Figure 2 – Graphical representation - The sectors contribution to the added value growth (1990-2011) % of GDP for Romania

Figure 3 – Graphical representation - The sectors contribution to the added value growth (1990-2011) % of GDP for Romania

Structural changes occurred in the structure of economic sectors have caused an important source of economic growth and improvement on productivity. The weight decrease of the less productive sector (agriculture) and the weight increase in the more productive sectors (industry and services) have positively influenced the productivity on the macroeconomic level.

The new economy based on knowledge, brings a gradual increase of the tertiary and quaternary sector, these becoming dominants. Analysis of the economic convergence of Romania to the EU becomes relevant in the analysis of the two charts above. Can be seen that the sectorial structure of our country has evolved in order to reduce the share of agriculture sector and dramatically increase of the tertiary sector. It is true that the services contribution to the growth of the added value as a percentage of GDP, for our country is far below the EURO area rate.

The large companies' structures that are vertically oriented make the professional activity more complex and less effective. To achieve the objectives of the knowledge-based economy, the big companies have to modify these vertical structures in flat organizational structures. The organizations' vertical design (specific to the industrial era) makes difficult the implementation of the decisions and also reduces their quality.

Thereby, the transition to the flat organizational structure is recommended.

In the context of the new economy becomes imperative the transition to an organizational structure characterized by teamwork, liability and flexibility. The hierarchical structure is a structure in which excessive bureaucracy prevents the information flow while specialization of the processes, also excessive, discourages the integration of specialized knowledge, delaying the response time (Cross, 2000).

Among the benefits of the flat organization can also be included:

- The flat organization operates with a minimum of formal hierarchical levels for reporting;
- Decentralized authority on the team level and a better distribution of knowledge;

Strategies of flat organizations base their economic growth on innovation and creating networks that connects the customers, suppliers and competitors.

5. Conclusions

The organization of the new economy must be based on the new types of organization forms that could allow the access to information with no impediments occurred due to the hierarchical and functional structure. Informal relationships are also important, they smoothens the knowledge flow, facilitate the production of tacit knowledge, and increase the flexibility on the response to change.

The versatile organization specific to the new economy has the following features:

- flat organizational structure
- interactive partnership
- less structured networks, semiautomatic teams
- fewer levels;
- Operating multiple forms of collaboration with other companies, such as strategic partnerships.
- Reduce the barriers between the individual and organization.

Organizational Performance and Substantiate Organizations Work Mainly on Intangible Resources

Lazar Cristina Mihaela
Ovidius University of Constanta
lazarcristinam@yahoo.com

Abstract

The purpose of the paper is to present a detailed investigative study. The nature the study is theoretical as well as applied in the area of business diagnostics based on local knowledge.

The thesis of the study will be validated based on a survey. The survey contains questions that reflect the degree to which the studied organizations, based mainly in Constanta, base their activity on intangible resources.

Many researchers consider intangible assets to be the main resources of the organizations added value.

Cuvinte cheie: organization, intangible resources, performance

Clasificare J.E.L.: D8, P47

1. Introduction

Intellectual capital comprises all intangible resources available to the company, which give the company an edge, and which in combination with other advantages can lead to possible future benefits[1]

Intangible values have become increasingly important for the managers of the new economy. Intangible assets have gradually become the most important resources of competitive advantage. Traditional factors of production (material resources, labor, capital) have gradually diminished in importance. At the same time intangibles assets such as knowledge, information, and creativity have increased importance. While land, capital, and labor are subject to decreasing returns, knowledge and information induce increasing returns

"To make the most efficient use of intangible assets, like new engines creating wealth, in a knowledge based society, we must distance ourselves as much as possible from the old engines of the industrial economy, which in turn, they had replaced the engines of the agricultural economy. [...] The real source of wealth of nations and businesses must be sought in people, in their knowledge and their abilities, in internal processes, and businesses reputation." [1]

In Romania, intellectual capital is not sufficiently exploited due to lack of adequate markets for knowledge. In Romania this problem is more the concern of academics, universities in general, the Chamber of Commerce and Industry of Romania and less of businesses and legislators[2].

The success of the countries in the new economy will become increasingly determined by how they manage to spur technological innovation, entrepreneurial relations, education, specialized skills and transition to all organizations, public and private, from the bureaucratic and highly hierarchical style to networks of learning[2]

In a knowledge society, there are four key dimensions of competitiveness, which are in close correlation:

- Resources and inputs (investments in Research & Development, technology acquisition, etc..)

- Intangible assets obtained by combining resources. This way we can see specific results such as knowledge, patents, brand names, reputation, and networks.

- Change management is one of the most important levels in implementing a dynamic perspective to introduce change in the entire organization.

- Development of competitive advantage and efficiency as key sources for macroeconomic and microeconomic performance

2. Method

Through my research I propose to formulate questions that will lead to answers useful to analyze the approach position Constanta organizations transition to knowledge-based organization.

Hypothesis

H1: Organizations base their activities mainly on intangible resources

The investigation was carried out scientific research based on the evaluation questionnaire. Quantitative empirical research findings of this research is the foundation.

Evaluation questionnaire aimed at measuring and analyzing the views of employees on key practices and organization of the knowledge economy and the extent to which they are applied in local organizations. Questions were raised after a profound analysis of knowledge in the field. Their formulation is straightforward, using interrogation methods that lead to valid and representative results.

The sample investigated. Research unit is represented by employee organizations Constanta economic. The total number of investigated subjects was 35. The sample includes both employees who are part of executives, grassroots management and environmental management or top management. To ensure proper representation of the organizations investigated, their selection will be random on a voluntary basis.

3. Quantitative study through questionnaire

The questionnaire contains five questions leading to answers to review position in Constanta organizations approach to the economy and thus passing on knowledge based organization. For statements of the questionnaire interviewees answered YES or NO

Questions

1. Organization has an important base of information resources (patents, patents, licenses, trademarks, etc..).

2. Within the organization to allocate a high proportion of revenues to research and development activities

3. The organization promotes the use of new information and communication technologies

4. Employees have access to knowledge in various forms: databases, documents, reports, forums, e-learning platform, etc.

5. Employees are familiar with computer and Internet.

4. Research results

Question 1

Figure 1

In terms of ownership of the organization of a major base of information resources, we can see that most of them do not have such a basis. 77% of respondents operate in organizations that do not have patents, patents, licenses or trademarks.

Question 2

Figure 2

You can see that only 17% of respondents think the organization is assigned a high share of revenues on R & D activity. The rest, mostly, responded negatively to this statement. Most organizations do not allocate all funds Constanta in research and development.

Question 3

Figure 3

66% of responders believe that in the analyzed organizations promote the use of new information and communication technologies and only 34% of respondents believe that this does not happen. This shows that employees provide information technology organizations are aware of their importance.

Question 4

Figure 4

Half of respondents have access to knowledge in various forms: databases, documents, reports, forums, e-learning platform, etc.

Question 5

Figure 5

87% of respondents believe that employees are familiar with computer and internet and only 13% of them have these skills. The organizations studied, there was most of the activities focus mainly focused on computer and Internet

5. Conclusions

Following the responses obtained can be concluded that, in organizations in Constanta the foundation of activities based on intangible resources are not predominant. However we see higher percentages for questions that concern in the use of computer and Internet activity and half of respondents have access to knowledge in various forms: databases, documents, reports, forums, e-learning platforms, etc..

Smaller percentages were obtained from questions that regarded the information resource databases and funds allocated to research and development. These low levels may be due in small part to the current context, namely the economic crisis.

However, an organization which does not effectively exploits its intangible resources cannot cope with competition based on knowledge which tends to become dominant in the current economic landscape.

Monetary Assumptions From the Classical School Perspective

Lipară Daniel

„Alexandru Ioan Cuza” University of Iași, Doctoral School of Economics
danl_02@yahoo.com

Abstract

Out of all the ideas and assumptions regarding the money and monetary theory, the classical liberalism was the first major paradigm that contributed to the development of the quantity theory of money.

This paper aims to express the first steps made by the Classical School economists in crystallization of the classical quantity theory. The interest rate is also studied in order to emphasize its effects over the macroeconomic stability.

What was the role of money in Smith’s view? What is the relationship between money and interest rate? Does money have an impact over the economic activity?

Key words: money, interest rate, monetary policy, economic growth.

J.E.L. classification: E40, E52, O40.

1. The birth of a new paradigm

The seventeenth century brought forward a new current of economic thinking. It focused on the natural order of things and on economic freedom. Covered by the *laissez-faire* cloak, the classical liberalism will provide a new perspective on society and on economy. Being also named “the first major paradigm of economic thought history”, the current will eliminate everything that is insignificant in the economic analysis, and therefore, will always capture what is essential and what gives originality [5].

For Classical School representatives, the wealth of nations is a constant theme of economic science. Unlike mercantilists, classics will lean on production rather than the movement of goods on market. The division of labour is fundamental and so is the role of its productivity.

Among the leading figures of the new current, Adam Smith, David Ricardo, Robert

Thomas Malthus, John Stuart Mill or Jean Baptiste Say left their mark – through their works – on the functioning of the economy and the society of those times.

2. The early times of classical liberalism

John Locke (1632-1704) estimated that the wealth is represented by gold and silver money whose value remains stable in time. Locke – whose ideas will later be developed by Ricardo – has researched the monetary issue too, considering that the value of money is shown by the amount of money in circulation.

The Irish Richard Cantillon (1697-1734) spoke about the role of money and its role in economic development. He also studied the impact of the demand and money supply over the wealth of nations. Based on the idea that money is a commodity, according to Cantillon, its value is calculated as the value of any other commodity [5].

Unlike mercantilists, classics didn’t consider money to be so important. They thought that money didn’t have any impact on the economic equilibrium.

But the founders of the quantity theory of money are not the classics. Its origins are found somewhere in the middle ages and relate their existence to Jean Bodin (1530 – 1596). Bodin believed that there is a direct relationship between prices and the quantity of money in the economy, so that an increase of the amount of money will lead to higher prices and vice versa. More than that, he highlighted the inverse relationship between the purchasing power of money and the amount of money in circulation.

The famous formula $MV = PT$ was established by mercantilists, who considered that money supply is the core of economic growth. Bodin agreed that money is not responsible for any macroeconomic change.

3. Classical School's perspective over money and monetary issues

The quantity theory of money was the starting point in shaping the opinion of the Classical School's economists regarding the money.

Smith, Ricardo or Say appreciated that money has a neutral role, being an intermediate in the exchange of products. Classics didn't "feel" the impact of money on the economy, considering that they have no influence over the balance between demand and supply.

The most important figure of the Classical School is British Adam Smith (1723 – 1790). For the author of *Wealth of Nations*, the free market is responsible for adjusting the money supply, not the government: "Upon every account, therefore, the attention of government never was so unnecessarily employed, as when directed to watch over the preservation or increase of the quantity of money in any country" [7].

He criticized the mercantilist doctrine that admitted that money and precious metals are synonymous with the wealth of nations. According to Smith, the goods represent the wealth.

Smith identified a double role of money: that of circulation and a measuring instrument of the value of goods. Although considers that paper money has a positive effect on the economy, ensuring national wealth, he doesn't believe that can help increase the money supply. In fact, he sees them as mere substitutes of precious metal money, which must not exceed in quantity, because, whenever we can face the danger of their devaluation: "The commerce and industry of the country, however, it must be acknowledged, though they may be somewhat augmented, cannot be altogether so secure, when they are thus, as it were, suspended upon the Daedalian wings of paper money, as when they travel about upon the solid ground of gold and silver" [7].

The interest rate has not been such an extensively studied topic by Smith. He showed the declining trend of interest and the indirect relationship between the interest rate and the economic development degree of countries.

Smith presented the interest rate from the borrowers' and the lenders' point of view. He

thought that the interest rate depends on the interactions between those two economic agents. The borrower will accept to take money, looking forward to make that investment to be profitable. The best deal for the lender that will determine him to give money will be when the lending interest rate is higher than the cost of funds. As mentioned by Choi (2011), these two decisions will have a great influence over the interest rate [1].

Adam Smith is well known in the economic literature as the inventor of the invisible hand theory. The doctrine states that it is better for everyone to behave for satisfying its personal interest, rather than to achieve the public interests. In this case, there is an invisible hand that helps the society to improve, to develop and to obtain great results [2]. In *Wealth of Nations*, Smith stated perfectly the core of the ideology: "It is not from the benevolence of the butcher, the brewer, or the baker, that we expect our dinner, but from their regard to their own interest. We address ourselves, not to their humanity, but to their self-love, and never talk to them of our own necessities, but of their advantages" [7].

One of the most important followers of Smith's ideas is David Ricardo (1772 – 1823) that saw money fulfil only the function of medium of exchange.

He admits the objective theory of value, but criticizes the Say's subjective theory. Through 1816's work, *Proposals for an Economical and Secure Currency; with observations on the Profits of the Bank of England, as they regard the Public and the Proprietors of Bank Stock*, Ricardo advocated for demonetization of precious metals, for using them instead of paper money and for setting a fixed exchange course by the monetary authorities, in order to eliminate the threat of money devaluation [6].

Ricardo's quantity theory of money can be illustrated through the formula $M = PT$, showing another time the positive relationship between money supply and the level of prices. In other words, if we had to quote Ricardo himself, "a certain production of goods and services results in a certain volume of transactions (T), at a certain medium price (P), taking into account the amount of money (M) available" [8].

Through his works, the French Jean Baptiste Say (1767 – 1832) continued and summarized Smith’s concepts.

Money market equilibrium – said the French classical economist – is a constant of the economy, being always there and at any time, because the goods are offered on the market, for money, which are further used to buy other goods.

In that case, on the money market, the total value of demanded goods is equal with the total amount of offered goods. Money market equilibrium is achieved; and this balance is permanent because the goods are exchanged for money, which are used to buy other goods. So, the monetary theory is excluded by the terms of this Say’s identity [8].

He is the author of the Law of Markets, which assumes that “products are paid for with products”, disregarding the role of money in the goods exchange. The identity appears because every supply creates its own demand, as goods are obtained from correct factors of production.

The British philosopher John Stuart Mill (1806-1873) – considered the last symbol of the classical liberalism – is credited with a synthesis of the Classical School’s ideas. For him, as for Smith too, the object of the economic science is the analysis of wealth.

Speaking about the interest rate, Mill said “The rate of interest will be such as to equalize the demand for loans with the supply of them. It will be such, that exactly as much as some people are desirous to borrow at that rate, others shall be willing to lend. If there is more offered than demanded, interest will fall; if more is demanded than offered, it will rise; and in both cases, to the point at which the equation of supply and demand is re-established” [4].

An increase of the interest rates leads, accordingly to Smith and Ricardo to an expensive credit and to a decrease of the purchasing power of money, creating the perfect framework for recession.

Like the mathematical model of Leon Walras – where money is a homogenization instrument – classical economists emphasized the idea of currency’s futility. So, Mill considered that money has no impact in the economic activity; on the other hand, the creator of the Law of Markets, Say,

admitted the idea that we need money not to keep, but to use it immediately.

4. The development of the quantity theory of money

The quantity theory of money has progressed through two models: the transactions model and the cash balances model [3], [8].

The two models have emerged in the early twentieth century, when the quantity theory of money was not answering to that existing reality, and the economists were looking for alternatives.

The transactions model is based on the ideas of David Hume, who showed the equality $PT = MV$, where P is the prices level, T represents the transactions, M is the amount of money in circulation and V is the velocity of money.

Hume’s assumptions will be later updated by Irving Fisher in *The Purchasing Power of Money* (1911) through the mathematical equation of exchange:

$$MV + M^i V^i = PT, \text{ where}$$

M – currency in circulation,

V – velocity of currency in circulation,

M^i – demand deposits (scriptural money),

V^i – velocity of scriptural money (bank money).

Through this equation, Fisher shows how the money market works. We must not fall into the trap of believing that there is proportionality between variables, although that’s the case at a first glance. We are talking about a model, a copy of reality, but not the reality itself. *Money has here an active role, because they influence prices and not vice versa!* Fisher’s correlation is not only between money and prices, but with other factors too, such as population growth, technical progress or bank loan, bringing forward a touch of originality and improvement to the classical theory of money.

The idea of considering money as a first element in the analysis, even before prices, is showed by Fisher in *Appreciation and Interest* (1896), in *The Rate of Interest* (1907) and later, in *The Purchasing Power of Money* (1911).

The cash balances model is developed from the idea that people establish a certain reserve from their income that will be used for a future consumption of goods. The cash reserve size depends on the frequency of collecting the income, the needs of each individual, the preference for a particular good or their marginal utilities.

Arthur Cecil Pigou and Alfred Marshal are considered the parents of this model, which expresses the direct link between the money and prices. Keynes, will later update this model, promoting it in the monetary field as the Cambridge equation.

The Cambridge equation is based on Fisher's equation, the only difference being the K coefficient that represents a part from the income that people keep it as liquid currency, or, in other words, the average period for which money is kept:

$$M = KPT, \text{ where}$$

M – money supply,

K – the average period for which money is kept,

P – price level,

T – the volume of transactions.

The K coefficient may be associated with the inverse of the velocity of money from Fisher's equation.

The two models deal with pretty much ease the price dynamics, ignoring important issues that might influence the K coefficient, the amount of money or the velocity of money.

Comparing the two models, we see that Fisher focuses on the amount of money in circulation, so, on the money supply, while Keynes, emphasizes the K coefficient, so the purchasing power of money, or the demand of money. Any change in the K coefficient will lead to price fluctuations, but will have no impact on the amount of money in circulation, as the quantity theory of money stated.

In the Classical School perspective, the amount of money in the economy does not determine the market interest rate.

5. Conclusions

Classical School is one of the most important schools of economic thought that

contributed to the development of the quantity theory of money.

Although classic economists didn't give so much credit to money, having no impact on the economic equilibrium, their ideas were fundamental for the progress of monetary theory.

Money is futile in the economy and does not determine the market interest rate.

The transactions and the cash balances models had helped to the improvement of the quantity theory of money.

The Monetary Paradigm in the Misesian Theory

Lipară Daniel

„Alexandru Ioan Cuza” University of Iași, Doctoral School of Economics
danl_02@yahoo.com

Abstract

One of the leading figures of the Austrian School is by far Ludwig von Mises. Known better for his findings regarding the relationship between money, prices and interest, Mises brought originality and a new perspective over the monetary policy.

This paper is a tribute to the philosopher Mises, who focused on human acting and who enriched the monetary theory with an analytical perspective and deductive models, creating the so called Misesian theory.

What is Mises contribution to the development of monetary paradigm? Is expansionary monetary policy good? Is he for private initiative and free market rule? And most important how does the business cycle theory influence money?

Key words: money, interest rate, monetary policy, business cycle theory.

J.E.L. classification: E40, E52, E30.

1. A new School at horizons

The second half of the twentieth century is dominated by a new economic thinking current, the Austrian School.

The base of this School's analysis is considered Carl Menger's work *Principles of economics*, in which he systematizes the entire Austrian theory [6].

Three stages can be seen in the evolution of the Austrian's current. The first Austrian School, represented by Carl Menger, Eugen von Böhm-Bawerk and Friedrich von Wieser had studied different approaches to prices, interests and production. This is the pioneer stage where the first Austrian ideas are born. Nevertheless, the true contribution in the development of this School is brought by the second Austrian generation, which is actually the most known one. So, Hayek, Machlup, Strigl or Haberler are the economists that

sprinkled the Austrian theory with a touch of originality. Ludwig von Mises is by far their leading figure. Through his business cycle theory, he reinvented the theory in economics. Anyway, the spread of the new Keynesian paradigm, together with the emigration of the representatives of this second generation of economists because of political issues, seemed to bury forever the treasure of the Austrian thinking. That is how Rothbard, Kirzner, Lachman or Garrison, inspired and attracted by Mises' works, revive the Austrian tradition in the United States, in the 70s, through the third generation of Austrian economists [6].

Declared opponent of Keynesianism, the Austrian School will focus on concepts like: methodological individualism, marginal analysis and opposition to socialism. Austrians have always kept in mind the individual and especially its preferences. For them, any analysis must take into account people's preferences. So, according to this School, people act and learn, facilitating the economic activity to be dynamic [6].

2. Mises's contribution to the development of the Austrian paradigm

Philosopher Ludwig Heinrich Edler von Mises (1881 – 1973) is the most known representative in the Austrian School. Being influenced by the works of Carl Menger, Mises had developed his entire work on praxeological method, studying *action* and especially, human action. What is praxeology? Well, the methodology used is unique. It is focused on how the human beings act and establish goals. So, *acting* is the best way to describe this method. And humans will therefore act towards goals and will do whatever it takes to reach them.

According to Manolescu (2007), there are two stages in developing the monetarist economic thinking. Along with new monetarism stage, there is another one, the

Austrian School. Menger, Mises and Hayek centered their studies on researching how the money supply will impact the phenomena of inflation and unemployment [2].

Mises criticized socialism, saying that in a planned economy there is no market, so prices can not form and therefore, any economic calculation is impossible.

However, the most outstanding contribution of Mises to the development of the economic theory remains the famous business cycle theory, which is masterly presented in *The Theory of Money and Credit*. Using elements from the Austrian capital theory, as well as from the wicksellian monetary policy, the business cycle theory believes that increasing the volume of loans or credits affect the economic expansion. The volume of loans increases due to lower interest rates. Business is encouraged, and investments are flourishing. However, a rise in the production goods prices will diminish profitability. The lack of credit will raise the prices of production goods, making them closer to the level of consumer goods prices. It is an undesirable situation, because in this way, the profitability objective cannot be achieved anymore. The premises of a crisis are set up. The goods cannot be sold and if it would, it would have been at low prices. An increase of the money supply is needed. As stated above, the business cycle theory developed by Mises, didn't offer an anticrisis solution. The Austrian School will oppose socialism and government intervention [6].

Salerno (2010) agreed that a general theory is needed, as a combination between monetary theory and value theory. This will better explain the market economy. One of his big desires in *Money, Sound and Unsound* was to emphasize the connection between Misesian theory and modern monetary theories [7].

3. The Misesian monetary paradigm

Ludwig von Mises is known to determine the relationship between money, prices and interest, although its contribution in monetary policy remained in the shadow of Alfred Marshall, Knut Wicksell or Irving Fisher. Appreciating the monetary imbalances as being the result of the fluctuations in the amount of money in the economy, Mises could be regarded as a monetarist.

Lawrence Moss (1976) considers that *The Theory of Money and Credit* is by far one of the most comprehensive approaches to monetary policy in the early twentieth century. However, Mises's work doesn't seek a suitable methodological framework to study monetary policy. Mises treats monetary policy from an analytical perspective, full of deductive models, recalling in this way the Austrian School, through its representatives: Carl Menger and Böhm – Bawerk [5].

In *The Economics of Ludwig von Mises: Toward a Critical Reappraisal*, Moss will recall Mises's relationship with Menger, Fisher, Wicksell and not least with Hayek.

Money is – in Menger's and Mises's view – the result of market economy. People buy and sell on the market in order to obtain goods for their existence [4]. Money is those goods accepted in any market.

Mises was detached from the unanimous opinion of the Austrian School when he said that for him, the purchasing power of money in the past affect their future value. Using the regression model in *The Theory of Money and Credit*, Mises shows how “today's” prices are explained through “yesterday's” prices [5].

In other words, a theory of money always takes into account the past behaviour of prices. He used this to show that countries that have experienced high inflation “the decrease in the value of the money has occurred faster than the increase in its quantity” [4]. He also states that “in a long run, a money which continually fell in value would have no commercial utility” [4].

Mises believed that between the interest rate and the amount of money that population has, there is no direct link [4]. Moreover, he believed that when the bond prices will rise, population will increase the money demand, so, that's why interest rate and money demand are inversely proportional.

Inflation occurs because of large amounts of money on the market. Mises had shown that, in fact, in prolonged inflationary conditions, the economy is experiencing a lack of money. *How can be explained this paradox?*

Individuals are currently reducing their amount of money they need because of an expected increase of inflation. Prices depend

on the future value of money. The decrease in the amount of money will be made until future revenues will cover this current reduction. A decision to reduce the growth rate of money supply by the monetary authorities will impact on future incomes that will not cover the population's decrease of cash. In other words, the economy will face a shortage of money. Monetary authorities are expected to come with the solution of less restricted policy, whose goal would be the increase of liquidity in the economy [4], [5].

Mises says that inflation *is doing very well* in the presence of cartels or trusts that set market prices. In times of inflation, people doesn't give up consuming and, moreover, decide to pay now the highest price rather than wait and pay a higher price later [4], [5].

Mises believes that a price increase is favourable to certain individuals, but disadvantages others. Suppose that we would have an increase of the money supply in the market. This will lead – according to Mises – to a raise of prices, in opposition to the wicksellian idea that any increase in the money supply has a neutral effect over commodity prices. Individuals who will receive money are disadvantaged because the prices rose and the real value of the money received fell.

Mises brings into question the idea that the state is winning during a monetary issue. Why is that? Because, usually, the state is the debtor in the economic activity and any monetary issue or any increase of the money supply will amplify inflation. As a consequence, the real value that the state has to pay to economic agents is diminished [4].

Wicksell's theory of cumulative expansion was analyzed by Mises too. By maintaining the market interest rate below the rate of profit, or the natural interest rate, banks open the lending gates, encouraging the demand for bank loans and increasing the commodity prices too.

What if banks decide to keep this policy? They will continue lending and prices will rise. In *Interest and Prices*, Wicksell sought a solution for timing the process. The stop button was the *interest rate for deposits*, which should not fall below a certain level. The banks increase the interest rates so the rising prices process is stopped, although their level is high enough. In order to avoid this situation, the equality between the

interest rate and the profit rate is needed, so the lending process is slowed down and so is the increase of prices. Mises believed that if the interest rate would remain below the rate of profit, the money supply should increase.

For Mises, an *expansionary monetary policy has inflationary implications*, and especially deadly for the social class, because it further impoverish the poorest people. Mises believes that hyperinflation has negative economic consequences, facilitating a total state control [4], [5].

Hülsmann (2008) considers that the entire work of Mises is based on two major themes: firstly, a free market competition that will lead to a monetary order focused on gold and reserve banking, and secondly, the theory of denationalization of money, which will be studied by Mises' student, Hayek [1].

Two monetary problems are revealed by Mises in *Money and inflation - A Synthesis of Several Lectures*: the first one is inflation and the second one is the cause of prices increase – the increase in the quantity of money.

The Austrian admits that “the government resorts to inflation, and that means an increase in the quantity of money. And this is the second monetary problem” [3].

If the monetarists admitted an immediate relationship between money and real events, based on a long term analysis, the Keynesians' short term analysis express the pessimism regarding this relation. What is the opinion of the Austrian School? De Soto (2009) thinks that the capital theory, which is the base of Austrian School thinking stands somewhere in the middle, between the perspectives of the two macroeconomic schools: “Austrians see a certain connection – a *loose joint*, to use Hayek's terminology – between monetary phenomena and real phenomena, a link which is neither absolute, as monetarists claim, nor totally non-existent, as Keynesians assert” [8].

4. Conclusions

Mises remained in economic thinking through his works in the field of monetary theory and business cycle. Staunch opponent of socialism and Keynesian paradigm, Mises is one of the most prominent personalities of the Austrian School [6].

Regarding the monetary theory, Ludwig von Mises stated the elimination of state

intervention from the production of money or from banking field. Beside this, he emphasized that private initiative and free market are better than state interventionism. The system of Mises is based on gold-coin circulation and 100% reserve banking [1].

According to Austrian School, money is not neutral and banks should fight against “falsification” of relative prices, because these “lead to the widespread malinvestment of resources, and inevitably, to crisis and recession” [8].

The Austrian School’s policy is based on three pillars. *Firstly*, there are the stability of the quantity of money and the reduction of credit expansion, which are the most important conditions for creating a 100% reserve banking system. *Secondly*, a flexibility of the relative prices of goods, services and factors of production is needed in order to combat unemployment and corruption. And *thirdly*, there is the ability to predict any changes in the purchasing power of money, especially on long term [8].

In Austrian’s view, the market prices influence the production costs and the interest rate is a subjectively established price [8].

Mises didn’t see any link between the interest rate and the amount of money that population has.

Through his entire work, Mises brought a new vision over the monetary theory from the twentieth century.

The echo of his research will not be forgotten, because his ideas will be continued by Hayek, Rothbard, Kirzner and many more.

Abstract

As it demonstrates evolution in recent years, intelligent agents technology is regarded as an essential tool in automating the decision-making functions and analysis as a means of facilitating and promoting organizational change, with significant potential in many areas of activity, including the accounting and finance domain. Within this area, the role of agents is oriented towards the automation of specific tasks which involve processing auditor, manual large volumes of financial data, which means that the staff member will be responsible for this processing, achieving continuous on-line. Thus, the relevant purpose during this paper is to highlight the role and benefits of using intelligent agent's technology as a fundamental tool in automating functions of financial analysis in a virtual environment.

Keywords: intelligent agent, SEC, XBRL, web reporting and auditing.

JEL Code: G11, G17, M15, M21, M41, M51, O16, O33

1. Introduction

Intelligent technologies are becoming more attractive to many fields of activity because of the benefits they can bring. So, slowly but surely, the industry, in general and financial accounting in particular, are beginning to reap the advantages and benefits that intelligent technologies offers them generously.

Basically, becomes more and more obvious that the competitive advantages can

be gained only when all the economic actors involved (from simply hired and up to the entire economic branch concerned) they choose to adopt and to appeal to intelligent technologies, as the only viable solution to advancement on the specific technological scale in the 21st century, one that allows economic entities to survive and, especially to obtain important benefits and acquire successful businesses.

Within this work are of concern intelligent agent's technology, which currently is able to cover more areas, the overwhelming economic importance at the level of economic processes. In addition, it is clear to us that they are able to create important competitive opportunities for all economic entities which have grasped that their major role is and how it can be acquired and converted to value the benefits that they bring intelligent technologies.

The present work is a multidisciplinary approach to border areas computer science and accounting and focus on highlighting the impact of intelligent agents and the role of technology in the field of financial accounting, through FRAANK agent (*Financial Reporting and Auditing Agent with Net Knowledge*). The agent is able to guarantee access to large volumes of financial information available at different locations on the Internet, but also functionality and integration of their processing, too. Basically, the fact that we are able to access the available on-line financial information does not ensure success meant, but if the information is subsequently passed through electronic instruments, then business success can be guaranteed easily. So, as we look over the course of this work,

FRAANK is a modern solution that provides intelligent features and can successfully support human actors in the decision-making process. It improves the quality and accuracy of knowledge that can be obtained about the different organizations, allowing successful operation with smart technologies and picks all the benefits to which they are able to offer them.

FRAANK is an example of an agent that can be used to extract data from financial documents in text format, which they then converted into XBRL documents. This agent can be useful both in the field of statutory audit, as well as for different categories of users, as are investors or lenders, in the process of decision-making.

2. Actual context

Currently, in order to survive, each organization must be permanently connected to the virtual environment to have access to the information as soon as it needs. Thus, we can affirm, without the risk to fail that the expansion of the Internet has enabled organizations to be active in virtual mode too, offering the possibility of accessibility a growing volume of information available in on-line format. Furthermore, most organizations are reorganized and rethinking business processes around the Internet, just because of the benefits that it is able to offer. This reorganization will have as its main result the data sharing between companies, according to certain levels of authorization or access.

At the same time, it should be noted that there are already public data sources and accessible on the Internet (most notably in the context of the domain portion is the SEC Edgar data store, which contains reports of the SEC), and many portals such as Yahoo! provides access to specific data, for example, in financial markets, economists forecast of analysts and many other information relevant and important to the whole business. This virtual environment is an ideal space for exploitation and use by intelligent agents.

In recent years, intelligent technologies have achieved in online audit area, where it is found that the benefits can be significant. Traditionally, audit refers to checking the accuracy of reported data across the organization. In addition, auditing practices

provides quality because they are audited financial reports of organizations on different time periods. Furthermore, the information provided can be extremely useful for many categories of users (e.g., analysts or investors), which means that we must not be indifferent when these information are available. Thus, researches the past few years have been just to achieve that objective, and modern intelligent technologies began to have an increasing role.

Clearly, once available on the Internet, the information may be used in different ways, from the traditional analysis to complex interpretations by using the latest technologies. So, we can consider the FRAANK agent, whose main purpose is to achieve the integration of accounts, together with their values, and then, using other sources of information available on the Internet too, it can calculate various indicators of financial accountants to express and play themselves as closely as every organization's financial performance.

Thus, the availability of financial information in the virtual environment is the result of the latest trends in ensuring and guaranteeing the transparency of enterprises in business-web reporting financial information. Web reporting of financial information is a modern method, applicable in many countries around the world and refers to the use of websites specific to a company to distribute information about their economic performance. Web reporting of financial information of organizations may be a good marketing policy, whereby it is made known to all categories of interested users, having at least two direct economic implications:

- web reporting of financial-accounting information generates the need for standardization of its format, which led to the development and accelerated adoption of XBRL web reporting language, but also a considerable number of web applications that are able to analyze and process information in XBRL format reported in documents;
- the *Internet* affects information processing costs, and default the supply and demand for financial information on capital markets.

3. The modern information challenges in financial accounting approach: intelligent agents

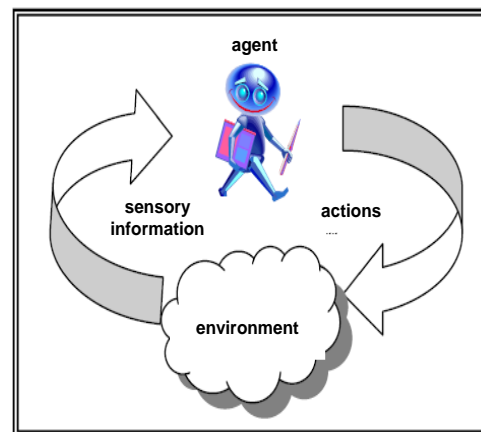

As shown in the literature, we can see intelligent agents as systems that operate autonomously to perform certain specific tasks without direct intervention on the part of the human factor.

In the field of accounting-financial audit, automating tasks human auditor enables him to deviate from the usual and customary duties and focus on the issues that really require expertise. Thus, human auditor is improving the quality of services provided and the time of their audit practice, expanding beyond its traditional limits.

Joint the decision-making capacity of the human factor with the results provided by intelligent systems can lead to extremely important benefits for all involved parts. At the level of intelligent systems, are neither neglected nor neural networks-based technologies, which earn them more and more land, especially in the process of preparation or decision-aid. Obviously, the goal of each and every computer system of modern technologies (especially those regarded as intelligent area) is to streamline the current work and to support more intense decision-making act accompanying the respective activity.

Although the field of intelligent agents is an active topic of research, including economic domain too, there is currently no universally accepted definition of all researchers about its. However, a consensus regarding their traits place in the spotlight the autonomy property which refers to the ability of an agent to act and to fulfill certain tasks without direct intervention on the part of the human actor [Wooldridge, 2002, p.35]. However, to be considered intelligent, an agent must accomplish the other two fundamental properties: *pro-activity* and *reactivity*. Reactivity refers to the ability of agent to perceive its environment and react appropriately to the changes imposed, while *pro-activity* refers to the functions of a agent who is not only limited to the reactions to the environment, but aimed at the fulfillment of its objectives. Thus, *figure 1* highlights the interaction of an agent with its environment.

Figure 1. Agent interaction with its environment

Source: (Wooldridge, 2002, p.16)

Intelligent agents specific audit accounts domains are considered to be sophisticated software systems that can perform complex tasks using specific knowledge in their dynamic environment where they operate.

In the study of literature we can conclude that, in order to be effective from the practical point of view, an application must be specialized in a limited number of tasks. For example, FRAANK agent has as its main objective to retrieve relevant information (as for example the number of accounts) in semi-structured documents as naturally text, from accounting or audit field.

An intelligent agent will require additional skills, in addition to those mentioned above, for financial reporting and auditing applications. In other words, an agent will must be able to interact with others. Ability to *communicate* can be or not required of an agent, depending on the tasks assigned to it. But, an agent who can communicate may then be able to *collaborate* with other agents. Collaboration is only possible when all agents use the same communication protocols, or when there is another intermediate agent specializing in „translation” of messages between agents. If the FRAANK agent would be endowed with communication skills, then we can receive requests from other agents and could provide financial data interpreted by others, such as those that automate financial analysis applications or banking loans solvability.

Mobility is another important property of agents; although this is not a necessary and sufficient condition for a society of agents, some researchers [Gilbert et al., 1999],

[Brazier et al., 2003] include it when discussing the agent's properties. Sometimes it is much more appropriate for an agent to interact with a remote computer, being several reasons why prefers such a form of interaction, and one of them is efficiency: network traffic can be reduced when the computer and agent are found at the same location. For example, when an agent requires a remote database, the data should be sent back to the database by the agent. This communication can be carried out locally, when agent and the system can be found at the same location and thus reduces network traffic. Another reason is that the data aren't exchanged via a public network, but can be processed locally; agents may act in a much more secure manner. In addition, remote systems allow agents to operate only local and thus forcing them to migrate to the remote location.

4. XBRL web reporting

Today, XBRL is technology that revolutionizing business reporting because it allows us to share, transport and access to the information more efficiently, both in terms of time and cost involved, without interaction with the human factor and platform-independent, too. The adoption of this standard of reporting eliminates errors caused by man to (re)print of information for the purpose of reporting or decision making. XBRL is developed with the aim of achieving financial reporting since provide transparency in business management and fairness in reporting financial information, defining a new syntax for reporting.

XBRL technology allows that the financial information to be shared, communicated, understood and reused electronically, without human intervention. It is a language derived from XML, developed not only to display information, but also to specify the context of used it. XBRL, as an adopted reporting standard, presents important advantages, such as reduced costs, increased efficiency and accuracy, and increased safety to all parties who provide or use financial data.

Basically, to be able to analyze financial documents available on the Internet, it is need a standardization of the information contained in those documents to be specified because the heterogeneity of reporting

documents would make it impossible to achieve that objective. This task is in the responsibility of XBRL, which provides a standard vocabulary and one uniquely field that identifies each item in reporting documents. In this way, using XBRL, the information reported is no longer „locked” inside the document, but can be accessed using XBRL services, each data field within the document. In this way, it becomes possible through XBRL tools, the analysis of information that is published on the web.

The XBRL standard has been compared with the introduction of barcodes or ISBN number for books. Thus, the SEC has made some great strides in implementing XBRL; investors can require insurances during the process of wrapping and labeling of financial information. The Audit Committee of Public Companies (Public Company Accounting Oversight Board – PCAOB) are initiated general rules for the certification of commitments with respect to financial information XBRL, starting from the completion of certain files at the request of the SEC, which is based on manifesting understanding XBRL version by the auditor.

XBRL allows publication, exchange and analyze complex financial information business reports in dynamic and interactive world of the Internet. In addition, the standard provides a common platform for reporting processes of accounting and financial information and streamlines data communication between intern and extern users of the information. It also marks all necessary financial accounting information to all categories of users, both intern and extern decisions.

Research of the past years has shown that the benefits of intelligent modern technologies are important, it having a large impact on the various areas of activity. In this context, researchers from the informatics management showed more interest in the direction of using and adapting it in the economic field. A good example is the development of the XBRL standard for financial reporting, respectively the use of reactive intelligent agents technology, that can be made from the financial expert systems.

Starting from matters specified above, *E&Y CART* (Center for International Business Education and Research) has

developed a web site, designed as a resource center for specialists in accounting and auditing. Their experts have created an intelligent agent called FRAANK which has the task to get information and non-financial of 10 million reports of public companies. In order to maintain compatibility with the latest advances in technology, the FRAANK incorporates the XBRL language. Thus, software product called FRAANK-XBRL converts millions of reports from text format to a version with bookmarks based on XBRL USA taxonomy.

The main objective of FRAANK is to create a universal assistant for financial reporting and auditing to be able to interact with a multitude of sources of information, to learn the structure of web sites, to analyze the text in documents accounting or auditing and to formally represent and use the knowledge in the areas of accounting and the range of audit.

It constitutes the first step towards collecting financial data of organizations, data that are available on the Internet, which it then will use in order to provide value-added services. Once the agent returns financial information to the end user, it can be processed and combined using other artificial intelligence systems to obtain and provide real-time knowledge needed to the human actors in the decision-making process.

FRAANK is made up of many sub agents, each corresponding to the source of information used by it in real time. They are: Edgar agent, ticker agent, the agent of the quotation on a stock exchange and EPS agent. FRAANK's functional architecture allows its logic to be clearly detached of the end user interface, on the one hand, and the sources of specific knowledge of the financial accounting domain stored in a relational database, on the other hand.

Being mainly based on textual analysis of 10-Q reports, FRAANK is implemented entirely in Perl language, because this is the programming language that provides the most efficient pattern matching functionality. It is obvious that most of the source code of FRAANK is devoted to the implementation of the intelligent interpretation of structured text SEC reports.

5. Concluding remarks and future researches

Insurance provided by XBRL to financial statements is a certainty and is seen as a potential field of the development of scientific research carried out by specialists in audit, researchers or practitioners. Today, the XBRL data – obtained through SEC program of voluntary pick – does not require independent additional insurance, and guides to supplement information required by XBRL refers to audit information and recommended testing, if the financial aspects are labeled correctly. To control of the risk, in the case of XBRL commitments, relate more to the process of labeling of financial information, only the internal control on the process of counting.

Researchers in audit can provide potential solutions at important aspects in according with benefits of XBRL language and its implications in this domain. For example, owing to the nature and XBRL, automation will increase both the efficiency and the effectiveness of these commitments. Technological developments have potential in this area, such as the FRAANK, which has its origins in academic research. The ongoing development of XBRL is a certainty, this technological advantage which may be used in the process of assurance to facilitate it. XBRL – based technologies can be used in other auditing procedures, for example in the area of risk assessment and fraud or making comparisons of industrial very specific data. Overall, the benefits of XBRL audit increases the efficiency of audit process.

Concluding, we can affirm that the joint of intelligent technology with modern means of reporting and analysis of financial accounting information can lead to significant benefits and opportunities for all parts involved.

irina_lupu13@yahoo.com

Abstract

The great inflation of the 70s, triggered after two decades of stability and growth was explained as known, by the representatives of neo-liberal economic theory as due to the erroneous feature of state interventionism policies inspired by Keynesian doctrine, which have been mainly applied throughout this period. In particular, the regulatory activity of the financial monetary system and the cheap money policy have been accused, being regarded as obstacles to the market and its mechanisms of self-regulation.

Our exposé supports, conversely, that the hyperinflation of the 1970s, followed by economic stagnation and rising unemployment do not refute the theory developed by Keynes, but provides new arguments in its favor. Because, what was implemented was inspired either from a distorted view of it, or out of mainly political reasons, hence the proven inconsistency in applying the Keynesian economic model.

Key words: Keynesian doctrine, money policy, hyperinflation,

J.E.L. Classification: E12, E31, E52

1. Introduction

Inflation is always a consequence of strong money supply growth, and this is accomplished either by increasing the monetary base or by increasing the broad money supply. By 1965, the main inflation threat came only from the monetary base growth, but since the mid 60s, the main threat comes from those financial innovations, which increase the amount of monetary means placed on the market [1].

The lack of effective control on the amount of such monetary means in circulation will also lead to a worrying increase in quantity, an increase that is in itself the expression of a visible inflationary potential. Postwar period of economic history shows the close relationship that existed between financial innovation, the emergence and expansion of speculative bubbles and inflation. Thus, it appears that any new U.S. financial innovation was followed by a visible increase in inflation, its rhythm increasing with the number of financial innovations.

The weakening of the financial system, resulting from the uncontrolled growth of the range of lending instruments will form the basis on which inflation will become a chronic and difficult to control phenomenon. A number of specific causes will be added later to this endogenous cause of the inflationary phenomenon in the U.S., such as the Vietnam War and the overbidding of the position held by the U.S. dollar in the international monetary system. The Vietnam War marked the significant growth of the public debt, a phenomenon with strong inflationary effects and the necessity of keeping the debt within fairly reasonable limits will increase the supply of dollars in circulation, for the moment this latter measure enjoying the gold standard protection.

The costs entailed by the war in Vietnam and the impetuous development of West European and Japanese economies, have determined the fact that large amounts of dollars were in possession of other states, which will represented a serious threat to U.S. economy, especially while the U.S. promised to ensure conversion of any quantity of gold dollars. The high pressure caused the Nixon administration to abandon

the gold convertibility of the dollar and to accept its free fluctuation. However, this represented, in fact, the strong devaluation of the dollar, a phenomenon with strong inflationary implications, which will be particularly felt in the economies of those countries that were in possession of large amounts of U.S. currency. Thus, the inflation started in the U.S. will spread to a global scale, affecting all world market economies.

Graphic 1 Annual CPI inflation – Germany

Source: ECB, Monthly Bulletin May 2010, *The “Great Inflation”: lessons for monetary policy*, p.3

In this inflationary storm that will affect the world economy, some islands of stability will appear however such as, for instance, the one represented by the West German economy. In order to curb the inflation, which seemed to be the most serious threat to the stability of their economic system, West Germans have sought the solution in the monetarist doctrine recommendations that is to exercise tight control over money supply.

Graphic 2 Annual CPI inflation – United States

Source: ECB, Monthly Bulletin May 2010, *The “Great Inflation”: lessons for monetary policy*, p.3

While North Americans lost all control over the inflationary phenomenon, not acting for the development of a strong anti-inflationary policy that would take into account the whole evolution of the economy, according to which to be able to anchor the inflationary expectations, FRG acted with all forces to print a predictable trend in inflation.

In this context, mention must be made that the phenomena of mega-inflation recorded in the first years after the war were still vivid in the memory of West Germans, so that were willing to accept any sacrifice in order to avoid updating them. At the same time, the FRG also had the means required to control inflation, specifically, they had a strong, dynamic and competitive economy, on the one hand, and on the other hand, they benefited from a strong and fully independent central bank, which had complete freedom in taking measures meant to ensure currency stability and the rigorous application of existing regulations in this regard. The results of this realistic policy will be identified in the lowest level of inflation ever recorded in this country, in comparison with those found in the rest of Western countries.

2. Results and failures in applying Keynesian policies

The strong inflation of the 70s affected the market economy in all its joints, negatively affecting both the economic growth rate and the employment of labor. If up to that time, the moderate inflation of the first two decades was associated with a slight economic growth and low unemployment, the now incomparably higher inflation is linked to the economic stagnation and rising unemployment.

Table 1 Evolution of unemployment and economic growth between 1965-1985

Years	Unemployment		Economic growth

What is also interesting is the fact that the North American state continued to appeal, even after the outset of the Great inflation, to the same Keynesian prescriptions in order to overcome this crisis. But unlike the past, they do not have the expected results.

The failures of these economic policies in the new monetary and financial circumstances will be interpreted as the denial of the validity of Keynesian doctrine. Cheap money policy postulated by Keynes, which worked in the first decades, has now proven insufficient or inappropriate to the current circumstances, which will cause opponents to insist on the idea that the solution would be a renunciation of Keynesianism and crossing the border to neo-liberalism. If for Keynes, state interventionism represented the main means of settling failures and strengthening the economy, for the advocates of neo-liberalism, the strong renunciation to interventionist policies was considered to be the best solution.

The neo-liberal schools, in particular the monetary school, believed that the policy of cheap money was the real cause of failure and implicitly, of the strong deadlock reached by Western economy after nearly three decades of Keynesianism. Cheap money encourages the spirit of adventure, unprofitable investments, hedge games. Therefore, expensive money policy would be a healthy way of economic development, and expensive money means safe money and controlled inflation.

Despite the exaggerations that can be blamed on the neo-liberal schools of this time, they are however right when they highlight the dangers of rampant inflation and draw attention on the ongoing control of money supply. Their great error will however be their absolute confidence in the market's

capacity to solve all problems without the state intervention.

As for the alleged failure of Keynesian doctrine, one can see that it is not its failure, but merely a distorted interpretation and failure of an inconsistent application. Economy has not reached this state of inflation due to excessive state intervention and regulation, but rather due to insufficient regulations in relation to accelerating innovations in all areas of economic and, especially in finance. Keynes recommended budget deficit as a temporary solution to increasing aggregate demand and overcoming moments of recession, while the support of economic growth will come from private sector investments, as beneficiaries of the cheap money policy.

On the other hand, cheap money policy can achieve its goal only if there is a continuous monitoring of the rules' observance for granting loans, only in this way is there a guarantee that money will be directed to socially useful investments that will contribute to real economic growth and high efficiency. Otherwise, cheap money will fuel speculative bubbles, as it happened first in the North American economy and then in other Western economies, where money has skyrocketed. For the first time during the post-war period, the strong advancing of the GDP growth of broad money (in time of peace) meant to introducing a profound gap between money and production.

It should be noted that the major danger was not the increase of the money supply, but rather its change in structure in favor of the quasi-currency, those financial instruments that will serve as the main sources of credit. As, it was precisely this abundance of the quasi-currency that has opened the door to excess lending and financing speculative bubbles, which is the most powerful means of undermining the economic stability. This situation would not have become possible if the financial regulatory policy innovations had operated at maximum, which proves that the cause of failure is not the overregulation, but the insufficient regulation.

The recommendation regarding the aggregate demand was applied in a unilateral way by increasing the public deficit, as it is essential the way in which expenditures underlying deficit growth are targeted. If such costs are directly aimed at stimulating

investment in certain areas, then their effects will be beneficial and the line of considerations will be found in Keynes's theory. If, on the contrary, it retains only the formal aspect of the problem, in that it increases the budget deficit, yet with all external causes of economic development, then the impact will be negative, and instead of stimulating economic growth new dysfunctions will be registered. As equally important as it is the extent to which public debt is allowed for, so that it stimulates growth. Recent experience has shown that in the case of each state there is a level at which the increase of public debt is a serious threat to economic stability and national security.

3. Inconsistencies in the recommendations of Keynesian theoretical model

Inconsistencies in the recommendations of Keynesian theoretical model resulted primarily due to a misinterpretation of the principles of Keynesian theory. If for Keynes, instability was the fundamental feature of market economies, those who will implement practical recommendations will start from the premise of the stability of this economy and its capacity for self regulation, thus creating an artificial synthesis between the classical theory and the one developed by Keynes. Yet, starting from such a premise means to ignore the main factors of instability and therefore not to give them due consideration. In such a situation it is likely to retain only the formal aspect of practical recommendations and to isolate from context the measures initiated by the state in order to increase the aggregate demand.

Secondly, Keynes's view on the economy is a systemic one, in which each component has a well-defined place, constantly interacting with others, suffering their influence and influencing them in turn. Therefore, when initiating a measure in a specific area one must take into account also its inevitable effects on the other, hence the requirement to adjust activities in those areas.

What was not retained sufficiently was the importance of the financial system, the fact that the health of the economy depends on its health, an aspect highlighted by Keynes repeatedly. This unintentional omission will cause that attitude of indifference of the state authorities against those innovations in the

structuring and functioning of the financial system, which had from the outset a strong destabilizing potential. Or, to apprehend from Keynes only the idea that that cheap credit is a basic condition of economic recovery, without any concern for the soundness of the system in which credit is made, is acting with half measures and reaching results totally contrary to the targeted objective. But in this case, the guilt cannot be placed on the cheap money policy advocated by Keynes, but on the application of this policy, which was totally contrary to what Keynes recommended.

In Keynes's view, the economic policy was only part of the general policy and the latter had to meet the requirement of achieving three fundamental objectives: *“economic efficiency, social justice and individual liberty. The first is a critical need for caution and technical knowledge, the second, an enthusiastic and bright soul with love for all his peers, the third, of tolerance and scope, of assessing the virtues of variety and independence, that prefer above all to give unlimited possibilities to those exceptional and aspiring”*. Unfortunately, however, both the general and economic policy have focused mainly on the economic efficiency, without sufficiently worrying about how this efficiency is capitalized, and whether it ensures an overall prosperity, or if it represents the basis of social justice and the fundamental condition of individual freedom.

Ignoring the social dimension of economic development has led to the violent divorce between the ideals of democratic societies based on market economy and the results of developing this economy, thus leading to greater social inequalities, to the concentration of economic and political power and to restricting individual freedom.

Keynes considered, indeed, that the main objective of economic policy must be to fully employ the available work, but it reported this objective to the ideal goal of full affirmation of human personality. A useful and effective work, which allows individuals to give full measure of his skill and creativity, is meant not only to insure his livelihood, but also to help affirm itself creatively, this affirmation being achieved in close unity with the entire community welfare.

Therefore, reducing unemployment to the lowest level is meant not only to provide decent livelihoods for all able bodied members of society, but also to provide the recovery of their creative potential. If the purpose of Keynes's objective is limited to ensuring livelihoods, the problem can be considered as completed and if the unemployment rate is high, the unemployed do not suffer because they are the beneficiaries of unemployment compensations. Such a formula, although necessary in the context in which unemployment cannot be reduced, is not desirable. Because, just as many important economists will notice, the entire social security policy which includes the unemployment aids, contribute to increasing the *transfer payments*, payments made from the state budget, but which do not contribute to the GDP growth. This continuous increase in the volume of transfer payments to the state budget structure is in itself a factor to reduce the efficiency of budgetary expenditures and increase awareness on the fragile financial structures. Disregarding the fact that transfer payments will have a higher influence on the public debt growth. However, for inflation, contracting a large government debt represents a ticking bomb, the inflationary consequences unfolding only at the time when government securities are redeemed, during the boom.

Government intervention in economy is nowadays a visible objective requirement, but this action itself must be made based on the principles of organization and functioning of a fair democratic society. If that particular intervention will be made in favor of certain influence groups that manage to have an even higher influence on policy makers, a situation common in all Western societies in the recent decades of the twentieth century, then the state will also become the prisoner of these interest groups, mainly acting on their behalf. Thus, this inadmissible twinning between economic power and political power became possible, the first financing the election campaigns of those who will hold political office, while the latter will subordinate the economic policy of the state to serving the preferred interests of those that have funded their political campaign.

4. Conclusions

Most economic theories, with influence on European politics, which have brought harsh criticism on the Keynesian economic model following the inflation of the 1970's, ruling for promoting without any restraints the market fundamentalism have identified contradictory elements of market economy, presenting it as a coherent and capable of self-regulation. The diagnosis of different stages of its evolution is inevitably wrong, so that economic policy decisions will be insufficiently adequate and not always effective enough. The main cause of instability in the capitalist economy after 1960 was due to the so-called limits of Keynesian theory, but that was due to the continual weakening of the financial system, which was started in the mid 60s. As one can see in the current presentation, the fragile financial structures and their deepening instability were based on the financial regulations. As for the attitude of growing tolerance for more and more violations of the existing regulations, this in itself was due to the unfounded belief that a strong economy excludes the possibility of serious disruption when they violate restrictions that were introduced during a time of crisis. On the other hand, during this period of time specialists began to reconsider the interpretation according to which the ability of the market economy is self-limited, a central point in Keynesian theory and which is to justify the need for state intervention in economic life, including its quality of judge on the competitive market. As such, the ideas according to which a fully stabilized market must be allowed to move freely will become increasingly influential resulting in the only such full exploitation of the self-regulated potential. This explains, in our opinion, the reduction of the activity of monitoring the compliance with the existing regulations in finance, the beginning of the manifestation of factors with strong inflationary effects, an overall process generated by the obvious contempt of Keynes's recommendations.

The Necessity of Nuclear Energy Development in the Context of Global Economy

Marcean Dana-Elena
dana_marcean@yahoo.com

Abstract

Energy is one of the most important elements of the global economy, being in the same time the basic unit of world economic development as a whole. In the energy mix, nuclear energy, more than any other type of energy, generated and will always generate a series of controversies.

The energy system extends its applicability in many areas and, wherever is situated the obtaining of the finished product, it has direct consequences worldwide. Due to these considerations, in this field it is not possible a unilateral view. The division of energy in subdomains is difficult to do because of their interconnections, each element having a specific influence on the others.

Although the notion of sustainable development is manifested increasingly stronger, economic issues involved in energy processes cause most countries to implement energy policies in such a way as to not sacrifice the balance against any of these items. The practice of many countries shows that every decision has an economic foundation that is never unheeded.

Key Words: energy, nuclear, economic development

JEL Classification: Q41, Q43, Q47

1. Introduction

Energy has always been a major factor in global politics, an element of paramount importance and a component that represents a major cost in the context of economic and social development worldwide, thus resulting a high degree of concern for major international forums in this domain of activity. The limitation of resources has always been a debate problem for economists. This is considered to be the

starting point of all the problems in this field: energetical resources are limited. That is why the objective of production, supply and energy consumption in a most efficient way is essential.

Economic and social development worldwide is characterized by an increase in energy consumption. Due to the possibility of being easily transported over long distances, but having also the advantage of the multitude of forms that it can take, electricity has had an important role in human progress. In terms of historical time which marked the beginning of electricity was on September 13, 1882, when Thomas Edison switched on in New York, the first power plant, on which there were connected a few dozen of subscribers. [1]

2. Economic implications of using different types of energy resources in the European Union

European Union countries use a diversified energy mix based on a range of reasons, most important of which are internal resources, the price of imported resources and the needs of the population. In terms of energy dependence, European Union was dependent, in 2011, at the rate of 59% of external energy.

The most pressing problem for the European Union on this matter is the security of supplying resources of energy, given its dependence on a single exporting producer, namely Russia. The economic and financial crisis has added more and new pressures, their results being materialized in decreasing the provisions for critical energy projects or discouraging results obtained in operational internal market for energy, carbon reduction, energy saving and efficiency.

Underinvestment in networks, capacity of production, transport and clean technologies can lead to a shortage of supplies of hydrocarbons, which would determine easily

the energy prices to rise and slows down the rhythm of recovery of communitarian economy. These issues demonstrate the economic importance of the energy system.

Figure 1: Type of Fuel Used in the European Union in Order to Produce Electric Energy (2010)

Source: <http://www.hidroelectrica.ro>.

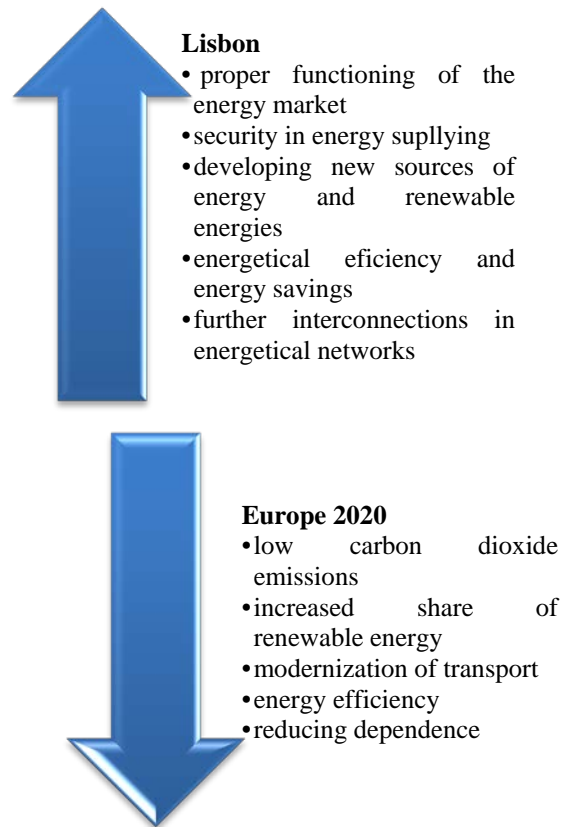

Except for Denmark, all other European countries are dependent on imported hydrocarbons. Dependence on energy imports is increasing both in most member states and at the level of European Union. Based on different scenarios emitted by the officials in Brussels, EU-27 energy dependence will increase from 56% in 2010 to 64% in 2020 and 67% in 2030. Energy dependence is very important in terms of community safety, but especially in terms of costs involved, the great owners of resources having the freedom of delivering their products according to their own wishes. [2]

From a legal perspective, at the communitarian level, there have been outlined two documents that contain elements of European energy strategy: the Lisbon Treaty and Europe 2020. The most important energy provisions can be summarized by the 2020 energy targets, known as "20-20-20 targets", which refer to the following:

- reducing greenhouse gas emissions in the EU by at least 20% from 1990;
- 20% increase in the share of renewable energy in overall EU energy consumption;
- 20% reduction in primary energy consumption, to be achieved through

energy efficiency, to the extent that consumption would have reached without such measures. [3]

Figure 2: Energy Stipulations in Lisbon Treaty and in Europe 2020 Strategy

Sources: Lisbon Treaty, Lisbon, 13th of December 2007, www.consilium.europa.eu/uedocs/cmsUpload/20-cg14.ro07.doc; European Commission, Europe 2020 Strategy, Brussels, 3rd of march 2010, http://ec.europa.eu/eu2020/pdf/1_RO_ACT_part1_v1.pdf.

All legislative measures taken have two major final goals: reducing pollution and reducing long term costs. Although these measures do not provide precise economical reasons, they imply different economic sides in all the points of application. Thus, the major costs generated by the measures are show in medium term, by the level of investments required and in long term, by the level of results.

3. Nuclear energy in the new European legislative context

European legislation on energy focuses on reducing pollution, increased use of

renewable energy and energy efficiency improvements. From these points of view, the usage of nuclear energy is marked by a number of advantages and disadvantages.

Advantages include low running costs and that is less polluting. Of disadvantages, the most important is the degree of danger the population and environment are exposed to. This is why, at the level of EU, while nuclear capacity decreased by 6000 MW during 2000-2011, the capacity of plants based on natural gas and wind power increased by 15000MW.

Regarding the degree of danger on which the population and the environment are exposed to, it is a true fact that nuclear energy is the most dangerous type among all. Thus, considering the situation manifested worldwide, 16% of the electric energy is produced in nuclear power plants, and considering the situation in the EU, 35%. The evolution of the use of nuclear fuel had several major steps at the level of EU:

- Austria - 1978 – the stopping point in constructing nuclear power plants was established by referendum;
- Italy - 1987 – the nuclear energetic sector was closed up.
- Belgium – limited the life period of reactors to 40 years and forbade the construction of new ones;
- Germany – has 17 production units; limited the duration of life to 32 years and has the intention to relinquish until 2020 to the usage of civil nuclear power;
- Spain – has 8 nuclear reactors, being forbidden the construction of new ones;
- Denmark, Greece, Portugal, Ireland, the Baltic States, Poland, Cyprus, Malta, Luxembourg – had never used nuclear energy nor have this intention.[4]

Therefore, most Western European states agree not to use nuclear energy in their territories. However, for states with developing economies, supporting energy production using nuclear fuel is an option worthy of being taken into account. This rule seems to apply to the European Union, the only exception being France, European leader in energy use with 58 nuclear reactors, which supports nuclear power in its territory due to shortages of fossil fuels.

According to statistical data, in early 2011, in Europe there were 195 nuclear power reactors and 9 units under construction or

scheduled to be built. Non-EU countries who have nuclear power units are Switzerland, Ukraine and Russia. Globally, the biggest energy consumers are China and the United States, being in the same time the greatest supporters of nuclear energy. U.S. has 104 nuclear reactors providing 20% of the country's energy needs, being the largest supplier of nuclear power in the world. China is the largest developer of nuclear construction in the world. Consequently, the largest energy consumers worldwide are the biggest supporters of nuclear energy.

4. The costs of nuclear energy

Energy obtained by nuclear fuels is controversial both in terms of ecological conditions, but also economically.

Table 1: The Average Cost of Energy, Depending on the Type of Fuel Used (2010, cents / kWh)

Country	Nuclear	Coal	Gas	Wind
Japan	5	8,8	10,5	11
France	5,6	10	10,5	9
Germany	5	7,9	8,5	10,6
Romania	5	6	8	17

Source: International Energy Agency, Nuclear Energy Agency, OECD - Projected Costs of Generating Electricity, 2010 Edition, disponibil la adresa <http://www.oecd-nea.org/pub/egc/docs/exec-summary-ENG.pdf>

The final product obtained using different fuels has its lowest cost for nuclear energy. Exceptions are few in number worldwide, one of them being United States, where wind energy has the lowest cost. In calculating the cost for nuclear power, experts in the field of sustainable development raise the question of so-called "hidden costs", pretending these costs usually are not counted. These include the following:

- The amounts necessary to fund decommissioning; few nuclear plants have been decommissioned, but more and more plants will reach the end of productive life in the coming years and will be closed. Experience has shown that this procedure is extremely expensive.

For example, decommissioning Yankee Rowe in the United States was expected to cost 120 million dollars, but actually cost about 450 million.

- In case of accident, many states do not have a special fund created for this purpose;
- The costs involved in the construction of a nuclear waste repository, which exists nowhere else in the world, the first such deposit being scheduled for the year 2055.[5]

Consequently, experts sustain the idea that nuclear energy costs are enormous, although not shown in the price of electricity, because many costs are financed by society as government subsidies. If the nuclear industry should bear only the costs of decommissioning, waste management, risk insurance etc., it would be a very expensive energy source.

Another important aspect is that nuclear costs increase while green energy costs decrease due to the numerous improvements in technologies.[6] Uneven global development determines nuclear energy to be a reliable option for the economical developing states such as Romania, green energy development level not reaching a high enough lever in order to be able to meet the needs of consumption.

5. Conclusions

Nuclear energy is an economic reality success, globally recognized as such, confirmed by data, level of development and social benefits. The main advantage of nuclear energy is efficiency - constantly energy supply at a low price. The two greatest economical powers of the world, China and U.S.A, also sustain nuclear energy, even if the degree of risk-taking of owning nuclear reactors is high.

Another value of nuclear power is the ability to transform communities, to provide opportunities for urban development and public access to many facilities. These opportunities result not only from regular payment of taxes and other direct obligations of the local budget, but with attention focused on the direct benefits of the people in communities that host nuclear power plants.

No other industry, regardless of social impact, during and after the investment, does

not offer so much to the communities in which they develop. Nuclear benefits come in various forms: jobs decently paid, collective and individual development, increased local budgets, heating at an unbeatable price, infrastructure.

Although the risks involved in construction and operation of such plants are large and generally recognized, not only the existence of legislation in the field and strict adherence to these regulations, but also a proper assessment risks at regular intervals make taking a compromise to be a reliable option.

Theories of Consumption – The Persistent Influence of Past Consumption on Present Consumption Patterns

Andreea Daniela Moraru
Ovidius University of Constanta
amoraru@univ-ovidius.ro

Abstract

Ever since it has been proclaimed “as the sole end and purpose of all production” consumption has been performing an essential role in economic theory. Although consumption was approached by economists prior to Keynes, it is only in his work that consumption gained its due importance, starting with the famous formulation of the psychological law. Subsequently, several other theories brought consumption to the centre of the economic research the most widely acknowledged being the contributions brought by James Duesenberry, Milton Friedman, Franco Modigliani and Richard Brumberg. The aim of this paper is to analyse some of the most important theories of consumption from the perspective of the past influences on current consumption patterns. The notion is certainly easy to assimilate at an intuitive level, it is present in the economic theory, and may be rather conveniently applied to consumption.

Keywords: consumption theory, consumption patterns, past consumption, persistent influence

J.E.L. Classification: B22, E21

1. Introduction

The assumption that past influences continue to impact current economic conditions is certainly not new, it has made its way to the economic theory ever since Marshall’s *Principles of Economics* [1]. Moreover, in the case of consumption, it is only natural to assume that present consumption is subject to both the influence of present factors, as well as to the influence of past factors. The aim of the paper is therefore to briefly revisit the most important consumption theories and point out the

acknowledgement of the past factors’ influence on present consumption patterns.

2. Main Theories of Consumption and the Past Revisited

Consumption is one of the main determinants of the aggregate demand of an economy and plays an important part in the economic theory ever since has been proclaimed by Adam Smith as “the sole end and purpose of all production” [2].

But although consumption was certainly present in the works of Jean Baptiste Say, Thomas Malthus and Alfred Marshall it was not until the development of the Keynesian system that it claimed its place in the theory of the whole economic process [3].

The modern consumption theory begins therefore with Keynes (1936) formulation of the psychological law on which consumption behaviour is founded in the *General Theory of Employment, Interest, and Money*:

“The fundamental psychological law, upon which we are entitled to depend with great confidence both a priori from our knowledge of human nature and from the detailed facts of experience, is that men are disposed, as a rule and on the average, to increase their consumption as their income increases, but not by as much as the increase in their income” [4].

Keynes suggested a function of consumption after conducting a detailed analysis of potential determinants impacting individual consumption patterns. The function is also known as the absolute income hypothesis and in its most simple form may be written as follows: $C_t = c Y + a$, where C_t is the total consumption, c is the marginal propensity to consume, Y is the disposable income, and a is the autonomous consumption (assumed to be positive).

Taken into account the enunciated fundamental psychological law the

Keynesian view may be summarized as follows: consumption expenditure is a function of disposable income; the marginal propensity to save is positive and lower than 1; when income increases, both the marginal propensity to save and the average propensity to save decline; and the marginal propensity to save is lower than the average propensity.

Although the theory of consumption proposed by Keynes was rapidly embraced, it was soon contested by Kuznets (1946) who used U.S. statistic data for the period between 1869 and 1938 and revealed that the average propensity to consume remained constant for the tested period [5].

This empirical puzzle led not only to a revision of the Keynesian hypotheses but also to the genesis of several new hypotheses, the research conducted by economists leading to reformulations of the consumption to include new facets in order to ensure a better forecasting of consumption behaviour.

One of these newly emerged hypotheses is that of James Duesenberry (1949), the so-called relative income hypothesis, considered to be a promising theory which subsequently lost its amenity. His relative income theory of consumption states that consumption patterns are motivated by the eagerness to “keep up with the Joneses”, in other words Duesenberry introduces the idea that consumption is based on a demonstration or imitation effect. Goods are therefore consumed not only due to their capacity to satisfy certain needs, but also because are looked upon as symbols:

“The strength of any individual’s desire to increase his consumption expenditure is a function of the ratio of his expenditure to some weighted average of the expenditures of others with whom he comes into contact” [6].

Another important pillar of Duesenberry’s work is the conclusion that in the event of household income decrease, the savings are to be diminished in order to preserve the living standard. Or in other words, households are assumed to be reluctant to reduce consumption when confronted with falling income, with their present consumption depending on the past peak level of income. This is the so-called ratchet effect which prevents the consumption level to drop significantly when the income decreases, and states the dependence of

consumption on the highest level of income previously reached.

Brown (1952) gives an even greater importance to the influence of the past on present consumption. Based on previous research conducted by James Duesenberry and Franco Modigliani, he explains that due to some inertia in their actions consumers fail to react promptly to income changes [7]. The tests conducted by Brown revealed that in both cases of increase and decrease of income, consumer expenditure lagged behind inducing the idea that consumer demand was related to income or other cyclical variable. Brown uses the term “hysteresis”, asserting that “the habits, customs, standards and levels associated with real consumption previously enjoyed become “impressed” on the human physiological and psychological systems and this produces an inertia or “hysteresis” in consumer behaviour” [7]. The term “hysteresis” itself is used by economists to describe the persistent influence of past economic events and was popularized by Nicholas Georgescu-Roegen who presented an application to consumer behaviour in his work, *The Entropy Law and the Economic Process*, of 1971, acknowledging that physical behaviour sometimes depends on past experience [8]. In his paper, Brown replaces in the consumption function the level of past disposable income present as variable in the work of Duesenberry and Modigliani with the previous real consumption actually experienced [7].

In 1957, Milton Friedman introduces his new function of consumption, based on the hypothesis of permanent income and not current income, as main factor impacting final consumption. Friedman considered that the main determinant factor of consumption is not regular income, but permanent income, represented by the amount which the unit could consume without decreasing its wealth [9]. He asserts that people adapt consumption to their expected long-term or permanent income and fluctuations in income level impact consumption only if were anticipated. The ratio of current income not anticipated, called transitory income, is destined for saving. His hypothesis is based on the perception that individuals would wish to smooth consumption and avoid its fluctuation caused by fluctuations in income. He

therefore formulated the hypothesis that individuals' consumption behaviour is based on a longer term view of an income measure, a lifetime view or at least a view over a reasonable time horizon. The hypothesis encloses the idea that individuals consume only a fraction of their permanent income in each period and therefore the average propensity to consume would be equal to the marginal propensity to consume.

At the beginning of the 1950's, Franco Modigliani and Richard Brumberg elaborated the life cycle hypothesis, according to which consumption in a certain period depends only partially on the current income, but on a life time income expectations. The hypothesis brings to light the idea that income tends to fluctuate during an individual's life time and the individual's personal saving behaviour is determined therefore by the phases of the life cycle. At the beginning of the active life saving is negative, subsequently during the active life the savings become positive while the individuals save up to retirement, and following retirement the individuals start dissaving.

The life cycle framework is rather generous and encompasses many models going beyond the rather simple representation that agents make sequential decisions to achieve a coherent goal by doing the best they can with the currently available information. This enlarged framework includes the “buffer stock” model developed by Deaton which assumes that agents cannot borrow and that they are impatient, and can include habits, imperfections in capital markets, possible disagreements between the members of the family about the amount to be saved, limited computational powers, at the same time ruling out a series of psychological and behavioural explanations [10].

Starting from the life cycle permanent income hypothesis yet another theory was developed by Hall (1978) [11] and entitled rational expectations hypothesis, in which there are added variables to the consumption function based on past values. The test in Hall's model adds therefore a series of explicative variables to the consumption function related to its past value. His conclusion shows however that basically no other variable besides present consumption is useful in predicting future consumption.

3. Conclusions

The idea that the ascendant of past factors continues to influence economic equilibria, their impact leaving noticeable traces has been present in the economic theory since the work of Marshall at end of the 19th century.

It is a notion easy to assimilate related to economic phenomena and consumption does not make an exception. The acknowledgement of the notion at an intuitive level has been doubled by the empirical evidence that current consumption does indeed depend on past influence factors. Starting from this evidence, the paper briefly reviewed the most significant theories of consumption emphasising those particular elements of the theories that are related to the persistent influences of past factors on present consumption patterns.

The Role and Powers of Competition

Moşnianu Cristian
„Ovidius” University of Constanta
cristianmosnianu@gmail.com

Abstract

The Competition Law empowers the Competition Council with instruments to achieve the ultimate goal of protecting and stimulating competition to ensure a normal competitive environment so as to promote consumer interests. Competition Council examines the anticompetitive impact that it has or might have the notified merger, unless there are serious doubts on the compatibility with a normal competitive environment and will eventually authorize the eventual merger by means of a decision of non-objection, in the sense that the authorization is applied without any expressed conditions.

Key words: council, law, competition, market, powers.

Clasificare J.E.L.: C70 – General

Competition Council was established by the Competition Law no.21/1996, according to ulterior changes and annexes as independent competition authority. As regards the corresponding organization, the Competition Council was offered independence in point of the status of decision-making in the respective field. Thus, The Competition Council, as an autonomous administrative body, operates, deliberates and makes decisions in plenary and committee. Plenary decisions are taken by majority vote, provided that each member of the Competition Council shall have one vote and in case of a tie, the solution of the President prevails.

The Competition Council consists of seven members: a president, two vice presidents and four competition councilors. Competition Council members are appointed by the President of Romania, by decree at the Government proposal; the length of mandate is an interval of about five years. The above mentioned members have at their disposal a

number of two mandates. As independent public competition institution, includes specialized structures that are involved in investigations on competition and state aid, analysis of notifications in cases of economic mergers and state aid covered by the law, research and market surveillance, inventory, reporting and monitoring of state aid, European integration area and international relations.

The role of independent administrative authority that is imposed by the Competition Council has two dimensions, as follows: a preventive one, monitoring the market and surveillance of economic agents conduct, so that by its corresponding intervention to avoid a significant distortion of market competition and involvement in the legislative process, the outcome being the elimination of anticompetitive disposals, while the other one, the corrective dimension implies the establishment and maintaining of a normal competitive environment.

The Competition Law empowers the Competition Council with instruments to achieve the ultimate goal of protecting and stimulating competition to ensure a normal competitive environment so as to promote consumer interests. Experience has demonstrated that a functioning market economy based on competitive mechanisms is the best method towards the wealth of consumers along with all the drawbacks that might appear.

In a competitive market the law of supply and demand works effectively, and the buyer is offered the possibility to choose products with lower prices and higher quality. It is known that a normal competitive environment provides both consumer satisfaction and an efficient allocation of resources in the economy. In order to maintain these mechanisms functioning certain specific rules and institutions are necessary to ensure permanent compliance so as to intervene when particular acts or facts

might result in elimination or significant distortion of the competition. This role of "guardian of the market economy" corresponds to the Competition Council.

It should be emphasized that the Council's role is to protect competition, while the entry on the market is free, not restricted by any artificial barriers and inefficient operators out of the market, through bankruptcy. Operators must "defend themselves" by increasing the efficiency and respecting the rules of the game.

The powers of competition and state aid are mainly the following:

- regulatory;
- investigation;
- decision;
- sanction;
- the formulation of opinions, recommendations and proposals.

The main duties of the Competition Council according to the Competition Act, are:

1. Investigates the application of the law in point of to anticompetitive practices or economic mergers, on its own initiative or following a complaint, intimation or notification.

Complaints and intimation are an essential source of information for detecting infringements of competition rules. When the information available is not sufficient so as to justify an investigation, the Competition Council issues a decision of rejecting and the decision shall be preceded by the hearing of the applicant's arguments. Notification represents the adequate instrument by means of which the economic agents transmit, in particular cases, necessary information to the Competition Council so as the law to be applied, in respect of accords and mergers that regard the agreements they intend to conclude or have already completed.

2. Makes decisions for breaches of law as outcome of the investigations that are executed by order of the President of the Competition Council by the authorized competition inspectors;

3. Certifies, at the request of the economic agents or associations of economic agents, on the basis of investigations and existing evidence that there are no grounds for

intervention in an agreement, decision or concerted practice;

Before establishing an agreement, decision or concerted practice, or before assuming a position as regards the market, the involved economic agents or associations of economic agents concerned might require to the Competition Council a prior certification that no grounds is present for an intervention as regards the expected competitive conduct.

4. Makes decisions in merger cases. Competition Council examines the anticompetitive impact that it has or might have the notified merger, unless there are serious doubts on the compatibility with a normal competitive environment and will eventually authorize the eventual merger by means of a decision of non-objection, in the sense that the authorization is applied without any expressed conditions. The above mentioned Council might grant, on demand, an exception to the rule regarding the interdiction of the implementation of an economic concentration activity up to the moment when the Council issues a decision.

5. Ensures the effective implementation of its decisions.

6. Performs on its own initiative, investigations in respect of a better understanding of the market.

7. Refers to the Government about the existence of a monopoly case or other situations that are subject to the law and propose the necessary measures to remedy the faults.

8. Refers to the courts in point of cases they are competent on.

9. Refers to the Government as regards the interference of central and local public administration bodies as regards the application of competition Law, namely the respective actions of central and local administration bodies, the object of which might result in the prevention, restriction or distortion of competition, in particular the adoption of decisions that limits the freedom of trade and economic autonomy, or establish discriminatory conditions for the activity of economic agents.

10. Issues assent (required) in point of draft legislation that might have anticompetitive impact and propose amendments with similar outcome. In this way the control of correlating the provisions of other laws with those of the Competition

Act is ensured, thus concurring with the request of the European Council to provide the Competition Council power to oppose proposals for regulatory affairs and state aid in situations in which a breach of rules competition appears.

11. Makes recommendations to the Government and local government bodies to adopt measures to facilitate market development and competition.

12. Proposes Government and public administration bodies disciplinary action against the subordinating staff, if it does not comply with mandatory provisions of the Competition Council.

13. Adopt regulations and guidelines for the application of competition law in respect of: authorization of economic mergers, exemption of certain categories of agreements, decisions of associations of economic agents or concerted practices, exemption regime, report and apply sanctions that are provided by law.

14. Performs studies and prepares reports on its activity and provide the Government, the public and specialized international organizations information on this activity.

15. Represents Romania and promotes the exchange of information and experience in dealing with specialized international organizations and institutions and cooperates with foreign competition authorities and community.

The Competition Council elaborates and communicates the corresponding views on any aspect of competition policy, at the request of one of the following: President of Romania;

✓ parliamentary committees, senators and deputies;

✓ local and central public administration bodies;

✓ professional, employers and Union organizations, including among them the Chamber of Commerce and Industry of Romania;

✓ organizations in point of the protection of consumers;

✓ Courts and prosecutors. The Competition Council draws up an annual report on its activities, the competition and the manner in which economic agents and public authorities comply with competition rules. The report is adopted in the Plenary Council and is, eventually, made public.

The area of competence as regards the Competition Council includes the authorization in terms of effects on competition of any state aid any form it might take and regardless the beneficiary. Terms of the authorization, approval, inventory, monitoring and reporting of state aid are governed by Law no.143/1999, as amended and supplemented (hereinafter *State Aid Law*).

The powers of the Competition Council as regards the application of state aid law are mainly the following:

-Make decisions following the examination of notification as regards the intention to grant new aid or modify an existing state aid;

After analyzing the received notifications, the Competition Council might decide: as the notified measure should not constitute state aid;

- to authorize state aid, unless there are doubts about its compatibility with state aid Law;

- to authorize state aid, thus imposing by its decision conditions or obligations to ensure that it does not distort the normal competitive environment and does not affect the proper application of international agreements to which Romania is a party;

- to begin an investigation in case that the notified measure raises doubts about the compatibility with State aid Law;

- prohibit State aid if it distorts the competitive environment and affect the proper application of international agreements to which Romania is a party;

When the Competition Council makes a decision to prohibit a State aid, and it is, however, granted, the cancellation and recuperation of the aid or reimbursement by the beneficiary is required. Competition Council might request the Court of Appeal, the jurisdiction of which is in the corresponding territorial headquarters of the provider or the beneficiary of state aid, to cancel the administrative act by which the aid and, consequently, the recuperation, reimbursement or adjournment of its payment.

The interval the Competition Council is entitled to request the recuperation of State aid is of about 10 years, thus being taken over the limitation that is regulated at Community level in this field.

- monitor actual State aid, the Present State Aid represents an individual aid or an aid scheme which meets one of the following conditions: to function before the law takes effect, was authorized by the Competition Council or the one for which the Competition Council did not take legally one of the decisions required by law. If after the supervision of existing State aid is found that such aid distorts the competitive environment or affects trade between Romania and EU Member States, the Competition Council requests aid provider to take appropriate measures to eliminate the corresponding incompatibility.

Competition Council's request might include a recommendation to cancel or amend the existing aid. If measures are not taken adequately by the provider, the Competition Council might decide to stop the existing state aid or impose certain conditions and obligations to ensure that the aid is compatible with state aid law.

-observes effective enforcement of the corresponding decisions;

- notices the issuing authority of a normative act that establishes non-notified State aid measures or prohibited by a decision of the Competition Council and, simultaneously, informs supplier and recipient of state aid as regards the notification that is sent to the issuing authority.

Abstract

The entrepreneurship is the engine of the private development in any market economy. Human initiative and creativity haven't found a more favourable place of development than within the private sector. The study presented here is part of a complex research that was initiated by the managerial team from the project called “Be a manager for your business!”, project developed through the European Social Fund, Sectorial Operational Programme Human Resources Development 2007-2013.

Prior axis: 3 – The growth of employees' and enterprises' adaptability.

*Major field of intervention: 3.1 – Promoting the entrepreneurial culture
ID project POSDRU/92/3.1./S/49297*

The entrepreneurial activities can have different shapes, begging with individual projects of a natural and legal person and finishing with creating big enterprises at national and international level. The present study aims to realise a parallel between the entrepreneurial development in the two regions South-East and South-West Oltenia.

Key words: counties, entrepreneurship, private sector, local activities, size classes

J.E.L. classification: L52

1. Introduction

Knight F. H. (1967) [4] and Drucker P. (1970) [2],[3] defined the entrepreneurship as activity of some persons who are willing to

dedicate their carrier, activity and the funds they dispose in order to transpose into practice a new idea. Both theoreticians and practitioners as well as decision makers give a primary importance to entrepreneurship, stimulating the entrepreneurs to introduce new products, processes and organisational forms[6]. As the factor globalisation influences more powerfully the world's economy and the technological process, generating even bigger uncertainties in the economy and in the society, the entrepreneurship's dynamism is considered as a factor able to contribute to the strengthening of the new economy based on knowledge, to resolve environmental, economic and social challenges. More and more, the specialists consider that entrepreneurship and the innovation represent the keystone of the national economy's competitiveness[1],[5]. Politics within entrepreneurship are more and more tied up to the new ones, the characteristics and the common particularities of the two types of politics being concentrated on creating some goods, processes and new services under a mutual improvement.

Currently in Romania, the economic development trend is based on extending the services and diminishing the industrial activities. In our study, we concentrated on the following indicators:

- number of local unities from: industry, constructions and services;
- active local unities on size classes;
- active local unities on counties.

The role of the analysis of these indicators is to compare the development degree of the

private sector (on these branches taken into consideration), in the two regions South-East and South-West Oltenia.

2. Materials and methods

In order to realise the study we boned up on the private sector from the two regions South-East and South-West Oltenia. In that direction, we studied: The statistical Yearbook 2010, Statistical bulletins, we consulted documents from the Statistical Departments.

The methods used were those specific to statistical research: observation, grouping, processing, presentation and analysis of data. Also, we modified the questionnaires that were given to the entrepreneurs who registered in the project “Be a manager for your business!”

3. Results and discussions

South-East is a region of development of Romania, created in 1998, situated in the south-east part of Romania, covering 35.762 km² or 15 % of the total surface of the country; the region is the second in size from all 8 in Romania. In 2004, the region had a population of 2.850.318 inhabitants, representing 13,1 % from the country’s population; the density of 79,7 inhabitants/km² is under the average per country (90,91 inhabitants/km²), the biggest population density being in Galați county (139,5 inhabitants/km²), dominated by the industrial and commercial centre with the same name and the smallest, in Tulcea county (29,9 inhabitants/km²), where the natural and economic conditions are less favourable (figure 1).

Figure 1 South-East Region

Source: <http://ro.wikipedia.org>

Forced industrialisation after the war led to the population concentration in towns like Galați, Brăila and Constanța. The biggest town of the region is Constanța (309.965 inhabitants), followed by Galați and Brăila (over 200.000 inhabitants), Buzău, and Focșani (over 100.000 inhabitants), as it can be seen in table 1.

Table 1 Counties from South-East Region

County	Population	Urban	Rural
Brăila	365.628	237.922	127.706
Buzău	488.763	202.090	286.673
Constanța	716.576	506.852	209.724
Galați	617.979	350.759	267.220
Tulcea	253.383	124.563	128.820
Vrancea	392.619	148.247	244.372

Source: <http://ro.wikipedia.org>

South-West Oltenia is a region of development of Romania, whose administrative limits coincide a lot with the limits of historical Oltenia. The region encompasses five counties: Dolj, Gorj, Mehedinți, Olt and Vâlcea. It has a surface of 29.212 km² and a population of 2.330.792 inhabitants, figure 2.

Figure 2 South-West Oltenia Region

Source: <http://ro.wikipedia.org>

The most important towns are the county seats: Craiova (300.182 inhabitants), Râmnicu-Vâlcea (111.701 inhabitants), Drobeta Turnu-Severin (109.444 inhabitants), Târgu Jiu (96.318 inhabitants) and Slatina (80.282 inhabitants). The most important industrial centre is Craiova, followed by the other county seats.

In the paper, we studied:

1. Organising small and medium enterprises on counties and on size classes, depending on the main branches: industry, constructions and services, in the both regions South-East and South-West;
2. Organising the enterprises from the industry sector on counties and depending on size class, from both regions;
3. Organising the enterprises from constructions sector on counties and depending on size class, from both regions;
4. Organising enterprises from services sector on counties and depending on size class, from both regions;
5. Comparing the level of the indicators studied from South-East and South-West Oltenia regions.

Trying the current tendency of diminishing the industrial activities, big consumers of natural and material resources, in all counties of the south-east region, we can observe the reduction of their weight on size class 50-249, under 100 as a number. They still remain dominant at size class level 0-9, over 1400 as a number and they are situated under 400 as number, on size class 10-49, figure 3.

Figure 3 Organising small and medium enterprises on branches on size classes in industry sector in South-East region

No matter the size class we are in, the dominant county is Constanța, the least represented being Tulcea and Vrancea counties.

Figure 4 Organising small and medium enterprises on branches on size classes in industry sector in South-West region

Realising the industrial sector hierarchy in south-west Oltenia region, on the first place was situated Dolj county with 1235 unities, followed by Vâlcea (821) and Olt county (710). Less developed from this point of view is Mehedinți county (320).

Figure 5 Organising small and medium enterprises on branches on size classes in constructions sector in South-East region

At size class 0-9 level all counties are well represented, among them Constanța county is noticed with about 2000 enterprises in constructions sector, followed by Galați and Buzău counties with 1000 enterprises each, Brăila and Vrancea with under and over 500, and Tulcea county is the last one, with less than 250 enterprises in constructions sector, aspect demonstrated above. On size class 50-249, in this sector the number of enterprises is insignificant, and on size class 10-49, the only one that is remarked is Constanța county.

Figure 6 Organising small and medium enterprises on branches on size classes in constructions sector in South-West region.

On counties, the constructions sector is representative for Dolj, Vâlcea and Olt counties. In Mehedinți county, compared to the other counties, constructions have a very low weight. As a general observation, constructions sector is dominant on the segment of the size class 0-9.

Figure 7 Organising small and medium enterprises on branches on size classes in services sector in South-East region

In services sector unlike constructions sector, we can notice its fade out towards size class 50-249, being represented the best on size class 0-9, trying again the population’s predilection towards family businesses. Among all counties, Constanța remarks itself with over 10000 enterprises in services sector, followed by Galați with more than 6000 and Buzău with about 5000. The lowest number of enterprises is in Vrancea (3000) and Tulcea with less than 2500.

Figure 8 Organising small and medium enterprises on branches on size classes in services sector in South-East region.

Services sector is developed all over the region, Dolj county being the most remarked (8162), followed by Vâlcea (4726) and Gorj (4025). The segment where services sector is dominant in all counties is that of microenterprises. On the last place is situated again Mehedinți county (2477).

Another aspect was represented by the study of small and medium enterprises on size classes, as it can be noticed in the following figures.

Figure 9 Organising small and medium enterprises on branches depending on size class (0-9) in South-East region

The aspects presented until now are confirmed by the repartition depending on size classes of the three branches studied, the industry being the sector that diminished and that is continuously diminishing; constructions sector is very close to industry in number and the one that is well represented- the services sector has between 2000 and over 10000 microenterprises.

Figure 10 Organising small and medium enterprises on branches depending on size class (0-9) in South-West region

Although on the segment of the size class 0-9, we can notice its development in all the three activity sectors that were analysed, the services sector has the highest weight. Among all counties, representative is Dolj county, followed closely by Vâlcea, Olt and Gorj. In small enterprises' segment, the situation is a bit different, all sectors being well represented. As in the case of microenterprises on the segment 10-49, the services sector is still dominant, as it is noticed in the following figures.

Figure 11 Organising small and medium enterprises on branches depending on size class (10-49) in South-East region

The industrial sector is better represented here than within the microenterprises, their number being between 200 and 400 small enterprises. Constructions sector is almost the same represented as in figure 5, except that Brăila and Buzău counties have almost the same number of enterprises. Very well represented is the services sector, where the hierarchy maintains the same, specifying that

Brăila and Buzău are equal, as same as Tulcea and Vrancea.

Figure 11 Gruparea întreprinderilor mici și mijlocii pe ramuri după mărimea clasei(10-49) în regiunea Sud-Vest

We can notice that on the segment for the size class 10-49 all the three sectors taken into account are well represented. Also, the industrial sector in small enterprises is much better represented than in microenterprises.

Figure 12 Organising small and medium enterprises on branches depending on size class (50-249) in South-east region.

Unlike size classes represented until now, where the industry is low represented by the microenterprises and by the small enterprises, which shows also the complexity of the installations, natural resources plants, materials used for work here, on the segment 50-249 we notice that the industry is very well represented in each county.

Figure 13 Organising small and medium enterprises on branches depending on size class (50-249) in South-West region

In medium enterprises, very well represented is the industrial sector. On the first place is Dolj county, followed by Vâlcea county. The services sector is also well represented in the same counties described above.

4. Conclusions

The conclusions we can drag from this study are the following:

1. For microenterprises, dominant are the services that can be usually started as a family business. Once with the growth of the employees' number, their weight is reduced, ceding the place to constructions sector, and finally on size class 50-249 dominant is the industrial branch.

2. The situation is inverted where on size class 50-249 the services' presence is almost inexistent.

3. No matter the situation presented, Constanța county, beside Dolj are on the first places in all the sectors studied (industry, constructions et services).

4. The repartition on counties of the microenterprises, the small enterprises and the medium enterprises depend on the economic situation of each county, on relief, on the natural resources it disposes, on the number of the population in the area.

5. The constructions sector is well represented in all the region's counties, being so a sector that has grown a lot in the last 8 years, but which has come to a standstill once with the growth of the general crisis.

6. According to the existent tendencies at national level, those of reduction of the industrial activities, this tendency is noticed also in the south-east region, the industry

being present more in size classes 50-249, as it includes developed technology, installations and complex plants and it integrates high qualified labour force.

A Model of Human Capital Management in the Frame of Knowledge Assets Management

Neagu Olimpia

"Vasile Goldiș" Western University of Arad

olimpian2005@yahoo.com

Abstract

The paper aims to suggest a model of human capital management in the frame of the knowledge assets management and correlated to the organizational performance. The paper proposes to insert the system of human capital management into the knowledge management architecture. The inputs of the human capital management (education, training on the job, job experience and continual learning) are generating specific outputs (current jobs, training needs and expertise) through acquiring, sharing, creating, developing and using knowledge. These processes are specific to the knowledge assets management.

Key words: human capital management, knowledge management

J.E.L. classification: J24, M 12

1. Introduction

It is well known that the most economic activities rest on knowledge, not only the present society but in all forms of human societies. In the knowledge-based economy the main resource is the knowledge are viewed as generating competitive advantage on the long run. Knowledge is embodied in technology and in people, as assets. Without people and their human capital, business and organizations cannot exist.

The strategic role of human capital management in the knowledge assets management is derived from the determinant position of the organization's human capital (knowledge, skills and abilities) to achieve business goals. People and their human capital are able to: acquire, create, share, develop and apply knowledge.

In the knowledge based organization, the policies and practices belonging to human

capital management is an intrinsic part of the knowledge assets management.

The aim of the paper is to emphasize the role of the human capital management in the framework of the knowledge assets management. A model of human capital management, inserted into the frame of the knowledge assets management is proposed and discussed.

The paper is organized as follows: section 2 presents a short literature review on theoretical references on knowledge based economy and firm, the section 3 describes the content of the content and architecture of the knowledge management, the section 4 explains the position of human capital within the knowledge assets management, the section 5 expose a model of human capital management inserted into the knowledge assets management and the last section is dedicated to conclusions.

2. Knowledge-based economy and firm

There is a rich literature on knowledge based economies, based on the fact that knowledge has become an important resource in today's economy. For example, World Bank's pioneering report on Knowledge-based Development [21] observes that today's most technologically advanced economies are truly knowledge based. . . "and as they generate new wealth from their innovations, they are creating millions of knowledge related jobs in an array of disciplines that have emerged overnight".

The Organisation for Economic Corporation and Development (OECD) Report [12] defines a knowledge economy as one that is "based on production, distribution and use of knowledge" and "that utilizes knowledge as a key engine of economic growth".

According to Brinkley (2006), every economy is a knowledge economy since

there can be no economic activity without knowledge.

The following key characteristics of a knowledge-based economy have been outlined in the relevant literature:

- Greater share of high tech industries and services in the market;
- Greater percentage of persons engaged in knowledge-based occupations;
- Greater information and communication technology (ICT) usage;
- Increase in percentage population which is better educated and skilled and engaged in jobs such as R&D, software development and technology-based front room and backroom jobs etc;
- Increased percentage of knowledge consumers;
- Ability to foster collaboration among various entities (universities, firms, educational institutes, R&D units) concerned with creation and use of knowledge.

The rise of the knowledge-based economy has created the knowledge-based organizations, where intellectual capital is an integral part of organizational assets and creation, development and capturing of value from knowledge and competencies became a critical issue.

By definition, human capital focuses on the individual, whereas most knowledge management work is concerned with groups, communities, and networks. Nevertheless, knowledge management builds on human capital ideas and has, as one of its tasks, to continue making the value of human capital clear to organizational leaders while developing tools and techniques for investing and reaping benefits from it. However, it is becoming more concerned with group knowledge and the processes of social capital that undergird group knowledge [6].

3. Knowledge management: content and architecture

Knowledge architecture can be defined as a logically set of principles and standards which guides the engineering (high level design, detailed design, selection, construction, implementation, support, and management) of an organization's knowledge management system infrastructure [1]. Knowledge structures lead to easier navigation, organization and retrieval of

knowledge. As Plessis (2007) points out these structures should be very flexible and must be able to adapt as the business environment changes.

Defining knowledge management is not easy because it can refer to several different activities in an industrial firm, such as data collection, data analysis, data storage, data dissemination, and data utilization [10]. Knowledge management is to discover, develop, utilize, deliver, and absorb knowledge inside and outside the organization through an appropriate management process to meet current and future needs [16]. Knowledge management is the process through which organizations extract value from their intellectual assets.

Knowledge management is regarded as process involving various activities. According to Rumizen (2002), cited by Kazemi and Allahyari (2007), "knowledge management is the systematic processes by which an organization identifies, creates, captures, acquires, shares and leverages knowledge", knowledge management process has six major activities. These knowledge management activities may vary depending on organization and the industry sector.

Bixler (2002) indicates that knowledge processes should be incorporated into employee's daily work activities and integrated into business processes so that they become common practices in an organization and allow seamless flow of knowledge in the business life.

According to Gupta et al. (2000) knowledge maps are actually classification that identify where knowledge resides and which knowledge needs to be shared with whom, how and why within and outside the organization's boundaries. Organizations need to have these knowledge maps and ontology defined to ensure standardization and integrity of the development of the repositories as well as to facilitate maintenance and controlled growth of these repositories [11].

According to O'Leary (1999), the principle functions of a knowledge management system are to facilitate: conversion of data and text into knowledge; conversion of individual and group's knowledge into accessible knowledge; connection of people and knowledge to other people and other knowledge; communication

of information between different groups; creation of new knowledge that would be useful to the organization.

In the debates regarding the IT models of the knowledge architecture, the focus is lodged in the structure of knowledge captured in systems. It is closely related to infrastructure because infrastructure is focused on the systems that capture and store structured knowledge. Two key development fields are: knowledge modeling and knowledge ontologies. Knowledge modeling regards various strategic models for organizing knowledge-based systems, referencing such kernel theories as smart objects for data and knowledge representation [19]. Another example is a worldwide knowledge grid that represents knowledge in a three-dimensional space comprised of: knowledge category, knowledge level, and location. Knowledge management is the activity of managing globally distributed knowledge resources by locating these as a point in the three-dimensional space [22]. The knowledge ontologies, are based on drawing structure using web ontologies[13],[14]. An ontology is ‘a shared and common understanding of some domain that can be communicated across people and computers’[2]. Since most knowledge-based systems contain several knowledge bases, and these in turn rely on ontologies for clear specification of their characteristics and views, knowledge management ontologies are good candidates for creating intelligent knowledge retrieval components [8].

Summarizing the above considerations, the architecture of knowledge assets management is, usually, including the following activities: linking knowledge management activities to business process; continually improvement and developing of knowledge; sharing and storing of knowledge; knowledge structure; obtaining and creation internal and external knowledge; applying internal and external knowledge.

4. Human capital within the knowledge assets management

Knowledge assets are often referred, in the relevant literature, to as intellectual capital. This concept embodies a theory that emphasizes the value of knowledge within

the organization. Nowadays, the physical capital of an organization, particularly in the rising service sector, is of less relative importance for competitive advantage than intangible assets like know-how and personal sales networks. The market value of many service organizations is far too much larger than the value of their physical capital [17]. Intellectual capital has been defined as the difference between the book value of the company and the amount of money someone is prepared to pay for it. Intellectual capital theory is about assets: assets like trademarks and customer loyalty that give the company power in the marketplace; assets like patents and copyrights that give the company property rights ‘of the mind’; assets like corporate culture, structure, and IT style that give the company internal strength; and assets like employees’ knowledge and personal networks that enable company processes [5]. Organizational knowledge is viewed as a capital asset. This view implies that knowledge management regards balancing a knowledge portfolio. Thereafter, the portfolio is coordinated and exploited for maximized return-on-investment [20].

The general recognized categories of intellectual capital are:

- human capital;
- social capital (including customer capital);
- process capital; and
- intellectual property.

We presume that the knowledge assets management includes the following processes:

- knowledge identifying, capturing and collecting;
- knowledge storing;
- knowledge sharing;
- knowledge developing;
- knowledge applying or utilization;

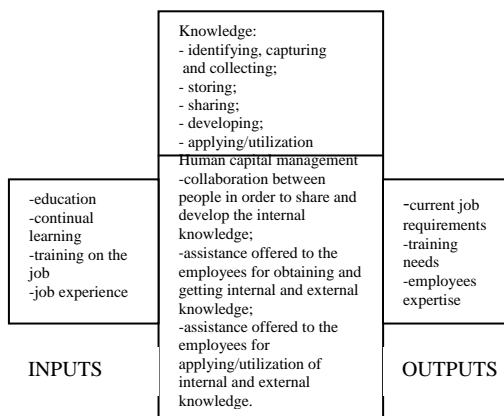

The knowledge management processes which are mediated through the human capital management are:

- facilitating the collaboration between people in order to share and develop the internal knowledge;
- assistance offered to the employees for obtaining and getting internal and external knowledge;
- assistance offered to the employees for applying/utilization of internal and external knowledge.

5. A model of human capital management inserted in the knowledge assets management

If we see the human capital management as a system, we can suggest a model of this system, having inputs, management processes and mechanisms and outputs. Figure 1 provides a picture of a suggested model for the human capital management inserted into the frame of the knowledge assets management. The inputs are: initial education, training on the job, job experience and continual learning of the employees. These are human capital specific resources that can create business value for the organization.

Figure 1 A model of human capital management inserted in the knowledge assets management

Knowledge assets management

Source: own author's view

The main processes which included in the knowledge assets management and using these inputs are: sharing, developing and applying/utilization of the knowledge assets, getting internal and external knowledge. These processes are carried out through the employees, according to specific procedures and rules. The human capital outputs of the knowledge assets management are: current job requirements, training needs, and employees expertise.

The human capital management has a strategic position in the frame of the knowledge assets management, due to the fact that the knowledge is embodied in people, in humans. Technologies are

incorporating knowledge, as well, but this resource cannot be active or useful without humans.

Conclusions

Nowadays, knowledge has become a critical asset and potential strategic resource for contemporary firms. Facing the advent of knowledge-based economy, it is important to know how to effectively manage and integrate various kinds of knowledge resources in order to survive and keep competitive advantages. In this view, knowledge management is considered to be a pressing and important issue, organizations must manage their knowledge bases and repositories effectively to gain long-term competitive advantage

Human capital management strategy is conspicuously linked to business performance, as measured in terms of growth and profitability. Using knowledge management strategy by itself, and ignoring the crucial part of human capital cannot lead to successful attainment of higher business performance.

Methods to Estimate Human Capital Stock: a Comparative Analysis

Neagu Olimpia

"Vasile Goldiș" Western University of Arad
olimpian2005@yahoo.com

Abstract

The paper identifies three general approaches to human capital measurement: (i) using proxies for educational variables, (ii) income-based and (iii) cost-based methods and presents a critical review of them. The measurement of human capital stock is important for assessing its impact on economic growth and for external effects generated by the production of human capital.

Key words: human capital, economic growth

J.E.L. classification: J 24, O 47

1. Introduction

Originating from Schultz (1961), human capital was defined as knowledge and skills that people acquired during their lifetime. Over the years, with the intakes of many economists, the concept was enriched and extended, resulting nowadays a complex concept, having multiple facets.

The main components of human capital are educational and health capital [18]. For the purpose of this paper, only the educational component will be discussed.

It is generally accepted that human capital is a crucial determinant of the economic growth. A general finding of several empirical studies was that the impact that human capital has on the economic growth is sensitive to the measurement method. Different methods capture different aspects of human capital, going from educational variables, resources devoted to human capital accumulation or cost, neglecting the valorization of human capital on the labour market. Different human capital measures generate mismatch in cross country comparisons, very different results and conclusions.

The objectives of the paper are to identify

the main approaches, existing in the relevant literature, for the measurement of human capital stock in the economy, and compare them, in a critical review.

The paper is organized as follows: the section 2 describe the estimation methods for the stock of human capital in the economy, the section 3 offers a summary of methods estimating human capital stock, a comparative and critical review of the human capital estimation methods is exposed in the section 4 and the final section is dedicated to conclusions.

2. Main approaches to estimate human capital stock

In the relevant literature focused on the estimation of human capital stock in the economy, there are three main strands: (i) methods using different proxies of educational variables, (ii) income-based methods and (iii) cost-based methods.

Literacy variable as proxies for human capital stock

In the early studies dedicated to estimation of human capital stock, one of the first approximation was to equate human capital to formal education. This approach estimates human capital based on such educational output indicators as literacy rates, enrolment rates, dropout rates, repetition rates, average years of schooling and test scores.

A very large number of empirical studies were developed using literacy and formal education data for proxy of human capital.

Adult literacy rates offer meaningful information about a country's general educational status. This indicator has been used in early empirical studies that control for human capital in growth equations, including Romer (1989) and Azariadis and Drazen (1990). This variable has shown a limited power of explanation in cross-country growth regressions. The reasons are: the

inconsistent definition of the content of adult literacy across countries and the miss of knowledge and skills specific to secondary and tertiary education.

Studies that used school enrolment rates as proxies for human capital in augmented growth models include Barro (1991), Mankiw et al (1992), Levine and Renelt (1992) and Gemmell (1996). These proxies have major limitations. First, literacy cannot measure the growth of human capital in secondary and tertiary education[35]. Second, the enrolment ratios in secondary and tertiary education can be seen as a better proxy of human capital growth. For example, a low level of primary enrolment rate could be accompanied by a higher secondary enrolment rate. Enrolment rates can be seen as a good approximation of the yearly addition to the human capital stock, being a good proxy for the growth of human capital, but not for the human capital stock.

A third proxy proposed for human capital was the ‘average years of education’ or ‘average years of schooling’, capturing the population’s average educational attainment. This measure has been used in many empirical studies such as: Benhabib and Spiegel (1994), Islam (1995), Barro and Lee (2001), Temple (1999), Krueger and Lindahl (2001), and Barro and Sala-i-Martin (2004).

The studies that have attempted to develop data series on years of schooling can be divided into three groups based on the method they employ: the census/survey-based estimation method, the perpetual inventory method and the projection method [35].

Psacharopoulos and Arriagada (1986, 1992) were the first to compile data on average years of schooling for countries, using the formula:

$$\bar{S} = \sum L_i D_i \quad (1)$$

where: where L_i is the proportion of labour-force participants with the i^{th} level of schooling and D_i the duration in years of the i^{th} level. Data on L_i were available directly from national censuses and surveys for 66 countries. A drawback of this method is the limited number of censuses (once in every 10 years). Later on, Barro and Lee (1993; 2001) suggested solving this problem by interpolating the census data to obtain

estimates of ‘average years of education’ for every fifth year. They constructed education data from census information where available, and for missing information used enrolment data and the perpetual inventory method for updating.

First, based on a Perpetual Inventory Method (PIM), estimates the total years spent with formal education using sufficiently long series of enrolment data[16],[24]. This estimate is corrected by correcting factors such as: mortality, repeaters, and drop-outs rates, and finally divided by the number of working age population yielding the average years of education. The method is sensitive to the availability of data for these correction factors, though, which are in most cases available for a few years only and are usually interpolated by a regression. Therefore, the accuracy of the method is suspect.

In 2004, Portela *et al* argued that the use of inventory perpetual method for the construction of education data per country leads to systematic measurement error and they suggested a methodology correcting this error. De la Fuente and Doménech (2000) and Cohen and Soto (2007) revised and upgraded the Barro and Lee's work for a larger set of countries.

The projection method, based on assumptions regarding the relationship between enrolment and educational attainment, is developed by Kyriacou (1991), which calculates the ‘average years of schooling’ from mid-1970s censuses for a few benchmark years and then uses lagged enrolment ratios to interpolate average years of schooling in the labor force for the missing years.

A popular way to improve the ability of educational attainment variable to capture the real differences in human capital endowment and the market value of human capital is based on a Mincerian approach. Mincer (1974) applied an earnings regression to estimate the return to schooling:

$$\ln w_i = \beta + rS_i + \dots + u_i \quad (2)$$

where: w_i and S_i are earning and the educational attainment of an individual i ; r denotes the rate of returns to an additional year of education.

This equation was used by other authors (i.e. Pritchett, 2001) to estimate the human capital stock, as follows:

$$h_{i,t} = e^{r_{i,t} \cdot s_{i,t}} \quad (3)$$

where: $h_{i,t}$ denotes the per capita human capital in country i in year t . In this equation, a country with either no educational attainment, or no returns to education, has a per capita human capital stock 1.

Indicators of quality of schooling, as pupil-teacher ratio or class size, teachers' salaries, length of the school year, teachers' characteristics, parental characteristics, family background, drop-out rates, repetition rates, test scores were examined in studies developed by Kanushek and Kimko (2000), Barro and Lee (1996), Lee and Barro (2001).

Wößmann (2003) makes further improvements by incorporating Hanushek and Kimko's quality measure into stock measures. First, he expresses Hanushek and Kimko's estimate for each country as a ratio to the estimate for the US. This relative measure can be used as quality weights for a year of schooling in a country, with the weight for the US being unity. World average rates of return to education are finally integrated to arrive at a quality-adjusted measure of human capital stock:

$$h_i^Q = e^{\sum_a r_a Q_i s_{ai}} \quad (4)$$

where r_a denotes the world average rate of return to education at level a , Q_i refers to Hanushek and Kimko's educational quality index for country i relative to the US value, and s_{ai} is average years of schooling at level a in country i .

Costs-based methods

These methods measure human capital as the sum of all costs incurred during the formation of human capital. Engel (1883) was the first to apply this method when he estimated human capital from the costs of rearing a child [19]. His approach was extended by Schultz (1961) and Machlup (1962). A more popular application (see for example Pyo and Jin, 2000) of the cost-based approach has been developed by Kendrick (1976) who estimated the human capital stock for the United States in the period 1929-1969 by summing the tangible costs (rearing a child until age 14) and the intangible costs (health, safety, education, and the opportunity costs of students

attending school) [19]. This method has its limitations too, but it partly solves the problems associated to 'average years of education' by incorporating qualitative aspects of human capital. This approach is similar to the measurement of physical capital stock. Judson(2002) suggested to calculate per capita stock of human capital stock at its replacement costs:

$$h_{ijt} = \sum_j d_{ijt} a_{ijt} \quad (5)$$

where: d_{ijt} is the public expenditures on education per education level j in country i in year t ; a_{ijt} denotes the share of the labour force in year t with a certain level of education; h_{ijt} denotes the average per worker human capital stock.

The income-based methods

These methods are estimating the value of human capital from the future (expected) earnings(incomes). This method originates with Petty (1690) who calculated the human capital of England as the difference between his estimates of the national income and property income, capitalized in perpetuity at a 5% interest rate [19]. The modern versions of income based estimations define the (expected) value of human capital as the total income that could be generated in the labor market over a lifetime [17], human capital being treated as an investment. Dagum and Slottje (2001) applied this income-based approach to estimate of the average human capital stock of the USA in 1982.

The idea that wages reflect differences in efficiency and ultimately human capital endowment has been used by other authors as well to develop their methods. Jeong (2002), following Mulligan and Sala-i-Martin (1997), estimated a human capital index for 39 countries. He assumes that all countries have the same Cobb-Douglas type production function, and therefore the difference in the observed real wages must be attributed only to differences in human capital endowment and aggregate output[19].The following equation was used:

$$\frac{H_i}{H_j} = \frac{Y_i}{Y_j} \cdot \frac{w_j}{w_i} \quad (6)$$

where: H_i and H_j denote human capital

stock in countries i and j , respectively; Y_i and Y_j denote aggregate income; w_i and w_j are real wages in countries i and j , respectively.

Recognizing that every method has its limitations, some researchers combined different methods, resulting an *integrated approach*.

For example, Tao and Stinson (1997) integrated the cost and income methods. The investments in human capital determine the human capital stock, which can be established by the cost method. Human capital, in turn, determines earnings through the income-based approach:

$$Y_{s,a,e} = w_t h_{s,a,e} \quad (7)$$

where: h and Y are respectively human capital and earnings, s , a and e denote the sex, age and education level of an individual, and w_t is the human capital rental rate in year t .

Another example of methods combination is given by Dagum and Slottje (2000) which define human capital as a dimension less latent variable:

$$z = L(x_1, x_2, x_3, \dots, x_p) \quad (8)$$

where z is a standardized (zero mean and unit variance) human capital latent variable, and $x_1, x_2, x_3, \dots, x_p$ are standardized indicators of human capital. An accounting value of human capital for the i^{th} economic unit is given as: $h_i = e^{z_i}$ (9)

Dagum and Slottje estimated the human capital, H_x , of the average economic unit aged x . The monetary value of human capital of the i^{th} sample observation is:

$$H_i = h_i \frac{\bar{H}}{h} \quad (10)$$

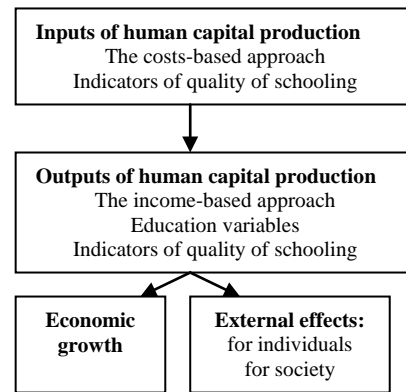

where: h and H are respectively the average values of h_i and H_x .

We can conclude that the monetary value of a person's human capital is equal to the average lifetime earnings of the population, weighted by the level of human capital that he has relative to the average human capital of the population.

3.Summary of methods measuring human capital stock

The three different approaches described above are interrelated.

Figure 1: Common approaches to human capital measurement

Source: adaptation by [25]

Figure 1 shows how these models are connected. To measure the inputs in the human capital production process, the cost based method (private and public spending on health, mobility and education, opportunity costs of attending school) is used and indicators of quality of schooling (pupil-teacher ratio or class size, teachers' salaries, length of the school year, teachers' characteristics, parental characteristics, family background).

The outcomes of human capital production can be measured through educational variables (literacy rates, enrolment rates, years of schooling), indicators of quality of schooling (drop-out rates, repetition rates, test scores) and the income based method (productivity, earnings).

Human capital is seen by many economists as a tool for explaining economic growth across countries and producing positive external effects on individual level (earnings, personal development) and in the society, as a whole (better public health, reduction of crime, unemployment, higher civic, social and political participation).

4.A comparative and critical review of the human capital estimation methods

Educational variables method

Years of schooling has been widely used in human capital studies, at both micro and macro levels and became the common proxy for human capital in growth models. But is to

mention the low explanatory power of cross-country growth regressions, due to the imperfections of this indicator. First, years of schooling does not incorporate the costs and returns to education, that varies from level to level. Second, does not reflect the differences in quality of education across time and space. Third, it ignores that workers with equal years of schooling can be in different education categories. Fourth, it ignores other human capital elements as informal schooling, training on the job, work experience, health.

Cost based method

The main shortcomings of the method are: cross - sectional and temporal comparisons are not always reliable, due to the fact that the value of human capital is determined by the demand for it, not by the cost of production; the components entering into the production of human capital and their prices can not be easily identified and it is difficult to distinguish between investment expenditures and consumption expenditures.

Income based method

A main drawback of the method is the assumption that differences in wages truly reflect differences in productivity. But, in practice, wages may vary for other reasons. Under such circumstances, income-based measures of human capital will be biased. Another disadvantage of the income-based method is that data on earnings are not as widely available as data on investment. This is especially the case for developing countries, where the wage rate is often not observable.

The integrated approach

The integrated approach of Dagum and Slottje assumes a standardized normal distribution of human capital, that is not realistic. Moreover, as with the income-based method, results are very sensitive to assumptions regarding the retirement age, discount rate and real income growth rate.

Final conclusions

Each approach is more or less subject to limitations and shortcomings: it does not always adequately reflect key elements of human capital or data on the measure are of

poor quality. Therefore, properly measuring human capital remains a challenge for further research.

Abstract:

A new business requires top priority during the entrepreneur, the emotions, and loyalty. Thus, the consequence for the commitment and determination is usually personal sacrifice. Commitment to an entrepreneur can be measured in several ways - through the availability to invest a substantial portion of his or her net income in the business, the willingness to give up salary since he or she will hold a large share of business, and other large sacrifices in lifestyle and family circumstances.

Keywords: entrepreneurial, income, wages, business

JEL: M21 - Business Economics

“1. Introduction”

Financial crisis in 2008 in Romania has led to the diminished of revenues for each family, with devastating consequences for elderly people, unless they take precautions during the active life. It is obvious that Romania is currently experiencing a difficult period and if no action is taken, Romania, the country is likely to fail and then disappear as a country [1].

“2. Entrepreneurship in Romania”

Each family in Romania suffered financial contract, meaning that after 2008, family incomes have declined significantly in terms of purchasing power. Reduced costs for the family budget adjustment must be made in consensus by both partners. Decreased revenues may lead to lifestyle changes a

couple times in the relations of interest are more likely to fall apart.

Entrepreneurial skills offer to pupils, students and people in old age tools to think creatively, to solve financial problems, due to the crisis, effectively, to analyze a business idea objectively and to communicate, to establish ties in the workplace, conduct and evaluate any given project.

Pupils, students and elderly people are feeling more confident about setting up their own business.

“3. Crisis of debts”

After the Second World War has followed a period of prosperity in which people have prospered differently depending on resources, intellectual elite, family tradition, and regional habits. During this period from 1945 to 2005 were acquired and consolidated conflicts of interest that led to unprecedented changes brutal regimes (Romania, Libya, Egypt, Serbia) or to changes in velvet, but deep (Czech Republic, Italy - Silvio Berlusconi, Greece - Georgios Papandreou, Ireland - Brian Cowen, Spain - José Luis Rodríguez Zapatero).

Are almost certainly France, Germany, Bulgaria and, last but not least, Romania.

Funding prosperity during 1945 - 2005 was based on the concept of inflation to moderate positive impact on prosperity.

Let's imagine that a country produces goods and services and puts them all in a bathtub. In the fall open mainly to fund four valves covering goods and services on two levels: value of goods and property value plus some (extra pocket urges you to buy). While money supply exceeded the value of assets as a percentage of common sense, 2 to 3%,

economies prospered. But when funding sources, particularly loans were based on toxic securities, overvalued, sovereign debt crisis erupted which caused Greece to be close to bankruptcy, Berlusconi to resign and Hungary to use their knees, the Fund money.

Romania can not make an exception to European models (see Spain, Ireland, Greece, Italy, Portugal) and sooner or later will go bankrupt after several sets of Government change.

At the level of common man, the only way to defend is to reverse pyramid options [2].

Figure no. 1: Options pyramid

We propose to operate and purchase gold as a form of protecting the value of savings and ensure a decent pension!

„4. NORICUM GROUP”

S.C. Noricum Group SRL was founded on May 30, 2011 and is engaged in the brokering precious metals. Is a company included in a group of companies based in Austria based company operating in 12 countries in Europe.

Noricum is the concept of specialized products and financial services in Austria, Germany and other European countries.

Field of interest of the company, based in Austria is to ensure a stable property to the highest possible protection against the risks of financial markets. To meet the credit needs, many companies opt for financial investments recommended by us or use our concepts.

On request provide the full spectrum of financial services in the areas of investment, insurance and finance and, in some asset management services and asset management. Listings posted on the company's change 3 times daily.

Romanian version of the site is available at www.Noricum-Group.Ro (currently only a blog site is in process) gives more detailed information.

See below in the table and figures presented, that the gold price evolution has followed a continuous upward trend, indicating that gold related businesses are some of the proposed recommended to all those interested.

Thus, it requires some notions of entrepreneurship at all levels, from student to senior people.

Noricum Group Exchange traded gold Vienna from 20 to 25 of each month. On Romanian market, the trading price at the end of each year in recent history was:

Table no. 1: Trading price development as quotations NBR

Period	NBR gram gold, XAU quote
Dec. 2008	78,7536
Dec. 2009	108,0324
Dec. 2010	145,0274
Dec. 2011	179,0155
Jan. 2012	183,9433

Figure no. 2: Gram gold rate graph NBR, XAU quote

Figure no. 3: Chart evolution gold price as Kitco.com

„5. Conclusions”

Most successful entrepreneurs seem to anchor their vision of future business in certain philosophies and attitudes (e.g., attitudes about what is a team that is mission, and how they will be rewarded).

Entrepreneur's ability to build a vision and then to lead, inspire, convince, and get the key people to register and submit to make an enormous difference between the dream of success and failure.

Effective managers have a reputation for developing human capital (e.g., they care and other managers increase efficiency by their example and mentoring) [3]. Binding of a plan to increase human capital in the middle management and supervisory levels of business strategy is an essential first step.

Abstract

An objective of this analytical approach is to demonstrate that alike the income, the expenses vary also depending on the life cycle of individuals, living environment, and some personal characteristics, too, based on these criteria, major differences in household consumption expenditure resulting. Thus, the main purpose of the expenditure incurred by the population, being the consumption of food and nonfood supplies, services and transfers to the public and the social security budgets. This guidance is based on public expenditure action of objective and subjective factors, that incite individuals do not consume much of the income, but to save.

Key Words: the savings, consumer, influence factors

JEL Classification: E2, E21

1. Introduction

Economic literature committed to saving is continuously enriched with new and new contributions, attraction domain results from its pragmatic inclination to subject theories of "proof of facts" and investigating their consonance with contemporary realities. The work on which we stopped is the most cited, constituting the core of scientific concerns of this kind.

An important factor influencing the savings process of population is the consumption.

2. Consumption-saving arbitration

Gradually, it was realized that there is an interdependence between the income of the population and spending money. However, daily realities highlight the complex nature of the interaction between income and expenditure in the sense that there is no identity and no absolute causal relationship, or of automatism. Thus, we consider that the relationship between revenues and expenses is a subject of the action of a multitude of factors that exert a complex action, often in contradictory ways.

Increasing the population's money incomes do not lead to uniform increase of all components of costs from prior periods. Overall, dynamics and structure of consumption expenditure recorded different rhythms and meanings in relation to income growth, in that with traditional spending, new requirements arise that leads to the formation of new categories of expenditure. Factors influencing consumption are those elements of economic and social human nature, objective and subjective, which increase or decrease in consumer spending at a time, or for a certain period of time and in a geo-social space.

Thus there are two categories of factors (subjective and objective) that influence consumer demand. The first category of factors of influence is the result of conditions generated by economic life.

What distinguishes this representation? We have the answer in the following concluding:

- the decision to consume is made in close connection with the size and personal net income developments;
- unexpected changes or physical obsolescence caused by the different elements of fixed and circulating capital and / or increased restrictions on some natural resources can affect the price and therefore the consumer decision;
- in terms of decrease in purchasing power of money, although the expenses for the present consumption will be increased, the real consumption is reduced. Also, the increasing purchasing power of money due to reduced consumer prices, the real consumption increase now because you can buy a larger quantity of goods with the same money or less expense. The risks is related to the uncertainty of life - that influence the possibilities to benefit from future goods, external uncertainties for the future, the payment of unreasonably high taxes, with confiscate character, etc. We can say that this factor is identified with interest rate evolution. It is considered that the size of consumption spending changes in inverse relation to the interest rate.
- changes in tax policy can increase the propensity to consume or it can reduce it, if a significant part of the budgetary funds are used to pay the debt.
- consumption credit affects consumer spending via interest rate. Between consumption and interest rate, for the loans for purchase of consumption goods, there is a negative relationship. On the other hand, a low interest rate for consumption credit will result in a high present consumption of credit, with an impact on reducing the future consumption.
- Consumer expectations are about the evolution of relations between present and future income, between the current and future prices, the current supply and future consumer goods. Thus, if it is anticipated that

revenues will increase, the present consumption will decrease, increasing the propensity to save. If it is anticipated that future consumption prices will increase, the present consumption will increase too, and if it is anticipated that the prices will be reduced, the current consumption will occur normally. So it is with the expectations of the amount of consumer goods on a market: if it is expected a decrease, present consumption will increase and vice versa.

In conclusion, all those objective factors influences the size of spending on personal consumption, but added the subjective needs: psychological dispositions, individual habits, motives concerning prudence, foresight, thirst for prosperity, independence, business spirit, pride and avarice, and relating to:

- a) people's desire to create a contingency money reserve (this reduces the current consumption spending, in favor of future consumption);
- b) establishment of cash reserves for old age insurance or protection of certain persons;
- c) the desire to gain interest or other benefits by participating in some activities on which future business projects will be realised;
- d) the instinct to raise the living standards of people by gradual increase in consumer spending, based on money reservations made over time;
- e) the feeling of independence and freedom of movement on the existence of large amounts of money saved;
- f) the desire to leave the property to the heirs;
- g) expression of avarice in some people, reflected in decreasing consumer spending.

The second category of influential factors, subjective factors, is the result of psychological inclination, of peoples customs and traditions. These factors include: the desire of people to create a cash reserve for contingencies, which reduces the desire for current consumption expenditures in favor of future consumption, creation of reserve funds

for old age insurance or for the protection of certain people, the desire to gain interest or other benefits by participating in some activities on which will be carried out in future business projects, sense of independence and freedom of movement based on the existence of big amounts of saved money, the desire to leave the property to heirs, etc. ..

If we synthesize, we can find that all these motives, and many others that I have not stated, but that act to decrease consumer spending, private prudent, thirst for prosperity, independence, business spirit, pride and avarice.

Overall, subjective motives which prompt the individuals and the local and central power do not consume a part of income, generated positive savings. But it may appear some negative savings, as savings for old age insurance, unemployment benefits financed by borrowing, etc..

Because of the action of these objective and subjective factors, consumption and saving evolution is governed by fundamental psychological law made by JM Keynes, that with the increase or reduction of income, people tend to increase or to reduce the consumption, respectively the savings, but to a less extent, respectively higher.

It is obvious that the volume of consumer spending in a period of time depends on the evolution of the prices and tariffs for goods and services at the time, and therefore, the determined consumption is expressed by the cost of living.

Also, post-communist transition generated major changes in all spheres of socioeconomic life. One of the areas that have experienced the most dramatic change is that of consumption. On the one hand, immediately after 1989, there was an increase in volume and a diversification of supply of goods and services, with a social impact especially important since this phenomenon occurred in a very short time, consecutive to the pronounced poverty period, characteristic to the last years of communism. On the other hand, household income saw a sharp differentiation process, leading to a concomitant process of differentiation of consumer behavior.

3. Consumption structure and its evolution over the period 2001-2010

The process of population needs satisfaction suppose the transformation of money income in goods and services. Thus, consumer demand differs from one social class to another. Thus, employees demand structure differs from that of farmers whose incomes are formed not only in money but to some extent in products, and therefore much of the peasants consumption not involve cash movements. Therefore the increase of employees income will be directed generally to other goods than a corresponding increase in farmers. At the same time demand structure varies significantly within the same population groups according to income level.

Increased cash income is accompanied, necessarily, by the changes in the structure of consumer demand, meaning that while increasing in absolute consumption values of essential goods to meet normal physiological needs, a decrease of their share in total expenditure occurs, increasing the share of expenditure for products of high value costs and durable, that improve living conditions and comfort.

Analyzing the evolution of household consumption expenditure in the period 2001-2010 it can be seen an increase, although significant, growth which is supported by analyzing the economic behavior of people through the theories formulated by Modigliani and Friedman on life cycle savings and permanent income.

This increase in household consumption goods can lead to a weight reduction of theoretically considered "normal" (goods that have positive elasticity according to income, but subunit - for example food goods) for the "superior" goods (goods characterized by marginal propensity to consume higher than average propensity to consume). The risk comes from the fact that these trends in changing consumption structure shows that the population will increase spending on goods engaging the most to finance by resorting to loans, which may increase the indebtedness of the population. However, if the Romanian economy will not provide the qualitative and quantitative goods required by the population, consumption will be met by imports, which will have repercussions on the current account deficit.

If we consider the structure of public spending in recent years 2007-2008 it can be

said that the largest share is hold by the consumer spending (71.1%) of total expenses.

The main uses of population expenditure are the consumption of food goods, nonfood, services and transfers to the public, private and social insurance budgets, income taxes, contributions, fees, and expenses necessary for household production (birds and animals feed, work payment for household production, seeds, veterinary services, etc..). Investment expenditure, for the purchase or construction of housing, land and equipment purchase necessary to household production, shares purchasing, etc. have a small share of total household expenditures.

Some characteristics in terms of size and structure of consumption expenditures are determined by the residence. Thus, while the expense of monthly average consumption per household is higher in urban areas to 500 lei, the food consumption is increased by only 80 lei. This derives from the fact that, in rural, 41.2% of the food consumption represents the equivalent consumption from own resources. The urban food consumption from own resources covered 18.1% of the total food consumption.

