical buffer will be set by the supervisory authorities in the jurisdictions where the obligors are located, irrespective of

the creditor’s country of origin. The decision on the capital buffer level taken by the authorities in the host country shall be binding upon banks and supervisory authorities in the country of origin (up to 2.5 percent). The buffer that will apply to each bank will reflect the geographic composition of its portfolio of credit exposures. Internationally active banks will calculate their countercyclical capital buffer requirement as a weighted average of the buffers that are being applied in jurisdictions to which they have an exposure.

For an internationally active bank, the reliance on its geographic exposure and the elimination of the arbitrage risk are key components of an effective protection mechanism of the European financial system, since they allow stability to be preserved even within a financial system characterised by relatively high volatility of capital flows (as is the case of Romania). Furthermore, the countercyclical capital buffer needs to be determined and held at individual, sub-consolidated and consolidated level. [8]

The OECD estimates that the implementation of Basel III will decrease annual GDP growth by 0.05-0.15%. Outside the banking industry itself, criticism was muted. Bank directors would be required to know market liquidity conditions for major asset holdings to strengthen accountability for any major losses. [9]

The companies is not looking forward to the year 2013—when banks start complying with strict new Basel III banking rules that will require them to dramatically increase their capital over several years.

The expectation is that this is going to increase overall costs for corporates and companies. To the extent that banks are being asked for a lot more capital, they only have two choices at the end of the day—either accept lower returns or find ways to increase their pricing to offset some of those costs.

The dilemma that all corporate treasurers face is in anticipating which particular financial services they will wind up paying more for—or earning less from. The Basel Committee of the Bank for International Settlements’ new rules will require all banks—including the 23 that IP does business with—to more than triple their core Tier 1 capital from 2% of risk-weighted assets to a minimum of 7% by 2019. Made up of

common equity and disclosed reserves—or retained earnings—core Tier 1 is “the most expensive” type of capital that a bank hold. As a result, it predicts that banks will stop looking at profitability per transaction and start looking more closely at overall profitability per client. [10]

The new rules are intended to shore up the global financial system and prevent a repeat of the debacles that brought down Lehman Brothers and Bear Stearns in 2008. But rather than rejoice at rules that are intended to reduce overall risk in the global financial system, senior managers of banks around the globe that are starting to comply with Basel III are quick to identify a litany of brutal impact points for their corporate clients, ranging from a drop in already-low interest rates on deposits to dramatic increases in interest rates on loans.

The Leasing Market in Romania

Munteanu Irena
Faculty of Economic Sciences
„Ovidius” University of Constanta
irena.munteanu@yahoo.com

Abstract

The leasing market in Romania is made up of thousands of businesses that meet the two conditions required by law for operators in this market, namely: inclusion of "leasing activity" in the subject of activity and social a capital of RON 50.000, more than 270 companies are active 39 and have notified the National Bank of Romania (NBR) as being finance leases, and of these 34 members ASLR, holding a market share of approx. 48%.

The leasing market in Romania is structured (and percentage in the ASLR): (i) leasing companies affiliated to banks (30%); (ii) leasing companies affiliated to producers or suppliers of products (15%); (iii) independent leasing companies (55%).

Recent legislative changes have led to cancellation of tax incentives for leasing operations. The paper captured the effects on the leasing market in Romania.

Cuvinte cheie: leasing, leasing market, loan

Clasificare J.E.L.: G10; G21

1. Introduction

Leasing is a process by which a firm can obtain the use of a certain fixed assets for which it must pay a series of contractual, periodic, tax deductible payments.

The lessee is the receiver of the services or the assets under the lease contract and the lessor is the owner of the assets. The relationship between the tenant and the landlord is called a tenancy, and can be for a fixed or an indefinite period of time (called the term of the lease). The consideration for the lease is called rent. A gross lease is when the tenant pays a flat rental amount and the landlord pays for all property charges

regularly incurred by the ownership from lawnmowers and washing machines to handbags and jewellery.[1]

Under normal circumstances, a freehold owner of property is at liberty to do what they want with their property, including destroy it or hand over possession of the property to a tenant. However, if the owner has surrendered possession to another (the tenant) then any interference with the quiet enjoyment of the property by the tenant in lawful possession is unlawful.

Similar principles apply to real property as well as to personal property, though the terminology would be different. Similar principles apply to sub-leasing, that is the leasing by a tenant in possession to a sub-tenant. The right to sub-lease can be expressly prohibited by the main lease.

In Romania, the lease is regulated by Government Ordinance no. 51/1997, republished in the M.O.R. no. 9 / 12.01.2000, leasing operations into a new category of acts of trade which adds to the provisions of art. 3 Commercial Code.

Leasing operations subject it may be real estate, durable movable under the civil circuit, except the audio tape recordings and videos, plays, manuscripts, patents and copyright. Statistically, the leased it formed special computer equipment, devices and instrumentation, vehicles, machine tools, agricultural machines. The user can choose to purchase the property before the end of the lease, if the parties so agree and if the user pays all obligations under the contract.

2. Leasing companies- Non-bank financial institutions

The activity carried out by NBFIs in Romania focus on _ nancial leasing operations, which account for about 75 percent of total loans extended by this sector.

The worsening macroeconomic conditions had a negative impact on financial leasing operations in the EU, most member states reporting a lower volume of loans granted. The depth of the financial leasing market in Romania is similar to that of Poland, France or Greece, yet below that of Hungary and Austria.

The loans granted by NBFIs are particularly channelled to non-financial corporations that hold a share of roughly 75 percent of total. With regard to the concentration of NBFi loans by economic sector, the exposure to companies in the services sector is prevalent. (52.2%).

Considering the specific activity, credit risk is the main challenge for the undertakings in this sector. Recent macroeconomic developments made a significant contribution to the rise in non-performing loan ratio of NBFIs. However, as compared with 2009, loan portfolio quality deteriorated at a slower pace, following a trend similar to that of credit institutions. As a result, provisioning costs were further high, but provisioning was slower, the quarterly costs related to new provisions standing below those recorded in the same periods of 2009.

3. The structure of the leasing market

Leasing as a means of financing registered a downward trend in recent years.

The leasing market in Romania recorded in 2009 a volume decrease funding by 25-30% compared to 2008, mainly due to reduced auto and real estate transactions segments and amid international turmoil. In 2008, auto reached 3.38 billion euros, equipment and funds totaled 1.082 billion euros.

Auto leasing segment in 2008 remained the main business profile companies, accounting for 71% of the market, equipment leasing represented 22%, while real estate segment deleasing weighed 7% of the overall market (Chart 1)

Funding for the purchase of vehicles fell last year more than the market average, 75.2% respectively at 839.58 million euros. Also, equipment segment fell by 75.9%, to 261.15 million euros. The real estate segment was 34% lower at 232.64 million euros. In financing transport vehicles have a share of 61%, 21% heavy commercial vehicles, 16% vans and other vehicles a rate of 2% of the total. Funding of transport recorded a decline of about 72% in the cars and light commercial vehicles. Largest decrease, 81% occurred in the heavy commercial vehicles. Auto leasing market used to revived in 2009, as leasing companies have turned to leasing segment car used for business in 2009, while the volumes of sales in this segment increased. In the first half of 2008, auto leasing market used 5% of the total auto financing. [3].Auto leasing market reached 2.1 billion at the end of June 2009, accounting for 80% of total leasing market (chart 2)

The contract period is longer with the monthly rate is lower and the customer can easily pay. A long period of funding usually results in the accumulation of larger amounts to be reimbursed.

In terms of the lease term, the most common period is 4-5 years years (33%), followed by 3-4 years (28%) 2-3 years (18%), over 5 years (13%) 1-2 years (5%) and 1 year (3%).

4. Leasing for vehicle vs. loans in 2011

In 2011, only leases on vehicles on an increase over the previous year, but in a very low level of only 0.67%.

Total value of leasing contracts in 2011 is 4817.654 thousand euros, of which the vehicle is financed through leasing 3383.806 thousand euros of equipment 1082.011 thousand euros, and the property financed by leasing 351,837 thousand euros.

Looking in more detail on the financing structure leases vehicles for 2011, they note that car leasing financing remains the main client application (to an extent of 55%), followed by demand for heavy commercial vehicles in a much smaller, only 27%, and light commercial vehicles (15%), the remaining 3% being the other devehicule.

In terms of the duration of the lease in Romania in 2011, the largest share of 33% o have carried out contracts lasting 4-5 years, followed by contracts with duration of 3-4 years (28%) and that the contracts with duration of 2-3 years 18%. But less were the contracts for more than five years (only 13%) and those 1-2 years (5%) or 1 year, holding the other, the monkey represents only 3% .

In 2011, leasing and auto loans had annual percentage rates of about 13-14% per year. Both the loans and leasing, the cost of borrowing in domestic currency loans equaled that of the euro and often meet in local currency loans that are even cheaper than the currency. Instead, leverage low and

high feed make a product more disadvantageous lease for residential customers than bank credit.

So, who plans to buy a car and have no savings can not access a product leasing. Minimum down payment charged by lenders in the industry is about 10-15% and can go up to 50% of the purchased vehicle.

Banks usually do not charge advance personal loans. For auto loans, banks require advance, but there are players in the market who are willing to finance their property without any input from the client.

One is the Romanian Commercial Bank. An impediment to purchasing a car lease could be low level of debt (share of income customer rate) allowed companies.

If a commercial bank if it can climb to 40-50% of the eligible income of the debtor, the most leasing companies can be more than 30-35% of income. Times, a loan is granted usually leased for a period not exceeding four to five years.

5. Conclusions

It finds that leasing companies have subsidiary banks throughout the period analyzed the largest share, while recording a permanent upward trend, until 2010, in contrast to captive companies, whose share of total assets financed continues to decline.

In 2011, however, is a decrease of 1% at the expense of captive leasing companies, plant whose contribution to total assets increased by 2%, while independent companies share equally decreased, reaching 18%.

Thus, the end of 2011, the market is dominated by companies belonging to large financial and banking groups (63%), followed by captive producers (19%) and independent companies (18%).

This concentration of volume in most dominated by companies belonging to banking groups is part of the classical dynamics of the leasing market development.

The main sources of funding in recent years calling Romanians, to purchase car leasing cars are the loan. Each one of the two options has advantages and disadvantages, significant differences between the two versions is the cost you.

To determine the costs involved by the two types of funding, is necessary to compare

the values and lesingului auto loan based on common criteria.

If the funding type option lease or loan the most important indicator of cost efficiency is the annual percentage rate (APR), because it offers a high degree of comparability between apparently similar financial products.

APR expressing total costs of a loan, accumulating interest, commissions and / or other fees. Funding advantage realized by leasing costs lower than for personal loan, being comparable with those for auto loans. Regarding the loan currency, while finance lease is offered predominant type in euro, personal loans and the car are offered both in domestic and foreign.

To obtain a lease is required but an advance of at least 15-20%, and by the agreement of the leasing company is the sole owner of the car. However, insurance is concluded by the insurance company agreed list and pay the legal costs.

In 2012 it expected a 10-15 percent growth, last year, but fortunately the leasing market went up 20 percent. We believe the leasing market is to see a 10-15 percent rise, this year, as it benefits from all required investments, and there is demand for leasing products on the Romanian market.

There are postponed projects in the infrastructure, whose negotiations unfortunately were not reached, but we hope they will be unblocked.

We are trying to switch the offer to lei, but clients prefer euros, because they make family budgets in euros. As far as the phone bills or other bills are calculated according to the euro's exchange rates, automatically everything is calculated in euro.

The Romanian leasing market grew from 1.121 billion euros, in 2010 to 1.349 billion euros, in 2011. The leasing market for cars increased by 29 percent, namely from 712 million euros, in 2010, to 917 million euros, in 2011, whilst that for equipment advanced 43 percent, namely from 238 million euros, in 2010, to 339 million euros, last year.

On the other hand, the real estate market dropped 46 percent, namely to 93 million euros. As much as 68 percent of the leasing market means car leasing, 7 percent of it stands for the real estate financing and 25 percent for the equipment leasing.

Implications of Financial Crisis on the Savings Plan for a Family in Romania

Negoescu Gheorghe

”Ovidius” University Constanta, Faculty of Economics

negoescugl@yahoo.com

Romano Oana

Abstract:

Some of the effects of the financial crisis are obvious when you open the wallet or going to the Bank, but the crisis may have a powerful impact on the lives of the couple. In difficult times, decrease in income can affect profoundly the life of couple and family. For married couples, the crisis could mean loss of revenue can affect intending to children.

Keywords: crisis, savings, financial, resource

JEL: M21 - Business Economics

“1. Introduction”

Lack of money or the desire to reach more easily they can be reasons to protect them not to have to go through the same negative experiences of professional parents were subjected. Lost sight of the fact that you can only work performance in any area and only in circumstances in which you have the skills necessary for that trade or profession. Reduced costs for the family budget adjustment must be made in consensus by both partners. Decreased revenues may lead to lifestyle changes a couple times in the relations of interest are more likely to fall apart.

A country's economic development takes place in two stages, depending on the motivation of this development, namely:

- A necessary first step is the transition from poverty to a decent standard of living generally. This means that each family to succeed to secure cash income to cover his needs for food, clothing, housing, education, health, etc., that those needs that

are common to all individuals, regardless of origin, culture, gender or race.

The size of these needs depends, of course, from person to person, so the development of society, and the level of individual development;

- In a second phase transition is needed to complement the qualitative standards of living secured in the first stage, and by meeting other necessities - in culture, education, individual transport, informatics, health services, tourism, sports, entertainment, recreation, maintenance, repairs, etc., and improving the social climate, political, labor, family, etc.. All these needs evolve naturally as society and individual development.

Given the above, we can say that the first priority of economic development of Romania is organizing a mass production of consumer goods and infrastructure, to ensure higher standards of living of all citizens of the country.

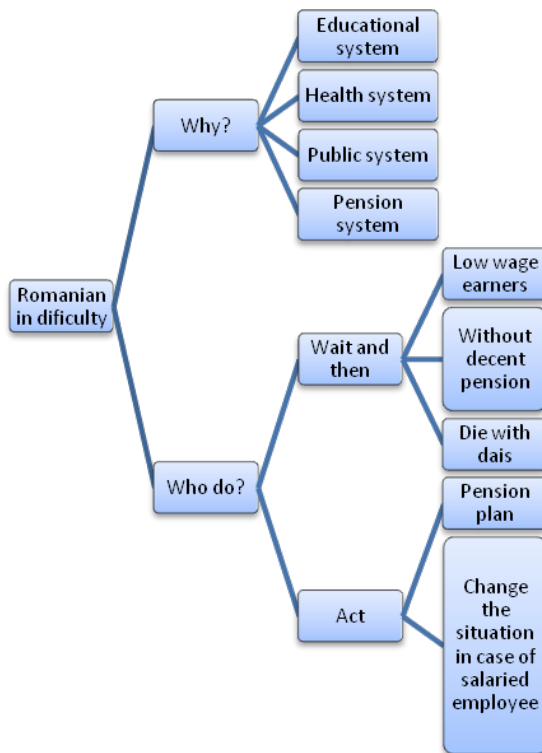

Romanians who have participated ideal body and soul since 1989 was the transition from a centrally planned social dictatorship, to a capitalist economic and social system, characterized by democracy and freedoms.

This goal was realized, in general, could make the transition from central plan economy based only on an economy based on free market only. If the socialist economic mechanism was based on planning, but did not exclude market, capitalist economic mechanism is based on the market, but does not preclude planning. Being not understand this fact, in former socialist countries, so also in Romania, was dropped completely in planning macroeconomic actually gave meaning to a modern and effective management tool to Socio-economic imperative in transition from socialism to capitalism.

Financial crisis in 2008 in Romania has resulted in lower revenues for each family,

with devastating consequences for elderly people, unless they take precautions during the active life. It is obvious that Romania is currently experiencing a difficult period and if no action is taken, Romania, the country is likely to fail and then disappear as a country (Figure 1):

Figure no. 1: Romania likely to fail

Source: Own contribution

Romania's population decrease in 2012 compared to 2000 by about 2 million people, gives a signal to the active population that will have difficulties at the age of III, because the current pension system is not credible. In these circumstances, the principle of "peasant car makes its winter and summer sled", each of us must have a different approach to the concept of spending the income. I will propose a distribution of savings by 4-saving systems on a "go to market when eggs are put in several baskets" namely[1]:

- 7.5% in lei deposits with monthly capitalization, land, houses or jewelry;
- 7.5% shares or bonds to mutual funds with a history of five years the rate of

gain was higher than the inflation rate 10%;

- 7.5% pure gold bullion purchases of 24 carats;
- 7.5% background risk, in starting a business.

"2. The human resource"

Human resources can be measured by net income during active indicator. Assuming that a man has 40 years working life and earn on average 1,500 Euro when its value is: $40 \text{ years} \times 1500 \text{ E / month} \times 12 \text{ months / year} = 720,000\text{Euro}$

In a more pessimistic assumption (but closer to the truth) if a man earns on average 500 euros per month throughout the active, then its value is:

$500\text{E/lună} \times 40 \text{ years} \times 12 \text{ months / year} = 240,000\text{Euro}$

The conclusion resulting from these calculations is that one can not live decently, especially single parents, from a salary. Consequently, it became a necessity to earn money from several activities [2].

"3. Money Quadrant"

Robert Kiyosaki has shown that there are four quadrants in which a man can earn money: employee, self-employed, employer, investor (figure no. 2).

Figure no. 2: Money Quadrant

Source: Own contribution

In my opinion, after 2008, entrepreneurial skills have become a necessity for all of us and no longer a luxury for people with specific skills [3].

Need for entrepreneurial knowledge [4] is true conception machine, vacuum cleaner, computer or mobile phone (Figure no. 3)

Figure no. 3: *Luxury or necessity*

Year, conception, movable	Year	Conception
Car	1960	Luxury
	1990	Need
Vacuum cleaner	1970	Luxury
	1995	Need
Computer	1990	Luxury
	2000	Need
Mobile phone	1995	Luxury
	2006	Need
Entrepreneurial	2000	Luxury
	2008	Need

"4. Conclusion"

Each family in Romania suffered financial contract, meaning that after 2008, family incomes have declined significantly in terms of purchasing power. Increased incidence of loan payment due from banks, reducing wages and pensions and increase VAT from 19% to 24%, confirming the downward trend in the purchasing power of families in Romania.

A Review on the Assessment of Public Debt Sustainability

Nicolescu Cristina

West University of Timișoara, Faculty of Economics and Business Administration
cristina.nicolescu@feaa.uvt.ro

Abstract

In light of the growing public debt, the issue of debt sustainability has increasingly attracted attention. At least half of the EU countries will have to implement stringent fiscal consolidation programmes over the next few years in order to prevent already high public-debt-to-GDP ratios from a further significant rise, also the case of Romania. However, drastic fiscal policy adjustment may be not feasible in the short term and hence public debt is likely to grow further.

Key words: public debt, fiscal policy, fiscal sustainability, GDP, fiscal consolidation.

J.E.L. Classification: H63, H30, H69, H60, H59.

1. Introduction

Sustainability can be assessed in other terms but the size of the accumulated stock of public debt. Even with an indebtedness degree of 20%, budget and fiscal policies may be unsustainable if, for example, that State is unable to pay its obligations arising from the contracted public loans, so if it is not creditworthy.

Public debt's sustainability can be represented as a relationship between the budgetary balance (surplus or deficit and public debt, for any annual GDP growth rate. There are two versions of the mentioned relationship, depending on considering the consolidated or primary budgetary surplus/deficit.

2. A review on the assessment of public debt sustainability

For some time, the recent rise in government budget deficits and debts worried mainly academics, policy makers

and politicians. In the beginning of 2010 the financial markets questioned the solvability of some member states, leading again rising to sovereign bonds spreads and finally to urgent and drastic actions of the EU and IMF to support Greece and other threatened member states.

From the literature review on sustainable debt levels we derive four indicators that appear to be useful for the assessment of debt sustainability. (Lejour et. al., 2010). [1]

First, the forward looking sustainability gap indicator which shows the distance in terms of primary surplus as a percentage of GDP from a stable debt-ratio.

Second, the backward looking sustainability gap indicator which indicates whether the current debt level is commensurate with the debt-ratio that would be sustainable if augmented primary surpluses, interest rates and GDP growth rates would remain at their average level of the recent past.

Third, the debt-to-government revenue indicator that was on average 350% for emerging market economies that defaulted since 1998 and 250% for non-defaulting countries (Callen et al., 2003). [2]

And finally, the debt-to-GDP ratio for which a threshold value of 90% can be associated with below-median GDP-growth (Reinhart and Rogoff, 2010) [3]; hence, it is likely that maintaining debt-ratio's around 90% or higher is more difficult and thus less sustainable than debt-ratio's at a more modest level.

In Europe, government debt and budget deficits are not only considered as a national issue, but also as a European matter. Our article takes into account the international dimensions of government debt in particular in the EU member states. Many of the spill over channels between countries are also apparent between countries outside the Euro zone, but they are more intensive in a common currency area.

Identifying these spills over channels is also a first step to assess the probability of a debt crisis and to understand the mechanisms of such a crisis. (Lejour et. al., 2010). [1]

The first externality is higher inflation expectations in the euro zone. The argument is that high debt in one country could only be recovered with inflation such that the central bank is urged to raise the overall inflation rate in the union and affecting price stability in other EMU countries.

Fischer et al. (2002) [4] show that larger budget deficits exert an upward pressure on inflation in developing countries in cross sections and panel regressions. However, these effects are insignificant in developed countries. Canzoneri et al. (2001) [5] confirm these results by showing that government debt in Europe and the US is not a significant determinant of the price level.

The second externality is a higher rate of interest on government debt. Every Euro zone country issues its own bonds with a national rate of interest. However, the high interest rate of a particular country could exert an upward pressure on the interest rates in other countries (perceptions of investors). This could even be the case for non-EMU countries, in particular if they have plans to join. This is closely connected to contagion and reputation issues which played a role in the Latino debt crisis and the Asia crisis.

Ardagna et al. (2007) [6] estimate for 16 OECD countries the effect of primary deficits and government debt on the nominal interest rate on 10-year government bonds in the period 1960 to 2002. In their preferred specification a one percentage point increase in the primary deficit to GDP ratio leads to a 10-basis point rise in the nominal interest rate. On the longer term a permanent increase in the primary deficit ratio has much larger effects: the nominal interest rate could increase by 70 basis points after five years and 150 basis points after ten years. The European Commission (2004) [7] reports in its literature overview a 20 to 100 basis points increase in the long-term nominal interest rates of government bonds, after having removed the insignificant results, suggesting that the Ardagna results are at the lower range. However they include the deficit and government debt simultaneously as explanatory variables while others do not.

Faini (2006) [8] focuses exclusively on the

EMU countries between 1979 and 2002 and distinguishes an EMU and national interest rates. An increase in the budget surplus of the EMU lowers the EMU interest rate with 41 basis points. The analogous effect at the country level is much smaller, only 3 basis points. The latter effect corresponds to the results of Chalk, N. and R. Hemming (2000). [9] Similar effects were found on the EMU interest rate for the US. This suggests that the quantitative impact of an expansionary fiscal policy in a member states on the EMU interest rates is much bigger than on the country spreads. Faini (2006) [8] concludes that there are substantial spill overs of national fiscal policies on the interest rate. The literature provides however a broad range of estimates on the size of the spill overs.

The effect of higher government debt (as ratio of GDP) on the interest rate is nonlinear. If debt increases, bonds become more risky. Ardagna et al. (2007) [6] conclude that if government debt is lower than (about) 60% of GDP an increase in debt could exert a downward pressure on the interest rate, but the direction of this effects switches if the debt is larger.

On the other hand, Faini (2006) [8] does not find strong evidence that the spill over effects of high debts on the interest rate and the country spread are larger than for low debts.

A third externality is that many European financial institutions hold bonds of other EU members. The data of the Bank of International Settlement (BIS) show that these cross-border holdings have increased substantially in the last decades. If there is a chance that the high debt country (partially) defaults, the assets of government bond holders will plummet. In uncertain times this could trigger a chain reaction. Currently banks hold a significant share of Euro zone debt and it is uncertain whether a breach in bank balance sheets caused by a sovereign default will lead to a chain reaction in the form of another banking crisis. Assessing the impact of such an event is crucial in determining whether such a spill over is significant.

A fourth externality is the stability of the euro vis-à-vis non-euro countries. Exporters benefit from a weaker euro, but imports become more expensive. The net economic

effect is not always clear and depends on the economic structure of a country. A deterioration of the euro in response to high debts in one or two member states has certainly an effect on the trading behaviour of euro members with non members. Moreover, financial markets interpret depreciation of currencies often as a sign of weakness of the economic development having adverse effects on stocks markets. A fifth externality is the transmission via the real economy due to budgetary decisions on the economies in other countries. Reinhart and Rogoff (2010) [3] argue that high government debt is often related to poor economic performance, although the causality is not heavily discussed.

Subsequently, poor economic performance affects other EMU economies, in particular via trade, FDI and R&D spill overs. The empirical literature estimates the spill over effects of trade (export and import) with VAR regression techniques. As an example, Giuliodori and Beetsma (2005) [10] estimate that a net tax reduction of 1% of GDP in Germany leads to a maximum 0.7% GDP increase in the Netherlands after seven quarters. After about four years the effect dies out.

We conclude that the long term effects are small although the short term effects are larger.

Concluding, there are that four methods available to assess sustainability of government debt:

- a) The sustainability gap indicators (Blanchard gap, over borrowing ratio);
- b) Benchmark indicator set of defaulting countries;
- c) Consideration of debt-to-GDP ratios in view of underperformance of GDP-growth once they exceed 90%;
- d) Primary surplus to debt feedback rule.

3. Conclusions

In many DMs and a few EMs, one should not forget that expansionary policies mitigated the adverse effects of the global crisis and very likely prevented a collapse of the global financial system and the world economy.

At the moment, it appears that a fiscal exit can take place only gradually. Future scenarios as well as debt target analysis

highlight that public debt has become, or is at least at the risk of becoming, unsustainable in many DMs but only in a few EMs. At least in theory, most EMs could afford to run looser fiscal policies, for instance by extending counter-cyclical fiscal policies in order to smooth the fall-out from the global crisis.

Moreover, moderate initial debt levels put them in a relatively comfortable position to stabilise or even outgrow their debt-to-GDP ratios. Only austere and bold fiscal policy adjustments after the worst of the crisis is over, which may lay the foundations for higher potential real GDP growth, lower real interest rates and improved fiscal accounts, would significantly alter the presented public debt dynamics. For some countries the permanent primary balances required to stabilise or even reduce public-debt-to-GDP ratios look very ambitious.

Nevertheless, the required economic and political efforts to consolidate public finances might be much greater than in the past. Overall, medium-term fiscal consolidation is more likely to occur in a supportive macroeconomic environment. During an economic downturn or recession, rising tax rates may not suffice to substantially increase the tax-to-GDP ratio.

Should consolidation fail policymakers in DMs and some EMs, one may be tempted to look for other ways to fix the fiscal damage. Either they could tolerate a substantial acceleration in CPI inflation to inflate public debt and/or they risk severe adjustments in the real effective exchange rate. Such adverse scenarios should not be disregarded. The assumption that major macro issues cannot go wrong in the DM world (including EMU) has to be scrapped in the aftermath of the global crisis while this time EM, not DM, economies are the ones in the lead to keep public indebtedness sustainable.

Abstract

The paper proposes a critical analysis, based on consistency criteria, regarding the controversial current state of the informational efficiency theory of the capital market (Efficient Market Hypothesis).

Nowadays, after several decades of research and thousands of studies, economists have not yet reached a consensus about the existence of efficient financial markets in terms of information. In the problematized approaches regarding the treated subject, one can find the inquiries on the validity of assumptions underlying the concept of informational efficient market and the informational efficiency theory of the financial market. In this sense, the critical approach is one that highlights the weaknesses, the vulnerable aspects that characterize the classical form of EMH theory, in order to exclude a cumulative process, achieved by extending or articulating the methodological and instrumental existing premises (based on optimality criteria - the current paradigm of economics), aiming their reconsideration and reconstruction.

Key words: efficient market hypothesis, information, rationality, price

J.E.L. Classification: G14, D8, G00

1. Introduction: market efficiency, in light of the classical EMH theories

Considerations concerning the efficiency of financial markets lay under two theories: random walk and the theory of efficient markets. The first theory, “random walk”, is the theory of random movement of the financial assets. Elaborated during the 6th decade of the 20th century, it supports the

idea that the future movement of an asset is independent from past movements of assets on a market. In 1900, in a theoretical study, Louis Bachelier anticipates the theory of efficient markets, stating that *stock market speculation* is a fair game, in which neither the sellers, nor the buyers, do not gain a net profit overall. We can thus say that the idea of an efficient market, as it is understood in today's literature, has its origins with Bachelier, which postulated the model of random steps: “Random Walk”, or “Fair Game”, reprinted in English in 1964's paper by Paul Cootner: “The Random Character of Stock Market Prices”. The origins of the EMH are also found with Paul Samuelson (1965) whose contribution is summarized by the title of its article “*proof that properly anticipated prices fluctuate randomly*”. In an informational efficient market, price movements are unpredictable, because they encompass the information and expectations of all market participants.

The second theory, which refers to the hypothesis of efficient markets, was established in the early 60s and assumes that asset markets process with great sensitivity the economic intelligence which they receive and react quickly to adjust the course of financial assets. The theory of efficient markets justifies the need of balanced markets. Roberts (1967) and Fama (1970) have operationalized this hypothesis. In his famous study, which will definitively mark the theory of efficient markets, *Efficient Capital Markets: A Review of Theory and Empirical Work*, written by Fama in 1970, he gives the following definition: “A market in which prices always reflect the available information is called an efficient market”. In this paper, he realizes a synthesis of previous research concerning the predictability of capital markets, the notions of *fair game* and *random walk* becoming well formulated. The

distinction between the three forms of efficiency is being made: efficiency in its hard form, semi-hard efficiency and weak efficiency.

The weak efficiency form sustains the hypothesis that the current price of stocks fully reflects all the informations concerning the stock market, such as: past prices, exchange rates, volumes of transactions and any other information concerning the markets. This involves the fact that there will be no correlations between past and future exchanges of stock rates: the rates of exchange are independent. Thus, any rule for their transaction depends on the past changes of information flows will not be useful. In an efficient market, past prices of the titles cannot be used to beat the market or to obtain adjusted rentabilities for a superior risk. In such a context, the chartist or technical analysis is useless.

Semi-hard efficiency look, in addition, to the immediate integration within the new course of any new information with a public character, concerning the firms wealth, its results, dividends, the distribution of free stocks, stock market introduction, etc. the evolution of the course is random, and eventual variations are determined by unpredictable factors, others than the history of courses and publicly broadcasted information. In an efficient market, in its semi-hard form, fundamental analysis, founded on public information, is useless.

Hard efficiency implies, more than that, the quick integration within the market prices, of all available information about the traded asset, including privileged information. On such a market, superior performances cannot be made even by people who own all the informations available on the transacted asset. Thus, nobody, not even the initiated ones, can thoroughly anticipate the future evolution of the courses, as they have already recorded all the existent information about the intrinsic value of the title, and any new information will be transparent and thus, will immediately be integrated in the price of the title. So, such efficiency (as the semi-hard one) puts into discussion the validity of the entire fundamental value analysis, as the intrinsic value is the market price itself.

The more efficient the market, the more the evolution of the price is random, and the most efficient market accounts for

completely random price movements, totally unpredictable. And this is the result of the fact that market agents try to take advantage of available information, and thus, by using them quickly, they are rapidly incorporated in prices and thus they cancel the gaining opportunities of arbitration. If this is done instantly (which is doable only in a market which lacks transaction costs), then prices will always reflect all the available information. Thus, extra-profits can not be generated from having information, because such profits have already been incorporated.

2. The critical analysis – the main criteria

In order to reflect lack of concordances reflected by the economic reality as related to the theory of informational efficiency of the financial market, one needs, as a first step, to establish at a conceptual level how we can define the informational efficiency. Informational efficiency looks at integrating fundamental intelligence in stock market courses, concerning the intrinsic value of the quoted assets (the historical evolution of stock market courses, publicly available information, concerning the financial execution and economic perspective of the issuing company, privileged information, accessible only to the initiated ones: managers, stock holders, etc.).

The main traits of the efficient market (which represent the correspondent of the market with the pure and perfect) and refers to the following:

- Transaction costs have a null value;
- Free and instantaneous access of all the investors to all available information;
- All participants are rational agents which make homogenous estimates on future trends.

We can rephrase these theoretical traits, purely idealistic, which can be found in practice, in an efficient market, in a weaker form, as such:

- Transaction costs are not null, but acceptable;
- Free access to available information is allowed to a great number of investors;
- There is not a systematic dominant position for either of the transaction participants.

In a market characterized by the traits

mentioned above, all the financial assets have the same risk characteristics, and must offer the same income. The financial market is efficient; if the price of each financial asset is equal to its intrinsic value of the respective title, at any time, ergo the equilibrium price in the pure and perfect conditions. Actually, the “aligning” of the equilibrium price is not instantaneous. There is always a non-null time span, because one reaches equilibrium via lacks of equilibrium. An efficient market however shortens this time span considerably.

In the following, the critical analysis concerning the theory of informational efficiency of the financial markets will be realized considering three criteria, as follows: according to the concept of informational efficiency of the financial market; according to the typology of information and their integration within the price; after the propositions of relaxation of the classical hypotheses of the EMH theory.

Criterion 1: according to the concept of informational efficiency of the financial market

Eugene Fama (January 1965: “The behavior of stock market prices”), stated that an efficient market for the financial assets is a market in which, considering the available information, prices represent an accurate intrinsic value estimate at all times. The same author (September – October 1965 : Random walks in stock market prices) mentions that an efficient market is a market where there is a great number of rational competitors which actively follow profit maximization, each trying to forecast the future values of their financial titles, and where current information is available to participants almost free. Four years later, Fama specifies the fact that an efficient market is the one that quickly adjusts to any new information, and in 1970 he stated that a market in which prices always reflects available information is, as a whole, an efficient market.

The formal definition of efficiency as related with a series of information is given in 1978 by Jensen: a market is efficient as related to the θ_t if it is impossible to obtain a profit if one makes transactions on the basis of that multitude of information.

In 1991, Eugene Fama writes his second synthesis paper on efficient capital markets (Efficient Capital Markets: II) in which he

makes a passage in effect if the main results concerning the testing of the hypothesis of an efficient market, introducing, for the first time in the literature, the concept of yield predictability, in stead of the weak efficiency formula.

Malkiel (1992) stated the fact that a capital market is efficient if it fully and correctly reflects all the relevant information for the assets prices. In a formal manner, the market is efficient in ratio with several relevant information of the prices of the assets will not be affected by the knowledge of that information by all the participants. Moreover, the efficiency in relation with the θ_t involves the fact that it is impossible to obtain a profit by trading on the basis of this information lot.

A new direction of research will take into account the materialization of a new definition of the concept of informational efficiency of the financial market, which will be required to generate additional epistemological consequences as compared to classical definitions, mentioned above. In relation with the consequences generated by the ancient definitions, from a cognitive perspective, the new definition will have to produce new consequences, which are revealed from the new approach. An example for a new approach to the concept of informational efficiency of the financial market is presented below, although it requires the further definitivation through the rethinking of the mentioned aspects and through the establishment of required and sufficient attributes: a market is efficient from an informational perspective if, in the context of the existence of a certain informational set, of certain identification methods of the new information, but also in the conditions of availability for certain methods of modelling based on existing information, it is not possible to realize extra profits by linking the three sets of data.

Criterion 2: according to the classification of informations and their integration within the price

The concept of market efficiency refers to information: at a certain moment, prices reflect all available information. This involves the fact that no processing, no matter how deep, can predict future trends. The interest of every investor is to obtain informations about the actions of the quoted

companies. These informations will allow it to evaluate the perspective of each investment opportunity and to invest in the portfolio which has the best perspectives. All information channels are efficient if they spread intelligence quickly and if every new information becomes public very quickly.

Many practical observations concerning the reaction of investors to new intelligence, but also the mechanisms for their encompassing in the price of stocks, come to highlight the aspects of “market inefficiency” and refer, among others, to:

1. The appearance of time gaps in incorporating information – certain financial investors can present a defensive attitude concerning important public informations, which they hesitate to use, so as not to “fall pray” to better informed agents;
2. There is a quickness of reaction which is not the same for all additional or unpredictable information;
3. Investors have a different perception, more or less profound, or selective, concerning information;
4. The appearance of action inertia – some investor imitates those who react first to intelligence. This phenomenon, of bringing new and new investors in the “professionals net” continues, until the first, considering the course is over-evaluated, retire from the market. The contrary movement carries the same inertia.

An important argument concerning the impossibility of the existence of a perfectly efficient informational market is that information has a price and it is not available to all investors in the market at a given moment (Grossman, Stiglitz, 1980). So, the price reflected within the informations of professional investors (the informed), by only partially; as these informed investors pay to obtain information, it is normal that the price does not fully reflect the informations which they own, because on the contrary it would not be possible for them to cover the costs of obtaining the information in the first place. As a result, any model of capital market equilibrium must take information costs into account.

As an alternate research direction, with the purpose of studying information integration mechanisms within the price of market assets, one must classify informations according to Fama (past intelligence – public

intelligence – priviledged intelligence) by realizing a new parametric type classification of the informations with the impact on financial decisions, criteria such as: the origin of information (x), type of information (y), type of financial impact of the information (z), credibility of information (t), the truth value of the information (p), the legitimacy of the information (authority level r): $I(x,y,z,t,p,r)$.

Criterion 3: after the relaxation proposals of the prerequisites of the classical EMH variant

As a synthesis of the most important premise of the informational efficiency concept concerning financial markets, these are:

- Investors are rational. Investors have risk aversion and only desire actives which have the highest yield for a certain degree of risk. Still, contrary to the general perception, EMH does not imply that all market participants are rational. Indeed, markets can become efficient if a group of investors have an irrational behaviour and are correlated in behaviour, as long as there are rational investors looking for arbitrary opportunities (Shleifer, 2000).

- Markets are efficient, meaning that current courses reflect all public and available information.

- Yields are independent. The exchange of courses can be determined only by new information. The yield in day t is not correlated with the yield in day t+1.

- Markets have a “random walk”. The probability of yield distribution is the same with the normal distribution (Gauss bell).

But, in reality, the prerequisites which lay at the basis of the theory of efficient markets are not real. The hypothesis that investors are fully rational agents which instantaneously process information in a correct manner in most unrealistic, and rationality is hard to define, human behaviour is often unpredictable. The rationality of investors appears as a result of the fact that orthodox economic science still remains the prisoner of the mechanical paradigm, in which values, irrationality, lack of direct interest, intuition, are not considered valuables of the economic process (Dinga, 2009). Information can be difficult to interpret, technology and institutions are constantly changing, and also, the gathering and processing of information,

as well as the realization of transactions require significant costs.

Investors will always have a risk aversion and also, they do not react to immediate informations, but in most cases, they react late, guiding themselves to the trend (which implies past intelligence) in the reaction of present strategies. We presented, in the above, several practical observations concerning the reaction of investors to the new information, but also mechanisms of incorporating them in the price of assets, which come to highlight aspects of market “inefficiency” and refers to: the occurrence of time gaps in incorporating information; the quickness of reaction is unequally distributed to any additional or unpredicted information; action inertia. One can distinguish between two categories of participants on the stock market, which obtain various portfolio investments, as they are either rational investors (“*smart money*”) which operate with relevant information, but also with regular participants (“*noise traders*”) which react to rumours and fashion.

People will not always behave in a linear way to new information, encompassing them immediately, as the EMH requires; people behave non-linear. Because of this, the prerequisite that investors are rational and thus, the modifications of courses is independent and that markets have a random step movement can not be accepted. The irregular assimilation of information, as it happens in reality, could lead to a tendency of random movement – “biased random walk”, called a fractal time series.

Most EMH criteria refer to the preferences and behavior of market participants. Several strays have been identified from the classical paradigm of EMH bound by investor behavior, of which we mention: *over-confidence* (supreme trust) (Gervais and Odean, 2001); *overreaction* (DeBondt and Thaler, 1986: they revealed that when assets are ordered by their rentability in the last 3 – 5 years, assets which during the past period had a high yield tend to have a low yield during the following time span and vice-versa. They attribute these anomalies to the over-reactions to information. In the formation of expectations, investor grant a high importance on past performances of companies and a low importance to the fact

that these performances can be inversed; *loss aversion* (which refers to the tendency of people to strongly avoid loss as they lack to seek gains), *herding*, *regret* (the theory of the late Bell, 1982). These critics of the EMH argument the fact that investors are often irrational.

3. Conclusions

Orthodox economic science considers three external methodological premises which are debatable: the rationality of the individual, the idea that the methodological anchor in economic science is globally efficient (minimization of opportunity costs), the idea that the economic process must be cast away, at least as a tendency, towards equilibrium (Dinga, 2009). But, in reality, the prerequisites which lay at the basis of the theory of efficient markets are not real. The hypothesis that investors are completely rational and they always process instantaneously and correctly all the available information which is surely unrealistic, as rationality is hard to define and human behaviour is unpredictable at many times. The more and more important influence of information factors, but also the acknowledgement – which became an axiom – is in general non-linear and even more so in human behaviour, economic processes and stock market activity have lead to the non-linear approach of stock market processes.

In order to succeed as a theory of efficient information of the financial markets, and thus, operational, we must consider certain additional structures, except for the way in which the price of a stock completely reflects available information, which have not been considered by the classical version of the theory, such as: investor preferences, their will, their attitude concerning risk, the structure of impact information of stock prices, the conditions of the economic environment, the state of the economy, etc. However, in this new context, it becomes an issue to test efficient market hypotheses, because it will also become a test for auxiliary hypotheses, and a non-confirmation of this mix of hypotheses will not state a great deal of things on the aspects which are not linked to existent data.

Financial Performance - an Approach from the Public Sector Perspective

Păcurari Doina

”Vasile Alecsandri” University of Bacau, Faculty of Economic Sciences
doinap_ro@yahoo.com

Abstract

The accounting standard settings for the public sector entities go through a process of adaptation, on one hand the international accounting standards and, on the other hand, the particularities of this sector. Initiated by the European Commission and professional bodies, this process led to a series of changes in the Romanian specific legislation. Application of accrual accounting increased confidence and transparency of financial reports prepared by governments and their agencies. A special importance in financial reporting of public sector entities is given to financial performance and, more recently, to the performance of services provided by them. Problems encountered in recent years due to the global financial crisis require improving management control in the public institutions to increase performance, efficiency and effectiveness in public spending of funds. In this article we aim to point out some of the concerns of the setters regarding reporting performance information of public sector.

Key-words: setting, public sector, performance, financial management

J.E.L. classification: H83, M48

1. Introduction

Ever since 2005, the European Union questioned the adoption of measures to enable better management information on spending public funds, ensuring increased transparency and better control of these expenses. As a measure regarding this respect, the European Commission and the International Federation of Accountants (IFAC) has promoted the application of accrual accounting and prepared financial statements of public institutions based on the International Public Sector Accounting

Standards (IPSAS). Other professional bodies such as the Federation of European Accountants (FEE), recommended the use of accrual accounting by public sector entities because it provides greater accountability and transparency of financial reporting and provides better quality information to planning and management of public funds. Applying this reporting basis is situated at different stages in the European Union member states and it still generates debates about the degree of adaptation to the specific of public sector.

2. Features in Public Sector Financial Reporting

In one of the documents subjected to public consultation by the International Public Sector Accounting Standards Board (IPSASB) of IFAC website (www.ifac.org, Exposure Draft, April 29, 2011), there have been identified and presented a number of key features of the public sector that influence financial reporting and distinguish the public sector from the private one [3]. These features are:

a) the volume and financial significance of non-exchange transactions (taxes and fees, on one hand, free services, on the other);

b) the importance of budget and its legal status (as opposed to the private sector, the budget is a public document required by law and the activity of public institutions is judged on budget implementation; this feature regarding the budget raises the question of introducing in the General Accounts Plan of accounts for recording of the amounts approved in the budget and their spending, which involving the cash accounting application);

c) the nature of fixed assets (there may interfere problems related to their age assessment or difficulties of evaluation);

d) responsibility for management and preservation of public heritage (national and local);

e) longevity of the public sector;

f) the regulatory role of government, which can radically change the regulations and specific norms;

g) ownership or control of rights to natural resources and phenomena;

h) relations with national statistics (the purpose of an accounting report having statistical basis is to provide aggregated information for analysis and modelling at a macroeconomic level, these standing further at the basis of state tax analysis).

Such features should be taken into account by setters when they "build" the regulatory framework for public sector entities.

3. IPSAS Implementation in National Accounting Regulation

In Romania, accounting regulations for public institutions have undergone significant changes since 2006, introducing accrual accounting and taking over some elements of IPSAS. These accounting regulations [5] have been harmonized to a certain extent with the regulations of the private sector, both in the structure of the General Accounts Plan and content of financial statements. The setter of Romania, the Ministry of Finance, was supported in its efforts to modernize the accounting regulations by the Body of Expert and Licensed Accountants of Romania (CECCAR), as the body of the accounting profession in our country. CECCAR translated into Romanian the Accounting Standards for the Public Sector IFAC 2005 and 2009 editions, issued by the International Public Sector Accounting Standards Board (IPSASB) [4].

Prior to this major changes in accounting regulations for of public institutions, in the reform process there have been taken some steps that can be summarized as follows [2]:

✓ engagement, liquidation, authorization and payment of expenses of public institutions (OMPF nr.1792/2002, [11]), the four phases of the budgetary implementation of expenditure are being completed by all of the public institutions, regardless of subordination and financing, in compliance with mandatory procedures;

✓ revaluation and depreciation of fixed assets owned by the public institutions (OG nr.81/2003 and OMPF nr.1487/2003 [7], [9]) are introduced for the first time in the history of public administration in Romania (meantime OMPF 1487/2003 was abrogated and new methodological rules have been approved by OMPF 3471/2008 [8]);

✓ organization and management of revenue accounting (OMPF nr.520/2003 [10]), according to the Accounting Law, which requires the obligation of the accounting registration of rights and obligations of public institutions at the moment of their ascertain (the order was abrogated upon the approval of new accounting regulations for public institutions, approved by OMPF 1917/2005);

✓ introduction of new budgetary classification (OMPF nr.1025/2005), applicable from 2006, in accordance to the requirements of ESA 95 (European Standard Accounts) regarding the accounting and public debt, helped to complete a significant step in the harmonization of public sector accounting system with the European and international regulations.

According to existing regulations on accounting and public finance, the public accounting in Romania includes the following components:

1) accounting of budgetary revenues and expenses, reflecting the collection of the revenue and payment of the expense for the budgetary year;

2) state treasury accounting;

3) general accounting based on the principle of finding the rights and obligations, to reflect the evolution of the financial and patrimonial situation and patrimonial surplus or deficit;

4) accounting designed for cost analysis of approved programs.

In regard to component 4), only certain public institutions (ministries, specialized bodies of the central public administration, other public authorities) are required to prepare and attach to the annual financial statements the performance reports in which they present the objectives, expected results and obtained, indicators and the costs associated with publicly funded programs.

To implement the provisions of points 1) and 3), the General Accounts Plan of public

entities has in its structure two types of accounts:

a) budgetary accounts - to reflect the revenue collection and payment of expense and determining budgetary result (surplus or deficit). Accounting of budgetary revenues and expenses are made with special accounts, opened to the budget classification structure. These accounts ensure the registration of received revenues and paid expenses under the approved budget and provide the information necessary for compiling the budgetary account and setting the budgetary result;

b) general accounts - to reflect the assets, liabilities and equity, expenses and revenues for the year in determining the patrimonial result of the institution. The patrimonial result is an economic result that expresses the financial performance of the public entity, respectively patrimonial surplus or deficit.

Evidence of engagements that the institution may contract, within the limit of the funds approved in the budget (budget appropriations represents the amounts approved in the budget, within which one can make expenditures for the current activity and investment), is held by means of off-balance sheet accounts. These accounts allow tracking of the approved and consumed engagements, separately for each subdivision of the budget classification.

Therefore, the public accounting involves both the application of accrual accounting (for determining the patrimonial result) and the cash accounting (for determining the budgetary result). The two results are reported in quarterly and annual financial statements, which are composed of:

- balance sheet;
- patrimonial result account;
- cash flow statement;
- statement of changes in the structure of assets/capital;
- annexes to the financial statements, including accounting policies and explanatory notes;
- the budgetary account.

Reporting the public institution performance through the patrimonial result account provides summarized, relevant and understandable information even for those users unfamiliar with budget classifications specific to the public sector.

To point out some similarities and differences regarding the situation of financial performance in the vision of IPSAS and the setter in Romania, we present the following comparative table (adapted from Ștefănescu et al., [1]):

Table 1. Reporting financial performance through the patrimonial result account

Elements	IPSAS 1	National regulations
<i>Designation</i>	Situation of financial performance	Patrimonial result account
<i>Objective</i>	[...] to provide information regarding the financial performance [...]	Presents the revenues, funding and expenses during the current year. Patrimonial result, calculated as the difference between revenues and expenses, expresses institution's financial performance.
<i>Format</i>	List	List
<i>Reporting basis</i>	Accrual accounting	Accrual accounting
<i>Revenues</i>	Gross inputs of economic benefits or potential services recorded during the reporting period when those inputs are reflected in increases in net assets / own equity, other than those relating to contributions of the owners.	Revenues represent taxes, fees, contributions and other amounts to be collected under the law, and price of goods sold and services provided, as the case, relating to a period of time.

<i>Expenses</i>	Decreases of the economic benefits or potential services during the reporting period in the form of outputs or consumption of assets or debt occurrences that result in decreases in net assets / own equity, other than those relating to distributions to the owners.	Expenses reflect the cost of goods and services used in order to achieve public services or revenues, as the case, and grants, transfers, social assistance, relating to a period of time.
<i>Classification criteria</i>	Revenues are presented by their nature and expenses can be set by nature or by function and by program or purpose they are made.	Revenues and expenses are presented by their nature, separately for the three categories of activities: operational (basic activity of the institution), financial and extraordinary.
<i>Measuring performance indicator</i>	Surplus/ Deficit Includes all items of revenues and expenses recognized in a period excepting the case when IPSAS provides otherwise.	Patrimonial result (surplus / deficit) The difference between total revenues and expenses during the budgetary year (sums the results of the three activities: operational,

		financial and extraordinary)
--	--	-------------------------------

It is noted that in addition to different designation of this financial statement, Romanian setters arranged a presentation of revenues and expenses on activities, similar to the presentation of the financial statements of private entities. This helps to establish the three partial results (results from operating activity, results of financial activity and the result of extraordinary activity). By summing these results it is obtained the patrimonial result of the period. It should be noted here that the extraordinary activity has a more "large" character in the accounting regulations for the public sector, compared to the regulations for the private sector. Thus, in addition to events like natural disasters, the extraordinary activity includes the operations regarding the disposal of fixed assets. Therefore, revenues and expenses related to disposal of fixed assets affect the extraordinary result.

It can also be notice that, unlike IPSAS 1 which presents a definition of revenues and expenses of a general nature (similar to IAS 1), Romanian accounting regulations define revenues and expenses in a manner more tailored to the public sector (revenues usually originating in the amounts collected at the budget as taxes and fees and expenses are made mainly to achieve public services).

Regarding the *reporting basis, format and objective* of this financial statement (i.e. presentation of financial performance, as the difference between total revenue and total expenditure), we can speak of an accordance with the international standards.

For a better track of the spending of public funds, in addition to quarterly and annual financial statements, public institutions in Romania are required to submit a monthly series of reports on revenues received, expenses paid and budget commitments. In addition, the budgetary expenses are separated, both in the forecast and in the execution phase, in the operating expenses and investment expenses. It is wanted a permanent reduction in operating costs and allocation of public funds mainly to investments generating jobs and with multiplier economic effect.

4. Measures to Improve Financial Management and Quality of Public Services

Changes have occurred in recent years in the law on internal control and audit of public entities (both the internal and external audit, the last being conducted by the Court of Accounts of Romania). All public sector entities are required to implement a control system in conformity to standards of internal control / management (contained in the Internal Control/Management Code, issued by the Ministry of Finance [6]). A modern financial management and appropriate control are considered to be tools that can lead to improved performance of the public entities. In terms of good practice principles that comprise the *communaute acquis*, control is seen as a managerial function rather than a verification operation. Through the function of control, management finds deviations of the results from the objectives, analyzes the causes that have determined them and sets the corrective or preventive measures that have to be taken. In order to follow up the progress of implementation of internal control / management standards at the national level there are collected information from all public institution on measures taken and the special problems found. The collection of information is done through the quarterly / annual reports that the public institutions should report to the superior institutions. Reports are then centralized and analyzed at the level of the Government.

A topical issue is currently subjected to public debate that is creating a framework for reporting information regarding services performance for public sector entities (the project was published on in the IFAC website in October 2011). The purpose of the project issued by the IPSASB is to increase public sector accountability and provide information useful to making decision for potential users. Reporting service performance can provide information (financial and non-financial, quantitative and qualitative) on acquisitions for services provided in the current period, as well as future services to be provided and the necessary resources. Users can shape thus an opinion about the efficiency and effectiveness with which public resources are used. Currently, various public sector entities

provide such information on their service performance. However, the way of reporting in various countries of the world is not uniform. Therefore IPSASB project aims at a standardization of these reports and the terminology used, so as to increase the comparability across time and space and understanding of information among users.

5. Conclusions

In the public sector specific legislation occurred in recent years important changes. The main reasons were better supervision of the distribution and spending of public resources, and implement specific provisions of European legislation. In terms of public sector accounting regulations, the main change occurred with the introduction of accrual. Thus, financial statements provide more reliable information than cash accounting application hypothesis. Romania has opted for gradual takeover provisions of IPSAS into national legislation, which still requires legislative changes. Important changes have been made to legislation on internal control and audit of public entities, as approved code of internal control / management. Also to improve control of public resources is currently seeking public service performance reporting solutions. IPSASB aims to achieve a standardization of these reports in order to ensure the comparability of information.

An Overview on Sovereign Debt Evolution in the World

Maria Pascal (Andriescu)

“Alexandru Ioan Cuza” University of Iasi

maria.andriescu@yahoo.com

Abstract

Public debts have surged in recent years, in advanced economies, to the levels that have not been recorded since the end of the World War II. The average public debt/GDP ratio for all advanced economies has surpassed the pre-World War II peaks reached during the World War I and subsequently during the Great Depression. This paper attempts to realize both a retrospective of public indebtedness critical moments and an analysis of the current sovereign debt crisis that facing many countries of the world.

Keywords: sovereign debt, debt crisis, debt service, indebtedness degree

J.E.L. Classification: F34, H63, H68

1. Introduction

Sovereign debts in advanced economies have increased in recent years, as a result of the global economic and financial crisis, to levels not recorded since the end of the World War II, surpassing the heights reached during the First World War and Great Depression. Because of these significant increases in public indebtedness there is a strong, renewed interest in the behavior of public debt, especially in advanced economies.

This paper provides a clear image regarding public indebtedness evolution in the period 1880 – 2010, also making a detailed analysis of the main episodes of sovereign debt crisis.

The rest of paper is organized as follows: Next section presents the episodes of sovereign debt crisis during 1970-2007, detailing the '80s, when have occurred the most indebtedness crises. Section 3 places

the recent surge in government debt in advanced economies in historical perspectives, distinguishing the timing and magnitudes of earlier high-debt episodes. Section 4 presents an analysis of the public debt growth since the trigger of the current global economic and financial crisis until 2010. Section 5 concludes.

2. Critical moments of the public indebtedness

Debt problem has known many critical moments, empirical literature identifying 63 episodes of sovereign debt defaults and restructuring for the period 1970-2007, which occurred mainly in the 1980s: seven episodes in the period 1970-1979, 41 between 1980-1989, seven in the period 1990-1999 and eight since 1999 [4].

Early 1980s made known to the whole world dramatic scenarios triggered by the external debt crisis in many indebted countries, distinguishing especially the countries of the Central and South America [2]. Developing regions have experienced a debt crisis due to their inability to cover the debt service. Spark that ignited the debt crisis in the developing states was the inability of Mexico, declared on August 12, 1982, to honor the debt service due on August 16, 1982, worth \$ 80 billion, to U.S. commercial banks and to the other creditors. The situation continued to deteriorate and in October 1983, 27 states that due 239 billion dollars have rescheduled their debts to banks.

The origins of the debt crisis lies mainly in the international expansion of the US banking organizations in the 1950s and 1960s, together with global economic growth. For more than a decade before the oil price to rise four times in 1973-74, the growth rate of real domestic production in developing states was approximately 6% annually. Such an increase has triggered new

US corporate investment in these markets, supported by international banks.

The sharp increase in the price of barrel of oil, which began in 1973 and continued for about a decade, have accelerated lending. Changes in oil prices have imbalanced the external balances of payments in the developing countries, importing oil. These countries have also supported much of the additional cost of oil imported by developed countries that they have transferred it, by raising prices of manufactured products, to the developing countries, importing such products.

In order to meet the additional costs caused by oil and manufactured products price rises, developing countries have contracted substantial loans from private banks in industrialized countries and other financial institutions.

In August 1982, a delegation of Mexican officials went to Washington to inform that the Mexican government ran out of money, being unable to meet payment obligations. Within a few months, the crisis has spread in most of Latin America and beyond.

Once the debt crisis has triggered, foreign banks have stopped lending to these countries incapable to repay debt and started proceedings to recover the amounts borrowed, recycling petrodollars and syndicated loans being completely closed. At this stage, the International Monetary Fund and World Bank intervened, in close connection with the US government, which extended funding to fill “financing gap”, as long as the affected state government take concrete policy adjustment. Paris Club and London Club came also to support states in financial difficulty.

Conditionality for support consisted generally in macroeconomic constraints (budget cuts and slow growth of credit to reduce domestic spending) and structural adjustment (deregulation, privatization, trade liberalization to promote the response of private offer).

3. The worldwide evolution of public debt

Abbas, Belhocine, ElGanainy și Horton [1] constructed a complex database (HPDD – Historical Public Debt Database) regarding the evolution of government debt/GDP ratio

in 1880-2009, in 174 IMF member states. HPDD is achieved by combining a number of other databases of individual researchers or institutional bodies and information from official government publications, publications of the League of Nations and United Nations, having the advantage of being regularly updated.

Figure 1. Evolution of the debt/GDP ratio by groups of countries during 1880-2009

Source: HPDD,

<http://www.imf.org/external/ns/cs.aspx?id=262>;

Debt levels in G-20 advanced economies averaged 55% of GDP during 1880-2009, although episodes of much higher debt ratios have been common. During the first period of financial globalization (1880-1913), the debt ratios in both G-20 advanced and emerging economies trended down, World War I and fiscal crises that followed causing a debt spike in advanced economies. Debt reductions through the 1920s were followed by two further spikes linked to Great Depression (early 1930s) and, respectively, during the World War II (1941-1945). In the latter period, many countries were excessive indebted in order to finance war expenses, indebtedness degree in advanced economies increasing to almost 150% of GDP, the highest level recorded. By 1960, however, the advanced G-20 economy average debt

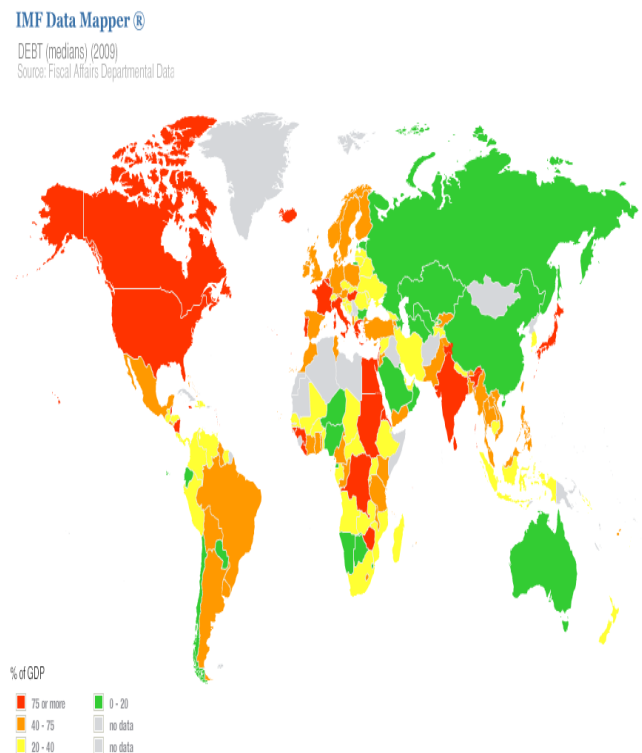

ratio declined to 50% of GDP, due to rapid growth and inflation. Average advanced G-20 economy debt ratios continued to fall until the mid-1970s when, ending of the Bretton Woods system of exchange rates and two oil price shocks led to the accumulation of debt. This trend continued until the current global financial crisis.

Emerging countries and those with LICs have lower rates during the same period, although they were more volatile. Average debt levels for these countries is 44% of GDP during 1880-2009, with 11 percentage points lower than the average in advanced economies. Volatility was particularly pronounced in G-20 emerging economies, noting here the crisis in Latin America in the early 1980s and in Asia in the late 1990s. Model for LICs have a sudden accumulation of debt in the 1980s and a reduction in the last 15 years, in the context of the HIPC Initiative (Highly Indebted Poor Country) and MDRI (Multilateral Debt Relief Initiatives).

The global financial crisis which started in 2007 affected in particular public finances in advanced economies, public debt recording substantial increases. Difficult situation in which advanced economies are due to high levels of public debt is a major change whereas in the last decades emerging economies were in the center of concerns related to sovereign debt crises. Emerging markets have tended to be more sensitive to the debt crisis than advanced economies. High levels of debt in some emerging economies, access to fewer resources to repay debt, volatility of commodity prices and weak political institutions are often mentioned as factors in emerging markets debt crisis. The structure of debt contracted in these countries also contributed to increased vulnerability. Emerging countries debt tends to be denominated in foreign currency and to be contracted on short-term. Loans in foreign currencies make emerging markets vulnerable to exchange rates changes and short-term maturity has implications for the ability to refinance. Since the debt is contracted on short-term, it must be refinanced frequently, which can be difficult if investors lose confidence in government. By contrast, developed economies are able to borrow in local currency and their debt is

predominantly long-term. Thus, sovereign debt in advanced economies was generally more stable than in emerging countries.

Figure 2. The map of public indebtedness in 2009

Source: HPDD,
<http://www.imf.org/external/ns/cs.aspx?id=262>;

The public debt map related HPDD database updated by the IMF in the year 2009 indicates that the areas most affected by the problem of high levels of debt are: Japan (217.6%), Greece (115.16%), Italy (115.77%), Iceland (99.87%), USA (84.26%), Nicaragua (81.28), Hungary (78.26%), France (78.07%), India (77.69%), Egypt (76.18%) and many low income countries of Africa (Liberia-224.13%, Congo-138.26%, Zimbabwe-89.66%, Sudan-80.60%, Guinea-77.01%). Near the threshold of 75% is also Germany, with public debt/GDP ratio of 73.51%.

On the opposite side are countries with public debt levels in the range 0%-20% namely: Turkmenistan (2.67%), Chile (6.21%), Russia (10.88%), Kazakhstan (10.93%), Uzbekistan (11.2%), Ecuador

(14.67%), Nigeria (15.49%), Niger (15.78%), Saudi Arabia (15.97%), Australia (17.63%), Paraguay (18.04%), China (18.59%).

4. Public debt growth in the period 2007-2010

After the financial crisis onset, concerns about debt sustainability have moved from emerging markets to advanced economies. In many advanced countries the financial crisis has contributed to increased levels of sovereign debt. Thus, high level of public debt became unsustainable in three states in the Euro Zone: Greece, Ireland and Portugal. These countries have appeal to the International Monetary Fund and other international governments for financial assistance in order to avoid failing to pay their loans. Despite the international financial support, concerns about the sustainability of public finances remains and analysts also follow closely the debt situation in other European countries, including Spain, Italy and Belgium.

Figure 3. Cumulative increase in real public debt since 2007, selected countries

Source: Reinhart C.M., Rogoff K.S. (2011), "A Decade of Debt", *National Bureau of*

Economic Research Working Paper, Cambridge, p. 12;

In the countries with systematic financial crises or sovereign debt problems (Greece, Iceland, Ireland, Portugal, Spain, UK, USA), average debt levels have increased in the period 2007-2010 to about 134%, exceeding by a considerable margin the increase of 86% founded by Reinhart and Rogoff [8], as average debt growth during the first three years of financial crisis. Huge debt increases are driven mainly by sharp decrease of tax revenues, due to severe and prolonged recessions in the post-crisis period. In some notable cases (especially in Japan, 1990s), the deterioration of fiscal balances was due increased spending to fight recession.

Returning to the period 2007-2010, we can say that the highest growth rate debt, in Ireland and Iceland is not associated only with the magnitude of the recession in these countries but also with bank debt accumulation before the crisis. Year 2010 is not the final year in which will be recorded increases in public debt. Currently, forecasts for the US indicates increasing levels of debt in the near future; for few other, despite the austerity programs, debt are likely to continue to increase since the economic conditions do not improve and debt service costs go up.

Even in states that have not experienced a major financial crises, debt has increased by an average of about 36% in real terms between 2007 and 2010. Many states have adopted stimulus packages to cope with recession in 2008-2009 and were hit by significant decreases in government revenue. Furthermore, some of the largest increases in debt in countries where the crisis has not been installed (Norway, Australia, Chile) are related to cyclical lowering of commodity prices worldwide, which accompanied the global recession.

5. Conclusions

Public debt issue has known over time many critical moments, empirical literature identifying 63 episodes of sovereign debt crisis in the period 1970-2007, of which 41 in the 1980s.