According to the standard classification of consumption expenditure by purpose (COICOP), food and soft drinks were served in 2011 on average 40.8% of household consumption, down 1.2 percentage points from first quarter, and respectively, by 2.5 percentage points from second quarter of 2011. A component of consumption, with relatively high share of expenditure is related to the dwelling (water, electricity, gas, fuel, furniture, household equipment and maintenance). In the third quarter of 2011, it was allotted 19.3% of consumer spending. Most of the housing costs (18.6% in the first quarter, 15.3% in the second quarter and 15.1% in the third quarter) was absorbed by the utility consumption for the operation and home heating (water, electricity heating, gas and other fuels).

Health spending by households (4.8% of consumer spending) and especially with education (0.4%) had a low level, especially

because these needs of household members is done in the largely through public services they receive in social security system or not.

4. Conclusions

Conclusion that emerges is that the savings depends on a large proportion of consumption, and saving can therefore be regarded as the mirror image of consumption. The aknowledge of population consumption behavior, especially its response to exogenous shocks affecting demand determinants, is an important source of information for understanding short-term fluctuations and long-term trends that manifest in an economy, including savings fluctuations understanding . Thus, saving is a necessary objective factor to expanding the consumption. In other words, higher living standards and changes in consumer demand patterns necessarily leads to savings, which is an objective process, with statistical regularity nature.

Abstract

In terms of market economies increasingly complex competitive environment reflects a prerequisite in ensuring transparent competition. This paper proposes an overview of the main meanings and characteristics of the competition, from a perspective of a viable and stable economic environment. Elements such as the transparency of market, regulations on entry and exit a given market, economic development opportunities or the possibilities to stimulate, are decisive vectors in boosting and potentiation of competition. That competition importance is expressed by the functions it fulfills in the implementation of market relations. Depending on the evolution of these relations, competition has extended its influence on multiple elements of market economy.

Key Words: competition, competitive environment, price, level of development, consumers.

JEL Classification.: D40, F10.

1. General considerations on competition

Along with demand, supply and price, competition is one of the variables defining the market, an essential feature of it.

Competition is the specific behavior of some subjects interested in property, and wish, to achieve their objectives, enters into relations of cooperation and confrontation

with others, being the expression of free enterprise.

Competition is both confrontation and cooperation between economic agents [2] for better conditions of production, sales, purchasing consumer goods, by making cash transactions, foreign exchange, financial, etc. It's a race to get the benefits (or at least reduce the likelihood of risk).

In competition, each acts of interest. For example, the buyer "run" to find sellers with the lowest price, highest quality, most favorable terms of delivery of consumer goods and factors of production. Sellers are competing among themselves for "client money" to attract as many buyers with high economic force, set in procurement, responsive to price and other favorability. From this competition, normally, comes out the winners.

Conditions of competition are: freedom of price formation and the existence of private property, and property rights are strictly defined and guaranteed. Competition has evolved over time and space, and its magnitude is influenced by: ● demand and supply agents number and economic power; ● degree of differentiation of the offer and preferences; ● degree of market transparency; ● the extent to which society, the economic, social, political, cultural, are able to stimulate initiative, creativity, risk, competitive spirit, and cooperation; ● regulations on entry / exit a given market; ● degree of substitutability and complementarity of economic assets; ● The amount of income and the mechanisms by which they are obtained; ● economic

development, cultural and spiritual and moral members of society; • nature of economic policies; • scale and typology of anticompetitive practices; • training level of the operators.

A market is more competitive with the more limited ability of every firm to influence it through price, quantity and method of marketing. Theoretically, competitiveness is maximum when each firm has zero power to influence the market.

For example, if company A increased the price of good "X" by 10% and the market demand is reduced by 0.1%, it means that the property market "X" is a competitive market. Conversely, if by that measure market demand shrinks by 4%, it means that the market is less competitive.

Like any competition, the market competition takes place under certain rules, being, as the market, social conscious creation.

In all the countries with competitive market economy there are legal regulations regarding the rules on development of the competition, penalties applicable to those who violate them, authorized bodies to supervise and enforce punitive measures (in Romania, competition regulation is achieved by numerous acts of which is detached Commercial Code, Law no. 21/10 April 1996, competition Law, Law no. 31/1996 on State monopoly regime; competition institutions in Romania are: the Competition Council and competition Office). In the lack of supervision and regulation, competition can destroy itself, it can lead to monopolies and other economic anomalies.

2. Competitive environment - specific objective framework of contemporary market economies

In the specialised literature, the notion of competition is treated through the juxtaposition of two theoretical approaches: structuralist approach and behavioral approach.

In the structuralist approach, competition is defined as a state and a market structure. Therefore, in this approach, competition is identified with a situation that contributes to free price formation and operation of the laws of supply and demand in a market, a situation in which the number of consumers

and businesses occurred onto the market is so large that they can not individually influence price formation.

Structuralist approach was largely own to classics and neoclassics which, in support thereof, have developed models of pure and perfect market competition and imperfect competition. Subsequently, this approach has been assigned a static character, as it is based, in particular, on the study of market structure determined by the number of operators.

The behavioral approach (behaviorist), present especially among neoliberal and postkeynesists, the focus is on another aspect of competition, the subjective side, caused by human behavior. Competition is defined as a concept that meets the following behaviors: report, interaction, fights, rivalry, competition for operators to achieve goals such as minimizing price, winning customers, gaining productive resources (human, physical, financial), labor leadership, increase profits. The French economist, A. Jackemin, in his work on industrial and competition policies, defines competition as a set of interactions between agents, who consider that agents behaviors and conditions are data. Russian scientists - A. Iudanov, defines market competition as a battle between companies for the limited capacity of consumer solvency, and I. Rubin, highlights rival interests, treating competition as a permanent struggle for leadership in the production market, for the possibilities arising from this for distribution and consumption.

The most common definition of competition in the literature used by Romanian economist Dobrotă Nita, can also be attributed to behavioral approach: "Competition is a confrontation, rivalry of private economic agents to attract the customers consuming the most convenient prices through better quality goods, in order to obtain the greatest and secure possible profits".

It is considered that the behaviorist approach is a dynamic character, as reveal changes in economic behavior over time and how these changes transform the environment in which they act. We believe that both the structural (static) and the behavioral (dynamic) approach are correct. Moreover, they are complementary. Indeed,

on the one hand, market competition is a condition characterized by parameters such as number of firms and consumers, the degree of homogeneity of goods, mobility of factors of production, possibility of enter the industry, market transparency, and on the other hand, it defines the relationship between economic character by adopting different strategies of action, all in the context of specific market structures (the market structure we mean perfect and imperfect forms of competition: pure and perfect competition, monopoly, monopolistic competition, oligopoly, oligopolistic competition, monopsony, etc.).

Sometimes, the notion of competition is confused with another notion, which originated in the competition - competitive. In the past, competitiveness was attributed exclusively to the ability of firms to sell goods and services in national markets. Today, with the processes of internationalization and globalization of economic, competitive spread over the nation, representing its ability to sustainably improve the living standards of its people and to get them a high level of employment and social cohesion (official definition of competitiveness, proposed by the Consultative Group on the competitiveness of the European Commission). Moreover, competitiveness is generated by practicing free market competition. The free competition is one of the conditions of emergence of competitiveness.

Another term, almost indispensable term to competition research is competitive environment. It is a coordinated system that includes: the number of producers and consumers in the market, the diversity of the sold goods and services, the organization of markets, the existence of the legal, government intervention, etc.. Normal competitive environment creates favorable prerequisites of a viable growing market.

3. The evolution of functions and competition types in the contemporary economy.

Typically, competition is in terms of three components: function, typology and mechanism. These three components have evolved over time and other factors. Determinants factors of modern economy,

which generated changes in competition, are the globalization and the regionalization of economic life.

The competition importance is expressed by the functions it fulfills in the implementation of market relations. Depending on the evolution of these relations, competition has extended its influence on multiple elements of market economy.

Usually, in economics textbooks are listed the functions performed by competition, not to delineate their evolutionary nature. Following investigations, we concluded that it would be logical to tie them into two categories according to the period they occurred. By this we want to emphasize that competition functions do not remain unchanged and in each stage of economic development, they achieve new goals. Classical functions of competition, characteristic to economy up to globalization and regionalization are:

- satisfaction of consumer demand;
- autonomous adjustment of supply and demand;
- optimal allocation of resources;
- fair distribution of income.

1. Satisfaction of consumer demand.

Manufacturers aim to profit, while consumers express their choices for the goods and services offered by manufacturers to meet their needs. Directing the operators to produce what is desired and demanded by consumers at lower costs in the given circumstances, competition ensures the expected prices and profits for the producers and satisfaction for the consumer.

2. Independent adjustment of consumer demand and producer supply.

The competition is held to stimulate the concern of the producers to increase, diversify and improve the quality of offered goods, in order to prevent, adapt and meet the needs of consumers.

3. Optimal allocation of resources.

This feature is one of the key features of competition. It decides the parameters within which it is obtained the highest degree of satisfaction of the society members, both as consumers and producers. Optimal allocation

of resources is obtained by determining the following parameters:

- what kind of goods and how much should be produced;
- how the goods produced to be distributed among the members of society;
- what will be the set of resources in producing goods and what will be the used production methods.

The function of the income distribution is reflected in the fact that, as the result of free competition, the operators are rewarded for their work. Consequently, the more skilled companies organized their activity better, obtained higher profits, and the less performant obtained a lower income.

Simultaneously with the development of market relations, the unprecedented increase in the level of production and in international trade, most generated by processes of regionalization and globalization, competition has acquired several new features that we call *modern features*:

- promoting the innovation;
- limiting the economic and political power;
- influence on the economic agents psychology.

4. Promoting innovation can be considered a new feature of the competition, because it increases predominantly in the contemporary economy conditions, subject to regionalization and globalization. This function is achieved by stimulating economic and technical progress. Competition gives to firms a strong reason to develop advanced products and discover ways to produce with a lower cost, to maintain traditional markets and to win international markets. Entrepreneurs are free to introduce a new product into production or to use a manufacturing technology which opens prospects more favorable than those used so far. The novelty of ideas put into practice must face the verification required by consumers. If consumers like the novelty that brings this idea, so as to cover the cost of goods or services proposed by the company, new business will prosper and succeed. Otherwise it will fail.

Reality shows that a manufacturer trader to succeed in a competitive market should have the ability to anticipate, identify and adapt quickly to new ideas. And by

continuing competition between operators, the competition favors the best-performing and destroys the weak, the unable to adapt to the market.

5. Limitation of economic power, and thus, the political power. In a market economy competition is free, it is part of free enterprise or freedom of action, which means that economic agents act to achieve their own interests, and the economy, as a whole, is the result of this action. Origin of each interests is in economic- competition environment, in which the central place returns to property and market. Thus, competition freedom expresses freedom to act in the economy whose functioning takes the form of market. The importance of this function is particularly significant in modern economy, as traders appear (monopolies, transnational companies) seeking to influence certain business processes, such as consumer decision, the free prices, access to resources, political decisions, etc. .

6. Competition influences economic agents psychology. This function is determined mainly by changing strategies of competitive rivalry in the modern economy, expressed through actions related to the influence of the consumer by different advertising or public relations actions. This causes changes in the value system of consumers, the options for new lifestyles and, ultimately, the more clear shaping of their personalities, which reflects on his behavior. There is a growing requirement of the consumer to consumption, due mainly to the concern for keeping in shape and intellectual, to health, but also to more timely and comprehensive information on consumer alternatives. Under the influence of globalization / regionalization, consumer value system changes as a result of the internationalization of the consumption of certain goods and services.

4. Conclusions

Thus we can say that in terms of active and dynamic competitive environment, the advantages offered by the development of competition are very important. All defining and determining elements entail a guarantee of increased competitiveness and a deeper

economic development with a direct influence in increasing the productivity and economic yields regardless of the degree or the level of their development.

Activity of Collective Administration Organizations on the Market of Copyright and Related Rights in Romania

Nițu Valentin Ionuț
The Bucharest Academy of Economic Studies
nivalentin@yahoo.com

Abstract

In the context of development of the utilization techniques of a work or of those utilizations of a work that can be hardly monitored by the rights owners, the collective administration organizations are essential in the exploitation system of copyrights and related rights. Mandating the collecting societies by the right holders is the legal solution for the authorization of the uses of a work. By this, on the one hand, there are respected the rights and the remuneration of the rights holders and, on the other hand, users are provided with legal certainty for the use of a work as well as economic advantages from it.

Keywords: collective administration organization, copyright, related rights, the market work.

JEL Code: K11, O34

1. Introduction

In the regulation system of Law no. 8/1996, the owners of copyright and related rights may exercise their rights recognized by law individually or by proxy, by collective administration organizations in accordance with the law. The development and, especially, the advantages of the technical means of reproduction and dissemination of works led to the regulation of collective management of copyright.

The administration organizations are defined by Law no. 8 / 1996 on Copyright and Related Rights, subsequently amended and supplemented, as non-profit association established by rights holders and which have as main activity the collection and distribution of appropriate remuneration for the rights granted by mandate from the members or by law.

The collective administration organizations may be established under the endorsement of Romanian Copyright Office (O.R.D.A.) and must comply with specific legal provisions stipulated in Law no. 8 / 1996 on Copyright and Related Rights, subsequently amended and supplemented. Thus, the legislator has provided special conditions governing the status of collective administration organizations, rules applicable to collective administration as well as obligations of the collective administration organizations in relation to the public, to the authors, the users and ORDA. The most important of these provisions refer to:

- establishing rules of distribution of collected remuneration in the status of collective management body, on the basis of proportional distribution of collected remuneration to the use of the work;
- decisions regarding important aspects of collective management should be taken by members in general meeting;
- the requirement to have a website as well as specifying the minimum information that should be posted on it;
- Limiting the management fee payable by the rights owners, which are members of the collective administration organization, fees which are used to cover its operating expenses, at 15% of the amounts collected annually. The collective administration organizations must have sufficient income to carry out its duties effectively, especially when the managed rights cover a vast repertoire and there are required several distribution and payment operations, which generates costs.
- the management fee will be deducted from the amounts distributed to members after calculating individual repair;
- the amounts collected by collective management organizations are not and

cannot be treated as their income, because the most important duty as a collecting society is to allocate appropriate amounts to the rights holders according to the use of their works. Collecting societies would not discharge this burden if, instead of making payments to holders of rights, would use these resources to provide funds and reserves for other purposes.

- complying with the principle of equal treatment of the rights and work holders. For example, in the case of collecting societies, all or at least most of the collected money will be transferred abroad under reciprocal agreements concluded with similar bodies. Must however be stressed that all management societies are obliged by law and by the concluded reciprocal representation agreements with similar foreign companies to comply with a strict equal treatment with regard to any national or foreign works.

2. The collective administration organizations in Romania

The collective administration organizations can be created separately for different categories of rights management corresponding to different areas of creation as well as management of rights belonging to different categories of owners. Currently, in Romania there are operating a number of **12 collecting societies**, designed to manage different categories of rights, i.e. copyright and related rights, as follows:

Copyright category:

COPYRO – manages the authors’ rights of written works

DACIN-SARA – manages authors' rights of cinematographic other audiovisual works

PERGAM- manages the authors’ rights of scientific works

UCMR-ADA – manages the authors’ rights of musical works

VISARTA – manages the authors’ rights in the field of visual arts

Related rights category:

ADPFR – manages the authors’ rights of phonograms producers

CREDIDAM – manages performers' rights

AGICOA ROMANIA - manages producers’ rights of cinematographic and other audiovisual works

ARAIEX- manages performers' rights

UPFAR-ARGO – manages producers’ rights of cinematographic and other audiovisual works

UPFR – manages the authors’ rights of phonograms producers

UPVR- is the body that administers neighboring rights that belong to the producers of videograms.

COPYRO - collecting society of copyright. COPYRO is a member of IFRRO and has signed reciprocal agreements with the collective management organizations RAO (Russia), SOPE (Greece) and SGAE (Spain).

Concerning the number of members, this collecting society now has 1664 members, managed based on mandates and a total of 521 managed works.

Currently, COPYRO collects the remuneration of the written works’ authors from the following sources: the compensatory remuneration for private copying in the graphic field, sole collector for: compensatory remuneration for private copying rights holders - copy paper, compensatory remuneration for private copying rights holders - devices and other media, broadcasting by radio and television broadcasting organizations, broadcasting via cable retransmission, publishing reproduction, public communication (theaters).

DACIN-SARA (Society of copyright in cinematographic and audiovisual - Romanian Society of Audiovisual Authors), manages the rights of authors of cinematographic other audiovisual works, being approved to operate as a collecting society by Decision no. 1 / 1997 of the General Director of O.R.D.A.

PERGAM (Romanian Society of Authors and Editors of Scientific Works) manages rights of authors and publishers of scientific work, being approved to operate as a collecting society by Decision no. 98/2009 of the General Director of O.R.D.A. (published in the Official Gazette, Part I no. 579/20.08.2009).

The collective administration organization PERGAM collects the remunerations of authors and publishers of scientific work

from the following sources: broadcasting, cable retransmission, communication to the public, private copying, public borrowing, making derivative works.

UCMR – ADA (Union of Composers and Musicologists from Romania - Copyright Association), the most important collecting society in Romania, manages the rights of authors of musical works; established by free association between composers and lyricists.

UCMR-ADA is a member of CISAC (International Conference of Societies of Authors and Composers) and BIEM, and has signed over 50 mutual agreements with similar foreign bodies (e.g. SIAE - Italy, MCPS - United Kingdom, AMRA - U.S. ASCAP - U.S.).

The fundamental principles on which UCMR-ADA operates are:

- UCMR-ADA is a collective administration organization, open to all holders of copyrights in music from Romania and abroad.
- In exercising their functions, UCMR-ADA will comply with Romanian legislation, international agreements to which Romania adhered, and the principles and methodologies applied worldwide.
- UCMR-ADA treats with the same rules all works whose rights have been entrusted to management, whether it was mandated directly by the authors or by their representatives.
- UCMR-ADA guards the moral rights of authors. In this respect, the UCMR-ADA will only manage related rights as secondary activity.
- UCMR-ADA guarantees its members access to information and data required by them about managing their rights.

Currently, UCMR-ADA collects the remuneration of authors of musical work from the following sources: public communication (cinema), public communication (ambient and lucrative), broadcasting by radio and television broadcasting organizations, cable retransmission, private copying from the sound and audiovisual field, reproduction of musical works on phonograms, reproduction of musical works on videograms, the use of musical works as ringtones and on the Internet.

VISARTA (Collecting society of copyright in visual arts), manages the rights of authors in the visual arts. The operation of collecting society VISARTA was approved by Decision no. 8 / 1999 of the General Director of O.R.D.A.

VISARTA collects and distributes the remuneration of its members from the following sources: cable retransmission, private copying in the graphic field, reproduction; remuneration determined by direct negotiation with the users, resale right.

A.D.P.F.R. is constituted and functions as a collecting society for the related rights of its members - producers of phonograms in the musical field, according to decision of the General Director of ORDA no. 206/30.06.2006, published in Official Gazette no. 589/07.07.2006.

A.D.P.F.R. collects and distributes the remuneration of its members from the following sources: public communication (ambient and lucrative); broadcasting phonograms published for commercial broadcasting by radio; broadcasting phonograms published for commercial broadcasting by television; cable retransmission, private copying from the sound and audiovisual field (sole collector).

CREDIDAM (Romanian Center for Performers Rights Management), managing the rights of performers and acts as collecting society since 1997.

CREDIDAM is open to all related rights holders, Romanian or residing in Romania or in other countries, as well as foreign citizens. The activity of CREDIDAM is the collection and distribution of their remuneration from commercial recordings broadcast in Romania by radio, cable, TV, in restaurants, hotels, discos, etc.

CREDIDAM collects and distributes the remuneration of its members from the following sources: broadcasting phonograms published for commercial broadcasting by radio, broadcasting phonograms published for commercial broadcasting by television, broadcasting artistic performances by television, cable retransmission, private copying from the sound and audiovisual field, public communication (cinema), public communication (ambient and lucrative).

The Union of Phonogram Producers of Romania (UPFR) is a nonprofit professional

association founded in 1996 in order to defend and promote the professional, cultural and moral interests of its members under a mandate given by them to manage their related rights and involvement in activities relating anti-piracy.

UPFR gathers the myriad of today's most important producers and importers of phonograms in the Romanian market and is open to all those who, in accordance with the interests of current members, express their willingness to adhere to the principles that animate the work of all the legal producers.

UPFR collects and distributes the remuneration of its members from the following sources: public communication (ambient and lucrative), broadcasting phonograms published for commercial broadcasting by radio, broadcasting phonograms published for commercial broadcasting by television, cable retransmission, private copying from the sound and audiovisual field.

UPFAR-ARGO (Union of Film and Audiovisual Producers of Romania - Romanian Association of Audiovisual Works management) manages the rights of producers of audiovisual works and is a collecting society established by Decision no. 9/ 1999 of the General Director of O.R.D.A.

UPFAR-ARGO collects the remuneration of producers of cinematographic and other audiovisual works from the following sources: public communication (ambient and lucrative), broadcasting by television; cable retransmission, private copying from the audiovisual field.

3. The analysis of the amounts collected

Table no. 1. The evolution of the amounts collected by collective management organizations in 2004-2009

OGC	TOTAL
2004	32,793,457
2005	46,611,666
2006	87,798,674
2007	111,456,985
2008	157,085,742
2009	152,873,851

Source: <http://www.orda.ro>

From the analysis of total incomes made by the collective management organizations it results a considerable increase from 2004 to 2008. In 2009 a decrease was registered also due to the crisis affecting the world economy. Taking into account the evolution in those six years leads to the conclusion that this form of management of copyright is in continuous development and growth due to the market where these organizations operate and to the legislative regulations which enhances the use of these assets. In a 6 year period there was a five time increase in the amounts collected, which shows the evolution of this way right holders obtain remuneration through collective management organizations.

Table no. 2. The evolution of the amounts collected by each collective management organization in 2008-2009

OGC	2008	2009	EV.(%)
UCMR-ADA	98,135,921	94,449,479	-3,76
COPYRO	4,313,981	3,535,122	-18,05
DACIN-SARA	3,407,724	7,109,119	+108,62
VISARTA	721,810	631,949	-12,45
CREDIDA M	24,786,130	22,113,841	-10,78
UPFR	15,460,859	18,515,988	+19,76
UPFAR-ARGO	9,280,777	5,622,986	-39,41
ADPFR	483,158	895,365	+85,32
AGICOA	0	0	0
PERGAM	0	0	0

Source : <http://www.orda.ro>

In 2009, for the first time in the period 2004-2009 there has been a decrease in total incomes. From the analysis of the table above it can be seen the amounts collected by each organization. The biggest share in total income belongs to UCMR-ADA, of 61.78%, followed by CREDIDAM with 14.47% and UPFR with 12.11%. Significant increases were registered at DACIN-SARA – 108% and at ADPFR – 85.32%. This increase did not have a significant influence on total

incomes because the percentage was significant, not the value of the incomes.

4. Conclusions

In Romania, it has been developed a complex system of collecting and collective administration organizations must continually align to the practices of collecting societies in other EU countries and must face the new challenges caused by the use of works and products bearing copyrights and related rights in the modern society.

The value of the copyrights and related rights market has dramatically increased between 2004 and 2009. This growth is also due to the way the authors' creations, who evolved and developed, could be publicized. This growth is entirely understandable because it is supported by the existence in Romania of such organizations which can judiciously manage these rights. The copyright holder is not a specialist in the market, but through these specialized organizations he can be properly paid.

SMEs and International Competition: Empirical Evidence for Romanian SMEs

Oncioiu Ionica
Tomis University Constanta
nelly_oncioiu@yahoo.com

Abstract

One of the issues covered by the current debate concerns the future of the national economy in a world in an accelerated process of globalization. It is, in fact, the transition from national economy to the global economy as homogenous global space in which national economies are melting and whose background includes a variety of positions since the companies compete globally and not states, and structuring is determined by the dynamic global economy industries and firms efforts to create competitive advantages.

This paper has as main objective to understand and to approach the topic of the SMEs in the international competition, which, being considered a significant resource for those an organization is fundamental for the creation of the wealth since an appropriate administration takes place a series of benefits. Is it important to improve innovation potential, quality and operational excellence?.

Keywords: competition, SMEs, internationalization, economy.

J.E.L.: F23, D22, O12

1. Introduction

Michael Porter argues, in turn, in his “Competitive advantage of nations”, the effort to assess the competitiveness of a nation must consider the standard of living result, because we can not talk about a competitive nation without that country's population has a level high standard of living. Definition, for example, strictly as part of market competitiveness, worldwide, which covers a country's exports bring limited and unproductive approach, because it takes into

account the economy's ability to create the nation's welfare.

Increasingly, we are witnessing changes in the business world does not resemble the past. This is why practitioners advocate for small and medium reinvention from that recognized principles have no relevance today. Competitiveness crisis facing the sector has not transient. Adam Smith's world and how it did business are a paradigm of yesterday. It turned out that a gradual transformation is illusory moment when radical transformation can not be postponed.

Recent theories and show new aspects related to the internationalization of business and, especially, the internationalization of SMEs, which raises a growing interest in academia and business in Europe and worldwide, while the transformations taking place in the economy beginning XXI century tend to bring small and medium enterprises at the forefront of economic development, giving them a new status.

As regards SME internationalization motivations, the literature associated to the two established categories of motivations for reactive and proactive type: The first category of motives which are reactive response to the pressures coming company in the business, such as: competitive pressure, lower domestic sales, excess capacity in relation to market opportunities at home, over-determined by off factors, the availability of foreign markets, etc.;

The second category of motivations underlying voluntary commitment to international business in order to capitalize on competitive advantages, among them including: access to material and financial resources abroad, reducing costs by harnessing the benefits of economic or trade policy or foreign countries increasing the production scale, technological advance capitalizing held in some areas, management of external market orientation, etc.

In our opinion internationalization and innovation besides Romanian SMEs lack the periodic review evaluation of their position in the market, according to the results of these tests, setting medium and long term strategies. This refers to how powerful the SME market position, if this position is expected to improve or contrary to deteriorate, which is the position stands firm against rivals from the market (usually the local market) and each important competitive variable, which is the company's capacity to defend its position opposite the probable changes in the field of trade and competition anticipated movements.

2. The Romanian SMEs in the International Competition: Stakes, Advantages and Limits

Increasing competition is the reality of sharp pressure on small and medium enterprises worldwide. To compete in niche markets for these companies bring unique balance resources, values and managerial capacities. The distinctive competencies they strive to build a competitive advantage relative to competitors and achieve superior financial performance, to ensure their access to some of the resources available to society. Capacity of larger firms to reduce costs through economies of scale effect, to support expensive research programs, SMEs oppose them greater flexibility and adaptation to market changes occur, greater mobility in the satisfaction of personal needs.

Innovation can be defined as new or innovative solutions in international competition. It provides small competitive advantage in that it provides, for a period of time, a monopoly to exploit unique trait obtained as a result of innovation. Furthermore, systematic innovation is probably the only indispensable lever for sustainable competitive advantage for small and medium enterprises.

To form an overview on SMEs in Romania, knowledge of nature in their innovation activities carried out are a starting point in analyzing the competitive advantage. Statistical data (Figure 1) for 2008 showed that innovation efforts of SMEs have focused mainly on new products (37,49%), new technology (28,75%), management and new marketing approaches (24,02%). These

figures illustrate how Romanian entrepreneurs are becoming more aware that, in the context of growing competition in all areas of activity, innovation is the most effective way to ensure competitiveness.

Figure 1. Nature of innovative SMEs

Given the size of firms on innovative efforts is found that the extent to which companies aimed at improving staff training system and amplification increase with size businesses. Activities to introduce new products and improved uptake of technologies are more common in small organizations and small for micro-enterprises. Medium enterprises recorded in greater managerial and marketing approaches us.

If small and medium enterprises in Romania, however, the emphasis is on motivation proactive type, and in particular on management involvement.

I also raised a number of essential changes in typology and structure of small and medium enterprise sector, which have a more pronounced international dimension - its leading companies in sectors of the economy, virtual enterprises; integrated enterprises value added chain of large enterprises, business networks or clusters that raises a growing interest in literature.

Internationalization of SMEs is achieved, in principle, gradually, by going through several stages, which define as many types of companies with international activity and expressed specific motivations to participate in the global market. Studies from the 90s of last century shows that some firms, namely SMEs, there is a gradual process, the stage of internationalization, they have international activities since its establishment right to enter the market under the large geographical

distance, to penetrate in several countries simultaneously, to form strategic alliances and joint ventures without the benefit of previous experience, etc. Therefore developed a new theory to explain the current process of internationalization, which is based on these developments and is centered on small and medium enterprises, which is currently in the process of consolidation. It is also generally agreed that none of these models alone can explain the dynamics of internationalization of SMEs, especially those leading sectors of the economy, whose main resource tends to be more represented by knowledge. It is often suggested a comprehensive approach that takes into account several models and theories to allow deepening phenomenon. However, most studies devoted to prioritize one of the models and the approach is still dominant stage. At the same time essentially notes and changes in typology and structure of small and medium enterprise sector, due to these new developments.

If the European Union special attention was given to the following types of SMEs: SMEs in the sectors of top technology and media have affinity with nature developed Internet business and new market developments, small and medium exploit the opportunities offered by electronic commerce, especially in services - sometimes called cyber-companies, small and medium-sized integrated value-added chains of large companies are forced to innovate under pressure from major customers.

An analysis by the European Commission to member countries in May 2009 showed that 33,3% of medium firms and 32,2% of small generating over 10% of their turnover from new or renewed during the last two years. These weights are close to that of large enterprises (35,8%), which prove that European SMEs are becoming increasingly innovative.

In the U.S., SMEs account for 86% of all exporting firms. In the last 10 years, the number of small and medium exporters tripled, contributing 31% of total exports.

Studies by the OECD show that the share of innovative SMEs in the total national companies varies between 30% and 60%, depending on the member country. On average, they perform research and development at a rate and a lower level of

large companies, but prove more innovative redesign of products or services to better meet market demand, the introduction of new organizational forms that increase productivity or in inventing new techniques to expand the market.

Worldwide, can be identified a small segment with an exceptional growth rate, which is positioned within the first 5-10% of companies in the world expanding. In many countries, the volume of jobs created by these SMEs is higher than that achieved large size firms. They are based on new technologies and developing impressive research activities. These SMEs are found in industries knowledge-based high-tech and in regions where there is an intense economic activity. They play a pioneering role in developing new products and markets, bringing an outstanding contribution to the creation of a new type of global economy, one based on quality, professionalism and creativity of the workforce.

So, in their haste to gain new markets or being forced to constantly reduce costs and increase quality, large corporations left uncovered important market niches that can be filled more effectively by small and medium enterprises. Therefore, intelligent strategies allow small businesses to grow despite increasing competition worldwide and marked the growing strength of large companies. SMEs can achieve this either independently, by promoting products / services differentiated from those of large companies, either by working with large companies as subcontractors, or by building alliances to multiply their potential.

Alliances of SMEs but is not limited only to those with big companies, they carried with companies of similar size. The sharing of infrastructure, technology and supply and distribution channels, allied SMEs manage productivity, competitiveness and ultimately profitability.

But, it is necessary to be taken into account that innovation is a prerequisite for survival in the market for both companies in countries with advanced economies and for those in process development, it can change quickly today rankings that seemed unshakable. Dynamics dizzying technical progress in the current era is that companies and economies that until recently have excelled in certain areas they could lose

global primacy over night the rate of introduction of innovation falls.

Relevant aspects of the table are evaluated in terms of implications for business strategies, supplemented or restricted and used under the terms of each company. This type of analysis allows the positioning of the SME in relation to the competition, highlighting both their strengths and those of rivals.

Table 1 – Competitive position of SMEs

Pluses(+):	Minuses(-):
<ul style="list-style-type: none"> - Competitive advantages; - High customer loyalty; - Well defined market strategy; - Well differentiated product offer; - Increasing market share; - High flexibility to changes in demand; - Other. 	<ul style="list-style-type: none"> - Poor competitive advantage; - Target of rival attacks; - Inadequate distribution system; - Poor response to changes in demand; - Bad reputation among customers; - Other.

Once the mission enterprise, assess business potential and positioned against the competition, the next step is to transpose the general objectives of the mission, to measure company performance. These general objectives that are established for longer periods of time vary depending on the specific terms of reference, usually focuses on SMEs: profits, turnover, market share, etc.

A rigorous system for measuring their achievement, supposedly basic parts: expressing indicator (turnover, profit, market share, etc.) unit (lei, %, units, etc.) and the (actual size).

The general objectives of the Romanian SMEs can be ranked in relation to their scope of reference and hierarchical level to which they are established, the following sequence:

- Strategic overall objectives set out in the entrepreneurial SME, explicitly (usually in medium-sized companies) and implicitly (in the micro and small class), in relation to key areas of activity, they constitute the starting point objective in establishing the network of the company;
- Tactical objectives (derived) regarding the allocation of resources, they also usually set by the developer in micro and small and

mid-level managers respectively of medium-sized companies;

- Operational objectives (operational) that set the business in micro-firms respectively lower level managers in medium-sized companies, they relate to specific activities, current, which serve to achieve strategic and tactical objectives.

However, the objectives are the starting point in formulating strategies, providing the criteria against which, will be evaluating and measuring the results. These companies would be beneficial to gravitate as far as possible, around strategies difficult to imitate and / or offset, while starting from the premise that whenever one or more of the competing SMEs initiated by one nine “offensive” strategy, competitive pressures will be activated in November.

Basically, the behavior of each “actor” in the market, that market influences, and this in turn affects their behavior. An important role in this regard plays various rivalries between SMEs, which appear in different market sectors. Extrapolating observations made by A. Thomson and A. Strickland on Romanian SMEs can formulate the following conclusions:

- Rivalries between SMEs tend to increase as the number of competitors increases and firms are close in size and potential;
- Rivalries are usually stronger when the growth rate of demand for our products is slow;
- Rivalries become more volatile and unpredictable, the more diversity of SMEs according to priorities and resources, etc., is higher.

Design strategies will match the specific conditions under which each company operates. In this sense, scientists have developed various classification schemes; to better define the types of strategies. Experience has shown that the wide range of strategic options can be grouped according to the general objectives set out in a few basic types known: growth strategies, maintenance strategies, defensive strategies and combined strategies, most of themselves and making their own choices achievement.

In a highly competitive market as one that enables SMEs generally, each of which can become not only the subject, but also the object of attack rivals, be they companies or new entrants existing companies. Therefore,

the purpose of defensive strategies is to minimize the risk of SMEs to be attacked, or decrease the intensity of the attack.

Arsenal defensive strategies is vast, from those aimed at blocking access routes to competitors (which lends itself to a small extent but small and medium enterprises), to those designed to convince potential attacker, the effort is too high in relation to the effect (announcement intent to preserve market share, maintaining the profit share less attractive to outsiders, etc.). The benefits of successful defensive strategies are difficult to measure.

Design strategies are a necessary condition but not sufficient to ensure survival and even growth of SMEs. It is therefore important that the developer be able to translate strategic vision into practice. It should be noted, however, that in a small and medium enterprises, implementation is facilitated by its structural and functional flexibility, the concentration of power in the entrepreneur and the exercise by it of an active role authoritatively on his subordinates. The implementation of the various strategic options presented, concerns mainly the development of market strategies and financial strategy specific to each category of firms analyzed. Algorithm strategic management of SMEs can be developed on two vital directions listed: marketing and finance.

Attitude towards risk entrepreneur also has a considerable influence on strategy. Thus, those with reduced capacity to take risks will opt for so-called strategy mostly “safe”, which minimizes the impact of environmental threats; the profits are not spectacular, but acceptable. Often, the entrepreneur with risk aversion insists on addressing the financial perspective of the business, preferring financing from own resources of borrowed resources. He avoids as much as possible, significant financial commitments until the likely effects of the uncertainty is minimal. Moreover, innovations of any kind of business are interpreted as too risky, compared with the situation. Such places great value on entrepreneurial strategies “conservative” or defensive, designed to minimize risks.

A small entrepreneur with a high capacity to take risks, more proactive strategies “offensive”, with increased chances of profit,

more demanding, challenging but also risky. For him, innovation is better imitation and offensive defense is better. The Romanian economy is already operating in an open and competitive. There are a number of measures that can help maintain the competitiveness of SMEs continue to operate on the domestic market more competitive and increasingly important, although often neglected in unrealistic. It would be beneficial for Romania's economic development undertakings in the sector to succeed domestically and at the same time, turn to international markets through appropriate strategic approach to find niches, avoiding direct competition with large companies on field market segment that it dominates.

3. Conclusion

We believe that a more general level, the shift from internationalization to globalization of economic life - one of the defining characteristics of the evolution of global business in the second half of the twentieth century - has a strong influence on SMEs and their internationalization. The influence is mixed, both negative, the top competition, increased business turbulence, but positive, facilitating access to new markets, supply and sales, accelerate the transfer of know-how, access to new technologies, partnerships and strategic alliances at international level, etc. Literature and actual developments of SMEs shows that it lies rather in a position to counter the negative effects of economic internationalization and to capitalize on the positive, especially in the peak areas of the economy.

In conclusions, the competitiveness of SMEs is therefore interdependent national business environment developments and political environment, business clusters, and development of industrial zones and internationalization of economic processes of globalization. Moreover, the internationalization of SMEs internationalization evolves with the national business environment.

In the context of competitive markets XXI century, it becomes imperative need for strategic approaches to entrepreneurial survival and success of SMEs soliciting effective business strategies and actions.

Strategic entrepreneurship is applicable to new SMEs and existing firms in the market, thereby facilitating the positive impact of the efforts of companies to identify the most advantageous opportunities with profit potential of the highest, according to available resources.

According to Strategy 2020, Romania will harmonize legislation so as to enable promotion of the internationalization of SMEs and improve access to the single market. Entrepreneurship would need to be developed by concrete policy initiatives, including a simplification of company law (bankruptcy, the status of private companies, etc.) and initiatives to enable entrepreneurs to restart after bankruptcy. This gives in particular small means to participate fully in the Single Market.

After going through old and new concepts about the company and its competitiveness, conclusions can be drawn are very simple: from small and medium enterprises has been a competitive power market, whose springs are less predictable, but requires that any business that wants to survive to develop into a feature some form of uniqueness. Ultimately, the only sustainable competitive factor is innovation, which in turn depends on the quality of human resources and management.

It is difficult to place small and medium enterprises in domestic and foreign competition because they are less developed than in other transition countries. Their contribution to the growth performance of the Romanian economy is still needed. The influence is mixed, both negative, by the superior concurrence, the increase of the turbulence of the businesses environment, and positive, facilitating the access at new markets of provision and sale, the acceleration of the know-how transfer, the access at new technologies, partnerships and strategic alliances at international level, etc.

The full potential of the SME sector contributing to employment growth and competitiveness policy requires consistent and favorable development in general. In some moments, it is necessary for the state to intervene to offset the adverse consequences of market registered small businesses. A condition for the success of Romanian SMEs is that those who decide its fate to look into the future, not past.

A Critical Approach to Hofstede's Model on Cultural Dimensions

Ploae Catalin

Ovidius University of Constanta, Romania
catalinploae@gmail.com

Abstract

Hofstede's model on cultural dimensions to explain cultural difference has been widely used for exploring different aspects of culture, from management to educational settings. Based on his research from the beginning of 1970, Geert Hofstede created a new paradigm for the study of cultural differences, meaning a model of national culture on four dimensions, later expanded and updated on the basis of an analysis of other cross-cultural data and on the extrapolation of the model. Following the penetration of the model in the scientific community, it became a cornerstone for cross-cultural research, providing a popular method for the study of cultural differences in a wide range of disciplines. In the same time, as with any idea or paradigm shift, Hofstede doctrine has also generated controversies, being both undervalued and overused (Peterson, 2003). The purpose of our paper is to conduct an in-depth analysis on Hofstede model, revealing an objective reflection upon the work of Hofstede by tracking various subtleties and exploring some of its limitations, postulating that seeking commonalities among existing models of national culture represents the way in which cross-cultural research is offered the possibility to advance. As for the methodology applied, the goal of the paper is achieved by analyzing the pro and cons of Hofstede's model and from the findings derived, by indentifying the keystones of a convergent widely accepted model.

Key Words: Hofstede; Culture; cultural differences; cultural model; cross-culture.

J.E.L. Classification: A12, B40, P40

1. Introduction

The cultural dimensions developed by

Geert Hofstede to explain cultural differences have been widely used to explore different aspects of the concept of culture. Based on his research in the early 1970's, Geert Hofstede attached a new paradigm to the studies on cultural differences, as a model of national culture, structured in four dimensions. Over the last decades, the model will undergo expansions and improvements, based on the analysis of the new data collected but also through the extrapolation of the model. It can be observed by analyzing the literature of the past thirty years, that through the introduction and the usage increase of Hofstede's the model among the scientific community, it has become the basis of scientific research in the field of interculturalism, providing a popular way of studying the cultural differences of vast disciplinary areas as well as inter-and trans-disciplinary areas. At the same time, as with any new ideas or other change of paradigm, the doctrine developed and exposed by Hofstede has generated much controversy, being both under-valued as well as used excessively.^[1]

The objective of this paper is to achieve a deeper analysis of the model put forth by Hofstede, constructed on the basis of objective reflections on the stated concept and following in this sense the various subtleties of the model, but also some of its limitations.

In terms of methodology, the objective of the research is achieved through pro-con analysis of the model and the derived results, by indentifying some basic principles of a widely acceptable convergent model, postulating that the identification of common anchors in existing models developed around the concept of national culture represents the path through which intercultural research could advance.

2. Hofstede's cultural dimensions model

The empirical basis of Hofstede's

multidimensional cultural model originates in the factor analysis of 116,000 questionnaires given to IBM employees in 72 countries in the early 1970's. Hofstede argues that most national differences in relation to values, beliefs, norms, self-characterization, as well as many other societal variables can be explained in terms of their statistical and conceptual association to four major dimensions of national culture. According to the theory developed, social interactions are culturally mediated and intercultural relations are inherently conflictual.^[2] The four cultural dimensions identified are power distance, individualism, masculinity and uncertainty avoidance.^[2]

In developing the model, Hofstede used constructed scaled indices to rank each nation within the dimension thereby achieving a „typology” of national cultural differences. This led him to argue that each dimension shaped behaviours in different social settings. Later, Hofstede added a fifth dimension – the short and long-term orientation towards time – in an attempt to „avoid cultural bias”.^[3]

It should be mentioned that in addition to Hofstede's model, the scholarly literature allows us to state that there are at least five national culture models that continue to be quoted and widely used in management research. We refer here to the models proposed by Kluckhohn and Strodtbeck, Hall, Trompenaars, Schwartz and House (the latter one suggesting the model known as GLOBE).

In this context, a brief description of the five dimensions of Hofstede's model is required.

The power distance dimension presents the differences between countries, referring to vertical interpersonal relationships, i.e. between individuals with different levels of authority on a certain hierarchical scale (social, organizational etc.). Small power distance countries are presented as exhibiting social relations developed on the egalitarian principle and interaction is thought to be independent of the society members' authority statuses ^{[2][5]}. In large power distance countries one can observe marked privileges and behavior or communication differences depending on the status of the individuals interacting.

Hofstede's second dimension – individualist –
collectivist dimension –

describes the power of the group over the individual. Hofstede defines collectivist nations as 'those where the group's interest prevails over an individual's interest'.^[2] This leads to a high integration: the 'in-group' protects the individual, in exchange for this protection the individual offers loyalty. In individualistic nations, the subject is much more independent of the 'in-group' which he/she is a member of, so that individual interests prevail in social relations.

The third dimension, masculinity-femininity dimension, is used by Hofstede to describe the polarization between gender roles in a country. Male and female roles represent the two extremes of a continuum that covers a wide range of issues, from the importance given to values such as success and possession (masculine values by definition) to the social environment and mutual assistance (feminine values).

The uncertainty avoidance/acceptance dimension measures how people from different countries are likely to 'feel threatened towards situations they perceive as uncertain, unstructured or unknown' ^{[2][5]}. This dimension is expressed socially in the need for norms (formal and informal).

The recently added fifth dimension was labeled by Hofstede the long-term orientation versus short term orientation. Long-term orientation 'stands for fostering virtues oriented towards future rewards' whilst short-term orientation stands for 'fostering virtues related to the past and present – in particular, respect for tradition, [...] and fulfilling social obligations' ^[3].

A comparative introspection allows us to observe within Hofstede's doctrine a series of conceptual features that confer a distinct identity and the status of paradigm shift in intercultural research ^[6]:

- Before the emergence of Hofstede's model, intercultural research often treated culture as a singular variable, the statistical differences identified between two nations or ethnical groups with no obvious cause were explained by using the cultural function. Empirically, it was considered that the cultural phenomenon is one sufficiently complex that its discussion as a whole would not represent the Solution of the decodification of statistical data. Hofstede's model is the first to highlight the need for an approach

on culture using distinct variables, through the use of the cultural dimension.

- The cultural dimensions of Hofstede’s model were constructed on a national level, being supported by correlating variables not on individual or organizational level, but on a national level. In fact, the dimensions discussed lose their meaning and content if they are used as individual descriptors or in relation with individual differences, because the variables they define do not relate to on an individual level, but on a level of national group. In consideration to these findings, Hofstede argues that the use of the culture notion in relation to the notion of nation or organization is faulty, a nation not being an organization and the two types of culture are different in nature ^[7]. The organizational culture consists primarily of organizational practices, being more superficial.
- Counter-arguing the critiques concerning the viability of the data collected and processed forty years back, Hofstede sustains that the dimensions of his model reflect stable national differences, thus defending the opinion according to which the cultures evolve, but in their evolution they tend to move together in the same cultural direction. To validate this hypothesis, the results of the study conducted by Inglehart in 2008 ^[8] can be presented. This study consists of an analysis of the empirical data gathered from countries in West Europe between 1970 and 2006. The results show the fact that while the cultures of the countries analyzed have evolved during the time period referenced and have shown a tendency to underline even an incomplete convergence, at least at the level of subjectively selected variables, the cultural pattern has not shown alterations during the 36 years of observation.

3. Critique of Hofstede’s notion of culture

Our analysis concerning the problematization of empirical identified inconsistencies of Hofstede’s model would not be thorough without approaching from the beginning Hofstede’s vision concerning the notion of “culture”.

Culture is conceptualized by Hofstede as

“the collective programming of the mind which distinguishes the members of one group or category of people from another” ^[5]. His definition outlines three inherent characteristics:

- By referring to culture as collective programming he is emphasizing its social nature whereby culture is a social product, formed, nurtured and shared by a group.
- By defining it as a ‘software’ of the mind, he underlines culture’s effect on our cognitive processes. One processes information and acts depending on our cultural software.
- Given the character of social product of culture, there will be as many cultures as there are social groups or systems. At an individual level, this implies that a person is likely to have different cultures, at least as many as the number of social groups to which they belong. This is referred to as ‘layers of culture’ ^[3].

Hofstede appears to overlook the innate ‘fuzziness’ of culture. This is particularly evident in his notion of ‘cultural layers’, which postulates that an individual has clear and independent cultures or value sets, for each group he/she belongs to. Instead, we can not omit to evoke the complexity of one’s multicultural being by defining culture ‘as a fuzzy set of attitudes, beliefs, behavior and their interpretation of the meaning of other people’s behavior’ ^[9]. We understand this ‘culture haziness’ to be two-fold. First ‘group members are unlikely to share identical sets of attitudes, beliefs and so on but rather show family resemblance’ ^[9]. Second, we propose that there is some overlap between one’s different cultural sets, which allows us to act socially. This merger occurs at both micro level (individual) and at macro level (society). Hence, the concept of layers, which metaphorically can be represented as separate coats one wears and one takes off one by one, may not be adequate and instead one’s multicultural being is better symbolized as a single knitted coat with different types of thread.

Another ontological assumption in Hofstede’s definition of culture is its depiction as a relatively static concept, particularly regarding values. Hofstede describes culture through an onion metaphor

and states ‘culture change is slow for the onion’s core, labeled values’^[3]. Contrary to this, Spencer-Oatey’s^[10] emphasis is on the mutable nature of culture. Hofstede’s description emphasises a one-way relationship between values and social structures. Spencer-Oatey^[10] in contrast argues for a systemic notion of culture, which stresses the interdependent relations between all elements of culture, for example, ‘the introduction of a single technological innovation may set off a whole series of related changes. In other words, culture changes beget other cultural changes’^[10].

Similarly, Neo-Vygotskian theorists stress the interrelationship between tools, the individual’s activity and other elements of culture emphasizing the two way process between individual/group activities and possible cultural changes. This bi-directional relationship between values and other components of culture challenges the capacity of Hofstede’s model to reflect contemporary values: particularly in those countries where radical political, social and educational structural reforms have occurred after he collected the data. More generally, globalization and technological revolutions such as the internet and mobile communication are having effects on nations, work forces and educational systems^[11].

Although Hofstede makes reference repeatedly to the concept of ‘in-groups’ to differentiate between the nations with collectivist character and individualistic nations, he fails to give a definition of these groups. While Hofstede describes the group dimensions as being either collectivist or individualist, Spencer-Oatey^[9] makes reference to the notion of one’s responsibility towards the collective group, although the group’s nature may vary from a culture to another. For example, an argument can be made that a highly philanthropic and voluntary culture such as the American culture represents a manifestation of collectivist values. On the other hand, social security regulations in some of the so-called collectivist countries are significantly deficient; therefore one may argue that the respective collectivist behavior is not just an expression of one individual’s belief (value) that he/she depends on his/hers family, but a real necessity based on socio-economical factors.

These examples illustrate that individual interests are congruent to collective interests and vice-versa, making the classification of a society as being either individualist or collectivist difficult. Moreover, these examples reflect the complicated relationship between values and social structures. Finally, considering the case in which the collectivist character and one’s interest are expressed differently in each culture, a single measurement seems to be an impossible endeavor.

As highlighted before, Hofstede does not acknowledge particular organizational cultures within national organizations. To counter-argue, we can bring into focus the educational system and show that different schools, ranked differently according to prestige, regularly exhibit different student behaviors and it is accepted that understanding the school culture is important in understanding such differences^{[12][13]}. Cambridge (2006) proposes that the lack of significant differences between teachers’ cultural values in sample of international schools could be a result of similar organizational cultures. Findings from Higher Education research show that the particular characteristics of the educational setting and the nature of the relationship between tutors and students, among other factors, are also influential in international students’ experience of British PhD courses^[14]. Additionally, there are a range of studies that recognize the existence of specific Higher Education micro-cultures. (to see for example, Mayor&Swann, 2002).

Hofstede repeatedly emphasizes cultural differences and not commonalities. Nevertheless, there are many instances within his model where for example an Eastern country’s cultural dimension coincides with that of a Western country. In this context, we can suggest that an emphasis on commonalities can better explain how becoming bicultural is possible.

4. Conclusion

We have argued that there are several problems with applying Hofstede’s model of culture:

- equating ‘culture’ to ‘nation’ is highly problematic;
- Hofstede’s model does not take into

account the flexible and changing nature of culture and his model is not able to reflect culture changes in the new global context;

- Hofstede's sets of information were used excessively in relation to time and space, ie Hofstede collected data in IBM offices in 1960 and 1970, and not in the evolutionary dynamics of human communities in the early 21st century.

Considering the identifiable shortcomings of Hofstede's model, we would like to suggest alternatives to his model, not as a substitute model, but as a set of suggestions for the assessment and research of cultural and intercultural learning in specific frames.

We argue that the notion of culture can not be reduced to such immutable concepts as nationality and other regional geopolitical constructs. Instead, support the opposite approach through the analytical approach of micro-cultures.

This approach would allow the development of models of reduced amplitude, which can be gradually extended to larger models revolving around cultural and intercultural relations. From this perspective, we consider culture a flexible and dynamic concept. In this respect, we take note to the need for a clear differentiation within the framework of scientific research on the concept of culture, and in intercultural, multicultural and cross-cultural research.

It is obvious that a critical approach to any other model mentioned at the beginning of our analysis would lead to the outlining of further inconsistencies. A study of convergent and divergent points of these models, conducted in 2006^[4], leads to the conclusion that the most widely used cultural models focus on different aspects of societal beliefs, norms and values, so that often convergence of these models is limited. The absence of this convergence is problematic for both researchers in their quest to study cultural differences and management practitioners in their quest to understand and adapt to new cultural environments.

The absence of convergence of the models brings us to suggest five main themes emerging of the six models set out, approach that allows the integration of the convergent aspects and thus to strengthen the utility (and possibly the validity) of the existing models. Thus we propose the following five themes:

- Relationship with the environment;
- The social organization;
- Distribution of power;
- Orientation in relation to rules;
- Orientation in relation to time.

At first glance, these five themes seem to replicate the five dimensions of Hofstede's model, but at closer scrutiny, one can observe that the other models are used to amplify, clarify and in some cases reposition the dimensions so that they have an increased relevance in a contemporary context.

Identity and Economics: Review of the Literature

Ploae Catalin

Ovidius University of Constanta, Romania

catalinploae@gmail.com

Abstract

Classical economic theory has evolved over the last fifty years in the way that economists have abandoned the exclusive consideration of the only two market structures (perfect competition and monopoly) and the assumptions that all participants from one market have the same information as the others. Today, the economists are addressing deviations from the perfect rationality of homo economicus, such as the preconception of the present moment, formation of the behavior and aversion to loss. Economists describe the motivation in that the individual has a "utility function", which is a numeric value attached to things important to the people. The economic theory of identity, formulated by George Akerlof and Rachel Kranton^[1], follows the progressive tradition in economics. In this paper are highlighted the theoretical foundation of the economic pillars of identity (the economics of identity) and the main areas of human activity where the theory could be observed.

Key Words: economics; identity; norms, social categories.

J.E.L. Classification: A12, B40, P40

1. Introduction

Classical economic theory has evolved over the last fifty years in the way that economists have abandoned the exclusive consideration of the only two market structures (perfect competition and monopoly) and the assumptions that all participants from one market have the same information as the others. Today, the economists are addressing deviations from the perfect rationality of homo economicus, such as the preconception of the present moment, formation of the behavior and aversion to loss. Economists describe the

motivation in that the individual has a "utility function", which is a numeric value attached to things important to the people. The economic theory of identity, formulated by George Akerlof and Rachel Kranton^[1], follows the progressive tradition in economics. In this paper are highlighted the theoretical foundation of the economic pillars of identity (the economics of identity) and the main areas of human activity where the theory could be observed.

2. Review of the literature

Identity can account for many phenomena that current economics cannot well explain. The issue of identity of individuals has been a major difference between Continental European and British theories of economics in the 19th century. Many continental theorists have presupposed that there is a cultural and historical specificity of economic behavior.

The main argue between Marxian economics and other approaches referred to the question of endogeneity of identities. This question was conceptualized by the notion of "class" in Marxian economics. A class defines a "set of agents with similar behavioral patterns and structural roles in the economic systems"^[4]. From this definition emerges the notion of "class consciousness" as a "peculiar expression of this identity, which might also enable those agents to collective action directed at changing the system"^[4]. We could mention also the theory provided by Marx and Engels regarding the endogenous formation of the identity, taking into consideration that the evolution of technology engenders changes in the structural relations among classes which ultimately lead to changes of identities in the sense of their reflection in cultural and ideological frames (i.e. the claimed creation of the "new man" of the communist ideology).

The Marxian materialist position is just an

extreme side of the issue. On the other extreme side we find the works of Max Weber, whose approach elaborates on the issue of the cultural formation of economic systems and the process of “rationalization” of the Western European world is seen as being a change of identity of individuals, and the Calvinist entrepreneur represent the historical prototype of a new kind of individuals.^[4]

The scientific approaches regarding the identity has been re-discovered in economics in two contributions by Akerlof and Kranton^[1] and John Davis^[3]. We will focus in this paper on Akerlof and Kranton approach which is basically about the social identity of individuals and the set up of a classical utility function, which just includes identity as a variable.

3. The definition of identity upon Akerlof and Kranton theory

The Akerlof and Kranton definition of identity is built on notions of taste and preferences as we can find them in the standard neoclassical view.

There are three notions that are used by Akerlof and Kranton in order to define identity: norms, situation and social category.

The first, meaning the *norms*, have been described by Vilfredo Pareto, “who noticed that much of utility depends not only on what economists normally think of as tastes, but also on norms as to how people think that they and others should behave”^[2]. Following Akerlof and Kranton, the Pareto’s conception introduces very little change in economics until it is combined with another notion, meaning the situation: the way people should behave depends upon the particular *situation* – that is, when, where, how and between whom a transaction takes place.^[2]

The third notion is the *social category*, which is used to describe types of people. Researchers argue that social categories matter to behavior because people often think of themselves in terms of social categories^[2].

Therefore, we can state that norms as to how an individual and the other individuals should behave vary with their social category and the situation.

Therefore, following Akerlof and Kranton^[2], we can use the term identity to describe:

- A person’s social category;

- A person’s self-image, capturing how people feel about themselves as well as how those feelings depend upon their actions;
- Gain and losses in utility from behavior that conforms or departs from the norms for particular social categories in particular situations.

In Akerlof and Kranton’s conception utility functions can change, because norms of appropriate and inappropriate behavior differ across space and time^[2]. This approach seems to be a break with classic economics where utility functions are fixed. And this approach also seems to be validated by the psychologists, who consider that people can internalize norms.

The individual maximises the utility function, that specifies the social norms and preferences or tastes of the same individual.

The individual – in absence of the others – are gaining a benefit comparing to his utility of identity, when he adheres to the norms of the category he belongs to. This gain of which the identity utility benefits from may represent the pleasure of the people feel when they do something that helps them integrate into a group. This more vast perspective on the utility of identity corresponds to the interactionist perspective of identity, promoted by sociologists and anthropologists, by which identities and norms are deriving from the social interactions and power relations. The people that belong to groups or classes adopt different common signs to differ from the others from other groups or classes.^[1]

The Akerlof and Kranton analysis could underline the dynamics between individuals and groups, presenting the way one activity can become the defining norm of the group.

4. Conclusion

Identity is useful to economists because it suggests a natural way in which behavior can vary within a population. And this is because identity corresponds to people’s own self-classifications and also to their classification of others.

Identity is also useful because the concept could lead us to conclusions on how behavior should vary across types. There is empirical evidence for the statement that particular norms for behavior are associated with the

notion of social categories. This behavior is often described in sociology by pointing to ideals, which are real or imagined characters who personify how someone in a given social category should behave ^[2]. Therefore, in terms of utility, we can observe the fact that an individual, that considers himself as a member of a given social category, could lose utility if his behavior differs from that of the ideal. We could also notice that the same person could lose utility even when he considers that he failed to live up to ideals.

The combination of identity, social category, norm and ideal allows parsimonious modeling of how utility functions change as people adopt different mental frames of themselves – that is, as they take on different possible identities^[2]. Identity describes one special way in which people frame their situation.

Performance Indicators in Museum Institutions from the Three Es Perspective (Economy, Efficiency, Effectiveness)

Abstract

For many organizations, such as museums, the lowest profit line, frequently used as a last performance test, does not exist.

In these cases, both the financial performance and the impact of the services are difficult to measure. Still, it is important to know if all the museum resources are properly assigned and if these are used in such a way, so as to offer the maximum effect.

Keywords: management, museum, economy, efficiency, effectiveness.

Classification J.E.L.: M 16

1. Introduction

Museum managers request information about efficiency and effectiveness if they have to evaluate the performance of their organization. This information is insured by the performance indicators; without it, the managers risk assigning the resources “in the dark”. Museum managers will not know how to compare their performance with that of similar museums, or how their own performance will change in time. Without this information they won’t know when the diagnosis of their current management practices is necessary.

2. The evaluation of the performance

The evaluation of the performance contributes to a number of activities of the manager:

* supports the information and implementation for the policies;

* supports the planning and budget of the services and the supervision of the implementation of plan changes;

* helps improve the standards of the service content and the efficiency of the organization;

* helps approach an efficient use of the resources;

* is used to increase the control and influence on the decision-making process.

Performance measurements improve the management practice, insures essential information so that the management can monitor the activities on some grounds, on certain levels of the organization. Performance measurements also insure information for the post-mortem strategies, when the policies, management practice and methods are evaluated.

Managers want the best features of the performance measurements to be [2]:

- a) The ability to make comparisons between the current performance, despite the targets, despite the performance of the prior period, or despite the performance of some departments or similar programs;
- b) Ability to underline the interest areas and relevant questions to make;
- c) Ability to insure a vast overview of a service;
- d) To identify trends over time;
- e) To develop the notes of local branches, norms and targets.

The use of performance measurements is thus, an essential management tool. The measurement of performance provides the information requested by the managers in order to improve the performance of their organization. Still, some see performance measurements as being exclusively in the context of improving managerial control. The

information is a means to exercise control; performance measurements can and should be used in such a way, but in order to focus on control aspects they must be confronted with the risk that the performances be seen with suspicion and unwanted answers be invoked at their introduction. There is a more positive aspect of using performance measurements, that allow the possibility of organisational learning. If the current performance drops below the preset targets, then the management may answer one question “Why has this drop occurred?”

A public organization, such a museum can be seen as a system that is depended on its resources, depending on its relationships with the external environment. The public sector museums are quite dependent on their relationship with central sponsorship and the local governmental departments. Private museums, and non-profit ones depend on their location, private sponsors and benefactors. It is certain that the system with mixed public and private financing that currently characterizes the museums in Great Britain, involves a complex knitting of resource-dependent relationships. This means that there is a large number of different constituents whose interests will, at some point or another come into conflict with one-another. The management has the task to chose which interest to serve at the expense of others, or to look for a reconciliation of interests. All the constituents will want to be satisfied receiving an added value for money. The performance is thus evaluated through money for value (VFM value for money).

Museums, like any other organizations, use their resources to purchase from suppliers (work and capital, buildings, materials) in order to produce or insure the services required by the clients/consumers. The value for money framework closely examines the performance of museums in terms of the relationship between the resources of suppliers and service production, and at the same time, tries to ascertain if the service production insures or not the values for the various constituents of the museum.

3. The 3 E: economy, efficiency and effectiveness

There are 3 fundamental elements within the value for money framework that are

usually referred to as „The 3 Es”. These are economy, efficiency and effectiveness [4].

Economy deals with the lowering of the costs of the used or purchased resources, taking into consideration the quality of the suppliers as well. In short, economy refers to spending as little as possible.

Efficiency deals with the relationship between the production of goods, services and other results and the resources used for their production. How far can you go with a maximum production output for some given suppliers, or the minimum number of suppliers for a given production?

Effectiveness deals with the relationship between the results to be achieved and the actual results of programs and services. How successful is the production of goods, services and other results achieved through the objectives policy, the operational targets and other intended results? In short, effectiveness refers to spending wisely.

The examination of the value for money framework in museums may cover some or all of the following aspects:

1. Presentation, contract, control procedures plan used for the construction of the work capital; purchase of the procedures used for material purchases. This will offer the management information whether the purchase action is carried out for the best possible prices or not, in agreement with the wanted quality of the suppliers (economy).
2. The use of facilities, assignment of staff and mix, service integration; maintenance, management and system of resource assignment (efficiency)
3. Consumer satisfaction results, improved educational value; increased awareness of the national cultural inheritance (effectiveness).

Museum managers must also include the maximization of added value to their objective. The value for money framework proves if they are able to reach these objectives.

It is clear that some of them, who come from a non-managerial culture, will change the value included in the norms above, because the managerial objectives could be threatened by such an approach. A moment of reflection should tell us though, that the value of museum professionals can be in

agreement with managerial values. This is not a denial of the fact that the approach is not without flaws, that will be explored in detail in this paper.

The added value is just the difference between the value of the museum suppliers and the production.

The decrease of the suppliers' value is a relatively direct task for the managers who look for an increase of the added value. It is an exercise of minimizing the costs and restricting the budget. Still, both parts of the equation are not met. A very zealous attempt to contain the costs may turn into a reduction of the quality of the production (services) with the result that the value of that production will also decrease. More attention should have been paid to the evaluation of the services for the public.

There are two dimensions of the value for money framework. One that stresses the lowering of the costs for the suppliers: no matter the resulted service, it should be produced with minimum costs in agreement with the quality requirements. The other dimension, that is most often forgotten, requires that the produced service, be evaluated by its users. There is a rationalization in the production of thing with minimum costs, if nobody wants that given good. The value for money framework places the value of the consumers back in the managerial decision on the determination of the level of services, mix or quality. Obtaining information about consumer preferences and the evaluation of their service list does not exist as an independent task.

In case of museum services, many – perhaps most consumers- know nothing about that given service. A buyer-focused management will still try and find out what the buyers think about the delivered services. Instead of taking an attitude, a service focused on the consumer will approach a problem in more ways, paying attention to the need to train the public and evaluate aspects of their cultural inheritance; in order to find out what consumer think is attractive; to learn why some visitors come to museums while others don't. This requires performance indicators on using the service and is an example about how performance indicators can be used for organisational learning.

In an interesting paper, Ames [1] stresses that the performance measurements and the use of performance indicators is an area that is underdeveloped among museum people. He then starts to suggest a series of indicators that might be used. In Great Britain, the Audit Commission has also made an attempt to define the basic performance indicators for local museum authorities (1986). Some of the indicators suggested by these two publications are now present in the value-for-money context, along with suggested indicators.

Cost indicators (economy)

- * Gross services' costs
- * Gross costs for the visitors
- * income to gross costs ratio
- * preservation/custodial expenses
- * operational costs per visitor
- * level of resource

These indicators will include the index of income resources, capital resources, equipment and buildings. Examples of resource indicators may include:

- * the number of staff on payroll
 - * the ratio of the administrative staff reported to the operative staff
 - * square meters of the buildings
 - * ratio of the square meters assigned to specific activities and the total available area
- Fund sources indicators
- * public ratio in total income
 - * ratio of total income generated by the market in total income
 - * ratio of the income generated by various sources in total income
 - * volume of services

These indicators are a clear sign for the request of a service:

- * number of visitors
- * number of visitors per day
- * visitors' trend – total number of visitors in the current year reported to the average number of visitors in the last 3 years
- * number of exhibition days per day
- * number of visit hours per day
- * the use of collections; rate and total number of exhibited objects reported to the number of objects from the collection
- * Productivity indicators (effectiveness)

The productivity indicators are available for the museum as a whole, or for the specific departments of activities in the museum:

- * Energy efficiency – rate of costs with the energy for the total square meter area;

- * Gross income per visitor (income from the entrance tax, shops, food, parking, etc);

- * marketing efficiency – ratio of the changes of the marketing budget for the total changes for entrance or the total changes of the incomes from the entrance;

- * Shops efficiency – ratio of sells per square meter or per buyer or visitor;

- * Fund collection efficiency – rate of cost changes for the fund;

- * percentage of documented collections;

- * percentage of the budget assigned to preserving activities

Service availability (equity)

- * low availability of income – ratio between the available hours per day from the total available hours during the week for a duration of minimum 3 years for the public sector;

- * Minority visitors – rate of the annual presence of the minority, in the total presence;

- * General availability – average of the number of ours during which the museum is opened: per week or per week, but in an interval other than from 09:00 to 17:00 from Monday to Friday;

- * number of used lessees;

- * Number of used lessees from the total number of users;

- * number of users from the target groups, as percentage between the total number in the target group.

Quality

- * Exhibit safekeeping – ratio between the number of ordered exhibits and total number of exhibits on the move;

- * Number of complaints from the users;

- * Staff expertise – rate of the expenses with the training of the staff to the total number of staff (equivalent to full-time jobs).

Production indicators (effectiveness)

- * results of the polls regarding consumers’ perception, etc.

The list of performance indicators is nothing more than a suggestion. It is neither prescriptive, nor exhaustive. Given the statute of art of measuring the performance in museum-related services, any performance indicator needs to be tested in order to establish if there is sufficient data for it to be calculated; the usefulness of the information given by the management scopes; and the costs of the purchase of information, in relation to its usefulness.

The performance indicators are themselves less interesting or valuable. The content of the information in the in the indicators is useful only if it is used for a future comparison with something. This can be a set of indicators from different museums that offer a similar variety of services, or it can be the value of a single museum, the indicators from a previous year. The variation of the indicators between similar museums, or between different years can generate questions regarding the variation in itself.

Another way the indicators are used is setting some purposes and values for them. If the current execution is lower than the objective, then a diagnosis is necessary in order to find out why this has happened – could it be that an unexpected event that hasn’t been taken into consideration by the management control has caused this deviation?

Jackson [3] considered some criteria that can be used in order to judge the usefulness of the performance indicators.

Consistency. The definitions used to produce the indicators must be considered over years and units.

Comparability. Coming from the consistency requirement, it is the only reasonable for comparison.

Clarity. The performance of the indicators should be simple, well defined and easy to understand.

Controllability. The performance of the manager should be judged (measured) only in the areas where he/she has control.

Contingence. Performance is not independent from the environment where decisions are made: this includes the organisational structure and the adopted management style, as well as the complexity and uncertainty of the external environment.

Coverage. Do the indicators reflect those aspects of the behaviour that are important for the decision taking management?

Limitation. Focused on a limited number of key indexes of performance – that hat have the highest rate of amortization in terms of valuable management information.

Relevance. Many applications require specific performance indicators, relevant for their needs and conditions.

Feasibility. Are the purposes based on which predictions are made, realistic? Can

those targets be reached through reasonable actions?

It has already been discussed that performance measurements are managerial innovations in museum services. The exercise of initializing a performance revision needs a strong hand at the top of the organization. It needs a partnership between various constituents, between the senior manager and the manager, the cooperatives and in case of the museums from the public sector, between the management and the selected members. Without this unity of purpose, that is the basis for establishing a partnership, the efforts will be detoured towards debates on the usefulness of the performance and not on a revision of the business.

A strong management is needed to bring the “cultural change” in the organization. This is essential if we want the performance revision to have the desired effects. Cultural change means a change of the belief and value system that the top-management team of an organisation like a museum guides its activity. This usually involved a change from the ethos of one reactive administration (the administration of museum collections) to a more pro-active management of the organisation, that places the needs and interests of the consumers at the centre of the decision-making process and that judges the success and performance in terms of consumer service, through the value-for-money framework. Indeed, a part of the needed cultural change means accepting the new language of the value-for-money audit and the idea of some consumers who have preferences, instead of being passive users.

The message of the cultural change had to be transmitted in the entire organization, from the top to the bottom. It needs the setting of a total organisational dedication. From time to time it has been proven that individuals performed better, with regard to their contribution to the operations of the organisation, if they knew in which way their activities are connected to the work of the entire organisational team. A sense of attaining this, is that it insures that the objectives of each position are clarified and notified and translated specific results and performance predictions on all levels of the organisation.

Bringing cultural changes into an organisation is easily attained through an organisational development program, in which training plays an important role. This will divide the ethos of the high performance of the organisation, and at the same time, it will give the staff the needed skills and experience to reach these improvements. An increase of the performance needs, in most cases, a reorientation of the current practices, which in turn require a new set of expertise.

In many cases, the new information, and the value-for-money audit that will generate the data for the performance indications will require negotiations. Some managers will need buying and negotiation skills. A top-to-bottom approach, in which the above mentioned be introduced in the new system, is doomed to fail. In order to successfully operate within the value-for-money framework, data is necessary in order to build the performance indicators, and the organisation will issue data of the required quality if the organisational environment in which the new system is to be implemented, is in good order. If they introduce a threatening trend, that stresses their use as a managerial control instrument, then it is less likely that the cooperation will work properly. On the other hand, if they are presented as a type of organisational learning, then cooperation will probably be a success.

If sufficient resources are not assigned for the purchase of new abilities on all levels of the organisation, the improvement of the performances will be at risk. The new management informational systems involved in the value-for-money framework are needed, but are not sufficient to increase performance. These information systems will be of use only if the managers of the services will know how to use them efficiently.

The first stage in any performance revision exercise is the clarification of the strategic and corporative objectives for each organization. In these objectives, which in part define the effectiveness dimension- the effectiveness indicators prove the degree in which the organization has managed to reach its strategic objectives. If the corporatist objectives are not clearly denounced, there is a high risk that the organization be under-optimized. Even if the constituent elements of the organization meet their operational

objectives, if these are not clear regarding the way their actions will contribute to the corporatist objectives, there is no guarantee that these strategic objectives will be reached.

4. Conclusions

While the more general level of the strategic objectives in any organisation is the increase of added value, the subject of constraining the quality of the process due to the fact that the added value is acceptable, becomes a statement too abstract to put into practice. Going further, some problems in defining the added value have already been presented. The strategic objectives need to be more concrete if they have to be translated into operational objectives.

Examples of corporatist objectives of the museum are included in the following list:

- * to properly meet the request for its services;
- * to insure services of the best quality;
- * to develop services according to the request;
- * to take care of all statutory debts;
- * to maintain all taxes at tolerable levels;
- * to look for new financing sources;
- * to assist individuals and specific groups for potential development;
- * to be a good and careful employer;
- * to develop a performance-oriented management style;
- * to encourage the concern for the general public of visual art and crafts and the local and national, cultural or scientific content;
- * to make sure there are clear policies for the management of collections and targeting of users;
- * to provide special events and exhibitions regarding the declared policies;
- * to make sure that the background and quality of the presentations are attractive from visual point of view and of high standards;
- * to make sure that the facilities are used within the limitations of the policies;
- * to supervise the protection of the primary evidence of local and national history, natural history, as well as to increase the care regarding this subject.

The Economics of Inner Well-Being: Holistic Personal Development Between Lucrative Opportunity and Mass Human Awakening

Popovici Veronica

„Ovidius” University of Constanta, Faculty of Economic Sciences

verovnp@yahoo.com

Abstract

This paper explores the recent trend of holistic ideas and self-development practices from two different angles: that of a very profitable business opportunity on one hand, and that of a large-scale, societal transformation at the spiritual level on the other. As our quest for happiness never ceases to amplify into a real social phenomenon, fuelled by inner desires as well as external pressures, a whole new market place for personal development products of all kinds emerges with it. The multi-media and publishing industries are flourishing on the accounts of billions of consumers worldwide, who give in to one seductive promise or the other in an everlasting race of becoming the best versions of themselves and who nowadays are so easily reachable through the internet. Is this a legitimate offer following the perfectly natural demand of our evolved society, whose primary need has become that of self-actualization? Or is it an opportunistic way of responding to this mass human awakening tendency, more and more noticeable in recent years? In a daring analysis at the borderline of business, psychology and sociology, this article aims at revealing interesting arguments from both sides of the story.

Key words: holistic personal development, positive psychology, happiness industry

J.E.L. classification: Z10

1. Introduction

Departing from the general idea of inner, holistic well-being, but from the strict point of view of the individual, we can honestly state that our modern society has become very loyal to the cult of happiness. After all, this mysterious condition is what everyone is looking for, the universal dream we all want to transform into reality. Personal quest for some, genuine dictatorship imposed by social norms for others, people are ready to make any effort enabling them to foresee the light of happiness. As anything worth having, this state is not an easily attainable one, there is no recipe for success because we are all so different and there surely isn't a clear pathway towards it.

For this reason, maybe, we are able to talk nowadays about happiness taking the leap from a very intimate concept to a selling product, largely exploited by our consumerist society. It seems like we are bombarded from all sides with a plethora of offers and solutions meant as an answer to any sort of personal problem or inner longing, from how to lose weight, stop smoking, improve your brain's capacities up to, for example, getting initiated into the art of meditation. And so on and so forth, the list could go on forever. We are to choose from a multitude of personal development therapies and methods usually wrapped up into books, seminars, conferences, work-shops, articles or all sorts of multi-media products, nicely pushed forward especially by the power of advertising, celebrity endorsement and personal branding of experts.

Nevertheless, all these things did not appear out of nowhere. There is an important demand for personal development products in general, which accentuated tremendously over the past couple of decades. In order to achieve a complete understanding of this entire phenomenon, we will first look into the socio-psychological aspects causing this increasing obsession for holistic personal

development among the individuals of the 21st century. In this sense, positive psychology – a fairly young science and the newest branch of this field - seems to clarify many interesting things by simply studying the psychological conditions necessary for us to reach a state of fulfillment.

Further on we shall expand on how this inner impulse towards personal betterment of the majority among us has led to the emergence of a new lucrative sector. A myriad of business opportunities gathered together under what we could call a “happiness industry” have found a fertile soil especially in western, developed economies, within culturally individualistic societies. Holistic personal development refers to a whole life, where continuous improvement is sought after in all three main dimensions of our existence: body, mind and spirit. This way, the happiness industry has become a sub-part of different other traditional industries like multi-media, publishing, beauty or medical industry. Nothing wrong in all that, except when there are people trying to take advantage of this trend, ending up in harming the innocent, naïve consumer. There are many voices attacking some of the personal development products in the market place today as, without a clear framework and proper legislation for this sector, everyone is potentially at risk.

After analyzing the causes and manifestations of this phenomenon, our goal is to closely look at the criticism brought to the happiness industry at large and see what conclusions can be drawn out of that. Last but not least, we are asking the question if, in spite of all the criticism, the existence of all these personal development products out there can lead to more good than bad in the end, as maybe for the first time in history humanity is truly preoccupied with continuous, conscious betterment from within. Are there serious arguments in this sense or is it just a vain hope that all the resources coming into play when talking about happiness industry are not simply wasted in a money-making exercise?

This article is set to find complete, researched answers to all these questions. But first things first - let’s understand the real premises of holistic personal development.

2. The need for personal development: psychological and socio-cultural factors

There are many factors influencing our insatiable appetite for self-improvement. In a very thorough analysis of what she calls the rise of “mind-body-spirit” or MBS publishing, Elisabeth Puttick (former editorial director of Thorsons at HarperCollins, the largest MBS imprint in the UK) admits to the complex causes of why the market for MBS products has known such a rapid growth. Extrapolating the MBS market to the holistic personal development market, we cite what we believe to be the most relevant factors outlined by Puttick (2005) as leading up to such considerable growth:

- “growth of holistic thinking and approach throughout culture, e.g. in religion, science, medicine, computers, education, psychology, business, gender relations;
- post-scientific, post-secular search for meaning and purpose;
- globalization bringing increased interest in non-Christian spiritualities, particularly Buddhism and shamanism; it also increases the sense of personal smallness, helplessness and alienation, shifting the emphasis from the political to the personal – from changing the world to changing oneself;
- shift from organized religion towards organized spirituality;
- influence of US trends (therapy culture, individualism that encourages self-development, greater interest in religion and spirituality)”.

To all this we could also add an argument derived from Maslow’s hierarchy of needs (1943), implying that, in a modern society whose material and safety needs are largely satisfied, it is only normal we start exploring higher needs, such as the need for self-actualization. Sticking with Maslow, we also remember his ideas regarding what he called people with “B-Cognitions”, where the B stood for “being” as opposed to “having”. It may just be that all the time we spent chasing success (and all the pragmatic things it implies) have led us to a long-awaited realization that inner values nourishing our

souls are worth much more than any worldly or imagined possessions.

Moreover, in addition to all this, what we believe to have played a crucial role in the growing interest for holistic personal development practices is the increasing scientific evidence that our connected attitudes and beliefs come from our very fabric as human beings. In this sense, one of the newest sciences out there – positive psychology – has gained incredible momentum and success, starting in the US with the research efforts of Martin Seligman and being disseminated worldwide in a matter of years. Together with his colleague Mihaly Csikszentmihalyi, he was expressing his conviction that “a psychology of positive human functioning will arise, which achieves a scientific understanding and effective interventions to build thriving individuals, families and communities” (Seligman & Csikszentmihalyi, 2000). This field is founded on the belief that people want to lead meaningful and fulfilling lives, to cultivate what is best within them, and to enhance their experiences of love, work and play. Its merits lay primarily in the fact that it brought our pursuit of happiness under the scientists’ magnifier, taking theoretic psychology from studying and treating psycho-pathological illnesses to also studying and understanding “normal” persons and what determines their happiness.

With its three central concerns: positive emotions (contentment with the past, happiness in the present and hope for the future), positive individual traits (the study of personal strengths and virtues) and positive institutions (the study of general strengths that foster better communities), positive psychology makes it very easy for everyone to relate to it, hence its tsunami-like ascension. In his book “*Authentic Happiness: Using the New Positive Psychology to Realize Your Potential for Lasting Fulfillment*”, Seligman (2002) explains how happiness encompasses many different emotional and mental phenomena, delimited in three overlapping areas of research:

- The Pleasant Life = “life of enjoyment”, or how we savor positive things and emotions that are part of normal and healthy living;

- The Good Life = “life of engagement”, or the benefits of experiencing states of *flow* and *mindfulness*;
- The Meaningful Life = “life of affiliation”, or how contribution determines a positive sense of well-being, belonging, meaning and purpose.

Looking at this theoretical conceptualization we understand why everyone relates to positive psychology. It encompasses the study of ancestral emotions and values generally valid for our species, that we care for and pursue beyond any social, cultural, political or economical segregation criteria invented by the human mind. Therefore it all seems like a forgotten language that everyone knows how to speak only in their hearts. So when it was finally revealed in an organized, palpable form and enjoying the legitimacy brought by its rise to the rank of science, the human soul rejoiced in finally being offered an accredited map towards fulfillment. This may very well be the missing puzzle piece explaining why we are all so drawn towards self-improvement and personal development products in general, and even more so in recent years. After all, these are just practical applications of positive psychology and, following our natural tendency of gravitating towards a holistic state of well-being, we have begun to explore and create an ever richer arsenal of such applications.

3. Happiness - a thriving but controversial business

For reasons briefly exposed so far, we can say happiness is more than ever taken very seriously. As Puttick (2005) puts it in the case of holistic personal development books, the success of the first mind-body-soul bestsellers from the mid ‘90s “demonstrated the demand – the market – for these types of books, which in turn stimulated the supply. The key players were now hungry for ‘product’, and began to pump it through”. This showed an incredible opportunity that needed to be seized immediately, that of feeding a new-born demand for a specialty niche and turning it into the fastest-growing non-fiction genre of the global publishing and multi-media industry. As a result, all the

methods and practices for holistic personal development that have been perfected over the past years and fed to the avid public, firstly as books and then taking advantage of any possibly existent channel, each with its own supreme promise of initiation into a world of abundant happiness.

It is difficult to estimate the real value of this ultra-competitive market, still in full boom. The most recent study we found on the market for self-improvement products and services is the 8th edition of the only available analysis of this market, elaborated by Market Data Enterprises in 2010 and concentrating primarily on US-originated products and services[1]. Going through this study we realize the actual extent of this \$ 10.5 billion market for motivational self-improvement programs, products or services that seek to improve us from a holistic point of view. It encompasses books, CDs/DVDs, videos, audio-books, infomercials, motivational speakers, multi-media packages, public seminars, workshops, retreats, webinars, holistic institutes, personal coaching, online education, websites, training organizations and more, covering major topic categories such as weight loss / exercise, business / sales skills, business opportunities / investing, improving relationships, general motivational and stress management.

Thus we realize that what may initially seem to be a nebula-like market place, it is actually a very segmented one, with every specialty showing different major characteristics, different past and provisional developments and most importantly different experts and champions.

The motivational speakers market is characterized by live events and an amplifying shift in product mix to webinars/online courses. It comprises also the corporate training market and it is dominated by self-improvement gurus / celebrities, who developed astonishing careers via personal branding and transformed it into a way of life. These are people like Anthony Robbins, Richard Bandler, Deepak Chopra, Stephen Covey, Dale Carnegie, Louise Hay, Napoleon Hill, to name only a few of the past and present giants in this industry.

The self-improvement books market, comprising also the so-called “New Age” bookstores, has its own stars as well. From

classics like Scot Peck’s *The Road Less Travelled* (1978) and Louise Hay’s *You Can Heal Your Life* (1984) to a perpetual bestseller like Paulo Coelho’s *The Alchemist* (1988), to titles consolidating this genre such as James Redfield’s *Celestine Prophecy* (1993), Daniel Goleman’s *Emotional Intelligence* (1996) or Eckhart Tolle’s *The Power of Now* (1997) and making room for major book phenomena that boosted the market: *Chicken Soup for the Soul* and *The Secret* (also a movie) again, to name only a few.

These two main segments may seem to take care only of the mind & spirit aspects of our personal development, but there is an entire offer out there leading us on the way to a healthy, faultless body. The biggest chunk of it is occupied by the weight loss market, responding to our fixation for fitting into this generation’s highly debatable norm of a perfect body image. The diet industry is like an enormous octopus expanding its tentacles into sub-segments such as: diet soft drinks, artificial sweeteners, health clubs / gyms, commercial and medical programs, diet drugs / pills, surgeries, fasting plans, low-cal foods, meal replacements, diet books etc.

And then there are products specifically designed to serve our body, mind and spirit simultaneously, directly answering the needs of our exigent, fast-paced lifestyle, like the very popular practices of yoga and meditation or the stress management programs relying mainly on relaxation techniques, biofeedback and massage therapy.

Absolutely everything that we mentioned so far is also available or marketed online, where the long tail of self-improvement products and services seems indeed infinite. Technological development made the internet an ever more democratized universe, opening the gates of online commerce and advertizing to established market players and those of independence and free-lance careers to the newbie’s of the industry. Moreover, the social media phenomenon sends traditional “word-of-mouth” on new heights and this is what truly makes or breaks a personal development product, even more so than in other industries.

Nevertheless, it becomes more and more difficult to navigate through the online ocean of offers, through all the promises of life

coaches, auto-proclaimed psychotherapists or spiritual gurus. And the vigilance of our collective wisdom is usually inefficient, as there are split opinions on most subjects. This market place is in soaring need for regulations, frameworks and standards meant to protect the consumer from fake experts and made up self-improvement methods with a purely deceiving, lucrative purpose.

In an apparently soft marketing exercise, based on the supposed intention of sharing and empathizing with the client, every coach says that his / her method has changed his / her life. Many of them are assumed to be normal people with no special skills or abilities (just like the clients upon whose credulity they are trying to build a business), who at some point in their lives had a breakthrough moment applying one self-improvement method or the other and who consequently decided they could teach that method further on for a living. Some skeptical voices assume these people to simply reiterate the concepts or methods of previously acknowledged experts, renaming and reorganizing content in an attempt to make it their own. Thus, all of a sudden, a new self-made expert in personal development is fabricated.

The certification problem is a serious one. Consumer protection authorities have no legal reference point when it comes to those willing to exploit this flourishing industry. You don't have to be certified in order to become a personal coach and in some countries it is absolutely possible to auto-proclaim yourself a psychotherapist. No wonder the general discontent with untrained people preaching diverse methods when it comes to holistic personal development.

Previously mentioned aspects, extremely accentuated by the chaotic hyper-online-market, built up a shady reputation of an otherwise very interesting and dynamic business area. It all makes up for a bazaar-like marketplace out of control, an economic jungle in which the consumer of self-improvement products finds it more and more difficult to make the right choices or to separate the best, the real professionals, from the fakes.

Even more so, it has led to a fierce debate on whether or not any of these practices are actually working, if they are worth their money or not, going as far as rising

allegations of similarities with sectist behaviors and methods. This is especially the case when it comes to practices for the mind and spirit, where scientifically proven evidence of their efficiency is mostly lacking. All that is defending them is the wave of positive testimonials coming from satisfied clients. But skeptics do not accept this as a valid argument; they attack it with the conviction that self-suggestion and the placebo effect can be powerful enough to create the illusion of a real, positive influence, even more so if the practice / method in question is supported by the skills and technique of a versed, charismatic so-called expert, with a witty, persuasive discourse.

4. The road to a possible mass human awakening

All of this criticism brought to the ways in which the marketplace for self-improvement products and services continues to expand is not illegitimate at all. In fact, some would go so much further than this, saying “these trends can be interpreted negatively as symptomatic of the general dumbing down and decadence” of modern society and culture (Puttick, 2005). After all, how else could we be so blind in our search for happiness, so ready to accept and pay for any method promising us the world, no matter how wacky, without any further inquiry? How else would such important things, playing with our very well-being, could be left unregulated? Looking at the veritable explosion of practices we can only assume things go on exactly like this. We are willing to “swallow” anything, any book, course or webinar liable of bringing us closer to our ideal state of existence.

However, mainstream acceptance might not be such a negative thing after all. The multitude of body-mind-soul products and services available on both the online and offline market, together with the increasing recognition of name-brand authors are indicators of the integration of holism into popular culture and lifestyle as a perennial, omnipresent spirituality. This is no fling, no superficial or ephemeral tendency of trying out the new trend. To once again cite Elizabeth Puttick (2005), “on the bigger scale, holistic spirituality needs business, to

get its message to the market as well as its goods and services. And mainstream society needs holism”. It needs holism because we should never cease dreaming and trying to change the world for the better, to transform it into a more pleasant life arena for us and generations to come. But if we want to change the world we have to start with ourselves, each and every individual. Or as Gandhi said: “Be the change you want to see in the world”. This deep, sustained interest for holistic personal development will give birth to paradigm shifts and will help us break free from outdated thinking patterns, allowing us to become real change agents.

Positive psychology helps us understand how this actually happens in practice. Practical applications of positive psychology include helping individuals and organizations identify their strengths and use them to increase and sustain their respective levels of well-being. Through many of the holistic personal development products and services we learn exactly this – to identify and accentuate our strengths and become happier, better functioning individuals in every area of our lives, from our educative years to the time invested in the workplace, to pursuing and sustaining beautiful and meaningful relationships with other people around us. And as it has been scientifically proven, it is exactly this factor that makes us most happy in live, that gives us the feeling of fulfillment and of “successful living” – that of having healthy and strong relationships (Shenk, 2009).

5. Conclusions

This paper reflects the socio-economic reality of our modern society in its continuous access towards happiness-bringing self-improvement. Scientists have proven that what predisposes us to happiness are mainly the genetic inheritance (50%), external conditions / environment (10%) and most importantly, what constitutes our intervention, investment and control margin, our daily way of thinking (Davidson & Begley, 2012) and taking action (40%). As if we intuitively knew that beforehand, we embarked on a journey of self-discovery and continuous improvement. This, in turn, engaged copious business opportunities, a whole new industry and an overabundance of

holistic personal development products and services, but not without side-effects.

The majority of negative comments addressed to this high-paced emerging happiness industry are very justified. The two forces creating this fascinating market place – a curious demand following its quest for fulfillment and the responding offer trying to capitalize on each and every one of our personal development areas – are already too big to self-regulate. Like any other industry, this too should be taken more seriously and offered the attention it deserves. It is hoped that this paper will help to the better understanding of the “happiness industry”, the discovery of innovative measures for addressing this stringent problem and the identification of new and productive areas of research, based on empirical data.

Last but not least, we feel the need to express a general concern regarding the pursuit of happiness with all costs. More often than not an imperative, a self-imposed goal, this sort of happiness becomes harmful, bringing anxiety and not liberation. As noble a goal to reach true happiness and as elevating as this mass movement towards holistic spirituality might be, we must remember they are not a destination but the journey itself.

Economic Discourse in Globalization

Șerban Monica

”Constantin Brâncoveanu” University of Brăila

monika_serban@yahoo.com

Abstract

Discourse has been referred to as in many ways and a great importance has been attached to its context (be it cultural, political or economical). In other words, it has been viewed as integral part of a social, cultural or economical practice. Among many other important factors in the process of globalization, language occupies the first places. To put it differently, globalization has been and should be approached with a focus on language.

Key Words: discourse, text, economical discourse, globalization.

J. E. L. Classification: Z 19

Communication within or across languages implies interpretation of discourse. Understanding how elements of a discourse concur to produce a given meaning involves comprehension skills and competence. The cultural, political or economical are paramount as well.

1.1. Discourse or text

In linguistics, the syntagm “discourse analysis” is used to refer to the analysis of both spoken and written texts. Discourse analysis has been defined as “The attempt by various linguists to extend the methods of analysis developed for the description of words and sentences to the study of larger structures in, or involved in the production of, connected discourse. Term first used in the 1950s by Zellig Harris [...]”. [13] In both cases, the emphasis is on the analysis of the way texts go across the limits of single sentences in order to form whole stretches of language.

Like many other theorists, Bruce considers that text and discourse are interconnected. [1]

He asserts that “discourse is embodied in texts and texts make up discourse.” Kress refers to this interrelation as to one of ‘emergence’. [8]

As he puts it, “discourse emerges in and through texts.” Therefore, text and discourse are not similar notions, but interrelated and independent ones.

The basic meaning of the term discourse in habitual usage is “talk”. It has been employed in many ways for infinite purposes. Historically, the term “discourse” has been applied to more rehearsed forms of spoken language (i.e. speeches) than to spontaneous speech. It has also been used to make reference to the topics and types of language used in particular contexts (i.e. the legal discourse, the medical discourse, the religious discourse). The W.N.E.E.D. provides us with meanings of the entry “discourse” such as:

“noun (Middle English *discours*, from Medieval Latin & Late Latin *discursus*; Medieval Latin, argument, from Late Latin, conversation, from Latin, act of running about, from *discurrere* to run about, from *dis-* + *currere* to run-more at CAR) (14th century)”

- archaic: the capacity of orderly thought or procedure: rationality
- verbal interchange of ideas; especially: conversation
- a: formal and orderly and usually extended expression of thought on a subject b: connected speech or writing c: a linguistic unit (as a conversation or a story) larger than a sentence
- obsolete: social familiarity.” [15]

Moreover, according to the O.C.D.O.L. the entry “discourse” is defined as “Any coherent succession of sentences, spoken or (in most usage) written. Thus this entry in the dictionary is an example of discourse; likewise a novel; likewise a speech by a politician or a lecture to students; likewise an

interview or any other series of speech events in which successive sentences or utterances hang together. Often equivalent to text. The term in French (“discours”) is often restricted, following Benveniste, to speech directed by a specific speaker (an ‘I’) to a specific audience or addressee (a ‘you’). Distinguished by Benveniste from a narration (e.g. an historical narrative) or ‘récit’.” [13]

Some linguists use discourse to separate speech from writing. In their opinion, discourse is employed when talking about speech whereas text is used when discussing writing.

Viewed from a different angle, discourse is viewed as process and text as product. In a more general perspective, the term “discourse” makes reference to any naturally occurring stretch of language, spoken or written.

As Kress (qtd. in Hatim 2001: 28) puts it, discourse represents “institutionalised modes of speaking and writing which give expression to particular attitudes towards areas of socio-cultural activity.” [6]

Hence, discourse represents a “part of socio-textual practices” (ibidem: 193). On the same line of thinking, Fairclough itemizes discourse as language use viewed as an integral part of social practice. [4]

For the purpose of our research, Hatim’s (2001: 187) definition is relevant. In his opinion, discourse is “a vehicle for the expression of cultural values and belief systems (racism, cultural hegemony, etc.) within and across languages.” [6]

The modern meaning of the term “discourse” as encompassing all forms of talk has developed since conversations also progress. This assertion makes us think that speakers make efforts in giving their interactions coherence and meaning. In other words, discourse becomes a “crafted medium” in the modern world. [2]

In addition, Carter metaphorically links the term “talk” as discourse to the term “text” since that they both allude to the act of weaving (from the Latin *texere*, *textum*-to weave). As a rule, people use the metaphor of “losing the thread of the conversation” when they are engaged in a dialogue. On the other hand, he considers discourse in written texts to be the focus on the way written texts are constructed that is to the texture of texts.

This analysis includes semantic and grammatical rules at the level of words, sentences, paragraphs of different genres within a cultural context.

On the same line of thinking, Kramsch believes that there is a natural linkage between text and discourse. [7] In fact, a text is to be viewed as a discourse so that the whole meaning can be communicated. In addition, she emphasizes the fact that text explication (grasping the author’s intended meaning) and text deconstruction (associations within the text under scrutiny) are specific both to texts and discourse.

We totally share Ulrych’s opinion that both discourse and text call attention to any stretch of language that has unity. Seen in this light, Ulrych considers that it is the co-text or the knowledge of the world outside language that gives rise to the unity of discourse or text. [10]

Moreover, she lays emphasis on the fact that the text represents the uttered intention as understood by the speaker who then rebuilds this unity in another culture.

A totally different view is supported by Laclau and Mouffe who view discourse as a totality which encompass both the linguistic and non-linguistic. From their angle, discourse is not a mixture of speech and writing but they are two different internal constituents of the discursive totalities. [9]

Their ideas are weaved around Wittgenstein’s example of building of a wall. They start from the supposition that one asks his/her workmate to pass a brick and add it to the wall. Both the act of asking for the brick which is linguistic and the act of adding the brick to the wall which is extralinguistic are integral part of a total operation that is the building of a wall or communication, in our case.

Laclau and Mouffe also use the term “discourse” to lay emphasis on the fact that every social formation is meaningful and symbolic. This idea is reinforced by the parallel between two acts such as kicking a spherical object in the street and kicking a ball in a football match. We may say that both of the physical facts are similar but the meaning is totally different. They argue that the object is a football as far as it creates a system of interrelations with other objects which are socially built. They label this systematic set of relations as discourse.

On the other hand, integrating a football within a system of socially constructed rules does not involve that it stops being a physical object. Their proposition is additionally sustained by the example of a stone which exists independent of any system of social relations but it may be, for instance, an object of aesthetic contemplation within a particular discursive format.

Therefore, Laclau and Mouffe consider it necessary to point out the fact that the existence of objects is independent of their discursive articulation only to the extent that one could use that mere existence as a point of departure of a social analysis such as behaviourism which is in opposition with their *modus operandi*.

1.2. Discourse as a moment of the social process

Both agencies and agents use alternative strategies, especially in times of instability or crisis. They are used for structural change. These strategies, as we call them, are always “elaborated in and through discourses” (Fairclough 2006: 21). [4]

Discourses have non-discursive effects. They simplify economic and political relation and have also the capacity to mobilize people. Since the economy is viewed as “an imaginatively narrated system” and the state system as “an imagined political entity”, discourses are meant to have “a key role in the always tendential constitution and consolidation of the economic, political and other systems, shaping the forms of their institutional separation and subsequent articulation” (ibidem).

Discourses are constitutive. As Williams puts it:

“We find then not a reified ‘language’ or ‘society’ but an active social language. Nor is this language simply a ‘reflection’ or ‘expression’ of ‘material reality’. What we have rather is a grasping of this reality through language, which as practical consciousness is saturated by and saturates all social activity, including productive activity”. [11]

Many linguists and economists consider discourse to be a moment of social events which is dialectically interrelated with other moments. Some use the term ‘text’ for the discursive moment of social events. This

does not only mean written texts but also speech as a moment of events.

Discourses are part of social changes. Social change implies change in the behaviour of social events, in social practices and the networking of social practices. Therefore, it includes change in the character of texts, discourse and languages.

As an example, when a particular state is subsumed to globalization processes, we can expect change in its institutions and organizations, change in discourses and so forth. In the case of discourses, we may say that new discourses are constantly emerging. In other words, they condense other moments of the social process as people experience them in their interaction with the world.

By way of illustration, new public management implies a shift in relations between social fields: government and private business. Government organizations are more like private business organizations in particular ways. In part, these will be changes in orders of discourse: relations between new market discourses and existing discourses, new market genres and old ones, new market styles and old ones.

New institutions, organizations, practices or discourse will emerge within what is basically a change in relations between social fields, institutions, organizations, orders of discourse, discourses, genres and styles.

1.3. Economical discourse in the globalized world

The idea that the economical discourse (or ‘jargon’ as some people would describe it) is very popular both in the West and in Romania is widely shared. As far as Romania is concerned, it is true that it had a socialist economy and a one-party state until 1989 but is now functioning economically in the capitalist ‘global economy’. This shift also implies a change in the Romanian language as well.

As an example, the Romanian language comprises direct borrowings from the English language such as *marketing* (meaning marketing); *marketability* (meaning “vandabilitate; grad de tranzacționare”); *marketing mix* (meaning “mix de marketing; elementele de bază ale unui plan de marketing: produs, preț, piață, promovare”); *carrying market* (meaning “piață portantă”);

crossed-market (meaning “piață intersectată, situație în care prețul oferit de un broker este mai mare decât prețul de ofertă cel mai scăzut al celui alt broker și viceversa”); *either-way market* (meaning ”piață în care cotațiile la ofertă și la cerere sunt aceleași”); *accounting* (meaning “contabilitate; evidență contabilă; gestiune; clacul; explicare; justificare”); *cash budgeting* (meaning “planificare a intrărilor și ieșirilor de numerar”); *company* (meaning “companie, firmă, societate comercială”); *crossing* (meaning “încrucișare”) or *monetary asset* (meaning “activ monetar”). [14]

On the other hand, there are some words which previously existed in the Romanian language “and are historically the same as words familiar to us in English (with differences in spelling, pronunciation and morphology due to the difference between the languages), but are used here in the ways and with the meanings of contemporary business English, which is new in Romania” (Fairclough 2006: 2). These words are *global*, *strategie* or *success*. [4]

For the purpose of our paper, we also consider the following terms relevant: *capital* (“în sens larg) stoc de valori sau de active care, intrate în circuitul economic, pot genera venituri posesorilor lor. (2) Ca factor de producție, capitalul cuprinde bunurile rezultate din producție și care sunt folosite pentru producerea altor bunuri economice [...]” (D.D.E. 2001: 80)) and *corporație* (“formă specifică de organizare a activității economice. Inițial, corporația a apărut sub forma unor organizații ce uneau meșteșugarii din aceeași meserie sau de meserii înrudite. Se mai numea breaslă și era constituită în scopul de a promova interesele și drepturile profesionale ale membrilor ei” (D.D.E. 2001: 129)). [12]

Some of the literature on globalization puts forward the issue of discourse as a feature of globalization. A relevant theory on discourse in the process of globalization is put forward by Harvey [5] and Fairclough [4]. They both view discourse as an integral part of the social system. Harvey describes discourse as being one of the six dialectically interrelated instants of the social activity such as power, values and beliefs, social connections, rituals and institutions and material practices. By dialectal relationship, Fairclough means that although these

instances are distinct from one another, they intermingle. It is also true that a change in discourse brings about new identities or realities.

As a conclusion, the new economical discourse in Romania is widely influenced by the English language.

Moreover, the change in discourse has triggered the economic change as well. In other words, economic change occurred when the the discourse was operationalized and put into practice.

The general conclusion is that the word or the discourse has a major impact on the social, cultural or economical environment. The word has the power to change realities and also to build new identities, cultures and economies.

The Clash of Identity and Economic Behavior

Ana Rodica Stăiculescu
Ovidius University, Constanta
staicul@univ-ovidius.ro

Alina Stan
Ovidius University, Constanta
costiana_stan@yahoo.com

Abstract

This paper is a response to the recent implications of the economic crisis on social identity and social choice. We aim to explore the emerging forms of protest and their liaison with group identity, according to the current mutations of state's economic policies. Firstly, our task is to examine what happens to group identity when faced with anxieties about the economic welfare in the circumstances of the prolonged economic crisis.

Secondly, the following concepts are to be discussed: the interminglements between the economic difficulties encountered by individuals and their mobilization around the need for social security, the social identity thus constructed, and the protest seen as collective grievance. We will emphasize that the negative outcomes of the economic crisis and the recession that followed caused a complex configuration of social constructs, leading to social cohesion despite the existing differences, due to the perception of facing the same inequalities.

Keywords: protest, group identity, economic behavior, mobilization

J.E.L classification: D63

1. Introduction

The contemporary financial and economic crisis, that after more than two years is still casting its negative consequences not only on the European but also on the world economy, has left behind many negative outcomes. The long terms consequences can easily be seen in all the spheres of social life. In this paper, we have limited the material to relate strictly to the interminglements of social identity in the wider context of economic behavior. The

arguments and conclusions presented here are in accordance with those of well known authors like Appadurai Arjun, Mathieu Deflem and Michael Chibnik. One of the main consequences of the economic crisis was that it announced the death of the neoliberal ideology. [1] Thus, the same system that created the liberal paradigm became the harbor for unleashing violent reactions, exacerbating social inequalities and creating a cycle of protests. The perception and illusion of economic inequality was promoted by the same actors that globalization has created, therefore the new medias were crowned in the role of the freedom fighter, organizing the protesters and stimulating their demands for accountability. Human beings were also transformed by risk and uncertainty as propagated by the media and denounced by decisions makers. [2]

2. Social mobilization: A Janus faced concept

The anthropological perspective in the analysis of the financial and economic effects on social identity must first look at the correlation between economic inequality and individual mobilization for the sake of social rights.

Firstly, we must underpin the idea that the crisis is primarily a matter of the global market, and the main point of analysis for scholars is the economic and financial one. Nevertheless, even for a non expert, the crisis has also sociologic points of view.

Secondly, since the financial meltdown, propelled by the increase of unemployment, the social identity has suffered significant transformations, manifested especially as the unanticipated collective grievances and protests that made the future appear even more unpredictable than ever. During the past

year, hundreds of thousands of people have demonstrated on the streets against the austerity measures of European governments to overcome unemployment and poverty. They imply that the government failed in protecting their interests in guarantying the needed social security. [3]

In order to understand these issues, it is extremely important to make a thorough analysis of the concept of social choice and protest. Equally important in our approach are the reasons for the collective protest as a part of constructing a group identity, and the ways in which mobilization is considered a solution. We will start by talking about an interesting concept in our point of view in this matter, namely the representation of social identity as a protest against the state's economic policies. [4] We will frame the discussion between two essential problems that arise in connection with the cause for which social identity can be expressed in relationship with the economic behavior, namely the *collective* fear of economic insecurity and the way in which it defined a new material identity. [5]

For scholars, the mobilization of the unemployed has for long been considered by the specialists in the field of collective action as a highly improbable phenomenon due to the fact that they have no strong organizations, leaders and ideologies. The events following “the crisis” have debunked this theory by proving that marginalization and individual values are equally important in fueling the cohesion of individuals.

Today's society promotes individualistic values, like self esteem, wealth and material accomplishments and, due to this representation, unemployment is considered to be the consequence of personal failure.[6] This observation became invalid when a large part of the population became aware that they are becoming a majority that opposes the financial decisions taken by a selected minority.[7] “We are the 99%” became one of the mottos for those that were powerless against decisions makers in the United States market regulation. Their apparent diversity was structured around the reality of sharing a public conscience that valued the concept of social justice and social choice. In the large context of social unrest and resistance against the austerity measures, „we are the 99%” became a metaphor of

what comes to be interpreted as political activism in the core of capitalism (i.e. Wall Street). As a paradox, the same accumulation of capital, known as the flexible accumulation that has led to a dispersal and fragmentation of social groups and classes, has now created the ground for marshaling against this old order.

Conflict can arise if the agent recognizes that the moral values of his or her society are harmed and if he or she is aggrieved in what he or she can consider his or her personal interests. [8]

Identity, as Nobel laureate Amartya Sen said, is a double edge sword, and the sense of security, given by the appartenance to group, is similar to an instinctive force and a weapon of choice. [9] Going beyond the level of person and role identities, the different aspects of the economic crisis pushed the individual to demand accountability and engage in active measures. Identity is not only a source of pride, but also a source of power, and can create conflicts between those that assume social values and those who can be regarded as disconsidering them. Within a group, the inside solidarity can lead to group discord on the outside. [10]

The first problem that arises, and which can be considered the most delicate one, is represented by the motivation of economic behavior in the spontaneous actions made by protesters against anti-recession. As a result of social comparison, those individuals who are similar to the group characteristic are categorized as being part of the eponymous group and are labeled in as members of the group. Correspondingly, those individuals having different values are categorized as the outsiders of this group, as outcasts. In a way, the fact that one has a particular social identity means being similar to others in the group and that he perceives things from the group's perspective, ergo having internalized their values. It is assumed that individuals, as group members, think alike and act alike, as group identity is their higher moral conscience. Thus, there can be a certain level of uniformity in the acts and ideas of group members.

Sociologist Peter J. Burke and sociological psychologist Jan E. Stets, both Professors at the University of California, Riverside, in their *Identity Theory*, define the term of identity taking into account the existence of

three main elements: role, group and individual particular characteristics: “An identity is the set of meanings that define who one is when one is an occupant of a particular role in society, a member of a particular group, or claims particular characteristics that identify him or her as a unique person” [10]. Thus, by means of this definition, the two identity theorists underline that there are three bases of identities (role, social group and person) and, accordingly, they make the distinction between role identity, social identity and person identity. Role identities are based on the various social structural positions individuals hold, social identities are related to individuals’ memberships in certain groups and are based on group categorization and group evaluation and person identities are based on the perspective according to which each person is a unique entity, distinct from other individuals (in this case the focus being on the features individuals internalize as their own, like social security, welfare and financial stability).

This theory assumes that individuals do not have to interact with other group members in order to think and act alike. The simple act of identifying with the group is enough to activate the adoption of similar perceptions (e.g. competence, character) and behavior among group members. In the instance that individuals consider themselves as the embodiment of a group prototype, social psychologists state that a *depersonalization process* has taken place. [11]

In that instance, instead of having a *unique existence as individuals*, they see themselves in terms of the full-scale attributes that other group members have, or in terms of their ideal representations of the group values.

Arne Johan Vetlesen identifies thus how they perceive the individual rights like “certain given, irremovable, and hence non optional conditions of human being-in-the-world, namely, dependency, vulnerability, mortality, the frailty of interpersonal relationships, and existential loneliness” [12] In our situation the fact that no individual or community is entirely sufficient unto itself is crucial to understand the cooperation of individuals that are strangers one to the other against decision makers. The conflict of what is the public good is an agent for

mobilization and social cohesion. More precisely, Vetlesen identifies a series of mandatory conditions, in order to emphasize the way social ideologies are constructed, perpetuated and propagated;

“We (as individuals and groups) are limited in our actions by our *interdependency* with others; we are *vulnerable* because our existential and even physical well-being is dependent upon others over whom we only have a limited control at best (hence the social centrality of the problem of the management of the action of others, and the concern to render their action predictable); we are *mortal* because we are embodied; our interpersonal relationships are *frail* because they are always to some degree contingent, and not least they are rendered more or less doubtful because of the mortality of the other; and we are existentially *alone* since our dependency upon others means that we possess no self-knowledge without them, and yet upon them ultimately we cannot depend(...) the form of a *protest against such givens*; recognizing their realness for others . . . but denying their realness for oneself”[12].

The social identity’s ability to arise powerful emotions by invoking solidarity between citizens, on the basis of group identities, is a result of cultural capital. In creating the “*cultural habitus*”, the use of symbolic practices can ground solidarity between the group members. Like gender, the economic status is the symbolic association of difference with class that creates the instance of being unlike. The economic status, like unemployment, remains one of the most potent symbolic categories of political unlikeness. [13] Social psychologists, like Stets and Burke, state that identity is defined in a social context and that people have a personal identity, which is unique to them, as well as a social identity, which is based on their membership in social groups (e.g. member of a political party, or trade union).

The concept of identity is seen as a corollary to the problem of conflict, as a mechanism for disturbing the presumption of a stateless social structure where the group seeks to act as a state agent. [14]

In his book *Fear of Small Numbers- An essay on the geography of anger*, Arjun Appadurai develops the theory that globalization can produce violence, exclusion

and inequalities. As seen in the worldwide protest against post-crisis austerity measures, the individuals that now have the same economic status (i.e. unemployed or indebted to banks) tend to develop a peculiar form of strong self-identity. This economic identity is often seen and employed as a form of counter-identity, a way to oppose the risk of being socially excluded. Mixed with media representations and political hate speeches, they develop the conscience of “we” or “they”, as opposed to “us”, the “99%” and “others”, “the 1%”. [15]

A clear discrepancy between self-situation significance and identity-standard significance can be established if we chose to analyze the use of collective pronouns like “we” and “they” in the Occupy Wall Street Movement and the social uprising against austerity measures all around Europe.

Globalization can be defined as many things, as a process or as a product of our knowledge society. Some authors consider globalization the pillar of recent events. [16] This is an interesting attempt at explaining how mobility and dynamics, as basic features of globalization can generate insecurity or even fear, thus becoming the source for intensive campaigns that call into action the resort to group violence. An analysis of “this social productivity of violence” shows that it can now be considered as an important element in generating both social cohesion and political activism. This process is explained as the result of the clash of identities and the driving forces of social change. Thus, globalization can exacerbate social, economic and political uncertainties by producing in the same time new encouragements for protests. [17]. Thus, globalization, as a way to promote a universal cultural identity, can fuel riots, exacerbating the large scale grieves and the existing tensions between a majority group and a minority, because both groups fear the reversal process that globalization can achieve.

The clustering of economic protests, however, remains to a large extent a driving force in search of an explanation. Saying that they occur in proximate states is not interesting in itself. We know that riots, like violence, often spread across national boundaries, but what are the exact causal mechanisms behind the international

diffusion of economic protests? Previous studies of conflict diffusion have established several possible explanations. The mobilization against the economic policies may be spatially clustered because the issues and actors engaged in them span national boundaries due to the same process of globalisation. Furthermore, through a “demonstration effect,” the protest against a state’s monetary policy in one country can lead actors in other states to update their beliefs about the efficacy and desirability of challenging their own governments or reshaping their demands. Most of the scholarly literature and public discussion about violent acts (i.e. uprising or rebellion) can have important security consequences, which suggests that the groups in seek of expressing their identity can spur the spread of conflicts both between and within other groups, or even at a larger scale, between them and state agents. [18]

Rebellion and insurgency are forms and specific types of political violence. Political violence refers to all collective attacks within a political community against the political regime, its actors-including competing political parties. The concept, according to Gurr “subsumes revolution, guerrilla wars, coup d’état, rebellions and riots”. [19] The social uprising that engulfed the world financial market, increased under the “force” and the threat of using a violent reactions Participants in political violence may value it as a means of expressing political demands or opposing undesirable policies.

The major challenge for the sociology of protest is which form of political mobilization could be described or considered as an isolate rebellion due to economical difficulties, and which could be defined as a conflict, i.e. the manifestation of group identity? To determine which political acts are rebellious, international law specialists distinguish between two types of non-institutionalized collective actions by citizens: social protests aimed at limited issues, such as changing the policies of authorities or particular personnel; and the rebellion dealing with fundamental issues, such as who governs and what is the structure of authority, when this authority is not the expression of the majority group identity. As argued by Gurr, the former are generally violent and may include mass violence,

because they challenge directly the authorities, are disruptive and entail violence. [20]

When analyzing the problem of the recent mobilizations against the crisis's effects, a concept that is circulated is *social movement*. In “*Violence and New Social Movements*” Rucht defines it as “an action system, formed for a certain period of time and based on collective identity, of mobilized networks of groups and organizations which aim to bring about, prevent, or reverse social change by means of protest—if necessary, violent protest”[21]. Social movements in their many forms can include formal organizations, like trade unions, but are not themselves organizations. A distinctive feature between formal and informal movements is that the latter doesn't include a clearly defined membership, like a charter or statutes, binding agendas, and hierarchical structures. The boundaries between social and political movements in modern societies are blurred, like the conflicts between the individual pursuit of self-interest and the decision maker's interest.

The unemployed classes and those impoverished by tax policies were strongly involved in collective protest actions in early 2010 and 2011. They have had a considerable impact on public debates and mainstream culture, as symbols of resistance. Their mobilization depended on a series of factors, which help to explain protest differences across time and space, like the financial crises in Spain, Greece and Italy and the market regulation and the need of scapegoats in the USA postmarked meltdown.

These peculiarities have to do, first, with grievances, given the fact that financial deprivations were much more pronounced in countries that have a higher unemployment rates and lower wages. In the wider context of the financial and economic crisis, people around the world fund themselves close to full employment and poverty, while the state failed in protecting their interests and social rights. In 2010 and 2011, the persons who were unemployed and disappointed with social policies were occupying the “headlines” of social and political news for demanding an increase in the minimum social payments and economic measures against inflation and low income.

The emergence of acts that unified trade unions and anarchic groups can be “evoked” as an unprecedented movement in their quest of economic security and social justice. Moreover, the precarity of daily life has provided a funded and reasonable action against the government's lack of interest for their grievances. The general state of frustration and anxiety can also be correlated with their perceived political, social and economic marginalization. As outcasts, they could not establish a reciprocal relation with the local political landscape due to the fact that they were treated by the public authorities as illegitimate actors, and not as social and political partners. [22]

This climate has created a well founded fear of those “powerless” for regaining a position as a social partner interested in economic welfare. As we stated before, the exceptional and prolonged episode of social insecurity emphasized the need for social action. Even if the social and economic outcasts came from different backgrounds, the fear of marginalization and poverty rose above other social differences like age, religion and culture. Acting collectively has changed the economic and political behavior of these individuals, fueling their need for association and thus, act in a unitary form. As Ted Robert Gurr stated in *Why Men Rebel*, the generalization of the fear of being unemployed and socially excluded threatened the social identity in itself and generated feelings of frustration and anger, all the more vivid when expectations have been failed [23]

These movements assert their ideology and identity by using symbols, language and clothing and through the collective practice of protest (i.e. violent or non-violent). Culturally, how individuals understand and relate to wealth, poverty and social inequality is crucially influenced by social group membership and personal history.

3. Conclusions

Through this paper we have tried to demonstrate that there are many forms in which the complex and the context-dependent term “group identity and social mobilization” can be defined. A “social group” can be thus attracted in this widening gyre of the political and economic struggle

and can perceive their activism and resistance as its only resort to conserve its social welfare. The negative outcome of the economic struggle and recession harbored the clashes between group members and political actors hence they were only exacerbated by the process of globalization.

In this alarming chain of events, a unique process of cohesion and ideological homogeneity took place. The endemic financial crisis is a reflection of a society in which laws have regained their role as means of preserving privilege, as well as the best instruments for repression against the public interest. It is a global society in which differences are the exchange currency for inequalities and unconformity, seen as a menace. If classes ceased to exist long time ago, the economic crisis transformed their lingering remains into inequalities and, consequently, into latent conflicts. In a Europe where citizenship, qualification and income divide the population in nationals and foreigners, into workers and socially helped, there is no surprise that the struggle for a new economic model and implicit behavior is occurring.

Abstract

In this paper we want to achieve an approximation algorithm for Bayesian networks using data. At first we want to make a description of Bayesian networks and then talk about their modeling of the data using approximation algorithm PNM.

Keywords: Bayesian networks, data approximation, modeling.

Clasificare J.E.L.: L8-Industry Studies:Services (L86-Information and Internet Services)

INTRODUCTION

Bayesian approach is an alternative to traditional methods of assessment which provides a convenient way of incorporating the information set.

One of the disadvantages of the method is unable to make estimates without knowing the prior distribution of parameters.

Techniques used in Bayesian networks have been widely usage for proving extremely effective in data analysis. Bayesian networks are known and trusted networks as probabilistic graphical models belong to the family. Graphical models are graphs in which nodes are random variables and arcs are the propagation conditions is used to represent uncertain knowledge of a domain. In particular, each node represents a

random variable while the lines between nodes is dependent probability between corresponding variables. These addicts are generally estimated using statistical methods of calculation. So Bayesian network combines the principles of graph theory, probability theory, computer science and statistics. In this paper we want to approach the optimization problem for a Bayesian network so first we want to introduce some knowledge about Bayesian modeling will talk about methods for approximating the Bayesian network.

Feature of a Bayesian network is that we allow uncertainty modeling and reasoning. BN is a directed graph where each node contine a probability information. Full specifications are as follows:

- set of random variables make up the Bayesian network nodes. Variables can be discrete or continuous.
- A set of directed links (arcs) connecting pairs of nodes. If an arc from node X to node Y, X is called the father of Y.
- Each node X_i has a conditional probability distribution $P(X_i | \text{Parents}(X_i))$ which cuantizeaza effect that I have parents on that node.
- The graph has no directed cycles, therefore directed acyclic graph is called (DAG - Directed Acyclic Graph)

There are specialized software for processing of RB, such AgenaRisk. When RB is compiled, it can be done

dynamically and have the following characteristics:

1. The effects of observations entered in one or more nodes can be propagated in all Bayesian networks, in any direction, and the marginal distributions of all nodes are updated.
2. Only relevant inferences can be made in Bayesian networks (using conditional dependency structure and current knowledge to identify those inferences that are valid).

Bayesian network modeling

To build a Bayesian network must specify two things to describe: topology (structure) and nodes. Numerous methods have been proposed for inference of probabilities in Bayesian networks including accurate prediction methods or approximate prediction methods. For example, Monte Carlo methods provide approximate solutions by selecting random samples from the distribution of variables. In theory though, so exact inference methods and the approximation method can be an NP problem (Dagum and Luby, 1993).

Fortunately, in practice, approximate methods to demonstrate to be extremely useful in many cases.

If there are k random variables on the model, the spring $k(k-1)/2$ non-oriented network can move on, that amount of space network will be $2^{k(k-1)/2}$. Thus, the researchers used search algorithms, EM algorithm, Monte Carlo method, etc..

Suppose we have a network known S and all known variables. We denote by $S^h =$ probability and can be taken jointly depending on the set of variables S , V and $\Delta C =$ standard specified

Step 1: Choose S^h and evaluate ΔC for all arcs S^h , we change the arc in two steps, for any maximum ΔC .

Step 2: Repeat step 1 until there are changes to the arcs (for any $\Delta C > 0$)

An important measure for learning Bayesian network model selection is on the fringe of its connection $P(D | S^h v_s)$

Where v_s is a probability vector and S^h is a probability network and D is a set of data.

If we assume D independent parameters unlimited distribution and no lack of data, each vector v_{ij} is updated independently.

For all i and j is given by the product likelihood probability for each pair i and j

$$p(c|\xi) = \frac{\Gamma(\alpha)}{\Gamma(\alpha + N)} \prod_{k=1}^r \frac{\Gamma(\alpha_k + N_k)}{\Gamma(\alpha_k)}$$

$$p(D|S^h) = \prod_{i=1}^n \prod_{j=1}^{q_i} \frac{\Gamma(\alpha_{ij})}{\Gamma(\alpha_{ij} + N_{ij})} * \prod_{k=1}^{r_i} \frac{\Gamma(\alpha_{ijk} + N_{ijk})}{\Gamma(\alpha_{ijk})}$$

and Bayesian network approach for a maximum is:

$$\underset{v^h}{Max}(p(D|S^h))$$

For individual variables approximation problem, the procedure can be described as:

Let $X = A_1, A_2, \dots, A_p$ be an initial partition and λ a known distribution, we apply a model $f(x)$ the initial partition, we have an optimal distribution model λ_c with under $X_c = B_1, B_2, \dots, B_c$ with $c \leq p$.

Probability PNM

For a variable. Let dataset $D = \{X_1, X_2, \dots, X_n\}$ for each variable X_i of D define the norm for the approximation error.

$$\|U_i\|^2 = \int_{-\infty}^{+\infty} (p(x_i)f(x_i))^2 - (p(x_i)x_i)^2 dx_i$$

and the sum of differences for all variables in D , where $\|D\|^2$ is the identifier of the approximation error.

$$\|U\|^2 = \sum_{i=1}^n \|U_i\|^2, \text{ where } \sum_{i=1}^n p(x_i) = 1$$

Seeking approximation for D is:

$$\text{Min} : \int_{-\infty}^{+\infty} (p(x_i) f(x_i))^2 - (p(x_i) x_i)^2 dx_i$$

, where $i=1, \dots, n$

For n-variable. Based on the above case we can expand the variables n

$$\|U_{ij}\|^2 = \int_{-\infty}^{+\infty} \int_{-\infty}^{+\infty} (p(x_i|x_j) f(x_i))^2 - (p(x_j|x_i))^2 dx_i dx_j$$

$$\|U\|^2 = \sum_{i=1}^n \sum_{j=1}^n \|U_{ij}\|^2$$

PNM data approximation algorithm (for one variable)

Inputs: proxy variables (x), where kernel iterations (steps), minimum norm (ξ)

Output data: number of variables procedure

the variables (X, L, kernel, ξ)

statically int C out_c[];

L=level; C=1;

Calculating $f_c(x, L)$ of

$$f(x, n) = \frac{1}{n} \sum_{i=1}^n Kh(x - X_i)$$

Calculating approximate $\|U_0\|^2$ of

$$\|U_i\|^2 = \int_{-\infty}^{+\infty} (p(x_i) f(x_i))^2 - (p(x_i) x_i)^2 dx_i$$

While ($c \leq \text{length}(x) \parallel \|Uc\|^2 < \xi \|U_0\|^2$)

```
{ i=1;
  while (x(C+1) ≤ x ( C ) i++;
    C = C + I;
```

Update $f_c(x, L)$

Update PNM aproximam $\|Uc\|^2$

If ($\|Uc\|^2 < \xi \|Uc-1\|^2$) {

$\|Uc\|^2 = \|Uc-1\|^2$;

locate C; }

}

L = L-1;

If (L!=0) {

$X_{\text{front}} = x(1), \dots, x(C)$

$X_{\text{behind}} = x(C+1), \dots, x(\text{Length}$

(x))

If (length (X_{front}) !=0) intra
variabile (X_{front} , L, kernel, ξ)

If (length (X_{behind}) !=0) intra
variabile (X_{behind} , L, kernel, ξ)

L = L-1;

Return Null; }

Else return out_c;

CONCLUSIONS

In this paper we analyzed the Bayesian networks and their modeling algorithm using PNM.

In conclusion, the advantages of Bayesian networks are:

- are more compact than core systems run
- use past information to predict what will happen
- provide a valid analysis even when information is uncertain
- allows prediction or diagnosis, according to the analysis required
- is made with a lower cost than building systems or expert systems decision
- is easy to explain how a system reaches a certain decision, action
- offers diagnostic problems

Analysis Algorithms to Search the Web Links

Stancu Ana-Maria Ramona

Apetrei Marius Cristian

Universitatea Crestina “Dimitrie Cantemir”

ana_maria_ramona@yahoo.com, marius.apetrei@gmail.com

Abstract

In this paper we want to achieve an algorithm for carrying out searches on the web. We speak of the two algorithms, namely Kleinberg and Page Rank, search algorithms.

Keywords: Algorithm, web topology, link, information.

Clasificare JEL: L8-Industry Studies: Services (L86-Information and Internet Services)

INTRODUCTION

Increasing volume of information caused by the emergence of electronic commerce, electronic education and the site made it difficult for search engines work. Many pages contain irrelevant links are used only for its internal navigation between pages. Data Mining manages to find the partial or total solutions and can be divided into:

- Web Content Mining, is used to search information in a document
- Web Structure Mining is based on the topology of links
- Web usage mining controlling user behavior.

Next we address the algorithm "Page rank" (for assigning measures to pages) and "Hubs and Authorities" (for detailed evaluation of the importance of web pages)

Kleinberg algorithm

1. Creates a lot of pages page
2. Identify candidate sites

3. Realize your page ranking sites authorized and hubs

Step 1. This step is a great text-based search, which are selected from hundreds of pages to be used for startup process, pages often contain information not expected the authorized user, because it may be that these sources not use common topic. Following the searches made in the first phase, based on a text search, there are pages containing that text.

Step 2. At this step set of root pages is extended by pages that include links to any page in the root, root saudin the pages that have property that there is a link from the root set of pages to them. This set is called extended candidate set.

Step 3. In this step the extended set is ordered according to the degree of authority on topical sought, and depending on the links to other sites authorized therein.

Note: Kleinberg's algorithm based on the pages returned by search words are then processed to find a larger collection of pages of authorized sites are selected.

PageRank was developed at Stanford University by Larry Page (from which derives its name and then and Sergey Brin as part of a research project about a new kind of search engine. Project started in 1995 and led, in 1998, a working prototype named Google. shortly thereafter, Page and Brin founded Google Inc. company., the company

behind the Google search engine. Although only one of the factors leading position Google search results, PageRank continues to provide all devices based search engine Google. PageRank is based on citation analysis, theory developed in the 1950s by Eugene Garfield at Pennsylvania State University, Google's founders cite Garfield's work in their original work. analysis was developed web links first Jon Kleinberg and his team in the CLEVER project at the Almaden Research Center IBM.

Page Rank algorithm was created in 1997-1998. The most successful Internet search engine, Google works based on this algorithm. Page Rank is rooted in social network analysis and is basically providing a ranking of each web page depending on how many links from other Web pages lead to that page.

Assume that we have n Web pages, each page I containing a number of O_i links to other websites. Note A the adjacency matrix associated with the website seen as a directed graph $G = (V, E)$ where pages are vertices and links between pages are arcs of the graph. Associated graph adjacency matrix will have elements

$$A_{ij} = \begin{cases} \frac{1}{O_i}, & \text{if } (i, j) \in E \\ 0, & \text{if } (i, j) \notin E \end{cases} \quad (1)$$

Starting with an initial vector of probabilities, using a stochastic irreducible and aperiodic matrix, according to Ergodic Theorem of Markov chains, we obtain a range of vectors of probabilities converges to a unique state of equilibrium

$$P_1 = A^T P_0 \quad (2)$$

$$P_k = A^T P_{k-1} \quad (3)$$

$$\lim_{k \rightarrow \infty} P_k = P \quad (4)$$

Vector of probabilities obtained will give us web pages rank. To apply Ergodic Theorem adjacency matrix is transformed to meet conditions of irreducibility and aperiodicity. The next formula

$$P(i) = (1-d) + d \sum_{(j,i) \in E} \frac{P(j)}{O_j} \quad (5)$$

gives the rank of page i , $P(i)$, and d is a mitigating factor that takes values between 0 and 1.

The pseudocode algorithm for calculating the ranking of web pages is:

Page Rank

```

P0 ←  $\frac{e}{n}$ 
k ← 1
repeat
    Pk ← (1-d)e + dATPk-1
    k ← k+1
until  $\|P_k - P_{k-1}\| < \varepsilon$ 
display Pk
    
```

Where e is a vector with all elements 1, ε is called the threshold of accuracy and 1-norm of a vector is given by the sum of constituents.

Algorithm

Label the edges in $G_{Q,p}$ with an index ranging from 1 to $R_{Q,p}$

Set $\eta_e = \eta_{ij}$

Set $\delta_e = \delta_{ij}$

Set $\tau_e = \eta_{ij} / \delta_{ij}$

Mark all the edges in $G_{Q,p}$ as not visited

Allocate weight vector W of size $|C_{Q,p}|-1$

Allocate vector Σ of size $|C_{Q,p}|-1$

Initialize W and Σ to zero

for $e = 1, e \leq |R_{Q,p}|, e = e + 1$

mark edge e as visited

visit $(e, e, 1, \tau_e)$

$W[1] = W[1] + \tau_e$

$\Sigma[1] = \Sigma[1] + 1$

Function visit $(o, e, 1, s)$

$a = e + 1$

while $a \leq |R_{Q,p}|$ și $l \leq |C_{Q,p}|-1$

if a is not visited and a is safe

mark edge a as visited

```

visit (o,a,l+1,s*τ)
W[l+1] = W[l+1]+s
Σ [l+1] = Σ [l+1] + 1
Set edge a as not visited
Else
a=a+1
    
```

The pages are most important, the other pages tend to have greater links with it. In a web page, some links are more important than others and its importance can not be distributed evenly to all its connected pages and the problem is solved by Weighted PageRank algorithm. The algorithm calculates the importance of pages called "outlink". Each page receives an importance commensurate with its links.

Importance inlink sites will be denoted by $W_{(w,u)}^{in}$

Importance outlink sites will be denoted by $W_{(w,u)}^{out}$.

Denote by I_u number u inlink pages sites, sites I_p number inlink pages p and $R(v)$ the set of pages that have links to you, we have:

$$W_{(v,u)}^{in} = \frac{I_u}{\sum_{p \in R(v)} I_p}$$

If we note with O_u the egg-sized pages outlink number u, with O_p sized pages outlink number p and $R(v)$ the set of pages that have links to you, we have:

$$W_{(v,u)}^{out} = \frac{O_u}{\sum_{p \in R(v)} O_p}$$

Given the importance of Page Rank and outlink sites u get a page's importance:

$$PR(u) = (1-d) + d \sum_{v \in B(u)} PR(v) * W_{(v,u)}^{in} * W_{(v,u)}^{out}$$

Where d is the "tax" used by Google to combat the effects of "dead ends" and "spider trap".

Authorized pages are pages that can provide information about a given subject.

To define the degree of authority and degree of connection, assign each site a matrix like matrix used to define the importance of the site pages.

Let A be the matrix associated to a site where:

$$A = \begin{cases} a_{ij}, & \text{if the page has successors or predecessors} \\ 0, & \text{altfel} \end{cases}$$

We note with its transpose A_t , is the vector that measures the degree of authority and h is the vector that measures the degree of connection. The vector h can be calculated: $h = \mu_1 * A * a$, formula shows that the degree of connection of a page is given by the sum of all degrees of authority pages link to it by μ_1 .

The degree of authority can be calculated: $a = \mu_2 * A_t * h$, the formula shows that the degree of authority of a page is given by the sum of all degrees of related pages that link it with μ_2 .

CONCLUSIONS

The Internet and e-commerce is an important key to future success of any organization, offering huge opportunities and market outlets worldwide. E-commerce projects are doomed to failure because of misunderstanding the new rules of e-economy environment, thus failing to step into the competition.

Abstract

One of the themes that have been approached more and more within the specialised literature is being represented by economic cycles. The analysis of these is very useful in the long term predictions, in finding solutions for the economic raise and for solving the economic crisis. The concept of the green economy has gained currency to a large extent because it provides a response to the multiple crises that the world has been facing in recent years – the climate, food and economic crises, so the importance of greentech innovation. In this paper we intend to bring contributions to the study of the Kondratieff cycles in terms of new techno-economic paradigm.

Key words: Kondratieff Cycle, techno-economic paradigm, green economy, greentech innovation

J.E.L. Classification: E32, E6, Q55

1. Introduction

One of the themes that have been approached more and more within the specialised literature is being represented by economic cycles. The analysis of these is very useful in the long term predictions, in finding solutions for the economic raise and for solving the economic crisis. General development of the economy (based on data relating to advanced countries) shows that the country's productive forces take place in the form of "waves" (cycles) long by 40-60 years. This period is dominated by a technical way of production of certain technology. Some experts identify the big "waves" with the history time of the

outbreak, maturation and exhaustion values of an industrial revolution. In these terms, where is "the place" of global economy nowadays?

2. The New Kondratieff cycle

In the development of each economy, two main phases are distinguished: an upswing phase and a downswing phase, each with a duration of 20-30 years.

In the upswing phase the implementation and technical operation of the new way of production occurs, business activities - based on new technologies - take place at this stage, with increased efficiency. Within the period of 20-30 years there are being observed: the dominance of years of prosperity, relatively high rates of economic growth, rising living standards, high employment level, etc.. The period of transition from the old way to the new production techniques is marked by a structural crisis, a period which is extended during downward phase. In this phase of long economic cycles, initially, some showing signs of exhaustion values of favorable growth factors occur. There is a tendency of decreased efficiency and rate of profit. It is the sustained period of scientific research to find solutions to streamline the production process. It also marks a transition to new production techniques.

The effects of a particular techno-economic paradigm most faithfully represent Schumpeter's idea of "creative destruction", capable of sustaining a lengthy growth cycle resulting from the emergence, disappearance and reconfiguration of the various sectors. Each techno-economic paradigm requires a new infrastructure allowing the new technologies to be diffused throughout the economic system, while the dominant characteristics of the production system are

restructured to incorporate processes that allow new products to be created and distributed. We try to characterize the five technological revolutions that occurred between 1770 and 2010 and their corresponding techno-economic paradigms, as well as the characteristics of the industries and infrastructure underlying them (Freeman and Pérez, 1988; Pérez, 2002) and the new Kondratieff cycle – the sixth.

❖ **First Kondratieff cycle:** From 1790 till 1844- 1851

- **Technological revolution** : The “Industrial revolution” - Britain;
- **New or redefined infrastructures** : Canals and waterways Turnpike roads, Water power (highly improved water wheels);
- **New technologies and new or redefined industries** : Mechanized cotton industry, Wrought iron, Machinery

❖ **Second Kondratieff cycle:** From 1844-1851 till 1890-1896

- **Technological revolution** : Age of steam and railways , In Britain and spreading to Continent and United States ;
- **New or redefined infrastructures:** Railways (use of steam engine) Universal postal service, Telegraph (mainly nationally along railway lines) , Great ports, great depots and worldwide sailing ships, City gas;
- **New technologies and new or redefined industries:** Steam engines and machinery (made of iron, fuelled by coal), Iron and coal mining (now playing a central role in growth), Railway construction, Rolling stock production Steam power for many industries (including textiles)

❖ **Third Kondratieff cycle:** From 1890-1896 till 1939-1950

- **Technological revolution:** Age of steel, electricity and heavy engineering - United States and Germany overtaking Britain ;
- **New or redefined infrastructures:** Worldwide shipping in rapid steel steamships (use of Suez Canal) Worldwide railways , Great bridges and tunnels Worldwide telegraph Telephone (mainly nationally),

Electrical networks (for illumination and industrial use);

- **New technologies and new or redefined industries:** Cheap steel (especially Bessemer), Full development of steam engine for steel ships, Heavy chemicals and civil engineering, Electrical equipment industry, Copper and cables, Canned and bottled food, Paper and packaging

❖ **Fourth Kondratieff cycle:** From 1939-1950 till 1984-1990

- **Technological revolution:** Age of oil, the automobile and mass production, In United States and spreading to Europe;
- **New or redefined infrastructures:** Networks of roads, highways, ports and airports, Networks of oil ducts, Universal electricity (industry and homes), Worldwide analog telecommunications (telephone, telex and cablegram) wire and wireless;
- **New technologies and new or redefined industries:** Mass-produced automobiles, Cheap oil and oil fuels, Petrochemicals (synthetics), Internal combustion engine for automobiles, transport, tractors, airplanes, war tanks and electricity, Home electrical appliances, Refrigerated and frozen foods

❖ **Fifth Kondratieff cycle:** From the 1980s till 2030(?)

- **Technological revolution:** Age of information and telecommunications, In United States, spreading to Europe and Asia and then becoming globalized;
- **New or redefined infrastructures:** World digital telecommunications (cable, fibre optics, radio and satellite) Internet/electronic mail and other e- services, Multiple-source, flexible-use electricity networks, High-speed physical transport links (by land, air and water);
- **New technologies and new or redefined industries:** The information revolution Cheap microelectronics Computers, software, Telecommunications, Control instruments, Computer-aided biotechnology and new

materials

❖ **Sixth Kondratieff cycle**

- **Technological revolution:** Green New –Deal, Eco-bio-economy;
- **New or redefined infrastructures:** Bioinformatics - Computation applications for the analysis and storage of biological data (genomes, protein sequences, modelling of complex processes, etc.), Nanobiotechnology;
- **New technologies and new or redefined industries :** Greentechnology , Application of nanotechnology/ micromanufacturing tools and processes to construct various biotechnology devices and applications (studies of biosystems, diagnostics, etc.)

The fifth upswing began in the 1980s and ended with the current crisis. On past durations, we are now in a downswing phase with the dates of beginning: 2008-2010.

However, there is also quite a bit of evidence to suggest that the current financial crisis does indeed mark the start of the downswing. Given that this is not a normal recession, but a downturn caused by an all-embracing banking crisis, 2008-2010 seems the more likely inflection point.

3. The Green Economy – a new paradigm?

The concept of the green economy has gained currency to a large extent because it provides a response to the multiple crises that the world has been facing in recent years – the climate, food and economic crises – with an alternative paradigm that offers the promise of growth while protecting the earth’s ecosystems and, in turn, contributing to poverty alleviation. In this sense, the transition to a green economy will entail moving away from the system that allowed, and at times generated, these crises to a system that proactively addresses and prevents them.

The concept of green economy should be seen as consistent with the broader and older concept of sustainable development. The specificities of the broader concept are its *holistic* character, as it encompasses the three pillars of development – economic, social and

environmental – and its particular focus on *inter-generational* equity. This is reflected in UNEP’s definition of a green economy as “one that results in improved human well-being and social equity, while significantly reducing environmental risks and ecological scarcities”.

Ocampo highlights four different macroeconomic issues that must be taken into account in the analysis of the green economy.

1. The first one relates to issues of inter-temporal welfare: how the welfare of future generations is taken into account in current economic decisions, an issue that is relevant for savings and investment decisions today, but has broader implications, as the social discount rate chosen should be used in cost-benefit analysis at the microeconomic and sectoral levels.
2. The second refers to the effects that the degradation of the environment has on aggregate supply, as well as the effects of environmental spending and protection policies on both aggregate supply and demand.
3. The third is the fact that economic growth is always a process of structural change, a fact that is highlighted by the significant changes in the patterns of production and consumption that must be put in place in the transition to the green economy, which in this regard can be characterized as no less than a new technological or industrial revolution, and will have deep impacts on production structures as well as on consumption patterns.
4. The final one relates to how global initiatives in this area are going to be financed.

A broader analysis of the macroeconomic implications of environmental protection is that provided by UNEP’s recent Green Economy Report (UNEP, 2011, chapter 13). According to the simulations provided, investing in the green economy \$1.3 trillion, equivalent to 2% of world GDP or one-tenth of global investment, may lead to slower growth for a few years (relative to the scenario in which those resources are invested according to past patterns), as renewable natural resources are replenished, but will result in faster growth after 5-10 years. Aside from the fact that the green economy can deliver in the long-term more

growth, it also reduces downside risks associated with climate change, energy shocks, water scarcity and loss of ecosystem services, increases employment (as green investments are generally more employment intensive) and have direct benefits in terms of poverty reduction (particularly through improvements of agricultural productivity of rural smallholders). Relative to business-as-usual, this scenario reduces energy demand by 40% by 2050 (largely through reduced power, and transport efficiency), which is increasing supplied by renewables production, and also decreases water demand by 22% and the ecological footprint by 48%.

The Green Economy – some challenges and dilemmas

- ❖ **One dimensional approach** - The first risk is that the “green economy” is defined or operationalised in a one-dimensional manner, taken out of its being embedded in the sustainable development framework, and promoted in a purely “environmental” manner and without consideration of the international dimension, especially its negative effects on developing countries (Khor, 2011).
- ❖ **”One size fits all” approach** - all countries – without considering the levels and stages of development - are treated in the same manner. This would lead to failures either for environment, development or both.
- ❖ **Use of environment for trade protection** - There is a risk that the environment, and by implication the “green economy”, can be inappropriately made use of by countries for trade protectionist purposes, and that in particular developed countries may use this as a principle or concept to justify unilateral trade measures against the products of developing countries.
- ❖ **Attempting to gain market access through the guise of environment** - Another risk is that the environment is misused as a disguised method by countries to promote the access of their goods and services into markets of other countries. There is a fear that the Green Economy concept could be used as a front for mercantilist interests.
- ❖ **The treatment of subsidies** - Another concern of many developing countries is that some developed countries have been providing their companies with major subsidies for the research and development (R&D) of environmentally sound technologies. This puts developing countries at a disadvantage, especially since they lack the financial resources to match the developed countries' subsidies. Given this unfair imbalance in subsidies, the developing countries and their firms would be in an even worse competitive situation if they have to lower their tariffs on environmental products.
- ❖ **Environmental standards** - Another potential problem is the adoption of environmental standards for products; developing countries that are unable to meet the standards face the prospect of losing their exports. The approach towards developing countries should be to provide resources and technology for upgrading their environmental technology and standards, and not to penalise them.
- ❖ **New conditionality** - Another risk is that the “green economy” may be used as new conditionality on developing countries for aid, loans, and debt rescheduling or debt relief. This may pressurise affected developing countries to take on one-dimensional environmental measures rather than sustainable development policies that take economic and social development and equity goals into account.
- ❖ **Intellectual property rights** - One of the basic tensions is this: the willingness to invest in innovation depends to some degree on the products of that innovation being protected from low-cost imitation. This is particularly true for technologies where the costs of research and development are high and the cost of imitation is low.
- ❖ **Government support** - is critical to creating national systems of innovation, among other things though investment in education, support of research and development.

The Greentech Innovation

Investment is fundamental for the green economy, and for sustainable development more broadly. It is the vehicle by which old infrastructure and productive capacity are transformed into new and greener stock. A number of developing country firms have already gained significant market share in new technologies. China in 2009 exported over \$10 billion worth of solar panels and cells, more than twice as much as the second biggest exporter and almost 80 times the value exported only ten years earlier, when it was not even among the top 5 world exporters. India’s Suzlon Energy is now a global power in supplying wind turbines, with a 6.4% share of the global market. Three Chinese companies now rank in the top ten for market share in wind power as well, though they are almost exclusively focused on meeting domestic demand.

The Green or Clean Revolution is a swift and massive scaling-up of clean energy technologies and infrastructure. It will satisfy the increasing energy requirements of emerging economies which are determined to develop unhindered, while continuing to provide the high quality energy services the developed world has come to expect.

Policymakers have also begun to see the opportunity for growth in low carbon markets. China has developed from non-player to world-leader in creating economic value from green technology. Chinese investments of \$912 billion in clean energy and environmental protection will create 10.6 million jobs, boost GDP by \$1.3 trillion and drive an additional \$220 billion in energy savings.

Clean technology innovation is a global phenomenon. The Cleantech innovation study: “Coming Clean: The Cleantech Global Innovation Index 2012” study ranked 38 countries across 15 indicators that relate “to the creation and commercialisation of cleantech start-ups, ...measuring each [country] relative potential to produce entrepreneurial start-up companies and commercialise technology innovations over the next 10 years.

Top-line results:

- Denmark leads the global rankings, “with its unique combination of a supportive environment for innovative cleantech start-ups, evidence of those start-ups gaining momentum, as well as a strong

track-record of companies commercialising their cleantech innovations and scaling them up to widespread market adoption, particularly in wind.”

- Scandinavian (or Nordic countries more broadly) “performed notably well, as Sweden and Finland also placed third and fourth respectively. These countries ... are behind [Denmark and Israel] on their ability to scale-up entrepreneurial cleantech companies to wider commercial success. (A pattern shared by fifth place country the United States.)”
- “China and India placed 13th and 12th respectively, but stand out as having a strong potential to rise through the ranks in the coming years. While not currently creating innovative cleantech companies in great numbers relative to the size of their economies, they are already strong centres for cleantech production, and have increasingly supportive governments, large sums of private money ready to be invested, and massive domestic markets.”

- Romania received an average score for cleantech-specific innovation drivers, though it had well below average scores on all other factors. It lacks: general innovation inputs, an entrepreneurial culture, and a local cleantech investment community.

5. Conclusions

- The global financial crisis that began in 2007, and is still resonant today, is considered by many economists as the worst financial crisis since the Great Depression of the 1930s. One of the key lessons we can draw from this experience

is that running economies the way we've always done, doing business as usual, is clearly not an option. The new Green Economy is therefore a proposal for an alternative and far more sustainable way of doing business.

- A green economy is described as one that results in improved human well-being and social equity, while significantly reducing environmental risks and ecological scarcities. In other words, we can think of a green economy as an economic environment that achieves low carbon emissions, resource efficiency and at the same time is socially inclusive.
- There is no unique definition of the green economy, but the term itself underscores the *economic* dimensions of sustainability or, in terms of the recent UNEP report on the Green Economy, it responds to the “growing recognition that achieving sustainability rests almost entirely on getting the economy right”. It also emphasizes the crucial point that economic growth and environmental stewardship can be complementary strategies, challenging the still common view that there are significant tradeoffs between these two objectives – in other words, that the synergies prevail over the tradeoffs.
- The Clean Revolution is a swift and massive scaling-up of clean energy technologies and infrastructure. It will satisfy the increasing energy requirements of emerging economies which are determined to develop unhindered, while continuing to provide the high quality energy services the developed world has come to expect.

Abstract

The issue of establishing various categories of statements within scientific research is not new and does not represent a niche subject, only debated within certain sciences or during different time spans. We could say, more than that, that the proposed subject is, at this time, and was in the past, an attraction point for researchers in all scientific fields, regardless of the more permissive or strict manner of delimitation. Logicians, philosophers, sociologists, linguists, and last, but not least, economists, have dedicated ample spaces within their researches in order to establish the different role of various statements within the scientific research. Through this paper we will present our own vision concerning content and the role of empirical statements in the scientific researches in general and within economic science, in particular.

Keywords: empirical statements, empirical economic statement, the sufficient attributes of the concept of empirical economic statement.

J.E.L. Classification: B40, B41

1. Introduction

In order to achieve our purpose, we have established the following objectives for our study:

- The inventory of sufficient predicates which a statement must fulfil in order to be included within the category of empirical statements;
- Establishing the various types of statements which are included in the empirical ones, of another sort of statements which exist outside the

empirical ones and their role within the scaffolding of scientific research activities;

- Establishing the sufficient attributes which an economic statement must fulfil in order to be included in the category of empirical statements;

The method of research that we will apply in reaching the proposed objectives will consist of a critical analysis, realized from a logical perspective, of the main points of view expressed throughout time in connection with the proposed subject and expressing one's own point of view. The result of this approach will be, we hope, the creation of a new personal approach in connection with the role of empirical statements within the research methods used within the case of scientific research within the economic field.

2. A methodological principle of scientific research – appearance

As we already said in our previous study [5], Kant [2] does not deny the existence of an objective reality, quite the opposite, he supports it, but he states at the same time that it is outside of our possibilities of rational knowledge. We know, from a rational point of view, through our senses, thus objective reality is filtered [3] and subjectivised. What we come to know about reality refers to those perceivable forms of manifestation of reality, so, to appearance, to a phenomenon [1] and thus not to the reality per se, to its essence, which remains unknown. Any primary observation created as a result of the study of the world around us implies our perception on this world. For this reason, we believe that any empirical statement must be tested by its confrontation with the primary observations which fundament it. The supported idea,

however, generates the appearance of the issue presented in the following paragraphs. Because these primary observations are at the core of statements concerning the surrounding world, they should meet, at the same time, the following prerequisites: to be synthetic sentences about the world we live in and to be non-debatable. A consequence of the principle of appearance is however the logical impossibility of meeting both conditions at the same time. Either the primary observation talks about what we believe about the world and *not the world as it is*, but then it does not meet the first condition, being, in fact, a statement about the watcher and not the watched object, or it presents a part of the external world and involves our perception about *belonging to this world*, being, in this situation, debatable. To put it differently, any primary synthetic observation about the world is debatable because it surprises its appearance, while any personal perception is undebatable, but it is not included within the synthetic affirmations about the surrounding world.

The principle of appearance become, we claim, within the presented context, a methodological premise of all researchers. In the following part of this paper, we will remember the solutions which have been taken into account by the specific literature when dealing with overcoming the methodological deadlock mentioned before, already presented in our aforementioned study [5].

3. The critical analysis of sufficient attributes of empirical statements

In order to limit the sphere of inclusion of the “empirical statement” category, we will try, in the following, to establish the adequate criteria which an statement must meet in order to be considered empirical, or, to put it in another way, the sufficient attributes of empirical statements.

Watkins [6] creates a synthesis of the criteria which have been used throughout time to delineate the category of factual understandable statements from other categories of statements. He presents the following categories of criteria:

- Translational;
- Verifiable;
- Verifiable or falsifiable;

- Falsifiable.

Watkins [6] realizes, within his study, an analysis of the criteria mentioned above, but judged not from the perspective of factual understandability, but from the perspective of their ability to reveal the difference between empirical statements and non-empirical statements. In the author’s opinion, the sufficient adequacy criteria (the attributes which we will also use until establishing our own criteria, in the second part of the paper) to set the bounds for an empirical statement are:

1. The possibility to universally generalize all the elements of the statement which refer to testable properties;
2. The lack of tautologies within the statement;
3. The lack of statements of a theological nature within a statement whose acceptance cannot be affected by observations.

The first adequacy criterion which Watkins [6] mentions is not one which cannot be challenged, and, for this reason, we will make a series of assumptions concerning its use. Through the “possibility of universal generalization of all the attributes of an assumption which make reference to testable properties” we understand the submission of all such attributes to the test of falsifiability (and not the one of verifiability), thus eliminating the false statements from the category of empirical statements.

The second criterion which Watkins [6] mentions, namely the lack of tautologies within the empirical statement takes into account the fact that it represents statements obtained by replacing several known terms of a statement with synonymous terms and this is why it is not tautology, which represents a logical truth and is empirically testable, but the initial statement that was the foundation for its construction.

The third criterion of adequacy mentioned by the author, namely, the lack from within the statement, of several tautological statements whose acceptance cannot be affected by observations, is cited, as no such statement is not testable.

Coming back to the boundary criteria whose usage has been considered throughout time to be possible with the purpose of creating demarcation line. The first category

of criteria on which we shall pause, from the chronological perspective of their occurrence, represents the translational criteria.

3.1. Translational criteria

According to Wittgenstein [7], any original sentence results from the logical processing of the elementary sentences, true or false according to performed observations, so the sentences which are not testable are meaningless. The world, he says, is completely described by the specifications of all the elementary sentences and the mentioning of these specifications being true or false. To make a difference between the empirical statements, a solution is thus, to build an empirical language which would be used as a “bed of Procrustes” for the statements which are subject to being tested. Those who cannot be expressed by the usage of the created language will not pass the test to which they were subjects.

The supporters of the translational criteria are the partisans of such an empirical language whose foundation is given by connected primary observations, through various logical connections. In our opinion, however, such a translational criterion would not be adequate for the third criterion for empirical statements which Watkins [6] identified. As Popper [4] proved, by building a counter-example, such a criterion would allow for the issuing of theological statements whose acceptance cannot be affected by observations, within the statement. As long as such a language includes, within its logical operations, an universally existential quantifier, negation, and primary noticeable elements, the statement “there is an X which was not born, will not die, is not divisible, is not limited and is not material; and there is no Y of which X does not know about or cannot influence or a Y which can influence X” is, according to the translational criteria, empirical [6].

Also, we believe that, considering all the presented aspects for the support of philosophical grounds of the appearance principle, an elementary statement bound to the surrounding world cannot be true or false, only apparently true or apparently false according to this principle. In this context, a universal generalization of all the elements of

the statement to which it refers is not possible.

As a result, a translational criterion cannot be used as a means for demarcation for the delimitation of empirical statements because it allows for the inclusion of theological statements within them and does not lead to the universal generalization of all the elements of the statement which refers to testable properties, which is in contradiction with the adequacy criteria defined before.

3.2. Verifiable criteria

Another solution to the problem which Wittgenstein [7] issued, proposed in an attempt to eliminate the lackings of the translational criteria, is that of using statement verification criteria, which, if confirmed via primary observations, validate the verified statements, confirming their empirical character.

The partisans of these verifiable criteria consider that the probability of an empirical statement to be true is greater and greater as the number of singular particular verified cases which confirm the statement in cause is greater.

The application of the checkable approach comes in contradiction with the first criterion which Watkins [6] established for empirical statements, because it does not allow for the universal generalization of all the elements of the statement which refers to testable properties. The probability that a universal law is true cannot be “pushed” towards zero most of the times by applying verifiable criteria, because most universal laws are statements which make reference to a number of situations which is invariably greater than the number of verified cases. The practice to determine the probability that an empirical statement is true by establishing a relation between the number of verified cases which confirm the statement to the total of verified cases most often generates the occurrence of a paradox, meaning that the statement which was empirically proven false has a high possibility of being true. This probability differs from zero, but only appears because the denominator has the number of possible cases (infinite) is replaced with the number of observed cases (finite).

Still, such a paradox cannot exist when the verifiable criteria are being used to confirm

empirical statements which regard a finite number of terms, completely observed. Considering all these factors, we believe that verifiable approaches cannot be used in these situations, in order to validate an empirical statement because the first adequacy criterion stated by Watkins [6] is not accomplished. According to the principle of appearance which we issued, an elementary sentence linked to the surrounding world cannot be true or false, but only apparently true or apparently false. In this context of universal generalization of all the elements of the statement which refers to testable properties is not possible and because appearance always allows for the apparition of new manifestations of the real which would transform elementary verified statements and considered to a certain point both true and universally valid, in challengeable statements. Testable properties which result after the primary observations are not logically unchallengeable, considering the appearance.

3.3. Verifiable and falsifiability criteria

Using this group of criteria appeared as a reaction of logical empiricists to the critics of Popper’s verifiability. Using this disjunctive criterion does not succeed in the delimitation of empirical statements because it breaks the second adequacy criterion which Watkins [6] issued, allowing the existence of tautologies within the statement. So, a statement like “Romanians are blonds or non-blonds” through “non-blonds” meaning “which are not blonds”, would be included within the verifiable half of the used criterion within the category of empirical statements.

And within the situation of using such a type of demarcation criteria, the testable properties which result from primary observations are not logically unchallengeable. Considering the appearance and using the same arguments as with the verifiable criteria, we have as a result the impossibility of their universal generalization, ergo the rejection of the first adequacy criterion used.

3.4. Falsifiability criteria

Popper [4] tries to solve one of the issues signalled within the first pages of this article, meaning that the synthetic primary observations on the world are challengeable because they also include their appearance, introducing a new criterion in the debate. He says that we can include them within the sphere of primary synthetic observations which we can test as long as we consider necessary. In other words, the author creates a relaxation of the defining characteristics of the primary observations on the world, considering that they must be synthetic statements about the world outside us which can be tested as long as we consider necessary. By introducing the testable criterion, Popper [4] accepts challengeable statements within the category of primary synthetic observations, with the condition that they can be tested (thus proven false). Statements with a theological content are however eliminated from this category, because they can neither be tested, nor unchallenged.

By introducing this new condition with a large affordability, Popper does not solve, we believe, the issue raised by the first adequacy criterion used by Watkins [6]. The possibility to universally generalize all the elements of the statement which refer to the testable properties is not logically possible as long as falsifiability does not solve the issue of primary sentences, true or false according to made observations.

Popper [4] states that we can accept within the category of empirical statements only those who contradict at least one of the primary observations, as true or false, considered “a potential falsifiability”. But the existence of potential falsifiability is impossible within the acceptance of appearance as a methodological principle. A “true” primary observation now can prove “false” in the future which involves the impossibility of a universal generalization of statements which refers to possible false properties. If within the situation of verifiability the observation of does not allow for the generalization, as showed before, neither in the case of falsifiability, an (apparently) unfalsified statement until the present moment, cannot be universally generalized, from a logical perspective, because:

- a) It could become false in the future or

- b) It was false in the past, but the appearance did not allow noticing its falsehood.

In the context of sufficient given attributes, the relaxation of defining characteristics of primary observations of the world which Popper [4] realized does not solve the problem of belonging which we raised because the second situation allows for the universal generalization of sentences which refer to properties which were already false. So, falsifiability cannot be used as a criterion of demarcation within the situation when we use the sufficient attributes of the empirical statements which Watkins [6] used in his article.

4. New sufficient attributes of empirical statements

Within the presented context, there are two possible ways to solve the stalemate of delimiting empirical statements from non-empirical statements. The first consists of redefining sufficient attributes of empirical statements, whereas the second consists of finding a new demarcation criterion.

Considering the vulnerabilities noticed as a result of the analysis of the first of the sufficient attributes of the concept of empirical statement, meaning the possibility of universal generalization of all the elements of the statement which refers to testable properties, we will choose the first of the options chosen above and we will try to adjust it. Considering the fact that using this criterion in conjunction with the principle of appearance makes it logically impossible to find a demarcation line among the reasons already mentioned, our purpose is, thus, to replace it in order to obtain a set of sufficient attributes through which the usage of an empirical statement will gain consistence. In our opinion, such a set is formed from the following three components:

1. The universal interpersonal acceptance of all the elements of the statement which makes reference through possibly false properties;
2. The lack of existence of tautologies within the statement;
3. The lack of theological affirmations within the field whose acceptance cannot be affected by observations.

One can notice that we left unchanged the two sufficient attributes which Watkins used and we modified the first. From this reason, we shall make several considerations bound by the use of delimitation of the concept of empirical statement.

As we showed before, neither verifiability nor falsifiability cannot allow for a universal generalization of all the elements of a statement which refers to testable properties. The situation changes, however, if we use as a first sufficient attribute the universal interpersonal acceptance of all the elements of the statement which refers to falsehood properties. The principle of appearance, mentioned within the first part of this study, does not allow for the fulfilment of primary observations, in a cumulative fashion, the following conditions: to be synthetic statements on the world we live in, undebatable. They are either personal perceptions of the world we live in, undebatable, or they are synthetic statements of the world around us, but then they can be contested. The issue which follows is determined by the way in which the passage from subjective statements (apparent) is made, to undebatable synthetic statements. The only solution which we see to solve this issue is the universal interpersonal acceptance of these statements.

So, in the situation in which falsifiability is used as a demarcation criterion, a true statement (apparently) can be, from a logical perspective, accepted in a universal and interpersonal fashion, even if:

- a) Can become false in the future or,
- b) Was false in the past, but the appearance did not allow for the observation of its falsehood.

5. The concept of empirical economic statement

If, within the most important part of our study, so far, we have tried to create the foundation for the concept of empirical scientific statement, in general, in this last part we try to establish the sufficient predicates which an empirical economic statement must fulfil. To fulfil this desideratum we will create a short recall of the way in which we define „economics”, in one of our papers. Economics, we said, is that kind of human action which is held in the expectancy of an immediate or subsequent

intervention in nature in order to change material changes with it. As the arguments which are at the basis of this definition were presented in another paper, we will not present them again, considering them known. As a result, we will use the given definition in order to found, from a logical perspective, the sufficient attributes of the concept of empirical economic statement. In our opinion, such attributes are:

1. The universal interpersonal acceptance of all the elements of the statement which make reference to falsehood properties;
2. The lack of existence of tautologies within the statement;
3. The lack of theological affirmations within the statement whose acceptance cannot be affected by observations;
4. The explicit or implicit inclusion of the realization purpose of the material and natural exchanges.

While the first three predicates characterize the proximal genre of scientific empirical statements, the fourth represents the specific difference for the class of economic empirical statements. To put it differently, through an empirical economic statement we understand that statement which does not include tautologies and theological affirmations, whose properties can be proven false, are accepted in a universal and interpersonal manner and which imply the purpose of the material and natural exchange. Any other formulas which do not account for the sufficient attributes mentioned above are not economic empirical statements, but statements with a metaphysical character. In our opinion, such statements cannot be included, due to this reason, within the category of scientific statements and cannot be the object of study for research within economics. A debate on

such statements is thus meaningless for scientific growth, and for this reason in particular, it cannot be included within the category of scientific ones.

Abstract

The notion of performance has multiple meanings and sometimes it is paradoxical as each company must define performance for its internal and external communication. As we are trying to find a definition of performance based upon the features that a company should have, we find that every day companies invent new ways to compete in a competitive environment. One thing is certain: performance is achieved over time and can be seen.

We will test the model on the analysis of credit risk indicators of multitude of existing indicators, we considered representative performance.

Key words: performance, credit risk, indicators.

Jel clasification: M40, M41, G32

Performance does not exist if it can not be measured (if it can be described by a set of measures or indicators, more or less complex). Performance assessment cannot be limited to a plain result.

Performance is a state of competitiveness of the company that ensures sustainable market presence. Performance is a potential indicator of future results that is due to meet strategic objectives. We can say that performance was not only a present or a

temporary situation; it also refers to the future.

We believe that the performing company is one that brings together the expectations of all partners: to comply with its contractual obligations and create value for shareholders, employees and customers.

The notion of performance is evidently associated to Profitability, Efficiency and Effectiveness. However, we believe that performance should not be confused with the indicators which describe it. Efficiency expresses mainly the quality of the economic activity of rationally using the production factors within the company. It is a fundamental requirement for the economy and it should always guide business actions and decisions. Efficiency is seen as an assessment term, a value concept, which is measured by the ratio between the value of the production obtained and the value of input resources. Efficiency applies within all socio-economic activities and it can be defined as the quantity of the useful effect retained in the effort unit. Efficiency reflects both economic and social effects. It expresses the maximum increase in results with minimum effort and time costs, this, of course, taking into account the specificities which vary from one branch to another.

Profitability is an issue that concerns any company because its activity is oriented towards profit, towards running a profitable activity.

The pursuit of an economic activity in

order to obtain a higher profit should be based on a coherent economic theory which has to guide the material, financial and human efforts of the company in a competitive environment. An increasing profit can be ensured by reducing uncertainty, the risk assumed in the economic activity. If there were no uncertainty, then we would know all the elements necessary to obtain profits; the companies would have the certainty that revenues are higher than expenses and there would be registered an increase in supply over demand, leading to a balance between revenues and expenses and the profits would be zero. However, in reality, uncertainty and risk lead to the existence of profits, without being reduced to zero by competition. Since, in a world without uncertainty, there would be no profits or losses, we might consider the profit or loss as a consequence of uncertainty.

“Therefore, the profit is not a payment to be made in order to obtain a resource, it is a remnant; it is what remains of the revenue after the total costs are covered, it is the result of forecasting the future more accurately than other competitors. It is a random income, and not a flat-rate income, which determines each economic agent to better anticipate the circumstances of his/her activities.” (Ciucur D., Gavrila I., Popescu C., 2007)

According to the neoclassical theory of risk, whose theses were drafted by A. Marshall and developed by A.C. Pigou, a company operating under uncertainty and whose profit is a random variable takes into account the following issues:

- the amount of the expected profit;
- the size of possible profit fluctuations.

Starting from the theory of the marginal unit, Marshall and Pigou tried to underlie the entrepreneur’s behavior. Thus, if there are two possible options which give the same expected profit, the entrepreneur chooses that option where the expected profit fluctuation is less. A decision involves choosing the alternative which allows the achievement of the same profit, but in terms of minimum fluctuations.

The fundamental thesis of the neoclassical theory of risk is that “for a higher expected profit, the entrepreneur is ready to accept a higher risk.” The concept of risk is financial, hence the need to capture and predict its size. The expected profitability is the one which, for a future period, has the greatest opportunity to achieve.

Performance may be defined as “a state of competitiveness of the company reached by a level of *efficiency* and *productivity*, which ensures its sustainable market presence.” (Niculescu Maria, Lavalette G., 1999)

Thus, taking into account the above definition, performance requires the simultaneous and complementary presence of the two “ingredients” which, separately, represent the necessary conditions of, but not enough for, performance. This is important because a holistic view of performance is possible only by correlating the dynamics of the two indicators.

Bogdan Andronic, in his work *Firm performance (Performanța firmei)*, brings into discussion a metaphor that expresses the above relationship, namely: “... we can compare the company with a car engine, the efficiency with the accelerator and the productivity with the clutch pedal...”

Therefore, a performing enterprise is also effective and productive, these being its effects (results). At the same time, efficiency and productivity are the causes that determine performance.

Professor M. Ristea believes that “we can associate the following three concepts to performance: efficiency, economy and effectiveness.” (Ristea M., 2000)

In conclusion, the enterprise *performance* requires knowledge of:

- a) current objectives, strategies and company policies;
- b) the achievement degree of economic objectives set for a period of time in order to be met by a company, i.e. the degree of the achieved economic efficiency;
- c) the productivity level of production factors, especially labor productivity;
- d) the performances reflected in the key

economic and financial indicators: profitability, liquidity, solvency, profit/share, return on investment, market share.

We focus on profitability as a measure of the company’s capacity to obtain profit, making a comparison between the results obtained and the means used in order to achieve it. *The profit* may not represent the company goal, but it is necessary in order to achieve its objectives. In general, the strongest competitors:

- create value;
- obtain competitive advantages and optimally distribute the created value;
- improve the ratio effect / efforts.

Achieving high performance requires meeting all the three conditions mentioned above, as it is possible for a company to perform work efficiently but without obtaining a competitive advantage, or certain products / services can have a competitive advantage even if they belong to, and are produced by, inefficient enterprises. In other words, it results that a business can be effective but not competitive on the market, in which case we can not talk about performance globally or we can talk about competitiveness at the company level but not about efficiency, which leads again to a lack of performance.

Return On Assets – ROA will be determined having in sight the average of fixed assets (between the beginning and the end of the period) because there is the probability of a false improvement of this rate by selling fixed assets towards the end of the considered period. At the same time, we will underline also the ROA’s assessment prospectively determined by using the balance sheet and profit-and-loss account foreseen by the customer for the next period; the same procedure will be used for the ROE too.

If shareholders have invested during the period by their own resources into business, we recommend ROE formula as formula of the financial return calculation {ROE = Profit / (capital at beginning of period + new capital investment - capital repayments during the period)}. Also, we may consider in calculating financial profitability the

credits given to the company by the shareholders; it’s preferred to consider loans directly subordinated loans to the bank because the bank ensures the stability of this resource in the company.

Return shareholder rate(*Jianu, I.,2007*) is obtained for a single period and it is determined based upon the formula:

$$\text{Return shareholder value ratio} = \frac{\text{Return} + \text{plus or minus obtained shareholder value}}{V_0} = \frac{d}{V_0} + \frac{V_1 - V_0}{V_0}$$

Where

d - dividend received by shareholders for the period taken into account

V_0 - value of shares at beginning of a period

V_1 - value of shares at end of a period

We can start from the amount of profit shown by the company forecasts or we can calculate this expected rate, as it concerns stock exchange listed companies taking into account the shares’ value. We can say however that, although derived in this way, the rate of return received by shareholders is not useful to the forecast.

To capture this aspect, we propose a different rate, shareholders’ required rate of return:

$$\text{Shareholders' required rate of return} = R_d + \beta_i * (R_p - R_d)$$

R_d - Interest rate

β_i - Coefficient β of i share

R_p - Rate of market return

$R_p - R_d$ - market risk premium

If the company is not listed to the stock market, we can calculate this indicator, by asking the company manager on what are the prospects for pay equity for the current year and we will compare the prospected value to the shareholders’ required rate of return.

The difference between the two rates is that the first one represents the company expectations to reward shareholders and the

second considers the claims of shareholders to have financed their capital invested.

By making comparison between the two we can anticipate the shareholders' decision to retire, to sell their share package or to accept corporate takeovers or mergers.

It's about performance only if :

Shareholder's required rate of return < Shareholder's earned rate of return

Both return rates become useful by comparing their dynamics too, from a period to another (at credit reanalysis or at the extension of lines of credit).

In addition, we recommend the analysis of the dynamics of earning per share - IFRS considers it as the main indicator as it concerns the analysis of business performance

➤ **Earning per share:**

$$EPS = \frac{\text{Net Income}}{\text{Total Shares}}$$

➤ **Dividends per share:**

$$DPS = \frac{\text{Dividends}}{\text{Total Shares}}$$

➤ **Dividend payout ratio:**

$$DPR = \frac{\text{Paid Dividends}}{\text{Net Income}}$$

This is how we can understand whether shareholders have been accustomed to a certain remuneration of capital in prior periods, if they chose to reinvest the company's profits or to keep their due dividends. Therefore, creating value is synonymous to profitability, in the spirit of "win - win" partnership; it seems unfair the banking practice to prohibit the withdrawal of dividends during the financing period.

Not ultimately completed and ongoing ROI should be considered. As tools for measuring their performance, a project is highly efficient if the return period is the smallest, the net current value is above zero, and the internal rate of return is higher than the average market interest rate or weighted average cost of capital. It therefore requires an analysis of previous investment status if they meet their return period and whether the projections set at the time of the investment are met. The analysis of ongoing investment projects efficiency plays a primary role in the estimation of credit risk. It must be identified the extent to which they are not hiding losses and they are well forecasted by the company.

We believe that in order to achieve performance, the company must engage itself into innovative strategies and not just focus on the efficiency of current research.

The Present and Future of Investment and Saving Across The European Union and The Euro Area

Urziceanu Ramona-Mihaela

Agora University ORADEA, Law and Economics Faculty

ganearamona2002@yahoo.com

Abstract

Much attention has been devoted in recent years to the sustainability and adjustment of global imbalances. This has put the spotlight on saving-investment balances across the world. This paper investigates the factors behind developments in private saving and investment across Member States with a view to explaining trends and projecting the adjustment of saving-investment balances in the near term. While neither the EU nor the euro area is characterised by any apparent major imbalance at the aggregate level, this masks a considerable diversity across countries. Divergences across Member States have come under particular scrutiny in the course of the financial and economic crises.

Key words: private saving, private investment, prospects, euro area Member States, outside the euro area.

Clasificare J.E.L.: O16.

1. Introduction

Gaps between gross national saving and investment are not problematic per se. Indeed, such gaps may be interpreted as reconciling the independent decisions of savers and investors and promoting the efficient allocation of savings towards productive investment across countries, which has in turn been facilitated by financial market liberalization and financial deepening among EU countries. In the initial stages of transition of Eastern and Central European countries, it appears that capital flows were channelled towards investment in productive capital stock. However, against a background of robust growth and contained inflationary pressures, the search for higher returns directed capital towards a wider range of opportunities, including less productive uses

in both the emerging countries of the EU and the catching-up countries of the euro area.

2. Aggregate and sectoral patterns in saving and investment

Over the long run, there was a strong downward trend in both investment and saving ratios in the EU between the early 1970s and the mid-1980s. From a cyclical perspective, the sharp drops incurred in the course of the recessions of the early and late 1970s were never recouped, leading to an overall contraction in savings and investment of about 5 pps. of GDP. This was followed by a relatively more stable period (1995-2000), characterised by average saving and investment ratios of around 21-23%. In the run-up to the financial crisis, both ratios recorded significant, albeit temporary, increases, while remaining below the previous peaks of the early 1990s. The crisis saw concurrent sharp drops in both ratios, which fell to all-time lows in 2009-2010. Overall, the saving-investment gap has remained very small over the past two decades for both the EU and the euro area.

Aggregate saving and investment patterns across the Member States prior to the crisis: stylised fact. The strong co-movement in saving and investment observed at the aggregate EU and euro-area levels was also the predominant pattern across countries in the period from the second half of the nineties to the mid 2000s. However, important divergences in movements of savings and investment were visible across the Member States in the period preceding the crisis. Typically, many countries experiencing stronger growth in investment were catching-up economies, with lower per capita income levels compared with the EU average, which benefited from large inflows

of foreign direct investment. Nonetheless, even for catching-up and post-transformation countries of Central and Eastern Europe – which have typically enjoyed relatively high investment ratios – investment growth was unusually strong compared with non-European emerging market economies with similar per capita income levels: e.g., the almost 20-pps.rise in the share of investment in GDP in Bulgaria and Latvia. In several countries, the investment boom was also linked to a strong expansion in house-building activity (e.g. the Baltics, Ireland and Spain). On the other hand, declines in investment-to-GDP ratios were recorded by several euro-area countries - Germany, Netherlands, Austria, Portugal and Slovakia - and some non-euro-area Member States - the Czech Republic, Hungary and Poland. In the latter group of countries, the increases in residential housing investment were muted in comparison with their regional peers. On the saving side, strong upswings were evident in the run-up to the crisis in a number of countries, namely Denmark, Germany, Ireland, Latvia, Lithuania, Austria, Slovenia, Finland and Sweden. Conversely, some Member States saw a noticeable deterioration in their saving ratios – particularly those suffering from long-lasting fiscal imbalances (Greece, Portugal and Hungary).

Adjustment during the crisis. Measures of dispersion broadly point to a reduction of cross-country divergences in investment and saving behaviour in the course of the crisis, although the dispersion of saving ratios broadly stabilised for the euro-area Member States. As a general pattern, both saving and investment ratios decreased noticeably as a direct consequence of the crisis. The Baltic countries (together with Ireland and Luxembourg) experienced the most significant downward adjustments. The reversal in investment activity, in particular, was sizeable in countries with buoyant investment in the pre-crisis period. These mostly catching-up countries – typically Member States with housing booms before the crisis – saw a significant downward correction in investment ratios (Estonia, Ireland, Latvia, Lithuania and Luxembourg). Saving ratios also fell sharply in most Member States. However, despite the economic slump, saving ratios rose in Bulgaria, Estonia, Latvia, Hungary and

Romania. All Member States with a marked increase in the saving ratio in the pre-crisis period experienced a drop during the crisis (Finland, the Netherlands and Denmark). Conversely, saving ratios continued to fall in most countries that had already witnessed noticeable reductions ahead of the crisis (Greece and Portugal).

Sectoral patterns underlying saving and investment across Member States ahead of the crisis: stylised facts. The various patterns in aggregate saving-investment dynamics across countries hide an even greater variation in sectoral trends. The private sector accounts for the major share (around 90%) of both gross national saving and investment. Within the private sector, the corporate sector predominates in most countries in terms of both source of saving and instrument of investment. In the pre-crisis period, gross national saving was driven up largely by higher general government saving across the Member States. This reflected—to varying degrees - successful fiscal consolidation efforts and boom-related windfall fiscal revenues. The corporate sector also contributed to higher savings. In particular, higher corporate saving was recorded in the non-euro-area countries and in some euro-area Member States (Germany, Estonia, Ireland and the Netherlands). In most Member States, the saving ratio was depressed primarily by lower saving in the household sector (Estonia, Greece, Italy, Romania and the United Kingdom). Nonetheless, the household sector made a neutral or slightly positive contribution to the change in overall saving in some Member States (Germany, Austria and Sweden). Rising investment by the household sector was typical in countries experiencing a housing boom (Denmark, Estonia, Ireland, Spain, Latvia, Lithuania and the UK) and was partly driven by considerable foreign capital inflows in some countries. The corporate sector also contributed to higher investment (Estonia, Latvia, Romania and Slovenia) – linked in most cases to large inflows of foreign direct investment. At the same time, among the older Member States, Spain, France and Italy also recorded a marked increase in corporate investment rates. On the other hand, lower corporate-sector investment weighed on aggregate investment ratios in some Member

States (Germany, the Netherlands, Slovakia and the Czech Republic). The general government sector had a mostly neutral or positive impact on the overall investment ratio (generally in the non-euro-area Member States), although some countries recorded a deterioration in the government investment ratio ahead of the crisis (Germany, Austria, Portugal and Slovakia).

Sectoral developments during the crisis. The decline in saving ratio was largely driven by a sharp drop in general-government saving during the crisis. This reflected, inter alia, the impact of the crisis on general-government revenues and expenditures via automatic stabilisers and stimulus measures. Only Hungary recorded an increase in general-government saving – the result of limited fiscal room for manoeuvre against the background of a balance-of-payments crisis. Moreover, in most euro-area Member States, where corporate saving had increased before the crisis, corporate saving also came under pressure (Estonia, Ireland, Greece and the Netherlands). Nonetheless, an increase in household saving in most Member States – along with a continuous rise in saving in the non-euro-area corporate sector – acted to partly offset this general trend. The pre-crisis investment boom was abruptly reversed during the 2008-2010 period. Most Member States experienced falling investment ratios largely due to a sharp drop in investment activity in the corporate sector (particularly in Ireland, Latvia, Lithuania and Estonia). The household sector also contributed significantly to a decline in the investment-to-GDP ratio – in particular in Member States with unwinding housing booms (Spain, Ireland, Estonia and Greece). However, in some Member States, higher public investment partly contained the drop in investment ratios in the private sector (Poland, the United Kingdom).

3. An assessment of potential driving forces behind developments in saving and investment

Drivers of national saving. National saving is important from both the micro and the macro perspectives. At the micro level, households save to fund retirement, purchase expenditures. Corporations save to fund their

own investments or to strengthen their balance sheets. At the macro level, depending on the current-account position of the country, saving can fund domestic investment either partially or completely and accumulate net claims against foreigners. Movements in the saving ratio (both public and private) have an important influence on domestic demand, helping to determine both domestic capacity utilisation and, through the saving-investment balance, the country's current-account position. This sub-section examines the factors which drive saving ratios in the government and private sector.

Drivers of government saving. The factors which lead governments to run deficits or surpluses are numerous, complex and much-studied. The most important time series determinant is usually the cyclical position of the economy, as higher transfer payments and lower tax receipts worsen the fiscal balance during cyclical downturns. At the EU and euro-area levels, this relationship appears to hold remarkably well. However, at the individual country level, the picture is more varied. For the ten years up to 2007, the correlation between the deficit and the output gap is significant at the 5% level in only ten Member States. This increases to 21 Member States when the end-date is moved to 2009 to include two years of the financial crisis which brought a relatively uniform worsening of fiscal balances and widening of output gaps across the EU. The remaining six Member States are Romania. Of these Member States, four had average deficits over the period of at least double the EU average. Persistent deficits could be linked to a weak cyclical response of the fiscal balance, for example if a less-than-reliable tax base caused revenues to respond to factors other than the cycle.

Drivers of private saving. The drivers of private saving are more complex. An important issue is the distinction between the household and corporate sectors. However, data on the sectoral breakdown are not always reliable enough to draw strong inferences on the distinct behaviour of the two sectors. For households, the theoretical starting point for this section is a life-cycle consumption model although there are widely-acknowledged deviations from this model in practice, particularly due to considerations of uncertainty and constrained

liquidity. The corporate sector is fundamentally an intermediate one, owned finally by the household sector and foreigners. The preferences and rights of shareholders therefore play a role in determining saving. If it can be assumed that shareholders generally prefer to have cash over and above that needed for the operation of the business paid to them as dividends and that company management has incentives to hoard cash and therefore maximise their range of strategic options, it would be reasonable to expect countries with more developed shareholder rights to have lower rates of corporate savings. More concentrated ownership of firms should have the same effect, because larger shareholders have greater incentives and opportunities to influence company managers. Because of such factors, interest rates may not have the same impact on corporate saving as in other sectors, since high interest rates could just as well be expected to increase shareholder demands for dividends, reflecting the higher opportunity cost to shareholders of leaving the money within the company. It is also possible that some households vary their saving behaviour according to the behaviour of the firms which they own, saving less when the firms they own save more, in anticipation of bigger dividends in the future. Household and corporate savings in the EU are not strongly correlated and trended in opposite directions during the pre-crisis decade, suggesting that the drivers of saving behaviour in each sector are different.

The role of interest rates in influencing saving behaviour is complex. It is clear that higher interest rates increase the incentive to save but they may also reduce disposable income, and therefore the opportunity for saving by net-debtor households and firms, meaning that the overall effect varies with the relative marginal propensities to save of net creditors and net debtors. The market-clearing interest rate also responds to developments in demand for financing and, in an open economy, foreign capital supply and demand. EU real interest rates and savings followed a markedly similar downward path in the mid-and late nineties. But their paths have diverged in the more recent past. A common influence on private-sector saving, of particular current importance, is public sector saving. Both

households and corporations may save more in anticipation of future tax rises if the government has a large deficit. The causality could also run the other way, with governments increasing their borrowing at times of high private-sector saving in order to make up for shortfalls in aggregate demand which such higher saving could create in the absence of strong export demand or domestic investment. It is also likely that common factors will act in opposite directions on the private sector and government balances. For example, higher cyclical unemployment increases the government deficit and is also likely to increase household precautionary savings. The relationship between government and private saving is therefore also connected to the economic cycle and the output gap. This negative correlation between government and private-sector saving does appear to hold for the EU as a whole. A final potential influence is that of demographics. The greater the proportion of life a worker plans to spend in retirement, the more he should save during his working life. With a constant retirement age, this would translate into a positive relationship between saving and longevity. However, it would not be surprising if such phenomena did not show through in the data. In reality, few individuals make specific calculations about the exact level of saving needed to retire comfortably at a given age.

Determinants of investment. Investment is a crucial element of economic performance. It determines the size and structure of the capital stock and enables the penetration of new technologies, thereby influencing employment and growth prospects in the medium-and longer-term. Moreover, as one of the most volatile components of aggregate demand, investment is a key driving force of the business cycle. This section begins with a description of cyclical fluctuations in investment before turning to the drivers of investment. Over the period 1996-2010, real investment in the EU grew on average at about the same rate as real GDP, i.e. slightly below 2% per year. As a result, the share of investment to GDP (in constant prices) remained broadly unchanged for the period as a whole, at around 20%. This is in line with the standard growth literature which suggests a constant investment-to-GDP ratio over the long run. In spite of this long-run stability,

the investment- to-GDP ratio has fluctuated over the business cycle. This is because investment displays a clear pro-cyclical pattern, accelerating more than overall economic activity at the beginning of recoveries and decelerating more during slowdowns. Over the period 1996-2010, two cycles can be identified: the first in the late 1990s and the second towards the end of the last decade. During the second cycle, the investment-to-GDP ratio experienced a wider fluctuation: 2½ pps. in terms of annual figures between peak (2007) and trough (2010) against 1½ pps. in the previous cycle.

Drivers of private investment. The most straightforward model of investment –the "accelerator model" – in its simplest form postulates a linear relationship between investment and changes in output. As the microeconomic foundations of this relationship are rather poor, other models have been developed which emphasise the role of costs. Modern economic theory focuses on three main macroeconomic determinants of investment: aggregate demand, cost of capital and profitability. In turn, the key components of the user cost of capital are financing costs, the purchase price of new capital relative to the output price, and the depreciation rate of the capital stock. The remainder of this section explores the potential explanatory power of these investment drivers for the various investment trajectories of capital formation in the EU countries over the last 15 years. Where aggregate demand is concerned, several Member States fared much better than the EU average in the years preceding the financial crisis. Between 1996 and 2007, the average growth rate of GDP exceeded 5% in Estonia, Ireland, Latvia, Lithuania and Slovakia compared to 2½% in the EU as a whole. Although demand growth may account for part of the difference in investment growth rates, it cannot provide an explanation for the diverging trends in the share of investment-to- GDP compared to the EU. For the user cost of capital, long-term real interest rates are commonly used as indicators of borrowing costs. The latter decreased significantly in several EU countries in the ten years preceding the financial crisis. On average, their level in the EU in 2007 was about 2½ pps.lower than in 1996. Focusing only on long-term real

interest rates as a measure of the user cost of capital may be too restrictive. A better measure of the overall cost of financing could be a composite indicator, which would take into account the composition of the source of financing, e.g. loans, debt securities and equities. However, while the various measures of the cost of capital may exhibit different developments and volatilities in the short run, the underlying trends tend to co-move in the long run. The equipment-construction breakdown of investment shows that this negative correlation between the investment price deflator and the investment to GDP ratio holds and largely stems from equipment rather than construction investment. This is hardly surprising. As the real-estate booms of the past decade in several EU countries have shown, it is the expected rather than the actual relative, price of output which spurs capital spending in the construction sector. Observed patterns of construction investment in Ireland and Spain seem to confirm this. In both countries, expectations of rising real estate prices boosted construction investment well above normal levels. For instance, the recently-acceded EU Member States have traditionally enjoyed a lower wage share (higher profit share) than core euro-area countries. The evidence is not categorical, however. Germany and Spain experienced very different investment patterns, particularly in the construction sector during most of the past decade, despite similar developments in the wage share. All in all, the examination of traditional macroeconomic variables suggests that they are unlikely to be able to fully explain the different investment patterns observed in several EU countries since 1996. Divergent expectations about future profitability across countries, possibly related to underlying structural differences in labour and product markets, have also probably played a role. But there is reason to believe that financial conditions play a role in corporate investment decisions.

4. Near-term adjustment prospects for saving and investment

On one hand, the ongoing fiscal consolidation is set to improve government savings by around 1¾ pps.and 1½ pps. of

GDP, respectively, in the EU and the euro area. On the other hand, saving ratios in the private sector are set to decline as, in line with the empirical results, they react negatively to the increase in government savings and possibly the worsened terms of trade related to higher prices of imported commodities. As a result, over 2011-2012, the overall increase in the saving ratios of the economy as a whole is expected to be relatively limited in both the EU and the euro area – in the order of 1pp.of GDP. These developments at aggregate level reflect similar patterns projected for most Member States. However, the size and sectoral composition of the adjustment vary widely. Some euro-area Member States, which are characterised by large imbalances and relatively low savings ratios, are expected to increase their saving by more than the average. This is particularly evident for Greece, where both the government and the household sectors are engaged in balance-sheet adjustments, while the large adjustments anticipated in the government sector in Ireland and Portugal are set to be only partly offset by lower savings in the private sector. Outside the euro area, saving ratios are set to rise significantly in Lithuania and the UK between 2010 and 2012. In the former, private saving is expected to increase marginally in parallel with a large improvement in government saving.

The expected overall moderate increase is driven by the rise in the private (especially corporate) investment ratio, while some decline is anticipated in government investment ratios, in line with the results of the previous empirical analysis. Corporate investment is set to benefit from improving demand prospects, still low real interest rates and moderate wage increases. At the country level, the decline in the investment ratio is set to continue over the forecast horizon in those euro-area Member States where large balance-sheet adjustments in both private (particularly household) and government sectors are still warranted, namely Ireland, Greece, Spain, Cyprus and Portugal. On the other hand, investment ratios in Estonia, Malta, Latvia and Lithuania are expected to benefit from renewed inflows of FDI.

The above projections for changes in saving and investment ratios imply broadly stable current-account balances in both the

EU and the euro area over the forecast horizon. Where imbalances within the euro area are concerned, sizeable improvements in the current-account balance over the forecast horizon are anticipated, in particular in Greece and Portugal, due to higher saving but also lower investment ratios. The still-sizeable external imbalances in these countries would suggest that further adjustment in sectoral balance sheets and improvements in competitiveness are to be expected beyond 2012. Some further adjustment also seems likely in those euro-area Member States where the anticipated increase in domestic demand is not sufficient to shrink the large current-account surpluses by 2012. On the saving side, progress on consolidation of public finances is likely to have a crucial impact on private saving ratios, which will differ depending on the fiscal space available. In Member States with the greatest need for fiscal restraint, reductions in the private saving ratio might partially compensate for this. As regards private investment, an important boost is likely to come from the closing of the output gap and gradual improvements in GDP growth. The restoration of profits in the corporate sector could also support investment.

5. Conclusions

As regards private investment, an important boost is likely to come from the closing of the output gap and gradual improvements in GDP growth. The restoration of profits in the corporate sector could also support investment. The impact of other determinants are likely to vary considerably across Member States: differences in real interest rates as well as relative cost of capital (partially reflecting falling prices in the construction sector of many EU countries), should have a differentiated effect on investment levels across Member States.

Abstract

Concerns for sustainable development at the level of every country and at international level are the result of a group of problems that are worrying: poverty in the middle of welfare, environmental degradation, losing trust in institutions, uncontrolled extension of urbanization, unemployment and other economic-financial or geopolitical crises.

Sustainable development policies start from the understanding of the fact that the economy of a country and of all countries means more than the sum of its parts, the alterations occurred within a subsystem cause changes by virtue of the dynamic interdependencies existing between the parts.

Cuvinte cheie: environment and environmental policy, social cohesion, development policy, sustainable economic development

Clasificare J.E.L.: E61, H12, O16, O20, R11;

1.Introduction

Sustainable development is considered that type of development that answers the needs of the presents, without compromising the abilities of future generations to fulfill theirs. Present generations cover their needs accordingly.

Sustainable development policies start from the understanding of the fact that the economy of a country and of all countries means more than the sum of its parts, the alterations occurred within a subsystem cause changes by virtue of the

dynamic interdependencies existing between the parts.

2. Sustainable development - multidimensional concept

Sustainable development is a multidimensional concept to the extent in which[1]:

1) It has a powerful moral weight. On the inheritance that every generation inherits, it builds its future; it is the duty of the current generation to give at least the same chances that it has inherited.

2) It is established as a worldwide concept to the extent in which we admit that there are no economic or ideological borders for pollution, poverty, waste and human degradation.

3) It supposes a different treatment depending on time and especially space and for space, meaningful distinction is between the rich and the poor. If in rich countries, the problem of de-pollution, improvement, living quality is a transformation one, for poorly developed countries the matter is not one of living quality, but rather of survival.

4) The notion of sustainable refers to duration, to a long time, the concept refers to the increase of quality to the disadvantage of quantitative economic growth. The process of sustainable development wants to be sustainable human development mainly oriented towards living and environmental quality.

5) The approach of the phenomenon is made on predominant economic positions. Economic philosophy is guilty of ecologic degradation and social, moral and political mutations, depending on the

growth type and post-war consumption way to which sustainable development proposes to answer.

6) The environment and environmental policy have a privileged place. Ecosphere degradation degree provides explanations in this matter.

7) Theoretical approach of the phenomenon of sustainable development has had a political weight more and more because political involvement in the economic and social life has been a doubtless fact.

Sustainable economic development involves intensive economic growth, environmental quality, creation of a favourable framework for solving social problems that the individual and communities are facing within the spirit of social justice, of democratization.

The pattern of sustainable economic development is centred on man and on fulfilling its needs, on human development, evolution by means of three indicators: living hope, valorization level and national income per inhabitant/wealth.

The pattern of sustainable development specific to the economic and social systems supposes compatibility of economic efficiency criteria with social, human and ecologic efficiency ones in order to provide equality of chances to the generations that coexist and succeed on earth.

Sustainable development is not a philosophy but it rather inspires economic and social policy on multiple directions. At the level of principles, sustainable development policy means[1]:

1) Increasing the concern for values economy directly requiring the decrease of specific consumers, raw materials and energy, with the preservation of goods quality;

2) Promoting a new technical production method based on:

a) Trivalent enterprise, regular company “to operate within a

network” taking from upstream and providing in downstream

b) “clean productions” with as less polluters as possible and less waste as possible

c) Biologic agriculture

3) Promoting a new way of consumption which refers to: reconsideration of the notion of need, the philosophy of reason instead of profit logics, removal of consumption from the effect of advertising

4) The solution of market by establishing competition mechanisms in allocating all the resources; application of the principle according to which the polluter pays by clearly defining and strictly complying with ownership rights; direct negotiation between economic agents, internationalization, guarantee-collection systems.

5) State solution which is materialized in the application of regulation and control standards and other measures; direct implication of the state in the economic and social policy and resources consumption regulation.

6) Promoting a new type of economic growth characterized[5] by:

a) A severe campaign against waste

b) A cult for product durability

c) Reconsideration of the importance of recycling

d) Permanent search of substituents and alternative technologies

e) Consistent effort for saving

f) Collaboration between generations

g) Distribution of results that bring social progress.

Sustainable economic growth is understood as a growth capable to support economic stability and human progress on long-term, to harmonize ecologic requirements with economic and human development.

This opinion connects the increase of sizes and change of structure. It excludes the assimilation of growth with progress.

This concept comprises four groups of phenomena[6]:

1) Increase of size which is revealed by size indicators especially by GGP (gross global product) of the national economy;

2) Objective structure alterations revealed by several structural indicators and coefficients: industrial product (IP)/ total product (TP)/ total profit (TP) etc.

3) Systems or groups of institutions alterations which control the fulfilment of fundamental economic functions within their mutual relations;

4) Progresses which are the result of an economy or of one of its parts towards a purpose being revealed by quality indicators, average, structure indicators, groups of several simple indicators.

Following the general trend of economics evolution towards an increased level of efficacy and pragmatism, the theory of economic growth develops towards a theory of economic growth process forecast that have the role of analysis and macroeconomic decisions substantiation regarding the growth process[7].

Sustainable development wants to be an alternative to post-war economic growth that because of the economic and social progress has caused negative effects. From this point of view, the supporting arguments of sustainable development are critics made to the weak functions of the type of economic growth. We can show that the type of post-war economic growth polluted the environment and affected human health, caused and encouraged waste by finishing the known reserves, frustrated the third world and increased the differences from that of the rich, created the illusion of welfare through lying statistics, corrupted well-known values and reduced the individual to one dimension that of homo oeconomicus[1].

These minuses underlined by literature on the theme of sustainable development show that the pattern of post-war economic growth has turned out to be a universal remedy and that the philosophy of the dominating man that owns the nature and acts as he pleases has to be changed.

Economic growth is the sustainable size of an economic, simple or complex unit, made by changes of structure and possible systems and accompanied by economic progresses.

Concerns for sustainable development at the level of every country and at international level are the result of a group of problems that are worrying: poverty in the middle of welfare, environmental degradation, losing trust in institutions, uncontrolled extension of urbanization, unemployment and other economic-financial or geopolitical crises.

Sustainable development policies start from the understanding of the fact that the economy of a country and of all countries means more than the sum of its parts, the alterations occurred within a subsystem cause changes by virtue of the dynamic interdependencies existing between the parts.

Starting from factors that influence one another in the process of development – population, natural resources and environment, agricultural production, industrial production and pollution – the policy of sustainable development wants to find the most adequate optimization criteria of the needs-resources ration, objectives to be reached, means necessary based on their mutual compatibilities in time and space. Such an economic environment has to be designed and developed which by means of its inputs, transformations, outputs, to be able to enter in direct dynamic compatibility with the natural environment and with the present and future needs and interests of the generations.

The concept of sustainable development as well as its achievement policy cause the problem of man purpose-means and human community in general from the points of view of time and space[8].

Such perspectives that have to be integrated in sustainable development depend on man’s culture, on its past existence, on the actuality and difficulty of its problems at every level, on the development and incorporation level of scientific and technical discoveries, on national and international development strategies. Mutual compatibility in time and space of the four extents (natural dimension exists only as long as the environment created by man is compatible with the natural environment, economic dimension based on competitiveness, social-human dimension, all outputs from the environment created by man have to directly answer the present and future needs and interests of coexisting generations, national state, regional, and world dimension within the meaning of optimization criteria compatibility at national, regional or international level) give the development criterion a durable character.

Through the answer that has to be given to the existing trends – fast increase of the population, accelerated industrialization, malnutrition, disappearance of resources and a deteriorated natural environment, the policy of sustainable development proposes to create the conditions for passing over the limits of progress in time and space both quantitatively and qualitatively from the position of the social man, of the compatibility of the environment created by him with the natural environment, of generations in time and space.

3.Vision of sustainable development

The vision of sustainable development integrates the following major requirements at the level of all national economies and at the level of the global system of world economy[7]:

1) An essentially revised fundamental behaviour as a direct way of fighting against objective and subjective restrictions of development and cohabitation with the natural environment;

2) Substantial improvement in real, absolute and relative terms of development in developing countries in relation to developed countries of the world;

3) Strategic planning with specific and common elements in direct compatibility both at national and international level;

4) Reaching a rational and durable state within the conditions of educational traditions and current activities, of immediate interests will slow down transformation, the success being provided the real understanding of human condition in the context of radical change.

5) By passing to sustainable development, one hopes to achieve a safer and safer present within a future through this complex and long lasting process;

6) Within this fundamental process, it is essential that science helps man investigate itself under its aspects and objectives as well as investigate the world it wants to change;

7) Within this complex process, the key of sustainable development is not only the survival of the human species, but rather whether it can survive without falling in a state of existence lacking any value.

Sustainable development is defined by the following important elements:

1) Permanent and safe compatibility of the environment created by man with the natural environment;

2) Equality of chances of the generations coexisting and succeeding in time and space;

3) Interpretation of the present through the future under the form of introducing the purpose of sustainable development the natural and human safety instead of money profit maximization;

4) Introducing the compatibility of national development strategies as a result of powerful interdependencies within geo-economic and ecologic plan;

5) Moving the weight centre in providing general welfare from the quantity and intensity of economic growth to its quality;

6) Ecologic capital is interdependence and organically integrates with the capital created by man within a global category that redefines the economic and social objectives and extends its horizon in time and space.

7) Passing to a new natural-human strategy in which the objectives of economic and social development have to be subordinated to human and environmental curing in time and space.

4. Conclusion

Starting from the need to achieve these components, the policy of sustainable development wants to detect the change of economic growth type, pollution control, creation of an institutional and legislative framework, educational system able to anticipate and deepen the knowledge, the system of economic instruments, able to prevent, protect and provide rare resources, the system of specific indicators based on which one can appreciate the quality of development and human life, ecologic balance.

Sustainable development needs short-term and medium-term policies and long-

term for 20-25 years. Policies are therefore necessary at regional, international and planetary level and at the level of the company with compatible objectives in time and space based on criteria that result from the improvement of living conditions. At the same time with the substantiation of these policies, it is essential that every level operates as a sum of economic, judicial, substation and information regulating means that provide the fulfilment of objectives.

Financial Risks Insurance

Văduva Cecilia Elena

vaduva.cecilia@yahoo.com

Abstract

The credit insurance protects the dealers and the producers from the risk of non-payment by the consumers who buy or rent goods or benefit from similar credit facilities. It appeared as a necessity coming from the fact the most of the trade contracts are concluded when the payment is made partially or totally after the delivery of the goods or the performance of the services making the contract object, so with a late payments, respectively "a credit sale".

Keywords: risk, insurance, credit insurance, decentralized economy

J.E.L. Classification: E20, E22, E24

1. Introduction

Financial insurances represent a relatively new form of insurance appeared as a consequence of the process of narrowing the distinction between financial institutions and insurance ones. It is a new concept by means of which the insured one removes the risks of financial losses that may appear in its activity, transferring them to an insurer.

Commercial credit represents both the value transferred to the buyer by a seller based on trust, and the lapse of time before the reimbursement by the buyer of the value, as payment[1].

The financial insurances are different from the bank guarantees. By the financial insurances, the risks are taken over only in certain conditions, while the bank guarantees involve the unconditioned assuming of all the obligations.

The commercial guarantees coming from the need of the persons responsible for offering guarantees against the non-payment, have started to be used thousands of years again. Such a guarantee was offered by means of one or several private guarantees

that assumed their responsibility for the non-payment risk. Such a system was considered as inadequate and even condemnable for the guarantor.

The guarantees offered by the companies acting as a bail have multiple advantages. The first company of England that practiced this system was Guarantee Society, in 1849. Subsequently, others insurers started to practice or were even constituted in different forms of association for practicing this type of insurances, by using different types of bills, either individually, or in group.

In 1934, based on the Swiss Civil Code, the International Association of the Credits and Investments Insurances was constituted and called the Bern Union, having as a purpose the acceleration of the free exchange of information regarding the country risk and the establishment of certain healthy principles and rules and of the discipline in international trade and in the field of insuring the export credits and the foreign investments[8].

2. The role of the credit insurance in the modern economy

The credit insurance is a special insurance because its object is much different than the other types of general insurances. The credit insurances certainly represent a feature of the contemporary business world.

The credit insurance protects the dealers and the producers from the risk of non-payment by the consumers who buy or rent goods or benefit from similar credit facilities. It appeared as a necessity coming from the fact the most of the trade contracts are concluded when the payment is made partially or totally after the delivery of the goods or the performance of the services making the contract object, so with a late payments, respectively "a credit sale". Thus, the credit insurance comes to remove the seller's fear regarding the non-payment by

the buyer of the amounts he deserves, offering protection for the non-payment risk. The reason may be represented by the buyer's financial situation or, if the sale occurs in another country than the one where the seller is, the causes related to the situation of the importer's country. The credit insurance appears as a direct protection of the sellers from the risk of non-cashing and, at the same time, as a guarantee in front of the bank, also constituting a possibility to access the financing[6].

The insurance may be made on only one credit or on the business number.

The purpose of the credit insurances is to protect from the financial losses resulted from the non-payment, the payment incapacity or the insolvability of the buyers who purchased goods on credit or the insolvability of the credit beneficiaries. The bills of credit insurances protect the collections from the commercial activity in conditions of transferring the non-collection risks on the insurer and, as a consequence, the business number may increase.

The credit insurance is considered as a luxurious insurance, as it is specific and it works in optimal conditions in the framework of the market economies, with a stable and well developed credit system. Globally, most of the credit insurances are practiced in developed countries.

The credit insurers usually offer a large scale of services, next to the insurance ones, such as; market studies, consultancy, technical assistance, feasibility studies, credit investigation and surveillance. Among the insured risks, we may also meet some that are more rarely accepted on the market, such as: exchange risk, expropriation risk, restrictions for the fund transfer, etc.

Even if the insurances against these risks are available on the national and international insurance markets, only a relatively reduced number of dealers call them in the entire world.

It is important to notice that, no matter the size of the risks, 3 demands for the insured ones are distinguished[9]:

1. Prevention, by collecting, processing and interpreting the information on clients, in order to minimize the non-payment risk;
2. Collection of the debts, respectively the ability to recover the debts anywhere

in the world, no matter the differences regarding the language, the culture or the legislative system;

3. Insurance, respectively the payment of the compensation in case of non-payment by the debtor to the insured one.

The insurable risks may be grouped in two categories:

1. Commercial risks, that are related to the buyer's financial situation and refer to:
 - a) The non-payment due to the buyer's insolvability.

Insolvability may be determined by different causes, such as: bankruptcy; any measure of forced execution on the property of the debtor who did not lead to the integral payment in favour of the insured one of the invoiced amounts; the execution of a judicial decision of homologating the agreement contracted between the debtor and its creditors; an agreement with no judicial procedure with all the creditors or with most of them; suspension or the official moratorium on the payments due by the debtor or any similar measures according to the legislation of the debtor's country.

- b) The temporary or permanent impossibility of the buyer to pay the purchased goods or the performed services.
 - c) The buyer's refuse to accept the contracted merchandises for reasons that do not depend on the seller.

2. Political risk, that represents a special category, very important for the correct evaluation of the possibility to return the credit and, implicitly of the non-payment risk. This risk interferes only when insuring the export credits. It may be mainly determined by the "subjective elements existing in the importer's country. By producing one of the risks afferent to the respective country, the entire contractual relation between the partners may be damaged. The political risk may be incarnated in:

- a) Difficulties and delays (longer than a certain number of days, usually 180) in the process of transferring the money from the buyer's country, as a consequence of a general moratorium, regarding the extern debt, declared by

- the government of the buyer's country, by means of which the payment is accomplished;
- b) The impossibility to transfer those amounts from the importer's country to the exporter's country as a consequence of certain governmental actions in the respective country (the one of the buyer) stopping the accomplishment of the export contract or determining delays in the money transfer;
 - c) Introducing certain regulations regarding the export or import licences to the buyer's country, retiring or non-renewing the export licence or imposing some commercial restrictions, after the date of entering the risk;
 - d) War, civil war and other similar events, outside the exporter's country, making impossible the accomplishment of the export contract, if the damage is not insurable as a commercial risk;
 - e) Risks regarding the public buyers; by public buyers we mean those entities that cannot be declared in bankruptcy;
 - f) The losses resulting from the impossibility to institute legal procedures in the buyer's country due to the lack or to the bad functioning of the legal system of that country.

Especially, for insuring the export credits, the insurable risks represent dangers resulted from selling goods or performing services on credit, outside the country[3].

The prolonged non-payment represents a risk that may affect the insured one's financial situation. It is considered a case of payment delay when the debtor or the bail has not paid the part of the debt for a certain aggregated time, usually 6 months to the date of payment established by the contract. The cases of major force, the difficulties in money transfer, the insufficiency of the convertible quotations or other political causes, the natural disasters, the epidemics or any form of violence in society are mainly excepted[7].

Next to the protection needed by the exporters for the risks that may affect the transactions on an average and long term, the insurance bill eases the access to financing, constituting a guarantee for the financing bank and removing an important part of the risks.

The excluded risks for which the insurer will not pay compensations may be:

- Reclamations for delivering goods or performing non-corresponding services;
- Penalties or any other losses related to the non-execution of the contractual obligations according to the sales contract concluded by the seller (the insured one) and the buyer;
- Fines of any kind;
- Losses resulted from the differences of appreciation;
- Compensations as a consequence of the political risks;
- Compensations as a consequence of a declared or undeclared war – civil war, revolution, revolt, sabotage, etc;
- Compensations as a consequence of certain natural calamities (cyclone, floods, earthquake, sea flooding, storm, tornados or other similar events having a catastrophe feature), if the technical means available for the fight with such calamities could not be used or were inefficient.

This insurance type mainly contains the following types:

- Credit insurance, respectively the insurance of the intern credits, the insurance of the export credits, the insurance of the credit rates and the insurance of the investment credits.
- Fidelity insurance.

The credit insurances substantially remove the risk of financial loss, especially when it is about transactions of big values or the number of the business partners is relatively reduced this may determine the appearance of a difficult situation if one or several debtors cannot achieve their payment obligations. However, the credit insurances are not always profitable, especially when the individual credits are reduced, and the risks are dispersed on a big business number[6].

The credit insurance is a compensation insurance, because it supposes the compensation paid to the insured one for the suffered loss as a consequence of the insolvability or of the payment incapacity of the client of the insured one, and not the production of a “physical” even as it is the case of the other insurances. This is why it is about a pecuniary insurance of financial, not material loss.

The differences between the usual insurance of compensation and the credit insurances comes from the risk nature and of the interested parties, namely[9]:

1. The credit insurance involves 3 parts, and every part acknowledges the existence of the others.
2. The responsibility regarding the credit reimbursement belongs to the debtor, and the responsibility only if the first one does not accomplishes its payment obligation for reasons included in the insurance bill.
3. The insurer has no interest in the contract, except for the one of bail for the buyer.

By insuring the intern credits, the insured one is protected against the risks of prolonged non-payment by the buyer or of its insolvency during the time between production and distribution, usually before the final sale to the consumer. There may be several types of insurance bills:

- The bill for only one transaction.
- The bill for a certain lapse of time based on the business number.

The administration of such insurances is costly and needs a big work volume and this is why it is mostly used for big value transactions (industrial equipments, construction works, installations and others).

- The bill by means of which we obtain the protection for a number of transactions.

- The bill for one or several buyers, and the insured one is free to decide on them. It is usually contracted on a determined term (12 months)

- The general bill on the business number on credit, frequently used, insures all the seller's business with one or several buyers, on a determined term, usually 12 months.

- The bill for several accounts of an insured one, when the covering is limited to those clients crossing a certain determined level of the debts and whose prolonged non-payment will have a big impact on the availabilities in the money account of the insured one.

These insurance types suppose reduced administration costs and involve a relatively reduce quantity for it; at the same time, the insurer may avoid the anti-selection because the clients will require insurance for all the credit contracts, not only for the ones with a big risk, and there will be the possibility to

check the solvability and the credit worthiness of its clients by means of the evaluators of risk and of the insurer[3].

The most frequently used bill is the general bill on business number, distinguished by the fact that it refers to importers who buy on credit. The main difference from insuring the intern credits consists of the fact that, in case of the exports on credit, the importer of the insured one develops its activity in another country, and this is why the risk evaluation should consider many factors outside the buyer, respectively the factors related to its country. This refers to the country risk that is evaluated by an analysis preponderantly of the economic and political factors, where we add the legal regulations, the risk factors, the uses of the buyer's country. This analysis is very important because, even if the purpose of the credit insurance is identical for the dealers of any country, the definition of insolvency, of the insurance bills and the procedures necessary for paying the insured amounts may be different[1].

The advantages of the insurance bill of the export credits are related to the efficiency of the commercial activity, such as:

- The reduction of the costs that may be obtained by insurance, unlike the bank guarantee; the reserves that are constituted for losses of claims are bigger than the insurance prime; the size of the costs as a consequence of administrating the extern claims by the insurer; finding certain financing ways that are more advantageous for the insured societies, obtaining certain reduced collection costs by experimentally involving the insurer.

- Increasing the profits of the diminution of the reserves constituted for covering the potential damage; focusing on partners having a good payment experience, increasing the business number, reducing the costs, considering the tax effect.

- The possibility to increase the business number given the fact that the seller has no longer the risk to reduce the activity or even to stop it due to the non-cashing of the counter value of the export merchandises; using some competitive payment means; developing some exports of new products or with new partners; the possibility to accomplish some additional deliveries to the debtors who benefitted

from low credit limits before the insurance; granting bonuses at the interest share for credits.

- Reducing the management responsibility of the insured company regarding the parent choice and contracting commercial transactions, given the fact that at least a “part” of the transaction fail may be covered by the insurance bill.

- Protection against certain major losses and even saving the position of the financial management in case of damage; easing the financial planning; keeping an optimal level of the liquidities and of profitability.

Referring to the insurance of the export on credit on a short term, this should be seen regarding the sale on credit. The export on credit supposes the accomplishment of a payment after delivering the merchandises making the object of the sales contract on a determined term of maximum 1 year. In this lapse of time, the cashing of the counter value of the exported merchandises is determined by the importer’s financial situation and, in many cases, by the economic and political situation of its country. Obviously, the covered risks may be commercial and political. The commercial risks may be: the buyer’s insolvability, the incapacity of payment on its certain lapse of time and the refuse of the imported merchandises[4].

The political risks may be: war, revolts, social movements stopping the merchandise import or making impossible the transfer of the corresponding amounts in the exporter’s country[5].

The insurance may be contracted on different lapses of time of the development of a contract, namely:

- For the pre-delivery time, it is covered the buyer’s insolvability or the appearance of some losses for political reasons between the moment when accepting the offer and the one of delivering the goods.

- For the post-delivery time, it is covered the lapse of time between delivering the merchandise and accomplishing the payment.

- For the depositing time, in the situations when the dealers create deposits in other countries, the insured one is compensated if the merchandises are

confiscated, lost or damaged for certain causes specified before their release from the deposit.

- For the transition time, it is covered the risk of confiscation of loss of the merchandises for political reasons, when they are in transit.

For example, the insurance bill practiced by Romania’s Bank of Export-Import, EXIMBANK, covers the risk of non-collecting the extern claims in case of producing certain events making impossible the payment due by the extern buyers. The two categories of risks covered by this insurance bill are:

- a) Commercial risks, protecting against insolvability, as a consequence of bankruptcy or of other financial difficulties, and also against the delays in achieving the payment obligations of more than 6 months.

- b) Country risks that are related to the economic, political, legislative, social and even cultural life of the importer’s country; here there are also the economic situation, political events, changes of the legislation of the buyer’s country that may affect the development of the commercial transactions[2].

The insurance bill does not cover the non-payment determined by the non-accomplishment of the contractual conditions. It may cover either the post-delivery time, or the pre-delivery time and the post-delivery time altogether. The insured percentage is 85% of a potential loss. The cost of the insurance bill is formed by the insurance prime, where we add the commission for establishing the credit limit as a result of the financial analysis accomplished based on the information on the extern buyers of the insured one. For calculating the insurance prime, we consider the buyer’s country, the payment way and the collection term of the counter value of the delivered merchandises. For every extern buyer, it is used to establish a credit limit representing an estimation of the payment capacity of the extern buyer and it represents the maximum unpaid amount insured at a certain point[3].

3. Some consideration about financial risk insurance in Romania

In Romania, the Governmental Order no. 14/1995 created the juridical framework necessary for stimulating and promoting complex exports that, next to specific tools, contains the insurance against the commercial and political risks on an average and long term. The insurance bill offered by EXIM BANK for insuring these risks offer protection for collecting the extern claims corresponding to complex exports, to the general contractors, producers or exporters of products supposing a long fabrication cycle. The offered types of bills are mainly distinguished by the object of the insurance contract – capital goods and works of constructions-montage. The insured part may be contained between 85% and 100% of the unrecovered costs (if the risk is produced in the fabrication time) or of the uncollected amounts (if the risk is produced after the delivery).

The level of the insurance prime is different depending on the insurance value, the insured time, the buyer’s “nature”, its country (the country risk), the payment way and the potential guarantees stipulated in the contract. It is paid at the same time with the conclusion of the insurance bill in a unique tranche in periodical rates, as it is agreed by the parts.

For insuring the export credits, there are certain international regulations expressly related to the contracts on an average and long term having a high risk of non-payment. Thus, according to the requirements of the OECD agreements and to the recommendations of the Bern Union, the extern contracts on an average and long term should accomplish the following conditions:

- 15% of the contract value should be paid in advance until the delivery moment (usually 5% at the contract validation and the rest of 10% at the delivery) so that the sale on credit could not cross 85%

- The part of 85% representing the sale on credit should be reimbursable in equal semi-yearly tranches starting in the latest case 6 months after the delivery.

- The credit time should be correlated to the nature of the goods (for example, for the capital goods, the maximum time is generally 5 years, but for big sized projects, a credit time of maximum 10 years may be also accepted).

- The credit time should be correlated to the transaction value.

The local costs may not overtake the advance level.

4. Conclusion

As an option of the credit insurances, it was developed the insurance of the credit rates that are used at present for the credits that are reimbursed in echeloned payments on a determined term. This type of insurance supposes a participation of the insured one of about 25% of the credit value. The insured one is the seller on credit, respectively the producer or the dealer. The insurance is generally contracted on the business number of the insured one in order to avoid the case when it insures only certain credits, in order to avoid the anti-selection.

The insurance of the credits granted for investments supposes the insurance of the account of debtors on an average and long term, practicing the insurance by the general bill on the business number on credit; this does not exclude the insurance of certain individual bills. It is used for the export of investment goods in parallel with the insurance in the leasing transactions..

Abstract

In case of certain important objectives referring to product deliveries, the execution of works or the performances of services abroad, having big values, the international competition gets sharp forms. Some economical agents, for being placed on a more advantageous position in the competition where they participate, present firm offers valid for a certain lapse of time. The change of the economic conditions (price, interest, appreciation, financing conditions) during the validity of the firm offer in report to the one considered when accomplishing this one, could train for the exporter agent, in case of adjudicating the order, a loss that cannot be recovered from the importer..

Keywords: insurance, investment, income distribution, export credits

J.E.L classification.: E20, E22, E24

1.Introduction

Credits insurance is meant to offer protection to economical agents against the risks specific to export. An export contract may have as an object merchandise deliveries, executions of works or performances of services, including sessions of licences or patent acts in favour of certain buyers or beneficiaries who live abroad[2].

When contracting parties agree that the deliveries, the works or the services making the object of the export contract should not be paid at delivery, but after a lapse of time, the supplier grants a commercial credit to the extern buyer. Consenting such a payment way, the supplier assumes the risks of the credit export, the treasury effects of the export operation with the payment on due date. As the credit export blocks the supplier's financial resources incorporated in

the products delivered on credit for a lapse of time, it is forced to complete them by calling a bank credit[3].

The supplying credit is granted on short lapses of time. In case of the export of big values, the supplier cannot block its financial resources for long lapses of time, without endangering its own financial administration. The buyer is forced to purchase the necessary resources for paying the import at the delivery of the products by the supplier. In this purpose, he addresses to a bank on the supplier's market, requiring the loan it needs and that is called a buying credit. This is a form of the financial credit featured by the fact that it is related to an export operation.

For the supplying credit, the contracting parties – the supplier and the buyer – accomplish only one document, the commercial contract, containing all the elements related to the delivered merchandises: structure, quantities, price, value, terms and payment way[4].

For the buying credit, there are two different documents: the commercial contract, concluded between supplier and the extern buyer, and the loan contract concluded between buyer, as a beneficiary of the extern credit and the creditor bank.

The export is accomplished either by means of the commercial credit granted by the supplier to its business partner, the extern buyer, or by means of the buying credit granted by a bank to the extern buyer, Both of the export credit forms follow the favouring of the commercial exchanges in the interest of the contracting parties and they are granted by private operators (suppliers, banks) in conditions similar to the ones practiced on the market (the interest rate, the time, the way of echeloning the reimbursement).

Next to these credit forms, we also met others having a helping feature, granted by

the states by means of their governments or by means of specialized public institutions.

The extern credits from public resources are granted in more advantageous conditions than the ones practiced by private operators (interests under the market level, longer reimbursement times, grace times). The help-credits from public resources are granted on bilateral or multilateral bases and they follow the favouring of the economic development of the beneficiary country[6].

Bilateral help-credits are related, they can be used only for paying certain imports of goods and services from the donor country.

Help-credits are not usually guaranteed by the credit insurers but they remain in the state task.

Ensuring the export credits covers many export risks that will be grouped depending on the moment when the risk and its nature interfere. Regarded by means of the moment when they appear, the risks covered by ensuring the export credits refer either to the lapse of time before signing the contracts or to the lapse of time after it[5].

2. Insurance Forms before concluding the export contract

For getting its products on a foreign market, an economical agent is forced to prospect that market for finding out if and how he could export on that market.

Prospecting the extern market claims expenditures from the potential exporter, without the certitude that its action will be successful, will make possible the conclusion of export contracts. Even if, in some countries, there is the practice of the state that supports a part of the prospecting expenditures for the expenditures remaining in the task of the economical agent, the risk of the commercial bad job of the prospecting action cannot be neglected. For protecting it against such a risk, the potential exporter may contract a prospecting insurance at an organ specialized in such insurances[1].

In case of certain important objectives referring to product deliveries, the execution of works or the performances of services abroad, having big values, the international competition gets sharp forms. Some economical agents, for being placed on a more advantageous position in the competition where they participate, present

firm offers valid for a certain lapse of time. The change of the economic conditions (price, interest, appreciation, financing conditions) during the validity of the firm offer in report to the one considered when accomplishing this one, could train for the exporter agent, in case of adjudicating the order, a loss that cannot be recovered from the importer. The supplier is forced to lay down a caution in the buyer's favour that should guarantee that the supplier, in the hypothesis of adjudicating the transaction, will sign the extern contract in the conditions stipulated in the presented offer.

We may contract insurances against the risks devolved by the exporter remitting firm offers on long validity times.

3. Insurance Forms after concluding the contract

After concluding the export contract, there may be two risk categories[3]:

- a) Some of them in the lapse of time contained between the moment of signing the export contract and the one of externally delivering the ordered products accompanied by legal documents;
- b) Others in the lapse of time of delivering the products on credit and until cashing their counter value.

During the proper production of the goods making the contract object for the exporter, there is the risk of cutting the contract because it is out of its control.

As long as the ordered goods, works or services are unique and, after being finished, they can no longer be capitalized by other beneficiaries, the cutting of the contract generates losses for the exporter.

The risk of registering losses for the exporter, in this phase of the contract development is a fabrication risk. If the exporter laid down a caution in favour of the buyer who should guarantee, in case of need, the return of the advance paid when concluding the contract or a quality guarantee, then the exporter loses the right on the guarantee.

In case of the works of international cooperation (the exporter executes certain twirled objectives abroad or certain works by means of the equipment, machines and materials that are to be distributed, after

accomplishing the contract), there is the risk for those material values belonging to the exporter to not be able to be brought again in the original country for political reasons[7].

During the commercial contract, the fabrication time may lie on a long lapse of time. In inflation condition, the fast increase of the intern prices could raise the fabrication costs of the delivery so that the contract should register losses instead of benefits. The risk of majoring the intern products may be protected by a guarantee of the economic risks.

After delivering the products (the loss of the executed works or the service performances) by the extern partner, for the supplier there is the risk of non-paying on term their counter value by the extern client.

The classic insurance society or a specialized insurance organism that acts of the order and for the account of the state may protect the exporter against such a risk. Guaranteeing the credit risk is granted by the credit supplier either to the exporter (in case of the supplier credit), or to the bank (in case of the buying credit).

The cautions laid down by the exporter in favour of the buyer by means of which it guarantees the good quality of executing the contract or returning the advance received from the buyer in case of non-accomplishing the contractual obligations by the supplier, may be capitalized in the established conditions.[7]

In this phase of developing the export contract, there may also be the risk of appreciation. Even if the extern client (debtor) honoured on term its commitment made to the supplier in case of the supplying credit or to the bank, in case of the buying credit on the export there may be the risk of registering a loss resulted from the difference between the existent appreciation when concluding the contract and the one practiced when paying the credit. Against the risk of appreciation, the exporter may contract an insurance that should protect him in such circumstances.

The risks of the export credit were approached by means of the moment when it manifests.

Such an approach refers to the nature of the respective risks that distinguishes the commercial risk, the political, exchange or economical risks.

The commercial risks, also called risks of non-payment, are related to the buyer's behaviour to its supplier. When the extern buyer is a private natural person or juridical entity, it presents the non-payment risk. Against it, we may act in justice in order to force it to respect the commitment made by the contract[4].

Against the public buyer that develops when accomplishing the contractual obligations that he made, there is no attack way in justice. For this reason, the risk of non-payment by the private buyer is considered a commercial risk, while the same risk coming from a public right buyer is considered as a political risk.

The political risk notion has a large content sphere, containing: the proper political risk, as the risk of non-payment by the public buyer and the risk of non-transferring the currency by the supplier.

The proper political risk refers to war, revolution, etc. and to the documents of the public authorities (nationalization, requisition, sequestration, interdiction or restraint of the import of certain products, limitation of the exchange transfer, forbidding the repatriation of the actives belonging to certain foreign persons) stopping the contract execution.

The political feature also belongs to the measure taken by a public authority from the exporting country, of forbidding the export of a certain contracted product placed in the fabrication time.

The execution of a contract may be influenced by the measures taken by a third country[9].

Some insurance organisms assimilate the risk of non-payment of an export contract concluded as a public right partner, with a political risk.

The risk of non-transferring the currency to the exporter who granted a supplying credit or to the creditor bank, in case of the buying-credit, appears when the supplier cannot own the currency representing the counter value of its export because the money authority does not transfer the amount the importer agent has to pay to its supplier and for which it laid down the equivalent in local currency.

This refuse of currency transfer gets the feature of a political risk, being generated by

a measure taken by a public authority, and not by the payment incapacity of its client.

Some insurers of export credits assimilate the natural catastrophes produced on the territory of another country different from the one of the exporter of the political risk.

In case of a catastrophe, a usual insurer covers the disappearance or the damage of the insured goods and an insurer of export credits covers the buyer's impossibility of owning the ordered goods or of paying them on term.

In their category, there are; the risk of appreciation, the risk of increasing the fabrication costs of the product making the export object and the risk of fluctuating the interest rate[2].

The risk of appreciation appears when the currency of the exporter's country and the currency of the importer's country are not related by a settled exchange report.

This makes the flow where the exchange of the two currencies is accomplished to evolve from a time to another, provoking negative or positive effects for the exporter.

For protecting against the risk of appreciation, the exporter demands the payment on due date, and so does the creditor bank that granted a loan to the importer, it may use different solutions.

a) Contracting an import in the currency of its client or in another currency, so that the risk of appreciation afferent to the payment commitment expressed by another currency different from the national one, complete the risk of appreciation afferent to its claim.

This solution should operate with identical amounts to be cashed abroad and to be paid abroad, payable at the same date and it should present the same risk of appreciation or a close one.

b) The exporter should sell its product at a flow settled before.

The exporter avoids the risk of registering a negative influence from the fluctuation of the appreciation, but also the one of accomplishing a favourable influence.

Every solution presents advantages and disadvantages and they sometimes present technical difficulties of application. The exporter addresses to an insurer of export credits for offering it the necessary protection against this risk. The exporter is submitted to the risk of appreciation not only when it sells

with the payment on due date expressed in another currency different from its own, but also when it concludes work contracted outs with the payment on due date in the entrepreneur's currency or in another currency.

The insurer of export credits covers the risks of appreciation appearing in both of the situations.

The risk of increasing the fabrication costs of the product making the export object appears as a consequence of the inflationist phenomena manifesting on the market of the exporter's country for the products with a long fabrication cycle, this risk is pronounced and it may make the cost increase be fast so that it would overtake the margin considered before and the transaction would sold by loss.

If the exporter, for reasons of prudence, includes a bigger margin in costs, it may get to a level of the offer price that makes it uncompetitive. If the exporter requires the inclusion in the commercial contract of a clause of reviewing the price, this solution might not be liked by the importer[8].

For protecting its interests, the exporter requires from the insurer of the export credits an insurance against the economic risks.

The risk of fluctuation of the interest rate perceived at the supplying-credit and also at the buying-credit. When they settle the interest rate the importer will pay to the exporter during the validity of the supplying-credit or of the creditor bank during the validity of the buying-credit, the supplier should consider the interest level where it could get the necessary money for refinancing. If the market interest manifests a majoring tendency, we should consider that when concluding the loan contract with settled interest. For a contract with settled interest, there is the risk for the market interest to be higher than the settled one stipulated in the contract, by disadvantaging the creditor exporter or the creditor bank.

For protecting the exporters and the banks from the risk of interest fluctuation at the credits granted by them, different solutions are applied[8].

In some countries, the mechanisms of refinancing the export with settled interest rates are administrated by public institutions. The state supports a part of the interest that the exporter should pay when he borrows from the market in order to complete its

financial resources; another solution consists of establishing the interest perceived by the banks from their extern clients. The difference between the market interest (the bigger one) and the settled interest, cashed from the extern client, is supported by the state during the entire validity of the credit contract[9].

No matter the organizational forms and their juridical statuses, the organisms specialized in insuring the export-import credits contract about the same insurance types, use the same types of bills, practice differentiated insurance primes.

Beside the insurances having identical or very similar, standard characteristics, some specialized insurance organisms also practice other insurance types.

Export Credit, Guarantee Department (ECGD) of Great Britain contract insurances for guarantees against the unjustified pretensions of the buyers, insurances for the investments abroad, insurances against the risk that may appear as a consequence of the fluctuation of the appreciation of the currency by means of which the payment is made[3];

- COFACE of France contracts insurances for exchange risks, insurances against the increase of the fabrication costs of the product meant to the export as a consequence of the inflation, insurances for guarantees;

- NCM of Holland contracts insurances for the exchange risks, additional insurances for guarantees and counter guarantees, insurances for construction equipments;

- HERMES of Germany contracts insurances for the leasing contracts, insurances regarding the risk of the capital investments, insurances for guarantees, insurances for the exchange risks.

- Istituto nazionale delle assicurazioni and sezione special per assicurazione del credito all'esportazione of Italy contracts insurances for: the exchange risks, guarantees, direct investments abroad, market studies, public contracts.

Irrespective of the organizational forms, of the activity they develop, of the insurance forms they contract, of the facilities they grant, the specialized organisms want to

promote the export of their country, to increase the production of the exports of their countries in the world export, to get the products of their country on several markets. The supply of the support needed by the economical agents of their country for increasing the competitiveness and the security of the export on extern markets[1].

The insurance of the export credit has certain limits, grants the protection meant for the insured one in the established limits and conditions. The loss suffered by the insured one should result from a risk contained in the insurance, the compensation meant for the insured one is paid to it at the expiration of the waiting term, the non-payment of the claim may be provoked by causes that are not related to the client's incapacity of payment, but to technical difficulties; a part of the risk, some percentages, remains in the task of the insured one, the export-import operation should be made by respecting the regulations of extern trade of the exporting country and also of the importing one, insuring the export credit does not cover the losses resulting from a litigation existing between supplier and buyer or between the one who makes the loan and the one who takes it.

The insurance of the state credit may be made only when the operation presents interest for the national economy.

During the world economic crisis, many countries dealt with difficulties that made it impossible for them to honour on term the commitments made by the extern creditors. Many countries, because of the lack of the exchange resources necessary for paying the service of the extern debt, were forced to demand to the creditors the re-echeloning of the payable extern debt[6].

This was determined by:

- The necessary putting up the price of the raw oil by the countries members of OPEC,

- Majoring the interest rate on the market of the loan capitals,

- Exacerbating the protectionism by the developed countries,

- The errors of economic, financial monetary errors of some countries importing capital.

At the non-cashing of the extern claims, other political causes contributed;

- Unleashing certain armed conflicts in certain areas of the world,
- Turning over some government by coups d’etat or changing some political systems,
- Dismembering certain federal states,
- Instituting the embargo against some states.

The political events have a strong impact on the economical increase in the countries where they also produce on the international commercial and financial relations. The exporters are more afraid of the political risks than of the commercial ones. In order to be protected from the consequences of such dangers, the exporting companies and the creditor banks demand the specialized governmental organisms to guarantee or insure the credits granted to certain external partners presenting more emphasized country risks[2].

4. Conclusion

After 1982, the governmental organisms of insuring the credits paid to the insured ones compensations in amounts overtaking the cashed insurance price, for the negative sold of the yearly financial operations, calling the previously constituted reserve funds.

For crossing this financially critical situation, the governmental organisms of insuring the credits took measures:

1 – they stopped receiving in insurance the credits granted to the countries incapable of payment or that have almost reached this situation, they established commitment limits for the countries that benefitted from the unlimited insurance or they reduced the previous limits for others,

2 – they reduced the compensation percentage of the damage, by correspondingly majoring the franchise;

3 – they prolonged the term when the payment of the insurance compensation becomes exigible hoping that the debtor would find solutions for paying the owing credit;

4 – they majoring the perceived insurance prices;

5 – they restrained the application sphere of insurance.

By the measures they took, the governmental organisms of insuring the credits wanted to improve the report between the cashed primes and the payable compensations and the accomplishment of the financial balance by transferring the losses provoked by the political risks on the insured ones.

Beside the measures taken in their relations with the insured ones, the governmental organisms of insuring the credits also acted on the line of intensifying their collaboration with the big international private insurers for limiting the negative effects of the insured political risks. It is about the participation to the insurance of certain political risks as co-insurers and the mutual receiving and cession in reinsurance of certain important parts of the subscribed political risks.

The problem of the risk of appreciation got a bigger importance since the main convertible currencies freely fluctuate on the market.

The risks of appreciation appear as a consequence of the fact that the relations between the insured one and the insurer use two currencies: the national currency and another currency where the export contract was released. The flow where the currency of the extern client is changed into the national currency of the exporter (the creditor bank) fluctuates from day to day, in the appreciation, there are unavoidably financial influences advantaging or disadvantaging the insured one. The insured one may demand to the insurer to insert in the insurance contract a clause of appreciation based on which the latter one takes over the risk of appreciation.

Study on Sustainable Development Assessment Criteria

Văduva Maria

"Constantin Brancuși" University of Targu-Jiu
Vaduvamaria09@yahoo.com

Abstract

The theory and practice of sustainable development has to be based on the compatibility of quality provision policies for the results of human activity, on environmental protection policies, on drawing-up a business charter within the vision of sustainable development.

Sustainable development wants to be an alternative to post-war economic growth that because of the economic and social progress has caused negative effects. From this point of view, the supporting arguments of sustainable development are critics made to the weak functions of the type of economic growth.

Key words: environment and environmental policy, social cohesion, development policy, sustainable economic development

J.E.L. Classification: E61, H12, O20, R11;

1. Introduction

In order to evaluate action means, we need criteria of economic and social efficacy and efficiency, equity, feasibility, acceptability and institutional ecologic compatibility.

At every level of sustainable development, strategic planning is necessary with clear objectives, with evaluation criteria and measurement indicators, with legal, economic and spiritual-cultural support mechanisms, with ecologic management of processes on every living cycle, as well as with the necessary audit with the development of technologies able to reach “zero effects”[10].

Business charter, within the vision of sustainable development has to comprise principles that have to be followed from production costs to incomes achieved together with educational management necessary both for those that produce and for those that distribute and use the products and services necessary for human life and environmental protection.

The age of natural environment, within the vision of sustainable development shows us that progress is an illusion if it can degrade the conditions necessary for a normal life.

The danger of climatic change on the Globe and the loss of food safety are two risks of development so far which make us conceive the new policy of sustainable development, first of all by raising the level of culture, civilization. Sustainable development has to be the basis for developing a reliable society able to fulfil its current needs without jeopardizing the perspectives of future generations by placing a moral concept at the basis of sustainable development – equity between generations[1].

The values on which sustainable development is based are those of rationality determined by the limitation of available resources in relation to the actual needs and hope resulting from the morality of chances equality of the generations that coexist and succeed in life.

Within the vision of sustainable development, the foundation rock of energetic systems will be solar energy, the efficiency of human activities will have to be considered in all the meanings that life requires, materials reuse and recycling will have to become a replacer

at large scale for fuels; biologic basis restructuration will be an essential condition for reaching prosperity and protection of future generations[2].

Sustainable development supposes a new set of values achieved within a general process of transition towards a reliable society where people can be attracted by the new ways of organizing their life and encouraged by knowing what would happen if they change their living way.

Placing knowledge and understanding processes at the basis of the two fundamental natural-human values – rationality and hope are the key for anticipating and causing the change from the point of view of sustainable development[7].

The age that humanity has gone through so far is that of a non-reliable world economy from the point of view of the surrounding environment based on unlimited growth phenomena. The new age that humanity will have to enter will have the common denominator of only one fundamental ideal: fulfilling the needs of current generations without compromising the potential of future generations to fulfill their own needs[9].

The ecologic age that will have to be established in the evolution of the world will have to begin with the design of a new reliable energetic system that will use solar energy as a renewable source.

Passing to the ecologic age of sustainable development will also mean materials recycling, waste decrease, change of products and people’s reaction, renunciation to the society of waste as elements of the strategy that gets closer to the final purpose of providing a maximum of welfare with minimum of consumption.

The vision of sustainable development organically integrates the strategy of rethinking urban transport taking into consideration that technology can become a good servant but a bad master if it is not conceived in direct

compatibility with human needs within a healthy environment.

The achievement of the new age of sustainable development supposes a period in which political leaders and citizens reevaluate their goals and dreams, redefine their success patterns in life and adapt their work and time use to a new set of values-principles aiming at prosperity and generations’ protection.

The strategy of sustainable development becomes operational through rational policies to the extent in which it favours compatibility of the systems that condition one another in time and space, regional and international cooperation and collaboration.

Within this long lasting process, the brake factor occurs beside the favourable factors. It is important to have a common powerful will in order to fulfill the objective in front of which all people are equal by nature.

2. The main problems of sustainable development

Like any big project, sustainable development supposes an evolution that can be achieved by solving several problems[3]:

1) Demographic constraint

From the point of view of sustainable development, population is of interest only as structure and health. From the number point of view, the theory of sustainable development has to give an answer to the following question: what number of people can planet Earth bear? What are the chances for this more and more numerous population to live in a preserved perfect environment and feed itself better and better?

As far as structure is concerned, the number of questions is not more important:

a) Taking into consideration the social and professional structure, the instruction level and population quality, sustainable development is facing the

following problem: where economic growth have to win both quantitatively and qualitatively in third world countries, the level of population's education suffers.

b) Distribution of the increasing population on the two large areas: urban and rural.

c) The logic of sustainable development does no longer allow for people's health to be sacrificed to the interests of profit.

2) Technical constraint

The key question that sustainable development has to answer is the following: which is the maximum level possible of production that can be achieved under given conditions of technical progress without affecting the environmental balance.

The maximum level of production that can be achieved without altering the environmental quality is in direct proportional relation with the environmental absorption quality, the capital invested in anti-polluting plants and polluting agents dispersion volume or surfaces and reversely proportional with the polluting emissions that depend on the level of production and consumption.

3) Equity and compensation within and between generations.

Sustainable development becomes reliable only in the conditions in which an associative, tolerance, solidarity spirit occurs between generations and within the same generation.

4) Efficiency

The great confrontation faced by sustainable development is to find the necessary compatibilities between economic mechanisms propelled by profit and social-human finality of development;

5) Environmental economy which is a challenge for the theory of sustainable development to the extent in which it tries the attempt to humanize and ecologize the economy.

The unity between rationality and hope is the key of sustainable development.

Sustainable development has the essential components of demographic increase stabilization, reduction of the oil dependence, promotion of renewable energy resources, soil preservation, protection of the biologic systems of the earth, materials recycling, climatic stability.

The concept of sustainable development defines essential changes within the process quality and comprises several objectives of economic and social policy: economic growth resizing in the meaning of natural resources preservation, altering the increase process, fulfilling the essential needs for work, food, energy, water, houses and medical care for all inhabitants, providing a level of sustainable increase of the population; preservation and increase of the resource basis, technological restructuring and controlling its risks; integrating decisions regarding the economy and environment in an unique process[8].

Ecologically sustainable industrial development that is the industrialization pattern increases the industrial contribution to economic and social benefits for present and future generations without damaging the basic processes[4].

This is completed by the following concepts: sustainable forest works, sustainable energy, sustainable water management, sustainable economic welfare and sustainable jobs, most of them being the subject of a debate and international documents.

The essence of the economic system is represented by the maximization of the amount of goods, services, products but under the conditions of efficiency maximization the resources are used by all types of people. The objectives of the social system refer to the balanced allocation of goods and services at all levels, locally, nationally and globally,

engaging all the members of the society in the development process and maintenance of cultural diversity as a basis of chances equality and society adaptation to the alteration of social and geo-economic conditions.

From the point of view of the ecologic system, the main objectives are given by biodiversity maintenance as a support of the biosphere adapting possibilities. All these are based on the coordination of entities' objectives and actions and on the functions of every system.

Passing to sustainable development marks people's entrance in the environmental age where development risks have to be determined and removed. For these purposes, sustainable development first of all proposes to alter the way in which people perceive some elements of life. By means of education, culture and science, people can overcome a perceptual threshold that determines them to observe, produce and act for better on a long term. Therefore, humankind can go towards a moral border that proves that the matter of development has to be considered through interdependence in time and space[8].

In raising people's civilization level, we have to begin with the recalculation of the economic progress of altering the assets and liabilities of the natural capital.

Sustainable development has to be the basis for developing a reliable society able to fulfil its current needs without jeopardizing the perspectives of future generations by placing a moral concept at the basis of sustainable development – equity between generations.

The values on which sustainable development is based are those of rationality determined by the limitation of available resources in relation to the actual needs and hope resulting from the morality of chances equality of the generations that coexist and succeed in life.

Within the vision of sustainable development, the foundation rock of energetic systems will be solar energy, the efficiency of human activities will have to be considered in all the meanings that life requires, materials reuse and recycling will have to become a replacer at large scale for fuels; biologic basis restructuration will be an essential condition for reaching prosperity and protection of future generations[2].

3. Sustainable development a general process of transition

Sustainable development supposes a new set of values achieved within a general process of transition towards a reliable society where people can be attracted by the new ways of organizing their life and encouraged by knowing what would happen if they change their living way.

Placing knowledge and understanding processes at the basis of the two fundamental natural-human values – rationality and hope is the key for anticipating and causing the change from the point of view of sustainable development.

The age that humanity has gone through so far is that of a non-reliable world economy from the point of view of the surrounding environment based on unlimited growth phenomena. The new age that humanity will have to enter will have the common denominator of only one fundamental ideal: fulfilling the needs of current generations without compromising the potential of future generations to fulfil their own needs.

The vision of sustainable development organically integrates the strategy of rethinking urban transport taking into consideration that technology can become a good servant but a bad master if it is not conceived in direct compatibility with human needs within a healthy environment. Together with the technologic revolution in infrastructure it

is essential to develop a new way of conceiving urbanization, in order for towns to be created for people, all these actually supposing a basic revision of policies so far.

In strong relation with these components sustainable development also supposes the passing to forests regenerative exploitation.

The achievement of the new age of sustainable development supposes a transition period in which political leaders and citizens reevaluate their goals and dreams, redefine their success patterns in life and adapt their work and time use to a new set of values-principles aiming at prosperity and generations' protection.

Within the background of common elements, sustainable development becomes an international action through adequate national policies to the extent in which it can allow compatibility of systems that condition one another in time and space, collaboration and cooperation with regional and international character.

Within this context, although the final objective of the sustainable strategy is the same for all countries, the actual problems that have to be solved, the financial sources as well as achievement ways, difficulties that may occur, the position of the population towards the objectives of such a lasting process as well as the costs to be paid, the stages and duration of goals proposed will be different[2].

Within this long lasting process, the brake factor occurs beside the favourable factors. It is important to have a common powerful will in order to fulfill the objective in front of which all people are equal by nature.

For the success of the new age of ecologic development besides national strategies based on its own resources and needs, regional and international strategies are important by taking into consideration by globalization of the

sustainable development and on the fact that it is necessary to redistribute the efforts and the intensity of the progress damages and natural environment by various states of the world.

4. Conclusion

The new strategy requires from economically developed countries to make a transition towards the basic restructuration of the economic and social activity of education, of health and natural environment for poor and underdeveloped countries the problem of economic growth is not necessary, but rather of finding those strategies that favourably answer to the problems of labour productivity increase as well as to the population, environmental people's life quality related problems. Within this complex and contradictory process, one cannot know who is more advantaged, countries that restructure almost all that they have created or the countries that have to think about the beginning of the new development age from the position of the delayed to the old development. Success in all countries will be favoured not only by the political will of the leaders but also by the decision that has to be taken individually and by us together[3].

The new vision of sustainable development has to comprise also new more balanced distribution strategies of the incomes and goods at the level of world's countries, a social superior order interested in the life of present generations focused more on planet and people's health rather than on material accumulation and power.

The group of factors interfering in the operation of national economy materialized in macroeconomic are directly or indirectly used in the economic growth processes. These factors have to be explained in a global vision because their influences are complex, conjugated, contradictory.

The Romanian Economic Policy “Censored” in the Parliament .Short Analysis of Motions of Censure in the Field of Economics Submitted in the Parliament of Romania Between 1992 and 2012

Diane Paula Corina Vancea
Ovidius University of Constanta
economics@ovidius-university.net

Abstract

Motions of censure are an important tool used by the legislature to exert control over the executive. Censure motions by the opposition focus on essential national issues, the government’s inability to rule its country, as well as problems deemed highly important by the opposition. Regarding the effects of censure motions, few were effectively implemented or led to the government’s demise, as many functioned only as the opposition’s alarm signals about what they consider to be some gravely skidding off course. Thus the public attention is gained and the opposition has the opportunity to express its viewpoints. This paper focuses on the contributions of the motions of censure read, discussed and passed in the Romanian parliament, to shaping Romanian economic policy between 1990 and 2012.

Keywords : motion, censure, parliament, government, economic

JEL Classification: H7, E6

Introduction

The Romanian parliamentary regime implies, as do all parliamentary democracies, the government’s collective accountability before the parliament.

Motions of censure are political instruments used to hold executives responsible, and which can lead in certain situations to the demise of the government. This paper analyzes the censure motions debated in the Romanian legislature, with an accent on motions that covered economic issues, as they attempted to alter and

even radically change the national economic policy at the time.

Also studied in the paper are the moments chosen for introducing motions, their reading in parliament, their impact on economic policy, and the government’s concrete responses to these contestations.

The data for this analysis was collected from parliamentary debates transcripts and the public listings of motions on the web sites of the two parliament chambers. The resulting database underwent a content analysis, enabling the evaluation of motions based on the issues raised, and the identification of censure motions of an economic nature.

The role of censure motions in parliamentary democracies

Motions of censure are in fact motions of no confidence. Their role is to act as a catalyst in a government’s demise, to determine the type of government in the making, by identifying the political parties responsible for policy failure, by questioning the government’s performance in key areas and increasing the risk of voluntary governmental dissolution [1]. Whether they result in the government’s demise or not, motions are evidently opportunities to hold them accountable and to draw public attention to lacking performance in governing. Motions aid the legislature in identifying and preventing abuse, arbitrary, illegal and unconstitutional behavior by the government and non-governmental agencies makes the government accountable for its use of taxpayer money, thus increasing the efficiency of governmental actions by identifying waste in the government machinery and public agencies [2].

The topic of non-confidence motions was interesting to researchers, and numerous empirical studies examined the causes of censure motions. In the literature we find various explanations for motions of censure, from their root in "the opposition's attempts to publicize the government's failures in a high priority political domain" [3], to the idea that they aid political parties, during difficult economic periods, to distance themselves from the government, by emphasizing its responsibility in the deteriorating economic situation [4].

A common theme in almost every study on motions of censure is that of them as vehicles attracting mass media attention on governmental failure, thus "consolidating the negative message about the government delivered to the voters" [5].

Evidently, the intentions of those introducing a motion of censure, beyond toppling the government, are to draw long term public attention, by presenting the motion's initiating party as having better solutions and providing a better representation of the electorate's interests.

In the case of minority governments, censure motions are real threats, and their imminence discourages the formation of governments without the backing of the parliamentary majority.

As research has shown, the effects of motions of censure range from providing only minor obstacles, easily overcome by the government, all the way to governmental reshuffling or a decision for anticipated elections [6].

The government threatened with a censure motion has the options to either ignore it, or to concede and resign. Regarding this, the literature has identified a paradoxical situation: the weaker a government's position, the more inclined they are to negotiate with the opposition, thus making censure motions less likely [7]. At the same time, a government can resign instead of ignoring the opposition's challenge, "when the benefits of holding office are sufficiently low", either in the case of "a high probability that the government will preserve power after the next elections", or when the overall concessions required to satisfy the opposition are deemed too high [8].

Laron Williams suggests that popular governments might resign, since they have a good chance of again forming the government after the elections, while unpopular governments will tend to cling to power, expecting to be negatively affected by anticipated elections.

The favorite subject of the motions of censure is the economic policy but it may extend to health, education, corruption, foreign policy, state of justice. When reflect the real state of the nation these motions are very effective. Therefore the economic issues are rarely introduced in times of economic prosperity. These motions are more able to generate a lack of confidence in the government during a crisis or a poor general economic condition.

The motions of censure are also analyzed in the specialized literature in Romania. For Simedru and Huiu "the motions are the only way to bring a prime minister in the parliament in order to introduce a debate on serious issues. ". In another article Huiu says that the political impact of the motions is related to three important democratic principles: " the challenge by an active opposition prepared to sanction the government, the participation of an engaged opposition who reacts critically against the executive and the representation by an opposition that synthesize a point of view of voters and citizens'

The Romanian legislation in the field

In the Romanian legislation the motions of censure are regulated by the Romanian Constitution, Article 113, which presents the conditions in which are initiated, introduced and voted the motions of censure in the Parliament: "The Chamber of Deputies and The Senate, in joint session, can withdraw the confidence granted to the Government, by adopting a motion of censure with a majority vote of the Deputies and the Senators. The motion of censure may be initiated by at least one quarter of the total number of deputies and senators and the initiators have the obligation to communicate its filing date to the government. The motion of censure shall be debated upon three days of the filing date in the joint session of the two chambers. If the motion of censure fails to be passed, the Deputies and the Senators who

signed it may not submit another motion, in the same session, except for the case the Government assumes responsibility for that program or bill.

At the same time, the constitution allows the government to assume responsibility before the house, in a joint sitting, for a specific program, a general policy statement or a bill. In accordance with Article 114 "the government shall be dismissed if a motion of censure, tabled within three days of the date of presenting the program, the general policy statement or the bill, has been passed, in accordance with Article 113". Thus, a successful motion of censure brings about the fall of the cabinet. The same article further reads that "If the government has not been dismissed, the bill presented, amended or supplemented, as the case may be, with amendments accepted by the government, shall be deemed as passed, and the implementation of the program or the general policy statement become binding on the government" . As a consequence, a successful motion of censure becomes part of the governmental program, if the cabinet refuses to step down or it cannot step down because another cabinet cannot be formed.

The analysis of the motions of censure submitted in the Romanian Parliament on economic issues 1990 - 2012

During the five legislatures, 25 motions of censure have been discussed in the parliament as follows: 5 in the legislature from 1992 to 1996, 4 in the period 1996 to 2000, 2 in the period 2000 to 2004, 5 in the legislature from 2004 to 2008 and 9 in period 2008 to 2012. Regarding the distribution by years during a legislature, we can note that they are generally initiated in the first (8), second (7) and the third year (8) of the legislature, the only exception being the present legislature, when in the last year of governance were submitted two motions, one adopted (see table 1)

There is an explanation in this regard: in the last months, without the ability to organize early elections, decreases greatly the possibility of government reorganization and therefore the option to submit a motion of censure becomes less attractive, parties preferring to wait for the scheduled elections.

Two observations worth to be mentioned:

- That the fewest motions of censure were submitted during the Nastase governance, only two, that government enjoying a solid majority and the opposition being weak, fragmented and, therefore, not very active;

- At the opposite end is the period 2008 - 2012 with the highest number of initiated motions of censure, 9, two of them being successfully, an explanation of this fact could be the particular creation of the majority, by attracting a significant number of parliamentarians from the opposition, one of the parties from the governmental coalition has not actually participated in the 2008 elections. Also, the Boc governments (I, II, III, IV) assuming repeatedly responsibility have provoked constantly the opposition, who was in a position to answer, most of the times, by submitting new motions of censure.

As we have noticed from reviewing the literature in this area, in general, the motions of censure appear in a large number in times of crisis. Given this aspect, another explanation for the large number of motions submitted during the mandates of Emil Boc and Mihai Razvan Ungureanu (2008 - 2012) is related to the deep crisis that Romania was and continues to pass, the opposition feeling frequently obliged to delimit itself firmly on the unpopular decisions taken by the governments. The year 2012 brings a premiere in the Romanian politics after 1989 representing the year when the cabinet is dismissed by a motion of censure initiated by the opposition, the alternation in the governmental power is realized not by elections but by using this tool of the parliamentary combat.

Table no.1 Voted censure motions by year of legislative term

Year/legislature	1992-6	1996-2000	2000-4	2004-8	2008-12	total
1 st year	2	2		1	3	8
2 nd	2		1	2	2	7
3 rd	1	2	1	2	2	8
4 th					2	2
total	5	4	2	5	9	25

Even sometimes the direct and visible effects of a motion of censure covering an economic issue were minor, the government ignoring analysis, ideas, sometimes alternatives proposed by the opposition, the fact that the government shortcomings and failures were brought into the spotlight effectively contributed to the erosion of party holding power, supplying significantly the level of awareness of the public.

It could say that the last motion of censure filed in April this year, which resulted in the collapse of the government Ungureanu, effectively censored the economic policy and radically changed the direction of governmental policy. In terms of style, content and the drafting of texts motions, we notice texts that range from a few pages (a few hundred words) to large complex motions on dozens of pages (several thousand words), real data compendia statistics and indicators. The opposition endeavor to be credible can be identify both in trying to find more resounding titles and with more impact and the solid foundation of ideas using significant figures and statistics. Gradually, the emphasis in text moved from pure demagoguery and populism to realistic and convincing presentation of the economy, the legislators realizing that cannot attract the electorate only with empty words. Moreover, the government policy was the main subject of the motions submitted in the parliament, 90% of those treating this subject, whether they were simple motions or censure motions.

The opposition filed motions in an effort to draw attention to the key issues of Romania; more than to get electoral gains meaningless questioning the government. This explains why very few motions of censure on economic issues (1) were submitted in the 2000 – 2004 period, a period of consistent economic growth and prosperity compared to the 2008 – 2012 period (8), when the center right government faced the economic crisis and the social unrest.

Thus, in the period 1992 - 1996 the center left government faced three of five motions with economic subject; 1996 - 2000, all motions that center-right government faced had economic content (4 of 4); 2000 - 2004 was only a motion with economic subject; 2004 - 2008 for the right-wing government 2 of 5 motions of censure had economic content; 2008 - 2012 the center-right

government faced 8 of 9 motions of censure voted have dealt with the economic and social issues.

In order to have a representation on the consistency of the texts related motions and the economic conjunctures of the moments in which they were originally submitted, required getting in depth texts, analyzing them period by period. The realistic reflection in motion text of the economic and social realities, offering alternative solutions, is, from our point of view, strength for the opposition, highlighting its ability to formulate coherent economic policy, viable alternatives in the governing process.

At the same time, the detection of changes in the governmental programs as a consequence of the motions of censure represents strength for the government, proving responsiveness, flexibility and realism in the exercise of governance in favor of the citizen.

1992 – 1996

The first motions of censure introduced in the Romanian Parliament circumscribes the period 1992 - 1996, from 1990 to 1992 this tool was not used. Of the five motions of censure relating to this period, 3 had an economic subject targeting the reform program and the privatization process carried out at that time.

The first one was initiated at 100 days of government, criticizing the socio-economic reform strategy of the government program was a declarative motion, not based on figures / indicators. We have not found a direct influence of the motion on the governance act, the government practically ignored this motion.

The motion's text refers to the program presented in the parliament by the Vacaroiu government called "socio-economic reform strategy of the government program" and considers that it is not a real government program but "a set of heterogeneous and conflicting goals of economic and social policy, missing concrete solutions, time of application and country resources available to achieve them.

The second motion that concern economic issues, from December 1993, only repeat the negative aspects noticed in the first motion. Also declarative, without substance, without concrete elements, the motion is limited to the request of the cabinet resignation. Rejected in the

parliament, it brings nothing new in the political landscape.

The last motion of censure on the economy was introduced in December 1994. Unfortunately in this case was seen that the opposition had no concrete ideas about solving problems. Limited to note “ the inability to govern and the government's lack of will to solve the difficult and the real problems of the economy and the population. The motion has not produced any effect beside the media.

As a first conclusion, the motions of censure submitted in the mandate of 1992 - 1996 had little or no influence on the economic policy of the government. We noticed the lack of experience of parliamentarians in drafting motions that would represent the true pressure on the government, the real threats addressed to it. No substance, no solutions these motions were only simple expressions of general dissatisfaction.

1996 – 2000

All motions of censure initiated in the legislature 1996 - 2000 had a socio-economic character. The epoch of the Democratic Convention was the one when the process of privatization and reform really started in Romania. Like any process of reform, was a painful one, which produced many popular discontents. The unemployment rate increased, inflation reached alarming levels, there have been many layoffs, the purchasing power decreased, etc.

On this background the opposition attacked questioning the ability of governments to govern the country, the program of global reform measures, the solutions to accelerate the reform. The attitude of the opposition was in consent with the wave of social complaints constantly eroding confidence in the cabinets in place, which resulted in the end the elections loss by Democratic Convention – Democratic Party – Democratic Union of the Hungarians in Romania coalition and for the Christian-Democratic National Peasants' Party, the main ruling party which has given two of the three prime ministers of the coalition: Victor Ciorbea and Radu Vasile, leaving the Parliament.

We notice the opposition's ability to produce more elaborate motions, based on figures, on indicators, highlighting some specific situations

that demonstrate various government inabilities. The motions, better prepared, even if not led directly to the fall of the governments against which they were initiated, led to a quasi-general idea that the governments of the Democratic Convention are incompetent. For this inability was mainly blamed the Christian-Democratic National Peasants' Party which lost parliamentary representation in 2000. The experience of the Social Democratic Party politicians was proved by the capacity to speculate effectively all mistakes and the ability to draft comprehensive texts that aimed virtually all aspects of economic, political and social. Without presenting alternatives, the motions of censure initiated by the Social Democratic Party have echoed among both population and media, and being publicized the ideas presented were acquired by the electorate.

2000 – 2004

The Nastase government faced, during the four years, with the least contestations. Two motions of censure were filed during this period, one on economic and social issues and one on corruption and the mafia widespread at central and local administration level. Although seen as a highly corrupt government, The Nastase cabinet was considered, both by the population and the media, an effective government that knows what to do, which has solutions and the ability to implement them. Having the advantage of a general economic growth, felt in the population's pockets too, the government has been appreciated, not actually threatened with fall by a weak, fragmented and disoriented opposition.

The only censure motion targeting the economy was initiated as a result of the assuming the responsibility on the general policy statement regarding the balance of the first year of governing and remained without effect, and The Nastase cabinet continued to work undisturbed. Moreover, the popular disgruntlement against The Nastase government did not target the efficiency of the governing act, considered satisfactory or good, but the generalized corruption and the arrogance of the Prime Minister Adrian Nastase.

Without immediate consequences on the government economic policy program, the only censure motion filed on economic issues failed

to alter confidence in the executive and did no significant changes in its economic policy. Adrian The Nastase and the Social Democratic Party did not lost the power due to the economic situation of the country but primarily due to the disastrous internal and external image related to increasing corruption and inefficient justice.

2004 - 2008

The period between 2004 and 2008 was extremely interesting from the political point of view. If at first there was a parliamentary majority formed DA Alliance, DUHR (The Democratic Union of Hungarians of Romania) and the Conservative Party, then, from 2007, DA Alliance has broken, LDP (The Liberal Democratic Party) withdrew from governance, NLP (The National Liberal Party) and DUHR formed a minority government.

This government resisted, always succumbing to the negotiations with the opposition, and especially with the Social Democratic Party, until 2008 at scheduled elections. Four censure motions have provoked Tariceanu government, including two on economic and social issues: Tariceanu Government - Facts and Lies and 1000 days of chaos, The end of the right government.