In the 1980s, the debt crisis has been triggered due to four times increase of the oil barrel price. Sharp climb in oil prices has unbalanced payments balance in developing states, importing oil which, in order to meet the additional costs, have contracted substantial loans from private banks in industrial countries and other financial institutions. Rescheduling and debt reduction, combined with neoclassical conditionality policies had as result the debt crisis overcome in many countries of the world.

Analyzing the evolution of the government debt/GDP ratio between 1880-2009 for 174 IMF member states, based on data provided by HPDD – Historical Public Debt Database, we found that debt levels in G-20 advanced economies reach the average of 55% in GDP while in emerging countries and in those with low income, the average of public debt is 44% in GDP.

During the first era of financial globalisation, the debt rates both in advanced and emerging economies were relatively small, World War I and fiscal crises that followed causing a sharp increase in advanced economies. Debt reductions from the 1920s were followed by two sharp increases in the Great Depression and respectively, during the World War II. In the latter period, many countries were indebted in order to finance war expenses, indebtedness degree in developed economies increasing to approximately 150% of GDP, the highest level recorded. In the 1960s, however, the average debt ratio fell to 50% of GDP due to rapid economic growth and inflation. Average debt rates in G-20 advanced economies have continued to fall until the mid-1970s when, the fall of the Bretton Woods system and the two oil price shocks led to accumulation of debt. This trend continued until the current global financial crisis.

The global economic crisis triggered in 2007 affected especially advanced economies, this situation representing a major change since in the last decades emerging markets were in the center of the concerns about sovereign debt crisis. The structure of debt contracted in these states contributed over time to increased vulnerability, given that debt in emerging countries tend to be denominated in foreign

currency and short-term contracted. Loans in foreign currencies make emerging markets vulnerable to changes in exchange rates and short-term maturity has implications for repayment ability.

In the period 2007-2010 average debt levels have increased, in countries with systemic financial crises and sovereign debt problems, to about 134% surpassing the growth margin of 86% found by Reinhart and Rogoff [8] as being debt average increase in the first three years of financial crisis.

Huge increases in debt are based mainly on both sharp decrease of tax revenues, due to severe and prolonged recessions in the post-crisis period, and increase of the budgetary expenditures incurred in fighting the recession.

Acknowledgment

This paper had benefit by the financial support within POSDRU/88/1.5/S/47646 project co-financed from European Social Fund, by the Sectorial Operational Program – Human Resources Development 2007-2013.

Eurozone Sovereign Debt Crisis: Causes and Solutions

Maria Pascal (Andriescu)

“Alexandru Ioan Cuza” University of Iasi

maria.andriescu@yahoo.com

Abstract

Debt issue is a highly debated topic today since many of the world economies, especially the Eurozone, hit by global financial and economic crisis, faces with high levels of deficits and debt. Credit rating agencies, due to the problems related deficits and public debt have downgraded the credit ratings of these countries, with the immediate impact on financial markets. This paper aims to develop an analysis of the Eurozone sovereign debt crisis and of the measures taken by European leaders to reduce excessive levels of budget deficits and debt.

Keywords: sovereign debt, Eurozone debt crisis, European Fiscal Pact, excessive deficit procedure

J.E.L. Classification: F34, H63, H68

1. Introduction

The global economy is currently facing with a sovereign debt crisis that is spreading rapidly across the euro region.

The sovereign debt crisis triggering proved the ineffective of the surveillance systems within EMU and of the framework for coordinating economic policies in general. Accumulation of the macroeconomic imbalances in pre-crisis year was not checked sufficiently and their unwinding has since proven very costly for some Eurozone countries and has also contributed to the ongoing sovereign debt crisis, with serious implications for the functioning of the Eurozone as a whole.

This paper provides a clear image regarding the Eurozone sovereign debt crisis by analyzing the causes that led to this situation, the evolution of public indebtedness starting with the year prior to triggering crisis up to the present and, also,

the measures taken to reduce budget deficits and excessive levels of public indebtedness.

The rest of paper is organized as follows: Next section presents the analysis of the causes that led to the Eurozone sovereign debt sharp increase. The dynamics of public debt in the period 2006-2012 is described in Section 3 of this paper followed, in Section 4, by an analysis of measures taken by European leaders in order to overcome the current sovereign debt crisis. Section 5 concludes.

2. Causes of indebtedness of Eurozone countries

The global economic crisis has increased the debt in all Eurozone countries due a combination of high fiscal deficits and support measures for the banking sector. While the magnitude of debt varies considerably among states, it is high enough overall to bring the issue of medium and long term sustainability [16].

Massive accumulation of budgetary deficits and unsustainable debt in the Eurozone countries endangers not only the monetary union or the European Union, but also the entire global economy.

In order to expand rapidly Euro Zone, the European Economic Community leaders have allowed the economically less prepared countries to adopt the euro. The new entrants have brought with them many elements of failure, affecting monetary union as a whole, including [6]:

- Inefficient restructuring of the economy;
- Existence of oversized public sectors;
- High social transfers;
- Industries oriented to produce goods with low added value;
- High consumption of raw materials, which make the cost structure to be extremely rigid, almost inflexible;
- Low sustainability of pension systems and public finances;

- Poor developed infrastructure, which shows an increase in transport costs and a reduction in trade;
- Large discrepancies between current and future economic competitiveness between the developed states and new members, due to inefficient labor policies promoted by the authorities.

In order to fit the parameters set by the Maastricht Treaty, countries such as Italy, Spain and Greece have implemented tough fiscal measures without making a comprehensive restructuring. These countries have resisted more than five years in the Eurozone, stimulated by the huge infusions of cash and by an unprecedented access to credit from other member states. At the same time, their productivity was limited due to rigid labor markets and a reduced economic competitiveness.

After the American crisis in the early 2000s that led debt again on an upward trend, Eurozone member states have succeeded, due to the expansion period in the years 2005-2007, to reduce government debt to a minimum of 66.2% in 2007. After this year, however, as a consequence of the economic and financial crisis that led to economic contraction and to the need of government aid for banking system, public indebtedness recorded a worrying trend, reaching 88.5% in 2012, according to the latest forecasts of European Commission.

Table 1. The amounts allocated by European governments to support the banking system

	Guarantees	Liquidity injections	Total
UK	460 bil. €	47 bil. €	507 bil. €
DE	400 bil. €	100 bil. €	500 bil. €
FR	320 bil. €	40 bil. €	360 bil. €
DK	200 bil. €		200 bil. €
NO		55.4 bil. €	55.4 bil. €
PT	20 bil. €		20 bil. €

Source: Wehinger, G. (2008), “Lessons from the Financial Market Turmoil: Challenges ahead for the Financial Industry and Policy Makers”, *Financial Market Trends*, OECD, p. 9;

To combat the credit market crisis, European governments have made available to financial system players around 1,870 billion euros in 2008.

Germany has allocated the sum of 400 billion euros for interbank market loans. The government also created a reserve fund of 100 billion euros to make infusions of liquidity into institutions in difficulty and to purchase illiquid assets.

The Paris Executive guaranteed interbank loans of 320 billion euros and provide liquidity reserves of 40 billion to financial institutions in order to increase liquidity index to 9% so that it can compete from the same level with the similar British institutions.

In the same time, the Netherlands, Spain, Italy, Austria, Portugal and Norway have joined this effort, paying 501 billion euros as guarantees and reserve funds. British government made available to three local banks liquidity worth 37 billion pounds (47 billion euros), as part of a financial system rescue plan worth 400 billion pounds (507 billion euros). Norway has offered to the domestic commercial banks credit lines totaling 55.4 billion euros, accepting mortgages hold by them as collateral. The Portuguese authorities have also allocated guarantees worth 20 billion euros for the interbank market operations.

These measures taken to save several European banks from bankruptcy represents one of the main factors that contributed to the current difficult situation in which are the European economies. Although the financial institutions support was necessary, avoiding a bankruptcies series that would have ruined economies, the way it was done has only move the debt from one place to another, leading to an EU countries public over-indebtedness.

3. Sovereign debt evolution

Analyzing data on sovereign debt, we observe that, in Eurozone, the most heavily indebted states, Greece and Italy, recorded even before the global financial and economic crisis high levels of public debt. Not the same thing we can say about Ireland and Portugal which, after the outbreak of the crisis, have experienced a sharp rise in debt levels. Thus, Irish presented in 2007, a indebtedness level of 25.9% and today it stands at about 108.1%. The global crisis has also hit the Portugal which recorded a rise of debt from 68.3% in 2007 to 101.6% in 2011.

*= estimation; ** = forecast; Source: “European Commission (2011), “European economic forecast – Autumn 2011”, *European Economy*, Vol. 6, p. 225;

The Eurozone is not the only faced with large increases in debt levels, as a result of the global crisis. Thus, the United States, with a debt level of 62.3% of GDP in 2007, is expected to arrive in 2012 at a indebtedness level of 102.4% of GDP. In a similar situation of an excessive increase of debt from the outbreak of the global crisis, is also Japan, for this being expected an increase from 167.0% of GDP in 2007 to 215.9% in 2012. The strong growth of public debt in both advanced economies, measured in percentage points of GDP indicates that the debt problem is not just an issue of the euro area.

Figure 1. Debt level in Eurozone countries in 2007 and 2012

Source: European Commission (2011), “Quarterly Report on the Euro Area”, Volume 10 No. 3;

As shown in Figure 1, there is a wide variation in the evolution of the debt in the Eurozone countries. While in countries like Estonia, Cyprus and Malta debt is estimated to have modest increases, in Spain and Portugal are expected increases of over 30 percentage points from 2007 and in Greece and Ireland, over 60 and, respectively, 90 percentage points.

Increasing debt represents a real problem for policy makers. The high levels of debt brings into question the sustainability of an economy, given that the sustainability refers to the ability of government to meet, on long term, its financial obligations related debt contracted. Here we do not refer only to the costs of an increasing debt but also to its side effects that create difficulties. Once exceeded a certain threshold, there is evidence that the debt has a negative effect on growth, while the perceived risk associated with high levels of debt may lead to an increased interest rate for the new debt. Thus, the interest payments increase not only because of the increasing debt levels but also due to higher loan costs. Moreover, higher taxes, required for debt service payment will act as a brake on growth.

4. Emergency measures for sovereign debt crisis resolving

On May 9, 2010, in order to assist countries with financial problems, the Eurozone member states have agreed to create the European Financial Stability Facility (EFSF). EFSF can issue bonds or other debt instruments on market, supported by the German Office of Debt Management in order to raise the necessary funds for providing loans to Eurozone countries in financial difficulty, to recapitalize banks or to redeem sovereign debt. Bond issues are supported by guarantees granted by Eurozone member states, proportional with their share in paid-up capital of the European Central Bank. Borrowing capacity of 440 billion is guaranteed by the Eurozone governments and can be combined with loans up to 60 billion euros from the European Financial Stabilization Mechanism (EFSM) and up to 250 billion euros from the IMF, to obtain a financial safety net up to 750 billion euros.

On November 29, 2011, Finance Ministers of the Member States agreed to extend EFSF by creating certificates that could guarantee up to 30% of Eurozone government new issues and to create investment tools that would increase the power of EFSF to intervene on primary and secondary bond markets.

Fund is scheduled to expire in 2013, running a year in parallel with funding program called the European Stability Mechanism (ESM), which will be launched most likely in July 2012.

On January 5, 2011, European Union created the European Financial Stabilization Mechanism (EFSM), an emergency funding program based in funds obtained from financial markets and guaranteed by the European Commission, using, as guarantee, EU budget. It works under the Commission supervision and aims to maintain stability in Europe by providing financial assistance to EU member states in economic difficulty. EFSM is rated AAA by rating agencies Fitch, Moody's and S&P.

By the EFSM, the EU has successfully placed on the capital markets bonds worth 5 billions euros as part of financial support package agreed for Ireland, at a EFSM borrowing cost of 2.59%.

As European Financial Stability Fund, the European Financial Stabilization Mechanism will be replaced with a permanent program funding named European Stability Mechanism (ESM), which will be launched in July 2012.

To assist states in financial difficulty, the ESM may provide loans, preventive financial assistance, purchase member states bonds on primary and secondary markets and credit in order to recapitalize financial institutions. Loans will be conditioned and reimbursement will be a priority. Volume adequacy of ESM maxim loans will be revised periodically. Current ceiling of common borrowing capacity EFSF/ESM is 500 billion euro.

A key element in the strategy of Euro zone debt crisis overcome is the new *Treaty on stability, coordination and governance in the economic and monetary union*, called also the *European Fiscal Pact*, signed on March 2, 2012 by the all member states, except United Kingdom and the Czech Republic.

The main objective of the Treaty is defined in its first Article as being *promoting fiscal discipline, strengthening economic policy coordination and improving governance in the Eurozone, in order to achieve EU objective of sustained economic growth, employment, competitiveness and social cohesion*.

The Fiscal Pact will come into force on January 1, 2013, subject to ratification by 12 Eurozone member states or on the first day of the month following storage of the last ratification instrument from the 12th euro zone member, first of two dates being chosen.

According to Article 3(1), *the budgetary position should be balanced or in surplus*. This rule is considered met if the annual structural balance meet medium-term budgetary objective and does not exceed 0.5% of GDP.

Also in the same article it is mentioned that, *structural deficit may have a higher than specified value, up to maxim 1% of GDP, at market prices, if public debt is significantly below 60% of GDP and risks for long term public finances sustainability are low*. Budget rules are introduced through national provisions with binding legal force and permanent character, preferably constitutional or otherwise guaranteeing the

full respect and adherence to them throughout the national budgetary processes. Rules must be specified in national law within one year after entry into force of the Treaty.

Article 8 provides that, *if the state does not include the two rules into national law, the Court of Justice of the European Union must be apprised. If the court decision is not respected, it may entail a lump sum payment or an appropriate situation penalty, which may not exceed 0.1% of Gross Domestic Product. Amounts imposed to a contracting party whose currency is euro are paid to European Stability Mechanism. In other cases, payments are paid to the general budget of the European Union.*

States that are the subject of an excessive deficit procedure establish the binding budgetary and economic partnership programs, monitored by the European Commission and European Union.

International Monetary Fund, through the chief economist Olivier Blanchard proclaims that the new agreement is a step in the right direction but not a complete solution to the sovereign debt crisis [2]. British Prime Minister, David Cameron, shares the same view, believing that the change of treaties does not solve current problems. In his conception, Eurozone member states must become more competitive and European Central Bank should support the euro currency and none of these things involve treaties changing.

By signing the European Fiscal Pact, Romania is committed to a fiscal discipline program, a program that imposes rules on budgetary deficit. It does not fit perfectly to the Romanian economy needs which would need major investments in the coming years in order to increase production capacity and infrastructure, but it is difficult to find a unified way to reduce debt. Fiscal adjustment measures are more appropriate for the UE rich countries than for the developing countries, as Romania. However, we can say that the Pact is, for Romania, a warranty that provides access to international capital markets in order to attract funds for financing budget deficit at reasonable prices.

5. Conclusions

The global economic crisis triggered in 2007 affected especially advanced economies, this situation representing a major change since the last decades emerging markets were in the central concerns relating sovereign debt crisis.

Three of the Eurozone countries (Greece, Ireland and Portugal) have received emergency loans in order to prevent entry into default but public debt crisis persists causing a domino effect in the country rating for most nations affected.

The gravity of the Eurozone current debt crisis is that it has potential to cause a massive banking crisis in center of Europe since much of the sovereign debt of the countries in financial difficulty is contracted from the banks of France and Germany.

Undoubtedly, the approximately three years of financial and economic crisis had serious consequences for the Eurozone countries. To assist, the EU has created two temporary instruments that will be replaced in 2012 with the permanent European Stability Mechanism. The first of these, the European Financial Stabilization Mechanism, was established in order to provide financial assistance from the Union with guarantees from the EU budget. The second instrument, the European Financial Stability Fund is designed to assist Eurozone member states with an amount of funds up to 440 billion.

In the strategy of Eurozone sovereign debt crisis overcoming, an important stage is the signing, in March 2012, of the Treaty on stability, coordination and governance in the economic and monetary union (European Fiscal Pact). It provides primarily tax rules for balancing budget and economic policy coordination at European level. European Fiscal Pact requires a commitment from the participating states to a strong fiscal governance, introduction of budget balancing provision in the Constitution, strengthening regulations on the excessive deficit procedure by automating sanctions and submission of the budget projects for European Commission verification.

Through these measures taken to resolve the debt crisis, European economies have exceeded the immediate danger but are in the front of a long period of convalescence. Europe must make further efforts to restart

economic growth while reducing debt in countries with problems. If the end of 2011 there were concerns about the disappearance of the Eurozone and the unique currency, major events in the early 2012 had a great contribution to reassure financial markets.

By signing the European Fiscal Pact, Romania is committed to a fiscal discipline program, a program that imposes rules on budgetary deficit. It is not perfectly fits to the needs of the Romanian economy, which would need major investments in the coming years in order to increase production capacity and infrastructure, but it is difficult to find a unified way to reduce debt. However, we can say that the Pact is, for Romania, a warranty that provides access to international capital markets in order to attract funds to finance the budget deficit at reasonable prices.

The Role of Accounting Information in the Decision Making Process

Petroianu Grazia – Oana
„Constantin Brancoveanu” University of Pitesti,

oana_petroianu@yahoo.com

Abstract

The act of management has always had an essential role in human community activities. The efficiency of a company depends on the quality of managerial process. This requires performant management, which means competence and rational decisions. Accountancy can support the decision making process and management activity. The objective of an accounting system is to provide financial information concerning the studied company. The information concerns the financial situation and the performance of a company and there is intended to the users to taking decisions.

For taking decisions by the management in order to achieve the objectives of the company it is necessary to know exactly the situation of the company, either compared to other companies that work in the same field or in relation to previous periods, this thing being possible through the accounting information.

Key words: management process, accounting system, decision making process, accounting information.

J.E.L. Classification: M40, M41, M49

1. Introduction

Under the actual conditions of an information society, the most important resource is the information lying on the basis of any decision making process. In economics, accountancy is the main source of information, both for the economic entity under consideration, and for its partners. Information availability and communication on international level among the organizations developing in different countries are vital for the efficiency of global

market. In order to make direct and indirect investments, to integrate on the global market of goods and services, these enterprises must have access and understand the financial information of partner companies to make correct and fundamental decisions.

The efficiency of each company depends on the managers ability to understand and apply the modern management principles, methods and techniques. A vital condition for companies to get competitive advantages and to resist in competitive mechanisms is represented by the quality of the management process. In the last years it has been demonstrated that the main factor of a company failure is given by the managers incompetence and by a faulty management in taking decisions. That is why the performant management which represents competence and rational decisions is imposing. A performant management can be achieved only by a pertinent information taken in due time.

2. Decision and decision - making system

Decision - making, the most representative function of management and in the same time the most effective adapting and selfregulating instrument in a dynamic environment, presupposes the most optimum selection from two or more possible variants. Decision – making represents a social, deliberately and rational act of a person or of a group of persons (managers) by whom are settled the objectives, directions and their achievement, depending on certain current necessities of social – economic life, on the basis of evaluation and analysing process of means and necessary resources and of the consequences of the respective activity.[8]

A decision materializes an idea, an intention or even a project, answering a

certain problem. A decision represents a form of social validity of an action, by moving human, material and financial resources. A decision is a selection made at a given moment, in a certain context, from many possibilities, to stimulate ample and variable lasting actions. It is considered essential the organization survival and development, as it is prior to any action.

Decision – making system consists in the totality of decisions adopted and applied by the managers within an organization. Therefore, a decision can be defined as a deliberate selection out of several possibilities, with the view to settle a problem.

The information system maintains the decision system as the information is considered the raw material essential in decision – making.

The world experience has proved that the main factors which favour the getting of economic resources or of another nature and which differentiate according to their performances, countries, branches of activity, business organizations and other bodies, are the management, the technologies and the ability to wisely use human and information resources. Not any natural or social system can exist without an exchange of information, both within the system, between its components and between the respective system and other external bodies.

In general, a decision represents the conclusion of the process by which a selection is made, an option between two or more alternative, available actions, with the aim to attain one or more objectives. The process of reaching this conclusion or option is known under the name of decision – making process. Decision presupposes a human action which confronted with an external event – an information, must identify the possible acting ways which will lead to the proposed objective.

In management, decision – making plays an important role in organization survival and development. Decision is considered the essence of management, the finishing of any management process, taking into account certain criteria with the view to attain some clear objectives.

Decision making in an organization requires a study and a quantity of information more or less limited, depending on the type

of decision.

The strategic decisions are those decisions on which the organization survival depends, taking such a decision implying a total analysis of the organization and of its environment in order to limit the risk error. In this situation, the decision – making process is very long, resorting to all possible techniques and certain marketing studies, financial plan. The strategic decisions contribute to the achievement of fundamental objectives, integrating into strategies, plans, long or medium term programmes.

The tactical decisions represent a logical sequence of strategic decisions which they can detail and segment. It is about the budget making or supplying policy. These decisions require limited information, but are considered important. Tactical decision deliberately contribute to the attainment of derivative objectives, integrating into annual and semestrial policies, programs and plans.

Operational decisions are the most numerous decisions, they requiring a very small number of information.

A good decision making depends on the quality of the internal or external information available to the company, and therefore on the knowledge of the environment in which it activates and on its internal capacities. The basis of each rational human action is given by the cycle information – decision - action. Therefore, if the objective of this activity is represented by the administration of the evolution of a social or economic system, than it will become a directed system, where the manager and the board of directors will make up the management system.

As an organization actor, the manager is responsible for decision – making, at operational and strategic level, as regards the way in which the limited resources under his control must be used.

At present, the manager has at his disposal an ever greater volume of information, which he has to process in a short period of time. His role is to know how to use this information and to direct the resources and the actions of the company to favourable occasions for getting some significant results from economic point of view.

3. Relation between accounting information – decision making process

Information allows the reduction of an uncertainty and complexity action, facilitates selections, spotlighting the possibilities and limits of alternative solutions.

The decision – making system is closely connected to the information system. The managerial process is primarily understood as a process of using an information, the act of management being achieved within the circuit information – decision - action.

Being within the perimeter of this relation, the utility of accounting information depends on the attributed qualitative characteristics. According to FASB, in order to be useful to its addressee and to have decisional utility, the accounting information must be intelligible and must have two main qualities: pertinence and reliability. Between these there is a quality considered as secondary that is comparability. [10]

The general background for making up and submitting IASB financial standing specifies the fact that the utility of information offered by the synthesis documents is determined by four qualitative characteristics.

Intelligibility – presupposes that accounting information can be easily understood by the users.

Relevance – has in view the information capacity to essentially influence the decision making process.

Reliability – presupposes that information should not contain significant errors, should not be impartial offering enough certainty elements in users decision making. In order to be reliable, it must accurately present the transactions and other events, in accordance with their economic fund and with financial reliability, not only with the juridical form.

Comparability – refers to the information capacity to be compared in time and space and reported to other reference values. The evaluation of the financial standing, of performance and of the modifications of financial situation of a company implicitly presupposes its comparability.

The qualitative characteristics are attributes which determine the utility of accounting information. In order to be useful in the decision – making process, the accounting information must have, even partially, each of the qualities it defines.

The information used in decision – making largely comes from managerial accounting.

Managerial accounting is the main source of information in activities, management and administration. Nevertheless, financial accountancy synthesized by annual financial standing, still supplies the information necessary for managers to administrate relations with third parties, to select investment projects as well as the financial resources.

By means of financial standing there must be supplied an information about the financial situation, about the performances and treasury flows of a company, an information to be useful to a large range of users, when adopting their economic decisions. The purpose of a financial standing is to show the administration results achieved by the company management, inclusively the way in which they used the given resources.

The synthesis documents and the accounting report represent the basic form in the publication of accounting information. They offer the necessary data for establishing the conditions in which a company develops its activity and evolves in time.

The accounting information represents an important factor in establishing results, in achievement of analyses, in decision making and promotion action – all in the financial accounting field with a role both at micro and macro economic level.

Accountancy is considered an essential source of information about the financial standing and performance of a company. By means of accountancy the managers develop their knowledge about the organization in many ways. Some problems may pass unnoticed during the ordinary actions. Thus the accounting information may bring to light these aspects, offering an independent control on operations and helping the managers to keep them abreast of them. By means of accounting information important aspects of the organization are at the manager’s disposal, a fact which allows the decision – maker to determine the sense and significance of all operations.

The accounting information allows the investors, the present or prospective share – holders to formulate a valuable judgement as regards the organization past, present or future events, in this way offering the confirmation or infirmation bases of initial forecast. Also, other partners of the

organization resort to financial standing in order to elaborate some decisions, but the use of accounting information is much greater for the company management.

The decision - making system at the organization level is the result of the managerial act, the company performance depending on its decision. The efficiency of a company depends on the quality of the managerial process. This situation imposes a performant management, which means competence and rational decisions. Accountancy, by the information it offers, sustains the decision – taking process and the managerial activity.

4. Conclusions

The organization is considered the space which allows the elaboration of some decisions of different nature, amplitude and duration. In order to understand a decision, it is necessary to know the stages which led to the endorsement of the respective decision, the behaviour of the implied actors, in other words the analysis of the whole process. Decisions are not taken only from information or reality, but also on the manager's convictions and representations of his own environment.

The quality of the managerial act is a vital condition for the organization to get competitive advantages and to resist on a competitive market. The main factors lying on the basis of a company failure are given by the managers incompetence and by their mismanagement caused by some errors in decision – making.

The accounting information has an essential role in the decision – making process, contributing to the development of the managers knowledge about the organization and to their training for future activities and decisions. The manager is considered the main actor in decision – making process. So, in his quality of leading actor in decision making process, the manager uses the accounting information to establish the organization objectives, the actions to be taken in this respect and the correction measures if necessary.

In the decision – making process, the managers use, as a rule, the information given by the managerial accounting. But in order to substantiate the investment and

financial decisions or to administrate the customers, the suppliers, the information given by financial accounting is useful.

Without accounting information an efficient management is impossible. So, the modern management frequently applies to accountancy informational offer.

The modern management is largely dependant on the accounting information. The managers are among the first users of financial accounting information, their interest being connected to the settlement of an optimum relation cost – benefits at organizational level, in other words the establishment of a balance between getting profits, social costs, reinvestment, self finance. At any level he might be, a manager administrates, in fact his field of responsibility, developing actions with the view to get a maximum effect with a minimum effort. While the administration keeps the balance, the management defines the strategy to obtain this maximum balance with a minimum effort, evidently for a limited period of time. The art of management is to perceive, if it might be anticipated, the moment when the balance risks to be overpassed. Also, he has to quantify the amount of the price paid to achieve the predetermined objective. Finally, all the efforts and actions made at economic level can be expressed precuniary, which impliciteally means the accountancy direct implication.

Therefore, the accountancy represents an important support of organization management, providing information meant to reasonably support the decision made.

Abstract

The article presents a study which aims to analyze the role of credit risk in banking industry. Nowadays the credit risk is still the most important risk in banking. In recent years, many banks have built new businesses – in particular trading operations and services – that generate fees and interest payments. Although banks’ incomes are less dependent from the performance of the loan portfolio, this type of credit risk – loan risk – is still very important. Badly priced loans can damage banks’ capital base seriously. The new traded instruments related from of credit risk – counterparty risk- can create losses as well.

Key word: credit risk, banking industry, risk management, Basle Capital Accord

J.E.L. Classification: G28, G21

1. Introduction

The credit risk is oldest in banking. It arises when counterparts are unwilling or unable to fulfill their contractual obligations. These obligations can be the repayment of a loan or the repayment of a traded instruments other delivery of a specified asset.

The credit risk is quite complex and it is difficult to measure precisely. The traditional accounting systems only provide partial information about the on-balance sheet instruments and the trading activities related systems are not always transparent enough to give a clear picture about the sometimes extremely complex off-balance sheet activities either.

2. Why the credit risk is important in banking industry?

It is difficult to analyses the credit risk properly, its management is very important for banks, because a vast majority of banking related risks is connected to the credit risk. Traded instruments through the counterparty risk are in close with the credit risk as well. The other important risk factors are also in a very similar situation.

The risk pricing methodologies used by an institution must be based on a comprehensive risk framework that encompasses all types of risk. For correct results the market risk measurement methodology should be fully integrated into the credit risk measurement approach because of its central importance in the integrated risk framework. The assumptions, which are used in the computation of market and credit risk, must be consistent with each other. The credit risk is the key element in this process because of its relation to the other kinds of banking risks.

3. Main risk factors in different banking areas

In a modern banking organizations the business activities can be classified into three major groups:

- Asset management division
- Investment banking division
- Retail and commercial banking division.

In these three business divisions the most important risk factors are different and the risk management has to be aware of these differences. Table 1 lists the most important activities and the risk factors typically attached to them [2].

Table 1. Banking Areas and the Major Volatility Drivers

Business Line	Major Volatility Drivers	Statistical Modeling
Asset Management/Private Banking	Exposure to change in financial markets (revenues are partly driven off portfolio value)	Yes
	Exposure to financial markets sentiment (greater portfolio activity in bull markets generate more fee income)	No
	Credit risk exposure (loans to private clients)	Yes
Retail and Commercial Banking Division		
Retail Banking	Credit risk exposure	Yes
	Interest rate risk	Partly
Commercial Banking	Credit risk	Yes
	Interest rate risk	Partly
Foreign Exchange Trading and Sales	Market risk exposure (change in value of positions held)	Yes
	Credit risk exposure (mainly derivatives)	Yes
Investment Banking Division		
Securities	Market risk	Yes

s/Derivatives	exposure (change in value of positions held)	
Trading and Sales	Credit risk exposure (primary derivatives)	Yes
Corporate Finance	Market risk exposure (primary positions)	Yes
	Credit risk exposure (e.g. loan products to corporate customers)	Yes

Source: Chris Hatten: Management Banking Capital – Capital Allocation and Performance Measurement, pp. 64.

Legal, operational and business risks are not in the table, they are more general and inherent in all activities. The changes in the regulatory and business environment could be enormous and unpredictable. Those kinds of risks are not measurable with statistical models in an adequate way.

From these different types of banking risks, credit risk is the most important and complex one. Although the separation of different risk factors is necessary, bank managers can not forget that these risk factors are closely connected to each other in several ways in the modern business environment.

4. Fundamental changes in the international business environment

After the Second World the banking industry was highly protected in every country, because of its strategically important position in the economy. The macroeconomic environment was very stable, which gave a comfortable position for banks. The competition was not too strong and the market was cartelized. Banks simply collected deposits, it gave loans and it made a comfortable living.

During the early seventies however, this environment started to change rapidly. The relative stability of the world economy decreased and the macroeconomic instability with a very high level of inflation became a

permanent factor for the last 30 years. Banks, as well as other businesses, had to cope with this new business environment.

The collapse of the Breton Woods exchange rate system together with the higher level of inflation produced very volatile foreign exchange and interest rates from time to time. The price volatility of such strategically important commodities as oil, further complicated the increasing complexity of the business environment [3].

The stock markets reacted to the fundamental changes with increased priced volatility. Especially the second of the 80' turned out eventful.

New important risks showed up and the governments replied to the new challenges with the deregulation of the financial markets. The deregulation process and the new environment gave inspiration to the financial innovation, and quickly eroded the barriers between the different types of financial firms. With the appearance of the new market participants the competition increased rapidly, therefore the proper risk measurement and pricing became strategic issues.

Banks' earnings structure has changed with the deregulation process. Banks are nowadays less dependent on their loan business and interest rate gap related incomes (difference between the interest rate on deposits and loans) than they were 30 years ago.

Supervision and regulation are needed to reduce the weaknesses that can pose a threat to the banking system of the country. There has been an ongoing debate on supervision as to whether be it productive or counter-productive. There are two views held in this context; the first view is that supervision is counter productive, as it imposes a cost on end users. Also, it results in a less efficient banking system. It is also believed that it undermines market discipline and therefore removes the penalty associated with excessive risk taking; in other words it creates a moral hazard.

The second view held says that supervision is an essential requirement. Since the markets have become completely free of supervision this encourages banks to take excessive risks. With the advances in technology and new financial innovations and new systems being developed, these

factors pose greater risk to the financial stability of the system and therefore supervision is required. Secondly, it brings confidence in the banking system and also reduces the systemic risk.

5. Preventive regulation

Preventive regulation can take different forms; some of them are briefly explained below.

- Anti-competitive measures:

- Competition limits: This is done by controlling the number of new entrants in the banking field, also by setting rules for new branches to open. The latter should be justified as a case of public need. It also restrains competition through taking measures that force banks to maintain the profitability of existing banks and existing branches.

- Restrictions on price competition: this is also a form of preventive regulation. Restrictions on price competition can be an interest rate cartel between banks. Banks determine the common interest rate on deposits and loans.

- Administered interest rates: this is also an anti-competitive measure by the government or regulatory authority. In this case the government or regulatory body sets the maximum interest rate that can be used. This was done mostly in US.

- The above-mentioned measures were most common in the developed countries but owing to the financial deregulation many of these measures have automatically vanished.

- Liquidity adequacy:

Specific ratios: this is also a kind of preventive measure where banks are forced to hold a specific certain ratio of liquid assets to their total assets. This is done to ensure that banks have enough cash for unexpected demands. This measure prevents banks from getting into solvency problems.

- Permissible business activities:

In this measure authorities put restraints on what business banks can actually do. These restraints can be min the form of product diversification.

- Loan limits:

Regulators control loan size to a single borrower. This is done mostly by fixing the percentage of the bank's capital base. The

aim of setting loan limits is to encourage diversification.

On-site loan inspections:

Regulatory authorities send outside auditors to assess the quality of the loan book.

- Capital adequacy

The reasons for capital adequacy requirement are:

- i. To cover setup costs of the bank itself;
- ii. To absorb unexpected losses;
- iii. To maintain confidence in bank through balance sheet strength;
- iv. Capital itself provides a source of lending for a bank's loan portfolio.

The above-mentioned requirements are the form of preventive regulation that stabilizes the banking system and keeps the bank e to an absolute minimum.

6. Protective regulation

Protective regulation involves deposit insurance and lender of last resort (LOLR). Both forms of protective regulation are briefly explained below.

- a. Deposit insurance scheme:

This type of protective regulation exists in many industrial countries. The main aims of such schemes are to:

- i. Prevent systemic collapse (deals with systemic risk);
- ii. Protect the consumer. The basic assumption made is that the average retailer cannot assess risk so needs some sort of protection.

In some countries deposit insurance schemes are operated under the control of the government (the UK and the US); in other countries the banking industry organizes them (Germany, France). In countries such as France, Japan and the UK it is obligatory to join deposit insurance schemes, whereas in other countries such as Germany and Italy it is voluntary. The amount of protection also varies from country to country and therefore the regulatory authorities set limits for the amount that could be insured. For example, in Germany and Norway deposit insurance is unlimited. These schemes are funded in different ways in different countries. In the UK there is a minimum amount that every bank has to pay, whereas in other countries it is started when needed.

Although deposit insurance schemes protect customers no prevent from systemic collapse they have been blamed for creating a moral hazard among financial institutions.

- b. Moral hazard problem

Deposit insurance encourages banks to undertake greater risks than they otherwise would undertake. This in consequence undermines the soundness of bank, as the bank believes that the bank would be bailed out with the taxpayers' funds. When the depositors are protected they have no incentive to monitor the bank's activities. The moral hazard problem in the 1980's encouraged authorities to reform the deposit insurance schemes. In the US reforms have been designed to reduce the moral hazard problem by computing deposit insurance premiums on a risk related basis, thereby reducing bank risk-taking.

Narrow banking is also another option available to combat the problems associated with deposit insurance. In narrow banking, insurance with no upper limit would be available if deposits are used for transaction purposes, so any other activity taken by the bank would not be covered by the deposit insurance.

To raise awareness among regulators and banks, the Bank of International Settlement has played a very important role by setting standards of capital adequacy and other issues such as electronic banking; also, the disparities among banking regulations between different countries have also been addressed. Moreover, risks arising from different bank exposures have also been communicated to bank management all over the world.

BIS in 1998 through its Basle we accord provided a level playing field by shifting towards harmonization rather than coordination. The main reason behind this shift was the disparities among the countries over capital adequacy, which in future could be harmful. Banks in the high capital standard countries were less able to compete with low capital standards countries. Similarly capital asset ratios also differed among banks and those banks with less capital/asset ratios were able to expand their balance sheets and thus lend money at a lower margin. This in turn decreased returns for all banks. Banks also began to take higher

risk with high risk lending in order to take the business from other banks [3].

It can be seen from these conditions that the UK and US demanded a level playing field in the global market. They demanded that all the banks should have the same K/A ratio.

7. Basle capital accord I

On July the 15th 1988 the central bankers from the group of ten countries reached a landmark agreement. The Basle can be summarized by dividing it into five main points.

- Basle was introduced in 1998 and fully implemented by 1993. (From the group of ten countries reached a landmark agreement.). The banking industry with regard to the capital standards was now regulated on a global basis, in other words, equalizes the capital requirements in all banks from G-10 countries. Another 90 countries also agreed and many countries adopted this accord.

- The capital accord strengthened the international banking system by introducing the uniform capital standard in all banks in over 100 countries. This was confined to the Asian financial crisis of 1997 and the 1998 Russian crisis, where as no western bank failed, since these banks had enough capital to prevent themselves from becoming insolvent.

- Accord took account of different categories of risk of the bank assets and it also incorporated on/off balance sheet items. Items such as cash had been given “0%” risk whereas loans were weighted with a risk of “100%”. For the first time banks had to take capital costs into account.

- A common capital to assets ratio was established at 8% for all the banks. This was the minimum requirement and it was up to national regulators to decide what ratio particular banks should operate at.

- Each country applying the capital accord was given some latitude with regard to defining capital accord and was also given some flexibility in risk weights to be applied in certain assets. Some argued this by saying that this point undermines the level playing field; accord has a degree of flexibility so a consensus could be formed, generally a level playing field with some bumps.

8. Basle Capital Accord Amendments

Many people complained against the validity of accord and raised questions about it being out of date. For this reason between 1993 and 1995 many consultations and discussions took place among the supervisors and bankers. The main points that were discussed between these bankers and supervisors were:

Netting - National supervisors were prepared to recognize that bilateral arrangements existed between the banks and multiple positions can be reduced to single net obligation. Recognition of this point resulted in less capital required by certain banks.

Interest rate risk – Banks were urged to use the correct method for measuring interest rate risk. Also national supervisors will seek to identify high-risk banks and recommend appropriate actions.

Market risk - Since 1988 banks and other financial institutions have become involved with sophisticated products such as securitization and derivatives. Dealing with such sophisticated products exposed banks to other types of risks that they were not exposed to before.

During the 1990’s there was an increased involvement of banks with new products that had an impact on balance sheets and overall risk position.

Therefore it was decided that capital was to be held against potential market risk; this increase was by 1%. [7]

Choices for banks – Banks were provided with the choice of using their own financial model for measuring value at risk (VAR) according to their strength or using the standard model provided by the Basle Committee.

These banks had to prove that the models they were to use is 99% correct in predicting the maximum amount that banks can lose over a period of a few weeks. $VAR \times 3 = K$, K over here shows the capital required for market risk and 3 is the multiplier factor subject to the quality of the bank’s risk management system.

Exemption of using their own financial model for calculating VAR was restricted to few big banks, while other banks were forced to use the Basle Committee’s model. [6]

These amendments provided a flexible style of regulation and also banks could ascertain their capital requirements more easily for new products.

The old formula of Basle treated a blue chip company and an unemployed person with an overdraft in exactly same way and made no distinction between a well-diversified portfolio and one where all the risks are concentrated in a particular country or sector. [5]

Apart from J. P. Morgan Bankers Trust a New York based wholesale bank also benefited from these new amendments and adopted its own model for capital needed to cushion the swings in the financial market. Many other banks, including some large international institutions, are still using the BIG's simple capital adequacy formulae, which can distort their perception of how profitable their different business lines are [4].

9. Basle capital accord II

There was a broad agreement to update the original 1988 formula for calculating how much capital does the bank needs.

Yet there is also enough disagreement on the philosophy and details of the new proposals to suggest that their implementation will be difficult and expensive, as banks will have to spend heavily on information technology for new systems.

Another disagreement is that it is going to damage a bank's investment in hedge funds. Before the new proposal banks did not have to hold any capital against these funds as they invested through the hedge fund companies and not directly.

Therefore the risks were fairly transferred from bank to the hedge fund companies. But following the near collapse of Long-Term Capital Management where many banks were the investors it was feared that if there is no capital against such funds they could trigger a systemic crisis. [1]

The initial paper by the Basle Committee on banking supervision came out in 1999. Amidst disagreements, the aim of this new report is to strengthen the solvency position of the world's banking system.

The minimum capital asset ratio is to remain the same at 8% as before; however,

there has been a modification for large banks with sophisticated risk management system that can operate on lower capital but still not less than 8%.

10. Conclusion

The basic framework is the same for two sets of proposals. Therefore the three-Pillar approach has been retained. There are also some differences to the June 1999 proposal; for example, there is greater detail in every aspect of the package. Secondly, the standardized approach to credit risk measurement will more closely align the various risk buckets to the underlying risk. Thirdly, two options have been provided under the internal ratings-based system approach so that more banks can use it. Finally, the focus of measurement of the risk has been changed with interest rate risk shifted from Pillar 1 to Pillar 2, but operational risk remaining in Pillar 1.

From the above discussion, it is clear that regulatory scene is currently in flux and it is hoped that national regulators along with international organizations will take prompt actions to deal with the problems facing the current regulatory scene. However, once the disparities and problems are over the international financial system will be stable and the number of bank failures and systemic crises will be reduced.

Country Risk Rating - Factorial Analysis Method

Piciu Gabriela Cornelia

Financial and Monetary Research Center „Victor Slăvescu”, Bucharest, Romania
gabriela_piciu@yahoo.com

Abstract

Defining risks and performances is a classical procedure, but also very important, because it is the base in evaluating risks.

The patterns of evaluation are the most important instruments of scientific knowledge, a conventional image of the objective that needs to be examined. Those are builder in a way that reflects the characteristics of the object: attributes, reciprocal relationships, structural and functional parameters, needed in researching purpose.

The patterns of evaluation are, most of the times, a combination of qualitative and quantitative analysis, using techniques adopted by international firms, but also using techniques adopted by banking institutions. The purpose is to offer clients more exact information's about the risks in order to obtain the best optimization of banking portfolio.

Key Words: country risk, patterns of evaluation, qualitative analysis, quantitative analysis, banking portfolio

JEL Classification: G21, G24

1. Introduction

Since 1974, private banks have been involving themselves in crediting partner countries, because they were worried about the county risk. Many of these banks founded departments that are specialized in the evaluation of risk. Here, specific methods for country risk are elaborated and applied.

During the activity of international lending, commercial banks are facing the risk of default international obligations arising from foreign loans. [4].

For a commercial bank, country risk analysis is necessary if the bank wants to operate above the average effective

competition. The more accurate will be the risk assessment, the higher will be the bank's performance and level of income from international operations and the smaller will be the losses.

The evaluation method is one of the most important tools of scientific knowledge, a conventional image of the objective that must be researched: attributes, mutual relationships, structural and functional parameters, etc, essential for the research purposes. [3].

2. The evaluation method

The evaluation method used is a combination of quantitative and qualitative analysis, using both techniques used by international companies and the ones used by banking institutions. The aim of using this method is to provide customers with accurate information about country risk for good banking portfolio optimization. [7].

The measurement of risk assumed by banks requires taking in consideration several factors, such as:

- the volume of assumed risks, considering that their measurement is made by combining the direct and indirect risks
- including the off-balance sheet commitments and the risk that it this implies
- recipient risk division (public or private sector) splitting risk depending on due dates or nature (loan, credit line).
- reducing the risk. Corporate risk Committee sets the maximum amount of commitments that connote be exceeded according to geographic zones and sovereign states. The limits are determined according to the balance sheet structure of the bank and to the level of own funds and risk policy (aggressive or conservative). [6].

In the model to be presented, we opted for the seven classes of risk (Table 1).

Table 1. Classes of risk

Class	Score	Definition of risk class
Aa	100-76	Payment difficulties appear unlikely
Ab	75-53	(nuances)
Bb	52-47	Payment difficulties are possible
Bc	46-37	(nuances)
Cc	36-24	Several payment problems, including rescheduling
Cd	23-15	(nuances)
Dd	14-0	Appreciable losses

Source: data processed by author

The model includes, in its standardized part, categories and risk elements groups related to fundamental aspects, and in its flexible part, possible ways of interpretation of specific elements. [2].

Thus, the standardized part is as follows:

I. Non-economic risk factors

1.Groups of risk factors related to the international position

2.Groups of risk factors related to the national stability

3.Groups of risk factors related to the international image

II. Economic factors

4.Groups of risk factors related to the macroeconomic management

5.Groups of risk factors related to the economic conjuncture

6.Groups of risk factors related to the balance of payments

7.Groups of risk factors related to the external debt

The proposed model assesses the country risk on short term based on two factors: economic factors and political factors. The weight of the two categories of factors in the final score is 50%.

A).Quantifying the economic factors involved in assessing country risk.

The economic factors which are involved in assessing country risk are

- the development of the country
- real GDP growth rate
- the balance of payments
- inflation rate, dependence on export
- import coverage by export
- the situation of reserves in months of imports

●value of the rapport between short term debt and external debt

●the foreign payments

Country’s development level is expressed by the GDP per capita. It is the economic factor which is expressed in dollars and assessed a maximum of 10 points (Table 2).

Table 2. Country’s development level

Number of points	Country’s development level
0	$0 \leq \text{GDP per capita} \leq 500$
1	$501 \leq \text{GDP per capita} \leq 1000$
2	$1001 \leq \text{GDP per capita} \leq 1500$
3	$1501 \leq \text{GDP per capita} \leq 2000$
4	$2001 \leq \text{GDP per capita} \leq 3000$
5	$3001 \leq \text{GDP per capita} \leq 4000$
6	$4001 \leq \text{GDP per capita} \leq 5000$
7	$5001 \leq \text{GDP per capita} \leq 6000$
8	$6001 \leq \text{GDP per capita} \leq 7000$
9	$8001 \leq \text{GDP per capita} \leq 10000$
10	$\text{GDP per capita} \geq 10001$

Source: data processed by the author

The real growth rate of GDP, is expressed in percentage and is evaluated with up to 10 points like this (Table 3).

Table 3. The real growth rate of GDP

Number of points	The real growth rate of GDP
0	$\text{GDP} \leq -1$
2	$-1 \leq \text{GDP} \leq 0,99$
4	$1 \leq \text{GDP} \leq 2,99$
6	$3 \leq \text{GDP} \leq 4,99$
8	$5 \leq \text{GDP} \leq 7,99$
10	$\text{GDP} \geq 8$

Source: processed data by author

Considering the dimension of the economy, a correction is made this way: with -1 for a GDP less than 3000 \$/inhabitant and with + 1 for a GDP greater than 5000 \$/inhabitant.

The situation of the payments balance is calculated as the ratio of the balance of payments and GDP and is rated with up to 10 points like this (Table 4).

Table 4. The situation of the payments balance

Number of points	Balance of payments situation/GDP
0	Balance of payments situation/GDP ≤ -10
2	$-10 \leq$ Balance of payments situation/GDP $\leq -4,99$ - $10 \leq$ Balance of payments situation/GDP $\leq -4,99$
4	$-5 \leq$ Balance of payments situation/GDP $\leq -2,99$
6	$-3 \leq$ Balance of payments situation/GDP $\leq -0,99$
8	$-1 \leq$ GDP $\leq 1,99$
10	GDP ≥ 2

Source: processed data by author

The Inflation rate of the current year, is expressed in percentage and is evaluated with up to 5 points, like this (Table 5).

Table 5. The Inflation rate

Number of points	Inflation rate
0	Inflation rate ≥ 50
1	$29,9 \leq$ Inflation rate ≤ 50
2	$19,9 \leq$ Inflation rate ≤ 30
3	$9,9 \leq$ Inflation rate ≤ 20
4	$4,9 \leq$ Inflation rate ≤ 10
5	Inflation rate ≤ 5

Source: processed data by author

Considering the dynamics of the last four quarters we apply a correction factor of +/-1. The Export dependence DE_x , is calculated as a percentage ratio between the main export revenues $IPPE_x$ and the value of the entire export TE_x .

$$DE_x = (IPPE_x : TE_x) \times 100$$

The scoring scale is just as Lloyds Bank's and the indicator may receive a maximum of 10 points, as follows (Table 6).

Table 6. Export dependence

Number of points	Export dependence
0	Export dependence > 55
1	$55 \leq$ Export dependence $\leq 50,1$
2	$50 \leq$ Export dependence $\leq 45,1$
3	$45 \leq$ Export dependence $\leq 40,1$
4	$40 \leq$ Export dependence $\leq 35,1$
5	$35 \leq$ Export dependence $\leq 30,1$
6	$30 \leq$ Export dependence $\leq 25,1$
7	$25 \leq$ Export dependence $\leq 20,1$
8	$20 \leq$ Export dependence $\leq 15,1$
9	$15 \leq$ Export dependence $\leq 10,1$

10	Export dependence ≤ 10
----	-----------------------------

Source: processed data by author

Considering the international market situation we apply a correction factor of -1 for unfavorable conditions for export and +1 for favorable conditions for export (for example: a correction of +1 point is made for a product's stable, inelastic export demand such as oil). [1].

The coverage of imports by exports $G_a I_m E_x$, is expressed in percentage and is calculated as a percentage ratio between the value of export E_x and the value of import I_m .

$$G_a I_m E_x = (E_x : I_m) \times 100$$

The coverage of imports by exports $G_a I_m E_x$ may receive a maximum of 10 points, as follows (Table 7).

Table 7. The coverage of imports by exports

Number of points	Coverage
0	coverage < 80
2	$80 \leq$ coverage $\leq 99,9$
4	$100 \leq$ coverage $\leq 109,9$
6	$110 \leq$ coverage $\leq 119,9$
8	$120 \leq$ coverage $\leq 129,9$
10	coverage ≥ 130

Source: processed data by author

The situation of reserves in months of imports may have a maximum of 15 points, as follows (Table 8).

Table 8. The situation of reserves

Number of points	Situation of reserves
0	Situation of reserves < 1 month
3	$1 \text{ month} \leq$ Situation of reserves $\leq 1,9$ months
6	$2 \text{ months} \leq$ Situation of reserves $\leq 3,9$ months
9	$4 \text{ months} \leq$ Situation of reserves $\leq 5,9$ months
12	$6 \text{ months} \leq$ Situation of reserves $\leq 8,9$ months
15	Situation of reserves ≥ 9 months

Source: processed data by author

The value of the ratio between the short-term debt and total external debt. The value of the ratio is expressed in percentage and may receive a maximum of 15 points, as follows (Table 9).

Table 9 The value of the ratio between the short-term debt and total external debt.

Number of points	Short-term debt/total external debt
0	Short-term debt/total external debt > 25
3	$19 \leq$ Short-term debt/total external debt ≤ 25
6	$14 \leq$ Short-term debt/total external debt ≤ 20
9	$9 \leq$ Short-term debt/total external debt ≤ 15
12	$4 \leq$ Short-term debt/total external debt ≤ 10
15	Short-term debt/total external debt < 5

Source: processed data by author

The external payments situation SP_{ex} , is expressed in percentage and is calculated as a ratio between the external debt SD_{dex} and exports E_{xbs}

$$SP_{ex} = (SD_{dex} : E_{xbs}) \times 100$$

Receiving a maximum of 15 points, as follows (Table 10).

Table 10. The external payments situation.

Number of point	short term debt/total external debt
0	Debt service/export > 70
3	$59 \leq$ Debt service/export ≤ 70
5	$49 \leq$ Debt service/export ≤ 60
7	$39 \leq$ Debt service/export ≤ 50
9	$29 \leq$ Debt service/export ≤ 40
11	$19 \leq$ Debt service/export ≤ 30
13	$9 \leq$ Debt service/export ≤ 20
15	Debt service/export < 10

Source: data processed by the author

Finally, the score of the economic factors is determined in the following way:

$$SE = \sum PFE_i$$

where, PFE_i is the score of each economic factor

B).Quantifying the political factors involved in evaluating country risk

Political factors involved and studied in risk country have the following structure:

1. The Current state of the government receives maximum 20 points as follows:

- 0 points for poor governance, frequent changes of government, democratic, high corruption

- 20 points for good governance, and normal regular changes of the government.

A strong democratic system based on broad popular consensus, is an important point in the analysis of credit quality against authoritarian regimes, often linked to a personality whose sequence is uncertain. [8].

2. The economic policy of the current government receives a maximum of 15 points as follows:

- 0 points for an unstable economic policy, inconsistent and unfavorable for the foreign capital;

- 7 points for reasonable coherence, rather restrictive regime regarding the foreign capital;

- 15 points for good coherence and favorable regime for the foreign capital.

3. internal stability receives maximum 15 points as follows:

- 0 points for civil war

- 15 points for social tensions, ethnic, political, racial, cultural, religious.

For each of the factors listed, in case they will not happen, it will be given 2 points

Internal stability allows the knowledge of the game rules, applicable in different circumstances and anticipation, to a certain point, the reactions of governments and the people in case of difficulties. [5].

4. Corruption receives a maximum of 20 points as follows:

- 0 points when corruption is big

- 20 points when corruption is low

5. International position receives a maximum of 20 points as follows:

- 0 points for international sanctions (embargo)

- 5 points for relatively isolation

- 10 points for diverse relationships

- 15 points for good relationships with the major economic powers and international organisms;

- 20 points for preferential economic relations with major economic powers and international organisms.

6. Debt restructuring (external image) is marked by a maximum of 15 points, as follows:

- 0 points for the cessation of payments;

- 3 points for failure in negotiations with the IMF;

- 6 points for the gradual rescheduling;

- 9 points for rescheduling;

- 11 points for delay;

- 15 points for the case without problems.

For the analysis of "debt restructuring" will follow the trend of recent years.

7. The volatility of the electorate, is reaching a maximum of 10 points, as follows:

- 0 points for a low volatility of the electorate;

- 10 points for the high volatility of the electorate.

8. The experience of bilateral relations, is reaching a maximum of 15 points, as follows:

- 0 points for non-payment (refusal, insolvency);

- 1 point for rescheduling difficulties;

- 3 points for rescheduling without problems;

- 5 points for delays;

- 10 points for slight delays;

- 15 points for the case without problems.

Depending on the analyst's assessment that makes this study may be a correction of up to 5% of the scores listed, as follows: C = (0 .. 5).

Finally, policy makers SP score is determined as follows:

$$SE = \sum PFP_j$$

where PFP_j is the score of each political factor..

3. Country risk index calculation

SF final score, which is the country risk index, is calculated as follows:

$$\text{FINAL SCORE} = (\text{ECONOMICAL SCORE} \times \text{POLITICAL SCORE}) / 100 \pm C$$

$$SF = \frac{SE \times SP \pm C}{100}$$

Where C is less than 5% correction that can be added.

In the proposed model of country risk assessment was carried out not only to substantiate their decisions by the bank concerned but also to provide consultancy in this area.

4. Conclusions

From the multitude of criteria used to substantiate the bank's strategy only the following were relevant for Romania:

1. Achieve of an acceptable level of global exposure as the level and structure of country risk by choosing as trading partners countries with acceptable risk and potential

and complementary economic and political characteristics;

2. Avoid an excessive dependence of economic relation with countries whose relations with major power are likely to become an object of international sanctions;

3. Avoid a significant dependency both as a source of raw materials and as markets, countries that could put pressure on country's unacceptable;

4. The existence of an positive experience of bilateral relations in the case of solving disputes;

5. The existence, of natural resources, in partner countries for Romanian economy and of the proper operating capacity;

6. Competition assessment that manifests in foreign markets.

Fiscal Fraud and the Underground Economy in Romania

Popescu Luigi

magdalenaradulescu@yahoo.com*

Abstract

The fiscal evasion has existed, exists and will exist as long as the state and the tax will continue to exist, but its forms of manifestation are subject to structure changes and they improve over time.

The fiscal evasion exists in all the countries, irrespective of their degree of development, manifesting in different ways, depending on the psychological, social, economical and judicial differences specific to every state and creates the underground economy.

Key words: fiscal evasion, underground economy, accounting mechanism, Romania.

JEL Classification: E01, H26, M41.

1. Introduction

The idea, of fiscal evasion generated by the subjective incapacity, but also a certain tolerance which can be manifested compared with the absentee behaviour of the tax payer, has lead to the concept of creative accountancy.

Basically, the creative accountancy represents a set of techniques or accounting methods (of registration, synthesis, consolidation and communication to the stakeholders) which aims to maximize the results of the company, from the perspective of the company managers' interest.

Therefore, the creative accountancy does not do anything else than to exploit certain imprecision, incompleteness, inconsistency from the legislation afferent to the taxation, so that to minimize the impact of the fiscal sampling on the final results of the organization. And this was the description of the fiscal evasion (licit).

2. Exploiting the inconsistency of the fiscal fraud legislation

In other words, the creative accountancy has another advantage, comparing with the orthodox accountancy: that of using the legal fiscal evasion (non-incriminated, as it is known). From this perspective, we think that the term creative accountancy is, in a way, redundant and it is exclusively meant to draw attention on the possibility of legal fiscal evasion, without bringing something new from the conceptual point of view, because, as we can see in the above image, immediately after the orthodox accountancy would use the inconsistency of the fiscal legislation, it will turn into a creative accountancy, while, from the point of view of breaking the fiscal legislation, there is no difference between the two types of accountancies (Hoanta, 1997):

1. *increase in expenses/and reduction of the incomes.* For example, if the reduction of the expenses is wished, one can adopt the method of linear depreciation of fixed capital (although this may endanger, for long time, the refurbishment). If the incomes increase is wanted, then some future incomes can be included (for example the incomes from rents invoiced at the moment of concluding the rent agreement), or the selling at an over valued price of an asset. Regarding the increase of the incomes, one can resort to over dimensioning of the provisions, reduction of the using duration of the fixed capital, acquiring the consumable materials or some inventory objects. If the reduction of the incomes is wanted, then, one can resort to the booking of the current incomes to the category of the incomes registered in advance;

2. *manipulation of the net value of assets,* through the volume of the provisions and of the practiced depreciation system;

3. *reconsideration of the company's debts* with the purpose of influencing the true image of its degree of duty;

4. *elusion of the resorting to the consolidation operation*, in the case of the transactions made between the parent company and its subsidiaries (including the case of assets acquisitions by merging method)

3. The accounting mechanism of evasion and fiscal fraud

The accounting mechanism of the fiscal evasion has as an essential purpose the reduction of the taxable base of the budgetary obligation, regardless the budgetary obligation we may be talking about. Obviously, we are talking about the financial accountancy or, in any case, about the accounting information intended for being used or known by the generic governmental inspector (the one that checks the forming of the budgetary obligation as a debt of the state on the tax payer).

Some conclusions regarding the functioning of the accounting mechanism of the fiscal evasion can be drawn (Clocotici, D., Gheorghiu, 1996):

1) The purpose of the accounting mechanism of fiscal evasion is the reduction of the state rights of sampling, according to the law, from the final incomes (the gross income) of the organization. As a result, the fiscal mechanism of the fiscal evasion will try to reduce the tax base to which the fiscal norms of taxation refer. As the taxation base is the final result of the organization's activity,

2) we will name the fiscal evasion produced by minimizing the entries, *contraction fiscal evasion* and the fiscal evasion generated by the increasing of the expenses *expansion fiscal evasion*. It's obvious that, under the aspect of the ways and the methods used within the fiscal mechanism of fiscal evasion, the contraction fiscal evasion and the expansion fiscal evasion present essential differences. The difference between the two categories of fiscal evasion is obvious from the point of view of the financial and fiscal control procedures of the internal and external audit, intended to detect the fiscal evasion phenomena;

3) Of course, the two procedures do not need to take place simultaneously – of decreasing and increasing the monetary entries – using only one of them being sufficient. The

„experts” that use the accounting mechanism of the fiscal evasion will appreciate, from one case to another, which method will be used or what mix of methods will be used for reaching the established purpose. The election is based on the evaluation made by the authors of the accounting mechanism of the fiscal evasion, regarding the institutional capacity of the governmental inspection of detecting the fraud, as such, they will use the method which seems to be more transparent for the governmental inspection.

4) the reduction of the monetary inputs, respectively the increase of the monetary outputs, with the purpose of illegal reduction of the tax base have their limits. In the first place, it is about the general trend of the organization's activity: there cannot appear visible discrepancies between the indicators that show the development (expansion) of the current activity of the organization and the final results indicators- these discrepancies would constitute, between themselves, clues for the governmental inspectors. In the second place, it is about the functional association between the dynamic of the incomes and the dynamic of the expenses: the expenses cannot increase over a limit that represents the contribution of the expenses to the incomes.

4. Fiscal evasion and fraud techniques

The fiscal evasion techniques depend on several factors: the nature of the organization's activity, the size of the organization, the capacity of the govern to make effective fiscal controls, the magnitude of the fiscal pression, the organizational culture etc.

The main technical categories (methods) of fiscal evasion can be summarized as follows (Saguna D.D., Tutungiu, 1995):

1. in the case of fiscal evasion regarding the profit tax:

– reduction of the tax base by including some expenses on costs, without evidence or legal basis (fines, penalties etc.)

– registering some over dimensioned expenses or expenses over the limit admitted by law (depreciation, social-cultural expenses, travel costs, protocol costs, etc.);

– deduction of some personal expenses of the companies or rates on loans given by the managers to the own organization;

– non-registering all the obtained incomes, either by non preparing the primary accounting

documents, or by writing in the documents some delivery prices, lower than the effective ones;

_ the transfer of the taxable incomes to the newly- created organizations (companies) within the same group (holding), which are in the period of exemption from income tax, concurrent with the registering of some losses by the parent company;

_ establishing the profit tax by non-corresponding applying of the legal provisions (ex., in the case in which the reinvested profit would be non-taxable)

_ non-calculation, by the non-profit organizations, of the tax afferent to the economical activities developed according to the law;

_non-registering in the accountancy the differences established through the fiscal control documents;

_ non-registering in the accountancy of the budgetary obligations regarding the owed tax profit;

2. In the case of fiscal evasion regarding the VAT(value added tax):

_ misapplication of the deduction system (VAT deduction on the basis of some documents which do not have the VAT value added, or even deductions or illegal documents, double deductions as a result of repeated registration of a bill in the purchases journal, deductions on the basis of some documents which belong to other organizations, VAT deduction afferent to the operations registered without any right of deduction);

_ non-inclusion in the calculation basis, of certain operations which are part of VAT sphere, or non-inclusion in the calculation basis of VAT afferent to all the bills;

_ non-registering and non-delivering VAT afferent to the advances from the clients;

_ non-registering, as a VAT payer at the moment of exceeding the minimum ceiling which has been on the basis of non-registering as a VAT payer;

_ avoiding the VAT payment afferent to the goods import, by presenting at the customs some fictional documents of donation, from the external partners, instead of the purchasing documents;

_ non-inclusion, in deductions of VAT for paying at the customs;

_ issuing fiscal bills and VAT bills, without the organization in question to be a VAT payer

and, so, without registering in accountancy and transferring the respective VAT;

_ non-using or defective using of the printed papers, with incomplete registrations in the purchasing journals with repeated registrations in these journals;

_ „losing” the bills, postponing the drawing-up of the fiscal bills with the purpose of postponing the VAT paying, non-inclusion in the calculation base of VAT of all the elements from the bill (packaging, travel costs etc);

_ the false declaration of some imports as being temporary (so without being included in the VAT paying);

_ different deliberate „calculation errors” with the intention of reducing the budgetary obligations referred to VAT;

3. in case of fiscal evasion regarding the salary tax:

_ non-taxation of the paid amounts to the employees with the title of salaries (aid in cash or kind, other rights, rewards, amounts representing the participation of the employees to the profit, different incentives etc);

_ incorrect applying of the taxation tables of the remunerations;

_ non-retention and non-transferring the tax salary owed for the people employed on the basis of civil conventions or for day-labourers;

_ non-accrual, with the purpose of taxation, of all the salaries;

_ non-registering in the accountancy the obligations for paying the salary tax;

_ non-compliance with the legislation regarding the establishment of the tax base of the salaries rights (plurality of offices, exemptions or tax deductions etc.);

_ generating fictional expenses with the pay of some people (pays in the form of the dividends hidden under the remuneration rights);

_ creating facilities for the employees, which are not part of the tax sphere of the remuneration rights;

_ using the micro-enterprises for hiding the budgetary obligations regarding the salaries (consultancy contracts, etc.);

_ obtaining, by the employees, some documents which can prove their right of being exempt from tax salary: revolutionists certificates, handicapped certificate etc.;

4. in the case of fiscal evasion regarding the excises:

_ non-inclusion, in the tax base, of all the taxable amounts with excises;

_ diminishing the tax base by under-evaluation of the imported products, at the customs, by using the double documents (parallel);

_ non-calculation and non-registration in the accountancy of the afferent modifications of the alcoholic concentration;

_ non-inclusion of the excises in the selling price of the products for which excises are due;

_ non-highlighting in the accountancy of the pay obligation of the owed excises;

_ avoiding to pay the excises by changing the name of the excise products and the their switching to the category of the non-excise or excise products with reduced shares (mineral oils, alcohol, etc.);

5. in the case of fiscal evasion regarding other budgetary obligations

_ registering in the accountancy some buildings at lower than actual values;

_ non-deposition, at the fiscal bodies, of the declarations regarding the patrimony buildings, of the means of transport in the possession and the trains held by the organization;

_ declaring some incorrect, non-updated or false data regarding the tax buildings, the tax on the means of transport, tax for using the state owned lands, etc.;

_ non-formation and non-transfer of the dividend tax, incorrect calculation of it;

_ non-retention of the dividends tax afferent to the advances given during the year, which, after obtaining the profit and the approval of the balance, became dividends in the end.