The first motion, submitted after a year and half of governance is the longest motion ever submitted in the Romanian Parliament (over 9500 words / 28 pages).It was an exhaustive motion, reaching all the economic and social issues, from taxation to European integration, bird flu, health, education, flood, tourism, environment, highways, European projects, inflation, environment, film production in Romania. All in one! It is simply the motion of motions! This motion seems to be written without a specific purpose but from the desire to create a motion to criticize, no matter what and why.

Without representing realistic points of view, with Romania recording an economic growth in 2006, 2007, 2008, naturally, the motion was not a threat even from the viewpoint of the media exposure. It was intended a censure motion, was made one and that was the effect.

The second motion of censure on the economy was initiated in September 2007, when the government was a minority one, with only 20% of parliamentary support. Although the

motion mentioned that " who will vote the motion of censure vote not only to end of an incompetent, unstable, artificial and arrogant government, but for a different direction of the development of the country", however the motion was rejected, which showed that the opposition did not really want to take the governmental power.

Although it was stated that the Social Democratic Party has solutions to solve the economic problems, however, the motion is not presented any. It was a motion consistent in data and numbers, attacking almost all range of the economic and social problems, including justice and foreign policy. This motion had no direct effect.

It was intended a change of direction but with no results the motion being rejected, although the Tariceanu government was a 20% government. The opposition preferred to obtain benefits through negotiation than simply take the governmental power.

2008 - 2012

This period represents by far the most active period of the Romanian Parliament in terms of motions of censure: 11 initiated, 9 voted, 2 adopted. Also, the most loaded in terms of motions with the economic message, 8 of 9 being focused on the economy.

The first motion is dedicated to the governance program considered as a contempt against the electorate of the Liberal Democratic Party and the Social Democratic party that formed the government. The electoral programs, full of promises more or less attractive were abandoned, the state budget approved having no connection with the promise of wage and pension increases.

This is the first motion in which the National Liberal Party, this time in opposition, defends itself to the accusations against the prime minister Emil Boc and highlights the mistakes and babbles of the new government. It is criticized the introduction of "flat tax", giving up the flat 16%, the increase in general taxation, the lack of ideas regarding the Romanian economy revival, the politicization of public administration, the investment failure.

A consistent motion that demonstrates the experience gained by the National Liberal Party in the act of governance, the first in a long series

of motions that led to the gradual erosion of the government, and, finally to the shift of the Liberal Democratic Party in the opposition.

The third motion that challenged the Boc government was a response of the opposition to the government assuming the responsibility on three laws, one of them regarding the unitary pay law. Considered unconstitutional, the attitude of the government was criticized by the opposition, at the same time with the union complaints, resulting in the street demonstrations. There are mirrored the Tariceanu Government achievements and the failures of governance of the Social Democratic Party and the Liberal Democratic Party. The motion blamed the lies, the arrogance, the lack of government's communication with the population, the quarrel between different socio-professional categories, and the discriminatory treatment. They are, in fact, the most common complaints brought to the Liberal Democratic Party both by the opposition and the press and ultimately even by citizens who, in the January 2012 get out in the street for the same reasons. The motion did not have direct consequences but dug the confidence in the government.

Eventually abandoned before the general election by the Social Democratic Party, the Liberal Democratic Party remains in power with DUHR and face the first real threat from the opposition: motion 11 against Romania!

Considered unrepresentative and unconstitutional, the government is accused of "economic and moral Romania's destruction" and characterized as a tool by which Romania is "sunk in poverty" and which came into being "the foundations of an electoral fraud in favor of candidate Basescu." Interesting is that into the picture appears the substitute of Emil Boc, namely Klaus Johannis, Mayor of Sibiu. To be more credible, like the German model, the opposition came with an option for the prime minister position supported by 60% of the parliamentarians. The motion is adopted, the government falls. Expectations were all headed to replace Prime Minister and changing direction of government.

Instead, Traian Basescu, taking advantage of some ambiguity about the constitutional term to replace the government and the concrete ways of solving the situation, extended the interim Boc,

refused the option of the opposition and nominated for this position Lucian Croitoru, technocrat, a National Bank of Romania counselor. This together with his cabinet fails to pass in the parliament and it is made a new appointment, the mayor of Sector 3 Bucharest, Liviu Negoita from the Liberal Democratic Party. The second option had the same result in the parliament; do not even reach the vote of confidence, being blocked by the parliamentary procedure. The problem is solved with the presidential elections: Traian Basescu wins again, a new coalition is formed and Boc goes again as Prime Minister.

June 2010 bring to the government a new motion of censure: Stop the social genocide! As a response to the wage and pension cuts approved by the Boc government with the IMF and publicly supported by Traian Basescu as the only "correct solution", the motion inventoried negative effects that these cuts will cause. Considered an attack on the national security, the austerity measures represent, in the opinion of the initiators, an extremely dangerous precedent that cannot be tolerated

The government is considered like a "butcher surgery" that cuts without a head. The lack of economic recovery alternatives is also sanctioned. The motion refers to a plan of alternative measures, which have a different view with jobs problem as a priority. This motion produced consistent effects, not by replacing the government, because it was rejected, but through the image created of an arrogant, incompetent and corrupt government with a puppet prime minister.

The following three motions, filed during 2010 and 2011, attacked the government on the same economic and social coordinates taking advantage of the disastrous economic situation and the lack of communication at governmental level. Low wages, high unemployment, bankrupt companies were subject to analysis.

The government Basescu - Udrea - Boc was accused of corruption, theft, restricting the rights and the democratic freedoms of the citizens. All these motions were aimed at public exposure of the government inability to lead the country through crisis.

Realizing the lack of support in the Parliament, the opposition chose, however, the

path of initiating motions, not necessarily because they hope will replace the government, but rather to attract public attention. To ensure that motions will be rejected, the parliamentarians' power chose not to vote but to remain in banks, a situation encountered for the first time in Parliament, namely a mute power.

The intense parliamentary activity during 2008 - 2012, the opposition efforts to write and initiate motions have not remained without effect. Being consistent with the way most Romanians considered the act of governing of the Emil Boc cabinet, these permanent red flags held in Parliament on Romania going in the wrong direction eventually led to the discharge of the Liberal Democratic Party from the governmental power.

"Stop the blackmail government. This way, never!" Is probably the last motion of censure in the mandate 2008-2012. Although new, this instrument of parliamentary fight has shown efficacy. The approval of this motion of censure led to the replace of the Ungureanu government. Three issues were addressed in the motion: the illegal privatization of the natural resources, money from the budget allocated according to political criteria and the violation of university autonomy.

We can consider that the motion had such result because actually was placed on a background of dissatisfaction and lack of confidence in government and on an internal situation of the Liberal Democratic Party, facing numerous political desertions among the most resounded that of the party vice-president - Sorin Frunzaverde, Caras-Severin county chairman.

The political inability of Prime Minister Ungureanu, the Liberal Democratic Party arrogance, the betrayals inside the ruling party, the volatility DUHR, party formed mainly of former members of the Social Democratic Party, have contributed to the loss of power and pass it into the hands of Liberal Social Union, National Liberal Party-Social Democratic Party Conservative Party alliance, which has led to the mess of the Liberal Democratic Party and its categorical defeat in the local elections.

Conclusions

A careful analysis of the motions addressing economic issues, debated and voted in Parliament till 2012 allows us to distinguish some general patterns that characterize the use of these important legislative tools that synthesize the relations between government and opposition, the political parties work, the important public policies for the opposition, the way the Romanian realities were reflected in the parliamentary agenda and the moments chosen by the opposition to challenge the government.

Primarily, from the large number of motions presented in Parliament, the motions of censure have been used sparingly which highlights the fact that legislators have realized the role and the power of these tools. We notice a more intense use of the motions of censure in the mandate 2008-2012 when the popular discontent and the bad economic situation have created the premises for government reorganization.

Secondly, we notice the opposition effort to attract public attention on the government policy mistakes. For most motions of censure the result was known and the initiators knew that they will not pass but were initiated for public exposure in the media and later the electorate.

Thirdly, we have identified an effort of the opposition to learn how to write motions and motions that became more consistent and more analytical. If in the early years, the motions were without substance; with deep demagogical accents later they became much more documented and sometimes offering alternative solutions to solve problems more efficiently.

Fourthly, we noticed the increasingly serious connection between the motions in the reality. The opposition better speculated the political power mistakes managing eventually to use the full potential of this instrument by removing the government and taking over the governance.

Finally, the impact of the motions with socio-economic character, which were based on the wave of popular discontent, was significantly higher among population than other motions with the same content. Practically the motions written as a street request were the only motions with direct and obvious effects.

Comparative Analysis between Rehn-Meidner Model and the Swedish Model

Vasiliev Lucian

“Al. I. Cuza” University from Iasi

lucian.vasiliev@gmail.com

Abstract

This thesis studies two different models; the Swedish model and the Rehn-Meidner model. It shows their similarities and differences, and explains why it is inaccurate to put an equal mark between the two of them. An extensive discussion on the models is presented in order to give them each a fair assessment. It is shown how and why the Swedish model has failed, as well as how Sweden has failed to apply the Rehn-Meidner model in a consistent manner.

Keywords: models, organization, economic policy

JEL Classification: E, E6

1. Introduction

The Swedish economic system, categorized as a social market economy, is distinct in the way that there is no central planning and the market is privatized, but there is high level of income redistribution and mature social welfare system operated by the government. Sweden, among all the social market economies, is the most welfare-state-oriented and corporatist, characterized by its system of corporatism, wage solidarism and government intervention in labor markets.

Corporatism is a special political and economical system in Sweden. It is the centralized wage bargaining system, to maintain low unemployment rate and low inflation. Corporatism exerts control over the social and economic life of respective areas. There are two types of corporatism, authoritarian and liberal.

Authoritarian corporatism is known as state corporatism. It refers to the use of state established and recognized organizations to control wage bargaining, hence limit the

power of civil society. This form of corporatism mainly exists in fascist economies.

2. The Welfare State and the Global Economy

Liberal corporatism, on the other hand, is mainly a voluntary and self-organized process of bargaining between labor, capital, and government. Government only plays a supportive role in liberal corporatism. This form of corporatism is practiced in Sweden, with its strong labor party rule in the economy. The Saltsjöbaden Agreement, signed in Sweden in 1938, established the centralized wage bargaining process that was largely practiced until 1983. It labels the Swedish corporatism, but also balances the power between conflicting groups, named “conflict corporatist”. This type of liberal corporatism emphasizes on the role of labor hence achieve greater equality between conflicting groups. Nevertheless, “consensus corporatism” was also practiced in Sweden in the form of EFO model. This model stated that the standard of wage increase depends on the improvement of productivity in the internationally tradable goods sector.

There are similarities between the Swedish model and the Rehn-Meidner model, and more importantly some significant differences.

One example of active government labor policies is the Rehn-Meidner Plan which encourages the retraining and reallocation of workers from falling to rising industries through government program. Another significant policy is the wages fund, which “was to be created by a payroll and excess profits tax and would buy up shares of corporations to be owned by the unions”. However, this plan was not in practice any more after the change in government

ideology. Sweden is well-known for its complete and mature welfare state programs. However, these benefit programs cost high government spending, hence, high tax rates and inefficiencies in public sector. High tax rates also reduce labor supply and encourage the rising of underground economy. Nevertheless, although the welfare state program and high taxes in Sweden have caused lots of problems, Sweden is still one of the countries with the highest income and wealth equality.

First of all, the solidaristic wage policy is something that is prominent in both models. It is argued, however, that this idea has been pushed to its extreme limit and has moved towards “equal pay regardless of work”, rather than “equal pay for equal work”, which was the original idea of the Rehn-Meidner model. This movement away from the idea of Rehn and Meidner is argued to have decreased the interest in growth.

Another similarity is the collective bargaining, which is one of the most important features of the Swedish model still today. The strong position of labour unions was also something that Rehn and Meidner considered necessary in their model.

Regarding the labour market, which is the foundation of both models, it is possible to see similarities in its policies. The Rehn-Meidner model advocated active labour market policies, which is something that has also been followed in the Swedish model, mainly during the 1950s and 60s. Lately, however, policies in the labour market have become less and less active.

Furthermore, the fundamental goal of full employment is apparent in both models. Differences are obvious, though, in how this goal was supposed to be achieved. The Rehn-Meidner model required all of its instruments to be used, as they are interdependent, which the Swedish model did not recognize this interdependency and neglected parts of the Rehn-Meidner model.

One major departure from the Rehn-Meidner model was the failure to keep down inflation. Keeping down inflation was important for Meidner and especially Rehn who used the motto “hate inflation”.

It is obvious that the Swedish model and the Rehn-Meidner model do have some similarities, but it is equally obvious that they are not identical – they do have some crucial

differences as well. The most clear corresponding characteristic the models share is the labour market policy, in which it is feasible to count also the solidaristic wage policy and collective bargaining. The strong position of trade unions in Sweden does also have much to do with that.

The most noticeable departure from the model is the economic policy in Sweden, which has not been as tight as proposed by the Rehn-Meidner model. This has resulted in a failure of the ambition of a low inflation. This is something that has been much recognized, for example by Rudolf Meidner himself.

Sweden's welfare ambitions were probably incompatible with the Rehn Meidner model. For example, it is obvious that relatively equal incomes, regardless of work, have been advocated in Sweden, which is not in line with the solidaristic wage policy of the Rehn Meidner model.

3. The failure of the Swedish model

It has been shown that the Rehn-Meidner model was never applied, and is not the same as the Swedish mode. Some obvious differences, as well as similarities between the two models have been outlined. Furthermore, the Swedish model is thought by many to have failed, especially from an economic point of view. While it was easy to see that the Rehn-Meidner model failed, it is more difficult to analyse the failure of the Swedish model.

One of those criticizing the model is economist Klas Eklund, who argues that the Swedish model has indeed failed. He claims that the Swedish model was too little influenced by the Rehn-Meidner, and that is part of the reason why the Swedish model failed, and yet another relation between the Swedish model and the Rehn-Meidner model worth discussing.

First of all, a more differentiated labour market where human capital was regarded more important than previously complicated the use of the solidaristic wage policy. The notion “equal pay for equal work” eventually led to equal pay regardless of work, which led to a shortage of skilled workers. This wage solidarity reduced incentives to study,

which also resulted in a shortage of skilled workers [1].

Marginal tax rates grew rapidly. Deductions were generous. Hence, looking for loop-holes was interesting. Many Swedes then started to plan their lives, work, savings and investments according to what was good for them personally, not for the social economy. As Gunnar Myrdal said: “the Swedes are turning into a nation of cheaters”. Absenteeism and early retirement also increased as the benefits did too [1].

Some factors were directly related to departures from the Rehn-Meidner model, such as how the Swedish model, the way it was shaped in the 1970s, was too rigid, unable to respond in a flexible way to globalisation, and how neither monetary nor fiscal policy was as tight as Rehn-Meidner wanted [1].

German sociologist and philosopher Jürgen Habermas is following the same track, and argues that a crisis of confidence is born when the people are not willing to contribute to the security that is demanded. In *Legitimationsproblem im Spätkapitalismus* from 1973 he writes:

“The division of labor between the state and the private sector that forms the basis for the Swedish model requires that a continually increasing share of the national product be transferred to the public sector [it is now 64 percent]. Technical and economic changes must be accompanied by enormous public investment in order to insure the stability of society. There is a point where a dislocation in the social structure, caused by the free play of the market forces, becomes so great that people are no longer willing to pay the price for the necessary remedies. The demand for security remains, but the desire for each person to contribute to the cost of this security diminishes. The welfare state then faces a crisis of confidence.” [2].

This “crisis of confidence” is what Sweden is argued to have experienced, and a reason to the failure of the Swedish model. It is simply becoming too costly to contribute to the welfare state. This is related to what Myrdal suggested when he was talking about Sweden turning into a nation of cheaters, as discussed above.

More criticism comes from the historian Urban Lundberg who points out that another sign of the failure of the Swedish model is

the increased deviation from the model by its foremost advocates – the Social Democrats. Lundberg takes up a number of reforms that work as examples of this: deregulation of the currency market and the bond market; increased privatization; tightening of the qualifications for sick leave; liberalization of the labour market; a lower level of compensation [3].

The failure of the Swedish model is not as simple to recognize as the failure of the Rehn-Meidner model. The Rehn-Meidner model failed since it was never applied consistently – the interdependency of the instruments of the model was neglected. The Swedish model is more complex, and so is its failure. The failure of the Swedish model is mainly argued to concern the unwillingness of the Swedes to pay the high cost of the model. Also, the model requires homogeneity, both socially as well as economically, that is not worthwhile.

As the Swedish model is argued to have failed, and the Rehn-Meidner model is argued not to have been applied consistently, a myriad of questions arise concerning the future of Sweden, its economics, politics and models. A few of them are discussed in the next chapter.

Unquestionably, these labor market institutions have contributed to the success of Swedish economy. Sweden, with these three unique labor market characteristics, is the most successful redistributionist social market economy. Swedish economy combines the free market output, private ownership with active government intervention in labor market, has practiced corporatism (centralized wage bargaining), complete state welfare security, and wage solidarity. Sweden has benefited from these policies, with high economic growth and great income and wealth equality. These three market institutions set up the base for the Swedish economy model. However, experiencing difficulties since 1970s, the Swedish economy has been adjusting and changing to restore the competitiveness of Sweden. These three institutions may not maintain unchanged anymore, but they certainly still serve the foundation of Swedish economy.

4. Conclusions

To conclude, in order for the Rehn-Meidner model to work properly, it is required that all its instruments are considered since they are interdependent. This is where Sweden has failed in terms of the Rehn-Meidner model. As it has been shown, the Rehn-Meidner model has influenced Sweden in the creation of the Swedish model, but to say that Sweden adopted the Rehn-Meidner model is definitely not accurate. The main reason for this is the interdependency between Rehn and Meidners instruments that has not been considered in the Swedish model.

The main objective of this thesis was to sort out the Swedish model and the Rehn-Meidner model, and analyse their relation. It was found that there are obvious similarities between the models, but more importantly that there are crucial differences.

The core of the Swedish model was found in four different ideas: the basic concepts of equality and solidarity as a foundation of the Swedish model, were found in Swedish Prime Minister Per Albin Hansson's idea of „the people's home“; the level of state intervention to guarantee welfare is apparent, but not excessive, which is recognized by Marquis Childs in his idea of Sweden as the middle way between capitalism and communism; this reasonable level of state intervention was accompanied with an agreement between labour and capital in order to secure the welfare, which Walter Korpi called „the historical compromise“; and finally, these ideas have led to a system where citizens are not dependent on the labour market for a certain high standard of living, as Gösta Esping-Andersen's concept „de-commodification“ means.

The Rehn-Meidner model is more concrete. The goals of full employment, low inflation, high growth and equality were to be achieved by solidaristic wage policy, restrictive general economic policy, labour market policy and marginal employment subsidies. Important for the model was that these instruments were interdependent. This interdependency was failed to be recognized in Sweden, and hence the model was never accurately applied. The model had its obvious influence in Sweden, however, and some similarities to the Swedish model, but since the interdependency of its instruments was neglected, it is incorrect to say that it was applied.

The Swedish model is also argued to have failed, but for completely different reasons. It is argued that the Swedish model requires homogeneity, socially and economically, that is not worthwhile for its citizens, and that people consider it too costly to contribute to the model.

Applications of the Rehn-Meidner Model

Vasiliev Lucian

“Al. I. Cuza” University from Iasi

lucian.vasiliev@gmail.com

Abstract

The Swedish Model is a term that pops up here and there. The purpose of this background report is to summarize the elements of literature and investigate what referring. However, it is important to initially clarify that although the Rehn-Meidner model can appear to be central to the emergence of the Swedish model, so began the development of Swedish society long before it was presented. Rehn-Meidner model is more a theoretical document that summarizes the policy which culminated in Sweden sixties. It is after this thesis that the outline drawn. First, a review of the Rehn-Meidner model and the effects it had on society. This is followed by a more detailed review of the mixed economy, (“korporativismen”), the general welfare policy, active labor market policies, and finally wage formation with the central negotiations.

Keywords: Rehn-Meidner Model, economy, economic policy, corporatism

JEL Classification: E, E6

1. Introduction

After World War II prepared the Swedish economists on a similar crisis after the First World War. This appeared, however, never, and instead stood before Sweden demand-pull inflation and labor shortages. There was a conflict in which the state wanted the union would work to reduce wages in order to halt the rise in prices, but where the union refused. Instead, the union felt that it was the state's responsibility to regulate demand so that it became adapted to the amount of employed labor.

The solution was formulated under the leadership of two LO economists Rudolf

Meidner and Gösta Rehn. They constructed a model in which the interaction and interdependence between the state and trade union movement's actions were used both to achieve more even distribution of wages and economic growth. Commentators have argued that this model represents the "core" of the Swedish model: "The importance of the Rehn-Meidner model for post-war Social Democratic regulation in Sweden cannot be underestimated. It was the paradigm. That informed the regulatory practices That rendered the universal welfare state compatible with the reproduction of the national capitalist economy; That is, the policy routines of wage determination, labor market policy, and macro economic policy. These can be said to constitute the core of Sweden fordist mode of regulation "

An important component of the Rehn-Meidner model was the wage policy of solidarity, which built on the principle of equal pay for equal work. Rate of pay was therefore independent of the work species, and independent of the solvency of the company. With this, there were essentially two purposes. First, they wanted a reduction of wages and increase the salaries of the most vulnerable groups. Second, the policy became an instrument to accelerate the closure of unprofitable businesses and industries. Pay policy therefore led to a structural rationalization and modernization of society.

The risk with this model, however, was that it could generate inflationary pressures in the market.

This could be prevented by a Treasury dampening demand policies also could provide a good starting point in contract negotiations between the various parties on labor market. In practice, this led to a Keynesian stabilization policy that saved in economic upturns, to spend more money in downturns. The model also resulted in an urbanization of the country, and hence to

forced labor to move where the jobs were. In order that the workers would move took him more than small differences in income, and this inertia led to the transformation of the market went slowly. To facilitate the urbanization, the state invested in the so-called "Million program", which resulted in the emergence of new suburbs to the big cities. A example, Tensta and Rinkeby outside Stockholm.

The egalitarian wage policy and the restrictive demand policy led to risks of structural unemployment. This problem was handled by the increasing mobility of workers designed a new and more active labor market policies. The result was the formation of Labour Market Board (AMS) 1948 and by giving workers more information about position (employment), and relocation allowances. They also began to train the unemployed to school them in the expanding business where it was needed labor. In connection with this was also the labor forecasts of future labor needs to preventing bottlenecks in economic upturns.

Another effect of the model was that the profit distribution was undesirable effects on income distribution. These were dealt with by taxing and regulating the capital market, which was designed to support the main growth forces. The emphasis of taxation was progressive individuals and low on income from work. The company was however, it is designed in a different way, as they so long as capital remained in the company was low. The rules relating to depreciation of capital was favorable and it was easy to fund profit margins. They wanted this encourage businesses to use the profits to investment, but it did instead of capital mobility decreased and also the importance of the stock market. In conclusion led Rehn-Meidner model for high growth, high employment and balance of payments. It managed, however, never quite achieving the goal of price stability, which Meidner complained the 1973rd.

The low unemployment and rising export figures, however, gave an increase in demand that created pressure on inflation in Sweden in the fifties and sixties. The reason for this was, according to Magnusson, Political: "In general terms, were the causes of this dilemma is mostly political. 1950 - and 60's was a period of rising expectations. The

public was subject to an annual standard increase of several percentage points. And politicians helped to lull the public into the idea that this economic growth was a natural state".

2. Among the economy with limited state ownership

Rehn-Meidner model and the Social Democrats' economic policy led to what in literature is called a "mixed economy" in which market forces are combined with socialist control. State ownership was never dominant, and has never exceeded 10 per cent of the number of employed. Instead, there was state influence with a more or less invisible hand of the market in the expansion behavior and directed in the direction they felt was best for society. This is something that Schonfield (1974) places emphasis on when he describes Government's role in the sixties: "The Fact That the government does not intervene – indeed is publicly seen not to intervene - not does it mean That Fails to let ITS views to be known Those concerned. " The goal of the Swedish model policy has primarily always been focused on the full Jobs. The characteristics of this policy is regulatory, not economic planning and state ownership. These regulations have, been the dominant the residential, agricultural and financial sector.

In the housing sector rents were more or less frozen from 1942 to 1975, where the norm in rent-setting was similar collective party negotiations between the tenant and landlord. The rent was for the "use value", the apartment's standard, and this price was also as a template for the private housing market. Other regulations in the housing market was among other things, that it was possible to rank the housing applicants, and residential construction determined by state standards for what a good standard meant. The regulations were intended to prevent segregation in the housing market and increased quality differences in housing assistance.

In agriculture, increased tariffs and a number of subsidies were introduced to farmers would to live on his farm. Instead of food prices was by supply and demand; the party was settled in negotiations between the state and agricultural interest groups. This

Not only was the peasants' sake, but also because Sweden could remain self-sufficient at the time of war. Food cartelised was with some sectors (Eg sugar industry) had a near monopoly on their products.

The Social Democrats also introduced controls over how freely capital could not move. Savings controlled and directed over to social priority sectors housing. Banks, insurance companies and pension funds were required to place funds in mortgage bonds. This policy results included in the construction of public pension fund (AP Fund). It also ruled the capital market, currency regulation, which has also had to seek permission for capital transactions as portfolio investment or loan transactions with foreign countries. The government oversaw all trading in foreign currencies through so-called exchange banks were regulated by special laws.

State ownership has been an impact, albeit limited, component of the Swedish Model. The modern roots of state ownership in commercial plant origins during nineteenth century, when such a state televerk and the state railway was established. There was already a post office, and in the twentieth century came Waterfall Board, National Lithographic Establishment, Defence factory work and the CAA. The reason they were in the state-run low in the expectation that private profitability criteria could not guarantee that they worked and worked for the good of society. State ownership also resulted in a public limited company sector expanded right up to the seventies. Approximately up to the fifties, so businesses were nationalized to avert the threat of closures and unemployment, which the state took over as owner during periods of crisis or for to organize activities in a better way. Organization The argument used among another at the nationalization of Wine and Spirits Center.

Some scholars argue that the expansion of state ownership in the sixties was as an end in itself. however, argues that this is not true, and proffers numbers where the state's gross investment is reduced during this period. However, he argues that there is a third reason nationalization to add the two as mentioned earlier benefits of mixed economy. These were mainly related industries at the time considered strategic -

telecommunications, energy, etc.

3. Strong social movements and "corporatism"

Beginning in 1945, increased the influence of various organizations in Sweden. This occurred on the expense of parliamentary importance, which effectively disowned his power to the government. Instead to make decisions in parliament, were in reality behind closed doors at Harpsund between government and various interest groups. This is often seen as an expression of corporatism, Thus a model in which organizations work together or become incorporated with the state apparatus. The involvement of government decision-making apparatus began in the early twentieth century. Already 1902, there were five representatives from the workers and five representatives from employers in Workers' Insurance Board of the Council. In the thirties, was expanded this model to include more state agencies, where the LO and SAF in particular, were represented in different boards. Through this presence and participation in various investigations and consultation bodies organizations won considerable influence over policy. This image was also reproduced by Schonfield: "In Sweden there is a Society in Which no residual groups are so Strongly Organized, Their Democratic basis so firm, and Their habit of bargaining with one another Independently from the government so well Established, that 'here, if Anywhere, 'Indicative planning' in the full sense - that is planning without any dependence of the state - looks as if it ought to be feasible. (...) (T) he government is Meant To keep the ITS distance. It is not Merely That it is Excluded from the colloquy between the two sides, it does not even, any longer, Attempt to exercise guidance " Firstly, it was organizations representing groups in the community where the size decided how much influence could be exercised over the decision-makers. Second, it could organizations exert influence through ideological similarities, such as in the case the relationship between SAP and the LO or the Centre Party and the LRF. Information and knowledge played also matters. If policy makers could obtain important knowledge of collaboration, greater empowerment of

Organization of decisions. The organizations produced Also own investigative material and had its own research institutes. Altogether, this was about intrasseartikulering, intrasseaggregering and expertise.

Important to mention is that the degree of influence and organizations in policy does not determined by agitation or aggression, but of objectivity and the importance of organization could be for policy makers. The reason, according to Nils Elvander, was that organizations considered to be working for the people and the public interest best, so they own interests were linked with society. This view indicates a holistic view of society, in which the peculiar interests aligned the whole. This can be linked back to the marginal importance of agitation. The organizations selected a lobbying approach that fitted better into the society's public game rules for lobbying activities would be assessed. A break of these standards would a lower degree of influence. The consideration of public interest was not purely tactical motivated: 'Organizations' efforts to identify and harmonize the group interest of public interest need not be perceived as merely tactical. It may well be honestly meant. The habit of arguing on the basis of interest can exert a educational impact, organizations are becoming more intent on the merits adapt their requirements and desires to the needs of society, to see their own area of interest as part of the whole. "This view is reinforced by Schonfield who says that "They (union) see Their Purpose as being like that of a skilful pilot in a sea of the currents and high winds, who sets out to employ the energy of the elements to bring his boatload of Passengers to Their destination. "But he never draws the conclusion that one should ask Sweden for a corporatist state in which organizations have a special legal status and acts as independent entities.

The standards upon which the organizations' strong role in the Swedish model is Walter according Korpi in the Swedish society's history. He argues that the fragmentation of Catholic diocese was a secular base, without which the emergence of the model would be impossible. Further emphasizes Korpi importance of linguistic and ethnic homogeneity, and the importance of industrialization came so late. This

allowed the industrial unions and labor movement to building to strong without to competitive of any hantverkarorganisationer or being distracted by conflicts based on linguistic or ethical grounds.

But it is also possible to interpret the organizations' involvement in decision-making as something more than corporatism and direct exercise of power. This view has been put forward including by Bertil Ostergren was SACO Chairman 1961st He wrote an acclaimed article where he presented the thesis that 'role as a force outside parliament and the Government gives the individual another venue to engage in debate. Under this assumption has party democracy's failure to pick up citizens' views and activism has been replaced by organizations' distribution democracy. "

4. General welfare policy

Although the term "general welfare policies" often figures in the public debate, it is not always its meaning is defined. According to Rothstein comply with a welfare system requirement generality of its general allocation rules, is universal, or both. In this definition model therefore placed contributions as housing, social assistance and child care outside the general welfare, as they are selective and targeted. However, this can be criticized on grounds that the rules surrounding the housing and welfare payments are not less general than those that control ATP or student aid systems. Molander therefore concludes that definition of what a general welfare policy can never be exact. Whether or Sweden, or has had a general welfare is therefore up to each one and what definition one chooses to use.

In the Swedish welfare state model is primarily thought important, as it is from this that welfare policy was born. It referred to here is Per Albin Hansson's welfare state based on community and solidarity. Welfare state idea grew from the thirties even stronger and evolved over time into a project that aimed to eliminate the social distress and allocate the increased revenue in the most equitable manner possible. This goal was to trade union movement could not accept the structural changes that come as a result of Rehn-Meidner model, even though it meant a certain party of the working class: "Society's

task was to allocate the increased revenue in the most 'egalitarian' way.

It also meant that the trade union movement supported the necessary rationalization and restructuring that was emerging philosophy condition. "

What distinguishes The Swedish Model welfare policies from other countries is not costs, without reconstruction. Gosta Esping-Andersen understands that what makes the model is unique mainly four different elements: a general universalism, equality, the strength of the social, civil liberties and efficiency. For these ideals to be put into practice, requires a State that provides services and models that meet all classes of society demands and needs. A minimum living guarantee is not enough, and therefore welfare system is inevitably costly.

Another factor that makes the Swedish welfare spending is the productivity-promoting and preventive social policy. This means that a very Money invested in employment, retraining, education and prevention of disease and accidents. The goal of this policy is to minimize the social distress and maximize jobs. Esping-Andersen explained the reduction in class differences, employment and the reduction of poverty as the distributional effects of welfare policy.

The Swedish welfare system is not only a result of the Social Democratic leadership policy, but it has also been limited by external factors. Since the party itself is never able to dictate their demands based on their parliamentary power, then welfare policy designed with the support of different class coalitions. The economic efficiency has also consistently recognize that the Swedish economy has been small, open and export dependent.

Furthermore, the struggle for social citizenship had to go before the democratization of ownership and egalitarian ideals.

Women's role has also been an important component of the Swedish welfare system. Social democracy has always strived to eliminate poverty, reduce class differences and a more equitable distribution of life chances. The inclusion of women in the labor market has been a means to increase the efficiency of the system. This was done through, among other things investment in the family to distribute purchasing power and

the promotion of industrial modernization through a solidaristic wage policy pointing out that a policy aimed for full employment gave women a stronger position in the labor market without the at risk of exclusion. The elimination of women's wages in the sixties meant that the average salary for the twenty years rose from 60% of men's earnings to 90%.

The Swedish welfare state's various stages of development characterized by distinct concept of solidarity, from a proletarian micro-socialist solidarity, through a national Solidarity comprehensive "little people", the current model which includes all wage workers. But the Swedish model also contains a system of stratification, as it managed to get the general solidarity accepted over other solidarity performances that dominated the other welfare states, such as England. These stratifikationsformer generated Social identities and political loyalties that have been decisive for the balance of power in the country.

5. The active labor market policies

As one of the Swedish model's slogans was "work instead of contributions" so it came about natural for an active labor market policy became a vital part of this model. The targets that were behind the reforms was a high employment, low inflation, solidaristic wage policy and rapid economic growth - in other words, the linchpins of the Rehn-Meidner model (which developed in section 2 of the report).

The unusual thing about the AMS was that it was a body that had unusually high level of autonomy against the State. This meant that the AMS is not bound by central regulations and had extensive powers. The reason was that you wanted them to rapidly changing labor market conditions could be met by prompt and flexible measures tailored to specific situations. AMS independence made it to yet a power in the political game, and in its Board were also representatives from all parties. Moreover, it was these representatives also partial responsibility for the business, then they got a direct decision-making positions. Rothstein consider that this opportunity could be a way to get organizational representatives to act more accountable and align their interests for the

common good. The bill that formed the basis for this model provided: "Participation from organization representatives' side not only in the deliberations but also in decisions are also likely to build confidence from the individual's side, thus strengthening Board's authority. This is of particular importance considering that the findings, which arrive on board, in many cases must be assumed to become the fragile nature of a negative impact on large populations. "

It works throughout the active labor market policy was based on was not a pure corporate machine, but it was also based on trade union domination, and was imbued with social democratic ideas and policies. This is what Rothstein term as a "Social democratic cadre organization within the Swedish state apparatus."

The organized class interests came to have great influence on the AMS Board of Directors. Organisationsinvolveringen also expanded to include various permanent working groups various issues to varying degrees contributed to the implementation of labor market policy. On these pages you will find even more details about the battle over the various lines around the constant support lines.

6. Conclusions

During the sixties, The Swedish model negotiations admired at several locations in the world. As a leader of the British trade union movement came to Sweden to study negotiation methods applied, he was greeted by a world very different from that he was used to: "The secret was Either too banal or too opaque to yield to intelligent investigation. "All They cancer tell you When You ask Them how to do it ', he said, some Describing Particularly Difficult Decision Which Involved the Concerted Action of comp thing rather than the residual groups, 'ice: We speed a Meeting ".

This quote describes well the mood that the Swedish model's negotiation policy was of. It was suggested that the circumstances

surrounding its origins, and it is clear that Social Democrats' 44-year-old power holdings have played a major role. This in turn reinforced by the ideological thrust of LO, Which is largely done in order to promote class solidarity at the expense of professional interests. In addition there was a strong LO, well organized and negotiation-oriented economy, and a rather weak and fragmented middle class.

The incentives for the parties to rally around what later came to be Saltsjöbaden agreement was around a troubled past with violent strikes and conflicts. These were formed around the former collective agreement and what Åmark call "open cartels' where competition for prices and sale of labor was limited. The high conflict rate by an subsequent political debate about industrial peace finally gave rise to a number of legislative proposals regarding how conflicts could be reduced. In the end, the threat of legislation to protect "Third parties" in labor disputes LO and SAF to open negotiations. 1938 Saltsjöbaden agreement through which they created a system of rules for the party determined conflict resolution.

This ideological aspect may be due to the LO long joined forced its members to Social where they may have been the ideological exercise and dimension they did not get Only by involving union.

Modelling Belief Systems with NLP: Linguistic Pathways to Communication and Negotiation

Zamfir Cristina-Mihaela

„Ovidius” University of Constanta, Department of Modern Languages

cristina_m_zamfir@yahoo.com

Abstract

Beliefs influence our experience and interpretation of reality by connecting our experiences to our criteria or value systems.

Neuro-Linguistic Programming provides perhaps the most powerful model of the mind and set of behavioural tools in existence. Through the processes of NLP, beliefs and belief strategies may be explicitly mapped and directed.

Beliefs connect values to our experiences through statements of 'cause-effect' and 'complex equivalence'. Beliefs can be a matter of choice. We can drop beliefs that limit us and build beliefs that will make our life more successful.

Beliefs influence behaviour. They can support particular behaviour or inhibit it. This is why modelling beliefs is so important.

Key words: limiting beliefs, cause-effect, complex equivalence, NLP, business communication.

J.E.L. Classification: D83

1. Introduction

The beliefs that we each have about ourselves, others and the way the world is have a major impact on the quality of our experience.

One of the simplest ways to model the beliefs of people with outstanding abilities is to ask them questions about *why* they do what they do. The answers they give us will be rich of insights into their beliefs and values. Beliefs will take one of three main forms. They can be beliefs about what things mean, what causes what (cause-effect) and so give rise to the rules we choose to live by, or what is important and what matters most, so giving rise to our values and criteria. In modelling our beliefs, we focus on those that

are most relevant to and supportive of the particular skills and competencies that we are interested in. We build beliefs by generalizing from our experience of the world. But how do we know what experiences to generalize from? According to O'Connor and Seymour (2002: 83) [1], "Some beliefs come to us ready made from the culture and environment we are born into [...] When we believe something, we act as if it is true. Beliefs act as strong perceptual filters. Beliefs are not just maps of what has happened, but *blueprints* for future actions" (emphasis added). Beliefs are expressed in simple terms: if I do this ... then that will happen. I can ... I can't ..., and these are translated into: I must ... I should ... I must not Language is an essential part of the process we use to understand the world around us and express our beliefs.

2. The basic structure of beliefs

The main aim of our beliefs and belief systems is to link core values to other parts of our experience and maps of the world. The belief statement, "Consensus in business requires good negotiation skills", links the value "consensus" to a particular class of activity ("negotiation skills"). The statement, "Consensus in business is mainly a matter of talent", connects the same value to a different cause ("talent"). As these statements illustrate, beliefs are fundamentally statements of relationships between various elements of our experiences.

From a linguistic perspective, the basic structure of beliefs is framed on *complex equivalences* and *cause-effect* relationships since "the *combination of complex equivalences and cause-effect* relationships form the *basis for our belief systems* and are the fundamental processes behind *programming*" (Dilts and DeLozier 2000: 145, emphasis added) [2]. These verbal

patterns may be looked upon as the building blocks of our beliefs and are the linguistic structures which help us build our maps of the world.

The first linguistic element, i.e. *complex equivalences*, implies equivalences between different aspects of our experience ($A=B$, or A means B). Through this language pattern definitions of values are generally provided and evidences for whether or not values have been met are established. For example, statements such as:

- e.g. *Having a lot of money means you are successful.*
- Not attaining the objectives properly means a lack of professional competence.*

could be examples of complex equivalences reflecting beliefs.

The second linguistic element, i.e. *cause-effect relationship*, represents the causal link between values and other aspects of our experience. This is frequently characterized by verbs like *cause*, *make*, *force*, *leads to*, *results in/from*. Such linguistic structures are used to define the causes and consequences of particular values.

From the NLP perspective, the sayings *power corrupts*, *money talks*, *time/love heals* are perceived as statements concerning the consequences of values related to our experiences. As a matter of fact, cause-effect statements and complex equivalence are those which connect values with our experiences, or, as Dilts and DeLozier put it, “Values are what give our beliefs and experience meaning” (Dilts and DeLozier 2000:99).

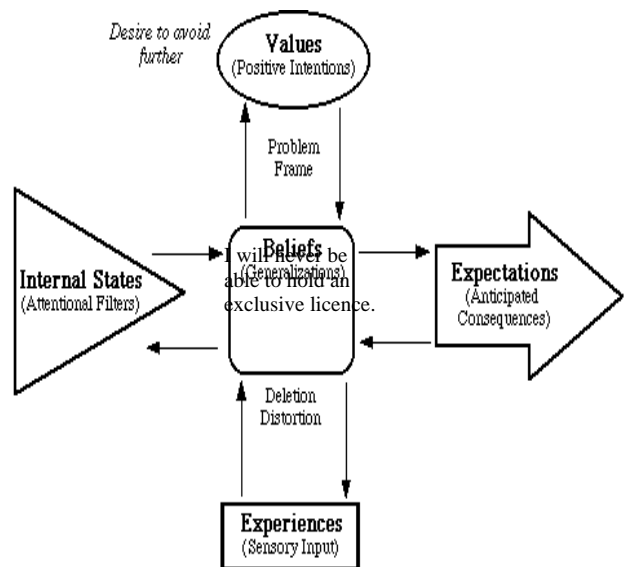

3. The meta structure of beliefs

Beliefs can also be limiting, a fact which will have a negative impact on all the other levels, especially on the capabilities level. The meta structure of beliefs implies that all our beliefs are **generalizations** drawn from our map of experiencing the world (Dilts 1990 [3], Dilts and DeLozier 2000, McLaren 2000 [4], Molden 1996 [5], Molden and Hutchinson 2006 [6]) whose function is to link together various components of our personal and professional experience (sensory experience, values, expectations and

internal states). All these together make up the map of our beliefs, or what Richard Bandler called the “fabric of reality”. As an example, let us think of a person who has serious doubts about whether he or she ever succeeds in signing an exclusive agreement or contract:

- e.g. *I will never be able to hold an exclusive licence.*

Such a limiting belief creates a “problem frame” and can result as a shift in any of the four components mentioned above to a negative formulation.

(Source: Dilts and DeLozier 2000:101)

According to Dilts and DeLozier (2000:101), “When limiting beliefs and *generalizations* stay connected with the intentions and experiences from which they have been established, the *deletions* and *distortions* eventually become updated or corrected as a result of new experiences, changed in internal state, and revised expectations. New data or ‘counter examples’ that do not fit with the generalization will lead the person to reconsider the validity of his or her limiting belief” (emphasis added).

Linguistically, beliefs which are limiting rather than permitting are rendered by negative expressions. Many beliefs turn out to be limiting as a result of unanswered **how to** questions. Beliefs can be transformed by providing the answers to the **how** questions

and thus develop a much clearer picture of a person's identity and mission. For example, a person who does not have experience in how to mastermind the activities of his/her firm may develop the belief ***I am incapable of successfully running this company.*** Similarly, in order to address a belief such as ***It is risky to evade my income taxes,*** one should answer the clarifying question ***How have you managed to evade your income taxes and get away with it?*** (you haven't been made responsible or punished by law).

Limiting beliefs can be explored by applying specific verbal frames for eliciting limiting belief statements because “No matter what one's actual capabilities are, if one has limiting beliefs resulting performance will tend to fulfil the negative prophesies because the capabilities will, to a large extent, be blocked” (Katan 2004:55) [7]. For example:

e.g. ***I can't make a discount.***

It's impossible to make a concession.

I'm not up to making an improvement.

What if I can't make a compromise.

Other simple statements which indicate an impasse or strong resistance relating to a belief usually begin with: *This sounds crazy but...; This doesn't make any sense but...; It just isn't like me. I don't understand it.; I just can't!; Logically I know it isn't true but...; It is not possible for me to...; I'm not capable of...; I must not be...; I'll never be...; People should...; They don't want...; Everyone / no one thinks... :*

e.g. ***I can't find better suppliers anywhere else.***

People never take my suggestions seriously.

She is easily intimidated.

They should give this project priority. / They shouldn't waste any more time on this project.

Accepting these terms and conditions is impossible.

I'm no good at running my finances.

Molden and Hutchinson's (2006:20-22) research on limiting beliefs makes it clear that at work many people are held back by such limiting beliefs. The two NLP theorists' opinion is that limiting beliefs are workplace determined and act as a barrier on improving

performance. They prefer to describe them metaphorically by mentioning that “Holding a limiting belief is like wearing blinkers – you see only what you expect to see. [...] Beliefs can be stubborn defying the most rigorous logic”.

For many (Dilts and DeLozier 2000, O'Connor 2001 [8], Knight 2002 [9]), beliefs are the inner maps which guide our behaviour and strongly influence our capabilities. They also make sense of the world we live in and shape what we do. O'Connor and Seymour (2002:83) also agree that shared beliefs are “the guiding principles which give a deeper sense of **rapport** and **community** than shared work”, being explicitly mapped and directed. Functioning at a level which is different from that of behaviour, beliefs act as strong perceptual filters that influence our interpretation of reality by connecting our experiences to our value systems, what NLP calls our “core criteria”. Beliefs stated in the positive are permissions to further explore the world of possibility. They “turn on our capabilities, create results and [...] keep us resourceful and capable of succeeding in the end” (O'Connor and Seymour 2002:84-85). Beliefs stated in the negative, i.e. limiting beliefs, centre around modal verbs in the negative form like *I can't...*, *I must not...*, or *I would not...*:

e.g. ***I can't dance on the rope.*** (do many activities at the same time)

I wouldn't dance on the manager's tune.
(do what he wants me to do)

I can't dance attendance on him. (do everything possible in order to please him)

I mustn't give my subordinates too much rope. (give them a lot of freedom to do their work in the way they want to do it)

The solution to find out how far one can “push” his/her capabilities is to pretend that one can do whatever thing, in other words, to counteract “can't” with “as if”, and act “as if” one can. A change in belief triggers a change in behaviour. By way of illustration, the following sentences can be considered:

e.g. *If I handle such situations, I will have a rise in pay.*

I can handle such situations, and I must have a rise in pay.

I can handle such situations, and I should have a rise in pay.

I can't handle such situations, and I must not have a rise in pay.

Looking at such examples, we realize that the words we use express our beliefs. Consequently, the language we use is a means of communicating our thoughts, beliefs and values.

Our *values* are the embodiment of our beliefs. *Webster's Dictionary* (1996:1578) [10] defines values as the “principles, qualities or entities that are intrinsically valuable or desirable”. In accordance with O'Connor and Seymour's (2002:83) perspective, Dilts and DeLozier (2000:1519) find a direct relationship between values and rapport, pointing out that people feel more congruent and have a sense of satisfaction when their values match each other, “When people's values are met or matched, they feel a sense of satisfaction, harmony, or rapport”. Our outcomes are usually influenced and directed by such values as **a sense of achievement, recognition, praise, success, creativity, or responsibility**. We set ourselves goals which match our values and motivate us. For instance, a manager whose goal is to “stay ahead of the competition” is more likely to value *a permanent improvement in products and services*. A venture capitalist whose goal is to “invest money in new businesses” most likely values *creating more wealth*, in the same way that a high-powered business tycoon who has a value of *expansion* will relate his goals to “undertaking more prosperous economic activities”. The importance of values cannot be overstated. People who have a strong sense of what is important to them usually have a real sense of purpose that acts like a propulsion system, which moves them towards it.

4. Conclusions

Beliefs can be positive driving forces in people's lives but they can also be disempowering and limiting. When we believe something, we act in a way that

validates it. That is true whether it is a positive or negative belief.

Many limiting beliefs originate from a vacuum at the capability level, in other words people do not know how to do something. If they do learn how, their beliefs often change spontaneously. If, after a few goes, people continue to struggle to grasp how to do something it is easy for them to slip into believing it is not possible. Limiting beliefs hold people back or prevent them from doing things.

The Repercussions of the Medical Staff Emigration Phenomenon on the Romanian Sanitary System

Adriana Zanfir

The Bucharest Academy of Economic Studies

zanfir.adriana@gmail.com

Andreea-Monica Predonu

The Bucharest Academy of Economic Studies

monica.predonu@yahoo.com

Abstract

The migration tendency of the health care staff represents a major problem which affects the great majority of the EU states. The Romanian sanitary economy presents an alarming situation, because not only that the number of health care workers leaving the country is high, but it is continuously increasing. Cumulating the issues determined by the sanitary system's under-financing with the exodus of specialist doctors we reach the conclusion that the health care system urgently needs undertaking some real measures in order to diminish the negative effects and to improve the services provided to patients.

In order to achieve these goals, the main objective of this paper is to identify the causes which determine the international migration of Romanian doctors and to elaborate a series of recommendations which would be useful in solving some problems generated by the lack of health care staff.

Key words: sanitary system, health care staff, workforce migration, European salary, health care services.

J.E.L Classification: F22, I15

1. Introduction

One of the economic environment globalization's positive effects was the liberalization of world trade, goods and services, including the workforce. Surpassing the issues generated at a global scale, the workforce migration phenomenon has considerably developed and this is to be

noticed in national and international statistics.

The migration phenomenon manifests as a process of shifting a part of the active population towards economically developed areas in order to find proper workplaces which would be better paid as compared to the national salaries [1].

The economic factor has always been considered the main cause of migration. This factor determines two immigrant categories in the European Union: highly prepared immigrants (doctors, for example) who can contribute to economic growth, on the one hand and those who are not professionally prepared and accomplish activities specific to unskilled workers, on the other hand. Although the last few years hadn't been favorable to economic development, there still exist some countries which have managed to balance the work market, becoming more and more attractive to immigrants. However, beyond the positive aspects of working elsewhere (for example, the improvement of life quality, the growth of the living standard, the social development etc.) we should take into consideration the repercussions of the migration phenomenon, especially at a macroeconomic level. This is also the case of Romania, which has become Europe's main workforce exporter in specific sectors of activity. One of these sectors is the health care system. The migration of medical staff (especially the migration of specialist doctors) has become an international problem, as many Eastern European countries reported a considerable increase in what regards the health care staff migration in the Western countries. In this new era of migration, regardless the country, doctors occupy a very important position, as their departure from that country is perceived as

“the migration of health quality”, because quality is a vital element in the medical field.

The medical staff migration phenomenon has continuously increased over the last few years in Romania, if we take into consideration that the effects of economic crisis are still present in the medical field. Being based on a strong motivation of leaving the country, many Romanian doctors chose to do their job under better circumstances offered by countries with greatly developed sanitary systems, such as Germany, Spain, France or Great Britain. It is obvious that this thing was the equivalent of significant losses for the entire Romanian health care system. This phenomenon has led to medical staff deficits in some areas, especially rural ones.

2. Romania – Europe’s main doctors exporter

The numerous deficiencies of Romania’s health care system has led, over the last three years, to a growth in what regards the requests of working abroad, coming from the part of doctors and medical aids.

This high amount of requests is due to the fact that Romania and its health care system aren’t points of attraction anymore and, moreover, they are discouraged. The insufficient funds of the hospitals, the lack of professional medical equipment (there are many medical units which do not possess the equipment they need and there are others which do not have even the basic medical tools, such as medicaments and bandages) and the unattractive salary are just few of the causes which determine the Romanian doctors to move abroad. Besides the financial reasons mentioned above, there are also some non-financial motivations such as the possibility of working or demonstrating their professionalism in a place where they are respected and appreciated and where they are offered all the necessary work conditions. If we take into consideration causes such as the doctors’ professionalism (because they would not leave the country if they weren’t able to adapt to other development systems), the impossibility of putting into practice all knowledge apprehended during all the years of study or the political conflictive situation which is transferred to the sanitary system (causes which have been identified by the

Romanian College of Physicians) we understand why the number of emigrants faces a continuous growth.

Statistics show that the great majority of those who have already received certificates of conformity in order to work abroad fall into the 35-50 years old category. Therefore, the Romanian sanitary system lacks experienced doctors.

All costs which appear as a result of the long period of majoring in a specific medicine branch should represent a long term investment for Romania. Unfortunately, the sanitary system does not have the ability of keeping its doctors, assuring the health of the human capital. This is also to be observed by specialists in the medical field; in this sense, Dr. Ionel Sinescu, the new rector of “Carol Davila” Bucharest University of Medicine and Pharmacy, said that “in the context in which the state pays 8.000 Euros for six years of study per medicine student, the loss that the state undertakes by doctors’ migration is huge”. The calculation shows that there are approximately 64 million Euros corresponding to the departure of the 8.000 doctors which have left the Romanian sanitary system starting from 2007 until the present day. The President of the Romanian College of Physicians also noticed the fact that the losses are highly significant for our country, recently saying that “if the situation continues to develop in the same direction, we will reach the negative level of having highly equipped hospitals functioning only as museums. They would be visited by patients, but they wouldn’t provide any medical assistance”. According to his ideas, “we invest in individuals, but we do not possess the knowledge of keeping them in the country”.

Looking back to 2010, we notice that from the total of 40.000 doctors with practice license, almost 2.800 requested professional certificates of conformity in order to work abroad. 2011 registers, in this sense, a number of approximately 2000 primary and specialist doctors migrating abroad because of the Romanian sanitary system’s under-financing.

The main medical branches that Romania lacks specialists are General Medicine, Family Medicine and General Surgery, most doctors wanting to leave abroad coming from Bucharest. Because of doctors’ exodus we

face the situation of having some branches left uncovered.

Starting from 2000 we have been registering increases of number of doctors per inhabitant in all European countries (with only one exception: the Slovak Republic). The average of the EU member states indicates a growth of density in what regards the number of doctors with a rate of 1.5% per year. Currently, the numbers show an average between 3.3-3.5% doctors/1000 inhabitants at a European level. It is obvious that in the context of a massive emigration, Romania is under average (with a percent of 1.9 doctors/1000 inhabitants).

3. The work offer in the health care system at the EU level

The liberalization of workforce circulation has brought a series of advantages for many EU member states.

At a European level, the work offer in health care specialists' domain is extremely disproportioned, as there is a surplus in many countries, while other countries face a lack of workforce. In 2008, Greece had the highest number of doctors per number of inhabitants, with an average of 6 doctors per 1000 inhabitants, almost twice the EU's average. Austria, Italy and Norway had at least 4 doctors per 1000 inhabitants. In what regards this average, Turkey, Poland and Romania have the lowest values [3].

It is estimated that over the next few years there will be approximately 10.000 physicians choosing to work abroad. This will have devastating effects for the Romanian sanitary system. The main countries that Romanian doctors choose to emigrate to are France, Great Britain and Germany.

The situation is getting worse and Romania avoids taking measures in order to keep its physicians.

The last few years had been characterized by the development of a significant workforce recruiting companies which help the health care staff to find better paid jobs abroad.

Manpower Romania is one of the leaders in the domain of human resources. The company is specialized in permanent, temporary and contractual recruiting, based on assessing, evaluating, professional development, externalization and consultancy in the HR field [6].

Manpower Company is currently developing a special project of recruiting Romanian physicians from the medical field for jobs in France (Manpower Professional Romania is developed in collaboration with a specialized team belonging to Manpower Professional France).

This project refers to workplaces in pediatrics, radiology, internal medicine and work medicine. These workplaces are based on a permanent employment contract; this is the reason why these types of jobs are dedicated to those who want a permanent relocation in France. At the same time, it is good to know that a French physician earns 4300 Euros a month. But this level can be achieved only if that specialist is registered to

the Council of the Ordre des Médecins in France.

Because of salary decreases, a resident physician earns as much as 680lei/month in Romania, while in the European Union the average is 1200Euros; in Romania, a specialist physician earns approximately 500Euros/month, while the European average is of 7000Euros/month. However, Romanian physicians can also choose the private environment. They have the possibility of being employed or to develop their own business in the health care field. The spokesman of Manpower Company declared that “in the private sector, the salary level is superior to that obtained in the public sector, varying according to institution, specialization (residency) or the candidate’s experience”. However, there is a problem which can stand in the way of obtaining a job in France: the candidates are required to be advanced French speakers.

Generally, the process of hiring abroad has various different features according to country, as the recognition of diplomas and specializations obtained in the country of origin undergoes different methods of being accomplished. In the case of physicians, the situation is a little bit different, in the sense that for applying for a job abroad they get their diplomas recognized only on the base of some certificates of conformity. Besides all the necessary documents, it’s possible for some countries (Italy, for example) to focus on the candidate’s experience in the field or to request a residency stage when needed (in case of major differences between the programs of the two countries).

Taking advantage of the opportunity of migrating to countries where they could earn financial benefits and other benefits, there is only one dilemma for the Romanian physicians: “should I leave the country for working in better conditions or should I remain in a less efficient system?”

4. Conclusions and recommendations regarding the developing and putting into practice of various measures of reducing the health care staff’s migration

In order to diminish the health care workforce migration, The Ministry of Public Health, in its quality main regulation organism of Romania’s sanitary system, has

developed a series of measures such as: decentralizing the residency by giving the medicine students the possibility of working in both public and private health care units or with family doctors.

Taking into account the fact that the number of physicians choosing to leave the Romanian medical system hasn’t changed, but it is continuously increasing, we consider that it is necessary to make a warn in this sense. The improvement of health care services’ quality has become the main objective of all efficient medical systems. We, as direct beneficiaries of the services provided by the Romanian sanitary system, are all interested in the ways of improving this sector. On one hand, these are not luxury services, as all citizens should have access to them. On the other hand, health services cannot be substituted according to preference. Their quality should be permanently assessed, because it is impossible to preserve a specific type of service, of a specific quality, in order to reuse it later, when we really need it.

A first step on the path of obtaining health services quality is building a highly effective system, consisting of subsystems and components which would collaborate in an efficient manner in order to provide a good functioning of the whole system. Romania still faces a series of problems when it comes to achieving this goal, because the sanitary system functions with independent sectors and the primary assistance is not related to that provided by hospitals; there aren’t any obvious relationships between the health promoting assistance and the curative one. It is obvious that the effects reflect upon the entire society. The specialist in this field underline the fact that we face a major problem by not integrating the health services in the sanitary system and this issue should be rapidly solved. From our point of view, a good development and coordination of activities from the entire health care system (at a both macroeconomic and microeconomic level) represent a good motivation for young practitioners.

We are aware of the fact that in the actual economic context the Romanian medical system cannot offer physicians a proper income in order to remunerate their work (before and after becoming physicians) and the responsibility they have in what regards

the patients and the entire society. However, we consider that keeping our specialists in this sensitive and highly disturbed system is a vital thing for the future of the Romanian health care system. Regardless the age or experience, a good salary is an enough motivation for our doctors and they could be persuaded to remain in the country where they studied. However, this goal cannot be achieved immediately, but the salaries could be progressively increased over the next few years.

Another recommendation we consider extremely important is that of creating a safe workplace, in the sense of paying malpractice polices by the health care unit where the doctor works.

The development of a strategy referring to keeping the doctors from leaving abroad, with highly defined objectives, must be done as soon as possible in order to improve the Romanian medical system.

Abstract

Nigeria is not exempted with the present global issue with the focus on reducing poverty level using local content. This paper focus on apprenticeship fee, entrepreneurial skill through training and small Scale Enterprises in Nigeria as countries differs so the appropriate solution differs. The technique adopted is ordinary least square method using binary probit model to analyse primarily sourced data. The financial constraint remains of the major problem facing SSE and government at all level need to design programme to address recent economy issues.

Keywords: Apprenticeship, Entrepreneurial Skills, Small Scale Enterprises

JEL Codes: J39, M53, L26

1.Introduction

In Nigeria the traditional commercial banks have not been able to provide the necessary finance for the SSEs, because of the latter's inability to offer physical collateral, among other reasons. Thus, local finance organizations which are able to acquire information about entrepreneurs' characteristics at a lower cost than the banks have therefore been promoted as a method of enabling the small scale enterprises to acquire productive capital. However, many

of the credit organizations in Nigeria, for instance, Lift Above Poverty Organization (LAPO), Co-operative and Credit thrift societies, and other micro-credit institutions that make only small loans have also failed owing largely to high default rates. This corroborates the studies of Yaron (1992) which on different countries found out that, although many programmes have been instituted in support of SSEs in a bid to providing credit in many developing countries, success has always eluded them.

Based on the foregoing, the role of apprenticeship comes to play in the development of informal financial markets available to the SSEs. First, if entrepreneurs charge fees to train apprentices, this can form a substantive source of working capital finance to the SSEs, and second, the labour of the apprentices whether they are charged fees or not constitute a cost of production which might have important ramification for credit markets. In fact in many of the SSEs the proportion of apprenticeship to total labour force of SSE has been found to be as high as 91 percent (Olaniyan, 2000), thus the importance of this relationship between apprenticeship and SSEs in Nigeria.

In spite of the inherent contribution of the apprenticeship training to the SSEs in particular and the economy in general, the Nigerian government and policy makers have paid little or no attention to the effective functioning or growth of this institution. This little interest is predicated upon the belief that apprentices and the apprenticeship institutions are mere reservoir for potential

entrepreneurs. Given the above, this study aims at determining the relationship that exists between apprenticeship Fees in the SSEs and credit markets in Nigeria.

2.1.Apprenticeship Training in Nigeria

Apprenticeship training in Nigeria is such that is not based on any particularly defined rule. The organizational orientation of training under the apprenticeship system is basically informal, while the training in its entirety is carried out on-the-job. Basically the training contracts are informal and verbal in nature. This is so because there are no clear-cut legal frameworks for the training of apprentices. In spite of the absence of a legal framework, the surviving apprenticeship contracts, undoubtedly represents a significant proportion of the population of training contracts, which encompass a vast majority of young teenage secondary school leavers. Drawing up an informal training contract is quite common in Nigeria, and an agreement signifying apprenticeship training in Nigeria often covers issues such as length of training; amount and mode of payment for training; the performance of freedom ceremony; and hours of work.

Although many agreements are made verbally, apprenticeship training contracts are entered into in the presence of a master craftsman or enterprise owner (as the case may be), the prospective apprentice and the parents or guardian of the prospective apprentice in the master-crafts man’s residence or workshop. The process largely follows a fairly established pattern, where certain conditions are negotiable, while others are rarely questioned. It is in this manner of contractual process that disputes arising over the fulfilment of obligations are often settled, without any recourse to legal or judicial authorities. After the recruitment of an apprentice, he or she is not considered in the enterprise as a worker with a definite hours of work at the inception, until a later period when he is thought of as a part and parcel of the enterprise, where he or she is expected to perform several other activities that are unrelated to the training agreement earlier reached. This is because the apprenticeship training system is considered by both the parents or guardian and the master crafts man or the enterprise owner to

be more than just a training, but a part of the traditional African setting and belief of a large process of bringing up a child (which is a part delegated to the enterprise owner or master crafts man). This process is what Mabawonku (1978) referred to as “fosterage”, since the pattern of training is not different even when blood relationship is involved.

The apprenticeship training in its entirety is carried out on-the-job through a hierarchy of authority with the master crafts man or the owner of the enterprise being the head and the sole issuer of authority, followed by the most senior apprentice or a graduated one who works as a journey-man, who in turn delegates or assigns works to be done to the junior apprentices and so on down the line of duty. The length of training of an apprentice in many small scale enterprises in Nigeria strictly depends on factors such as age, level of education and the type of trade that is to be learnt. The average length of training is noted by Ekpenyong and Nyong (1992) in their study of the auto repair and furniture sub-sector of the manufacturing sector to have ranged between three to six years. Also they reported that about 70% and 80% of workers in the small scale enterprises are in their teens and barely completed primary school education respectively. In the area of apprenticeship fees, quite a significant variation exists. Fees in many cases are charged arbitrarily with a few exceptions where trade associations are in existence. However there are enterprises where fees are not charged for the training of apprentices, where the reasons are largely due to inheritance and the motive of preserving their special family trade.

In Nigeria, apprenticeship training is a predominant means of transferring, selling and acquiring entrepreneurial skills, since there are little or no apprenticeship training ground in skilled crafts, professions and service trades. To further substantiate that the informal sector provides a training ground for future entrepreneurs through apprenticeship. Despite this, there exists no particular policy focussing on the training of apprentices per se, but there are programmes by the government that implicitly encourage apprenticeship training.

2.2. Small Scale Enterprises in Nigeria

Small Scale enterprises in Nigeria are characteristically different from other form of enterprises. These characteristics however are not very well known, in spite of the works of ILO (1972, 1985) and the de Soto (1989). Small Scale enterprises in Nigeria were relatively few before 1981, representing only 4.5% of enterprises in existence in 1970 and about 16.4% up to 1980 (see Abumere, et.al. 1998). The above assertion does not necessarily mean that SSEs in Nigeria are a recent phenomenon, but rather suggests a high mortality rate. The mid 80s however to date witnessed the proliferation of SSEs, which is attributable to the structural adjustment programme instituted by the then Federal Military Government.

The ownership structure of SSEs has been found to comprise 83.4% individually owned enterprises, which varies across towns and cities. The eastern part of Nigeria displays a sole ownership rate of 98.5%, while for the other parts of the country a sole ownership rate of at least 80% is common. (See Abumere et. al, 1998). Other forms of ownership in the SSEs in Nigeria such as partnerships, joint ventures, co-operatives and limited liability companies are negligible and sometimes non-existent. With respect to legal status and registration procedures, two approaches are in existence, .one formal registration with government and second with the appropriate association, union or guild.

In terms of finance, many studies on Nigeria recognised that SSEs source their funds and finance from both the formal and the informal financial and credit markets. The bulk of finance for the SSEs however is sourced from the informal markets. SSEs in Nigeria source funds through personal savings, rotational savings contribution (esusu) etc. (see Olaniyan et. al., 1998; Ekpenyong and Nyong, 1992, and Abumere et. al. 1995). The location of SSEs is another basic characteristic that is peculiar to Nigeria. Many of these small entrepreneurs use their residences as workshops, offices and shops (as the case may be). This location pattern cuts across both the rural and the urban areas. There are however other locations where small scale enterprises carry out their activities. These include, the market place,

the streets, specially built workshops and in some cases open spaces.

3.0 Methodology

3.1.1. Model Specification

In order to examine the impact of credit markets on apprenticeship in Nigeria, we specify a binary probit model. The model is to help examine the influence of capital market features as well as other performance variables on the probability that a firm charge fees to the apprentices. We denote this event for SSE i by a dichotomous variable ($apprentice_i$) which equals 1 if the event occurs and 0 otherwise. Our model is expressed as follows:

$$Prob (apprentice_i = 1) = \phi (X_i' \beta)$$

Where X_i is a vector of explanatory variables taken to influence the probability of charging apprentice fees. β denotes a vector of unknown parameters to be estimated and ϕ (.) denotes the standard normal cumulative distribution function.

The explanatory variables include the following: Capital market behaviour dummies (The dummies variables take the value of 1 if the variable holds and 0 if otherwise.). This includes, whether firms holds a bank account; whether firms has ever received bank credit; whether firms received informal credit; and whether firms receive advance payments for goods or services. Sector Dummies (The dummies variables take the value of 1 if the variable holds). These include, manufacturing; and services

3.1.2. Data and Sampling Approach

The data used for this study are drawn from a survey of small-scale enterprises in manufacturing and services business in Nigeria. Our small-scale enterprise is defined in terms of employment. This is because it is easy to apply and that it is closely correlated to size measured in terms of capital or output (see Little, 1987). We define a small-scale enterprise as a business employing 0 to 25 workers including owner, apprentices, and workers (both paid and unpaid). This study employs primary data, derived through the

administration of questionnaires in a survey as described above. This is however complemented with a Focus Group Discussion in order to give more meaning to the result obtained from the survey.

The Population for this study comprised all small-scale enterprises in Nigeria. For the sake of an in depth study, we have limited our study sample to the South-Western Nigeria. Our choice of states was based on factors such as cultural homogeneity, geographical proximity, prevalence of trade and the demand for the acquired skills as well as the cosmopolitan nature of the two states in terms of literacy level and urbanization. A total of 1500 questionnaires were administered on enterprises in the services and the manufacturing sectors. In order to avoid systematic errors in collecting the data, we started by identifying the SSEs. The list for all SSEs operating in each of the sub-sector identified above was collected from the local association of operators of each sub-sector¹. Thereafter, firms were randomly chosen from the list of registered firms. Our interest has been narrowed down to three main sub-sectors viz. Textile and garment, metal work SSEs (e.g. Welders, Iron benders and tinkering,) and Artisans (e.g. Barbers, Hair dressers and Mechanics). These are grouped into manufacturing SSEs and services SSEs.

The sampling of the cases was carried out by way of systematic random sampling, where the first respondent was chosen at random from the list of SSEs, while the next respondent was selected after an interval of five SSEs. The urban centres were chosen using the purposive sampling method based on the prevalence of a special trade and also to cater for the macro economic impact of policies directed towards SSEs.

There are two sets of questionnaires. The first one is the enterprise owner/master questionnaire while the second is the apprentice questionnaire. The owner

questionnaire was administered on the entrepreneur, and the apprentice questionnaire was administered on the most senior apprentice. The owner questionnaire seeks to obtain the following information; Nature and characteristics of business enterprise; Enterprise owner characteristics; Apprenticeship (number, fees charged, allowances paid, apprenticeship labour; and Sources of finance and working capital and relationship with the credit market. The second questionnaire, which is the apprentice questionnaire, seeks to obtain information on the background of individual apprentice, the nature of contracts and the source of finance for training. In administering the questionnaire, we placed no restriction on the legal status of the SSE. However, the self-employed with no fixed place of business were excluded.

4.0 Findings

4.1.1 Focus Group Discussion (FGD)

Focus Group Discussions (FGD) was organized to complement the information obtained through the administration of questionnaire. It consisted of some numbers of unstructured interviews meant to address the motives and the incentives for entrepreneurs and apprentices in the labour and the training market. One of the key elements of the group session method is the selection of participants. In this regard, entrepreneurs and apprentices were carefully selected in some selected manufacturing and services firms in each of the sampled states. Trained moderators, experienced with groups of this kind, led discussions in each state. The moderators followed the topic guide that ensures that the same subject matter is discussed in each state. However, it is worthy to mention that the discussion guide was not meant to be a full-fledged questionnaire, nor to be followed rigidly by the group moderators. It was an aide-memoir to be referred to by the moderators. In specific terms, the discussion centred on the following issues:

Recruitment process

In most cases, the would-be trainee signifies his or her own intention to train under a particular master-craftsman or trainer. The decision is taken at the family level and conveyed to the trainer who accepts or rejects the trainee depending on whether

¹ Our initial survey shows that the lists from the association's of specific SSEs are more comprehensive than the one with the Ministry of Trade and Commerce. Since the list from the ministry does not exhaust the population of SSE any sub sample chosen based on the list (and by extension the sample) would not be random.

or not the basic terms of the contract are fulfilled by the trainee and his or her parents or guardian. On the part of the entrepreneurs, the motive or the incentives for recruiting apprentices include among others, labour supply potentials, fund, raising family relationships and continuity or preservation of particular trade or skills. On the part of apprentices, the desire to undergo apprenticeship training revolves around the need for a means of livelihood and the attractiveness of a particular trade, craft, or skill (i.e. the expected rate of return).

The Contract

The contract specifies the obligations of the trainee, his parents and the master craftsman. It covers issues like length of training, amount and mode of payment for training, hours of work, performance of the freedom ceremony etc. It may be verbal or written. Violations of the contractual agreement is settled without any recourse to legal or any judicial authorities as earlier on stated. Such settlements are made by the officers of associations of specific SSEs. Normally each association has a set of rules and regulations which guide the activities of each member. Whether an apprentice will stay with the master throughout the course of his training depends on his ability to endure and submit himself to the discipline peculiar to the training, his determination to succeed in life, the degree to which the master can accommodate him and parental support and encouragement. His apprenticeship life-cycle depends on his age, and his ability to learn and internalize the skill imparted. Whether the apprentice will be retained after training depends on his output, his willingness to remain with the master and his moral character.

Perception of the labour and the training market

Entrepreneurs are of the opinion that there are many opportunities for both apprentices and master craftsmen who distinguish themselves in their chosen skills or trade so long as there is increased demand for their goods and services. The same opinion was expressed by the apprentices citing their masters as examples.

4.1.2 Result Analysis

For our analysis a firm is considered to have received credit if he takes bank loan, cooperative loan or gets credit from money lenders while he is considered otherwise if he gets fund from advance payment for jobs or through non-loan source. From the first estimation result, firms that charge apprenticeship fees have been found to be less likely to involve in taking any form of loan-able fund that is they indicate limited use of the credit market as a source of their working capital finance. This result shows a significant correlation between the independent variable, particularly that which relates to the credit market (see Table 1). This result indicate that a relationship exist between credit market behaviour and the use of apprenticeship fees. Also there was a negative relationship exist between the credit market behaviour of small-scale manufacturing SSEs and apprenticeship fees. Thus SSEs who charge apprenticeship fees are less likely to source loans from the credit markets and vice versa. This is illustrated by the negative sign of the estimated coefficients, (see Table 2). The estimates and the t- statistic are both significant at 5% and 1% levels. In an attempt to run the probit for the services sub-sector to ascertain whether there is any relationship between the charging of fees and credit market behaviour was not successful owing to the fact that the dependent variable was not having any variance, hence the conclusion does hold for the services sector in this study.

5. Conclusions

It could also be observed that apprentices are very important to SSEs because they do not have to be paid. Specifically, the study analyzed the effects of apprenticeship training on the credit market behaviour of firms that train apprentices. It reveals that apprenticeship fees constitute an insignificant proportion of the working capital finance of SSEs. Furthermore it shows that the firms that train apprentices source fund from the credit markets both formal and informal. However, firms who charge fees participate more actively in the informal credit market than those who do not charge fees. Also firms who do not charge fees participate more actively in the formal credit market than those that charge fees. In addition, our analysis also reveals that large SSEs have more access to loans compared to smaller SSEs who rely heavily on non-loan sources of finance. Besides, SSEs in the manufacturing sub-sector have more access to loans than their services sector counterparts. It is however noted that SSEs still face finance constraints, despite, their potential benefits in terms of skill generation and industrial development. It is therefore important that programmes of assistance are designed for SSEs in Nigeria if their full advantages/ potentials must be realised.

Relationship Types on the Romanian Vegetable Chain

Cornelia Alboiu

Institute of Agricultural Economics, INCE, the Romanian Academy
coraalboiu@yahoo.com

Abstract

The paper studies the role of business relationships in the Romanian vegetable supply chain. In this respect, the paper draws on Williamson's governance structure of non formal relationship and formal relationship existing between farmers and buyers in order to see what type of contractual relationship is prevalent in the vegetable supply chain. The analysis reveals that informal contractual relationships are prevalent on the market while in many cases the contractual enforcement is at stake.

The paper employs a qualitative analysis based on structured questionnaires in order to assess the type of contractual relationship between parts.

Key words: contractual relationship, vegetable, supply chain

J.E.L. Classification: Q13

1. Introducere

Although several studies were carried out in order to study the type of contractual relationship and the vegetable commercialization channel at the European level, there is no empirical evidence about Romania. The analysis is necessary to assess the needs and constraints of the stakeholders involved both at farmer-wholesaler-processor level and processor-retailer level.

As far as it concerns the contractual relationships, there is a typology of relationship produced by a matrix of different strategic options of vertical co-ordination and relationship-specific characteristics (e.g., independence, exclusivity), [1]. Gorton shows that relationships become more complex with increasing level of formality and of vertical co-ordination. While price, supply and demand are at the core of spot market relationships, property rights, trust

and negotiations increase with growing vertical collaboration.

The paper uses Williamson's governance structures, [2] and accordingly two relationship types, formal and non-formal are described:

Non-formal relationship types:

- Spot or 'open' markets (immediate transaction at actual prices),
- Repeated market transactions with the same buyer/supplier with non-formal, non-written contracts.

Formal relationship types:

Formal (written) bilateral contracts (contract terms and obligations are legally enforceable).

Financial participation arrangements (both parties are legally independent entities).

In the last 20 years, the vegetable supply chain in Romania experienced a dramatic evolution following the destruction of the former fruit and vegetable commercialization companies which led to the year-round domestic vegetable supply failure and production fragmentation.

Moreover, stricter quality requirements imposed by large chains are hardly met by small scale farmer but even though when these requirements are met by larger farmers the contractual terms are not respected, or even worse the supermarkets avoid concluding the contract. Also, the main problem the farmers have claimed that they have to face is the non-execution of concluded contracts.

2. Data collection and methodology

The paper is based on data provided by 30 farmers and 8 processors located in the S-E region of Romania following a survey conducted in this region in 2007. In total, 30 structured questionnaires were applied to farmers and 10 questionnaires to processors. The analysis is mainly a qualitative one and takes into consideration stakeholder answers

to the questions regarding the type of existing contractual relationship along with a set of questions regarding their main commercialization channels. An open comment has been also introduced in the questionnaire.

In valoric terms, in 2010, the production of vegetables accounted for 24% of the total crop production value. Nevertheless, following the EU integration, the vegetable supply chain seems the most negatively affected sector, due to the high share of imports and the farmers' impossibility or incapacity to maintain stable contractual relationship within the chain. In addition, many of them are not able to enter or form producers' groups either because of lack of trust or willingness to cooperate. The high fragmentation and dispersion of cultivated areas (especially for field vegetables) is a result of the reinstatement of the private property in agriculture after 1990. The high number of existing plots creates major limitations for technological upgrade (agricultural works, production structure, professional training of farmers, etc) and the increase of the production costs. On the other hand due to the lack of experience in using insurance instruments any negative climate phenomena, diseases or pest attack create a direct loss for the producer. At the same time the large number of farms producing primarily for own consumption but also selling part of the harvest from their doorsteps or via unofficial selling points do not allow a clear separation between commercial and subsistence farming and consequently makes it difficult to implement a coherent fiscal policy.

All these factors have a direct influence on fluctuations of farmers' income, promotion of consumption, and enhancement of the environmental safeguards as well as a strong impact on the improvement of the competitiveness and market orientation of the fruit and vegetable sector.

The land area under vegetables accounted for 3.3% of total cultivated arable area in the year 2010. At the European Union level, the share of area under vegetables is quite similar; the difference is that currently in Romania the consumption needs are not fully covered by the current domestic supply. In the year 2008, the main cultivated vegetables were the following: tomatoes 18%, cabbage

17.7%, and dry onion 14%. The individual holdings have the highest share in the cultivated areas in the vegetables sector (over 95%) (Figure 1).

Figure 1: Share of cultivated areas by types of holdings

Source: MAFRD, 2008

The figure depicts the situation at national level; in the region where the analysis was carried out, the vegetable production is also obtained in the individual holdings (more than 96%).

The methodology used is based on statistical analysis of the stakeholders' answers to the questions addressed in a structured questionnaire. The description of the methodology and the data collection methods were structured as a set of criteria and questions that were answered and analysed by employing the structure proposed by Williamson's governance structures.

3. Empirical findings

3.1 Contractual relationships

The relationships types as described by Williams are classified into 2 categories, namely formal and non-formal. Respondents were asked to present which type of contractual relationships they use in their business and further, they were asked to choose more than one of the four relationships, i.d. spot market, repeated market transaction, formal-written contracts, and financial participation arrangements.

Table 1: Percentage of formal relationship

	Farmer– buyer (wholesale er)	Farmer- process or	Processo r- retailer
Formal relationships ip %	1/30 3%	2/30 6%	1/8 12.5%

Source: Field survey, 2008

Table 1 reveals the relationship type for the three chain stages. The answers show that the percentage of formal relationship is extremely low both at farmer-wholesaler level and farmer-processor stage. A higher percentage of formal relationship can be noticed in the case of processor-retailer level. The formal relationships include formal written contracts and financial participation arrangements, including prices, qualities, quantities and any other financial support. Retailers tend to choose more formal relationships with processors, in comparison with farmers, showing that downstream businesses are more likely to coordinate and organize their relationships more systematically and in a standardized way. Similar findings are also presented at the European level [3], with the difference that the percentages are much lower in Romania’s case, especially at the farmer-buyer and farmer–processor level. As far as the relationship and contractual aspects are concerned, the respondents were asked to rate on a scale from 1 to 4 (1: extremely poor to 4: very good) their opinions on the following aspects concerning: the quality of the relationship, trust, contractual terms and the level of enforcement of the contracts. Table 2 reveals the answers of the interviewed stakeholders.

Table 2. Farmer-buyer relationship and contractual aspects

	Very good	Good	Poor	Very poor
The history relationship with the buyer is	7%	13%	33%	50%
The respect of contractual terms	0%	13%	43%	43%
The trust in our partner is	3%	13%	33%	50%
The enforcement of this contract is	0%	10%	37%	53%

Source: own calculations

The enforcement of the contract is seen as the biggest problem the farmers have to face, 53% of them answering that the enforcement of the contract is extremely poor. The level of trust in partners and the history relationships are seen as poor and extremely poor. Also the farmers suggested that there is no real enforcement of contracts. The structure of contract is taken in consideration in the analysis. This category includes practically all the aspects concerning prices and payment mechanism.

Table 3. Processor-retailer relationship and contractual aspects

Source: own calculation based on field survey

	Very good	Good	Poor	Very poor
The history relationship with the buyer is	0%	23%	60%	17%
The respect of contractual terms is	0%	23%	75%	20%
The trust in our partner is	0%	20%	60%	20%
The enforcement of this contract is	0%	13%	60%	27%

The relationship and contractual aspects at the processor-retailer level were assessed in a better light by the respondents, but still there is a lack of trust and a bad enforcement of contracts among stakeholders.

Farmers were also asked to choose the type of relationship they are involved. 67% of them are involved only in a spot market relationship (sale at the farm gate to different wholesalers) while the rest might choose some other relationships (repeated market transactions, formal contracts, and financial participation). 83% of them are involved in only one type relationship while 17% are involved in more than one relationship type (Figure 2).

Figure 2: Relationship types

Source: farm survey 2010

Another problem reported by the respondents, is represented by imports, the quality of which is not rigorously checked at present. For many vegetables, production has a seasonal nature, and the products have to be consumed immediately after harvesting. That is why the prices greatly fluctuate throughout the year. In general, immediately after harvesting begins, prices go down fast. For example, the prices of tomatoes, eggplants and peppers may decrease by up to 50% in 2 weeks.

As long as the area under heated glasshouses is low, the producers cannot benefit from the high prices during the winter; in this period of the year, most vegetables come from imports, mainly from Greece, Netherlands and Turkey.

4. Conclusions

Effective business relationships can help to reduce environmental uncertainty (e.g., by securing a more stable inflow of orders); contribute to better access to crucial resources (e.g., raw materials, capital, specialised skills); and/or result in higher business productivity (e.g., by enhancing loyalty among suppliers), [5].

Nevertheless, the results obtained reveal that in Romania's case there is a high degree of uncertainty among stakeholders both in terms of contractual relationships and contract enforcement. The share of contractual relationship is higher at the processing-retailing level which is in line with the EU findings, but much lower than in the EU both for the farmer-buyer and the processor-retailer level.

This sector lacked a coherent strategy in the period 2000-2007, being characterized by the diminution of the capacity to face the market competition. At the same time, as a result of Romania's joining the EU, its competitors from the EU both in the production and processing sector are testing the Romanian market; in case the Romanian vegetable sector is not able to get reorganized and benefit from the established intervention measures, it will not be able to face the strong competition coming from the Single Market and not only.

Abstract

Recently, business services are experiencing an important growing, explained by several phenomena such as urbanization, increased demand for services, technologic progress, trade liberalization and trade development. On the other hand, the phenomenon of business services expansion is supported and substantiated by appropriate strategies. Service companies are able to adopt strategies to increase the use of internal development, external development or choose a combination thereof.

Key words: business, services, expansion, strategy.

J.E.L.Clasification: L 24, L84, G34

1. Introduction

The continuous development and diversification of the global economy structures, the extension of technical progress and anchoring in everyday life are just some of the elements that favored the affirmation and development of services, encouraged a greater participation in to various business processes and increased their role in the economy. Position of services sector in today's world economies is the result of a complex evolutionary process, supported by profound changes in economic and social life. The importance of services and their position in the national economic system are bounded closely with economic growth and social development as a condition of entire modern society development.

The increasing presence or services in the economic and social life, along with

reconsidering labor character in this sensitive sector of the economy, lead to a unanimous opinion of specialists in the field in recognition the services as a factor of progress, enabled to stimulate the economic growth. Many economists characterize today's world as a society of services, arguing that the share of services in employment and the creation of gross domestic product (GDP), exceeds 70% in the developed countries. In these conditions we discuss more and more often about the tertiary tendency of modern economy, the service sector being considered as the "engine" of economic growth.

2. Points of View in Expanding the Services

Trying to explain the phenomenon of expansion of services business, literature brings together many viewpoints and many determinants. According to some authors, a category of determinants such as *urbanization* - this phenomenon is followed by an increase in consumption of services - , *low labor productivity* - explained by relative productivity of services in many countries (the ratio between the share of services in GDP and the labor force in service sector relative to working population), that registered high values, sustained growth and expansion of technical progress in the branches of service -, *factors endowment* - mainly cheaper labor in developing countries and of course, cheaper services[1] -, the role of government – revealed as implementation of some welfare programs (in health care, education, etc..) in developed countries and as governmental institutions in developing countries, resultins numerous jobs in the service sector.

A study of Canadian Economic Council[2] estimates as the first determinant of business expansion in services: *increased demand for services* along with *technological evolution, increasing the complexity of tasks* that requires specialized enterprises, *trade liberalization and foreign trade development*, leading to new opportunities for firms that provides services, *increasing demand for industrialized services* as a consequence of higher living standards, implying services as: food, entertainment, recreation, personal services, *increasing demand for public services*, as companies are aware of the importance of protecting and investing in human capital.

The opinion of other authors regarding factors that induce services business expansion, refers to: continuous growth in demand for services as a result of increasing incomes and based on expenses for services higher and higher every time; intensification of *outsourcing services*, due to: businesses attention is focused on core activities as a result to increased competition, total costs are reduced as a request from companies providing services, the need to use specialized knowledge to solve problems, access to additional resources such as skills, technology, management, recovery of capital; *technological development and its impact on productivity services*, low compared to other sectors of the economy, because services are less dependent on new technologies; *the emergence of services society* understood that a new society, pointed by a revolution in services, which is the binder between industrial society and new society development.

Millions of businesses are starting now worldwide, but business services, which have exploded in the recent years, are in the spotlight. Trying to define the concept of expansion, we enter the land of strategy, widely debated by the specialized literature.

As Business English Dictionary says, the expansion is a business strategy in which growth is achieved by increasing the number of stores from where customers can buy products or services of the company. This involves new stores opening in different physical locations, while maintaining the current location (business) [3].

On the other hand, the Oxford English Dictionary gives the following meanings of

the concept of expansion, namely: (1) the action of getting bigger and larger, (2) small increase in industry and (3) political strategy to expand the territory of a State.

We notice that both definitions have a common denominator, namely strategy, which is one of the concepts most used today, generally due to the growth economic and social complexity, but also to highly dynamic aspect of contemporary society and to the increasing national and global competition.

The concept of strategy was undertaken by economists from the military area, where it targets enemy destruction through effective use of resources. In the literature there are a relatively large number of definitions of strategy, but most of them converge to the idea that "*strategy is a plan to know how to act in an uncertain future circumstances*" [4]. This involves a set of rules on actions to be performed under certain circumstances. Other definitions capture the following strategy's issues:

"*A strategy is a model or plan that integrates the major goals of the organization, its policies and sequential actions in a whole*"[5].

"*Strategy is not only a general point of view, but that particular configuration of activities to be taken by a company compared to its rivals*"[6].

The importance of strategy is outlined and assessed by the difficulties as cause of its absence; ignoring strategy is a source of business failure. These difficulties relate to two aspects: the emergence of strategic gaps and the organizational fragmentation. Strategic discrepancies relate to serious backlogs that the organization, industry or country can register. Organizational fragmentation is effect attracted by the lack of strategy identified as the danger that each branch, organization, department to act autonomously, in different directions and mutually disturbing activity. In other words, the strategy "*acts like a powerful magnet to unify all entities for the same purpose*", obtaining synergistic effect [7].

Companies providing services establish their market strategy based on the objectives they pursue, their available resources and the development environment in which they operate. "*The strategy of a company providing services should be a coherent set*

of key objectives on long term, together with main ways to achieve them, with the resources and time required and with the expected effects in terms of market competition, resulting from a broad and deep review process of internal and external environmental of the company providing services"[8]. The main components of the strategy approached by company providing services are: premises, mission, goals, strategic alternatives, strategic directions, resources, time, competitive advantage.

3. Strategies of Growth Means in Business Services

Companies providing service are able to adopt strategies to increase the use of internal development, external development or choose for a combination thereof. However, studies show that organizations prefer first the external development strategies, followed by paths used for a combination of external and internal development.

1. **Internal growth (organic)** is the classical way of self-increasing organization through: building new capacities, adding the means of production, research and distribution (built on the organization's own resources, namely: financial resources and human resources). The essential feature of organic development is reinvesting profits from previous years, but also appealing to financial resources provided by shareholders or banks. The organization reasons for such an option are focused on: the existence of strong demand for its products, launching new products such research, financial capabilities resulted from major self financing, human potential that can support the development of new products. The organization holds its own contractor, taking control in all its structures. The process is relatively slow, it refers, mainly to the provision of new working area, equipments and trained staff and it is supported on short and medium term by commercial relations of the organization with suppliers. The internal development is preferred by small and medium organizations due to situations such as: unavailability of partners for external development, managers want to keep control of the

organization, merger or acquisition is prevented by the high cost of land or unfavorable regulations, resources and skills are available internally, etc. This type of strategy is associated with both advantages and disadvantages. The advantages consist in the organization ability to choose: selecting the location of new buildings, purchase the most appropriate equipments, appropriate staffing, choosing those items that match what already exists, the risk being higher when they keep elements incorporated into a system that worked for a while. The disadvantages are related to long period of time to reach normal operating parameters of the new entity, the threats coming from the external environment changes.

2. **Merger and acquisition** (English Merger & Acquisition)

The merger is a transaction that involves the existence of two or more firms, which become a single company. Other generic definitions of this concept are: taking ownership of an asset by purchase; taking control of a company by buying at least 51% of portfolio shares [9]. The process between companies of similar size is "friendly" and consists of the union of all resources held by each organization in a new, larger organization, including the same ownership structure. The transaction is difficult and long-term, which is due to negotiations, evaluation and processing of all related operations.

Acquisition is a "marriage" between unequal partners, understood as purchase of a company by another company, the bought company being absorbed and its shareholders cease to own the new organization. If the two organizations were competing, the purchase is called horizontal integration, and if the two organizations were one another supplier or customer, the purchase is called vertical integration [10]. Acquisition can be "friendly", when there is consensus between the two entities; in order to maintain jobs and wage levels for managers of purchased company ,or may be "hostile" generating a war between the two organizations involved.

The reasons for adopting the strategy of mergers and acquisitions are numerous: growing market share in order to increased profits and more power to dictate the market

price, reducing competition, access to new technologies, achieving economies of scale.

The literature provides a classification of acquisitions and mergers, as follows [11]:

- vertical acquisition or merger, as purchase of a supplier or customer;
 - horizontal acquisition or merger, as buying a competitor;
 - product extension by acquiring a company to gain access to complementary products;
 - market-expansion by acquiring a company to gain access to complementary markets;
 - conglomerate, when there are no strategic links between the companies involved.
3. **Joint venture** is formation (temporarily) of a new organizational entity, in order to obtain a synergistic effect, keeping partners and judicial independence. This strategy is practiced particularly by organizations wishing to internationalize their businesses, between businesses who want to maintain independence and do not want to merge or when this is not legally possible. Joint ventures is practiced between private companies and public companies of residence state or of another state or at international level, between companies belonging to different national economies.
4. **Alliances** are long-term associations between several competitors or potential competitors who choose to join efforts to achieve a specific objective or project. Alliances allows keeping judicial identity and independence of organizations working together and are created especially to enter new markets. They are widespread in services and air passenger transport. As an example: Star Alliance, which includes Singapore Airlines, Lufthansa, United Airlines, Austrian Airlines, Turkish Airlines, etc. Alliances work as long as there is trust between partners, offering many advantages associated with the possible synergies: entering new markets, economies of scale, transfer of know-how, reduce costs, risks and uncertainty.

Although when they are speaking, managers worldwide say they intend to engage procurement activities, mergers and

acquisitions market is declining, characterized by caution, especially in China, India, U.S., Brazil and Indonesia.

Current economic environment provides companies cheap ways of funding, but lack of confidence in forecasting global economic recovery and long-term failure of market value are reflected in substantially lower volume of worldwide mergers and acquisitions against 2011. Companies that run, however, such operations, rely on organic growth [12].

Also in Romania, mergers and acquisitions market in 2010 totaled a value of about three billion dollars, down 14% compared to 2009 due to economic crisis. Total number of transactions was 106, the largest being achieved in the service sector: the first was in the real estate field (value: \$ 363 million) and the second in telecommunications field (value: \$ 264 million).

4. Conclusions

Small and medium businesses prefer the way of development through personal effort, because they don't have enough business relationships to identify external competitive partners and because their managers fear they could lose control of the business. On the other hand, large companies adopt the strategy of mergers and acquisitions aiming to grow market share, increase profits and market power. By this strategy, large companies cut their competition, gain competitive advantages and even dictate market trends. When strategy aims only part of the companies objectives and they do not want to merge, but, in order to work together to achieve common objectives, keeping independence at the same time, they choose joint ventures or strategic alliances.

In real life, companies prefer to wait although financing is cheaper in the current economic climate, given the uncertainty of the market value of companies, which led to lower market mergers and acquisitions.

Abstract

The literature about organizational learning (OL) and knowledge management (KM) is characterized by use of diverse terminology, where these two concepts are often employed but rarely discussed together. Recognizing that no single overarching framework has been proposed to clear up this conceptual confusion, this article proposes a model that integrates OL and KM while establishing a theoretical link between these constructs and performance.

Key words: organizational learning, management, knowledge management, performance strategy.

J.E.L classification: M14

1. Introduction

In the 1990s, the rapid development of information technology and the Internet has allowed the development of sophisticated knowledge instruments. But while consultants provide learning and knowledge management solutions to managers, university teachers have expressed their concern with the lack of consistent terminology of cumulative (research) works and of a widely accepted framework ensuring the link between the domain of learning and that of knowledge.

2. Organizational learning and company performance

In this section, we integrate existing work dealing with OL and OK and propose a theoretical link between these constructs and firm performance. We define performance as the success or failure of the company to achieve financial and non-financial targets (e.g., reputation with regard to quality, growth).

Proposal 1: Learning is the process whereby knowledge is created and developed.

Current knowledge affects future learning. Researchers have opposing views on the impact of learning and knowledge on company performance. On one side of this debate there are those scholars who have established a positive link between these concepts. Whatever the underlying interpretations of the OL, “there is always the assumption that learning will improve future performance.” The perspective of the knowledge-based viewpoint points to a further positive link between knowledge and performance. It is assumed that a particular sub-category of knowledge, which is valuable, rare, inimitable and irreplaceable [2] would lead to competitive advantage.

On the opposite side of the discussion there are authors [1] that do not see any direct relationship between learning, knowledge and performance. Entities can learn wrong and learn correctly that what is wrong. Complementary to this point of view is Zach's description [7] about how core rigidities are deeply rooted knowledge that hinders innovation. Increasing profit (or which should increase) sustains the equivocal link between knowledge and performance.

While having sound knowledge base means that the company is able to multiply profits and increase its competitive edge, a poor knowledge base would cause the company to lose its advantage or lose it only for the future.

In conclusion, the OL and OK perceptions on the impact of learning and knowledge on the performance would vary. While OL literature shows a clear connection between learning and performance, the literature on knowledge suggests that knowledge, if recognized as a source of competitive edge, explains the difference in performance levels. Recent empirical endeavors have found arguments in support of the direct impact of learning, knowledge and human and social capital on performance. It is important to note, in conclusion, that “the more the amount of learning, the better” or “the more the amount of knowledge, the better”, and that effective learning and relevant knowledge can have positive effects on performance. In our model, we have stressed out that, when studying learning and knowledge as the history of the company's results, it is essential that contextual variables and in particular strategic variables should be also included. Learning effectiveness can be assessed based only on its usefulness in guiding behavior in relation to the relevant line of business of the organization [3].

Proposal 2: Co-alignment between the learning / knowledge strategy of a company and its business.

The objective pursued by this article is to reduce the conceptual confusion on OL and KM, while providing a synthesis and integration of these otherwise closely related concepts. To achieve this goal, we have reviewed previous studies with a critical look, in an effort to understand how they can be marched and how they can intersect into a conceptual model that is richer in meaning for both researchers and academics, and for practitioners. We propose this framework as a tool to facilitate communication between researchers. Our intention is not to have this model match at all costs, but to build on previous research in an attempt to open the way to a challenging and creative dialogue that will further develop this integrative model.

We have also underlines in our discussion the strong connection between the learning

processes and the associated knowledge processes. In our model we have recognized that learning can be defined in terms of processes such as knowledge creation, storage, transfer etc.

A final conclusion of our model is that learning and knowledge acquisition lead to better corporate performance only when they support and are aligned with the business strategy of the company. In this paper we are advocating the idea that researchers interested in studying the OL and OK impact on performance should to be more precise (exact) about those traits of the knowledge that foster performance and about the conditions under which learning leads to competitive edge. We have proposed the co-alignment of the company learning/knowledge strategy, as a moderator of the impact of learning and knowledge on the corporate performance. We believe that there is potential for further theoretical development of the “learning/knowledge strategy” concept and we are inviting researchers from these two domains to work together and define the critical decisions or the compromises that managers need to address in terms of the learning resources and the knowledge inside their companies.

A direction for a future empirical work is to put these to proposals test. In their testing, future research should address the issue of choosing the appropriate actions and methodology. Several tools are available in academic and managerial literatures related to OL and OK. In particular, it will be important to find or to develop measurements that capture the nature of learning as a process and of the knowledge as the content of learning. Furthermore, future research could build on the theory of Bierly and Chakabarti [5] of an operationalization of a knowledge strategy in the pharmaceutical industry. To operationalize the coalignment between the business strategy of a company and its knowledge / learning strategy, researchers can build on the empirical works in the domain of contingency theories and the configurational theories, which are studying the fit between concepts and how the fit affects performance results.

Organizational learning interventions, alike other planned changing efforts, often fail to achieve the goals that they are pursuing explicitly. We believe that that

change initiatives can attain varying degrees of success in the different parts of an organization, depending on the interpersonal context. Early papers on organizational change have suggested that psychological safety is a crucial factor in reducing resistance to change and in helping people to cope with change. Recent research has shown that psychological safety varies significantly from one group to another within the same organization. Building on these observations, we may theorize that the same organizational learning intervention can lead to different results in different groups in an organization, due to variations in psychological safety. To further explore this approach, we have investigated the results of a change program designed to promote organizational learning in a large manufacture company. Study sheds light on the question as to why different parts of the organization may show different responses to one and the same program. We are discussing the implications for research and practice related to organizational learning interventions.

3. On the boundaries of OL (organizational learning) and OK (organizational knowledge)

There is a growing interest in studying the alignment between the *firm's knowledge* and its strategy, structure, environment and *leadership* [4].

In a nutshell, OL focuses on learning as a process of change, while OK emphasis knowledge as a resource that generates competitive advantage and studies the processes associated with its management. Both share common views on how firms should actively learn and manage knowledge.

The definition of borders summarizes our findings about the OL and OK domains and the borders between them. We see these boundaries as fluid. They will evolve as the dialogue between the members of these two domains progresses. We are presenting the OL and the OK as two research areas that overlap in part, but we recognize that there are topics which are treated primarily in one of these two areas, as well as topics with respect to which the thinking in one domain is more advanced than in the other. For example, we see OL as the more advanced in terms of the delivery of a theory of

organizational learning on several levels. We also see that OL speaks of an OL system or an OL infrastructure where knowledge deposits across the organization - strategy, structure, systems, culture and procedures - are aligned. In contrast, we find that the OK focuses on creating a *knowledge-based view of the firm*, where the creation and integration of knowledge is why the very *raison d'être* of the firm.

4. Conclusions

The following 10 points summarize our observations:

1. Each of these two areas has its own component of prescriptive literature. One aspect in which the OK literature can learn from the OL developments deals with the distinction between prescriptive vs. descriptive works. While the OL literature has clarified the confusion between the concepts of “organizational learning” and “learning organization”, the terms “organizational knowledge” and “knowledge management” still means different things to different communities - we can see how the OK exhibits strong academic roots. On the other hand though, we may conclude that KM is more concerned with providing and prescribing ways to bring pro-active knowledge inside organizations.

2. From a positivist perspective, a basic difference between OL and OK is that where OK is focused mainly on understanding knowledge as an asset (valuable asset) or as a deposit, OL is primarily emphasizing the process by which knowledge is acquired. In other words, there is a clear cut distinction between studying what is being learnt and understanding the learning process, or between studying the content vs. studying the process, which stresses out the need to understand learning as a process when it states that “the possibility to develop organizational capacity can be important in creating competitive advantage than the specific knowledge gained.” OK sees knowledge as a firm resource, which can lead to sustainable competitive advantage. Thus, we have positioned the firm's knowledge base within the borders of the OK domain. The discussion is centered on the attempt to understand what knowledge is, on defining knowledge typologies and on the contrast

between knowledge and concepts such as data and information. We have come to the conclusion that OK has a more static view on knowledge (content-based), while OL is first and foremost concerned with the changes (processes) in knowledge.

3. Although we have made a distinction between the studying of static knowledge (OK) vs. the studying of how knowledge changes (OL), we have shown that the two areas overlap to some extent, because there are studies in the OK domain (e.g. knowledge conversion and knowledge development processes) that examine knowledge evolution in time.

4. There various OL literatures are increasingly agreeing that learning occurs only when a change takes place in thinking and behavior. OK literature, despite its strong cognitive side, discusses the knowledge and the knowledge process as being based on action and as processes that require both cognitive and physical activity. Moreover, constructivist approaches on knowledge emphasize that knowledge is built from the interaction with the world out there, that knowledge is rooted into practice, being relational, mediated by artifacts, contextualized and dynamic. We have concluded that, while the OL domain has been most specific in explaining the cognitive and behavioral aspects of the learning phenomenon, the OK field has expanded its scope over thinking, to include action-orientation and the use in the action of the knowledge gained.

5. As suggested earlier in this article, OL and OK also overlap to some extent because organizational learning has been increasingly defined more in terms of knowledge processes. For example, Argyris [1] defines learning as “*knowledge acquisition*”, a process through which members of a community share, generate, evaluate and combine knowledge. In addition, as we have mentioned in point 4 above, knowledge is no longer seen as purely cognitive. Hence, the concept of static knowledge is replaced by dynamic knowledge and the priority shifts from knowledge asset management to studying the processes associated to knowledge, such as creation, preservation and transfer of knowledge. There is a wide opportunity to unify the insights of both communities - OL and OK.

6. When studied from a social constructivist perspective, OL and OK are both recognizing that learning and the process of knowing are seated in practice. This research includes the study of the common set of practices and work systems. The basic idea is that learning cannot possibly be separated from work and that knowledge exists in socially distributed work systems, where participants apply their knowledge situated in a context that is developing on the spot. In response to this changing situation, participants learn, meaning that their knowledge and behavior will inevitably develop.

7. In terms of levels of analysis, several authors in the domain of OL and OK [3] have proposed the idea that learning occurs and that knowledge exists at individual, group, organizational, inter-organizational or network level. This fourth level of analysis has attracted particular attention of the researchers interested by the role of learning in alliances, joint ventures from different countries, strategic groups and inter-firms, in general. However, other researchers associate learning with knowing only with the individual or only with a specific subset of these four levels. The debate in the specialized literature focuses mainly on the organizational level, because of the preoccupations with anthropomorphism. “All learning takes place inside individual human heads; an organization learns in only two ways: (a) by the learning of its members; or (b) by ingesting new members who have knowledge the organization didn’t previously have”. Hedlung [4] argues that “although organizational learning occurs through individuals, it would be a mistake to conclude that organizational learning is nothing but the cumulative result of their members... Members come and go, and leadership changes, but organizations’ memories preserve certain behaviors, mental maps, norms and values over time” In our analysis, we have found that the two domains move towards such a direction and that authors agree that organizations are more than a multitude of people and that, by acknowledging the existence of non-human deposits of knowledge and OL systems, firms can be attributed the ability to learn, know and have a memory.

8. Once the different levels of analysis acknowledged, the next step is to provide a theory to link these levels together, explaining the micro-processes through which learning and knowledge at one level become learning and knowledge at another level. Schwandt's dynamic Organizational Learning model [6], for example, is moving right in this direction. According to Schwandt's model, organizational learning is a dynamic social system defined as “a system of actions, actors, symbols and processes that enables an organization to transform information into valued knowledge which in turn increases its long-run adaptive capacity”. Four learning subsystems (environment interface, action&reflection, dissemination&diffusion and meaning&memory) and their associated processes explain how individuals and groups within organizations are collectively engaging in social learning actions. From our analysis on this work, we may argue that OL is more advanced than OK in the delivery of this multi-level theory on how learning occurs at individual, group and organizational level, how learning at one level influences learning at the other levels, and on how knowledge flows from one level to the other levels. When talking about the multiple levels of knowledge, the OK agenda has focused on tacit knowledge versus explicit knowledge and transfer from person to person. However, the cognitive and behavioral processes involved in these learning flows must be identified, in order to come up with prescriptions (rules) that are useful for firms.

9. To develop a multi-level knowledge theory within organizations, OK must also establish relationships between the various processes associated with knowledge at different levels. For example, what for an individual is knowledge sharing may be perceived as knowledge acquisition (learning) by a group of people; likewise, what for an individual is knowledge creation (learning) may be seen as access to knowledge by a group. In addition, when, for example, the transfer of knowledge is discussed at group level, what the transferor sees as transfer of common knowledge may be an acquisition (gaining) of new information in the eyes of the recipient. These examples show that OL and OK involve many knowing processes and that

there are significant opportunities for the two domains to work together in building up a theory to ensure the link between processes at different levels of analysis.

10. Finally, we have concluded that the OL literature has tackled to a great extent with the idea of developing a learning system or a learning infrastructure consisting of learning embedded into the firm's strategy, structure, culture, systems and procedures. Such a learning infrastructure affects and is affected by the learning processes, and the various elements of the systems must be aligned to one other for the firm to be successful. Building further on the conclusions from this initial review, the following section presents a proposals designed to integrate the learning and knowledge constructs to firm performance.

Abstract

Human resources represent an important asset for modern organizations in the context of knowledge based society. The Romanian companies striving for the improvement of their performances have to consider the importance of human resources management field. In the last few years, the transfer process of human resources management practices has been largely discussed at international level. This paper presents a point of view regarding the transfer process as a solution to improve the human resources management practices within local companies. It indicates that the influence of institutional and cultural background of our country should be strongly considered when such a process is discussed. The latest changes in local specific regulations indicate that a company has new possibilities to improve its human resources management practices. We have to mention that such a transfer process will enhance along with the development of more consistent European approach on human resources management practices

Key words: human resources management practices, transfer process, Romanian companies

J.E.L. Classification: M12 Personnel Management

1. Introduction

The evolution of economical activities has

proved that the human resources are the most valuable assets of a company. Specialized literature presents various studies regarding the human resources management.

An important theme developed in the past years concerned the transfer issues toward the human resources management specialised practices. Specialists have argued over the transfer process:: how it is done and what are the effects?

Romanian companies have acknowledged the importance of human resources management field in the past few years. They are striving to compete in a globalized economy and a modern approach of specialized practices could represent a valuable asset. In this paper we tried to analyse this issue starting from the theoretical background of transfer process, presenting the state of human resources management practices within romanian companies and finally discussing the transfer of specific practices and its impact over the human resources management field.

2. Transfer theories

Specialized literature hosts different debates concerning the transfer process. We consider more relevant to present such debates at European level.

The process of European integration generated different debates among human resources management specialists about the convergence/divergence process of human resources practices [1].

There are many arguments for both theories. Convergence theorists sustain the

idea that we can talk about an ongoing process of diminishing the differences between European countries based on the common institutional framework promoted across the European Union.

Divergence theory promotes the idea that noticeable differences exist between European countries (groups of countries are identified) based on specific institutional regulations, cultural dimensions etc.

Another point of view regarding the human resources management practices at national level and therefore with important implication upon the transfer process, indicates that there are three major categories of factors that have to be considered [2]:

- **The international institutional context** – supranational organizations (such as European Union) will impact upon the human resources management field within different countries;
- **National culture** – cultural approach has already been considered in order to explain differences between countries;
- **The national institutional context** – every country has its own institutional system that will affect the structure and business organization. Therefore, human resources management practices will be affected by this specific country context.

The human resources management practices are analysed at the international level based on two major approaches [3]:

- **The rational approach** – the companies will develop the practices that will enable them to fulfil their objectives in a rational manner and efficiently. According to this point of view the managerial practices will be similar within a specific sector of activity for the same country, even for different countries. This approach assumes a high degree of managerial autonomy.
- **The institutional approach** assumes that the companies are influenced in a decisive manner by their environment. Thus, their practices will be adjusted considering the regulations and compulsions of this environment. Therefore the

managerial practice will be different not only from a country to another, but from a sector of activity to another. These differences are explained by various elements such as different regulations concerning the business within a country, the relation between unions and management etc.

Such approaches should be analysed when the transfer of the human resources management practices is discussed.

It is clear that the transfer process of human resources management practices is not a simple task. It is necessary to establish in a clear manner what has to be transferred and what can be transferred what elements can enable or jam the transfer process in order to successfully complete the transfer process.

3. Romanian companies and human resources management practices

The Romanian companies have assumed different human resources management practices, especially from the theory and practice of Anglo-Saxon countries and accordingly to the UE specific legal framework.

We consider relevant for the stage achieved by the human resources management within the Romanian organizations, a study undergone by Interact and Gallup Romania. This study tried to determine the main cultural values of our society, using the G. Hofstede methodology. Based on this, the most suitable approaches and practices of human resources management have been identified.

The most relevant results of this study are presented below [4]:

- **Human resources planning process** - due to the dimension of uncertainty avoidance, in the human resources planning process the human resources department has to analyze the job positions and to avoid the frequent changes within the organizational structure;
- **Recruitment and selection** - in the recruitment and selection process the fact that the Romanian people are more compelling with the job satisfaction than the promotion

- opportunities or the stimulating side of job position has to be considered.;
- **Performance appraisal** - the use of a system for the appraisal of the performances proves to be a difficult task. This is due to the fact that a clear statement of specific objectives and an enhanced attention paid to performance measurement generates anxiety among the subordinates;
 - **Reward** - for the Romanian employee the level of payment, the certitude at the work place, the working condition are more important than the job perspective or the content of job position;
 - **Employee’s training and development** - the cultural dimension of collectivism determines that the employees are waiting for the company to provide them training and protection.

The results of the above mentioned study indicates that the cultural context of our society represents an important issue that should be considered when the transfer process is developed.

Regarding the human resources management practices used by the Romanian companies we appreciate as relevant the results of a specialized study undergone in 2011. These results summarize for the 4th quarter the following [5]:

- For the period considered the human resources department budget has been increased compared with the same period of the past year;
- The recruitment activities are still in the front, the number of companies investing in such activities increased by 14% and also the budget for this activity has been increased;
- The training and development activities are still the most used methods to learn and develop. It can be noticed that the classical training starts to loose field against the e-learning platforms. It also should be notice an increase of using external funds for these activities;
- In order to retain the most valuable employees, the companies are using training facilities, official recognition of work performances and providing of a pleasant work

environment;

- For the period considered the participant companies have reported and increased activity of recruitment and selection for the entry levels throughout the universities and student associations.

Based on the above mentioned results we can argue that the romanian companies are focused on the improvement of human resources management practices. This can be proved by the increase of the budget for the specialized department. It also can be noticed the used of modern training methods such as e- learning platforms. In order to improve the efficiency of such activities the studied companies have attracted external funds.

We have to notice that the administrative activities regarding human resources management are still the most important (the attention paid to the recruitment and selection activities) compared with the strategical one such as human resources planning process, career management etc.

The Romanian companies proved themselves preoccupied with recognition of work performances and with the insurance of training programs in order to maintain and develop the competences of their employees.

When the transfer process is initiated it should be considered the legislative framework in our country. The last Labor Code promoted by the Romanian Government generates a more flexible legislative context for the companies in order to promote different human resources practices such as:

- Working time;
- Hiring and firing process;
- Reward and its connections with employee’s performance etc.

Considering the above mentioned we can argue that the institutional theory regarding the transfer of human resources management practices is more suitable for Romanian companies.

The transfer process should consider the constraints of legal framework, cultural dimensions of Romanian society and other issues that will determine which practices are suitable for transfer and the ones that are not.

As we mentioned before an important role within this process is played by the legislative framework which can provide

changes that will be perceived as compulsory by the companies and therefore accepted.

4. Conclusions

The Romanian companies need to constantly improve their management practices. Considering the importance of human resources for the modern companies, the development of specific practice should represent an important objective for them.

The transfer process represents the solution for our companies in order to improve their human resources management practices.

Such a process proves to be no easy task. There are many issues to be considering when the transfer issue is discussed.

This paper aimed to present the main approaches related to the transfer issues at international level, considering the EU membership of our country. These approaches underline the main possibilities and also the potential difficulties related to that process.

The results of several specialized studies indicate the progress made by the Romanian companies in the past few years toward a modern human resources management.

The mentioned results also prove that an institutional approach regarding the transfer process is the most appropriate for our country. In this situation there are several limits related to the institutional and legislative framework, the cultural dimensions of Romanian society etc. Therefore, there are some practices that are more suitable to be transferred in Romanian companies, meanwhile others will be rejected.

The transfer process proves to be an important source for improvement of human resources management within Romanian companies. It is possible that such a process be enhanced along with a change of perspective toward a more relaxed attitude.

Human Capital Management Based on the Harvard Approach: a Solution for Reducing Human Capital Erosion

Adela Suzana Artene
Tibiscus University of Timisoara
adela.artene@gmail.com

Costică Roman
„Stefan cel Mare” University of Suceava
corpad03@yahoo.com

Abstract

Human capital management is a pragmatically new approach of what used to be called personnel management. Human capital represents the only inexhaustible resource of creativity, solutions, and new, innovating and valuable ideas. The Harvard approach recognizes a common element in every business, the fact that human capital (personnel) represents a group of important stakeholders in an organization, and they have their own needs and preoccupations as the other groups of stakeholders, such as customers, shareholders. Organizations – in this knowledge based economy – are challenged to ensure their need of qualified human capital on labor markets through complex, unequal evolutions.

Key words: human capital, management, erosion, personnel, stakeholders

JEL: M54

1. INTRODUCTION

Unfortunately we are still dealing with the global financial crisis. And despite the fact there are countries that register economic growth (such as Germany) Romania is still struggling to combat the negative impacts of the crisis and maybe in the nearest future to register an economic growth.

As a consequence of the crisis we discover in our country two important forms of human capital erosion, namely: the under-use of human capital (this being reflected through the high unemployment rate), or as a paradox the over-use of human capital (as a consequence of the massive dismissals).

People are considered one of the most essential resources necessary for achieving the objectives of an organization, as well as for organizational development. But they are a very special type of resource, they don't only work for the organization, they are the organization.

Human capital represents the only inexhaustible resource of creativity, solutions, and new, innovating and valuable ideas. Other resource categories (such as financial, material) of the organization are important and useful, but human capital and its' management are very important for resolving unknown situations and identifying optimum solutions.

2. FROM PERSONNEL MANAGEMENT TO HUMAN CAPITAL MANAGEMENT

In 1980 we noticed that the term personnel management is being replaced with human resource management. For about 15 years there was a period of conceptualization in which many specialists analyzed what is the difference between personnel management and human resource management. The following years the important questions were regarding the effects of human resource management upon organizations and organizational performance.

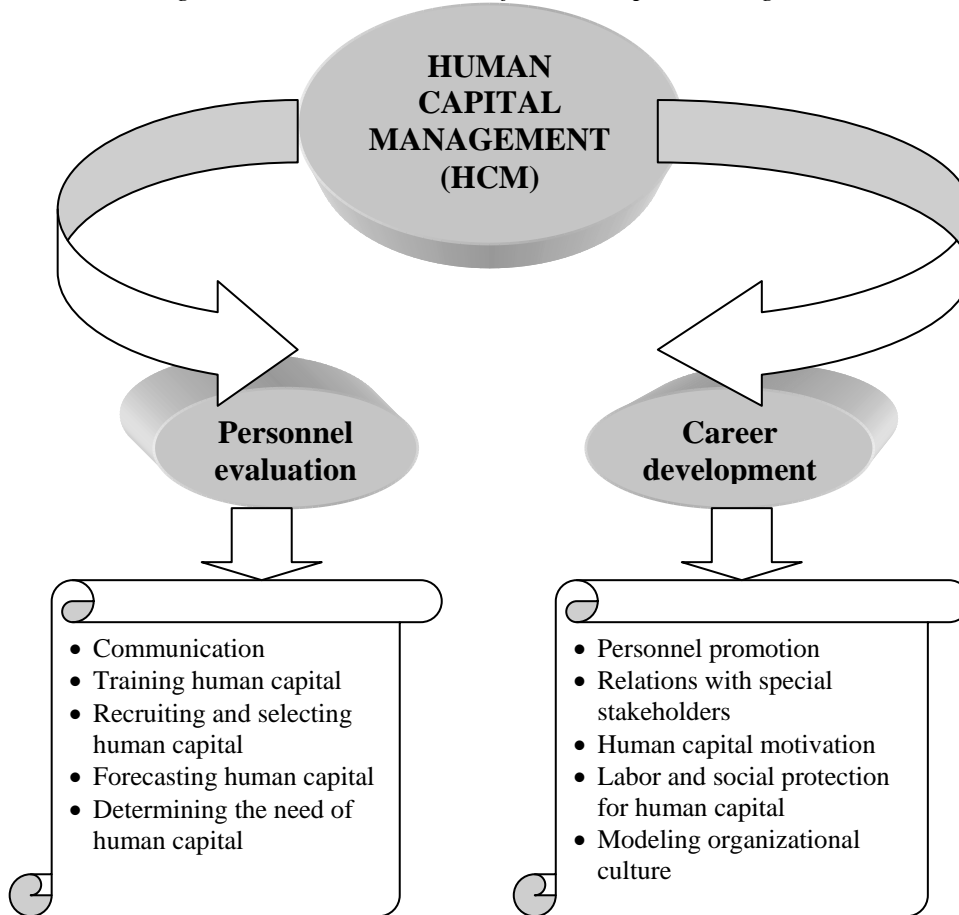

The appearance of human resource management was part of a major change in the nature and meaning of management at the end of the 20th century. The important evolutions in the international competition's structure and intensity determined organizations to make radical changes regarding their work practices.

Recently, specialists began to use the term human capital, because they consider it to be

more adequate. Human capital is more than a resource and therefore it shouldn't be considered a resource, because human capital is the organization itself.

The basic activities of human capital management are represented in Figure no. 1

Figure no. 1 Basic activities of human capital management

Source: Projection made by the author

3. THE HARVARD APPROACH: A SOLUTION FOR REDUCING HUMAN CAPITAL EROSION

Human capital management is considered a strategic process which uses at maximum level the human capital in an organization. Therefore human capital politics must be correlated with the organizations' general strategy.

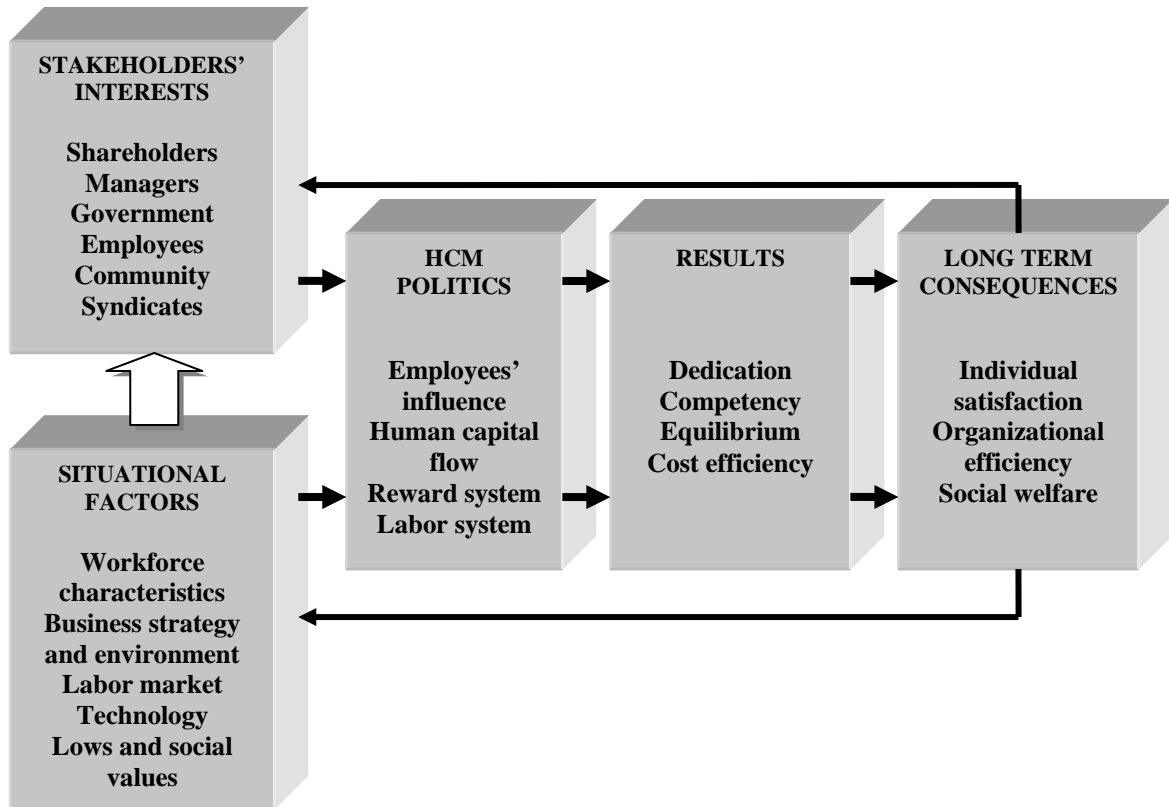

The Harvard approach was inspired by the behaviorist science and it is also known as the "soft" version of human capital management. This approach disagrees with the Michigan approach (the "hard" version of human capital), according to which human capital represent only resources and they

should be managed in the same manner as equipments and raw materials; that human capital should be obtained at the lowest costs and exploited at maximum.

The Harvard approach recognizes a common element in every business, the fact that human capital (personnel) represents a group of important stakeholders in an organization, and they have their own needs and preoccupations as the other groups of stakeholders, such as customers, shareholders.

We can state that we evolved from personnel management, which uses the Michigan approach, to human capital management, which uses the Harvard approach.

Figure no. 2 The Harvard approach

Source: Beer et al., *Managing Human Assets*, The Free Press, in A. Price, *Human Resource Management in a Business Context*, Thomson, 2004, p.41

Although the Harvard approach is widely used among all types of organizations, there still are organizations, especially small and medium size enterprises (SME's) in Romania that apply the Michigan approach.

As a result to this, the human capital is under-used because even if there were massive dismissals in the last period, there are a lot of organizations that are in need of human capital. At the opposite side we find the Romanian SME's which over-use the human capital in order to reduce their expenditures.

4. CONCLUSIONS

From the organization's perspective, human capital represents its personnel and the potential human capital available for that business. People come in organizations with a wide range of qualifications, skills and knowledge that may or may not be useful to that organization.

Some of them identify with the organization and are motivated to reach the organization's objectives, and others consider

the organization as an opportunity to satisfy their own purposes.

As a result we identify situations in which human capital is over-used, and some situations in which human capital is under-used.

The under-use of human capital, as well as the over-use of human capital are forms of human capital erosion. Unfortunately, in Romania we find both of the forms of capital erosion, this given to the fact that the Harvard approach is not fully implemented in all the organizations, and there are still organizations that do not want to give up the Michigan approach. On the one hand, the under-use of human capital due to the massive dismissals, and on the other hand, the over-use of human capital due to the fact that there are not enough employees and the few employees that are in organizations, are over-worked.

In the new economy – the economy based on knowledge – the volume of information and knowledge which is absorbed by human capital is superior to the existent volume from several decades ago. Organizations – in this knowledge based economy – are

challenged to ensure their need of qualified human capital on labor markets through complex, unequal evolutions. Therefore human capital becomes more important and, of course, human capital management becomes more important for every organization.

In conclusion, I strongly recommend that every organization uses the Harvard approach because this could be one of the solutions to reduce human capital erosion, and maybe to “survive” through this critical time when a lot of organizations disappear from the economic market.

Gaining Competitive Advantage by Emphasizing the Positive Attributes of Resources Held

Avrigeanu Alina Florentina
Romanian-American University, Faculty of Management-Marketing
alina.avrigeanu@gmail.com

Abstract

This paper aims to present the elements of the internal environment of firms and how they contribute to achieve a relative advantage.

Although VRIO framework is a precious strategic management tool it can be effective only in correlation with analysis of the external environment given, for example, need to find external references for estimating the value, scarcity and inimitability of a resource and selection of reference elements from the same market or the same strategic group.

Keywords: resource, competence, capability, VRIO

J.E.L. classification: M21

1. Introduction

Generating strategies to improve the competitive position of companies involves an external environment analysis to identify opportunities and threats and, also, taking into consideration of their internal potential – their available resources that define their competitive strength and profile. Since internal environment is the primary source of its performance and the strategy is determined by the resources available to it, by the history of its development and by its behavior in the past, the formulation of policy options implies an analysis of its internal environment focused on identifying the different elements that can be used as sources for creating performance and how they contribute to a relative advantage compared to similar companies operating in the same area. This way, the company will work towards improving its competitive position by emphasizing the positive attributes of resources held.

2. The resource-based approach of competitive advantage

Resource-based approach, known as the "model of resources and strategic skills" appeared in the United States of America in the 90s. Arguments for this theory argue that subscribe to some theorists of strategic management today is that, on the one hand, numerous studies have failed to demonstrate a relationship between firm performance and industry performance and on the other firm position in the industry depends significantly on its resources.

Deep historical source of this approach, however, is the work of David Ricardo in 1817. The author argued that the supply of land is inelastic and therefore owner of the land resources of higher quality will have a competitive advantage. Similarly, an organization that has better resources than its competitors will have better performance.

According to the resource-based approach, the internal environment of an organization is the primary source of its performance and the strategy is determined by the resources available to it, the history of its development and past behavior. The formulation of policy options is, necessarily, based on an initial analysis of the internal environment of the organization, focused on identifying the different elements that can be used as sources for creating performance and how they contribute to a relative advantage compared to similar organizations operating in the same area.

The theoretical base of studies on the resources of the organization was given by two fundamental assumptions: resource heterogeneity (each company operates its own and unique combination of resources) [9] and resource immobility (some resources of a company, especially the material and human, are difficult or costly to imitate) [12].

Studying the use of resources by the

organization in a holistic perspective of tools of analysis, we find a global interpretation, operating with concepts such as resources, skills, capabilities. These concepts are directly related to the performance of the organization, explained by comparison with the performance of competitors, the result being summarized in a position relative to them.

Elements of the internal environment that, according to resource-based approach of competitive advantage can be used as sources for creating performance are resources, competencies and capabilities.

As elements of the organization, resources can be tangible, naming them, in this case, "capital" (financial, human, physical and organizational) and intangible (brand name, company reputation, product reputation, ties in business, organizational culture). Different types of resources can be classified according to their content (human, financial, physical, etc.), or according to their functional use within the organization (production, marketing, personnel, etc.). Theorists concerned with the strategic management issues complete categories of resources commonly found in economic literature, introducing the following concepts:

- organizational resources (as an attribute of a group of individuals, including the organization, cultural value system, coordination and control systems of an organization);
- limit-resources (necessary for organizations to meet the minimum requirements of economic survival);
- unique resources (which provide a competitive advantage that is difficult to obtain by other competitors).

Studying the reference works on resource-based approach of competitive advantage and firm, we find a relative confusion in defining the concepts of "resources", "skills" or "capabilities" that still persists in management literature and that there is not, to today, an unanimity of authors regarding their definition. Thus, the concept of competencies concerns at large activities and processes that an organization uses its resources in an effective manner, taking advantage from their full potential. In Prahalad and Hamel's vision, in diversified firms case, core competencies can be identified, defined as "the collective

experience of the organization, manifested especially in combining various skills associated with the production and technological integration of multiple streams" [10]. In the French literature of management there is a concept close to the meaning of the term of competence – "metier", defined as a combination of skills and abilities to know and to do certain activities met within an enterprise, contributing to a new value created and ensuring business success in a competitive environment. With reference to the concept of capability, some authors consider it to be restricted to achieve coordination of other resources. According to Barney and Hesterly, capability is "a subset of resources that allow the firm to fully exploit other resources" [3], while, in view of Hax and Majluf, resources and capabilities are unique sources of business skills [7]. Despite some efforts to differentiate the concepts mentioned, there is a vague demarcation between them and, therefore, a possibility of overlap, which would justify the position of authors who exclude one or the other terms.

Realizing that the in the mutual reporting concepts of competence, resource and capability there are misunderstandings and ambiguities, Romanian specialist Bogdan Bacanu carried out a clear delineation of terms in the context of strategic management theory, operation designed to keep all three concepts, to give a comprehensible definition in Romanian and establish a relationship between them. According to Bacanu [1], [2], resources define what the organization has available to achieve its stated mission and strategy resulting from this, competencies define the know-how to transform resources into products and its features, mainly relating to combining the available resources it has to create value, while the capability defines the power of company to exploit the existing opportunities and to create an advantage over competitors. Strategic capability requires the existence of organizational resources and the possibility of their exploitation, translating, specifically, through the will to do something for which there are resources and competence.

Briefly, the concepts of resources, skills and capabilities can be summarized as follows (Figure 1):

Figure 1. Internal environmental elements that can be used as sources for creating performance and their relationship

Source: made by author

3. Critical organizational resources to create performance and achieve a competitive advantage

In the context of strategic management practice, the demarcation of the three concepts is relatively vague, which is why we operate with the general term "resources". Table 1 presents a classification of the critical organizational resources to create performance and achieve a competitive advantage:

Table 1. A classification of the critical organizational resources

Resource category	Features	Examples
Physical resources	Assets and processes, including their geographical location and spatial	position (location or site), buildings, equipment, materials
Financial resources	Concentration, collection, materializing as an investment	skills related to financial management, risk management
Human resources	Qualitative aspects of human resources (senior managers, which provides an overview of the	leadership, ability to develop and operationalize strategies, ability to generate manage-

	organization and 'front line' employees, with skills essential to the processes that define the identity of the company)	ment structures to ensure stability of operations, skills and professional skills, collective learning
General resources	Elements, mostly intangible, that give specificity to company and have a significant impact on economic performance	patents, copyrights, trademarks brand reputation, the organization's external relations system
Organizational culture	The combined rules, regularities of behavior, philosophy, dominant values, organizational climate and rules resulting in the development of identity with direct consequences in differentiating of the firm	the visible level, expressed by physical products, oral products and behavioral products and the invisible one, expressed by shared values and organizational skills

Source: made by author

As shown in the strategic management literature circumscribed to resources-based approach, the primary source of organizational performance, reflected in a competitive advantage, is represented by the distinctive resources that can be met on a small number of competitors.

4. Firm's resources and competitive advantage

The link between resources and

competitive advantage was addressed by Professor Jay B. Barney in his management textbooks and studies. Professor Barney is the creator and promoter of a tool of strategic analysis - the VRIO framework - that focuses on resources associated attributes, the name of this tool for strategic management being an acronym for value, rare, inimitable and organization.

The link between resources and competitive advantage according VRIO framework is presented in Table 2:

Table 2. Resources and competitive advantage

V	R	I	O	Consequence in competition
-	-	-	No	Disadvantage
✓	-	-	↑	Parity
✓	✓	-	↕	Temporary advantage
✓	✓	✓	Yes	Sustainable advantage

Source: Bacanu, B., “Strategic Management in Tourism - Concepts and Case Studies” Polirom, Iasi, 2009, p.79

A resource can be considered valuable (V) if it allows the company a favorable position to opportunities and threats. Economically, having a valuable resource means generating additional profit compared to the situation of not owning that resource. In terms of competition, the value has a positive impact which could translate into improved market share held and, consequently, an increase in profit. Some empirical studies reveal a significant relationship between market share and profit, which implies a similarity of effects in relation to a given resource [5]. To identify a valuable resource, a detailed analysis of the processes of the company is required, reflected in the decomposition of chain of activities, based on either the value chain, Porter or the McKinsey version or a functional approach, based the functional categories inspired by Fayol.

In the VRIO framework of analysis, scarcity of a resource (R) means that it is found in a small number of competitors, being an attribute relatively hard to materialize and maintain. Therefore, if any, rarity is considered a sustainable attribute. Scarcity may be the result of an exclusive arrangement between two partners, like

franchise or the result of a legal regulation, like patent or trademark.

Inimitability (I) involves two aspects: actual inimitability and non-substitutability. A resource is considered inimitable if a competitor cannot take possession of them in a short time or it induces the purchase costs higher than the reference company, while non-substitutability is about a competitor being unable to obtain such benefits from a different combination of resources.

Resource organization (O) refers to the firm's ability to exploit its resources, resources that have the attributes of value, rare and inimitable. This capacity is given by the configuration of organizational structure, efficiency and effectiveness of control, motivation and remuneration policies, mechanisms and budgetary allocation intentions, etc.

5. Conclusions

Without disputing the usefulness of the VRIO framework in the analysis of internal environment elements which are responsible for organizational performance, we must emphasize the need to correlate this type of analysis with analysis of the external environment given, for example, need to find external references for estimating the value, scarcity and inimitability of a resource and selection of reference elements from the same market or the same strategic group.

Strategic Challenges for Apparel Manufacturing Companies

Avrigeanu Alina Florentina
Romanian-American University, Faculty of Management-Marketing
alina.avrigeanu@gmail.com

Abstract

In this paper we highlight environmental challenges faced by the apparel manufacturing companies, thus bringing to the forefront of analyzing a multitude of features and trends that have or will gain, in the future, a significant influence on the industry.

Survival and development of companies in the field are generally dependent on the external environment in which they evolve, requiring a clear perception of the changes occurring in it.

Keywords: apparel, TQM, flexibility, TSS, UPS

J.E.L. Classification: M21

1. Introduction

Apparel industry has an important place within the national industrial system of the developing economies, and the use of an active commercial policy to highly stimulate exports, as a “locomotive” of economic growth, is a factor of the economic growth of these countries.

Nowadays companies, including the apparel manufacturing ones, are required, through the strategic approach taken, to provide the right response to environmental challenges grouped by two strategic axes of analysis: new features of production processes and selecting and focusing on strengths for development [3]. We believe it is necessary that environmental challenges to be highlighted, thus bringing to the forefront of analyzing a multitude of features and trends that have or will gain, in the future, a significant influence on the industry.

2. New features of production processes

Regarding the new features of the production processes, a defining feature of

contemporary competitive environment is to impose costs, flexibility and quality assurance as forefront factors of competitiveness.

A. With regard to costs, the main changes are:

A. Increasing costs for research and development of new products, due to the need to identify new products or new functions of existing ones and the requirement of finding development solutions that ensure the effective capitalization of company strengths. This trend is also reflected in the apparel industry, dominant firms winning leading positions in the world hierarchy by combining creative textiles and chemical products, by skillful selection and combination of materials and processing options and creating aggressive new designs, styles and functionalities for products. Research activities, mainly nontechnological, the big textile companies invest considerable sums, give them the ability to constantly innovate in terms of products, to use the most advanced, flexible and efficient processes, aiming to the meeting needs of clients also in constant evolution.

Prevailing industry fragmentation phenomenon has an impact on research, acting as a prohibitive factor - in an industry dominated by SMEs, lack of resources, especially financial ones, is an important issue. It will be supplemented by inconsistent long-term strategies, both in businesses and industry, fragmentation, duplication and discontinuity research efforts, poor translation of research results into products and processes difficulties in protecting research results, etc.

3. The rise of fixed costs due to use of modern production technologies and equipment, of computer systems becoming more efficient and also very expensive.

The production performance apparel production technologies based on modern

technology means computing and information systems are mainly used in appropriate training activities of production, technological innovations enabling:

- three-dimensional design of products and creation of virtual clothing products by applying the two-dimensional patterns on three-dimensional image of real bodies, significantly decreasing the time of approval of products to be manufactured, so that everyone involved to view products and to propose changes without having to create as many samples of production;

- direct extraction of two-dimensional patterns from three-dimensional designed models;

- automatic grading of patterns;

- automatic generation of frames, using multiple processors for settlement and compaction to get the best use of material by compacting parts to remove excess material of patterns;

- electronic submission of product specifications both inside and outside the company, to the subcontractors, distributors and suppliers. Information (including costs, material tables, dimensions, construction details, drawings and multilingual functions) can be accessed anywhere through LAN, WAN, virtual private networks, telephone or through the Internet.

In terms of achieving the production preparation, cutting of parts, technological innovations enable:

- preparing tailored fabrics using computerized machines for controlling and measuring and measuring fabrics;

- automatic spanning and cutting of fabrics.

Basic production processes, assembly by sewing, use production technologies, essentially unchanged for over 100 years. The most significant increases in productivity are achieved through:

- advanced sewing needles;

- sewing equipment with high degree of automation (automatic sewing sleeves, etc.)

- automatic processing apparatus (fusing machines, presses preformed collars, cuffs, pockets, etc.)

- suspended systems (manual, mechanical, electrical, electronic or computerized) to transport individual products or packages.

In the finishing phase of products, technologies based on use of equipment such

as automatic machine embroidery, special buttons reinforced by wrapping, corrugation machines, automatic machines for special finishing (simple or stone washing, printing, etc.) ironing presses, folding machines, etc.

Rising of fixed costs is also the result of the emergence of expenditure that, on certain periods, have the features of fixed costs, such as advertising and promotion costs and product distribution costs. Obtaining performance of clothing industry companies marketing implies a strong marketing activity, due to displacement of ratio of power to buyers (in this business particularly distributors and buyers, less final consumers). This shift of power relation is reflected, among others into the contribution to creating value for the final consumer: the distribution's accounts for a share of 50-75%, while manufacturing's share, on average, is below 20% .

4. ROI reduction, due to increased value for the purpose of actual value and interest to be paid, on the one hand and reducing manufacturing series and the life of products, on the other. Demand features reduce the production batches – although apparel are consumer goods, they are also fashion and style dependent, reflecting the personality of the person who buy them. Diminishing of production batches reduces ROI, so a successful business is often a succession of turnovers at a minimum level of profitability.

5. Adoption by apparel firms, of the price taker position in a saturated, highly competitive market, characterized by a low coefficient of elasticity of demand for income and an volatile demand in volume and structure, unstable under the influence of fashion or change of seasons. In these conditions, ensuring viability of the industry call for a philosophy such as "market price minus total costs is profit worth" and requires modern methods of management and production organization: management by budgets, organizing just-in-time design and production based on "target cost", etc.

B. Challenges regarding flexibility in production are more acutely felt in the clothing sector than in other areas. In the current period, marked by the shift from mass production to customer-oriented production, garments are not only functional but also play a major role in identity and personal expression. Therefore, they are ideal products

for customer focus, their customization according customer's specification offering significant added value.

In the production of clothing, there are two forms of flexibility [1]:

- Static flexibility, reflected in firm's capacity to take an additional order that may occur during the implementation of the provisions of production. Making the most of static flexibility requires the adoption of management policies aimed at the accurate sizing of capacity reserves, resources and working in the various levels of the enterprise and ensuring organizational conditions necessary for their immediate mobilization when necessary;
- Dynamic flexibility, expressing ability of enterprise production system to react to any unforeseen event, based on flexible automation systems, robotics and informatics, organization of production, technical universal equipment capabilities, versatility skills of employees, etc.

Recent technological developments, represented by sophisticated CAD solutions for achieving virtual prototyping, online communication systems between producers, distributors and users, enabling manufacturers to develop successful operations in the production of mass customized high fashion and premium apparel, comparable to production in other sectors such as PCs or cars. In this way, producers are flexible, while maintaining the advantages of series production of large and very large.

Ensuring flexibility in textiles production is based on modern organizational systems: TSS - (Toyota sewing system) and UPS (unit production system). Unlike the classical organization of production batch / packages, featuring downtime up to 80% during production and large stocks of unfinished production TSS is a concept based on methods with fast response.

In TSS environment, operators work in teams organized so that is tracked one product's sewing, movement between machines and operations, and transitions to the next operator, available immediately after processing. Therefore, there aren't unfinished products between phases and operators' work materializes immediately by completing the

product. Thus, a garment with a time of 60 minutes produced by a TSS team can reach the end of the production line after 60 minutes.

Another way to eliminate waste of time and unfinished production stock is using Unitary Production Systems - UPS, which eliminates the need for operator to pack supplies, or arrange to collect them because they are delivered to the point of stitching ergonomically already prepared. Studies have shown that by adopting UPS can change the ratio of time handling / production of 80/20 60/40 or better.

C. Total quality as a feature of the mode of production, assumes that products are developed to meet needs, which involves the enrichment and diversification of offer and also diversification of product functions that would, so that firm will be able to achieve the best possible satisfaction of customers expectations.

The quality of a product or service is a complex notion, in a widely accepted definition representing all the characteristics which give it the ability to meet the needs expressed or implied.

From the traditional quality control aimed at an acceptable quality level evolved the quality management system, understood as a method of administration /management organization that determines a high degree of satisfaction for all parties interested therein.

In order to appreciate the quality orientation of the firm, since they work within a quality management system, were developed ISO 9000 standards, containing a number of requirements for quality management as the referential of focus on quality assessment of the company. Adopting a standard in quality, although it is considered voluntary, has become increasingly "mandatory" for all producers that address their products/ services to markets of the European Union.

Currently, improving quality requires a comprehensive approach - total quality management defined by four concepts:

- visible quality level, which means providing a common definition of quality for all personnel, setting easily measurable criteria for all parties involved in the process;
- measuring quality during production;
- preventing defects - defects should not be considered as acceptable;

- the ultimate goal should be "zero defects".

Quality analysis is an element of overall strategy to exploit with maximum efficiency enterprise resources, quality of products and services, as a factor in boosting sales, reduce costs and increase profitability, turning, also, into a competitive necessity.

As shown in several studies of strategic management TQM can be considered as a source of competitive advantage and therefore a high level of performance, noting the following seven key factors or practices that constitute philosophy support of such management type, as follows:

- involvement of the management team;
- adopting a philosophy of quality;
- increased training oriented to TQM;
- customer orientation;
- continuous improvement of processes;
- management by results;
- adoption of TQM methods.

3. Selecting and focusing on strengths for development

In the current period, the need to find solutions to business development that ensures the best results involves selecting and focusing on strengths. To support this trend, the practice recorded many cases it was easier, less costly and more efficient to develop a strength of a given firm, but to eliminate a malfunction. The main changes in this regard, noticeable in apparel manufacturing sector are:

- Development by multiplying niches of activity, consisting of well-protected market segments that provide high profit margins or bearing innovative vectors. Multiplying niches involves an initial phase of specialization required by the need to target dominance ensuring high profit margins and avoid investments in related fields, followed by a phase of external growth. In the clothing business niches that can be exploited profitably are customized products, enhanced by accessories or embroideries, clothing for atypical dimensional, uniforms, etc.;

- Downstream integration to increase value added – this approach is called for because profitability of dealers, distributors and retailers of clothing is higher than producers'.

4. Conclusions

Elements of competitive game in the clothing industry, survival and development of companies in the field are generally dependent on the external environment in which they evolve, requiring a clear perception of the changes occurring in it. However, the formulation of realistic and feasible policy options for clothing industry companies involves a deeper analysis of the external environment and a focus of attention on the evolving competitive environment in these firms.

Abstract

When we think about the online commerce market, the first question that arises is, how do the players on this market manage to attract potential customers and convince them to buy online repeatedly. With the development of Internet, the online presence can not be ignored, whether a site is transactional or not. A company without a presence on the Internet is a company with no personality. There are many tools which can be used for acquiring customers and retaining existing ones. This paper aims to address the issue of e-mail as a marketing tool for communicating with Internet users and stimulating to them to buy online.

Cuvinte cheie: Internet, online user, e-mail, communication, online store.

Clasificare J.E.L.: M31, L81, L86, F10.

1. Introduction

Once the competition has intensified, companies have realized they can not overcome relying solely on price and have developed strategies to provide value to customers, in order to differentiate themselves from competitors.

Online retailers are widely using e-mail to communicate permanently with their customers. Thus, they benefit from the advantages offered by e-mail, like low communication costs and the possibility to address to target people, that have asked to receive messages or the possibility to analyze the behavior of those who are receiving the mail. Although e-mail can be successfully used to attract and retain customers, to sell and promote the products, to form loyalty and to offer services to customers, a real

challenge for online retailers is to convince consumers to subscribe. Many are hesitant because of overloading with messages, and many messages are often just ignored.

Newsletters have the merit of attracting and keeping users under the influence of the website's shop. A regularly sent newsletter, at a normal frequency of once or twice a month, brings into memory of the customer the products and services that the company sells and encourages repeated purchase.

Sales on the Internet are increasing as more people have access and become more confident to online transactions, but a web site alone will not guarantee an increase in sales. Sites focus on sales need to have strong online advertising. This generally involves reaching goals like developing the degree of awareness, developing and maintaining brand image and generating visits on the website and initiate online transactions.

Attracting customers is an important factor determining the profitability of an online store. In addition to the right offer, to attract customers is necessary also the use of appropriate tools, such as display advertising, e-mail and search engines.

Using the current online tools, every online company can develop efficient programs to build relationship with customers. E-mail is an important tool for acquiring customers and retaining existing ones, for communicating with users and stimulating to action.

The Internet itself fulfills a function of communication, embodied by electronic mail, which allows the rapid and inexpensive transmission of audio, video and text correspondence. Not only online users communicate with other Internet users, but also companies realize a communication with customers via the Internet.

Electronic mail can be very profitable in

terms of costs, but also as response rate. It can be used to attract and retain consumers, to sell and promote products, to form loyalty, to provide exceptional customer service and for strengthening the brand. Successful e-mail campaigns success are mainly based on trust. Permission and confidentiality is the key to gaining the trust of customers. [5].

According to Marketing Sherpa Email Marketing Benchmark Guide 2008, e-mail is tremendously important to consumers: over 45% of all consumers rate it of higher importance than postal mail or the phone – even amongst seniors and older adults. The medium is not dying out in favor of instant messaging, texting or social networks. Over 70% of all age groups are using email more and more each year. [11].

2. E-mail marketing

E-mail marketing options include: [8]

- a regular newsletter by e-mail to keep customers informed about the company and its products;
- a discussion list, probably related to customer support or a group of users;
- e-mail promotions - special offers, contests and discounts to encourage repeat visits to the company's website and convert those visits into sales;
- viral e-mail, to encourage customers to introduce e-mail addresses of friends or colleagues to forward information or entertainment;
- promotions to encourage the renewal of a contract, for example for mobile telephony or insurance.

E-mail marketing campaigns can provide an inexpensive and effective way to address potential customers. The first step is to set campaign objectives. This means setting the target audience, including geographical location, demographic profile and determining the level of personalization of the campaign. Personalized e-mails address to consumers with specific information. Using the name of clients, offering right products at the right time and sending special promotions oriented at the interests of consumers leads to building stronger relationships with those who received e-mails. [3].

Using e-mail offers advantages such as: [4]

- It is cheap; it has no printing costs or shipping costs.
- E-mail is distributed immediately; it does not require moving to a place to be delivered.
- It offers worldwide access.
- Customers are auto-selected; customers requesting deliberately to send them marketing messages are likely to be more profitable.
- It is target-oriented, allows segmentation in order to increase conversion.
- It can be analyzed: can be obtained data on those who opened the mail and clicked on a specific link.
- It can be automated, automatic deliveries.
- Easy transmission through word-of-mouth is a great viral potential.
- The feedback from the public helps create loyalty.

3. Building relationships using e-mail

If the goal is building a solid relationship by using e-mail, certain mistakes, such as the following, have to be avoided:

- Sending "spam" to the mailing list.
- Not sending messages for a long time - the opposite of spam. If not keeping in touch with subscribers for a long time, they will tend to forget that company, and this will harm the relationship between customer and the company.
- Sending irrelevant offers - when launching a new product, there may be a tendency to inform all subscribers, although some of them are not interested in that product, or do not need that product.
- Sending e-mails only when selling something. No user wants to be in the mailing list only for selling purposes. The reason they subscribe to the mailing list is because they want something valuable. If they fail to find value, they will unsubscribe immediately.
- To send e-mails hastily. An email with errors, either in content or subject line, such as subscriber name will look unprofessional and create a bad impression.
- E-mail can be considered an excellent marketing environment for the following reasons: [1].

- It is easy to use: With the current tools currently, it is easy for any organization to develop effective e-mail programs to build relationships with customers.
- It is cheap: There is no other marketing medium that is less expensive than e-mail.
- It is interactive: A very important feature is the interactivity. E-mail can be tracked; companies can get exactly data about links accessed from an email and links ignored. It can measure the overall effectiveness and integrate with other systems in order to measure actual behavior (purchases, etc.). In the interactive world, this is equivalent to listening.

The obtained data from the users can be used to adapt a message to an individual recipient. The data is necessary for the organization to show its uniqueness, to prove that it listens to customers and delivers relevant messages over time. The combination of these benefits forms a very powerful marketing tool which enables building long lasting relationships in the online space.

Internet users can be encouraged to read email messages. First, it is essential to stimulate curiosity through an interesting topic of the electronic message and create anticipation in the message subject. The sender of the message must ensure that the message is interesting enough to capture user's attention. It is also recommended customizing the message and using the recipient's name in the message and an indication about the message content.

Consumers are overcrowded with messages that are relevant or less relevant for them. Only permission based marketers will be able to obtain a competitive edge in the online space. Permission based marketing involves a "pull" communication in that the concerned requests for information, subscribing to the newsletter (opt in) and is always able to unsubscribe. Consumers will decide for themselves what information they receive from companies. Marketing based on permission offers advantages for the clients, because the clients have the possibility to establish themselves what information they wish to receive and to benefit from a personalized approach where their interests are taken into account. Marketing based on

permission offers advantages also consisting in a better knowledge of the market and the desires of customers. [7].

Godin S. (2004) analyzes the Internet from a marketing perspective based on permission and defines five stages that any permission-based marketing campaign on the Internet needs to have:

The online marketer offers the potential customer an incentive to join the system voluntarily.

- Using the consumer's attention, the marketer offers a true information program that instructs the user regarding the company's products or services.
- Incentives strengthen the maintenance of given permission.
- Marketer offers additional incentives to achieve greater consumer permission.
- Over time, the online marketer uses the permission to change consumer behavior, making it into a source of profit.

Permission based marketing refers to obtaining customer consent before initiating marketing efforts of databases. The main benefit is to make an exchange: the company collects customer data, in exchange for products and customized offers. 3

According to the Marketing Sherpa Email Marketing Benchmark Guide 2008 [11], the amount of data collected during e-mail list sign up is still fairly basic. Most companies only collect the basics of name and e-mail address from consumers. Less than 30% of those surveyed ask for more detailed information like contact preferences and delivery preferences.

The first step in a successful e-mail marketing campaign is forming a list of people interested in the products or services that the company has to offer. It is recommended to offer visitors a free registration in return for their contact information. An own list is better than buying other lists of e-mail. The latter, in addition to being expensive has the disadvantage that the response rate is generally low.

High quality addresses usually guarantee high click rates, positive feedback and strong contact with the customer, contact that is reflected in a profitable customer relationship. [2].

In a long term strategy is not only important to gain subscribers to the newsletter, but rather to obtain their

permission, their desire to gain information and their interest for a long term. In this age of overloaded information, a person's willingness to allow voluntarily to be sent electronic messages should not be underestimated.

There are a plenty of reasons why users may choose to opt-out from a mailing list, in order to stop receiving commercial e-mails. The main reasons are: messages are not addressed to their needs, users are overload with mail messages, and users are sent unsolicited communications (spam).

The Marketing Sherpa Email Marketing Benchmark Guide reports that the first reason that consumers opted out of email lists was that the e-mails received were not pertinent to them (58%). The second most popular reason was that the sender sent too many emails (44%). Less than a third of those surveyed opted out over too many e-mails in general or because their situation changed or they are using less e-mail in favor of other modes of communication like the social media [11].

To obtain e-mail addresses, a trader can create its own mailing list or purchase it. While purchasing a list of e-mails may seem a quick way to reach large numbers of people, practically there is no way to check the quality of the purchased list.

The real challenge comes from attracting a large number of visitors to subscribe, given that Internet users protect their e-mail addresses. Only by gaining their trust, they will provide their e-mail addresses. The company must explain why it requires this data, for example, to send them special offers, inform them about promotions, and also to ensure that it will not disclose information obtained to third parties. [9].

The vast majority of consumers wants to have control of their online experience and do not want their behavior to be monitored in cyberspace. Therefore, in the communication process with permission, the relationship the company has with customers plays an essential role. If it is built on long-term and based on trust, it gets a greater importance as the online consumer experience is richer. Thus, the user is willing to provide more personal information to companies that he trusts [6].

4. Conclusions

Online retailers are using e-mail to communicate with their customers. This is an unexpensive way to keep them in contact with the company and its products. Online retailers realized that e-mail can be successfully used to communicate with customers, to form loyalty and to develop a strong customer – company relationship. Despite this advantages, it is a real challenge for online traders to find the right potential customers and to convince them to subscribe for further e-mail communication. Own mailing lists bring the best potential customers. Attracting and retaining customers through e-mail is possible only by gaining their trust, by letting the users to have control of their online experience and by not overflowing them with messages and irrelevant information. In this relationship through e-mail, permission plays an important role.

Abstract

Only those companies which succeed in building lasting relationships with online customers are those who customers are confident in and transact online securely. Furthermore, successful companies are those who pay attention to customer satisfaction, who are trying to understand customer needs and expectations and to fulfill them properly. Only those online store managers that focus more on gaining customer loyalty, than to customer acquisition succeed in the online business medium. Customer loyalty is generated by many factors, which include satisfaction, service quality, customer expectations and complaints of the customer. Companies operating online need to take into account these factors to ensure that online customers are loyal and relationships with them are developed.

Cuvinte cheie: online user, satisfaction, relationship, loyalty, expectations.

Clasificare J.E.L.: M31, L81, L86, F10.

1. Introduction

Customer loyalty can be defined as all measures of a company, which aim to direct behavioral intentions of current customers, but also those of the prospectives, to develop a strong and lasting relationship with them. Customer loyalty can be seen in terms of a real behavior, resulted in repeated purchase, or in making additional purchases and in the sense of intentional behavior, referring to the intention to repurchase or intention to make additional purchases.

The first step in managing an online business based on loyalty is to find and

attract the right customers, those who are profitable for the company and that those whose loyalty can be gained and preserved.

Companies based on loyalty should guide herself after the following rules: [9]

- Some customers are inherently predictable and loyal and simply prefer stable relationships for long term.
- Some customers are more profitable than others, spend more money, require less assistance.
- Some customers will perceive products and services of a company being more valuable than those of competitors. No company can be perfect for all consumers. Strengths of a company will better suit the needs of certain consumers.

To increase customer satisfaction and loyalty, companies must continuously analyze customer expectations and exceed them. So they must have a customer oriented approach to develop and maintain long term profitable relationships with them. A company that is focused on customers will be able not only to meet customer expectations but also to anticipate their behavior, being able to obtain a higher level of customer satisfaction.

2. Loyalty and its determinant elements

A client of a company can easily become a client of competitors. Buyers no longer have that kind of loyalty as in the past. Products are available from several companies and the choices they have are multiple. Where the customer is loyal, means that its loyalty was created by service and customer assistance provided by the company, rather than loyalty to be obtained through the product itself. [10]

D. Tapscott [11] brings into question the

so-called "Net Generation", a generation that makes its presence felt and thanks to it, relationship marketing gets a different meaning. The rise of "Generation N" undermines brand loyalty, because they want more options and also have more options to choose the products and brands.

The N generation wants personalization of products according to individual desires, which implies a permanent change of behavior, which also weakens the significance of brand loyalty. This generation is always looking for something new, new experiences, with consequences for loyalty to the brand.

Retention is generated by many factors, which include satisfaction, service quality and confidence of the customer. This article aims to treat concepts of satisfaction, customer expectations and services provided for customers.

3. Satisfaction and its measurement

It is often argued that those customers who have a higher level of satisfaction will shop online again from the same store and even form emotional bonds to the store online. Emotions serve users as information on fulfilling their expectations: if surfers are excited, this is an indication that the expectations of visitors of the online store have been met. In evaluating satisfaction with the organization's online store, visitors are less reliant on their emotions.

According to McGaughey [7], "today's consumers not only expect a high level of service, but they require such services for their benefit." Customer satisfaction is achieved when a company can meet customer needs.

Because a company's customers are different, their level of satisfaction vary, and the extent they are satisfied after the same situations differ from one customer to another. It may be impossible to know what satisfies each customer. Achieving high levels of customer satisfaction by short-term measures is important, but such satisfaction is vulnerable and must be accompanied by a greater relationship for long term, with the company. Customer satisfaction is an extremely important step in developing a solid relationship with customers, but only satisfaction will not lead to the formation and

maintaining this relationship. [1]

Customer satisfaction is a fundamental concept of marketing which claims that customer satisfaction is the key to retain customers. Recent research on the online medium mentions satisfaction as a fundamental element in building customer loyalty. In an empirical study, Shankar (2003) [8] approaches the topic of customer satisfaction in both the online and offline medium. The author concludes that overall satisfaction helps to create loyalty, but that the relationship between satisfaction and loyalty is stronger online than offline.

Formation of satisfaction in the online environment relies on a greater trust than in the offline environment. A satisfied user is one who will return to the company's online store, will generate traffic and make acquisitions, but also one that will promote the store through viral marketing, by communicating with other visitors the perceived values.

Monitoring customer satisfaction brings valuable information on how merchants are perceived, on products and services and allows managing the online business according to customer expectations. Some companies operating online use questionnaires to assess the degree of satisfaction, which are sent after providing the service. Generally, in the online medium it can be determined the level of customer satisfaction through a focus group, questionnaire, surveys or through suggestions customer post on site. The last is still a passive way in which only complaints are likely to be received.

4. Customer expectations

Customer expectations are based on previous experiences in similar situations, on what promises advertising or other forms of communication or on what the customer believes that should happen. Online, customers have higher expectations. They want and expect higher quality services, convenience, fast service, competitive prices and a varied offer of products. Although not expected, they want to be in control, transactions to be secure and that their data to be safe. Having higher expectations, this can be harder to fulfill.

Managing customer expectations in the

online environment becomes more challenging due to high expectations. A company must: [4]

- Understand customer expectations regarding service delivery and the difference between expectations and the actual customer service delivery
- Ensure that the promises made regarding the privacy policy, ensure security on delivery, price and assistance on time
- Deliver customer service through a user-friendly site, offering competitive prices and based on excellent service

Some researches demonstrate that it is not sufficient to provide only low prices and fast delivery of products in order to attract and retain customers. In this process also contribute issues like access to a wide range of goods and services, transaction security, aesthetics of the website, the available amount of information and credibility.

5. Services provided and complaints

In the virtual market, the power structure of participants changes. Structures of this market allow customers to compare products and prices of different suppliers without too much effort. Online stores have to offer high quality products at lower prices than for offline offers. The customer has the possibility, that only by one click, to change the store, to move to competition. Often the reason is not the price charged by that store, but the lack of services for the client. Because some online stores offer bad services and because of the lack of communication between the client and company, confidence in electronic commerce is still low.

Once the competition has increased, companies have realized that they cannot win relying solely on price and have developed strategies to provide value to customers, in order to differentiate themselves from competitors.

Quality services for customers offer advantages such as: [5]

- differentiation from competitors;
- improving the image in the eyes of customers;
- reducing sensitivity to price;
- increasing satisfaction and loyalty;

- strengthen the reputation;
- reducing costs.

Those companies that already have experience in electronic commerce realize that not only the simple online presence attracts success in this environment, but lower price, and especially the quality of online customer service. In the online environment, customers expect quality services at are at least so good, but preferably more, compared to customer service in offline environment.

The Internet has opened a new way for companies to interact with their customers. Customers want a consistent personalized experience, which means they are served effectively, either by Internet or one conventional means of communication such as phone. Companies that neglect to provide good customer service, online or offline do not take into account that no site, no matter how well structured it is and how aesthetic it looks is a substitute for promises and unfulfilled expectations.

Only those companies who decide to build loyal customers by providing quality services, whenever they are contacted by clients will be able to survive in the online environment. [2]

An effective program to solve customer complaints is essential to the success of a business and is a vital component to form powerful brands. Through the complaints, customers communicate directly with the company, suggesting the direction for improvement. Through continuous improvement of business activity, one can improve customer retention rate. If customers do not feel a continuous quality improvement of services in their favor, they will leave the company.

Customer complaints have a quite big impact. If a customer will tell to eight to ten people about a positive experience from the sale, he will tell a number of 16 to 18 people about a negative experience encountered on sales. [3]

When a company receives a complaint, it must do all that is possible to resolve the claim and to minimize customer concerns. Most customers do never claim. However, if a customer does not complain, it does not mean that he is also satisfied. A company should be concerned about customers claiming different problems, and especially

about those who do not communicate with the company.

Therefore, it becomes extremely important to get feedback from customers. When customers make a complaint, customers expect that the complaint is solved seriously, that they are in connection with the person who can quickly resolve the complaint, they receive an explanation about the cause of the problem and they are informed about progress in resolving the complaint. If the problem could not be resolved on time, they should be ensured that that situation does not happen again. [6]

An online trader must be thankful that the complaint has been expressed by the client and he was able to help the customer. Most of the times, however customers are not complaining, and they change to another trader and will advise friends to avoid the trader where they had problems. Such a claim can be seen by merchants as an opportunity to interact with clients.

6. Conclusions

Once the competition has increased, online companies have realized that they cannot win relying solely on price and have developed strategies to provide value to customers, in order to differentiate themselves from competitors. Those companies that already have experience in electronic commerce not only realize that the existence of a website attracts success in this environment, but also the quality of online customer service.

Online managers are turning to creating customer relationships that form over time, even if in the first phase the profit from them is reduced. Moreover, focusing especially on customer acquisition and the high cost of customer acquisition make many relationships with customers to be unprofitable during the first year.

A successful online company knows how to gain the loyalty of its customers. Loyalty in the online medium may be easier to be achieved than in the offline medium, since there is trust, good service quality and customer expectations are predicted and taken into consideration.

On the e-commerce market, attracting and retaining more customers is more and more important and contributes to the success of an

online store. Unfortunately, the orientation of attention of online retailers is moving mainly on attracting and acquiring new customers and not on gaining their loyalty.

Typology and Characteristics of Strategic Planning

Barbu Andreea Mihaela

Bucharest Academy of Economic Studies, Marketing Faculty
abarbu@mk.ase.ro

Abstract

The process of strategic planning has been addressed by many authors in the international specialty literature, aspects as planning's typology, stages or advantages for companies having been analysed and described in various management - marketing scientific articles or books.

The present paper tries to define the concepts of strategic planning, long-term planning, and marketing planning, by highlighting their content and the differences between them, in terms of time or level of implementing. At the same time, this study reveals the results of international studies or conceptual approaches, which support these distinctive characteristics, in order to clarify any possible confusion regarding these tools.

The paper ends by mentioning the favourable consequences that a company enhance due to developing a strategic planning process.

Keywords: strategic planning, long-term planning, marketing planning, corporate planning

J.E.L. Classification: M31

1. Introduction

The process of strategic planning has been addressed by many authors in the international specialty literature, as well as in the Romanian one. Aspects as planning's typology, stages or advantages for companies have been analysed and described in management - marketing scientific papers.

According to Carter, strategic planning exists since the most ancient times, but as military strategy. It entered into the economic sphere in the 1920s, along with the development of the first strategic planning methodology in the commercial field,

elaborated by the Harvard Business School.[4]

In the 1950s, the strategic planning shifted towards the risk management and increasing the market share. It became so important that almost all large companies had their own strategic planning department. If in the 80's, the strategic planning was in decline, being at one point considered even redundant. But in the late 90's that concept was given again due attention.

2. Defining strategic planning

Planning is a process that involves several steps [12]. Firstly, the company defines its purpose and more precisely it identifies the target customers' needs and the necessary technology for meeting them. The second step focuses on determining key areas: market research, innovation, productivity, physical and financial resources, profitability, manager's performance and development, performance and attitude of non-managerial staff. The third phase includes identifying means for measuring results, while within the fourth stage the constraints and the limits are met or exceeded (legal or ethical issues).

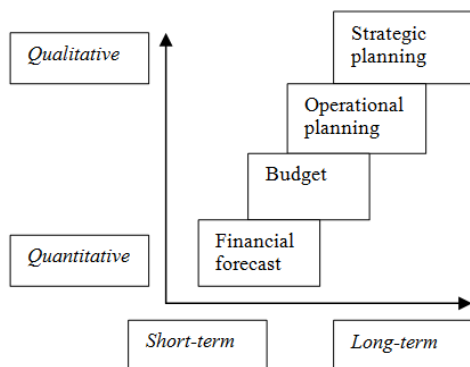

Piercy suggests a multidimensional model of planning, encompassing three dimensions: analytical, behavioural and organizational [6]. So, according to the first dimension, the analytical instruments, techniques and models are important because they provide the necessary framework to address the results and identify and solve the problems. While the planning systems have the advantage of a common systematic approach, in order to be effective, they must address the behavioural and organizational issues.

The behavioural dimension focuses on human resources within the planning process. Plans are successful due to the support, participation, motivation and commitment of human resources.

According to organizational dimension, planning takes place within a context of a particular organization. Thus, it will be influenced by organizational factors such as culture and management style.

Lasher takes into consideration four types of planning: (1) strategic planning, (2) operational planning, (3) budgeting and (4) forecast. [1]

Figure 1. Planning's typology

Source: Analoui, F, Karami, A., *Strategic Management in Small and Medium Enterprises*, Thomson Learning, London, 2003, p. 155

Strategic planning creates strategic plans, which rather explain the general ideas and concepts, being developed on long term.

Operational planning specifies the necessary actions to achieve the objectives and it determines the modalities of business daily running.

Budgeting involves allocating resources to specific functions and then helps to measure the activities, while the forecast estimates the short-term financial results.

The two concepts of strategic and operational planning have been also discussed in the specialty literature in Romania. Thereby, strategic planning sets the direction and objectives, while operational planning refers to the daily decisions specific to lower levels of the organization. Strategic planning is oriented to make good things (necessary activities - effectively), and operational planning intends to make things better (by necessary means - efficiency) [5].

Therefore, strategic planning is a management tool, and like any tool of this type, it is used for one purpose: to help the

company to operate, to ensure that the employees are gathering their energy and work together to achieve the same ideal, to set and adjust the company's action direction in response to a changing business environment.

In fact, the new concept of market-oriented strategic planning that was proposed by Kotler represents “the management process of designing and maintaining a viable relationship of correspondence between the objectives, skills and resources of the organization and its changing market opportunities. Strategic planning’s goal is to shape the company's economic activities and products so as to achieve the established profits and growth rates”. [9]

The analysis of this definition ensures key elements that cover the meaning and success of strategic planning process.

The process is strategic because it involves finding the best solutions to the circumstances of the company’s business environment, whether they are known in advance or not. Strategic planning requires clear knowledge of company’s objectives, of its resources, but it assumes also a responsible response from the company’s managerial staff, in the context of such an unstable marketing environment. In addition, the process refers to the planning function, as it involves setting deliberately certain objectives – linked to a desired situation in the near or distant future – and develops ways of achieving these objectives.

Strategic planning process raises multiple questions, which helps the professionals to gather and incorporate information about the current situation and predict the business environment in which the company will operate in the future.

Finally, the process is related to fundamental decisions and actions because choices must be made in such order, to meet the above series of questions.

Strategic planning involves a set of decisions about the tasks to be undertaken and carried out successfully, the reasons behind these responsibilities and the modalities of action. As sometimes is difficult or even impossible to organize all the necessary activities due to various obstacles, the strategic planning can help the organization to prioritize the decisions and to

adopt those that are closely related to successful consequences.

The most important consequence of strategic planning is to achieve the desired profit, while the customers declare themselves fully satisfied with the company's products or services.

Regarding the strategic planning's stages, it appears that this process includes:

- mission, vision and corporate objectives;
- assumptions underlying the plan;
- strategic issues arising from the appraisal of organization, marketing environment and competitor analysis;
- evaluation of a profit margin;
- strategies drawn from the above mentioned elements, including creative thinking about how to exploit the opportunities and gain competitive advantages;
- detailed analysis of risk factors;
- financial results. [8]

3. Strategic planning versus long-term planning

Taking into consideration the time of implementing the plan within a company, some authors consider that a tactical plan is established for one year, and the strategic plan is established for an interval of time longer than one year. [3]

There are also specialists who say that there is a difference between strategic plan and long-term plan, in terms of the marketing environment, which those two processes assume. [13]

The concept of long-term planning appeared in the late fifties and early sixties, when the economies of various countries were relatively stable. Therefore, the long-term planning is generally considered that is developing a plan for achieving a goal or set of goals over a period of several years, indicating that current information about future conditions are sufficiently safe to ensure the quality of the plan even over the time of its implementation.

Unlike long-term planning that is useful in the context of a stable environment, the strategic one takes into account that the organization must respond to a dynamic marketing environment.

In the non-profit sector there is a common view according to which marketing environment is changing, sometimes in unpredictable ways. Thus, strategic planning emphasizes the importance of taking decisions that will ensure the organization's ability to respond successfully to changes in marketing environment.

Two other differences exist in theory between long-term planning and the strategic one [13]. First of all, strategic planning is done at the highest level of organization, while long-term planning is carried out bottom up and it is rather a set of plans specific to individual units. Second of all, strategic planning bears the mark of quality and assures the company a clear vision, while long-term planning is driven by numbers.

In addition, the specialists have tried to identify whether in practice there is a difference between the strategic planning and the long-term one and what it would consist of.

Therefore, a marketing research was undertaken among 65 libraries, 34 being public and 31 belonging to various universities [13]. The study showed no significant difference between the plans named “strategic” and those entitled “long term”. Both fit a pattern that each library interprets in a particular way. In conclusion, in practice, the concepts “long term” and “strategic” seem to be equivalent.

4. Levels of strategic planning

Every company needs a plan for each product that it sells, specific strategies and adequate resources, the development of these plans being called marketing planning. [2]

Instead, strategic marketing planning involves coordinating marketing activities necessary for successful sale of all products of a company, and it can also provide answers to certain questions, such as:

- What is the organization's current situation and what are the steps taken to get here?
- Where does the company intend to get in the future?
- What are the stages that need to be fulfilled for the organization to reach the desired position in the future?
- What are the costs associated with these steps?

- What kind of performance has the company to achieve, in order to conquer the desired position in the future? [14]

In other words, the strategic marketing planning is a complex process of establishing and maintaining the best relationship between objectives, staff training and resources of an enterprise, on the one hand, and marketing mix, compared to market conditions, on the other hand. [7]

However, over time, in order to avoid the confusion in the marketing theory and the use of specialty terms as synonymous words, even if they address distinct issues and express different ideas, many authors have attempted to define both concepts (strategic planning and marketing planning), as clearly as possible.

In this respect, Morse brings multiple arguments to support his point of view, namely that between long-term planning and annual marketing planning there are many differences. [12]

Thus, long-term planning encompass the following data: (1) information about consumers, as age, gender, salary, statistics on consumption or spending, (2) data regarding commercial issues, as channels of distribution, trends and statistics, (3) economic data, like changes in prices, raw materials, legislation, (4) competitive activity, and (5) post-selling performance.

However, the annual marketing planning is basing on: (1) diagnosis of marketing data from the past, (2) product performance versus goals, (3) data related to the product, as sales volume, market share, profit, (4) distribution objectives, (5) strategies and objectives for every group of products, per month, per territory, (6) promotional plans.

A difference between the corporate planning and the strategic marketing one is underlined by Young [15]. Thus, corporate planning process includes the following steps:

- establishing vision, mission and corporate objectives;
- declaring the strategic intent;
- proposing a value for ROI (“return on investment”);
- identifying the target segments of the strategic business unit;
- elaborating business growth plans;
- reducing investment;

- establishing the market position to which the company aspire to get;
- choosing the corporate brand strategy;
- using effectively all the company’s resources.

Instead, strategic marketing planning focus on: marketing objectives, target market segments, intentions for positioning, sales and revenue objectives, desired market share in key markets, products or services portfolio strategy (new products or services, re-launches, withdrawals and associated activities), competitive strategies, entering on new markets, strategic programs and initiatives of a particular importance, high quality plans and related measures, emergency plans, internal and external communication objectives.

Table 1 reveals the three levels of planning within a big corporation.

Table 1. Planning levels

Planning level	Management level	Decisions type
<i>Company</i>	Top management	Decisions regarding the activity domain
<i>Strategic business unit</i>	Business management	Decisions regarding product portfolio
<i>Product</i>	Product management	Decisions regarding marketing-mix

Source: Assael, H., Marketing. Principles & Strategy, Thomson Learning, United States of America, 1990, p. 617

Moreover, at the company level there is implemented a corporate development strategy and are adopted directives towards strategic business units.

Both the corporate planning and the strategic business unit one are designed for a five years interval of time, while the planning specific to individual product is for one year.

The strategy chosen at the product level include market segmentation and product positioning.

However, one cannot completely separate the strategic marketing planning from corporate planning. In support of this idea comes McDonald, who states that is not possible the planning of marketing activities separately from other functions of the

company, as marketing planning is the instrument by which the company monitors and controls internal and external influences on its own ability to obtain considerable sales, and communicates what it wants to go to completion. [11]

Consequently, marketing planning process should be based firmly on the corporate planning system and the first link between the two concepts is the stage of establishment the company's mission and objectives.

But taking into account the level of development and implementation of the planning process, it can be said that strategic planning takes place at the level of both company and strategic business units, while marketing planning is carried out only at the level of the individual products.

5. Conclusions

Strategic planning is a circular process, whose steps include: (a) choosing strategy, (b) establishing the strategic objectives, (c) elaborating specific plans, by mentioning at the same time the tasks, the deadlines and the responsibilities, (d) allocating the resources, and (e) applying the monitoring and control procedures in the case of objectives and resources and for validating the predictions regarding the environment. [14]

Although sometimes the planning's usefulness is challenged [10], considering that “much of corporate planning ... is like a ritual dance to invoke rain, it has absolutely no effect on the weather of the next day”, this process brings many benefits for companies, including the following:

- greater capacity for predicting the development of the external environment's components, and rapid adaptation of resources, which is basing both on complex and accurate analysis, and on the increasing of managers' responsibilities and the staff's professionalism. Planning also enables them to anticipate threats and opportunities and to properly assess the strengths and weaknesses.
- better organization of managers' work, which are facing multiple, difficult and sometimes unpredictable tasks.
- favourable position in the market, as a consequence of the technological innovations implementation and

competitors challenge, knowing the risks and potential financial benefits.

Organizational Learning and Learning Organization in Knowledge-Based Economy in Romania

Bordeianu Otilia-Maria
"Stefan cel Mare University", Suceava
otilia@seap.usv.ro

Abstract

Each company's future depends on its transformation into a learning organization, and their success will depend on the effective use of talented people. Organizational learning remains an imperative for developing a knowledge based economy; it is also necessary to affirm the creativity of Romanian organizations as the main source of competitiveness and international identity. The learning ability of the organization's members must be rediscovered and revived. It is necessary for learning to become the background for change.

Key words: organizational learning, learning organisation, knowledge management, organizational culture

J.E.L. Classification: M16

1. Introduction

Although, initially, the terms *organizational learning* and *learning organization* were interchangeable, gradually, since the mid 90's, the two concepts separated into two trends.

Organizational learning is the descriptive trend, oriented on the process of learning in organizations. The roots of this trend are in social and cognitive psychology and have a strong academic orientation. Basic question is: How does a learning organization? and in these research publications Argyris and Schon's (1978, 1996) are widely mentioned. [1]. On the other hand, the *learning organization* is a prescriptive trend that focuses on the characteristics of the organization that facilitates learning and aims to create a certain type of organization. We can say that this trend has a strong practical orientation and research are made predominantly of practitioners: Drew and

Smith (1995), Benoit and Mackenzie (1994), Moilanen (2001 - quoted by Sun and Scott, 2003), and Senge's work (1990) is the foundation of these approaches.

The concept of *learning organization* has a more recent history than the *organizational learning*. It was known by the late '80s, through the European scientific world contribution, including British writers Garratt (1988) and Pedler (1981). Then, in 1990, Senge's work is one that has attracted particular interest, perhaps because organizations and consultants were seeking new ideas to replace the concept of *corporate excellence* (Peters and Waterman, 1982). [2]

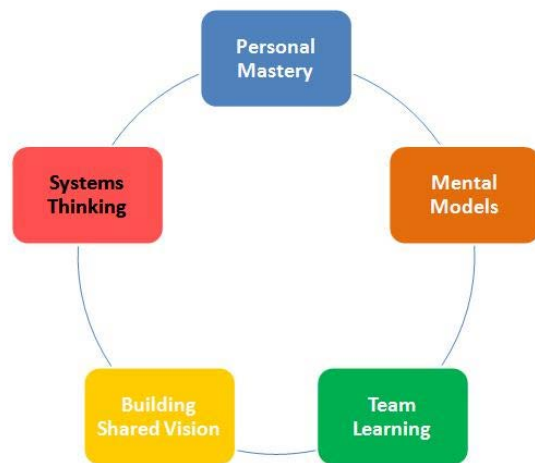

Although Senge's success was substantially in Europe, his view was not fully accepted by the academic community in North America and, thus, was more at issue discussed and extended in Europe (consider some authors such as Swieringa and Wierdsma - 1992, Burgoyne - 1994; Peam - 1995; Probst and Buchel - 1997, etc.). Between the few American scientists who have addressed this concept we mention Dixon (1994) and Torbert (1994), largely influenced by European ideas.

The concept of *learning organization* (or knowledge-based organization), was described by Peter Senge, in his "The Fifth Discipline", in 1990. [3] For the author, learning organizations are organizations where people continually expand their capacity to create the results they truly desire, where new and expansive patterns of thinking are nurtured, where collective aspiration is set free, and where people are continually learning how to learn together." Mike Pedler suggested another version of the same concept – learning organisation "is a company that teaches projection, a vision of what might be possible." A learning organization expands its capacity to create its future, not only willing to survive. Learning to survive, often seen as adaptive learning,

important and necessary, couples with generative learning that develops substantially the ability to create ”.

Senge (1992) described the core of a learning organisation’s work as based upon five learning disciplines which represented lifelong programs of both personal and organisational learning and practice.

Figure. 5. „Five learning disciplines”
(according to P. Senge)

These include: [4]

- *Personal Mastery* — individuals learn to expand their own personal capacity to create results that they most desire. Employees also create an organisational environment that encourages all fellow employees to develop themselves toward the goals and purposes that they desire.

- *Mental Models* — this involves each individual reflecting upon, continually clarifying, and improving his or her internal pictures of the world, and seeing how they shape personal actions and decisions.

- *Shared Vision* — this involves individuals building a sense of commitment within particular workgroups, developing shared images of common and desirable futures, and the principles and guiding practices to support the journey to such futures.

- *Team Learning* — this involves relevant thinking skills that enable groups of people to develop intelligence and an ability that is greater than the sum of individual members' talents.

- *Systems Thinking* — this involves a way of thinking about, and a language for describing and understanding forces and

interrelationships that shape the behaviour of systems. This discipline helps managers and employees alike to see how to change systems more effectively, and to act more in tune with the larger processes of the natural and economic world.

Garvin (2000) defined the learning organization as a qualified organization for the creation, acquisition, interpretation, transfer and acquisition of knowledge, which deliberate change its behaviour to reflect new knowledge and insights.

As individuals learn through different means or in different styles, so it is happening with the organizations. Up to a certain level, these differences are explained according to the environment in which the organization operates. For example, *why* and *how* organizations learn in external stable environments, with well-defined products, such as matches and toothpicks, will be different from what happens in *volatile* industries, involving new products and evolving technologies: *hardware-products* and *software* type. The differences between organizations in the learning process can also be a result of differences in history, culture, organization size or age. The new organizations appeared on the market learn differently from larger ones.

Organizational learning style suggests how organizations learn and it is defined by the learning activities that are taking place (Di Bella and Nevis, 1998). A set of learning activities belonging to an organization reflects its style of learning. Learning style can not, however, indicate how well the organization learn and can not appreciate the value of the learned but instead may provide clues about what *is learned* and *how learning takes place*. As a result, a complex organization applies different learning practices which are themselves, different learning styles. These practices and learning styles form the basics or the background of the organization *learning portfolio*. [2]

Learning styles is an ability that the organization has acquired. To use this ability to obtain competitive advantage, it is necessary for organization members to identify, as accurately, what this ability consists in. Research shows that some organizations have a dominant learning style, while many others use a variety of styles, each providing a particular style of learning

capacity. Organizations with a portfolio of learning styles and multiple skills are able to demonstrate a greater ability to adapt to change than those based on one single learning style. [5]

2. Organisational learning (OL) and knowledge management (KM)

Because of the fast development and growth of the organizations, the information technology and information capital have become significant assets. Managing knowledge is important because knowledge is one of the most strategic weapons that can lead to sustained increase in profits (Choi & Lee, 2002). [6]

Organizations are seen as learning through processes that create new knowledge or modify existing knowledge (Phanng, 2008). From the knowledge-based perspective, Bates (1998) argued that knowledge is the basis of learning. An organization can not compete with others in this changeable environment for the lack of adequate knowledge and renewal capability. Knowledge or information is now perceived as the most significant strategic resource in organizations, and its management is regarded as critical to organizational success (Ipe, 2003). The development and growth of organizations have made information technology and information capital significant assets in organizations. Managing knowledge is important because knowledge is one of the most strategic weapons that can lead to sustained increase in profits (Choi & Lee, 2002).

Facing such a turbulent environment, business must continue with learning in order to maintain its competitiveness. As we argued before, according to (Senge, 1990) *learning* was the only sustainable competitive advantage. He regarded KM as a business process, through which firms generate and implement their institutional or collective knowledge, including organisational learning, knowledge production and knowledge distribution. Organisational learning is the process through which a firm obtains information or knowledge.

In organizations which rely most on tacit knowledge more than explicit knowledge, the approach that works best is the personal

transfer and the information technology can only support this process, not to replace it.

Learning processes must become more deeply, anticipative and participatory, to ensure the transition from specialist to adaptable generalist; to put the focus on innovative learning, to ensure autonomy of the individual (as a key element of personal fulfilment) and its organic integration within the society (as a key element of human relations)

Any new knowledge, especially in a training organization, is both a product of past activities and a source of knowledge on a future activity. The ability to organize activities which ends with the generation of new knowledge is valuable but the knowledge has a low utility if employees are unable to apply them practically. Experience, interpretation and context in which information becomes knowledge are difficult to replicate and, in consequence, the talent, dexterity and / or skill of each individual are unique and can not be acquired in an identical manner by others.

It becomes increasingly clear that if there is a community of interests, people who have achieved the same goals or share the same values will recognize how advantageous it is to put together everything they know. Of the same importance is for everyone to show off what they know with relevance in the workplace.

3. The role of organisational culture (OC) in support of organisational learning (OL)

Organisational culture means the shared understanding or values between the employees within an organisation, which finally will determine how things work in the organization. Osland, Kolb, and Rubin (2000) defined OC as a pattern of shared values and beliefs that produce certain norms of behaviour. Andrew and Yate (2002) argue that OC is an aggregation of shared values, beliefs, and understandings among members. When Tucker (2001) describes OC the focus is underlining the effect in terms of organisational change: OC represents the company's values, traditions, priorities and paradigms and its universal existence within organization will affect the implementation of organizational change.

Dodgson (1993) provides a comprehensive definition of organisational learning: OL involves the ways firms build, supplement and organize knowledge and routines around their activities and within their culture, and adapt and develop organizational efficiency by improving the use of the broad skills of their workforces. So, the OL is seen as a dynamic process based on knowledge, and also implies moving among the different levels of action, going from the individual to the group level, and then to the organizational level and back again.

A culture encouraging change is a critical feature of OL. In order to face such a complex environmental situations, organization needs more stronger adaptive culture to encourage the mutual cooperation and earning among members (Daft, 2001). Sometimes the failures in organisational learning may be caused by the lack of communication among the organization's different cultures. Organisational learning can be the catalyst for implementing an organizational learning culture and in return , the learning culture would systematically improve organisational learning. Brian and Pattarawan (2003) suggested that organisational culture is positively related to organisational learning.

4. Organizational learning and learning organization in knowledge-based economy in Romania

Romanian organizational environment is no exception from the global trend of contemporary orientation to knowledge but, due to the lack of strategic options, it happened unsystematic, especially locating the informal plan. Large organizations are more attached to the hierarchical configuration and functionality, even in case of the transition to computer assistance. Instead, however, within the SMEs and non-governmental organizations, professional management practices and knowledge are already present, but in more experimental, reversible, forms.

Organizational learning remains an imperative for developing a knowledge based economy; it is necessary to assert Romanian creativity as the main source of competitiveness and international identity.

In Romania, many organizations are considering the *change, the development*, but can not decide the *direction* of change or development. Ensuring feasibility of organizational learning projects in the Romanian context requires both strategic computerization effort and educational support, but also a proper management.

It takes another way to see the leadership in the context of business environment in Romania and to get change in this proper context. A linear thinking, top down, will lead to errors because it will lose to all causes of unwanted effects. The problems are seen in a different view/perspective by those facing every day with it and there is another perception to the next level.

Often, managers resistance to ideas of subordinates reflects intolerance of contrary opinion, difficulties in accepting the truth or simply the fear of coming up with a better solution. In theory, this concept of organisational learning is very attractive. But how many organizations actually put it into practice? What are the obstacles that prevent us put it into practice? How can we evaluate the learning within the organization?

Our current vision and the manner in which we understand things are not consistent with the reality of the environment or with our system of values that define this environment.

According to (Filip L, Dragomirescu H., 2001) some measures appear to be vital, starting from the national level:

- (1) training of professionals in knowledge related areas and its management,
- (2) official recognition of new professions and occupations and knowledge-based organizations,
- (3) training of trainers for these competence profiles.

Developing organizational learning, along with its foundation on knowledge can be organized/achieved within the following generic scenarios (according to Filip Dragomirescu, 2001): [7]

1. *The scenario of emergent development* – is one scenario in which the orientation of the organizations towards knowledge is produced under its own essential inevitability. A trend in such a scenario is likely to occur under the conditions of inaction or delays in concentrating efforts to

support the country's progress towards the knowledge society.

2. *The scenario of strategic development* - it is based on projects aimed at facilitating the establishment of the knowledge appropriate changes in existing organizations and creating new ones. The result of applying this scenario is also a non-hierarchical configuration, but in a form represented by the pattern centred on organization memory; in this type of organisation the synergistic effects would prevail, by strengthening organizations integrating elements (memory, network infrastructure, intelligent solutions for tutoring groups) to support partnership and creative behaviours.

The second scenario is superior to the first, both in terms of *approach* and the *expected results*.

5. Conclusions

Each company's future depends on its transformation into a learning organization, and their success will depend on the effective use of talented people. The organisations that will not create a generative learning culture, will not adapt fast enough, will not face the challenges of the environment in which they operate.

Therefore, the learning and improvement have the goal the orientation to innovation, towards different and creative solutions and preparation of the responses to different situations. We face complex problems are as effects of several causes. People must learn to solve the problems by their own and they have to be aware that in their ability to learn, to develop unique and individual capacities are kept many answers. We are heading for an era of human freedom, responsibility and intelligence. The learning ability of the organization's members must be rediscovered and revived. It is necessary for *learning* to become a background for change.

Organizational learning remains an imperative for developing a knowledge based economy; it is also necessary to affirm the creativity of Romanian organizations as the main source of competitiveness and international identity.

Abstract

The negative effects of the global crisis can be seen on SME's because of their size and their difficulty to access finance. SME's need to be aware of the impact that their activities have on the environment which will turn into a great opportunity to explore the economic advantages that emerges from implementing an environmental management system. If an SME has already implemented an ISO 14001 environmental management system, the next natural step would be to turn its attention towards this new and long awaited ISO standard which is ISO 26000.

Key words: *competitive advantages, risks of environmental accidents, EMS, SME, ISO 26000, ISO 14000, healthy ecosystems, social equity, good SME management*

JEL M41

1. INTRODUCTION

Small and medium size enterprises, even in this time of crisis, represent more than 90 per cent of all enterprises and they operate in a constant changing environment. From the viewpoint of sustainable development, SME's play a fundamental part in redirecting the economy to more sustainable patterns of production and consumption.

The most concerning problems that small and medium size enterprises are facing are the access to finance, witch in this times of global crisis represents the greatest threat to their future, not to mention that finding customers is always a challenge for this type of enterprises, the competition, the costs of production or labour, the availability of

highly trained staff or experienced managers, and last but not least the regulations.

SME's need to be aware of the impact that their activities have on the environment which will turn into a great opportunity to explore the economic advantages that emerges from implementing an environmental management system.

2. SME'S AND THE ENVIRONMENT

Across Europe, small and medium size enterprises, category in which we include also micro firms, represent about 95 per cent of all type of enterprises. Along with their large number comes also a dose of optimism because on some surveys more than half of them anticipate growth.

Even if they are interacting in this constantly changing environment on all aspects their capacity to adapt quickly to new situations is diminishing. The economic situation that we are facing requires a great effort to adapt in order to fell efficient and competitive, effort that is not encountered by SME's which are not willing to invest in research and development. A consistent part of SME's do not spend money on innovation and they don't allocate any of their revenues on research and development. This situation may occur also because the major part of the small and medium firms cut their investments along with the coming crisis.

When it comes to environment this is a problem which does not concern only a country being in fact a global action with a firm objective of environmental protection.

If we turn to SME's their large representation in the economy generates also a great impact on the environment. This impact includes among others: air pollution,

the use of natural resources, the use of energy, noise, odor, dust, disposal of wastes

and many other.

Figure 1 - Small and medium size enterprises described by their type of activities

SME's by economic activities

Source: projection made by authors

In all of this areas SME's have a significant impact on the environment from waste, discharges, emissions to consumption of raw materials, consumption of water, consumption of energy, risks of environmental accidents, effects on biodiversity and others.

3. COMBINING ISO 14001 WITH ISO 14006

In order to implement an environment management system (EMS) SME's needs to take into account booth their direct and indirect environmental aspects. The implementation process defines and establishes a strategy to develop all the process of implementation.

Aside with the implementation of ISO 14001 SME's can also consider the implementation of the new ISO 14006 representing guideline for incorporating ecodesign, incorporating ecodesign into any environmental, quality or similar management system.

All products or services of SME's have an impact on the environment during all stages of their lifecycle, from extraction of resources to end-of-life. The main objective of ecodesign is to integrate certain environmental aspects into the design and development of products and services order to reduce their environmental impacts and

continually improve their environmental performance throughout their lifecycle.

SME's witch decides to implement this new ISO standard will find themselves offering cleaner products and services and a greener planet.

The implementation of ISO 14001 and ISO14006 reduces costs and attracts financing and investments increases revenues by converting waste and they are reducing the use of materials through improved and timely follow-up materials and reporting systems.

The advantages of ISO 14006 is that it is applicable to SME's and it is suitable for SME's that alrely have implemented an ISO 14001 environment management system.

Another advantage of this ISO 14006 standard is that it does not establish by itself any specific performance criteria and was not created for certification purpose. The management of the SME can apply this particular standard to those aspects inside the SME that they control and has a big influence on.

4. GETTING AHEAD OF OTHES BY IMPLEMENTING ISO 26000

SME'S must be aware of the need for and benefits of socially responsible behavior. The main purpose of social responsibility is to contribute to sustainable development.

The performance of an competitive SME in relation to its impact on the environment and the society in which it operates has become a critical part of measuring its overall performance and its ability to continue operating effectively. It represents a reflection of the growing recognizing of the need of healthy ecosystems, social equity and good SME management. If we think in long term, all SME's activities depend on the health of the world's ecosystems.

If an SME has already implemented an ISO 14001 environmental management system, the next natural step would be to turn its attention towards this new and long awaited ISO standard which is ISO 26000.

This ISO 26000 helps SME's around the world to contribute to sustainable development. It is meant to encourage SME's to go beyond all legal compliance, knowing that compliance with the law is a fundamental obligation of any SME and a main part of their social responsibility.

ISO 26000 is intended to promote common understanding in terms of social responsibility, and last but not least to

complement other instruments and initiatives for social responsibility, not to replace them.

Getting ahead of others by implementing ISO 26000 gives SME competitive advantages, not to mention the ability of hiring and retaining workers, customers and clients. Through this process SME's develop their relationship with companies, government, the media, suppliers, customers and the community in which this SME's operates.

Another benefit that comes along with the implementation of this standard is rising the employee morale, commitment and productivity things that mean a lot to a SME further on it means everything to a micro-firm.

Making ISO 26000 a guideline document, it offers a concise opportunity for managers to look at the principles and the objectives of social responsibility and to look how they may apply these principles in their SME.

We must say that ISO 26000 is not a management system standard and is not intended or appropriate for certification purposes This ISO 26000 does not contain requirements.

Figure 2 – Social responsibility main subjects

Source: projection made by author

5. CONCLUSIONS

In our times the environmental problem regards not just a particular country, being a global action with the major objective of environmental protection.

SMEs have a great role in redirecting the economy to more sustainable patterns of production and consumption.

Environmental and business benefits along with social responsibility and sustainable development can be achieved by combing and implementing this two ISO standard making the SME more competitive,

increasing its reputation, improving public policy making in relation with the environment, improving the information used for the evaluation of environmental performance. SME's can reduce costs of maintenance, repair and operations, can reduce costs associated with waste and losses of material. SME's also can increase revenues by converting waste and they can reduce the use of materials.

Developing the relation between ISO 14000 and ISO 26000 will increase credibility of SME's and will give them a greater security on the management of environmental issues along with social responsibility awareness and a real sustainable development.

Human Resource Management and Corporate Social Responsibility

Bujor Anca Liliana
„Petre Andrei” University of Iași
anca_bujor@yahoo.com

Abstract

The current context of economic development, the transformations that are subject to national and international organizations impose their traditional attitude change in relation to results and performance of current activity. In this context, the Corporate Social Responsibility (CSR) aims to achieve economic success in an ethical manner with respect for people, communities and environment.

This article analyses the concept of Corporate Social Responsibility in relation to Human Resources (HR) Management, respectively the issues relating to human resources that an organization must consider when designing their corporate social responsibility strategies.

Key Words: Corporate Social Responsibility, Human Resources Management, Human Resources Development

JEL classification: O15

1. Introduction

Human Resources Management in the context of human thinking was individualized as a well determined field within general management theories and practices it influences in entire organization becoming; it comprise total conceptions, methods, procedures, projection and solutioning objectives and tasks of all leadership issues at organization level as system in all activity fields and on all company hierarchy levels. Human resources management, G.A. Cole regards managers' activity of those with responsibility of achieving policies and strategies in the field of assuring, recruitment, selecting, training, socialization and estimating organization personnel [5]. They have double professional

preoccupation for both employees and for organization leadership, advising the two organization structures—employees and leadership—to administrate as carefully and efficiently the most active, valuable, innovating- creative resource, people who, acting individually and group, accomplish organization existential objectives. One must not omit the fact that organizations mean people in their diversity and unity as well, they are “groups of groups”, G. Lapassade between whom there are interpersonal complex relationships focused on mutual pursues. Human resources management is related to both theoretical, conceptual values of management and to personnel practice, incapacities integration and altitudinal, attitudinal and behavioral of employees evaluation.

Realities of knowledge society, post-bureaucratic organization - “expressive organization”, “democratic organization” [1], “intelligent organization”, “learning organization”, “relational organization” resulted in the development of a new organization culture, dense, borderless with record communication time. Such organization structures demand new needs, first of all the inter-human relationships need – between lead and leading since existence milieu and existence is another one. Interest partners, who do no limit only to employees—are preoccupied that their relational system, of business, beyond pressure for profit gaining, get accomplished in a responsible manner, in transparent standards and within an existential or relationships with community structures they serve in organization full responsibility.

New post-industrial realities develop new paradigms, among which Corporate Social Responsibility (CSR) within which values of company culture become dominant in organization manifestation area, values hey have to believe in and act in entire responsible becoming of its business, in

business strategies as well as in company daily activity.

2.The concept of Corporate Social Responsibility (CSR)

Multivalent concept CSR has a time becoming synthesized and evaluated after 1960, as consequence of new post-industrial changes and also as a sustainable development. CSR regards voluntary managers' selection activity of actions and activities system meant to protect and assure society welfare as well as of organization and employees. Comprehended as that conception which regards companies' voluntary contribution to modern society development, CSR serves to sustainable development through promoting desirable corporatist behavior. It is deliberately assumed engagement, beyond legal or imposed by economic restrictions, to pursue objectives in the long run regarding society becoming [12].

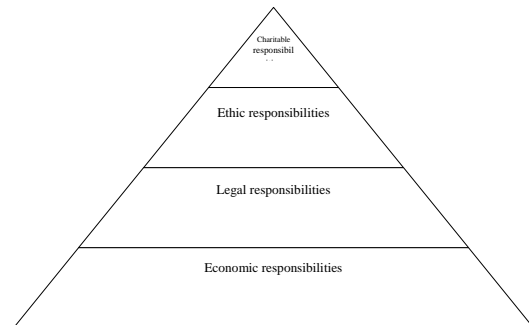

By issues amplexness and depth CSR engages modern post-industrial society in its integrality: international institutions-principles-recommendations; national institutions-regulations normative, legislative; local institutions—decisions; companies-resources; communities-development needs. Thus, UNO, EU, OECD are only the most important international structures that involved in conceiving and elaborating both defining frame and indicators defining and allow estimating CSR. Practically, this economic and social relationship, (CSR) structures issues into two conceptions: 1. CSR perceived as company moral obligation or duty; 2. CSR perceived as deliberate initiative, voluntarily assumed by company in view of heir existential economic and social objectives.

Theoretical confrontations are present through their step to activity of elucidating of real and proper CSR for actual world. O.Falk and S. Hebllich [6] hold that “CSR must be understood as a voluntary corporatist engagement I order to surpass implicit and explicit obligations imposed to a company by society expectations regarding to conventional corporatist behavior.”From this standpoint, there also are P. Kotler et Lee [9] who define CSR as being main activities carried out by corporation to support social

causes and to accomplish responsibilities engagements assumed, that CSR has an Omni-comprising, global contents resulted also from accepts given by UN through global principles provided for companies strategies, for their actions, known as NU Global Compact (comprising four domains and ten principles). Developing these recommendations, A.B.Carroll [3] draws attention upon the fact hat CSR regard the entire scores of social order face to society-legal economic, legal, ethic and charitable responsibilities elaborating social corporatist responsibilities pyramid (Fig.1).

Pyramid base is given by economic responsibilities, followed by the legal ones, ethic and on peak there are the charitable. Dimensions do not exclude. Neither are they treated as proper structures of social responsibilities, because whatever company action is based simultaneously upon the four of responsibility structure précising that a certain dimension out of the four ones become predominant in a certain given context without excluding the other ones.

Fig. 1. The Pyramid of Corporate Social Responsibility

Source: A.B.Carroll, 1991, p.42

Expert literature reveals, chronologically three approaches of social responsibility [11]:

- CSR as obligation only face to shareholders, a narrow approach the only responsibility is profit growth, their maximizing as central preoccupation of companies , and social responsibility is in Government competence and preoccupation [7]; is narrow CSR since business system is “closed, microeconomic outdated vision;
- CSR as obligation face to stakeholder, therefore not only of shareholders but

face to all stakeholder even though such stakes are divergent of influent social groups-CSR dominant dimension [8];

- CSR as obligation of company for society in its totality, extended perspective of CSR; company is responsible to society in its integrality, in its quality of component of existential milieu; organization acts functions through public consensus, motive determining it to serve deliberately social needs of society; CSR is a strategic response to the new, actual internal and external needs that are extended to organization level; companies according to this vision extended CSR promotes social welfare as a response to a social need, that because they are actually open business systems where there is a well determined balance between organization economic and social performances.

CSR, according to Ed. W. Younkins [13], involves engagement in market open competition with no illicit means, but in respect of employee's and engagements assumed to them rights, to partners providers and clients, supposes a suggested debt organization, as social existence has for all parts involved into its actions and activities, to human community, therefore face to people.

CSR, E.Cohen [4] shows, must be comprehended as a business strategy viewed on ethic principles, on structured management elements, which takes into account in decision making process social and environmental aspects besides the economic ones and which attempts to positively influence all parts involved to constitute a voluntary approach going beyond conforming to regulations and legislation, regards beyond final purpose. – profit maximization – gives also attention and satisfies other public categories, minimizing their negative impact upon environment, on society in general, those stakeholders who have positive interest in this (shareholders, employees, clients, providers, distributors, public bodies, local communities, etc.), pursuing maintenance and development of solutions in the long run and mutually advantageous.

3.Human resources management and CSR

Human resources management, in context of knowledge based society development has as target for its entire step fact that organizations are people, they also are fundamental argument to promoting CSR, brought into relief also by N.E. Bowie and F. Duska [2]. By their quality of society institutional members, are citizens, people, and they have civic duties and responsibilities. Organizations benefit of totality of society existential values, therefore, they have certain gratefulness duties for these, that allow them he exist and function, to materialize their existing objectives and tasks and businesses to develop according to stakeholders' existential needs.

Out of such prerogatives, human resources management are both conceptually and practically optimally responds and have preoccupations for social corporatist responsibilities in the sense that it has fundamental preoccupation covering with expertly personnel all organization professional activities under required efficiency, competitiveness and performance conditions. Investment in people remains the certain path by which whatever company competitiveness, as well as future are assured; interest being that such investment, the most active, innovative and creative one should act as performing as possible. Personnel need and satisfying it is an ample, simple to accomplish conscientious process and which is accomplished, as A. Tabachiu shows [14], according to knowing organization actual development stage, it's becoming directions careful and responsible analysis of and professions and their practicing scientific development level, respect of psychological requirements regarding profession practicing, human and social-human, relational qualities and organization socialization and integration degree of promoted organization culture norms and values, etc.

Or people with highest influence upon company and who also are most influenced by them are employees, without diminishing the other organization structures. Organization functioning depends on them, they are actively, devotedly, motivated involved, able and competent. By common

activities, they assure company's social responsibility becoming [4] in conceiving and elaborating social responsibility strategies, organization should give a special attention to position content, working place offered to employees, respectively, therefore to human capital, to qualitative accomplishment of its existential objectives and tasks to assuring working conditions, climate and atmosphere proper to creativity and innovation, of a motivational system and also for evaluation and corresponding evaluation and appreciation of social and economic development stage. Employees' involvement is a result of responsible working place, and it belongs to organization management.

CSR has its becoming, therefore here, in working place creating where responsibility must be on first place, and organization assumes its responsibility for the impact on employees and their families, on community. Treated as complex personalities, employees will behave correspondingly in their entire relational system-active in production in organization culture, in community, in voluntary activities, in environment protection both in and out of organization.

Corporate social responsibility at working place has a rich content at the size of human individual richness and complexity, of its nature [5], and regards on assemble of issues such as:

- Employees' rights: Company is responsible when employees' rights are known, respected/applied, fight protected by international conventions, national legislations and local decisions.
- Employees' payment: incomes able to provide decent living and reflect local level cost of common goods. This, naturally, is larger than minimum wages per economy imposed by normative acts; payments, rewards to belong to organization capacity, to company management to correlate incomes with outcome obtained by work carried out;
- Employees' welfare: is a CSR dimension comprising: certainty at working place; assurance at working place, healthy working milieu, protected against risks, drugs, harassments, tobacco and alcohol noxious influence; sanitary training of personnel; offer of benefits of social care delivery and aid; balance between professional and private life, etc.;

- Personnel recruitment: CSR represents an actual recruitment and selecting personnel. Organization which is responsible of its becoming and development, is responsible above all, also socially, improving attracting, maintaining and developing capacity for talented personnel by providing equal opportunities in recruiting and selection to all human individuals, irrespective origin, race, religion, sex, age, etc;
- Employees formation and development: settling down preparing strategies and policies, training forms-organization and self preparing-to respond at larger extent to social and economic needs of companies; assurance of ethical programs in context of working place responsibilities, in organizations based on authentic and resistant values able to create mentality focused on responsibility, ad dominant of expected behavior;
- Communication with employees, intra-organization dialogue: though it is a jeopardizing action communication with employees is a human, necessary behavior and it belongs to organization obligations to employees as to their expectation, organization contents, of employees and managers in relation with projected objectives and tasks; dialogue is a well-structured activity, to obtain certain information from employees, it is not confused with “sterile, friendly or gossiping”; organization is not necessarily democracy: managers decide, but after dialogue with employees, their decisions can be in knowledge of cause and not adopted based on suppositions; dialogue needs attention and capacity of comprehension, considering employees' opinions, aspirations, preoccupations, company success belongs to;
- Employees' involvement is related to organization existence and functioning. We know organizations are people and people are organizations, heir mirror; Company existence and permanent becoming depend on them. Engagement, Involving belongs to organization management and is an actual form of its motivation in performing accomplishment of tasks, of organization viability. Process involves employees' participation in planning and implementing organization projects, to participate with innovating solutions at company's success, in career development programs. Employees' involvement, E. Cohen [4] shows, supposes

that organization has capacity do discover, to awake interest of personal in activity success, motivate interest, evaluated and promoted; to put into value creative energies of each human individual of company, inspiring employees to make use their passion, creativity, talent, attitudinal and behavioral states, personality characteristic in favor of working place development; to recognize, evaluate and praise each component efforts, contributions to company successes.

- CSR success is possible if objective materialization is provide by human resource management processes and if some imperatives of post industrial becoming:
- Comprehending society as a social complex, where organization is a factor, an agent, its active actor, whose positive impact is assured by awareness of the place occupied in its structure;
- Existence of global reality characterized by manifesting a rich relational network, partnerships, strategically and tactical value alliances for surpassing possible malfunctions. It is about, first of all intra-organization relationships between company's components, then partnership interrelations-providers, beneficiaries, distributors, client, government and local bodies or non-governmental ones, etc, précing that only company employees can materialize conceptions and social preoccupations, of business, in their daily activities;
- Life quality development, aspect surpassing restrictive sense of business - profit gaining, its maximization – regard in toward a sustainable development and community welfare providing, o people and environment-process attracting other structures, too, beside those in business milieu, but which solidarism with development projects community future. Company issue complex with social and environmental ones integrated into organization' general strategic plans where CSR becomes business dimension meaning that each company component should take into account in his activity by social and environmental impact of its own action step.

4. Conclusions

Concept of CSR, L. Oprea [12] shows appears in our country by means of multi-

national companies and early imposed as a “vogue” and not as a result of awareness of all stakeholders need. Though it appeared at the end of World War II, CSR becomes a sustainable development dimension, as a consequence of social and economic analyses carried out after 1990. In our country, it is elaborated Strategy of Promoting of Social Responsibility and approved by Romania Government on 14 September, 2011. Strategy pursues organizations responsabilization with needs of environment development and protection, of local communities for economic growth and sustainable Romania development. They are opinions [14] holding in Romania companies to respect CSR's four dimensions— employees, community-society, environment, and clients - consumers. “We start getting civilized”, Fl. Glinta holds [14]. EurActiv.ro makes a synthesis of CSR contribution of some Romanian companies RomPetrol, Groupe Societe Generale, Danone, Coca-Cola – as well as Romania's Trade and Industry Chamber, by coordinating a network of 42 advising offices for promoting CSR of company.

Unfortunately in the last three years against economic recession background many companies cut off completely CSR budget or reduced it very much. However, there are also companies that developed on-line platforms in order to make their initiatives regarding involvement into society known; for example, **Petrom** with “Andrei Country”, RomPetrol with “Together for everyone”, Raiffaissen with “Raiffaissen Communities “ or URBB Tuborg with ‘Green Umbrella”, platforms well received by stockholders [14].

In practice many CSR are spontaneous, accidental. Some companies look at what do the others do trying then to copy. However there also are companies that choose domains upon which they concentrate according to marketing /PR value they could obtain Multinational companies get indications from their central headquarters on domains they must get involved into. For example, for banking industry there are domains with involvement domains valid everywhere in the world Culture, education and financial inclusion, digital security, struggle against corruption, chance diversity and equality, etc. Certainly, ideally companies in Romania will

also reach sooner or later to establish domains to concentrate upon consequently to real dialogues with public interested (stakeholders) and consequent to analysis of importance the worries and expectations they have.

Domains many CSR programs they concentrate upon in Romania are environment protection. On one hand companies, similar with the rest of public opinion, recognize that threats related to environment are real and it is a global issue they cannot ignore. Don't they improve their impact with environment now, they will be forced by law to do it later. On the other hand, environment is, from all CSR specific themes, the worry toughing the most numerous public. It touches cosmopolite categories, with big incomes, categories that, in general are nor sensitive to other social themes. That is why, an environment program offers the biggest potential benefits in image level.

As regards human resources, companies in Romania integrate responsibility for employees in their CSR programs through their training and continuous learning programs, security and occupational health ones, programs of diversity and work inclusion, corporative voluntaries, salary donation etc. programs.

A big problem in Romania is the lack of CSR reporting; it means there is a lack of transparence regarding budgets invested in social programs, the domains investments have been made in and the decisional process they came at respective domains through. Consequently, a company cannot assume the merits in CSR domain until he writes a public report (similar with annual financial report). There are elaborated universal standards such as Global Reporting Initiative Framework (GRI) and ISO 26000. Not in the last line, in order to obtain realistic maximum level of “accountability”, reports are audited by third parts. In certain countries, such as the United Kingdom, public companies (listed in stock exchange) are obliged by law to report regarding their economic, social and environmental impact.

Differently, in Romania companies reporting are very few, and those correctly reporting (conform to international standards) are as many as non-existent. In such conditions deficit domains are hard to

identify. Similarly, many times it is difficult to draw a line between a CSR initiative and a PR company

In a globalizes world economy where corporations became ever more powerful, raising the problem of responsibility assuming, companies give ever more importance to social corporatist responsibility. While some analysts qualified CSR as being ‘an exercise of public relations, many companies consider there are powerful commercial reasons to develop CSR strategy from the relations with external interested partners, to employees engagement. Moreover, increased interest of companies manifested in external checkup of CSR practices indicates that CSR domain is taken in seriously with a real engagement in offering real significance to the concept.

Present Day Recession Effects on Human Resources

Bujor Anca Liliana
„Petre Andrei” University of Iași
anca_bujor@yahoo.com

Abstract

Specific characteristic for recession situation are: instability, anxiety, unpredictable attitude and behavior accentuation of knowledge, cognitive filters and erroneous interpretation of social, economic or existential realities.

In this paper, for knowing this recession from the perspective of human resources, I started from determining some objectives such as: Knowledge of present recession peculiarities, of its area and depth, learning recession effects, its impact upon human resources, identifying solutions for overcoming these malfunctioning.

Key Words: Human Resources Management, Human Resources Development, Economic Recession

JEL classification: M54

1. Introduction

Understanding recession as a malfunctioning, we shall also notice this phenomenon actuality, especially when we relate in on economic, social or political or plan or to its area: local, international or global, generalized. Specific characteristic for recession situation are: instability, anxiety, unpredictable attitude and behavior accentuation of knowledge, cognitive filters and erroneous interpretation of social, economic or existential realities. For knowing this recession from the perspective of human resources I started from determining some objectives such as: Knowledge of present recession peculiarities, of its area and depth, learning recession effects, its impact upon human resources, identifying solutions for overcoming these malfunctioning. As working hypothesis I established: whether recession created malfunctions belong to human and his

activities, then overcoming them should be done by solutions initiated and implemented by humans. As working methods for deciphering such a malfunction complex all our existence levels I made use of: the study of specialty literature regarding recession phenomenon in global, zone, and local plans, knowledge of some realities in Iasi zone through direct investigations – study of official documents, interviewing and questioning subjects various role statuses in organization – managers, workers in executive sectors.

According to those communicated by National Bureau of Economic Research (NBER), recession, in defining sense, is “a significant decrease of economic activity for several months reflected in GDP, of individual incomes, diminishing occupation level diminishing industrial production and consumption, with effects upon every human existence dimensions [9]. In specialty literature it is reflected the fact that malfunctioning of this kind, economic recessions have a financial, social and political determination. As financial recession is a facet, a form of economic recession as a consequence of increasing mistrust in financial system, hence also natural consequences: decrease of stock exchange transactions, affecting activities of various compartments or departments.

Through its disastrous effects nowadays recession drew experts’ attention so that it is only natural Alan Greenspan [4] held that “it is an actual Tsunami which appears once a century” whose waves propagated to almost all real economy sectors, to real economy on every globe meridians. Irrespective it is private or public domain. Malfunctions created in the financial sector of private companies negatively restricted over public finance, imposing new restrictions and new impoverishing rules in financial transactions.

2. Recession effects at human resources level

In general plan recession impact, its effects let not be expected, they were felt in every levels of economic, social, and individual levels because exports, investments, foreign capital inputs, demands for inner large consumption goods, general and individual earnings etc., all were diminished.

Referring to existential life in Romania, effects have been felt above all in macroeconomic system inadequate development, process felt in our society's all dimensions: budgetary deficit reaches cca.5% of GDP, economic growth was based of inner consumption as well as on base of some investments raised by foreign capital, with a low inner saving leading to increase of external indebting –21.5 billion in 2004 , 74.0 billion in 2008 of which public unguaranteed debt in the short run increased by 75 times, amplifying vulnerability high degree in assuring external deficit financing. Romanian exports drastically decrease also as a consequence of the fact that exported produces – metallurgy, petro-chemistry, complex equipments (cars) registered no more demands; investments decrease, and national currency registers depreciation of 10.4% in 2008 and with still 6.4% in 2009, etc.[10]

Effects let not be expected in human resources level either, if we have in view that man, human individual stays at the base of every existential, social and human processes, so that malfunctions impact – malfunctions owed to man - were highly felt in this level. Firstly by stopping its activities crediting, continuing with drastic phenomena such as unemployment growth, wealth decrease, of population material state, implicitly of the consumption and its increasing poverty.

In such a situation it is important that a company's personnel should be treated very carefully, be priced because it is the inestimable wealth of an organization, if either they keep it or make it available. A company's personnel is the one representing most frequently the organization, its products or services accomplished; at least out of this reason company's people should be treated as well as at clients' level.

In conditions of personnel maintaining, employers, in order to support productivity increase to the expectance level are determined to promote a direct and permanent dialogue with employees, to create them a certain assurance regarding working place certainty, to combat rumors, false information, not to renounce to performing personnel or investments and company's perspectives. In conditions or wage diminishing they should find alternative, supplementary forms of motivating the personnel under the form of bonuses, commissions, to make employees responsible by consulting them in management act, in decisions making regarding company well going. In such conditions employee feels integrated and important within the group, he refinds his norms, principles and company directions and policies - a feeling which increases his own attachment to organization and to his like.

Even in conditions of more definite solutions - employees disponibilization /firing, diminishing working time etc. - the measure imposed by labor market, they should have in view these were done grounded on certain criteria, the same it was done at employing, respectively by taking into account abilities, experience and career aspirations personality traits, manner of self-evaluation etc. In these conditions, too, managers' attention should focus on keeping employees with increased working profitability, to key personnel involved into working processes efficient making.

It is according to Maastricht Treaty (1991, art. 136), recognized as EU treaty. “(EU) communities and member states (...) should have as objectives to promote labor force occupation, combining life and work conditions, proper social protection, dialogue between management and work, human resources development, having in view high and sustained labor force and combat of exclusion.” [5]

Concrete realities within business milieu confirm the fact that recession first affected are people in their existence complexity bear under one form or another the effects of such economic, financial, social psycho-human and political malfunctions due to either state or its institutions that become incapable face to catastrophic, unprecedented phenomena,

or to owners for their incapacity to maintain working processes at competitive level, in order to naturally reward as deserved employees' work. In fact the general picture of recession effects viewed through prism of human dimension shows us a *duplicate state*: increase of disponibilized from one stage to another and an extended unemployment, remaining, sending an active, important autochthonous population to hit the road outside a working place while in many companies many owners appeal for continuing working processes specific in foreign labor force – Asians, Africans etc. European Commission has launched the campaign: “do you know what social Europe can do for you?” by which it established some fundamental values, some rights regarding labor among which: labor force mobility, combat of social exclusion, professional formation and adaptability to working place etc., right that if promoted, they would make human individuals' life more bearable, including in condition of restrictive measures, like those of recession are [12].

Facts confirm the existence of a contradictory picture regarding positive administration of human resources in such moments As Ioana Manaila—President of experts in human resources holds: “All structures, public and patronage, make a profit of recession in order to commit lawless acts” [8]. Disrespect of chance equality between men and women as well as for persons surpassing 40-45 years of age, for simple motive that generation – the second one is not as efficient and productive as persons belonging to anterior generations; generally women are selected for execution activities those of managing being improper for them; the “age criterion” became an absolute milestone to post “forbidden” sign for employment, age becoming in fact the annulling criterion of engagement for persons belonging to second and third generations, and mainly for those in the third generation there were not found socializing forms able to change psycho-social and existential climate for such people, too.

- Young people are employed, as age and also within profession, nothing wrong, but to the detriment of those ones with experience, mainly in multinational companies, a category without necessary

experience, easily maneuverable, with minimal wages, easy to control and fired when necessary. Or when they try to request their rights;

- Disrespect of the rights regarding employees' recovering physical and psycho-human state, mainly the rest rights, besides the abusive lengthening of working day. The rest vacancy is not given in its totality but moreover it is given divided in stages and during “dead seasons”, non-benefitting and recovery value of human state;
- Diminishing activities specific for assuring with human resources, of recruiting and selecting programs of professional formatting and developing, of training in becoming - in career with direct impact in non-accomplishment of performance indicators, in full evaluation of employees' capacities, and their un-motivating.

To these working place insecurity, timely earnings established payment, practicing ever newer taxes and imposes strain is added: it diminishes their earnings and are factors that increase the demotivating feeling as performing outcome as possible, insincere attachment to organization, diminishing human individual statute and role within working group, respectively in company. Managers in either public domain or in private one omit that their careless, indifferent treatment of employees, manifested during recession is with effects in the long run, unless irrecoverable. By its consequences, taking into account the only dimension that human resources remain organization only dimension capable to offer sustainability, viability to company irrespective its situation.

Present economic and financial recession negative impact was felt synthetically first by profound organization need of solvability of ever diminished material possibilities of companies that had contracted loans to pay their debts, the recession fell disastrously upon people, on human resources, the one producing plus-value.

Out of this last perspective affecting human resources - based on our investigations, anti-crisis measures had, essentially a *reductionist* contents - reducing expenditures, the costs in all chapters to assure conditions necessary to existence, to

companies survival, and in some cases solutions regarded either their bankruptcy or drastic diminishing of basic activities volume, specific ones with direct impact on human resources, through personnel disponibilization and substantial reduction of those maintained earnings.

3. Investigation results

At the level of Iasi county, according to National Office of Trade Register (ONRC) in 2011 the number of companies wiped out from Trade Register is over 500, and those with suspended activity is 260; wages level decreases with 8.1% in 2010 face to 2009, and employees earnings are with 7.6% lower face to earnings achieved at national level; in 2011 wages in services are with 12.0% smaller than in 2010 [6]. Therefore, present recession negative effects hit frontally man, organization most active and innovative resource – reduction of working places, firings, diminished wages, social insecurity etc.

Research I initiated comprised 18 (18.9%) organizations in industry, constructions, services, trade, and tourism with 192 subjects of which 36 (18.8%) managers and 156 (81.2%) execution personnel.

Present economic and social life dynamics, economic activity international, interdependent characteristic as consequent to globalization and post-industrial changes, our presence in EU, foreign investors' participation and national economic activity as well as the newness for most human individuals of the phenomena recession has created, a phenomenon which by its content surprised population largest part resulted in appearance of apart conduct more or less manifested in both managers and executive personnel. So, e.g. as for knowing recession contents, 48% of the managers and 36% of executives are of opinion that it represents an inactivity state in organization, work performance lack with direct implications in individual and organization plan. This aspect reflects managers' preparation lack and of the organization personnel as regards the content and negative, catastrophic effects of such a phenomenon with possible malfunctioning in economic, social and political plan, and also managers' capacity in recession positive administrating. As to recession effects,

research subjects' opinions are structured on two dimensions The former one regards effects felt in personal level of human individual: 9 (25%) managers answer positive, therefore they felt this phenomenon effects in individual level while the number of executives reaches 145 (93%). The latter dimension regards the feeling these effects in organization all 36 (100% managers and 153((8%) executives perceive.

From managers' perspective, recession negative impact was felt in organization level, mainly by: restraining production activities, restraint access to credits and very high costs when done, decreasing exports, mainly to states within Euro zone; decreasing consumption/internal market demands, social effects, working place and earnings insecurity, performance, productivity, and earnings galloping diminishing, some services externalization, some outsourcing services.

In the level of most active organization resources, of executives, *recession negative impact* was perceived mainly by restructuring, reducing or loading/developing working places, reduction of working week/day with direct effects in earnings freezing or diminishing, in employees disponibilization, early retiring of an employee category, working place insecurity, funds for human resources specific activities, especially for their professional training, and becoming in career.

My investigation also confirms some opinions regarding positive effects, present recession opportunities that may be synthesized in this way: 58 (30.2%) of subjects hold that there are also perceived positive effects: thus: 33% of managers and 29.5% of executives hold that present recession determined organizations to proceed to a more careful selecting and grounded on certain criteria of distinct work results of employees with appreciable degree of integration and socialization, facilitated those of other employing modalities—contract for limited periods, part-time contracts, externalization of some activities, generally for entertaining and not only, as well as of some well-determined activities of those for achieving some products/services; changing the mentality regarding self-evaluation as well as its achieving modalities, accentuating working place security in

relation with wages level, change of employees attitude states regarding their attachment to organization, noticing those with false attachment.

I therefore attempt to draw attention that in human resources level perception of present recession covers two dimensions: a *positive* one - maintenance of best and most valuable employees and working place security for them, promotion from inside, based on certain value criteria; finding out alternative of motivating employees; involving employees in the making decisions act regarding organization survival and profitable becoming, by enforcing employee's role-status in his working group, in organization etc. The *negative* effect of recession impact perceived human resources level regards: firing, renouncing to certain employees attached to organization—phenomenon resulting in, employment freezing, in blocking positions, working time reduction (weeks and certain days), adverse, nonfunctional inter - organization, interpersonal communication directional with implications in settling down the mistrust among people, in managers, fright or scare to lose working place, diminishing feeling for working mates, fellows and organization, affecting psycho-social, ambient climate and working motivation of the personnel, etc. Present recession, therefore affected human individual in its whole existential structure, in bio-psycho-social totality and the wave recession propagated has provoked malfunctioning of human communities and occupation organization structures in all activity domains and sectors.

As to present recession effects administering from present research it results that measures of attenuating its negative effects were taken. Thus, all the 192 subjects in my sample for investigation hold such measure have been taken, though they regarded, as one could see, the restricting human resources development, mainly regarding personnel continuous training and development for career becoming, as well as direct measures for human resources, within the scale of stopping or diminishing new taxes and imposes, etc. It is also disputable for sample largest part the justice of such measures, their destructing and dehumanizing consequences 88 (45.8%) of subjects hold that such measures have not

been so severely and stringently imposed. 78 (40.6%) are of opinion for their imperative characteristic, that necessity imposed, and most executives, 86 (55%) think such measures are not imposed - an opinion also supported by 5.6% of managers.

Self estimating their attitude and conduct states face to recession negative phenomena, subjects expressed opinions on a value scale with grades from +5 to -5 (+ positive estimations, and - negative ones), it results that, generally, personnel administered well this personality dimension in both individual and organization level: in 62.5 grades had positive values, and out of them cca.29% estimated this dimension in recession situations with superior grades, respectively, +5. This means that most employees comprehended relatively correctly the manifestation of malfunctioning present recession created. (62.5% promoting a normal, decent working and organization conduct, 37.5% were estimated with decreases of working tonus, engagement and performance, expected coherence and efficacy, 52.8% of them have values between -4 and -5, therefore, high degree of affecting attitude and conduct states.

Research also reflects that such attitude and conduct states encountered in employees are natural consequences of the wrong way organization communication, interpersonal relation system in inner plan have been administered 86.1% of managers hold they promoted a careful, permanent and sincere communication with employees, and 13.9% claimed not being satisfied with management achieved in this domain. In executive level inter-organization communication has a complete another perception. 21.2% of subjects claimed an engaging, well-shaped on finding and implementing solutions able to make recession effects bearable communication was promoted. 58.9% internal communication they hold, wasn't accomplished at the size of recession created phenomena, under expected level and necessities, and especially “it was and not very much an intra - organization communication.” And 19.9% organization communication was absent.

Faced with such realities employees attitude and conduct states surrendered, escaped from under reason control: 6.8% hold that in company there were vindictive

manifestations, such as refuse to work, decrease of working intensity and performance, works deserted etc.; 93.2% hold that they manifested maximum caution, comprehension, promoting decent conduct with efforts not to surrender as attitude, but notwithstanding tasks have not been accomplished in normal performing parameters. Attenuating actual recession negative impact from human resources perspective, is an achievable, possible, viewed by 79% subjects of total sample, by first adopting measures able to provide organization survival as well as its moral existence, measures belonging above all to qualitative, focused on man, adaptable management practicing by promoting concrete measures in organization plan such as: intense internal communication in all levels and oriented towards employee; searching and promoting personnel motivation by non-financial variants for promoting personnel motivation, able to assure careful responsabilizing and evaluation of human resources within working and creating process; conceiving and implementing some modern and training programs with small expenditure, making use of internal strategies that would stimulate employees' trust in managers, in organization; intensifying activities for promoting responsible organization culture, by bringing much more in value the norms and principles regarding work quality, personnel engagement and attachment to company.

4. Conclusions

Therefore, recession phenomena produce instability, anxiety, uncertainty as well as lack of outlook, fright, and scare for our existence with direct consequence upon attitude and conduct states that can no more be controlled: modify man's cognitive, knowledge system, comprehension and action, inter-human and inter-organization relations etc. Administering these phenomena as it results from my investigations belongs to man, on promoting a focused on man, on employee management, as they are whatever organization fundamental resource, in evaluating his creative and innovative potency.

Romanian Customer Perception and Behavior in the Current Economic Conditions

Călin Mariana Floricica

Tomis University of Constanta, Faculty of Economic and Administrative Studies
mariana_bentea@yahoo.com

Abstract

Romanian retail continues to grow both in terms of penetration, and in terms of number of players. No headway buyer and simple familiarity with the store brand is not enough when it comes to choosing shopping site. This maturation creates high expectations, that retailers must consider if they want to differentiate themselves from competitors. Given the constant changes that occur in the Romanian economy in the world is natural for consumers to change behavior. Those who suffer most from the crisis are those who do not want to change, to adapt. Consumers are able to cope in this difficult economic environment with a small salary, manage to buy from shops to get their money until the next salary makes things themselves without being forced to buy them in stores.

Keywords: consumer behavior, market strategies

JEL Classification: D12

1. Introduction

Retail market shows signs of recovery, a trend that is seen in increased frequency of access for most formats of stores in 2011, compared to 2010. Modern retail continues to strengthen its position attracted most shopping budgets.

Also, frequency of visiting supermarkets and hypermarkets has increased slightly, while the traditional trade has struggled to remain even in the previous years.

In terms of buying behavior for two main categories - food and non-food - almost do not notice any change. Fresh foods such as fruits and vegetables, meat or dairy, continues to have the largest share in the

shopping cart and default to capture most of the budget (66%).

2. Consumer research

As every year, analysts Nielsen study done in over 50 countries including Romania on buyer behavior.

ShopperTrends unveils the important factors for developing retailer brands. By asking what consumers do, know and think about retailers, we find out what are the influencers in choosing the stores. The study was conducted during October-November 2011 on a sample of 1,200 participants, 300 of Bucharest, 100 participants from each of the following cities: Iasi, Cluj Napoca, Timisoara, Constanta, Brasov, Ploiesti and 60 participants in each each of the following cities: Arad, Targu Mures, Rm.Valcea, Piatra Neamt, Targoviste. The application of the survey was face to face interview. The sample is nationally representative for large and medium cities including persons between 18 and 65, people who do regular shopping.

After two years of steady decline in consumer confidence and passed, Romanians have been a first rebound can be explained by a positive outlook for personal income and their ability to purchase various goods. In November 2011, the average wage increased by 8% the previous year, while revenue growth rate increased 5 times, from 1.3% to 8.7%.

However, national Romanian consumers are uneasy with the other Europeans, only a quarter of them having a positive perception of their financial status.

Revenues were up superimposed higher prices in shops. From the survey, more than four in five customers said that prices in Romania are increasing their share is higher than a year ago. Of these, more than half simply buy based products.

Figure 1. Where do people spend the majority of their grocery budget?

Source: Nielsen. Shopper trends 2012.

As in previous years, Romanians prefer to do their shopping in hypermarkets, 55% of respondents saying they prefer this type of stores. Are supermarkets, attracting 21% of their income, compared with 22% a year ago and discounters, who lost her importance-17% in 2011 compared to 18% in 2010. Regardless of where they source, Romanians quality private brands associated with the store. Thus, approximately three out of four respondents agree that the best stores have the best private brands.

Figure 2. Frequency of Main grocery shopping

Source: Nielsen. Shopper trends 2012.

34% of shoppers go shopping every week, against 21% a year ago, indicating a slight market growth. However, frequency of intermediate purchases remained the same. The phenomenon can be explained by the availability of people to spend a large amount of budget shopping in one occasion, but also by seeking active and continuous promotions, supported by other work and the

increasing number of stores visited in one month.

In terms of buying behavior, 4 of 5 Romanians believe that prices in Romania rose and their main reaction was the waiver, and more expensive products, essential. Against this background, promotions remain an important criterion for purchase, but they are no longer a differentiating factor when choosing the right store. We are talking about a dynamic and mature market, which includes products of first necessity, with a frequency of purchase, thus, quite high. The diversity category was sustained in recent years by launching more and more specialized products that benefit and diverse forms of use, which take place or come in addition to universal products.

Following the purchasing behavior of consumers if the basis for food, specialized manufacturers say they have not thought about long-term usefulness of the product but were oriented to the detriment of small packets to the big weights. Exception is made where the item was on promotion, and then the acquisition price was justified by the reduced package.

Regarding promotions, discounts come best to Romanian, 59% of respondents preferring this type of campaign. In fact, many consumers (3 of 5) know the prices of most products they buy regularly. Although special offers and promotions remains a strong influence in the acquisition, they are no longer representative differentiation factor between stores, because of their abundance in the market.

3. Reaction of customers to higher prices

The important things for the Romans when shopping, are found in a weight becoming more emotional aspects of category benefits, such as providing a pleasant shopping experience.

It is characterized by the existence of value added services to the buyer, a pleasant atmosphere in the store or a layout that allows quickly find popular products. It is notable that although the vast majority of buyers tend to plan purchases in advance, a significant number of them remain loyal to the list. This means that an attractive

promotion or a better shelf positioning can convince the buyer.

Figure 3. Behavior of buyers

Source: Nielsen. Shopper trends 2012.

Avoid situations of unavailability of products on the shelves is crucial for producers and retailers, as many as half of respondents said that in such circumstances would buy an alternative brand, and one third of those surveyed they go to another store in search for your product. For example, the study showed that personal care products and coffee there is a greater degree of loyalty, a larger number of buyers who say they are willing to go to another store favorite brand in case you do not find it in location already.

On the other hand, in categories such as sweets or carbonated soft drinks, the number who would buy an alternative brand is higher (63%, respectively, 56%). The year 2011 brought nothing new right nor the availability of people to try new things, three quarters of Romanians saying they prefer to buy products that they already know.

As mentioned, promotions play an important role in buying behavior. However, the study emphasized that the promotion is more effective if the buyer has had a positive experience with the product / brand at a time or if the perception is positive. 22% of respondents said that promotions do not buy if not already like the brand. Discounts promotional mechanism is by far the Romans preferred buyers (59%), followed by "1 +1 free" (38%) and "a larger amount at the same price" (23%).

Figure 4. Consumer perception of price

Source: Nielsen. Shopper trends 2012.

Asked how aware are the price of the products they buy, 3 of 5 respondents said they know the prices of most or all the products you buy frequently. And also in this chapter, retailer Kaufland 2011 brought the status of "store with the lowest prices" and are able to unseat him Carrefour competitor who was the first position of the top in the last two years. The top two networks are followed by real, - Hypermarket Auchan and Cora.

Retail market shows signs of recovery, a trend that is seen in increased frequency of access for most formats of stores in 2011, compared to 2010. Modern retail continues to strengthen its position attracted most shopping budgets. Also, frequency of visiting supermarkets and hypermarkets has increased slightly, while the traditional trade has struggled to remain even in the previous years. In this context, 55% of respondents said that they leave most of the money in hypermarkets, with 5% more than the previous edition of the study.

In terms of buying behavior for two main categories - food and non-food - almost do not notice any change. Fresh foods such as

fruits and vegetables, meat or dairy, continues to have the largest share in the shopping cart and default to capture most of the budget (66%).

While visiting the store media in a month only a slight increase compared to 2010 last year seemed more willing buyers to test several shops or to go more places. No less than 33% of respondents said they had visited at least two stores in the last four weeks, while 24% say they have taken it in three different stores. This trend can be explained not only by their desire to find the best price, but also by increasing operational proximity stores

4. Conclusions

Romanian retail continues to grow both in terms of penetration, and in terms of number of players. No headway buyer and simple familiarity with the store brand is not enough when it comes to choosing shopping site. This maturation creates high expectations, that retailers must consider if they want to differentiate themselves from competitors.

Besides location, which must be accessible, offering a broad product assortments and good value for money, modern shops should pay attention to the general atmosphere in the store and small details can make a visit to the store experience nice purchase.

Last but not least, although any modern store should provide at least an intermediate level services mentioned by buyers as important (to have a pleasant, to be in an accessible location, to have low prices on most products high quality fresh products, I find everything I need to find good promotions, courteous employees, etc..), they should choose an attribute and convert it into their brand promise to build a relationship of loyalty with customers.

New Strategies of the Retail Market to Attract Buyers

Călin Mariana Floricica

Tomis University of Constanta, Faculty of Economic and Administrative Studies

mariana_bentea@yahoo.com

Abstract

New realities of the digital age (continuous growth of internet penetration, card payments and mobile applications) forcing large retailers to rethink their tactics to increase business.

The consequences of this development are manifold and manifest more and more that consumers want the ability to get information online on a retailer, you can compare prices - so an increasing demand for transparency - and you can order anytime, anywhere in a simple manner.

Online retail allows introducing a wider range of products, more diversified and can help increase the basket of goods purchased. On the other hand waning purchasing power to cause people to turn to production companies cheaper to own brand with a lower final cost by 20%.

Keywords: consumer behavior, market strategies

JEL Classification: D12 Consumer Economics: empirical Analysis

1. Introduction

Given that the market remains quite difficult for retailers and consumer expectations are changing more rapidly, we expect in the near future (even this year) to see new launches online platform of traditional retailers. Online sales in Romania are now only about 1% of total retail, with the EU average of 4%. And internet penetration is significantly lower than the EU average (47% vs. 72%).

2. Online Retail

New realities of the digital age (continuous growth of internet penetration,

card payments and mobile applications) forcing large retailers to rethink their tactics to increase business.

Furthermore, only about 13% of internet users in Romania have purchased products online in 2011 compared to a European average of 57% (82% in Britain). However, given the high growth rate of Internet penetration and use of modern means of payment, e-commerce in Romania is expected to grow strongly in the next period.

Online Retail in Romania recorded very rapid growth in the period 2006-2011 and estimates show that this growth rate will continue in coming years. By contrast, traditional retail has experienced a decline, followed by a resting.

The main barriers to trade online are now about the lack of direct experience in this regard (many consumers have a negative perception of online trade without actually had any negative experience), distrust of modern means of payment and low satisfaction on home delivery services. As these factors improve, grow and demand for online retail. In addition, changes in lifestyle that can be felt in Romania, especially among younger generations, coupled with the growing spread of mobile applications, will lead to more widespread adoption of online commerce.

Analyzing online retail market currently find these attempts to trade on-line:

1. Brasov group of companies, who won the 2011 Masters Spar franchise for Romania, has launched an online trading platform. www.aprozarulmeu.ro shop takes orders both online, and telephone. The site mentioned are available most of the existing products in the 19 Spar stores in Brasov, and deliveries are both outside the city and its surrounding areas. Online purchases allow buyers including

access to promotions conducted in locations in that period, their identification is easy due to site interface. Announces its online store buyers that deliveries are made within two hours after the order. The company's decision to test this concept follows the potential of online commerce is on the Romanian market. Silviu Sumanaru, manager and initiator of the project, says that in December and so far about 100 clients have used this site for shopping. For example, results of a survey research company GfK shows that 28% of urban Internet users have shopped online last year. Almost one quarter of those who buy online do it at least once a month, more study. Young buyers remain among the highest predilection for online.

2. CumparatoruClick.ro was born early last year, with full functionality in June 2011. Customers shop or people who have little free time and prefer to use it other than shopping and standing in lines. Additionally, there are people who for reasons of health or convenience, prefer to order everything online and leave as little of the house. Another representative group of customers is those well-known public. Many of them avoid a variety of reasons, exposing themselves in public and prefer online shopping. The average shopping basket is worth 350 lei, and the products sold are milk, eggs, vegetables, beverages (water, juice, beer, wine), and organic products.
3. METRO Cash & Carry implements, first for the retail market in Romania, the first personalized discount system - Metro Touch. The solution addresses the company's professional customers. Simply scan the ticket the client METRO, METRO Touch new system generates, for each client, a preference list of products ranges fresh and ultra fresh articles. Depending on each customer's profile and transactions, they benefit from a discount granted on a shopping coupon generated instead of METRO Touch. Customers can

use coupons up to five such days. The Metro Touch is already available in the 26 Metro Cash & Carry stores in Romania, except in Metro Point.

4. Cora hypermarket network in Romania plans to introduce online ordering service lift products store called "Cora Drive". The retailer has not established but the launch date of service in the country. Cora Drive operating principle is simple: customers consult online product offerings, send their shopping list and they get to Cora, products are delivered and loaded into the machine. Cora Romania has already started (the end of 2010), Cora Digital service through which customers smaller shops in the province have access to the full range of IT & C and electrical equipment to Cora. Basically, customers offer on site consultations and can order products directly home.

Large retail chains are known mostly in the name of "modern trade" opposed "traditional trade" which brings together small shops usually are not integrated within some chains. From a practical perspective, the notion of "traditional trade" should refer more to the marketing of products in markets and fairs. Thus, modern trade would hold somewhere over 50% nationwide, with higher rates in urban areas, reaching 75% in Bucharest.

Total trade weights but provides a more close to reality in terms of bargaining power of these chains in relations with suppliers of products. That big retail chains are sized buyers increasingly higher. From their perspective, retailers feel entitled to ask for discounts and more uniform quality conditions. From the perspective of manufacturers and distributors, large retail chains become trading partners increasingly difficult to avoid in the way their products to final consumers. Tensions and accusations of "monopolization" occur mostly in relation manufacturers and distributors / retailers, but the latter are caught in the middle, given that the consumer will experience price increases cashier trader and it will be viewed with distaste, even if he is not due to price increases.

3. The new structure of the consumer basket

The new structure of the consumer basket, which will be calculated after inflation in 2012, shows that families have been forced to severely restrict daily expenses and give up less important varieties for basic needs.

Inflation in 2012 is based on the consumer behavior recorded in 2010 and revealed the family budget survey, conducted by the National Statistics Institute (INS). Data reported by the INS on inflation in the first month of 2012 have revealed a new structure of the consumption basket, which shows first that the goods have gained immediate need higher rates to the detriment of others.

Here are some examples: potatoes, fish and food basic necessities were sold better and therefore have higher rates achieved in the basket, while meat, cheese and sugar have lower weights, that have sold more least. Non-food category, increased demand for fuel, heating, cigarettes and electricity, reducing the clothing, footwear, auto parts and household items. So if services where rent, sanitation and cable-TV subscription gained ground against transport by train or bus. All this reflects a specific behavior financially distressed people, as most Romanians were in the years of crisis. Preferred products are cheaper (but worse quality), to the detriment of the most expensive.

Overall, food reduced their share of the inflation basket, from 37.45% in 2011 to 37.21% in 2012. The share of services in the basket rose from 18.33% last year to 18.53% in 2012, and the weight of food was maintained at 44.2%. Similar to what happened in Western trade, where its brands dominate the shelves in Romania gaining ground segment. The economic crisis has fueled the trend by encouraging retailers to invest more in these products.

Market in our country there is much room for expanding the range of own brands, representatives of retail chains expecting their share Cart novel to rise significantly in the near future.

Figure 1. Priorities of consumers shopping

Source: National Statistics Institute (INS)

The explanation of this phenomenon is very simple: the customer has smaller budgets and prefer to shop that range who can provide satisfactory report between quality and price. If in case we can not pronounce quality when it comes to costs that are competitive is clearly being up to 20% cheaper than other products.

Last year, 9% of modern trade was the deliveries by private brands of chain stores. Private label market is valued somewhere around 1.5 billion euros. Large financial turnover generated by this segment has caused quite acidic side of the "nationalist", who claimed that by marketing products retailers fenteaza domestic producers. Analysing the phenomenon better can be seen as a part of the goods sold in our country have entered private brand "Made in Romania".

If in 2010, the question "own brand products you bought in the last four weeks?", 75% of the sampled research ShopperTrends said yes, in 2011, the share of those who said this was reduced to 64%.

Figure 2. Analysis of private brands

Source: Nielsen. Shopper trends 2012

Perception of quality is reflected strongly in store own brand perceptions of that retailer. Thus, in 2011, 72% of respondents have agreed with the statement "the store as the best, with both brands have their best", compared to only 63% in 2010.

A high share of those who tend to compare prices at private label manufacturer of brands, from 64% to 71%. On the other hand, 5% more people believe that own label is for those who have very low budget shopping.

Paper products, basic food and household products categories continue to be the best buy and top choices of those who tend to buy them, the top ranks K-Classic (Kaufland), Carrefour and no. 1 (Carrefour), said the report ShopperTrends 2012, conducted by Nielsen.

Regarding the categories in that register the highest level of purchasing private label, the top remains unchanged from the previous edition of the study: paper products are the first place (62%), followed by basic products (51%) and the care home (43%). In general, private label brands are seen as similar, but the perception of store brand strongly reflects the perception of its private label. Almost one

in two respondents agrees that the more good store, with both the quality of their products is better.

4. Conclusions

The local trade is growing over the next four years, will reach the 2015 level of 19.2 billion euros from 17.1 billion euros this year.

Despite the upward trend, the market will remain on the maximum level of 21 billion won in 2008, last year boom, according to data from retailer Profi, owned by Polish investment fund Enterprise Investors.

Although in words, in recent years, buyers seem more open about trying private label products, there is still a perception that, despite higher prices, brands the manufacturer offers a better value - price and that private brands are more likely for those with low incomes.

Overview on Tourist Destination

Caruntu Andreea Laura
Bucharest Academy of Economic Studies, Faculty of Marketing
andreea.caruntu@yahoo.com

Abstract

People nowadays have the tendency to travel even for a day in order to get away from their daily routine.

The tourism industry seems to have started recovering from the financial crisis and the number of tourists visiting destinations has increased.

The concept of tourist destination is very important and should be understood not only by marketers but also by tourists so the purpose of the paper regards this aspect.

Each person can become a tourist so it is important to see the all the elements that are behind a tourist destination. Offers are provided to tourists according to their wishes, according to their needs.

Kew words: tourist, tourist market, destination, destination image

J.E.L Classification: M31

1. Introduction

The tourist industry has an important role in the economy of any country, having a major contribution at incomes of the state budget. Due to the great number of tourists that travel in different tourist destinations, there is a high competition among companies that operate in the tourism area. Trying to reach customers, to fulfill their needs by offering them the right tourist products is done with attention by marketers.

Tourist destinations must offer tourists as many elements of attraction so that they can choose the offer that best satisfies the needs they have.

2. Concepts regarding tourism

Tourism can be defined as the processes, activities, and results that appear from the relationships and interactions among tourists,

tourist suppliers, host governments, host communities and surrounding environments that are implied in attracting and accommodating visitors.[1]

The financial and economic crisis that has started in the year 2007 has had an essential role in the decrease of the number of tourists, affecting seriously the tourist industry. Thus, the number of tourists has decreased in the year 2009, being followed by a comeback in the next year, the number of international tourists increasing with 7% so that the number of visitors has reached a level of 940 billion.

We find Europe on the first place, with 51% of the total amount, followed by Asia and Pacific with 22%, due to the fact that the economies of the states from the area had known increases. There was also an increase in Africa, an increase of 5%, not much but enough, increase due to the fact that in 2010 the World Championship at Football took place in the countries of the continent.

All these data were released by the report given to publicity by the World Tourism Organization, the report of the year 2010.

Source: UNWTO raport pe 2010, p.10

When they decide to travel, tourists choose a certain tourist destination and a certain tourist product.

A tourist product may be defined as: „a) a complex ensemble of goods and services put at the disposition of consumers (tourists) by one or more tourist companies; form of sale of the tourist offer, its component elements (accommodation, meal, transportation) can be sold separately or under the form of a tourist package;; b) in a large sense, a specific ambiance to natural and human factors and to tourist facilities that represent component elements of tourist animation and can have a certain attraction over tourists (for example: mountain tourist product, seaside tourist product, tourist product of resorts)[2]

Tourists have the opportunity to choose a tourist product that best fit the needs the wishes they have or the needs that will be satisfied by travelling.

Each tourist has its own reasons to decide to travel and can have different activities, activities that regard either visiting museums, taking part in certain events, socializing, relaxing, accumulating new experiences.

3. Tourist market

In order to understand the concept of tourist destination we need first to take a look at tourist markets. Many authors have tried to give a definition to this concept

A market is a set of actual and potential buyers who might transact with a seller. The size of a market depends on the number of persons who exhibit a common need, have the money or other sources that interest others, and are willing to offer these resources in exchange for what they want. [3]

We encounter on the tourist market, the demand and the supply, two elements that are in a relationship.

Vital demand data include: 1) how many visitors arrived, 2) by what means of transportation, 3) how long they stayed and in what type of accommodation, and (4) how much money was spent.[4]

By taking into consideration the demand, companies decide to set up a certain offer for the clients, in our case for tourists. The offer must take into account all the needs that tourists have.

When discussing about the offer, we must pay an important attention to the services

offered on the tourist market. All tourist products regard offering different services to tourists. The main issue regards the fact that services are intangible. It is not like when you buy a product and you see it, you can touch it.

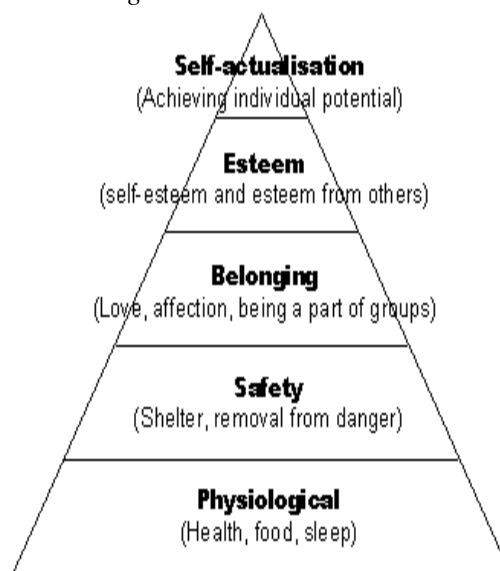

In the case of services, they are produced and consumed in the same time which makes it difficult for a customer to choose among different services.

Services have also other characteristics like variability, inseparability, perishability. All these, offer a unique perspective to this concept and makes it harder for marketers to promote destinations.

It can be noticed that the tourist market help tourists find what they need. Marketers develop their strategies after noticing the needs that tourists have, after segmenting them.

Abraham Maslow has defined in a clear way the needs that people tend to have in a daily basis. Needs that help us survive each day, like hunger, and needs that help us become a part of the communities we live in, of achieving something in life.

Figure 2: Maslow's Needs

Source: Montana,Patrick J., Charnov Bruce,H. Management, Barron 2008,p. 238

An important process in establishing which are the customers a company is interested in is the segmentation process. A process that divides people into groups by taking into consideration certain characteristic like : geographic, as country, city; demographic, like age, income,

occupation, social class; psychographic, like values, attitudes; behavioral, like the degree of knowledge concerning the products and services that customers buy.

4. Tourist destination

Destinations are places with some form of actual or perceived boundaries, such as the physical boundary of an island, political boundaries, or even market created boundaries such as those of a travel wholesaler who defines a South Pacific Tour solely on Australia and New Zealand. [5]

As it can be noticed tourist destinations include both tangible and intangible elements. Each tourist takes into consideration the element he cares the most. But most of them are interested in the experiences they take part.

Experiences are an important element when tourist choose among different tourist destinations. They also help tourist have a certain image of the destination, image that will remain in their minds for a long period of time.

All tourist destinations must try to have a competitive advantage that clearly makes an important distinction between them. Experiences can have an important role in the creation of a competitive advantage.

Having a positive image of a destination is a good thing because on the long term it means that tourists might decide to come also next time in the same location and they can also tell other tourists about the remarkable experiences they have had.

In order to create a certain image of a destination, marketers should take into consideration also using branding techniques. Nowadays people have a tendency to be more interested in well-known brands, they consider that these brands offer them more value, that they have higher quality services.

It is well known that retaining existing customers is less expensive than trying to acquire new ones. By building long term relationships with their clients, companies only gain.

Destination image characteristics can be classified as functional, (e.g. climate, prices, roads, nightlife, mental picture of physical characteristics) and psychological (e.g. friendly people, generally safe, general feelings and impression of the atmosphere of

the place.[6]

Word-of-mouth is becoming increasingly important in the process of taking decisions of many people.

The destination elements include [7] :

- natural attractions: landscapes, seascapes, beaches, climate, flora and fauna and other geographical features of the destination and its natural resources;

- built attractions: buildings and tourism infrastructure including historic and modern architecture, monuments, promenades, parks and gardens;

- cultural attractions: history and folklore, religion and art, theatre, music, dance and other entertainment, and museums;

- social attractions: way of life and customs of resident or host population, language and opportunities for social encounters.

As we can see, destinations are different and tend to fulfill the needs of all tourists that travel. Of course, there are destinations that include only one of these elements but there are also destinations that may include several elements. People have the tendency to choose destinations which offer them a greater variety of possibilities of what to do on a vacation.

The elements presented above regard the attractions the destinations offer to their tourists. It is important that people have a lot to see but there are destinations where the residents do not know how to treat tourists, where some tourists do not like the noise, the crowd. For example, Naples is a beautiful city, with lots of things to offer due to its location, but a few years ago due to the fact that goods were dumped in certain areas of the city, tourists forgot all the beautiful things they had seen and reminded with the image of these goods.

If companies performing in the tourism industry want to have higher revenues they must take into consideration all these elements in the offer they provide to the customer.

Of course, as we have seen destinations do not only have strengths, they also have weaknesses. Therefore, it must be taken into consideration that by analyzing the environment, analysis like SWOT should be performed on a regular basis so that weaknesses do not surpass the number of strengths.

Many believe that tourism is easy to do but as we have seen there are a lot of elements that must be taken into consideration when talking about the tourist market, tourists, destinations.

Butterworth Heinemann, Oxford, 2001

5. Conclusions

As we have seen, the tourism industry has become an important factor in the economy of any country.

Tourists increase the economy of a country by spending their financial resources in travelling, either in their country or in other countries, far away.

Nowadays, tourists have the possibility to travel not only in the country they live in but also in other countries that are far away. All of these happen due to the advances in the means of transportation.

Tourist destinations find themselves in a strong competition for attracting and retaining tourists. Creative a positive image of the destination can be an important competitive advantage in creating long-term relationships with tourists.

Having a bad image can only hurt a destination because tourist that leave dissatisfied tend to not to come the second time in the same place and tell other people about the experiences they have had. People ask for references from their friends so such a thing can have a higher impact when choosing a certain tourist destination.

Factors Affecting Performance Evaluation in Public Organizations

Cioclea Alexandra Ema

„Alexandru Ioan Cuza” University of Iasi, Doctoral School of Economics
alexandra.cioclea@yahoo.com

Abstract

Although performance evaluation has received a lot of attention in the research literature in the last two decades, it still hasn't reached an universal acceptance as an effective public management instrument.

Many public institutions avoid designing and implementing performance evaluation systems, sometimes for good reasons.

The paper attempts to contribute to identifying and understanding the factors that influence the utilization of performance evaluation.

The study is based on review and analysis of academic research, relevant government documents and personal perspectives, extracting and linking key findings from existing research and practice.

Keywords: performance, public organization, factors, impact

JEL Classification: D73, H11, H83

1. Introduction

Concern for performance evaluation is becoming more pronounced as organizations try to implement new measurement systems to support organizational objectives [2]. These initiatives originated in the private sector, but recent efforts to improve government performance have focused on evaluation as a means of empowering policy-makers and bringing coherence for the decision-making process.

In the context of the new managerial approach, performance measurement and reporting are critical. For public managers, information on performance is the most valuable resource in decision making and strategic planning. Information on performance of programs, organizations and individuals illustrates managerial commitment for continuous development and

it also contributes to more efficient and effective fulfillment of objectives [4]. As for the accountability of managers, performance evaluation provides information to all stakeholders either within the organization (elected officials, other managers, employees) or outside (customers, citizens, civil society, entrepreneurs).

2. Defining performance for public organizations

Public performance is not an objective reality, easily available to be measured and evaluated, it is in fact a social construct, distinctly perceived by different stakeholders [3] and it must be defined broadly enough to include all key dimensions as they are perceived by the major stakeholders. The “classical” dimensions of performance have been considered *efficiency, effectiveness and economy*, but recent theories added other E's to the well-known trio, such as equity, excellence, ethics. Still, most evaluation frameworks focus on the first three.

Regardless the size, sector or activities, organizations tend to be interested in the same facets of performance: financial performance, performance of operations and processes, employee and stakeholders satisfaction.

In public institutions it is necessary to measure achievements and progress against objectives and managers must decide on how to make measurement relevant. That is why, some key measures with more features are more effective than a variety of single-faced measures.

The chosen evaluation system should also resolve the problem faced by many organizations the so-called “drowning in data”. Key measures should include those concerning: operational performance, financial performance and human resources performance [1].

3. Performance evaluation and factors affecting its utilization

The performance measurement systems were developed mostly in the 90's as a tool for private companies to support strategic management functions. The most popular system from that time was the Balanced Scorecard, created by Kaplan and Norton (1992, 1996). Initially structured for big private companies, measurement systems have been adapted and recently used for small and medium enterprises and even, the public sector. In the last two decades, the research literature on performance and its evaluation has been well represented and an important number of authors have approached this subject.

Performance evaluation shouldn't be seen as a goal itself or as single determining factor for the future of an organization. It should be in fact an instrument for gathering and reporting information, a support mechanism for public managers either to warn them about problems and difficulties, either to signal potential opportunities. It is also a way to increase accountability for spending public money, especially as the first performance measure frameworks were taking into account only financial data. While in the private sector the main indicator is profit, public organizations don't have generally accepted indicators for performance. In public organizations the concept should be analyzed in relation to program objectives, especially whether or not they were reached through appropriate outcomes.

Due to the characteristics of the public organizations, there are specific aspects that influence the design and implementation of these systems.

3.1. Factors influencing the design of performance evaluation systems

Defining and evaluating performance in public institutions is influenced by particular aspects [6]:

- *uncertainty* – there are external circumstances that influence the activity of the institution and the accuracy of performance indicators;
- *diversity* – because of the high number of stakeholders and their various interests, it is difficult to reach consensus on the

scope and objectives of the organizations and on the most appropriate evaluation method;

- *interdependency* – between the resources available and the decisions and organizational activities;
 - *instability* – social, economic, technological changes influence the policies, aim and objectives already set.
- In Saad's opinion [8], for local authorities an efficient performance evaluation is confronted with specific difficulties:
- each public service has specific characteristics;
 - the main scope it's not profit, it's offering the best services for the citizen;
 - there are many stakeholders, sometimes with conflicting interests and objectives;
 - individual expectations may be different from those of the community;
 - organizational results may be both tangible and intangible.

At the same time, based on past research and his own observations, Saad [8] argues that the effectiveness of a strategic evaluation system for public performance is determined by the following elements:

- evaluation criteria;
- level of importance or priority for each criterion;
- evaluation process itself, including those applying it and the way it's implemented, sequential or simultaneous;
- defining each criterion for each evaluated aspect.

Also interested on this subject, Rantanen et al. [7] initiated a study on three public organizations, in order to identify internal and external aspects that have important impact on measuring performance. The results are similar to those of prior researchers: conflicting interests leading to ambiguous objectives and unclear measures; many stakeholders affecting the unity of the evaluation system; the public servants don't understand the utility of the evaluation and they ignore it or resist it; too many persons responsible for evaluation lead to low accountability.

Orientation toward citizens is one of the main thesis of public management, but at the same time, taking into account all their needs and expectations, integrating them in the organizational objectives and in the

organizational performance standards are the most important problems in designing evaluation systems.

3.2. Factors influencing implementation of performance evaluation systems

In implementing performance evaluation systems, De Lancer Julnes and Holzer [5] suggest a classification for the factors influencing evaluation:

- *rational factors* – represented by: available resources, information acquired through training, goal orientation, external requirements;
- *political factors* – represented by internal interest groups, external interest groups and unions. The support from elected officials and citizen may come in two ways: by allowing the organization to devote resources to the effort of evaluation and by using information even when the results contravene a political agenda;
- *cultural factors* – represented by the attitude towards change and risk, the organizational culture. An organizations potential to evaluate performance depends on how open it is to change. This is evident if there are systems that reward innovation and risk taking, if management and non-management employees accept innovation, change and performance measures.

On the same subject, regarding influences on evaluation systems, studies on public organizations [General Accounting Office, USA, 2000] have identified possible impediments in successful implementation, including:

- identifying appropriate goals in an environment characterized by multiple and conflicting interests;
- measuring the performance of intangible or subjective goal/activities;
- deficiencies of the informational system;
- artificial increase of employee motivation for using performance information;
- low managerial commitment towards evaluation;
- low capacity of the informational system in offering valid, relevant, timely data with minimal costs.