_ non-declaring the obtained incomes by the natural people, from different activities (private lessons, rents incomes, selling goods in shops, selling poultry goods etc.);

_ breaking the legal provisions regarding the way of developing and taxation of taxi business, by the authorized people, without going to the fiscal body for presenting the meters or alteration of the information provided by these people in the activity in question;

The fiscal evasion committed according to the above presented techniques (and, of course, to other similar techniques) is, in a way, benign, in the sense that it can be found by the competent fiscal control bodies. The problem gets worse when the evasion amounts are subject to salaries, which determines them

to become “honourable” unlike the fraudulent origin of the amounts in question.

5. Fiscal fraud and the submerged economy in Romania

The dimension of the submerged economy differs very much, depending on the calculation method adopted by each institution.

The economists recognized in this field estimate the size of the submerged economy in the new member countries in EU at the level of the following figures: 39.4% of GDP in Latvia, 38.2% in Estonia, 36.5% in Bulgaria and 35.4% in Romania, the highest share; 18.3% of GDP in the Czech Republic and 18.2% Slovakia the lowest levels (Miritoiu, Popescu, 2009).

Estimating the unobserved economy in Romania is made for all the activities made by the family associations and self-employed. The information about these activities come from the Ministry of Economy and Finances. Estimation is not only a under-reporting one, because the method contains also a problem of non-registering and lack of statistic investigations on this segment of the economy.

Another important category of the unobserved economy is represented by the activity made by the non-registered companies from the informal sector. In this category there are: tailors, car mechanics, hairdressers, painters, plumbers, teachers who teach private lessons, people who rent holiday house etc. For this kind of activities different estimations are made, using specific hypothesis and data sources available from the statistic system, as follows:

▪ **Hotels:** it is supposed that the level of the non-registered tourists is 1/3 from the total number of the registered ones. The average value of a night accommodation with a number of non-registered tourists is multiplied with the average number of holiday days from an year, this way being obtained the production of this activity. The intermediate consumption is estimated using the intermediary consumption/production registered in the formal sector for the companies with less than ten employees.

▪ **Constructions:** it is assumed that a number from the total number of workers on their own registered in this area also do an unregistered activity. This number is multiplied with the value of the average gross wages from construction field, obtaining this

way the gross added value. To calculate production one can use the ratio between the gross added value and the production recorded in the small formal sector.

▪ **Education:** It is assumed that some of the students registered in the last year of the secondary schools receive tutoring. Their number, multiplied with the average value of a lesson, the frequency of the private lessons on a week and the number of weeks from an year give the value of this field.

According to studies conducted by the National Statistics Institute, the largest share in the hidden economy have an illegal employment and VAT fraud, the domestic industry being around 8%. The estimation from the first to components is made as follows:

➤ ***Estimating the illegal work***

For this, it is compared the demand and the labor supply at the level of industry. The difference between the number of people who declared that they work in an enterprise and the number of people employed by enterprises is reported as „moonlighting”. The illicit work is evaluated with the same components of the legal situation (average gross wages, social insurance contributions etc). The intermediary consumption is determined by using the same production share as the one obtained by the small enterprises for the respective industry.

➤ ***Estimation of VAT fraud***

In the Romanian national accounts estimations are being made regarding the evasion of VAT. The tax evasion is obtained as a difference between theoretical VAT and VAT levied on the state budget. Theoretical VAT is estimated using elements of intermediate consumption, household final consumption, private and public administration final consumption and VAT charged on the VAT rates on products, established by law.

The period 2005-2007 shows a stabilization of the hidden economy at the share of 17% from official GDP, in decrease from the levels around 22% located in the late 90s. All these represent the effect of the economic development, the mass of the accumulated capital exceeding the absorptive capacity of informal sector and the movement taking place in the opposite sense: rich people on account of their underground activities formalize their new status by entering into legal activities.

By attracting the submerged economy of tax payers, the tax reform of 2005, respectively of implementing a flat tax of 16%, proved to be a

success on attracting additional resources from the state budget. Thus, at the end of the first semester of 2005, the number of employees from the economy grew by almost 180,000 employees compared to the end of 2004, because, at the end of 2005, the increase of the number of workers employed with individual labour contract is over 200,000, according to data published by the National Institute of Statistics. If we consider, on one side, that the increase is higher in the period 1999-2005 it results that this development can be regarded as being the effect of the measures of fiscal loosening.

Since 2006, the number of transfers from the black market on the formal employment declined substantially. The increase in the number of employees comes from creating new jobs and is based on hiring new staff, which is observed in the reduction in the number of unemployed. It is also important the inclination of the tax payer towards tax evasion and the evasion of the tax payer from paying taxes, thus making higher net incomes. In addition, many workers prefer working illegally, without a labour contract that requires the employee obligations, allowing them to rapidly changing workplace if they are offered more elsewhere. In this part should be also included those who work abroad illegally, the estimation being over one million people. The amounts sent to the country by Romanian immigrants in 2007 reached about 5.5 billion euros, mainly from activities in the informal economy.

The counterfeits represent one of the most profitable businesses from the planet. Studies made by international institutions indicate that the turnover of counterfeiting represents over one quarter of the world economy. At the level of Western Europe, one third of software is pirated, and sports equipment companies declare annual losses of 7.5 billion euros. According to the European Commission, counterfeit goods, especially those from China, cause annual losses of around 500 billion.

Also in Romania the counterfeits represent a profitable business, especially their commerce, our country not being a base of production. Is difficult to establish the exact value of losses, in 2006 the damages summing almost a billion euros. The commercialization with counterfeit goods is doubled by the sub evaluation of the imports, which leads to another form of unfair competition.

The real estate market is impossible to be evaluated from the point of view of the turnover. The big profits made of real estate investment that until 2007 were of 50% or even higher, have attracted a lot of money. In the present day, especially for the big projects, the profit has been reduced to 20-30%, which does not mean that it is not superior to the other economical activities. Moreover, a great part of the money invested into real estate business represents the profits from other businesses that the bosses redirect. The efficiency of the real estate investment has attracted important amounts of money from the submerged economy.

A great contribution to the business of submerged economy is given by the *tourism*. During the summer, the authorities have announced that the degree of occupancy in the seaside resorts exceeds 100%. The explanation is given by the fact that this study takes into consideration the private bosses who offer “black” accommodation.

6. Conclusions

During the last decade has been a growing tendency of law, agencies and intergovernmental organisations to focus upon international evasion and fraud phenomenon. This subject has an increased importance as a direct result of climate of economical recession, which determined the increasing of the tendency of a part of tax payers to reduce their taxes as a source of a new finance, in the same time, for other reasons the governs has continued to retrieve missing tax by fighting against fiscal fraud, by avoiding tax burdens and by modifying national fiscal policies (Din, Meghisan, Diaconu, 2011).

The existence of the submerged economy is a true challenge for the public authorities that, in their essay of limiting or taking over into the official economy, will have to take into consideration its negative effects as well as the positive ones.

The submerged economy has a strong impact in the social plan, as well, this one being on a strong relationship with a series of phenomenon like: corruption, different types of crimes, drug consume, mafia organizations, work exploitation through the black market, money laundering, human rights violation, environmental pollution etc. The increasing of the submerged economy leads to the reduction

of the public incomes. Hereby, the governments will no longer have the financial capacity to improve the administration, the public goods and the infrastructure. The quality and quantity of goods and public services will decrease in time, while the governments will try to prevent this by increasing the taxes. The excessive taxing and the public services and weak infrastructure motivate more and more actors from the official economy to direct their activities towards the submerged economy. This way, a vicious circle appears, being hard to get out of it (Schneider, Fr., Burger, C, 2005).

Taking into consideration all these conclusions and observations we can consider that the biggest challenge for each government is the one of adopting efficient measures to make working in the submerged economy to be less attractive.

Discounting and Lumping – Financing Methods for External Commerce Operations in the Current Context of Worldwide Economic Crisis. Accounting Treatment

Pravăț Ionela-Cristina

“Vasile Alecsandri” University of Bacău, Faculty of Economic Sciences
crisspra@yahoo.com

Abstract

For companies which undertake and manage international business, a problem which needs solving, especially in the context of the current global economic crisis, is related to ensuring the financing of external economic transactions. The accomplishment of this goal has led to the emergence and development, among commercial credit relations - connected to external commerce and not only to it - of some efficient forms of mobilizing trade effects like lumping and discounting.

Therefore, this article aims to describe a series of basic aspects which characterize the two types of financing external economic transactions, to present comparatively the major differences between them, and to present a model of reflecting the operations related to discounting and lumping in accounting documents.

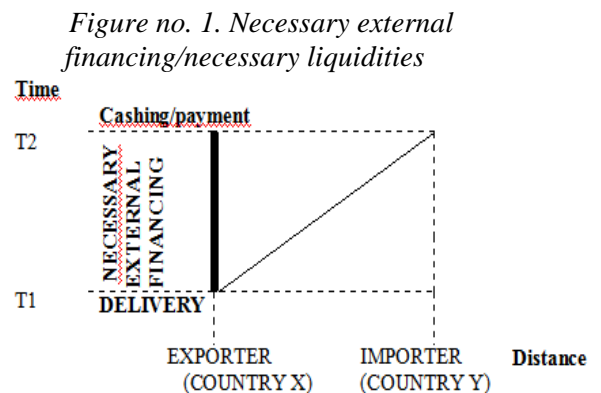

Key words: external trade, financing, discount, lumping, accounting.

J.E.L. classification: M41 - Accounting; P33 - International Trade, Finance, Investment, and Aid;

Introduction

In the context of the global economic crisis on the one hand, and having in view the conditions of the current level of development related to external trade on the other, we can consider that any economic agent which exceeds the borders of his native country, aiming to obtain a maximum profitability level, will have to run his business so as to maintain his financial stability and to assure the liquidities which are necessary for external financing.

In the context of export operations, the commercial relation is externalized, and hence, it can often entail a series of problems concerning the financial equilibrium of the exporter. This means that, inevitably, there are several situations when the spatial distance can result in a significant temporal delay between the delivery stage/phase and the phase which includes cashing payment for the supplied goods. The direct consequence is that financial resources are blocked, there is a lower liquidity rate, and thus the necessity to finance the enterprise by external means emerges, which is represented in the figure below:

External financing is offered by banks and other financial institutions under the form of credits, but also by means of the financial instruments offers and special financing techniques, such as discounts and lump-sums.

1. Commercial discounting – a classical financing method. Accounting treatment

Operating according to the same scheme as in the case of internal trade, discounting specific to expert activities represents the technique of mobilizing commercial credits on a short-term basis, by means of which the

exporter (as the importer’s creditor) benefits from short-term financing from a bank, without any real guarantee.

This does not mean that banks which grant the discount credit/loan do not take preventive measures/security against the risk of not cashing the payment for commercial effects when they are due: they often receive for discount only avalized effects, or on the basis of a banking guarantee, they can often resort, in extreme cases, to the right of appeal against the exporter.

In this case, for the exporting firm, the purpose of discount is – as the beneficiary of a bill of exchange, or of a promissory note – to transform the debt for a third party (importer) in payment/cash against delivery (in liquidities), before the due date.

The discount credit/loan which is given by the bank to the beneficiary (upon receipt of the instrument endorsed in its favour) is determined starting from the equivalent value of the trade effect, and this value is diminished by the discount cost (which is established depending on the conditions of the national credit market), as follows:

$$\text{Discount credit} = V - \frac{V \times Rs \times n}{360 \times 100} - C$$

where:

V- is the value of the title at due date, including interest, if it is the case/the nominal value of the title;

Rs - is the discount rate, expressed in percents per year;

n - is the number of days before the due date (the number of days from discount date to due date);

C - is the bank commission; C = is the nominal value of the title multiplied by the commission percent established by the bank.

To sum up, we can say that discount at this level presents a series of advantages, among which the mention the following:

- it practically transforms a sale on credit in a sale with payment on delivery, exporters including in their tender price a supplementary margin which could eventually cover the discount cost;

- the considerable reduction and even the disappearance of risks related to the evolution in time of the interest rate, and this is due to the fact that the discount rate is a fixed one.

The figure below presents the simplified mechanism of discount credit:

Figure no. 2. The simplified mechanism of discount credit

where:

(1) – represents the ending of the export contract, and the exporter asks the importer to accept the bill of exchange which is taken over by it;

(2) – delivery of goods and receipt of the accepted trade effect;

(3) – handing in the trade effect, together with the delivery documents at the bank, and then discounting it;

(4) – ulterior settling, either directly or indirectly, of the debt.

When resorting to this type of financing, in the exporter’s bookkeeping records the following data will be registered:

a) the issuing and receipt of the bill of exchange accepted by the importer:

413	=	4111	V
<i>Receivable effects</i>		<i>Clients</i>	

b) handing in the bill of exchange (together with the delivery documents) at the bank, for discount:

5114	=	413	V
<i>Effects submitted for discount</i>		<i>Receivable effects/effects to be received</i>	

c) the exporter cashes the equivalent value for the discounted bill of exchange (including the bank commission and discount):

c1) in case favourable currency differences occur:

5124	=	%	V ₁
<i>Bank accounts in foreign currency</i>		5114	V
		<i>Effects submitted for discount</i>	
		765	V ₁ -V
		<i>Revenues from currency differences</i>	

c2) in case unfavourable currency differences occur:

%	=	5114	V
5124		<i>Effects submitted for discount</i>	V ₁
<i>Bank accounts in foreign currency</i>			
665			V-
<i>Expenses from currency differences</i>			V ₁

d) recording the bank commission and the discount paid to the bank:

%	=	5114	T + C
667		<i>Effects submitted for discount</i>	T
<i>Expenses with granted discounts</i>			
627			C
<i>Expenses with banking services and assimilated services</i>			

The manner of presenting, in accounting records, the discount methods previously described does not clearly delineate the three phases which form the circuit of trade effects (emitting/issuing the effect, accepting its receipt, and handing it over to the bank for discounting)[1].

Hence, we propose the following solution for bookkeeping:

a) issuing the trade effect:

413	=	4111	V
<i>Receivable effects</i>		<i>Clients</i>	

b) receiving the trade effect for discount at the bank:

5113/x	=	413	V
<i>Cashable effects</i>		<i>Receivable effects</i>	

c) depositing/handing in the effect discount at the bank:

5114	=	5113/x	V
<i>Effects submitted for discount</i>		<i>Cashable effects</i>	

2. Lumping – a modern financing method. Accounting treatment

Export lumping represents the transfer of debts (expressed in titles accepted for lumping) – the result of external trade operations undertaken on credit – to a

specialized financial institution, which will pay for them immediately and the factor will get the debt repaid afterward, from the importer, at due date.

In this situation, as compared to discount, the lumping institution does not have the right of appeal upon the seller of the debt in case the importer cannot make the payment, the risks being thus taken over by the lumping institution. As a result, the cost of lumping is much higher than the cost of discount, and it is represented by a fixed interest rate (established depending on the level of the interest of the reference euro currency in which the debt is expressed), to which the commission charged by the lumping institution is added, determined depending on the creditworthiness of the debtor, whether the debt title is avalized or not, the creditworthiness of the referee (avalist), the payment method, or the risk of the operation.

The lumping tax is the result of the lumping basic cost and the global risk margin, and is calculated as follows:

$$TF = \frac{VN \times (D + Mr) \times n}{100 \times 360}$$

where:

VN - is the nominal value of the credit title;

D - is the basic interest;

Mr - is the risk margin;

N - represents the number of days until due date.

Financing external businesses by way of lumping is reflected in the exporter's accounting records as follows:

a) invoicing the importer's merchandise:

4111	=	%
<i>Clients</i>		707
		<i>Revenues from merchandise sale</i>
		708
		<i>Revenues from various activities</i>
		766
		<i>Revenues from interests</i>

b) emitting/issuing the trade effect (debt title):

413	=	4111	V
<i>Receivable effects</i>		<i>Clients</i>	

c) data outside accounting records/
documents:

8028 <i>Other engagements received</i>	V
--	---

d) invoicing the lumping institution’s debts,
simultaneously transmitting/communicating
the endorsed trade effects:

4111 <i>Clients/Factor</i>	=	413 <i>Receivable effects</i>	V
-------------------------------	---	----------------------------------	---

e) cashing/collecting the equivalent value for
the lumping institution’s invoices, including
the lumping tax and commissions charged:

5124 <i>Bank accounts in quotations</i>	=	4111 <i>Clients/lumping institution</i>	V-TF-C
--	---	--	--------

Note: Possible currency differences can also
intervene.

f) registering the lumping tax and
commissions owed to the specialized
institution:

V1: The lumping institution calculates
globally the lumping tax and commissions:

668 <i>Other financial expenses</i>	=	4111 <i>Clients/lumping institution</i>	TF + C
--	---	--	--------

V2: The lumping institution calculates
separately the lumping tax and commissions:

%	=	4111	TF+C
667 <i>Expenses with granted discounts</i>		<i>Clients/lumping institution</i>	TF
627 <i>Expenses with banking services and assimilated services</i>			C

Conclusions

In conclusion, it could be interesting to
present a series of differences between
discount and lumping:

*Table no. 1. A presentation of the
differences between discount and lumping [2]*

No.	Segment where differences occur	Discount	Lumping
1.	The non-payment risk	The bank does not take over the non-payment risks generated by the bankruptcy or ill intentions of the importer or guarantor	The lumping institution takes charge of all non-payment risks
2.	Institution performing the discount	It is carried out by commercial banks, on the national credit market	It is carried out at an international level, by a relatively reduced number of specialized institutions
3.	Due date of trade effects	The due date of trade effects, bills of exchange and promissory notes is established at a maximum of 90 days	The due date generally exceeds 90 days, because long-term debt titles are usually negotiated
4.	Financing/re financing source	The bank doing the discount can refinance itself from the central bank	Financing sources are represented by funds collected by lumping institutions from the international markets
5.	Cost/Tax	The discount tax is established on depending on the conditions of the national credit market	The lumping tax results from the interest level on financial markets for the foreign currency in which the debt title is expressed, and is generally higher than the discount tax due to overtaking non-payment risks by the lumping institution
6.	Reference currency	Commercial banks generally discount credit titles in national currency	Lumping institutions receive credit titles in foreign currency
7.	Category of exports to which it is applied	It is generally applied for debt titles with a shorter discount term and even with a slightly lower value.	It is applicable even in case of average-term debts resulting from exports on credit, thus stimulating the export of high-value goods.

In conclusion, exporters, and not only them, resort increasingly to financing by means of the two methods presented in this paper. This is due to the fact that these flexible instruments allow, first of all, a decrease in the duration between carrying out the export and actually recovering the debt, thus ensuring, in time, the necessary amount of liquidity.

News on Accounting and Tax Treatment Related to the Activity of Intracommunitarian Goods Transport

Pravăț Ionela-Cristina

“Vasile Alecsandri” University of Bacău, Faculty of Economic Sciences

crisspra@yahoo.com

Abstract

The economical activity of transport fits within the broad category of services, but in terms of taxation, transport services are treated as an exception, compared to how services are approached in general.

Among the categories of transportation services, intracommunitarian transport shows certain particularities. Therefore, we proposed in this work to address from a theoretical point of view a series of news occurred in the tax and accounting treatment of specific business operations of intracommunitarian goods transport.

Intracommunitarian goods transport means any kind of transport of goods for which the place of departure and place of destination is located in two different states belonging to the European Union. If over the course of intracommunitarian transport, from the point of departure and the arrival point, a third country outside the European Union is crossed, the quality of intracommunitarian goods transport of that transport is not affected.

Key words: intracommunitarian transport, accounting, fiscality.

J.E.L. classification: H3 - Fiscal Policies and Behavior of Economic Agents; M41 - Accounting.

1. General aspects regarding intracommunitarian goods transport

The intracommunitarian goods transport means any transport of goods for which:

- Place of departure and place of arrival are situated in two different member states – the *actual intracommunitarian transport*, or
- Place of departure and place of arrival are situated in the same member state but the transport is directly connected with an

intracommunitarian goods transport – *national transport assimilated to intracommunitarian transport.*

We address in the following the issues of the actual intracommunitarian transport.

We recall here that the general rule regarding the place of provision of services provides that:

a) if the services are rendered to a **taxable person** acting as such, the place is where this person, the **beneficiary**, has established the headquarters of his business or has a fixed establishment where the services are rendered; in the absence of such an establishment, the place of provision is where he has his permanent address or habitual residence;

b) if the services are supplied to an **untaxable person**, the place is there where the **provider** has established the headquarters of his business or has a fixed establishment from where the services are supplied or, in the absence of such an establishment, the place of provision is where he has his permanent address or habitual residence, with some exceptions concerning transport:

- the place where transport takes place, proportional to the distances covered, in case of transport of goods services, other than intracommunitarian goods transport, to untaxable persons; methodological rules;
- the place of departure of an intracommunitarian goods transport, for the services of intracommunitarian goods transport provided by untaxable persons.

Summarizing, we are calling into question the following cases:

Case I: The provider and the beneficiary are taxable person established in Romania

This situation leads to the establishment in Romania of the place of provision for any

intracommunitarian goods transport invoiced between two taxable persons established in Romania. Person liable to pay VAT is the provider who must issue VAT invoice, if any tax exemption does not apply.

Example:

A society from Romania provides to another company also established in Romania an intracommunitarian goods transport from France to Italy, the place of provision is in Romania, and the provider has the obligation of paying the fee.

Note: According to the latest changes in the Tax Code, the fact that the beneficiary from Romania has a registration code for VAT purposes in another member state is no longer important, unless he has a fixed establishment in that member state.

Case II: The provider is established in Romania, the beneficiary - taxable person - is established in another member state

In this situation, the provider is established in Romania and will provide services of intracommunitarian goods transport to taxable persons established in other member states. Therefore, transport services are not considered intracommunitarian services and do not have the place of provision in Romania this, in principle, being considered to be in the member state in which the beneficiary is established (a rule).

To apply the rule from art. 133 Para. (2) of the Tax Code (a rule), the customer must communicate to the provider:

- a valid VAT code from another member state and
- location of the headquarters of its business or of a fixed establishment in the Community.

Intracommunitarian transport services are to be reported by the transporter from Romania in the Recapitulative statement.

If the Romanian provider is not registered for VAT, he will need to apply for registration according to art. 153 of the Tax Code (for intracommunitarian services), before performing this intracommunitarian goods transport.

Example:

A company from Romania invoices for the benefit of a company established in Italy a transport of goods from Bucharest to Rome. The place of provision of services is in Italy,

where the beneficiary is established; therefore the transaction is not taxable in Romania in terms of VAT.

The Romanian provider will report this transport in the monthly Recapitulative statement to rd.3 and 3.1 of the VAT Return.

Note: The above rule can be applied if the beneficiary is a company with his business headquarters in Romania, but has a fixed establishment in another member state and is registered for VAT in that member state, if the transport is made for that fixed establishment.

Case III: The provider is established in another member state, the beneficiary - taxable person - is established in Romania

In this case, the provider is established in another member state and invoices intracommunitarian goods transport to customers that are taxable persons established in Romania. Therefore, transport services are considered intracommunitarian acquisitions of services and the place of provision is in Romania.

The obligation of paying the fee rests with the beneficiary established in Romania that:

- if registered for VAT, reverse charge rule will be applied;
- if not registered for VAT, he needs to apply for registration according to art. 1531 of the Tax Code, before benefiting from this service and will submit a special VAT return (Form 301).

Because it is an intracommunitarian acquisition of services, there is the obligation to declare the transaction in the monthly Recapitulative statement (390).

Example:

A Hungarian company performs a transport from Budapest to Bucharest to a company from Romania, normally registered for VAT purposes according to art. 153 of the Tax Code.

Therefore, the place of provision is considered Romania, according to art. 133 Para. (2) of the Tax Code, the service being taxable in Romania - the country where the customer is established. Since the provider is not established in Romania, the client from Romania, normally registered for VAT applies reverse charge and enters the operation in the Recapitulative Statement (390).

2. Aspects regarding the accounting of the activity of intracommunitarian goods transport

To substantiate the accounting rules for the activity of intracommunitarian goods transport we will present a series of practical examples.

A. The reflection of the activity of intracommunitarian goods transport in Romanian accounting provider

We present below some examples of activities of intracommunitarian goods transport and the accounting treatment supported by the Romanian provider.

Example 1:

S.C. "A" S.R.L, established and registered for VAT in Romania, transports goods from Romania to Spain for an untaxable Spanish.

- The tax treatment to be applied in this case will be:

According to general rule of the Tax Code, intracommunitarian goods transport takes place in Romania as the place of provision is considered Romania, the beneficiary being an untaxable person. Therefore, the activity of intracommunitarian goods transport is taxable in Romania.

- The accounting treatment to be applied in this case will be:

The invoice issued by the company from Romania will include VAT and the operation of provision of services will reflect in the accounting of SC "A" S.R.L as follows:

4111 „Customers”	=	%
		704 „Income from performed activities and rendered services”
		4427 „Collected VAT”

Example 2:

S.C. "B" S.R.L, established and registered for VAT in Romania, transports goods from Romania to Spain for the company "S", taxable person in Spain. The Spanish beneficiary has provided the Romanian carrier its registration code for VAT in Spain.

- The tax treatment to be applied in this case will be:

In this case, because the beneficiary company is a taxable person registered for

VAT in Spain, the place of provision will be considered Spain. Therefore, the activity of intracommunitarian goods transport is taxable in Spain.

- The accounting treatment to be applied in this case will be:

The invoice issued by the company from Romania will not include VAT, the Romanian transporter not being obliged to charge VAT and the activity of intracommunitarian transport (operation untaxable in Romania) will reflect in the accounting of SC "B" S.R.L as follows, whilst maintaining the right to deduct:

4111 „Customers”	=	704 „Income from performed activities and rendered services”
---------------------	---	--

The Spanish beneficiary will proceed to reverse charge applying VAT rate valid in Spain, at the rate of 18%.

Note: Please note that in this case, the carrier must check the validity of the registration code for VAT purposes provided by the beneficiary, using one of the ways laid down by O.M.P.F. no. 1706/2006, published in M.O. no. 894/02.11.2006.

Example 3:

S.C. "C" S.R.L., established and registered for VAT in Romania, transports goods from Romania to Italy for the company "T" from Spain, which has a fixed establishment in Italy, establishment that is also the destination of the shipment. The Spanish beneficiary is registered for VAT both in Spain and in Italy, but he provided the Romanian carrier his registration code available in Italy.

- The tax treatment to be applied in this case will be:

In this case, because the beneficiary company owns fixed establishment in another member state, where the intracommunitarian transport was completed, the place of provision will be considered Italy. Therefore, the activity of intracommunitarian goods transport is taxable in Italy.

- The accounting treatment to be applied in this case will be:

The invoice issued by the company from Romania will not include VAT and the

activity of intracommunitarian transport (activity untaxable in Romania) will reflect in the accounting of SC "C" S.R.L as follows, whilst maintaining the right to deduct:

4111 „Customers”	=	704 „Income from performed activities and rendered services”
---------------------	---	---

B. The reflection of the activity of intracommunitarian goods transport in Romanian accounting beneficiary

We present below some examples of the activity of intracommunitarian goods transport and the accounting treatment supported by the Romanian beneficiary.

Example 1:

Company "F", established and registered for VAT in France, carries goods from France to Romania, for SC "D" S.R.L from Romania, taxable person that communicates to the French carrier a valid registration code for VAT in Romania.

- The tax treatment to be applied in this case will be:

In this case, because the beneficiary company is a taxable person that communicated the VAT code available in Romania, the place of provision will be considered Romania. Therefore, the activity of intracommunitarian goods transport is taxable in Romania.

The provider will issue an invoice without VAT, and the beneficiary shall submit the activity of intracommunitarian goods transport through reverse charge tax.

- The accounting treatment to be applied in this case will be:

Beneficiary, S.C. "D" S.R.L, will receive an invoice without VAT, but will highlight in accounting both the deductible VAT and the collected VAT in the WATT return, based on the accounting note:

624 „Expenses with transport of goods and personnel”	=	401 „Suppliers”
---	---	-----------------

4426 „Deductible VAT”	=	4427 „Collected VAT”
-----------------------------	---	-------------------------

Example 2:

Company "F", established and registered for VAT in France, carries goods from France to Romania, for an untaxable Romanian.

- The tax treatment to be applied in this case will be:

According to general rule of the Tax Code, intracommunitarian goods transport takes place and will be taxed in France as the place of provision is considered the place where the provider has his business headquarters, respectively France, as the beneficiary is an untaxable person.

- The accounting treatment to be applied in this case will be:

The invoice issued by the French company will include VAT in total value (transport value plus 19.6% VAT) and the activity of intracommunitarian goods transport will reflect in the accounting of the beneficiary as follows:

624 „Expenses with transport of goods and personnel”	=	401 „Suppliers”
---	---	-----------------

Abstract

The accounting as an instrument of information must offer information to different users of exact information. The information concerning the accounting for the intellectual capital of the enterprise, not only that they can be useful for the inside public, but also to the outside one, as well as contributing to the creation of value within the organization by showing to what extent the organization is socially accountable and contributes to the creation of intangible assets. The accounting of the intellectual capital is not quite easy to achieve, because of the assessment difficulties and through the viability within the process of accounting taking into consideration the current legislation. This article aims to show what hidden intangible assets (intellectual capital) are, what their importance and usability in the knowledge economy is, which are the advantages and disadvantages of publishing information regarding them.

Keywords: alternative accounting, intellectual capital, hidden intangible assets, Skandia Navigator

J.E.L. Classification: M41 - Accounting

1. Introduction

The accounting exists from the beginning of the world while the data regarding the transactions and the financial relations between different parts have been written down from the babilonic civilization. However, the accounting had a long way to

cross until it reached the assembly of coordinated principles within a coherent system of accounting. The system of accounting, 500 years old, which has not suffered massive changes within the past years, is not sufficient in order to capture the economic reality of the organization. In the last years, traditional management – based on the analysis and interpretation of accounting data – has turned out to be incapable to assess and express, in a clear and correct manner, real performance of the entities involved [1]. The traditional financial situations do not provide enough information so that the administrators or the investors could understand how come the resources- the majority of them intangible- could create value for the future. The intellectual capital represents an important promoter for the value of organizations. Very important to mention is the fact that this one affects all the sectors and it doesn't stop just to firms but also the state institutions, universities, and governments and even to churches.

The booking of the intellectual capital begins to be recognized as one of the biggest challenges of the modern accounting. The current accounting is based on the principles of the double match, guaranteeing equilibrium between active and passive. The accounting of the intellectual capital is not based on the system of the double match and does not guarantee the equilibrium between active and passive.

2. Intellectual capital – definition and clasification

In the new economy, intellectual capital is

the key factor of company competitiveness and long term value. Nowadays, as we are well aware of, the value is mostly given by intangible assets than physical.

What is intellectual capital? It is, as defined by a company, “what exits the gate at the end of the day”. People? Company’s know how? ... it is the sum of ideas, investments, technologies, general knowledge, computer software, projection, data processing techniques, processes, creativity and company’s publications. Intellectual capital can be easily understood as knowledge turned into benefits [2].

Edvinsson and Malone [3] define intellectual capital as the possession of knowledge, applied experience, organizational technology, customer relationships and professional skills that give a competitive advantage in the market.

Nevado and López [4] talk about intellectual capital as total assets of a firm, even if not reflected in traditional financial statements, generate or will generate value for the company in the future, and consequence of the issues related to human capital and the structural: the capacity of innovation, customer relations, quality of processes, products and services, cultural and communicational capital, which allows a company or organization to take better advantage of opportunities, giving birth to generation of future benefits.

We also find many definitions of intellectual capital that is related to intellectual capital defined as the sum of its components, and definitions that make reference only to the human aspect.

In order to achieve this goal, we consider the most appropriate the classification of intellectual capital in: human capital, structural capital, relational capital.

Human capital is the total amount of staff abilities and concentrates skills (knowledge, skills, talent and know-how), attitude (behavior, satisfaction, motivation, performance and ethics) and intellectual agility (innovation, imitation, adaptation).

Structural capital is the physical and organizational structure, property of the enterprise, which supports human capital and facilitates knowledge transfer. Structural capital consists of internal processes capital and research, development and innovation capital. Internal processes capital is related to

quality of processes, products and services that gives the company its competitive advantages. R&D capital include investments that are made in developing new products, new technologies.

Relational capital includes clients’ portfolio, relations with competitors, suppliers, shareholders, governments and public administrations, other stakeholders and their impact on business. Relational capital is composed by commerce capital and communication capital. Commercial capital includes relationships with customers and suppliers, and their satisfaction, market share, etc. Communication capital includes marketing activities.

3. Intellectual capital – an accounting approach

Most organizations fail to identify, measure and publish data on their most important intangible assets. Non-recognition of internally generated financial assets will lead to an inefficient allocation of resources and will not take advantage of the opportunities offered by business environment by losing to competition. What has to be done is to start managing and presenting situations on the intellectual capital of organizations. Nowadays, organizations do not include in the financial statements information on hidden intangible assets that generate value and “information provided by traditional financial statements do not meet the needs of different stakeholders”. [5]

Although IAS 38 - Intangible Assets encourages the submission of such additional cases on intangible assets that are not reflected in current financial statements [6]: “an entity is encouraged but not forced to report the following information: ... a brief description of significant tangible assets controlled by an entity but not recognized as assets because they did not meet the recognition criteria within this standard”.

The appropriate question is where and when to publish this information on intellectual capital, information that we will treat as “Report on the intellectual capital of the company”. The most appropriate moment to publish this report we believe it would be with the annual financial statements, appearing as an appendix to this binding. For

this and taking into account the specificities of each national sector will be necessary to develop and enact one report model for each of these national sectors.

Thus Skandia, the famous Swedish insurance company paved the way for additional financial statements disclosure, by publishing in 1994 a Report on Intellectual Capital Audit. There many other companies followed. Following the publication of this audit on intellectual capital, share price rose by over 40% of which over 25% due to intellectual capital [7].

4. Skandia: first report on intellectual capital

Skandia established intellectual capital as one of "the three fundamental stones for building intelligent organizations" [8]. The other two are technology and values.

The first report of intellectual capital that has been published as a supplement to the annual accounts of Skandia in 1994 was the "Intellectual Capital View", followed in 1995 by the "Creative Process Value" and in 1996 by "The Power of Innovation". For Skandia, financial capital and intellectual capital are the 2 elements that define the organization, value which is actually fair value. According to IAS 16 the fair value represents the sum for an asset that might be willing changed between the 2 interested parts within a transaction developed in objectives conditions with objective determinate.

According to the Skandia intellectual capital consists of:

1. Human capital: personal skills, knowledge, skills and experience of employees and staff, organizational culture.

2. Structural capital: "what remains in the office when employees go home" (such as hardware, software, databases, patents), infrastructure that incorporates, forms and sustain human capital:

a. Capital customers: customer relations, their satisfaction and loyalty, longevity, sensitivity to price, long-term welfare clients;

b. Organizational Capital: organizational competence and investment in systems:

- Innovative capital: the capacity for renewal and innovation of new products and services and other intangible assets and used talent for creating and launching new

products and services.

- Processes capital: techniques and programs for employees in order to add value for the enterprise and to increase the efficiency, work processes.

As we can see, Skandia uses both financial elements and non-financial elements in order to establish the market value of a company.

The model has 111 main indicators and 51 auxiliary indicators that are being used. They may be quantitative or percentages indicators.

The model proportionates a balance between the past (financial perspective), present (customer perspective, human perspective and perspective of processes) and future (innovation and development perspective):

1. Financial perspective surprises information stemming from the financial statements;

2. Customer's perspective offer a vision of the degree in which the enterprises satisfies the needs of customers with products and services, being present indicators related to share sales customers, or how loyal are its customers.

3. Human perspective is "the heart of the organization", "that part of the intellectual capital that goes home every night" and "the combination of experience and innovation that are in these employees and the strategies of the enterprises for change and preserve this combination" [9] it presents indicators such as employee satisfaction, their improvement.

4. Process perspective refers to the processes of efficient production of goods and efficient service-oriented to customers.

5. Innovation and development perspective aims to capture the opportunities that define the future of the enterprises - look into the future to prepare for it and to establish lines of action to ensure long term growth and profitability.

Skandia Navigator is a model of organizational planning, oriented to the future, which proportionate a more balanced picture of the organization operations. This is how a balance between past (financial perspective), present (customer, processes and human perspective) and future (renewal and development perspective) is created.

The model allows communicating the

vision and strategic objectives of the organization.

5. Advantages and limitations of disclosing information on intellectual capital

Intellectual capital is a key element in developing a company and thanks to it we can obtain competitive advantages including:

1. Instead of registering intellectual capital as an investment, it is recorded as expense, leading to a distorted price policy. Nevado and Lopez [10] state that this may lead to overestimated production costs because these investments are not spread over several years and hence the two types of behaviors observed in pricing:

- The company continues with higher costs in investment periods and then loses a part of the price competitiveness;
- Or, it continues at lower cost in investment periods but suffers insufficient margins, profitability issues, survival or jobs.

If the company would record investments in intangible assets the same way as in the tangible, depreciating them over several years, it could improve the management analysis through financial statements and development of some more relevant commercial policies.

2. In case of fusions and takeovers, where the real value of companies acquired is much higher than those exposed in the financial statements it is required a report on intangible assets for all users. In most cases these are the ones that, along with tangible and financial assets, establish the real value of the company and to those it must be assigned the difference between the market value and value in financial statements.

3. Allows its use as a marketing tool and provides long-term vision of the company;

4. Regarding strategic choices, the absence of investments accounting in intangible assets involves damaging effects [11].

5. It improves transparency, giving as result a decrease in capital costs and therefore higher prices of shares [12]. This is the case of the famous Swedish company Skandia, the first company that published a statement on intellectual capital where the share price rose by 40% following publication, of which only 25% due

exclusively to intellectual capital.

6. Disclosing information on intellectual capital allows improving relations with customers by informing them of the efforts the company does to meet, attract and maintain them with new innovations, new products and services. Canibano and Sanchez [13] agree with this, saying that “disclosing such information may help to improve - and not exclusively to describe – the company’s relationship with its customers, employees and owners, and generally, to focus more on those activities that enable knowledge sharing with interested third parties, beyond the limits of the company”.

7. Balanced investment in intangible assets helps to increase the competitiveness, effectiveness and efficiency;

8. Presenting information on intellectual capital is important first of all for large organizations, because within these the number of brands sold is high. In this respect, some of the big Japanese companies (Mitsubishi, Softbank, Toyota) have been forced to define and develop indicators on the prospect of gaining benefits of all their brands, grouping them according to various criteria. Thus, the simple assembly of all these indicators calculated provided to the managers a mechanism to measure the monetary impact on benefits related to each brand, allowing the implantation of a more efficient Target Cost Management [14].

9. If the objective is to increase company’s competitiveness by increasing efficiency and quality, investment in intangible assets implies, according to Nevado and López [15], two types of effects and results:

- On short term, immediate results, recorded in the result accounts of the year, with reduction of obvious cost and/or growth of visible revenue, and with reduction of hidden costs;
- On long term, because the creation of the current economic and human potential is recorded in the revenues account of future years, when speaking about research and development of new product, the negotiation on new markets or improving skills, since these strategic effects are incorrectly identified within information accounting and financial systems of companies.

10. And last but not least it helps acquiring a psychological advantage discouraging competition. Roos [16] agree with this saying that it would make the competition believe that the company dominates the market and will not be willing to enter the same market.

11. Information can influence in a very important way most financial analysts' investment decisions.

Disadvantages of disclosing Information on intellectual capital

Uncertainty, subjectivity, potential abuse, lack of a rigorous generally accepted model and lack of comparisons between existing models are important limitations of models of classification and measurement of intellectual capital.

One of the main reticencies is the strict application of the precautionary principle [17], situation in which, for now, it seems difficult to overcome. Thus, among the main limitations can be highlighted the following:

1. The property nature of intangible investment.
2. These investments are difficult to delimit, meaning that they are hand in hand with tangible investments and, moreover, it is quite complex to determine the funding level and related profitability.
3. The capacity to generate future benefits, meaning that the potential of assets must contribute directly or indirectly in business results.
4. The opportunity of a control for future uses.
5. The assessment opportunity, meaning expressing the value in monetary terms.

The usability of information regarding the intellectual capital

The reports regarding the intellectual capital have a utility for the internal public (owners, managers, employees etc) as well as for the external public (creditors, provisioners, clients and debtors, government and public administrations etc). For each of these ones we will try to analyze which would be the utility to have access to those reports concerning the intellectual capital.

The users at the internal level can be:

1. The owners. These ones are interested in knowing in what manner the obtained results bring stability and profitableness for the organization, the prices of the stocks and the strategic implications which are

generated by the intellectual capital for the organization. Sullivan asserts that the interests of the owners in the case of information regarding the intellectual capital could be:

- The degree of alignment of the resources of intellectual capital with the vision and the strategy of the company;
- The assessment of the competitive position on two fronts:

a) Commercial: routine assessments of the competitiveness of the products, of the processes and of the services of the company on the commercial market;

b) Technological: routine assessments of the competitive position of the company

- Provisions regarding the incomes based in innovation and development;
- The identification of the elements which generates value and reports regarding the activities and reserves which generate value.

2. The employees. These ones are preoccupied by the richness of the company in present as well as in the future as a guarantee for the stability and for the salaries for their work. Nevado and Lopez assert that a report concerning the intellectual capital can stimulate the employees and raise the esteem for the work place, enhancing their competences and, the simple act of reporting this kind of information, will lead to the growing of the qualitative level of the human resources.

3. The managers. The reports regarding the intellectual capital are essential in the decision-making process. The users at the external level can be:

1. The creditors are those who sustain the financing and who are interested by the recapture of the credits, of the interests or the specific commissions.

2. The providers use the reports regarding the intellectual capital for evaluating the necessities and the capacity of production of the enterprise as well as the possibilities of payment.

3. The clients and the debtors will be informed in what concerns the new innovations and the new products, as well as the efforts made by the company for their satisfaction, through pre-selling and post-selling services.

4. The government and the public administrations in order to update the social, economic, monetary and fiscal policies, with the intention of taking care of the protection, the security, the rights and the work guarantees, the social and political competitive policy.

6. Conclusions

The big enterprise of the world, whose intellectual capital increases in time, accuses the difficulties of measurement of the human quality, the faithfulness of the clients and the efficacy of the organizational structure. This situation significantly decreases the benefits of the enterprise, through the fact that a great part of its intangible value can not be managed, precisely because of the measurement difficulties. Until the adoption of a general recognized model of measurement and recording of the intellectual capital, the modification of the current situation of accounting is not pursued, but the publications on several complementary situations of the hidden intangible assets (intellectual capital) of an organization which give competitive advantages and which are very difficult to assess and appreciated by the current norms of accounting. It is necessary to have a standard system which could allow the identification of the intellectual capital, some measurement indicators for this one and a standard model of information.

These accounting information's regarding the intellectual capital of the enterprise not only can be useful both internally (for owners, employees, managers) and externally (to potential investors, creditors, suppliers and customers, government and public administration) but also contribute to creating value within the organization showing the extent to which the organization is socially responsible and contribute to the creation of intangible assets. For Skandia, financial capital and intellectual capital are the 2 elements that define the value of an organization. Even if Skandia is one of the most comprehensive models for measuring intellectual capital, it has not according the importance of determining the components to determine the proportion of capital contribution each component separately.

The Impact of the Foreign Direct Investments on the Competitiveness and Economic Growth in Central and Eastern European Countries

Magdalena Rădulescu,

magdalenaradulescu@yahoo.com

Abstract

The countries in transition need FDI not just to produce more goods and a higher quality. Foreign capital investments are the most efficient and safe way to integrate into the world economy. Further, we shall examine some structural changes, which had been made, under the influence of FDI, in the economies of new European countries (Czech Republic, Poland, Romania, Bulgaria), drawing attention also upon the changes in the export potential of that country. We examine the impact of FDIs on economic growth in the short-run and in the long-run in the above mentioned countries, Poland and Czech Republic being one of the most developed CEE countries that attracted most of FDIs in the region for the last two decades and Bulgaria and Romania being from the second wave of EU accession.

Keywords: foreign direct investments, multinational companies, economic growth.

JEL Classification: E22, E52, E58, F21, F23, O11, O16, O23, O24, O33.

1. Introduction

The growth of international production is driven by economic and technological forces. It is also driven by the ongoing liberalization of Foreign Direct Investment (FDI) and trade policies. In this context, globalization offers an unprecedented opportunity for developing countries to achieve faster economic growth through trade and investment. In the period 1970s, international trade grew more rapidly than FDI, and thus international trade was by far than most other important international economic activities.

Foreign direct investment has long been seen – and strongly recommended – as a crucial instrument in the process of

transforming the former centrally planned economies of Eastern Europe and the former Soviet Union into vibrant market systems. This paper looks at the actual performance of FDI in promoting economic growth and restructuring in the transition economies since 1990. In the transition economies since 1990 has largely flowed to just a few central European countries, which are also the leading candidates for EU membership. These have indeed benefited from significant FDI financing of the balance of payments, and enterprises with foreign investment, not surprisingly, have had high rates of growth of output, productivity and exports.

2. FDIs and Economic Growth in CEE Countries

The FDI inflow in the CEE economies has been a vital factor in the first stage of the privatization process during the transition period. Currently, the main reasons to pursue FDI are to boost productivity, encourage employment, stimulate innovation and technology transfer, and enhance economic growth (Mueller & Goic, 2002). The CEE countries have identified the positive effects of FDI on the transformation process of their economies.

The most important economic reason for attracting FDI at the beginning of the transformation process was to facilitate the privatization and restructuring of the central planning economies. At present as the privatization and reconstructing processes come to an end, the main reason to pursue FDI is to enhance sustained economic growth (Gao, 2005).

The size and increasing FDI inflows to transitioning CEE countries has been impressive. Poland, Hungary, and the Czech Republic have become the most attractive destination for foreign investments.

Important factor influencing business environment in the CEE countries is their membership in the EU. The EU policies and the national incentive based FDI policies are two driving forces influencing business environment in the CEE countries. During the preparation period of CEE countries to become members of the EU (2003-2004) the FDI inflows in the Czech Republic increased by 186.3% (from USD 1.863 to 3.596 million), in Hungary by 176.3% (from USD 1.909 to 3.365 million), in Poland by 133.7% (from USD 3.660 to 4.892 million), in Slovakia 142.1% (from USD 636 to 904 million) and in Slovenia by 141.1% (from USD 299 to 422 million).

Recent inflows can be attributed to the positive impact of the EU enlargement in May of 2004. For example the value of FDI located in Poland in 2006 (USD 22. 123 million) was higher by 81.9% when compared to the previous year (USD 12. 162 million). The greatest amount of FDI inflow in 2006 was invested in real estate and other business activities (USD 7. 197 million), manufacturing (USD 5.241 million), trade and repairs (USD 3.150 million), financial intermediation (USD 2.448 million), and buying and selling of real estate by nonresidents (USD 1.336 million).

New EU countries have improved the business environment and introduced policy measures aimed at liberalizing their economies (Witkowska, 2007).

Poland became the main destination of FDI in 1996. An acceleration of flows into Latvia and, with a lag, into Lithuania (second wave countries), but their cumulative flows continue to lag behind those of Estonia. FDI in the Czech Republic surged following the passage of a new investment law in 1998 and accelerated privatization. For two years the country has received FDI amounting to around 10 per cent of GDP, one of the highest ratios in the CEE region. Accelerated privatization in Bulgaria and Romania significantly boosted inflows in 1996-1999. The sale of the national telecom companies in the latter two countries markedly raised FDI in 1998 and 1999, respectively.

The experiences of Hungary and Estonia indicate that the winding down of privatization programs results in a fall of receipts. In most east European and Baltic states, these programs are due to be completed in 2001-2002, but in other countries the process is much further behind.

In 1999, the ratio of the cumulated inflows to GDP, a measure of the penetration of FDI in the host economy, was in the range of 30-40 per cent in the Czech Republic, Hungary, Estonia compared with around 10-16 per cent or less in many other countries.

The FDI inflow in transition CEE countries constitutes a relatively high percentage of GDP. The inward FDI inflow in 2005, in the Czech Republic and Hungary accounted for 8.5% and 6.1% of GDP in 2005. Poland is aiming for 5% FDI inflow as a percentage of GDP (Tables 1 and 2).

The share of foreign stock as a percentage of GDP has been very high in Hungary, the Czech Republic, Slovenia and Slovakia, and constitutes respectively 43%, 34%, 24%, and 22% of each country's GDP (2004). In Poland, the share of foreign stock as a percentage of GDP is much lower and amounts to 19% of GDP (Table 2).

In Hungary and Estonia, for example, early privatization-related FDI inflows helped to boost foreign exchange reserves and/or reduce external debt (net debt reduction). Indeed, reducing the high debt burden was a consideration determining Hungary's particular privatization strategy.

Despite periods of sizeable current account deficits in the 1990s, the Czech Republic and Poland were able to forgo sovereign borrowing and hold down their external debt. On the other hand, there was a marked increase in the foreign indebtedness of several countries with large current account deficits and relatively low levels of inward FDI (Croatia, Romania, Slovakia). FDI-related privatizations proved to be an attractive financing option for several countries nearing their debt ceiling. In the transition economies, Hungary and Estonia showed early signs of FDI-led growth.

Source: UNCTAD, FDI database, annual data, 1990-2010.

In both cases, the governments' strategies involved an early infusion of FDI through the sale of strategic state assets. On the other hand, in Poland an economic recovery (starting in 1992) preceded the surge in FDI by several years. Due to its size, location etc., Poland was from the very beginning of the transition considered one of the most attractive countries for foreign investment.

As regards indirect evidence, in Hungary, FDI-driven export growth appears to have been largely responsible for the improvement in economic performance in the second half of the 1990s. Exports were by far the most dynamic component of final demand, far exceeding the combined contribution of consumption and investment. This was also the case in the Czech Republic although GDP actually contracted due to falling domestic absorption. In all the countries in this sample, GDP and export growth were nearly always positively related and, given the role of foreign companies in exports, FDI is likely to have contributed significantly to this outcome.

The volume of FDI inflows has grown rapidly, as the Governments of the CEE countries have officially encouraged FDI and

developed a formal FDI promotion programs providing substantial incentives for foreign companies. Table 1 presents FDI inflows into the CEE between 1990 and 2010. The last decade has made it clear that foreign direct investment created employment, increased productivity and exports, and led to transfers of knowledge and technology to the CEE host countries.

The share of foreign stock as a percentage of GDP has been very high in Hungary, the Czech Republic, Slovenia and Slovakia, and constitutes respectively 43%, 34%, 24% and 22% of each country's GDP (2004). In Poland, the share of foreign stock as a percentage of GDP was much lower and amounted to 19% of GDP (Tables 1 and 2).

3. Conclusion

Like most developing countries, CEE countries have been actively seeking FDI inflows to invigorate growth in their economies and transform them to true market systems. The empiric evidence found a compelling positive and statistically significant effect of FDI inflows on growth in

the case of EU accession countries of the CEE region. EU accession countries have generally faced stronger pressures and stricter performance requirements compared to other countries. Also, the relatively large size of FDI inflows to EU accession countries could also explain that.

FDI inflows contributed to higher supply capacity in all those countries, leading to more exports, but the period of time to produce effects is different among CEE countries. On the other hand, evidence for FDI-specific effects is mixed. The results suggest that this effect has been present mainly for the new EU member states, reflecting, among other things, the higher amount of FDI inflows received by these countries relative to Southeast European countries (Romania and Bulgaria), as well as the potentially higher initial productivity of domestic companies acquired by TNCs. Still, if we consider the dimension of underground economy in Bulgaria (36,5% of GDP) and Romania (35,4% of GDP), we can explain the lower economic growth rates against Czech Republic (with an underground economy of 18,3% of GDP) and Poland (18,2% of GDP). (Miritoiu and Popescu, 2009).

The inward FDI has increased in the CEE in the past twenty years to become the most common type of capital flow. Most of the time Poland was the leader in FDI compared to the other CEE countries. As Poland is the largest economy among the CEE countries FDI as a percentage of GDP in Poland is relatively lower than in other CEE countries.

Poland, coming from the most backward position, experienced the strongest growth in capital endowment. Traditionally more focused on agriculture, it is now adopting new technologies and raising industrial production. Poland might be able to close gaps with Hungary within the next years. However, the Czech Republic maintains its leading position among the transition countries and is quickly approaching the level of capital endowment in the EU-12 (Apergis et al., 2004).

In Poland, GDP per capita, level of capital formation, openness to trade, corporate income tax rate, labor cost and productivity, quick introduction of market reforms at the

beginning of '90s have been the key determinants that influenced greatly the FDI inflows in the last two decades and made Poland the greatest recipient for FDIs. However, the initial success was not fully exploited in the recent years and Poland is not anymore the leader among CEE countries and it need to exploit more its size and potential. Today, Poland is recognized as a large, stable country with good prospects for growth. EU membership imposed several changes in the Polish legislation which led to an improvement in the business climate in Poland. Poland should exploit its size potential and focus on the economic policies which will further sustain the growth of the market. It should work on creating favorable conditions for foreign investors, especially in terms of the simplification of existing law and effectiveness of the juridical system, in particular law enforcement. It should work to increase the domestic expenditure on R&D and on infrastructure that will allow the dissemination of knowledge into the Polish economy. Once the crisis erupted and the fiscal deficits increased, Poland couldn't base on its low corporate income tax that attracted FDIs in the past. So, it should focus on reducing other tax burden and on simplifying the tax system regulations and procedures for investors. Moreover, Poland should work on its trade liberalization, because the trade openness is one of the strong factor that influenced FDIs inflows in Poland (Kornecki and Rhoades, 2007).

What started as a global financial crisis but grew into economic recession has hit the emerging market economies in CEE with acute harshness only some twenty years after they first embarked on the path of economic policy overhaul. Amongst them, the Baltic states (Latvia, in particular), Hungary and Poland have perished. Impressive GDP growth rates over the past few years were achieved in part through heavy borrowing from Western banks, giving them easy access to foreign currency denominated loans. Now that credit lines are in halt and uncharacteristically high interest rates prevail, huge debt loads have accumulated to repay,

leaving many Eastern European currencies in free fall.

The relative ‘poverty’ of Bulgaria left its economy oblivious to the direct impact of the global financial crisis of 2007-2008. Although this incidence is itself not an isolated case amongst the CEE countries, the causality of it is in large part founded in the particular structure of the Bulgarian economy. The shortage of liquidity on the market intensified by the sharp withdrawal of foreign direct investments where Bulgaria had become the most FDI reliant economy in CEE by 2009. At the same time the current account deficit stands at more than 24% of GDP to be entirely financed by FDI capital flows. Although Bulgaria is the poorest of the EU-27 member states today, the low GDP base has allowed for robust real GDP growth rates between 2000 and 2008, before the crisis. The Bulgarian economy is heavily reliant on FDI capital-inflows than other CEE countries. The gap is significant, primarily reflecting the smaller GDP of Bulgaria than that of other CEE countries. The disparity in real growth outlook between Bulgaria and the majority of the CEE countries is on account of two factors in the main: (1) an over-reliance of the national economy on FDI; (2) a large volume of speculative investments in the total FDI stock that failed to generate significant absorptive capacities in the country’s industrial base.

However, it is clear that FDI to the industrial sector has received much less attention than the services sector, chief amongst which the real estate market and financial intermediation. In the last decade, foreign investors in Bulgaria preferred in greater extent to work with foreign suppliers or foreign-controlled Bulgarian suppliers.

Relatively low institutional quality in Bulgaria and Romania would be the major reason for a modest increase in this region. On the basis of the analysis on the role of foreign direct investments in stimulating economic growth in Romania during 2000-2010, the relatively important linear relationship between the dynamics inflow of foreign direct investment and the dynamics of economic growth in Romania was confirmed. FDI by

themselves induce a false effect of growth. The Romanian level of development is not sufficient to enhance a positive effect of the FDI, exports and imports on the economic growth of the country (Jude and Silaghi, 2010).

FDI in Romania is a source of implementing new technologies needed to overcome the current crisis, especially since foreign direct investments in Romania have been directed towards sectors that have led to increased imports and implicitly to the current account deficit. Obtaining the desired results is achieved by directing investment to areas with an innovative character and which use modern technology, to areas where sustainable economic growth is achieved.

Abstract

Recent international financial crisis has highlighted the crucial importance of financial stability and showed clearly that ensuring price stability as an objective of monetary policy is a necessary but not a sufficient condition to ensure financial stability. In this context, there have been intensified debate among researchers and policy makers on how monetary policy can bring a major contribution to financial stability and even on the award of a clear mandate for financial stability.

Our paper aims to highlight the challenges that arise for central banks and their monetary policy when they try to ensure the financial stability. Also, our study highlights the vital need for price stability on medium to long term to remain the primary objective of the monetary policy and that the financial stability to be the primary responsibility of macro-prudential policies that can prevent and limit the buildup of vulnerabilities in the financial system.

Keywords: monetary policy, price stability, financial stability, central banks, financial crises

J.E.L. classification: E52, E58, G01

1. Introduction

Internationally there is a consensus among economists and policy makers regarding the fundamental objective of monetary policy, namely price stability over medium term. By achieving this objective is considered that the

monetary policy can make its most important contribution to the stabilization of output and to increase social welfare.

In recent years, leading up to the recent global crisis, the decrease of inflation and of interest rates in international economic environment have led to excessive risk taking in the financial system and to significantly increase of the leverage ratio in non-financial private sector but also in the banking sector. In this context, there was a credit boom and an excessive rise in financial asset prices, which have led to the financial system instability, proving that price stability is a necessary but not sufficient condition to ensure financial stability.

The major negative effects of the recent financial crisis on the financial system but also on real economy led to intensifying debate among researchers and policy makers on how monetary policy can bring a major contribution to financial stability and even on the award of a clear mandate for monetary policy on financial stability.

Although there is no consensus yet on how monetary policy can contribute more efficiently to ensuring the financial stability, we can appreciate that, by its complex and extremely serious implications, the financial crisis represents the most important challenge for central banks and monetary policy, since the Great Depression from 1929-1933.

Our paper it is structured as follow: *section two* is devoted to highlighting the role of central banks in ensuring financial stability; *the third section* reflects the relationship between price stability and financial stability, as well as the problems faced by the central banks and by the

monetary policy due to the major adverse effects of the recent financial crisis; *the fourth section* includes the conclusions of our research.

2. The role of central banks in promoting financial stability

In the last two decades, prior to recent international financial crisis, in most countries, achieving price stability was considered one of the most significant achievements of central banks. Such an achievement was attributed to the monetary policy framework adopted, which was based on two pillars, namely *central banks independence* and *price stability*, seen as a fundamental objective of monetary policy [12]. Also, the central banks have played an important role in ensuring financial stability, in particular through the surveillance over the system of payments, but also through their involvement in the supervision and regulation of the Financial Sector. Therefore, although the problem of the role of central banks in financial stability it is not new, the serious implications of the recent international financial crisis have brought into focus the issue of the important role of central banks in ensuring financial stability.

According to the studies of The Bank for International Settlements [2], the vital necessity of central banks involvement in ensuring financial stability would result from three main reasons, namely: financial instability can influence macroeconomic environment with major implications on the economic activity, price stability and on the transmission of monetary policy; the central banks are the ultimate source of liquidity for the economy, and providing appropriate liquidity is crucial for financial stability; also in achieving the functions related to monetary policy the central banks have a macro view and an understanding of financial markets, institutions and infrastructure, which enable them to perform a macro-prudential function.

The national financial stability frameworks and the place of central banks, show differences from country to country, but in most states is to note that the law makes clear that the financial stability is a goal or a task of central banks, as shown in table 1.

Table 1. The exemplification of the role of central banks in ensuring financial stability

	Law explicitly states financial stability (1)	The central bank's function in financial stability (2)	
		Regulation	Supervision
Argentina	x	x	x
Brazil	x	x	x
Canada	x		
China	x		#
ECB	x		
France	x	x	x
Germany	x	#	#
India		x	x
Indonesia	x	x	x
Italy	x	x	x
Japan	x		*
Korea			*
Mexico	x		
Russia	x	x	x
Saudi Arabia	x	x	x
South Africa	x	x	x
Turkey	x		
England	x		
USA	x	#	#

(1): x- indicates that there is an explicit reference in the law. In some cases a financial stability objective may be referred to outside of the law, for example in memoranda of understanding;

(2): x- indicates that the central bank has a lead responsibility; # indicates a function is shared with other agencies, and * indicates that the central bank does not have a responsibility, but can conduct or participate in supervision activities.

Source: [17]

The very serious effects of the recent crisis caused unprecedented reactions of central banks, resulting in particular through interventions in financial markets so as to avoid the collapse of the global financial system. In this context we observe, an extension of the role of central banks in ensuring financial stability (see table 2), as evidenced by the development and implementation of innovative tools of

monetary policy, known as unconventional instruments of monetary policy (such as, for example, measures of „quantitative support” - quantitative easing-and measures of „credit support” - credit easing). By applying these measures, central banks have aimed to avoid the collapse of the financial markets and to bring their contribution to support lending to businesses and households.

Table 2. Enhancing the role of central banks from the hard-hit countries

conventional	Monetary policy tools	Prudential policy tools
Focus on prices	Policy interest rate	Capital requirements
Indirect approach to influencing financial conditions and asset prices	Reserve requirements	Liquidity requirements
Direct influence on the very short-term interbank market only		
Unconventional	Central bank balance sheet tools	
	Intervention in domestic financial markets	Intervention in FX markets
Focus shifted from prices to quantities	Term interbank market Sovereign bond markets	FX intervention Reserve accumulation
Direct intervention in financial markets	Credit markets Mortgage markets	Currency swap arrangements

Source: [5]

It is also worth noting that, the significant interventions of central banks in the developed countries hard-hit by the financial markets crisis led to a significant enhancement in the size of their balance sheets (see figure 1), which highlights their increased role in financial intermediation, but also generates some concerns about the possible inflationary impact of the measures taken by central banks [12].

Figure 1. The evolution of the size of some central banks' balance sheets (percentage of GDP)

Source: [14]

3. Price stability versus financial stability and new guidelines for the monetary policy

In the years preceding the recent international financial crisis, the international economic environment was characterized by low and stable inflation rates which have coincided, for a period of time, with significant economic growth and low volatility of GDP, a period known as “The Great Moderation” [11]. From the monetary policy perspective, was considered that by maintaining a low and stable inflation, the monetary policy could make its largest contribution to ensuring the financial stability.

However, paradoxically, the recent financial crisis shows that price stability is a necessary but not sufficient condition to maintain financial stability. On the other hand, price stability is a prerequisite condition for financial stability, in the sense that a high and volatile inflation threatens the foundations of the financial system because it leads to an unpredicted redistribution of wealth between debtors and creditors. Backward, the financial stability is indispensable to price stability because by preserving the stability of the financial system there are avoided the risks regarding price stability [11].

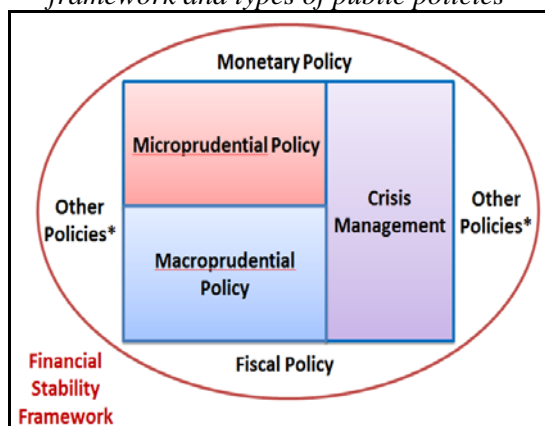

For example, prior to the global economic crisis, in some countries the very rapid credit growth, especially of those granted to

households, led to a significant increase in domestic demand, which in the conditions of a sufficient offer has led to an increase in inflation.

The two dimensions of stability, namely price stability and financial stability, as the main objectives of central banks raise the problem of identifying the instruments necessary to achieve them. In general, central banks use short-term interest rates as the primary instrument to determine the monetary policy orientation. However, the policy rates have an impact on the whole economy, and their use to achieve those two objectives can lead to adverse effects [18]. As highlighted by the recent period before the financial crisis, the optimum interest rate level which allows the achievement of price stability under conditions of full employment may be different from the optimal level that would allow the financial market stability. According to „Tinbergen Rule“, the same tool can be used only to achieve a single objective. Therefore, if for price stability the interest rate it is used, as the primary tool, there is required a second instrument, often a macro-prudential instrument to ensure the financial stability.

Financial stability is a shared responsibility of several types of public policies (see figure 2), including monetary policy; but the primary responsibility lies on the macro-prudential policy, which specifically focuses its content directly on the stability of the financial system as a whole.

Figure 2. The financial stability framework and types of public policies

* *Other policies* involve, e.g., policies related to business conduct, consumer protection, accounting rules and competition.

Source: [7]

The importance of the financial stability requires that all public policies - prudential (micro and macro-prudential), monetary and fiscal - to contribute to ensure the financial stability, as shown in table 3.

Table 3. The contribution of public policies in ensuring financial stability

Existing paradigm	New paradigm
Monetary policy focused on inflation	The monetary policy focused on inflation having the role to counter the financial imbalances
Micro-prudential policy focused on individual banks	Micro-prudential policy combined with the macro-prudential policy focused on systemic risk
Reliance on internal risk management, self-regulation and market discipline	Higher bank capital, better governance, and expanded perimeter of regulation
The fiscal policy does not take account of financial stability issues	Countercyclical fiscal policy (fiscal buffers)
Domestic focus	More global coordination

Source: [6]

From the monetary policy perspective and with reference to its role in ensuring financial stability, the severe effects of the financial crisis have led to increased debates on the award of a clear mandate for financial stability. Although until now there is not a consensus on this issue, many views argue that by adopting an additional explicitly objective by the monetary policy, it would be an over-burden and there will be the risk to trigger a loss of credibility. It is also argued that the monetary policy should focus on maintaining price stability over the medium term as a fundamental objective and that ensuring financial stability should be the primary objective of the macro-prudential policies, which generally focus on systemic risk. This approach takes into account both the principle of Tinbergen (cited above) and the Mundell's principle according to which to achieve an objective it must be used the tool

that presents the greatest efficacy compared to other instruments.

Besides the inclusion of the financial stability as an explicit secondary objective of monetary policy, the debate between researchers and decision makers focus on other important aspects such as [9]: taking into account explicitly as monetary policy targets the prices of certain assets or some developments on credit markets; extending the horizon of time to achieve the primary objective of monetary policy on the grounds that, for example, the current inflation targets are covering a shorter time horizon (usually two years) while the financial imbalances take longer to build up.

The serious implications of the crisis on the financial system and indirectly on the real economy call for outlining some lessons for the future. Thus, from the perspective of central banks and monetary policy, Viñals [17] highlights three important lessons offered by the recent crisis, namely: the financial stability must be addressed mainly through macro-prudential policies, because they can alleviate the systemic risk and accumulation of structural vulnerabilities; price stability remains, the main objective of monetary policy; the necessity of changing the operations of central banks and providing some frameworks of crisis management.

In the light of the responsibilities of central banks, the recent financial crisis highlights the need that the central banks responsibility to provide and maintain financial stability to be as important as the responsibility to use monetary policy to pursue macroeconomic objectives [3].

4. Conclusions

Recent international financial crisis has highlighted the crucial importance of financial stability and showed clearly that price stability as an objective of monetary policy is a necessary but not a sufficient condition to ensure financial stability. In this context, the main challenge for the central banks is to identify the tools needed to achieve both price stability and financial stability. To this end, the central banks should take into account both the “Tinbergen Rule”, which says that a tool can be used only to achieve a single objective, and the Mundell's rule according to which to achieve

an objective it must be used that tool that presents the greatest efficacy compared to other instruments. From these considerations it is argued that the primary objective of the monetary policy it must be ensuring and maintaining price stability on medium and long term and the primary objective of the macro-prudential policies has to be the financial stability.

Although currently there is no consensus regarding the effective contribution of the monetary policy to ensure financial stability, the fact is that the financial systems of all countries of the world know profound transformations, materialized in the implementation of significant financial and regulatory reforms for preventing new crises in the future. All these changes have repercussions on the role of central banks and monetary policy whose priority objective we consider that should remain price stability.

Also, we agree with the view that central banks responsibility to ensure financial stability should be as important as the responsibility to use monetary policy to pursue price stability.

Innovation Impact on EU Countries Economy

Mircea-Iosif Rus

Universitatea Babeş-Bolyai

Facultatea de Ştiinţe Economice şi Gestiune Afacerilor

mircearus2004@yahoo.com

Abstract

Science has begun to play an increasing role in industrial development not only as a major source of knowledge for new technological activities or scientointensive industries (medicine industry, chemistry, electronics), but also as essential input in testing, evaluation and quality control. Innovation is one of the activities that can generate economic and social progress. Therefore, this paper also approaches the significance of innovative information dissemination, as well as the objectives of this activity in view of the EU Member States. The European Union has prepared two funding programs for innovation activity, Europe 2020 and Horizon 2020.

Key words: R & D and innovation, finance, technology dissemination

JEL Code: G28, G29, O30,O31

1. Introduction

Innovative activity is as old as human history. From his earliest attempts to change and adapt nature to his needs, man has never ceased to innovate, that is to introduce something new into his material or spiritual existence. Metallurgy, the mirror, porcelain, the gear, suspension bridges, the loom, the scales, the calculating machines, cartography, the clock, the compass, the decimal system, geometry, the square root, the sterilization system, vaccines are just a few of the findings of anonymous inventors of antiquity in Babylon, Mesopotamia or China.

Innovation's main goal is not only to improve the stock of knowledge, inventions and patents, but also to disseminate them on a large scale, in other words the dissemination stage of new and improved knowledge, products, technologies and services. This

process is becoming more and more interesting area of study for the understanding, influencing and adjusting of the competitive market mechanisms market economy countries or in countries in transition to such economy.

2. Technology dissemination

Technology dissemination has gained increasing importance in the policy goals of science and technology due to the fact that financial support in this area is increasingly conditioned by rigorous and pragmatic evaluations in terms of real economic effects.

A series of aspects concerning micro and macroeconomic efficiency (increase in capital efficiency, labor productivity and competitiveness, operation of structural adjustment) are related to high hopes, especially for developing countries, for programs with consistent objectives of technological diffusion.

Technology dissemination is narrowly considered as a large-scale application of any available technology. The area of dissemination of these technologies may refer to various fields and sectors and, of course, to both public and private sectors. Technology dissemination doesn't only pursue goals directly related to improving the parameters of productive process efficiency, but also the elimination of duplication in innovative activities that would discover things already known in another part of the country or in other institutions.

Technology dissemination is also dependant on economy's, and especially industry's structural characteristic, on their complexity and intensity. In this respect it is worth noting the role that large companies (machinery constructions, electrical, electronics, metallurgy, chemistry, etc.) that have greater opportunities to invest and operate machinery, equipment and new equipment, have. Close connections between the various companies in supply, production and marketing, horizontal

cooperation, involving sales and purchases of intermediate goods, create a proper framework for encouraging the expansion of technical progress for all participants. [1]

Profitable achievements in technology dissemination are however conditioned by the level of the employees' professional qualification, their competent and adherent responsiveness, trade unions includes, to technological and organizational novelties. For adopting superior technologies, the level and structure of wage costs, as well as other statutory obligations of the company have a significant importance. In case of high productivity and wages, of effective operation of labor relations systems, of the labor market and information fluxes, technological diffusion rate can benefit from considerable human support.

3. Knowledge and technology transfer from research to industry

Theoretical studies approaching the variety of aspects in business life conducted in the academic environment are circumscribed to the subject known in the specialized literature as „Academy-Industry Relations”, area of research that theorizes particular or common aspects of the concrete forms of manifestation of research interest, especially in universities, to develop efficient contacts with economy in general and industry in particular. Most of these papers describe or analyze in detail the causes and factors of success or failure of various initiatives that have occurred locally or regionally, evaluate their performance and impact, perform statistical and sociological surveys and forecasts etc., being less concerned with conceptualization, theoretical debates or semantic controversies.

Therefore, the notions used by this area of research, like business incubation center or incubator, science park, spin-off, technology transfer center, research park, technology center, etc., don't have a clear conceptual distinction, being used in practice without too much exigency and rigor, often being considered as substitutable, complementary or synonyms.

The specialized literature has a variety of definitions of the same concepts. Thus, the *Science Park* is characterized by its territorial vicinity to a, institution of higher education or an advanced research center, with which it has

close relations. It aims to: supporting the development of companies, facilitating technology transfer from research and education to companies and organizations within the park or surrounding areas, encouraging businesses based on research results of R&D university departments or research institutes. The main objective of these parks is researching and designing new products and their development to prototype stage, production for market being achieved in separate units.

The Research Park is usually located within a university or research institute and has a predominantly scientific activity in which students and academics are working together. Production concerns are usually excluded.

The *Technology Center* helps develop an enterprise engaged in applying advanced technologies based on research that should not necessarily be carried out within the university, offering also a range of facilities and services, including the sale of products. It is distinguished from *the Science Park* by accentuating aspects concerning production and by the optional involvement of academic research. The selection of “residents” uses rigorous criteria concerning the inclination to use research or products requiring a high technological level.

The Innovation Center provides a range of facilities to new small and medium companies that engage in high technological level products (by taking a large risk to their market launch): office equipment, different services, access to considerable network of research, consulting and financing institutions etc. They can often be part of Science Parks.

Business incubators concentrate in a limited space a number of newly-created companies for the purpose of helping them increase their chances of survival by providing them with modular construction, shared facilities (telephone, computer, secretarial, etc.) and with managerial support and other support services. Their main goal is both the orientation towards new technologies, as well as local development and the creation of new jobs.

Industrial or business parks provide an environment of high qualification, suitable for a wide range of activities including manufacturing, sales, exhibitions, etc., without necessarily having to be in the vicinity of academic institutions.

The Managerial Workshop provides a multitude of consultancy and financing services to industrial business activities, taking place in new or existing units. By dealing with improving the quality of common services and imposing strict admission and output rules, a series of managerial workshops have become innovation centers or business incubators. [2]

4. Strategies for stimulating the innovation process

Strategies in R&D and innovation evolved after a trajectory described by combining in different proportions two different types of policies, namely the policies of science and industry, sensibly influenced by the company’s behavior. Innovation strategies relied on the explicit recognition of the fact that the success of creating and marketing new products is due to a set of factors, far more numerous than the R&D activity that was, until recently, taking all the credit. Of these factors, the market of products and technologies plays a significant role. [3]

Provided that economic competitiveness has become a major focus, increasing attention has been given to research conducted in industry, reflected in increased collaboration between industry and universities, as well as to the development of human resources potential for research. Maintaining a high quality in basic research remains an important objective, regardless of the levels of economic development of different European Union Member States.

A special attention is paid to participation in international research and development programs (particularly the Community Framework Programme for R & D) and to increasing the number of networks, consisting of public and private participants of the EU Member States. Another series of objectives in research and development tend to be shared in a growing number of EU Member States. [4]

The issue of public interest research has been treated, in the last few years, both in theory and in the practice of the developed European countries, with much more nuance and flexibility, observing a sensitive mutation from the interest in R&D public or government institutions to public interest strategic fields or R&D programs. These changes most strongly are reflected in the prevalence of R&D funding in comparison with institutional funding,

mechanism also adopted by countries in transition to market economy, whose systems of science and technology are in full process of reform.

The experiences of developed countries are particularly relevant in terms of forming inter-institutional research networks, promoting research in collaboration between teams from public institutions and teams from private enterprises or institutions.

Table 1. General objectives of the EU Member States in the field of science and technology strategies

	Objectives
Objectives common to most Member States	<ul style="list-style-type: none"> -Developing training and mobility for researchers; - Promoting innovation and technology transfer (exploitation of results, especially in small and medium companies) - Increasing collaboration and cooperation between industry and higher education and, in general, improving cooperation between private companies and public research sector; - Supporting and promoting industrial research both financially and in implementation; - Sustaining and developing high quality basic research; - Boosting economic competitiveness and stimulating economic growth; - Increasing R&D contribution to regional development; - Intensifying international cooperation, especially within Europe.
Objectives that tend to become common to Member States	<ul style="list-style-type: none"> - Developing programs containing socio-economic objectives of major importance; - Promoting public acceptance of science and technology; - Assessing the ethical and social aspects of technological development; - Improving the mechanisms and methods for program evaluation; - Developing the capacities of strategic deliberation in selecting priorities in science and technology.

(Source: Sandu S., 2002)

In **Belgium**, between 1987 and 1991, 14 of these networks worked under the “inter-university attraction poles” program in domains as: genetics, raw materials, robotics and optics, being financed for a period of 5 years. In **France**, starting with 1982 and until 1992 24 “groups of public interest” (Groupement d’interêt public) worked, and it created a collaboration between research actors involved in national interest projects. A series of “corporations” were created, corporations formed by public R-D institutions (at least one), local authorities and firms that elaborated together programs from primary science fields such as: agronomy, medicine, new materials, computer science. In **Holland**, public interest programs financed from 1984 until today, had as a research object: the stimulation of small and medium companies; technologies orientated towards business – PBTs; research programs orientated towards innovation IOPs. For the stimulation of private companies in order to collaborate for the realization and implementation of these programs, subventions were granted, representing 50% from the cost of the projects deployed in domains like: materials technology, biotechnologies, informative technologies, environment technology, etc. Regarding the programs orientated towards innovation, it was pursued the creation of research networks in those important fields for the growth of competitiveness of the Holland industry between industry and universities. The programs were financed for 8 years with an intermediary evaluation in 4 years.

In European countries that are recently on the market economy, R-D systems are in more or less advanced stages of profound reforms, aiming the modernization of the legislation, the institutional structures, financing and management mechanisms, in order to adapt more to those west-European.

In **Romania**, although this process started later than in other countries, the directions of the reform are convergent, aiming: the making permanent the evaluation processes of research programs, of institutions and researchers after the scientific performance’s criteria, the intensification of the relations between the research inside the Romanian Academy and the superior education, the growth of the scientific cooperation and collaboration level, both on an European and international level.

Like in other countries, industrial research encountered, initially, in Romania, serious difficulties due to the absence of financing sources. Today, financing this domain from budgetary sources is based on programs and homework, evaluated by specialty committees which work under a R-D authority of the Minister of Education and Research, especially the National Authority for Scientific Research.

In **Bulgaria**, the main institutions developing the R-D activity are, mainly, like in other eastern European countries, institutions of the Science Academy, superior education institutions and those for industrial research which have a certain tendency to decrease and to transform into service organizations for the R-D activity. Financing the industrial research is granted more and more from special funds replacing the state budget.

In **Hungary**, in 1997, R-D expenses were 0,74% from PIB, in comparison to 2,28% in 1988 and 1,61% in 1990. In different types of financing, meaning: the state budget, the Central Fund for Technological Research (KNUFA) and special state funds, the structure of public expenses had an evolution unfavorable after 1990, especially regarding the weight of the expenses for technological research. In public research unities, like those from the superior education, the Science Academy’s institutes or other governmental unities, they were spent, in 1997, 54,8% from the total R-D funds.

In **Poland**, like in Hungary, where research unities and personnel were reduced, industrial research and the innovation activity encountered the highest difficulties after 1990. The reform of the science and technology financing system, introduced in 1990, aimed the cut of the financing weight from governmental sources and the stimulation of private financing, but also the perfection of the evaluation systems. The volume of the governmental funds received by each institute for an activity of public interest, such as: health, environment, fundamental research, etc. depends on the performance level evaluated by Poland’s State Council for Scientific Research (KBN). The unities from group A have the right to grants that covers 30% of the basic activity’s needs, those from group B – 20%, those from group C – 10%, and those from group D – 0%. The expenses for research-development were in 1995, 0,7% from the PIB, in comparison with 0,9% in 1992.[3]

5. Europe 2020 and "Innovation Union"

As other states adhered to the European Union, the creation of common policies insuring the Union's development became more and more necessary. Thus, common policies were created in fields like agriculture, trade, fishing, taxation, justice, internal affairs, etc. Research policy in the European Union is part of a broader policy of the European construct, namely, "Science and Technology". Policies in the field of information society arise from this, concerning audiovisual, media, space, life sciences and biotechnology.

The reason for a policy in research and innovation is justified by satisfying two needs. Firstly, the need of coordination for the member states' activity in increasing efficiency and reducing costs, and secondly the need to strengthen the international competitiveness of European economy. Also, research and development develops economy and creates new jobs, and technological innovation can fight or diminish social problems like poverty, certain diseases or environmental degradation.

In 2009, the EU allocated an average 2% of GDP to R&D and innovation, while the US allocated 2.8% and Japan 3.4%. For 2010; the average for the EU countries was 2.7-2.8%. Also, we should not ignore the fact that in 2014, China's net RDI expenditure will surpass the EU.

Figure 1. 2009RDI budget

TN: GDB Percentage (%)

(Source: <http://www.ec.europa.eu/innovation>)

Figure 2. People with university degree in the population aged 25-34 years

TN: Total population percentage (%)

(Source: <http://www.ec.europa.eu/innovation>)

However, the rate of people aged 25-34 who have a university degree, in the year 2009, shows they Europe does not lack potential. It has researchers, entrepreneurs and world-class companies as well as high quality in terms of values, traditions, creativity and diversity. European companies and civil society are actively engaged in emerging and developing economies all over the world. Many innovations that changed the world occurred in Europe.

The biggest challenge for the EU and Member States is probably a more strategic approach to innovation. An approach where innovation is the primary policy objective, that would consider a medium and long-term perspective, where the measures and funding are designed so that they contribute to innovation, where EU and national / regional policies closely aligned and mutually consolidated and last, but not least, where the highest political level sets a strategic program and regularly monitors its progress.

The initiative, "Innovation Union established such an ambitious, integrated and strategic approach, exploiting and enhancing our strengths by using new and productive ways, preserving therefore the economic foundation that supports our quality of life and social model in the conditions of population aging. "Business as usual" is equivalent to a gradual loss of the competitive advantages that we possess and accepting Europe's constant decline. [5]

More specifically, in order to achieve, "Innovation Union, among other things, the following are required:

a) In times of budgetary restrictions, the EU and Member States should continue to invest in education, research, development, innovation and ICT. Such investment should, if possible, not only be protected by budget cuts, but should they receive additional funding.

b) They should be accompanied by reforms that would increase the return on investment and approach the issue of fragmentation. The systems of research and innovation in the EU and Member states should be better coordinated and their performance must be improved.

c) Researchers and innovators must be able to work and cooperate across the EU as easily as at national level. The European Research Area must be completed within four years,

establishing therefore a framework for a genuine free movement of knowledge.

d) Access to EU programs should be simplified and their leverage effect on private sector investments should be increased, with the support of the European Investment Bank. The contribution of the development framework program to fast-growing SMEs should be intensified. The European Regional Development Fund should be fully exploited for the development of research and innovation capacity throughout Europe, based on intelligent specialized regional strategies.

6. Conclusions

The European Union has an extraordinary potential for innovation. Europe has a long tradition of determined inventions. It has a variety of creative talents and it can rely on its It has a variety of creative talents. We should not forget that Europe founded one of the largest single markets in the world, where innovative products and services can be widely marketed. The Union also has a tradition of a strong and responsible public sector, which must be exploited.

Almost all EU Member States have improved their performance in research. However, the increase of performances in innovation has slowed down, and the EU is not covering the persistent gap in relation to the world leaders in innovation, U.S., Japan and South Korea. For EU-27, the largest gap remains for innovation in the private sector. EU still has a clear lead from the emerging economies of China, Brazil, India, Russia and South Africa. However, China is improving its innovation performances and continuously reduces the gap.

In the EU and the developed European countries, innovation has been seen for several years as an engine of economic and social progress, and the EU budget for 2014-2020 provides for the allocation of large sums of money to technological research and inventions within the "Horizon 2020" program, which will have a budget of over 80 billion euro. Particularities Regarding the Apparition and Evolution of the Audit’s Activity

Salomia Maria Mădălina
Bucharest Academy of Economic Studies
madalina_salomia@yahoo.com

Abstract

In the context of a competitor environment more and more dynamic, the entities are confronting with a general problem which might be defined as being that of finding solutions for improving the obtained performances. The managers of entities are constantly putting questions regarding the efficiency and effectiveness of the control about the manner of entity’s function, so these ones appeal many times to audit’s services offered by the professional accounting in order to obtain correct and concrete about the activity developed by the entity they are leading. Due to the transactions and operation’s complexity and largeness effectuated by the economical entities as well as the development of the economical business environment, they have definitely determined even the evolution of the audit’s activity.

Keywords: evolution, audit, audit’s activity, auditor, regulations,

JEL Classification: M42

1. Introduction

The word *audit* has its origin in the Latin “*audire*” – which means “*to listen and to transmit farther*” [1], in English it has been taken as meaning the “*checking or accounting control*”[1]. Initially, the word *to audit* had the signification of checking the financial situations of a society but progressively, the word *to audit* took the signification of studying a society in order to appreciate its transformation process, the transactions and the financial situations (financial audit), in order to ameliorate the performances (operational audit) or to make a judge upon the inventory (inventory audit).

2. The aparition and the evolution of audit’s activity

From the effectuated researches it has been taken the conclusion that from the third century B.J. the roman governments named people (questeurs) to control the provinces accounting. The audit was commanded by kings, emperors, churches and had as objective the identification and punishment of thieves for traceable malversations and preventing these kind of facts with the purpose of protecting that patrimony’s entity. [1] At the beginning the named persons were the priests.

The historical events which happened in the XVIII th century and until the half of the XIX th century brought changes among the audit’s sequencers, hence the states’ formation brought to the jurisdictional court’s foundation and the commercial societies which were led by the shareholders, who took the place to old social classes, and the auditors were the named persons among the best professional accountings. All these things led to audit activity’s development through the amplification of objectives upon detecting the fraud, punishing those who made them as well as searching solutions to keep the patrimony’s entity.

The sense of *audit* was different at that time compared to the one we know today, so this one started to become known and used in the XVIII th century, transformed in time by the Anglo-Saxon practice, he means today, strictly a control of the account, realized by independent experts called auditors, who expresses a professional opinion, responsible and independent upon the way of elaborating and presenting the financial situations of an entity. At the end of XIX Century, starts to settle into shape the relationship between the audit’s entity and auditors, who are chosen among the accounting professionals and jury consult. At that time, the accounting

professionals had as an objective the attestation and certification reality's financial situations against avoiding the errors and frauds from the audit entities. .

In the first part of the XX th century, the audit activity is realized by the professionals specialized in audit with accountings who effectuated works commanded by states and shareholders upon the activity developed by their entities.

Using the term audit nowadays is relatively recent and it is situated in the period of the economic crises from 1929, from the United States of America, when the economic entities were affected by the economic recession and had to pay important amount of money to auditors who effectuated the certification of accounts rated to exchange. Big economic entities started to use the services offered by the Audit Offices, independent constitutions, which had the mission to check the accounts and accounting audit and certify the final financial situations. In order to accomplish the responsibility the audit offices effectuated a series of preparing specialized works as follows: the patrimony's inventory, account's inspection, checking the sold, different probing, etc, which led to a good understanding of audit entities, of their economic situation. After the finishing of the economic crises, the auditors played an important role in offering information to audit entities, using various techniques and knowledge as well as specified tools from the accounting – financial domain.

Alongside the years, the audit activity has diversified by modifying its objectives leading to the need of function's existence as well as the intern audit activity that has been organized in the entities' interior.

The role of the intern auditors started to grow, and this is why these felt the need of organizing as a professional constitution. Thus, in the year 1941, Orlando has been created, Florida and USA, the Institute of Intern Auditors I.I.A.I.[2] is a professional constitution recognize internationally to which it adhered other auditors from countries like Great Britain, Sweden, Norway, Denmark and other states. Nowadays, at this Institute were aggregated over 90 national institutes of intern auditors and members over 120 countries who obtained the quality of

C.I.A- intern audit certified after taking some exams of professional competence. During the years 1940-1970, when the international trade is developing, and it is dominated by exchange relationships between states of goods and services, the audit sequencers are amplifying the sphere of applying the audit activity upon banks, owners, and other financial institutes due to market capital. Audit activity is realized by profesionists in audit and accounting. and their objectives were leading to give an attesting shape of the sincerity and financial situations.

In the year 1941, J.B Thurson, the first president of the International Institute of Intern Auditors, declared with an amazing prediction that the most brilliant perspective of the intern audit would be “the assistant manager”. In 1991, Joseph J. Mossis- the president of the Intern Auditors from Great Britain, takes the same remark, but in more exact terms.” It is clear for those who work in the function of the Intern Audit that this has a vital role to be judged, helping the administration to take the lead of the intern control”[3]. After the year 1970, the word audit was used to designate checking missions of the accounts and then its meaning spread up to control and certification of financial situations, so, the audit of entities becomes a mature domain, which has as objective the attestation of intern control, the abidance by accounting conceptual field and audit norms, all that will open various ways of research in audit activity. After the year 1970, the professional accountants would be constituted in independent, professional organizations under the form of audit and expertise societies. Through the activity taken, the auditors analyzed the facts, documents, operations, and they formulated opinions which attested the real image of accountings, the quality of intern control, respecting the norms and protecting against national and international frauds.

In our country in the communist period, the accounting profession was not let to be developed and it has been limited only to simple mathematic

operations, but after the year 1994 the accounting activity was reinstated as it had to be.

In Romania, the activity of financial audit was regulated through the publication in the Official Monitor of Emergency Ordinance number 75/01.06.1999 which constitutes legal border for organizing the activity of financial audit and the independent prosecution of profession of financial audit.[4]

Still through Emergency Ordinance nr. 75/1999 was brought into being the Financial Auditor’s Room from Romania, self-governing person, as a professional organization of public use without a working purpose.

The financial Auditor’s Room from Romania has elaborated the Audit Standards and the Code regarding the professional ethical conduct in the financial audit domain, after the International Federation of Accountants (IFAC)[5].

From this perspective, the accountant financial audit is interposing between the producers and users, from accounting information, through professionals of high class (auditors) who assume their responsibility of certifying the financial situations through their reference to a standard or a legal quality norm.

Through the publishing of the Minister’s Public Financial Ordinance nr. 403 from 22.04.1999, for approving the accounting regulations, with the IVth Directive and the VIIth Directive of European Economical Communities ,[6] was introduced the indispensability of effectuating the accounting financial audit for all the commercial societies, self-governing administrations, public institutions, banks, investment funds, etc, those who accomplish certain criteria provided in this Ordinance. Thus, through effectuating the audit upon the financial situations, a lot of entities could prevent the insolvency, the liquidation, bankruptcy and the loss of financial resources through a correct informing, exact, real an honest of all the participants to a social economical life.

The audit activity was defined by auditors as being the professional examination of information with the purpose of expressing a

responsible and independent opinion with quality criteria.

According to national norm of audit, an audit mission of financial situations has as an objective the expressing by the auditor of an opinion according to the financial situations has been established, in all their aspects, according to an international accounting reference.”

Nowadays, the economical social phenomena are complex and they cannot be multilaterally analyzed in order to clear some aspects, only with the help of specialists of high professional and moral integrity.

This work refers to the referential from the audit domain, represented by International Audit Standards, Ethic Code of IFAC and the VIIIth European Directive as well as the research and the studies taken in worldwide and in Romania, in connection with audit activity and the audit of financial situations.

On the European area, the accounting harmony is realized by:

- IVth Directive of Council 78/660/EEC regarding the yearly accounts of certain titles of commercial societies;

- VIIth Directive of Council 83/349/EEC regarding the hardened accounts;

- VIIIth Directive of Council 84/253/EEC

regarding the authorized persons responsible with effectuating the financial audit of accounting documents.

In Romania, it is organized a national system of public control of audit estate activity, having as base the OUG nr. 90/2008 regarding the estate audit activity of financial yearly situation and the hardened financial situations.[7]

The European Legislation through

- Directive 78/660/CEE from 25th of July 1978 regarding the yearly accounts of ceratin form of commercial societies;

- Directive 83/349/CEE from 13th of June 1983, regarding the hardened accounts;

- Directive 86/635/CEE from 8th of December 1986 regarding the yearly accounts and the hardened accounts of the banks and other financial institutes.

- Directive 91/674/CEE from 19th of December 1991 regarding the yearly financial situations and financial situations hardened by the insurance companies, imposes auditing the hardened accounts by

one or many authorized persons to effectuate this kind of auditing.

The need of a harmonized approach of the audit activity at the level of Community was the reason for which the Commission proposed its Communication from 1998 regarding the audit in the European Union, creating a committee regarding the audit that could elaborate future actions connected to the accounting profession and with the member states. As a materialization of the committee's activity, was emitted Directive 2006/43CE from 17th of May 2006 regarding the legal audit of yearly accounts and of hardened accounts, which has modified Directives 78/660/CEE and 83/349/CEE and approved the Directive 84/253/CEE, having as an objective the harmony on a high level of the audit legal requirements

Directive 2006/43/CE has a double objective. On one hand, it proposes to contribute to the improvement of yearly audit accounts quality on the entire territory of European Union, in this way accumulating the thrust in this type of reporting and improving the situation of financial markets situation. On the other hand, it proposes to create conditions of competition for the accounting field on the intern market.

Over the time, the audit methodology has known a big evolution. Until the years '30, the activity uncoiled by the financial auditors consisted in checking the accounting records. After the years 50' in the audit's methodology was integrated the problem of the risk. Between the years 1950-1960, the financial auditors has passes to the checking of accounting records to analyzing the flux of information and the system's intern control.[8]

3. Conclusions

The audit activity is a pluridiscipline complex one and it continues to develop itself. In Romania, as well as in other states, the methodological undertaking is brought to be known by the professionals through norm and recommendations from professional organization but even through work methodologies specified to big audit companies.

The entire evolution of audit methodology led in time to an increase of the number and of the obtained proves quality, with the

effects upon the credibility of the opinion expressed by the auditor.

University „Petre Andrei” from Iasi

Abstract

Decision has an important role in our lives. From the point of view, it is closely connected with the ultimate goal and efficiency of any activities in the economic entity. To take appropriate decision, every manager needs a set of conclusive information.

Given the importance of accounting information, the responsibility for preparing and presenting financial statements of the unit is legally regulated and returns management. The latter is also interested in the information contained in financial statements, even if it has access to additional financial and management information to help achieving the planning, decision making and control. To meet their own needs, any unit can determine its form and content of additional information contained in the notes.

Cuvinte cheie: Decision, Accounting information, Financial statements, IASB Framework, Quality.

Clasificare J.E.L.: M49, D81.

Introduction

Information is a vital necessity decision-making. Generally speaking, information is defined as new knowledge about the past, depending on which management decisions and determines the measures to be taken in future for the work the leads to be effective.

1. Main factors in developing the decision-making

Making the decision requires the presence of four elements:

- **Management**, as governor, is responsible for deciding upon the information it holds. Given the

privileged position held within the organization, he will base his decision solely on external information contained in annual financial statements, but will benefit from inside information from specific processing of management accounting. In an organization, which recognize management under the name of an entity is formally established, with permanent or temporary operation (board of directors, steering committee, committee work).

- **Objectives** reflect usually results (performance) that are intended to be further obtained. The business objectives are developed complex units, differentiated by multiple criteria: partners' interests, time frame, hierarchical level, functional area and others. In this case, the decision that directly affects performance, they should consider directly the real possibilities to increase revenues, decrease costs without affecting quality of work and maximize the benefit.
- **Factors influence performance** considering the elements of internal and external organizational environment that significantly affect activities of the organization and their results.
- **Performance (results) shows the actual** extent to which desired goals are met. Regarding this aspect of the results of decisions, accounting information in space and time allows comparison of the results, so necessary management decision making. Depending on the results reported, managers can base their strategies work for future periods. For example, management accounting provides information on the cost price of each product, which is formed on the sale price. From here, one may find the profitability of a product or service in a

specific area of sales. Suppose that the unit delivers the same product in country X and country Y of accounting information, it appears that selling the product in country X is extremely profitable, while selling the product in country Y is poor. Management unit balances the data obtained and decide to stop selling the product in country Y. If he acted otherwise, would have had to give up sales in country X, because supplies in the two countries are related to each. Profits from country X are sufficient to cover the deficit in country Y. In total, the unit stands to profit.

2. Accounting data – the core in developing the decision-making

Accounting data is obtained by methods, procedures and instruments of economic data processing. She is the real, accurate, complete and operative information, such as process management support.

Accounting is the core management information system (MIS - Management Information System). This system is a set of interrelated information subsystems required normal operation of the economic entity. The objective of an accounting system is to provide financial information on the observation. This information relates to the financial position and performance of an entity and is intended for users in the decision-making.

Most of the decisions made by management are based on information obtained from accounting. Decisions in the unit are collective, being involved in making their general manager, finance director, heads of specialized offices, information obtained as a result of consensus and compromise between them.

Component decision cannot be reduced to a single enterprise management level. In this context there are at least three echelons:

- First, related to basic strategy sets strategic objectives in the medium term (1-2 years) and long-term (3-5 years);
- Second, related to operative strategy expresses the basic objectives of the strategy over the medium term (1-2 years) in short-term operational objectives (quarter, semester);

- Third, related to operational tactics used to reach the operational objectives in the medium term (quarter, half) and their declining short-term objectives (week, month).

Reduced to its simplest expression, the strategy can be understood as all the targets set and monitored to maintain and / or increase profits through competitive advantages and long term. In this perspective:

- Defined objectives are the result of decisions taken or planned by the management company, driven by investors in tangible and intangible capital required to achieve those objectives;
- Pursuit of strategic objectives have an impact on the organization and declining performance objectives and management by delegation of supervisory monitoring (enforcement of the means and resources) and control (degree of fulfillment of objectives achieved through the enforcement of the means and resources in various entities).

Competitive advantage will be obtained through an offensive strategy and / or defense based on production costs and / or differentiation of products and services or through integration of activities.

3. The qualitative characteristics of accounting information

For accounting information to be useful to take all decisions, regardless of driving and temporal perspective, it must acquire four quality characteristics. These qualitative characteristics of information contained in annual financial statements were presented for the first time in the Framework were taken IASB accounting regulations harmonized with European directives contained in Order no. 3055/2009.

Thus, *the intelligibility* means that financial statements should be readily understood by users. For this, they must have sufficient economic knowledge of accounting concepts and an interest in studying the information presented.

Accounting information is *relevant* if it influences the economic decisions of users, helping them to analyze past, present, or future, confirming or correcting their past

evaluations. Size the relevance of information is influenced by the nature and importance, the latter being assessed by omission or inaccuracy its consequences on the economic decisions of users taken on the financial statements. That information is considered *significant* whose omission or misrepresentation may significantly influence the decisions taken on of them, and materiality depends on the size of the item or error judged in the particular circumstances of omission or erroneous declaration. Therefore materiality limit is rather than a qualitative characteristic which information must have in order to be useful.

Information is *credible* (reliable) when it does not contain errors or elements leading to misinterpretation and therefore users can trust it. Most financial information is subject to some risk of giving a representation less credible, which is not due to bias, but rather the inherent difficulties or identify transactions and other events to be evaluated, or design and application evaluation and presentation techniques that can provide feedback relating to other transactions and events.

Limits of credible and relevant information regarding refers to opportunity cost and profit ratio of the balance of qualitative characteristics of financial information. Opportunity refers to timeliness in presenting financial information; information may lead to undue loss of its relevance.

Information provided annual financial statements must be *comparable*, meaning that users must be able to compare financial statements of an enterprise the *time* to identify trends in financial position and performance and in *space*, that is financial statements can be compared with those of other undertakings.

Professional accountants should provide useful information in making decisions, thus ensuring the usefulness of financial statements, together with the relevance of including the value of the image of the past, the foresight and timeliness, and reliability by faithful representation, verifiability and neutrality, provides all necessary conditions makers interpret accounting information in making decisions.

Information provided unless they lose their utility qualities presented. At the same time can not possess all these qualities, each

presenting a "mixture" of qualitative characteristics, as each having a different weight.

There is also scope to *increase the quality of accounting information* such as harmonization of accounting principles under the internationalization of business, defining an overall conceptual framework of accounting principles and promoting research to guide best options for their applications, empowering accounting to taxation rules, the definition and implementation of management accounting, development of business applications solutions to the difficulties of application of accounting principles, practices comparative study of corporations in international accounting principles, financial disclosure and accounting estimates; active participation accounting profession in developing accounting standards; restructuring accounting and financial information sources available; accelerate the development and publication of financial information, simplifying financial information for the public, establish a comparison of financial information obligations.

Accounting information contained in financial statements must present all of the above to reflect fairly the financial position and performance unit. From the offered position of accounting information, accounting information management unit used to substantiate the internal decisions, but also to communicate with different users.

Financial and accounting information users base their decisions on information disclosed by companies. IASB Framework summarizes these decisions, considering that users are interested to:

- Decide when to buy, keep or sell an investment in equity;
- Assess the management and leadership responsibility;
- Evaluate the company's capacity to pay staff and provide other benefits to its employees;
- Assess guarantee that the entity can provide for loans which have been granted?
- Determine the fiscal policies;
- Determine profit and dividends can be distributed;

- Develop and use statistical data on national income;
- Regulate the activities of entities.

Responsibility for preparing and presenting financial statements of the unit is legally regulated and returns management, stressing the importance of accounting information. The latter is also interested in the information contained in financial statements, even if it has access to additional financial and management information to help achieving the planning, decision making and control. To meet their own needs, any unit can determine its form and content of additional information contained in the notes.

Conclusions

Most of the decisions made by management are based on information obtained from accounting. Decisions in the unit are collective, being involved in making their general manager, finance director, heads of specialized offices, information obtained as a result of consensus and compromise between them.

Abstract

This paper explores the latest trends in Romanian investment fund industry by examining the investors' prudentially behavior before and after the crisis.

We focus our study on a data set from the Romanian National Securities Commission (abr. CNVMR), with evidence on quarterly data on net sales value, number of units of funds and number of investors.

This study provides two contributions. First, it presents the newest UCITS regulations to maintain investors' trust in these investment vehicles. On the other hand, it provides a comparative analysis on open-end and close-end funds evidence. As a result, the paper concludes that open funds are more attractive for the domestic capital as compared to closed funds, but their evolution according to the preference for certain types is rather similar, in the sense that money market or diversified funds are preferred, as they offer a higher degree of certainty during crisis periods.

Keywords: investment funds, harmonized funds, non-harmonized funds, EU Directive

J.E.L. Classification: G28, G29, K22

1. Introduction

Investment funds represent a viable alternative for investors' individual portfolios. The advantages of this choice would be the access to financial instruments-otherwise not available for small amounts of money, reasonable management costs and the absence of the obligation to be permanently connected to the evolution of one or several markets. Furthermore, the investment

liquidation as well as the disinvestment is easy, the deriving costs and conditions are known and the counterparty is sure. Although, unfortunately, the only unknown quantity is the evolution of the net asset value of fund units, this opportunity is chosen by an increasing number of investors. Due to their success and in order to meet investors' demand, investment funds became more complex and specialized.

But what are investment funds or mutual funds, as they are known by the public? They represent collective investment schemes that have as functioning principle the combining of money belonging to a large number of investors and investing it in order to achieve the best possible return. Investment funds are like living organisms, they attract money through a permanent offer of units and they continuously redeem these units.

It is said that the stock exchange represents the barometer of the economy and this is true for both its functions, of primary and secondary market, but we must mention that a thorough study on the evolution of open funds number, correlated to the value of the assets they attract and the evolution of investors' number may reveal interesting aspects.

This is the reason why we are aiming to make an analysis of the evolution of the Romanian mutual funds industry in the post-crisis period.

2. The crisis and the prudence regulatory

We notice that during the financial crisis the invested amounts in Romanian funds are increasing. We could therefore conclude that they are deriving either from the withdrawal from stock exchanges or from the closing of

bank deposits, thus renouncing to the safety that they are offering.

The merit could be shared between the regulatory authority - that introduced this market in the European circuit by transposing Community regulations, making them accessible and understandable to foreign capital - and the management companies that made huge efforts in order to delete their recent history from the public memory. Money market funds, equity funds, bond funds, diversified funds appeared. This market sector has an ascendant evolution. In the meantime, investors became more sophisticated and they understood, some of them after losing their own money, how these funds are functioning, the advantages they are offering, but also the risks they are entailing.

First of all, investors learned that an investment in UCITS depends on the evolution of the entire financial market and, consequently, this investment is not riskless. At the same time, they have to be aware that these risks cannot and will not be covered by any state authority. Investors understood that the choice of the funds they are going to invest in is made according to several criteria and in several stages. Hence, they must analyze the investment horizon, the level of

new UCITS Directive (i.e. Directive 2009/65/EC of the European Parliament) that will create the premises of a development according to the more coherent and open for business community expectations are encouraging.

3. UCITS compliance in Europe

UCITS in Europe has a longer and more important history. In 2006, UCITS net assets stood at EUR 5.9 trillion and it reaches 4.5 trillion EUR at the end of 2008 because of the global financial crisis which has made from 2008 one of the most difficult year in the perspective of investment funds too. UCITS outflows for the year were EUR 356 billion in 2008. Almost 40% of the total outflows from UCITS in 2008 were recorded in the single month of October. 2009 saw the UCITS fund industry recovering from the onslaught of the global credit crisis in 2008, with total net assets growing 17% to EUR5.3trillion. In 2010, UCITS continued to grow with total net assets growing 13% to EUR5.9trillion. UCITS enjoyed net inflows of EUR 166 billion in 2010.

If we examine the last five years (Table 1) we can see that the UCITS funds industry had a setback in 2008 as a result of the global

risk, namely the level of risk aversion, the available amount of money, the fund portfolio structure, the applicable taxation, the expectations as regards the evolution of the units, in other words the return of the investment. At the same time, investment and disinvestment costs, the reputation of the management company or the reputation of its management team, the previous fund evolution are also assessed. It turns out that a preliminary research is necessary and crucial when making an investment decision.

The battle for regaining the trust has been won and the perspectives offered by the transposition in the national legislation of the

financial crisis, where the number assets decreased dramatically. The impact on the number of UCITS funds was not felt until the following year, where at the end of 2009, the total number of UCITS stood at 36,011 compared to 37,330 at the end of 2008. The financial crisis were quickly reversed and in 2009 UCITS assets rose by 17% and as of 2010, UCITS assets were making their way up to the previous high of 2007. Subsequently, as of 2010, UCITS fund numbers had increased again to 36,490.

In the five years from 2006 to 2010, we can see that the top ten countries each year for UCITS distribution have been mainly

European based, which is not surprising given that UCITS is a European products. The top three have been consistent for the last five years; Germany, Austria and Switzerland. France Spain and the Netherlands have moved between ranks 4 and 7.(see Table 2.)

were attracted by the newly created harmonized or non-harmonized, specialized or diversified funds, with the aim to meet the demand and to adjust themselves according to the profile of the domestic investor.

Taking the year 2009 as a reference point, as it represents the first year after the beginning of the crisis.

- individuals	158804	214847	226909	225284	141,86%
- institutional	5607	6967	8543	8523	152,01%

source: www.cnvmr.ro, www.aaf.ro, www.kmarket.ro

The net assets of investment funds has increased steadily and the number of fund units held by investors, also, has been reduced in the last quarter of the year 2011. Generally, this kind of decrease at the end of the year is not relevant as long as the decrease is not registered also in the first quarter of the next year. The net asset dramatically increased to over 200%, representing a relevant factor for the period of profound economic contraction we are referring to and for the investment culture of Romanian public.

Also, the analysis of net asset evolution on the types of funds (Table 5.) is indicating that the money market funds and bond funds are the ones that

money market funds. Unlike equity funds, which, either they track or not an index, they have an evolution that is correlated with the stock market and, consequently, they are confronted with its volatility. It is hopeful that investments prove responsibility, knowledge and prudence.

4.2. Close-end funds perspective

The number of closed funds increased in 2011 as compared to 2010. A number of 23 closed funds were operating in Romania at the end of 2011, as compared to 18 in the previous year.

However, this type of UCITS has not yet

Table 5. Quarter ev		Table 5. The evolution of Romanian close-end funds investors' in 2010-2011

Equity funds	211.8	TOTAL	92.909	92.597	- 0,34	
Diversified funds	190.7	- individual investors	92.589	92.276	- 0,33	
		- institutional investors	320	321	+ 0,31	
Bond Funds	1.860.309.023		2.406.713.178	2.606.457.430	40,11	
Money market funds	3.155.885.866		3.846.692.915	3.783.305.973	19,88	

source: www.cnvmr.ro, www.aaf.ro, www.kmarket.ro

attracted the investors' attention and succeeded to manage and to exploit the disposed assets.

Although the number of investors hasn't increased significantly, we must not forget that the crisis persists and generates financial prudence among investors.

gained a significant part of the market. This is the reason why, most of the times, they are ignored by the statistics and the studies on the general phenomenon of investment schemes.

At the end of 2011, the number of investors slightly decreased.

Tabel. 6. The number of fund units – evidence on Romanian Close-end funds

Indicators	31 dec. 2010	31 dec.2011	(%) Changing rate 2011/2010
Number of unit funds, held by	7.057.427	7.069.417	+ 0,17
Individual investors	6.022.248	6.205.166	+ 0,05
Institutional investors	855.149	864.251	+ 1,06

source: www.cnvmr.ro, www.aaf.ro, www.kmarket.ro

We can notice the interest of investors for funds with a prudent investment policy, money market funds. The number of fund units did not register significant changes (Table 6.).

6. Final remarks

We can conclude that open funds are more attractive for the domestic capital as compared to closed funds, but their evolution according to the preference for certain types is rather similar, in the sense that money market or diversified funds are preferred, as they offer a higher degree of certainty during crisis periods.

Banks and Companies - Partners in a Challenging Economy

Săveanu Cristina
University “AL. I. CUZA” Iași – Romania
Doctoral School of Economics
cristina.saveanu@bnro.ro

Abstract

Nowadays, banks have become interested in saving companies from insolvency in order to protect themselves from not getting back the loans released and have involved themselves in restructuring operations.

This paper presents the temporary holding of shares by credit institutions in companies and entities from outside the financial sector, this operation being a new way of restructuring and a measure of last resort, involving the change of the company's capital structure, by converting debts into shares.

Representing a market maturation process, the subject is approached on different aspects: the need of such an institution, its legal regime, main characteristics and consequences .

The analysis is objective, presenting the rules and regulations issued, showing the limits and the possible interferences with other law acts.

This procedure is a practical example of overcoming risks, making the borrower and the lender partners on the same side of the game, sharing capital and motivation.

Keywords: shares, debt, banks, companies, capital

JEL Classification: D21, E22, G32

1. Introduction

The actual economic recession in the context of the global financial and banking crisis, has created problems even to the Romanian credit institutions, our country being more and more integrated in the global financial system.

The negative aspects of all the economies and financial systems directly related to the Romanian economy had a great influence

over our national economy the same way as the positive aspects did before the crisis.

These consequences of globalization cannot be ignored by the banking system in Romania, as it has been deeply affected.

In this economic context, the operation of converting debts into shares for a company, as a way of activity restructuring, represents the signal of a maturation process in the relationship between bank and its clients.

There are several points which sustain the necessity of this restructuring process: the first point is the one that the market of insolvency has reached its maturity and in these conditions converting debts into shares is a new and efficient solution that permits a correct diagnosis of the company and gives the creditors the perspectives of future profitability. Another idea is that the debts canceling action, although a simple and convenient way for the debtor, has a great risk because canceling a debt means in fact generating another.

Today's increased competition, cyclical and volatile financial markets, and economic trends have created a climate in which no business can take stability for granted. The operation of converting debts into shares is a good solution, giving the credit institutions the possibility to directly influence the restructuring of the client. The solution of debt to equity swap is temporary and credit institutions can hold shares only for short term (2-3 years), giving the former shareholders the possibility to buy back their part of shares.

2. Ways of restructuring for a company

Debts restructuring represents the process that permits the debtors, both individuals and companies, having problems with their cash flows, to change their credit conditions, agreeing with their banks on several matters; interests, period, deadlines.

In the actual economic context, the relationship between creditors and debtors has evolved and has generated ways of agreement, which are beneficial for both parts of the economic equation. Starting from this relationship, there are several ways of restructuring:

- the debt to equity swap;
- the concordat;
- the mandate;
- the mediation.

The restructuring schemes can be analyzed both from the company's perspective and from the credit institution's perspective (and here we include banks, as banks are the main creditors for the companies).

Starting from the banking perspective, the most frequent restructuring schemes are:

- rescheduling by the change of the monthly deadline or of the monthly amount without exceeding the established final period;
- rescheduling by the change of the monthly amount and the monthly deadline together with the change of the final deadline or even the change of the term category of the credit;
- refinancing through a new credit facility for reimbursement of the previous which presents difficulties
- short term credit facilities for the companies to help them manage their temporary lack of cash;
- other solutions as assignment of receivables, subrogation, novation.

When it comes to the company's perspective, the financial difficulties can be overcome by using different methods, such as: changes in the management's structure, a credit restructuring process, following a restructuring program which has to be based on reasonable forecasts and has to demonstrate that the business can generate cash flow and can function on a profitable basis.

Coming back to the ways of restructuring in relationship with banks we are going to shortly describe the alternative ways to insolvency and among these, we are going to refer to mandate, concordat and mediation and we will analyze the features of the debt to equity swap.

The debt to equity swap represents a bilateral way of action, a symbol of

cooperation between debtors and creditors and it will be widely described in chapters 3 and 4 of the present paper.

The concordat and **mandate** have been established as alternative methods of intervention to sustain the negotiations between the companies in difficulty and their creditors.

The mandate is a confidential procedure which starts at debtor's request, through which a legally called representative negotiates with the creditors for establishing a mutual agreement between two or more creditors and the debtor in order to overcome the difficulty of the company [9]. The final purpose of this procedure is to reach a solution in 90 days time, for saving the company and cover its debts.

The concordat [5] is another procedure based on a agreement between the debtor and the creditors holding 2/3 of debts and by which, the debtor propose a recovery plan. Accepting the plan, the creditors sustain the debtor in his trial of getting over the difficulties. What is very important is the fact that during the concordat procedure, the insolvency cannot be opened against the debtor. The concordat [1] represents an alternative way to bankruptcy and helps the company to maintain its function. It is a necessary tool for protecting the debtors which are confronted with financial difficulties, starting from the opinion that recovery is always preferred to insolvency. This tool is considered to be more flexible and more efficient, due to the fact that all the terms are shorter and all the procedures are simpler.

Another method [5], to overcome the difficulties without insolvency is **the mediation**. The mediation is a negotiation form, assisted by a professional called mediator, who has all the necessary pieces of knowledge to facilitate the discussions between creditors and debtors and to identify the best solution between them. It has specific advantages such as confidentiality, which is essential in the banking system.

By mediation the parties can solve their problems through an agreement that reflects their wish resulted from negotiation, that is why the costs are lower than in a legal procedure.

All these ways of company's debts restructuring have a common element [8]: the

fact that they are all trying to generate supporting mechanisms in the relationship between banks and companies. When it comes to the credit agreements between banks and companies these mechanisms can give more power to companies in order to negotiate with banks from similar positions.

3. Debts to equity swap – main characteristics

The process of holding shares can be considered among the temporary operations during an assistance operation or financial restructuring.

The analysis of the share holding process means the analysis of the mechanism which operates in this situation, especially because debt to equity swap means changing the company's capital structure. The mechanism presumes several steps [5]: the first is **the social capital increase through issuance of shares** and the second is **the transformation of debts into shares**.

Acquiring and temporary holding of shares and their disposal shall be made in accordance with the provisions of the companies' legislation.

The shares must be obtained through the effect of the converting debt into shares, the main purpose of this operation being the restructuring process of the company.

Concerning the preference right of the former shareholders there is the possibility of giving up the right of preference or cancellation of this right by the decision of the general meeting of shareholders.

The effects of converting debts into shares are:

- the temporary holding of shares are not considered qualified parts of capital
- the credit institution gains control over the company
- the initial guarantees are canceled.

There are several conditions that must be fulfilled by a credit institution in order to be considered eligible or able to participate in the capital structure of a company :

- formalizing a strategy and a general policy on this type of operations, at individual or consolidated level;
- to have and implement a concrete, viable and well-founded financial reconstruction or rescue plan for the undertaking concerned, plan that should

be approved by the credit institution's management body (management function or supervisory function according to their competences). This plan should provide at least the maximum level of future guarantees and financing the credit institution commits to put up to that undertaking. However, this level can not exceed 25% of the exposure the credit institution recorded against that entity at the end of the month preceding the month in which the conversion was made; the plan should provide at least the following: a) in case of the restructuring of an entity outside the financial sector requires obtaining additional financing and guarantees, it shall mention the maximum estimated value, which shall not exceed 25% of the exposure value before the completion of the conversion; b) the motivation for selecting this solution, based on the cost-benefit analysis, of all the methods of insuring the credit institution's interests in respect of the receivables against the entity outside the financial sector; c) a documented estimation of the method, achievement level and timing for the recovery of the advanced funds;

- to have policies/procedures for assuming, identifying, measuring, controlling and reporting all risks entailed by such a transaction, including the concentration risk. Within these policies, the credit institution has to establish a maximum level (related to its individual original own funds) for the total amount of temporary holdings of shares during financial reconstruction or rescue operations. This level can not exceed 10% of credit institution individual original own funds, and is set to include the temporary holdings shown in credit institution's financial statements and also those of the entities within the group toward which such holdings/claims were transferred and which initially were displayed in the credit institution's financial statements;
- formalizing (at individual or consolidated level), a shares valuation methodology to the lowest assigned value to them in accordance with applicable accounting framework.

As regards the temporary nature of the

holding, credit institutions are allowed to own the shares acquired during a financial reconstruction or rescue operation for a period that can not exceed 36 months from the date of acquisition. In order to comply with this time limit, the credit institution must take the appropriate steps for the disposal of such shares or for its withdrawal from that undertaking, with the transfer of such shares to an entity outside the prudential consolidated supervision area of the credit institution.

4. Rules and regulations concerning the temporary holding of shares

Credit restructuring and companies rescue operations are instruments adapted to the current economic context. That is why the legal framework for such actions should be developed and adapted to the new requirements of the financial market.

The supervision authority in Romania, The National Bank of Romania, has answered to this demanding situation and has found legal solutions to maintain the financial stability.

First of all there was a draft of a regulation which obtained the agreement from the Central European Bank on the 5th of november 2010.

The final form of regulation concerning this matter was enacted by The National Bank of Romania (“**NBR**”) on the 18th of November 2011 and it is the Regulation no. 26 regarding the temporary holdings of shares of an entity outside the financial sector during an assistance or financial restructuring operation (“**Regulation**”). The Regulation was published in the Romanian Official Gazette, Part I, no. 855/05.12.2011, and entered into force on the date of its publication.

The regulation sets out requirements for credit institutions’ prudent decision-making processes when they seek to temporarily acquire shares in (and possibly control of) a non-financial undertaking during a financial reconstruction or a rescue operation, by way of a debt-to-equity swap.[4]

The regulation provides further details on the exemption clause under Article 145 of the Government’s Emergency Ordinance No 99/2006 (GEO 99/2006), which transposes Article 121 of Directive 2006/48/EC. This clause provides that shares held temporarily

during a financial reconstruction or rescue operation shall not be counted as qualifying holdings. Therefore, the limitation applicable to qualifying holdings of credit institutions in non-financial undertakings, as laid down in Articles 143 and 144 of GEO 99/2006, which transposes Article 120 of Directive 2006/48/EC, does not apply.

The Regulation establishes the requirements that have to be fulfilled in order to apply the provisions of Article 145 of the Government Emergency Ordinance no. 99/2006 on credit institutions and capital adequacy (“**Ordinance**”), regarding temporary holding of shares acquired by the credit institutions or by the entities in their area of consolidation, by totally or partially converting the debts they have against entities outside the financial sector, during an operation of assistance or financial restructuring.

The temporary holdings of shares that comply with the requirements provided under the Regulation are not considered qualified participations in the meaning of Article 143 paragraph 1 of the Ordinance, and the restrictions under Article 144 under the Ordinance are not applicable to holding such shares.

Article 5 of the regulation sets out the specific requirements to be met by a credit institution before acquiring shares in order for it to benefit from the exemption. In particular, the credit institution needs to provide a strategy and an overall policy. It must formulate and implement a concrete, viable and well-founded financial reconstruction or rescue plan for the undertaking concerned. It must also properly justify its view that the acquisition of shares is a measure of last resort and it must have suitable risk management policies/procedures in place.

According to the provisions of the regulation, the credit institutions are required to notify to the Supervision Department of NBR their intention to acquire shares and to submit documentation; within 60 days as of receipt of the complete documentation, NBR communicates to the credit institution the result of the analysis. If in the opinion of the Supervision Department, the Regulation requirements are not fulfilled, the shares can be acquired, but the provisions of Article 143 and 144 of the Ordinance shall apply to

holding such shares.

Furthermore, the credit institution needs to notify National Bank of Romania’s Supervision Department of its intention to acquire the shares and to submit documentation demonstrating that it meets the requirements stipulated in Article 5 of the draft regulation. The Supervision Department shall then deliver an opinion as to whether these requirements have been met.

In their intention of acquiring some temporary holdings of shares during a financial reconstruction or rescue operation, all credit institutions must submit the following documents to the Supervision Department within the National Bank of Romania [7]:

- written notice of its intention of temporary holding of shares during a financial reconstruction or rescue operation of an undertaking operating outside the financial sector as well as the manner of acquisition and foreseeable holding period;
- the overall strategy and policy regarding this kind of operations;
- the financial reconstruction or rescue plan for the undertaking concerned and its most recent financial statements;
- the policies/procedures for assuming, identifying, measuring, controlling and reporting the risks entailed by such a transaction;
- the written justification which shows that there is no other manner more efficient for the credit institution to recover the claims against that undertaking;

The total net value of holdings is deducted from its tier 1 capital, calculated by the credit institution at individual or consolidated level.

The shares can be held for a maximum period of 36 months, which can be extended by NBR for valid reasons, without exceeding a total of 48 months as of the acquisition date. At the expiry of this period, the shares will be considered qualified participations and the credit institution has the obligation to totally or partially dispose of these shares. The disposal of shares shall not be made to an entity in the area of consolidation of the credit institution. In order to comply with the time limit referred to, the credit institution must take the appropriate steps for the alienation of such shares or for its withdrawal from the entity in question, with

the transfer of such shares in the holding of an entity outside the scope of consolidated supervision of that credit institution.

In respect of the ongoing assistance or financial restructuring operations, the credit institutions must follow the procedure established under the Regulation, within 3 months after its entry into force.

5. Conclusions

The debt to equity swap represents a way of debt recovery, instead of collateral execution which needs a long term and depends a lot on the market functionality.

This operation of taking off shares has a beneficial effect mainly for the banks. Using this way of action they do not overload their balance with low performance credits and they have to establish a lower amount of provisions and their image reflected in their risk profile is better.

Economic analysts appreciate this new way of relationship between banks and companies as a different way of foreign investments . Considering the fact that most of the banks are not romanian banks, but foreigners, it is a way through which foreign banks have access to the romanian economy.

This process of converting debts into shares makes a better image for the company in front of the other creditors because, by this procedure, the company’s debts are reduced and the possibility of recovery is increased. For the former shareholders the situation is different, because they must share even the potential benefits with the newcomers, but anyway is a better situation towards insolvency.

Although, at the beginning, this new type of partnership between banks and companies has attracted for and against points of view.

In the previous paragraph we mentioned some of the “for” opinions. When it comes to the “against” opinions, they mainly refer to the fact that through this method, banks can solve some emergency problems: the passives becomes shares which means actives and generates a reduction in the degree of capitalization if banks use this facility they partially become investment funds. The competencies requested in these two situations are not the same and there is the risk that banks do not have the adequate personnel both quantitative and qualitative.

There also might appear the risk of a conflict between the bank's quality of creditor and the one of shareholder.

Other against opinions finds many difficulties in establishing the price of shares for converting debts and the operation in itself is considered to be quite difficult

When it comes to the political influence over these operations, this risk can appear only if in this kind of business are involved public banks. In the private sector where most of the banks operate there is no fear for such an involvement and the conditions in which there is done such an operation can be very demanding, but in fact this is a stimulative point.

Although there are for and against opinions on this matter, this new type of rescue operation is an answer to the demanding reality. The involvement of banks in the companies' life, as shareholders, will definitely increase the chances of successfully passing over this difficult period.

Abstract

Various methods of analyzing the value of the stocks are called as a general characterization, titles evaluation. Fundamental analysis attempts to predict the direction of evolution of prices of the medium and long term stocks from past and present achievements of the company and the estimates of its future. This article discusses some of the most popular methods of stock assessment using fundamental analysis and propose a build of portfolio for stocks listed at Italian Stock Market using indicators of fundamental analysis.

Key words: risk; selection of assets; fundamental analyzes; optimization;

J.E.L. Classification: C02, C61, G11

1. Introduction

All investors, whether institutional or private individuals, are establishing criteria by which to invest money.

In the process of making any investment decision, the primary issue is the aknowledge of accurate and up to date information. Fundamental analysis takes into account the

"health" of the company's financial, the macroeconomic and political conditions of the environment in which the company operates, the global development factor of the industry that is part of the projections about the future company performance.

Fundamental analysis is the method of forecasting future price movements of a financial instrument based on economical, political, environmental and other factors, and the relevant statistical data which significantly affect the supply and demand for whatever support of the financial instrument. Fundamental analysis identifies and measures factors that determine the intrinsic value of a financial instrument, such as general economic and political climate, including any factors affecting supply and demand for the product or service reference. If there is a reduction in supply, but demand remains the same, then there will be an increase in market prices. An increase in supply, and the demand is the same, produces the opposite effect.

For example, an analyst of a listed company studies: the supply and the demand for products or services for that company, the quality of the management and its policies, its historical and forecasted performances, its future plans, the prospects and plans of its competitors, industry statistics, general economic conditions, government policies.

In the case of goods, an analyst studies statistics on prices, supply, demand and inventory levels, prospects for use, production or planned crops, weather and climatic conditions, availability of substitutes, economic conditions, political developments. From these data, the analyst

could build a model to determine the current and future value of the instrument. The basic idea is that for the inconsistent increase of supply corresponds the decline of prices, while for the discrepancies in the demand increases corresponds the tendency in prices to rise. Once the intrinsic value is estimated, the analyst compares it with current prices and decides if prices should increase or decrease. The basic premise is that if the price is currently lower than the intrinsic value, it should increase. If price is currently more than intrinsic value, then it should decrease.

One of the fundamental analysis difficulties in ensuring such accuracy is measured by the correlation between variables. Inevitably, the analyst must make estimates based on experience. Moreover, markets tend to anticipate events and punish them through price. Ultimately, the markets often take time to recognize that prices are not in line with the value, which acts both as an advantage and as a disadvantage (depending on the correlation time).

2. Multipliers method

2.1 Book price/value (P/BV) and book value per stock (BV)

Generally there is a relatively weak correlation between the net asset value of a company and its market capitalization. Net asset value usually refers to the book amount for the assets of a company, as shown in annual accounts, and is "cash value" of the company or close to that value. The net asset value may be used as an indicator of the wealth of a company when it is subject to a takeover bid. A high value of net assets is perceived by investors as support for the market price of the stock. The better the performances of a company, the larger the gap is between net assets and market capitalization, which is seen as a measure of that company's ability to "increase profits." Over a period, the value of a successful company becomes greater than its net asset value. Coefficient price/ book value is comparing market valuation of a company with its market value:

$$\text{Price/ Book value} = \frac{\text{Market Capitalization}}{\text{Shareholders Capital}}$$

Price/ book value is important for evaluating a company about to receive a takeover bid. If a stock is close to net asset value, the cash balance is too high, thus reducing the likelihood of a takeover, especially when a market declines (bear)

Book value per stock (BV) is the ratio of stockholders capital and number of stocks issued ($\frac{\text{Shareholders Capital}}{\text{Number of stocks}}$)

$$\text{So, Price/Book value} = \text{P/BV} = \frac{\text{Market price of the stocks}}{\text{BV}}$$

2.2 Price/profit (P/E or PER) and earnings per stock (EPS)

Earnings per stock (EPS), EPS will normally be higher than the dividend per stock, because some earnings are retained by the title company reserves and are not distributed as dividends.

Another way to address the ratio P / E refers to the number of years for the company's market value to be matched by its earnings. Ratio P / E is given by the quoted price for common stocks divided by the most recent EPS value

$$\text{So, Price / earnings} = \text{P / E (PER)} = \frac{\text{Market price of the stocks}}{\text{EPS}}$$

2.3 Price/Sales (P / S) and turnover per stock (S)

Turnover per stock (S) is calculated by dividing company's revenue by the total number of stocks

Price / Sales = P / S is calculated by dividing the current price action market value of turnover of the company registered in the past four consecutive quarters divided by the number of outstanding stocks.

3. Case study: Italian Stock Market

3.1. Stage of selection of assets

In the context of present financial markets it is a huge amount of available financial data. Therefore, it is very difficult to make use of such amount of information and find basic patterns, relationships or trends in data. We use data analysis techniques in order to

discover relevant information to financial data, which will be useful during the selection of assets and decision making. Consider that we have collected information on a number S of assets, each with P features, which represent various financial ratios, still called variables. Denote by y_i^j the j -th variable for stock i . Multivariate data set will be represented by a matrix $Y = (y_i^j)_{i=1, \overline{S}}^{j=1, \overline{P}}$ and can be viewed as a set of S

points in a P -dimensional space. Principal components analysis (PCA) is a useful technique for analyzing data in order to find patterns in a large-scale data space. PCA involves a mathematical procedure that transforms P variables, usually correlated in a number of $p \leq P$ uncorrelated variables called principal components. After applying the PCA, each asset i will be characterized by p variables, represented by a set of parameters $y_i^1, y_i^2, \dots, y_i^p$. Therefore, it is possible to form the arrays $Y_i = (y_i^1, y_i^2, \dots, y_i^p)$, $i = \overline{1, S}$, which correspond to a set of S assets. Suppose now that we have obtained a data set $Y_i = (y_i^1, y_i^2, \dots, y_i^p)$, $i = \overline{1, S}$. Then we will use clustering techniques in order to find similarities and differences between the stocks under consideration. The idea of clustering is an assignment of the vectors Y_1, Y_2, \dots, Y_S in T classes C_1, C_2, \dots, C_T . Once completed the selection of activities, we construct the initial portfolio by selecting low-risk assets in each class.

We will present some of the most important financial indicators that we will use in the study:

- The P / E is calculated by dividing the current market price to the value of net profit per share for the past four consecutive quarters, net income per share is calculated by dividing the total net profit earned by the company during the reporting period (it is relevant to relate to the last 12 months) and the number of shares issued and outstanding.

- The P / BV is calculated by dividing the current trading price to book value per share determined according to the latest financial reporting; accounting value of a share is calculated by dividing the total equity value

of the company to the total of its shares issued and outstanding; equity value is determined by deducting total liabilities from total assets owned company and its "shareholder wealth", which is what remains to be recovered if the assets and liabilities would be paid.

- *Divy index* measures the performance of dividends and is calculated as the ratio between the amount of the dividend and book value or market value of the stock. This assesses the efficiency of investment in an asset.

- *Volatility* is a measure for price variation of a financial instrument over time. It is used to quantify the risk of the financial instrument over the specified time period.