As response to these impediments,

Cavalluzzo [2] suggests some positive influences of different organizational factors:

- explicit commitment of top-management for using performance information in decision-making;
- decision power delegated to those who use relevant information for performance evaluation;
- training regarding performance evaluation methods and instruments.

Other research studies offer a different classification of such factors: *technical factors* (capacity to supply relevant data on performance, capacity to develop measurement and analysis systems) and *organizational factors* (management commitment, level of decision authority, specific trainings, elected official mandates).

In order to implement performance evaluation in public organizations, it is important to analyze factors such as political support, management support, and analytical support. In addition, the impact of time must be taken into consideration, as some researchers have argued that it takes time to develop and implement appropriate and effective evaluation systems.

4. Conclusions

Designing and implementing effective performance evaluation systems should be an integral part of any public management system.

Performance measurement encourages the use of results for learning and improvement in public organizations and it also supports transparency, value for money and citizen involvement.

Still, due to the characteristics of public institutions and the difficulties in defining public performance as a concept, not all evaluation initiatives were successful and probably it will be the case for some future attempts too.

Analyzing the factors affecting performance evaluation must be a permanent preoccupation for public managers. Identifying and understanding these factors help organizations in reducing their negative impact and also in improving their managerial tools. An evaluation system must be sensitive to external and internal changes.

The design stage of evaluation is important as it should create an adaptive

structure that can integrate and respond to external influences.

The implementation stage strongly depends on internal commitment for evaluation and on available resources. Implementation is related to the organizational culture, and at the same time the performance information that results from evaluation must be used for improving internal working environment and organizational culture.

Performance evaluation brings benefits in decision-making and at the same time increases organizational accountability, both internal and external. In decision-making, evaluation is an important tool supporting diagnosis capacity, strategic thinking, managerial capabilities and organizational development. At the same time, through encouraging accountability, performance evaluation offers transparent reporting and determines citizen involvement.

Abstract

The purpose of this paper is to have an in-depth look into the phenomenon of risk assessment and risk management strategies in managing dry port operations as an integrated part into international containerized freight trade. The fact that world crises take the form of disruptions, bankruptcies, breakdowns, macroeconomic and political changes, and disasters leads to higher risks and makes risk management more and more difficult. This paper aims to discuss the theory behind the dry port concept and to explore the possibility of improving its management by increasing its economic performance by correlating it with new policies regarding risk strategies. The research provides managers with a direction for choosing risk management strategies based on the global supply chain environment. This study provides insights into the applicability of risk management strategies with respect to environmental conditions and it may also draw new directions for policy makers.

Key words: dry port, freight containers, risk management.

J.E.L. classification: D81, L92, R40.

1. Dry port and risk management concepts

One of the most recent definitions describes a dry port as “an inland intermodal terminal directly connected to seaport(s) by rail where customers can leave/pick up their units as if directly to a seaport” [1] with classification of dry ports [2]. It is important to note that dry ports developments are normally part of a national plan, usually

within the transport section. As such, dry port development programs have to fit with other national schemes and budgets. They often form part of a railway upgrading projects, but it may also be linked to highway construction, sea port expansion and similar transport links. The funding of dry port is related to the key actors as public sector and private sector or a combination of both. Many actors are involved in a dry port, each having its own strategy depending on its core business even if vertical integration could lead to overlapping to a certain extent. At the same time, various functions could be developed in a dry port depending on the actors involved. The most basic dry port is an inland terminal allowing the modal shift of the containers from barges or trains to trucks or vice versa.

Research carried out in 2007 [1] classifies dry ports as follows: close dry ports, mid range dry ports and distant dry ports. This classification is based on the distance between the seaports that dry ports are servicing and dry ports themselves. However, such a classification could not be sufficient in order to get a clear definition of the dry port concept. There is still a wide area for research regarding the concept and we will mention other criteria of classification as it follows:

- According to size (meaning how many TEU it can handle per year): small, medium, large and mega dry ports, which can be implemented in land-locked countries.
- According to means of access: depending on how many rail tracks and roads are in and out of the facility.
- According to value added services: as stuffing/stripping of containers, maintenance of container, handling and

storage of refrigerated/frozen and dangerous goods.

A summative definition, as observed from above, is that dry ports, having the word “dry” as a structural part of their name, are supposed to be viewed as different from inland intermodal terminals which have, in addition to standard dry port facilities, at least one inland waterway, by means of which goods can also be transferred by water means: either by barges, tugs, or other navigational equipment; moreover, its handling equipment is operated at a higher scale than that of dry ports.

There are still a lot of academic debates over dry ports definition and classification as the research field in container trade and inland logistics has been developing over the recent years.

The analysis of the literature on risk management in supply chains [3] led to the identification of three major gaps, in connection with operation of dry ports, as an integrated part in the supply chain. First of all, no existing definition adequately takes into account the unique dimensions of risk and risk management in a global supply chain. Secondly, strategies to address risks require increased attention. Although several studies provide a list of risk management strategies [3], these studies do not address the manner in which managers select among them, i.e. the precedents to global supply chain risk management strategies, and their consequences. Third, there is limited research on moderators of the risk management process [3].

- One definition of supply chain risk was developed and four types of global supply chain risks are defined.
- Another definition of risk management in a global supply chain context is developed. Rich descriptions of risk management strategies are provided and important antecedents to strategy selection are discussed.
- Three moderators in the process of risk management are explored, namely team composition, supply chain complexity management, and inter-organizational learning. [3]

We will provide a more thorough analysis on the assessment and management of risk go in the next section.

2. Framework for risk assessment and management

The proposed framework provides a means to assess the relative importance of codes and standards, good practice, engineering judgment, risk analysis, cost benefit analysis, company and social values when making a decision. It is an appropriate basis on which to improve decision making and will result in a more transparent process to the wider public.

The methodology used is called risk analysis (RA), and it was taken from the work of Giziaki and Giziaki [4]. This method is used extensively in other fields such as medicine and epidemiology. It has been applied to marine accidents by the authors. RA generally deals with the pathology of a system. It tries to quantify the risk resulting from the exposure of the system to certain factors and thereafter takes specific measures to control this risk.

Accidents related to maritime freight can be thought of as cases indicating a pathology of the maritime safety system. In this sense, these accidents create the conditions for employing the risk analysis technique. The technique is divided into risk assessment and risk management [3]. The task of risk assessment is to analyse scientific evidence in order to evaluate the relationship between exposure to certain factors and the potential occurrence of failure (accident), thus quantifying the corresponding risk. Then, risk management uses the results of the risk assessment procedure to produce a decision about actions to be taken.

Due to lack of extended knowledge on the issue, we must proceed towards grounded theory methodology. Grounded theory is a qualitative research methodology that allows the exploration of concepts, identification of relationships in raw data. Another advantage of grounded theory is the ability to handle a complex phenomenon such as risk management because the methodology emphasizes the need for developing multiple concepts and their linkages in order to capture the central phenomenon. Insights from the grounded theory study and existing literature were used to develop the model presented in the article by Manuj and Mentzer[3].

Further in this paper, the term ‘dry port’ is

treated as an inland container terminal which operates with freight containers, these representing an important aspect and integrated part of the supply chain management of the globalised international freight trade and worldwide logistics.

These and several other definitions provided by supply chain managers are consistent with the literature which suggests two risk components:

- possible losses (if the risk is realized, what losses will result and what is the significance of the consequences of the losses;
- probability of those losses (the probability of the occurrence of an event that leads to realization of the risk).

Therefore, risk is the expected outcome of an uncertain event, i.e. uncertain events lead to the existence of risks. These uncertain events are named “risk events.” While probability and impact of losses are the most commonly discussed dimensions of risk, two more risk dimensions - speed and frequency - are important in global containerization.

The speed of risk can be divided into the rate at which the event leading to loss happens, the rate at which losses happen, and how quickly the risk event is discovered. Coupled with increased lead times, lead time variability, physical distances from sources of risk, and less control over the supply chain, speed increases the magnitude of global supply chains problems.

Frequency is a measure of how often a similar kind of risk event happens.

The results of a study [4] show a striking conclusion - 60 percent of the accidents involved in pollution have occurred in regulated zones and ports, an aspect which increases the importance of proper inspections by port state controls. The risk assessment method used in the mentioned study has shown that tankers have an almost four times higher risk of causing pollution and this risk becomes more than double in bulk carriers. Despite the fact that laws are nevertheless important, case studies show that too many rules and regulations can also increase the level of risks. Some notifications here can be mentioned as results in an effective reduction of risk of accidental environmental pollution [3].

3. Elaborating risk strategies in dry ports operations

The complex system of network connections inside the supply chain and international logistics are inclined to disruptions, bankruptcies, breakdowns, macroeconomic and political changes, leading to higher risks and thus making risk management difficult.

The literature [3] suggests four categories of risks: supply, demand, operational, and security risks.

Supply risk is the distribution of consequences related to adverse events in inbound supply that affect the ability of a dry port to meet customer demand (in terms of both quantity and quality) within anticipated costs and time.

Operations risk is the distribution of consequences related to unfavourable events within the dry port that affect a firm’s internal ability to produce goods and services, quality and timeliness of production, and/or profitability.

Demand risk is the distribution of consequences related to unfavourable events in the outbound flows that affect the possibility of customers placing orders with the local dry port, and/or variance in the volume and assortment desired by the customer.

Security risk is the distribution of consequences related to unfavourable events that threaten human resources, operations integrity, and information systems; and may lead to outcomes such as freight breaches, stolen data or proprietary knowledge, vandalism, crime, and sabotage.

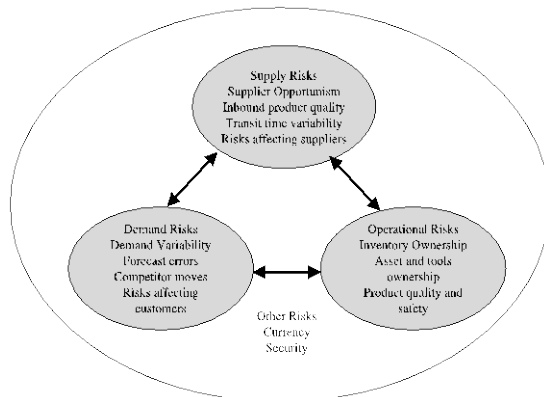

Another widely used classification [3], classifies risks as:

- macroeconomic risks associated with significant economic modifications in wage rates, interest rates, exchange rates, and prices;
- policy risks associated with unexpected actions of national governments and local authorities;
- competitive risks associated with uncertainty about competitor activities in foreign markets;
- resource risks associated with unanticipated differences in resource requirements in foreign markets.

The risk events most frequently

encountered by the global supply chain managers [3] were currency, transit time variability, forecasts, quality, safety, business disruption, survival, inventory (and tools) ownership, culture, dependency and opportunism, oil price fluctuation, and risk events affecting suppliers and customers.

Figure.1. Risks in the global supply chain

Source: Manuj & Mentzer, 2008

In the above-mentioned authors' article, six risk management strategies in the qualitative study, also supported by the literature, were specified: postponement, speculation, hedging, control/share/transfer, security, and avoidance.

Postponement refers to delaying the actual commitment of resources to maintain flexibility and delay incurring costs.

Speculation (also called selective risk taking) is a risk management strategy on the demand side that is the opposite of postponement.

Hedging is a supply side risk management strategy. In a global supply chain context, hedging is undertaken by having a globally dispersed portfolio of suppliers and facilities so that a single event (like currency fluctuations or a natural disaster) would not affect all the entities at the same time and/or to the same extent.

The importance of control, share, or transfer of risks takes the form of vertical integration, contracts, and agreements. Vertical integration increases the ability of a supply chain member to control processes, systems, methods, and decisions. Vertical integration may take the form of forward (downstream) or backward (upstream) integration, and is therefore, both a supply and demand side risk management strategy.

The global supply chain security

encompasses information systems security, freight breaches, terrorism, vandalism, crime, and sabotage. The security strategy is aimed at increasing a supply chain's ability to sort out what is moving, and identify unusual or suspicious elements.

The qualitative study [3] pointed to the existence of two types of avoidance strategies. The first type of avoidance strategy is used when the risks associated with operating in a given product or geographical market, or working with particular suppliers or customers, is considered unacceptable. The second type of avoidance strategy takes the form of overriding adverse events. Managers must understand the advantages and disadvantages of various risk management strategies, and must be able to seize the moment when they should be applied. Managers should also consider the composition of risk management teams, in terms of functions and orientations represented, to assess and manage the multitude of global supply chain risks. The risk management outcomes discussed in this paper also provide a direction to managers in the performance metrics which should be developed to assess the success or failure of the global supply chain risk management.

Thus, this paper is an important initial step in developing models of global supply chain risk management strategies. The area is rich in opportunities, both for future research and competitive advantage.

In 2008, Panayides and Song [4] showed that the scale can be used for benchmarking purposes in order to identify the level of supply chain integration of different terminals. Managers can assess the level of integration of different terminals, something that will allow container terminal managers to pursue a competitive strategy. Using this instrument would allow terminal operators to assess which variables and measures the terminal needs to improve upon.

Since the actors involved in containerised freight logistics increasingly focus on the provision of door-to-door logistics services, it is important for dry ports to strategically position themselves as able to facilitate the provision of high quality services to their users through integration with their supply chain, an assessment of which can be made by using this instrument. In addition, a measurement instrument may be used to

provide a ranking of the supply chain integration of terminals at the global level.

What is becoming increasingly important for ports as well as port users is not merely the efficiency of the port per se, but the efficiency of the supply chain that the port and its users are involved in. Port productivity and performance is therefore related to the effectiveness of the supply chain and, by integrating in the supply chain, ports and users can take advantage of complementary strategies and capabilities to improve performance.

Having as a departure point the above-mentioned risk assessment, with the introduction of supply chain systems in other areas of transportation like liquid and dry bulk, new possibilities of extending the study of dry ports' integration in supply chains arise [5].

4. Conclusions

The study takes a much needed step toward building a theory of risk management in global supply chains, which opens important future research directions. It should be tested in other contexts and with other methods to provide universality. This research provides direction to managers for choosing risk management strategies based on the global supply chain environment. Moderators have practical implications for the global supply chain managers. The study provides insights into the applicability of six risk management strategies with respect to

environmental conditions and the role of three moderators. The present paper can help policy makers to concentrate on actions necessary to protect ports and regulated zones from accidental environmental pollution, a risk which has now become more immediate due to their increased importance as links in the logistics chain next to dry ports.

Orientation and Integration of Volunteers in Organizational Culture

Ciucescu Nicoleta

“Vasile Alecsandri” University of Bacau, Faculty of Economics
ciucnico@yahoo.com

Abstract

For an individual to become a volunteer in a organization, he must ensure himself that he will be compatible with the values, standards and procedures of the organization. Multiple problems and failures, that may negatively affect both volunteer and beneficiary organization, can be avoided by a real knowledge of the organizational culture in which will act volunteers. Paper aims to analyze some aspects of organizational culture on one hand, and orientation and integration of volunteers, on other hand.

Keywords: volunteer, organizational culture, norms, NGO.

J.E.L. Classification: L31.

1. Introduction

The organization is a dynamic system that aims to achieve some goals and is influenced by social by social characteristics of its members, and also by external environment. Every organization consists of three elements of internal nature, between which it may observe a close synchronization, on one hand, and coordination, on other hand.

The first element includes the totality of formal and tangible characteristics, respectively, the *structure* of the organization. It refers to a number of issues, such as: official objectives and employed strategies, politics and rules, hierarchical relations and the forms of leadership and of exercising of power, existing resources within organization etc.

The second is the *culture*, which incorporates the values, traditions, beliefs, symbols and attitudes common to a group of individuals and supported by specific structural arrangements, which confer a basis of each organization. The culture has often a

strong influence on decisions' premises, on the behaviors and actions of managers, employees, volunteers.

The third elements refers to the *individuals*, leaders and staff of all hierarchical levels, they contributing to the creation and the change of organizational culture.

2. The concept of organizational culture

Generally speaking, the culture represents an assembly of definitions whom the people have at certain moment about what exists and happen around them – their representation of the world. In the sphere of culture are symbols, norms, laws, values, rituals, morals, myths that form a style that defines a specific way of each organization.

The organizational culture was defined in multiple ways along the time. The most representative definitions present organizational culture as follows:

“A learned and accepted set of presumptions about the norms (standards, rules) which regulate the behaviors of members” [Burke W.W. și Hornstein H.A., 1972];

“Is a model of common assumptions learned by the group learned once with the solving of problems, which proved functional and were considered valid in a sufficient measure to be transmitted to the new members as the correct way to perceive and approach the similar problems arose later” (Schein E. 1985);

“It is a unitary system of thinking of members of one group which make it different from other groups” (G. Hofstede 1991);

“The philosophy, values, presumptions, beliefs, expectations and attitudes which are common and act as a chain of the organization” (Sherman WA and Bohlander G.W., 1992);

“Organizational variables of the system

that, although difficult to define precisely, they exist and are described by employees in common terms; a system of accepted significations of organization’ members, which differentiate it from other organizations” (Robins SP 1992).

Thus, the concept of organizational culture refers to all that mean collective standards of thinking, attitudes, values, beliefs, norms and customs that exist in an organization. In cultural component may remark some visible elements like behaviors and common language, rituals and symbols, but preponderant there are components less visible, perceptions and representations of what is “value” in organization, myths, empirical standards about what means to work well and to behave properly etc.

The organizational culture is influenced by each of the elements mentioned above, but especially by the mood how this relate with the external environments, but also between them.

The organizational culture:

- mission of the organization;
- decision’s mechanism practised in organization;
- approaching mood of problems in organization;
- standards after which functions the organization;
- motivation / reward and / or reprimand practised in organization;
- traditions, habits and values that are promoted and transmitted into organization;
- degree of the adaptability of the organization at changes of social environment in which activate.;
- degree and mood of incorporation of the diversity in the structure of the organization;
- traditional partners of the organization;
- compatibility between the individual systems of values;
- motivation of the organization’s members to take part a long period in the organization;
- personality of the leader;
- individual personalities of those taking part in the organization;
- compatibility between individual personalities of the members of the organization;

- atmosphere at the working place etc.

3. Aspects referring to the discovering of culture of an organization

Like people, each organization has a unique personality and transmits itself organizational culture. The behavior of members, the approaching moods of problems and / or people entering in contact with the organizations, promoted values, habits and procedures of the organizations, chosen symbols to represent the organization (mission, logo, colours) etc., may represent as many characteristics that contribute to individualization of the organization.

In the goal that a future volunteer will discover the culture of an organization, it is imposed the realization of an analyse referring on behavioural norms, procedural norms and habitual norms within organization, by finding answers to a series of questions.

Behavioural norms:

People from organization are preoccupied on their colleagues?

- There is opportunity for everyone to ask questions to anyone?
- Can you get help from anyone, regardless of hierarchical positions they occupy?
- People in the organization rather act and think positively or negatively?
- There is a desire of permanent improving and excellence?
- There is a feeling of contentment to the place of working?
- What are the individual qualities most prized and valued in the organization?
- Procedural norms:
- Are included all organization members in decision making?
- The mistakes are encouraged?
- There are enough resources for the assigned tasks to be fulfilled?
- There is centralized authority or decision making at different levels?
- Everyone is encouraged to think about solutions to existing problems and to contribute solving them?
- What are the cultural groups represented in management structure and / or in the row of members of the organization?
- How are tackled and resolved the conflicts?

- Operates the organization according to a long term vision?

There are running procedures of consultation and cooperation

Habitual norms:

- Why people leaved out the organization?
- What are legends that were said about those who left?
- What are the relations with those who left?
- Why remain people in the organization?
- There are traditional partners of the organization?

4. Orientation and integration of volunteers

Volunteering is the activity done on own initiative, through which an physical person offers his time, knowledge, talents, abilities and energy in the support of others, but without receiving a financial compensation. In the frame of volunteering the options are as much as possible diverse, from social attendance and services to education, culture, religion, environment protection, health, art, sport, human rights protection an many others.

The orientation is the process of training of volunteers to have a clear relation with the organization and represents an opportunity for volunteers to become familiar with the organization and its concrete activities.

Trough orientation it will be provided accumulation by the new volunteers of all knowledges and abilities that are necessary to the activity of volunteering.

Thus, in order to conduct in a efficient way the activity, a new volunteer needs to know a series of basic informations, such as:

- description of general activities of the organization;
- description of target groups;
- mission and vision of the organization;
- programs and services that are offered by the organization;
- other organizations working in the field;
- future plans of the organizations;
- expectations of the organization from the volunteers;
- benefits of the volunteer from his activity;
- the moods to communicate within the organization;
- equipment that can use volunteer.

In a systematic form, previous informations which presumes the orientation of volunteers can be realized by following stages:

- introduction about the organization;
- presentation of the vision statement;
- presentation of the volunteers management system, respectively, of the policies, of working documents etc.;
- aspects related to organizational culture;
- rights and responsibilities of the volunteer and of the organization which are stipulated in the contract on volunteering.
- The orientation of volunteers is usually realized by oral way, by a discussion, although in the frame of NGOs is recommended to be an Manual / Guide of Volunteer, which has different roles:
- to communicate to volunteers information about the organization;
- to transmit clear, direct and in written form the expectations from the volunteers and their responsibilities;
- to present to volunteers the organization in a positive manner, in order to help them to adapt themselves by providing informations, which may indicate the role and place in the organization;
- to have a common basis of reference in case of disputes or conflicts.

In orientation session is very important that to volunteers to be gradually given vital informations they need, both to avoid around them agglomeration of the informations and confused estate, as in order that the information received on this occasion to be useful later.

Although for volunteer it is necessary to be introduced volunteer coordinator, who has an essential role both in orientation process, as in integration process, and also the team working within the organization.

Generally, integration represents reunification in the same place of several components, activities, production units or individuals, in order to obtain a common result (V. Popescu and A. Deaconu, 2008).

Many times, however, the orientation of volunteers is not sufficient and should be completed with full training program in which volunteer coordinator should:

- a. develop an orientation program for volunteers;

b. support the employees to work with volunteers;

c. develop training program;

d. prepare training materials (manuals, brochures etc.).

In an NGO, integration ensures assimilation of the volunteer and his adaptation to the requirements of the group to which he belongs. New volunteers need support to fit the existing team, especially because of multiple informations from this environment which is new for him.

Integration of a new volunteer takes end when this is able to perform correctly the tasks of the position he occupies. It is necessary to try providing as much as possible good correlation between aspirations of new volunteers and demands of the organization, leaving them the necessary time to a good knowledge of both the function and the organization, as a whole.

5. Compatibility of individual culture and organizational culture

Volunteers wishing to participate in various volunteer programs should first find out if a certain organization has an organizational culture that can be compatible with their own individual culture. In this sense, the volunteer should undergo a test which highlights a number of key words, written in capital letters, grouped in two sets.

Questions about yourself:

- I always tell the TRUTH?
- I am COMMUNICATIVE?
- I always work in TEAMS?
- I invest ENERGY into daily work?
- I PARTICIPATE in decision making?
- I am well PREPARED for the activity I will perform?
- I LIKE really the people from this organization?
- I NEED really to activate in this organization?
- If I have decision making I could CHANGE something in good in this organization?
- I think I will INTEGRATE myself in this organization?

Questions about organization:

- In this organisation it is saying always the TRUTH?
- In this organisation people are

COMMUNICATIVE?

- In this organization it is working in TEAM?
- People in this organization invest ENERGY into daily activity?
- In this organization all members PARTICIPATE in decision making?
- In this organization people are well PREPARED for the activity they perform?
- People from this organization LIKE me really?
- It is a NEED of me in this organization?
- If I propose a CHANGE in this organization, my proposal will be taken into consideration?
- Will I be ACCEPTED in this organization?

The volunteer will accord to each question from two sets a score from 1 (false / disagreement with the statement / not applicable) to 5 (true, full agreement with the statement / applicable). The limit of compatibility is established by each volunteer according to his beliefs, standards and / or rules which guide his behavior.

6. Conclusions

Both people with whom he will work, and the organization in which he will work, will have an important role in the success or in failure of achievement of the desire of the individual to be volunteer.

For an individual who wants to become a volunteer in an organization, the easiest criterion for choosing the organization is its domain of activity. A number of other aspects, such as image of the organization, what kind of activities were carried out till now and what is the culture of the respective organization must be taken into account. So it is necessary to know what is the personality of the organization, what are its characteristics, what is the mood of functioning and what are the principles on which people are integrated and accepted within the organization.

mihaela_constandache@yahoo.com

Radu Steluța

Agricultural Science and Veterinary Medicine University of Iași, Agriculture Faculty
stelaradu2010@yahoo.com

Abstract

Food quality is a concern because it directly affects the health of the population.

In Romania, fruits, vegetables, fish, milk and dairy products consumption is even lower than nutritional recommendations resulting in a lower contribution to the need of nutrients such as potassium, calcium, vitamin D, polyunsaturated fatty acids and therefore reasons for concern to ensure the health of population.

It is recommended the consumption of the so-called „dense nutrients” which provide vitamins, minerals and other substances with favorable effects on health but low in calories, such as: vegetables (except for potatoes), fruits, whole grains, milk and other dairy products partially or completely defatted, fish and sea fruits, lean meat and chicken meat, eggs, legumes, fruits, prepared without added solid fats, sugar, starch and salt.

Key words: food consumption, quality of food, biologic active compounds, dense foods, nutritional recommendations

Classification J.E.L.: I 15 - Health and Economic Development

1. Introduction

Beyond the common trends manifested in the diet for each region and each nation, certain particularities are distinguished.

Romanian food specific for each period was grafted by the historical particularities of the time, by the socio-economic development level and not least the adopted lifestyle. After 1980 Romanian eating habits start to be

gradually characterized by chronic imbalances typical for modern human diet, including excess caloric intake of fat and carbohydrate (especially from concentrated and refine sources), but also by the uncontrolled usage of food additives through rigorous mechanisms, alongside stands insufficient consumption of animal proteins vitamin deficiencies that are based on insufficient intake of fruit and vegetables and low calcium intake, phosphorus and iron (especially with children, women and elders).

One can appreciate the fact that the socio-economic transition period after 1990 is characterized by a decrease of the living standards, accompanied by inflation and unemployment extension, all these resulting in nutritional imbalances widening, especially in deeply disadvantaged groups by this evolution such as children, elderly, unemployed, and alteration of health more frequently and more severe. For years, the majority of budgets of most families in Romania have been directed at trying to cover the daily requirement of food, many high quality products are, unfortunately, less accessible because of financial impediments.

2. Romanian’s food consumption during 1990-2010

Romania has one of the largest share of food expenditure among the 27 member states of the European Union, being 2.63 times higher than the 27 European Union average. The magnitude of this percentage decreases with the increase of the purchasing power, which confirms Engel’s law of consumption.

Although expenditure indicator has indicative average value and hides important

variations within each state, it provides an image of the low living standards in Romania compared to EU states, measured by the importance of food expenditure in the budget of families reducing their size increased opportunities for consumer goods and food services. Even in comparison with the less developed states from Europe, Romania has a high share of food expenditure in total consumption expenditure, almost twice as Estonia, Hungary and Malta, which suggests the fact that the convergence process of consumption patterns specific to the European Union is a long one.

The comparative analysis of the main groups of food consumption, per inhabitant, in some EU countries (table 1) indicates the fact that in Romania, cereal and cereal consumption products is higher, while milk and dairy consumption is among the highest. All these, together with low augger and butter consumption (table 1) represent some of the most positive features characteristic to a balanced diet. Instead, meat consumption is the lowest among EU countries, its structure being unbalanced due to the very high proportion (51.72% from the total meat consumption) of pork meat and of a relatively small share of poultry and cattle respectively. This, together with relatively high consumption of potatoes, is evidence of a subsistence diet, which could lead to the installation to powerful diet imbalances that could lead to nutritional deficiency diseases.

Table 1. Average consumption of food, per capita, in 2009, corresponding to several EU states

nd - data not available

Processing after Eurostat

The analysis of daily average consumption, per inhabitant, expressed in kcal (figure 1) compared to average daily caloric needs, per inhabitant, being calculated considering the structure of the population

from Romania and FAO recommendations, shows a surprisingly dietary caloric surplus of 20%, during the period 1990-2000, in the context of real average earnings decreased, probably maintained by the consumption of cheap calories, while for the 2001-2008 period to increase the caloric surplus at 24-33% compared to the needed one, and after the year 2008, following the registration of a new decline in average real wage in the surplus population to decrease at 27.2% of required.

Reducing food quality in Romania during 1990-2000 can be highlighted by reducing protein intake by 3.16% in 2000 compared to 1990. More than that, the proportion of animal protein, with high biologic value, is inferior to the proportion of vegetable protein and recommended value of 50%. During the period 2000-2010 food quality slightly improves, fact noted by the increasing protein intake with 1.51% than the one for the year 1990, as well as by the increase of animal protein with high biological value. Thus, in 2004, the share of animal protein, with high biological value, equals the share of vegetable protein and the dietary recommendations, while for the year 2005 the proportion of proteins with high biological value to exceed 50%.

Figure 1. Evolution of average daily consumption, per capita compared with the recommendations

Processing after National Institute of Statistics

In the balance between fat intake and lipid requirements, the 1990-2000 period can be considered as fairly balanced, while starting with the year 2001, due to the increase of

consumers' real incomes, increase fat intake to a maximum of 32.7% than required, in 2006, as for later to decrease slightly, up to 24% than required (for the year 2010). Analysing structural fat intake an imbalance can be observed, imbalance to the nutritionists recommendations, determined by a share of more than 10% saturated fatty acids, at the expense of polyunsaturated fatty acids intake which is well below the FAO recommendations of 10%. Starting with the year 2003 an intake of fat is found over 35% of average daily energy intake, which can be associated with the increased intake of saturated fats and daily caloric intake, promoting obesity.

The largest imbalance between intake and the need to register for carbohydrates, due to high food intake of grains and cereal products, that in the context of lower levels of income in Romania, contributes to a high proportion to ensuring the caloric needs (over 40%, compared to up to 30% in developed countries). In this way, the imbalance between the carbohydrate intake and requirements are noted throughout the analyzed period, being continuously increasing from 21.78% in 1991, to 46.16% in 2003, when, due to higher incomes, it begins to decrease reaching 32.7% in 2010.

Disaggregating caloric consumption by type of family, it suggests potential nutritional deficiencies among poor families. Thus, average caloric consumption in families of unemployed was less than the minimum amount recommended for adults by nutritionists (2450 cal), calculated considering the consumption basket required for a healthy life. Therefore, at the level of 1999, families from the 1 income decile had an average daily consume of 2036 cal, below the one recommended by nutritionists for a healthy life.

There are signs of nutritional deficiencies in the more numerous poor families, since poverty was systematically associated with a high family size. Most frequently, the victims among these families, are children. Food quality is poor in low income families, standing lower share of animal proteins, on lower purchasing power for meat and dairy products. The dominant share of these families and especially caloric protein consumption is represented by vegetable products, animal calories representing on

average only 25%, actually considered an indicator of poor food quality.

The analysis of nutritional factors in consumption by deciles of income suggests that with the increase of income, a reduction in calorie consumption share of plant products, especially in the protein has taken place. In the same time, the increase in education level is accompanied by a reduction of animal fat, which shows a possible positive association between this variable and the knowledge level of healthy eating .

Figure 2 presents what can be called a typical Romanian food, which is based on grains and cereal products (bakery products, maize, etc), milk and dairy products and meat and meat products, potatoes, vegetables, fruits and fish products. One can appreciate that Romanian diet is close to the one from the Mediterranean countries (high percentage of grains and low of meat).

Figure 2. Caloric intake of major food groups in Romania, in 2010

Processing after National Institute of Statistics

Respecting religious traditions, especially within the countryside families, creates the opportunities for deficiencies of protein and calcium, due abstinence from animal products, during relatively long periods of the year. Families with low incomes among the unemployed and pensioners constitute a special risk group.

Deficiencies of vitamins and minerals, especially in children, can have long-term dramatic effects: impaired due to vitamin deficiencies, anemia due to the reduced rate of absorption of iron from food, especially in

children with vitamin C deficiencies, high risk of diarrhea and respiratory diseases caused by lack of iron.

The structure of caloric consumption in the year 2010 does not reflect any major signs of concern, the proportion of protein (14.13%), carbohydrates (57.39%) and fats (29.23%) being close to the OMS recommendations. Regarding the consumption structure in depth, although fat consumption is within the limits of nutritional recommendations the high percentage of saturated fats (by the consumption of pork and animal fats), increases the risk of cardiovascular diseases, actually supported by a high rate of cardiovascular disease in Romania, one of the highest in the European Union. Examining the incidence of mortality by specific categories of diseases of the circulatory system, it is shown a very high incidence of especially cerebrovascular diseases, women being more vulnerable, a distribution different from the distribution of ischemic heart disease.

Another cause of high incidence of cardiovascular disease is the relatively high egg consumption associated with high cholesterol intake. Thus, according to a study performed by prof. Dr. Cintează, M. in December 2010, 30% of the population from Romania, both at the urban and rural level, presents a high level of cholesterol, while 42.6% among people aged over 70 record a high level of serum cholesterol which explains the high rate of sudden death caused by stroke. Over 30% from the Romanians have a high level of cholesterol and approximately 40% are hypertensive, the consequence being that 2 out of 3 Romanians die from cardiovascular diseases compared to the situation in the traditional core of countries in Western Europe, which have been popularized as the devastating effects of high cholesterol, from the same cause 1 out of 3 Europeans die. One can appreciate that this phenomenon is caused by poor education on diet and induced risk of high cholesterol. Therefore, in countries with a traditional diet rich in fiber and low in cholesterol, diseases such as colon cancer, diabetes and cardiovascular diseases are much rarer than in Western countries.

As it can be observed from the analysis consumption of the population from

Romania, a number of food or food components are consumed in excess, which increases the risk of chronic disease. It is the high consumption of saturated fats (food rich in saturated and trans fatty acids) cholesterol, salt and even alcohol.

The body uses a quantity of saturated fatty acids to support structural and physiological functions, but their food intake exceeds by far the requirements in meeting these needs. Several studies indicate the fact that the high intake of saturated fats is associated with high levels regarding both the total content of cholesterol in blood and LDL-cholesterol levels, considered important risk factors for cardiovascular disease. The diet of the population of Romania intake of animal fats is 15.5% from the total daily energetic intake, which exceeds the experts' advice, this largely due to the high consumption of pork and animal fats. In order to reduce the intake of saturated fats, the consumers should limit their consumption of foods rich in animal fats, replacing them with foods high in monosaturated fatty acids and respectively polisaturated ones. If the decreasing consumption of butter is analyzed against the backdrop of margarine, we can say that the first step was taken, but it is not enough. In this respect it is recommended to use low-fat dairy products, weak meat, the increase of dietary chicken meat and especially fish.

Following the analysis of food consumption of population from Romania, there was high cholesterol food intake, over 450 mg cholesterol / daily, the most important sources being the eggs, pork meat, beef, whole milk and high fat dairy products. Cholesterol intake can be reduced by limiting the consumption of these foods high in cholesterol. Cholesterol intake from foods was associated, for some individuals, with increased LDL-cholesterol. However, this effect is reduced when the intake of saturated fatty acids is reduced; the potential negative effect of cholesterol is lower than that induced by the presence of trans-saturated fatty acids. A series of studies has demonstrated the relationship between the high level of cholesterol and the increased risk of cardiovascular disease. Thus, nutritionists believe that the consumption of cholesterol below 300 mg /daily ensures maintenance of normal serum cholesterol level while the consumption below 200 mg

/daily can reduce the risk of cardiovascular disease.

Sodium is a macro element required by the body in relatively small amounts. Numerous studies have shown that increased intake of sodium in the body is associated with increased blood pressure. On the other hand, maintaining normal blood pressure reduces the risk of heart disease, congestive heart failure and kidney disease. This is the reason why for the sodium intake to be limited to 5g/ daily, that is 2 g /daily in people aged 51 and those people with hypertension, diabetes or those who have a chronic kidney disease.

Salt consumption in Romania, in 2010, according to a study performed by Zugravu, C.A. (2011) is of 11,25 g /daily, the biggest contribution being that of homemade food (soups/broths/cooked food), followed by homemade meat and bread (figure 3). Cheese, salty snacks and meats, although having a high salt concentration, due to their limited use, their net contribution is low [1].

Figure 3. Percentage contribution of each type of food to daily salt intake

3. Recommendations to correct certain nutritional aspects

In Romania fruit, vegetables, fish and even milk consumption and dairy products are inferior to nutritional recommendations, which determine a lower intake than the need for some nutrients like potassium, calcium, vitamin D, polysaturated fatty acids and therefore of concern to ensure the health of the population. In order to avoid maintaining these potential long term gaps, with adverse implications on the health status of the population, the following recommendations can be made:

- Increase the consumption of fresh fruit and vegetables;

- Reduce the consumption of potatoes and increase the consumption of vegetables and legume;
- Replacing refined cereals with whole ones;
- Increasing the consumption of partially or completely skimmed milk products, foods and beverages fortified with soy;
- Diversification of protein in the diet: fish and sea fruits, lean meat, poultry, eggs, legumes, soy products, unsalted fruits;
- Decrease in food weight of pork and the increase in meat eating fish and seafood;
- Reducing foods high in solid fats with other lower-calorie or high aromatic oils ;
- Replacing the consumption of solid fat oils, whenever possible [2].

The biggest challenge for consumers is that these recommendations careful control the body weight. That is why it is recommended the consumption of certain „dense foods” which provide vitamins, minerals and other substances with favorable effects on health but with low calorie intake. These foods are rich in dietary fiber, but do not contain or have a very low fat content of solid fats, sugar, starch, sodium or high sodium containing compounds. Legumes (except for potatoes), fruits, whole cereals, milk and partially or totally defatted dairy products, fish and sea fruits, lean meat and poultry, eggs, legumes, oleaginous fruits that are prepared without prepared added fat solids, sugar, starch and salt are considered nutrient dense.

There are three arguments behind the recommendation to increase consumption of fruit and vegetables. The first one is that, most of fruits and vegetables are the main source of certain nutrients whose food intake does not equal the daily needs of the body, namely magnesium, potassium, calcium, dietary fiber, vitamin A, C, folic acid, making it a concern to ensure the health of the population. Secondly, fruit and vegetable consumption is associated with reducing the risk a numerous chronic disease. Thus, there are evidence in this regard, that a daily consumption of 2¹/₂ fruit and vegetable portions reduce the risk of cardiovascular disease, including myocardial attack and stroke. Furthermore, certain fruit and

vegetables can have a protective role against different types of cancer due to their high content in antioxidants. In the third place, most fruit and vegetables, when consumed fresh or prepared without added fats or sugars, have a low caloric content, which allows a good control of daily energy intake and body weight default.

Although Romanians diet contains a sufficient quantity of cereals, a problem that could have serious repercussions on the health of the population draws the attentions that are the even higher share of refined grain products rich in fat and sugar solids to the detriment of whole cereals. Whole cereals are an important source of iron, magnesium, selenium, vitamin B complex and dietary fiber. There are studies supporting that whole cereal intake reduces the risk of cardiovascular disease and it is associated with the reduction of body weight and the incidence of type 2 diabetes. In this way, to keep the daily energy intake within the recommended limits and to have a better weight control, at least half of cereal intake should be represented by whole cereals, the remaining cereals being required to be fortified with several vitamins and minerals.

With regard to protein intake in the diet of Romanians, these may be considered appropriate in terms of quantity but not quality.

Fish consumption among the population of Romania is very low and it is recommended to increase further because, among other nutrients, it represents an important source of fatty acids Ω -3 type, and eicosapentaenoic acid (EPA) and docosahexaenoic acid (DHA). There are studies which demonstrate the fact that weekly consumption of 225 g of fish or sea fruits ensures the body a weekly intake of 250 mg/daily EPA and DHA, which is associate with the reduction of death caused by cardiovascular disease. Furthermore, it has been demonstrated that this food intake in pregnant women or those breast-feeding is associated with improved health status of children, especially in terms of cognitive and visual acuity.

4. Conclusions

The analysis of food consumption of the population revealed that a number of nutrients are below recommended values:

vitamins (especially A, B, D), calcium, due to low consumption of fish and lower consumption of dairy products recommended by nutritionists, vitamin C, folic acid, iron (due to low consumption of fruit and vegetables).

The increasingly higher share of refined grain products rich in fat and sugar solids, to the detriment of whole cereals, may represent a health risk which must be corrected.

It is recommended the increase of fish and fish products consumption which would ensure an adequate intake of polyunsaturated fatty acids of type Ω -3, with positive effects in ensuring the health of the population. It is also recommended the increased consumption of meat and a special focus on the percentage of pork whose increase could contribute, together with other factors, to the increased risk of cardiovascular disease.

Correcting all these consumption deficiencies of the population from Romania is absolutely necessary to achieve and maintain the health of the population, in order to avoid nutritional imbalances that could lead to the increased risk of chronic diseases.

Occupational stress reduction, between theory and practical case

Cruceru Raluca

Economic Studies Academy, Bucharest, Romania,
cruceruraluca@rdslink.ro, raluca11c@yahoo.com

Abstract

This article includes 2 parts: theoretical elements and a case study. Theoretical elements define and explain concepts such as: stress, stress management, organizational change and counseling.

In the case study these elements are applied on a research unit development. The reason for this analysis was to understand and try to find solutions for an existing tense situation in the analyzed company. Work methodology included: observation, direct discussions with staff (in small groups) and the application of a questionnaire consisting of 6 modules. On that base, major dominant stressful manifestations were determined. Following, the obtained results solutions have been proposed to management and employees. In the last part the obtained results from the implementation of some of proposed solutions are presented.

Key words: Stress, management, counseling, organizational change, results.

J.E.L. Classification : J2, J24, M54.

1. Introduction

Whatever we do in life, we often experience stress. A study conducted by Reader's Digest in 15 European countries showed that, at present, the Romanians have "managed" a spectacular counter performance: we are number 1 in Europe at perceived level of stress: 52% believe that stress is the greater health problems, compared to European average of 33%. Stress is not necessarily negative, characterizing it as negative or positive stress depending on each particular situation. Up to a certain limit, the stress is even motivating to business.

2. Theoretical elements

Stress. Positive stress is necessary for our protection, for example in case of an accident

by mobilizing all body resources in order to avoid it. In this case, we speak of a positive stress because in a stressful situation, typical stress reactions of the body show - heart begins to beat faster, the brain receives more oxygen, the muscles are tense and so on - but for a positive resolution of the situation.

The negative stress is a reaction to the inherent psychological stressors demands that have the potential to make a person feel tense and anxious, because he or she is not able to face these demands. It is a tension that arises when a person responds to job demands, family and other external sources as if they were generated by its internal needs, obligations and self-criticism. Stress is both additive and cumulative. In time it accumulates up to the state of crisis when symptoms appear. These can manifest physically by: irritability, anxiety, concentration decreased, frustration and hatred. Also physical symptoms can occur: muscle tension, headaches, back pain, insomnia and hypertension. Untreated, symptoms may lead to illness and even death.

Stress management refers to:

- Identifying causes which produce and adopt measures such as: individual responsibilities change (reduction or increase them); increased autonomy in carrying out tasks; agreeing to employee goals; providing appropriate training (e.g. in time management techniques); allowing adoption of a flexible schedule; offering professional and personal counseling; improved working conditions; employee relocation; providing access to the sports centers (e.g.: Many Japanese companies insist their employees workout at the beginning of a working day).
- Helping employees in developing the capacity to cope better with stress by: providing counseling services; organizing working sessions on stress; sports and social activities; training in

relaxation techniques; serving meals and providing spaces for adequate rest.

- Counseling is essentially a discussion (a series of talks) between the person who needs help (the client) and another person who masters the techniques of counseling. Managers should know such techniques if they wish to solve effectively their subordinates' problems and obtain maximum results.

Counseling is a process that helps clients to:

- 1) identify the problem;
- 2) determine which would be ideal or preferred outcomes;
- 3) explore ways of achieving results.

Besides the specialists within the human resources compartment (economists, sociologists and psychologists) an extremely important role falls upon managers at all hierarchical levels, from top managers to team leaders because they are the ones who work directly with people, who create a climate, those who know them best and who can think, with the support of specialists, the best solutions and most important, who can actually implement them.

Organizational change. In contrast to stress management and assistance programs for employees, some organizations try to reduce stress by using a specialized consultant who is responsible for recommending some ways for improving working conditions. This approach is the most direct way to reduce stress at work. It involves identifying the most stressful aspects of work (e.g. overwork, conflict) and design strategies to reduce or eliminate the identified stressors. The advantage of this approach is that it treats directly the main cause of stress at work. However, sometimes managers do not agree with this approach because it involves changes in work routine, production schedule or in the organizational structure.

As a general rule, actions to reduce stress at work should pay particular attention to organizational change in order to improve working conditions. But even the most conscious efforts to improve working conditions are unable to eliminate stress completely for all employees. Therefore, a combination of organizational change and

stress management is often the most useful approach to prevent stress at work.

3. Case study: research and development unit of public utility.

3.1 Methods

In order to identify stressors, the following methods were used: passive observation (a 3 days period), informal discussions and an inventory of stressors.

Passive observation - Simple observation was done over a period of 3 days, direct, discontinuous. Data were recorded following each stage of observation. The purpose was to make an observation of the original image on the environment, activity and behavior caused by this environment. By observation we distinguished characteristic manifestations from the random ones.

Informal discussions - were held in small groups (2-3 employees) and focused on grievances, problems and difficulties they meet in their work. Conversations with employees were the most direct way to find out details of the motivations, aspirations, emotional experiences, interests. Following that discussion an inventory of stressors was made. This inventory was then submitted to all employees and constituted the support for differentiation of stress levels present at employees.

In order to complete the data a 6 modules questionnaire on stress at work was used:

I. Work requests: My work requires me to work very quickly. My job makes me work hard. I am not required to provide a large amount of work. I have enough time to finish my work. My work requires me long periods of intense concentration. My tasks are interrupted before they are finished and I will have to pay attention to them later. My job is very hectic. Pending due to other colleagues or departments slows down my work.

II. Decisional authority: My job allows me to take many decisions. At work, I have little freedom to decide how to do my work. I can determine the order in which I finish my tasks. I can determine when I need to fulfill a task. I can easily go away from work for a short period. I can set my own working rhythm. I feel that my work gives me a place in the community.

III. Abilities: My work requires me to learn new things. My job involves a lot of repetitive work. My work requires me to be creative. My work requires me a high level of skills. I have to do different things in my work. I have the opportunity to develop my specific skills.

IV. Working contract terms: I can determine when to start and finish work. I can determine when I need a break. I know my work schedule a week before. I can determine when to take my holidays. The health and safety norms are well known and respected. Prospects for my career development are good. In five year time, my skills will still be valuable. I have the opportunity to attend training courses, specialization and training. My wages is satisfactory.

V. Bosses and colleagues' aid: The atmosphere at work is good. Most of the people irritate me. If needed, I can call in for help one or more colleagues. Where I work, daily order is good. My work is properly appreciated. I'm informed about the situation of the company. I feel free to discuss problems and complaints with companies' management. My suggestions regarding changes in working practices in order to streamline work are taken into consideration. Magazine company (if any) is useful. If there is no magazine, don't answer.

VI. Socio-demographic: Sex; Age; Marital status; Family component: number of members.... out of which children; Training level; Activity field: public service; other: research projects; Personal income; Income per family member; City: Bucharest

3.2 Stressors inventory

The following dominant stressors resulted from discussions: complaints about career: the impossibility of advancement; conservatism in terms of job design; conflicts with superiors, colleagues, subordinates and customers of the company; contradicted requirements from the institution; unstructured or unclear objectives; inadequate resources; conflicts between the needs and expectations; bad working conditions (noise, faulty lighting, lack of performing equipment); inadequate time management; routines; overload; poor management of potential and skills of

employees in the way of not-exploiting resources, capacities, skills; responsibilities on other people; unrealistic deadlines, inadequate schedule; conflict between home demands and those from work; lack of free time; family and housing conditions; financial status; insufficient sleep; legislative changes; the risk of occupational diseases; poor communication.

The substantial presence of following stress indicators was noticed: high level of sickness; headaches and stomach aches; mental states such as absenteeism, apathy, embarrassment, boredom, dissatisfaction, fatigue, alienation, anger or irritability, negativism; low productivity and inability to achieve the objectives set forth; increased error rate ; increased number of internal conflicts between employees, excessive rate of staff fluctuation, phenomenon increasing while time passes by.

3.3 Proposed Solutions

Because a fairly large number of employees expressed dissatisfaction about the same issues, we believe that these are active factors of stress. So the stress reduction strategy will focus mainly on reducing them.

The solution we proposed is a combination of a stress management with organizational change.

It is necessary to be mentioned that the contribution of both parties, especially their readiness to achieve a positive result, respectively a not tensioned and productive working atmosphere, an environment in which the human potential that exists in the organization is able to express and develop.

Thus, after the analysis, the following recommendations can be made:

For management:

1. It is recommended: that specialized programs, involving all employees at a time, are to be developed, in order to enable wider perspective on the possibilities offered by working with companies' clients. Apart from these courses, there may be some changes within the institutional behavior by promoting friendly attitudes between management and employees of the institution. These can start from the management or from the employees. In this way the managements' image of the

employees may improve and the employees can evaluate, diversify and develop professional capabilities.

Participation in specialized courses enables interaction with other leading business media and professional re perception of the employees' activities.

Evaluation of this strategy can be made after at least 6 months, time required in order to assure the participation of at least one set of employees at specialized courses related to the effects of less formal atmosphere due to behavioral changes. A form of assessment could be done through interviews.

2. To improve communication between management and employees, besides the possibility of friendly relations, meetings can be organized involving both management and employees where they can express every opinion. An indicator of good communication is the degree in which the chief and subordinate agree on job issues and each is sensitive to other's point of view. It may be that the parties "agree they disagree" in some respects. These meetings aim to present several points of view and to emphasize that those can lead to expected results. Agreement between the parties "implies increased confidence in the professionalism of others. Training team work spirit aims to increase the efficiency by improving interpersonal relationships, clarifying goals and roles (what is the team trying to achieve and who is responsible?). It can thus facilitate communication and coordination. Training team spirit usually begins with a diagnostic session, "often kept out of work, in which the team examines their current level of functionality"[4]. Because our group' main factor of stress involves extended working hours, the opportunity of doing these sessions away from the workplace is appropriate.

3. Defining jobs in a manner that allows a maximum freedom of exercising the skills and discernment of the job' owner, in order to maintain the interest for the position.

4. Design activities so that the employee should have a certain degree of responsibility, sufficient authority and the right to participate in decisions that influence its activity.

5. The way employees are treated should give confidence about job security and the position they occupy in the institution.

6. Employees must be treated with respect. Addressing inadequate generally leads to conflicts, and when they cannot show it creates a complex kind of "impotence" which maintained, creates a constant state of stress.

7. Providing counseling services for employees, internally, using their own qualified advisors, or resorting to the services of an outside consulting organization. In this way the organization obtains several advantages using minimal resources. For example: a good external image (the company is interested in the welfare of employees), different employees' attitude towards the management of the institution (including reducing of conflicts frequency), compared to the work they perform, high efficiency, intellectual comfort and so on. In terms of resources used, comparing the financial problems that may arise from inefficient work or staff fluctuation, it can be easily concluded that in fact this will not be considered a substantial effort.

8. Create optimal conditions for work – adjusting locations in accordance with occupational health, providing required equipment in order to perform duties.

9. Where there is lack of possibilities for material reward, it is recommended to provide other facilities, e.g. granting time off, merit and performance recognition in public.

10. Identifying the right person for a specific job - execution, management. This may lead at the same time to: the optimal use of human potential, rewarding the deserving, avoidance of conflicts arising between employees on grounds of incompetence, unnecessary loading of the work of some others, allowing the direct superior to delegate his power because he will do it efficiently.

11. Implementing a management system that takes into account the fact that people have also have family problems, such as taking children to kindergarten, and therefore to accept the request of the employee to a flexible or lagged working program. Thus we obtain multiple benefits: the employee is satisfied that he/she is understood and helped, personal problems are solved, and the institution benefits from a stable committed and flexible enough employee (considering that they agree to the working conditions and benefits they get from the institution).

For employees:

Learn to manage stress in order to ensure long-term professional success and to maintain physical and mental health:

1. Change of perspective. For those employees who think the employer requires too much (quite a big number), it is advisable to check if the problem lies within its personal organization or the way that the department is operating. It is better to turn to a career counselor to make an action plan, which will lead in time to the intellectual and personal comfort.

2. If tension or stress is felt, a five minutes break it is recommended outside the working space, away from work routine. There has been noticed in time that this contributes to a significant stress decrease.

3. Respect the time dedicated to family or itself. It is important to leave work at the office, in all the cases. Decreasing personal time in favor of the professional one has proven to be a powerful stress factor, regardless of the individual position on the social ladder.

4. Organizing the workplace and tasks, keeping a list of priorities and supervising them. Feeling overloaded and out of control are situations that cause stress.

5. Manifestation of personal feelings towards a close person. The existence of support, of a person who wants to listen, helps relaxation and reduces stress.

6. There certainty that help exists in situations of overload will decrease the tension. But that relationship should be work both ways, from the transmitter to the receiver and back, because in time, roles can reverse and the one who help in a certain situation must be sure that the same support will come back from the one who's been helped now, when a similar situation should appear.

7. Laugh therapy. Almost any situation can be detensioned through a joke or a good disposition created by a man with a sense of humor.

8. The employee must be realistic. Too high and unrealistic expectations of what can be done in a day, week or month can cause negative feelings. High levels of stress negatively affect motivation and influence professional outcomes. In time, a very capable and performing professional, but unmotivated properly, will come to point of not providing appropriate outcomes.

9. The idea of perfection has to be dropped. No one is omnipotent. Failures don't have to be lived dramatically, but viewed positively and considered ways of learning from their mistakes.

10. A positive attitude is recommended, avoiding negative people with a bad attitude because they can "contaminate" others with their behavior. Negativism destroys energy and motivation. A positive atmosphere needs to be created around people with which one interacts and within the working environment. Achievements should be a cause for joy, even when nobody else feels the same.

4. Implemented solutions – Obtained results

Following the analysis and the proposed solutions, management has decided to organize a team building outside the city, involving a part of the company's staff.

Although the main purpose of the delegation was work, the delegation's evolution from a psychological and behavioral perspective was a positive one during the three days.

Starting from a general and permanent state of stress, manifested in various ways, from the high tones of voice to expressed depressions, in the second night a state of relaxation and good communication within the team was reached, which has generated a good mood, maintained after the return to work.

As each, at a time, felt able to express him/herself freely, without regard to function, age and corporate position, the atmosphere was detensioned, accounts adjusted and nerves exhausted.

Even though organizational problems arose during the delegation, they were treated with more relaxation than normal, and clearly resolved quicker and more efficient.

The applied solution was very simple and less expensive for the company, with maximum results.

Multiple outcomes were registered:

- Delegation target was achieved, cooperation between the analyzed company and hosts was perfected and joint projects have been proposed, convenient for both parties;

- People to work more relaxed, returned as more than daily colleagues, depending on compatibilities, constructing or deepening a friendship relationship and they became to know each other better than they can do it in the office;

- In terms of the impression created by the analyzed company's management, one can argue that using a reduced amount of money, yet something was offered to its employees, which tempered, at least for a while, reluctant and nervous attitude shown before.

5. Conclusions

In terms of stress there are 2 main ways of approach: total ignorance, with negative results or amplify the importance of the phenomenon and justify the majority of failures on its expense.

We believe that no one's approach is neither normal nor useful for companies or employees. A middle way is always best. Far from us the idea of reducing the importance of this element within daily activities, but we do not believe that stress is responsible for all failures, whether personal or professional. Thus, from our experience, we recommend to the institutions and employees to consider the evidence presented in this work, both as theory, and practice and seek to apply, according to the specific job, one or more of the solutions we proposed. Obviously, depending on stress factors and dominant manifestations that result from an analysis, other solutions might be proposed. Therefore we consider it appropriate for everyone, before you diagnose by ear or take a position depending on appearances, to make a brief analysis of the reasons which lead to disruption of the daily activity of everyone.

Abstract

Many companies try to create a centralized program for managing innovation. Usually innovation is delegated to the marketing or R&D department or sometimes a new function is created to manage innovation across the organization. Unfortunately such models for fostering innovation are insufficient and inefficient. Innovation is limited by the available talent, attention, insights and instincts of the managing group. They don't allow a largely pool of talented and insightful employees to create and act on their ideas. We believe that a solution can be to create a system for stimulating potentially valuable ideas and managing the process of converting the best of them to innovations that have an impact on competitiveness.

Keywords: knowledge management, competitive advantage, innovation.

J.E.L. Classification: M10.

1. Introduction

The word innovation derives from the Latin word *innovatus*, which is the noun form of *innovare* "to renew or change" stemming from *in*—"into" +*novus*-"new". Diffusion of innovation research was first started in 1903 by seminal researcher Gabriel Tarde, who first plotted the S-shaped diffusion curve. Tarde (1903) defined the innovation-decision process as a series of steps that includes: First knowledge, Forming an attitude, A decision to adopt or reject, Implementation and use, Confirmation of the decision.

Almost every company includes innovation on their core mission and values statement. Many exhort their people to think outside the box, to generate ideas and to submit them online. Some invite front-line employees to idea generation and innovation training sessions. The innovation learning is shelved until the day when the everyday load lessens. The learning is likely to become out of date as the business context changes [1].

2. Theories of Innovation and How Innovation works

There are many different theories of innovation: breakthrough, incremental, open source to name but a few. There are arguments stating innovations have to be disruptive to qualify; others argue that any change—as long as it is measurable—qualifies as innovation. Some people want innovations to be open and available to all as a means of challenging even more growth and ingenuity; others believe that new discoveries and paths need to be developed privately and secretly.[2]

Our assessment is that front-line employees, those closest to the customers and the work of delivering the products and services, have some of the freshest ideas and insights. Unfortunately, because they are largely unfamiliar with the business plans of the organization, their ideas and insights, may not be adequately framed. But setting broad corporate challenges, teaching employees new skills and engaging them in the quest for innovation can produce powerful insights, innovative approaches to problems, and an increase in the capacity of an organization to implement new ideas. It

also produces the positive side-effect of aligning the employees' efforts with major strategic goals and encouraging quick and effective action toward those goals. To be effective the effort must be locally managed and staffed. Local decisions and quick actions reduce the need for scarce corporate managerial talent.

Front-line employees – tellers, clerks, customer service representatives – are given tools to generate ideas around local and corporate challenges and forums to assemble teams that develop the ideas themselves. A locally managed governance process evaluates ideas and allocates local resources. Local coaches help teams through the process of idea development and implementation. A series of metrics helps manage the effectiveness of the local innovation process.

The corporate leadership will have to ensure that successful front-line innovations are disseminated throughout the company and that ideas generated requiring large, complex, and resource intensive development are fielded appropriately. Both systems complement each other. Front-line innovation results in many ideas with local application that require fast, simple, and cheap development, whereas centrally developed innovation results in few big ideas with company-wide application, that require time-consuming, complex, and expensive development.[3]

Each team has a small set of people who do most or all of the work. Every manager knows who these “go-to” people are. They are a very scarce resource. The aim is to create more of them in every unit. Provide them with small set of simple tools on what to look for in a nascent idea, how to describe and how to elaborate a rough idea. Publicize them and their role on your company intranet. Since they are likely to be locally known and well respected, employees find it easier to approach them with their ideas than to try to persuade a central innovation group or even their own managers.

3. Methods and Tools for Innovation

There are methods and tools for innovation. Although innovation is highly touted as the future of business, very few people have any idea for how to actually make that happen other than hoping they hire

someone who will keep coming up with good – and profitable – products and services each year. (Trial-and-error is not an effective or efficient means of facilitating innovation.)

Install an innovation pipeline, a process for shepherding ideas through to implementation in each location. Ideas are stimulated and generated by periodically posing innovation challenges or strategic imperatives to the front-line employees. When ideas are submitted by employees, they are quickly evaluated by the coaches and local managers against a set of transparent and publicly-known criteria and shelved or green lighted to the next stage. The bar for success is set higher and each stage and process demands more rigor from the innovator and the team as the idea progresses along the pipeline.

An occasional off-site to promote creativity or any other off-and-on-again motivational program, cannot be counted upon to generate a steady and sustained flow of innovative ideas. Managers need to learn how to deploy innovation tools and methods to stimulate ideas, to initially describe and to elaborate ideas.

Apply technology to declare innovation challenges, to publish and share nascent ideas with the widest possible group across the enterprise. Encourage the formation of virtual communities by having coaches, managers and innovators openly comment on each other's ideas. [4]

Effectively managing innovation requires a somewhat peculiar combination of allowing chaos to happen within a set of well-defined boundaries. Under such conditions, proposed ideas may range from the ridiculous to the sublime. Separating the wheat from the chaff, extracting kernels of insight from ideas and guiding tentative innovators is an unfamiliar capability for many managers. Get started by creating a local innovation board consisting of coaches and a few local managers – a team that balances imagination and experience. Set a tempo for monthly innovation board meetings to review new ideas and green light or shelve them. Have innovators present their ideas in an open critique session. Once the pipeline has been established, schedule sessions quarterly. Rotate membership within the management team. [5]

4. Measures of Innovation

There are no definitive metrics for innovation. Measures of innovative success vary by company and industry. And, as with any type of statistic, the numbers must be looked at closely in order to withstand analysis. The most common metrics are patent creation and R&D.

- Patent creation – Some companies create patent after patent and boast of their innovative capabilities. While this may be well and true for a few, if the numbers of patented products, processes, and services are now making it to the marketplace, then their relevance diminishes.
- R&D – This metric assumes that the amount of money spent on research and development directly correlates to the amount of innovative products, processes and services that get to the public.

Other measures? Total shareholder return is gaining in popularity, but for the most part the field is still open to metrics competition.

Metrics help local management effectively run their local innovation process, ensuring that at any given time, there a set of interesting ideas that are being generated, elaborated upon and experimented on, and implemented. Three general types of metrics are useful. The first measures the level of engagement that employees have in the front-line innovation program. Examples of engagement metrics include the percentage of employees submitting new ideas and the percentage of employees commenting on others' ideas.[6]

The second type of metric looks at the results of front-line generated ideas. In aggregate, the innovations adopted should have an impact on the bottom line of the enterprise as a whole. To maximize impact, management needs to ensure that developed ideas are implemented so that their full potential is achieved, that the results are recorded, and that learning from experiments, successful or otherwise, is widely shared across the enterprise. The last type of metric tracks the flow of ideas. In order to maintain positive momentum there needs to be a constant and regular stream of ideas through the innovation pipeline. This is effectively a measure of how regularly local management is making decisions to promote attractive ideas to the next stage of development while

pulling the plug on unpromising ideas that are consuming resources.[7]

The employees are exceedingly valuable assets. It surfaces new leaders and gives them the tools to create and act on ideas that are aimed at the most difficult problems facing the organization. It builds a capacity for creativity, resilience and agility into the fabric of the organization. Each organization must learn how to optimize its own process of frontline innovation – developing best practices for managing people, process, tools, technology, governance and metrics. Clearly, a creative front-line employee is a potent competitive weapon when supported by such a system.[8]

5. Conclusion

In sum, it is important to be clear as to what innovation is not. Innovation is not invention, even if invention is the mother of necessity. These two words are sometimes used interchangeably, but although connected they are not the same. An innovation is the extension of an invention.

If an inventor discovers the "next big thing," but is unable to find anyone to produce it, then the next big thing remains undiscovered to the world. For this invention to become an innovation, a public needs to be introduced to the invention and have said invention improve their lives in some way. This may happen behind the scenes (e.g., streamlined processes that lower costs to the customer) or be clearly visible (e.g., the flexibility of a laptop vs. a desktop).

"Real" Innovation does not happen haphazardly or sporadically within organizations. "Real" Innovation is accomplished consistently and systematically, given the true voice of the customer and a process for delivering solutions. Companies that innovate successfully do so using an efficient and repeatable methodology. Success is not dependent upon genius – it emerges from the disciplined application of a proven innovation methodology.

Communication an Important Management Tool for Leaders

Abstract

Leaders can create an organization that is used with change and thrives on innovation, one where people embrace the chance to do things differently. Top executives help leaders throughout an organization to see the necessity for that. These leaders are able to communicate their enthusiasm to others. Management practices will create an organization that is comfortable with change only if leadership effectively inspires enthusiasm for change. To set the stage for adaptive innovation, what matters at the outset is what leaders say and whether it motivates the required risk taking – or the opposite.

Keywords: leader, management, communication.

J.E.L. Classification: M10.

1. Introduction

Leadership is "organizing a group of people to achieve a common goal". The leader may or may not have any formal authority.

Good leaders are *made* not born. If you have the desire and willpower, you can become an effective leader. Good leaders develop through a never ending process of self-study, education, training, and experience.

To inspire your workers into higher levels of teamwork, there are certain things you must *be*, *know*, and *do*. These do not come naturally, but are acquired through continual work and study. Good leaders are continually

working and studying to improve their leadership skills; they are not resting on their laurels.[1]

Communication is the activity of conveying information. Communication has been derived from the Latin word "communis", meaning to share. Communication requires a sender, a message, and an intended recipient, although the receiver need not be present or aware of the sender's intent to communicate at the time of communication; thus communication can occur across vast distances in time and space. Communication requires that the communicating parties share an area of communicative commonality. The communication process is complete once the receiver has understood the message of the sender. Feedback is critical to effective communication between parties.

2. Inspiring enthusiasm through communication

Studying the communication process is important because you coach, coordinate, counsel, evaluate, and supervise throughout this process. It is the chain of understanding that integrates the members of an organization from top to bottom, bottom to top, and side to side.[2]

Working with a number of organizations to achieve these goals indicates that over time, a number of managerial practices will have their effect: identify and explain the irresistible forces of change; establish a larger purpose for the organization; recognize that innovation is everyone's job; create the innovation capability across the organization; take structural steps to support innovation.

Inspiring enthusiasm for change requires a distinct shift from the traditional mode of communication, in which the leader states the problem to be dealt with, followed by an analysis of the options, and a recommended conclusion.

Good organizations convey a strong vision of where they will be in the future. As a leader, you have to get your people to trust you and be sold on your vision.

Communication is the exchange and flow of information and ideas from one person to another; it involves a sender transmitting an idea, information, or feeling to a receiver. *Effective* communication occurs only if the receiver understands the exact information or idea that the sender intended to transmit. Many of the problems that occur in an organization are the either the direct result of people failing to communicate and/or processes, which leads to confusion and can cause good plans to fail. [3]

3. Getting the audience's attention

There are a number of factors which affect attention, and can be used to control the audience's attention. These are variety, the length of time concentration is needed, the time of day, and the amount of arousal and motivation the speaker can communicate to the listeners. Motivation, in turn, is affected by the audience's sense of security, how much their natural responses are repressed, and how much enthusiasm the speaker shows. Let me deal with each of these factors in turn, to give you some ideas about how to control the audience's attention.

Levels of arousal have been compared to an inverted 'U' curve, where performance levels rise as arousal increases, but dissolve in chaos as arousal gets too high. Most people spend most of their life in the restricted performance, low arousal part of the curve. Speakers spend much of their time in the hyper-active, anxious and over-aroused part of the curve. The art is to get both speaker and audience on the peak performance part of the curve. For listeners, it usually means awaking their interest, arousing them, by energy and variety.

Define problem > analyze problem > recommend solution. This is the common sense way of communicating and it is present in organizations. When you're trying to get

human beings to change what they are doing and act in some fundamentally new way with sustained energy and enthusiasm, it has two serious problems. One, it doesn't work. And two, it often makes the situation worse.[4] Successful leaders inspire enthusiasm for change through communication that is fundamentally differently from the traditional, abstract approach. They communicate by first, getting attention; then stimulating desire and only then reinforcing with reasons. [5]

Get attention > stimulate desire > reinforce with reasons. The language of leadership can inspire enduring enthusiasm for a cause and spark action to start implementing it. Successful leaders don't stop with a one-time communication. Leaders and their followers stay in communication and co-create the future by continuing the conversation.

Leaders try to get people's attention. If people aren't listening, speakers are simply wasting their breath. Usually people simply aren't listening in any attentive way. They may be aware in a background way that someone is talking, and maybe know the discussion subject. The most important in communicating is to get their urgent attention.

It is very important to know the ways of getting people's attention. Social scientists have also shown that negative messages are more attention-getting than positive messages. Among the more effective ways to get the audience's attention are: stories about the audience's problems, stories about the likely trajectory of the audience's problems, an unexpected question or warning.[6]

4. Creating desire for a different future

Change is everywhere you look in business today as organisations continue to seek out new ways to transform themselves and get ahead of the competition at an ever increasing pace. A good organisational change professional can help you navigate through and select the most appropriate tools, methodologies and techniques for your organisation and will assist with your organisations understanding, planning and implementation of the change.

By focusing at the individual level and understanding peoples' attitude to change you are then able to target and engage the

people most affected by different strategies in order to increase their desire to accept the changes being introduced. Your change initiative becomes much more successful with more people making a personal choice to embrace the change.[7]

Failing to distinguish between getting attention and stimulating desire can have disastrous results. That's because what gets people's attention typically doesn't stimulate a desire to act. Whereas getting attention is generally done more effectively by negative content, getting people to want to do something different needs to accentuate the positive. Negative stories, questions or challenges wake us up. They activate the reptilian brain, suggesting fight or flight. They start us thinking, but they also generate worry, anxiety, and caution. They don't stimulate enthusiastic action. To be effective, a leader needs to establish an emotional connection and stimulate desire for a different future. Without the emotional connection, nothing happens.

Only the emotional connection isn't enough. Still relevant are the reasons. The desire for change may wane unless it is supported and reinforced by compelling reasons why the change makes sense and should be sustained. Placing the reasons in a presentation is crucial. When we encounter strange new ideas, psychological studies show that we seek to preserve our existing viewpoint. We stubbornly ignore, discredit or reinterpret information that is contrary to views we already hold, to avoid the dissonance of being wrong. By contrast, when we have made a decision to explore change, we actively look for elements that confirm the decision we've already made. Giving people reasons at a time when they are ready to receive them is one of the keys to communication that leads to action. Reasons are put at a different position in the flow from the Western intellectual tradition. They come, not at the beginning or middle, but at the end. [8]

5. Conclusion

In sum, these three steps – one, getting attention, two, creating desire for change, and three, reinforcing the desire for change with reasons, are the same whatever the leadership setting. Of the three steps, the middle step –

stimulating desire for change – is the most important, because it generates desire for change. Without desire for change, there is no energy or enthusiasm. Indeed without desire for change, there is hardly any point in getting the audience's attention. And without desire for change, there is nothing for reason to reinforce. It's desire for change that drives the change process. So if transformational leaders do only one thing, they should make sure that stimulate desire for change.

If change is to be pervasive throughout the organization, then it's not enough for top management to be able to inspire enthusiasm for innovation. Many leaders will be needed throughout the organization, and they in turn need to have the capability to create new champions in their audiences. An ability to spark enthusiasm for change thus becomes an essential competence for all leaders in the organization.

As this competence usually requires a fundamental rethinking of the way communications are conducted in the firm, to acquire it, most firms will need (1) to establish training programs for all leaders in the firm; (2) to appoint mentors to support the development of appropriate capability and (3) to incorporate an ability to spark change in career planning for leaders.

Main Challenges in Generating Loyalty Among TV Viewers

sabin.niculae@gmail.com

Abstract

In a global context marked by consistent changes in the media channels consumer's behavior, the main challenge for the organizations operating in this field is the retention of their readers, listeners and viewers. As television is the media that still focuses the large majority of consumption, the manner in which the TV stations manage to calibrate their communication strategy is critical for the entire evolution of the marketing and communication environment.

Through this paper, we aim to underline the fact that TV stations no longer rely exclusively, anywhere in the world, on the “on-air” communication vehicle, strictly limited to the broadcast in the promotional undertaking. Each station develops a lateral structure consisting of its own medium (“owned media”), builds strong partnerships with other types of media, such as newspapers, magazines, radio stations, websites or social networks (“earned media”) or even purchases exposure on other vehicles, using a so called “paid media”.

Key words: TV, viewers, loyalty, communication mix, new media

J.E.L. Classification: M31

1. Introduction

All the strategic options that might be used in approaching the communication effort come under the central business objectives – achieving the rating and audience market share goals on the main target of that specific channel, but also image

objectives, focused on the brand power of the channel. The key performance indicators for the brand power are the awareness of both the channel and its products portfolio (programs, categories of programs, stars), the favorability (positive perception of the TV station among the viewers), as well as the loyalty, the way and the degree in which the audience is actually consuming the programs of the channel.

Critical for the organization is the manner in which it manages to integrate the 3 types of media into a structure able to implement the viewer's loyalty, in an environment marked by a sharp competition, within a crisis that affects the budgets and, of course, the quality of the programming that has to meet the needs of a “spoiled” consumer nowadays, due to the high amount of information, entertainment and socializing vehicles.

2. The communication mix of a TV station

The entire range of communication vehicles mobilized by a full-format TV station consists of:

- On-air promo. The promos are those video and graphic works that communicate the offer of that specific channel. They are placed in the advertising breaks, together with the ads from external advertisers and are focused on shows, movies, series, stars of the channel, but also they might be “brand promos”, centered of establishing an emotional link with the viewers, promos that revolve around the concept and the statement of the entire channel and

not around a specific program. The short duration of these types of works is a key aspect in tailoring a communication campaign. A promo at the full-format TV stations in Romania, such as ProTV, Antena1, Prima TV or Kanal D has an average of 30-50 seconds. This leads to a higher concentration of the message in a more expressive manner, from a creative point of view. It is, actually, the most important “owned media” type of vehicle that TV station benefits of. According to a Data Media Romania Survey (“ProTV brand power analysis, 2011), the promos of a certain program influence in a “high manner” the decision of 38.8% of the respondents towards watching that program, at the time it will be aired.

- The graphic package, also known as ID package. Its elements come as links between two separate fragments of programs on the channel, being also a reminder of the station, because they contain its name, slogan, all packed in line with the visual identity of the TV channel. Similar with the promos, the graphic executions’ duration is small, this type of insertions having from 5 up to 20 seconds each.
- Public relations. In case of television, this vehicles deal with the exposure of the programming schedule offer, but mainly the anchors within the written publications (newspapers and magazines, either daily, weekly or monthly ones, as well as TV guides). It is one of the most important vehicles in terms of building loyalty among viewers compared with the “on-air promo” where the duration limitations do not allow the description of all the details deriving from a specific channel’s offer.

Apart from the above mentioned “conventional” vehicles, the last years brought a lot of innovations among them, but also the development of completely new ones, appeared as a consequence of the online and social networks evolution.

3. The globalization of the social networks

Beyond any doubt, the social networks become the dominant force in the social media “ecosystem”, a fact that was revealed by a series of annual research studies conducted by Universal McCann, starting 2006. So called “The waves”, as they were named by Hutton, G. and Fosdick, M. in “The globalization of social media: Consumer relationships with brands evolve in the digital space” (Journal of Advertising Research, 2011), the research captures the evolution, dynamic, structure and the behavior of the elements this “ecosystem” consists of.

Having a profile on one of the social networks was familiar, in 2011, to 61% of the respondents from 57 countries that were part of the above mentioned annual research. The evolution of this index was consistent in the last 3 years (starting in 2008) and it is estimated to continue the same way in 2012, with a higher increase in the BRIC countries (Brazil, Russia, India and China), where the values as with at least 10% above the global average.

One of the main conclusions of the last waves in this research is that in the top 3 of activities the users list, we can find so called “passive” ones, such as: “watching videos online” (mentioned by 77% of the respondents), “visiting a company or a brand’s website” (done by 74%) or “viewing the social network profile of a friend or a person I know” (mentioned by more than 69% of the respondent). The so called “active” actions that imply a certain involvement of the user are lower in the ranking: “maintaining a profile on a social network”, mentioned by 62% of the respondents, “leaving a comment on a blog or a website” (51% from the panel), “opening a topic of discussion on a social network profile or websites dedicated to photo sharing” (mentioned by 48%).

4. The importance of interactivity

The interactive eve that we are going through this century marks, according to Don Peppers (“Managing Customer Relationships” – John Wiley & Sons, Inc., New Jersey), a major change in the approach the organizations use in order to gain a sustainable competitive advantage, based on

the information they gather regarding their own clients.

The author defines this approach “a branded relationship”, a connection that evolves based on a continuous dialogue between the organization and the client, with the clear objective of meeting and satisfying the needs of the last one of them. From Don Peppers’ point of view, there are two fundamental evolutions that have marked the impact of technology in the business environment in the last years. The first one refers to the increasing influence of the new media (including the entire range of vehicles from blogging and micro blogging to social networks such as Facebook, LinkedIn, Hi5 or MySpace). The second one consists of continuous development of the mobile devices and of the interactive applications revolving around these types of technology. The overall presence of wireless internet, combined with the increasing number of smartphones and tablets allow easy access to internet pages, calendar check and update, e-mail exchange, photos and video content sharing, all being interactivity enhancers.

The psychological means involved in the evolution of the interactive vehicles and social networks are the main subject of “Connected. The Amazing Power of Social Networks and How They Shape Our Lives” (Christakis, N, Fowler, J., Harper Press, 2010). According to the authors, the individual behavior is strongly connected to the involvement in these social networks, in which members are able to have a significant impact on actions that were considered until now exclusively autonomous. Therefore, the social networks are a monographic image of how the whole society works, authors insisting on the need to enhance the positive elements deriving from it, in parallel with the attenuation of the harmful ones. The key element, from the behavioral perspective is, according to Christakis and Fowler the way in which individuals become groups.

In March, 2012, an unprecedented event happened in the global media. The website of one of the most important newspaper in the world, The Guardian, has received a higher number of visitors coming from Facebook than from the search engine Google. The event is even more spectacular, because in the entire history of the www.guardian.co.uk

website, the percentage of viewers brought by Facebook was not above 5%.

In that month, the publication managed to capitalize in the best manner the homonym app launched on Facebook five months before, app through which articles read by a user can be seen by the user’s friends that can also read the materials themselves on the newspaper’s website. The wave of new visits that followed, called “social traffic”, was facilitated by the massive use of this application that was advertised through an aggressive campaign, using mainly the communication vehicles having a high affinity with the particularity of The Guardian’s main target readers.

A surprising factor is related to the age categories of the new visitors. The app was mainly downloaded by the users from the 18-24 years old target, usually the most difficult to reach by any written press organization, taking into account that most readers of publications come from the above 40 years old category. Then, the geographic area where the visitors come from has increased considerably after the app was launched and adopted by the users. Millions of new online readers come from countries such as Brazil, Japan, Egypt or Nigeria, outside the usual area, traditionally limited to Great Britain and United States of America.

5. The integration of the new media vehicles in the TV stations communication mix

The “new media” type of vehicles complete the conventional communication mix explained above. A channel’s website is a very important pivot in implementing a communication campaign through all its stages. For example, the website of the “MasterChef Romania” show, aired starting March, 2012, on ProTV was launched from the teasing phase of the program, in August, 2011, almost a year before. That was actually, the main platform for registration of viewers wanting to become competitors. Together with the development of the launching campaign, the website has evolved into a new tool for communicating the show’s content, containing details regarding the program, as well promotion materials initiated and carried by other vehicles (on-air TV promos present on ProTV, the news aired

on the same channel related to the program), plus exclusive materials, meaning an important value-added element for the loyal viewers. Once the show started, the website became the space in which the visitors can review the best moments in the previous episodes, but also an area where comments and points of view could be posted, regarding the mix of content: competitors, jury, hosts, acts, set, suspense deriving from the evolution through the phases.

The Facebook page of the same show completes the online communication done through the website. Concentrating a high number of “fans” (individuals that have pressed the “like” button of the MasterChef’s Facebook public page, www.facebook.com/MasterChef-Romania and the real time messaging able to generate instant reactions towards the program is vital for creating a bigger online community and also generating a higher audience on TV.

One of the main benefits of having such a big community of fans on Facebook is the consistent feedback generated, through comments, likes before, during and after an episode is aired. Apart from this, any post related to the show is directly linked with its website (www.masterchef.protv.ro). Another link with the site, having a high promotional impact is the newsletter (weekly), reminding to the subscribed fans about a new episode.

Online banners present on other websites belonging to the ProTV S.A. group (so, still in the “owned media” category), such as: www.acasatv.ro (the online dimension of the AcasaTV channel) www.sport.ro (the website belonging to Sport.ro, the leading sports channel in Romania), www.procinema.ro, (online extension of Pro Cinema, the series and movies focused channel), www.profm.ro (belonging to the ProFM radio station) www.protvintl.ro (the website of ProTV International, the station that aired abroad the main programs of ProTV and Acasa) and many other complete the integrate approach of communication for this specific show. The result is the MasterChef’s audience (an average of 10.3 rating points and 23.4% market share, compared to the main competitor, Antena 1, having 5.1 rating points and 12.4% market share), that managed to be the highest this spring after the record-breaking “Romanians Got Talent,

aired every Friday, in Prime Time, also on ProTV

6. Conclusions

The challenges deriving from the shift within the consumer’s behavior, together with a sharp competition on the media market, are elements that determine a quick adaptation of the communication strategy for each channel, in the direction of extending the traditional communication mix by integrating vehicles from the “new media” field, intensively used by the media consumers lately. A critical success factor is the perfect synchronization of these vehicles from the concept point of view and also from the strategic perspective, with the conventional tools, so that the synergy between all of them would be able to fortify the viewer’s loyalty and, as a consequence, to reach higher audience results.

The Place of Railway Transport in Romania’s Transport System

Dăneci-Pătrău Daniel

Spiru Haret University, Faculty of Management Financial Accounting Constanta
danusidenima2@yahoo.com

Coca Carmen Elena

Tomis University of Constanta, Department of Economic and Administrative Studies,
zelesneacarmen@yahoo.com

Abstract

The transport activity in all its forms represents one of the most complex sections of an economy, but also an important factor of influence over the quality of life, that is why current preoccupations of international organisms are oriented towards measures meant to develop performing transport systems and compatible with the environment.

In the article the main activities and resources of Romania’s railway transport system are presented , the place of the railway transport in the transport system being approached in a integrative manner.

Keywords: railway transport, railway management, human resources

J.E.L. Classification: O18, R41, M12

1. Introduction

An important place in the sphere of human preoccupations is represented by the activity of passenger and goods transport, which as the economy developed it has known a continual improvement in the way of enhancing the comfort for travelers and regarding the security of transported goods, of reducing the energy consumption and enlarging the degree of traffic safety.

A country’s economy is made up of three big activity fields [4]: the primary field, determined by agriculture and obtaining agricultural products; the secondary field represented by the industry with all its subcomponents and the third field represented by services. Viewed as a whole, the transport activity is part of the third field of economy and represents moving the elements entrusted for being transported from

a starting point to an arrival point.

Transports, no matter their type have as a main purpose satisfying human needs regarding movement, servicing national and international economy, ensuring economic exchange, circulation of goods and passengers. As a general rule, the transport demands of the economy and population are satisfied by several technical transport systems: railway, road, naval, aerial and by pipeline. In our country’s specialized literature, the railway system is defined as being the sum of infrastructures represented by ways to travel and terminals, of means of transport and of control systems which allow people and goods to be moved from one place to another, in time to participate in a timely manner to a required activity [3].

For a long time the idea that railway transport represents the most complex and well-organized transport system has been certified, Thus its characterization as ” a country’s second weapon” . Through the explosive development of automobile and aerial transport, things have been reconsidered, without questioning the importance of railways in the general transport system. This significance imposes the actual and perspective necessity to modernize railway transport in order to cope with competitive pressure on the behalf of the other ways of transport. There are several ways of transport in Romania their status being presented on categories in Table 1.

According to the information in this chart, railway transport on rail is the most used transport system no matter the regional level to which we refer. The specific features of transport activity in railway traffic performed in our country, they are determined by the structure of transported goods, the diversity of transport relationships, means of transport being used and their ownership.

Table 1. Types of transport systems in Romania

Source: Adapted from Iancu, G. *Economical and management principles in transport*, Tomorrow’s Foundation of Romania Publishing, Bucharest, 2003, p. 30

Transport systems, being distinct and competitive, they are organized so that they can contribute to performing a transport combined on different distances. The five fundamental ways of transport – railway, road, naval, aerial and by pipeline together with the infrastructures and necessary vehicles forming the transport system, not being able to perform their activity outside their system.

2. Activities and main resources of railway transport system

In the specialized literature, the railway transport system is analyzed as a set of processes which try to optimize general performance of railway exploitation management. The effects of railway transport are important, because this means of transport represents an essential component of the economic and social developing process, often absorbing an overwhelming proportion of national budgets. At the development of an economy by facilitating trade, both national and international, the strong correlation which exists between covered miles and gross domestic product; thus the population’s access to working places, education, health and other services is improved.

In order to analyze the main activities and resources of railway transport system is important to define it. In a narrow way, railway transport represents a benefit service of special type, in the way that it cannot be stored nor preserved, being executed in special conditions in order to face peak times regarding requests. At large, through railway transport we mean any passenger and goods

movement accomplished with railway vehicles by transport operators through railway infrastructure [5]. Main activities of railway transport are:

- commercial operation of passenger and goods transport;
- repairing and maintaining railway infrastructure;
- commercial exploitation of subsidiary heritage.

A challenge for railway management is to identify the best way to use the railway as a mechanism for efficient managing of management of all types of railway activities. Railway transport has as a purpose maintaining and improving the current railway network to allow its continual use, by commercial exploitation of traffic in a safe and efficient manner. Depending on the main activities in railway transport, we can distinguish between several types of railway management, namely:

- management of maintenance activity specific to railway infrastructure;
- management of leading train traffic;
- management of commercial operating in goods and passenger transport;
- management of main organizational functions, human resources, financial control and inventory.

As a whole, the railway transport system is made up of entries, transport activities and outputs in Figure 1.

Figure 1. The elements of railway transport system.

The resources of railway transport system are engaged inside the system of technological process transport, resulting from the following technologies specific to railway station activities, outputs of the system materialized in the transport service provided for goods and passengers entrusted. Of all the railway transport system’s entries we consider the railway infrastructure the most important

resource of the system.

Railway infrastructure is defined from a technical point of view, as being the ensemble of elements required by traffic and operating the rolling stock, railway station buildings with related facilities, sortings, bridges, tunnels, signaling telecommunications and voltage installations for enabling railway transport [1]. The most important element of railway infrastructure is represented by the railway lines. The most widely used classification is current lines, placed between railway stations and station lines, which fulfill multiple purposes: traffic, maneuver, connection or that of waiting.

Railway transport operators public or private are national companies or commercial ones licensed to perform public or in own interest transport, of goods or passengers by using the capabilities of railway infrastructure. For this purpose, railway operators sustain a utilization fee of the railway infrastructure called TUI, which thus becomes own income from developing the activity for the national company which manages the railway infrastructure.

The rolling stock of the railway transport system made up of railway engines, wagons for the transport of goods and wagons for passenger transport. The railway engines, which travel on the line of a traffic department, assure the traction of goods and passenger trains on the traffic departments as well as making maneuver activities in stations.

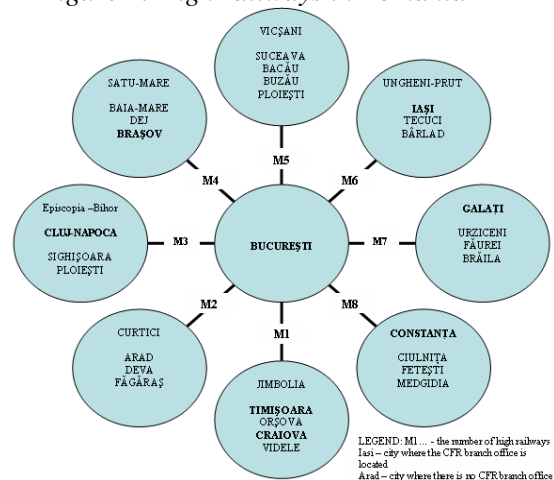

Traffic capacity represents the biggest number of direct goods and passenger trains that travel on a traffic department in 24 hours. This capacity depends on several factors: the type of line and its condition, the number and length of sidetracks from the station, the type of facilities available and the way of managing traffic.

According to their economic and volume traffic, railways are classified in:

- *main railways* which ensure the link between the capital and main cities in our country and with the transport systems of neighbouring countries;
- *main lines*, with a special; economic importance because they make connections between the capital and main cities, being partially included in the high railways system;
- *secondary lines*, serving certain urban areas and ensure links with main and high railways.

The railway network in our country includes eight territorial areas serviced by eight high railways, each being under the management of a branch of infrastructure. The current configuration of high railways is presented in Figure 2.

Figure 2. High railways in Romania

In order to identify the place of the railway transport in Romania’s transport system, the evolution of significant and quantitative indicators of the railway infrastructures has been analyzed, their situation being presented in Table 2.

The indicator of railway network length in our country, presents at the end of 2010, a percentage of 36,6 % electrified line from the total length of railway network, growing since 1990 and a network density of 45,8 km/1000 km² dropping during recent years because of the decreasing in total length of the network, which had a total of 10820 railway line.

Table 2. Quantitative indicators of railway infrastructure.

INDICATORS	U.M.	1990	2000	2010
Total length of railway network	km	11348	11057	10820
Developed length of lines	km	22567	22247	20347
The length of electrified lines	km	3680	3885	3971
Percentage of electrical lines	%	32,4	35,1	36,7
Density of railway network	kml/1000km ²	47,8	46,7	45,8
Number of railway stations		1419	1100	978

Source: website of the National Company CFR SA, www.cfr.ro [6]

Also, because of restriction in the activity of railway transport, the number of railway stations has dropped by a third in the last 20 years, from 1419 stations in 1990 to 978 functional units at the end of 2010. Railway transport is the second way of transport in Romania's economy after road transport, from the point of view of the indicator for transported goods, scrolling annually about 50 million tons of goods from a total of near 380 million tons, which represents almost 13,4% on the market of transported goods in Romania, as you can see in Table 3.

Table 3. The evolution of market share of main types of transported goods.

Goods transported, from which: (%)	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010
SNTF Marfa	17,1	20	19,7	18,8	18,5	15,9	13,6	11,8	10,9	9,7	7,8
Private transport operators (OTF)	0	0	0,2	0,7	0,7	2,5	3,4	3,9	4,2	4,9	5,6
TOTAL Railway	17,1	20	19,9	19,5	19,2	18,4	17	15,7	15,1	14,5	13,4
Road	75,8	73,5	73,7	73,7	74,3	74,6	75,6	77,6	78,8	79,5	77,8
naval	5,94	4,94	4,59	4,87	4,32	4,87	5,25	4,39	3,82	3,77	5,95
aerial	0,1	0,2	0,1	0,1	0,1	0,1	0,1	0,3	0,2	0,2	0,4
by pipeline	1,06	1,36	1,71	1,83	2,08	2,03	2,05	2,01	2,08	2,03	2,45
TOTAL	100	100	100	100	100	100	100	100	100	100	100

Source: website of the Ministry of Transport, www.mt.ro [7]

The market share of goods railway transport in Romania dropped from 17.1 % in 1999 to 13,4 % in 2009. Railway transport, SNTF Marfa, diminished from 100% in 2000, when it was the only railway company which operated on the market of goods railway transport, to 58,2% in 2010, for the volume of transported goods expressed in net tons-km and to 48,5% for goods route expressed in train-km since 2001, the market of goods railway transport is divided between SNTF Marfa and the 27 private railway transport operators which were granted

license of goods transport. During this period, the market share held by SNTF Marfa dropped from 19,7% for transported goods in 2002, to 7,8% in 2010. Regarding ownership, railway transport has been entirely a public state transport until 2001, both from a transported goods point of view and goods route.

In the system of Romanian railway transport, private railway transport operators started to conduct business, OTF, since 2001, those transporting goods, reaching at the end of 2010 to own almost half the market of transported goods in the railway system, respectively, since 2005 OTF passengers, which now transports almost a third of the total number of passengers.

In the last three years the goods and passengers railway transport has decreased continually. The reasons for this decreases find themselves in the general drop in large companies production, the shutting down or clearing some economic agents due to the economic crisis, the orientation of others towards road transport with the dispersion of dissolution towards a big number of partners, in short time and in small amounts and not least, lower family incomes because of budget cuts. Because of lack in necessary funding, public railway companies were forced to dismiss part of the staff, to limit expenses to the essential in order to perform exploitation, cutting maintenance expenses, repairs and investments in order to maintain a balance relatively equally-balanced.

3. The advantage of railway transport

The decisive role of railway lines in the development of a country's economy, both internally and externally is major but the economic development also has a contribution to the expansion of exchange relations between producer and consumer, and the more this network is developed faster, the more the transport services increase. Railway technique had a major role in the development of goods and passenger transport, so that, starting from a transport speed of almost 30 km/hour, today you can travel with more than 300km/hour; in addition to this, railway transport presents a higher degree of safety and security. Considering these aspects, EU granted priority to the development of community

railway transport, even more as, in terms of energy, the cost per transported unit is smaller than that of road transport. Comparing the energy consumption in different means of transport indicates for passenger transport by car a consumption of 3,5 bigger and double in naval transport than that of railway transport [2]. In goods transport, the energy consumption for lorries is of 8,7 bigger than using railway transport. Another argument regarding the advantage of railway line is given by the transport on electrified lines which don't need fuel. Thus, the case of Romania is eloquent, because the electrified network represents almost a third of the total network, and the railway transport on electrified network represents 54% of total volume of transport.

The system of railway transport in its evolution has become a complex and specialized system, with remarkable features and in economic conditions of efficiency superior to the other forms of transport: large quantities of goods or an increased number of passengers transported at the same time and under safety conditions, access in areas where other means of transport cannot enter, the strategic role and environmental friendly character.

4. Conclusions

The fact that it connects through a unique network all country's counties, railway transport presents an important role in the economic and strategic life of the country. This role is emphasized by the fact that, by its good operation, the economic agents depend of their provision with raw materials and goods, the swift satisfaction of the population with consumer goods, ensuring passenger transport. Any delay or disorder of railway traffic has powerful repercussions over the entire gearing of social life.

Establishing the place of railway transport in the ensemble of transport system in Romania is facilitated by the conclusions revealed by researching the activities with railway singularity, namely:

- train traffic is performed without interruption in any season of the year and at any hour, which demands a perfect coordination of all fields of railway activity;
- the result of productive work isn't

represented by a new merchandise, but a service; by using railway transport, the merchandise keeps all its properties, but increases its value;

- the railway network spreads on a large surface, thus being a close interdependence between different departments and units of railway;
- railway lines constitute a means of mass transport, ensuring the most favourable condition from a traffic safety point of view;
- the variety of activity fields of railway transport from a mechanism which, thus complicated, forms a whole and imposes using a qualified staff in exploiting installations and railway infrastructure.

Today, the railway companies in our country, like most Romanian organizations are confronted with a recession imposed by the world financial –economic crisis. In this context, taking into consideration only the sides connected to technology and the imperative of economic recovery, without taking into consideration social consequences, individual and collective motivations of the employees, cannot lead to a quick solving of the social-economic problems of nowadays, in which the effects of the financial-economic crisis overlap with the necessity of the alignment of Romanian railway system to the standards and demands imposed by the EU.

A major challenge for railway management in a world continually changing, we consider it isn't only that of minimalizing the effects upon the environment but to identify the best way of using railway, especially, ensuring and using proper human resources, with a high level of specialization, that will ensure the function of the railway transport system as a mechanism to sustain economic and social development.

New Research in Handling Consumer Behaviour

Dinu Gabriel

Dinu Loredana

"Eftimie Murgu" University of Resita

Faculty of Economic Sciences

g.dinu@uem.ro

l.dinu@uem.ro

Abstract

Market research has never been a model in terms of professional ethics. But these findings link market research field to that of science fiction in terms of their implications. Neuroscientists have used laboratory research to sketch a map of brain activity responses to the desires and needs for certain products. About this new field is said to click the buy button in the consumer's mind.

Key words: mind, consumer, behaviour, neuromarketing, MRI.

J.E.L classification: M31.

1. Introduction

Consumer behavior research marks the progress every year, gaining new approach.

In a direct relationship with post-industrial society, stand new ways to influence consumer behavior. In this respect it refers to satisfying consumer needs. Postmodernism is seen as a major conceptual background that enables a superior understanding of changes in contemporary society, by an increasing number of researchers in marketing.

Postmodernist social orientation was characterized by emotions and feelings, and postmodern consumer looking more like for a way to relate with others in communities, and less than looking for a way to make sense of life. Consumption is no longer perceived to be a priority and overcontrolling of the social interbond, but is secondary and subordinated to the social bond. Postmodern man is looking for products and services, not so much for their use value, functional or symbolic value, but especially for their value to establish social relationships.

The new techniques for studying consumer behavior shall contribute to the decision process by triggering direct act of acquisition, which will influence companies from top down and bottom-up, with big corporations setting the base of their own research departments of consumer behavior.

Anticipating consumer behavior, identifying ads that consumers remember, selecting media channels that are the most accessible can be made through new methods that combine several specialized disciplines, such as neurology, and marketing. With this revolutionary tool and daring, the neuromarketing, researchers distinguish personal patterns to those taken (received) in research groups.

2. Method and results

The fundamental science underlying neuromarketing is neurology, which study how the brain creates the mind. In other words neurology is how the brain causes us to perceive, to think, to make decisions, to feel emotional, to communicate. Techniques used in neurology are psychophysiology (planning/ levels detection), magnetic resonance imaging (MRI) Magnetoencephalography (MEG) and electroencephalogram (EEG). The most interesting tool is MRI neuromarketing. This technique is used in specialty practices, the seriousness of this practice being the subject of TV specials, where patients move in and out of cars which make noise and different sounds.

The prominent professor Sean Kelly at Harvard University said that marketers have even used hypnosis in groups of market research for specific market topics.

The current challenge is the use of science to discover the subconscious of consumers.

Studying consumer subconscious techniques was born at Harvard Medical. In the late '90s, marketing professor Gerry Zaltman and his collaborator began scanning people's brains at the request of different companies.

Consumers' brain research through neurological instruments has become a boom in past years in the U.S.

The new discovery has reached climax following the research conducted by Clinton Kilts, a professor and vice president of the Psychiatry and Behavioral Sciences Department, expert in addiction and author of numerous professional papers at Emory University Hospital, USA. The research was continued by BrightHouse Institute for Thought Sciences, where Clinton Kilts became manager, using neural findings of Emory University Hospital. The Institute has an advertising agency whose clients are: Coca-Cola, Pepperidge Farm, K-Mart and Home Depot.

BrightHouse Institute has begun using magnetic resonance imaging, traditional technology used in health, to create images of brain activity to reveal what people feel for things, for certain products and services, much more accurate than people can explain through their feelings.

BrightHouse Institute methods are based in part on an experiment that Kilts conducted in early 2002. He gathered a group of research subjects and asked them to look at a number of products, assessing how much they liked or disliked them. Then while their brains were scanned by the MRI scanner, he showed them pictures of the products again.

Brain scan results surprised him. When watching the image he observed that whenever a subject saw a product, he identified it as one to which he was very attached to, it could be observed that that product would represent the person a lot. Thus his brain showed increased activity in the median prefrontal cortex. That brain region is associated with the identity of each individual, with self-image.

In market research, these methods study sensory feedback, cognitive and emotional stimuli of consumers to products or services. The brain scan reveals areas of brain activation sequence. Pleasure, interest and desire to buy is activated in all segments of the public, but only on the basis of hierarchy.

In a study published not long ago, called "The source of neurons", researchers monitored the brains of 67 subjects who tasted Coca-Cola and Pepsi. Half of the subjects chose Pepsi to Coke, MRI images in the cortex of the brain, revealing activity in the region for thinking and in the region of emotions and memories.

The results show that Pepsi should have half the market, but consumers actually drink Coke for reasons related less to taste and more about brand. However it should be noted also that the studies showed that Pepsi is sweeter and Coke is stronger. Many people who prefer small quantities of Pepsi would probably like to consume an entire bottle of Coke to one of Pepsi, because people were tired of his sweet taste.

When subjects learned that they drunk Coca-Cola, three quarters of them said that it is better for the sake of brand and less for the sake of taste.

Human brain is often viewed as a "black box", something rather mysterious. Marketers undertake activities" advertising, direct marketing, sales target set, target market. The results of these marketing efforts can be measured in time, sales, preferences and other. We understand quite well the beginning and the end but not the middle part, which is vital. The middle part is the mind of consumers.

Neuromarketing has contrary opinions. Since the BrightHouse Institute supports it because they created it, another entity should have been formed to oppose the scientific approach. This is about the American Association Commercial Alert.

Criticism to Emory University about neural findings were strengthened by the principle that universities are places where it clears the mind and not for commercial purposes.

This is because, at physical level, neurological research in marketing is conducted using magnetic resonance on human subjects. Magnetic waves can harm subjects if they have metal inside their body (cardiac prostheses, rods, etc.) or if they wear metal such as coins or jewelry. Risk which subjects undergo is low, however, this does not mean that there is no possibility. Subjects undergoing these tests report dizziness or nausea because of brain investigation in the drum of the MRI equipment.

We wonder then how can a technique which aroused so much criticism, can be used, and have gathered so many subjects in "focus groups". The answer is simple: each subject is paid for participation in these experiments.

We must highlight a statistical aspect regarding this practice, namely that there were never problems during a brain scan.

It was definitely discussed the moral conduct of some market companies, which using such techniques had an unfair advantage over other companies which did not have the financial resources and therefore could not enjoy the almost certain results of this technique.

Large companies include the cost of such research in the annual budget. Magnetic resonance imaging (MRI) are not yet as expensive as one might think, being a little more expensive than average costs of other types of research, but not everyone can afford.

Many financially potent companies have learned about images of the brain and were really eager to use them to get results for their sales department. An example is DaimlerChrysler, which used technology among young people at the University Ulm in Germany, to highlight types of car design they preferred.

The popularity of this instrument has made it to be used even in the field of political marketing in the United States, obviously. Professor Marco Jacobin, of California University, Los Angeles, has made several studies on the political issue regarding election loyalty against George Bush Jr., John Kerry and Ralph Nader. In the first election campaign after the attacks of September 11, 2001, neuromarketing techniques were also used.

We also noted that in the United States after 2007, interest in neuromarketing fell slightly, as is still seen as an expensive technique, that on the one hand, on the other hand, companies who had financial resources to use the technique got the results and now they use them and competitors do not have the resources needed to use it.

After 2002, these market research methods were developed in Europe, especially Germany, France and Austria, the first attempts were related to when a customer comes in contact with a new advertisement.

However a difference appears. Because research by MRI is very expensive, Europeans use electroencephalogram a cheaper neurological tool.

Romania, the country we live in, is ready for such market instrument only at a theoretical level, as there aren't the necessary resources for implementation of such an approach, being a subject far too distant from the realities we live.

3. Conclusion

The best neuromarketing product is anticipating consumer behavior, identifying ads that consumers retain, the selection of media channels that are accessible and how consumers personal patterns differ from those taken (received) in research groups. Marketers will use these techniques to better measure the consumer's preferences and the question whether we like a product will be closer to the truth. This discovery will help researchers to create marketing products and services with an unique and practical design, and companies to handle more brain responses.

The neuromarketing tells the marketers what consumers react to, which could be the color of the container, which makes it sound to vibrate, or idea which they have and that consumers would embrace it.

Most importantly, perhaps, merit of this technique is to have opened means of using it in more areas, to establish certainty about some market aspects through brain scanning. So, specialists in the field can learn how the human brain responds to the advertisement and they can improve to perfection a popularity of a brand appealing to a sample of consumers who are shown some pictures while being inserted into a machine and subjected to a radio-magnetic flow.

It is important to determine for the future what suddenly stopped the rising of a marketing tool with a huge success through its positive results of which some companies enjoy today, lack of money or criticism coming from consumer protection associations?

About this revolutionary new method of research of consumer behavior has been said many, beyond justified criticism this practice has proved a huge success. No one would have thought a few years ago, that the

resounding success of some products on the market is due to neuromarketing. Answering the question why buy a product is clear: the selling shop knows in advance that we like that product.

Besides talks for and against violation of human brain, response to our study with straight answers as consumers has been created, and hence to the coming out of new techniques has been only one step. The new technique also appeared in Harvard, with Professor Gerry Zaltman on forefront and is based on conscious and unconscious retrieval of thoughts using neurobiology, psychology, semiotics, linguistics, art theory, called ZMET (Zaltman Metaphor Elicitation Technique).

Finally, as young professionals, we can tell that we would like to use in a research such a tool, but as its use is very financially difficult even for well known companies, we are pleased to discuss this issue, hoping that you will do the same thing.

Abstract

In almost entire civilized world there is an emerging consensus about respecting the environment and an increasing level of the sound of voices that sustain that companies have social and environmental responsibilities. But not always it was the same thing. Great economic and political personalities sustained that this issue is of secondary importance for our business. Nowadays, the idea of including environmental protection among the production factors, near capital and human resources has more and more followers.

Keywords: environment, business, social responsibility, environmental laws

JEL Classification: M29

1. Introduction

This is a comparatively recent development. In *Capitalism and Freedom* Friedman [18] observed:

The view has been gaining widespread acceptance that corporate officials and labour leaders have a “special responsibility” that goes beyond serving the interest of their stockholders or their members. This view shows a fundamental misconception of the character and nature of a free economy. In such an economy there is one and only one social responsibility of business - to use its resources and engage in activities designed to increase its profits ... Few trends could so thoroughly undermine the very foundations of our free society as the acceptance by corporate officials of a social responsibility

other than to make as much money for their stockholders as possible.

This approach to economics stands within a tradition established by Adam Smith. By directing his industry “in such a manner as its produce may be of the greatest value”, each individual:

... intends only his own gain, and he is in this, as in many other cases, led by an invisible hand to promote an end which was no part of his intention. Nor is it always the worse for society that it was no part of it. By pursuing his own interest he frequently promotes that of the society more effectively than when he really intends to promote it. I have never known much good done by those who affected to trade for the public good. It is an affectation, indeed, not very common among merchants, and very few words indeed need be employed in dissuading them from it.

Similar views have been expressed by management theorists such as Drucker [10]:

To do something out of social responsibility which is economically irrational and untenable is . . . never responsible. It is sentimental ... That business should stick to its business, that is, to the economic sphere, is not a denial of responsibility. It is indeed the only consistent position in a free society.

2. The growth of environmental awareness

The environment became a major subject of public (and political) concern in the 1970s. Greenpeace and Friends of the Earth were both founded in 1971. The 1972 United Nations Conference on the Environment (Stockholm) was the first major international

conference which addressed environmental issues in a systematic and coherent manner. The following decade witnessed the emergence of coherent systems of environmental law in the UK, the USA and the European Community. Early legislation tended to be concerned largely with pollution. “Acid rain”, for example, was an important issue in many European countries. In the 1980s there was increased interest in conservation and “sustainable development”. The publication of *Our Common Future* by the World Commission on Environment and Development [31] (the Brundtland Commission) was highly significant. The principle of sustainable development received international support at the 1992 United Nations Conference on Environment and Development (Rio). The evolution of international environmental law was given further encouragement at the 2002 Johannesburg Conference.

Environmental law is relatively new, but legislation is developing rapidly. More prosecutions for environmental offences are taking place annually. Much of the legislation is based on the “command and control” approach. This approach has been criticised and market based alternatives advocated. Market failure suggests that an absolute trust in markets is misplaced. Alternative solutions to the regulatory problem have been sought in self-disclosure. Although this is a regulatory approach there are both legal and economic benefits accruing to firms from environmental auditing and self-disclosure.

3. Corporate social responsibility

How have businesses responded to the challenges of sustainable development and related environmental issues? Corporate social responsibility (CSR) is an umbrella term used to describe the various ways in which firms attempt to integrate environmental and social obligations within their business activities. According to the European Commission [16]:

Socially responsible initiatives by entrepreneurs have a long tradition in Europe. What distinguishes today’s understanding of CSR from the initiatives of the past is the

attempt to manage it strategically and to develop instruments for this. It means a business approach, which puts stakeholder expectations and the principle of continuous improvement and innovation at the heart of business strategies.

A recent PricewaterhouseCoopers survey revealed that 70 per cent of the global chief executives interviewed took the view that CSR was “vital to their companies’ profitability” [9]. Although CSR is widely regarded as a good thing many companies seem to interpret it rather narrowly. Social issues tend to receive far more attention than environmental ones.

Emphasizing corporate philanthropy is also easier than analysing and remedying the consequences of a firm’s activities on the environment. Many executives undoubtedly feel that CSR is essentially a matter for their marketing departments.

Despite its rising profile, the debate about CSR often lacks depth. A major problem is the scarcity of reliable evidence concerning the relationship between CSR and profitability. The situation is described by Dickson [9]:

Numerous academic papers have concluded that improved corporate reputation, better recruitment prospects and bigger sales to environmentally conscious consumers are among the benefits [of CSR]. All such studies are long on description, but the vast majority are distinctly short of quantitative data.

„Triple bottom line” reporting (which measures a company’s economic, environmental and social performance) is potentially a valuable source of such information [12].

4. Auditing for the environment

Why should firms engage in environmental and social auditing? In most jurisdictions, companies are only required to audit their economic activities. Additional audits and reports absorb time and resources without producing the immediate results associated with traditional corporate

philanthropy. Demands on staff may cause salaries to rise [26]. Advocates of triple bottom line reporting such as Elkington [12] argue that these costs are more than off-set by the advantage of having a green reputation.

Analysts have calculated that approximately 25 per cent of their company's reputation is linked to issues relating to sustainable development. They estimate that overall customer satisfaction would fall by about 10 per cent if all CSR activities were abandoned [9].

This was confirmed in studies cited by McDonagh and Prothero [22] where respondents to questionnaires reported a concern for the environment and even a willingness to pay more for goods manufactured in a way which produced less pollution.

Conversely the evidence strongly suggests that a poor reputation on an environmental issue can be damaging. Bad environmental news certainly appears to have greater commercial significance than its opposite [Chan and Milne, 1999] and firms often adopt environmental reporting procedures after receiving damaging media coverage [3]; [7].

Moon and Bonny [24] are clear about why companies should adopt an ethical stance, saying that the motives are to avoid expensive court cases, to avoid bad publicity, to avoid activist action, to boost brand value and attract funds from investors. In *Business Ethics: Facing up to the Issues* [24] they argue that unethical behavior can cost a company its reputation, hard cash, and reduce its share price. To back this up they give the examples of Nestle which was, and they say remains, tainted by its unethical stance on baby nutrition in selling baby milk to mothers in less developed countries, Perrier for selling contaminated water, and Shell for its perceived non-environmentally-friendly disposal of the Brent Spa oil rig.

5. Nature of environmental auditing

Environmental auditing and environmental disclosure are increasing in popularity with corporations. An environmental audit is a means of assessing environmental performance and, as Welford and Gouldson [28] point out, the first corporate

environmental audits were carried out in the USA in the 1970s in response to domestic liability laws. During the 1980s these audits were extended beyond simply adhering to legislation. Shell Oil introduced a proactive audit as early as 1981.

The environmental audit checks (at least in theory) a corporation's environmental performance against stated objectives and environmental policy. It is an integral part of the environmental management system (EMS) and is promoted by institutions such as the International Chamber of Commerce and the European Commission. The aims and objectives of the audit would be to check regularly and systematically, amongst other things, whether the management systems are performing well, compliance with health and safety legislation, and the impact of the organisation's activities on the environment.

It is increasingly common for businesses to conduct audits to assess environmental risks, energy consumption, and waste or pollution emissions. They often seek third-party verification of their EMS using a standard such as ISO 14001, the European Eco-management and Audit Scheme (EMAS), or by signing up to an initiative such as the United Nations' Global Compact. Although corporations set standards and gather masses of data, the disclosure of environmental information is not compulsory in most countries and there are no internationally agreed standards. In 2001 Tony Blair, the British Prime Minister, challenged all FTSE 350 companies to publish environmental reports by the end of the year. Only 76 did so. In the White Paper *Modernising Company Law* [8] the Department of Trade and Industry (DTI) proposes that companies should be obliged to produce environmental reports if their directors take the view that such issues are a material consideration for shareholders.

6. The importance of environmental reporting

A study by Gray *et al.* [20] examined social and environmental disclosures. In their own study the authors found that larger companies and those in environmentally sensitive industries made greatest use of voluntary disclosure. They also cited findings from earlier studies such as Deegan and

Gordon, Filos, Jones and Tilt [7] which highlighted factors such as organizational culture, experience with pressure groups, and media profiles. From their research Gray *et al.* [20] concluded that:

Social and environmental disclosures are an important phenomenon employed by corporations for a variety of purposes.

Is honesty the best policy?

Rather than analyzing why firms undertake environmental disclosure, Niskanen and Neiminen [25] looked at whether reporting is objective. To establish objectivity the authors tried to establish whether firms report equally on positive and negative environmental issues related to their own operations. After studying the annual reports of Finnish companies published between 1985 and 1996 they concluded [25]:

The environmental reporting of the sample firms cannot be considered as objective since the proportional share of negative events reported was negligible compared to the respective percentage for positive events.

Between 1985 and 1996 there were only seven negative news items disclosed by firms out of a possible 50. Niskanen and Neiminen [25] say that it is not only Finnish companies which do not report on environmental issues objectively. Indeed, their findings have been replicated in studies in other countries.

There is considerable evidence that British companies seek ISO 14001 accreditation without making genuine efforts to improve their environmental performances.

According to Brian Kraus, the chief executive of ERM Certification and Verification Services, firms often exhibit a “breathtaking level of commitment to achieving certification”. Unfortunately:

Resources are largely being expended in a way that is giving little of value to the environment, to companies themselves, or to the communities they operate in . . . Most companies do not realise the true costs of waste and other causes of poor environmental performance. However, ISO 14001 certification seems to be

yielding little in these terms for companies.

7. Accountancy and the environment

When the impact of the corporation’s activities on the environment is reported in company accounts, accountants face the difficulty that in economic terms the environment has typically been treated as a free good. That is, no price is recorded in the marketplace for such things as clean air, quietness and a beautiful countryside. Such things are therefore not easy to value. In similar fashion, pollution has been treated as an externality, i.e. something external to the marketplace. So long as corporations do not incur recorded costs such as the fitting of air filters or water purifiers, the cost of pollution will also go unvalued. It would be difficult, though not impossible, for firms to estimate these costs. This is unlikely to happen in the absence of a willingness to commit the resources necessary to gather such information.

8. Conclusion

The Coalition for Environmentally Responsible Economies (CERES) is attempting to address this issue by launching an international reporting initiative which corporations could participate in but this may be some time in coming. In the meantime, the above studies suggest that as long as environmental accounting continues to be a voluntary activity over which the corporations have total control, there must be a real danger of businesses either ignoring the process entirely or of skewing their environmental reporting in order to “greenwash” their accounts.

ABSTRACT

The evolution of the economy in the last century was influenced by the development of concepts such as the industrial revolution, technological revolution and globalization. The “new economy” is characterized by sustained growth in the long term and refers to the quantitative and qualitative changes which have transformed the structure, functioning and rules of the economy.

KEY WORDS: *eco-innovation, eco-efficiency, sustainable development*
JEL: O32, Q01

1. INTRODUCTION

After ecological disasters and progressive degradation of the environment, the society begins to exert pressure increasingly larger both on Governments and on companies, in order to determine a responsible behavior on their part.

Sustainable development, contoured in 1987 as a concept and goal to be achieved, extended the existing economic perspective by bringing into attention the serious environmental problems and by emphasising the importance of environment conservation and environment protection on long-term.

The concepts of sustainability and sustainable development naturally raised the question of whether businesses can provide a basis for promoting the principles of the relevant, answers focusing primarily on the analysis of eco-efficiency.

Efficiency measures the relationship between output and the input size of a system

or process, which will be the more effective the higher output value will be higher for a given value of input or as input value is smaller for a given value of output.

Knowing that the resources are limited, it is evident that efforts aimed at optimisation of activities should focused on maximizing output for a given value of inputs.

2. INCREASE COMPANY VALUE BY ECO-INNOVATION AND ECO-EFFICIENCY

In the eco-innovation literature two research directions can be identified:

- one direction focused on eco-innovation adoption;
- other direction focused on consumer resistance to eco-innovation.

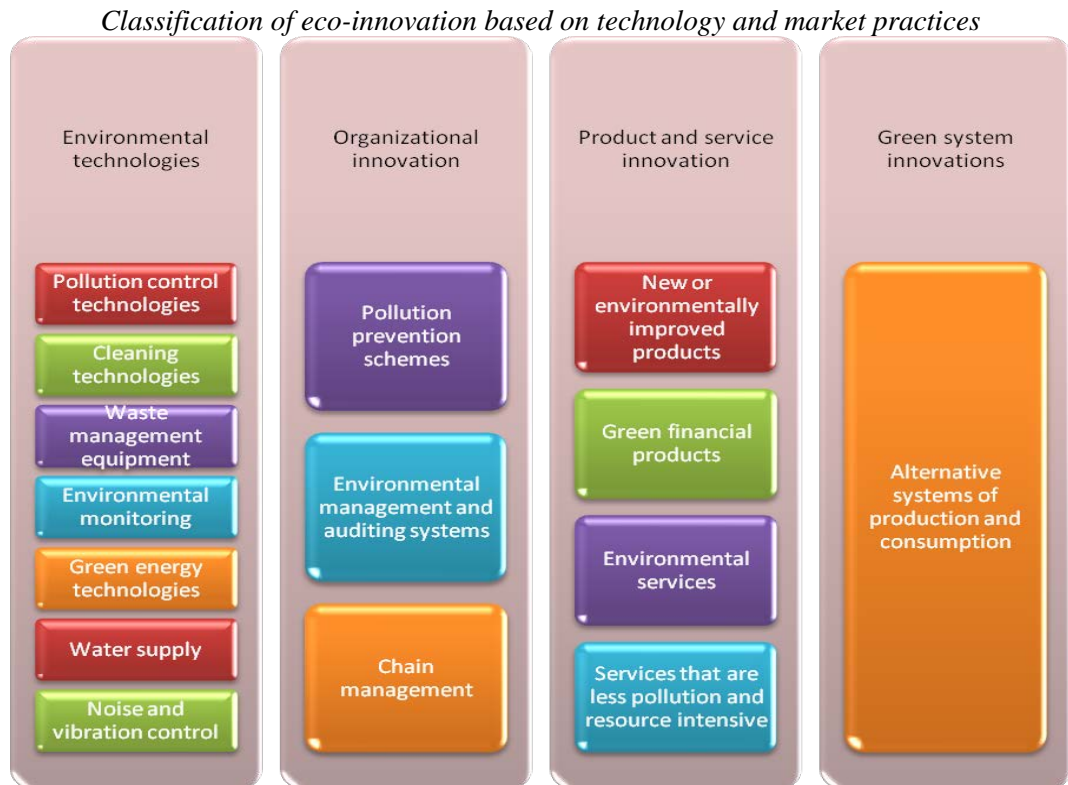

Eco-innovation, as a new concept, emerges in several recent papers:

- P. James (1997) defines eco-innovation as “ new products and processes which provide customer and business value but significantly decrease environmental impacts”;

- R. Kemp (2008) defines eco-innovation as “the production, assimilation or exploitation of a product, production process, service or management or business methods that is novel to the organisation (developing or adopting it) and which results, throughout its life cycle, in a reduction of environmental risk, pollution and other negative impacts of resources use (including energy use) compared to relevant alternatives”;

- K. Rennings (2000) defines eco-innovation as “shorthand

for environmental innovation”;

Source: Author based on Clark (1985) and Arundel (2011)

Any investment made by an entity in order to increase the degree efficiency and more responsible use of resources, means reduced production costs, and creates an essential competitive advantage.

Eco-innovation, in the case of production processes, excluding technology, organization or marketing, has won the most adherents in agriculture, while the construction sector preferred to invest in ecological materials and food industry focused on organizational innovation. In the past two years, more than 40% of the companies in the EU who have understood the importance of eco-innovation have managed to reduce by up to 20% the quantity of raw materials used. Although it seems a minor change, any competitive advantage it may prove essential in the current business environment. In the view of the managers, raw material crisis is an important vector for eco-innovation. In the same time, the managers identified increasing energy prices as an essential factor for stimulating innovation.

Unfortunately, eco-innovation is often slowed down by obstacles such as:

- economic or financial constraints, especially lack of external funding;
- uncertainties regarding market demand, as the European economic recovery is not up to the previous expectations

Eco-efficiency as a multi-dimensional concept, can be define as ratio of an environment variable (effort) and financial (effect) (S. Schaltegger, 1992).

$$\text{Ecological Efficiency} = \frac{\text{Outputs}}{\text{The effect on the environment}}$$

Depending on the nature of the subject measuring efficiency of action, ecological efficiency can have two forms:

- product eco-efficiency - measures the ratio of a unit of product supply and environmental
- impacts created by it, during the product life cycle (Schaltegger S., 1996);

-- activities eco-efficiency - measure the ration of a unit of product supply and environmental impact generated by a specific activity for a period of time (Buritt R.L., 2006).

Eco-efficiency is achieved by offering competitive products and services in terms of price, to satisfy human needs and to contribute to raising the standard of living, while contribute to raising the standard of living, while reducing ecological impacts and intensity of the use of resource. According to the Organization for Economic Co-operation and Development, eco-efficiency characterizes the effectiveness with which natural resources are used in human needs, the result represented by the value of the products and services offered, and the amount of effort the environmental pressures generated by the entity, industry or nation.

Increasing eco-efficiency is determined by the pursuit of those activities that generate economic value while reducing impacts on the environment and reduce consumption of natural resources. Pollution and poor waste management shows that production processes are inefficient, thus grabbing additional production costs can be reduced or eliminated by improvements in manufacturing processes or technological innovations.

Efficient use of environmental components in the entity's strategic planning, contribute to the creation of a direct links between the environmental objectives of the company and its profitability.

3. SUSTAINABLE DEVELOPMENT AND ECO - EFFICIENCY

Sustainable development should be viewed in terms of economic, social and environmental grounds that can be correlated with the notion of eco-efficiency.

Reshaping the new economy in terms of ecological perspective, involves the use of new management tools in the entities, as Environmental Management System and Environmental Accounting.

Sustainable development is related to the concept of quality of life and include the achievement of three desiderata such as economic welfare, social stability and environmental protection. The three desiderata are defined as:

- economic welfare is that which seeks to generate a maximum flow of income by keeping the capital that produced these benefits;

- the establishment of social and cultural systems, providing human capital needed in type of development, including by reducing the destructive conflicts;

- regarding environmental protection, sustainable development aims to preserve the physical and biological stability of national systems.

Concept of eco- efficiency will be reflected in reduction costs and environmental impacts by efficient use of energy, water and materials, planning and implementation of investments in pollution control project, planning and implementation of projects for energy and material efficiency, evaluation of revenue's annual investments in eco-efficiency activities.

Strategic management of an entity can be improved by:

- designing green products and services;
- reviews of the internal costs in the light of future regulations;
- reporting to internal and external users.

4. CONCLUSIONS

The decision to conduct a study on environmental accounting in accordance with community requirements was based on the growing need to highlight the economic and social impact of the environment.

Permanent concern of the academic and business environment is to identify effect of the integration problems of conservation and environment protection issues, as:

- practicing environmental management and developing an environmental management systems;

- introducing of “end-of-pipe” technologies;

- developing technologies to prevent pollution.

So, economical growth can not be analyzed and modeled in the absence of material and human resources and without providing a dynamic balance of natural economic structures.

In the future, entities concerns will be related to the development and implementation of the eco-efficiency concept

whose purpose will be reflected both in reducing total cost of the entity and consolidating its position strategy in long-term, by increasing competitive advantage.

5. ACKNOWLEDGEMENT

This work was supported by the project "Post-Doctoral Studies in Economics: training program for elite researchers - SPODE" co-funded from the European Social Fund through the Development of Human Resources Operational Programme 2007-2013, contract no. POSDRU/89/1.5/S/61755.

Abstract

Increasing the role of leisure in promoting rural areas, to ensure their sustainable development and meet the needs of tourists has led to its transformation into tourist motivation itself, leading to the emergence of new types of vacations. Recreational activity is one of the effective ways for reducing the minimum periods in travel request. Forms of tourism in rural areas represents a complex of activities that relate to cultural-sport, entertainment, recreation, etc., and which is intended for lovers of nature. The aim of the research is to identify the main connection between rural tourism and recreational activities in rural areas. The entertainment activity in the rural tourism is becoming an important facilitator of sustainable development of any industry or community. In our article we intend to show the constituent elements of entertainment in rural areas within sustainable development and suggest how this could be applied to tourism.

Keywords: entertainment, recreation, rural tourism, sustainable development, tourism based nature.

J.E.L Classification: L83, Q01, Q57, Q58.

1. Introduction

International leisure tourism in recent years began to grow, attracts many tourists showing increasingly a higher attraction for this form of tourism, the country has much to offer specific leisure tourism attractions.

Entertainment aims to relieve the physical and recomforting, entertainment and tourist capacities, the development of mental satisfaction, through fun and educational activities, cultural enjoyment and growth of knowledge. Entertainment can become, therefore, an element of differentiation to organizations or destinations, which represent the main motivation for making a journey. Once it becomes the main motivation for travelling, the entertainment could lead to the emergence of new types of holidays: holiday vacation skiing, climbing, holiday tennis, yachting and surfing holiday, holiday for hunting, holiday for cultural tourism, etc.

The entertainment services are designed to maintain a coordinated tourism product, to harmonize relations between supply and demand, thus satisfying the tourist a multitude of tourist motivations. Therefore, entertainment is a quantitative and qualitative indicator of the touristic phenomenon, along with the quality factor of tourism development itself. Competition of touristic companies, but also at the level of tourism destinations highlights the development process and diversification of tourist services, and recreational nature and diversification of development of these services continued, more than in the case of other categories of tourist services.

Recreational service delivery assumes a suitable material and technical bases, to properly trained human resources, to make continuous efforts to improve their destinations. Given the place in contemporary services is necessary to consider the arrangement of tourist areas by

developing entertainment strategy, which enhance the economic component of each area, to make an overall planning and long term of the man - nature, to ensure weighted rational sizing of the equipment, an adaptation of their configuration spaces and landscapes. Leisure services are equally important to travelers (provide conditions for recreation, entertainment, capacity building and improved knowledge etc.) and for provider organizations (source of income, way to create differentiation and competitive advantage, customer loyalty, etc.). In relation to leisure services is necessary to recall the animation, which means a set of activities, like sports games mere entertainment or to which participation is free, aimed at physical and mental relaxation and facilitate mutual agreements, namely the creation of good provisions.

2. Leisure activities – promoting sustainable development

Leisure and entertainment services in the rural space can be organized and provided by the accommodation and / or food companies, generally upper class, and those activities are simple and require no special effort or investment personnel. This might include: practicing sports like swimming, skiing, skating, riding, golf, tennis clubs, discos, video, bar, night-club, musical performances, dances, events - exhibitions, festivals and so other examples.

Leisure services can be organized in tourist destinations, the cooperation between tourism organizations and / or between them and local governments in this case the benefits are more diversified and have a greater degree of complexity (specific services for equestrian centers, sport centers, polygons, holiday clubs, marinas, etc.).

Leisure services can be services organized by third parties, usually highly complex forms, resulting from involvement of specialized bodies, other than tourism - amusement parks, tours of theater ensembles, dance, music, recreational vehicles (aircraft sports, boats, trains).

Depending on the content and touristic destination, recreational facilities and equipment can be classified, in our opinion, the next model:

- tools and equipment specific cultural entertainment - museums, theaters, exhibitions, cinemas, cultural houses, philharmonic orchestras, libraries, etc.;
- specific tools for physical well-being maintenance - pools, saunas, solariums, fitness centers, etc.;
- leisure equipment sports - football, tennis, basketball, gyms, swimming pools, sports pools, artificial ice rinks, miniature golf, go-kart tracks, horse riding, water sports, etc.;
- entertainment production equipment - entertainment - bowling, billiards, slot machines, casinos, restaurants, clubs, amusement parks, rides, cable transport, etc.;
- entertainment production equipment specific mountain and rural tourism - golf, horse riding tourism, travel on foot, hiking, cycling, river trips, fishing etc.

3. Types of tourism specific rural environment

Tourism in rural environment allows people to approach, to know the conditions of material life and spiritual contact with other persons who connect with. From experience of other countries - especially European ones - has been observed that rural areas are suitable for tourism and have, in many ways, the conditions for developing such tourism activities. What could be more wonderful than a breakfast with fresh milk, a walk in the paths of the mountains or valleys, to look unique landscapes, a sunset or sunrise, to hear the murmur of a stream or the roar of a waterfall, to walk on the village street, to wait a few moments before an exhibition or home to artisans, ride a sleigh rides, a few hours dreaming in front of the stove are just a few moments of life universe Romanian village?

Apparently tourists from urban environments run by the civilized world, with a desire for isolation and return to nature. However, modern people wants his holidays in the middle of green countryside a series of activities that dream, that actually think or practice in large urban areas (it is true or accident, lack of free time maybe ?) when he has leisure for the thought to roam [6].

Consequence of industrial development and urban population growth, rural tourism

has become a reality. Search the countryside as a way for rest and recreation is a general trend in domestic and international tourism [2].