- *Evolution of price* observes the price level at a given time, taking into account the maximum price and minimum price achieved in the last 6 months.

We used information on a total of those 40 shares representing shares of FTSE MIB Index traded on the Borsa Italiana. The aim of our study is to find similarities and differences between the current analysis and build a diversified portfolio. We took into account for each stock the 5 features described above.

We used data analysis techniques in order to process the vast amount of information. Table 1 lists, for each of the 40 stocks analyzed, the values of the five features; we used the data available on the Borsa Italiana on 27 March 2012.

Table 1: The value of the 6 features

We apply data analysis techniques to discover the similarities and differences between the stocks of the Bucharest Stock Exchange, using the package StatistiXL 1.8.

Figure 1 contains the tree resulted from PCA (dendrogram).

Dendrogram usually begins with all assets as separate groups and shows a combination of mergers to a single root. Stocks belonging to the same cluster are similar in terms of features taken into account. In order to build a diversified portfolio, we first choose the number of clusters, which will be taken into account. We will then choose a stock from each group and we will get the initial portfolio.

Figure 1: Group of stocks Dendrogram

Source: programe STATISTI XL 1.8

3.2. Phase risk estimation.

We evaluate the performance of an asset using expected future income, an indicator widely used in financial analysis. Denote by $S_j(t)$ the closing price for an asset j at time t . Expected future income attached to the time horizon $[t, t + 1]$ is given by:

$$R_j(t) = \ln S_j(t + 1) - \ln S_j(t), \quad j \in \overline{1, S}.$$

Similarly, we define the loss random variable, the variable L_j , for asset j for $[t, t + 1]$ as

$$L_j(t) = -R_j(t) = \ln S_j(t) - \ln S_j(t + 1), \quad j \in \overline{1, S}.$$

Using Rockafellar et al., 2000, we define the risk measure VaR corresponding loss random variable L_j . Probability of L_j not to exceed a threshold $z \in \mathbf{R}$ is $G_{L_j}(z) = P(L_j \leq z)$.

Value at risk of loss random variable L_j associated with the value of asset j income and corresponding probability level $\alpha \in (0, 1)$ is: $VaR_\alpha(L_j) = \min\{z \in \mathbf{R} \mid G_{L_j}(z) \geq 1 - \alpha\}$

or $P(X > VaR) = \alpha$. If G_{L_j} is strictly increasing and continuous, $VaR_\alpha(L_j)$ is the unique solution of equation $G_{L_j}(z) = 1 - \alpha$

then $VaR_\alpha(L_j) = G_{L_j}^{-1}(1 - \alpha)$. One of the

most frequently used methods for estimating the risk is the *historical simulation method*. This risk assessment method is useful if empirical evidence indicates that the random variables in question may not be well approximated by normal distribution, or if we are not able to make assumptions on the

distribution. Historical simulation method calculates the value of a hypothetical changes in the current portfolio, according to historical changes in risk factors. The great advantage of this method is that it makes no assumption of probability distribution, using the empirical distribution obtained from analysis of past data. Disadvantage of this method is that it predicts the future development based on historical data, which could lead to inaccurate estimates if the trend of the past no longer corresponds. If L_j is the loss random variable and \hat{G}_n is empirical distribution function of L_j and $\alpha \in (0,1)$ a fixed level of probability, then $\hat{G}_n(z) = \frac{1}{n} \sum_{i=1}^n I_{\{L_j \leq z\}}$.

We can prove that:

$$VaR(L_j) = \min \left\{ z \in \mathbf{R} \mid \frac{1}{n} \sum_{i=1}^n I_{\{L_j \leq z\}} \geq 1 - \alpha \right\}.$$

Once completed the phase of grouping the assets in T classes by the existing similarities, we focus on the selection of the assets of each class to have a minimal risk. Consider the loss random variable corresponding to each asset in each obtained class $C_i, i = \overline{1, T}$: $\min_k VaR L(A_k^i)$

We used the closing price values daily for each share, corresponding to a time horizon of 50 days to measure VaR for each stock. We used the data available on the Borsa Italiana from 15 March, 2012 - 30 April, 2012. The following tables contain values of VaR for each stock and three levels of probability values

Class 1	0.90	0.95	0.99

3.3 Optimization portfolio phase in the framework Mean - VaR

We obtained an initial portfolio comprising a wide range of stocks with minimal risk. We will try to determine what percentage is the optimal composition of capital that needs to be invested in each of the assets under consideration, so that at the end of the investment we will have a maximum return on investment.

Thus, T is a set of stocks, with stock j that leads to expected income $R_j, j = \overline{1, T}$; Expected income of portfolio is: $R_x = \sum_{j=1}^T x_j R_j$. The model to be solved is:

$$\max \sum_{j=1}^T x_j R_j, \text{ with } VaR_\alpha(L_x) \leq v_0, \text{ where}$$

v_0 is the parameter of the model.

As a consequence of applying the technique of selection, we selected a portfolio of 5 stocks, each of them representing the minimum risk stock class corresponding VaR measured probability level 0.99: Bca, Mps, Telecom, Saipem, Unicredit, A2A.

In these conditions, the optimization problem to be solved is:

$$\begin{aligned} \max f &= 0.1122x_1 + 0.0286x_2 + 0.04x_3 + 0.1724x_4 + 0.205x_5 \\ \begin{cases} 0.031x_1 + 0.052x_2 + 0.044x_3 + 0.0354x_4 + 0.0392x_5 \leq v_0 \\ \sum_{i=1}^5 x_i = 1 \\ x_i \geq 0, i = \overline{1,5} \end{cases} \end{aligned}$$

There are several methods for solving this problem (math programming or software *Scientific Work Place*). A solution to this problem remains a challenge for future.

Accounting, Economic Theory, "Transilvania" University, Brasov*

antoneta_simen@yahoo.com

Abstract

The IFIs analyze methodology of investment projects based on dynamic methods of assessment and financial analysis in which the predominant component is to update the flow of revenues and expenses. IFIs have adopted the method of analysis based on internal rate of return (financial and economic), considered the most appropriate because it allows comparison with the appropriate cost of capital, the reference standard for financial analysis in market economies. The expression of projects efficiency by the two forms the financial and economic aims on the one hand, satisfying investors' decisions and on the other hand the governments to allocate resources at national and international financial institutions to apply uniform criteria regardless of economic policies countries in which the project.

Keywords: Financial Institution (IFIs); internal rate of return; investment projects; economic analysis; financial analysis.

J.E.L Classification: G21

1. Introducere

Access to financing from the IFIs on beneficiary demand is based on a complex and rigorous analysis of these institutions. For this the beneficiary must draw up a file to allow the creditor conducting the review and funding decision.

2. Preparation and analysis of the investment projects by IFIs methodology

Drafting the investment projects mainly takes up a series of steps, of which the most important are:

2.1. Identification of investment projects

In this stage is determined if the the future objective fits within the general development strategy of the country. It aims to feasible production technologies to be applied and markets. Generally, to identify investment projects using two methods: relay project, when there is an initial draft, and the new project is an improvement of the old, and methods of strategic development projects, projects involving the development of policy on circumscribed development of industry or activity, of which the future economic objective to be achieved

2.2. Feasibility Study Project

This is the tool by which an identified project is feasible from the technical, economic and financial. The feasibility study includes: project history; market outlets; objective and program production capacity; material facilities, including necessary supplies; study site with consideration of the various variations; engineering studies; strategies adopted; placement areas; target organization; economic and financial evaluation. The economical and financial evaluation includes: budgeting; project financing; production cost; financial evaluation: payback period, break-even point, rate of return on investment, internal rate of return (IRR); economical evaluation: cost / profit, savings estimates, annual cash flow (cash flow).

3. Specific issues of the assessment methodology of investment projects

These issues are examined by experts who advise favorable bank loans for investment projects.

3.1. The economic issue

The IFIs aim to effectively manage internal resources by comparing the expected economic effects of investment and production efforts.

Market type (newly created, well established and traditional) is essential to determine the risk of project cash flow forecast. Depending on the project can be described and any funding that could benefit customers in the project. This concern the following: determining the relevant markets; market share and sales volume; competition; pricing strategy his is necessary and retrospective analysis of the evolution of prices of products and the main factors that determine the price (cost of market entry, consumer awareness, product substitution); distribution and sales

3.2. Environmental issues

The IFIs are tasked to promote projects that are based on a sound and sustainable development in environmental terms. It's necessary that the applications contain sufficient information on the incidence of project on environment. It will consider: the location of investment, current or previous land use, description of construction or changes of land, measures intended to protect or improve the environment, defining responsibilities for pollution, the policy pursued by the enterprise environment, authorizations obtained from public authorities, restrictions or facilities that are undertaking the necessary imports, restrictions or existing facilities in the export, public services price structure, currency restrictions

3.3. Technical issue

IFIs shall review the production to ensure that the technology will provide a competitive advantage with the potential benefits of taxation and low cost labor. Five categories of information are required: location, plant and equipment, manufacture, raw materials costs, labor.

3.4. Institutional, organizational and leadership issues

Promoters are generally responsible for project development to execution to final and usually are major shareholders in the project, contributing in cash or in kind to it. Bank requires a firm commitment from promoters and detailed information on global assistance, on their plans for participation in the capital and on their involvement in management, production and marketing to the project. It aims at:

- Experience of promoters in the field. A promoter who has some experience in area is considered to be more aware of the risks which it could take. It will take strategic decisions based on commercial and financial experience
- Financial situation. Require information on the financial statements of projects previous knowledge enabling bank activity results. This can be seen to what extent the promoter carried out their duties and the extent of this activity is a guarantee to finance the new project. The documents provided should cover the last three years. If the shareholder is an individual will be given information on its heritage elements, they hold shares in other companies.
- Other shareholders. When the project participants and other stakeholders, the promoter will provide information on their role in the project, their power and decision control. It also specifies the contribution they can make to guarantee or project funding.

3.5. Financial aspect

Consist of considerations on financial and investment policy practiced in that country. IFIs will only be one source of financing of the project. It may be the only fund only if an extension is made of existing capacities, provided that this does not represent more than 35% of its final value. Given that the promoter has difficulty in attracting other funding sources, the bank can help by giving assistance in this regard. In such co-financing bank is interested in sharing risks with other donors that have a richer experience in the field concerned and wants to play a catalytic role by encouraging other organizations to fund projects.

Information on sources of funding must include the following elements:

a) Details of equity: who participates capital and for how long; what is the distribution of contribution in kind and in cash; how shares are shared;

b) Details of loans: who provide credit; currency of the granted loans; credit conditions;

c) Details of agreements signed: guarantee agreements; subsidize agreements; tax agreements

d) Details of guarantees: guarantees given to creditors and describe the nature and type (pledge, mortgage, privilege, etc..).

The information given in this section should enable the IFIs to assess the possibilities of the project to release sufficient cash flow to repay debt and pay dividends. Forecasts are for a number of years equal to the period of involvement of the bank. To this end are under consideration:

- operating assumptions regarding: sales volume and product price; cost allocation, taking into account labor force (number of employees and average salary), raw materials, transportation, public services, sales and administration; equipment and maintenance expenses of their working capital
- financial forecasts: on the income statement, balance sheet and operating cash flow, calendar of maturities and repayments of loans and interest, the depreciation of assets, the working capital, the taxes that the company must pay the bank during the intervention of bank in the project.

For the profit and loss forecasts, revenues are estimated based on expected sales volume and unit price forecast. Cost of sales is estimated based on volume forecasts, costs of raw materials and labor and indirect costs. Depreciation expense arises from amortization plan. Interest costs are calculated based on the terms and conditions of financial agreements including repayment plan, grace period, interest, commissions, etc.

Cash flow statement (cash flow) consists of three elements: operating cash flows from financing activities and investing activities. To estimate operating cash flows, projected net income, depreciation, taxes will be taken from the profit and loss forecast. To estimate forecast flows from financing activities, the agreements provide the data necessary funding as repayment plan, interest, fees and

investment activity forecasts are estimated based on the investment plan or the company's capital expenditures.

Balance forecast sheet is based on the income statement forecast and cash flow statement. Customer receivables are estimated based on the number of days of collection or collection average period. Stocks designed are based on projected inventory velocity. Fixed assets are extracted from the expenditure of capital, depreciation and amortization resulting from the plan. Long-term debts are obtained from anticipated borrowing plan Equity is calculated from the investment plan and earnings is shown in the profit and loss forecast.

Forecast financial statements are used to calculate financial ratios. Five categories of financial ratios: liquidity, leverage, activity, profitability and market.

A distinguishing feature of the methodology is the proper economic analysis of financial analysis.

Economic analysis is used primarily to assess the economic efficiency of investment projects with international funding aimed at economic issues - social, levels of infrastructure to provide a stable and sustainable growth. The results of economic analysis is the starting point in developing projects and that the allocation of funds for development of international programs for macroeconomic growth.

Financial analysis aims evaluation of the economic efficiency of projects under the loan application, funding from banks and financial companies for expansion and business development. This is to reveal the economic efficiency in the public and private economic agents taking into account the sources and destinations efforts and effects involved. The result of this type of analysis is much greater for investors who are faced with deciding how best allocation and distribution of own funds and financial institutions who want to place the funds available to enable effective business recovery fund and obtain an additional profit. Prices used in financial analysis are market prices for both products in the country and those imported including related taxes.

The main aspect that distinguishes the two types of analysis is the structure of income statement. Purpose of economic analysis is to

highlight the project return to the national economy regardless of the nature of resources committed and the effects obtained by the beneficiaries. In this regard the establishment of income statement is not taken into account subsidies, taxes of any nature.

Determination of the structure of income and expenditure in the financial analysis will include all fees, taxes and subsidies related to the economic relationship with the state and financial institutions. In terms of revenues, financial analysis, will be included in addition to operation income, credits upon receipt is income to expense when the entity returned. The depreciation of fixed assets are not included in operating costs in the feasibility study because it would be double counting, the value of fixed assets is taken into account through investment.

Calculation of economic efficiency are based on technical upgrade, which provide comparability the efforts with investment and production and the effects achieved, revenue, profits, etc.. This comparability is achieved at the beginning of the investment objective.

Another feature of the methodology is that the effects and efforts are taken into account throughout the implementation and operation of investment objective. Duration of achievement can vary from 1 to 2 months for minor objectives, to 2 to 3 years for the industrial scale. Operating periods are between 5 and 7 years or less machines for special construction and 10 30 years from construction to certain destinations.

These time periods used in efficiency calculations give rise to difficulties in accurate assessment of income and expenditure because a series of calculations should be considered that take into account forecast demand, market trends, cost of raw materials and materials, labor and the situation on international markets.

Element to be taken into account in the preparation of revenue and expenditure forecasts for investment projects developed in developing countries is inflation, which will correct the values recorded in the base year.

Updated calculations use a index called the update rate. Recommendations for drafting investment bank in stable economies, suggest using a level of 15%

update rate, for economies in transition where the value should be corrected by the inflation rate, the level of interest for borrowings and the rate economic efficiency at the branch environment and economy.

Any investment project regardless of its size and length of time is affected by a number of factors influence favorable or unfavorable. Anticipating the influence of factors on the project can be achieved by performing sensitivity studies in which calculations are recovering successively modifying one item at a time and then a combination of successive element. These studies are a means to assess changes that may arise in carrying out investment and production processes, since all predictions are subject to great degree of uncertainty. Through them, sensitivity, project profitability is tested in a series of changes that may occur in the conduct of investment and production processes,

All efficiency calculations are considering estimates regarding the investment, costs, revenues and profits. Not all items can be determined accurately. If these elements have an important share in the project and their variation induces significant deviations in calculations require better understanding of existing relationships to see whether calculations of the project are reliable. Thus, projects are tested for sensitivity to deviations of 10%, generally to items such as costs increase, loss of revenue, reducing exports. A project may be solid if the tests succeed to maintain the internal rate of return or if it is not reduced by more than 10%, not fall below 7-8%.

4. Conclusions

Methodology for analyzing investment projects based on analysis of expected cash - flow. IFIs used analysis method based on internal rate of return (financial and economic), considered the most appropriate because it allows comparison with the appropriate cost of capital, the reference standard for financial analysis in market economies. The article presents in detail the stages of the development of investment projects and specific assessment methodology, focusing on the calculation of internal rate (financial and economic) profitability. Using the most rigorous available funds based on investment

decisions that are based on technical calculations - economic feasibility study contained in each investment objective.

Features of Commercial Operating Risk Analysis

Solomon Daniela Cristina
Faculty of Economic Sciences, “Vasile Alecsandri” University of Bacău
solomon.daniela@yahoo.com

Abstract

The activity of any trade businesses is subjected to risk of exploitation or economic since it can not predict with certainty the various components of its outcome (cost, quantity, price) and of the operating cycle (purchases, sales). Sales condition the activity across the enterprise, their variation being considered the main risk factor for the performance of commercial enterprise. Breakeven analysis in commercial activity is based on the indicators: turnover critical (critical sales volume) and sales of goods critical which prove their usefulness in providing and implementing a risk management that enables decision optimization, risk diminution and uncertainty.

Keywords: performance, risk analysis, commercial enterprise.

J.E.L. Classification: D61, M41, M49.

1. Introduction

Commercially operational risk assessment refers to analysis and identification of relevant risks in goals achievement, to know how they should be managed.

Economic risk can appreciate the possibility of registration (obtaining) an insufficient result or even losses, expressing the result economic volatility in operating conditions [1].

The main indicator that measures the operation risk of *breakeven* is called the critical point, the equilibrium or neutral „point mort” or „breakeven point”.

Risk management consists in running a series of processes of identification, estimation of consequences, evaluation, management and monitoring the business’ risks. This is realized in a sequence of steps, such as: *risk identification; analysis and risk*

assessment; determination of priority interventions to limit risk; risk treatment [2].

2. The breakeven point in trade

In commercial enterprises, which are based exclusively on **trade activity**, breakeven point is determined by taking into account the *fixed costs* (C_f) and the development of specific factors, namely:

- ☑ *Loose goods turnover* (R);
- ☑ *Average rate of profit margin* (\bar{A});
- ☑ *Average rate of service variable costs* (\bar{N}_v) (related to sales of goods).

Factorial, sales of goods related benefit (B) is determined by the relationship [3]:

$$B = Vz - Ch_{circ} = \frac{R \cdot \bar{A}}{100} - \left(Cf + \frac{R \cdot \bar{N}_v}{100} \right)$$

where:

Vz = sales of goods;

$$Vz = \frac{R \cdot \bar{A}}{100};$$

Ch_{circ} = circulation costs concerning goods made from fixed costs (C_f) and variable movement costs.

Breakeven trade marks that dimension of activity where **revenues from the sale of goods** (Vz) covers **movement costs related to goods** (Ch_{circ}), the company not getting any profit or loss, *the benefit being zero* ($B = 0$).

Equality $Vz = Ch_{circ}$ corresponding to equilibrium point leads to the next equation:

$$\begin{aligned} \frac{R \cdot \bar{A}}{100} &= Cf + \frac{R \cdot \bar{N}_v}{100} \Rightarrow \\ \frac{R \cdot \bar{A}}{100} - \frac{R \cdot \bar{N}_v}{100} - Cf &= 0 \Rightarrow \\ \frac{R \cdot (\bar{A} - \bar{N}_v)}{100} - Cf &= 0 \end{aligned}$$

Indicators used in the trade breakeven analysis are presented in Table 1.

Table 1. Indicators used in the trade breakeven analysis

Indicator's name	Calculation relation
1. Critical turnover (sales volume) (R_{crit}) = is related to breakeven sales volume (critical point)	$R_{crit} = \frac{Cf}{\bar{A} - \bar{N}_v} \cdot 100$ (lei)
2. Critical goods sales (V_{z_{crit}}) : is related break-even sales volume (critical point)	$V_{z_{crit}} = R_{crit} \cdot \bar{A};$ $V_{z_{crit}} = \frac{Cf}{1 - \frac{\bar{N}_v}{\bar{A}}} \text{ (lei)}$

* Fixed costs (Cf) related to sales of goods - according to the management accounting data

Graphical representation of the evolution of sales of goods in relation to actual critical sales of goods is suggestively presented in Figure 1 for S.C. ALFA S.A. and in Figure 2, for S.C. BETA S.A.

S.C. ALFA S.A. proves low economic performance in trading activity compared to S.C. BETA S.A. as interval values of safety, efficiency growth are much lower in the first two years, and during the three last years values are negative actual sales of goods being situated below break-even (sales of goods critical) making company to be „unstable” and to be at risk of exploitation.

Figure 1 The evolution of critical goods sale for S.C. ALFA S.A.

Figure 2 The evolution of critical goods sale for S.C. BETA S.A.

S.C. BETA S.A. shows high performance in trade activity in the last four years, being in a „comfortable” situation as sales of goods are well above the critical goods sales, ahead of safety interval of 20%, so the company is not subject to risk in trading activity.

Existing gap between sales of goods and critical values is higher for S.C. BETA S.A. during the last four years, proving flexibility and adaptability higher than the short and medium term developments in the economic sector recorded operating, while in case of S.C. ALFA S.A. spread is negative in the last three years the company being at risk in trading activity.

4. Conclusions

On future S.C. ALFA S.A. needs to review its strategy, to reformulate their sales and marketing objectives focusing mainly on increasing turnover, object achievable by: reducing the sales price (sales price reduction effect may lead to increased turnover), improvement of product’s quality, increased

business area, product diversification and restructuring (elimination of noncompetitive products, launching new products, green ones), improving the promotion and distribution of products (website updating, expanding online sales) etc.

Operational risk will be even greater as the operating weight of fixed costs, variable operating costs compared with the expenditure of movement will be higher. Fixed costs reduce business flexibility, namely its ability to adapt to changes in turnover. Degree of flexibility is dependent on the technical potential of the enterprise, human potential and its organizational structure, variability in outcome will be better mastered by the entity, the more it manifests a degree of flexibility.

Theoretical and Methodological Foundations of the Financial System of the Enterprise

Spineanu – Georgescu Luciana
Universitatea „Spiru Haret” Constanta
lspineanu@yahoo.com

Abstract

In conceptual terms, definition of financial system has a complex content and meaning, both in the finance literature and in everyday human activities, that phrase is used with quite different meanings. In this situation, can be observed quite different approaches on how to define and interpret the foreign and domestic professional literature, particularly its emphasis on content items to be considered relevant by the authors.

Key words: financial system, financial and monetary flows, financial markets, real flows.

J.E.L. clasification: G19

1. Introduction

So, for shaping the concept of financial system is important to the general notion reporting system, which has several meanings, but means, in essence, a set of interdependent elements (principles, rules, criteria, etc..), Which is an organized, that puts order in a field of theoretical thinking, governing the classification of material in a field of natural sciences or cause to operate as a practical purpose.

1.1. Enterprise approach to financial system

The philosopher Aristotle, gives a first definition of the system, saying that "the whole is greater than the sum of parts".

In another approach, the system is seen as "a meeting of principles linked together in a manner to establish a doctrine", or "a combination of parts that are coordinated to contribute to a result or to form an assembly." In a simplified way, is to admit that a multiplicity of elements common essence and

manifest link between the interaction and interdependence, integration and operation enabling a consistent set is, generally, a system.

To be components of a system, all the items and categories regarded as objects of research must meet a number of cumulative conditions.

First, in the context considered, the components must have common reference elements, organic connection and interdependence.

Second, the system is a generator output - s, based on input-s, materialized through a series of input and output streams (streams real financial - monetary, informational, etc.).

Third, the system consists of many interconnected subsystems, which have connections between that can occur in a particular context, opportunities for substitution.

In the light of the delimitation process and economic relations that takes into account the concept of finance, in line with the scope of the finances, the financial system can be assigned and accepting more restrictive or more extensive, in relation to other concepts, such as for example that the financial sector. At the same time, however, aspects of the concept of financial system is interrelated with other areas of event concepts, such as those of system and banking sector, monetary system and taxation system.

Usually, the term of the financial system is dealt with quite differently understood in relation to the concept of "financial sector". In the literature it is considered that the term "financial sector" has a narrower sense, the financial sector is often defined as "a component, part of an economy that provides financial services to other entities of the economy".

Viewed in another aspect, continuing analysis of the particular to the general one can see that, in a broader approach to running processes, phenomena and economic relations

of the scope of the financial sector, financial processes and phenomena manifest specific financial system .

It seeks, therefore, a more general reference to economic relations and processes taking place in connection with "the interaction between supply and demand for financial services, and, looking deeper financial services, as set of "interrelations that occurs between demand and supply capital for establishing various economic entities".

In this sense, that the concept delineation and analysis of its financial system, is important to study the demand for financial services, which comes not only from financial agents (banks, non-bank financial institutions, etc.), but also from non-financial agents, like for example households, firms and state.

The notion of financial system has also a broader sense and because of the kind expressed above, includes including running financial flows are interrelated with the development of real flows, but has also considered the development of other types flows, such as the information.

The concept of monetary system is part of the same area of analysis is most often defined as "a complex of institutions and arrangements that allow regulation of monetary circulation in a country through a set of legal rules emanating from the public authority and that all payment instruments and techniques." Monetary system refers mainly to the currency as legal tender and must specify its parity. Depending on the content of the monetary standard adopted were established, over time, several types of monetary systems namely monetary systems as standard with metal monetary standard monetary systems based on combined and monetary systems based on standard power purchase. Expression of all processes and phenomena referred to the financial system today is done through standard purchasing power, the currency issued, so the central bank of a state or union of States.

In the context of research concept definition and financial system, given the processes and phenomena to which it relates, is important to clarify that a significant part of these processes take place in the context of public authorities' involvement in economic and social government.

Of the many definitions of the notion of a common system emerges designating a set of components to achieve a group objective.

A system can have a relative character, in that it can be decomposed into subsystems and in turn can be regarded as a subsystem of a more complex system. In this respect, the economic system can be considered as belonging to macro system - social system. In turn, the financial system is a subsystem belonging to the economic system.

System concept can be applied to many areas of economic and social characteristics of each field that induces the system complexity.

The concept of system in a more close socio-economic, is designated a part of objective reality that can be identified processes, phenomena, concepts, objects or groups connected by a multitude of mutual relations, which have links with external environment and working to achieve established objectives.

Features economies today shows that the system is a mix of types of systems previously known and considered the theoretically "pure economic systems." However, giving it the character of economic system in the above sense, the economy appears as a integrated whole (in terms of fundamental) elements of economic links exist between interdependence and compatibility, which interact and influence each other.

In this respect, the financial system results in a subsystem consisting of components of economic substance expressed in cash, part of the (sub) economic systems that interact with its various structures.

Thus, the concept of financial system has, in turn, more accepted arising usually in differently oriented approaches to certain elements of it. Thus, we consider that any economic system that uses money and place processes and financial relationships include financial component, so the financial system.

In other words, a type of financial system emerges and works in any economy in which the expression of economic processes in cash (irrespective of their expression of specific instances of money - goods or money - a sign, or degree of development), being able to say that the financial system known today is "an integrated component of the economic system of advanced and industrialized society", that information and knowledge.

In the literature, how to define and address the financial system is to describe and explore ways in which various components (financial) system are interconnected and interact, both within the system (endogenous) and at the influences mutual various phenomena and processes external (exogenous).

Also appears important to distinguish clearly between those categories there are interconnections that determine, in fact, the possibility of grouping and regrouping them into the financial system.

In this approach, the financial system is structured as follows:

- as a system of economic relationships, in cash, which circulates financial resources;
- as a system of institutions with responsibilities in the organization of financial relations, development and execution of financial decisions;
- as a fund of funds, that is, distributed and used in various economic and financial structures;
- as a financial planning system, through which the leadership and, to some extent, regulate financial activity.

Briefly, the financial system and in the opinion of other authors regarded as a system of economic relations, financial funds, financial plans and institutions.

Therefore, the event brings together a wealth of financial systems specific elements, connected by a common essence and financial phenomena which have interdependent relationships. At the same time, the financial system is viewed as a whole, representing all economic relations in cash, resulting in the distribution of national income, manifested in the complex process of formation, distribution and use of funds and financial.

Financial system as a set of financial relationships is presented, in terms of its economic content, "as a set of financial relationships that manifest in the complex process of formation, distribution and use of funds to financial".

The system is defined in terms of two components namely character subsystem:

- public financial subsystem;
- private financial subsystem.

On the one hand, the emergence of financial relations system components leading to the development of financial relations established among the participants, the financial system is represented mainly by "the ways in which they

exchanged for cash resources," while "elements that facilitate this exchange (markets, institutions) play a secondary role".

On the other hand, the content of the financial system may be considered as a fundamental element of financial institutions, and operates in a specific economic and social field, signifying a different assessment from that set out above. Core financial system, in this respect is the existence and functioning of financial markets and a socio-economic area, by performing specific functions.

The approach focuses on participation (institutions) for solving problems of financial economics. Initially, they are grouped in institutions that are part of representative democracy, the authority is administrative or specialized organs of executive power or financial departments in companies and institutions, as appropriate.

From another perspective, the demarcation of the financial system based on their financial institutions operate in a certain economic and social context, is studied based on the existence of specific tasks financial institutions and markets in the economy. Conforms to it, "financial institutions and financial markets are combined in a network forming the financial system".

If the early stages of a financial, real processes are considered the economic development, however, in the current, and financial transactions occur as part of it, and this is also achieved without inter-transactions in natural form and material (goods and / or services). What we have here an approach might subscribe treat the financial system as financial relationships.

In this first variant of the financial system shows two components:

- market (financial);
- financial institutions (financial intermediaries).

In the design of other authors, indicating a second variant of the institutional approach, are considered three components of the financial system:

- financial instruments, defined as claims arising from the change in resources among participants;
- financial markets-areas or mechanisms through which financial instruments are traded;
- financial institutions that issue and negotiate financial securities, facilitating the

transfer of resources between market participants.

Financial institutions in the context above, are those entities that issue and use financial instruments, making important financial system definition.

The role of the financial system is necessary to provide mechanisms through which financial funds can be transferred between companies with surplus and those who want to borrow (firms with deficit).

As parts of the financial system, we believe that its elements are important in function and the role they perform in the economy. Thus, an essential function of the system resulting from the use of complex financial instruments lies in their ability to facilitate transfer of resources (transfer value) in the economic system. Financial market functions is essential to establish, through negotiation, the value of financial instruments and trading them. Financial institutions in the context of belonging to the financial system, and stands as financial intermediaries, whose function is to supply bodies lack the resources obtained from entities account surplus. The role of entities referred to above, taken within the system may be considered to be distribution and redistribution of resources (financial) due to event specific distribution function finances and financial system amid transactions that involve the use of money and hence transfer gain value.

The financial system performs in our opinion, and finance specific functions such as distribution function, control and regulation - stability.

Expression of the financial system functions would fall more in the context of defining the functions which it can fulfill in the economy and not the delimitation of the concept of system. Presentation of financial system functions is, however, necessary to express its purpose, namely the ability to lead the implementation of processes that may not manifest in the absence of the class considered optimal.

Content and significance of the financial system may be described in terms of financing arrangements and the economy, and from this angle, the literature distinguishes financial system based on capital market operations based on operation at banks. Content and its characteristics are expressed in this case with

reference to the manner of carrying out the operations through banks or the capital market.

The literature defines and interprets the concept of financial system analysis based on the following issues:

- institutional analysis;
- analysis in terms of "financial intermediary";
- functional analysis;
- systemic analysis.

Institutional analysis focuses on the creation and functioning financial institutions - such as existing bank central bank, commercial banks, insurance companies, stock exchanges, investment and pension funds, etc.. This involves structuring and analytical description of the financial institutions that form, effective financial system.

Mainly, the analysis in terms of financial intermediation is the role of the financial system intermediation, transformation (maturity) and transfer of capital to cover different needs of participants in economic and financial activity. Financial intermediation occurs when indirect finance as a solution to solve some inconveniences that may occur as a result of direct financing. This problem results from different preferences and needs against the need for placement and investment of money capital. Thus, companies with surplus capital funding wish to place smaller, short-term at low risk and the possibility to withdraw at any time, while those deficient (investors - the typical case of companies) want placing as high scale of capital investment, long term, to a high degree of risk.

A second problem is related to direct funding of moral hazard ("ex ante" and "ex post") that accurate information is the inability of those who saved resources and effective monitoring of the use of capital transferred to investors. The result is that lenders will waive the transfer of capital available to investors or would require too high a cost of capital, which the latter are not willing to pay.

Functional analysis can be considered as a complement to institutional analysis in that the latter does not deal with structural changes and the causes which produced them, but focuses mainly on identifying the specific functions of financial institutions "seeks to identify the most appropriate structure for the manifestation of these functions at some point in time and space ". The focus is therefore on the functions performed by various

components of the financial system and ways of achieving them. The functional analysis, these functions are considered "anchors" and "known" system and institutional structure of each system and structural changes would require some restructuring. In this case "institutional structure" includes financial institutions, financial markets, production, service, organization operations, regulation, including the book. Financial functions may occur in private, public (government) and households. Assessment may be, on the one hand, descriptive, for the purposes of structure analysis of existing financial systems, and on the other hand, dogmatic, that is to expose how the system should be structured.

Financial system is done through money transfer financial resources in time and space (between regions or sectors), which is the fundamental function of the financial system.

The financial system provides the mechanism necessary concentration of resources and also provides ways to control uncertainty and risk. In this sense, provides information about prices, useful decentralized decision processes and help in the control of information asymmetry.

Functional analysis is useful in presenting and analyzing the global financial system of a country. However, the approach is more stable to changes in time and space, compared with analysis of institutional structure.

Considering the recent guidelines on the impact of the financial system on sustainable development, whereby a high functionality of financial institutions leads to economic and social development in the functional analysis that institutional restructuring is needed, to meet the requirements for inclusion and technologies information in carrying out specific functions based on the use of data that can be delivered simultaneously by many financial institutions in order to achieve the system, primarily to achieve economic growth.

Systemic analysis is done through the interrelationships between system components is manifested finance and the impact of interdependencies on the system as a whole.

Thus, it is intended to structure the financial system integrated subsystems, analyzing the possibility of complementarity various subsystems within the whole. In this respect, complementarity may consider how the various components of the system enterprises induce or impact on others, such as the positive

effects resulting from the manifestation of the role of banks in one segment or another, or the global financial system, influence on finance companies, the financial policies of the enterprise application, effects of government policies on economic growth by applying fiscal policies - budget and monetary effects resulting from the event role of financial markets in relation to financial intermediaries at the cost of capital.

Depending on how the management and control of the economy and hence the financial flows, there are two economic systems which correspond to two possible types of financial systems, namely:

- market economy system, on the one hand;
- statist economic system, the command, led by plan provisions required to execute, on the other.

In another approach to the content of the financial system, consider a simple model economy consists of two sectors:

- business sector, producing goods and services,
- household sector, which provides resources on the first possession.

Sharing resources within the system is in its infancy, through barter. With the emergence of intermediaries universally accepted by the participants - money, the shortcomings of the first type of exchange disappear. In an economy that does not take into account the financial markets assume that cash flows are carried out in correspondence with real flows, the latter manifesting either as input streams - resources (capital, land, labor, etc.) or as streams output - transfer of goods and services.

Involve cash flows, on the one hand income (rents, interest, profits), and on the other hand, payments for real output streams.

In this type of economy where trade is done through money there, but the possibility of the large-scale savings and investment.

Financial system, that any economic system can be regarded as an information system, defined as a set of processes and means of collecting, processing and transmission of information necessary for the management of enterprises, institutions, ministries, etc.. In the present context, where money (currency unit), the instrument tends to transform the economic information - financial, it (information) is a component of value creation, along with matter and energy is reflected in the value of goods

and services. Information in general, and financial-monetary, in particular, is seen as a factor of production alongside labor, land and capital. Financial information is considered a means of economic and social knowledge, an important support for economic-financial decisions.

The accuracy of the information circulating through the financial system is in close interdependence with the quality of decisions at different levels of economic and social organization, of which the most relevant to meet the financial policy of the enterprise, the micro level, and policy financial, fiscal and monetary macroeconomic.

1.2. Addressed the financial system against financial environment of the enterprise

Taking into account the economic environment and the impact of financial decisions at the micro level "is a set of processes of creation, preservation and circulation of currency and other financial assets.

However, currency and other assets, are only one manifestation of which involve complex financial system, in fact, five distinct categories of components ".

These parts are in the literature:

- » payment instruments,
- » specialized financial institutions,
- » financial asset markets,
- » legal provisions,
- » control variables (interest rate, exchange rate, stock).

2. Conclusion

That the concept of financial system has multiple signifiers, and a possible definition that emerges in relation to the meanings addressed is "essentially set of components that show financial links between organic, which would impart a unitary system. Normally, incumbent financial system functions similar to those of finance, and in context, we can admit that it is meant to

mediate the transactions of payments in an economy, and its main role is to provide mechanisms to finance company .

In terms of structure elements, with the support of the literature different approaches, consider the following relevant financial system accepts:

a) system of financial relations - economic relations set in cash, often called financial, or financially - money that is circulating cash resources;

b) system of financial institutions - all the institutions participating in the organization of financial relations, the creation and distribution of funds and the organization, conduct and control of economic activities;

c) as a system of financial funds - general fund cash resources of an enterprise that is used in relation to certain destinations;

d) as a system of financing the economy - the financing of the economy, being found most often in the form of capital market financing, that the debt from banks;

e) as a financial and monetary flows, all flows that take place in the economy, micro and macro level, which is analyzed, usually in relation to conduct real flows, as part of the financial circuits.

New Approaches to Monetary Policy in the Context of Actual Financial Crisis

Stan Viorica

„Petre Andrei” University from Iasi

lu_vio@yahoo.com

Abstract

As a result of economic turmoil started in 2007, some questions have been risen whether monetary policy suffers radical changes or just rethinking the details of the basic monetary policy stance. Therefore, in this article, inter alia, we have analyzed the monetary policy relationship with the financial stability. In the context of actual crises, monetary policy should consider whether to rely on credit bubbles and to clean up after their explosion or to interfere and fight against financial fragility during both the financial boom and bust (Lean vs. Clean debate)

Keywords : monetary policy, financial crisis and instability, bubbles

JEL Classification: B26; E40

1. Introduction

After the high-tech bubble in 2001-2002, there has been a growing debate on how to integrate financial instability in monetary policy. The central bankers conventional wisdom of “cleaning up after the bubble bursts” defended an ex post integration, central banks intervening only during the burst. On the contrary, some academics preferred the ‘leaning the wind strategy’ approach promoting a policy intervention against financial fragility during both the financial boom and bust. This ‘cleaning up after the bubble bursts’ versus ‘leaning against the wind’ debate is re-examined in light of the current financial crisis that begun in August 2007.

The paper, using comparison methodology, introduces the “lean” versus “clean” debate and its implication on monetary policy (interest rate).

2. The debate “lean versus clean” in the context of actual financial crisis

Since the New Economy boom-bust in 2001-2002, the common wisdom among central bankers is the ‘clean after the bubble burst’ strategy: *‘the monetary authorities should deal with the financial instability that may result from a crash in asset prices if and when the latter occurs, but they should not adjust monetary policy pre-emptively in the boom phase’* (Bordo & Jeanne, 2002:4). This means that central bankers do not have to take directly into account financial instability such as asset boom-bust or credit boom, instead they should laissez-faire the bubble (Greenspan, 2002). The “clean after the bubbles burst” strategy calls for addressing indirectly financial instability, via the primary goal of inflation. Financial imbalances matter only if they impact on future inflation or output. This “clean after the bubble bursts” strategy has been developed in the academic field by Bernanke and Gertler (1999 ; 2001) and comforted by practitioners (Greenspan, 2002).

This common wisdom is criticised by promoters of the ‘*leaning against the wind*’ (LW) strategy defended by Cecchetti *et al.* (2000; 2002) but also at the Bank of International Settlements. They claim that the high-tech bubble and boom-bust should have been regulated via a more activist interest rate policy. A pre-emptive action “to prick” the bubble could have reduced the bust and so would have improved social welfare.

The financial crisis has challenged the standard “clean after the bubble bursts” strategy, calling for a re-examination of the “lean versus clean” dispute. Despite it concerned New Economy asset prices in 2001-2002, this controversy suits to the current crisis with the problem of toxic assets or houses prices. In the aftermath of the current financial crisis, does “clean after the

bubble bursts” consensus among central bankers still hold?

To answer this question we present the pros and cons for “Cleaning up after the bubble bursts ” strategy and the” Leaning against the wind” strategy.

3. The”clean after the bubbles burst strategy” : pros and cons

First cross argument is that bubbles are hard to detect: the central bank can not really determinate if a financial imbalance, like a bubble, is under way. Since by definition the bubble means a situation out of the fundamental value and results instead of animal spirit, there is no reason for irrational markets acting with ‘irrational exuberance’ to react to the rational action from the central bank.

Besides, because financial markets are not necessary inefficient, but can follow the Keynes’s animal spirit psychology, it is difficult to predict their reaction to an active monetary policy. The LW can do more harm than good, adding extra market volatility instead of reducing it (Papademos, 2004). Moreover, because of their herding behaviour, it is difficult to influence market participants, making the LW poorly efficient. Furthermore, due to financial markets complexity and their potential inefficiency, their reactions to large interest rate increase.

A second objection against leaning against bubbles is that raising interest rates may be very ineffective in restraining the bubble, because market participants expect such high rates of return from buying bubble-driven assets. The main feature of bubbles is departures from the behavior that is normally incorporated within models, and so the tools of monetary policy are unlikely to work normally in abnormal conditions.

A third objection is that there are many asset prices, and at any one time a bubble may be present in only a fraction of assets. Monetary policy actions are a very blunt instrument in such a case, as such actions would be likely to affect asset prices in general, rather than solely those in a bubble.

The fourth rejection of the LW strategy suggests that raising interest rates would cause a bubble to burst more severely, thus doing even more damage to the economy. This view was supported by historical

examples, such as the monetary tightening that occurred in 1928 and 1929 in the United States and 1989 in Japan, suggesting that raising interest rates may cause a bubble to burst more severely, thereby increasing the damage to the economy. Another way of saying this is that bubbles are departures from normal behavior, and it is unrealistic to expect that the usual tools of monetary policy will be effective in abnormal conditions.

Moreover, because of the transmission lags of the interest rate instrument, there is potentially a timing problem: the LW can affect too late the economy, being out of phase with the current situation: when rates increases affect the economy to fight the boom, the economy can already have turn to a burst. This implies that the LW is pro-cyclical for timing reasons.

On top of that, markets distorted reaction or overreaction to the stabilising policy cannot be ruled out, hence ”lean against the wind” efficiency is not warranted and it can even do more harm than good. Financial instability, like bubbles, can be only the symptom of an underlying more structural imbalances, suggesting that instability should be address through other more appropriate policy than interest rate policies like prudential regulation or supervision.

Another empirical argument is that the Greenspan doctrine, which was strongly supported by Federal Reserve officials, held great sway in the central banking world before the crisis. However, there were dissenting voices. For example, Mervyn King, the Governor of the Bank of England, did not advocate leaning against the wind but did suggest that, to prevent a buildup of financial imbalances, a central bank might extend the horizon over which inflation is brought back to target.

The main pros argument is that, by stabilising the financial cycles, this strategy is supposed to improve macroeconomic stability. The idea that asset imbalances are not identifiable is not specific to financial instability: it is also difficult to estimate potential output (output gap), the NAIRU or the natural or neutral real interest rate. Yet central banks produce forecasts from these variables and publish these variables misalignment state. So it does not seem totally impossible for asset prices. Moreover, ”the clean after the bubbles burst” claims to

be able to forecast the financial instability impact on inflation and output. So there are some reasons to expect them to assess financial instability itself.

4. The “clean after the bubbles burst strategy”: pros and cons

The ‘mop up’ after the bubble burst consists in using monetary policy to offset its negative impact on the economy. Methodologically speaking, it consists in acting *ex post*, not *ex ante*. The mop up is not supposed to create a bubble, since monetary policy easing is followed by a form of bubble in only one third of case, and because asset prices boom can happen when monetary conditions are not easy. This strategy is based on the efficient market hypothesis and the dichotomy between the real and financial economies. Hence, there is little or no chance that the bubble feeds into the real economy, meaning the boom and the bust are inoffensive. It is also based on historical studies claiming that bubbles do not influence the real economy since market crashes generally do not degenerate into financial instability (Mishkin, 2008).

The main cross argument contests identification problem. First, as an institution, the central bank is supposed to have more information than the markets and is supposed to be independent from the markets some should have information on them. The fact that the fundamental value cannot be judged precisely, so that the proper action is difficult to assess, does not mean that no action is possible. It simply implies that the precise action to implement is difficult to estimate, but the action direction seems to be identifiable (Issing, 2003:8). During the financial crisis, the exact magnitude of policy action was clearly difficult to determinate, but the direction was clear: stop the housing bubble (boom) and stop the credit crunch (burst). Hence it was not impossible to identify the housing bubble (Trichet 2009). Moreover the “clean after the bubble bursts” strategy rests upon the fundamental value theory that has been challenged by the current financial crisis.

The “clean after the bubble bursts” asymmetric nature is an incentive to moral hazard since it stresses that the central bank will help banks and financial actors, what

ever the price (Issing, 2009:14). Asymmetric policy also means inactive interest rate policy during the boom period, implying potentially too low interest rates, encouraging excessive risk taking so preparing the burst and threatening risk taking.

The mop up strategy is also perilous since it is not necessary fast working enough. Indeed the current financial crisis has suggested that it could be overwhelmed by the speed and magnitude of the financial crash, in particular because of the zero lower bound on nominal interest rate that constrains the extent of the mop up. The burst is actually non linear and can be brutal and deep, threatening the whole economy, making the mop up inefficient. Moreover, the mop up can lay the ground for the next bubble by setting interest rate too low (Issing, 2009:15). Besides, this address of the bubble bursting can relocate the bubble elsewhere, in another part of the financial system or the real economy, meaning that one imbalance is leading to another: ‘*So I do not think that mopping up is a doctrine than can be relied upon*’ (Tucker, 2008:7).

Furthermore, the inefficient interest rate policy stressed by the “clean after the bubble bursts” strategy during the boom works in both direction: if market participants do not react to rate increases during the boom because of optimism, there are reasons to think they won’t react to rate decreases during the mop up, because of pessimism. Market participants’ panic requires large rate decreases for the mop up, meaning that the 0% lower bound is quickly achieved. Yet, the idea that monetary is ‘too blunt a tool’ to deal with financial instability is now contested in light of the current crisis experience.

5. Conclusions

The global financial crisis of 2007-2009 was not only a tsunami that flattened the economy, but it has flattened the science of monetary policy, requiring a total rethink. Before the recent financial crisis, the common view, both in academia and in central banks was that achieving price and output stability would promote financial stability. This was supported by research which indicated that monetary policy which optimally stabilizes inflation and output is likely to stabilize asset prices, making asset-

price bubbles less likely. Indeed, central bank's success in stabilizing inflation and the decreased volatility of business cycle fluctuations, which became known as the Great Moderation, made policymakers complacent about the risks from financial disruptions. The benign economic environment leading up to 2007, however, surely did not protect the economy from financial instability. Indeed, it may have promoted it. The low volatility of both inflation and output fluctuations may have determined market participants into thinking there was less risk in the economic system than was really the case. Credit risk premiums fell to very low levels and underwriting standards for loans dropped considerably. Some recent theoretical research even suggests that benign economic environments may promote excessive risk taking and may actually make the financial system more fragile. In our opinion, although price and output stability are surely beneficial, the recent crisis indicates that a policy focus solely on these objectives may not be enough to produce good economic outcomes.

A lesson from this analysis is that policy makers and, especially, monetary policy makers will need tools to assess whether the credit bubble is developing. Research is being underway to find measures to signal that credit bubbles are likely to form. But even so there is a strong case for monetary policy to support the credit bubble rather than to order after the explosion bubbles. Using monetary policy to pursue objectives of financial stability is not an easy task, and research how to monitor credit conditions in order to take monetary policy decision to restrict the use of excessive ownership risk are based on correct information and have a high priority for future research.

The financial crisis of 2007-2009 although demonstrates demonstrates the role of nonlinearities in the macro economy when there is a financial disruption.

Many quantitative studies have also assumed that the shocks hitting the economy have a time-invariant Gaussian distribution, that is, a classical bell curve with symmetric and well-behaved tails. When there are significant financial disruptions, as we have seen in the recent crisis, the shocks hitting the economy may exhibit excess kurtosis,

that is, tail risk, because the probability of relatively large negative disturbances is higher than would be implied by a Gaussian distribution.

Finishing the Financial Audit Mission

Stănescu Niculina
Constantin Brâncoveanu University Pitesti
n.marcu@yahoo.com

Abstract

The purpose of the financial audit is to ensure the credibility of the financial statements presented to the shareholders, investors, send to the financial institutions and to the public but also to contribute to the good operating of the company.

Users needs for financial audit, review the historical financial statements, review of intermediar financial statements, procedures, have increased lately due to requests of regulators or as a result of shareholders interests to protect their business.

Only a quality financial audit, which assumes conformity with International Standards on Auditing, Ethic Code and valid national regulations, will achive the objectives and fulfill its purpose.

Key words: financial audit, audit report, auditor conclusions, recommendations, review financial statements

J.E.L Classification.: M4, M42

1. Introduction

In the narrow circumstances of the financial economical crisis, the companies need more than ever the services provided by the financial auditors.

The auditors can perform a lot of operations like verify financial transactions, results of the inventories, reevaluations, accounts and documents control, main financial-economical indicators analysis, interpretation of financial position, performance, forecast financial information, review financial statements. Their recommendations and conclusions may have significant impact in improving financial results.

Of all services provided by financial auditors, the audit remains the most complex,

with the most samples required, with most tests and applied procedures.

Regardless of the activity he performs, the auditor should ensure that he obtains sufficient appropriate audit evidence in order to support the conclusions presented in the report.

Economic entities may apply for financial mission or may be required to be audites under current regulations.

2. Performing a financial audit mission

In order to execute an audit mission, the auditors must complete several steps, from which visible for the audited company are: preparation and submission of the mission letter, planning the mission and send the audit planning, accounts and documents verifications, being part of the inventory teams, submission of the recomandations letters and the audit raport.

The auditors must built two files for each financial audit: current file and permanent file. The permanent file will be prepared at the begining of the mission and it will be updated along the way for a recurrent audit.

The current file must contain at least the tests provided in the „Quality Audit Guide”, which replaced the „Minimum audit requirements”. Beside this mandatory minimum tests, the auditors can attach other procedures, workcharts, checks.

Unlike the current file, the permanent file is not provided with minimum procedures, but only with recommendations about the information that must be collected: activity field, management of the society, organization, assets, etc.

Both files must be provided in any audit company Quality manual so there is a certain standard, a certain document organization, unique and appropriate procedures that are applied as well as documentation of every important aspects, decisions, additional applied procedures.

Inside the audit company, internal control must follow the quality of the performed audit missions, meaning that the policies and procedures from the quality manual exists and are applied by the audit teams. In order to respect this, inside the company must be respected for every mission International Standards on Auditing, Ethic Code regulations including ethics requirements (independency, confidentiality, professional behavior, objectivity and integrity), review of the audit file before and after the audit report is released, follow-up of the audit missions, solve the differences between team members.

A part with major importance in finalizing the financial audit mission is review the audit process, which involves:

- Evaluation of the teams professional opinions and conclusions made during the mission and how these are presented in the audit report
- Valutate the documents from the audit files in order to identify any aspects regarding non-conformity
- Valutate audit risk and semnification point to establish possible errors and their influences on financial situations, in order to define professional thinking, apply more procedures and resuce risks to an acceptable level

From the review notes must result a series of aspects like:

- All the procedures shown in the „Quality Audit Guide” are present
- Mission letter is in conformity with ISA 210
- Documents to certificate the independency (Independency statement and survey form)
- Audit plan exists
- Balance confirmations
- Audit risk assessment
- Respect the minimum number of hours according the HC CAFR no. 44/2005
- Conclusions presented by the auditor
- Verify that the continuity principle is respected
- Verify leasings and loans
- Document the previous auditor was consulted
- Signification point value is documented

- Check the mathematical calculations
- Document that the auditor was present at the inventory
- Verify the amortizations method and amortizations calculations are correct
- Verify bills cancellations / storno
- Define the provisions for risks and expenses
- Document communications with the government
- Develop the recommendation letters for the management
- Document client meetings
- Respect the workcharts patterns
- Verify tax calculations
- Affiliated parts situation
- Communicate with the internal auditor
- Verify how the internal control works
- Define the opinion based on the developed conclusions
- Sign and date all the documents

For those parts where, according to professional thinking, the financial auditor considers there are not enough probations, or fraud suspicions exists, he will extend the tests applying extra procedures.

The existence of the audit probations in the mission files is necessary both for support the opinion and for guarantee a quality financial audit. Maximum 60 days later after the audit mission was completed, the auditor must complete the audit files.

3.Preparing the recommendation letter and writing the audit report

The audit documents is auditors property and he alone can decide to show the client some workcharts or statements. The auditated company will receive recommendation letters from the auditor as well as the audit report.

A recommendation letter can contain elements like:

- If the company respects the laws, the accounting reglementations according Law No. 82/1991 republished with modifications and OMFP 3055/2009 which defines the approval of the Accounting Reglementations with the european guidelines, with its modifications or IRFSs (International Standards of Financial Statement)

- Internal audit is in conformity with the HC CAFR no. 88/2007 for Internal Audit Guidelines which states that the companies with yearly financial situations are audited according to the law or its shareholders option and must organize internal audit in a distinct department, inside the company, or if is company choice, an external audit based on a contract

- The evolution of the general inventory, presence of the documents (inventory decision, inventory charts, inventory minute), entries of the results in the accounting

- Appropriate/Non-appropriate organization of financial accounting, defined internal procedures supplying the needed information to ensure a good and quality management based on appropriate decisions

- Existence/non-existence of the internal control and how it works (efficient/non-efficient)

- Existence/non-existence of the accounting policies

- Financial books show/doesn't show in a good manner the entries based on necessary documents

- Financial reports were/weren't built by correctly transferring the account balance from 31.12

- Account Books and Inventory Book are/aren't up to date

- The company use/doesn't use a proper informatical system in accounting

- Exist/doesn't exist formalized procedures for compiling account books

- Professional training program for the personal inside financial department

No audit report will be dated or signed if declaration letter is not present and it shall not be issued if differences still exist between the auditor and the person that review the report.

Preparing of the audit report must be according ISA 700, ISA 705, ISA 706, depending on the case when we discuss about an unmodified audit report, report with a matter paragraph, observations paragraph or according ISRE 2400 when the auditor makes a review of the historical financial situations, ISRE 2410 when he makes a review of the intermediary financial situation, ISAE 3400 when he makes an assurance

mission like checking the prospective financial information ISRS 4400 when he performs an agreed procedure (financial audit on a EU financed project). It is not accepted a different format than the one imposed by the standard with minimum mandatory paragraphs.

4. Conclusions

The role of the financial auditors became more and more known inside the companies. The shareholders require an audit when suspicions exist, when they are taking over the company, when they purchase something or when they want to know the real status of the company. In the same time the auditors are called to explain in the General Shareholders Meeting their conclusions, the financial status of the company, his opinion on the company and they are asked about the recommendations and about the solutions they proposed.

In these times, the auditors only have one solution: to perform a quality financial audit both for customer retention as well for avoiding the problems that may occur after the audit and for which problems the auditor must answer according to the documentation he made, tests applied, procedures and opinion he formulated.

I consider that in Romania the purpose of the audit is more and more useful and growing as well as the market due to the understanding of the importance of the audit in a company, the need to have a very well trained person but more important an independent person.

Going out of the economical crisis will add value to the financial audit which in the crisis period was improved and will increase the number of the audit departments inside the companies.

The Place of Sustainable Development in the Financial Reporting of Large Romanian Companies

Stănilă Georgiana Oana
Popa Adriana Florina
Ispas Simona

Academy of Economic Studies, Bucharest, Romania

gostanila@gmail.com

adriana.fp@gmail.com

simonaispas@ymail.com

Abstract

How can we reconcile economic and social progress without endangering the natural balance of the planet? How can we spread the wealth between developed and less developed ones? How to ensure a decent living for millions of people in danger, where the planet already seems stifled by excessive exploitation of natural resources? To answer these questions was born the concept of sustainable development (www.mmediu.ro). More efficient use of resources in order to reduce the economic costs and environmental impact provides benefits to society, environment and economy. In what follows, based on this concept appealing both basic research and applied research, which consisted in testing several hypotheses based on a questionnaire. We intend to establish to what extent it is assimilated by the Romanian economic entities to determine the importance given and to highlight practical ways in which companies meet the objective of sustainable development.

Keywords: sustainable development, social responsibility, environment, environmental reports, financial reports, accounting environment.

Clasificare J.E.L.:G20, Q01, Q56

1. Introduction

The concept of **sustainable development** means that all forms and methods of socio-economic development whose foundation are providing socio-economic balance between

systems and potential natural (<http://ro.wikipedia.org/wiki/>).

The best-known definition of sustainable development is the date of the world for the Environment and Development (WCEF) in the report "*our shared future*", known under the name of "*The Bruntland report*". "Sustainable development is development which seeks needs, without compromising possibilities future generations to meet their own needs."

The key challenge of sustainable development is the opposition between the needs of the population growth and limits imposed by planet resources and environmental degradation process. During the summit in Rio in 1992, at which attended 120 heads of state, have been brought back to the center of attention, problems on the Environment and Development. On this occasion, sustainable development was defined as: "*a new path of development to support human progress for the whole world and for a long future*". The stated aim of the conference century was setting a new strategy of economic development, industrial and social world, covered under the name of sustainable development "*sustainable development*" (<http://www.un.org/geninfo/bp/enviro.html>).

In this process, there have been taken into account international conventions in which were established obligations precise from states and deadlines of strict implementation on climate change, conservation of biodiversity, protecting forestry and wetlands, limiting use of certain chemicals, access to information on the state environmental protection, and others, which

covers a juridical space international for implementation of sustainable development.

The concept of **sustainable development** is that human civilization has the premise that it is a subsystem of ecosphere, dependent on flows of material and energy within it, the stability and its capacity of self-adjustment. Public policies that are drawn up on this basis, such as this National strategy for Sustainable Development of Romania, aimed at restoring and maintaining a balance rationally, long-term between economic development and integrity of natural environment in forms understood and accepted by society (the National Strategy for sustainable development of Romania, doors 2013-2020-2030, www.euractiv.ro/uniunea-European/articles/).

2. Sustainable development-past, present and future

The sustainable development has become a political objective of the European Union from the year 1997, through its inclusion in the Treaty of Maastricht. In 2001, the European Council in Gothenburg adopted the strategy of sustainable development of the European Union, to which it has been added a dimension abroad at Barcelona in 2002.

In 2005, the European Commission has started a process of Revision of Strategy and published in February, a critical evaluation of progress after 2001, which points a series of guidelines for action to be followed and to continue. The document revealed some trends nonsustainable, with adverse effects on environment, which could affect future development of the European Union, i.e. climate change, threats to public health, poverty and social exclusion, depletion of natural resources and biodiversity erosion. As a result of identifying these issues, in June 2005, heads of state and governments of countries of the European Union adopted a declaration on the guidelines of sustainable development, which incorporates Lisbon agenda, reviewed the economic growth and created new jobs as an essential component of the sustainable development's objective. After wide consultation, the European Commission presented on 13th of December 2005, a proposal for a review of strategy at Gothenburg in 2001.

As a result of the process, the EU Council adopted on 9th of June 2006, the renewed Strategy for the sustainable development, for an extended Europe. The document is designed in a strategic vision and consistency unit, with the **overall objective** of continuing improvement in the quality of life for present and future generations by creating sustainable communities, able to handle and use resources efficiently and to use the potential for environmental innovation and social economy in order to ensure prosperity, environmental protection and social cohesion.

3. The national strategy for sustainable development of Romania

The UE strategy for Sustainable Development, which represents the fundament of Romania's National Strategy in this field, completes Lisbon Strategy and wants to be a catalyst for those who develop public policy and the public opinion, in order to change behavior in European and Romanian society also, and to actively involve the decisional factors, private and public in society and citizens in the development, implementation and monitoring of the objectives of sustainable development.

The responsibility to implement the Strategy pertains to European Union and its Member States, involving all the institutional components at Community level and national levels. It is underlined the importance of close collaboration with civil society, the social partners, local communities and citizens to achieve the objectives of sustainable development (National Strategy for Sustainable Development of Romania, Horizons 2013-2020-2030, www.euractiv.ro/uniunea-European/articles/).

Four key objectives that are underlying this strategy are:

-Environmental protection, through measures to enable dissociation of economic growth and its negative environmental impacts,

-Fairness and social cohesion, through respecting fundamental rights, cultural diversity, equality of chances and the fight against discrimination of any kind,

-Economic prosperity by promoting knowledge and innovation and

competitiveness to ensure certain standards of living high and some abundant and well-paid jobs,

-Accomplishing the international responsibilities of the EU by promoting democratic institutions to serve peace, security and freedom, the principles and practices of sustainable development throughout the world.

4. Environment reporting in the economic entities in Romania

For Romania, as a Member State of the European Union, the sustainable development is not one of the options, but only rational perspective of having as result implementation of new development paradigms through the confluence of economic, social and environment factors.

In the current context of globalization, sustainable development and competitiveness, companies are getting more valued considering not only the economic achievements, quality management and political communication, but also considering the contribution made by the social life of community they belong.

A complete reporting must comprise the spectrum of values on which an organization must adopt –from economically, environmentally and social point of view. In practical terms, accounts must expand its traditional reporting framework so as to take into account not only financial results, but also the company's environment. In financial reports should be found information on elements of reporting environmental, social and economic; a coherent vision on sustainable development; the main challenges of sustainable development from the point of view of the company; the clear strategy for sustainable development of the company; information and data environmental, social and economic presented in a coherent manner (Şendroi C., Roman C., 2006).

At the end of 80's, there were only a few companies in the world which issued reports about environment. At the beginning of the XXth century, were about 2000 such companies, their number growing in time. This is in large part due to the appearance of some models of environment reports.

Taking into account that the problems of environment have significant impact on certain areas of interest, such as:

Accounting for management, through:

-evaluating investments, judging by costs and benefits of environment,

-incorporating the new costs, the increase in capital and other information in budgets and business plans,

-conduct cost analysis/benefit on environmental improvements.

Financial accounting, through:

-the effects of costs arising from cleaning space, waste treatment and removal, on profit and loss,

-measure the impact on the balance sheet, in particular of debt, valuation reserves and assets' evaluation;

-effect of environmental aspects and potential debt over the business relations with the financial creditors and shareholders majority;

-performance evaluation of the environment in the annual reports.

Projects accounting:

-the audit of environmental factors in the case of acquisitions, mergers and other matters of planning,

-evaluating investments.

Internal audit, meaning environmental audit:

Informatics accounting systems, through its effects and their changes required to financial and managerial informatics systems.

Environmental accounting

In order to describe this field, we start by identifying the main approached aspects, meaning:

-recognition and search for ways to remove any negative effects of conventional accounting practices over the environment,

-separately identification of income and expenses related to environment matters in the accounting systems;

-developing new accounting informatics systems financial and non-financial and also of control systems with the aim of encouraging managerial decisions related to environment;

-the development of new forms of reporting and appreciation of how to measure the performance both for internal and external purposes;

-identification, examination and search for situations in which the criteria for environmental and financial ones are in conflict,

-experimenting ways in which sustainability can be assessed and incorporated into the organizational order.

The environment agenda is in continue change, the enterprise being forced to monitor carefully the situation.

The ways of codification of enterprises' attitude towards the environment are often the result of a politic and environment document, which can be adopted at internal level or through a general standard approved. Through the followed problems, there can be named: biosphere protection, natural resources sustainability, waste removal and reduction, rational utilization of energy, risk reduction, promoting secure products and services, damage compensation, information offer, managers' and directors' involvement regarding the environment matters, evaluation, annually audit, etc. There is often the fear that the commitments required to the companies could be too large and with severe effects over the indebtment.

Environmental audit

The audit covers a large scale of domains and it involves the performance of the realized tests. The goal of this activity has to be determined, depending on the type of company.

Financial reporting

There are disclosure requirements imposed by international standards in environmental issues. Thus, any presentation tends to be voluntary, if environmental issues are not covered by accounting principles required by international standards. In most cases, the information is descriptive and unskilled, with no sufficient motivation to produce environmental information. In most cases occur for reasons such as the secrecy of the company. The main factor seems to be apathy that demonstrates the company, especially shareholders and investors. If information is not required, nor is it offered.

Environmental issues can be reported to the company accounts for contingent liabilities, extraordinary costs, comments on the financial and operating situation, the estimates of investment income and expenses.

One more step in this endeavor to achieve the goal of complete reporting was done by placing the operating costs of new categories of "environmental costs" (OMPF 3055/2009 for the approval of the accounts in accordance with European directives). It offers the opportunity for entities to keep track of environmental costs separately for a better tracking and control them, but for better information.

The limits of the company's management

A company provides goods and services to customers and has employees. It is an integral part of society and is subject to the pressures. Many companies have similar objectives regarding:

- looking for a good public image;
- environmental protection against pollution and waste of non-renewable resources;
- provision of welfare facilities or local community through sponsorships, donations to charity;
- adoption of a good wage policy.

There are different views on the extent to which external pressure changes and generates business objectives limits the exercise of management discretion.

Shareholders concerning business objectives by the fact that there are several interest groups: commercial lenders, managers, employees and customers. A business depends on relations between these groups, otherwise its operation would be questioned. Each group has its own objectives, which requires the emergence of a compromise. Management must balance the objective of obtaining profit pressures from these groups in establishing strategic business plans.

There are views that consider that managers run the company, but does not hold, and the targets are actually of interest. Therefore, not all targets are selected and controlled by management.

5. Investigation on the place of sustainable development and environmental reporting within the company

The aim of our approach was so determine to what extent they took big Romanian companies and understand the concept of "sustainable development" and to identify

sustainable development given the site's activity and reports made by it.

We followed the analysis made in response to the following questions to find:

1. The company has published information on sustainable development?
2. Information on sustainable development are presented separately?
3. It used the concept of corporate social responsibility?
4. What concrete measures for environmental protection were adopted?

We started with the view that "an entity that neglects the natural environment is penalized by investors" (Jianu I., 2006). Therefore, the financial reasons are the basis for strategies regarding the environment protection by the entities of any size and any sector. It speaks more about the need for "green accounting", which aims at presenting information about the natural environment in the financial statements, and presenting a specific report on the natural environment protection policy.

We chose as subjects for analysis to companies listed on the Bucharest Stock Exchange listing tier. Of the 21 such companies have eliminated the credit companies and financial brokerage companies, the number 9 on the grounds that environmental impact is negligible. The choice criterion for selecting companies were due to research conducted by us our opinion that sustainable development involves financial costs too large to be accepted by all classes of society. The complexity of activities, interest costs and to attract new investors and to preserve those old narrow the scope of companies "willing" to contribute to sustainable development.

Depending on the scope of the companies analyzed can be grouped depending on the field of activities: Pharmaceutical Industry (2 companies), Aluminum Production (1 companie), Production of fertilizers (1 companie), Electricity generating industry(1 companie), Exploitation of natural gas (1 companie), Chemical and petrochemical industry(2 companies), Handling of petroleum, petroleum products, petrochemicals, liquid chemicals and other finished products (1 companie), Port Operator (1 companie), Development (Promotion) Real estate (1 companie) and Manufacturer of subansable

components and aircraft industry (1 companie).

The analysis has reached the following conclusions:

The vast majority of companies analyzed (10) publish information related to sustainable development. In the following we will refer only to them.

Equally, in 50% of cases are part of the information published annual report, while 50% of companies granted a separate section on the website.

In general, the information published in connection with sustainable development refers to the environmental component. Three of the analyzed companies apply a policy of corporate social responsibility as an integral part of sustainable development, having allocated a separate chapter on its own website. In their case, corporate social responsibility for involving society in areas such as arts and culture, education, health, humanitarian, social development actions and community. The active contribution of the policy recognizes the company's growth long term. In the case of two companies, they have integrated quality management systems and environmental management, occupational safety and health.

An interlocking concrete measures taken by companies for environmental analysis led us to the next result:

- environmental programs and the quality of air and soil (specialized laboratories to control water pollution levels, air and soil);
- studies of environmental management and waste management;
- projects and investments undertaken for improving water treatment resulting from technological processes, storage, recycling, incineration, controlled disposal of hazardous wastes;
- water treatment plants since the beginning through advanced;
- the existence of selective waste collection points, including paper and cardboard;
- monitor the impact on the environment through wastewater analysis and semi-monthly for air emissions, including noise periuizinal;
- monitoring of soil, groundwater and wastewater.
- monitoring the level of risk of oil products and facilities to the environment by emissions of fumes or accidental loss;

- inspection of technical condition of transport capacity and safety of wastewater facilities;

- developing new materials and technologies for sustainable development in energy and maintenance;

- maintenance / repairs to the internal network and drill drainage and water distribution network, filter elements etc.

- projects, piping studies, their crossing of the underground above ground; initiatives in exploration and production operations (new energy monitoring system, replacing boilers with significant impact on energy efficiency and emissions of greenhouse gases, development of cogeneration facilities and energy use of gas can not be marketed);

- refining operations initiatives;

- prevention of leaks and waste management (well modernization program);

- energy efficiency;

- staffing for maintenance and operation of specific stations;

- education of the production team to develop enthusiasm and knowledge about the environment;

- publishing regular information distributed to all employees;

- financial support for partnerships with NGOs, schools or public institutions for environmental protection projects and development of green spaces;

Supporting projects initiated by local ecology.

6. Conclusions

From the research conducted, we conclude that the first steps towards awareness of sustainable development are taken by most large companies.

A consistent principle of applying a management company responsible in fulfilling obligations, acknowledges the importance that, sometimes, financial support for a worthy cause or an important goal, is vital and that the social responsibility programs and projects initiated and is actively involved in community life, thus demonstrating their status as "good citizen". We cannot speak about the existence of a proper green accounting or a clear delineation of the costs of applying sustainable development policy.

Part of the strategy of sustainable development, **corporate social responsibility** policy is to continuously increase the degree of accountability to the company's employees, shareholders, partners, community and environmental impact and efficiency programs as "*Triple P - Profit, People, Planet*" initiated for this purpose.

A true environmental culture comes from within the company. But, as everybody really learning and passion in action, a successful policy requires **staff involvement in all environmental programs and improving environmental performance indicators**.

On the whole national economy, the concept of sustainable development will remain, at least for the next few years, only one concept. The practice of selecting waste, reduce energy consumption, water, informing citizens about the measures to be taken to preserve the environment are just some ideas that should always be taken into account in implementing projects that provide for achieving the principle of regional convergence. Sustainable development is the notion that must always be considered the creation of any project, despite the additional costs involved.

Acknowledging the need for environmental awareness in all actions done by private actors or public is the first step in achieving sustainability in all areas. The solution is **to think and act fully aware of our responsibilities on long term in economic, social and environmental domains**.

Tax and Accounting Issues in Supply Chain

Mihaela Stet
Western University “Vasile Goldis” of Arad,
Faculty of Economics
miha9s@yahoo.com

Abstract

The investigation field of the paper covers two distinct areas, namely, the area of accounting research and the taxation field, focusing mainly on issues at the intersection of two research areas, customized to the supply chain. The study reveals some specific tax and accounting aspects for logistics companies. It highlights also the impact caused by the various tax measures on the cost of distribution logistics, assessment of the fiscal effect of various rules, proper tax management being able to optimize the tax position and allowing economic entities to find potential opportunities to reduce corporate tax exposure in the supply chain.

Key words: accounting, taxation, logistics, supply chain.

J.E.L. classification: H21, H25, L81, M41

1. Introduction

The aim of this study is to analyze the relation between accounting and taxation for the activities in supply chain. The paper reveals also the impact caused by the various tax measures on the cost of distribution logistics. Besides the operational costs that needs to be optimized by the actions of supply chain management, it can be identified a series of other costs generated by different taxes and fees.

The large number of situations in which the business decisions are influenced by fiscal regulations requires a demarcation of fiscal management as a separate component in the activity of companies in logistics channel. The paper give indications about how economic entities from logistics field can use some tax provisions in their favor, thus trying to achieve a reduction in spending on certain categories of taxes. The level of

connection between accounting and taxation is considered one of the key factors in the study of differences in the international accounting. In countries where taxation has an impact on the accounting, through financial statements, companies try to benefit from tax advantages, often to the detriment of the economic reality.

Fiscal effectiveness of the business can be achieved both directly and indirectly. Directly, it can be achieved by it can be done through legal regulations that includes support measures or tax incentive. Indirectly, this is possible while the system of taxes and contributions provides a range of options for the taxpayer. From the point of view of the companies, the practice has proved the best fiscal solution is that it takes into account the objectives and strategies of business.

This study was conducted using qualitative methods, achieving a qualitative analysis of the relationship between accounting and taxation, based on information collected from various categories of logistics companies. The research was an exploratory nature, using interviews as a form of investigation. The scientific approach combined the descriptive perspective - with the empirical concept, using a wide range of research methods: external observation, document analysis, comparative method.

2. Literature review

Although in recent years, supply chain management has attracted the interest of a large number of specialists, the number of studies related to the accounting in supply chain is not very high [4], [14], [6]. There have not been, also, many concerns to address the specific fiscal features in supply chain. The fewer are the studies concerning the relationship between accounting and taxation in the supply chain.

In a study conducted in 2006, Bremmers

[1] introduces three principles for accounting in supply chains: the reciprocity in information access, retrieval and asset investment, and matching Risks and returns, with the aim to provide guidance in managerial and stakeholder decision making, monitoring and control.

Using a combination of analytical and computational techniques Shunk and Gavirneni [13] show that randomness in a supply chain magnifies the impact of transfer prices. Only few studies deal with the impact of fiscal policies on total logistics costs in the distribution of goods [10], [11].

Several studies deals with the relationship between accounting and taxation, analyzing the accounting and tax systems and their influence on different types of companies [2], [3], [5], [7], [8], [9], [12].

3. Impact of taxation in supply chain

The expansion of globalization over the last years has given rise to changes in supply chain structure. A number of companies have expanded their market areas which it operates, increasing international transactions both in supply and distribution. Supply chains are setting up locations in all parts of the world. This has as result different local taxes in each of the countries where there are set up premises. International shipments, crossing multiple borders lead to some additional costs like customs and other taxes that are not used for domestic supply chains.

The export of products, the low-cost country sourcing and the trend of outsourcing certain activities, raise both operational as well as financial problems. As a result, besides the operational issues raised by logistical channel should be considered also the connections between supply chain management, accounting, international taxation and corporate finance.

Logistics network design involves selecting the most appropriate locations for distribution centers. In a vertically integrated structure of the logistics channel or for multinational firms, fiscal optimization may be given by the design of logistic channel regarding the choice of suppliers, manufacturing locations, warehouses, logistics platforms as well as transport routes, transit through certain countries, in a

combination that provides the lowest tax costs.

Decisions on design of supply chain and planning activities in logistics channel need to be based not only on operational considerations, but also on fiscal aspects, in order to protect the profit against excessive taxation in certain regions. Tax issues affect decisions about facility location. It is therefore necessary to find the countries, locations with low levels of taxation and minimize revenue and operations in countries with high levels of taxation. For example, in some countries of the EU profit tax is lower or there are practiced strong incentives for certain categories of companies.

Tax effectiveness of supply chain is about seeking solutions leading to record the lowest tax cost, including by using all facilities provided by the tax laws. Optimization of supply chain could be realized through differences in tax rates between country of parent company and the countries of subsidiaries, improving the after-tax profit (net profit).

The design of supply chain could be influenced by tax rebates or subsidized financing opportunities offered by some countries to attract investments, foreign capital. Companies can benefit also from postponement and avoidance of payment of indirect taxes by using foreign trade areas. Opportunities offered by free trade agreements or trade facilitating procedures are also means for supply chain optimization.

To avoid double taxation, fiscal laws of different countries allow companies to claim credit for foreign taxes paid or incurred by a subsidiary or a branch operating in other countries.

The customs and the VAT frameworks are very important. For goods imported the base for customs duties is the customs value of imported goods. At the customs value, to the extent that they were made but were not included in the price of goods, there can be included: international transportation costs to border, loading, unloading and handling expenses, transport related, and insurance cost for external route. In the European Union by removing customs barriers between member states, the distribution patterns could be changed, given that no longer required distribution centers in each country.

VAT is an indirect tax based on deductibility criteria, a tax that charges the final consumer and it affects only in certain situations the profitability. Obtaining tax benefits appears in the area of deductibility, and in terms of payment.

Besides customs duties and VAT, however, participants in the channel of distribution of goods are required and to pay other tax liabilities such as tax on profit, property taxes, contributions of wages, environmental taxes, etc..

In terms of labor costs it can be point out also some differences between European countries, in Eastern European countries labor costs being significantly lower than in Western countries.

In the field of excise duties, at the EU level it can be revealed also the existence of different treatments.

Regarding the acquisition of the land for development of logistics platforms, its cost includes a number of specific costs associated with the procurement process, such as taxes and fees.

Warehousing involves tangible costs associated storage facilities and a number of expenses for inventories management. Buildings incorporate in their cost, besides the purchasing price, the costs of repairs and costs of putting them into operation. For tax purposes, storage areas are subject to specific tax, depending on area and value of buildings.

In the case of a vertically integrated logistics company it will not have to pay VAT on each transaction. For tax purposes it will not have to support the cascading effect throughout the supply chain, the final price the consumer can be, therefore, lower.

In what it concerns the tax on profit, generally, operating expenses are deductible expenses in its determination. In the activity of companies in supply chain it can be identified some types of expenses that have limited deductibility or are not deductible for tax on profit. Limited deductibility of these costs reduces profitability of the activities in logistics channel.

4. Interactions of accounting and taxation in supply chain

Tax implications of equity accounting, are generated by initial capital contributions

and by their subsequent increases. Relative to firm constitution and increase the share capital by issuing actions, the tax consequences of this operation is materialized in the form of taxes to be paid.

Another group of components of equity, reserves established by different methods, know different tax implications depending on their type, that their method of constitution.

As regards the legal reserves, reserves formed by capitalizing profits, tax implications occur both from the constitution and their use.

The tax rules and the commercial, prohibit the increase of social capital from legal reserves. According Romanian laws in the case of their use to cover losses or their distribution in any form, subsequent reconstruction is not deductible in calculation taxable profits.

Relative to the effects of reserves on the outcome, they can be found in the analysis of legal reserves or reserves representing fiscal incentives. In the case of use of the corresponding values to increase in capital or to cover losses, they will be taxed, adding to the value of the tax on profit due the interest and late payment penalties.

The other categories of reserves, set up on net profit, have no influence on the determination of taxable income. Their use for capital increase will not generate dividends, unless it is done through the distribution of new units, changing thus the percentage of ownership of securities to participants.

In what it concerns the tax consequences of the revaluation of assets it can be identified in terms of tax two situations: revaluation of fixed assets for that is allowed tax depreciation and revaluation for tangible assets that are not subject for amortization.

In the first case, accounting revaluations are taken into account in determination of tax depreciation of revalued assets, but the value of the reduction or subsequent cancellation of reserves that were previously deducted due to the change of their use or their distribution to participants, will be imposed on that moment.

For the second category of assets, given that revaluation reserves are not deducted through amortization, these have no influence on taxable profit.

In addition, in case of sale, in the fiscal deducted value of the asset is included also

the revaluation value, but in the case of the change of reserve use this will be taxed on its turn.

An important source of financing economic entities is the long-term loans. The elements that influence funding decisions lies also tax issues, due to the influence they can have on resource costs and their incidence on taxable profit.

In most of the logistics companies surveyed are preferred rental or leasing contracts as the procurement over its own resources to the detriment of purchases of own resources or bank loans. Selection of method of financing is influenced by several variables, among which it can be revealed as critical the resource costs. Loan capital costs are determined not only by the interest rates for different forms of loans, but also by the tax rate, which can reduce these costs in proportion to the deductibility of these expenses. Taxation, through its direct and indirect influence on these costs, thus becomes one of the factors of influence that has a significant position in the financing, given the impact they have on funding decisions on taxable income.

In the case of the leasing contracts the impact of the cost is determined by the applicable amortization rules, tax rules that may limit the deductibility of interest or other expenses, and tax systems of lease, according to territoriality of transaction.

Leases are subject to the tax laws on tax on profit, VAT and customs duties. In the case finance lease the lessee is treated in terms of taxation as the owner, recording depreciation and interest expense, deductible for tax on profit. For operating leases the financier has the status of owner, user recording rent expense.

As regards the evaluation of the input of assets, tax implications are related to the options to include or not certain expenses, such as, for example, professional fees. Including them in the input value, can create negative effects on the entity's management, especially for non-depreciable assets for which recovery of these costs will not be achieved during use. Moreover, the increase of the assets value through their incorporation will lead to an increase in the tax charged on the asset, as is the case of land

Romanian regulations recognize as part of the asset the investments made in tangible

assets that have the effect of improvement of their original techniques and leading to future economic benefits, in addition to those originally estimated, as subsequent expenditures. This is the case of modernization expenses recognized as investment. All other expenses subsequent incurred to keep performance are recognized as expenses in the period, falling in this category the repair or maintenance expenses of tangible assets.

Selection of a method of amortization supposes an accounting option, a matter of judgment in setting accounting politics, according to business objectives and the approach of tax administration. The selected amortization method should reflect as fairly as the probable future rate of use of the asset by the economic entity, to match the consumption of economic benefits and not the general practices for certain categories of assets.

Tax benefits that are generated by the depreciation policy adopted by the enterprise, can improve the predictable return on investment in fixed assets. Option for a depreciation system, in the same financing conditions has a different effect on profitability of different investments.

Most of the surveyed companies use the straight-line method of amortization, but depreciation rates differ significantly from one sector to another. Use of degressive and accelerated methods presents the delay advantage of the tax burden. In times of inflation, this advantage is doubled by the payment in a depreciated currency.

The most significant and obvious fiscal implications can be identified at the assessment of stock outputs. In an inflationary economy, while the prices are growing, LIFO is considered the optimal method of evaluation in terms of results: it evaluates the maximum consumption value, the accounting result is presented at minimum values and the final stock value is minimal. From the taxation point of view, as the expenditures related to inventories are higher, the profit and the tax on profit are lower.

High levels of stocks determine, on the one hand, high costs of holding inventories, such as storage costs, property insurance, related taxes and, on the other hand,

immobilization of capital which may involve financial costs, but also a cost of opportunity.

5. Conclusions

The study reveals some specific tax and accounting aspects for logistics companies, which, besides the operational logistics requirements, need to be compliant to various tax and accounting legislations along the international supply chain. Organization, structure and specific supply chain management activities have evolved in recent years. In the meantime, as general rule, accounting systems have not evolved very much. It cannot be said that always accounting reflects very accurately the processes and transactions that take place in the logistics channel, both in centralized networks, as well as decentralized logistics networks.

On the other side, assessment of the fiscal impact of various rules and the adequate taxation management could determine significant improvement both of cash flow and profit and can help to optimize the tax position, allowing economic entities to find potential opportunities to reduce corporate tax exposure in the supply chain.

Even if some countries provide some tax incentives and exemptions from duties and taxes, it should not be neglected in the analysis the operational logistics costs. In some cases the benefit of configuration of logistics network by locating production in countries with low production costs or tax advantages may be offset by higher logistics costs.

The Evolution of Non-Performing Credits in Romania

Tofănică Ramona-Ionela

„Alexandru Ioan-Cuza” University of Iași, Doctoral School of Economics
ramona_tofanica@yahoo.com

Abstract

This paper is an overview of the specialty literature as regards the non-performing credits, both globally and at the level of our country, expressing my own point of view concerning the evolution of this phenomenon. My paper shows that first of all it is necessary to make an analysis of provisions constituted in order to determine the bank's capacity to face the cases of non-payment followed by taking into consideration the impact on the profit and loss account in order to establish exactly the manner in which the credit institution will be affected by the deterioration of the assets' quality.

Keywords: non-performing loans, assets' quality, Romania

J.E.L. Classification: M41, G21

1. Introduction

The indices, such as the delayed payments of instalments and interests, the deterioration of the relationships with their business partners or with the personnel, the legal actions against the client show that the respective credit can become in a short period of time a non-performing credit.

In general, the credits are considered non-performing when the principal or the afferent interest is matured and it has not been paid for 90 days or more, and better said the non-performing character of a credit is manifested when there are no more chances of integral reimbursement and payment of the afferent interests and commissions.

2. The notion of non-performing credit and the causes that lead to its occurrence in the international and national practice

A credit is considered non-performing and the debtor in payment incapacity when the payment of the principal and of the interest is

in default for more than 90 days [1].

Another approach of the notion of non-performing credit makes the distinction between the credits given to the population (consumer), the commercial credits and leasing and any credit for which there are clear non-performance indices. A credit being considered non-performing differs from the three situations and namely: in the case of the consumer credit it is considered non-performing if it registers defaults at the principal and interest for at least 60 days, in the case of the commercial credit and leasing it is considered non-performing if it registers defaults at the principal and interest of at least 90 days, and any credit for which there are clear indices of non-performance [2].

In 15 states of Europe (taken as research model) there is no unitary approach of the notion of non-performing credit, it differs from one country to the other and takes into account the following criteria in order to define the concept: the number of default days in the case of credits and interests (in countries such as Romania, Bulgaria, Cyprus, Greece Macedonia, Serbia, Hungary, Poland, Czech Republic, Ukraine, Latvia, Austria is considered non-performing if it exceeds 90 days, in countries such as Estonia, Lithuania it is considered non-performing if it exceeds 60 days, and in Russia it is considered non-performing if it exceeds 30 days), the financial performance (in all the countries), the contagion at the debtor level (in countries such as Romania, Bulgaria, Cyprus, Serbia, Hungary, Czech Republic, Ukraine, Latvia, Russia, Estonia, a credit becomes non-performing through contagion at the debtor level, in countries such as Greece, Poland, Lithuania, Austria, a credit does not become non-performing through contagion at the debtor level, and in Macedonia it depends from case to case, it depends/does not depend of the contagion at the debtor level) [3].

For a better comparability of data, the FMI Guide (Financial Soundness Indicator:

Compilation Guide) recommends that the loans and other assets are classified as non-performing when the payment instalments representing principal and interest register defaults of 90 days or more. Moreover, the non-performing credits will include those credits with a debt service smaller than 90 days which in the national legislation are recognized as being non-performing when there are clear indices of non-reimbursement (ex. Bankruptcy situation).

After the analysis made, the 90 days criterion represents the most encountered practice in different countries for determining the non-performing credits.

The mistakes in the professional reasoning of bank employees are often considered major causes of the occurrence of non-performing credits. The real problems are those afferent to the banking system and which are rooted in the banks' crediting politics, some of the signs of distortion of the credit cult quoted by the American Central Bank being: the internal operations, the award of too many credits to the managers and large shareholders or parties affiliated to them; compromising the healthy crediting principles, awarding credits with high risks, with the full awareness of breaching the healthy crediting principles; the desire of obtaining incomes as high as possible; incomplete credit information; complaisance, the lack of surveillance of old, familiar clients; the lack of monitoring; technical incompleteness; the weak selection of risks[4].

Other researches in the field have demonstrated the fact that the deterioration of the quality of credit portfolio is always manifested gradually, being accompanied by warning signals that allow the banks to act in order to prevent the aggravation of the situation or at least to minimize the loss that could be registered by the bank. Before not being able to reimburse a credit, the debtor goes through a cash crisis. The specialty literature mentions three distinctive stages regarding the cash: difficulty maintaining the liquidity, stage when the stocks start accumulating and the speed of cashing the boo debts slows down, the loaned person's reaction being the slowing down of the providers' payment, thus reducing the expenses; the second stage, when the cash administration becomes a priority, imposing

ceilings and expense limiting; the employees are left to look for other jobs, investments are no longer made, they attempt to capitalize the non-essential assets, dividends are no longer paid with the purpose of capitalizing them in order to cover their own capital diminished by the exploitation losses. The loaned person's relations with the bank start deteriorating, in the clauses of the existent credit contract; the threat of bankruptcy danger, stage when the loaned person uses all his cash resources from the accounts, no longer pays any debts or obligations. The last choice is to declare bankruptcy or find a partner to fuse with, that will absorb him [5].

Among the criteria used by the defining of non-performing credits by Romania we can mention the Prudential Methodology [6] and the Accounting Methodology [7].

The Prudential Methodology [6] defines the non-performing credits according to: the debt service, the initiation of judicial procedures, financial performance, rating downgrade through contagion, the past due credit and the past due interests.

The accounting methodologies [7] defines the non-performing credits according to : the debt service, the initiation of judicial procedures, the past due rates of the principal exceeding one day.

3. The evolution of non-performing credits in Romania and their causes of occurrence

In Romania we noticed that in 1998 we reached a maximum level of non-performing credits, of about 54.77% of the total of credit exposal, fact due to the credit portfolios of the Agricultural Bank and Bancorex. In the immediately following period, the year 2000-2002 we noticed a decrease of the percentage of non-performing credits, fact due to the apparent improvement of the quality of credit portfolio as a result of the elimination of financial performance from the above-mentioned classification criterion and the percentage of low-quality credits has tripled. A slight decrease during the period 2004-2006v can be motivated by the real consolidation of the Romanian financial system and the increase of its stability as a result of the privatization of a great number of credit institutions and the buyout of their majority by foreign banks, differently said from the total of 33 credit institutions, only

two banks with state majority capital remained, and among those with private capital, 24 held a foreign majority capital.

Starting with 2006, the quality of credit portfolio started deteriorating, its negative evolution being emphasized in the following two years.

In the banking system of Romania, the non-performing credits reached the maximum level towards the end of 2011.

The recession of Romania negatively affected the quality of assets from the banking system. The non-performing credits increased to 13% from the total of credits, at the end of April 2011, from 11.9% at the end of 2010 and 7.9% at the end of 2009.

The crediting was strongly affected by the low industrial activity and the consume attenuation at the end of 2008, and the crediting has had a negative evolution in 2009 as well and in 2010, the exception being the mortgage loans through the “First House” program.

The National Bank of Romania adopted measures to stimulate the crediting activity. Thus, the interest rate was maintained at a low record level (5.25%) since April 2012.

In these conditions, the central bank started in the autumn of 2011 a cycle of reducing the monetary politics interest rate and of appropriate adequacy of liquidity conditions, the movements being quickly received by the monetary market through the decrease of inter-banking interest rates below the level of monetary politics interest level. The improvement of monetary market conditions induced a continuously descendant tendency of the turn-over of government securities on the primary market, their secondary market also becoming more active, with favourable impact on the redistribution of liquidity in the banking system.

Romania’s economy shows signs of recovery after a long recession, which should support an improvement of performances in the banking system, but, unlike other regions from the Central and Eastern Europe, Romania remained in recession in 2010 because the Government’s austerity program, which involved the reduction with 25% of the salaries in the public sector, was implemented over the effects of the world financial crisis.

The non-performing credits can be treated,

according to the bank’s crediting politics, in two manners and namely:

- by maintaining the active receivables until the debtor recover or until the bank is forced to admit the loss, registering as such. This approach is typical to the banking systems based on the British tradition, and the level of loan write-downs in this case could seem unusually high.
- by considering the non-reimbursed receivable as loss and its recovery from reserves, followed by the attempt to recover what is possible from the debtor. This model is typical for the USA and it is more conservatory through the fact that the assets-loss are considered to be “non-bankable” (Bratanovic, B and Greuning, H, 2004) and not necessarily non-recoverable. Through the immediate removal of the books of the non-performing credits the level of reserves will seem smaller in relation with the existent credit portfolio.

The recovery of non-performing economic agents supposes that the credit institution takes one of the following measures, necessary and opportune for recovering their payment capacity:

- rescheduling the credits, respectively postponing the reimbursement term of at least two intermediary credit instalments, without exceeding the maximum award term, or the modification, only once, both of the reimbursement terms and of the quantum of instalments, however by complying with the maximum crediting term initially approved. This may have beneficial effects on the cash flow by postponing without supplementary costs (the interest remaining the same) of a planned debt, thus offering the chance of recovering the debtor’s payment capacity
- restructuring the credits, respectively extending or postponing all the instalments’ due dates, and the modification of their quantum within the total balance remained to be reimbursed, by exceeding the initially approved term, but by complying with the maximum crediting term provided by the legislation for the respective type of credit. This is an intermediary measure, preceding the declaration of the payment default, and

starting the procedure of enforcement, offering the chance of recovering the debtor's payment capacity. Unlike the rescheduling, an interest increase occurs, however smaller than in the case of outstanding credits.

- Giving new loans, respectively supplementing the already-awarded credits, in order to avoid the debtor's entering into payment default. This measure supposes a supplementary analysis, extremely careful of the borrower and imposing some special conditions, such as: using the new credit strictly for the purpose agreed with the bank, performing all the receipts and payments through accounts open at the respective credit institution, ensuring and keeping the guarantees constituted in favour of the bank etc.
- Increasing the working capital, by increasing the long-term liabilities or reducing the fixed assets. Taking into account the client's financial situation, the long-term increase of liabilities is practically impossible, since the debtor does not dispose of the necessary sources for increasing the capital or issuing new bonds, and the capitalization of fixed assets is not desirable since it would affect the business solidity. However, in the case that the client made investments without having financing sources appropriate as term, a series of fixed assets being practically financed from short-term credits, there is the possibility of transforming these loans into medium and long term credits, which are reimbursed while amortizing the fixed assets they finance [8].
- Reducing the necessary of working capital, by increasing the rotation speed of circulating assets that will have as result either the reduction of stocks, or obtaining a higher turnover with the same stock, which means higher receipts, therefore supplementary cash flow.

As a result, in the evaluation of the level of provisions established by a bank, the analysts must clearly understand that if the bank performs the operation of registering the losses as expenses directly or purely and simply constitute provisions for them. The modality used often depends on the fiscal

regulations applicable to the provisions.

In the analysis of problematic credits, a special importance is held by guarantees, respectively their type and extent, which are used in case of the debtor's insolvency for covering the losses by capitalizing them, according to the current regulations [9] both in the bank credit contracts, and the real and personal guarantees constituted with the purpose of guaranteeing the bank credit, representing enforceable titles.

4. Conclusions

The analysis of the portfolio of non-performing credits is very vast because it offers important clues on the quality of the total portfolio and, lastly, on the crediting decisions of a bank.

In this regard, it is not sufficient just to establish the time of overdue credits, but they must be divided according to the types of clients and segments of activity, in order to be able to determine the general tendencies and establish if all the clients are or not affected to an equal extent.

In addition, each case must be assessed to determine if the situation is reversible, what can be made to improve the reimbursement capacity and whether recovery plans were used in this regard or not.

In the analysis process, it is very important to establish the causes of the deterioration of the credit portfolio quality in order to be able to identify the possible measures to be undertaken by the bank to counter-attack a certain trend.

luminita.ristea@crgnexia.ro

Abstract

Even if Romania has a huge tourism potential, is moving slowly in this industry. This study aims to investigate the impacts of tax measures on the Romanian Black Sea Coastline tourism and we have chosen a very specific area, i.e. the southern part and namely a specific seaside resort Neptun – Olimp and also one of the hotels of it: Hotel Cocor. For our investigation we use a linear regression model. To highlight the impact of tax measures adopted by the national authorities on local tourism, the model take into consideration three scenarios: the rate of VAT applied at this moment (respectively, 24%), the rate of 0% VAT and the rate of 9% VAT that were could be applied to tourism services.

Keywords: tax measures, VAT rate, occupancy degree, tourism.

J.E.L. Classification: H30 Fiscal policies and Behavior of Economic Agents, General

1. Introduction

Throughout the process of understanding tourism development, the main attention has been usually focused on the more advanced and stable societies of Central Europe - all of which are very closely related to major Western European states, such as: Hungary, Czech Republic, Poland and Slovenia. Outside of the former Soviet Union is post-socialist Europe's least developed South Eastern Europe (SEE) with countries like Romania, Bulgaria, Albania and Croatia that have a considerable tourism potential, but are still being relatively neglected in the literature. With a lack of media recognition and inconsistency in macroeconomics policy,

the region's image continues to be characterized by instability that usually has an impact on politics, economy, culture and tourism.

Therefore, this study focuses on understanding how tourism in the Romanian Black Sea Coastline is affected by national tax measures and severe worldwide economic downturn. The article has three parts: first part is a brief overview of Romanian tourism, the second part examines the impact of fiscal measures taken by authorities on the number of tourists using a linear correlation, and the last part presents the conclusions of issues considered.

2. A Short Review of Romanian Tourism

The broad concept of tourism includes a variety of jobs and industries (accommodation, food and beverage, etc). Hunter and Green (1995) describe tourism as a 'nebulous phenomenon, characterized by an amalgam of fragmented trades, organisations and activities'. This makes it difficult to assess who the ultimate beneficiaries of tourism are because if the social costs are internal to the region, the private and social benefits can be external (Pessoa and Silva, 2007).

Even though Romania has a huge tourism potential, in Hall's "edited review of Romania's post Ceausescu future, tourism is quoted only in one paragraph in comparison with the popularity for coastal holidays in Dalmatian coast and the notably high proportion of national income derived by Yugoslavia from the Croatian litoral before 1990. Hall noticed the SEE's relative wealth of cultural and natural resource potential for the development of interior niche tourism products, the (re)appearance of mass outbound tourism from Central Europe and

the rapid growth of high spending outbound tourism from Russia, and also the region’s need to consolidate employment and development strategies in order to be able to counterbalance the demise of heavy industry and a restructuring of agriculture” (Hall, 1998).

The economy of Romania is going through a difficult transition stage, starting with the 90’s, that included the decline in production throughout all sectors and sub-sectors including services, national currency depreciation, balance of payments, deficit of the public budget. Between the years 2000 and 2008, economic growth has been stimulated and specific measures have been taken, but the worldwide economic downturn has strongly affected this economic growth. In this context a special place in a future recovery position is held by the tourism industry, welcoming additional income for smaller countries, such as Romania and also generating jobs and promoting the countries’ image around the world.

In Romania, the concept of coastal tourism is becoming popular and therefore an important touristic attraction. This development has been presented in several articles (Cooper, 1990; Smith, 1992). In the management of the Romanian coastline resorts, sustainability is one of the most important principles that should be taken into consideration. Moreover, the government decided to get involved, having the intention to provide funds in order for this area to develop faster in the next 5-10 years. A negative aspect of the tourism activity on the coastline is seasonality, because hotels are operating 5 months a year, through the summer. Recent tourist arrivals statistics has showed a significant rise in tourists (domestic and international) from 25.000 to 200.000 that prefer to spend the summer on the Romanian coastline, which is not the best result, comparing to previous years when there was no economic crisis. The resort hotel is the most common form of resort development. The company holding a business meeting in a self-contained resort setting keeps the outside distractions of a city to a minimum while utilizing the recuperative effects of recreation to improve business productivity (R.C. Mill, 2001). Managers have difficulty in learning human relations skills rather than developing technical skills.

Therefore, planning, organizing, staffing, controlling make up the process of management. A revised plan is usually put in place and the process can begin.

3. How National Tax Measures affect the Romanian Black Sea Coastline Tourism

To highlight the impact of tax measures adopted by the national authorities on local tourism, the model take into consideration three scenarios: the rate of VAT applied at this moment (respectively, 24%), the rate of 0% VAT and the rate of 9% VAT that were could be applied to tourism services.

Using a linear regression model, further, we analyzed the impact of three rates of VAT on occupancy degree in a hotel located in the southern Romanian coast, respectively Cocor hotel, for a period of eight years (2004-2011).

Using regression techniques and Granger causality in the following is presented the impacts of national tax measures on local tourism, using the software package Eviews and the following variables:

- VAT rates, under three scenarios (presented above), rates receipts from tourism caught in the Cocor hotel during 2004-2011, as independent variables;
- occupancy degree, representing accommodation days / year, as the dependent variable;

The table below illustrates the descriptive statistics of variables

Table no.1. Descriptive statistivtic of the variables

	OCCUPA NCY_DEG REE	INCOME_0 VAT	INCOM E_9VAT	INCOM E_24VA T
Mean	51.7025	6.312	6.880	7.827
Median	53.565	5.781	6.302	7.169
Maximum	60.15	8.685	9.467	10.77
Minimum	32.77	3.823	4.167	4.741
Std. Dev.	9.365	1.962	2.139	2.433
Skewness	-1.007	0.147	0.147	0.147
Kurtosis	3.024	1.349	1.349	1.349
Jarque- Bera	1.353	0.936	0.936	0.937
Probability	0.508	0.626	0.626	0.625
Sum	413.62	50.498	55.043	62.617
Sum Sq. Dev.	614.041	26.958	32.030	41.453
Observatio ns	8	8	8	8

Source: Own calculations in Eviews software and the data from the Cocor hotel documents

In this analysis, the independent variable is the VAT rate under three scenarios and dependent variable is the occupancy degree of the Cocor hotel in the period analyzed.

For estimating the correlation between the occupancy degree and the other three indicators mentioned above, we will use the regression technique, applying the method of least squares for determining the parameters of the following regression equation for each variable.

$$Y = \alpha + \beta X$$

Y – is the dependent variable

X – is the independent variable

α , β – are the parameters of the regression equation.

The correlation between occupancy degree and 0% VAT rate

By using the method of least squares , the regression equation between the two variables over 2004-2011 period is:

Table 2 The correlation between the occupancy degree and 0% VAT rate

Dependent Variable: OCCUPANCY_DEGREE				
Method: Least Squares				
Sample: 2004 2011				
Included observations: 8				
OCCUPANCY_DEGREE=C(1)+C(2)*INCOME_0 VAT				
	Coefficient	Std. Error	t-Statistic	Prob.
C(1)	66.561	12.538	5.308	0.0018
C(2)	-2.353	1.962	-1.199	0.275
R-squared	0.243	Mean dependent var		51.702
Adjusted R-squared	0.117	S.D. dependent var		9.365
S.E. of regression	8.8	Akaike info criterion		7.399
Sum squared resid	464.65	Schwarz criterion		7.4195
Log likelihood	-27.598	Durbin-Watson stat		2.448

Source: Own calculations in Eviews software

On the basis of the table above, the regression equation of the variables is:

$$Occupancy_degree = 66.56 - 2.35 * Income_0\%VAT$$

According to this econometric relationship, the correlation of the occupancy degree of the Cocor hotel and the 0% VAT rate is unproportional , that is a rise of 1% of VAT rate implies a modification in the other way of 2.35% occupancy degree.

The coefficient of determination for regression (R-squared) signifies the fact that 24.3% of the variation in the occupancy degree is explainable by the modification of the 0% VAT rate.

The correlation between occupancy degree and 9% VAT rate

Estimating the parameters of the regression equation between the occupancy degree and the 9% VAT rate over 2004-2011 period, the following results are obtained:

Table 3 The correlation between the occupancy degree and 9% VAT rate

Dependent Variable: OCCUPANCY_DEGREE				
Method: Least Squares				
Sample: 2004 2011				
Included observations: 8				
OCCUPANCY_DEGREE=C(1)+C(2)*INCOME_9 VAT				
	Coefficient	Std. Error	t-Statistic	Prob.
C(1)	66.561	12.538	5.308	0.001
C(2)	-2.159	1.8	-1.199	0.275
R-squared	0.243	Mean dependent var		51.7
Adjusted R-squared	0.117	S.D. dependent var		9.36
S.E. of regression	8.8	Akaike info criterion		7.399
Sum squared resid	464.65	Schwarz criterion		7.419
Log likelihood	-27.598	Durbin-Watson stat		2.448

Source: Own calculations in Eviews software

According to the data in the table above, the regression equation between the analyzed variables is under this form:

$$Occupancy_degree = 66.56 - 2.159 * Income_9\%VAT$$

According to this econometric relationship, the correlation of the occupancy degree of the Cocor hotel and the 9% VAT

rate is unproportional , that is a rise of 1% of VAT rate implies a modification in the other way of 2.16% occupancy degree.

The coefficient of determination for regression (R-squared) signifies the fact that 24.3% of the variation in the occupancy degree is explainable by the modification of the 9% VAT rate.

The correlation between occupancy degree and 24% VAT rate

By using the method of least squares , the regression equation between the two variables over 2004-2011 period is:

Table 4 The correlation between the occupancy degree and 24% VAT rate

Dependent Variable: OCCUPANCY_DEGREE				
Method: Least Squares				
Sample: 2004 2011				
Included observations: 8				
OCCUPANCY_DEGREE=C(1)+C(2)*INCOME_24VAT				
	Coefficient	Std. Error	t-Statistic	Prob.
C(1)	66.564	12.536	5.30	0.001
C(2)	-1.89	1.582	-1.19	0.275
R-squared	0.243	Mean dependent var		51.70
Adjusted R-squared	0.117	S.D. dependent var		9.365
S.E. of regression	8.79	Akaike info criterion		7.39
Sum squared resid	464.58	Schwarz criterion		7.419
Log likelihood	-27.59	Durbin-Watson stat		2.44

Source: Own calculations in Eviews software

According to the data in the table above, the regression equation between the analyzed variables is under this form:

$$Occupancy_degree = 66.56 - 1.89 * Income_24\%VAT$$

According to this econometric relationship, the correlation of the occupancy degree of the Cocor hotel and the 24% VAT rate is unproportional , that is a rise of 1% of VAT rate implies a modification in the other way of 1.89% occupancy degree.

The coefficient of determination for regression (R-squared) signifies the fact that 24.3% of the variation in the occupancy degree is explainable by the modification of the 24% VAT rate.

I will further my analysis to the Granger causality for each pair formed in the four variables.

The type tests *Causality-Granger* (CG) indicate what variables are useful for forecasting other variables. More precisely, we may say that X causes -Granger Y if the forecasting of Y is made considering information about X history which is better than one that ignores the X history. We may check if X (the independent variable , which is the fiscal pressure)causes-Granger Y (the dependent variable given by the unemployment, inflation, economic growth, and public dept) testing if the parameters are significantly different from zero. I need to underline that despite the name, CG cannot be interpreted as the real causality (structural), as Cooley și LeRoy (Cooley, T.F., and LeRoy S.F, 1985, A theoretical macroeconomics, *Journal of Monetary Economics*) demonstrated. CG is consistent with (without being either necessary or sufficient for) the authentic causality, in that the effect has to follow the cause in time. More importantly, CG is extremely useful when answering question such as :”What variables can signal anticipatorily a rise in the X variable?”

Table 5 Granger Causality Tests

Pairwise Granger Causality Tests			
Sample: 2004 2011			
Lags: 2			
Null Hypothesis:	Obs	F-Statistic	Probability
INCOME_0VAT does not Granger Cause OCCUPANCY_DEGREE	6	18.956	0.160
OCCUPANCY_DEGREE does not Granger Cause INCOME_0VAT		1.716	0.474
INCOME_9VAT does not Granger Cause OCCUPANCY_DEGREE	6	18.814	0.1608
OCCUPANCY_DEGREE does not Granger Cause INCOME_9VAT		1.722	0.474

INCOME_24VAT does not Granger Cause OCCUPANCY_DEGREE	6	18.858	0.160
OCCUPANCY_DEGREE does not Granger Cause INCOME_24VAT		1.721	0.474
INCOME_9VAT does not Granger Cause INCOME_0VAT	6	0.250	0.816
INCOME_0VAT does not Granger Cause INCOME_9VAT		0.250	0.816
INCOME_24VAT does not Granger Cause INCOME_0VAT	6	0.248	0.817
INCOME_0VAT does not Granger Cause INCOME_24VAT		0.248	0.817
INCOME_24VAT does not Granger Cause INCOME_9VAT	6	0.0093	0.990
INCOME_9VAT does not Granger Cause INCOME_24VAT		0.009	0.990

Source: Own calculations in Eviews software

According to the test p-value null hypothesis claiming that X does not Granger cause Granger Y is rejected for values lower than 0,05 of the associated probabilities. Thus, the null hypothesis alleged default of the associated probabilities is rejected. So, it is possible that the 9% VAT rate causes Granger the 24% VAT rate. Therefore, it is denied the nule hypothesis presumed implied, so it is probable that the 24% VAT rate to cause Granger the 9% VAT rate.

4. Conclusions and discussions

By using the regression technique and Granger causality in the analysis on the impact of the VAT rate under three scenarios on occupancy degree, in the period between 2004-2011, the following were observed: all correlations are inversly proportional in the sense that a rise of 1% of the 0% VAT rate triggers a modification in the other way of 2.35% in the occupancy degree, 1% modification of the 9% VAT rate triggers a modification of 2.16% in the occupancy degree, and a rise of 1% of the 24% VAT rate triggers a modification in the other way of 1.89% in the occupancy degree. The modification of the dependent variable analysed is 24% justified by the modification

of the independent variables, that are the VAT rates. This result indicates the indirect relationship, which is strong enough, between the analysed variables.

As can be seen the tax measures affected the local tourism. The largest increase in occupancy degree is recorded for a 0% VAT rate, respectively 2.35%. This is a result that authorities must take into account if they want to support Romanian tourism. The authorities should be applied reduced Vate rate in tourism services.

We conclude that Romania can be an attractive country for the European tourists and also throughout the world. This destination has been seeked by external tourists and had a developed domestic tourism which was supported by the Law of Tourism since the interbelic period. At the beginning of the 70's, Romania was already known on the market of the main European countries that generated tourism, such as Germany, UK, France, Italy, Austria or Belgium. But unfortunately in the 80's, this country had suffered a decline of the foreign tourists, trend that had gone even more in the 90's.

The main cause for this happening was the missing of small development investments, modernization and renovation of infrastructure (road, building), because of the process of privatization, inexistency of banking systems. So, Romania is moving slowly regarding the performance of the tourism industry.

The Role of Social Balance Sheet in a Modern Accountancy

Ungureanu Mihaela

“Alexandru Ioan Cuza” University of Iasi,
myhaella5@gmail.com

Abstract

Reporting social behavior of the company in a similar annual reporting of financial matters, supports the establishment of a social report (corporate social reporting) between the entity and the community to which it belongs. This analogy with accounting and financial reporting is imposed today in France, where the term retained by law is the social balance sheet. The practice of social reporting is also generally associated with the financial reporting: a growing number of companies worldwide publish, together with their financial situations, social data to supplement and clarify the financial information made available to shareholders and the public .

The economic environment is increasingly intertwined with the social one, so that the performance of a company no longer refers only to the financial one, being considered also the social one, and increasing the organizational value can no longer ignore the interests of shareholders, employees and business partners.

Key words: social balance sheet, accounting, performance, costs, benefits.

JEL code: M14, M41.

Introduction

The enterprise has represented and will represent, especially on free markets, a pace of conflict, to a lesser or higher degree. Conflicts can be regarded as normal and even desirable events and to a certain point as a factor of progress. Social responsibility is also a subject that arouses fierce controversy between a commercial company and the external environment, but also the internal one. Interpretation of the same economic

results differs for the social policies implemented and for those involved.

For example, shareholders appreciate a dynamically social policy, with favorable implications for medium and long term on economic and financial performances of the enterprise.

Worldwide, the social balance sheet is recognized as a tool to promote the amelioration of these conflicts.

1. The emergence and evolution of the concept of social balance sheet

The notion of social balance sheet has its beginnings in France, being presented in a law of July 12, 1977 as a specific document, standardized and mandatory for enterprises and units with more than three hundred employees covered by legislation on works committees. It appeared as the result of the Sudreau report regarding enterprise reform, the context in which public authorities wanted to establish a social dialogue on specific elements and objectives, based on objective indicators, which remain constant every year. Currently, the complexity of social problems involved in economic activities as the preparation of this balance is to involve a broader range of indicators and actors within the company.

After 1979 have emerged certain summary of the social balance sheet, ADIA Institute having a pioneering role.

Only after 1980, the social balance sheet data were effectively material for a socio-economic accounting of whose object is represented by the hidden performance and for a social accounting, whose object is to evaluate costs and benefits, such as the impact of measures to improve working conditions on productivity.

After 1990 have emerged empirical works which have tried to identify the most important variables into the external financial diagnosis, the problem being to identify

immediate or delayed associations between financial performance and some indicators extracted from social balance sheet: education, absenteeism, dismissals or work accidents indeed appear to be significantly associated with productivity and profitability.

Since 2000, based on American works in the field, it started the execution of rating the large companies listed on stock exchanges globally significant from their social balance sheet data.

2. Social balance sheet – a modern accounting tool

Social balance sheet is defined as a report presenting the costs and benefits of an economic entity according to the environment into which they operate, in order to inform the various social groups involved. That consists of two key parts: the enunciation of a social policy, the objectives and measures for their implementation and a report on the adjusted value obtained by the entity and its distribution on the national economy.

The term “balance sheet” it doesn’t transform this report in which it means an accounting balance sheet. The social balance sheet is a document drafted as a table that contains a number of quantitative information only expressing the social status and working conditions in the enterprise. So, it must be understood in the sense of an inventory, a report similar to the Health Check.

Management control is essential in the approach of elaboration of the social balance sheet. In this regarding is necessary to share indicators related to the structural indicators, which expresses the patrimonial situation at a time (eg number of employees) and performance indicators, which present variations (eg promoted employees). Through their analysis can be drawing conclusions concerning the measures taken by the entity. For example, if 50-60% of employees were become aware, through the deployment of some special courses, on the need of compliance with the rules of health and safety work, the risks of labor accidents and the rate of the latter decreased by 10-15% it may be that there is a profitable relationship between the action and result.

By adding data from the social balance sheet, the effect of the efforts of the entity

may be translated as a reconciliation between results indicators and resource indicators (eg, impact of increased security spending to the rate of accidents or training expenses of raising qualification).

Using social balance sheet may differ according to the role and purpose. So, it may take the form of:

- an information tool when operating in environments in which the dissemination of its information. Benefits of a large dissemination are limited by the abstract of numbers, the absence of comments, so an essential condition is represented by the ownership of financial and accounting knowledge to understand and interpret the content of indicators and method of analysis. Without a prospective nature, social balance sheet is an incomplete instrument of information – it doesn’t present the draft amendments to staff levels etc. – and does not define the business strategy, instead provides elements of social policy evaluation, contributing to social diagnosis of the entity.
- an instrument of settlement of conflicts, in that it satisfies the need for accurate social information and facilitates the establishment of agreements between the various stakeholders.
- a social management tool, providing a diagnostic of strengths and weaknesses of the social subsystem of the enterprise. Remedial measures are then integrated into a comprehensive social planning and management.

Indeed, the data is not defined or treated in an identical manner from one company to another. For example, gross wages are sometimes in gross expression, sometimes in net expression; sometimes is taking account of the last salary of the year, sometimes reduced to a monthly average for that year, it may include bonuses or not...

3. Reflecting social costs and benefits in the accounting of enterprise

Social costs are the main strategic target of social responsibility policies implemented by a company, having the role of compensation to the community when it caused some damage. In the same category are found also the cost of other stakeholders: investors,

creditors, customers, suppliers, employees etc.

Among the main social costs can be listed the safety and health requirements at work. The importance of this issue has increased in recent years, both social and economic reasons. Work accidents are transferring the responsibility on employees but also on the company. The costs of work accidents, but also the benefits of prevention activities, are illustrating the diversity of financial gains and losses, requiring social and economic assessment for such events. The determinants of social costs are identified according to the purpose of evaluation, the possibilities of entity to collect an appropriate amount of data, its economic activity, and stakeholder interests. For the employees, considered individually, the economic effects are difficult to express, especially injuries involving long-term sequelae after. When, following the accident, the victim fully recovers, having a limited period of disability, the costs may be expressed more easily. At the enterprise level, these costs are determined by the immediate effects on health of employees involved, but also on the production interruptions. It is noted so that the prevention activity determines not only to reduce potential damage but also technological modernization.

Consumption and production decisions of an entity are generally based on costs and benefits for it. Some decisions generate costs and benefits for other businesses. Thus, can be distinguished between private values and social values. In the same way can be distinguished private costs and benefits (generated for an entity by an activity undertaken by it) and social costs and benefits (generated for another economic entities or for community). Private benefits can take the form of income, when the company conducts its activities to maximize profit or satisfaction, when the activity is focused on customer needs.

Social benefits can be exemplified in different ways: when an entity uses in its work heavy machinery it concretizes the access routes to the headquarters or working points, obtain private benefit, protecting and facilitating the access for the engines. Private benefit, with reducing pollution and protecting the health of people living or working nearby constitute the social benefit.

Speaking of costs, typically the social ones, generated by an economic activity, are higher than the private ones because of shortcomings due to the natural environment.

Analysis from private and social costs and benefits is based on the notion of externality. This implies that the activity of an agent A brings services or disservices activity detrimental to an economic agent B, but the first does not consider these issues in his decisions on such activity. The agent A will direct his attention to the problems caused by agent B, only if he will require a compensation. If the latter benefits from the activity of agent A, then agent A has the right to seek retribution and will take account of benefits received in the decision to realize the activity. In both cases, the agent A has internalized his business benefits and costs and externalities arise when social costs or benefits are superior to private ones, resulting in negative externalities, which are positive.

Accounting is providing unable to translate in terms of social costs a malfunction, such as the absence of a worker or the reduction work motivation of staff. Absences, failure to technological specifications of the equipment or product quality, increase inefficiently the production cost.

4. Using for a social rating

The aim of this approach is to make a diagnosis, not by reference to social policies of the enterprise, but by comparison with the general and sectoral norms, in order to inform providers of funds and financial analysts about the risks involved in the management of the company. Arcimoles did not consider these associations sufficient to validate the utility and relevance of social balance sheet, but he admitted that some indicators are susceptible to announce the economic performance of enterprises, especially because of possible warning signals that indicate more problems than successes.

Social balance sheet provides the foundation for a social rating which may permit assessment of risk by investors and that, by its nature discriminatory, it's likely to operate businesses differentiation.

Indicators of social balance sheet analysis allow an evaluation of social policies of the

company or by an internal auditor or by an external consultant. Three stages can be distinguished in the process: a social balance sheet data analysis highlights the company's characteristics, evaluation of social policies and coherence between these policies and characteristics of the previous medium-term projection assess this coherence. In the latter case, the analysis should be based on internal sources of information larger than social balance sheet. By adding data from the social balance sheet, the effect of the efforts of the entity can be translated as a reconciliation between results indicators and resource indicators (eg. impact of increased security spending to the rate work accidents or training expenses of raising qualification).

5. Conclusions

The term “social balance sheet” may seem exaggerated; indeed, it does not involve a balance between jobs and resources or between costs and benefits and the document does not include information that allows articulated overall coherence. It represents an inventory balance is in the same way that one can speak about a Health Check; it alone is not sufficient to give a diagnosis, but provides elements that, after analysis, can contribute to a diagnosis.

The role of social balance sheet, as a mean of information and social reporting tool, is widely appreciated. Although many critics are sometimes strong, no one thinks about the cause (especially the unions), on the contrary, all parties concerned want to improve it, in the desire to stimulate the social debate. Considering the social balance sheet the disadvantage of a formal ritual than one depth. As a planning tool it can be estimated that in most companies with more than three hundred employees, social balance sheet in the development integrates social scoreboard, which is an interesting development.

A rigorous strategy of internalizing the externalities related to social impact of an economic entity has as result obtaining some economic benefits for the entity (direct interest) but also for stakeholders (indirect interest). Internalization of social costs directly affects the outcome of the current result (economic, social or environmental) by determining current costs and future obligations.

Cost-benefit analysis represent the method that determines the social and environmental performance indicators, parameters increasingly required of both internal and external environment of the company, to have good relations with those involved in its activities (employees, suppliers, creditors, etc.) but also with civil society (the community in which it operates and the general public).

Integrating Sustainability into the Firm Accounting through the Environmental Balance Sheet

Ungureanu Mihaela

“Alexandru Ioan Cuza” University of Iasi,

myhaella5@gmail.com

Abstract

The economic practice has shown that speculative businesses are leading to tensions in the relationship with the natural environment, resulting in even endangering of the continuity. Economic prosperity can not exist without respect and concern for people, environment or community as a whole. Accounting modernisation, in the context of globalization and internationalization, should not assume only the development of new definitions, concepts and standards, but also the implementation of practical solutions to solve the problems faced by enterprises, third parties and the community as a whole.

This paper aims to present a recently introduced tool in the economic practice: environmental balance sheet. It also wants to analyze its role in presenting environmental performance of an enterprise as a factor for the economic and financial influence.

Key words: environmental balance sheet, sustainability, performances.

JEL code: M41, Q56

1. Introduction

The idea of integrating a company's accounts with its natural environment occurred in the early 1970s. This concern of economists to consider environmental externalities has been observed since the '60s, but only ten years later was formally expressed by requiring of the report developed by the Club of Rome. However, the idea remained only at the level of intent until the late of the '80s, when the notion of externalities had passed the traditional accounting limit to the natural environment, so there was what is called the environmental accounting.

Over the passed century, characterized by industrialization, thick smoke and contaminated water were regarded as a necessary evil and even as a confirmation of the successful industrial activities.

Nowadays, civil society calls for protect the natural environment by reducing pollution and conserving natural resources. For this purpose are carried out more and more sustainable development policies, eco-efficiency for the environmental information dissemination. Socially responsible behavior is increasingly becoming a key success factor as differentiates companies on the market, the preferred being the ones that contribute to sustainable development. Not only the business partners but also the civil society are waiting from companies both high quality and measures to protect the environment by reducing consumption of natural factors and the volume of waste discharged or by obtaining biodegradable waste.

Awareness of these issues is a matter not dealt with locally or regionally, but globally. It might even say that, in fact, environmental problems are first expressed globally through the voice of some NGOs and associations working in the field, then try taking them to regional and national level. Environmental protection expresses all the actions taken under internal and external rules of the company, whether voluntary or compulsory. Compliance criterion is not an economic one, but aims to prevent or reduce environmental impacts.

2. Integration of environmental issues into accounting

Traditional accounting concerns the environmental issues from two perspectives:

- the functionalist approach, which ignores environmental issues in the accounting process, excluding natural resources or any others that can not be reliably

measured. Thus, people are considered more important than nature, but also the profit obtained more important than capital, tangible assets outweigh the intangible ones;

- the green approach reflects the preoccupations for environmental protection within the accounting process.

An environmental accounting may more accurately reflect the impact of human activities on nature and the environment has value only to the extent that people appreciate the results of exploitation of its resources. Thus, present serious problems such as exhaustion of deposits of oil or the disappearance of forest areas could be even partially resolved through a more effective use of these resources by traditional accounting. An evaluation of resources efficiency in the future may solve the current problems of the environment.

A comparison between environmental and traditional accounting is summarized in the table below.

Table 1 – A comparison between environmental and traditional accounting

Traditional accounting	Environmental accounting
General accounting	Negative added value and development of the environmental actions included in the traditional accounting
Analytical accounting	Life Cycle Analysis
Social accounting: collecting information in physical data (numbers, statistics...), leading to the presentation of a social balance sheet	Environmental report: collecting information in physical terms (the amount of pollutants emitted...) and monetary (the environmental investment costs) Sustainable development report: environmental and social data collecting

Source: Colasse, B., avec la collaboration de Cédric Lesage, *Introduction à la comptabilité*, Editions Economica, Paris, 2010, p. 749.

In other words, environmental accounting represents that method that measures an organization’s performance in economic terms related to the environment as a tool for identification and evaluation costs of projects

and activities that support biodiversity and human health. This information corroborated by management decisions to not harm the environment, such as the implementation of sustainable practices to conserve natural resources for future generations.

3. The economic performances reflected by environmental costs and benefits

Environmental damage caused by a company and whose prevention or remediation remains under the responsibility of the community, are called externalities. Environmental costs occurs each time that the company will internalize these externalities by taking preventive or remedial expenses. The environmental expenses can involve either the production process (clean technologies) or the product itself (cleaner products).

This definition can hardly be applied in practice. On one side, the “clean” use of a product depends not only on the product itself but also on its use beyond the company and, secondly, in the absence of clear procedures, may be achieved some results almost absurd, for example: it is considered that since a product is safe, all costs incurred in production contribute to environmental protection.

Identification and recognition of environmental costs are significant in making positive management decisions. Thus, can be exemplified as environmental costs:

- costs of alignment with the environmental legislative requirements;
- environmental remediation costs, pollution control equipment, non-compliance fines;
- other costs involved in environmental activities, even if not explicitly required by applicable law.

There are also cases when it is difficult to separate the environmental costs for the health and safety or risk management. Here can be considered the costs of “clean” technologies, the costs of monitoring categories of raw materials and suppliers, etc.

Costs caused by the economic impact on the natural environment, include environmental costs and costs of repercussions. The first ones can be separated into prevention and restoration costs and the

repercussions ones in avoiding and treatment costs.

The rules governing these issues fosters internationalization of additional costs to the environment. Costs must be known by companies so that they comply with the environmental standards and conform with monitoring and reducing pollution costs and with the preparation of the documents and reports required. Entities need to understand the potential monetary rewards gained by implementing environmental performance, an important role having, in this sense, the work of professional accountants. They can influence the management decisions, may propose the implementation of economic policies that take into account the environmental damage from the use or natural resources. Economic activities should aim to reduce costs and waste, both natural and financial resources.

The implementation of environmental performance in large companies led to the identification of products and services necessary for the introduction of green business, able to adapt to environmental changes and maintaining good relations with funders, local communities etc. The organization that effectively monitors the environmental pressures, being concerned about the associated costs and benefits requires different types of expertise: technical, environmental, financial, accounting, marketing, management. Professional accountants have once again a significant contribution, because they have access to internal information, they can check their qualitatively level and can be used in investment decisions.

If the activities and resources used can be measured by charges then the costs and benefits of environmental management are more easily perceived by managers.

The most common costs induced by environmental impact are related to raw materials that affect the natural environment, from fines, penalties, waste management, products, etc. The generated obligations are related to the costs incurred by remediation of sites affected or by damage caused by disputes related to environmental impact. These obligations may also be of a fiscal nature, such expenses for carbon dioxide emissions (emission taxes), and green technologies generate tax revenue.

We can also talk about environmental assets, which according to the standards are included in the category of tangible or intangible and environmental liabilities. These are obligations that require future payments due to past events or compensation to a third party harmed by environmental damage and may be employed or potential. Into the financial statements must be recorded any environmental objective which results of operations involving other parties or train current and future financial obligations known and estimable. Environmental assets and liabilities are usually integrated into accounting posts, legal rules do not require separate presentation only for those elements that should be reflected separately in the notes.

Financial accounting theory does not recognize the environmental costs as part of production and administration costs of an enterprise so they are not recorded in specific accounts, but are considered overhead costs. So, there is a tendency of their separation of the products, processes or activities that cause them.

4. Environmental balance sheet – a tool for information on the sustainability

In the most developed countries, companies operating with an impact on natural environment must obtain the functioning authorizations from various authorities in the field. Usually, obtaining this approval is preceded by the development of an environmental balance sheet. This is a continuous improvement tool that offers, at a certain moment, the image of the reality on the economic activities impact on the environment and sustainable development as well as environmental performance registered by a company whereas.

Environmental balance sheet has certain similarities with the social one, firstly from the definition, both being monitoring tools, offering the opportunity to intervene to correct weaknesses. Secondly, the term “balance sheet” can be misleading. This is not the purpose of a balance sheet, a parallel array reflecting the amount of existing and recorded consumption, trying to maintain a balance. Equally as the social on, the environmental balance sheet represents a

report showing that effectively the present or future impact of a company's work on the environment.

According to the nature and size of business, the environmental balance sheet may take various forms:

- a simple characterization of the activity sheet;
- an extensive study, an analysis of available information on the state of the environment and economic activities conducted on a particular location;
- a study accompanied by technical investigations by sampling water, air, soil and various measures of the site.

Generally, an environmental balance sheet includes elements of:

- the activity natural site description;
- identification of the potential polluting, with the implementation of pollution scenarios confirmed or refuted by specialized measurements (soil, water etc.);
- safety emergency measures already implemented or planned for the future;
- monitoring the impact of the site exploitation, including a conservation program elaboration;
- determining the residual risk, by creating a conceptual scheme of the site.

Elaboration of such a balance sheet is based on environmental indicators used in environmental reporting. The OECD framework presents three types of indicators:

- “pressure indicators” that highlights the economic activities and social pressures on the environment and presents the causes of environmental problems (eg industrial production, energy consumption, waste produced);
- “status indicators” emphasizes physical changes or developments in the environment (eg air quality, nitrate concentration);
- “response indicators” showing the efforts made by a company to improve its environmental degradation or decrease (eg expenses for alternative energy, protection costs, recycling costs, penalties, fines).

An environmental assessment may be required also for reorganization or liquidation of a company whose activities has an impact on the environment, in addition to the

balance sheet and, where appropriate, of the social one. It is made either at the request of the manager, investors or to the syndic judge’s request, if necessary.

Managers, shareholders as well as other stakeholders, to which the company has a certain social responsibility, acquire, through accounting, information on the effects of economic growth on environmental opportunities. Ideally, all that means the impact of an entity on the community and natural environment should be presented in a separate accounting system. In practice, only a small part of the externalities are internalized, voluntarily or by coercion rules. Without this information, decision making system can not operate in a consistent manner in the conduct of business and capital management. Worse than the absence of an item is the erroneous internalization of which may directly affect the economic performance indicators.

So we can talk about an conventional accounting as an informational system in order to efficiently measure the past economic events and document the present economic performance.

5. Conclusions

Are expecting from the companies quality products and services, but also measures directed towards the social needs and environmental protection, such as a rational use of natural factors, as well as a low negative impact achieved by reducing the volume of waste discharged or producing biodegradable waste.

Tools such as environmental management accounting are useful for identifying externalities that will be treated as current income, through internalization, or will be transformed into future obligations.

To be relevant, information must comply with environmental standards integrated in the accounting (traditional accounting is primarily an information system on the financial situation of the company), the most important accounting principles to be considered are those of permanence methods, prudence and continuity.

The enterprise is often using on its production processes natural raw materials that are the result of years of geological evolution (wood, oil ...). The market prices of

these resources does not take into account geologic time scale accumulated for obtaining them. It might imagine a system of accounts to reflect the environmental costs evaluation to express in financial terms the use of geological time, regardless of market price of the natural resources. For example, the oil price would be expressed in terms of value and hours of labor time involved in obtaining it. Such an approach would be difficult now, but can not be excluded the emergence of management tools for this purpose.

Thus, with a descriptive character rather than prescriptive, the environmental balance sheet consists in a set of statistical tables that provide information about the environment, either in physical or monetary units, accompanied by a statement of the company's management about its environmental strategy and the means used in achieving the established objectives.

The Evolution of the Number of the Disabled Persons During the Period 2000-2011

Urseanu Claudiu Mihăiță

University of Craiova, Faculty of Economics and Business Administration

m.urseanu@yahoo.com

Abstract

In this paper I want to emphasize the evolution of the number of disabled persons. Having in mind this objective I took in mind three important issues such as: the infrastructure, the evolution of the number of the people in need and the structure of the people wich benefits from the system. Furthermore I manage to give valuable solution to increase the finance of the system and the capacity of the system te react in time to any demand.

Keywords: social protection, budget, GDP

JEL classification: H60, I00, I 31, I38

1. Introduction

The romanian social protection can be analyzed as a system or by parts. According to the legal regulations can benefit by the national system of social protection each individual even if he did not pay any tax or contribution.

The source used to finance the romanian national social protection system is the taxes paid by employees and their employers.

Having in mind that Romania is a member of the European Union his citizens can benefit, in certain conditions stated by the local legal system, by social assistance according the the european directives and regulations.