Agro-tourism is a particular form of tourism, a more complex form of tourism, including the actual tourism activity (accommodation, board, tourist traffic, running programs, basic and supplementary services, etc.) and economic activity, agriculture usually practiced by hosts tourists - manufacturer of agricultural products processing and marketing of household by tourists.

This form of activity which is agro-tourism which takes place in guesthouses and farms includes accommodation, meals and recreation and other services provided during the stay of tourists and tourist services at their request.

Agro-tourism, rural tourism is an alternative environmentally gentle mass tourism, a source of income for rural population, a solution for the unemployed labor force.

Agro-tourism is one of the important branches of national economy that aims to develop tourism in rural areas, in close correlation with the local economy, with strong linkages between tourism and other branches of local economy and in this case especially with agriculture.

For many of our urban citizens arrived in the rural houses, many of the life aspects of the inhabitants are new. The guests' participation can be as spectators, beneficiaries or even workers in such activities [3]:

- the land cultivation, raising the animals, woodcraft ship, skin craft ship or woolen craft ship, the obtaining of the cheese, or wine as well as cultivation of the fruit bearing trees, of the grape wine, vegetables, flowers, mushrooms, chicken raising; doves and even ostrich give a certain image to the holiday and presents many advantages;
- allows a better understanding and communication between the host and the guests;
- assure the host a helping hand (through a symbolic one), which can be evaluate don the paying services by diminishing it or by offering food and fruits to the guests at their departure;

- permits the clients' loyalty by sentimental bonds. It may occur initiative from the guests to collaborate for utilization of the product son the city market or for advertising and bring new clients.

All this comes to greet tourists offering a wide range of tourist activities in order to relax and make it come back again and again. Agro-tourism is related to the *farm tourism* which usually means the use of peasant houses as accommodation for tourists. Farm tourism is not agro-tourism in the strict sense of the term, as these homes lose peasant agricultural function or is not too long occupied by active farmers. Despite losing the direct connection with actual farming, farm tourism is an important form of rural tourism and an important contribution to the local economy where it is practiced [4]. Tourist activity is closely linked to agriculture and often the viability of domestic economy [7].

Rural tourism. Utilisation of resources through activities of rural tourism takes place and by: leveraging specific resources (Winerry Association, skilled trades, essays, ethnographic or numismatic interest, revitalisation of art crafts specific rural areas, the keeping of traditions and customs specific to a rural area, recouping primary agricultural products and of water resources, fisheries, for example.

Rural Tourism is that form of tourism where the crop is a key component of a recreational tourist product, as it says World Tourism Organization. Trait distinguishing feature is the rural tourist products on the fact that visitors are offered personalized contacts, enjoy the physical and human environment of rural space and participate, as far as possible, activities, traditions and lifestyle of the local population [11].

Connection of rural tourism with entertainment is a long term one. If the definition of entertainment is accepted then it can not be ignored what activities might have tourists, offering highly attractive activities to fill free time.

Nature based tourism is that form of tourism where activities are dependent on the natural properties. Nature tourism involves travel to destinations and activities and experiences that are totally dependent on nature, may include visits to popular

attractions and can appear as mass tourism, alternative tourism, or a combination of adventure tourism, cultural tourism and ecotourism. Nature tourism is closely connected with ecotourism, often promoted as a factor in recovery and conservation in many parts of the world.

4. Forms of entertainment in rural areas

Recreational activities can take various forms, from active to passive. But the essential element is not what makes a person but how do for getting satisfaction [8].

Horse riding tourism. It is considered that this activity could give more fun and entertainment to holidays spent in the countryside. If this activity comes to the attention of Romanian entrepreneurs eager to do business in areas such as leisure tourism could bring many benefits to rural tourism. In present there are horseriding centres in all country (nearly Bucharest are 8 such centres, in Valcea County – Brezoi is a specialized centre, in Breaza – Prahova County). Of particular sports that attract and are very loved and appreciated, is horseriding followed by tennis, football, swimming or fishing. This leisure activity is a problematic one regarding the legal statement, but it should be noted at the same time is increasingly required.

Day trippers. The development of this product is frequently performed by travel agencies. Pedestrian travel enjoys greater appreciation among both youth and other ages. Desire to admire natural landscapes combined with a passion for photography, painting or flee from urban stress are among the main reasons for this form of entertainment. Currently this entertainment product market is confronted with the following trends [6]:

- a relative stagnation for large customers walking pedestrian;
- progress of „daytripper” tourists or half a day, regular clientele who do not seek operation of sports;
- the increasing search, especially by organizers specialized hiking "bagless" and comfortable accommodations.

Bike riding. is the ideal of leisure for mountain biking enthusiasts on trails and valleys. It is a form of entertainment that can take place alone or with friends, to explore

the bike away from factories and cars, without intersections, traffic rules or horns. That would be hiking and novelty: the unknown and more vegetation. With luck, it can be found deer, pheasants and wild rabbits.

Mountain excursions. The so-called "trekking" can be made throughout the year regardless of season. These trips are made to safe areas in every way, areas that do not present any danger to the sport loving tourists. There are leisure form to spent free time in nature, and nature lovers can explore it all over the trip.

Fishing. For many of those who love nature freshwater fishing remains a possibility to spend moments of respite during the holidays or on weekends or near home, or even further. Recreational fishing is a form that can be practiced at any time of year. Lovers of this form of entertainment can admire the landscape, taking part in protecting the natural beauty.

Another leisure activities that might take place in countryside: motor rally, climbing, rafting, snorkeling-ul (in this sport exists the opportunity to observe underwater attractions with relatively little effort).

5. Entertainment and rural sustainable development

A key challenge in sustainable tourism is to develop economically viable enterprises that provide livelihood benefits to local communities while protecting indigenous cultures and environments. Such ventures are difficult to assess due to a general lack of effective assessment and monitoring methods, a lack of consensus about methodology and the inability of some monitoring systems to incorporate all elements of tourism impacts [5].

Sustainable tourism development is that important part of the process of activity planning, which, as far as tourism is concerned has a purpose to avoid any action that might affect the very base of development.

Sustainable development is a strategy whereby communities search ways of economical development, while benefiting from the local environment, or creating benefits for the life quality.

In order to succeed on the market, organizations must permanently focus their efforts towards understanding and fulfilling the necessities and expectations of all their clients, both the current and the potential ones [9].

Organizing tourist activities, especially in a rural area leads to a number of implications that arise from good management and local resource management and creating a positive image of the host community and those involved.

Development of tourism and travel arrangements for enrolling in the positive pole of the attractiveness of activities as environmental and urban areas requires [2]:

- protection, conservation and prevention of environmental degradation;
- touristic assets conservation;
- integration of tourism activities and entertainment forms;
- educate participants to develop respect for nature and create a green behavior.

In witness whereof said above is talking increasingly more controlled development of tourism. For this reason rural localities use the term of sustainable development, which includes current and future needs of society.

A definition of sustainable rural development is a reflection of this process on improving overall economic and social well-being of rural residents and the institutional and physical environment in which they live.

Rural Development is the term often confused with rural growth, which is totally wrong. The same error is made and when boundaries or terms of growth and economic development, which even they are not synonymous. This distinction is explained by the fact that economic growth does not always improve the living conditions of rural residents. Thus, rural development concept focuses mainly to the welfare of rural residents living [1].

Sustainable development, for a certain period of time, leaves intact the entire property, including natural capital. We should leave by the same capital will future generations, including potential opportunities for the current standard that we want.

Sustainable development is a development strategy that involves all property, natural resources and human resources and financial and physical resources to increase the long term welfare [10].

6. Conclusions

Most travelers are seeing their vacation to nature as a vacation getaway from everyday activities, as a "moment" in which they are lacking any care and do not need no little concern for what is around.

We consider that rural tourism will solve the problems of planning and will try to reach a balance between urban and rural environment. This type of tourism represents a sustainable development way of the main tourist regions in Romania. Although Romanian tourism is currently going through difficult times, Romanian rural tourism will join the segment that it is European rural tourism. Therefore the ethnographic characteristic of tourist villages, maintaining the traditional style of life must be preserved and perpetuated in order to become a real tourist attraction and a visitor reception permanent basis.

Leisure in tourism can be defined by all means, equipment and forms provided by the unit, resort or tourist areas capable of providing an individual or a social group status fun, pleasure, to give the feeling of satisfaction, of fulfillment, to leave an impression and a beautiful memory [8].

Entrepreneurship and Entrepreneurial Romanian Environment. Perspective of European Integration

Dromereschi Maria Irina
„Anghel Saligny” College Bacău
dromereschi_irina@yahoo.com

Abstract

Entrepreneurship is a concept of current as of great significance as it is cultural. Direct correlation with the manifestation of his country's economic development comes only to update the strategic importance and invariably interdependent with other factors that influence development. Expression of free enterprise and entrepreneurship is done mainly in small and medium businesses that provide effective and stimulating the exercise decision. During recent development of SMEs in Romania enables us to ask more than the Romanian business environment, more support and accountability from the state and more consistencies of policy makers. Reality economic, social and European policy today requires more than ever to create a business environment to highlight the private initiative, entrepreneurship, competitiveness and innovation. How real economic integration efforts are consistent on both sides, the focus of political attention is warranted and is intended to be a sustainable.

Key words: entrepreneurship, small and medium-sized enterprises (SMEs), european integration.

J.E.L. Classification: L26, M13.

1. Introduction

Entrepreneurship is generally accepted to be "background noise" of long-term economic development [1]. Entrepreneurs are initiators, ie those introducing new products and production processes in an economy. In this process, companies are forced to innovate to withstand the pressure generated by new businesses. As a result, entrepreneurship has a rejuvenating effect, training and transforming economies. This

theoretical relationship has inspired a large amount of empirical studies in developed countries are largely in agreement, the positive correlation between entrepreneurship and economic growth [2]. Entrepreneurship is often seen as a positive result, and also as a pivotal economic development [3]. The main argument for entrepreneurship is the positive effect it has on economic activity. The idea can be found in Schumpeter's work [4] in which he shows that, by introducing new ideas, products, production processes and organizational structures, causing entrepreneurs and future economic conditions affect the current. Existing firms are forced to adapt to new standards. Those who are unable to do so will experience loss of performance and, eventually, disappear. This process of "creative destruction", increases productivity and regional competitiveness and as a consequence, regional economic development. This is actually the reasoning applied in assessing the role of entrepreneurship in economic growth for developed countries. It remains unclear whether the same positive relationship can be expected in developing countries. There are reasons to expect that the situation be different in developing countries. Schumpeterian views on entrepreneurship, assumes that new firms are started based on perceived business opportunities that are left unexplored by existing firms. The distinction between opportunity and necessity require as starting points in starting a business. In countries developing motivation for entrepreneurship is the need for self-subsistence, because all other options are either nonexistent or unsatisfactory work [5]. Appearance of necessity entrepreneurship is linked to early development stage of an economy. Developing countries are expected to have higher shares based on necessity entrepreneurship because of the need for self-support and lack of employment

opportunities [6]. GEM reports demonstrate the link between a country's economic development level and rate of early-stage entrepreneurial activity (Bosma et al., 2010, 2009, 2008) [7]. GEM results confirm that institutional and demographic characteristics, entrepreneurial culture and economic wellbeing of a country emerging entrepreneurial characteristics (Bosma et al., 2010). In 2009 early-stage entrepreneurial activity rate was 5.02% higher rate than that measured in 2008 (3.98%). Even if this rate increase, remains one of the lowest among savings based on efficiency. Variables that significantly influence their desire to start a business are: household income, knowing other entrepreneurs, age, sex, fear of failure, confidence in knowledge and entrepreneurial skills, entrepreneurial success perception of promotion by the media and occupation. In 2007-2008 the factors of influence or change, age, sex, fear of failure and factors that influence becoming occupation probability of becoming an entrepreneur at an early stage during the global financial crisis.

2. Origins of Romanian entrepreneurship in European context

Since sec. XV and XVI, the main centers of business activity in Romania were cities like Sibiu and Brasov, which have become large shopping centers, first entrepreneurs of Romania is of foreign origin, many of whom were Germans. Entrepreneurial activity involving trade markets, fairs called, where people exchanged goods they produced the goods we consume - Tîrgu Mures, Tîrgu Neamt, Tîrgu Jiu, etc. The first and most important business writings are in Romania are: "Neagoe teachings" (leader of one third of Romania between 1512 and 1521) to his son Theodosius, containing advice on leadership in general, the army, coordinating messengers and things like the military bill. Entrepreneurial activity has been seen increasingly in terms of management and trade concept is nonexistent free market due to political instability and military innovation. Energy and resources have been invested in potential entrepreneurs species to obtain education or military or administrative functions within the power structures of that time. In terms of economic history, the period between 1500 and 1800 may be of

character by increasing the share of trade in relation to self-consumption, asserting a set of specific institutions of market economy and slow real growth yet the stock of real economic assets capita [8]. Internationally, noted German historian Rudolf Vierhaus educational monopoly of the Church, scientific criticism and reform movements within the Church, overseas expansion of European powers, the genesis of world trade and global military conflicts, international diplomacy formation of a codified law of nations and a practiced *jus publicum europaeum* blossoming of modern science, philosophical criticism, and literary history, and theories of reason of state, increasing literacy and the development of public space communication [9]. Neither West nor East European economic areas were not homogeneous, but includes countries and regions such as outstanding overall development and the pace of development during the three centuries so that increased economic disparities have increased in the European continent. Sec period. XVI-XVIII permeates Ottoman rule and the pressure it put it on arrhythmic development of the Romanian Lands. Peșcheșurile (taxes on goods and money to the Ottoman Empire, mainly related to obtain appointment as ruler) and later dramatic increase in taxation (including their perception of money) have resulted in forced selling of output produced or accumulated wealth, poverty free peasants, forced to sell land and / or self (personal addiction to landowners, moneylenders or ecclesiastical large landowners). Default prevented accumulation of capital and delayed emergence and development of local entrepreneurship.

The nineteenth century was one of accelerating overall growth and demographics. Several factors have contributed to economic performance: the demographic transition, agrotechnical innovations and increasing agricultural production, the industrial revolution (coal engines), the benefits of oil, electricity, metallurgical, engineering, electrical and chemical industries, the spectacular progress of transport and communication, service development and international trade (the first wave of globalization). Evolution syncopated upward trend but was characterized by a deepening division of labor (where

development differentiated regions or countries) and by an intensification of economic integration processes, especially the transport and trade, international conventions on postal systems (1865), Protection of Industrial Property (1883 and 1900), the international movement of capital (loans, foreign direct investment) and the people. Romanian entrepreneurs in sec. nineteenth and twentieth-century Romanian economic literature uses the concept of the entrepreneurial manager synonymous, "a specific person overseeing the process and ensures secure a particular result, predetermined". Romanian market when the first types of entrepreneurship: public meetings established (1831), elective assemblies Convention (1858), the bicameral system in Romania (1886), "Trade Rule" E.Ion Nechifor - considered classic manual management.

World War has not only produced extensive casualties and material destruction, but also agricultural and industrial production fall, the phenomenon of inflation (Germany, hyperinflation) and a severe reduction in international trade. Social struggles, economic structures to adapt to new borders, restoration and inter-Allied debts were made at different rates from state to state [10]. Short recovery period, '24-'27, not obviously offset the decline of agriculture, and no boom or revival services industry. Statistics are proof GDP / capita in different European countries grouped in three categories: 12 developed countries, 4 countries and Southern Europe Western Peripheral and 7 central-eastern European countries including Romania. It decreased in the 1919-1929 and returned to growth since cu1938. In the early twentieth century was initiated innovative process in a textile factory in Pitesti - unique in Europe - and was to organize scientific work after Taylorist theories (Frederick Taylor). It is noteworthy initiative of scientists (D.Gusti, Gheorghe Ionescu-Sisesti, V. Madgearu Gheorghe Marinescu, Gheorghe Buzila) from the Romanian Institute for Scientific Organization of Labor (IROM). Also, have been translated into Romanian classical management important books (Industrial and General Administration, Henry Fayol) and economic works have been published as: N. Smith,

commercial and industrial enterprises as monetary stabilization, 1939, C. Filipescu, Textiles Romanian, 1939, V. Madgearu Romanian economy after the World War. By 1948, the Romanian state was ruled by a constitutional monarchy modeled on Western monarchies, with a liberal political and economic.

After 1948, the model followed by the Romanian economy was the Soviet Union, the abolition of all democratic political institutions, individual rights, free speech and individual property - building socialism brought about the nationalization of industry, banks, transport companies, the collectivization of agriculture (1949 -1962) and organized a centralized economy with an emphasis on stalinist industrialization. Types of businesses most common were: state enterprises and cooperatives. Entrepreneurship in the communist era that is characterized by various forms of private entrepreneurship coexisted with public ownership and entrepreneurship in the state enterprises during the socialist period. There were: the official economy owned and controlled by the state and economic activity consisting of gray economy tolerated but illegal. Gray economy refers to all forms but unregistered private entrepreneurial activity condoned by the state, including private sector activities that were not officially registered and illegal use of state property. In such case add "lack of institutional preconditions that facilitate transformation scheme has now in the absence of economic culture (represented by a class of entrepreneurs)" [11].

After 1989, the major problems faced and still faces entrepreneurship in Romania were: poor infrastructure, privatization, agriculture, banking, economic subsidies in an environment disrupted both nationally and worldwide. A real socialist system development, economic literacy of a large part of society, both in knowledge of financial instruments of the modern economy and in terms of economic knowledge base correlations at the micro and macro. Failure of the grafted side was the great economic expectations of enthusiasm triumph of the revolution. Now as then, regardless of political orientation, almost all experts' opinions and not only converge on the idea that the strength and effectiveness of current

savings are represented by small and medium entrepreneurs.

3. Small and medium enterprises in Romania

European Union legislation, the enterprise means any entity engaged in economic activity, regardless of legal form of incorporation. Thus, the category of business can take: authorized individuals, family associations, business partnerships, associations of entrepreneurs. We note that while compliance with the ceilings on the number of employees is required, an SME may not comply with one of the two other criteria: year net turnover or on the total assets. It is not necessary to satisfy two criteria, and overcoming one of them lets you keep SME status. The period between 1990 and 1995 is characterized by annual establishment of a very large (between 50 000 and 130 000) of SMEs in all fields. Most of them have gone as easily as they occurred (70-80% of businesses have gone in 2-3 years) since their activity trying to exploit / exploit opportunities or favorable circumstances and experience in managing a small even small business. The period 1996-2000 was test time for new entrepreneurs and their businesses. Economic policy mistakes (lack of income tax for private businesses, financial imbalances and currency, inflation of 294% in 1993, depreciation of 100% in early 1997 compared to 1996) led to a strong rebound of private initiative (number and company fell to 30-40 thousand). Economic measures in early 2000 again induce the desire to invest, 2001-2006, largely pointing errors of the past. Thus, inflation of between 15 and 30% of private initiative became bearable and the exchange rate and tax advantageous for both entrepreneurs and the state budget. Number of small and medium increases up to 50 000, to create new jobs, their activity is stable partnerships with both large public companies and large multinationals as they have become contractors or subcontractors. Moreover, dynamic industry itself has been superseded by the services and construction boom. Labor shortages in agriculture was caused both by absorbing a part of the new jobs in services, industry and construction, labor migration to the West and exit of the active population of

a large number of elderly farmers [12].

Table 1. Share of main sectors of the economy during the pre-accession

		2000	2006
Agriculture and Forestry	% in employment	41,4	30,5
	% in PIB	11,1	7,8
Industry and construction	% in employment	27,3	30,6
	% in PIB	30,9	31,9
Services (including taxes)	% in employment	31,3	38,8
	% in PIB	57,8	60,3

Visible from a variety of indicators, Romania has managed a partial recovery of the differences that separate the EU average. The trend continued in fact and in 2007-2008, but most significantly to the GDP/capita.

Table 2. GDP per capita to the EU average (EU 27 = 100)

	1999	2000	2001	2002	2003	2004	2005	2006	2007	2008
Romania	26	26	28	29	31	34	35	38	42	47
Nord-Est	19,2	18,2	20,1	21,0	22,3	23,5	23,3	24,5	26,8	29,0

Source: INS 2009

The period from 2007 until now was marked by the accession to NATO and the European Union and the opportunities that these political decisions have made: the transfer of goods, capital and labor, information technology, managerial expertise and, European economic law, entrepreneurship education and permanent training. Further privatization of state and redistributing wealth are the most important economic decision economic changes, this is reflected in the average number of organizations established annual returns in the range of 30-40 thousands of companies, which maintain economic sustainability within Romania declared functional (able to ensure economic growth) and regarded as favoring the development of private initiative and entrepreneurial environment for small and medium entrepreneurs. In late 2009, in

Romania there were about 500 000 micro-enterprises and small and medium business in all areas of law. The global economic crisis was felt in Romania in the second half of 2008. Some was imported (reducing external demand and investment behavior of entrepreneurs hesitant foreign) domestic premises and another created, maintained or ignored economic policy (massive entry of foreign capital and "exuberant behavior on lending in foreign currencies", pro-cyclical fiscal policy "imprudent" and increased government spending in light of the 2008-2009 elections, which gave rise to irrational consumption in a time when the external deficit in the budget is completely unhappy) [14].

At the beginning of 2010, global perspectives begin to emerge out of the crisis, internal view of the Romanian economy is announcing more difficult. Even if it seems a solution Romanian exports with added value (cars, drugs, power equipment) [15] failed to overcome revenue shortfalls, the budget deficit to GDP, oversized state apparatus and associated expenses, increase in the number pensioners [16] and weak administrative capacity of the state. The combination of these factors was anticipated trend forecasts provided INS compression consumption and delay processes near the incomes and prices in the EU. According to International Monetary Fund (IMF), GDP per capita, adjusted for purchasing power of Romanians, this year will be equal to 40.2% of the EU. In 2015, Romania will have a GDP per capita of \$ 15,396 compared to 12,644 in 2008. Data is confirmed, given that, according to the National Statistics Institute (INS), the state regulated prices increased compared to 1990 even 37,000 times, respectively 2 to 10 times the inflation rate in two decades. Estimates show that Romania's GDP will grow much faster than most other EU countries. In 2025, GDP per capita will reach 60% of the EU, compared to almost 40% today. Slovakia and Poland are the first Eastern European countries will reach EU average living standards in 2025.

Figure 1. Convergence – nominal GDP per capita and proportion of EU average 2000-2025

Source: Eurostat, Nomura Global Economics
Note: We assume forecasts for GDP converging to Nomura's estimate of potential over the medium run. We assume once a country has converged (i.e. passed the EU average GDP per capita) then it stops the process of convergence and then on grows at the same rate as the EU average.

Source: International Monetary Fund (IMF)

Romania ranks second in Europe, with 24.7 points, in terms of Romanian intentions to establish a business, the first being Latvia (by 24.8 points), according to the Global Entrepreneurship Monitor, conducted the 24 European countries. Behind us are countries like Poland, Hungary, Slovakia, Croatia, France and Lithuania, which shows that a large number of countries with a high index of intention to open a business are in the Central and Eastern Europe or the Baltic. On the other hand, among countries where very little people want to be entrepreneurs include Russia, Ireland, Germany, Denmark, Finland, Netherlands, Norway. Britain, Spain and Turkey. Romania is very large increase from 2010 when our country is in the middle ranking by 8.6 points. On the other hand, Norway is the first place two years ago, while in 2011 came to top end.

Source: GEM

GEM study shows that Romania has progressed greatly in the last year promoting entrepreneurship in the media and the opportunities they see as suitable entrepreneurs to open a business. At the same time, Romania has recorded a slight increase in the perception they have about their abilities in the consideration of

entrepreneurship as a good career opportunity in the image of the Romanians have about entrepreneurs. However, Romanians fear becoming less to have failures. At this point, the Romanians increased interest in entrepreneurship is an effect of economic crisis. Those who have lost their jobs had to find other solutions than the one to be employed, and those who were employed and had experience in crisis need to identify good business opportunities, preferring to start their own business. Those who have founded a business or launch a business as a result of opportunities arising from the crisis (for example, people in finance who have opened businesses that help companies streamline their costs) or started a business focused a passion / hobby (for example, people in real estate and boutique stores have opened with bio). As the number of examples of success will increase, people will realize that there are still many untapped opportunities on the market, will increase interest in entrepreneurship and fear of failure will decrease.

5. Catching and economic integration of Romania

Convergence policy requires high rates of saving and investment, continuous improvement of educational standards and labor (human capital), constant improvement of competitiveness, a tolerable level of social tension (considerable social cohesion), and most importantly, a constant and rapid increase overall productivity of production factors, with the flagship high labor productivity growth. An indispensable support entrepreneurial activity and safeguard its quality is the quality of institutions at national and European level. Such improvement requires coherence, consistency and thought out but and additional financial and human resources. Limited administrative capacity of the state attaching to the global economic crisis and lack of resources prevents the selection of priorities and implement proactive policies but accelerates the elimination of surplus state to prepare the necessary institutional reforms. This process is expected to grow by achieving economic recovery but he must be prepared, not expected, the quality and sustainability considerations.

On the other side, the European Union creates the perfect tool to support entrepreneurial activity is an example: : European Union Support. Programmes for SMEs 2012. The European Union provides support to European small and medium-sized enterprises (SMEs). This is available in different forms such as grants, loans and, in some cases, guarantees. SMEs can also benefit from a series of non-financial assistance measures in the form of programmes and business support services. The assistance schemes have been divided into the following four categories: *Thematic funding opportunities* (environment, energy and transport; innovation and research; education and training; culture and media); *Structural funds* (European Regional Development Fund [ERDF] and European Social Fund [ESF]); *Financial instruments*; *Support for the internationalisation of SMEs*; *Information on the Enterprise Europe Network*, which offers business support in the Member States and beyond.

Characteristics of SME in Romania are mostly common with similar organizations in developed countries regardless of cultural space which they belong. These are: are created by entrepreneurs, alone or in combination, are led in most cases even by those who created them, are impregnated and reflect personality-creative entrepreneur (intuition, education, training, experience, professionalism , intelligence, charisma, ability to create, maintain, build and capitalize on relationships) serve personal or group interests (who created the business environment), recover, usually local opportunities, exploit a competitive advantage as contractor or subcontractor, are flexible and adaptable to a changing economic environment and tend to associate with others in the same category so as to develop effective business relationships with potential "growth" are the beneficiaries of specific legislation, often favoring (tax benefits, administrative facilities), committed workforce prepared but not necessarily specialized, expensive and create a competitive environment that is conducive to the integration of technical progress and promote value added.

6. Conclusions

The current economic differences accumulated over time and will require overcoming backwardness in real time one or even two generations. But the issue remains pending horizons Romanians who want to stage some measurements (eg functional economy) to be tangible for the greatest number of individuals, to be reflected in their daily life. Economic development is impossible without integration of the abstract world of economics and Nobel Peace but a complex problem that companies engage in efforts to timely, consistent, which leads, creates and transforms institutions and especially people, generations.

Performance in Public Administration. A Systemic Approach

Adelina Dumitrescu

National School of Political Studies and Public Administration
adelinad@snsps.ro

Abstract

There are two points of view on the performance of the public administration: an internal one, governed by the principle of the three “E”’s and an external one, a measure of the public accessibility to the civil service. The problem with these two points of view in that, although they show the same direction they are of opposite bearings.

Even though the inherent purpose is ensuring the citizen’s access to the civil service, serving the tax payer with their problems thus serving the whole community in a most efficient manner, we cannot overlook the fact that the resources of the public administration are often more limited than those of private economic agents, especially when considering that the civil service usually involves very high operating costs.

In these conditions the performance of the public administration is defined as an optimum between the capacity to deliver the civil service towards the citizens and the associated costs of this capacity.

Key Words: Performance; Civil Service; System; Management; Optimum

JEL Classification: G31, H11, H21, H61, H63, H72, M48, P17.

1. INTRODUCTION

The term of public service in Romania has evolved a lot in the past 20 years. On the one side, the problems of subjects for public service have changed, becoming more and more complex, on the other, the integration process into EU and NATO structures has demanded the modernization and transformation of the public administration. Before the 1989 revolution Romania had a planned economy, and the public administration was a public apparatus,

specialized in the satisfaction of a certain, somehow narrow set of needs. But, with the start of the transition process towards a market economy, the needs of the subjects have adopted an individual character, differentiating themselves from one case to the other.

This is why it was and still is necessary to define criteria for the measurement of the degree of satisfaction of the demands coming from the subjects, without neglecting the fact that the public administration is itself an socio-economic entity which obeys the restrictions imposed by the limited character of available resources.

In its status of socio-economic entity the public administration is an open system, which interacts on various levels with other socio-economic entities, being influenced by a very dynamic game between stake holders, meaning the interests of certain groups in defending their rights. For example, in the case of the local administration, the citizens have the right to access some public services like public lighting, whilst the city hall has the obligation to collect taxes from the citizens.

Thus, a modern public administration is an efficient one, which is at the same time flexible enough to solve the problems of its subjects. In order to guarantee this demand it is necessary to institute a legal framework which permits public servants to solve the cases that are presented to them, but it is equally important to manage public institutions according to imposed performance criteria.

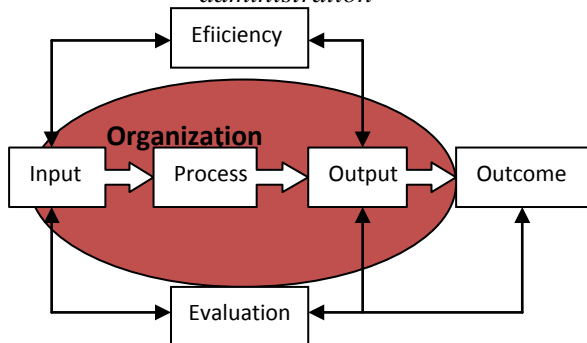

2. PERFORMANCE IN THE PUBLIC SECTOR

2.1. Defining performance

From a linguistic point of view, performance can be defined as an extraordinary achievement in a field of

activity. From a systematic point of view, performance is defined as the best result of that system, in regard to one of its characteristics. This result must be understood here as the ratio of inputs and outputs of the considered system.

Figure 1- Performance model in the public administration

A simple performance model which describes the definition from above is illustrated in figure 1. Here, the internal processes which determine the relationship between inputs and outputs and the variables which measure the performance are being shown. It must be said, that performance is a somewhat abstract notion, which cannot be directly measured, but can be expressed by other variables like, in our case, efficiency.

2.2. Measuring performance

If in the case of private socio-economic entities can be measured fairly easily by expressing certain economic indexes like profit or cash flow, it is not so easy to express it in the public administration due to its non-profit character. On the performance of public administration there are two points of view:

- One of the subjects, whose interest is to have easy access to a high quality public service and;
- One, which takes into consideration the three “E” principle, Efficiency, Efficacy and Economy.

At a first glance, these two points of view have opposite bearings because a high quality service implies very high costs, like for example the sanitary system. Thus, performance in the public sector seems to be an optimum between or a “way between” these two points of view: performance could be defined as the degree in which the public administration satisfies the problems of the

contributors using as efficiently as possible the resources that it has available. However, this answer is not sufficient because it contains no engagement to deliver high quality services, and leaves room for excuses like “the service would be of a higher quality, if we had more funds at our disposal”, which is unacceptable. Also, in a fiscal system like the one in our country, in which the financial burden on the contributor is very heavy, it is equally unacceptable to increase the tax levels.

In order to exit this vicious circle, a new instrument is necessary in which should determine the development directions and criteria of the public administration. Help in this regard could come from the private sector, to be exact from large corporations, namely the corporate governance. Of course, in this case we can only talk of a stakeholder model for the governance. The stake holders or “key players” are in this case the contributors, the Parliament, the different groups defending different interests but most of all the subjects of the offered public services.

All these key players have a common interest, mainly to offer a set of high quality public services imposing to the public administration objectives that have to be reached, but also have the responsibility of following these objectives.

Under these conditions the performance of the public sector approaches the above mentioned conditions in the context of a systematic point of view, thus creating the proper framework for its continuous improvement and for the legal framework in which the activity of the public administration takes place.

2.3. Performance and public opinion

The above model of the corporate governance has a big shortcoming because it lacks a regulatory process to the current needs of its subjects. Continuing the analogy to the private system, in which this regulation is made by the market reaction to the actions of any company, we can say that this role is assumed in the case of the public administration by the public opinion, because the public opinion is the “market” of the public administration.

Figure 2 – Public administration and governance

The public administration has to adapt, just like any company, to the needs of the markets on which it is active. In order to reach this, it is necessary to have a very good communication with the groups the public services are addressed to, regarding the needs they have on the one side, and on the other regarding the degree in which the public administration reaches its set goals, meaning the satisfaction degree of its subjects.

The public opinion thus is the player that gives the feedback to the actions undertaken by the public administration.

3. SOME PROPOSALS

In order to guarantee the feasibility of the model presented at point 2.3. regarding the enhancement of the performance of the public system, some major changes within the public administration are necessary, especially concerning the relationship with its subjects, but also concerning the demands for efficiency, efficacy and economy.

Regarding the communication with the public opinion, we propose:

- Intensified preoccupations towards public marketing;
- The migration of the activity of the official spokesperson towards the preoccupations of public relations;
- The better information of the public opinion concerning the efforts of the public administration to ease the access of its subjects to the public services and/or to increase the quality of the offered services.

Regarding the efficiency of the public service, we consider the following actions to be utterly necessary:

- Building on the existing e-government platform a network of platforms is to be created between the different public institutions and

organisms of the public administration, in order to create a common information base;

- The extension of existing remote access platforms (via the internet) to public services;
- Extension of the legal framework of these platforms;
- The continuous education of public servants and their information regarding legal changes and new access possibilities of the public to the public services.

Finally, regarding the economy of the offered services the following steps are necessary:

- Massive investments in infrastructure, in order to decrease current costs of public services by decreasing the solution time of cases;
- Follow-up of the spending of public institutions in order to ensure an efficient allocation of resources;
- The reduction of duties of the personnel so that they can concentrate on the public service itself;
- The continuous preparation of the personnel and the presentation of the latest working methods to ensure the accomplishment of service duties in an efficient and professional manner;
- The increase of the importance of the role played by the internal public audit within the structures of the public administration.

4. CONCLUSIONS

A modern public administration has to be able to solve different issues in a professional and economic manner, using a minimum of resources. To ensure this, public institutions have to be oriented towards achieving performance. Also it is necessary that the development, modernization processes and the generation of a high performance evaluation system of the public administration activity continue within the public administration.

Abstract

The tourism activity is considered by most economists, and not only, as an activity that can contribute to the development and prosperity of the areas with tourism potential. To make the most of the opportunities offered by tourism, it is necessary that it should be a qualitative one that being achieved only through trained staff with excellent skills and competencies. The increase of competencies, knowledge and skills through training programs can improve the organization's position on a market with high competition as the services sector is. This paper examines, through quantitative research, the employers' perceptions on the training offer, the necessary skills and abilities for those who want to start or develop a career in this field in Braila and Constanta counties.

Keywords: tourism, competencies, quantitative analysis.

J.E.L. classification: M31

1. Introduction

The training needs and requirements for skills and professional competencies/abilities in tourism have been represented a research topic conducted by authors in 2011, in order to identify the position and requirements of entrepreneurs in this regard. As a quantitative method of gathering information there was

used the direct survey, and the investigation instrument used was the questionnaire. The main indicators monitored were:

- the necessary for performance / skills of employers and future employees;
- categories of knowledge, skills and abilities acquired through training programs and covered by the employee in the tourism and trade sectors;
- criteria for selecting the staff to attend training programs.

2. The content of the questionnaire and the profile of the interviewed organization

The questionnaire comprised 28 questions and was made on the basis of “inverted funnel” principle. The first four questions had identification purposes, the other attaining the research objectives.

Of the 28 questions, 9 are scaled questions used to evaluate the intensity, the responses being ranked from the most favorable attitude to the worst one. The applied questionnaire covered issues such as:

- the criteria considered by employers for the staff recruitment and the difficulties encountered;
- the perception of the categories of training programs;
- the appropriate ways of training for the organizations in the area specified;
- the impact that the recruiting of the qualified staff has on the performance of the organizations;

- the necessary skills and the employers' requirements related to the skills, and abilities of employees.

The sample consisted of organizations in the tourism and trade sectors in Braila and Constanta counties belonging to the South-Eastern Development Region.

The profile of the interviewed organizations can be sketched as follows:

- 83% are owned entirely by the Romanian investors;
- 73% are limited liability companies;
- 47.52% have few employees, up to 9 people;
- 69.31% consider the qualification of staff as being of great importance because they recruited qualified personnel;
- the categories of activities performed mainly by the interviewed organizations are: accommodation 34.65%, food and catering services 42.57%, conferences and events 19.80%, tourism and travel 49.50%, commerce 25.74 %, transport 12.87%, tourist attractions 4.95%, tourist organization and management 5.94%, others 12.50%.

In any organization, regardless of the sector they work, all activities compete, to varying degrees, for achieving the goals wished. Therefore, the respondents were asked to present the *importance of the activities*, in an organization, that ensure its proper functioning. According to the responses there are considered as being very important the relationship with the public / customers (77%), as well as the activities of sales (69%), IT (65%), services (65%), marketing promotion (61%), supply (51%). If sales and services are activities that compete, par excellence, for achieving the main activity objective and promotion contributes to the knowledge of the organization in the external environment, we can notice the importance given to IT in both directions.

In general, the activities of the functional departments were rated as “important”: administrative 51%, human resources 47%, accounting 43%. It is noted that the interviewed organizations are aware that the administration and management activities shall contribute substantially, providing infrastructure to the operational activity.

As in every sphere of activity, in the analyzed sector as well, there are *difficulties*, which hinder the proper conduct of activity.

3. The problems of the analyzed sector

The main problems faced can be focused on three categories:

- the lack of qualified personnel in the area: “very much” for 37% of respondents, “more” for 27%, “medium” for 17%;
- difficult access to the European funds, “very much” for 35%, “more” for 32% and “very little” for 13%;
- insufficient means of promotion, including the promotion on the websites of local authorities, central agencies and tourism operators: “very much” for 30%, “more” for 25%, “medium” for 17% and “less” for 19%.

Other difficulties encountered in the activity were considered, in particular, the road condition, the current situation of the national economy, the high levels of taxation or the difficult access to information.

The human resources issues in the tourism sector are very complex and diverse, one of the key aspects being the recruitment of personnel. The research aimed the way the employers express their opinion on the ranking of the criteria they consider important for this activity. The following criteria were proposed: qualification/ specialization in the field, experience in the field, communication skills, foreign languages skills, computer skills, self-control in critical situations and availability for overtime or flexible schedule.

As it can be seen from Chart no. 1, 66% of the respondents felt that communication skills represent a very important criterion, which confirms that employers are aware that tourism is a field in which people provide services to people, so that the communication with customers is essential. 77% of the employers cite that, in an organization, public relations are very important. The training and specialization of each worker in tourism represent a very important criterion for 63% of employers, which concludes that in this sector there should be a focus on increasing the priority on training. The same percentage of 63% as much appreciates the experience in the field. However, for 51% of employers, availability for over time or flexible schedule is a very important criterion. (Chart no. 1)

Regarding the possession of computer skills, 45% of employers consider that this criterion is very important, while 34% think it just has importance. In the case of foreign languages

skills, it is as follows: 37% of employers consider it a very important criterion, while 35% think it just has importance.

Chart no. 2 shows that a 54% of the respondents had difficulty in recruiting qualified staff. But for the remaining 46% of the surveyed companies, recruiting qualified staff did not prove to be without difficulties. *The main difficulties*, grouped by profession, mentioned in the replies were:

- waiters: difficulties in service delivery, lack of training, lack of foreign languages

- knowledge, lack of interest;
- kitchen: negotiating of the tariff wage, lack of training;
- receptionists: compliance as employees, foreign languages knowledge, ability to coherently and completely present the existing tourism offer;
- sellers: no skills in the field;
- travel agents: lack of training, of experience and of foreign languages knowledge.

Chart no. 1. What is the importance given to the following criteria in the recruitment of personnel?

Source: created by authors

Chart no. 2. Have encountered difficulties in recruiting qualified personnel?

Source: created by authors

It can be concluded that the level of competence of employees in the analyzed sector is still low and the main categories of

knowledge, skills and abilities to be improved are: the rules of services, the ability to coherently present the list of food products, the

proper preparation of the supporting payment documents (restaurant bills), the way there are made possible some variants to satisfy the demands of food products, the identifying of the factors that influence the quality of the hotel services, the hotel services realization in terms of quality, the ability to coherently and comprehensively present the tourism offer, the ability to permanently and convincingly promote the tourism product, communication skills with customers, self-control, mathematics knowledge, experience in the field, relevant qualifications, foreign languages skills, continuous training of employees, the ability to apply theory into practice, knowledge of the hygiene program and food safety (HACCP), skills and practical abilities, mobility and flexibility, the ability to customize the offer according to the customer’s requirements, skills in the computer use, optimum organization of the working time.

An interesting aspect revealed in the research is related to the *certificates of competence* attesting the computer skills and the ones of using a foreign language held by the potential employees. Although the computer activity is used in all organizations,

only 56% of the respondents believe that possession, by an employee, of a certificate of competence in the computer use is advantageous for the performance of the organization. 27% believe that such a certificate is only sometimes advantageous, while 15% do not think that having a certificate of this kind brings benefits for the activity of the organization. The answers are not surprising if we consider that a certificate of competence, especially in computer operation, fully proves its usefulness only if it confirms the real practical skills of the holder. For the employees in the tourism sector, knowledge of at least one foreign language is vital. Certainly, English is the foreign language which is the most important for the activity within the interviewed organizations (95%). The overwhelming percentage confirms, if needed, that English is the language of trade and travel. Other important foreign languages are: Italian (44%), French (43%), German (33%) and Russian (18%). The respondents pointed out that other foreign which are important for their activity are Spanish and Turkish (Chart no. 3).

Chart no. 3. What are the major foreign languages in the activities of your organization?

Source: created by authors

The knowledge of a foreign language increases the chances of a candidate for employment, given that many of the tourism sector firms have clients or foreign partners. Surprisingly, only 23% of the respondents require a certificate of language skills to the new employees, while 38% do not require such a certificate, and 38% requires it only sometimes.

The possessions of a certificate of competency in the computer use or of knowledge of a foreign language are not enough for employers. Employees must show real skills and communication abilities in foreign languages with customers, real computer skills, and these are not always demonstrated by holding a certificate of language skills.

4. The quality of the tourism training programs

A researched aspect was the one related to the way employers perceive the *quality of the tourism training programs*. It is found that 74% have a favorable opinion, considering that it actually contributes in increasing the skills and abilities of employees, about 20% believe that after the completion of such courses there has not been any increase in the professional performance and only 6% have an unfavorable opinion.

The high interest to improve knowledge, skills and abilities through training programs is supported by the fact that, for all the categories proposed for hierarchy; the “very high” and “high” degree of interest exceeds 50% in all cases. Of a “very high” interest to respondents are the following training programs: vocational training courses for basic occupations of the organization (58%), education/training programs for the employed staff (44%), courses in tourism and trade management activities (39%), intensive foreign languages programs (39%) (Chart no. 4).

Chart no. 4. Note the degree of interest in the following professional training programs

Source: created by authors

There is a “high” degree of interest for the professional training courses for career development (43%). In terms of the operating rates and data validation, there is a “high” and “very high” degree of interest for 61.38% of the respondents.

To identify the ways of training which the employers consider optimum, they were asked to achieve their own rank noting them from 1-8 (1 = very adequate, 2 = most appropriate, 3 = more appropriate, 4 = appropriate, 5 = adequate enough, 6 = less adequate, 7 = least adequate, 8 = inadequate).

The analysis of the responses to that question suggests that the very adequate way of training is considered the one of the training courses at work (#1 choice of the scale, 26% of the respondents). This method has the advantage that it does not involve

interruptions in the work program of the employees. In total, the percentage of the ones who placed this way of training in the first and second places amounts to 39%.

The courses at the workshop would be the most appropriate for 14%; for interpretation, this version was ranked the 2nd because it was chosen in the first and second places by a total percentage of 33% of the surveyed organizations. The rank continues as follows:

- courses of 1-2 weeks would be a more appropriate way of training, mentioned in 23% of the answers, this way being ranked the 3rd;
- courses of 2-3 days over several weeks are considered appropriate in 15% of cases positioning on the 4th place;
- courses by correspondence / online courses are considered an adequate

enough way of training, ranked the 5th place (14%), however, to gain real practical skills and abilities these ones prove their usefulness less. The interviewed organizations expressed an interest in this way due to the multiple advantages: greater flexibility in terms of schedule, reduced complexity, lower costs, movement of personnel is not required, the use of audio-video;

- weekend courses in another city are rated as a less adequate way of training, ranked the 6th in 19% of the responses due to the extra travel expenses (transportation, meals, accommodation);
- courses of 4-6 weeks are considered a least adequate way of training in 22% of the responses, because they require a longer period of time, it is ranked the 7th;
- courses of 3-6 months are considered inadequate (22%), the motivation being the same as described above, earning the 8th place.

The funding for vocational training courses and programs has three sources: the funds of the organization the own resources of staff and the combining resources of the employer's with the employee's ones. The statistical analysis of the responses reveals the following:

- 33.66% of employers have allocated financial resources for training these ones being, aware that such an investment ultimately has benefits from the expertise and the skills acquired;
- 29.70% of employers scored by their answers that the training was made with their employees own resources without the financial involvement of the company;
- 20.79% said that the financial resources invested in the skills / the raising of skills and abilities of the employees are from both the employer and the employee;
- the national funding (1.98%) and the international funding (3.96%) have low share;
- 7.92% of the respondents mentioned the international funding in addition to other resources.

There are employers who are not interested in their employees to attend training or professional training, the reasons being:

- can not give up the employees who should attend training courses, concluding that a major problem would be the training program that overlaps with the working hours of the employees (37%);
- insufficient financial resources (36%);
- profession can learn directly from work (24%);
- leadership is satisfied with the level of

employees' existing training (21%).

We estimate, as positive, that only 9% motivates the disinterest by the lack of local training providers, which means that the offer of training is present and sufficiently diversified to meet the demand.

Conclusions

Service skills in the tourism sector both on the professional and the behavioral levels are still underdeveloped and require special attention. Also, the improvement of attitude and mentality towards the services are issues requiring urgent attention. The investment in the education and the continuous training of personnel in tourism contribute to providing competitive services to customers, which can be provided only by personnel with an adequate attitude, a correct mindset, and a appropriate behavior.

Employers in the tourism sector realize that the qualified employees are essential and the advantages of recruiting a qualified person are multiple: the increasing of the customer's satisfaction, loyalty, revenue increase from the accommodation activity, and the increase of the hotel management indicators, achievement in terms of quality services, higher degree of training, increased knowledge, skills and abilities, better yield than of a poorly trained person, awareness of its role in raising the company performance, individual performance improvement in activity; more fluent language and communication skills, keeping in touch with new practices.

The sector is emerging ever more the need for quality tourism, which is possible only through the contribution of some employees with excellent skills and abilities. The rapid changes in the economy and the strong competition increase the need for new skills for those who want to gain performance in this sphere of activity.

Abstract

CRM philosophy is based on the fact that a long term relationship with customers can be one of the most important assets of an organization. CRM uses the Internet to facilitate interaction with the client. The fact that large western organizations are re-evaluated based on their sites makes that the Internet to break into management plans of Romanian organizations too, the benefits of the Internet being already well known. You can organize such databases on customer issues, customer-interaction sites for the company to meet all three client concepts.

Key Words: internet, CRM, company, customer

JEL Classification: J5, J53

1. Introduction

This strategy is implemented using IT applications, and the new developments in IT can help an organization to adapt their strategies regularly. The main concept of CRM is relatively simple. For years companies have focused so much efforts on lowering costs and improving efficiency within the organization. They focused more on internal process, often automating their back office items functions such as production, logistics and finance. By contrast, management effort invested in

customer-related activities such as sales and marketing are often left behind.

As the market is consolidating and suppliers become more efficient in providing services or products, rival offerings are becoming increasingly difficult to distinguish. What is the most important difference between two toothpastes? At the same time, as services and products quality improves, increase customer expectations and demands. As long as the client is able to change his supplier, it is becoming increasingly difficult for a company to retain loyalty. It is therefore very important for a modern company to have a system to shorten response time to customer inquiries, providing quality support and services.

For many industries, the evolutionary process of how to do business is not new. Suppliers of consumer goods in large quantities fought over the years to create brands based on quality and price. But what changes is the impact of increased client's decision-making power, "his authority". Now, in an environment dominated by the Internet, where suppliers can change with just a few mouse clicks, the problem becomes more complex. It affects every organization, whether it focuses on the customer or business.

It turned out that maintaining old customers costs significantly less than the acquisition of new customers. Therefore, while companies are expanding their customer base, should not lose in sight of keeping and breeding the best of them. The

increase of "customer action" - in other words, the amount of business that each client offers - is as important as increasing market action. Through good management of customer relations can increase profitability. And this is essentially Customer Relationship Management.

2. Fundamentals of CRM

Since the marketing methods used by small businesses (close personal contact between buyer and supplier and a good knowledge of customer needs) can not be used in a large company, CRM technology should increase the effectiveness of customer relationship management.

CRM philosophy is the recognition that a long term relationship with customers can be one of the most important assets of an organization, providing competitive advantage and improved profitability.

3. CRM operation

CRM facilitates the interact with customers through the most efficient, faster and more sophisticated means of communication - the Internet. That's a solution that centralizes employees, processes and data from a company, so that they could better serve customers and increase their loyalty. Information can be structured, unstructured, conversational or transaction.

Spectacular growth and continuous review of organizations that use Internet websites have brought the Internet to the forefront of current management thinking. The Internet provides an infrastructure through which other organizations can interact with customers in the same way they interact on the phone, fax or e-mail. Complexity of interaction with customers through multiple channels indicates several areas where technology can reduce staff effort and money.

Generally, these responses are web pages containing answers to frequently asked questions (Frequently Asked Questions - FAQ). Complex systems analyzes the questions and is looking in "information base" for possible responses. In each case, the system must be constantly updated as new problems and solutions occurs. The

most sophisticated systems on the market "learns" automatically from the "solved" cases by adding in their database the needed information.

Because many users are skeptical about the concept of Web, much of the support systems on the Internet will provide various means to communicate directly with agencies, including the "chat". Most web-based service systems will also have a feature that will allow the customer to be contacted or to contact the agencies directly by phone, thus respecting the desire to provide the preferred communication channel. When this feature is enabled in an integrated system, contact center will be able to immediately identify and access the customer history of its interactions with the organization.

4. CRM - systems and technology

Since some of this information is gathered by the company's resource planning systems, ERP databases are to be integrated with some aspects of the CRM database. Furthermore, CRM technology includes various aspects of information management, including integration with other company systems and methods that convert data into usable information. CRM utilizes technology, strategic planning and marketing techniques to build personalized relationships to increase profit and productivity. It is a business strategy that puts the customer at the center of company processes and practices. Implementing CRM software should come with a change of thinking of the company so that it can focus more on client.

The customer-oriented business philosophy is needed for supporting effective sales, marketing, customer service and placing orders. Some examples of CRM initiatives are:

- database specifically aimed at issues related to customer service;
- website that allows customers to find information about the company and interact continuously with it;
- collecting and storing data to build a database with necessary information for better understanding of the client;
- data collection of the visitors accessing the website, including name, e-mail, location and purchase preferences.

5. Companies benefits of using CRM

A professional CRM strategy can improve customer service by facilitating communication with them through several means:

- increasing the efficiency of interaction with customers through all channels of communication;
- facilitating the customer-supplier collaboration through the web, thus reducing the costs of customer relationship management;
- providing product and its use information, technical support on Web sites that are accessible at all times, 24 hours a day, 7 days a week;
- identifying how each client defines quality and then developing a strategy for services for each client based on its individual requirements and expectations;
- a fast mechanism for managing and scheduling the follow-up to find out the customer opinion from a purchase and to determine trends of purchasing new goods, the time and the frequency of purchase;
- a mechanism for tracking the points of contact between a customer and the company - does this thing in an integrated manner so that all types of resources and contacts to be included and all system users have the same image on the consumer, reducing the risk of confusion;
- participation in the rapid identification of potential problems before they happen;
- a friendly mechanism for registering customer complaints (complaints that do not reach the company can not be solved and become an important source of dissatisfaction for the customer);
- an effective mechanism for solving the problems and complaints (complaints that are resolved quickly, increasing customer satisfaction);
- internet use cookies to track customer interests and personalize product offerings;

- a mechanism for managing and scheduling maintenance and ongoing support repair, improving the efficiency.

6. CRM objectives in different departments

Departments main specific objectives are:

- **Customer Support** - obtain basic information about customers and their complaints, monitoring customer satisfaction and faster resolution of claims in order to enhance their retention, the increase of self-service efficiency will alleviate the need for personal assistance.
- **Marketing** - creating a dynamic segmentation of customers to initiate a communication strategy and better targeted campaigns, appropriate marketing campaigns, customer satisfaction by analyzing the segments, monitoring the feed-back generated by the campaign.
- **Sales** - Sales development by regions, customer history tracking, streamlining and efficiency of the sales and customer qualification based on past experiences.
- **Field service** - monitoring customer complaints history and their resolution. Reducing the defects by 5% can increase the profit rate from 25% to 95% according to Harvard Business Review.

7. Quantification of CRM success

Even if success factors are different, many companies choose ultimately ROI (return on investment) as the sole factor, although this method of calculation led to controversial discussions.

Sometimes CRM systems measures ROI only as a residual income or as a profit margin derived from implementing CRM technology. This is however only a limited application because it does not provides sufficient analysis to serve the decision-making. Also, it evaluates the problem only from a business perspective and considers the client only as a source of income, while

CRM ROI should integrate both revenue and customer satisfaction.

A study conducted by University Dayton researchers highlights four main indicators for a successful CRM: CRM's ability to influence corporate strategy - 25% of respondents, successful integration of technology - 23% of respondents; Enhancing strategic partnerships - 20 % of respondents; assimilation of technologies related to CRM - 18% of respondents.

Another financial indicator of success is possible customer lifetime value (CLV - customer lifetime value). It allows businesses to analysis beyond a period of time and combines both a client and cash flow with cost reduction based on activity, and real probability of a customer retention to help understand the impact of various scenarios of CRM. Profitability results of most likely scenarios that can be implemented to be compared to find the best way to increase overall profitability.

8. Conclusions:

When a CRM is applied in a company, business objectives will be: increasing the number of customers and gain a fidelity from their greater feedback, more customers who come to visit the site. For a marketing service, such a strategy will help in organization of a better targeted campaign and in customer satisfaction. Sales department will benefit the automatic development of sales by region and customer qualification based on past experiences.

The CRM application benefits would be the fast identify of potential problems before

they happen, an effective mechanism for resolving problems and complaints, a mechanism for tracking the points of contact between a customer and company - getting basic information about customers and monitoring customer satisfaction.

Along with CRM, as management strategies using database organization is also found "Enterprise resource planning" (ERP), "supply chain management" (SCM), e-procurement and e-marketplaces. Although many companies have developed websites, experts estimate that the organizations that adopt strategies according to the old concepts will still have more to gain. The Internet will become a facility for feedback only and not necessarily an environment that will make sales of large companies. Hypothesis is supported by the fact that there are people that they are online documented about products, they choose online shopping, but they say they will not give up to go out and buy products from stores.

Impact of Economic Crisis on Buying Behaviour and Marketing-Mix Tools

Filip Alina,

The Bucharest Academy of Economic Studies, Marketing Faculty

filip.alina@gmail.com

Voinea Lelia

The Bucharest Academy of Economic Studies, Commerce Faculty

lelia.voinea@gmail.com

Abstract

International business environment is changing in the context of economic crisis. Consumers react by adapting their buying behaviour from impulse acquisitions to more prudent and rational purchasing decisions. As consumers are buying necessities and have a tendency to migrate to generics or cheaper brands, in recession many companies opt for an assortment selection strategy, withdrawing from the market those products and services that record a visible decline in demand. Price discounts are frequently adopted by companies in order to offset the negative effects of lower demand. Intermediaries with low performances are usually eliminated. Promotional budgets are decreased and mainly allocated to sales promotion techniques.

Key words: marketing-mix, economic crisis, consumer, buying behaviour, loyalty.

J.E.L. classification: M31-Marketing.

1. Introduction

In the last years there have been many changes in the international business environment under the impact of economic crisis, the living standards of people and the development of various businesses being adversely affected. Economic crisis occurred because of excessive lending and over consumption and quickly became a phenomenon in almost all national economies.

Major consequences of economic crisis for most of the European countries can be summarized through a global feeling of citizens' uncertainty and economic

instability, due to higher levels of unemployment and inflation rates, an increase in the volatility of many currencies and higher financial risks. Therefore, governments of affected states have been forced to adopt different anti-crisis measures, aiming to achieve a greater control on the budget deficits, despite the negative impact on households' consumption and their purchasing power.

Individuals began to perceive increased risks of losing their jobs and because their future incomes became more difficult to estimate, peoples' level of trust in economic recovery has known an important decrease. The overall effects of economic crisis on consumption are difficult to estimate with high precision, if considering the uncertainties perceived at the individual level, since most consumers feel affected by the recession not only financially, but especially in psychological terms.

2. New patterns of consumer behaviour

In times of recession, many individuals show a decrease in their propensity to spend on products and services, especially on luxury or expensive articles and express a tendency to purchase smaller quantities of items that address their superior needs. Some industries, such as restaurants, air travels or car industry are probably affected in a larger extend then grocery or retail stores. Therefore, consumers are generally reacting by reducing wastefulness, spending less for dining out, leisure activities and for buying clothing or accessories [2].

Even in the case of those products and services intended for basic needs such as food, cloth, health-care or personal hygiene products the general trend showed by

consumers is to switch to cheaper brands, usually from better-known to lesser-known brands [14]. However, switching behaviour is less likely to occur for those goods or services with a high perceived risk or relationship ending costs, like financial-banking services. This is also the case of strong equity brands which presents more guaranties, providing consumers with a sense of security [9].

During an economic crisis, consumer purchase decision process become essentially rational, due to increased price sensitivity among almost all market segments. Therefore, the cost performance of the product is a main attribute that individuals take into account when choosing between alternative bids. Regarding shopping behaviour, consumer price sensitivity is highlighted into a higher purchase rate from discount stores or from large chain stores that usually apply promotional activities in the form of price reductions or other demand incentives. Individuals show also their preferences for neighbourhood stores, having the opportunity to decrease additional time, energy or travel costs [5].

Additional to the price element, other important selection criteria underlying buying decisions are considered to be the effectiveness and the durability of products. Because consumers are in search of a larger amount of factual information arising from aversion to risk and greater uncertainty avoidance, the buying decisional processes tend to be more complex and lengthy in times of recession [2]. Because of financial difficulties and uncertainty feelings, people tend to prefer more informative or factual promotional messages and in a lesser extent the image-based advertisements.

Consequently, changes occurred in the demand level of many products, in quantitative and value terms, have effects on the market position and on the competitiveness of the most organizations. Therefore, firms have to reconsider their marketing-management decisions so as to adapt to more difficult realities and to meet the demand of more rational consumers, whose budgets are increasingly planned.

3. Organizational priorities and marketing-mix tools during recession

In times of economic crisis, businesses are determined to implement some adjustments at the level of their management and marketing strategies. Objectives and directions followed in economic growth periods cannot be often continued during economic crisis, considering the many changes occurred in consumer buying behaviour.

New behavioural patterns occurred in the consumer market have a decisive influence on the process of strategy development, in the context of a decreased demand and a low rate of customer retention.

Companies' reactions to the changes determined by the economic crisis vary significantly from one sector to another, being mainly influenced by organizational potential and also by managerial risk propensity.

Researches conducted by Shama [11] proved that those companies that succeed in a dynamic market are those that develop proactive strategies, being able not only to react to events occurring in the business environment, but even to be the factor that induces changes. Taking a similar point of view, other researchers have shown that proactive strategies can become, for some organizations, a way to turn the economic downturn into a number of advantages. Thus, companies that identify market opportunities during periods of economic crisis and invest additional resources in marketing activities will be able to benefit from significant advantages in times of recovery, which will result in improvements of specific business indices related to market share and profit [12]. These companies will continue to invest in expansion and diversification, hoping in favourable future results.

However, proactive strategies are not generally recommended, being a function of specific potential of a company in terms of its material, financial and human resources, industry evolution and organizational market share, intensity of competition, product category and so on. Due to all these arguments, many firms will consider the economic crisis as a significant threat and will consequently adopt a rather defensive attitude, based on cost cuts. By developing

defensive or rationalization strategies managerial decisions are focused on conserving a company's own resources [1].

According to Pearce and Michael there are four main strategic alternatives that companies can adopt during economic crisis [8].

Proactive strategies oriented towards external business environment involve making investments for penetrating new markets, business diversification, investments in sales and marketing, in customer acquisition and retention plans.

Proactive strategies oriented towards internal business environment aim to make investments in quality management, technologies, human resources, production and logistics, research and development.

Fortification or defensive strategies oriented towards external business environment are considering giving up to certain products or product lines, withdrawing from certain markets, reducing the costs of sales and marketing activities, selling some parts of the business to focus on core competencies.

Fortification or defensive strategies oriented towards internal business environment consists in the implementation of rationalization measures in areas such as: research and development, human resources, production and logistics, technology, administration.

From a marketing perspective, these strategic alternatives involve different tools of implementation. Because in times of crisis consumer demand changes and new preferences, requirements and behavioural patterns are emerging, organizations should have initiatives to adapt their marketing-mix instruments in order to avoid threats and to take advantage of arising opportunities.

As a response to more acute competition and reduced demand the market strategy of many companies will change in recession by withdrawing from markets in which they are weak in order to fortify markets in which they are a leader or a strong challenger [2].

According to researches conducted by Roberts [10], in times of economic downturn, brands that have the potential to develop or to maintain market share are either generic products or brands with a good reputation, offering consumers a sense of security.

Therefore, organizations with low product portfolio performances are likely to change their product tools by focusing on assortment selection strategies, involving a decrease in the size of the product range, usually by reducing its depth.

The process of portfolio analysis should underlie such a decision, by identifying each product contribution to organizational profitability, correlated with the life cycle stage of the analyzed products. Thus, shorter product lines become more manageable and companies can make better use of own resources by allocating them to products with a high profitability potential.

There are also firms that, despite economic difficulties, will aim to make additional investments in research and development activities in order to achieve long term profits [7]. In this case, brand strategies will focus on the launch of new products tailored to the current priorities of consumers, by incorporating new attributes related to economic performance, durability and functionality.

Another strategic program is the augmentation of the actual products with more guaranties. This is frequently applied by organizations that have a proactive approach in recession conditions. Consequently, product tools should be designed to fulfil the objective of gaining customer confidence, which are under the pressure of a low purchasing power and are focused on making rational acquisitions.

Although a less common strategy during the crisis, some companies will continue to innovate and will launch different versions of the existing premium brands, at a lower price. These are organizations holding consolidated positions in the market and which are seeking to achieve the loyalty of quality oriented buyers. Favourable effects of such initiatives are based on the positive association that consumers make between premium brands and second line brands, provided that the quality attributes of recently launched products do not affect the image of the previous brands.

Given the relatively high sensitivity of many customers to product costs, the price is the marketing-mix variable with the greater probability to be changed during economic downturn. Thus, companies can choose

between two main strategic choices regarding prices: to charge the same prices for products with quality improvements or to charge lower prices by maintaining the same quality standards at the product level [2].

Keeping the price level and improving the quality of products is usually adopted by companies that have opted for a concentrated market strategy and that have established as main objective to achieve the loyalty of high demanding customers, with a fairly high probability of losing unprofitable customers.

Increasing satisfaction and firm attachment among consumers that are less exposed to financial risks is achieved by providing additional value related to both tangible and intangible components of the product, with emphasis on durability and functional performance characteristics appreciated by customers.

By adopting this strategy, a company goal is to achieve long term image benefits by enhancing brand equity. Even though, this strategy has also risks that should not be omitted. For instance, the market share and the level of organizational profitability may be affected in the short-term. A certain business potential is therefore required for supporting the alternative, allowing the company to sacrifice short term profit results. Organizations are expecting more favourable effects in the post recession years, due to increased possibilities of extending the portfolio with certain products that may have superior profit margins.

The second price strategic option aims to maintain or expand market share, in spite of reduced profit margins for firms. It is an adequate choice in situations where the company has designed its marketing policy in order to target those customer segments that show high demand elasticity to price. This is a price alternative adopted especially in industries where it is more difficult to gain additional percentages of market share, the competitive pressure being particularly high [4].

Short-term benefits can be substantial, but companies that adopt this kind of strategy assume in the same time a number of risks, related to the difficulty of raising back the price in the years of economic recovery. A potential adverse effect on brand image is

also an expected outcome. Consequently, a better choice involving lower risks for future market activity would consist of planning a series of temporary price reductions in order to stimulate consumer demand.

A growing number of companies opt for the practice of low prices, while reducing the level of product quality, in those countries severally affected by the crisis. This price decision is motivated by the deteriorations of citizens' living standards, willing to make compromises when buying products, so as to not exceed the low budgets which they have [13]. Although it may generate substantial levels of sales in periods of recession, the strategy will be difficult to support over time and this is not a guarantee for business stability.

During recession many companies opt for decreasing marketing costs, especially those allocated to promotional activities, which is not always the best solution. Researches conducted in European markets show a much higher effectiveness of advertising during economic downturn, the favourable effects on sales and profits being multiplied especially in recovery years [3].

This situation is explained by lower costs of exposure in mass media, advertising agencies practicing relatively low rates in conditions of declining demand. Furthermore, individuals tend to remember more easily the received promotional messages, because of fewer competing campaigns, most players investing limited resources in advertising and other promotional activities.

Regarding communication channels, since consumers are becoming more rational and make purchasing decisions based on detailed analysis, an increased attention of the company towards press or Internet is expected, at the disadvantage of radio and television channels. Promotional messages are more and more informative, with emphasis on factual contents, based on objective arguments that are consistent with the attributes considered important by consumers in making buying decisions. So, messages that focus on elements like quality warranties, economy or product functional benefits are better appreciated by consumers than messages built around symbols or emotional issues. Moreover, advertisements

that emphasize practical experiences of consumption tend to be more trusted than those based on ideals and imagination.

Companies allocate a great part of the promotional budget to sales promotion techniques, especially to temporary price reduction, such as discounts, given the high sensitivity of consumers to the price element [2]. Special offers or loyalty programs are more effective in times of economic difficulties than promotional games or contests.

In the field of distribution, marketing decisions during economic downturn are especially focused on choosing appropriate commercial units that can guarantee a fairly high level of sales. Discount stores are most often included in this category. Providers tend to end business relationships with those intermediaries that underperform and to simultaneously identify cost-effective distribution alternatives [6]. Traditional channels of distribution can be supplemented by Internet or telephone transactions, in order to extend market activity to new customer types.

4. Conclusions

As a concluding remark, economic crisis has a significant influence on both consumer behavioural patterns and organizational market activity. Consequently, companies need to adapt to major changes of the business environment by redesigning their marketing mix tools in order to meet new market realities and gain customer loyalty.

Abstract

This paper aims to highlight some of the issues and challenges raised by implementing the most efficient approach for water pricing, to induce a sustainable water demand management.

Therefore, we define the concept and utility of water demand management, as one objective of efficient water pricing.

Next we briefly analyse some features of the water demand function and show some empirical evidence on the true correlation between the water pricing and the demand of water in Romania.

We end with conclusions and some personal recommendations on the actual opportunity, prospects, and challenges of sustainable water pricing.

Key words: water pricing, demand management, price elasticity, sustainable

J.E.L. classification: Q21, Q25

1. Importance and benefits of water demand management

Scarcity of the water resource has become a concern in recent studies, reflecting the shift from the engineering perspective of increasing supply to satisfy demand to the economic perspective of also managing demand through price to efficiently allocate the existing quantity of water supply.

Therefore, in 2007, the European Commission adopted a Communication on Water Scarcity & Drought (WS&D) which identified several policy areas that had to be addressed if Europe was to move towards a water-efficient economy.

In order to address and mitigate the challenge posed by water scarcity and droughts, it is essential to improve water demand management in Europe.

Sustainable water demand management is defined as the development and implementation of strategies aimed at influencing demand, so as to achieve efficient and sustainable use of a scarce resource, namely water. Besides efficiency, it should promote equity and environmental integrity.

Demand management strategies mainly consist of non-structural measures such as economic and legal incentives to change the behavior of water users and the creation of the institutional and policy environment that enables this approach [1].

An improved water demand management may lead to an increase in the efficiency of water use and/or reduction in water consumption, with several very important economic and environmental benefits in the medium and long run, such as:

- reduced costs of water treatment and distribution system capacity (including the capacity of infrastructure for the collection and treatment of wastewater);
- savings in capital expenditures because of deferred or downsized new water supply projects;
- energy savings for heating water as well as for pumping and treatment;
- environmental benefits of reduced withdrawals of water from streams and aquifers which leave more water available to preserve the ecological resources of streams, wetlands and estuaries.

Sustainable and efficient water use represents one of the biggest challenges of the present and the coming decades.

Especially the last decade has produced marked improvements in the available “know-how” for planning and evaluation of demand management alternatives. Taking into account previous experience and stakeholder consultations, an integrated approach based on a combination of options is considered now in the EU as the most appropriate approach for addressing WS&D (water scarcity and droughts), compared to alternatives based on water supply or economic instruments only.

However, the first policy area to be addressed in the member countries is putting the right price tag on water [2].

Implementing a sensible system of water pricing is one of the major means for efficient water use and the first requirements for the promotion of such use are full-cost prices. This way, suppliers and regulators using charges for use, metering and educating by increasing the awareness of the user about water conservation, must reduce water demand toward a more sustainable level [3].

2. Characteristics of water demand

Water is an economic good not only used as an input, but also directly consumed. Consumer behavior is highly influenced by preferences (a way in which they internally value the good), the price of the good, and budget constraints.

All of these factors will shape what is known as the willingness to pay for a good, which is the basis for a downward-sloping demand function, relating price to quantities demanded.

Thus the demand function relates the quantity of commodity (water) that a consumer is willing to purchase, to price, income and other variables. Demand may be typically expressed as a function of different variables, with a general form:

$$q = f(x_1, x_2, \dots, x_k) + \varepsilon$$

where f is the function of variables x_1, x_2, x_k , ε is a random variable describing the joint effect on q of all the factors not explicitly considered by the variables. The most important factor determining demand is the

price: the lower the price, the greater the quantity demanded.

The price elasticity of demand for water measures the willingness of consumers to give up water use in the face of rising prices, or conversely, the tendency to use more as price falls [4]

Normally, in the competitive markets, supply and demand for a good will interact to form an equilibrium price, which leads to optimal allocation of resources.

However, given the many public good features of water, this classical competitive market is seldom feasible for the operation of water services. Thus, water provision is often supplied or regulated by the State, and the price formation will not be an automatic result of supply– demand market interactions.

Notwithstanding the lack of markets, the production of water services still requires the use of scarce resources, and costs will be incurred. If the price paid for the use of water does not cover the costs (which should reflect an efficient provision of the water services; costs related to non-efficiencies and rent seeking in water provision must not be considered as part of a full cost recovery approach to water services), we would have troubles assuring the provision of water in the near future.

Therefore, the pricing of water is actually a most important factor determining water demand (water use and consumption) and water supply as well; although the water demand function should also take into account other specific variables (income, specific climate features, etc.).

3. Empirical evidence on the correlation between the water pricing and the demand of water in Romania

According to a previous detailed study [5], in Romania, the economic instruments for water management and protection have developed and include fixed service charges, various water charges, taxes, penalties and allowances. Their major aim is to have a rational and economical management of waters to ensure that users respect the quality limits for water discharges, to prevent the depletion of the water resources, to avoid quality damage and favor resource conservation.

Indeed, in the case of Romania, at least in the last about 15 years, we were able to observe, from a time series analysis of correlation and regression, the important role of water pricing in (determining) actually reducing the excessive, unsustainable and inefficient use and consumption of water from the public water supply.

We used for the time series analysis the latest data available, for the period 1998-2009. The evolution of these variables, as well as that of the water pricing, is presented in Table 1:

Table 1- Dynamics of the variables considered for analysis, in Romania, 1998-2009

Variable	Years in the time series					
	1998	1999	2000	2001	2002	2003
1.GDPS (% ,EU27 =100)	27	26	26	28	29	31
2. UWPS (Millions m3)	2800	2770	2609	2462	2225	1989
3.PWAT (indices %, previous year=100)	182,9	154,4	174,6	142,7	140,7	127,7
Variable	Years in the time series					
	2004	2005	2006	2007	2008	2009
1.GDPS (% ,EU27 =100)	34	35	38	42	47	47
2. UWPS (Millions m3)	1765	1686	1070	1088	1122	942
3.PWAT (indices %, previous year=100)	123,5	125,8	123,09	115,82	111,82	114,40

Table source: Raw data from Eurostat (variables 1, 2) and from the Romanian Statistical Yearbook, 2010 (variable 3).

It is interesting to note that we got to test for this insight by noticing the fact that there is a negative correlation between economic growth (expressed by GDP per capita in Purchasing Power Standard, as EU-27=100, a variable named GDPS) and the use of water from public water supply (a proxy variable for water demand, named UWPS).

For the purpose of our analysis, we also derived a series of the relative price of water (PWAT), in the considered period, by using and computing the data provided for the

Consumer Price Indices of the Water, sewerage and sanitation services.

By computing and processing these data, in different combinations serving the research objectives, we came to the following regression equations and correlation relationships:

(In the following approach, the LN function represents a natural logarithms procedure used to normalize the variables. The brackets below the estimated coefficients show the values of their t-Statistics)

a) In the first correlation considered, the dependent variable is GDPS, while the exogenous independent variable is UWPS. The regression equation estimation output is:

$$\text{LN}(\text{GDPS}) = -0.521 \text{LN}(\text{UWPS}) + 7.403$$

$$R^2 = 0.9370 \quad (-12.199) \quad (23.156)$$

The coefficient of determination R^2 , which takes a value close enough to 1, as well as the attached statistical tests for regression coefficients and Durbin-Watson test with a value close to 2, statistically and mathematically validate the regression equation (a).

In terms of economic analysis and significance, as seen from the above equation, in Romania, in the considered time-period, the determined variable GDP/capita was inversely correlated with water consumption from the public water supply.

This does not necessarily imply that a public water network is not important for economic development but can also mean that in this period, the restructuring and reforms of the water sector in Romania, have reduced the water waste and water losses from the network, so practically they increased the economic efficiency of water supply networks, nationally.

Well, a most important economic reform in the water sector was the continuous and important increase in the pricing level of the public water services, as it may be noticed from the data in Table 1 above.

It should be pointed out that, before the process of transition to a market economy in Romania, the price of water (utilities) was extremely low (state regulated), close to zero, this situation leading to water waste, low efficiency and overuse of the poorly developed water supply and sanitation infrastructure, with unsustainable prospects.

The process of reform, restructuring, regionalization of the Romanian water sector,

(still in progress) has the ultimate objective of implementing sustainable development and the sustainable water management principles.

The pricing of water seems indeed to have been an important lever of the reform for sustainable water management in Romania, as we shall try to show from the outcomes of regression b):

b) In the second correlation considered, the dependent variable is UWPS, while the exogenous independent variable is the price of water PWAT.

The regression equation estimation output is:

$$\text{LN(UWPS)} = -0.385\text{LN(PWAT)} + 10.181$$

$$R^2 = 0.8400 \quad (-7.248) \quad (26.940)$$

The coefficient of determination R^2 , which takes a high value, as well as the attached statistical tests for regression coefficients, statistically and mathematically validates the regression equation (b).

In terms of economic analysis and significance, as seen from this above equation, in Romania, in the considered time-period, the determined variable UWPS (the use of water from the public water supply) was inversely correlated with the price of water PWAT.

The increase in the volumetric price of water has determined the dramatic decrease of water use (demand) in Romania, which was in 2009 nearly three times (-66%) lower than in 1998.

Figure 1 Water demand as a decreasing function of the water price (tariff) in Romania

Source: own computations and correlation analysis.

Of course, these outcomes are quite normal, confirming the neoclassical theory of

a downward sloping demand function of the pricing for a good.

The estimated parameter of -0.385 for the price elasticity means that an increase in water price of one percent results in a decrease in water demand of 0.385 percent. Water demand is fairly elastic of the pricing in Romania, but the parameter fits within the results of other sophisticated research studies, such as the meta-analysis by [6], who found an average price elasticity of -0.41, and a median of -0.35 for a standard deviation of 0.86.

On the other hand, in the more developed EU states, the price elasticity of residential water demand is sensibly lower, with an estimated level of -0.22 in Germany and between -0.12 and -0.17 in Spain [7].

A more interesting and complete insight of the water demand function in Romania may be found in the last part c) of our research :

c) In the third correlation considered, the dependent variable is UWPS, while the exogenous independent variables are GDPS (as a proxy for income per capita) and the price of water PWAT.

The regression equation estimation output is:

$$\text{LN(UWPS)} = -1.402\text{LN(GDPS)} - 0.099\text{LN(PWAT)} + 13.082$$

$$R^2 = 0.9474 \quad (-4.289) \quad (-1.337) \quad (18.327)$$

The coefficient of determination R^2 takes a higher value, while the attached statistical tests for regression coefficients are not very satisfying, suggesting the fact that there is a strong correlation between GDPS and PWAT (indeed, the regulated evolution of the price of water was correlated with economic growth).

4. Conclusions and recommendations

Anyway, as a first conclusion, based on the empirical evidence above, we may state that in Romania, water pricing was and will continue to be a strong economic instrument for water demand management.

Still, considering the vital importance of water and all the incurred water benefits and services for people and communities, we consider that the estimated water demand function is quite steep in Romania; respectively the price elasticity of demand for water and the willingness of consumers to

give up water use, in the face of rising prices, are quite high.

Although we may find some explanatory issues (poverty, poor economic and environmental education of population), this trend may somehow jeopardize sustainable development prospects, at least those of water supply and sanitation (WSS) services in Romania.

Since, as we argue in [8], water is a vital and quasi-public good, and currently in Romania only about 50% of the population has access to public water supply, sewerage and sanitation, (due to the underdevelopment of water infrastructure), the pricing of water should not prevent Romanian people and businesses from consuming the right amount of water needed for a modern and civilized lifestyle and/or technological purposes.

Instead, the efficient and sustainable water pricing should reduce and prevent the waste or loss of publicly supplied water, by ensuring, at the same time, the continuity, further development and maintenance of the water and wastewater services and utilities.

Ideally, a sustainable water pricing should:

- reflect true costs and therefore induce efficient water production and consumption;
- promote the achievement of least-cost solutions for the provision of water service (optimization of water infrastructure and operation);
- be equitable in terms of incorporating cost-sharing practices as needed to enhance affordability of the water service;
- ensure the long-term viability of the water utility.

The prospects of development of the water and wastewater infrastructure in Romania, as imposed by the requirements to comply with the EU Water Directives, eventually with the WFD, impose a further increase of the water pricing, tending to implement the full cost recovery principle [8].

However, a Cost Benefit analysis recently carried out by the Romanian Water Association in relation to water pricing affordability in Romania revealed, as stated by the RWA President [9], that there is little chance for implementing the much-vaunted full-cost recovery principle, at least in the short-term.

Therefore, we believe that implementing sustainable water pricing in Romania, able to

provide an efficient and effective economic instrument for a sustainable water demand and supply management is still quite a challenge, though there may be two circumstances that would ease the burden of higher prices for water consumption in Romania:

- i. Whether there will be a sustained economic growth, able to increase consumer purchasing power;
- ii. Whether the expected unification of the charge for water services, implemented at the newly created regional water operators, would allow for regional cross-subsidization of the tariffs [10].

The Modalities to Resolve Conflicts of Interest between Stakeholders

Georgescu Cristina Elena
Ovidius University of Constanta
cristina.georgescu95@gmail.com

Abstract

The corporate governance is a complex system of relations and interactions, between various interest groups within and outside a company, aiming to maximize its own expectations. This paper discusses the relation between stakeholders and the means of resolving the conflicts between them. We intend to present main types of conflicts emerging within a company, such us: the shareholders-managers conflict, the shareholders-creditors conflict and the conflict between shareholders. Finally, we also intend to present the modalities to resolve the conflicts of interest between stakeholders.

Keywords: Corporate governance; conflicts of interest; stakeholders.

JEL Classification: G32, D 23.

1. Introduction

Corporations have become a powerful and We may claim that corporate governance is a fairly recent subject. It defines a wide array of senses. Although there are many definitions for corporate governance, the most inclusive of them, so far, is that given by the Organization for European Cooperation and Development (OECD). Personally, I think that corporate governance is a complex system of relations and interactions, between various interest groups within and outside a company, aiming to maximize its own expectations.

The need to regulate the relation between stakeholders (shareholders, managers, employees, creditors and other stakeholders), as well as that of resolving the conflicts between them, has become an issue of incentive for investors, as well as the general public.

Under these circumstances, the pioneering role of the OECD is commendable, seeing as how it managed to synthesize the basic tenets for applying corporate governance in 1999. These principles are meant to support the government efforts to perfect the legal framework and regulate corporate governance, on a national level.

2. Relations and conflicts between stakeholders

2.1. The relations between stakeholder groups

The term „stakeholders” was poached from Anglo-Saxon scholarly literature and marks all the agents partaking in a relation with the company or holding a stake within the company. In the category we include: shareholders, managers, employees, creditors, suppliers, competitors, central and local tax authorities, unions, the community, in its broadest sense, that includes: the civil society and opinion leaders.

2.2. The conflicts between stakeholders

The main types of conflicts emerging within a company are: the shareholders-managers conflict, the shareholders-creditors conflict and the conflict between shareholders.

a. The shareholders - managers conflict According to the company’s management theory, managers seek by all means to expand the advantages they might obtain as benefit to their position within the company, without hesitating, for instance, to resort to speculative diversifications in order to increase the size of the company (and as such, their own prestige) or to limit themselves to their subordinates’ initiative, centralizing all major decisions (Berle and Means, 1932).

Likewise, in his „free cash-flow” theory, Jensen states that managers are most often remotely motivated to distribute dividends to

shareholders, opting to reinvest outcome, even in projects with low profitability, in order to maintain control over important resources (Jensen, M.C., 1986). Jensen and Meckling declared that one of the essential references of the agency theory involves the managers' behavioral manifestation in terms of the capital share he holds. The higher the stake, the more interested he is in managing with the objective of maximizing the company's value (Jensen and Meckling, 1976). However, this conflict does not include the need for separation of property and governance. The legitimacy of shareholders, authorizing managers to make decisions, is confirmed, even if agency costs may become a reality.

The conflict of interests between shareholders and managers has always existed due to the fact that competitiveness is not a powerful enough restriction on the goods and services market, so as to motivate managers to work in favor of the shareholders. Moreover, in large corporations, there are numerous shareholders who, individually, do not own important shares of the company's equity. That being said, every shareholder is interested in leaving it to others to control managers, taking into account the associated cost of this responsibility.

Thus, the necessity of protecting managers is even more transparent. They will not accept to effectively execute value generating, dominating investments, if they are not capable of ensuring rent control – remunerations of their management capital (Charreaux, 1997).

In this surmise, managers are nothing more than common stakeholders, whose protection is vital to the existence of the coalition of interests that is the corporation.

b. The shareholders - creditors conflict Creditors are only partially protected by the contract signed with the company, because they face a two-fold dilemma. Before the contract they only dispose of a partial disclosure of information and have no guarantee of the validity of the information imparted onto them. After signing the contract, creditors may find themselves in the situation where shareholders will make decisions out of line with their interests and, thus, be subject to a veritable “*moral hazard*” (Diamond, 1984.). Also, creditors

are often incapable of properly understanding the risk of the loan. Creditors will determine their remuneration demands based on the average risk of the loans that raises the issue of adverse selection, because eligible corporations (less risky) are fined by this procedure that benefits companies prone to higher risks.

Four sources of conflicts can be identified between shareholders and creditors:

1. *The dividend allocation policy*: the value of the risk debt is fixed and it is assumed that the company maintains its dividend allocation policy. If the dividends grow, the value of the debt will decrease. As a consequence, the dividend installments contribute to the growth of the average risk of company's assets and of the creditors' reimbursement default risk.

2. *The debt dilution risk*: previous debts were assessed and it is presumed that no other debt will be contracted in the future. If the company contracts an additional, equal or higher degree debt, the value of the previous debt will diminish. Older creditors that lent to the company will sense the risk of bankruptcy depending on the growth of indebt.

3. *The substitution of funds*: the debt is used to finance a riskier project, which leads to a transfer of wealth from the creditors to the shareholders. The latter have the interest of investing in risky projects because they hold an option to buy the economic asset of the company, when the debt expires. By comparison to the options theory, the more important the risk of the investment projects selected by the company, the higher the value of this option. Furthermore, the reimbursement default risk grows for creditors, which signifies a decrease of the debt value.

4. *Subinvestment*: the company might tend to reject positive current net value projects if the sole beneficiaries would be the creditors. Under the assumption that there is an informational asymmetry, the shareholders have no interest of executing such projects that only allow the reimbursement of debt without generating any income.

c. The conflict between shareholders

It was discovered that among the company's shareholders, some own important shares of the equity, and other hold

a limited number of shares. That being said, important shareholders who own the majority of voting rights can nominate favorite managers in the context of opposing to the interests of minority shareholders. For instance they may sell the assets to a structure they only partially control, the transfer occurring under auspicious financial terms for the buyers.

There is also a potential conflict between old and new shareholders, which manifests itself during the issue of new shares or hybrid securities. As a consequence, the issue price determines the terms for new shareholders' participation in the company's capital. The latter are only partially informed of the real performances of the company, as they do not dispose of inside information. Moreover, managers act on behalf of the older shareholders' interests, who will not issue shares if their currency is under evaluated. Empirical studies show that the simple announcement of the issue of shares leads to a decrease in company value, which suggests that the financial market perfectly integrates the idea of over evaluating the course of action at the moment of issue. This is why settling this type of conflict between shareholders generally entails a sensible limitation of the use of capital growth and favoring, as an example, debt financing.

3. Means of solving conflicts between stakeholders

3.1. Solving the shareholders – managers conflict

The separation of the decision making and ownership duties births a constant doubt in respect to the managers' behavior, even if, as previously stated, nothing bars managers from being equal “victims” of the shareholders' decisions, in certain circumstances, or “rooting” strategies from being incompatible with the value generating process.

The solutions to such a conflict can be found by identifying the internal and external mechanisms of the corporation, that aim at inciting and motivating managers into acting exclusively for the interests of the shareholders:

- **The managers' performance-based remuneration system**

For Fama, the existence of a labor market is a way of controlling managers, and in relation to this, we reach a labeling of remunerations based on their performances (Fama, E., 1980.). The means of stimulating managers according to their performances are:

a) Options for managers to buy company shares at a certain moment in the future, at a price set in the present. Such a solution is relevant if the price of shares will grow in the future, in comparison to the fixed price of the present. The rationality of this practice lies in the fact that by granting the manager the possibility to buy shares in the future with a price set in the present, managers will do their best to maximize the value of the shares in the future. This practice is used in the period between the 1950's and 1960's, so that later on in 1970 they are proven unprofitable.

b) Management incentive plans through performance shares, which consist of offering shares to managers, based on the measure of the performances realized by the company. Three indicators are considered: earnings per share (EPS), the return on assets (ROA) and the return on equity (ROE). This way, the improvement of the company's performances will determine the growth of the shares' price.

c) Bonuses granted to managers based on the profit achieved.

- **The administrative power of the Board of Directors**

The Board of Directors is the direct result of the shareholders' vote and disposes of important prerogatives when it comes to controlling managers. In some countries, the Board of Directors has right of veto over certain decisions and preserves the power to revoke its president. For Fama and Jensen it is fundamental that administrative and control powers not be put in the hands of the same persons, which entails the presence of independent external managers (Fama and Jensen, 1983). If this condition is met, agency costs are brought to a minimum and managers are effectively controlled. Much criticism was brought against the Board of Directors, namely against its ability to control managers. On the other hand, managers don't have an obvious direct interest in the company's performance, because their majority only rarely owns a

high percentage of the equity. Sometimes, they are members in various Boards of Directors and don't dispose of the time necessary in order to fully take on their mission. Lastly, they can hold an interest and maintain good relations with the company's management to avoid being exposed to the risk of losing the associated advantages of their position.

- **Voting by proxy**

If the Board of directors is not equipped to effectively control its managers, shareholders will appoint a person to represent them in fulfilling this role. To this extent, if the appointed shareholder considers that the current managers show no signs of high performances, he will resume to propose the changing of the management team, to the other shareholders.

Practically, this operation is difficult to execute, as only one shareholder will have a hard time convincing the rest of the shareholders and gathering enough votes in the General Assembly of Shareholders. It is often found that in such operations the person involved is generally a shareholder holding a low percentage of the equity. The gathering of the major shareholders will benefit from the subsequent benefits of this operation, excepting the case when the shareholder by proxy keeps the advantages appointing a new company management team, for themselves. Furthermore, the replacement of the management team is done in the context of a quasi-total lack of information.

- **The existence of reference shareholders**

The existence of a shareholder holding a significant part of the equity is an effective way of controlling managers. Managers must avoid the diversion from the conduct preset in the contract. Moreover, a reference shareholder cannot lack interest in the company he invested important sums of money in and to this extent, it may be considered that the pressure exerted over managers is a powerful one, so that they might carry on their activity in the interest of the shareholders.

However, the existence of one or several reference shareholders with ownership over significant equity shares will not solve every conflict. The reference shareholder is mainly interested in the advantages associated to the diversification of the portfolio or obtaining

maximum profitability for a given level of risk. Agency conflicts between shareholders occur because important shareholders can influence management decisions to their favor (risk reduction).

- **Public Purchase Offers (PPO)**

Public purchase offers represent a threat to incompetent managers, as they are an effective mechanism for obtaining profit for shareholders. They are also called *hostile takeovers* and occur, mainly, when the company's capital is under assessed, due to bad decisions on the managers' part. Subsequent to the hostile takeover, managers are generally fired, or if kept, they will lose the autonomy had before the takeover. This interests managers in making decisions that will maximize share prices.

The public purchase offer threat is also limited by various factors. In the beginning, certain minority shareholders might be tempted, if they actually believe in the operation's success, not to declare their notes so as to subsequently benefit from a new management team. They reduce the chances of a successful offer. The public purchase offer notice also has consequences on informing other investors about the interest of buying back the company, which may entice offers higher than the tendering price, which in turn diminishes the expected benefit of the operation or even dissolves it.

The company's management disposes of various ways to counter-balance a public purchase offer. Before the offer, it may decide on a particular allocation of the voting rights (multiple voting rights; limiting the voting rights granted to one shareholder; redefining a new position within the board of directors; cumulative vote; the need of obtaining a majority, qualified to authorize a merger etc.), or use the *poison pill* tactic, meaning the obligation for new shareholders to reimburse the debt within a very short time span. After the offer, the company management may decide the majority of the equity to a *white knight*, susceptible of buying shares, and thus launch a counter-attack on the hostile public purchase offers.

- **Choosing a specific financial structure**

This is a way of constricting managers to act in the shareholders' interests. Using debt financing motivates managers, who, in order to repay the debt and avoid bankruptcy, have the obligation to guarantee the quality of the

decision-making process and obtain important results. The financial market capitalizes on the necessity of the indebted company to achieve higher performances, the only means by which it can guarantee the reimbursement of the debt owed to corporations.

In terms of the financial information of the company's external investors, debt signals the fact that managers consider the company capable of assuming on a debt, in the context of the high returns on investments, estimated for the following periods (specifically, managers are very well informed on the company's perspectives for development and dispose of privileged information).

3.2. Solving the shareholders – creditors conflict

In order to solve this type of conflict additional protection clauses could be introduced in loan agreements, which will limit the abnormal behavior of shareholders or managers. These clauses refer to:

- **The financing policy:** There are three types of financial decisions that restrict the future behavior of the indebted company:

- a) Creditors request of shareholders, by contract, that in case of bankruptcy, the debt should have the same level of priority as other current or future debts agreed on by the company.

- b) Creditors limit, through certain clauses, the possibility of offering future real notes that might diminish the ability of repaying the debts already contracted. Other, more sophisticated clauses, may deny a new issue of bonds, increasing the company's debts, if the company cannot handle current payments.

- **The dividend policy:** The payment of dividends is not denied, as opposed to their indexing, according to the level of profit obtained.

- **The operation and investment policy:** Certain clauses may impose limitations on the investment policy, the use of assets or mergers, confirming the preservation of a certain asset structure. Creditors want to limit any action of the shareholders or managers, that seeks to replace risk assets with risk-free assets.

- **Information disclosure clauses:** These clauses request the disclosure of financial information from companies, as integrated

part of debt agreements. Regularly, the documents requested for disclosure are financial and tax statements, audited by an independent forensic accounting office.

- **Early repayment clauses:** certain clauses within the contract allow creditors to request the early repayment of all or a certain share of the receivables, before maturity, as a consequence of non-compliance to the commitments made to the creditors in the contract.

- **Convertibility clauses and the use of hybrid securities:** convertibility clauses infer the issue of hybrid securities such as bonds convertible into shares, or bonds repayable in shares. Creditors own a bond with a fixed interest rate or an option to buy company shares, which allows the conversion of their notes into shares. Thus, if there is a wealth transfer made in favor of the shareholders, creditors will equally benefit by exerting their option. Furthermore, the convertible bond offers a lower remuneration as opposed to a classical bond, with the same level of risk.

Hybrid securities may be classified into three categories: quasi-shares, notes offering one or several options and quasi-debts.

The first category of hybrid securities, *quasi-shares*, results from a modification brought to the basic components of an ordinary share (voting right and remuneration right). We distinguish: investment certificates, priority dividend shares and shares with double voting right.

The notes that include an optional component contain at least one asset and one option. There are numerous combinations for this: convertible bonds, share subscription bonds, bonds repayable in shares etc.

The third category “*quasi-debts*”, integrate, beside loans from shares, two categories of repayable notes: buy-in notes and indefinite-term subordinated notes.

Widely used in the 1980's, hybrid securities allow for numerous conflicts to be solved between various equity stakeholders. These instruments result from deconstructing and putting back together simple assets, as they can be adapted to the needs of the investors and companies. Their intermediate character determines their exclusion in debts or equity.

4. Conclusion

This review presents the main types of conflicts of interest involving a company and their ways of solving.

Conflicts of interest between shareholders and managers have always existed, because competition in the goods and services is not a strong restriction to induce managers to work for shareholders. Resolving such a conflict finds solutions to identify internal and external mechanisms enterprise, namely: the managers' performance - based remuneration system, the administrative power of the board of directors, vote by proxy, the existence of reference shareholders, public purchase offers and choosing a specific financial structure.

Conflicts of interest between shareholders and creditors arise because creditors have only a partial information and have no certainty about the reliability of the information communicated to them. The sources of these conflicts can be: the dividend allocation policy, the debt dilution risk, the substitution of funds and subinvestment.

To solve this kind of conflict may introduce additional protection clauses in credit agreements relating to: the financial policy, the dividend policy, the operation and investment policy, information disclosure clauses, early repayment clauses and convertibility clauses and the use of hybrid securities.

Conflicts of interest between shareholders occurs first because some have a large share of capital, while others are owners of a limited number of shares and on the other hand there is a potential conflict between old and new shareholders, which is when issuing new shares or hybrid securities. Setting this type of conflict between shareholders involves minimizing the use of capital growth and favoring, for example, debt financing.

Abstract

The huge challenges for ensuring future energy supplies needed to global development imposed the initiation of a series of drastic changes to cope with diminishing conventional energy resources, which tends to endanger the mankind socio-economic development. In this context a shift of energy policies towards the use of green renewable technologies can be noted. At a national level, Romania’s Energy Security Strategy emphasizes more than ever the importance of this type of technologies, public authorities wanting more than ever to encourage their rapid adoption both at the individuals and economic agents’ level. The present study evaluates the actual impact of one of these programs, called Casa Verde and analyzes the weaknesses of its implementation in three counties located in southern Romania: Arges, Olt and Teleroman. First, a comparative analysis between these counties is presented and then the results are examined in view of the nationwide implementation of the aforementioned program.

Key words: global economic crisis, economic development, renewable energy, energy security of the country, funded programs.

J.E.L. Classification: M31

1. Introduction

In the last century, intensive use of energy from fossil fuels (oil, gas, coal - by burning) cause significant environmental degradation being the most important source of carbon dioxide emissions (gas causing the greenhouse effect), which prevents radiation dispersion and contribute to global warming and the thinning of the ozone layer.

In the modern world of XX and XXI centuries, the thirst for energy from fossil fuels derived from oil is one of the major causes of global and regional conflicts. A global movement focusing on sustainable energy (solar, wind, hydro, wave, geothermal, bioenergy, biodiesel) was born in order meet world’s growing energy needs. This new methods of obtaining energy produce far fewer emissions, reduce chemical and thermal pollution and are available virtually anywhere in the world.

Average annual solar radiation in Romania ranges from 1100 and 1300 (kWh / m²) for more than half of the country [4]. Solar thermal potential is estimated at 1400 (ktone / year). Solar radiation on the horizontal surface of Romania is about 200 million (GWh / year).

The atmosphere is optically speaking, a turbid medium, where besides the constituent gas molecules, there are many particles of different origins [5]. Entering into such an environment, direct incident solar radiation undergoes extinction due to the following factors:

- extinction induced by of aerosol, meaning, natural or anthropogenic dust and water

droplets suspended in the atmosphere;

- molecular diffusion in atmospheric gases;
- selective absorption due to permanent gases having constant concentration;
- absorption in water vapors;

Atmospheric opacity is expressed by the opacity factor called LINKE. This is calculated from radiometric stations in the network, 6,9,12,15,18 hours in true solar time, when direct measurements of solar radiation are made on normal surface, in clear sky conditions (sky completely cleared of clouds or up to 3 tenths clouds provided the clouds are at a distance of at least 5 ° from the solar disk).

Figure 1: Solar radiation map in the counties used in the current study

Source: [8] –authors

The study of solar radiation shows that from a total of nine levels of radiation, six are present in the Arges County, divided as follows:

- about 1/3 of the territory (north county) is a radiation from 1266.6 to 1358.8 [kWh / m² / year];
 - about 1/3 of the territory (mid county) has a radiation from 1358.9 to 1420.3 [kWh / m² / year];
 - about 1/3 of the territory (south county) has a radiation from 1420.4 to 1451.1 [kWh / m² / year];
- To better outline the solar energy potential of Arges County, meteorological data were used, regarding [6]:

- global solar radiation flux intensity [kW / m];
- average monthly solar energy [kWh / m² / day];

Olt and Teleorman Counties receive the maximum possible radiation in Romania which ranges from 1420.4 to 1451.1 [kWh / m² / year];

Global solar ultraviolet radiation, regardless of time of year, has a diurnal

evolution in intensity from morning to noon, when it usually peaks. In the afternoon, ultraviolet radiation has downturn evolution.

In Romania, for financing the investments in energy from renewable sources producing facilities, the Environmental Fund can be used. The national strategy on energy security takes into account all possible forms of energy. This can take the form of national resources that must be exploited rationally and also imported resources. Under these conditions, developing a law package aimed at providing country's energy security for the medium and long term becomes a necessity.

According to the latest research, published by Eurostat [7], the proportions of energy sources used in Romania has changed significantly in the last ten years. Romania's energy balance is composed of 36.1% natural gas, 28.5% oil, 20.8% coal, 3.4% hydroelectric power, 3.2% nuclear energy and the difference of 7, 6% of other energy sources.

Among the programs funded from the Environmental Fund it can mentioned:

- National incentive program for car fleet renewal;
- program for installation of heating using renewable energy, including replacement or addition to traditional heating systems (The "Green House" - Individuals, The "Green House" - Companies)
- The program to reduce the impact on the atmosphere and air quality control;

The second program which is specifically addressed to individuals provides fixed amounts financed from the Environment Fund budget, depending on the type of installation [9]:

- up to 6,000 lei to install solar panels;
- up to 8,000 lei for installing heat pumps;
- up to 6,000 lei for thermal power plant based pellets, briquettes, wood chips, scraps and vegetable waste, agricultural, forest, forest;

2. Research Methods

The role of the present study is to assess the degree of promotion, implementation and feedback from the public and traders for the informations regarding Casa Verde program for individuals and businesses transmitted by

the Government respectively the Ministry of Environment through Environment Fund Agency.

The study was performed using a simple random sampling method because the sample construction is done without imposing any prior restriction; each component was extracted from total community. That result in a sample which tends to have a distribution of the studied characteristics similar to that of the existing community.

S.C. Black Sea Suppliers LLC was established in 1996 in Constanta, as a limited company with a capital of 5,960,540 Lei [10].

Currently the company has 31 branches in Romania and neighboring countries: Bulgaria, Moldova and Ukraine.

The annual turnover of the company for the Romanian market, was around 80 million, also it has over 540 employees and a fleet of over 270 cars (cars, trucks, forklifts). S.C. Black Sea Suppliers LLC holds an ISO 9001 certified since 2005.

The company has over 250 suppliers' worldwide, main ones being located in:

- Europe: Italy, Turkey, Czech Republic, Germany, Greece, Austria, France, Lithuania, Spain, Netherlands, Bulgaria, Yugoslavia;
- Asia: China, South Korea and Taiwan;

The product range consists of:

- strategic products: boilers, heating boilers, radiators (steel, iron, aluminum), towel radiators, copper pipes, boilers, air conditioning;
- related products: solar systems, pipes and fittings: iron, steel, copper, multilayer, PPR, HDPE, PP, PVC, circulation pumps, water pumps, expansion tanks and reservoirs, valves and fittings of iron, batteries and sanitary;

The targets of the current study are the company' clients, active between 2005 and 2010, geographically located in the Arges, Olt and Teleorman Counties.

The study was conducted on a sample with the following characteristics:

- Size: 82 active clients (56.16%) randomly selected from a total of 146 active clients;
- A turnover between 2005 and 2010 above 15,000 lei;

The study was conducted from 4 to 15 April 2011.

Data was collected with the aid of a questionnaire at S.C. Black Sea Suppliers LLC offices in Pitesti and at the customer's location. In completion of the questionnaire, study subjects were assisted by a sales agent or technical commercial representative resulting in a better accuracy of the collected data.

The length of interview period was 2 weeks and the average completion time of the questionnaire was 10 minutes.

The analysis of county level data shows the following:

Table 1: Counties ranking by allocated amounts

		Applications			Allocated Amounts [12]
		Submitted	Approved	Rejected	
AG	I.	15	24	5	3.311.140 lei
	L.	10	13	18	3.471.994 lei
OT	I.	23	20	41	2.482.367 lei
	L.	24	19	15	3.862.281 lei
TL	I.	33	33	32	2.212.205 lei
	L.	27	28	16	1.030.230 lei

Sursa: [11] –authors

The rejected cases by individuals in the county of Arges are explained by:

- Lack of knowledge about the documents required to complete forms
- Believe that the applications will be approved even with incomplete documents
- Seek to circumvent the law (they don't own the properties or have not paid their taxes);

It can be noted that in the counties of Teleorman and Olt individuals:

- Do not have enough financial resources to pay a minimum difference;
 - Believe that funds are accessible only if you're politically involved.
- The legal entities of Olt County (12th place in the overall country ranking) are very interested in implementing green technologies, a fact which is explained by the amount that was approved. Arges

County firms' interest in green technologies (14th place in the overall country ranking) is close to that of the individuals. For Teleorman County (27th place in the overall country ranking), looking at the total amount of funds obtained, a total lack of interest (individuals and companies) to promote these technologies can be noted, although the region has a very favorable geographical position to implement them (similar to the neighboring county of Olt).

3. Main findings

Analysis of the results was made taking into account the three different methods of completing the questionnaire: the questionnaire completed by administrator - 49, questionnaire completed by the delegate employee from the firm part - 33, generally completed questionnaire.

A first observation is that employees can identify better than the management the environmental problems facing our country. About 73% of the companies are supporting and believe in the benefits of using renewable energy systems with low pollution. They have heard about The Green House Program (funded by government grants) that applies to individuals, businesses and public institutions.

Sources of information about this program were, in order of their score: Press - 34 pts, Internet - 33 points, TV - 32 pts, other - 21 pts, Radio - 13 points, Magazines - 9 points. 20 firms did not respond. Although 73% of companies know about The Green House Program, only 58% have the same knowledge about the procedure for submitting the document for obtaining the grant. This can be noted as a weakness for this companies, as competing firms, knowing how to access the funds, can capitalize on this lack of knowledge by better explaining the advantages of the scheme to their customers.

It can also be noted that the company's staff has competent knowledge about the technical characteristics of green equipment that they sell.

Regarding the individuals, it can appreciate that level of interest in renewable

energy is medium. At a national level those more interested in using renewable energies are the individuals from Bihor County. They have completed a total of 796 applications, 676 of which were approved, resulting in a ratio of 84.92%, between submitted and approved applications.

Looking at the same ratio for the counties used in the present study, the situation is as follows:

1st place: Olt - 97.94%;

13st place: Teleorman- 89.52%;

41st place: Arges - 62.35%

Only 37% of the individuals who are interested in renewable technologies know the amount of grants they can receive. A better score could be achieved through an aggressive advertising campaign by the Romanian Government which is absent to the present day. This claim is support by the fact that the number of applications filed nationwide, between July 1 and December 31, 2010 for individuals is 10,266 of which 8,627 were approved, with a success ratio of 84.36%.

Firm's customers consider that the presentation made by the engineer or sales agent was made in a professional manner, both in terms of the equipment characteristics and benefits (profits) that they can achieve by buying them. These benefits are further enhanced by the current global economic crisis which influenced the consumers purchasing decision towards systems with high energy efficiency and low consumption costs.

4. Conclusions

Romanian State institutions, namely the Government, Environmental Protection Agency, the Environment Fund Administration and National Environmental Guard should promote and educate the people and businesses in order to encourage purchase and use of renewable energy sources, to act wherever possible to minimize pollution and severely punish those who do not want to adopt such technologies.

The responses received from S.C. Black Sea Suppliers LLC customers show that the individuals, legal entities and state institutions are very reticent in purchasing and using these systems. In a population of 21,680,974 inhabitants, about 7,226,991

families (considering a family size of 3 members) 10,226 applications were filled in a six months period; so a 0.014% interest rate.

Taking into account the grants subsidies, interest must be at least the extent size of these funds (amounting to 110 million lei for individuals) and for businesses to an extend of 80% of the total investment, the total approved value being 109,412,379 lei. The procedure for allocating grant amounts for individuals, for each county was based on the following reasons:

a) The amount of 110 million lei was divided to the Romanian population of 21,680,974 inhabitants, resulting in a sum of 5.073573 USD / capita;

b) This value was multiplied by the number of inhabitants of each county, obtaining the actual amount allocated for that county;

From study results it can be noted that the approval of application and the amount of the actual grants are not influenced by the political affiliation of municipalities or county councils, especially regarding businesses. This indicates the concern of all political parties to encourage purchase and use of renewable energy sources.

In the first two weeks after launching the Green House Program, three counties had the highest rate of funds absorption: Bihor, Covasna, and Harghita because of the UDMR direct implication in promoting the program. Also from 2011 the Green House Program will be extended to public and religious institutions [13].

Table 2: Estimated value of an installation for domestic hot water

Value	Capacity (persons).	Complexity and quality levels
5.300	1-2	medium
6.000	2-3	
8.300	3-4	
11.000	4-6	
14.000	6-8	
6.300	1-2	high

0		
7.200	2-3	
9.300	3-4	
13.000	4-6	
4.000	3	low
4.500	4	
7.000	6	

Source: S.C. Black Sea Suppliers LLC

The structure of individuals who access the Green House Program is comprised of people who have worked or are working abroad and who are informed about the operation and advantages of alternative technologies; individuals who are seeking to reduce their bills by purchasing this equipments; people who believe that alternative technologies are always a saving solution opportunity.

An example of public disinterest for Green House program is reflected by the following situation: the budget for Iasi county was reduced by more than 50% due to the fact that there hasn't been a sufficient number of applications requests and funds were redistributed to other counties [14], with higher applications numbers: Bihor (doubling the funds, from 3 mln to 6.3 mln), Giurgiu (three different increases of funds), Brasov (two increases of funds), Salaj, Arad, Valcea.

People must realize that the money going to the businesses that sell this equipments can help them overcome the crisis and the economic recovery as a whole even for a short a period. This results in more wealth coming back to every citizen of Romania, decrease pollution and a present socio-economic growth without compromising the perspectives of future generations for development; in other words, a sustainable development.

Intermediate Products' Trade and Supply Chains

Georgeta Gherghina

Free International University of Moldova

Virgil Gherghina

Free International University of Moldova

gherghinavirgil@yahoo.com

Abstract

It is known that the intermediate products trade, as part of the global trade, is growing due to the international externalization. Companies divide the production activities and develop networks based on comparative advantages on a large scale. For that purpose, they take into account the legal situation in the target-countries for externalization. Therefore they analyze the intermediate goods trade structure trend versus other types of goods for the EU-27 countries in the last decade. Based on the common descriptive analysis methods in the specific economic literature, the analysis stress the intermediate goods trade models that lead to an extension of the intermediate goods trade.

Key words: intermediate goods, supply chain, international trade, externalization

J.E.L. classification: F14

1. Introduction

Multi-national nature of products is not only a specific feature of high-tech products such as mobile phones or cars. It is rare that a product is manufactured entirely from components or inputs in the country where it is assembled and sold; at least some components or services involved are often purchased from abroad. This is the case of direct inputs, wherein companies buy intermediate components for production from domestic or foreign markets. A component of a particular country may already include other components from other countries, and they are subsequently used indirectly in production. In another cases, companies send high-tech components in countries where the final product assembly takes place. The

complex nature of supply chains at individual products level was documented in a series of case studies for different products such as T-shirts (Rivoli, 2004), Barbie doll (Tempest, 1996), computers (Kraemer and Dedrick, 2002), iPod (Linden, Kraemer and Dedrick, 2007, Varian, 2007) and Boeing (Grossman and Rossi-Hansberg, 2009).

The purpose of the above mentioned studies and our analysis is to highlight the relative importance of intermediate products trade within the world trade for the EU-27 and individual groups of countries, its specific structure, and its trends over time. Therefore we shall try to answer the following questions: What is the share of trade with intermediate products in the overall trade, both exports and imports? Have the share of trade in intermediate products changed in time and if so, was it caused by changes within sectors or between sectors? We will analyze the patterns of specialization regarding the trade with intermediate products of the countries. We will also analyze the amount of the two-way trade and geographical structure of intermediate products over time.

The importance of intermediate products trade as for industries that use them is analyzed from different points of views: What is the size of intra-industrial link within certain industry groups, including service industries, and - most important for the present study - what is the size of the imported intermediate products into these industry groups and how much has it changed through time?

The economic crisis had a serious impact on trade flows, and perhaps the intermediary products trade might have played a special role. The impact of the financial crisis on intermediate products trade is further analyzed, addressing the following questions: To what extent intermediate goods trade was

more affected than other product categories? Greater impact on intermediate products trade results from commercial decline of industries with high levels registered in terms of inputs and components trade, or was there a rift that led to disruption of the overall supply chain?

These questions must be addressed on different levels of analysis: the global economy, for certain industries or groups of products, and finally, the individual companies or products. Aggregated to higher levels, the complex nature of international relations is reflected in particular in business models that reflect the aggregate supply chain. Therefore, this study contains analysis on different levels of aggregation, using detailed trade information, statistics and information from input-output. Each of these sets of data are important. Detailed trade data per product enables product differentiation in terms of their use as intermediate components, industrial goods or consumer goods.

However, the single use of trade statistics does not provide a complete image of supply chains. In particular, it does not reveal industrial differences regarding the structures source. The reason is that imports of intermediate goods cannot be attributed to industrial people who use trade statistics. For example, even there is information on imports of a specific product; the commercial information can not indicate which industries have imported products, or the extent to which imports are used in the production process. This issue can still be studied using information from input-output tables as discussed in detail below. Regarding specific products, supply chains and strategies companies can be revealed using detailed case studies analyzing source structure, national or international, for each individual component of the product.

One can distinguish patterns of trade in intermediate products. Production structures adapt and adjust quickly to the source structures and to international production networks from abroad. This is a prominent feature of globalization. Therefore, it is shown that the intermediate goods trade as share of global trade is increasing due to international outsourcing. Companies distribute their production activities and develop their supply chains in different

locations depending on comparative advantages in a broad sense. The legal situation of potential target countries for outsourcing is taken into account as well. Thus, these trends in intermediate products trade are analyzed versus other types of trade for EU-27 countries over the last decade. Descriptive analysis is based on common methods and specialized literature, with emphasis on patterns of trade in intermediate products leading to the extent of intermediate products trade.

2. Intermediate products' trade quota in total international trade

To support with documentation the relative importance of trade for the EU-27 and individual Member States, Table 1 shows the products' shares imported and exported in total imports and exports amount for each of the four categories of products in 2008. Share of intermediate components imported for the EU-27 is 53.7%, with the largest share of imports. Consumer goods represent the second category, with 22.6%, followed by industrial goods (17.6%). This large structure of imports is found in most countries, with few exceptions. Along with Germany, Slovenia, Poland, Czech Republic, Hungary and Slovakia have the highest share of intermediate products. One explanation could be that these countries are specialized in manufacturing and industries of these countries find production networks from abroad as important. This will be discussed in detail below.

Table 1 shows that exports of intermediate products represent an important part of trade for all countries. Models of intermediate products exports are compared with other categories of goods. Rates for different categories of products for the EU-27 are very similar to those for imports. Intermediate goods represent more than a half of exports, with a rate of 53.7, while exports of consumer goods and industrial goods represent 22.6%, 17.6% respectively.

Large shares of imports and exports of intermediate products in nearly all countries show that a typical distinction between outsourcing and target countries is not useful, so that such classifications must be made carefully. In addition, this indicates the existence of a significant intra-trade amount,

an aspect that we shall discuss in detail below.

Table 1. Import and export quotas for end-use categories in 2008

So far, analyzes have focused on the situation in 2008. Public and academic debates on trade with intermediate products focused on changes in the importance of intermediate products trade and the relative importance of production networks across the borders. In this regard, Table 2 presents an index of nominal import and export values

for 2008, expressed as an index value in 1999 was equal to 1. Those amendments on rates are expressed in percentage points for the four categories of end-use between 1999 and 2008.

Table 2. Changes at import and export levels and of import and export quotas for end-use categories for the EU-27

Index 1999=1		Change item In percentage points.							
		Intermediate product	Consumer products	Capital goods	Mixed category	Intermediate product	Consumer products	Capital goods	Mixed category
Imports		1,85	1,82	1,55	1,49	2,75	0,74	-2,38	-1,12
Exports		1,87	1,84	1,64	1,69	1,99	0,46	-1,94	-0,51

Imports of intermediate goods rose faster than other categories of goods by 85 %, followed by imports of consumer goods, which increased by 82 %. This resulted in a higher share 2.75 of intermediate goods in 2008 compared to the year 1999, consequently, shares of industrial goods and mixed products category declined. However, some individual countries have registered higher growth in terms of import value of this intermediate period, for all products. This group of countries consists mainly of EU-12, wherein the growth tends to be over 3 percent. Imports increased for these countries in terms of other product categories. Therefore it could be more important to consider whether the structure of imports has changed over time, as indicated by the rates.

Interestingly, the share of imported intermediate goods fell for a number of countries. This group also includes some countries from Member States, for example: Romania, Hungary and Bulgaria, along with EU-15 countries such as Britain and Finland. Another group of countries recorded growth rates of intermediate goods. This group includes Germany, Spain, Austria, Italy and Sweden, if we mention only some of the EU-15, but also Slovakia, Slovenia, Czech Republic and Poland. Thus, although there was a general tendency towards a higher share of imported intermediate goods, almost half the EU-27 countries experienced a decline in terms of share of imported intermediate goods and the extent to which these changes were significantly different in these countries. It may be noted that these general trends are the result of the economic crisis that hit the world economy in 2008.

A similar pattern, though of different scales, can be found in case of changes between 1999 and 2007. Exports of intermediate goods in the EU-27 exhibited the highest growth rate, followed closely by exports of consumer goods. Rates of exports were higher than those of imports, although the difference is relatively small for intermediate goods and consumer goods in particular. Specific patterns of individual countries in terms of product categories are rather mixed. It should be, however, noted that growth rates for EU-12 are often large for the groups of products other than intermediate goods. This group of countries started from a relatively low level, what partly explains the high growth of rates. In the EU-15 exporting countries such as Germany have registered increases slightly higher than the EU-27 average in terms of product categories. However, higher exports to other countries like Britain, France, and Italy have increased in average growth rate. Finally, the table presents the average of differences between industrials regarding these patterns. Table 3 shows the share of intermediate goods imported and exported in total imports and exports amount by industry sector of EU-27. Imports of intermediate goods vary from almost zero for the tobacco industry and clothing, up to very high rates of up to 100 percent for industries producing base metals. It seems that these models are relatively stable over time and quite similar. Correlation analysis shows correlation coefficients for all cases above the value of 0.8 and in most cases above the value 0.9. Export structures are very similar to those for imports, as it is shown in Table 3.

Table 3. Shares of imports and exports of intermediate industries achieved in 2008 for EU-27, in percents.

No.	Products	Imports	Exports
15	Food and beverage	22,5	17,0
16	Tobacco	0,9	0,4
17	Textiles	50,8	62,5
18	Garments	0,8	2,3
19	Leather	12,3	14,4
20	Wood products	95,2	97,9
21	Pulp and paper	83,4	80,1
22	Publishing	26,7	30,7
23	Coke	92,5	77,1

24	Chemicals	69,8	63,5
25	Rubber and plastic	72,7	73,4
26	Other non-metallic products	90,0	91,1
27	Basic metals	100,0	100,0
28	Metal products	80,3	81,5
29	Machinery and other equipment	43,6	39,7

3. Origin and destination of intermediate goods

Intermediate goods may come from different countries or groups of countries worldwide. Table 4 provides information about groups of countries from which intermediate goods come, and about the countries where they are exported. Considering the overall EU-27 situation, one can observe that most of the intermediate products are from EU-15 countries origin. As for other countries, like the advanced OECD countries, they have recorded 11.1 percent, EU-12 and BRIC countries recorded high rates as well, 8.7, while Asian countries registered only 3.8 percent. For the other groups of countries, variation in the EU-27 countries is even higher. Thus, in 2008, nearly 70 percent of intermediate goods came from the EU-27.

Source structures for intermediate goods are somehow different from those in other categories. Groups EU-15 and EU-12 record 70 percent of imports of intermediate goods, consumer goods and industrial goods, and even a greater share for the category of mixed goods, 84.6 percent. But there are some differences in terms of other countries-source partner for example. BRIC countries recorded 13.5, respectively 13.0 percent for consumer goods and industrial goods, but only 8.7 percent for intermediate products. On the other hand, advanced OECD countries have relatively high rates, 11.1 percent for intermediate goods and industrial supplies 13.7 percent.

Table 4. Import structures, end-use categories, and partner states for EU-27 in 2008, in percents.

	EU15	EU12	OECD advance	Asia	BRIC	RoW
Imports						
Intermediate	60,9	8,7	11,1	3,8	8,7	6,7
Consumer goods	59,0	8,8	7,8	3,7	13,5	7,3
Industrial goods	55,1	6,8	13,7	7,7	13,0	3,7
Mixed category	73,9	10,7	8,8	2,2	1,1	3,3
Exports						
Intermediate	58,1	10,1	11,6	3,3	5,9	10,9
Consumer goods	62,8	8,4	13,4	2,1	4,3	9,0
Industrial goods	48,6	9,2	12,8	3,7	9,9	15,7
Mixed category	57,0	6,9	18,2	1,2	5,3	11,4

Source: Eurostat COMEXT, WIIW calculation

Similarly, most of the exports of intermediate goods in the EU-27 countries are destined for the EU-15 countries. EU-15 share is 58.1 percent for the EU-27 and thus it is slightly reduced compared to imports. EU-12, advanced OECD countries and the rest receive a tenth each EU-27 exports. Share of EU-27 exports to the BRIC countries is 5.9 percent, while only 3.3 percent of EU-27 exports are destined for Asian countries. In addition, the share of exports from EU-12 countries to other EU-12 countries is also very high in most cases. Along with results of import structures, this suggests that there is also intra-regional trade in intermediate goods between EU-12 countries, indicating that outsourcing is important not only between advanced and less advanced economies, but also between countries with a similar development.

A comparison of geographical patterns for EU-27 exports to the four categories of products indicates that exports of consumer goods to the EU-15 is high, 62.8 percent, compared to 58.1 percent of intermediate goods and industrial goods 48, 6 percent. EU-27 exports and industrial intermediate goods to EU-12 countries are higher than other goods. This pattern is reversed for advanced OECD countries. For other groups of countries, exports of industrial goods are more important, especially the BRIC countries and rest of world category.

Below it is considered whether this model is stable. Table 5 provides information for EU-27 over the period 1999-2008. EU-15 and advanced OECD countries experienced large declines in the market shares of total

EU-27 imports, -4.6, -5.3 percentage points respectively, while the EU-12 and BRIC countries have gained market share, 3.9, 4.9 percentage points respectively. Considering the EU-27 countries, there is a significant change in imports from the EU-15 imports from the EU-12. Again, there is a considerable difference on geographical patterns changes. A common feature is that the EU-12 and BRIC countries have gained market share in all countries, while the advanced OECD countries have lost market share.

It remains to consider whether these changes are similar for all categories of products or if a specific model for intermediate products. EU-15 countries have lost market share in all categories, but they were significant for industrial goods and mixed goods category. Similarly, advanced OECD countries have lost market share in terms of industrial goods, -9.52 percent, and intermediate goods, -5.32 percent. BRIC countries have gained market share especially in terms of industrial goods 9.64 percent, this percentage is similar to the size of the decline in OECD countries. Market share of BRIC amounted to 5.21 percent for consumer goods and 4.94 percent for intermediate goods. Finally, EU-12 countries rank second in terms of market share, with 5.98 percent for mixed goods category and 3.18 percent for consumer goods.

Thus, in this period there was a significant change in the market in Europe, the EU-15 to EU-12 countries as suppliers of intermediate goods. However, EU-12 countries have started from a relatively low level of exports. It is interesting to note that these increases and losses were of the same size. In the same time, there was a significant shift in the BRIC countries against advanced OECD countries. Thus, one can observe a shift in EU structures and source for EU external import models.

Table 5. Changes at import and export levels and for end-use categories for source region and for the EU-27, 1999-2008 (in percent points)

	EU15	EU12	OECD advanced	Asia	BRIC	RoW
Imports						
Intermediate	-4,57	3,87	-5,32	-0,81	4,94	1,89
Consumer goods	-3,06	3,18	-1,93	-2,49	5,21	-0,90
Industrial goods	-5,31	4,22	-9,52	-0,23	9,64	1,20
Mixed category	-5,87	5,98	-2,16	-0,46	0,67	1,84
Exports						
Intermediate	-5,06	3,90	-3,42	-0,62	3,09	2,11
Consumer goods	-3,86	3,82	-2,86	-0,06	2,46	-0,50
Industrial goods	-10,95	4,59	-3,95	0,02	6,11	4,17
Unclassified	-14,50	3,98	-1,38	0,49	4,75	6,66

Source: Eurostat COMEXT, WIIW calculation

4. Conclusions

As it is shown above, the geographical pattern of exports to EU-27 has changed in the last 10 years. EU-27 export quotas to the EU-15 advanced OECD countries and Asia have declined, while the EU-27 export share rose to EU-12, BRIC and Rest of the world. With few exceptions, these models can be identified for individual EU-27 countries. Considering the EU-27 change in the geographical structure of exports for product categories, it can be noted that exports to EU-15 show big declines for industrial goods and mixed goods category. Export quotas have increased for these categories. Changes are similar to the types of products for EU-12 countries, advanced OECD countries and Asia.

These changes in market shares can be related to changes in unit values reflecting the relative cost advantages of emerging or increasing quality. This problem is analyzed through changes in unit value ratios and market shares between 1999 and 2008. Analysis indicates that the EU-12 countries have improved the quality of goods exported to EU-27 markets; a similar pattern is seen for BRIC countries, although with a less pronounced improvement in quality. These models are similar to product categories and appear to be more pronounced in advanced technology industries (high tech) in general.

Comparative Advantages of the Intermediate Products’ Trade

Virgil Gherghina

PhD student, Free International University of Moldova

gherghinavirgil@yahoo.com

Georgeta Gherghina

PhD student, Free International University of Moldova

Abstract

Intermediate goods trade analyzes indicate their relative importance compared to other product categories and their dynamics over time.

The industry size means specialization models, outlines general patterns and volumes of intermediate goods trade for individual countries.

The results indicate that intermediate goods trade can serve as an important vehicle for trade integration in world markets and allow countries to overcome adverse initial patterns of specialization, thus allowing dynamic changes in the structures of comparative advantage through learning effects

Key words: comparative advantages, intermediate goods, international trade, supply chain

J.E.L. classification: F14

1. Introduction

Financial and economic crisis hit the international market quite strongly in terms of intermediate goods (including spare parts and components), totaling a loss of about 50% of international market. It had also disrupted some of the established international supply chains (e.g. the automotive industry) and resulted in some changes in the sources of the strategies of multinational corporations and shift to domestic suppliers. If confirmed, this may have lasting consequences - at least temporarily restricting the internationalization activities of certain companies in certain industries and may

delay recovery of certain industries.

EU companies R&D and innovation activities, especially in high-tech industries are still predominantly national, but turn increasingly more in internationalized corporations, as the need to adapt products to the requirements of foreign markets brings product development standards closer to local markets.

Public programs may be required to provide additional funds for start-up and early stage finance.

Creative industries have great potential for strengthening economic growth and creating for new jobs. They have been for a long time among the sectors with the largest growth in the EU, playing a key role in global value chains and drive innovation. In addition, the number of creative occupations is increasing within and outside the creative industries, for example, spread and creative occupations in other sectors. EU is a world leader in exporting the products of creative industries. However, their importance is not just of economic order - it can facilitate structural adjustment in regions in decline and can stimulate the social cohesion and inclusion enhance.

2. Trade in the EU supply chains

We analyze trade in the EU supply chains by looking at the relative importance of intermediate trade with EU-27 and individual countries. The question to be answered is: what is the percentage of these products in global trade of import and export, which are changes that occur over time, what factors drive these changes and what is the geographical structure of trade in intermediate goods? We shall examine the extent to which intermediate trade was

affected by the economic crisis (including a comparison with another category of products) and how the crisis has affected the supply chain of EU. The aim is to study the comparative advantages of trade with intermediate goods, semi-finished products, bi-factorial trade, research and development issue for foreign corporations and their impact on innovation in the European Union.

Thus, the main objective is to provide an intelligible presentation of the comparative advantages of trade in intermediate goods, semi-finished products bi-factorial trade, innovation performance and competitiveness of creative industries, together with their relative size and economic performance in EU-27. To explore what produces the development of creative industries and their impact on the economy in various forms: direct contribution to the economy (employment and several measures to expand); the spread in the general economy, direct contributions, but less quantifiable, of the creative industries to innovation, and their role in improving quality of life.

The described patterns indicate the comparative advantages of trade in intermediate goods, countries or groups of countries that tend to specialize in the production of intermediate goods are compared to other product categories. It is not easy to differentiate only on descriptive analysis grounds whether certain countries or groups of countries have tended to specialize in the supply of intermediate goods compared to others and to what extent this has changed over time.

The present analysis clarifies this issue using the comparative advantages of end-use categories and groups of countries.

In the theoretic and specialized literature, different measures of variable comparative advantages were proposed, such as Balassa (1965), Vollrath (1991). Greenaway and Milner (1993) provided debates upon the proposed theories. In the figure above is used the third measure of revealed competitiveness of Vollrath is used.

$$RCA_j^c = \ln \frac{X_j^c / \sum_k X_j^k}{\sum_n X_n^c / \sum_{k,n} X_n^k} - \ln \frac{M_j^c / \sum_k M_j^k}{\sum_n M_n^c / \sum_{k,n} M_n^k}$$

Where, X and M show the imports and exports and j means an index for products

category taken into account and c represents an index for country. The first term show the relative advantage of exports, which is analogue to the Balassa index, and the second index stands for the relative advantage of the import. The index ranges from minus infinity to plus infinity and is symmetric around 0. A positive value reveals a comparative advantage. One explains the double-counting by excluding the country concerned in all countries and product categories in total of products. The index was calculated for a group of 40 countries that comprise a significant part of world trade.

Table 1 shows the results of this analysis for all countries included in the exercise. On the figures in 2007, it is interesting to note that the set of countries with comparative disadvantages is rather heterogeneous. On the EU-27, this set includes economically developed countries such as Germany, Denmark, and Italy on the one hand and EU-12 countries, e.g. Slovakia, Hungary, Poland, Slovenia and the Czech Republic on the other. It should, however, not be interpreted as a disadvantage or advantage on factor endowments or productivity, but it rather should reflect the national structure of industries or specializations within industries.