Romania must do further progress to achieve the quality required by the european social protection system.

2. The structure of the system

The persons with diasbilitis enjoy from a special socail protection. The state ensure the achievement of an national social protection of equality of chances, prevention and

treatment of the disability, in order to ensure the participation of this persons to the effective life of the community, respecting the rights and the duties of the parties and guardians.

The National Authority of the Persons with Disabilities in the core of the public central administration wich coordinates, the activities of special social protection and promotes the rights of the persons with disabilities, elaborates the policy of the sector, the strategies in the domain of the promotion of the rights of such people affected by handicap, it ensures of both the control of the application of the legal regulations and the activities of special social protection.

Even than the National Authority of the Persons with Disabilities has in his schedule a High Comission which must asses the adult persons affected by any handicap, with decision making capacity in solving the appeals to the certificates of handicap issued with a clasiffication by the County Comission or the Comission of the Municipality of Bucharest, the trust of the public is still reduced.

The special social protection of the persons with disabilities, as an institutionalised form, it is realised in by bringing assistance, care, treatment, recovery, rehabilitation, professional formation and guidance, as well other services in specialised institutions.

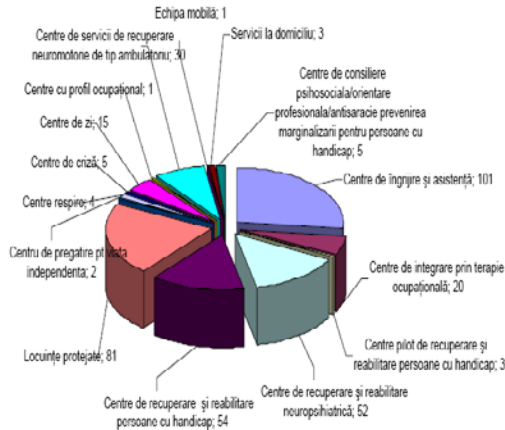

Such institutions of special social protection are founded and function as public institutions and they can be:

- pilot centers;
- care and assistance centers;
- recovery and rehabilitation centers;
- integration centers for occupational therapy;
- protected family housing;
- day care;
- early intervention center;
- other forms.

In the area of this special social protection the efforts were focused on the development and the implementation of the public policy on the protection and both social integration and inclusion of the person.

Judging the social assistance network on 30 June 2011 the structure was as follows:

Figure 1. The national network of assistance of the disabled persons

Source: <http://www.mmuncii.ro/pub/imagemanager/images/file/Statistica/Buletin%20statistic/2011/Handicap%20sem%20I-2011-site.pdf>, accessed at 21 January 2012

The main objective was the creation and the development of the community social services system which could come in support to the institutionalised disabled persons, allowing them to live their life independently, being assisted by an support network.

Now the social protection of the disabled persons can be made in two separate ways such as: in special institutions of the state and to their home.

3. Beneficiary

Also it is very important to analyze the evolution of the number of the persons with disabilities which benefits by this type of social protection. This way it is very important to analyze the statistics regarding the number of the people with disabilities during 2000-2011.

As it can be seen from the figure 2 the number of the persons with disability has grown year by year with an average of 26,118.

Figure 2. The evolution of the persons with disability during 2000-2011

Source: The Ministry of Labor, Family and Social Protection

Having in mind this evolution it is very important to emphasize that from the year 2000 to 2006 the number of the disabled persons has grown only by 21,32 % meanwhile in the period 2006-2011 the growth was by 41,29%.

The highest rate of growth was recorded in 2007 when the overall number of the disabled persons has an extra of 16,28%. As it is shown in the figure 2 the number of the people with disabilities has an important evolution.

This evolution has been generated by socio-economic issues. Since 2000 the Romanian economy has started the recovery process after a transition of an decade. After the year 2000 until 2008, as figure 3 show, the economy has started to grow in an sustainable manner. Both the employment rates and wages grow.

Figure 3. Romania GDP growth rate

Source: <http://www.tradingeconomics.com/romania/gdp-growth>, accessed at 22 April 2012

Since 2006 the number of the disabled persons grow because the amount for which they were entitled was better than nothing and most of the those entitled were old and without any hope to find a job until they achieve the age to retire to pension.

According to the figure 3 the number of the people with disabilities in Romania was at 31

december 2011 with 49,68% bigger than in 31 march 2006.

Overall we can see that each year the number has grow with an average of 45776,6 people.

Figure 4. The evolution of the numer of people with disabilities during 31 march 2006-31 december 2011

Source:<http://www.mmuncii.ro/pub/imagemanager/images/file/Statistica/Buletin%20statistic/2011/2011%20DGPPH.pdf>, accesed at 22 april 2012

The growth of the number of people of disabilities can be explained by three hypotheses:

- the benefits offered to this category of population are considered to be sufficient to show the locomotor or mental deficiency ;
- there are important changes to the colective mentality, the person with disabilities not being anymore stigmatised by the community;
- the economic-financial recession has determined the population to adopt a self preservment behaviour, each individual tries to ensure and preserve his welfare.

The number of people registrated with a disability has reached at 31 december 2011, 689,576 with a decrease of 107 beneficiars.

At 31 december 2011 from the overall number of the people registrated with a handicap 97,5 % (aproximately 672.403 people) are in the care of their families or they are living independently or are not institutionalised in an special institution and 2,5% (aproximately 17,173) are in the care of the public social assistance institutions for adult disability persons.

From the data published by the Ministry of Labor, Family and Social Protection I quote that the rate of the persons with disabilities is 3,22 which means than from 100 romanian

citizen 3,22 are registered with critical or not handicap.

Making an in depth analyze and having in mind, the age and gender of the beneficiary, we can observe that the majority of the persons registered with handicap is 54,1% female, 45,9 % being male, as figure 5 show:

Figure5. The group of people with disabilities by gender and age

Source:<http://www.mmuncii.ro/pub/imagemanager/images/file/Statistica/Buletin%20statistic/2011/2011%20DGPPH.pdf>, accesed at 22 april 2012

Also we can see that the most affected category of the population by an handicap is grouped during 18 – 65 years.

From the overall number (at 30 june 2011), of the persons with an disability 59,2% (aproximately 408,775 people) are grouped to the interval 18-65 years and 31,94% or 220,531 were grouped having over 65 years. Only 8,86 % were grouped having less than 18 years.

At 31 december 2011 the number of the persons with disabilities and age over 50 represents 65,46% from the overall of the adult persons.

Furthermore to the and of year 2011, 64,48% (405,761 persons)from the persons with disabilities were grouped 18-64 years, 35,53% over 65 years (223,545 persons).

The current proportio, by age, at 31 december 2012 was according the figure 6:

Figure 6. The proportion of the persons with disability by age at 31 december 2012.

Source: <http://www.mmuncii.ro/pub/imagemanager/images/file/Statistica/Buletin%20statistic/2011/2011%20DGPPH.pdf>, accessed at 22 april 2012

As it can be seen from the figure 6 at the end of 2011 8,73% from the disabled persons are children and 32,42 had more than 65 years.

The main issues are found to the group of people 18-64 years which had the biggest ratio, 58,85%. These people grouped 18-64 years lift the biggest issues to the state because they have the age to be employed but they are unable to do such things from serious causes.

Moreover the state must take measures to give these people a chance and grant, to the people able to work, facilities to be employee. Each state is responsible for the development and the level of life of his citizens and therefore takes measure to ensure the welfare of anyone.

4. Conclusions

Having in mind the significant number of the persons with disabilities in Romania the Government must take measures to ensure to these people a good life and the support at demand. It is important to mention that the people in need can still be useful to the society and they still can give back added value to the society.

However the disabled persons can work in special conditions and they needs are special the state must coordinate the policy and his strategies to ensure the maximum employment of these category of population.

A solution can be the development of a series of state companies which will produce to the market. Producing on a reduced price

can ensure both, the state and to the people, the reduction to the state expenses and an extra income to the people in need.

The market it would be Romania and the goods could be sold on the free european market and to the state institutions to a preferential price.

Also it would be very important to emphasize that the persons which want to work should be left to work.

Nevertheless in Romania this resource is not used at his full potential, the light industry is still undeveloped and therefore the profit is reduced and the income to the state budget is low. I consider that only by using this persons and encouraging them to go to work and to produce goods the romanian society will achieve a higher stage of development.

I believe that the integration of the disabled persons is the next stage of development of the romanian society. The integration of this category of population would have only advantages to the society and to them.

One of the most important advantage in by nature financial, the expenses with the disabled persons are reduced and the funds can be used in other areas to encourage the national economy. The same result can be obtained through the social reinsertion of this persons.

The most important difficulty of the system lies on assuring the sufficient financial resources to create the equilibrium between the income and the expenses of the system. This equilibrium can be achieved in two ways:

- reducing the number of beneficiary and exposing the fraud from the system;
- assuring an adequate finance to the system and financing some public investment (light industry) for the disabled persons.

The Family Allowances in Romania During the Period 2004 -2011

Urseanu Claudiu Mihăiță

University of Craiova, Faculty of Economics and Business Administration

m.urseanu@yahoo.com

Abstract

In this paper I tried to present the evolution of the family allowances in Romania, identifying to each one the positive and negative trend. Also had in view and the abrogate allowances and I made a comparison between the 2 legal regulations which were in force during 2004-2011. I started this paper by identifying the conditions needed to be fulfilled to benefit by the family allowance right and after that I done an in depth analzye of each allowance.

Keywords: social protection, budget, family allowance

JEL classification: I00, I 31, I38, J18

1. Introduction

The state allowance for children is a way of monthly financial support granted from the state to the families with children and it represents an universal right for each child and it is paid from the state budget according to the law 61 related to the state allowance for children from 1993.

The grant of the allowance for children depends by the age of the child, citizenship, the domicile of the parents and finally by the child scholastic situation. The right of allowance is granted for the under 16 year child and if the child takes a way of education the right can be paid until 18 years.

The kids which have a 1 or 2 grade of disability can benefit by the state allowance until 16 years. Also the disabled children can benefit by allowance to the 18-teen birthday, and after that they will be protected by the state social assistance. Until the age of 18 the disabled children which are in the family care can benefit by the state allowance in the amount established by law, with 100% increased.

The funds used to pay the child allowance

are supported from the state budget.

The keeper of the child allowance right in the child. The allowance is paid to one of the parents, by agreement with him, to the tutor, trustee or to the person to whom was given in foster care to grow, or by any case. After the child makes 14 years the allowance can be paid straight to him.

Besides the children born from the parents marriage, are still entitled the allowance, on the same terms, the children from the previous marriages to the husbands and which are in their care, the children from wedlock, which are recognized and to whom was established the affiliation by court order as well as the children in foster care according to the law.

The allowance is not granted for the 7 years children which are not going to school, exception being the sick children which are not attending the school from serious medical reasons which can be proved.

The child allowance is not paid in the months in which the holders of the right are for more the 15 days in foster care institutions or in social assistance institutions which assures the full sustenance. Plus the child allowance is not granted to the children which had their own revenues or to the children with a scholarship if they choose the scholarship. In this case the child allowance is paid during the holiday.

The Ministry of Education, Research, Youth and Sport has into his care the funds required to the pay of the child allowance for the following categories of children:

- children which are attending the school with age more than 7 years;
- children with medical issues which interrupt the school attendance from health reasons;
- children between 16 to 18 years which are attending school.

The birth allowance has as beneficiary the children mom for each one of the 4 alive children new born. The quantum of this

allowance is indexable, and the pay can be done to the legal representative when the mom cannot benefit by this right.

The supplementary allowance for the families with several children are paid from the state budget according the law 119/1997, the quantum of the allowance was different by the number of the children which they are in the family care.

2. The evolution of the family allowances in Romania

According to the data from the Ministry of Labor, Family and Social Protection the average number of family allowance beneficiary had the evolution presented to the figure 1:

Figure 1. The average number of the allowances paid

Source: The Ministry of Labor, Family and Social Protection

As shown to the figure 1 will see that the evolution of this indicator was not constant, the trend being given by the years of economic decrease and by the negative natural increase.

Also we will observe that starting 2008, the foreshadowed year of the global economic and financial crisis, the number of beneficiary of family allowance decreased by 10,26% in just one year.

Simultaneous with this decrease I found that during the period 2004-2007 the average number of beneficiary was almost constant, the data which were recorded not pointing otherwise.

The variation during the period 2004-2007 reached - 0,49%. Analyzing in depth the statistic data I determined that, yearly, the average number of the beneficiary of family allowance has an average decrease by 55,958.

It is important to mention that during 2008-2011 the evolution was contradictory pointing both significant increase and decrease. Overall the growth was 2,48%. During 2008-2011.

Also we can note that the average number of the child growth allowance had a positive evolution. According to the data from the figure 2 the evolution of this indicator was as follows:

Figure 2. The average number of child growth allowances

Source: The Ministry of Labor, Family and

Social Protection

Having in mind the data from the figure 2 we can observe that the evolution it was not linear, the data has both periods with powerful increase and decrease. Overall I observed that during 2008-2011 the average number of the child growth allowances increased by 2846,6 beneficiaries.

Furthermore we can distinguish 2 opposite periods as follows:

- 2006 – 2008, period of decrease by 7,254 beneficiaries and in average by 3,627 beneficiaries;
- 2008 – 2011, period with an increase both at absolute level and average. Judging both, absolute and average, we can observe the increase was by 17,610 beneficiaries and the average growth was 5,870.

At the end of year 2010 the Romanian Government adopted the Emergency Ordinance no.111/2010 regarding the holiday and the monthly allowance for child growth which brings a series of supplementary regulations as follows:

- starting with the 1-st of January 2011 the persons which to the previous year of the birth of the child had 12 months revenues for which they paid income tax according to the law 571/2003 regarding the Fiscal Code, can benefit by the following rights:

1. vacation for child growth with an age less than 1 year as well and an monthly allowance of 75% from the average of incomes from the last 12 months. This amount cannot be smallest than 600 lei the maximum amount which can be paid being 3,400 lei. The persons entitled to this

allowance can benefit by an extra 500 lei if they come back to work until the first year of vacation is completed.

2. vacation for the child growth till the 2 birthday of the child as well as a monthly allowance of 75% from the average of incomes from the last 12 months. This amount cannot be smaller than 600 lei and bigger than 1200 lei.

—for the disabled children the allowance is granted to the 3-rd birthday 75% from the average of incomes from the last 12 months and the amount cannot be smaller by 600 lei and must be less than 3,400 lei.

—for the people which they benefit by the Emergency Ordinance no. 105/2005, starting with 1 January 2011 the child growth allowance is paid in a quantum of 75% from the average of incomes from the last 12 months and the amount cannot be smaller than 600 lei the maximum amount which can be paid being 3,400 lei.

Having in mind that a central role to the family allowance was taken by the infant allowances we will take into consideration and this indicator, with data from 2004 to 2010.

According to the figure 3 the average number of had the following evolution:

Figure 3. The average number of infant allowances beneficiary

Source: The Ministry of Labor, Family and Social Protection

Taking into account the figure 3 we shall observe that the evolution was positive during the period 2004-2009, with growths from year to year, except 2006 where we observe a small decrease by 2,83 % .

Also we found that even the period 2008-2009 is considered affected by economic-financial issues and the world economies were in difficulty the infant allowance increase by 4,86%.

The data show the the average number of the beneficiary of infant allowances decrease in 2010, comparing with the value from 2009, with 66,765 beneficiaries which means that the indicator had a decrease by 34,48%.

This decrease was a consequence of the global economic-financial crisis.

Comparing with the previous values, eg 2004, the result from 2010 was with 9,3815.5 beneficiaries smaller.

Unfortunately due of the economic difficulties some of the family allowance were cancelled. The Government cancelled the following family allowances: the financial support for the family, the baby clothes, the infant allowance starting July 2010.

It is very important to mention that with the law 277/2010 according the allowance for the family sustainment a new allowance is instituted for the families with a low level of income an children in care.

As well as the Emergency Ordinance no 105/2003 according the complementary family allowance for the monoparental family the law no.277/2010 impose the obligativity to the children to go top school in exchange for the allowance.

According to the law no 277/2010 are canceled the complementary allowance and the allowance for the monoparental family.

Also by the law no. 277/2010 was stipulated that starting 01.01.2011 will take into force a new allowance and 2 old allowance will be out of use: the complementary allowance and the allowance for the monoparental family.

Both of the 2 abrogate allowance were destined to protect the families with several children. Having in mind the complementary allowance the evolution of the average number of beneficiary was according figure no. 4:

Figure 4. The evolution of the average number of beneficiary of complementary allowance

Source: The Ministry of Labor, Family and Social Protection

As it can be seen from the figure 4 during the period 2005-2008 the average number of beneficiaries decreased by 28,57%. Also starting 2008 we can observe significant growths as follows: by 8,4% in 2008-2009 and by 10,21% in 2009-2010.

Even if to the end of the period the data was positive, overall we can compute a decrease by 9,48% or in average by 10,549.33.

Judging the evolution of the monoparental allowance, figure 5, we observe that the average number of beneficiaries decreased by 1,445.33. Also we can observe, during 2004-2005, an increase by 18,17% and during 2006-2008 a decrease by 22,5%. From 2008 to 2010 we can mention an increase but only by 5,74%.

Figure 5. The evolution of the average number of beneficiary of monoparental allowance

Source: The Ministry of Labor, Family and Social Protection

Due of the law no 277/2010 in January the new allowance was not paid because the was established previously that the right of allowance is paid to the next month from the date of the demand, the holder of this allowance is the legal representant of the family.

3. Conclusions

Having in mind that the Romania's population is decreasing year by year due of an aging process and both the mortality and morbidity are at a high level the measures taken can create to the future of the state budget a disequilibrium.

We consider to be fit any form of social protection which will come into help to the families with several children, no matter of the structure of the family.

Also we believe that the law 277/2010 has a gap which must be as soon as possibly corrected, between the reduced level of the amount paid to the beneficiary and the real

amount needed to maintain a certain level of welfare .

Having in mind that any economic system is constituted from capable persons to generate added value it is important to take measures to stimulate the rate of birth and the occupancy of each individual.

Even on a short time the state budget does not support any expenses on a long term this measures can create some trouble which can be heavily to pass.

I suggest, as solution, a new strategy of social development on a long term. Only by ensuring the sufficient number of workers to the future the romanian people can achieve the level desired of welfare.

The strategy must be focused on 2 sides: the professional development of people and the encouragement of natality.

The Impact of Financial Leverage to Profitability Study of Companies Listed in Bucharest Stock Exchange

Georgeta VINTILĂ
Florinița DUCA

The Academy of Economic Studies, Bucharest, Romania

Georgeta.vintila@fin.ase.ro

florinitaduca@yahoo.com

Abstract

The present study examines the relationship between return on equity (ROE), leverage, size of firms and total assets turnover. A sample companies registered under Bucharest Stock Exchange were examined. The study employed regression method to estimate the impact of debt level on profitability (measured by Return on Equity or ROE). The empirical findings indicate that high debt level causes significant positive impact on ROE. Debt is used by many companies to leverage their capital and profit. However, debt is not the only factors that effect to leverage capital and profit.

Keywords: Profitability, firm size, Total assets turnover, equity multiplier

J.E.L. classification: C10, G10, G30.

1. Introduction

Analysis of the determinants of firm's profitability is of utmost importance to all stakeholders of a firm, especially to its common equity investors.

Debt is one of the tools used by many companies to leverage their capital in order to increase profit. One of the best ways in which company increases its profit is through financial leverage. Financial leverage uses debt instruments so that the anticipated level return on the company's equity would increase. The level of financial leverage of a certain company is determined by getting the total value of debt and the equity and the ratio of debt.

The use of high levels of debt in the capital structure leads to an increase or decrease in the return on shareholders' capital (ROE). ROE refers to the monetary gain by shareholders in return for the capital they would have offered to firms. Debt is always desirable if a firm achieves relatively high profits as it results in higher returns to shareholders.

2. Literature Review

Empirical investigations of the relationship between profitability and firm size in the past have given varying results. The nature of the relationship between firm size and profitability is an important issue that may shed some light on the factors that maximize profits.

An integration of the above-mentioned literature implies that the relationship between firm size and profitability may be positive over some firm size ranges and negative for others. Moreover, once a threshold size is reached, additional increases in size may further separate ownership from control. These arguments suggest that the relationship between firm size and profit can become negative beyond the threshold firm size (Amato and Wilder, 1985).

Du Pont chart analysis can describe the relationship between profitability and the use of debt as reflected by return on equity ratio of a company. The proper use of debt can raise the return on equity ratio. This means that the company's management can make use of the debt to increase the profit. It also can indicate the ability of company's management to maximize its operation on assets in making profit (Brigham and Ehrhardt, 2005).

3. Model and Variables

The model

The study uses various sources have been used for data collection. The book value based yearly financial data from 2010 has been collected from the financial statements. Return on equity(ROE) is dependent variable while equity multiplier, total assets turnover and size are selected as independent variables.

All financial data is nominated in terms of Romanian coin. The basic estimation strategy is to pool the observations across firms and apply the regression analysis on the pooled sample. That is, a pooled OLS (POLS) equation will be estimated in the form of:

$$Y = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \mu \quad (1),$$

Where;

- Y represents Return on equity(ROE);
- X1 represents Equity multiplier;
- X2 represents Total assets turnover;
- X3 represents Size;
- μ_{it} = Error term.

Variables

Return on equity

One of the most important profitability metrics is return on equity (ROE). Return on equity reveals how much profit a company earned in comparison to the total amount of shareholder equity found on the balance sheet. A business that has a high return on equity is more likely to be one that is capable of generating cash internally. For the most part, the higher a company's return on equity compared to its industry, the better.

One of the ways to measure the profit enjoyed by shareholders is by using return on equity (ROE) ratio. The reason is that ROE ratio is comparable between one companies to the other and can indicate the profitability of one industry with the other (Helfert, 2001).

ROE will be calculated by dividing net income with equity and multiply by 100.

We can analyze ROE using the traditional DuPont formulation which includes three components as follows:

$$ROE = \frac{\text{net income}}{\text{sales}} \times \frac{\text{sales}}{\text{total assets}} \times \frac{\text{total assets}}{\text{equity}};$$

$$ROE = \text{Profit margin} \times \text{Total Assets Turnover} \times \text{Equity multiplier}$$

There are three components in the calculation of return on equity using the traditional DuPont model; the net profit margin, asset turnover, and the equity multiplier. By examining each input individually, we can discover the sources of a company's return on equity and compare it to its competitors.

It is possible for a company with terrible sales and margins to take on excessive debt and artificially increase its return on equity.

Equity multiplier determines the use of additional resources that can lead to increase the financial profitability of equity and is calculated as the ratio between total assets and equity of credit institution.

The equity multiplier, a measure of financial leverage, allows the investor to see what portion of the return on equity is the result of debt.

One of the best ways in which company increases its profit is through leverage. Leverage uses debt instruments so that the anticipated level return on the company's equity would increase.

Hypothesis 1: Debt positively affects company's profitability.

Total assets turnover

The operating performance of a firm is examined with the use of operating efficiency ratios. Efficiency ratios scan how the firm uses its assets and capital measured by sales generated by various asset and capital components.

The total asset turnover ratio measures the ability of a company to use its assets to efficiently generate sales. This ratio considers all assets, current and fixed. Those assets include fixed assets, like plant and equipment, as well as inventory, accounts receivable, as well as any other current assets.

Hypothesis 2: Total assets turnover positively affects company's profitability

Size

Size is considered a key factor that can influence the financial structure of the firm. Firm size has been suggested to be an important variable related to the leverage ratios of the firm. It is also argued that relatively large firms tend to be more diversified and thereby less prone to bankruptcy. Shah A (2005), and Rajan and Zingales (1995), suggested the negative relationship between size and leverage of

the firm. While there are many different proxies for size, in this study, the natural logarithm total assets of the firm is used.

Hypothesis 3: Firm size positively affects company’s profitability

4. Empirical Results

Descriptive Statistics

Table 1. Descriptive Statistics

	ROE	Equity multiplier	Total assets turnover	Size
Mean	0.2662	1.6716	0.7089	17.9487
Median	0.0425	1.3448	0.6953	18.0965
Maximum	17.5490	30.7016	3.0738	24.1898
Minimum	-0.1151	-55.2911	0.0457	13.8660
Std. Dev.	1.7554	6.7620	0.5065	1.61233

Table 1 provides the descriptive statistics of return of equity, equity multiplier, total assets turnover and size.

The return on equity vary widely among the companies analyzed, fluctuating between a minimum of -0.1151 and a maximum of 17.5490. The average of this rate was 0.2662 with a standard deviation of 1.7554. The average level of the return on equity is low, meaning the

shareholders get a remuneration close to their minimum requirements.

Regression Model Results

Table 2 presents the results of pooled regression analysis, in which OLS method. The model explains almost 26 % of variation in profitability, with significant F-statistic. So, this means that choice of profitability is mainly defined by these three variables, more definitely by two variable- equity multiplier and size.

Table 2. Results of regression analysis

Dependent Variable: ROE

Variable	Coefficient	Std. Error	t-Statistic	Prob.
Equity multiplier	0.1200	0.0228	5.2512	0.0000
Total assets turnover	0.0969	0.3053	0.3173	0.7516
Size	-0.2494	0.0955	-2.6104	0.0105
C	4.4747	1.7256	2.5931	0.0110

Table 2 shows that p-value of total assets turnover is 0.7516. So, the coefficient of total assets turnover implies that it is statistically significant at the 75.16 percent level. Thus, we can say that based on p-values, in our model for listed companies just equity multiplier and size is statistically significant, and rest determinants are statistically insignificant.

Equity multiplier is positiv correlated with Profitability/ROA (0.1200; Table 2) but it is statistically significant. The results accepted any significant relationship between leverage and profitability. This suggests that equity multiplier of all companies significantly affects profitability of firm.

As far as debt ratio’s relation with profitability of the selected companies, there was a significant positive. This indicates a high positive influence on profitability, confirming Hypothesis 1.

Table 2 reports that the beta value of explanatory variable tangibility of assets is 0.0248 with the negative coefficient sign.

To test whether there is influence toward firm size partially to ROE, t test is used. Through the result from data processing, the value of t statistic obtained is equal to -2.6104, and the level of significance is 0.0105 (sig.<5%). This shows that there is significant effect between firm size and ROE. Thus, the current study does not support Hypothesis

3, as the effect of size on profitability, measured by ROE, is significantly negative at the 0.05 level

Examination of correlation

A correlation analysis was performed to verify a possible association between and among the variables, in order to test whether there is any linear correlation between and among the variables. Co-

linearity explains the dependence of one variable to other. When variables are highly correlated they both express essentially the same information. The highest correlation is positive 9.06% between equity multiplier and total assets turnover, second highest is 4.48 % between total assets turnover and size.

Table 3. Correlation Matrix of Independent Variables

	Equity multiplier	Total assets turnover	Size
Equity multiplier	1	0.0906	0.0308
Total assets turnover	0.0906	1	0.0448
Size	0.0308	0.0448	1

5. Conclusions

Through this study, we analyzed a sample Romanian firms by using a pooled regression model to measure the determinants of return on equity. We have selected three independent variables with purpose to see their effect on profitability. In the analysis, we have found the affect of equity multiplier, total assets turnover and size (all are independent variables) on the return on equity (dependent variables) position of the company. With the help of regression, we find that only two characteristics- equity multiplier and size determine the profitability. We have found that equity multiplier and total assets turnover have the positive relationship and size have the negative relationship with the profitability.

Firm size has significant effects on profitability measured by ROE . However, firm size showed significant negative relation with profitability (ROE). Bigger firms may be more oriented towards meeting the goals of bondholders than meeting the stockholder needs.

In conclusion, ROE is the most comprehensive measure of profitability of a firm. It considers the operating and investing decisions made as well as the financing and tax-related decisions.

Abstract

The company financing decision defines one of the most controversial areas of research in corporate finance theory. Identifying the optimal capital structure involves determinants of financing policy but also aspects that relate to corporate governance practices adopted by the firms.

Studies of corporate governance focus on how corporate capital providers make sure that they gain from the investment in the company. Since managers are tempted to exploit weaknesses in the management contracts in order to increase their utility, the shareholders must carefully monitor them.

The scope of the present research is to make a review on current corporate governance models and practices and also of their impact on firm financial structure. It also aims to develop links between the various financing sources and firm value, under the operation of corporate governance mechanisms.

Keywords: corporate governance, financial structure,

J.E.L. Code: G32

1. Introduction

Shareholders-managers conflict was analyzed in various studies, many of them giving it dramatic dimensions. In the last decade of last century, a new theory was launched, that managers will not the bankruptcy of the business even if liquidation would be preferred by investors. Thus, a high level of indebtedness will support the

liquidation decision, bankruptcy being more probable. A higher leverage is associated with a high value of the company and with a low probability of reorganization after filing for bankruptcy.

2. Corporate Governance: theory and practice

The concept of corporate governance refers to the coordination of interests of various stakeholders of the company: shareholders, managers, employees, creditors, customers, suppliers, state, etc. In every business environment, a set of specific relations between natural or legal persons who have an interest ("stake") in business manifests itself. In any entrepreneurial activity, business management or governance should take into account the conflicts inherent in the corporation created by the coexistence of this many interests. The most important conflict of interest, in terms of value and impact on corporate performance, is one between the owners and the company managers. The agent theory shows that the manager is concerned not only with maximizing the property of the owners, but also with the maximization of its own utility function. Therefore, the need for proper and strict supervision on how managers perform their contractual duties is necessary.

However, such a measure may lead to decreased management performance, creating a tense atmosphere in the workplace who could lead to overall weak financial performances. The first studies on corporate governance system emerged in the '30, based on research by Berle and Means. They analyzed the separation in value creation between ownership and management [1]. This scientific concern arose in the context of

the decline of traditional family owned firms, whose owners were also the managers.

These companies were subsequently replaced by companies with dispersed ownership, with a clear separation between ownership and control. Shareholders provide the financial funds to managers, in order for them to efficiently run their businesses. Agency problems are caused by the difficulties encountered in ensuring that investors will not be deprived of the funds allocated or that they will not be wasted [2] on investment projects with negative net present value.

The shareholder-manager relationship is defined through an agency contract, but this contract is always incomplete: it is impossible to predict accurately the likelihood of different consequences of this the relationship. In pursuing their own interests, managers will exploit the various "gaps" in the contracts. Thus, in the debates regarding corporate governance, managers "play" a very important role: they are the main "actors" that directly influence the value creation process and also have the ability to influence the distribution of wealth in the corporation.

Persistent conflict problems between shareholders and managers are clear signs of poor corporate governance, reflected in: restricting current operations, reduced profitability and dividends paid; lower quotes for company shares, excessive mobility of staff, etc. As a final effect, the company can go into bankruptcy and liquidation. In an optimistic scenario, the company can be the subject of a takeover by a competitor and management will be replaced by the new owner in order to improve general activity.

In the economic literature there are still many controversies about how appropriate or inappropriate various corporate governance mechanisms are. It is generally considered that the governance systems applied by USA, Germany, Japan and Britain companies are considered to be better, considering a worldwide hierarchy. On the other hand, in countries that are still in transition to market economy or in the underdeveloped ones, corporate governance mechanisms are practically non-existent [3]. The most representative definition of corporate governance is the one provided by experts of the World Bank as it pertains not only to how

corporate governance can be implemented, but to the affected areas as well [4]. To that end, corporate governance is a combination of laws, regulations and codes of conduct adopted voluntarily, that provide the opportunity for the company to do effectively achieve their goals and, at the same time, to ensure the generation of long-term value for its shareholders and society.

In developed economies of the world, corporate governance rules define the basic components of the business. In order to increase competitiveness and the quality of information provided to capital markets, in each country a code of corporate governance was adopted. This consists in a set of principles, standards and good practices of governance, which are only optional [5].

Studying the mechanisms of corporate governance is relevant only for large organizations where a clear separation between ownership and management exists. The legal form of this type of arrangement is that of joint stock companies, mostly listed on organized capital markets. For small organizations where only a few investors are involved in coordinating the business, corporate governance is reduced to a role of harmonizing the company relationships with employees, creditors, suppliers, etc.

3. Corporate governance models

Analyzing the enterprise governance structures of developed countries permits to identify specific characteristics in the Anglo-Saxon, European and Asian models. The literature identifies three main models: of corporate governance [6]:

- a) the traditional model;
- b) the co-determination model
- c) the stakeholder model

a) The traditional model is specific to the North American economies and runs on three levels: shareholders, administrators and managers. Manager's authority derives from the administrators. Under U.S. law, the right of shareholders to influence the activity of the corporation is limited to the election of board members.

Shareholders have no right to directly influence management's business decisions (eg dividends), but may act only indirectly, namely through the board ("board of

directors"), to change attitudes and decisions of managers. But the shareholders can decide to stop financing the company by refusing an eventual increase in equity. Without the financial support of the shareholders, in extreme cases, the Board could replace the Chief Executive Directors or other members of top management. [7]

b) The co-determination model is specific to Western European economies. The participants are ranked on four levels: shareholders, administrators, managers and employees. This model is representative for Germany, whose economic system is based on social co-determination, meaning that different social groups seek to raise the overall social welfare [8]. Compared to the traditional model, this one introduces a system of participatory management and the assumption that business risk is lower for shareholders than employees. The shareholders ultimately can not diversify their investment portfolio, but can make recommendations to Board to reduce risks, through a democratic decision-making process.

c) The stakeholder model is specific to Southeastern Asian economies and it is also characterized by four hierarchical levels. It differs from the co-determination model by the complexity of the relationships formed within. The model gives a high importance to each stakeholder and does not clarify the extent of their rights and obligations. This maintains a balance between decision making levels and the underlying structures.

Although these models are specific to large companies, they may apply to the smaller size enterprises, listed on stock exchanges. [9]

In Romania [10], as in other countries of Central and Eastern Europe, companies are characterized by a corporate governance model based on internal control of management and employees. If a company requires additional external funding it must make a choice between equity and different forms of debt (eg bonds, bank loans, cash credits). In an efficient capital market, the price a company expects to pay to access these sources are normally reported as a gain in risk for the securities issued by the company. The debt price tends to be less than equity, since the loans are less exposed to company-specific risks. In addition, if the

companies can not honor their obligations (principal and interest) they have the option of filling bankruptcy (liquidation), in which the control over its assets is transferred to the creditors.

It's worth mentioning that shareholders can increase their potential earnings if they can convince lenders to lend the company with other funds (for example, to convince that the cash flow distribution is less variable than in reality). If the company goes bankrupt, losses will be partly taken by lenders (because of the limited liability of the shareholders). Otherwise, additional returns will go to shareholders, who have invested less capital. Thus, they will get higher returns compared to shareholders of companies without debt or with a lower borrowing rate.

The question arises whether the financial leverage creates value, increases the value of the company or simply increases the risk (implicitly the returns) for the shareholders. These issues are central concerns of corporate finance since the publication of the famous theorem of irrelevance by Modigliani and Miller in 1958 [11]. The model proposed by these authors, states that on a perfect market, without transaction costs and taxation, financial structure of firms will have no impact on their value. Thus, decisions on capital structure will impact very little on the distribution of value among various interest holders in the companies.

These decisions will change the expectations of shareholders about the return-risk relation, but will have no impact on the total value of the company. But this perfect market model has no relevance in determining a choice of financial structure techniques for real-world companies. The model also implies that corporate governance is irrelevant in a perfect and complete market, in which all stakeholders can trade among themselves equally. It was found, by empirical means, that companies normally have a stable financial structure over time. More post-Modigliani Miller research have developed models of optimal capital structure involving maximizing firm value, in the context of achieving a compromise between the benefits of tax savings due to debt and equity costs.

The most prominent model of optimal financial structure is that proposed by Jensen and Meckling in 1976 [12]. According to this

model, in a market with zero taxation, but with heavy agency costs, capital ownership and financial structure are not independent of each other, but are chosen to minimize agency costs. Jensen and Meckling have been pioneering the development of agent theory and the theory of "optimal contracting". However, the model is based on some strong assumptions: all economic agents are rational entrepreneurs and the financial markets are efficient. Thus, agency costs will be borne ultimately by the shareholders. Agency and bankruptcy costs have a negative impact on the firm's value; on an information efficient capital market, the present value of these costs being reflected in the prices that providers of capital (shareholders, creditors) are prepared to pay.

Corporate policy initiatives have focused on agency costs associated with equity. Because debt requires regular interest payments (and refunds) it has been demonstrated that high level of debt may be important in order to reduce agency costs associated with equity in companies that register consistent levels of available cash flows that otherwise would be consumed by the management on investment projects with negative net present value [13]. These considerations are reflected in the model of "free cash flow" by Jensen (1993).

Other studies have examined the ways in which corporate managers, acting in the interests of shareholders may seek to transfer risks to other stakeholders. Also, the underinvestment issue, raised by Myers [1977] must be taken into account: shareholders may be losing if management invests in a project with positive NPV and the company suddenly enters into bankruptcy. Under these circumstances, the benefits of the project go to the creditors [14].

4. Conclusion

In summary it can be stated that corporate governance (the manner in which discretionary actions are directed towards meeting the executive interests of shareholders) has economic importance only in a world characterized by equal agency costs.

The "Market timing" theory has According to this theory there is no optimal

capital structure, the firms capital structure being defined as the cumulative result of previous attempts from the company to synchronize its efforts of raising equity with the markets.

According to the briefly presented studies, debt is a valuable tool to manage and control companies, to obtain performance expected by shareholders, along with corporate buyouts, venture capital investment companies, and acquisitions of companies on credit. Among these factors corporate governance has a key importance because it allows shareholders to replace managers from office if their results fail to rise to the owner's expectations.

alexandraspau@yahoo.com

Abstract

Basel Committee issued on December 16, 2010 text Basel III standards framework, which reports on worldwide regulations for capital adequacy and bank liquidity. It is estimated that the rules will help achieve financial stability and promoting economic growth. Combined with a framework of global liquidity, will significantly reduce the likelihood and severity of banking crises in the future by covering the area of micro elements and macroprudentiality.

The Framework sets out measures to improve the quality of capital, better risk coverage, measures to promote capital construction, which can overcome periods of stress without large gaps and introducing two global liquidity standards. Standards will be implemented gradually so that the banking sector could realize structural changes in economy without jeopardizing credit. Alongside the consolidation takes place the euro area whose main objective is to reduce credit risk in sovereign lending economy.

Keywords: capital adequacy, systemic risk, financial stability, capital anticiclic, fiscal consolidation

J.E.L. classification: F30, G01

1. Introduction

The financial crisis has highlighted weaknesses in the financial system in developed countries in the face of adverse economic conditions. In the EU, Basel II regulation in force could not prevent severe turbulence in financial markets which also imposed massive intervention at the state level for capitalization of banks in difficulty. The consequence has been strong growth in sovereign debt and fiscal deficits have now

turned into the biggest threat to world financial stability. In this context the Basel Committee on Banking Supervision (BCBS) has initiated significant reforms to the Basel II framework that focuses on the definition of capital treatment of counterparty credit risk quantification leverage financial year and the standard for liquidity –acidity in the world. Attention has focused on state banks and financial institutions framed in level 1 of systemic risk. ECB defined it “is the inability of institutions to fulfill their obligations on time and thereby cause failure of other institutions to meet its obligations on the due date. Such a situation can lead to contagion effects (for example, major problems of liquidity or credit), endangering the financial system and confidence in it. Inability to meet its obligations may be due to financial and operational problems”.

2. The main framework provisions

Reform of capital and liquidity

- Prudential treatment of minority interest in a subsidiary bank . Parent bank will allocate a minimum proportion to its share capital to minority interest.
- Significant investments in unconsolidated joint financial institutions such as rights of mortgage, financial assets and deferred tax as a result of timing differences. Component of a bank Tier 1 of capital is limited in relation to these three elements in each case to 10% of the bank`s common equity.
- Investments in other financial institutions. Given the situation during the crisis banks were abolished restrictions on the deduction of net short positions (sale) of long positions (buying) when calculating the deduction for unconsolidated investments.

Treatment of counterparty credit risk

- relaxation of the provisions relating to the hedging instruments of credit risk;

- raising the threshold from 25 billion to 100 billion USD for the correlation adjusted assets;
- market valuation of bank assets as capital market model;
- acceptance of guarantees only central counterparties (CCP) falling within risk in the range 1- 3%.

Capital ratio

One way to bypass of Basel II was off-balance out of risky assets. Subsequently imposed that these assets be subject to standard conversion factors of 10% of credit exceeding the ceiling canceling out of balance. Another important concern especially derivatives traded on the OTC, which is equivalent for a loan .

The minimum capital ratio tier1 for banks indebted to set 5% level who was applied in bank stress tests. One of acute problems in dealing with banks was that of transparency under the pretext of bank secrecy. The crisis highlighted the need for extensive real-time information for supervisors. The new regulations provide for the level of debt and its components in the monitoring period 1 jan 2011- 31 dec 2014, then the debt will periodically publish reports which will become a requirement since 2018.

Countercyclical capital buffer formation.

Before the crisis banks amid relaxed attitude towards risk ,have adopted strategies procyclical,who not taking into account a possible deterioration in the economic environment. The event captured crisis banks without capital reserves to provide the necessary protection in optimal performance of lending. Avoid future disruptions credit cycle and the liquidity of the stock of capital required to set aside.

Measures aimed at:

- ✓ minimum capital reserve to ensure functionality during times of severe stress;
- ✓ macroprudential measures to deal with excess credit demand.

The role of vision BCBS capital reserves is to protect the banking sector during the transition periods for excess credit growth which is associated with a high level of risk in maintaining the flow of credit in the economy and avoid insolvency in times of financial stress. Each jurisdiction is free to determine the capital buffer provided that decisions are announced in advance before 12 months to allow banks to comply.

Changing the upper limit is justified only when it is establishing or provides credit growth and excessive accumulation of risk occurs at the system level. Internationally active banks will be the buffer for each geographical location, depending on the exposure to credit risk. This requires an exchange of information between the bank's home and host authorities operating under the supervision BCBS will develop the methodology necessary.

Global liquidity standards

One of the most pressing issues caused the crisis is liquidity. Migration of global capital is determined by interest rates and the growth prospects of the geographical area. In principle liquidity analysis target commitments by duration:

- **short-term** coverage is optimal 30 day liquidity to extreme stress;
- **long-term** funding level is determined in relation to *stable sources of funding* (at least one year), the "liquidity profiles" of assets financed off balance sheet exposures.

Liquidity coverage ratio (LCR) is calculated as: **LCR = (Active high quality) / (30days net cash outflows) ≥ 100%** Class „quality assets” include those rated as less risky assets in stable markets,such as cash reserves of central banks, state debts in the currency of the country of operation, etc. Corporate bonds can be included in this class by developing a quantitative impact study which are adjusted corresponding situation at a time. Cash is appreciated qualitatively on a funding model with stability criteria as deposits ,the coverage and security.

Net rate of stable funding is calculated by comparing the availability of financing needs on a one-year horizon:

NSFR = stable funding available/necessary stable funding ≥ 100%

Available funds are calculated by weighting so stable:

100% - capital level 1 and 2,preferred stock and debt falling due > 1year;

85% - stable short-term funds and funds from the sale of retail assets under 1mild. euros per customer;

70% - funds from sale of assets with low retail;

50% - unsecured deposits.

Refunds central banks are excluded to avoid addiction banking.

Stable financing need (RSF) is calculated also by taking into account both weight and the off-balance sheet items:

0%-cash, securities \leq 1 year, loans to financial firms \leq 1 year;

20%- sovereign credits from central banks, BIS, IMF, etc., at least AA rated securities risk considered 0%;

50%- gold, listed stocks, corporate bonds rated from AA to A maturity less than one year, loans to non-financial institutions with maturity less than 1 year;

85% - retail loans;

100% - other assets.

Coverage liquidity and stable net lending rate will receive optimum values based on detailed rules for calculating "liquid assets", treatment sovereign commitments, operational requirements and the introduction of a "level 2" liquid assets. Credit Switzerland conducted a study showing that its net rate stable funding would require european banks to attract long-term funding aprox.1300 billion euros.

3. Results overall quantitative impact study

Basel III rules are based on a *comprehensive global quantitative impact study* (QIS) to correctly assess capital adequacy standards. Banks selected for study were sorted into two groups depending on the impact of systemic risk.

Group 1 included 94 banks that clasified Core Tier 1;

Group 2, which included a sample of 169 less systemically important banks.

First group is the highest level of systemic risk and the selection criteria were: minimum level capital of 3 billion eurors; have good portfolio diversification and active internationally.

Study hypotheses:

✓ Estimaof future developments of the banking system and was based on data from the end of 2009;

✓ Profitability of banks was analyzed two scenarios who have focused behavioral responses such as changes in capital or balance sheet composition. QIS results are not comparable with the economic assumptions that are based on predictions, taking into account management actions to mitigate

negative impacts and include estimates based on analysts private information.

Study results

▪ Capital rate as the average for group 1 was 5,7%, compared with the minimum requirement of 4,5%. For group 2 the average rate was 7,8%. For all banks in Group 1 to meet the new requirements is required additional capital estimated at 165 billion euros and the amount required for Group 2 is 8 billion euros.

▪ Minimum capital plus capital buffer is the minimum requirementof 7% (capital minimum 4,5% and 2,5% capital buffer). For banks in group 1 at the end of 2009 the deficit was 577 billion euros and 25 billion euros for group 2.

▪ The average coverage ratio of group 1 was 83%,and of group 2 was 98%.

▪ Average NSFR for group 1 was 93%, and for group 2 was 103%.

Deadlines are set to meet standards for 2015for LCR and 2018 for NSFR. Location below the minimum of 100% is necessary to achieve these standards ,*suggests that a large number of banks are vulnerable to liquidity in times of stress*. The Basel III objectives focuses capital and liquidity standards that will gradually rise to a high quality to reduce unstable funding structures. The transition period provides sufficient time for banks to move to new standards in a manner consistent with economic recovery.

4. A new capital standard

Minimum capital requirement will be raised from the current 2%, to 4,5%, phased in by january 1, 2015.

Tabel nr.1. Capital requirements (%)

	Equity after deduction	Tier 1 Capital	Total Capital
Minimum capital	4,5	6,0	8,0
Buffer capital	2,5		
Minimum and buffer capital	7,0	8,5	10,5
Cyclical capital	0 – 2,5		

Source: www.riskcapital.com

Tier 1 capital requirement, which includes equity and other financial instruments qualified stricter criteria, will increase from 4% to 6% over the same period.

The buffer capital is calibrated to 2,5% of equity after the application of deductions. The purpose of this type of capital is to absorb losses during periods of financial and economic stress.

The cyclical capital is set between 0-2,5% of equity applied in accordance with national circumstances. Purpose of this reserve is to protect the banking sector during periods of excessive credit growth that leads to the accumulation of risk in the system. Countercyclical buffer appear as an extension of *buffer preservation capital*. These capital requirements are supplemented by a leverage ratio of risk that will be used to accurately assess the range of banking risks. A first test, performed in several times, considered a minimum rate of 3% of capital tier 1. Based on the results and made final adjustments. For systemically important banks developed an integrated approach could include combinations of capital surcharges, contingent capital and debt relief. Since the start of the crisis, banks have undertaken substantial efforts to raise capital. However, preliminary results of the impact study shows that large banks will require a significant amount of additional capital to meet new requirements. Smaller banks, which are particularly important fit the SME – sector lending, for the most part already meet these higher standards.

National implementation of Basel III by member countries will begin on January 1, 2013, they are required to translate the rules into national law before that date. Starting January 1, 2013, banks will have to meet the following minimum requirements in terms of risk – weighted assets (RWA):

- equities / RWA = 3,5%
- capital Tier 1 / RWA = 4,5%
- total capital / RWA = 8,0%

Total RWA calculation is based on a complex weighting system that takes into account credit risk (MR) and operational risk (OR):

$$RWA = \{12,5 (O.R + MR) + \beta * \text{SUM} [w (i) A (i)]\}$$

where $w (i)$ is the risk weight for asset $A (i)$.

Credit risk is the sum of different asset classes, each weighted by appropriate risk weight. The multiplication factor (β) is esti-

mated at 1.06, based global quantitative impact study (QIS) and will be updated periodically.

Tabel nr.2. Timing of implementation
Source: www.riskcapital.com

Requirement for minimum equity and Tier 1 (systemic risk) will be introduced gradually between 1 January, 2013 and 1 Jan.

	13	14	15	16	17	18	19
	Implementation period Jan 2013 – Jan 2017						
Minimum equity	3,5	4,0	4,5	4,5	4,5	4,5	4,5
Buffer capital				0,6	1,2	1,8	2,50
Equities , plus buffer capital	3,5	4,0	4,5	5,1	5,7	6,3	7,0
Adjustment covered		20	40	60	80	100	100
Minimum capital Tier 1	4,5	5,5	6,0	6,0	6,0	6,0	6,0
Total minimum capital	8,0	8,0	8,0	8,0	8,0	8,0	8,0
Total minimum capital plus buffer capital	8,0	8,0	8,0	8,6	9,1	9,87	10,5
Capital Tier 2	Gradual elimination in 10 years from 2013						

2015 when it will stabilize at 4,5% and 6%.

Total capital requirement remains at 8,0% and may be supplemented by Tier 2 capital up to their elimination within 10 years.

Regulatory adjustments currently accepted maximum limit of 15% for investments in financial institutions, mortgage rights and the deferred tax timing differences. Since 2014, the ceiling will rise to 20 % and will increase annually in line, so the 2018 deductions will be 100% .

The buffer capital will be gradually introduced from January 1, 2016 and end of 2018. It will begin with a rate of 0.625% of RWA to January 1, 2016 and increase annually thereafter by an additional 0.625%, to reach the final level of 2,5% of RWA on January 1, 2019. Countries with excessive credit growth should consider accelerating the creation and countercyclical capital buffer.

Tier2 capital instruments to be phased out in a horizon of 10 years since January 1, 2013 decreasing at a rate of 10% annually.

In addition, instruments to be redeemed will be removed from their actual due date.

Capital instruments that meet the following three conditions are: issued by a corporation Tier 1; are treated as equity in accordance with accounting standards in force, are recognized as part of Tier 1 capital in accordance with national law will be removed gradually from equity and capital will be placed in category minimum capital Tier 1, from 2013.

Liquidity coverage rate (LCR), after an observation period of minimum standard will be introduced on January 1, 2015.

Net lending rate steady (NSFR) will be subject to observation from 2012 and will apply the minimum standard in 2018.

Monitoring during the transition period is intended to examine the implications of these standards for financial markets and economic growth.

5. Estimated impact of economic growth

Introduction of new rules sparked a wave of reactions from the banking groups. Extension is in fact an old dispute: regulated versus free enterprise. It is hard to believe that this issue will reach a consensus once, but global financial evolution itself requires regulation and free enterprise must be manifested in this framework.

Basel Committee on banking supervision initiated a study showing the following:

✓ decline in GDP in the G-4 owing to increased regulatory level - **0.38%**, in a period of 4,5 years.

✓ decline GDP in the same area and period without introducing new regulations - **3.1 %**.

The conclusion of the study show that sacrifices optimal and results much higher benefits. These benefits result not only from a stronger banking system in the long-term but also a greater confidence in the financial system. Over a period of time, the positive effects of rules requiring banks to increase the quality and quantity of capital and liquidity reserves will exceed the costs by increasing the soundness of the financial system and reduce the probability of another crisis like the recent bank which was the worst in 1930. The report of the IIF Washington organization, which represents more than 400 financial companies in more than 70 countries said that keeping the old

financial rules would compromise the establishment of *aprox. 9,7 million new jobs*.

6. Conclusions

Fundamental regulatory and supervisory reforms are currently underway – both international and european – the causes which led to the current financial crisis and prevent their recurrence. In this context, *a range of policy approaches have been developed* in order to to alleviate the burden on taxpayers and *minimize the future use of public funds to rescue financial institutions*. To improve *crisis resolution mechanisms* to reduce moral hazard and build financial buffers against possible future crisis, the G20 meeting in June 2010 in Toronto, is committed to developing a new policy framework . In this context *financial sector should contribute to fair and substantial risks and possible government intervention* where they repair the financial system. Countries intending to implement measures for this purpose should meet a number of principles :protecting taxpayers ;reduce risks in the financial system; ensuring the flow of credit both in times of growth and crisis; considering the circumstances of each country, promoting confidence in the financial system,creating national systems in the *financial sector will bear the net cost of a crisis financial*.

Likewise ruled and the European Council: member state should introduce systems of taxes on financial institutions to ensure fair competition and set incentives to reduce systemic risk. Such fees should be part of a credible resolution framework. So far, eight EU countries have introduced a number of charges: Germany, France, Latvia, Hungary, Austria, Portugal, Sweden and United Kingdom. Wide national tax already is large. Thus the application of a global tax on financial transactions as a means of reducing the size of the financial sector and discourage excessive risk taking.

The European Commission has proposed a fee of *gross financial activities (FAT)*, to be levied on profits and wages ,which could be adapted to **changes** in behavior of banks, bot could be the most effective way to raise money to strengthen the public balance sheets,which were severely affected by the financial crisis. Some countries, France, Austria și United Kingdom, introduced a

threshold over which banks are subject to tax. Many countries such as Hungary, have expanded the scope of the tax and other financial institutions such as insurance. As interpreted EU, collection of taxes is directly related to the objective to recover rescue costs (contribution ex-post), or long-term establishment of a rescue fund (contribution ex-ante). *Impact on moral hazard, however is uncertain*. On the one hand, excessive risk costs incurred will be immediately supported by the financial sector. This approach is fair if the funding is affected, at least in part, the sources of systemic risk, such as excessive leverage, taking risks and maturity mismatches, etc. *Examples of different approaches*: rate proportional to the size of financial institutions (Germany); different rates for different types of institutions such as insurance companies, brokers and dealers (Hungary); lower rates for long-term financing (United Kingdom). On the other hand, there is a rescue fund may induce moral risk circumvention because there is a safety net for the financial sector is explicit. Ex-post tax system is already used by some states. An example of temporary taxes on bonuses paid in the financial sector in the UK and France in 2010. As a tax based is used, as appropriate, net liabilities, equity and other financing sources. *Parameters of tax, the rate and scope*, differ considerably from state to state.

This raises the problem of distortion of competition in the short-term as long as banks have cross-border activity. On this issue, the European Commission agreed that "in accordance with Council's report, there should be further coordination between different tax systems to avoid double taxation". In all member states that have bank charges, there are different approaches to the institutions that fall within the scope of the tax base. This variety of approaches leads to a lot of overlap and possible tax lacune. Potential risk of double taxation is particularly high when member states introduce new charges to cover subsidiaries in other countries.

Bank Stress Tests Methodology Used in the Euro Area

Costică Vlad

Ovidius University of Constanta
euro_financial_consulting@yahoo.com

Abstract

The current financial crisis imposed farms interventions of the state and banking authorities especially in economically developed areas. Difficulties of american financial system were moved rapidly around the world, most affected was euro area whose banking system is closely related to the american with an exposure of 60%. Therefore the ECB were taken immediately measures to rescue the financial system and prevention for such situation is not repeated in future. One of the most important tools developed is the “stress test” which check, especially, european banks` ability with border activity to face a new crisis. Test methodology is based on the comparative analysis of the banks evolution simulating two scenarios. Construction of basic scenario was done on statistics collected by the end of 2010. Based on these were issued medium-term forecasts on macroeconomic developments for the euro area and EU. Adverse scenario is built in order to capture macroeconomic developments worldwide. The reasoning takes into account interactions between world economies which transfers at global level both incentives and negative aspects. The results obtained revealed the gradual consolidation of the banking system.

Keywords: bank stress test, systemic risk, reference level of capital, sovereign risk, margins of adjustment.

J.E.L. classification: F30, G01

1. Introduction

Stress test, which is based on methodology developed by the European Banking Authority (EBA), is an important tool of surveillance used to evaluate *european banks resistance to severe financial shocks*. Objective methodology is to develop a single

instrument for preventive detection of vulnerabilities of banking sector in E.U. and on this base taking appropriate measures for approach deficiencies. The test is applied in a coherent way to european banks assigned to the systemic risk *Core Tier 1*. According to the ECB definition, *the systemic risk* “is the inability of an institution to fullfill their obligations on time and determine by this the inability of other institutions to meet its obligations on the due date. Such a situation can cause contagion effects (for example: major problems of liquidity or credit), threatening the stability of financial system or confidence in it. Inability to meet its obligation may be due to financial and operational problems”. Classifications of ECB placed U.E. banks on two levels of systemic risk:

✓ Level-1(**CoreTier 1**), includes large banks who have a capital of *3 billion euros*, are *well diversified and internationally active*. They represent *65% of E.U. banking assets*.

✓ Level-2 (**CoreTier2**) includes *169 other smaller banks and less active internationally*.

The stress test aimed primarily banks at the level 1, which, by volume and transactions value that runs can transmit in banking network contagion effects large both domestically and across border, which would affect financial stability at planetary scale. Generally the test is designed to verify banks capacity to deal with systemic risk both in predictable economic evolution and in conditions of manifestation of the crisis phenomena. He opted for a standardized form of test to become an instrument of comparison between banks.

In this sense are built two scenarios in the period 2011-2012:

➤ *basic scenario*, which is forecast for the time horizon considered for macroeconomic developments for the euro area and E.U.;

➤ *adverse scenario*, which takes into account confounding factors most likely to

manifest globally and are calculated as deviations from the basic macroeconomic scenario.

The first stress test was performed in 2010 and used a total of 149 informations on trading activity and banks` balance sheets, so a low degree of transparency , comparable to that before the crisis. Actually the banking opacity is considered one of the major causes that triggered the crisis. The low level of banking supervision allowed to bypass rules as if Basel II norms. Conclusion of the test in 2010 was that the financial stability need much more data,situation was corrected in 2011 when was requested 3200 informations. In this context put the question of the compliance banking secrecy. Between one that led to the crisis and a real financial stability for the latter option was chosen.

The main features of the stress test Core Tier 1 for 2011:

- benchmark capital 5%;
- assumptions and clear definitions for building scenarios, basic and adverse;
- rules for determining the quality of capital;
- treatment of exposure to sovereign risk and the financial banking book;
- treatment of financing costs and administration;
- adjustments to sovereign exposures when market developments is adverse;
- treatment of interest income;
- treatment of risk-weighted assets (RWA) in the trading book;
- using historical averages of 5 years to determine trading income;
- establishment and use of provisions and reserves.
- offer unprecedented transparency in the E.U., using 3200 bank informations including sovereign risk leading to increased *market confidence* and the construction of an instrument of comparability of great accuracy.

2. Comparative analysis of stress tests in 2010 and 2011

Both tests were conducted on a sample of 90 banks from 21 E.U. countries, assigned to level 1 of systemic risk. Were applied two standard scenarios imposed by the methodology and was used as a benchmark 5%. The difference is the quantity of data used. At the

end of the 2010, a total of 25 banks were below the reference threshold of 5%, and 16 above but very close to this threshold. Most banks (51) were in the range 7,4–8,9%. European Banking Authority has set a deadline for improving the financial situation, in April 2011.

Tabel nr.1. Test results

CT-1	2010	2011
< 5%	25 banks	8 banks
5-6%	14 banks	16 banks
>7%	51banks	66 banks

Sursa: European Banching Authority

During this period banks involved in stress test have increased their capital by 60 billion euros. Capital increases are consolidated banks concerned, situation reflected in repeted stress test in 2011 when the number below the reference threshold was reduced to 8 (one < 2%, two between 3-4%, five between 4-5%). There remained a significant number of banks in interval 5-6% which in any event of unforeseen systemic risk can fall below 5%. Other banks have a sound financial condition shockproof large hovering ranges: 5-6% - 16bn, 6-7% -18 bn, 7-8% - 11bn, 8-9% -12bn, 9-10% -7bn, >10% -18bn. Compared with 2010, when the maximum was 8,9%, not more than 37 banks have exceeded this threshold.

Conclusions test in 2011

Extent of the investigation has surprised all *financial* and *business risks* that may occur in the E.U. banking system;

- strengthening the banking system in terms of equity positions or other financial or non-financial transactions;
- cover risks, including the sovereign, may be made in situations of extreme manifestation of adverse assumption.

Actions following the E.U. banking supervisors .

- presentation to 15 october 2011 of plans for banks situated below 5% to exceed this threshold;
- strengthening the banks positioned in the range 5-6%;
- submitting *reports* to the EBA (*february și june 2012*) on implementation recovery plans that provide a detailed overview of measures taken;

- measures to *strengthen capital levels of banks in the country of origin standards provided*: extending funding maturities, increasing liquidity and developing contingency plans if necessary.

3. Treatment exposures.

a) Treatment of exposure to sovereign risk and financial ones. Fundamental credit analysis evaluate the scenarios impact on sovereign debt in the banking book based on the *probability of loss (PD)* and exposure to *credit risk (LGDs)*. Standardized risk calculations cover both *expected losses (EL)* and the *loss calculations(UL)*.

b) a coherent approach to sovereign risk exposure and financial ones:

- AAA/Aaa highest level of credibility;
 - AA / Aa2 la A-/ A3
 - BBB + / Baa1
- CCC the lowest level credibility.

Credit rating agencies provide periodic assessments of country risk. Last rating in June 2011 for EU countries, reveal a consistent recovery after crisis, with no notation CCC, and the outlook is regarded as “stable”. Romania, for example, is framed on the BB+ (Fith Rating) which corresponds to a probability of loss of 3,34%.

c) Treatment of financing costs:

- *interest rate tend to increase*, which apparently has a *positive impact* on profits, but requires a careful treatment of interest received from loans and capital costs involved for the purchase.
- supervisors create control devices applicable to financing on the interbank market especially when the border is.
- *retail financing and official costs of financing*. EBA recommends that guidelines for the retail lending rates: application rate on *overnight* loans, and for *deposits* the reference would be *half the expected cost increase official financing market and half of the increase of the spread of sovereign loans*.

d) Adjustments to sovereign exposures:

- periodic assessments of sovereign bonds and the spread whichever reveal some significant short-term changes which require periodic reconsideration of the portofolio.
- changes of portofolio not automatically imply optimizing macroeconomic scenario *which is designed to understand the impact*

of hypothetical changes in extreme circumstances the banks.

e) Treatment of risk- weighted assets (RWA). Quantitatively they have reached a weight of 40% in portofolio following crisis. *Quality assurance process* revealed important differences between internal estimates and therefore offered a model to estimate the adverse scenario. It suggests applying a *scaling factor of 2,5*.

f) Treatment of interest income in the trading book. Because trading shocks occurs *instantly*, the methodology, allows to calculate the average income trading their last five years for all financial instruments. Reference used to determine *appropriate levels of interest income* on sovereign exposures in the trading book: applying a minimum two year adjustments to sovereign exposures or adjust existing *different exposures according to maturity*, and then include interest income of the trading risk-free rate.

4. Basic macro-economic scenario

Basic scenario construction was done on statistics collected by the end of 2010. Based on these were issued medium-term forecasts macroeconomic euro area and EU accept the new value the years 2011-2012. The main indicators considered representative are:

a) GDP was estimated amid continuing *economic recovery in the EU*, which at the end of 2010 was above forecasts. It is estimated an increase of 1,5% and 1,8% for euro area and 1,7% and 2% for the whole EU. Note that if recovery is a certainty at the aggregate progress of member state are not uniform.

b) With the economic recovery *situation on the labor market begins to stabilize in the EU*, with a modest improvement over the orizont. *The unemployment rate will decrease from 9,5% to 9% in 2012*. General conditions are rated as stable but implementation of policy measures taken in response to the recession and structural adjustment is conducted at a slow pace that does not give the possibility rapid improvements in this market.

c) *Price increase* is estimated to be modest at EU level, of 2% and 1,75%, for the euro area of 1,75% for both years. Inflation will be kept under control even if there is an

upward trend in commodity prices, agricultural products, administered prices and indirect taxes in some member state.

d) On a global environment fund return, concomitantly with the consolidation of public deficits member state begin to decline. In 2010 half of EU member state have reduced deficits decreased compared to 2009, and the next period all states shall take measures in this regard. For the EU overall, expects a deficit of 5% of GDP in 2011 and 4,25% in 2012. A further fiscal consolidation is necessary to improve the policies adopted which are essential to establish a solid basis for sustainable growth and creating jobs. Turbulence on sovereign debt market have disappeared in the absence of strong political action may recur.

e) Changes in interest rates forecast reflects investor concern that financial asset prices will rise. Short-term interest rate in the euro area are expected to rise gradually to 1,5% and 1,8% and in the long-term to 2,5% and 2,7%.

f) Based on U.S. monetary policy and projections for the euro area is expected to trend exchange rate EUR/USD around 1,39.

Tabel nr.2. Expected evolution

Indicators (%)	2011	2012
EU – 27		
GDP	1,7	2
Unemployment	9,5	9,1
Inflation	2	1,75
Public deficits	5	4,25
EURO AREA		
GDP	1,5	1,8
Short-term interest rate	1,6	1,8
Long-term interest rate	2,7	2,7
Unemployment	10	9,6
Inflation	1,75	1,75
Public deficits	5	4,25
Report EURO/USD	1,39	1,39

Source: European Banking Authority

Ascending phase of economic recovery have yet seen in moderation. If in terms of increased exports, the traditional first step of recovery, was solid, the next phase of investment demand, is still a modest evolution.

5. Adverse macroeconomic scenario

Adverse scenario is constructed to capture macroeconomic developments worldwide. The reasoning is considering interactions between world economies that the global transfer incentives and negative aspects. Scenario time horizon is 2011 and 2012 and captures the deviation of macroeconomic variables that have value in the basic scenario. Scenario represents *pessimistic variant* synonymous with a return to the forefront of the causes of economic and financial crisis generated it. Of the many possible causes have been retained as having a major negative impact following:

The high level of sovereign debt in the EU is in unstable equilibrium;

- ✓ Drastic reduction in world demand caused by a severe recession the U.S. economy;
- ✓ U.S. dollar depreciation against other currencies.

a) *Aggravation crisis* sovereign debts in EU will have profound effects on domestic demand and the effective functioning of financial markets. *Worsening fiscal position and their reluctance to strengthen the economy will enter a state of uncertainty effect which translates into loss of confidence of investors and consumers.* It is assumed that average interest rates on long-term euro area will grow by 7,5% and 6,6% in the rest of the EU. The effect on sale price will drop, estimated on average by 15% in euro area, and with 14% for the EU as a whole. At long-term government bond rates and sale prices believed to be modified in the first quarter of 2011 and then remain constant. *Housing prices* will fall differently in each country according to local trust level. With the worsening crisis in the EU *sovereign debt expected return tensions on european money market*, contributing to short-term interest rates on interbank markets by 12,5% similar with the scale was in period of deep crisis. Impact on domestic demand shocks sovereign extends to consumption and investment will decline in the euro area by 1,4%, and 4,5%.

b) *The severe recession of north american economy* is due to specific damage confidence following the introduction of restrictions on government spending. The shock will be transmitted to the rest of world economies and the EU preference. The

effects translate into lower private investment and consumption by 2,2% and 5,6%.

c) *U.S. dollar depreciation* is estimated at 4% in nominal terms. Basic materials and oil, which is related to the currency trading to experience price increases. A study in the euro area shows that the effect of spreading the oil price increase to 80 euros/barrel average price induces a mean price of energy products, with 38%.

Consider these shocks in the banking system testing will reveal its resistance level and allow preventive measures.

6. The event effects of adverse scenario in euro area and EU

Analysis of negative effects on EU countries combined effects of specific environmental impact external shocks transmitted through trade and financial channels.

a) *EU specific shocks* have strong effects on european GDP that would reduce by 1,3% and 1,5%. Transmission impact of EU specific shocks in external environment involves a reduction in real GDP in the world by about 1,5% in 2011 and 0,3 % in 2012. As a result of damage to EU exports in world GDP will decrease by about 2% on average for both years.

Tabel 3. General effects combined, deviations from the basic scenario.

Area/ Country	GDP growth		Inflation rate		Unemployment rate	
	2011	2012	2011	2012	2011	2012
EU	-2,1	-2,0	-0,6	-1,3	0,5	1,4
Euro area	-2,0	-2,0	-0,5	-1,1	0,3	1,2
Non-euro area	-2,4	-1,9	-0,7	-1,9	0,9	2,3
DE	-3,1	-1,5	-0,4	-1,0	0,1	0,6
FR	-1,2	-1,6	-0,3	-0,7	0,1	0,6
RO	-1,5	-1,7	-1,4	-2,6	0,1	0,4

Sursa: European Banking Authority

b) *The impact of negative changes in the external environment.* Their EU propagation will reduce GDP by about 0,8% and 0,5%, and HICP inflation increased with 0,5%, and 0,7% for both years. Combined these two sources of shocks generally have the effect of a reduction in euro area real GDP by

about 2% in both years. *The combined probability* of risk event listed is estimated as follows: for GDP, less than 1% in 2011 and about 4% in 2012, and for inflation of around 10%. The side effects listed on the manifest with *large government bond yields and house prices.* Depreciation yields bonds, calculated as a deviation from the reference basic scenario, is for the EU of 6,58%. Housing prices will drop, across the EU -3,8%.

7. Market risk parameters

The stress test requires banks to make a projection of gains and losses from trading various financial instruments: interest rates, exchange rates, commodity prices and capital, volatility and dividends. All they cover a large segment of the market and therefore requires the calculation of risk parameters calibrated by the ECB under adverse macroeconomic scenario. The parameters considered representative of the macrofinancial level, will be introduced for each case in model market risk equation based on *Standard information criteria combined* to ensure that banks bear the shocks in accordance with economic-theory. As the forecast horizon covers two years and trading is designed as an instantaneous event risk, the parameters are set within a mapped value of minimum/maximum accepted during the forecasting period (2011-2012).

Parameters for emerging markets have been calculated on a sample of countries considered sufficiently representative and to elaborate an overview over a long period of time. The risks who affects the group "other developed countries" have been calibrated as a weighted average of shocks in the euro area, U.S.,UK ,and Japan (G-4). For market risk parameters to consider a dispersion 0,25/0,75 to the basic forecast. Percentile choice is motivated by the need to take into account a possible excess of market risk and to mitigate the impact of uncertainty on model results. *Market risk parameters* pentru depend on the assumption for each scenario considerate evolution of macro-financial variables.

Assumptions of basic scenario

- european stock prices are expected to record a decrease to 15%;
- american dollar will depreciate by 11% against the major currencies;

- short-term interest rates will increase by 12,5%;
- euro area sovereign bond yields will rise on average by 7,5% in the long term;
- commodity prices remain capped;
- market liquidity and counterparty credit risk are calibrated separately on other documents prepared by EBA.

At *macroeconomic level* increased risk of commodity price shock and other transient expression was estimated at 5%.

Assumptions of adverse scenario

Risk scenario are calculated as deviations from the basic macroeconomic specific scenario. ECB prepared for the standardized approach, risk tables with values for each EU member parts-sell credit, foreign exchange and sovereign bonds. For example, *euro area sovereign bonds will register a growth* in average interest adverse scenario of 5,1% for maturities of one year and by 7,6% to maturity of fifteen years. Romanian state bonds maturing in 10 years will have a cost of 8.7% lower than states such as Spain (14,6%).Greece(17,1%) and Ireland (19,1%).

Margin adjustment construction is influenced by two main factors :increased credit spreads are rising sovereign risk –free interest rate of the base. Treatment of sovereign debt exposure, having baths large share they hold in portfolio assets must be analyzed under two distinct aspects: overall risk of interest rate differential between the rates as country-specific credit accordance to standard tables produced by the ECB. To sovereign risk exist indirect exposure, for positions CDS (credit default swap) which are protection contracts of credit risk. These contracts are the favorite target of speculative attacks and acts therefore the risk of default or event of interest rate risk.

8. Conclusions

The financial crisis has fundamentally changed the thinking and approach to economic phenomena . If the event until crisis is considered sufficient for a sustainable intervention by certain macroeconomic levers to combat the negative effects was used in a series of *unconventional measures* , general administrative tasks such as stress testing , Basel III regulations , provision of funds to combat future crisis ,etc . An important

aspect is to use stress tests to a incredible amount of information that were previously combined under the umbrella of bank secrecy

Perpetuating an attitude opaque when humanity supports dramatic effects of the crisis would mean total loss of credibility of the financial system . Risks induced by the financial crisis on real economy and sovereign debt level will show the long term and will require costly .

Innovation in Financial Services – A Theoretical Approach to Sustainable Structural Change

Roxana Voicu-Dorobanțu
Călin Adrian Cantemir

Faculty of International Business and Economics, Bucharest Academy of Economic Studies

rovodo@gmail.com
cantemir_calin@yahoo.com

Abstract

The present paper presents a theoretical analysis of the approaches on innovation as a determinant of organizational change. A relevant area where technology has produced many effects, bringing the need for innovation in services offered is the financial sector. Following a review of theories on innovation and its propagation, the paper presents the impact on payment systems, highly affected by innovation especially in recent decades and the impact on banks, which occurs much more specifically in the form of structural alteration.

Keywords: Innovation, electronic finance, payment systems, banking systems

J.E.L. Classification: O31

Introduction

From an organizational point of view, innovation can be defined as the adoption of new ideas for the foster organization ([1]). Modern literature on innovation begins however with Abernathy and Utterback, developing further through the contribution of authors such as [2], [3],[4], [5] [6] and [7]. Innovation is defined as a combination of invention and marketing, forming the basis for competitiveness ([8], [9]), namely "the adoption of ideas that are new to the organization that adopts them" ([1]). There are several types of innovations: technical, administrative, product or process innovations ([10], [11]). It is extremely important to identify not only the transformation of technological innovation of products, but also new ways to provide

services, by incorporating the information, processes and new procedures in the conduct of normal activities.

[5] speaks of, an “active inertia”, where companies that do not use their innovative potential may face a situation where unused innovation sources are sources of organizational rigidity, and even limiting their ability to enter new, small markets , ([12]). Disruptive innovation has been considered a creator of new markets, each proposing alternatives to value, with notable observations [13] on the way in which “architectural” innovation destroys current capabilities. Technological development usually consists of periods of experimentation, in which exploration and assimilation of new information is essential, followed by periods of acceptance and implementation of a dominant design. In these circumstances, we can identify several elements:

New market entrants have an advantage because they have fewer innovative constraints

In industries with high change rate, there is a “window of opportunity” rather than a benefit from first entrance, in which the first in may lose ground to other competitors with higher adaptive capacity and appropriate resources.

The opportunity to create new capacity is limited

Firms entering a market, in the “learning windows before the emergence of a dominant design, are less at risk of leaving that market ([14]).

The concept of industry or sector is a constraint in the disruptive innovation period ([15]), causing the existence of unidentified

risks, particularly by failure of companies to identify candidates in a fair way .

A commoditization can be seen as markets matures, usually caused by persistent excess capacity, increased competition, availability of capital, the desire to increase economies of scale and the existence of exit barriers. ([16], [17])

The competition increases in the, “intangible” domain, unlike previous periods in which competition was at the price level or product respectively service performance.

A company must use a wide range of business development strategies such as alliances, joint ventures, licensing, capital investments, acquisitions and mergers, to perform optimally over the life of a technology. The intended purpose of these strategies is to ensure capacity, forming alternatives to internal growth of organic nature. Potential, feasibility and effectiveness of such measures are determined by the context in which they are applied, such as use of network effects, the emergence of innovative clusters, academic influence or effectiveness of government policies ([12]).

Government policies directly and indirectly affect the availability of critical resources and development of new capacities by reducing the risks for other participants by promoting dominant designs and standards, intellectual property protection, transforming the state into a first adopter of new technologies, offering tax advantages for risky investments or increase efficiency, transparency and openness of markets.

Turning innovation into value depends on a number of dynamic elements that can be grouped into three categories ([18]), namely:

1. dynamics at the organizational level: acquisition and allocation of resources, technical efficiency, filtering information, response to innovation, capacity development, competition and profitability

2. dynamics in the market: *increasing competition*, market entry and exit of firms, technological evolution, risk aversion or sympathy, the emergence of dominant standards, adoption of new technologies

3. contextual level dynamics: network effects, social change, expansion of market opportunities, the effects of government policies, academic influence, availability of resources, the emergence of innovation clusters.

The impact on payment systems

Regarding the developments in payment systems, there have been identified three types of innovations that can increase efficiency, namely: technological, regulatory and financial innovations. Technological innovations may include payment processing facilities consolidation, outsourcing of operations, checks modernization, decentralization of payment systems. These translate into fewer facilities in order to benefit from economies of scale and cost reductions. For example in the United States this consolidation has been made, and in Italy, the central bank replaced Memoranda adjacent to Ingresso nad Retail payment systems with the BI-REL system starting from 1998. The same can be observed in Spain, with the replacement of provincial clearing houses with the National Electronic Clearing System in 1996. TARGET system in Europe is another example of efficiency, based on voluntary use by central banks of a unified platform, shared with the major objective of ensuring cost-effectiveness (ECB, 2002).

Hybrid systems, such as the Paris Net Settlement (France), New Clearing House Interbank Payment System (USA) and RTGS Plus (Germany), dominated for a while the national payment systems. Classified into two categories by, they aim to finally reduce the risk of closing the transaction and reduce the cost of liquidity for payment systems with high values and include:

“**CNS - continuous net settlement**” - with net continuous compensation - similar to “**DNS - deferred net settlement**” - different net clearing systems, but using an electronic algorithm that checks if the net amount of flow of a participant fits within the balance of his account, and if the conditions are met, allows payment. “**Queue - augmented RTGS**” - clearing systems for more payments simultaneously. Subcontracting of the management system to an outside entity has as objectives the reducing costs, the gaining of experience or the reduction of the impact of of non-essential functions of Central Banks (Sveriges Riksbank, 2002), as is the case with the compensation scheme in New Zealand whose hardware system was moved outside the national territory (Reserve .Bank of New Zealand, 2001)

In contrast, there is a relatively large number of central banks that prefer to operate under their own inter-bank RTGS systems in order to maintain financial stability and market confidence. Technological innovations can be identified in the modernization of processing checks, including using the Internet, or in the permissiveness processing of multiple compensations, which significantly reduces time for processing and allows the provision of information in real time. In relation to the theory of networks there can be identified approaches such as the case of Finland where interbank funds transfer systems are based on network type infrastructure, which are integrated with banks' payment systems

Innovations in regulations focus on creating a policy framework to improve the efficiency of payment systems. These include:

1. Legislative changes - legislation can be explained by clearly defining the role of central bank in the payment system. The central bank may designate a system of strategic importance and therefore may require more stringent control regime over it, or take measures to collect statistical data and information.

2. Transparent pricing policy - as in the United States. The degree of transparency or opacity of pricing is one of the criteria of heterogeneity between central banks worldwide.

3. Cost calculation applications - helps better management and resource allocation. These - applications can be of two types: systematic or ad hoc. An example is the systematic approach of the U.S. Federal Reserve PACS system (Planning and Control System), which has three major objectives: to identify the total costs of services provided in a uniform manner for all central banks, accounting integration costs and budgets and providing consistent basis for measuring the performances of central banks.

4. Associations of payments – often with a non-profit association regime, they help the industry cost-sharing and promotion of private initiatives to improve the efficiency of payment systems. This type of organization can be found in Australia, Canada and Britain, with similar institutions in Korea and Ireland.

5. Measures of value migration - involves removal of high value transactions from the retail area to operations with large values in order to reduce systemic risk. This involves setting ceilings for payment systems under retail.

Financial innovations are focused on creating liquidity in payment systems with high values and in compensation systems. These may include the potential use of private substitutes for central bank funds to offset transactions. Also in the financial innovations category, the hybrid systems can also be included.

The impact of electronic financial transactions on banking

One fast-growing industry in the financial sector refers to banking products and services packages, and is known as on-line banking. To maintain market share, many “brick-and-mortar”(banks with exclusive presence in the “real world”) have become “click-and-mortar” by adding the Internet to their methods of delivery. Specialized studies revealed that all the world's top 100 banks are offering online services for companies or individuals. Advantages of adopting Internet banking solutions are multiple: both prices and costs involved in their production are reduced. The fact that each customer can pay bills and check the online personal account reduces the time needed for processing a check after it was filed or required to pay, which amounts to an increase in efficiency of up to 25%. For example, if the client (be it individual or a company that accepts checks as a means of payment for products and services) and the check processing bank then sends it to collect funds, they will get faster over the Internet than by that of traditional means of transmission (fax, telex, etc.). Reducing this time period allows the release of funds that so far were blocked, while simultaneously reducing a company's claims. To the extent that these claims are recorded in the company's account far faster than before it can receive interest on a longer period of time. Another advantage is that information on account of personal accounts is always available, regardless of the work program of the bank, usually transfers being allowed even while the physical offices are closed. Also, the Internet enables banks to

increase their customer base, by having access to a much wider area than that which could be achieved by subsidiaries created. This may be a risk because it increases the level of competition that banks generally face, especially since the online market and participants are non-existent in the "real". This increased competition leads to the need for augmentation of the range of products and services, many of which need to be adapted or designed specifically for virtual area, such as, for example, credit cards online with instant acceptance. There are a number of risks of accessing on-line banks (non-click-and-mortar or online only), the most frequently mentioned being that of insecurity. Another risk is that the value of a subsidiary will decrease, but not to zero, as expected in the reports of the "Internet era" (1995-1999), having in mind the not so impressive evolution of exclusively online banks. Since the late '90s, the Bank for International Settlements (BIS), proposed a series of basic principles for reducing risks in the systems of electronic banking services and products, namely:

The Creation of a system of tracking electronic banking activities

1. Creating a process management system of subcontracting the relationships and dependencies with and third parties

2. Segregation of duties, databases and applications between the electronic system and the rest of the banking system (measure which was given up once the full integration of e-banking among the bank's usual activities)

3. The existence of measures and control the electronic authorization

4. The existence of the possibility of a clear audit of the electronic system, specifically the e-banking transactions

5. Authentication of each entity and counterparty data from the electronic banking

6. Responsibility for each transaction carried out online

7. A system of comprehensive security control system

8. The integrity of transactions and information on e-banking

9. Complete and transparent information on electronic banking

10. Maintaining client information privacy principle

11. The existence of continuity and contingency plans to ensure availability of electronic banking systems

12. Incident Response Plan

13. The role of the supervisor to ensure a clear and correct image on the management structure, internal controls and contingency plans of e-banking activities.

As we mentioned, there are two types of banks, which perform their daily activities using the Internet as a means of delivery:

Hybrid banks (click-and-mortar), comprising on-line services with the "real" and banks existing exclusively on the Internet.

Hybrid banks enjoy a well-known brand name, which gives confidence in their services among customers. Banks such as Wells Fargo or Bank of America provide banking and other financial services through their website, applying for a monthly subscription service makes it possible to use online bill payment service, or a commission, both of much lower value than if the transaction is done through traditional means. Physical presence is supported by a network of ATMs, especially the existence of local branches 'real', giving the client safety. By implementing an online solution, small, local banks, have the ability to reach national customers with quality services, generally using a sub-contractor to establish on-line connection, which reduces costs compared with a large bank, which usually builds its own platform.

The second type of bank is the one existing only on the Internet. The first of which we can say that is really an online bank is the Security First Network Bank (SFNB), which began trading in 1995 in Atlanta. In addition to assuming a pioneering role in terms of Internet banking, the company acquires two others they buy, and create a new company: Security First Technologies = S1, which was converted into one of the most important infrastructure providers for financial institutions offering a product called Virtual Bank Manager, used in most of the top 100 banks worldwide. Such banks record a lower profit margin than the spread between interest on loans and deposits, their costs are located at levels up to 10% of revenues, compared to brick-and-mortar banks or click-and-mortar where the minimum is 25%. They must accept

electronic deposits, because do not have a physical branch network and a transmission by mail would mean an extension of the period of processing the deposit, which is contrary to the principles of existence of such banks. The fact that they do not have brand presence as the brick-and-mortar or click-and-mortar banks makes such a bank to invest in Internet advertising and promoting their products and service packages much more than do other types of banks. To limit these costs, which in most cases, reduce the profit margin obtained by controlling cost and physical cost savings, some banks or entities providing electronic banking products and trying to establish a physical presence, as is the case E * Trade, which placed "interactive kiosks" where deposits are accepted. Other Internet banks offer their customers the possibility to use cards issued by them in existing ATM networks of "traditional" banks ", most times the fees that the client has to pay for ATM use being reimbursed by the bank. Another option to attract customers is to provide a minimum threshold of funds in the account, much lower than for physical banks.

One of the main products offered by banks is credit to individuals and businesses. Before implementing the Internet version, the search for favorable credit terms to all bank in the area of action of the customer was a long process, consuming time and money. As with other products, characterized by price and technical features, the electronic network made it possible to compare products in a very limited time and with minimal resources. An example of a company that provides online credits is E-Loan, where you can get real estate loans for buying cars, small and medium business and credit cards. The whole process of obtaining the loan is supported by a consultancy service, which allows users to ask questions or make comments on aspects of the product, the responses being prompt, some coming of the electronic support system (similar to Office Assistant package Microsoft Office) or from consultants employed by the site if the system does not recognize the question or has difficulty in giving adequate response. E-Loan is a "white label", site bringing together several products offered by banks and credit companies in their behalf, acting only as an aggregator of demand. There are also sites

that offer products of their own. This strategy is preferred in the case of less complex products, such as bill payments (customer pays the invoice to the local government via Yahoo! Finance site, without knowing that it follows the money trail to reach its destination as long as he receives a payment confirmation from local government). When E-Loan arranges a loan application provided by an affiliate, the client benefits from a program offered through the site that can follow the evolution of credit, namely the E-TRACK. Similar programs are used by websites selling physical products, such as Amazon.com, where customers can track delivery of the product purchased. When it comes to credit the aim is to track documents, the moment and the administrative area in which they need to be approved.

Conclusions

The literature offers a wide range of theories, models, strategies and development on innovation, seen as an effective way of acquiring organizational sustainability. Financial sector is one of the most affected sectors by continuous innovation, both in the services and the structures that are the basis of the business models. Innovation has specific ways of propagation and financial systems (banking and payments) are, by their network structure, extremely favorable to the pervasive and massive propagation of innovation. The paper identifies organizational changes in the international payment systems, in banking structures, and establishes for capital market investors behavioral alterations meant to facilitate innovation, and through it, the sustainability of those systems.

Money – Between Medium of Exchange and Institution

bvoroneanu@yahoo.com

Abstract

As one of the most debated economic concepts, with the biggest egos caused both in theory and in practice, but also one of the oldest realities, historically speaking, of the human society, it was inevitable that the money be portrayed us in different instances, depending on the emphasis on its functions (medium of exchange, measure of value, tool for preserving value), on the forms it wears, on the content revealed by the analysis of indicators and monetary aggregates (money supply in circulation), on the institutions which regulate it or on the relations that condition or intermediate it. Of all these instances, two stood in the centre of debates and of the theoretical and empirical approaches which animated the economic thinking: money as a medium of exchange and money as an institution.

Key Words: money, liquidity, medium of exchange, institution.

J.E.L. classification: B11 ; B12 ; B13;

1. Introduction

Monetary phenomena are in a permanent interdependency with phenomena in other areas of the economy and shows differences in terms of the nature and conduct, from an economic and social system to another and from one stage of economy development to another. To understand the meanings of ideas promoted by various monetary theories is necessary to fit them in the general context of economic theories concerning the functioning of that economy.

Accompanying our daily life, the money strongly reveals its social function. However, it remains an extremely complex concept, difficult to define and quantify. Defining currency can be done both in an indirect

manner, highlighting the functions they fulfil, but also in a direct manner, by revealing its content.

The functional (transactional) approach of the concept of money concerns the functions it performs. The antiquity has given us in the person of Aristotle not only one of the most prominent philosophers of humanity but also an accurate analyst of political community and its institutions. Within the contents of two representative works by the great philosopher (*Ethics Nicomahica* and *Politics*), are found defined the three main functions of money to which frequent refers the Classic School (Smith, Ricardo, Marshall):

- medium of exchange
- measure of value
- tool for preserving value

Modern analysis emphasizes that money can fulfil these three essential functions due to a property which was admirable revealed by J.M. Keynes: liquidity by excellence. Because of this quality, money represents for its owner a set of options. Unlike the other goods which are characterized by a degree of rigidity in terms of choice in their use, money provide to its holder a great opportunity to have a choice: at any moment in time it can be changed on other goods and services, it allows cancelling of debts, it can be saved etc.

In terms of content, the money approach based on analysis of indicators and monetary aggregates (money supply in circulation) offers two definitions of this concept. Thus, in a narrow sense, money include cash, time deposits and traveller checks, while in the broad sense, it also includes other quasi-monetary assets, being defined as the assembly of means of payment generally accepted in the exchange of goods and services or in the regulation of a debt.

There is an approach to the definition of money which aims to describe its features as

reflected in daily life. Money appears as a social convention, being widely accepted as a medium of exchange (in exchange for goods and services) within a community. Money is a belief shared by those participating in the exchange, by appealing to it they decrease its cost (with materials and time) comparing with the situation in which, every time, they should find a vehicle to make the exchange possible. Result of the individual initiatives (and further wearing the social robe), money becomes a widely shared belief; money becomes a religion [10].

2. The main economic theories about money

As historical evolution, the economic theories about money promoted or the neutral role or its active one in economic and social life. In this respect, between the value of money approach and the considerations concerning its role in economic systems, different correlations can be highlighted (sometimes even opposite), depending on the economic theories in which the monetary concepts are developed [5].

In view of the ancient philosophers, the value of money was conferred by law, being ignored the issues related to the pricing mechanism or to the relationships that emerges during the exchange between money and other goods. However, the ideas of ancient and medieval thinkers were the first attempts of quantitative approach of the monetary phenomena.

The issues ignored by ancient thinking began to show interest to the analysts of monetary phenomenon starting with XIV-XVII centuries with the appearance of a new economic doctrine - mercantilism - which emphasized the role of trade, the protection of gold and silver resources and the development of state. The representatives of this doctrine, militated for determining how the state to procure as large quantities of gold and silver. Spanish mercantilism (bullionism) promoted the prohibition of leaving the country of the precious metals and the increase of exports to facilitate the input of gold and silver. In this respect, the School of Salamanca (Francisco de Vitoria, Domingo de Soto, Azpilcueta Martin, Luis de Molina) is representative.

In France, Jean Babtiste Colbert (general

inspector of finance - France's Louis XIV) initiated protectionist measures for industry and trade development as a means of promoting exports. In England and Holland, mercantilism (commercialism) considered the abundance of money as the key of nation prosperity and promoting of foreign trade as the premise of its assurance. The main representatives: Thomas Mun (one of the creators of mercantilist system), William Petty (with three significant works for economic and monetary theory, *Treatise of Taxes and Contributions* - 1662, *Verbum Sapienti* - 1665 and *Quantulumcunque concerning money* - 1682) and James Steuart. Mercantilist concept was the basis for formation of national monetary system with gold and silver as essential standards.

French mercantilist precursors, the physiocrats (Richard Cantillon, François Quesnay, Anne Robert Jacques Turgot, Pierre Samuel du Pont) claimed that the wealth of nations comes from productive work. According to modern economic theories, one of the major weaknesses of the physiocrats is the idea that only agricultural labour is valuable. The physiocrats saw production of goods and services as a consumer of agricultural surplus, while modern economists consider them as productive activities that increase national income. Physiocrats were the first well-developed economic doctrine.

It was immediately preceded by the first modern economic school, the Classic School that debuted with the publication in 1776 of the famous work *The Wealth of Nations* of the great Scottish philosopher and economist Adam Smith. Other important representatives of Classic School: Jean-Baptiste Say, David Ricardo, Thomas Malthus and John Stuart Mill. British classical economists have noted the controversy between the British Banking School and the British Currency School.

These parallels are discussed recently by proponents of endogen theory of money (Nicholas Kaldi) and monetarists (Milton Friedman). The monetarists and members of the monetary school argue that banks can and should control the money supply. According to their theories, inflation is caused by excessive supply of money of the banks. According to supporters of endogen theory of money, the money supply automatically adjusts to demand, while banks can only

control only the terms of the loans (e.g. interest rate).

According to the metalist conception, in order to serve as a measure of goods, money must have a metal base, a stable monetary system being unthinkable if the functions of money are not performed by precious metals.

Opposed to this theory, of monetary nominalism exclude the metallic basis of the money value, defining money only as a simple calculation unit. Driven by the formation and the institutionalization of banks, the nominalism (Stewart Muller, Hawtrey, Schumpeter) is dominated by the ideas of dependency between the amount of money in circulation and the quantity of goods and services, as well as maintaining the function of money as a measure of value even in conditions of sublimation of the monetary instrument. The nominalist theory became prevalent in modern economics as the quantity theory of money.

The realistic conception starts from the marginal utility of money as merchandise, focusing on the fact money meets a need which represents the demand, being an instrument of transactions, while money supply depends on the production of precious metals. J.S. Mill, British philosopher and one of the most influential liberal thinkers of the nineteenth century, supported these ideas, but unlike the first classics, he minimized the role of money in the economy, saying that nothing is more regardless than money.

With its *General Theory of Employment, Interest and Money* (published in 1936), J.M. Keynes initiated an economic doctrine that argued for an active role of public sector in economy, achieved not only through monetarist actions of the national banks, but also by a vigorous fiscal policy, both measures being meant to be a counterpart to what he considered the relative inefficiency of the private economic system and economic cycles generated by it. In *Treatise on Money* (1930), Keynes draws a distinction between investment and savings, arguing that in case the saved money exceed the amounts invested (which can happen if the interest rate is too high), is registered an increase of the unemployment rate and the economy go into recession.

One of the main critics of Keynes was Milton Friedman, American economist and statistician which remained in the history of

economic thinking as the leader of the Chicago School and promoter of a macroeconomic policy called monetarism. This current of thought was characterized by maintaining the quantity theory of money and by the new modern expression attributed to it. Friedman believes that all economic flows must be conducted by adjusting the volume of money, which is seen as an essential lever of monetary policy.

In 1871, in *Principles of Economics*, Carl Menger (founder of the Austrian School) believes that the appearance of money led to more efficient transactions and thus it made possible the development of the social institution of money. Austrian School considers money as a medium of exchange and value by the transfer of time and space, the monetary system being developed as a result of the amplification of trade relations and of the establishment of the state monopoly. Representatives of this current thinking are: Friedrich A. Von Hayek, Ludwig von Mises and J. Schumpeter. Hayek and his supporters agree with Milton Friedman in terms of inflationary growth caused by a policy of reduction the unemployment below its equilibrium level or by the monetary levers. One of his criticism both to Keynes and Friedman is the fact that analyzes are performed globally, ignoring the effects of monetary growth at the microeconomic level.

3. Money as medium of exchange

In literature there are a large number of supporters of the view that the basic function of money is to allow separation in time of purchase of sale, allowing the transaction without double coincidence of desires or needs, which is a specific requirement of barter.

Money as a medium of exchange is used not because they have an intrinsic value, but because - and not only to the extent that - can be exchanged for other necessary goods. They have facilitated the specialization and division of labour because no manufacturer could not focus (specialize) only on a single product (being forced to produce other goods necessary for subsistence) if he had not been convinced that he produced a good which could be easily changed, through money, in other goods that he need.

In this respect, at the late 18th century, Adam Smith promoted the idea that specialization of production was the driving force for the emergence of a medium of exchange, arguing the fact that each individual producer will not consume everything he produce and he will want to consume goods made by other manufacturers. But in order to accomplish this fact, the trade was necessary and the commercial relations between manufacturers had to appear. He believes that without a referee of the market, some manufacturers can engage in direct trade to purchase their consumer goods, while others may engage in indirect trade relations and could keep goods for further exchanges for providing of consumer goods.

The theory of marketability promoted by Carl Menger aims to explain the origin of money, on the assumption that people accept certain goods based on the belief that others have the same desire. Among the factors that limit the degree of "marketability" of a commodity, Menger included the intrinsic values of products such as for example the cost of their storage. Evolution of money appears as a learning process that occurs over generations, in which "the practice and habit" but also imitation of successful traders was essential [6].

Paul Einzig signed on the same line stating that the primitive man is not a rational and calculated creature; his progress in adoption of money is often unconscious. But, comparatively, the primitive communities have the capacity to imitate each other their currencies and to learn from the mistakes and the achievements of their ancestors or neighbours.

It is therefore suggested that the money is established by the exchange and so it is primarily a means of it.

4. Money as institution

The approach in terms of institutional currency is not new, this theory benefit over time from its own supporters. In the literature there are many theoretical approaches but also focusing on quantitative nature which emphasises the importance of money for the economic activity considering its unique role as institution.

Viewed from this perspective, the

economic affairs are the monetary ones because money is not a simple passive insignia (symbol) of economic activity existence, but because it has an active role in shaping the characteristics of such activities. Wesley Mitchell was one of the authors who have aimed to highlight the active institution role of money that has shaped the human activity in a definite pattern. He insisted on the necessity to avoid the separation of the monetary aspects from the economic science.

Currency becomes one of the most important aspects of the human society because it models the native habits of thought. Instead of being a machine to do their job quickly and conveniently, in its absence (though less quickly and less convenient), use money carry its own distinct and independent influence [8] on what we want as consumers, on our ability to plan and on our ideals as citizens.

In approaching this concept, Luke Fantacci (Italian economist and historian) avoided the mechanical, simplified meaning specific to the neoclassical conception, considering money as a "human" institution, with a historical evolution and with diversity and vivacity which generates many theoretical challenges.

The Italian economist developed his concepts about the institutional nature of monetary evolution as a response to the dilemma previously generated by another Italian historian Carlo Cipolla, regarding the reason of historical trend of depreciation of money. While Cipolle proposed an explanation based on various causes, Fantacci put this phenomenon into account of the institutional evolution of the money and especially of its dual character.

In the modern economy, monetary phenomenon institutions (rules, organizations, procedures, tools) represents in extended sense the money, not being able to provide a definition of monetary phenomenon than by its institutions. But considering the fact it is a human creation, is subject to transformation, evolution, causing the variability of monetary phenomenon, and monetary theory.

5. Conclusions

Money is a way of thinking. The ability to understand the money during its historical

evolution is tied to our ability to reintegrate concepts and discourses that have defined and described monetary issues. It is therefore impossible to distinguish between monetary history and the history of thought.

A general definition of money should allow the operationalization of its use for analysis of the specific economic problems and should establish a dividing line between money and other money substitutes. Usually, in defining this concept, start from the three basic functions of money: medium of exchange or payment, measure of value and tool for preserving value.

Although this definition is widely accepted in the literature, it hides some of differences expressed through debates occasioned by more sophisticated approaches on how money should be defined. Some of the subtleties attempt an argumentation of necessity to define money as an institution, others, on the contrary, tries to prove that money medium of exchange is the most productive definition of this concept.

The money impact on the exchange development, on the social and economic life and on the history, generally was quite exceptional. Professor Mises (Austrian School representative) believed that rational economic activity became possible only through widespread adoption of a medium of exchange; recognition of this fact has led to the concept of price.

The role that money plays in the formation of economic phenomena was extended by the hypostasis (the concept) as institution of it. In fact, money has played an important role in economic activity, not only as a passive tool, but as an active force.

The overlap between ideas concerning the different hypostasis of money led to a better recognition of the assertion that the currency is an essential element in economic affairs.

The money is the expression of evolution of the social and economic life whose main protagonists are we humans. Over time, forms and hypostasis of money were evolved and diversified in pace of evolution of society.

An analysis in terms of forms on which currency he dressed highlights the tendency to its dematerialization, its transformation from metal coin with intrinsic value, to scriptural (electronic) money that became a necessity of modern economy.

Similarly, we can say that hypostasis of money (including the medium of exchange and the institution) and respectively the afferent theories have followed the same route. If initially the money came to support the exchange, favouring the development and facilitation of trade relations between individuals, causing also the division of the socio-economic activities, then, as amplification of business, at these primary needs joined and diversified others such as: reducing costs, reducing time transactions, their safety, treasuring desire, increasing the personal wealth.

At the beginning the money was produced privately, but its minting was monopolized gradually, first becoming the prerogative of the petty rulers, and then kings, emperors and finally governments, under which the foreign currency flow was reduced to a minimum, to the exchange rate, subject to a legal regime more or less restrictive, which affected the connections between different regions of the world market, separating the nations and "unbalanced" the international division of labour.

The following questions arise:

- In the present, the modern society is a creation of money or we still can say that we have control since the money is however a creation of man?
- What functions fulfil money earned from financial markets or currency speculation?
- In terms of institutionalization of money (especially of government interference), how close we are to perfect money and how close to a money "mediator of the global financial crisis" considering the existing global financial interconnections?

Abstract

Banking role in ensuring a proper functioning of the financial and monetary mechanism by facilitating performance of the cash flows in correspondence with the flows generated by the companies was the reason that bank (creditor) – company (debtor) relation was on a permanently attention of theorists, politicians and practitioners from all around the world. The countries from European Union have gone through a significant economic and financial transformation during the last decade. The purpose of this study is to examine the main components of the companies’ bank lending and also to analyse the evolution of the competition in terms of bank lending, in European Union, during 2005-2009 period. Section 1 presents the general principles of the companies’ bank lending; the second section researches the main forms of bank loans. The third one analysis the evolution of banking competition and the last one concludes.

Key words: European Union, bank lending, competition, companies.

J.E.L. classification: E44, E51, G01, G21, G32.

1. Introduction

The economic development of a nation it is influenced in a significant way by the functioning of the financial and economic mechanisms which are facilitating the performance of cash and financial flows in correspondence with real flows from an economy.

The banking activity cannot be separated by the social-economy one, seen as a system. Those activities are in a dependency report and there are influencing each other. That’s way the banking mechanism has to be understood and assimilated as an element of the general development strategy of each country (Trenca, 2003).

By the position of financial intermediary, the banking system represents an important link of the national financial system, having a significant impact on the economy, in general, because it is providing the monetary resources that companies need to expand and to develop. The mutations that have a permanently place on the financial and monetary market, considering the developing of the disintermediation phenomenon, failed to diminished the fundamental role of the banking credit in economy.

The management of the credit activity has as main objectives to protect the company’s investments and to optimize the cash flow. An important function of the credit activity’s management it is represented by the lending credit control. Graham and Coyle have approached the credit control in terms of decision making required by credit dimension, on the one hand and on the other hand in terms of fulfilment the negotiated terms and conditions.

Credit control is necessary to avoid the lack of liquidity as a result of excessive investments and to achieve on optimum equilibrium between profitability and the risks it involves. Structurally, lending management is seen as a system consists of the following elements: the management of the cycle payments/receipts, establishment of the secure payment methods, credit

insurance, planning and organization systems, risk management, credit analysis, credit policy, credit limits and credit terms.

2. General principles of the companies' bank lending

Banks have a crucial role in economic life, they are: facilitating the commercial transactions, both internal and external ones, providing payments and foreign exchange, involving in investment projects, either by placing or administration of the cash from economy.

In all the relations established between banks and companies an important place is occupied by the lending relations. Although lately there were significant changes on the financial and monetary market, by the development of the financial disintermediation, both in our country and at international level, bank lending is still the first choice for financing the company's current and investment activity.

The companies' bank lending is an important component of the banks' investment policy, both in terms of workload and also in terms of profit. Each loan can have multiple positive effects on the bank's activity and financial situation:

- First, it can be a quality investment. In this case, the bank, on the one hand, ensures certain income from interest and commission, and on the other hand, since the risk of the loan to enter in default is low, will not appear the problem of raising costs because of the provisions;
- Secondly, it will be a collateral revenue-generating for the bank: the charges of the related operations that will result (payments, foreign exchange);
- Third, is a good opportunity for cross selling of the whole range of products and services offered by the bank: internet banking, payroll agreements for company's employees, different types of debit and credit cards and other lending product for the company's employees, saving tools;
- Not at least, it can mean a marketing success – if the customer is a company known at a regional, national or/and international level – that can turn into a business one by attracting new customers (partners or not of the credited company).

In other words, the bank's stability and the

accomplishment of the solvability and liquidity indicators depend by the quality of the credit portfolio. This is the reason that determines the bank's management to show a special attention to the lending activity, following, on one hand, to fund the lending decisions on rigorous analysis of the credit risk and on the other hand to constant monitor and strict administration of the credit facilities granted.

Eligible companies for bank loans must fulfil some minimum conditions, such as:

- Are legally functioned and established;
- Have paid up share capital and perform legal activities according to the articles of incorporation;
- Fulfil reliability requirements: profitability, solvency and liquidity indicators;
- From the analysis of the revenue and costs budget to result that they have possibilities to repay the loan and the related interest;
- No records in Central Credit Register with outstanding amounts to other banks or to other financial institutions at the credit requirement date, and if included they have to prove that those debits aren't very old;
- Have included in their object of activity, and detailed in incorporation act, the operations that are the object of the credit requirement;
- Fit within the bank's maximum exposure to a single debtor for the requested credit, according to the National Bank's prudential and the bank's internal regulations;
- The required loan will be secured with bank accepted collateral in terms of type and value;
- No records in Payment Incidents Bureau at the credit requirement date.

3. Main forms of the companies' bank lending

Lending of the companies by banks has two major forms:

Releasing the financial funds to the companies, by operations booked in balance sheet accounts

In this case, the bank directly involves in financing of the companies' business whether it is about their current activity (purchasing of raw materials necessary for the production processes, payment of suppliers of goods, pre-funding or post-funding of the contracts

for works or services, paying the overdue amounts towards public budget, etc) or investment projects (financing and/or refinancing of the expenses generated by the erected of new administrative, logistic or production premises, developing of the residential projects, purchasing of means of transport or technological equipment) which aim to increase the company storage or production capacities, upgrading or rehabilitation of the existing ones.

Issuing of commitments to provide financial funds to companies, by operations booked in extra-balance sheet accounts

In this category are included the follows:

- letter of guarantee;
- letter of credit;
- bank avail.

All these variants are the expression of the direct implication of the bank within the companies’ socio-economic life: the bank resumes (as long as there are no requests for enforcement of the issued commitments) to offer guarantees needed for obtaining the necessary financing from other banks or financial institutions or even from their business partners.

The substitution of the decision to offer some lending products to companies must start with more precisely identification of their needs but also considering the risky involved by each company. These two elements combined must guide the loans officer in choosing the most suitable product, helping him to structure the transactions in the most convenient way both for bank and company.

From the company perspective, the concordance between the contracted banking loan (in terms of amount, periods, disbursements conditions, pricing etc.) and the objectives of its own financial policy has a considerable, direct impact on the company’s cash-flow:

- Obtaining significant discount from suppliers corroborated with increasing of the company’s sales volume (with positive effect on its market share), in case of the loans for financing of the current activity or letter of guarantees (payment guarantees, performance bonds etc.);
- Increasing and/or modernizing of the production capacities, in case of the credit facilities granted on medium or

long terms;

- Improving of the financial position by improving of the levels (values) registered by the main financial reliability ratios.

Having in view the impact that the lending activity can have on the economic-financial situation of banks and companies, it is very important to be based on an analysis system that efficiently integrates the economic criteria with prudence indicators.

4. Analysis of bank competition in terms of lending volumes in European Union

The increased banks’ need for a stable financing led to an intensification of the competition within European Union during the financial crisis. More than that, the competition outside the EU temporary increased because of the emerging of a group of Icelandic banks within some of the members during 2007 and 2008 with pricing that sometimes exceeded the market average considerably.

The competition was also increased in some of new members (Bulgaria, Hungary, Lithuania and Slovenia) partially because of the catch-up process generated by the accession to European Union but also because of the entering of the most important financial groups on the national markets with a direct impact materialized in diversification of the lending products offers.

Table no 1 – Total loans in EU between 2005 and 2009

Source:<http://www.ecb.int/pub/pdf/other/eubankingstructures201009en.pdf> consulted on 07.02.2012;

The interest ratios started to decrease in many countries during 2009 highlighting a smooth diminish of the competition conditions between some of them, on the one hand, but also being linked by other factors such as the decreasing of the central banks' ratios, on the other hand.

The main structural evolutions within European Union continued in accordance with the years before triggering the financial crisis. Consolidation of the banking system and a better utilization of the resources, measured by the capacity indicators, continued on medium term, and the concentration degree remained close to the level registered during the previous years.

The increase of the banks' assets stagnated and the volume of loans registered a decrease for the first time during the period 1999 – 2009 because of some factors which influenced both demand and offer of credit funds. Nevertheless, the first noticeable signs of increase registered at the end of 2009.

5. Conclusions

The companies lending is a complex activity which is based especially on the viability analysis and business realism of the companies to be lend, in order to identify and to evaluate their real possibilities assumed through the credit contracts, the repayment of the principal at the maturity date and the related interest. The determination of a company's reliability is the result of a specialised bank's department and it is realised through an analyses based on the principles that ensure consideration of all relevant aspects for the company's financial and economic activities. This includes both a financial analysis of business activity based on its financial and accounting documents and also non-financial aspects of the organization, its management, ownership structure, commercial policy, market outlook and received guarantees.

The competition favors innovation, reduces costs, increases efficiency. As a consequence, it generally enhances the competition level of the banking system and the economy. Encouraged by the competitive environment, the banks offer such products and services which are highly competitive regarding quality and price. The banks play an important part in allocating the economic resources. On top of all that, they have a decisive influence in assets' transformation, in insuring liquidities and access to the payment services. The banks are the key to the economic growth and development.

Aspects of Social Care Institutions for the Elderly in Romania

Zodieriu Elena

Faculty of FEEA/Department Management, “Alexandru Ioan Cuza” University, Iasi
elena_zodieriu@yahoo.com

Abstract

In Romania social welfare institutions for the elderly protects elderly people in need and is an alternative to home care. Although the institutionalization of people involves some costs, however it is needed when the elderly persons have no home and they require constant care, that can be achieved at home, but no one can administer, they have no legally binding or they cannot fulfill their duties because of health, economic situation or family services and have no income. An important role was played by the NGO's that have been the model for social institutions due to the fact that they benefited from the Western states experience in social services for the elderly. Today, the NGO's provide home services for the elderly.

Keywords: social institutions, organizations, elderly, social services, institutionalization, funding.

J.E.L. classifications: J14, J17, J18.

1. Introduction

In sociology, the concept of institution has two meanings. A broad sense, which involves a system of rules governing social area-family, kinship system, the system of political leadership, and school, the complex formed by all schools, courts, and a narrow sense including public systems such as: government ministry, municipality, county council. Social institutions are a crucial structural element in the system because it provides on the one hand, protection for persons in difficulty, and on the other hand, a good organization of the system included in the social systems from the EU. We recognize two types of institutions: the ones with responsibility for social care and those that are specialist in this field. The delegation of responsibilities at the local level needs

financial support from the local councils to develop institutions, specialized services and benefits. The common feature of modern social work is to develop the local level, in local communities. Currently, in Romania, the central and institutional levels are developed, but the local county, where we can find many beneficiaries of the social assistance is less developed. The second category of social institutions are the specialized institutions that operate as public or private and provide housing, care, protection, rehabilitation for the elderly, disabled, children and other people in need. These institutions are established by the county budget or local budgets and are being subordinated to the general welfare departments or the local council.[1]

Organizations have emerged from the intersection of collective action strategies to aggregate individual skills. The industrialism made the organizations the fundamental structure of action and interaction, although modern forms of organization and pre-existed in the ages that preceded it. The organization supports several meanings: the organization is always specialized, that is it has a mission which is associated with certain objectives, and the differentiation of missions and objectives is associated with technical expertise. The organization is an interaction structure, governed by formal and informal collective action generators (units). In social care we meet both the concept of institution and the one of organization. They both provide structural frames in order to initiate and carry out human interactions. The institutions formulate rules and the legal frame for the interactions and the organizations create strategies and promote actions and interactions.

Between institutions and organizations are established relationships that take at least three forms:

- Institutions are the legal base of the organizations. They sustain the organized functioning of the collective agents.

- By their performance, organizations become agents of institutional change.

- The main property institutions reproducibility. Through routine or routine patterns of behavior and relationships, institutions promote constancy.

The organizations reproduce the institutions, but they also change them, because the organizations are not dependent on institutional constraints but on other organizations and constraints that are related to the scientifically and technologically development, the distribution of wealth and income, the orientation of political interests. [2]

2. Social services for the elderly

The social system is represented by all institutions and organizations with social functions, programs and specific interventions by professionals, for individuals in need, and the legislative framework on which they are based. Social services, the most important structures of a social system can be: community social services, general services for home care, family or community, specialized social care services for home care and for the specialized institutions such as special schools or hospitals.

In the American social care system we find the concept of human services, in the Anglo-Saxon ones the concept of social care, in the African countries and in several Arabian countries—the concept of community development. Law No 17/2000 on the protection of the elderly defines the elderly person as "the person who has reached retirement age established by law" and it also mentions "older people receiving services and social benefits". Under the legislation, the elderly are defined by legal criteria of the standard retirement age. In this respect, the elderly are: women who are aged 57 years and 5 months, men aged 62 years and 5 months.

According to Law 17/2000 the conditions in which an elderly person can receive welfare services are: no family, no home and no opportunity to secure housing on their own resources, no income or the income is

not sufficient to provide necessary care; they are unable to provide social and medical needs due to physical or mental illness.

Elderly dependency is due to insufficient resources, but also to diseases that disrupt health: cardiovascular diseases and, degenerative diseases, diabetes, asthma, arthritis, lung problems, reduced mobility. In Romania, assessing the degree of dependency of the elderly is now done in accordance with "National Grid to assess the needs of older people", due to GD no.886/05.10.2000. For older people who are hospitalized in social units-health there is the Order No. 491/27.05.2003, "Evaluation grid for medical-social people that are hospitalized in medical - social care units".[3]

The national grid that evaluates the needs of the elderly identified three levels of dependence by assessing functional status, sensory and psycho the elderly.

3. Forms of elderly care

3.1. Home care for the elderly

Since the 60's in both the social and the political environment there was the tendency to keep the elderly at home appreciating that institutionalization would exclude the elderly from the wild life and such would induce a feeling of isolation. In order to keep the elderly at home are taken into account aspects such as: physical and mental health of elderly (high dependency care versus opportunity); the tolerance of the family and availability of community services: home care services (help households, information, nursing, geriatric), rehabilitation services (functional rehabilitation), services for terminally ill patients (especially those at end stage), social centers to coordinate services, services providing hot meals at home (meals on wheels), social canteens, day care, nursing home.[4]

A very important role in caring for the elderly is family's who should receive information and counseling services to maintain elderly in the family, information about: physical and mental changes in old age, diminishing resources and adaptation of the elderly specific diseases of old age.[1]

Each locality, taken separately, has its own resources and moreover, has its own rating system and it often dispose of certain forms

of aid, where possible. One can distinguish two categories of care: efforts directed against disability and functional disorders, and adjustment to disability living environment.

Assuring the maintenance at home for the elderly:

- Improving housing conditions is a prerequisite for maintaining quality home because living conditions of the elderly are often inadequate (old building without central heating, outside toilet, no hot water).
- The household aid is for elderly a physical, moral and social work. In addition to performing household work, also acts to maintain personal control with the outside world and a personal relationship with it.
- In France, the authorized intermediary services are realized by certain associations mandated by the older person through a contract to make the administrative procedures in his behalf.
- Home care services are nursing home care services most commonly in western European countries. They must ensure continuity of care on weekends. In some countries they are fully funded by health insurance (France). Treatment is prescribed by the doctor making the request directly to the care service and the service distributes a nurse and a nurse care, usually immediately, without prior house insurance.
- Tele-alarm is a device that allows the elderly to have help in any situation that he needs. The device shaped as a pendant, a bracelet, a watch cap, a pump or a pear is worn continuously and the elderly triggers the alarm if there is a problem. The call arrives to a listening center that helps the person in need. 2-3 persons appointed referees who may be family members, neighbors or doctor ensure the permanent availability. The elderly has the right to close the device and he has to pay the monthly tax for it. There is the possibility that some pension houses or humanitarian organizations to finance part of the expenses.
- Meal at home or "hot meals on wheels" is performed by a service that brings home a full meal, balanced, ready.
- Supervision and care home sickness ("garde-disease") in which the patient has the possibility to appeal the placement office of

the jobs at home, providing home care in case of illness (e.g. in France).

- Other services: clothes, troubleshooting, shopping provided by legal associations born from a neighborhood or rural areas solidarity. [5]

3.2. Institutionalization for the elderly

The law 17/2000 on social assistance for the elderly gives the main criteria for the access of the elderly in a home care. Thus, an elderly person would require institutionalization in the following conditions: they require constant care, which can be achieved at home, but no one can administer, has no legally binding and they cannot fulfill their duties because of health, the economic or family services; the elder doesn't have his own home and income.

According to the law no. 17/2000 on social assistance for the elderly, a special home for the elderly is the social institution with legal status, providing adequate housing and food medical care, recovery and rehabilitation, occupational therapy activities and leisure, social and psychological care. According to data from Ministry of Labor, Family and Social Protection in the first half of 2010 there were 131 homes for the elderly, with a total capacity of 7122 seats. From the total capacity, 25 with a capacity of 1570 respond to DGASPC, 52 with a capacity of 3734 respond to the local council and 54 with a capacity of 1818 seats are subordinated to NGOs.[6]

The estimated number of dependent elderly people is about 450,000, of which at least 140,000 would be in a state of dependence degree; this means that formal care provided by qualified staff is extremely underdeveloped in Romania. Financing the social programs for the elderly is made from funds from local budgets, the state budget or foreign funds. Under the legal framework in force, medical services at home may be settled through sickness fund, on a supporting file, to be approved within a week minimum.

The funds distributed through transfers from the state or local budget are used by organizations for:

- The payment for the caregivers or other employees.

- The acquisition of sanitary materials;
- Purchase products for the home table or other material assistance.

Table no 1. The amounts spent in 2009 for services for the elderly in Romania under MLFSP (the latest data released by MLFSP).

Financing (lei)					
No.	Centers	Local budget	State budget	Beneficiare's contributions	Other sources
1.	Homes for the elderly	105 502 314	2 803 142	29 049 230	18 802 618
2.	Nursing and support center	129 966 474	44667 646	17 441 833	5 195 457
3.	Rehabilitation center	163 666 084	33 342 736	7 720 333	7 726 404
4.	Day center	994 372	13 445	67 418	339 165
5.	Protected housing	-	-	-	-

Source: National Council of the elderly, Analizez and reports 2010-2011, Socio-economic situation of the elderly in Romania and EU countries – Present and development perspectives.

In 2010 MLFSP, based on the law no 34/1998 the granting of subsidies for the social services for older people worth 8,505,408 lei 19,999,905.28 of the total grant from State budget. 61 are home care social services for a number of 5679 beneficiaries, with a contracted value of 4,614,644 lei, 26 are residential centers for a total of 1,087 beneficiaries, 15 are day centers for a total of 923 beneficiaries and 5 are social canteen for a number of 227 beneficiaries. In conclusion, from 322 subsidized social services in 2010,

107 were for the elderly, representing 42.53% of the funds allocated for grants. Associations and foundations are established as Romanian legal persons, private, non-profit and are accredited or licensed to provide social services. Associations and foundations can receive subsidies from the state budget through the budget MLFSP if they grant social services for people from several counties.

4. Conclusions

Social services for the elderly should become a priority for social policies in Romania, especially since the life expectancy of the population has grown, on the one hand, and on the other hand we know that this segment of the population becomes more vulnerable as it gets older. In Romania an important role is the informal care provided by children, elderly relatives or neighbors but when they are missing the elderly should require admission in a center. About the home care, there are NGO's initiatives because the state didn't involve for financial reasons and also because of the Romanian cultural context where the family of the old person feels compelled to give him care.[7]

dobrica_3@yahoo.com

Abstract:

In this article we analyze which are the mutations of public debt stock and public debt service on the structure of public expenditures. We use functional classification of public expenditures and observe their evolution by using multiple regression equation in order to emphasize the shifts of public expenditures as a response at public debt service and its stock variations along with other macroeconomic indicators which bear a significant influence on public expenditures dynamic.

Keywords: Public debt, public debt service, public expenditures, functional classification of public expenditures, public expenditures mutations.

JEL:H50, H62, H63, H68, H69.

1. Introduction

In order to function the public sector requires an important amount of financial resources, intended to maintain normal functioning of the state apparatus. Implicitly the growth of public sector has imposed the demand for increasing financial resources.

As a consequence of higher public expenditures compared with smaller tax revenues the question of budget deficit covering arise. State involvement and the growth of public sector along with welfare service widening has increased the need of important amounts of financial resources to cover public sector expenditures. As long as the tax revenues didn't cope with increasing

spending, the governments were constrained to find new sources of funding – public loans.

Our main goal in this research is to analyze the implications and effects of public debt and it's servicing obligations upon the provision of public utilities.

We focus our attention on public debt and public expenditures and the relations between the public debt and the provision of public goods and services, analyzing the implications and the shifts of public expenditures composition as a response to the stock of public debt and it's service charges in total public expenditures. Along with public debt burden we use a series of macroeconomic indicators which have an significant impact over the composition of public expenditures.

Our research relates on Romanian economy taking in consideration the period of transition from centralized to the market economy, namely the period between 1990-2010, where we analyze the public indebtedness process and its impact over the public expenditures.

The structure of the paper include firstly the data and methodology used to test the mutations of public expenditures structure under public debt stock and its service variations and secondly we debate the results obtained where we focus our attention upon the impact of public debt and service burden over the composition (functional classification) of public expenditures and its evolution.

2. Literature review

Through our analysis we try to answer the following questions: *How does public debt*

servicing affects public expenditures composition?

In situation when public loans crowd-out private capital, the economy will go bankrupt if the mechanism of financing public deficits through public loans fails. From this statement we can understand the importance and the long-run effects of government austerity. In situation when public sector has defaulted, austerity measures are required and fiscal policy has to be responsive. The application of austerity measures can be operated only if the private sector can sustain and can respond proper to the budget constraints.

In situation of bankruptcy, government have two main solution to act, either they cut spending or they increase taxation. *Kannan and Pillai* (2001) consider that public utilities optimal provision, and the rationale of this supply can be placed in a simple classic framework where if the benefits of productive efficiency outweighs the cost of allocative inefficiency, then the society will have a welfare gain from maintaining the natural monopoly organization of a public utility.

Buchanan (1962) in his debate about the Public principles of debt, stress that public debt issue has normally been conceived as appropriate only for the financing of genuine public investment. The classic consider that access to debt issue might lead to irresponsible spending decisions on the part of legislative assemblies and executives.

James Buchanan at the question: *When should the government borrow?*, the author answers that it should borrow only to finance long-term or capital investment projects which are expected to yield benefits over future time periods. A very important statement made by Buchanan is that “it becomes essential that some method of financing the debt service and amortization be adopted at the time of the initial decision. It is the height of folly to allow individuals to choose a bond issue to finance a long-term project within corresponding means of paying the service charges”.

Another option when government could borrow is the issuance of public debt used to finance self-liquidating projects, meaning by this projects which will directly yield to the government a money return sufficient to service and to amortize the debt, when a

project is self-liquidating, then sufficient funds are earmarked for debt obligations.

Greiner (2004) sustain that “*the decline of public investment as a result of rising public debt is not too surprising*“, given the fact that once the government decide to finance the majority of public spending with an important amount of borrowed resources, which bear interest and has to be repaid at maturity affects the resources left for other public spending categories, once the stock of public debt is a significant one. Our analysis have a literature background, where empirical studies of the determinants of public debt were carried by several authors: *Ugo Panizza, Lima and Forslund* (2006; 2011) in their research paper use empirical data to study public debt characteristics in developing and emerging countries and the correlation between country features and domestic debt share. In addition, the authors find that bond market development is positively correlated with: trade openness, total public debt, institutional quality and the lack of capital controls.

On the other hand, *Madhavi* (2004) analyses the effects of external public debt burden on the composition of public spending using an panel sample of 47 countries for 1972-2001 period. The main findings of the paper are that high public debt levels are accompanied by high interest payments, fiscal austerity and changes in spending priorities that will require important shifts in budget shares of various spending categories. Particularly, the pattern of adjustment in spending mix, is influences by the burden of debt , which invariably changes the composition of spending in favor of interest payments and displace the share of nonwage goods and service category.

Dreher et al. (2008) test the implications of globalization over the government restraints, and analyze the effect of globalization upon the composition of government expenditures. The authors employed two different datasets and various measures of globalization to analyze the influence over the government expenditures. Regarding to the impact of globalization and external factors over public expenditures, *Gemmell et al.* (2007) has obtained the same results. In their paper, the research is based with two assumptions, the compensation and the efficiency hypothesis, that are supposing

that globalization affects both total and the composition of public expenditures in different ways.

In analyzing the relation between public debt and social expenditures *Lora and Olivera* (2006), the authors find that higher debt ratios reduce social expenditures, not just because of extra cost in interest payments, but because they are associated with cuts in total expenditures that affect the social sectors. Debt creates important shifts in social expenditures mainly because it reduces the room for further indebtedness.

Fosu (2008) analyze the impact of external debt-servicing upon the composition of government expenditures. The main findings are the same with *Lora and Olivera* (2006) where debt-servicing burden produce negative shifts of public expenditures, in particularly the social sectors of health and education and from public investment.

The changes of public debt service are deleterious on social sector, with a strong mutation in financial resources allocation where one standard increase in public debt burden is equal with a reduction of nearly one-third of share allocation to the social sector.

Signe Krogstrup (2002) analyses the effect of asymmetric debt service obligations on primary spending in EU countries, the authors main findings are that high debt countries have smaller public sectors and higher taxes, particularly in the short-run, and low debt countries have a bigger public sector and low rate of taxation.

Krugman (1988) debates in his paper the issue of building stock of public debt, reaching the point of debt overhang problem when “the expected value of potential future resources transfers is less than its debt”.

Particularly for developing countries the problem is more acute when inherited debt is larger than the present resource transfer that their creditors expect them to make in the future. First negative impact of debt overhang is the less incentive effect of countries to invest, mainly because an important amount of public resources is already absorbed by debt-servicing obligations as well as principal repayment on maturity.

To cover repayment and the interest, are needed future tax revenues raises, and a given tax revenue must be allocated and

diverted from other productive destinations that may affect economic growth and social welfare.

3. Data and methodology

Following the structure of this paper, in second part of our analysis we focus on the supply of public utilities, for which analyze we substitute it with its value expression – the public expenditures. From this point of view we intend to analyze the impact of the public debt and its service upon the composition of public expenditures, noticing the main shifts in public expenditure structure as a response to public debt burden. We use as principal repressors public debt to GDP and public debt burden, introducing also a set of control variables, which are macroeconomic indicators used as public expenditures determinants.

The method used is Two-Stage-Least-Squares (TSLS), the explanatory variable is the share of public expenditure in total public expenditures EXP_j , where $j=1,2,3,\dots,J$ expenditure category.

The categories of public expenditures is given by COFOG - Eurostat classification of public expenditures, the functional classification, comprising: 1. General Public Services; 2. Defence; 3. Public Order and Safety; 4. Economic Affairs; 5. Environment Protection; 5. Housing and community amenities; 6. Health; 7. Recreation, culture and religion; 8. Education; 9. Social Protection.

The control variables used in both regression equations are: PDET/GDP – gross consolidated public debt to GDP; PDET(-1)/GDP- previous period gross consolidated public debt to GDP; DS2/GDP – debt burden measure with government constraint effect; DEFPRIMAR/GDP – the primary deficit of public budget to GDP; GDP – the real growth rate of GDP; RATINFL(-1) – the previous period of inflation rate; UNEMPL – the rate of unemployment expressed to total labor force; CURACCDEF- current account deficit to GDP; TRADEOPEN – trade openness expressed as sum of Total Imports with Total Exports to GDP;

The equation which estimates the impact of public debt and other independent

variables mentioned above on public expenditures is:

$$EXP_j = \alpha_1 + \beta_1 PDET / GDP + \beta_2 PDET(-1) / GDP + \beta_3 DS2 / GDP + \beta_4 DEFPRIMAR / GDP + \beta_5 GDP_{growth} + \beta_6 RATINFL(-1) + \beta_7 UNEMPL + \beta_8 CURACCDEF + \beta_9 TRADEOPEN + \varepsilon_1$$

The data used for this regression equation is for 1995-2010, addressing Romania, as an example of developing countries, for the COFOG classifications of public expenditures, we use the Eurostat and

AMECO datasets, and control variables we use the World Development Indicators database from World Bank.

4. Discussion of results

Regarding the 10 equations results (see Table 1), we have obtained a high degree of determination where R-squared is on average 0.95, that enable us to see how fit are our variables in explaining and determining the dependent variables.

*Source: authors calculations.

In all equations we found that public debt ratio and debt burden has a significant impact over public expenditures. Most affected negatively by the debt service are Recreation, culture and religion, Defense and General Public Services.

On the other hand the ratio of debt and previous period debt to GDP(existent stock) has an negative impact over Health expenditures and Environment protection.

Current account deficit has an negative impact over Economic Affairs and Recreation, culture and religion. Increasing and prices instability has an strong negative impact over Defense, Culture, Economic Affairs, General Public Services and Public order and safety. Unemployment increases public expenditures with Health, Social protection and Housing and community amenities, and has a decreasing effect upon Education, Environment protection and General public services.

5. Conclusion

In this article we analyzed the mutations of public debt and its service on the structure of public expenditures, taking in consideration the functional classification (COFOG). Regarding the shifts suffered by the functional structure of public expenditures, we found strong negative impacts, mostly from public debt service and secondly from the increasing public debt to GDP ratio, as well as other macroeconomic indicators. We may conclude that increasing public indebtedness corroborated with high levels of inflation and unemployment, public expenditure composition suffers important shifts from productive to unproductive categories, which represents a final consume, which doesn't yield future income necessary to finance the public debt obligations. The negative effects by producing important mutations in public expenditure structure are deeper for fragile economies like developing ones, mostly because developing countries are more prone to crisis and the path to recovery is much more difficult than for high industrialized countries.

Even if public deficit represents an instrument to stimulate economic recovery and to boost growth, public indebtedness for unproductive spending, in a irresponsible way, leads, as empirical analysis prove, to sensible shifts in public expenditures compositions, leaving less room to finance important categories of expenditures like health, education, public investment and other public spending that have an positive effect on economic growth.

We may say that the size of government is a public choice, but it's composition is open to policy and option debate. In present days, of recession affecting economies across the world, which can be characterized by liquidity shortening and serious government restraints in face of public debt crisis, the need for healthy public policies which promote efficient public spending is fundamental.

Analyzing the principal determinants of public expenditures, and splitting between productive and unproductive expenditures, a country can improve its economic performance by changing the mix between the two categories of expenditure.

The majority of developing countries in front of a budget constraint face a hard decision to be made – which component of the public expenditures should be cut? Health? Education? Infrastructure? Defense?

The answer is given by the contribution of above categories of public expenditures to economic growth and development.

Analyzing the composition of public expenditures by regressing it through the impact of public indebtedness and other macroeconomic indicators enable us to provide some future prospects of economic growth and the direct or indirect impacts of public debt over the economic growth through the shifts in public sector spending.

After analyzing the impact of public debt service and its stock on public expenditures, we can say that even if public indebtedness in developed countries is the usual way to finance public action that boost economic growth and development, there are significant risks that are accompanying this process. Given the specific instability of developing economies, like Romania, which can be proven by the evolution of other macroeconomic indicators included in our analysis (inflation, unemployment, current account deficit, economic growth) public debt and its cost may not lower economic growth but also may embezzle the whole purpose of public loans.