Many countries that have revealed comparative disadvantage in the intermediate products show a strong comparative advantage in other categories: e.g. Cyprus, Hungary, Lithuania, Poland, Romania, Slovakia and Slovenia have a comparative advantage in consumer goods. In all cases the group of other advanced countries shows a positive index for intermediate goods, but negative for consumer goods, contrary to the model discussed above. With the BRIC countries, except Russia, they seem to have an advantage in producing consumer goods, such as relatively large importers of intermediate products in producing final goods. The exception is Russia, for which primary commodities are included. Regarding the group of other advanced countries, they seem all to have a comparative disadvantage, as they have comparative advantage in exports of goods supplies, although there was some shift over time.

Table 1. Revealed index of comparative advantages, 1997 and 2007

	Intermediates		Consumer goods		Capital goods	
	1999	2007	1999	2007	1999	2007

Source: Eurostat COMEXT, The Vienna Institute for International Economic Studies (WIIW) calculation

Note: UE -27 include trade UE - intra.

The analysis so far might have concealed the fact that exists - as in the total trade – bi-factorial trade, e.g. countries that are both exporting and importing semi-finished products and other categories. The following analysis examines the magnitude of this phenomenon in details and the way it has evolved over time. This analysis is done by applying the Grubel-Lloyd index to the categories of products.

To measure bi-factorial trade most common method is Grubel-Lloyd index (Grubel and Lloyd 1975). The analysis in this study uses a version of this index for imbalance trade (see Greenaway et al., 1994) which is calculated as follows:

$$RCA_j^c = \ln \frac{X_j^c / \sum_k X_j^k}{\sum_n X_n^c / \sum_{k,n} X_n^k} - \ln \frac{M_j^c / \sum_k M_j^k}{\sum_n M_n^c / \sum_{k,n} M_n^k}$$

This index is used for the product and country groups in the 8-numbers CN. The index has a scale of 0-1 and can be interpreted as trade bi-factorial share in total trade category. Whenever an export or import value is reported missing but does not correspond to import or export value of the partner country, it is rated from 0 although it is not possible to know if the value is missing and therefore should be positive or zero.

Alternative to skip those observations result in an indication of bi-factorial trade but the conclusions would still be the same.

In general, the index tends to be higher for consumers and capital goods compared to semi-finished products. Taking the average of countries, the index in 2008 is 0.35 for semi-products, 0.40 for consumer goods and 0.39 for capital goods. However, there seems to be no clear pattern, although countries with a higher index value in one category also tend to have higher values for the other categories. This may be due to country specific factors such as country size or per capita income, the most important determinants items for internal trade. A fact even more striking is the large variation across countries. This is shown graphically in Figure 2. for semi-trade, which also indicate changes in the index between 1999 and 2008.

The share of trade with semi-finished products varies from more than 50 percent in Germany and France in less than 10 percent in Malta. As one could expect; larger and

more developed countries regarding the per capita income tend to have a higher index. Interestingly, the index declined for a number of countries between 1999 and 2008. This was the case of France, Great Britain, Spain, Denmark, Sweden, Ireland, Portugal, Luxembourg, and Estonia. But there are also a number of countries where the semi-finished products trade increased. This was especially the case where countries bi-factorial trade was lower in 1999. Bi-factorial trade increased more in Latvia, Bulgaria, Romania, Slovakia, and to a lesser extent the Czech Republic.

Although, despite its potentially different nature, there is a considerable amount of bi-factorial trade that occurs semi-finished products trade blurring the distinction between producer and recipient countries which is still high. (Stehrer et.al, 2010)

Figure 1. Bi-factorial trade with semi-finished products, 1999 and 2008.

Source: Eurostat COMEXT, WIIW calculation
Note: Image based on CGLI measurement

The intra-UE trade with semi-finished products is characterized more by the bi-factorial trade than by the extra-UE trade. Bi-factorial trade with semi-finished products rose in all regions, except for the countries which are considered “The Rest of the World”, where it has fallen down gradually.

The bi-factorial UE-12 trade has grown by a third between 1999 and 2008, what can reflect some inadvertences among UE-15 and UE-12 industries.

Figure 2. EU-27 bi-factorial trade with semi-finished products per regions, 1999 and 2008

Note: Image based on CGLI measurement

Intermediate goods trade analyzes indicate their relative importance compared to other product categories and their dynamics over time. The imports of intermediate goods trade in total EU-27 is about 55% of total trade. Trade in intermediate goods is not very different from other product categories despite its relative importance and nature.

The study shows that the share of imported intermediate goods in total trade is rather stable for each industry, and there is a correlation between these rates in the industry in the country. This suggests that patterns of specialization may play an important role in explaining differences and changes over time. Analyses indicated that there is a general tendency towards increasing trade in intermediate goods shares over time. Slightly higher growth of trade in intermediate goods compared to other categories of products is largely due to modification by industries related to knowledge/science in imports of intermediate goods are more important than another industries.

Some important changes in intermediate goods trade have emerged over the last decade about the geographical structure of trade. Considering the EU-27 imports in the first place, a common trend is that the EU-15, advanced OECD countries and Asian countries have lost market share in all product categories, while EU-12 countries and BRICs have gained market share. A

surprising aspect is that these changes can be observed in all industrial categories. In particular, import quotas in the BRIC countries have increased relatively more for high-tech industries at the expense of EU-15 advanced OECD countries, while EU-12 have gained market share especially in high-tech consumer goods. Changes are similar to those in other industrial categories but less stressed. A similar pattern can be observed for EU-27 exports, with growing export shares observed for EU-12 and BRIC countries.

Overall, the analysis suggests that the trade with intermediate goods pattern and changes over time are not very different from other product categories, despite its complex role as input in the production process. As such, it seems that there is no requirement for specific or different policies regarding different product categories. These findings are suggestive to the importance of international supply products used in production processes to be considered in any policy of bilateral measures. Another conclusion is that industry size, *e.g.* specialized models, outlines general patterns and volumes of intermediate goods trade for individual countries. In some cases, the results indicate that intermediate goods trade can serve as an important vehicle for trade integration in world markets and allow countries to overcome adverse initial patterns of specialization, thus allowing dynamic changes in the structures of comparative advantage through learning effects. Countries such as China (and others) present a dynamic model for high technology industries or products, not only regarding the consumer goods, but the intermediate products as well.

Analyses indicate that most countries are both exporting and importing (which means that the two-way trade share is quite high) even at the industry level. Smaller economies, namely the EU-12, are relatively more specialized in trade of intermediate goods compared with other economies. Again, these patterns of specialization can be found both for imports and exports.

Using symmetrical domestic and imported input-output tables, analyses of imported intermediate goods share in total intermediate goods made by industry have been performed. Analyses were performed for both manufacturing industries and services.

Intermediate goods are most important tech industries with an import quota of about 55%. Imports of intermediate goods are also important for medium-advanced technology industries, the import share is 50% and 48% for medium-low technology industries and low technology industries only 30% of goods are imported. Again, there are significant differences between countries showing higher rates for small savings. These differences seem to be more pronounced in high technology industries. These rates, with few exceptions, have increased over the period 1995 to 2005. On service industries, imports generally play a much less important role, from 16% in trade and hotel industry and about 26% in transport services. Differences in service industries are small in comparison with manufacturing industries.

Analyses indicate an increase of links between industries and countries over time. The increase of inter-industry means that an industry, which is experiencing increased demand requires more goods (inputs) from other industries to meet demand. Industrial links between countries mean that demand for goods industry is satisfied by suppliers in another country. Calculations multiplier output (production) of input-output tables indicate that there is an increase in the output multipliers for EU-15 economies, but shows a decrease for the EU-12 economies, thus demonstrating the inter-industrial linkages are stronger in the first group of countries. When analyzing the multipliers internal/domestic, the first group indicates more or less constant multipliers, suggesting that higher imports of intermediate goods are the trigger mechanism for binding in terms of multiplier effects.

Given the complexity of production and its international relations, it is possible that aggregate commercial information not be the best source of information when pursuing a detailed analysis of the supply chains of companies or products. In this case, details of separated supply chains - a particular case Nokia 95 - have been used to address these questions in detail. It seems that, on average, Europe has registered 55% of total value added. N95 was assembled both in Europe and China. When the device was assembled and sold in Europe, for Europe share value rose to 68 percent. Even when it was assembled in Beijing and sold in the U.S.,

Europe recorded 51% of value. Final assembly, although important, is only a fraction of the total value added of a high-tech and mobile. Capturing value is detached from the physical flows of goods in the supply chain. Major portion of the value assigned to design, R&D, brand, marketing and distribution, and management of these functions. Estimations based on trade statistics and national accounts tend to provide inadequate and subjective picture of how added value is widespread geographically. The only way to clarify this issue, given the availability of statistical information, is to conduct case studies. The black box must be open to understanding the nature and consequences of cleavage production. The case study indicates that an analysis that takes into account flows of services and use information based on value added comes to different conclusions on global trade flows than analyzes using gross flows of goods. This suggests that concerted efforts must be made to develop trade statistics based on value added. The current system was developed for globalization “old paradigm”, the international economy to trade and specialization based on comparative advantage of sectors. Value added information based on trade flows are needed to enter further into the consequences of global trade.

3. Conclusions

Finally, when analyzing the impact for EU-27 trade flows, there have been offered a number of explanations for the collapse of trade in the winter 2008/2009. The growing role of intermediate goods trade plays a central role. The first reason is that a higher share of intermediate goods trade share has increased elasticity income of trade, which was confirmed here for the EU-15 trade. One of the major results of the analysis is that parts and components were also a category of badly affected objects by the crisis, registering 62% of the height of the crisis of September 2008. As a result, the relative importance of parts and components in the EU-27 decreased, post-crisis share parts and components in EU exports decreased by 2% and in imports by 1%. This decline seems to be rather small, but when considering it

within individual industries, changes become more pronounced for countries with a high share of trade in parts and components, reaching 7% for the share of parts and components exports to EU-27 in the electrical machinery industry. This result supports the hypothesis that some of the international supply chains created during globalization have been affected due to the fact that changes of in sourcing strategies of multinational companies have responded to a commercial environment less friendly.

Special Features of Premiums for Teamwork

Greco Gheorghe
Spiru Haret University
elianro@yahoo.com

Abstract

Although initially the system was first applied to individual work performed by employees, he was subsequently extended to work group or groups, where for a particular job requires more operators contest. The system is actually the first application in a form evolved and adapted to modern conditions, the systems used in the past, in which a contractor, hire a subcontractor who, in turn, pay the amount received by all workers use.

Key words: premium, incentive, salary, premiums for teamwork

J.E.L. Clasification: M52

1. Introduction

The premium may be granted and paid staff as time worked. Size depends on first achieving a pre-set schedule. In some sectors, in addition to general premium individual bonuses are granted, such as: raw coal economy, mileage bonuses, bonuses for accident-free activity, raw accuracy, premium economy electricity, raw crew for military campaign and so on.

Introduction of any premiums must meet a set of principles, such as:

- to be understood by staff;
- to be established in a trust;
- to promote rapid and accurate variables that should serve him;
- appear distinctly in payroll.

1.1. Setting premiums

Establish a premium serve masking not a chaotic and disorderly remuneration policies or notorious injustice to hide in the distribution of mass labor. Premiums should not lead to the promotion of paternalistic policies that would give free rein arbitrariness and favoritism.

For the premium incentive produce their effect, are required to have the following conditions:

- represent an important part of basic salary (10% to 25% or more)

- to vary significantly correlated with the activity of each employee;

- payment to be rapid and it even more as it descends the hierarchy;

- periodicity payments to be even shorter as the first is a greater proportion of income;

- the calculation is simple enough to be easily understood by the concerned.

If the premium scheme is well designed and applied, especially when applied to teamwork, they are included and productive workers and the auxiliary, then provides:

- a better climate in the relationship between management and staff;

- it promotes social and technical groups which contribute to the smooth operation of the company;

- boost the productivity of each of these groups, so any increase in salary to have the mandatory counterpart, increasing labor productivity;

- contributes to the creation of a personnel management tool that proxy media management and control, contribute to improving working conditions and so on.

The premium system on groups, is applicable in cases that meet one of the following conditions:

- a. there is a community of interests between members constituting the group;

- b. the nature of work performed is impossible to determine the precise contribution of each group member.

The most striking of the community of interests within the group is working on the assembly tape. Work to be performed in many specialized tasks and split equally. Overall achievements of the group depend on the extent to which each individual to fulfill the specific task in good conditions. Moreover, in this case, the application of individual premiums can not produce any effect, since the cadence of work can not be changed.

In other cases, such as in shipbuilding, the maintenance work, inability to measure individual benefits requires the use of group incentives.

1.2. Benefits of the premium system

Major advantages of the team premium system are:

- a. fostering team spirit that fosters collaboration among team members in good conditions;
- b. reduced need for supervision;
- c. decrease training time for operators;
- d. indirect employment can be included in the work group and controlled by him;
- e. simplify time spent;
- f. the fair distribution of wages.

Instead, pay premiums on the group the following major drawbacks:

- a. penalizing workers with exceptional skills;
- b. lack of control of individual achievements;
- c. difficulty clocking for unfinished work at the end of the payment;
- d. inability to control the time for individual work rules;
- e. the difficulty of finding the right person for the position of leader of the group.

Practically pay premiums on the group system is an adaptation of individual premium systems.

Although you can use any of these systems, the pay is spread on paper (part). Time overruns are collectively calculated and payment amounts are distributed among all team members, after a "key" that can be, for example, individual wage rate or work performed. Collective premiums distribution may give rise to difficulties that teams are not homogeneous in terms of skill and labor efficiency. And if the first distribution is made according to individual basic salary, the salaries of any existing inequalities within the group tend to increase or to perpetuate.

Teamwork usually inserted, as I stated, an unjust disparity between directly productive staff that can measure performance and ancillary employment for which work can not be measured directly.

The first condition is that the team is not more than 20-50 numbers of workers, above this level is difficult to manage.

Staff remuneration objectives can only resolve pay staff and pay them to avoid distortions in the productivity of workers.

When referring to a section of tracks, it comprises productive workers (workers trained) working on cars, their work can be standardized and paid by individual or team performance.

In the same section there and auxiliary workers, consisting of adjustable, unskilled workers and quality control. These workers can be paid: by hours worked, overtime after combined with fixed or variable premium, with remuneration calculated on a notional average yield, the neighbor of productive workers.

Difficulties include the problem solving methods have led to other principled basis to say:

- department or workshop is considered a homogeneous whole in which all staff is a joint production determined and imposed;
- station or studio needs and auxiliary workers, that every productive worker must be a very precise number of people with clearly defined functions of auxiliary workers category. If these proportions have not been met, resulting dispute will be changed.
- the principle is to pay all department personnel on the achievements made only productive workers. Under these conditions, auxiliary workers have an interest in production to make the best possible conditions, because any delay would risk the objectivity and would decrease the average department.

1.3. Conditions for the application

Conditions for implementing these principles are:

- for every productive worker working series receives a note that says labor and time for time worked.
- end of work calculated average wages of workers from machine (A) as follows:

$$A = \frac{\sum \text{times`gives`productive`worker s}}{\sum \text{times`worked`by`productive`worker s}}$$

This indicator is calculated across departments.

Defined and required an index ("i") which will be the ratio of working time of workers and productive work time for all workers (also productive and auxiliary).

Index "and" reflects the evolution workshop organization / department in relation to the principle defined in the organization studied.

Sizing of "i" is the first decrease in section index "and" may decrease mainly by

increasing the number of auxiliary workers, precinct workers (workshop) have interest to increase the number of auxiliary workers or to reduce it.

On this basis, it will define a production index "I" will consider "and" section and the average activity (A), achieving:

$$I = A \cdot i$$

Will be defined in this way a first workshop, establishing a relationship, they choose between linear and attenuated production index premium and "I". Thus, for a premium ranging from 0.60 to 1.20, we have an index "I" varies between 0 and 0.75.

Whole personnel department will then qualify for a premium P as seen in Figure. 1.

Fig. 1. The variation of premium with productive index

Source: Mullins, J. L., "Management and Organizational Behavior", Pitman Publishing, London, 1996

The second step is determining the individual salaries of the staff department. And this step is essential for good workers to work not for the weak.

Individualization is necessary for staff salaries, professional assessment of the value of each worker (v) in salary as time worked under its classification in the hierarchy of workers.

Hourly wage will be:

$$s = (s_0 + v) \cdot P,$$

where:

P = first defined above;

s_0 = only basic salary for a profession, but variable from one category to another. The basic salary is commensurate with the hierarchical factor working personnel;

v = is a value expressing RON value of employee training and vary within certain limits set by the direction of the company.

2. Conclusion

Advantages of remuneration "team uniform" are:

- ensure equitable workforce auxiliary
- reduction of auxiliary labor surplus;
- possible individualization of wages;
- determining a first applies to an entire section;
- easy understanding of the system by which workers at the end, the index output section is shown in the previous month.

Drawbacks of the system of remuneration "team uniform" would be:

- calculate the index "I" is relatively complex;
- difficulty moving workers from one team to another for the first coefficient may be different;
- the system requires that all workers be trained in their job, you need to take account of newly arrived workers, unusual with their workplace. In such cases, appropriate working times will be multiplied by a factor of a lower (e.g. 0.75).

Specific Issues Incentive-Based Pay Systems

Greco Gheorghe
Spiru Haret University
elianro@yahoo.com

Abstract

To elaborate or project an adequate wage system it is necessary to take into account: the market for which the company works, technology and manufacture factors that is using, labor market context and socio-cultural environment.

Key words: collective premiums, individual premiums, hourly wage, premiums for teamwork

J.E.L. Clasification: M52

1. Introduction

According to the conceptual boundaries drawn by some authors (1), incentive-based systems can be classified into four categories:

- raw systems that reward individual performance directly
- systems of collective premiums awarded for achieving production and productivity at the team level, division, department organizational level;
- premium collection systems provided for profit (profit sharing, equity participation);
- payment systems performance driven performance measurement (or pay for merit).

I. Remuneration with bonuses suggestion

Remuneration with bonuses suggestion may be individual and collective.

Gross premium includes the cost of achieving the suggestion.

The net premium is divided into three parts: part (P) staff distributed as individual premium, the inverse function of the number of months of depreciation, a part dedicated to lower selling price, and the third part, equal

to part two, for improving products technology, working condition and investment financing.

The individual premium is calculated differently depending on whether the suggestions result in quantifiable savings, according to the suggestions that improve safety or working conditions. In the first case to take account of originality of idea, the potential number of applications, hierarchical coefficients, the ratio of the position of the author and suggestions.

In the second case, the first volume is set against a scale type.

The collective premium are equal to the difference between P (sum of the first) and the first individual. First be paid in two parts: a low flat-rate premium, a premium commensurable with the expected results.

Establishment of the premium suggestion requires a psychological climate of trust and participation of staff in business life.

The premium can be hard drawn from usage, unless included in wages based on the results of the last 10 to 12 months.

Introduction of any premium is subject to a number of principles, such as:

- premium must be understood by staff;
- premium must be established in a trust;
- to promote rapid and accurate variable parameter that should serve him;
- to appear separately in payroll.

Establishment of the first should not be used:

- masking a chaotic and disordered remuneration policies;
- to hide the notorious injustice in the distribution of wage bill;
- the promotion of paternalistic policies that would give free rein to arbitrariness and favoritism.

For the first to produce their stimulating effect, are required to the following conditions:

- be an important part of the basic salary (minimum 10% to 25% or more);

- to vary significantly correlated with the activity of each employee;
- payment is fast and it even more as it descends the hierarchy;
- periodicity of payments to be even shorter as the first is a greater proportion of their salary;
- the calculation is simple enough to be easily understood by the person concerned.

It should be added that the introduction of any system of performance-based remuneration must be accompanied by payment of an initial minimum term of the running system.

II. Determination of premium (bonus) individual contractors for main systems of wage

The premium or bonus means the difference between the hourly wage received (s) and pay the contractor if it was paid as overtime, ie s₀.

It is understood here that the total salary schedule (s) depends on the performance or contractor activity (A), namely:

$$s = s_0 f(A),$$

in which:

s₀ – the basic hourly wage corresponding output/activity, ie A = 1;

f(A) - is the function of activity / performance that makes the first to be different depending on the pay system adopted.

On this basis, the function f(A) reflects the distinctive characteristics of major payroll systems in individual agreement, namely:

salary by hours worked (the director)

$$s = s_0 \cdot 1, \text{ so } f(A) = 1;$$

- wages piece:

$$s = s_0 \cdot A, \text{ so } f(A) = A;$$

- Halsey wage:

$$s = s_0 + s_0 \cdot \frac{A-1}{2} = s_0 \cdot \frac{A+1}{2},$$

$$\text{so: } f(A) = \frac{A+1}{2};$$

- Rowan wage:

$$s = s_0 \cdot \frac{2A-1}{A}, \text{ so: } f(A) = \frac{2A-1}{A}.$$

The difference between total pay, ie s₀ · f(A) and the basic salary corresponding activity A = 1 is written as:

$$s_0 \cdot f(A) - s_0 = s_0 \cdot [f(A) - 1]$$

So the prime can be written: P = f(A) – 1.

From the above, we can write the premium (P) for each major pay systems:

to pay as time worked:

$$P = 0$$

- for wages piece: P = A – 1

- for Halsey wage (m = 2):

$$P = \frac{A+1}{2} - 1 = \frac{A-1}{2}, \text{ means } P = \frac{A-1}{2}$$

- for Rowan wage:

$$P = \frac{A-1}{A}$$

- for Barth wage:

$$s = s_0 \sqrt{A} \text{ so } P = \sqrt{A} - 1$$

Visual representation P (fA), premium (P) on the ordinate as a variable outcome and f(A) on the abscissa as a variable factor, the following hierarchy results for the main graphics of the premium P payroll systems listed (Figure 1.)

Figure 1. Graphical representation of the premium for major systems salary

Source: Kessler, I., Purcell, J., *Performance-related pay: objectives and applications*, Human Resource Management Journal, vol. 2, No. 3

Graphical representation is particularly illustrative of hierarchy premium each pay system:

- salary by hours worked has no premium (P = 0), identify in the abscissa;

- the systems Halsey, Rowan and Barth earnings growth (premium) output growth is lower.

- all three pay systems with premium curves right below that indicates the premium part the salary system.

- finally, the piece shows that the premium salary (earnings) is proportional to yield.

From here you noticed that when output goes from 1-2, first multiply by 2.

The conclusion to be drawn is that the pay systems have a different impact on the cost of production due to different sizes of the first (bonus) obtained in the performance (activity) A.

III. Premiums for teamwork

Although initially the system was first applied to individual work performed by employees, he was later extended work group or groups, where for a particular job requires more operators contest. The first is actually a form application evolved and adapted to modern conditions of systems used in the past, in which a contractor, hire a subcontractor, which, in turn, pay the amount received all workers use.

If the schemes are well designed and implemented, especially when applied to the teamwork, you are included and productive workers and the auxiliary, then provides:

- an improved climate in relations between management and staff;
- itself promotes the social and technical groups that contribute to the smooth operation of the company;
- foster productivity, each of these groups, so that any wage increase as a counterpart to have compulsory labor productivity growth;
- contributing to the creation of a personnel management tool which proxy media management and control, contribute to improved working conditions, etc.

The first group is applicable in cases that meet one of two conditions:

- there is a community of interest between group members comprising;
- nature of work performed is impossible to determine precisely the contribution of each group member.
- the most striking of community of interest within the group is working on the assembly tape. Work performed should be decomposed into many specialized tasks and equal. Overall achievements of the group depends on whether the individual meets their specific task smoothly. On the other hand, in this case, application of individual premiums can not have any effect, since the pace of work can not be changed.

In other cases, for example, in shipbuilding, the maintenance, the impossibility of measuring individual benefits requires the use of group incentives.

Major advantages of the system first team are:

- a. fostering a team spirit that fosters collaboration among team members in good condition;
- b. reduce the need for supervision;
- c. reducing training time for operators;
- d. indirect labor can be included in the work group and controlled by it;
- e. simplify time consuming;
- f. equal distribution of wages.

Instead, the group premium payment the following major drawbacks:

- a. penalty exceptional skill workers;
- b. lack of control of individual achievements;
- c. difficulty clocking for uncompleted work at the end of the payment;
- d. unable to control rules for individual work;
- e. difficult to find the right person for the position of leader of the group.

In practice, pay for the system with raw group is an adaptation of the award of individual systems. Although you can use any of these systems, the spread is paid to work (play). Time overruns are calculated collectively and payment amounts are distributed among all team members, after a certain "key" can be, for example, individual wage rate or work. First collective distribution may give rise to difficulties if teams are not homogeneous in terms of skill and labor efficiency. And if the first distribution is made according to individual basic salary, the remuneration of any existing inequalities within the group tend to increase or to continue.

IV. Salaries with bonuses awarded for profit collective

Unlike collective incentive schemes to group and team incentive schemes scale plant, company, institution applies to all sizes of businesses (small, medium, high). This pay award is an additional formula which stimulates all staff, increases loyalty to the organization and also focusing on improving business (2).

Involves profit sharing profit sharing made between the organization and employees. If the profit exceeded the minimum set in early, the surplus is divided between the organization and employees or as a fixed

amount for all employees or salary percentage based. The amount accruing to employees is usually located between 5-20% of company profit (before tax).

After Joseph N. Scanlon (3) the incentive system used with success in small businesses and has several components, including:

- a. system of incentives throughout the company;
- b. system to encourage suggestions from employees;
- c. a profit sharing plan.

The company's incentive system is based on the activity (output) overall work of all employees. The overall efficiency of employees can be evaluated based on the ratio of the total cost of salaries (wages) and the commercial value of production achieved during a period (one month), compared to the same report for a base period considered over several years. The economy is divided employees achieved 75% and 25% is business.

To avoid variations in the size of these incentives, due to possible variations of monthly production, is set aside rate of 25%. Reserve is fully distributed at the end. The whole system of incentives is managed by a committee composed of representatives of business and trade unions (employees). This system, in addition to salary savings achieved, leading and promoting better relations between management and employees.

As shown, the global stimulation system in the company also includes bonuses and compensation of employees suggestions.

Bonuses not based on the amount of benefits beyond the reach of influence and control of employees, but production costs that have contributed in some degree. Therefore, here we understand that employees can receive bonuses even if company losses. However, employees do not receive bonuses if the company derives profits, even assuming that labor productivity - dependent employees - not done.

V. Performance-related pay

Performance pay can be defined as a system in which wage growth depends solely or mainly by the appreciation of individual merit or (4). Performance indicators are not only those related to productivity, but also

quality, flexibility, ability to work in teams and ability to achieve goals.

Performance is strictly linked to the outcome of the activity. Thus, in order to have control over labor costs, related to investments and profits earned, organizations associated with performance pay (5).

Employees see such salary more convenient than other systems in terms of security that gives the basic earnings. There are many reasons why managers would want to implement such a system, one of which would be attractive salary, which would lead to recruitment and retention of suitable employees, namely those who want to work in terms of performance. Will be discouraged however only those that the organization would be happy to do without.

This payment would facilitate changes in organizational culture, the purpose of directing a performance by emphasizing flexibility, dynamism, entrepreneurship and care resources (6).

However, by implementing this payment system would result in weakening the bargaining power of unions, as the assessment focuses on the individual, it feels increasingly involved in the making.

The role of line managers would increase, they are the ones who should communicate with employees and be able to make appropriate assessments.

In European countries surveyed by Price Waterhouse Cranfield in 1991, application of performance-related pay has acquired a large (7). As shown in Figure 2, performance-pay mostly applied in France and the UK.

Figure no 2. Comparison between performance-payment application for managers and executives

Source: Beardwell, I., Holden, L., Human Resource Management. A contemporary perspective, Second edition, Pitman Publishing, 1997

All of this graphical representation that the pay system is mainly applied to managers, but we can not see that there is a extension of this system and has no staff positions.

Causes for organizations to pay to performance werw different. For example, in France the payment system was used to restore hierarchies and differences, while in Sweden was used as a solution to regional labor market difficulties.

2. Conclusions

It is difficult to salary based on performance and most Romanian companies do not pay that. In Romania there are very few organizations that implement performance - bonus - only large firms do so.

Bonuses generally are expected as the 13th month, with no connection between money and performance (8).

According to a local business enviroment conducted by Deloitte in 2009, one in five executives of large companies in Romania recognizes that there may or may not know how to reward employees based on performance.

Luminița Mirela Olteanu

Valahia University from Targoviste

mirela_olt@yahoo.com

Abstract

The change as a form of response to the everyday challenges of the society should be achieved differently, according to its amplitude and nature. The difficult periods, such as the economic crisis, are moments that require the implementation of major changes in order to prevent, mitigate or offset the adverse effects. At the same time, these periods are not specific to the deep structural changes involving dissolution and the restructuring of systems.

The following paper aims to highlight the aspects of the change management and, also, the resistance to change and present partial results of a study of four focus groups on four changes proposed and implemented in Romania throughout the 2009-2011 period, during which the European economy was strongly affected by the economic crisis.

Key words: change management, socioeconomic systems, economic crisis

J.E.L. classification: M10, I20, Q58

1. Introduction

Taking into consideration, the current economic crisis faced by most of the world countries, EU and The United States being the most affected by the actual economic state, is required both an organizational and structural implementation of a series of protective measures (under the condition to be taken before the phenomenon), adapting measures (if these measures are the result of unbalances generated by the phenomenon) and recovery measures (if these come after the manifestation of the phenomenon as a form of organizational recovery, the returning to a balanced stat). The key

questions in this context are those related to how deep must be the change be in these moments, whether the made structural changes, that are elements of which they are based on, and the role of the state in these changes.

From this perspective, it is more than evident, that under this economic crisis situation the state's intervention is more than welcomed and necessary under the condition that the measure, implicitly the changes induced in the socioeconomic system, to be taken with the single purpose of reducing the negative effects of it.

Romania, in its latest years, constitutes an interesting study case concerning the implementation of change, the resistance to change and the effects of change.

2. Change management

The society of the explosion of technological and information, every second induces social change, personal or environmental and, by default, organization. A. Tofler said "The only certainty is that tomorrow will surprise us all." Charles Darwin's theory confirms that only those who survive can adapt quickly and effectively to changes. This finding can be translated from the individual, in society or organizations.

Every organization faces today and change managers say that change is a reality in the organizational learning. Most times, the change in an organization is in response to changes that occur in the environment. These changes can occur within the organization, be minor changes, of some structural links or change the entire organization. For these reasons, it is absolutely necessary to know the change process to be masters, and, through good management, to ensure the organization, efficiency and effectiveness.

The change problem has always been a concern, almost obsessive, the sociology of organizations, because of the uncertainty of applying conventional methods of forecasting (eg extrapolation) or the difficulty of change. Organisations should give up lure "certainty" and managers must understand the organization for which they are responsible can go from one state to another, in a difficult way to predict and operate and in unpredictable environments, there is no balance but a dynamic balance.

Given these arguments, in recent years, many scholars have helped managers with a rich literature, the intention to help them understand the change to correct decisions. Analyzing a small part of this literature, you may encounter the following definitions of change:

- a) "A radical transformation process or marginal structures and skills that emphasizes development organizations" [6];
- b) Change is the acceptance Mc Calman and Paton "an ongoing process of confrontation, identification, evaluation and action";
- c) "Replacement [2], modification, transformation in form and / or content of an object, process or phenomenon."

After analyzing these definitions, we can appreciate that change is not an end in itself, but an opportunity, a means of adapting the organization to the external environment through a continuous process of confrontation, identification, assessment and transformation in form or content of the structures and powers emphasizes development in order to improve performance.

Given the provided definitions, it means that change is the development and management of the organization structure and the transformation of cultural and human elements (values, norms, behaviors) of this can be addressed as a permanent form of development and adaptation to environmental changes. In other words, change in organizations can be considered a necessary process of transition from quasi-static equilibrium state to another.

To cope with these changes, P. Drucker's entrepreneurial thinking requires that a person's capacity to implement their ideas, through a management based on creativity,

flexibility, adaptability and risk taking (5). In an educational organization, for example, entrepreneurship practiced in one form eduprenoriati, trying to become a solution to the changes that are provided. Entrepreneurial thinking is defined as the search response and change operation considered as an opportunity, but do not forget that sometimes a lack can lead to regression analysis and change can be considered as a threat. Change is a factor with an impact on management functions, especially those planning and organization.

In this context they have imposed new management principles [8]:

- a) Multiple rationality that any organization must meet the needs and interests of various interest groups, conflict is natural and necessary for life and development organizations.
- b) Pro-Special offer for new means of intervention in reality and not just react, or how to support real change of environment.
- c) Replacement of management focused on control, with management based on "implicational commitment" (R. Walton).
- d) Focusing on communication strategies, participation, motivation and training, conditions considered in the development organizations.
- e) Constructive approach and removing barriers to change.

3. Patterns of change analyzed

Change as the ability to continually adapt (1990 – the beginning of the millennium): organizations seek lower costs but at the same time increasing their competitiveness, change is performed by external pressures and constraints are perceived as strategic actors are forced to develop their creativity and to change behaviors in order to achieve a certain goal.

Crisis situations require, in our opinion the occurrence of unplanned changes (occurring spontaneously, the manager must be rapid and, if serious consequences are unlikely to limit the negative consequences and maximize opportunities), change improvement / enhancement (aimed at improving functionality without changing the organization's current strategic concept),

reactive changes (occurring in response to a threat), anticipatory changes (which, in fact, preparing the organization for the future), change in behaviour (are designed to reduce employee resistance to change in preparation for the actual change), changes of harmonization (aimed elements harmonize the organization taking into account anticipated future changes), adaptive changes (assumed one responds and changes already produced) [4].

In contrast to strategic changes (basic aims of the organization system, including the power), macro-changes (organization aimed at all aspects - strategy, market vision, mission, organizational structure and culture, information and decision systems, etc. .), structural change (is to increase work efficiency by restoring the organizational structure, job requirements or authority relations) or changes to the shift (strategy considering changes depending on the specific area held events), changes redesign them (used when threatened existence of the organization and is in urgent need of significant changes made to the organization's size) involve partial or total dismantle the system and its reconstruction along new the needle is motor itself [4].

Figure 1. Sources of pressure for change

They have very well thought out and analyzed before implementation, any simulations or experiments can be made to eliminate possible malfunctions pilot.

4. Pressure sources to change

Continuously manifest pressure on organizations to this to change, either in whole or in the organizational elements.

Sources of pressure for change may be those represented schematically in The Figure 1.

It is the human nature to prefer the safety and certainty. Very few people accept without reservation the change and all that it is involved in its implementation. Generally, change is for most members the job insecurity of the future or relationships with others. Resistance to change is the main obstacle that we face in change. It can occur on two levels:

- a) at the individual level (individual resistance to change);
- b) level of organization (organization resistance to change)

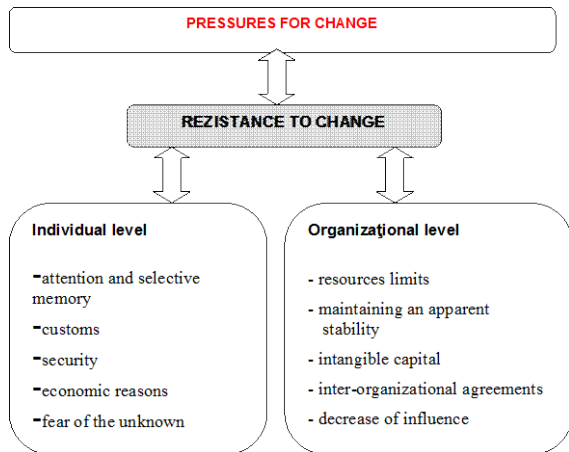

The resistance to change can take at least two forms: open or explicit resistance (late at work, negligence in work) and resistance hidden or implicit (absenteeism, low morale, lack of motivation). Managers must understand that adapting to change is gradual, individuals and organization crossing it in several steps.

According to Hellriegel [4] major causes that generate organization resistance to change are:

- a) lower level of influence and power of some members of the organization;
- b) maintaining organizational stability and continuity apparent (especially for highly formalized organizations with strong hierarchy);
- c) limiting resources / need for investments in resources (may also arise when organizations desiring change but lack of resources-human, financial, information or time - can not apply timely change);
- d) intangible capital: investment in physical assets or render impossible the organization's staff to accept change quickly;
- e) ongoing inter-agreements.

Briefly, the whole phenomenon of resistance to change can be represented as follows:

Figure 2. The Resistance to change

5. Objectives and research methodology

The conducted research proposed to make an analysis to determine the opinion of the socio-economic actors on two distinct categories of changes: deep structural changes (SSP) versus adaptive structural changes (SSA) and whether their implementation in some contexts such as the economic crisis.

Four focus groups of 7-10 people have been created for this purpose, as follows:

- a) G1-SME - 8 representatives of business (managers of SMEs);
- b) G2-EDU - 10 representatives of education;
- c) G3-ADP - 7 representatives of central and local government system;
- d) G4-CIV - 10 people from civil society.

With each group were held six meetings and debates within 2 -3 months (September 2010 - February 2011) in which they discussed their views on the following changes:

- a) S1-EDU - Education National Law no.1/2011, published in Official Gazette Part I no. 18 of 10 January 2011;
- b) S2-SAL - Framework Law no. 330/2009 on wages paid staff unit of public funds;
- c) S3-VAT - GEO 58/2010 - Amendments to the Law no. 571/2003 on Fiscal Code and other fiscal measures, published in Official Gazette on June 28, 2010, on increasing the standard VAT rate from 18% to 24%;

- d) S4-INF - GEO 34/2009 published Official Gazette 249 of 14 April 2009 on amending the tax code by introducing flat tax for companies.

Issues that were discussed were: (1) need the change, (2) whether its implementation during the economic crisis, (3) resistance to implementation difficulties, (4) assessment results. After discussions on the available information at the time of the meetings was to note the number of positive options for members, that change is necessary to promote appropriate time, resistance to change was me has good results.

6. Research results

From the results we present the evolution of views of the four groups on changing specific group.

From Figure 3 it can be seen that subjects in excess of 50% throughout the research considered necessary to change the tax system. Need to adjust tax rates of companies in crisis conditions is initially considered appropriate.

Figure 3. G1-SME about S4-INF

Introducing flat rate tax measure is then considered inappropriate for most subjects. Resistance to change is high, over 75% of subjects expressing this view it was manifested by extensive protests by professional organizations and business associations, media comments, interventions in parliament, views expressed by experts in various forms, in court actions.

Flat tax implementation results initially credited with 50% of the options show a significant decrease of 25% placing it in the end. This is because the effects of this change led to the closure of over 100,000 companies, is just one of them had no business and had no effect in stimulating business purposes.

With regard to national education law nr.1/2011, G2-EDU group shows that over 70% consider necessary to change the educational system, increasing their share to 90% as conduct research. Reasons for the increases are that law in the deconstructed and education is essential to profound changes in the system to restore balance.

Figure 4. G2-EDU about S1-EDU

Opportunity implement national education law changes related to the economic crisis is confirmed by 60% of subjects initially that ultimately falls to 30%. Unlike resistance to implementation is credited initially to 60% of all options and increase to 90%. Resistance takes various forms of street protests, strikes, union petitions, open letters, the views of specialists, demobilization existing teachers, depopulation scheme by starting staff, altering climate, dissatisfaction pupils, students and their parents, etc..

The results range from 50% change in option subjects and decreased to 30% probably because the system itself educated effects occur over a longer period of time, and during this period were found only shortcomings, inadequacies, discrepancies and disharmonies law.

Group deems necessary civil servants a wage in the public system at a rate of 85%. Appropriateness of this change in this period is placed initially at 57%, climbing to 85% and then gradually decreases to 29%. This is because initially reluctant subjects then hope that a system will be designed to give the possibility to access, even if not immediately, at a salary level consistent and comparable with other European countries (Figure 5).

Figure 5. G3-ADP about S3-SAL

It further demonstrates that the only purpose of this measure is split categories concerned and capping salaries as abusive reductions resulted in fact with a series of processes, many already won in court and in its execution.

For the same reasons implementation is growing resistance from 57% to 85%.

The results change decrease from 85% to 14% of these are not well reflected in the failure of the administration, leaving staff, lack of interest of young people for careers in administration, etc. poor performance.

Changing the VAT rate from 19% to 24% has been a topic of interest to all citizens. Need for changes in the rates of VAT registered 70% of options for further increasing to 90%. The subjects considered necessary because such a change, the more that we currently VAT undifferentiated and differentiated that the identification scheme can serve as incentive for the consumer business, and social protection.

Figure 6. G4-CIV about S2-VAT

The opportunity of these was started with 50% of options and decreased to 20%. Resistance to implementation to critical positions expressed by civil society, trade unions, professional organizations, employers, etc. and was above 70%.

The results showed that change rates between 30% and 40%.

7. Conclusions and further developments

From discussions with the four groups were the following conclusions on the four analyzed changes:

- Changes are necessary to enable adapting to new socio-economic challenges;
- Opportunity to implement a fundamental change of its nature depends, if deep structural or cyclical adaptive. Thus, S1 and S2 EDU-SAL were found to profound structural changes which opportunity is not in conditions of economic crisis. While the S3-S4-INF VAT and were considered effective safeguards and adaptation to the economic crisis and thus the opportunity for higher.
- Resistance to change and the results show just the lack of guidance in the implementation of timing and content changes.

Based on the data collected will be several types of analysis to show how perception

changes and peculiarities of different environments.

The Importance of Leadership in Sustainable Business Performance

Horga Maria-Gabriela
„Ovidius” University of Constanta
gabihorga@gmail.com
Bujduveanu Aurica

Abstract

This study attempts to describe the relationship between leadership and performance based on concepts, theories, national and international research in this large field.

In this context, by reviewing the literature in the field, I present an overview of the state of the art in the field of leadership and business performance, as well as some paradigms, limits and difficulties in the field.

I will further offer a large perspective on effective leadership based on concepts, theories and national and international research in this large field.

Key words: leadership, business performance, economic organization, leadership theories

J.E.L. Classification: M10

1. Introduction

Investigations on the ability to lead, that is the deliberate influence others to achieve a goal through collective action, show, that over time, leadership proves to be vital, not only for economic organizations, but for the entire world.

Thus, leadership is present every day, everywhere in society and along the history. The leader has now become a vital element of a successful business. The organization may have all the advantages: financial resources, market position, cutting-edge technology but if it fails to leading chapter, they are simply lost and the organization goes down. [13]

This study describes the relationship between leadership and performance based on concepts, theories, national and international research in this large field.

The universe of research is the economic

organization. The studied concepts are both leadership and the organizational performance and especially the relationship between leadership and performance as established by the current literature in the field.

2. The importance of leadership from the scientific, technologic, socio-economic or cultural point of view

The problem of this scientific paper is a relevant and topical issue, in terms of scientific, cultural, and socio-economic aspects, and it is located in an area where changes are frequent, disturbances are persistent, the trends of globalization are increasingly sharp, the global economic crisis grows in complexity, all of which determine the importance of the scientific research on the role of leadership in organizational change and performance. “The economic environment, constantly evolving and developing, requires companies a great flexibility. One of the biggest challenges of a company’s management is to adapt its activity to the changing requirements of the business environment. Given the fact that technological progress is accelerated, replacing obsolete equipment, launching new products, increasing production capacity of the enterprise, creating subsidiaries or the acquisition of financial holdings are just some of the objectives that an effective leader has to take into account. of an organization.” [12]

In Romania as a EU Member State, leadership’s role has grown in intensity more than ever. Business performance is now seen as a result of the confluence and merge of several factors, among which leadership often plays a decisive role. The ability to lead can take economic organizations towards performance and efficiency. The need for leaders is the basic condition of progress

towards a modern world, which is currently trying to reinvent the effective leadership.

This study addresses precisely this issue of effective leadership in national economic organizations, based on concepts, theories and national and international research in this large field.

At a socio-economic level, most of the world's activity is conducted within or through economic organizations, thus, I intend to cover a number of issues related to the leadership manifested in economic organizations. Leaders and the ability to lead are important organizational behavior topics that have been extensively investigated. People were interested in the ability to lead from the moment they started to come together in groups, in order to achieve goals.

Concerning the importance of leadership, organizations have experienced the intense need to develop a new generation of leaders capable to prime the mechanisms of development, learning, change and performance.

3. The connection between leadership and business performance

Business performance can be defined by using a series of concepts, theories and definitions. The approaches range from the performance in terms of profitability, from Goldratt's definition, which stresses that "the purpose of any business organization is to make money", to those of other TOC theorists or to that proposed by total quality management up to that of Ken Blanchard and Marc Muchnick, who analyzes the success of a business by evaluating three basic parameters, such as: the favorite supplier; the favorite employer; the favorite investment. [3]

Numerous research papers, theories and articles in the field state the value and the importance of leadership and also the existence of genuine association between leadership and performance. The connection is described by both classical leadership theories or current researches in organizational management and human resources management, such as: Theory X - Theory Y developed by Douglas McGregor; the social relations at work developed by Elton Mayo; the need for achievement and affiliation, developed by David McClelland;

Maslow's needs pyramid; Likert's leadership styles; Warren Bennis studies that have attempted to transform leadership into practice; a research study on human motivation conducted for more 10 years by the U.S. Sirota Group; J. Pfeffer's research; Romanian researches and many others.

Worth mentioning Romanian researches such as: Project Liderom, developed by professor Năftănăilă; Nicolescu and Verboncu, who defined the "symbiotic leadership"; professor Vagu's, D. Popescu's; Lefter's researches in the field; the Human Synergics research on leadership, which defined several types of leaders and validated the results by statistical analysis.

All these theories and studies have developed a particular and important influence on the assumptions, concepts and interpretations of this today's leadership and organizational performance study.

4. The difficulty elements of the problem

The importance of the relationship leadership - performance is clarified by literature, but the relationship itself and its implications are not fully clarified. There are plenty of difficulties, controversial elements and discussions over the existing leadership paradigms, as well as discussions over indicators used to measure the ability to lead and their determination. Also, many problems and difficulties arise in the existing studies of the leadership over the performance measurement criteria used.

Despite the widespread acknowledgement of the importance and value of leadership, when studying the leadership literature, it is striking that the concept of leadership lacks coherence and agreement. [14]

Most of leadership literature fails to make clear distinctions between leaders and non-leaders, effective leaders and ineffective leaders, as well as overlooking the organizational level at which leadership occurs, the context or differences between formal and informal leaders.

When referring to management we can list without any controversies the management functions and processes, we know aspects such as the manager's role within the organization, management levels, the source of its authority - the power of position and many others. As for leadership, its functions

vary from author to author, leadership manifests at every organizational level, leaders' sources of power range from the expert or the reference to the position. And if leadership occurs at all levels within the organization, when discussing the issue of “leading the organization towards performance”, to which of these leaders we are referring?

5. The limits of the current approaches in the context of the state of the art in the field

Despite the increased research into the leadership theme, many gaps and unanswered questions still remain in the existing studies.

Some theories focus heavily on social relation leaders - adherents, thus excluding other leadership features and some organizational variables (vision, learning, quality, etc.) as well as some external variables (customers, suppliers) considered crucial to the relationship between leadership and performance.

Many researches are focused on the positive effects of leadership on relations with adherents, but few have analyzed the connection of this relationship with organizational performance, showing it and explaining why and how leadership affects performance. Furthermore, there has been limited research that has specifically addressed the relationship between leadership and organizational performance.

It should be emphasized that, in determining business performance and establishing a causal relationship between leadership and performance it is very important the quality of the indicators used to measure performance. When selecting the measurements of performance, previous researchers have employed either financial measurements or non-financial measurements, rather than employing both kinds of measures in order to enhance the validity of the research. This provides a narrow measurement of the performance. [14]

Findings of researchers on identifying behavior and leadership style that facilitates efficiency and performance are different, and literature provides a theoretical framework, but it still incomplete.

6. Conclusions

Research and leadership paradigms are not conclusive especially regarding the relationship leadership-performance, there are many unanswered issues and also methodological problems that limit most existing studies.

Also, in Romanian articles and study papers there have been only few research studies in the field, some of which inconsistent in analyzing the performance of companies, others inconsistent in analyzing the leadership – performance connection.

To conclude, I plan during future study papers to extend the limit set by other researches and to adopt a progressive approach of the research that allows me to present my views and personal contribution in each stage of work study: the state of the art in the field, the diagnosis of leadership in the national economic reality and finally proposing of an effective working model for the Romanian leaders.

Abstract

The distribution in a direct sales system is carried out using its specific channels, from person to person or from producer directly to the consumer, instead of being carried out classically by shops. Network marketing represents the main force of the direct sales, as it relies on the use of a network marketing system, made up of independent enterprising people to find consumers and to move the products towards the clients.

From the perspective of the consumption goods distributed, most companies produce their own products or at least control their production. Given the specifics of distribution, the road between the production place and the consumer is shortened, through the creation of a relation producer-distributer-consumer or producer-consumer, which facilitates the possibility of a fast reaction to the consumer's desires. The demand and the offer take on specific forms, advantaged by the closer and more personalized contact between consumer and producer.

Key words: communication, marketing, globalization, network, business

J.E.L. Classification: M3

1. Introduction

Network marketing has evolved as a form of the direct marketing and can be included within the general marketing context. So, we can say that:

- According to the profile of the economic activity, it could belong

with all of the three types of marketing: *production goods marketing, consumption goods marketing and service marketing* – the difference being made by the company practicing the respective type of marketing;

- From the perspective of the geographic criterion, it lies within the area of the *international marketing*;
- According to the economic organization level, it is part of the *micro-marketing*.

Multi level marketing (MLM), also mentioned as Network marketing, is a business distribution model allowing a company to sell its products directly to the consumers by means of **direct sales**.

At present, direct marketing is an essential part of the marketing activity. The key principle is that a part of the communication exchanged with the clients should be direct – oriented towards the above-mentioned clients. Starting from this simple principle, a whole new discipline has developed, which also includes network marketing.

Direct marketing has to reduce the large number of messages that people get every day, so that, wherever it is necessary, the clarity, the relevance of the message and personalization (customization) may reach the consumers for which they were meant. As this thing consumes time and resources, direct marketing needs to be cost-efficient, measurable and sure as functioning. Technology has helped achieve this goal, facilitating the direct communication with the clients.

2. Network marketing and globalization

“Let us imagine a non-place where we all live and the entire world’s wealth is produced. It is exactly such a fiction that has come to light during the Internet explosion at the end of the 1990s. The Internet’s growth was so dramatic that it began to question even the meaning of space and of space relations.”

The progress in the domain of information technology and in the management science has led to the decrease of the costs for international transport and communications. In their turn, they triggered the commercialization of an increasingly number of goods and services, which were impossible or hard to sell before that. At the same time, the production and service internationalization was very much accelerated.

The financial institutions had very much to win following this processes. We can say that the financial transactions had to bear a very significant impact. Now, companies have an immediate or a much faster access to the conditions of the markets worldwide and can make the detailed calculations needed to identify profit opportunities through allotment of capital in different areas of the globe.

The extension of the financial and business mass-media, the acceptance of the English language as international business language are part of the main factors that have facilitated financial globalization.

In order to establish and support public and socio-cultural relations in this globalization framework – the geographic distances lose some of their importance. These things lead to “ricochet” effects such as changes in mentalities and administrative structures; yet they can also lead to demographic, security, ecological and social deficits.

The international financial market – getting developed – leads to the circulation of more products in commerce, to the appearance of transnational companies. At the same time, the integration of progress in the economic world leads to the improvement of the environmental quality, to the increase of the revenues, the improvement of the respect for human rights and the right to efficiently use the resources.

In the context of globalization, the interdependences between the economic agents grow. The creation of a network provides the opportunity to distribute risks and uncertainty. The network, being based on a good communication and cooperation, represents a new and dynamic form of organization, giving each partner the chance to attain their goals. In this way, the supply costs go down, the access to resources increases, the distribution and marketing costs decrease, and the products’ distribution is made much faster. “The richest people in the world build networks.”

Network marketing is one of the fast developing industries, well integrated in this globalization concept. It is a people communication business, so that any technological novelty leads to an industrial increase. The use on a large scale of the new technological discoveries such as *digital telephony, internet and satellite communication* will lead to the unprecedented development of the network marketing industry.

„Network marketing continues to develop faster than the franchise or traditional business domain.”

Marketing and distribution businesses totally depend on the local culture. If a business functions in America, it does not mean that it will function, without any adjustments, in any other country. In reality, these businesses need to adapt to the local conditions in each country. The only true measure of success in business is **sustainability**. In Romania, there are a lot of foreign firms, adapted to the local conditions, which develop every year. The international experience will be successfully implemented in Romania, providing a viable alternative to the governmental programs meant to raise the standard of living. “The Industrial Era is over and now we are entering the Information Era. Big Businesses, such as General Electric are Industrial Era businesses. Franchises such as McDonalds represent businesses of the transition from the Industrial Era to the Information Era. Network marketing businesses are the true franchises of the Informational Era, because they function almost exclusively based on information, without relying on lands, plants and employees. Many years ago, people laughed at the idea of network marketing. At present,

all the transformations taking place in the world turn the future of the network marketing into an increasingly promising one. Many companies have a network marketing department.”

The best solution for the successful development of any industry is a severe economic legislation. So, illegal operators can be detected and punished, and consumers and beginners will be protected. The Government fights against illegal operations, starting a campaign to eliminate corruption, bank criminality, trading offences and forbidden trading practices. In their turn, the Commerce Chamber and the Free Trade Associations try to harmonize the Romanian legislative regulations with the EU legislation, in order to facilitate the entrance of Romania into the large family of the old continent.

More often than not, network marketing companies have networks spread over several countries and territories. So, a person enlisting in the network and getting involved in its creation by inscribing in his/her turn other people can finally have partners in other countries, so that, by the circulation of goods that they bring, these people create revenue both for the company and for the people in the upper line, according to each person's degree of involvement. There is a significant connection between network marketing and globalization, the latter being an increasingly debated topic nowadays.

In network marketing, an international network means much more than recruiting people from another country, because this thing in itself does not bring significant revenue or may not bring any earnings at all. In order to obtain financial advantages, an independent network needs to be built, able to develop without the leader's permanent help.

The construction and development of international network marketing has to do with an adequate strategy, a well designed system, investments and measurable actions. The main trump of network marketing is that in a network the distributors work individually, although they are part of a team. When the company launches itself in a new country, it announces, together with the team leaders, the marketing strategy to be used. Depending on this strategy – being a checked

system leading to success – each distributor will work, yet for his own business.

3. Conclusions

Network marketing can mean the accentuation of the tendency to bring the products closer to the final consumer, not just in terms of shortening the time the product takes to get to the client but also in terms of the products' personalization to the client's profile and, in this way, in terms of building consumers' loyalty.

Small businesses can be viable during the periods of significant transformations and crisis through their capacity to adapt and the relatively small risks, all the more as they are supported by large corporations. In this sense, a distributor's individual business in network marketing can be considered a small business.

Team activities, the mentoring and the support provided in network marketing are determining educational factors supporting the passage from the employee mentality to the self-employed mindset.

In the context of the growing concern for the environment and for health, the quality products provided by the direct sales companies as well as the quality satisfaction guarantee represent strengths for such companies.

The easy access to this type of activity might represent a solution to increase one's revenues, all the more during crisis situations. The crisis has triggered lots of dismissals, and the revenues of many people have decreased. During these circumstances, more and more people are looking for new opportunities to earn supplementary revenues. At the same time, to adapt to the present financial situation, the network marketing companies have increased their bonuses, in order to provide a supplementary stimulation for their distributors. So, relying on consumption goods and loyal consumers, the effects of the crisis have been diminished.

As the direct sales companies that use multi level marketing have developed in countries with a strong economy and democracy, their marketing techniques, their communication, their market development, their focus on image and the ethic and legal aspects of the activities promoted by these firms in Romania might constitute a valuable

school for many people who, in other circumstances, would not have access to such information.

On the other hand, the easy access of anyone in such organizations might hijack the network from its initial purpose, if its regulations and policies are not very clear. The existence of fraudulent pyramidal schemes and the erroneous association of the MLM (Multi Level Marketing) type of activity with such businesses have generated a lack of trust in the legal MLM activities. In general, marketing plans have been experimented based on them, many distributors recording successes. However, nobody guarantees successes for all the network members.

The existence of this type of activity supposing high-quality services and products has had no major impact on the Romanian economy so far, considering the volume of merchandises sold by these systems compared to the general volume of goods sold in Romania. Yet, the development of the network marketing systems can be beneficial through its concurrential aspects and through the education of both the consumer and the distributor.

The training of efficient distributors supposes the development of certain essential general skills (communication, leadership, financial education, motivation). And this can only be beneficial for the Romanian society.

Considering all these elements, and the relatively scarce bibliography analyzing into detail the domain of network marketing, we consider it important to give more attention to all the aspects related to network marketing, in the present context of globalization.

Abstract

The aim of the present research paper is to investigate the corporate environmental responsibility (CER) in Romania, by taking into account a series of 24 relevant best practices examples in the field. First part of the paper analyses the concept of CER in close relationship with corporate social responsibility (CSR), by emphasizing the role of governments and companies in environmental protection. The main components, evaluation stages and common challenges associated with CER are briefly presented in the second part of the paper. Third part of the paper appoints the environmental responsibility in the European Union from the national public policies point of view, meanwhile fourth part of the paper presents an empirical evaluation of CER in Romania, with a special focus on supported issues and allocated budgets during 2006-2010 period. The paper ends with a set of conclusions and recommendations for strengthening CER in Romania.

Key words: corporate environmental responsibility (CER), corporate social responsibility (CSR), sustainability, environmental protection, environmental audit

J.E.L. Classification: M14, Q56, Q57.

1. Introduction

Broadly considering corporate social responsibility (CSR) as “a concept whereby companies integrate social and environmental

concerns in their business operations and in their interactions with their stakeholders on a voluntary basis” [1] or “the responsibility of enterprises for their impacts on society” [2], the freely assumed inclusion of social, environmental and ethical criteria in the corporate economic conduct remains the central idea of the CSR definition. Corporate environmental responsibility (CER) is a part of the vast concept of corporate social responsibility (CSR), and like CSR, CER is driven by a set of different reasons: pragmatic or rational reasons (the company assumes CER because of the competitive advantages induced by a responsible behaviour); deontological reasons (the company assumes CER because of an intrinsic corporate moral duty with respect to the community it is operating in); and social pressure reasons (the company assumes CER because of the consumer activism and constant demands from the shareholders and the investors).

Environmental protection was traditionally considered to be an issue of public interest imposed by governments to the private sector through regulations, sanctions and incentives [3], but the changes occurred in the last decades with respect to the societal perceptions on corporate roles and responsibilities are directing CER from “nice to have” to “must have”. On the other hand, the private sector is stimulated in freely adopting environmental responsibilities also because of the clear economic and financial benefits induced by CER [4].

In the specialized literature pertaining to highly developed countries [5], a complete definition of CER takes into account at least

the harmonization of the following three main themes: environmental commitment in which the company fully embraces sustainability and has a net positive impact on the environment and society; material and energy management in which the company operates within the finite ecological limits of the environment; and effective stakeholder engagement in which the company is fully transparent and accountable, with a demonstrated process in place to engage and empower stakeholders. In more specific terms, CER represents “the duty to cover the environmental implications of the company’s operations, products and facilities; eliminate waste and emissions; maximize the efficiency and productivity of its resources; and minimize practices that might adversely affect the enjoyment of the country’s resources by future generations” [6].

2. Characteristics of corporate environmental responsibility (CER)

The most relevant aspects regarding CER refer to its main components, evaluation stages and common challenges.

The following components of CER are offering a detailed vision with respect to the analysed concept:

- Corporate environmental commitment and awareness;
- Stakeholder engagement;
- Measuring, reporting and auditing;
- Transparency;
- Commitment to continuous improvement;
- Going beyond compliance [7].

In order to evaluate their impact on the environment, usually the companies use a set of instruments (or “steps”) that broadly represent their environmental accountability or their CER:

- Corporate environmental policy;
- Environmental audit;
- Employees involvement;
- Green procurement;
- Green products [8].

The most frequently identified challenges regarding CER are the following:

- Role of CER in supporting sustainable development and critique of classical and neoclassical models of market economy [9];
- Role of multinational companies (MNC)

in pollution control [10];

- Relationship between environmental and economic performance [11];
- Difficulty of discerning between real environmental commitment and public relations (PR) based on green washing [12];
- Need for effective participation of all the stakeholders in the corporate environmental decision-making process;
- Need for transparency and/or external third-party auditing in corporate environmental reporting and funds allocation [13];
- Need for standardized indicators and reporting procedures (like, for example, the ones of Global Reporting Initiative) [14];
- Need for adoption of environmental management standards (e.g.: ISO 14001, EMAS etc.).

These challenges mainly address the triple-bottom line analysis and the split of social and ecological responsibilities between governments – companies – society as a whole, and they are expressed in a more stringent way at the level of European Union.

3. Corporate environmental responsibility (CER) in the European Union

Comparing the development of corporate environmental responsibility in the European Union and the US, the corporate activity in the area at the European level has been much more pronounced. In this sense, more than half of the firms that have achieved ISO 14001 standardization requiring rigorous environmental management systems to be installed at a corporation are located in the European Union, meanwhile many NGOs that promote the idea of CER can be found in Europe as well [15]. In its Europe 2020 Strategy, the EU Commission sets out the priority of sustainable growth based upon a more resource-efficient, greener and more competitive economy [16].

Considering the environmental responsibility from the national public policies point of view, the European Commission analyses the CER concept mainly from two points of view: i. the potential of CSR in tackling climate change, and ii. green, social and sustainable public procurement [17]. The

corporate contribution in tackling climate change in sectors such as power generation, industry and manufacturing, transport, retail or building focuses on innovation and investment in clean technologies, products, services, or production processes such as those related to energy efficiency, renewable energy or sustainable mobility [18]. Referring to the role of governments in sustainable public procurement, green public procurement (GPP) is the process in which public authorities take environmental concerns into account in tendering for goods, works and services [19].

4. Corporate environmental responsibility (CER) in Romania

For conducting an empirical analysis of CER in Romania, a set of 24 case studies (corporate responsible initiatives) in the environmental area were taken into account (for the 2006-2010 period), representing a number of 13 responsible companies (Orange Romania, Vodafone Romania, Carpatcement Holding, Provident Financial Romania, Raiffeisen Bank, UniCredit Tiriac Bank, Coca-Cola HBC Romania, Tuborg Romania (URBB), MOL Romania, Petrom, Terapia Ranbaxy, Apa Nova and Transgaz) grouped into 7 fields of activity (Communications, Constructions, Financial services, Food and beverages, Oil and gas, Pharmaceuticals and Utilities). For a distinctive distribution of the 24 corporate environmental responsible initiatives on the 7 main fields of activity, see *Figure 1*. The information was retrieved from the www.responsabilitatesociala.ro, a site presenting examples of best practices in different six areas of CSR in Romania: education, art and culture, environment, social issues, human rights, and sports.

Figure 1. Sector segmentation of analysed case studies (24) in the area of CER

Source: Authors' representation using the information presented on <http://www.responsabilitatesociala.ro> site.

Table 1 presents a detailed situation of the 24 analysed case studies distributed by companies and main fields of activity, with a special emphasis on their corresponding budgets (if they were made public on the www.responsabilitatesociala.ro site).

Table 1. Synthesis of CER analysed case studies (24)

FIELD OF ACTIVITY (TOTAL NUMBER OF CER PROJECTS)	
Companies (Number of CER projects)	CER projects (CER budgets in Euros)
COMMUNICATIONS (4)	
Orange Romania (2)	Orange – Adept work camp, 2008 (N/A)

Transgaz (1)	Green Olympics, 2010 (N/A)

Source: Authors' representation using the information presented on <http://www.responsabilitatesociala.ro> site.

The industrial sectors where the corporate involvement in environmental issues is stronger are the following: Food and beverages, Communications, Constructions, Financial services, Oil and gas, and Utilities. The development of CER in these specific sectors could be explained by using two types of arguments, both of them proving the increasing CSR commitment in Romania in the last years: on one hand, a strategic approach of CSR, CER being specifically developed in those business sectors where the corporate impact on the human and natural environment is considered to be very high (Food and beverages, Communications, and Constructions); on the other hand, an intensive approach of CSR, CER being also highly developed in the Financial services sector, a field of activity that proved to be one of the most corporate responsible ones in Romania. In this sense, a correlation could be established between the main corporate object of activity and their involvement in CSR issues.

Regarding the budgets for the 24 analysed case studies, only 9 of them were made public by their corresponding companies (Orange Romania – € 170,000; Vodafone Romania – € 50,000; Carpatcement Holding

– € 55,000; UniCredit Tiriac Bank – € 179,000; MOL Romania – €191,000; Petrom – €1,500,000; Terapia Ranbaxy – €12,000), with Petrom and its “Parks of the future” project (2007) leading the top of corporate financial involvements in supporting environmental issues (€1,500,000), followed at great distance by UniCredit Tiriac Bank (“Cicloteque” project, 2010, € 150,000) and MOL Romania (“Green spaces” project, 2009, € 150,000). The Oil and gas sector could be highlighted because of its consistent financial involvement in the environmental issues.

Using a methodology that could be presented on request, our analysis envisaged further on the main types of CER issues supported by the analysed companies in Romania. The results, presented in *Figure 2*, emphasize that excepting Environmental protection, which is a common element for all the respective case studies, a special focus was put on: Ecological education; Reduction of pollution; and Rehabilitation of urban green spaces.

Figure 2. Supported CER issues by responsible companies in the analysed case studies (24)

Source: Authors' representation using the information presented on <http://www.responsabilitatesociala.ro> site.

The implementation of ISO 14000 series environmental management standards is strongly assumed by the most responsible companies in Romania (most of them listed on the www.responsabilitatesociala.ro site).

5. Recommendations and conclusions

For a comprehensive image of the CER in Romania, the information presented above in the empirical analysis conducted at corporate level could be complemented with a set of broader guidelines for strengthening the environmental protection emphasized in *The National Strategy for Promoting CSR in Romania 2011-2016*:

- Increasing awareness regarding the risks of the productive activities over the preservation of the environment;
- Promoting an approach based on environmental reduction impact at the corporate level;
- Promoting environmental impact analysis

at the corporate level;

- Organizing scientific / specialized events on environmental protection issues;
- Promoting an active involvement of the corporate environmental officials in order to improve the CSR activities;
- Promoting the application of sustainable solutions for linking environmental effectiveness with cost efficiency;
- Promoting the application of CSR in public procurement in correspondence with the provisions in the National Strategy for Sustainable Development;
- Protecting the water;
- Protecting the historical monuments and the ecosystems;
- Sustainable managing of forests;
- Issuing of norms and instructions for preventing the occurrence of corporate damages on the environment;
- Supporting corporate investments in areas underdeveloped in economic, social or environmental terms;
- Elaborating guidelines and specific methodological instruments for environmental protection [20].

Concluding about the empirical analysis of CER in Romania, a consistent strategic approach could be observed in the last years, the environmental issues supported by the Romanian companies reflecting their main objects of activity and being correlated with the main priorities emphasized at the European level. Although after the economic and financial crisis the social issues are leading the nowadays top of corporate involvement because of the community pressure, the ecological issues still remain a basic component of the CSR policies of the Romanian companies.

Abstract

The authors present the result of a research that uses already trained and validated artificial neural networks (ANN) in order to simulate the influence of Romanian's economic situation over the number of country's pupils and students (PAS). The objective is to determine which of the four economic indicators (GDP per capita in PPS, Share of government budget appropriations or outlays on research and development, Real GDP per capita and Employment rate) have the more influence and is that influence over the evolution of Romanian pupils and students. The present paper continues to reveal the result of a research from which the early results were shown in a different international conference. In conclusion, the use of the ANN is considered a success and the authors determine the possibility that ANN research application be extended to other countries or even to the European zone.

Key words: Artificial intelligence, Artificial Neural Network (ANN), Pupils and Students, GDP per capita.

J.E.L. Classification.: C53

1. Introduction

The importance of the government implication in the education is more emphasised with the spectre of financial crisis effects. But the government's investment in education, research and jobs is

determined by its economic result, such as Gross domestic product (GDP). Even if it is hard to find a linear or direct link and determination between the GDP and the number of the Romanian's pupils and student (PAS) a country has, it is obvious the existence of a direct relation between them. The present paper offer a method that uses nonlinear mathematics to determine the influence between indices for economic activity and PAS in order to assure the base for future research and to forecast the PAS accordingly to country's GDP.

2. Theoretical elements

Artificial neural network (ANN)

Today, Artificial Neural Network (ANN) can be found in the majority of the human life activity, their potential being considered immense. Starting with the human brain and continuing with the actual common application of the ANN, their use effectiveness is demonstrated as can be seen in Akira Hirose's book "Complex-valued neural networks: theories and applications" (Akira, 2003).

Input and Output data

The input and output data can be found on European Commission website (<http://epp.eurostat.ec.europa.eu>) and they are defined as follows:

GDP per capita in PPS (GDP), as - Gross domestic product (GDP) is a measure for the economic activity. It is defined as the value of all goods and services produced less the value of any goods or services used in their creation. The volume index of GDP per capita in Purchasing Power Standards (PPS)

is expressed in relation to the European Union (EU-27) average set to equal 100. If the index of a country is higher than 100, this country's level of GDP per head is higher than the EU average and vice versa. Basic figures are expressed in PPS, i.e. a common currency that eliminates the differences in price levels between countries allowing meaningful volume comparisons of GDP between countries.

Share of government budget appropriations or outlays on research and development (GOVB), as % of total general government expenditure - Data on Government Budget Appropriations or Outlays on Research and Development (GBAORD) refer to budget provisions, not to actual expenditure, i.e. GBAORD measures government support for R&D using data collected from budgets. The GBAORD indicator should be seen as a complement to indicators based on surveys of R&D performers, which are considered to be a more accurate but less timely way of measuring R&D activities. In this table, total GBAORD is expressed as a percentage of total general government expenditure.

Real GDP per capita (RGDP), growth rate and totals as percentage change on previous year - Euro per inhabitant - GDP includes goods and services that have markets (or which could have markets) and products which are produced by general government and non-profit institutions. For measuring the growth rate of real GDP, the GDP at current prices are valued in prices of the previous year and the thus computed volume changes are imposed on the level of a reference year; this is called a chain-linked series. Accordingly, price movements will not inflate the growth rate. Real GDP per capita is calculated as the ratio of real GDP to the average population of a specific year. It is often used as an indicator of how well off a country is, since it is a measure of average real income in that country. However, it is not a complete measure of economic welfare. For example, GDP does not include most unpaid household work. Neither does GDP take account of negative effects of economic activity, like environmental degradation.

Employment rate by sex (EMPR), as % - This employment rate is calculated by dividing the number of persons aged 15 to 64 in employment by the total population of the

same age group. This is not the Europe 2020 employment rate indicator which refers to persons aged 20 to 64. The indicator is based on the EU Labour Force Survey. The survey covers the entire population living in private households and excludes those in collective households such as boarding houses, halls of residence and hospitals. Employed population consists of those persons who during the reference week did any work for pay or profit for at least one hour, or were not working but had jobs from which they were temporarily absent.

Pupils and students (PAS), in Thousands - This table includes the total number of persons who are enrolled in the regular education system in each country. It covers all levels of education from primary education to postgraduate studies (excluding pre-primary education). It corresponds to the target population for education policy

3. Simulating the PAS using ANN

After the training, the ANN evaluated the importance that every input data has over the output data. The result of the evaluation is presented in table 1.

Table 1: Input Data over Output Data Importance

Input column name	Importance, %
GDP	38.48
GOVB	31.66
EMPR	13.41
RGDP	16.43

As can be seen the most influence over the PAS evolution is showed by the GDP, followed by closely by the GOVB. Also, the EMPR and the RGDP have much smaller influence over the evolution of PAS.

Validation and Testing

The second set of data testing is formed from data that was never fed to the ANN in order to train it. So this set was new to the trained ANN. The results of the comparison between the real data and the simulated data are presented in table 2.

Table 2: Testing results - Actual vs. Output

PAS_ real	PAS_ simulated	Difference PAS_real vs PAS_simulated [%]
3903.50	3879.15	0.623799
3879.20	4019.27	-3.6108

The ANN is able to simulate trends of the PAS relatively to the input data very close to the real ones. As expected, the more accurate ones are the trends of the GDP and RGDP, as the trends of the GOVB and EMRP contain a bigger amount of error. This can be explained by the importance the ANN allocated for each of the input data.

Figure 1. Simulated PAS versus the simulated GDP values.

Figure 2. Simulated PAS versus the simulated GOVB values.

Figure 3. Simulated PAS versus the simulated EMRP values.

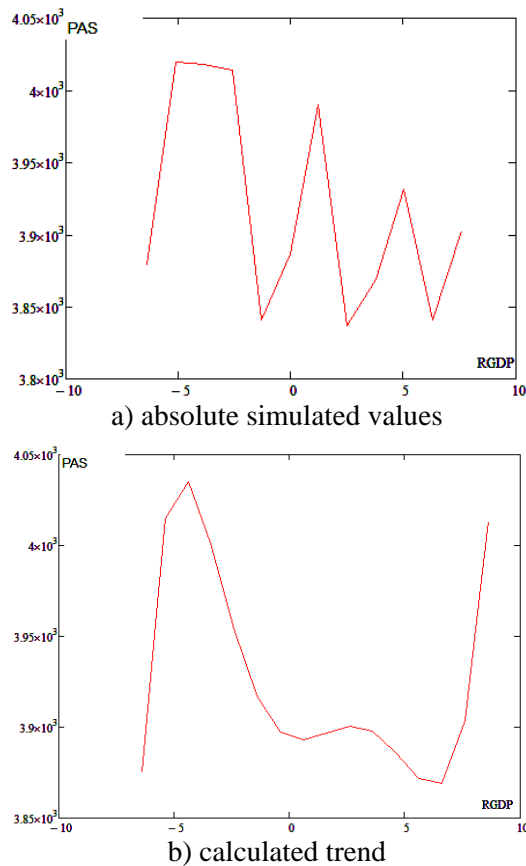

Figure 4. Simulated PAS versus the simulated EMPR values.

In figure 2, the 3D variation of the CONS simulated values is presented considering the determined trends of the each input data, based on the simulated data as consecutive values in arithmetic progression, for each and every input.

Analyzing the 5th figure, the following conclusion can be extracted:

- The GDP has almost the same influence over the PAS than the GOVB and the EMRP, but with a slight overcome, as it can be seen in figures 5.a and 5.b;
- The EMRP has a stronger influence over the PAS than the GDP, the GOVB and the RGDP as it can be seen in figures 5.d;
- The RGDP has almost the same influence over the PAS than the GDP and the EMRP, but with a slight overcome, as it can be seen in figures 5.c and 5.e;
- The GOVB has a stronger influence over the PAS than the RGDP as it can be seen in figures 5.b, 5.d and 5.f.

Analyzing the above statements from the simulated data, it becomes obvious that the most influential data for the Pupils and

students (PAS) is the GDP per capita (GDP) followed by the Real GDP per capita (RGDP), Employment rate (EMPR) and Share of government budget appropriations or outlays on research and development (GOVB).

Figure 5. 3D Simulated PAS variation versus: a) GDP and GOVB; b) GDP and EMRP; c) GDP and RGDP; d) EMRP and GOVB; e) EMRP and RGDP; f) GOVB and RGDP.

4. Acknowledgment and Conclusions

The research established the necessary theoretical characteristics for the pre-processing, training, validating and testing the ANN for the simulation of the numbers of Romanian’s Pupils and Students considering the country’s indices for economic activity. The ANN training is considered a success and all the initial conditions are respected.

The ANN offers information about the importance that the input data has over the PAS. The most influential inputs are the GDP (38.48%) and the GOVB (31.66%). This confirms the real situation that the countries with the biggest GDP and GOVB have the most numerous pupils and students.

The researchers consider that the studies must be extended over a larger period of time and also over a bigger database. This can create a more prepared ANN, and thus a more accurate result. Also, the 3D representation of the influences must be analyzed in order to determine the significance of the inflection point determined in every PAS representation.

Multi-Dimensional Approaches to Organizational Performance

Ionescu Alexandra
„Ovidius” University of Constanta
al3xandra_ionescu@yahoo.com
Cojocarui Diana
Caraman Tania

Abstract

Nowadays, addressing the different dimensions of organizational performance is a topic of major interest, as researchers, managers and stakeholders, alike, tend to increase its importance. This attitude towards organizational performance is motivated by the fact that many companies want to improve their performance evaluation system, aiming to capture the many factors behind its performance. Moreover, multidisciplinary perspectives on performance measurement, such as the balanced scorecard, the performance prism or the performance measurement matrix, point out the importance of non-financial measures in reflecting the overall activity of an organization.

Considering the diverse facets of organizational performance, this paper aims to detail existing performance frameworks designed as multi-dimensional models that can be used in performance evaluation. The main objective of this paper is to highlight the importance of a multi-dimensional view on organizational performance, as all factors influencing it must be taken into consideration.

Key words: performance prism, balanced scorecard.

J.E.L. Classification: M21.

1. Introduction

No doubt, performance has been and still is a continuous concern for the management of any organization. Unfortunately, identifying all factors that have influence on organizational performance is a difficult task. Consequently, it is of great interest to analyze the perception of the „performance” term in the economic theory.

Researchers and practitioners in the economic field have diverse opinions when defining business performance, hence there is no generally accepted definition of this term. Therefore, some economists address performance in terms of business objectives, referring to the extent at which objectives are achieved, others regard it as a measure of the value created by an organization, while a latter category considers performance in terms of productivity and efficiency of the business.

Considering an organization as a group of people which conduct activities aimed at achieving a common objective, performance refers to the degree at which an organization, as a social system, with certain resources and means, achieves its goals [11]. In this context, performance is analyzed in relation to the objectives pursued, as an internal reference. This first assessment of performance emphasizes a subjective point of view, as performance is entirely dependent on business objectives. Thus, companies that have set modest goals can consider a certain level of performance as high relative to its high level of achieving pursued objectives, while other companies can appreciate the same level of performance to be reduced relative to a lower degree of fulfilling some ambitious objectives. Therefore, the same level of performance can be assessed differently.

In this context, performance is considered to reflect all that contributes to achieving the strategic objectives of an enterprise, but also all that contributes to improving the value-cost couple[3]. Consequently, performance is defined by referring to the value created by an enterprise relative to its costs.

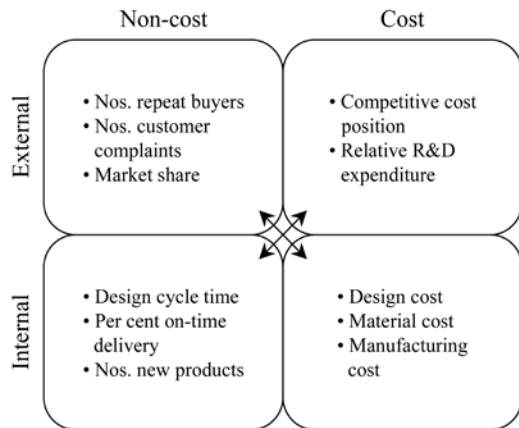

From another point of view, performance is defined in terms of effectiveness and efficiency, as a state of competitiveness of a company, reached through a certain level of effectiveness and efficiency which ensures a

sustainable presence on the market of the respective company [9].

2. Performance frameworks

Among the first proposed performance frameworks, the performance measurement matrix provides a wide range of performance measurements. Designed by Keegan, Eiler and Jones in 1989, the performance measurement matrix anticipated the different dimensions of an organization’s performance, putting in light that factors that drive performance of an organization are both internal and external, some of them generating costs, some generating non-costs - Figure no. 1. Thus, by using this framework, it is possible to identify all business performance indicators, and consequently, reduce eventual omissions in the performance measurement process. However, the performance measurement matrix provides little evidence on the various dimensions of performance that should be measured.

Figure no.1 – The performance measurement matrix

Source: Keegan, Eiler and Jones (1989) [5]

In order to overcome shortcomings in the performance measurement matrix, the results and determinants matrix was developed in 1991 (shown in Figure no.2). The model, designed by Fitzgerald et al. (1991) [1], was the result of their study conducted on performance measurements in the services sector.

The results and determinants matrix assumes that there are two basic types of performance measurements in any organization, namely those relating to results (competitiveness, financial performance), and those focused on the determinants of the

results (quality, flexibility, resource utilization and innovation).

Figure no.2 – the results and determinants matrix

Results	Financial performance
	Competitiveness
Determinants of the results	Quality
	Flexibility
	Resource utilisation
	Innovation

Source: Fitzgerald et. al. (1991) [1]

However, this approach highlights the fact that results are based on past performance of the company relative to specific determinants. In other words, criticism of the model shows that the results are indicators of the past, while determinants are indicators that influence future developments.

Still, one of the most used and well-known performance frameworks is the balanced scorecard, a model designed by Kaplan and Norton in 1992. The model is a simple one, aiming to assess four logical questions (as seen in Figure no.3) [6]:

- How do look at our shareholders?
- How do our shareholders see us?
- What must we excel at?
- Can we continue to improve and create value?

By answering these questions, an organisation can properly evaluate its overall performance, given that several perspectives are considered – financial perspective, customer perspective, internal business perspective and innovation and learning perspective.

Figure no.3 – The Balanced Scorecard

Source: Neely et al.(2005), adapted from Kaplan And Norton (1992)[8]

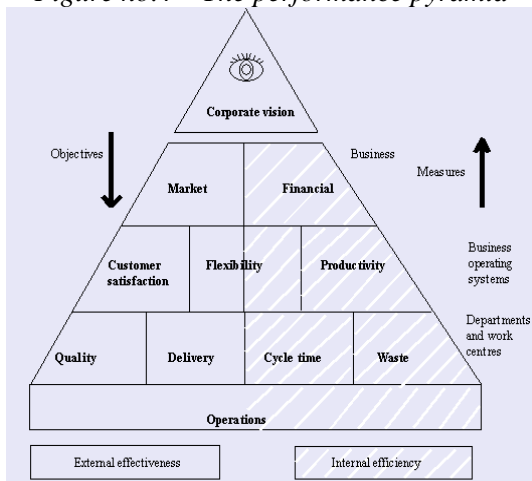

Kaplan and Norton’s balanced scorecard has some characteristics which make it preferable when structuring a system of performance indicators. Firstly, this four dimensional approach helps an organization establish explicit links between the strategy adopted and those performance indicators that it uses for strategy implementation and monitorization. However, there is no universal set of indicators that are suitable to all firms in all situations (as assumed in most approaches, for example, when determining financial performance), but business-specific indicators should be designed for specific situations.

Secondly, the four areas of interest within performance indicators will be projected - financial, customer-focused, process-oriented and innovation and learning - meet the needs of the key stakeholders of the company. It would be therefore possible to extend this model to one desired by organizations’ stakeholders.

According to Kaplan and Norton, by analyzing the four aspects mentioned above, an organization should be able obtain a balanced view on its activity, given that all major aspects of its activity have been considered.

Performance models above are based on models of hierarchical organization within companies. There are also models that focus on promoting horizontal flows in the company, for example, the orientation process, without excluding the hierarchical view. The most relevant model of this type is the proposed Lynch and Cross (1991), called performance pyramid (Figure no.4).

Figure no.4 – The performance pyramid

Source: Lynch and Cross (1991) [4]

Performance pyramid is built based on the idea that a company operates at different levels, each of which has a center of interest. However, it is imperative that between these levels is a constant connection, hence the pyramid links corporate strategy to daily operations of an organization. Lynch and Cross suggest measuring performance through eight dimensions (as seen in Figure no.4): cycle time, waste, productivity, financial, flexibility, quality, delivery customer satisfaction and market, the first four reflecting performance in terms of internal efficiency of the organization and the last four considered as performance indicators in terms of external effectiveness.

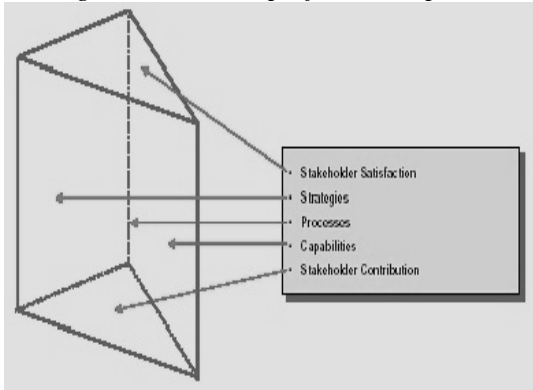

At the bottom, the objective is to improve the quality and delivery period and reduce cycles and losses. At this level a number of non-financial indicators will be used to measure operations. The four levels of the pyramid are designed in order to support each other in achieving goals. For example, reducing the duration of a cycle and/or losses will increase productivity and therefore increase profitability and cash-flows.

3. Recent approaches to organizational performance

One recent approach uses the performance model performance prism (Neely et al., 2002). The performance prism is a model developed by Cranfield University and highlights the importance of all stakeholders in an organization, without focusing on a particular group. Thus, the company takes into account the needs of all stakeholders and what are their expectations, and therefore identifies what the company needs and what it wants from its stakeholders.

There are five aspects of the performance prism (Figure no.5), namely, stakeholder satisfaction, stakeholder contribution, strategies, processes and capabilities.

Figure no.5 – The performance prism

Source: Neely, Adams and Kennerley(2002)[7]

In building the prism, the five above mentioned aspects require a series of specific questions (and answers), namely:

- Stakeholder satisfaction - Who are the key stakeholders, what do they want and need?
- Strategies - What kind of strategies do we need to meet the desires and needs of our stakeholders?
- Processes - What critical processes do we need to execute our strategies?
- Skills - What skills do we need to maintain and improve our processes?
- Stakeholder contribution - What contributions do we need from our stakeholders, if we want to maintain and develop these capabilities?

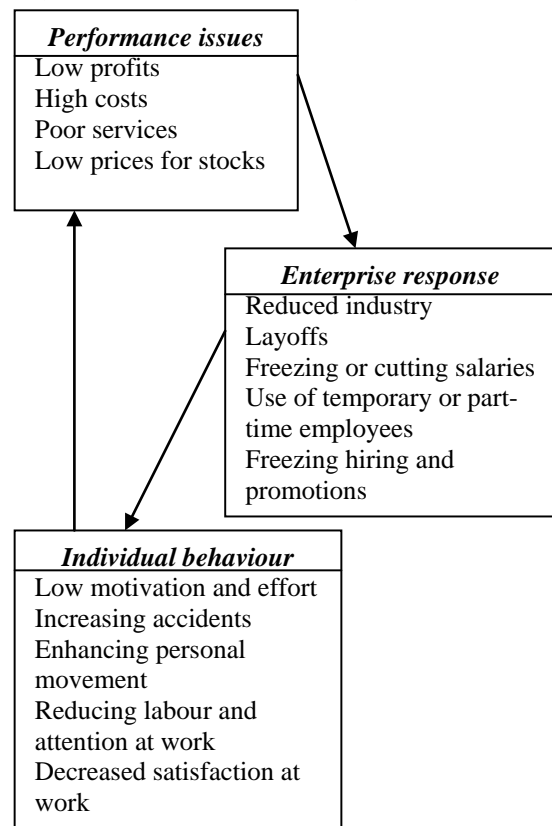

The performance prism is different from other models that address performance as it focuses attention to business stakeholders, and not to its strategy. The „stakeholder” term, by referring to a group of people that have a common interest in a business or industry, implies the fact that both customers and employees, investors and suppliers, regulators and pressure groups have an important influence on organizational performance, along shareholders and managers. Company’s success is seen in this context as based on successful partnerships and relationships between the organization and its stakeholders.

In accordance to Neely, Pfeffer J. (2010), considers that human resources are the ones responsible for the performance of an organization, showing how the first influence the latter. Thus, in building the downward performance spiral (shown in Figure no.7), Pfeffer identifies those factors that determine chain reductions in organizational

performance.[2]

According to Pfeffer, human capital is of major importance in any organization [2], hence it should consider its people first. Pfeffer argues that many companies have sought solutions in places that were not productive at all, treating their businesses as portfolios of assets that can be bought and sold. Consequently, by reducing the activity of an organization and contracting parts of it to third parties, in the attempt to find the shortest and simplest way to profit and performing countless other actions, will weaken or destroy organizational culture [10].

Figure no.6 – Downward performance spiral

Source: Pfeffer (2010) [10]

4. Conclusions

Although it seems simple to define and measure, organizational performance is a complex universe within different ideas and theories mingle. The present study offers a detailed review on existing performance frameworks, pointing out their strengths and weaknesses and revealing that:

- There are many factors that have an important influence on the success of an organization;

- Different frameworks can be designed in order to meet the needs of a specific organization;
- Performance needs to be assessed from multiple points of view;
- Not only shareholders, customers and employees count, but also investors, suppliers, regulars and other pressure groups.

Some of the frameworks discussed in this paper, such as the balanced scorecard, the performance prism or the downward performance spiral, emphasize the importance of analyzing performance in the light of some new topics, like customer satisfaction, employee attitudes, how the company is perceived by its competitors, etc. It is therefore necessary to study all aspects of a business and its relationship with the internal and external environment in order to design a proper and adequate performance framework.

Quality Management Spas

Ioniță Roxana Mihaela
Universitatea Creștină „Dimitrie Cantemir” București
ionita_roxana2000@yahoo.com

Abstract

Applying quality management in coastal tourist facilities became a necessity under current economic development. Increased quality of tourism services must be established as a priority for owners and management of tourism companies under increasing competition Powerful seaside tourist market.

Keywords: quality, tourist services, management, spas, eurespa

Jel Classification : L83

1.Introduction

Applying quality management in tourism Spas, as in other forms of tourism is essential and decisive influence on the quality of tourism services. Introduction of quality management in tourist services units increase the quality of services, whether we speak of accommodation, catering, transport, leisure and spa. These services make up a whole contributing to the optimum and higher satisfaction of needs and requirements of tourists.

2. Quality Management Spas

Quality is more important, if we refer to Spas, because those who benefit from these services are often people with special needs, elderly people, people who enjoy a good health or people who simply relax by appealing to certain therapies offered by this form of tourism.

Accommodation services require the existence of appropriate accommodation (hotels, motels, villas, etc.) and suitable equipment to ensure hygiene tourists.

Quality of accommodation depends essentially of:

- existence of technical and material accommodation and related facilities at a higher quality (sufficient and functional furniture, functional sanitation, cleanliness and hygiene of the accommodation, equipment rooms corresponding to the number of stars that is classified accommodation, there additional services and their provision in appropriate circumstances, etc.)
- staffing accommodation capacity, number, level of training and qualifications, work organization in hotel units.

Providing leisure tourists accommodation is fundamental to Spas and is subject to: [1]

- Location of accommodation (they must be accessible, quiet area, with numerous green spaces, equipped with special facilities)
- Soundproofing rooms in relation to high traffic areas (not to be located near railway stations, bus stations, amusement parks, etc.);
- Quality of its personnel (staff must be courteous, friendly, provide useful information).

Hygienic conditions are dependent on:

- quality medical equipment;
- proper functioning and maintenance of medical equipment;
- the existence of inventory items for personal hygiene;
- frequency of replacement inventory items for personal hygiene.

Insufficient accommodation, equipment are inadequate, the disparity between comfort level and demands of tourists and the small number of workers or their poor preparation adversely affect quality benefit tourism tourist flow dimensions and possibilities of recovery of the tourism potential of natural and anthropogenic .[3]

Catering services is an important side of serving tourism fits into the category of basic services. As economic activity, catering is not exclusively designed to meet the needs of consumers-tourists, but it is often associated

tourism activities and its dynamics is influenced by the evolution of tourist traffic. Between the tourism and catering are interrelated, the latter determines the quality of services and influence the content and activity tourism offer.

Primordial component in the structure of modern tourist offer, catering is the main means of raising the quality of tourism services in conditions of maximum efficiency.

Nutrition services aimed at meeting the food needs of the tourists, but also recreation and entertainment needs, developing in relation to housing services or independent of them.

Quality catering services depends greatly on the quality of production activities, marketing and service. They imply the existence of specialized areas for each activity, functional and equipped with modern equipment, qualified staff and specialized and consumer conditions culinary (sanitary rules, ambience, comfort, etc.).

Network catering units, restaurants occupy an important place of various specializations, offering consumers a wide range of dishes, and usually they are located within hotels (for Spas their existence inside or near the hotel has a role the choice of the unit).

Specific features of catering services in relation to tourism activity are: .[1]

- Presence in all key moments of tourism consumption: boarding places, places of destination and accommodation, places of entertainment, spa places;
- Necessity of a wide typology of food units that meet the needs of food and entertainment, etc.
- Special requirements to ensure rigorous diet, for medical spa tourism special diet regimens are necessary to contribute to successful treatment;
- To meet the requirements both local and foreign tourists (international cuisine, regional or local);
- The holiday treatment, diet should not affect the results of medical treatment, which is different in each particular seat is the tourist-patient and condition being treated.

Ensuring a constant high quality of catering services, is not only in using intrinsic quality material consumption

(tangible side benefit), but also in the art of hospitality (the intangible side benefit).

Learning the art of restaurant staff aims to structure customer in such a way that tourists really feel that is treated as a guest.

A characteristic feature of catering, to distinguish it from other units and to be competitive in the competitors, is the introduction, cultivation and maintenance of professional hospitality to their clients.

The spa tourism, introduction and maintenance of professional hospitality plays an important role due to the fact that here we work with a special category of tourists (tourists, patients) who have special characteristics and needs.

Transport services are essential in any form of tourism, they provide tourists travel from place of residence to place of destination or stay.

The vehicles used to move tourists in any form of transport used (road, air, rail, water) must meet the technical and functional. Comfort, convenience, speed, security, regularity, making travel time, the tariffs, additional services when traveling, are some factors to consider in assessing the quality of tourist transport.

Leisure services contributes to physical and psychological needs of tourists, thus creating the necessary spending leisure time enjoyable and instructive.

Equipment and recreational facilities and spas are outdoor thermal pools, indoor swimming pools, saunas, sports, bowling, ski, lift, games, libraries, museums, theaters, parks, athletics tracks, casinos, alleys designed for cleaning the land, beaches and furnished endowments, solariums, gyms, fitness centers, etc..

Approval is an indicator quantity and quality of the tourism phenomenon, while the quality factor for tourism development. The main trends that manifest in their leisure offer is ongoing development, quantitative and qualitative, and diversity of leisure and means available to tourists to ensure your shopping experience of spending free time.[3]

Cleaning services or medical spa treatment are additional travel and tourist occur in situations where complete their stay at a resort (motivated by rest, relaxation, sun-sea cure, etc.) to carry out simple treatments

(exercise, aerosols, mineral water cures, thermal water baths, etc.), taking preventive

Smooth running of these services requires the existence of natural therapeutic factors and addition of modern facilities such as cleaning hotels and sanatoria complex, the services of accommodation, diagnosis and treatment are offered framed the same building.

Quality spa services is valued both in terms of existing facilities in the basics of treatment (medical equipment to meet safety standards, to be functional and in sufficient numbers, the the capture of the natural factors of course well maintained and functioning to normal etc.) and personnel involved in providing these services. Contact staff must meet certain requirements related to training (specialists in certain types of diseases), moral conduct, willingness to serve promptly and efficiently, kindness, understanding the needs of tourists to their satisfaction as better.

The main spas in Romania have the necessary facilities for these services, but greater efforts should be made for tourists provide quality services to meet their every need at the highest levels, because current conditions are putting a growing emphasis on health care policy, physical and mental health is one of the basic levels of civilization

Signs of quality in tourism and spa tourism

Marks of quality in tourism are: [4]

- the stars are typical in all units of tourist accommodation: hotels, villas, hostels, rooms for rent and camping. They are marked with the number of stars, according to the classification criteria established by certificates issued by the Office of Tourism Authorization and Control. The maximum number of star accommodation is 5, but not all areas receive the maximum;
- the daisies, show quality rural tourist guesthouses and stars are equivalent;
- the dolphins symbolize quality categories of beaches on the following criteria: quality of sand, sand thickness, there showers, clothing exchange booths, toilets facilities, existence of groups of first

aid facilities and recreational facilities.;

- the quality categories are signs for restaurants, bars, fast foods, confectioneries, bakeries. There may be class "luxury" category I and II.

Mark Q

Q brand is a specific brand hotel units, as a tool for assessing the capability of hotels to operate in an optimal context and coherent, validated at the highest current standards.

Classification of hotels in the number of stars is based only on certain physical attributes (space, equipment and facilities and hotel rooms, etc.) and less on qualitative characteristics and codes of good practice based on quality standards (hospitality, availability, solicitude, basic and additional tourist services quality, etc.).

Q brand to introduce the hotel sector is to improve the quality of services to increase customer satisfaction and guarantee that customers will benefit in any hotel units valued and certified by a high level of quality services, regardless of hotel unit that category [2].

Such a system was introduced in Spain, a country with tradition in tourism, where the number of stars appear with the letter Q, the symbol of a system showing the highest quality of service offered by number of stars.

Blue Flag

Blue Flag - is a symbol of international recognition of certain beaches and marinas. Beach operators enrolled in the program "Blue Flag" enjoy significant advantages in terms of its own image, but also in terms of overall tourism activity.

Benefits of this program are: to ensure appropriate environmental management, ensuring security and promoting clean and beaches, as well as environmental education and information activities on the environment, cleanliness priority for tourists, promoting a whole, local, national and international beach, beaches in the registration requirements of EU regulations, attracting foreign tourists because this distinction has wide international recognition, having an organic symbol recognized internationally visible presence on the world map of towns with beaches "Blue Flag" 7-10% increase in the number of tourists per season, including periods of start of the season.

At European level, some countries have many blue-flag beaches, for example Spain with over 450, 140 Turkey, Bulgaria 10, while in Romania until 2005, there is no distinction beach. Now, after efforts, some beaches of Mamaia resort (beach Vega, 2010), North Eforie, Saturn, Neptune, Venus (2006) were obtained from the Foundation for Environment distinction "Blue Flag".

Mark Eurespa

Eurespa logo-med is European quality brand spas and health centers. Holding logo certifies Eurespa-med requirements ESPA (European Association resorts) on general infrastructure therapies, hygiene and security of tourists.

European Association of resorts based in Brussels, and brings together representatives of national associations in the field of European countries. This logo was introduced in order that accredited health resorts are distinguished from other competitors, the international recognition of the high quality of tourist services patients. Eurespa for accreditation must fulfill and comply with a number of 400 criteria in the following areas: system management and compliance, procurement and supply of therapeutic factors, implementation procedures and therapeutic spa's, accommodation and catering activities.

Eurespa logo - quite appreciated med health insurance companies and major tour operators in Germany, considering that it is reference to a certain high international quality tourism services and spa. In our country, only International Hotel Felix has Espa certificate for spa complex, several units in the country carrying out such activities on a specific ISO 9001 certifications.

In the near future it is expected that five other hotel units may be certified to the standard Espa. Hotels are located in resorts Ocna Sibiu, Geoagiu Spa, Vatra Dornei, Saturn and Felix..[5]

3. Conclusions

In the current period, quality has become a global strategic management of businesses because it causes the highest degree of competitiveness of products / services domestically and internationally. Quality is the main factor regulating the market through

customer entitled to choose what best suits his needs and his expectations.

Quality products and services to its customers is one of the strategies underlying the development of seaside tourism companies, and more.

The Analysis of Human Resources Management Particularities in Tourism

Cătălina Lache

“Petre Andrei” University of Iași, Faculty of Economics
catalina_lache@yahoo.com

Abstract

The human resources management in the tourism companies is part of the marketing mix and has a series of particularities that distinguish it from the same activities of the goods production sectors.

The article proposes to emphasize, theoretically, the human resources management particularities in tourism, and from the practical point of view, the results of a research are presented, achieved during the March-April 2012 period, in seven representative tourism companies from Iași municipality. The questionnaire used in this research aims at emphasizing the manner in which the managers take into account these specificities in recruiting and selecting the employees, motivating and training them for obtaining performance and coagulating the work teams, around the values promoted through the organizational culture of the analysed companies.

Key words: human resources management, tourism, organizational culture.

J.E.L. classification: M12

1. Introduction

In order to be effective, competitive, the tourism companies give a special importance to the human resources management and especially to the personnel management that has direct contacts with the clients. In the service processes, most of the times, the customer satisfaction is indissolubly related to the provider personnel, the appreciation of their quality being confounded with the executants themselves. The means of creating and delivering the service must combine the efficiency and competence with the charm, interpersonal skills, so that the client and company's interests are simultaneously served.

2. Theoretical considerations

In the tourist services, the personnel is considered the essence of the offer, because of the complex role and the responsibilities it has. The contact personnel of the service company has a crucial role, representing the interface. The contouring of the company image depends to a great extent on the time in which they answer the requests, the precision and politeness they show.

2.1. The contact personnel

The contact personnel has a complex role within the tourist services, being considered the most important aspect of the attending processes. These employees are at the crossroads of the client and company's interests, often conflicting, having the role of satisfying, to the highest extent possible, both parties.

From the point of view of the service company we can emphasize several roles of the contact personnel [14]:

- They represent the company in the relationship with the clients;
- They represent the trademark image, and the confirmation of qualitative standards and the trademark name before the clients depends on their behaviour;
- They represent an important factor of differentiation and competitive advantage;
- It represents an essential part of the service offer, the visible one, that takes place before the clients or with their participation, determining the objective quality of the service, and the most abstract and profound aspects of the consumers' satisfaction as well.

From the point of view of clients, the contact personnel represents, in very many cases the motivation for using the company services, representing a strong factor of gaining customers' loyalty politics. The differentiation, in the case of companies that display similar qualitative standards, is insignificant from the technological point of view, because of standardization, the human resources representing the determining factor. That is why, the main objective of the human resources management in the tourism companies is maintaining the competent, productive, motivated contact personnel, loyal to the employer and reducing the number of temporary employees.

2.2. Particular aspects of the contact personnel activity

The contact personnel of the tourism companies are given a special attention within the human resources management, because of the fact that they represent the interface between the company and the consumer.

Its role is multiple, of simultaneous representative of the client and the company, and the work is very complex. The operative tasks must be executed quickly and well, with politeness and readiness, so that the company achieves the quality, productivity and incomes desired, and the client leaves satisfied. Their role is crucial in achieving the qualitative standards and maintaining the customers' loyalty.

The presence at the attending place of other consumers or potential consumers requires a particular attention, all the clients having the right to an equal, nice, and competent treatment.

These aspects of the contact personnel activity are strongly generating stress and role conflicts. The main causes are: the psychological conflict of the service provider with his own role, the conflict between the norms and the rules of the company they represent and the customers' wishes, the mediation of conflicts that appear between the company clients [7, 8,12,15].

a. **The psychological conflict of the service provider with his own role** – derives from the fact that some clients are very difficult, they request things of which they are not sufficiently informed, and then project their discontent on the contact personnel,

others are arrogant, always dissatisfied with something or they always want more or to be served immediately, generating conflicts with the other clients.

Starting from the marketing principle “the client is a king” and “the client is always right”, the employees must prove a lot of tact, patience and competence, comply with the politeness and respect conventions, so that all clients are satisfied. This conflict of roles affects the self-respect, the situations when there are huge gaps between what the provider thinks and what he/she must do are frequent, in order to correctly accomplish his work tasks. The employees' advice in solving the conflicts and the recognition from the managers and colleagues can compensate a part of these negative aspects of the employees' work.

Despite the fact that the obligations generated by the nature of this type of jobs are complex and stressful, in the service companies, especially in the commerce and tourism ones, there are the smallest salaries and the biggest number of employees, and the studies requested at employment are under the average level. The professionalization of the contact personnel and its transforming into a competent personnel, indispensable to the company, requires the employers' special attention on the human resources management.

b. The company-client conflict

The role of company-client conflict mediator derives from the tasks of the contact personnel, to arbitrate between the attending regulations and procedures imposed by the company and the clients' requests.

The conciliating attitude in treating the exceptions is very convenient for the client, it induces satisfaction and loyalty, but it is a perturbing factor of productivity, it increases the attending time and the waiting periods for the other clients. Certainly, the exception must not become a rule.

The employees' flexibility is redeeming for the company before the client, and in the cases when the resources are insufficient and the priorities are not clearly established, only the employees' inventiveness, creativity and competence can attenuate these deficiencies. The capacity of dealing with the unforeseen situations, to satisfy the clients' requirements even in limit situations, being proud that they belong to the organization, the company

prestige being emphasized, induces satisfaction to the provider as well, reducing the stress. These positive attitudes, especially encountered in the great hotel chains and in the small pensions, do not mean that there are no sabotages where the personnel reduced number and the small salaries make more and more room to crowds, queues, employees' tiredness, who become more and more predisposed to making mistakes and exceed the normal attending time.

c. The conflicts between the clients

Although the tourism companies have the right to select their clients, and the organizations differentiated according to categories has the role of limiting the access through the high price, the presence of several consumers or potential consumers at the attending place can generate conflicts between them. The differences of education, culture, hierarchies of values are manifested in the case of clients' interactions among themselves. The majority of conflicting situations start from non-complying with the order of waiting lines, of reservations, of places registered on the tickets or travel certificates or restrictions regarding smoking, the consume of alcoholic drinks, of social cohabiting norms etc.

The mediator role of the contact personnel is very stressful, difficult and unpleasant. Both parties cannot be right at the same time and everybody cannot be satisfied, of what the employee decides that the company position represents. Taking measures and formulating an official position requires a special attention, all the clients having the right to an equal, condescend and competent treatment.

2.3. Particular aspects of human resources management in tourism

The human resources management in tourism is an integrant part of the marketing mix, being indissolubly related to the customers' satisfaction and the company image. Recruiting, selecting and integrating the employees are difficult activities, because in this field, a good professional training must be doubled by talent, charm, style and a personality suitable to the job. The intrinsic quality of the future employee and vocation cannot be acquired, training only refining talents.

These valuable employees represent the essence of service companies. The test periods or the apprenticeship are specific to the field of tourism and services. The employees

will be directly and indirectly observed, through behavioural simulations, then guided, in order to have a realistic vision on what they must do, how, when, integrating in the atmosphere and acquiring the organizational culture of the service company. During the trial period, they must acquire several categories of knowledge and skills, and namely [12]:

- Theoretical knowledge
- Procedural knowledge;
- Knowledge related to the company environment;
- Social and relational skills;
- Cognitive skills;
- Emotional skills.

The knowledge development starts with the training process, the integration within the organization, of the manner of collaborating but it must be accomplished through continuous learning. The employees must complete and permanently develop their professional knowledge and develop their skills. A particular aspect of the employees' recognition, in the tourism companies is considered the feed-back. In the specialty literature five basic aspects are emphasized, regarding the employees' reward and recognition [17]:

- Achieving the company objectives is the most important reward;
- Achieving the objectives is the foundation of rewards (salary, feed-back, recognition);
- The specific and difficult objectives of the attending personnel must be made public in order to offer recognition, even if they are intangible, such as the evaluation on a scale of courtesy improvement;
- The objectives' accomplishment (the feed-back) must be popularized within the company (recognition) in order to stimulate the employees;
- The specifications on the manner in which the objectives must be reached are not absolutely necessary – the feed-back speaks for itself about results, it is a corrective function, that helps the employees progress, even in the absence of other rewards.

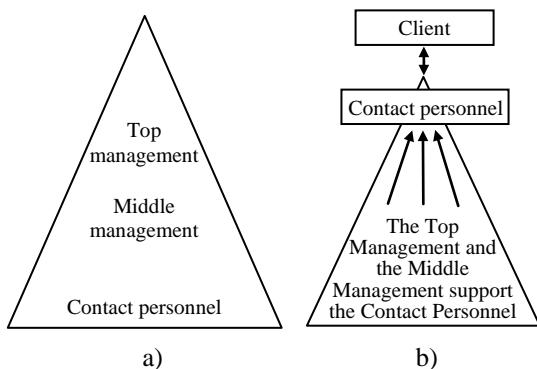

2.4. The organizational culture in the tourism companies

The organizational culture in the tourism companies is formed because of the repeated interactions between the members of the organization, of a common idea regarding the beliefs and values of the individuals composing it, although there are strong modelling factors that particularize it, such as: the management style and implicitly the manner of taking decisions, the formalist level, the organization structure, the different competences, the politics, the know-how and the systems that offer value and support to the work and the attending behaviour.

The organizational culture is what “binds” the organization in a chain of tacit significations, that offer human specific meanings to all the organizational activities and processes. At the same time, it is the most important factor of resistance in any change demarche, no matter its scope. [1, 2, 12]. One of the most important factors in building the organizational culture is due to the particularities of interactions between the employees, the leadership and the quality of organizational communication. The particular aspects derive from the contacts with the clients, and their understanding represents the essence of life for the tourism companies.

The efficiency, efficacy and the company survival in itself depend on the attending interaction. In the tourist companies with a strong attending culture, the management proves, through involvement, the client’s crucial role. The managers are not only preoccupied with the global service, but they focus also on the details that count, giving the company the notoriety that distinguishes it from the competition [6, 13, 14, 15].

Fig. 1. The traditional pyramidal organization versus the client focus [12]

Communication is an essential aspect of the organizational culture, beyond the informative role, it creates the teams, the familiar, warm, friendly atmosphere, which makes the clients feel good. An efficient internal communication ensures the efficient distribution in the attending points, strengthens the work relations, making them productive and harmonious, institutes trust, respect and loyalty of employees among themselves and towards the management and the company in itself. The managers’ role is crucial in formal communication, and the compliance of information, communication and decisions entail integrity, trust in the capacity of formal leaders to develop strong, competitive teams.

3. Research regarding the human resources management in the tourism companies of Iași

The research was achieved during the period March 2012-April 2012 in seven tourism companies, representative for Iași municipality, using a questionnaire with closed questions. The questions’ variables were assessed with different Likert type scales. The questionnaire was applied to the general managers from the analysed companies. The ideal situation was marked with a distinctive colour.

According to the assessment scale presented in table 1, the representative tourism companies of Iași Municipality registered very good results and they obtained the grade VERY GOOD, regarding the manner in which the managers take into account the particularities of the tourism sector, in the human resources management, having within the answers in the questionnaire 11 situations that overlap the ideal situation, of 13 possible ones, in the following manner:

Recruiting, selecting, training, motivating and coagulating the work teams in the tourism companies of Iași:

$$Qualification = \frac{11}{13} \cdot 100 = 84,61\% =$$

VERY GOOD

Table 1. Questionnaire regarding the particular aspects of human resources management in the tourism companies

HUMAN RESOURCES RECRUITMENT AND SELECTION	
1. Rigorous recruitment and selection : the suitable person at the suitable place (does not exist/to a small extent/occasionally/in general lines/to a great extent)	A B C D E
2. Image on the working force market (does not exist/unfavourable/medium level/favourable/excellent)	A B C D E
MOTIVATING AND DRIVE OF HUMAN RESOURCES IN OBTAINING PERFORMANCE	
3. The use of a motivating salary and bonuses for the employees' motivation (very little/little/average level/high/to a high extent)	A B C D E
4. The existence of feed-back and the public recognition of meritocracy (does not exist/ little/average level/high/to a high extent)	A B C D E
5. The achievement of company's objectives – means of employees' drive (does not exist/to a small extent/occasionally/in general lines/to a high extent)	A B C D E
6. Enriching the tasks and responsibilities – means of employees' drive (does not exist/to a small extent/occasionally/in general lines/to a high extent)	A B C D E
DRIVING AND COAGULATING THE TEAM FOR OBTAINING PERFORMANCE	
7. The intensive training of professional, procedural and interpersonal competences (very low/low/average level/high/to a very high extent)	A B C D E
8. Coagulation around the values and norms of the organizational culture within the company (very low/low/average level/high/to a very high extent)	A B C D E
9. Encouraging the contact personnel (very low/low/average level/high/to a very high extent)	A B C D E
10. The interest given for constituting a performing and compatible team for delivering the tourist services (little and occasionally, little, but continuously/average level/much/very much)	A B C D E
11. Work autonomy (very little/little/average level/high/to a very high extent)	A B C D E
12. Monitoring the employees' satisfaction, of the existence of a positive attending attitude (does not exist/to a small extent/occasionally/in general lines/to a great extent)	A B C D E
13. Client focus (little and occasionally/little, but continuously, average level/much/very much)	A B C D E

4. Conclusions

For achieving a performance management in the tourism companies, the strategies regarding human resources aim at attracting the most suitable candidates, their intensive training, their integration within the organization, the involvement of the new employees, and the responsibility to provide a competitive service. The adequate reward stipulates

a large range of modalities : salaries, bonuses, performance incentives, recognition and feed-back. The performance management means continuous learning and the continuous enrichment of the service company values and culture, emphasizing the excellence and productivity. The employees must support the achievement of the company objectives, create value, and the leaders must support performance and inspire trust and passion for exceeding the difficulties of attending activities. The performance will be re-

flected in the financial results and the position held on the tourist market, in the company image, in the work market attractiveness, in the public relations.

Although the companies analysed got the VERY GOOD qualification, as regards the manner in which the managers take into account the particularities of the tourism sector, in the human resources management, in order for this activity to be even more efficient, the following requirements are also added: developing the initiative and autonomy, giving the possibility to the higher professional training employees and managers of all the hierarchy level to think in an anticipative manner. In this regard the company managers also have to exceed certain mental barriers, that emphasize the correct execution of tasks and procedure compliance, but diminish initiative in approaching the exceptions. Or, if the “client is the king”, the service personalization and the empathy are basic elements in tourism. That is why the systematic theoretical and practical training, the capitalization of the accumulated professional experience, must lead to the diversification, enrichment and increase of tasks and responsibilities, stimulating at the same time the motivation and responsibility.

- Solving the problems related to ensuring some decent incomes, giving a stimulating salary, including bonuses, remains a problem of great actuality in the Romanian tourism. The salaries of this field have remained among the smallest ones in Romanian economy, being comparable only with those from the agricultural sector, which leads to the massive migration of the working force from this field towards similar jobs in other European countries.

- Correlating the evolution of human resources, according to structures and functions, in accordance with the information and communication technology in all the structures of accommodation, food departments and the maximum reduction of the waiting times and bureaucracy in attending clients.

- Client focus, encouraging and stimulating the contact personnel, creating a climate of simultaneous satisfaction of employees and clients.

The improvement of human resources management from the tourism companies must take into account the particularities of this sector of activity, and the experience of

countries which achieve considerable incomes from tourism, thus achieving a competitive export activity.

Abstract

Social economy is a new concept used to define that part of economy in which the activities of organizations are aimed at improving social welfare and secondarily at increasing the profit and benefits. The European and Romanian legislative framework authorize the establishment of certain organization as participants of social economy. The research is focusing on protected units, as organization of social economy taking in consideration the economic and social criteria proposed by researchers. The main purpose is to show the importance of protected units. The specific objectives of this paper are to set the boundaries of the social economy concept based on the review of the important theories and to describe a sector of Romanian social economy from protected units approach. The results will show the evolution of the sector in a period of four years which coincide with the implementation of The Sectoral Operational Programme Human Resources Development.

Key words: Social Economy, Protected Units, Disadvantaged Group, Work Force
J.E.L. classification: H75, J14

1. Introduction

Modern economic environment is surrounded by new circumstances that require new activities. These new activities taking place at the boundary between public and private sector are aimed at “helping in solving social issues and protecting the right

of various stakeholders” [1]. These activities require a legislative framework, the support from the State and the voluntary involvement of civil society.

2. Perspectives on concept of social economy

The synergy between market capitalism and state economy led to emergence of a new concept social economy. Setting the boundaries to this concept is even difficult taking in consideration the main two opinions. The American approach defines the social economy as an alternative sector, separate from and “balancing the state and the market” [2]. It includes legal organizations which through voluntary participation are involved in manufacturing activity or providing services but the status does not allow them to be a source of income, to generate profit or other financial gains. The legal entities are formal organized, they are independent, with their own rules and mechanisms of decisions making. From European perspective definition of the concept is more analytic with a strong emphasis on the mixed and pluralistic nature. Social economy is embedded in a system where the Market, the State and the Private households are the main source of influence. This triangular system describes the plural nature of resources that contribute to the social welfare [3]. Social enterprises are managed by different stakeholders (e.g. employees, volunteers, public authorities, donors). The organizations are structured to exclude profit as main goal and the provided goods and services are used to increase the benefit of community. The main forms of

organization recognized by European law are: voluntary organization, charities or associations, cooperatives, mutual aid societies, foundation and trusts. The typically for-profit organization can be considered as social enterprises when they acquire certain characteristics, including a constraint on the distribution of profits. The EMES European Research Network, a group of scholars coming from all European Union member states, carried out a research analyzing the concept of social enterprise. According to the results of the research there are four criteria which reflect the economic and entrepreneurial dimension of social enterprises: a continuous activity of producing or/ and selling goods or services; high degree of autonomy; a significant level of economic risk; a minimum amount of paid work. The social dimension of the enterprises is reflected by other five indicators: explicit aim to benefit the community; the initiative is launched by a group of citizens; the decision-making power is not based on the capital ownership; various parties are affected by the activity; and there is a limit on profit distribution [4].

3. Funding projects support for social economy

In practice there is no official definition of the term social economy recognized by European Union despite the interest given in this area of activity. At the European Union level social economy is represented starting from January 2008 by Social Economy Europe former CEP-CMAF (the European Standing Conference of Cooperatives, Mutual societies, Associations and Foundations). According to Social Economy Charter [5] the social economy accounts for 10% of all European companies and 10% of total employment. They recognize and accept the specificity of each state regarding the legal form of organization in social economy, and they mention “the capacity to grow and to adapt to new social and economic challenges” [5]. This capacity is supported by different projects and form of financing by European Union due to priorities and strategic objectives such as: social cohesion, full employment and the fight against poverty, sustainable development and better governance. The link between social

economy and employment is evident, taking in consideration the high number of workers of this sector. One of the instruments that promote employment mainly by funding initiatives to help people improve their skills and job prospects is European Social Found.

The founded operation are aimed at stimulating job creation and skills development; enhancing community capacity for social support; supporting economic growth; protecting the environment and mobilizing disadvantaged groups. In order to generate high quality jobs and a better quality of life, the European Social Found is supporting the sustainable integration of the disadvantaged and people with disabilities into the work force. In the human resources field in Romania, Sectoral Operational Programme Human Resources Development sets the priority axes and the major intervention areas.

One of the priority axes is number 6.1 Developing Social Economy. In Table number 1 are gathered data about the value and the total number of eligible projects on developing social economy in Romania.

Table 1. Total number and value of Romanian eligible projects on developing social economy. (Euro)

Private organization	4	50.986.241,21
Non-profit organization	36	394.750.921,74
Total	40	445.737.162,95

Source: Sectoral Operational Programme Human Resources Development (<http://www.fseromania.ro>)

Most of the amount 394.750.921,74 Euros was allocated to projects implemented by non-profit organization, only 4 projects where initiated by private organizations.

Concerning the form of organization according to Lepoutre *et al.* in the social entrepreneurship spectrum are included three types of organizations. First type is non-governmental “organizations are not-for-profit organizations that have an explicit social mission, but depend on market based income for less than 5% of their revenues” [6]. Second type is hybrid social enterprises. They are addressing to social needs through a private organization. “Receive at least 5% of their revenues from the sales of services or products, or identify themselves as a regular

business as well” [6]. The third type is socially committed regular enterprises. Because this type of the organization is under the area of social responsibility concept we will not take it in consideration, focusing our research on the first two types of organizations as entities of social economy. Other classification of social economy actors divides the organization in traditional ones including cooperatives, mutual organizations, foundations and associations and recent emerged entities: social enterprises.

Cooperatives are organization created due to the necessity of a self help method of individuals with similar jobs. Association and foundation unite people with similar social aspirations and mutual societies are created by individuals with similar needs. An increasing number of organizations established in social economy is observed during past years, from a total of 54684 in 2008 [7] to a total of 74104 in April 2012 [8]. The number of associations is greater than the number of foundations because the legal frame work is more accessible as opposed to other form of registration. (E.g. minimum level of initial assets). The growing number of organizations from third sector of economy indicates the existence of important social problems, the increased interest in solving this problems and more involvement of civil society. One of the most important obstacles in terms of social economy is legislative regulation. Currently, in Romania, there are six laws defining legal framework of some of the activity carried out by social entrepreneurs. In terms of economic and social criteria that must be achieved by social enterprises there is only one type of organization that meets the standards of social economy: protected units. Concerning labour market and the integration of people from vulnerable groups Law no 44/2006 establishes the protection, promotion and the rights of persons with disabilities. Article number 80, 81, 82 and 83 refers to protected units, the rights they have and state benefits, such as a grant from the state, exemption from income tax if at least 75% of income is reinvested for acquisition of technological equipment or improving protected places of work. The concept of protected units is referring to economic operators regardless of the ownership and organization, with at least 30% of the total number of employed persons

with disabilities employed with individual work contract and others structures of the economic operators or non-governmental organizations, which have their own management and at least 30% of the total number of employees employed are people with disabilities.

4. Insight into social economy in the county of Iasi

During 2007 - 2010 in Iasi were authorized and operated 15 protected units. Two thirds of them have acquired that status in 2008 and 2009 (Table. 3), and three quarters are profit-oriented, being organized as companies (Table. 2).

A significant proportion of protected units were established shortly prior to obtaining approval, which indicates an entrepreneurial premeditation, while the services are the predominant activity.

Table 2. Characteristics of protected units (Work Integration Social Enterprises WISE) operating in Iași county (Romania), from 2007 to 2010.

Number of protected units	15
Organization form	73% companies 20% NGOs 7% self employed
Background at time of authorization	40% up to one year 33% from 2 to 9 years 27% 10 years or more
Field	53% services 33% production 14% commerce

Source: Romanian Ministry of Labour, Family and Social Protection (www.mmuncii.ro)

Economic activity of protected units is not fully generated by employment of workers with disabilities, but this component can be considered dominant and decisive. To explore the size and dynamics of the economic results of this category of operators, we realized a sum of annual turnover, profit and number of employees, based on data from the balance sheets (Table. 3).

This analysis shows a relatively linear trend of economic indicators, which ignores the upward trend in the number of units protected from year to year.

Table 3. Indicators of economic activity for 15 protected units (Work Integration Social Enterprises WISE) operating in Iasi county (Romania), from 2007 to 2010. Turnover and profit are denominated in thousands of euro.

Year/ Indicators	2007	2008	2009	2010
New units	3	5	5	2
Cumulative units	3	8	13	15
Total turnover	5.326	7.434	7.422	7.237
Total income	836	752	677	706
Total employees	130	197	199	185

Source: Romanian Ministry of Finance (www.mfinante.ro), based on declared balance sheets

Legal mechanism designed to increase employment of people with disabilities, including an obligation of employers with at least 50 employees to purchase goods or services from protected units. The measure is addressed to employers who did not employ people with disabilities and shall apply optionally in tandem with the payment of contributions to the state budget. Territorial Labour Inspectorate Iasi carried out a series of controls, between July 2010 and December 2011, during a national campaign focused on checking how employers comply with the obligations established by Law no. 448/2006. Inspections covered a period of activity for employers of up to 3 years prior to the check.

Table 4. Employers options (at least 50 employees), compared to the obligations established by Law no. 448/2006. Multiple options possible during the period checked.

Employers controlled	57
Have at least one disabled employee	28%
Purchased products or services from protected units (Work Integration Social Enterprises WISE)	53%
Contribution paid to the state budget	53%
Not complied with any obligation	23%

Source: Territorial Labour Inspectorate Iași (www.itmiasi.ro)

The results of these inspections show that the opportunity to access the offer of protected units is used symmetric with pay an administrative charge (Table. 4). The final result showed a total or partial non-compliance level of 23%, as time duration or value of purchases / payments.

Compared to the global situation in the county, protected units and their employees is a small drop in a large glass of water. Nor at national level proportion does not change.

Social entrepreneurs engaged in organization line of protected units, oscillates between the idea of profit and opportunity. For the moment, low local amplitude of the phenomenon shows that the information and institutional guide does not provide solid benchmarks to develop protected units.

Coming years will confirm or refute the tangible results of the projects during the period analyzed by this article. Optimal balance between material profit sought by social entrepreneur and social profit, wanted by the institutional state, is the magic formula, to which converge daring initiatives of the moment. Social economic future depends directly on the accuracy and convergence of institutional setting made by the state, forced to accept a win-win relationship with respect to private entrepreneur.

5. Conclusions

Social enterprises operate in uncertain condition of Romanian business environment. It is a difficult situation because they must meet both the social and economic criteria, mentioned in theoretic literature, and the principles promoted by European Union. Protected units were chosen as a specific form of social enterprise organization in Romania. As indicated by Romanian law and the results of our research most of protected units are private companies that generate profit from manufacturing activity or service providing. The attention on this particular form of organization is a starting point in studying the impact of promoting social economy by national and supranational authorities. Financing and implementation of various programs for development of this sector supports the idea of synergy between public and private sector in order to solve social problems than a

separate sector. Through protected unit's activity, social and economy inclusion, good employment practices, cooperation and solidarity are promoted. With three characteristics: social aims, enterprises focus and local ownership, social economy enterprises, are helping to develop an inclusive society and active citizenship.

Improving Managerial Cognitive Skills through Mind Lab Method

Luț Dina Maria

“Dimitrie Cantemir” Christian University,
Faculty of Management in Tourism and Commerce Timișoara
dinalut@yahoo.com,

Abstract

Today, more than ever, managers are called to solve the problems facing the economy at the beginning of the third millennium, and on this basis, to solve many social problems of humanity.

Also, the business world moves today in a very rapid pace and less ordered. This has a direct implication: in any business, managers need to become extremely efficient. In such an environment, very aggressive in terms of competitiveness and totally unpredictable, managers encounter many difficulties when they implement successful strategies or when they adopt methods and techniques to enhance efficacy.

In terms of managerial efficiency, these circumstances compel managers to become as effective as possible. The manager profession requires the systematic training of skills in many developmental areas.

Based on these considerations, the paper presents The Mind Lab Method, as a unique and innovative approach for development and training the cognitive skills of managers through strategy games.

Keywords: *Mind Lab Method, strategy games, managerial skills, cognitive skills, leadership work.*

J.E.L. Classification: M54; J24; O15

1. Introduction

The business world moves today in a very rapid pace and less ordered. This has a direct implication: in any business, managers need to become extremely efficient. Even in Romania, gone the days when businesses grow with the market, without a very clear intervention of management, in terms of business performance and market exploitation. It seems that these days will not

return anytime soon.

In terms of managerial efficiency, the circumstances compel managers to become as effective as possible. A truly efficient and effective management, professional managers exercised, is the main "supplier" of performance in areas managed. Efficiency implies the existence of effects in relation to efforts to obtain it. Effectiveness is to achieve objectives and also to exercise of managerial tasks, in the temporal and qualitative pre-conditions. Effectiveness is focused on achieving performance management.

In such an environment, very aggressive in terms of competitiveness and totally unpredictable, managers encounter many difficulties when they implement successful strategies or when they adopt methods and techniques to enhance efficacy.

The manager profession is a very complex profession, requiring for a person to be effective in many activities. Today, more than ever, managers are called to solve the problems facing the economy at the beginning of the third millennium, and on this basis, to solve many social problems of humanity.

The set of skills that managers need to succeed in their work depends on the management level they are located: *lower levels of management* or *top level management*. Skills or competencies are observable behaviours and routine nature of skills.

The question is: What type of skills does a manager need?

Seeing managerial skills as a mixture of technical, human (interpersonal) and conceptual skills, the American specialist, Robert L. Katz (1974), has developed **the mix of managerial skills** [6].

Technical skills include knowledge of and proficiency in a certain specialized field, such as engineering, computers, financial and managerial accounting, or manufacturing.

These skills are more important *at lower levels of management* since these managers are dealing directly with employees doing the organization's work.

Katz believed that technical skills give lower-level managers the ability, knowledge and proficiency in a particular area, not just to carry out tasks, but also to plan and coordinate the tasks of workers in that area.

Human skills involve the ability to work well with other people both individually and in a group. Because managers deal directly with people, this skill is crucial. Managers with good human skills are able to get the best out of their people. They know how to communicate, motivate, lead and inspire enthusiasm and trust. These skills are equally important *at all levels of management*.

Finally, **conceptual (cognitive) skills** are the skills that managers must have to think and conceptualize about abstract and complex situations. Using these skills managers must be able to see the organization as a whole, understand the relationship among various subunits, and visualize how the organization fits into its broader environment. These skills are most important *at top level management*.

The three basic types of skills are needed by all managers. Each level of management has its own skill mix. Skill, as used by Katz, means an ability related to performance that is not necessarily inborn, but can be developed.

We believe that while talent and natural inclinations play undoubtedly an important role, becoming manager is the result of a professional and personal transformation process.

Based on these considerations we identified in the Mind Lab method an excellent tool to educate and develop the thinking of adults with major professional responsibilities.

2. What the Mind Lab is?

The International program Mind Lab is an educational program that was originally designed for the personal development of children between 4 and 14 years. It supports the systematic training of skills in three developmental areas: cognitive skills, social skills, and skills in the field of emotional intelligence.

The Mind Lab Method is a unique and innovative approach for the development and training of thinking abilities and life skills through *strategy games*.

Mind Lab's unique concept is based upon the notion that strategy games serve as a high-powered educational tool. Strategy games contribute to the improvement of cognitive skills and to creating an awareness of thinking processes. They also help the learner to better cope with emotional and social situations. The game-playing experience is at once enjoyable, captivating, and exciting – thus kindling great motivation and enthusiasm among students and serving as the foundation for a deep learning process.

This educational program was originally developed in Israel in 1994, by Ehud Shachar and Dan Gendelman, both experts in educational sciences. Today, Mind Lab's research team includes experts in science education, strategic games, psychologists, and engineering and computing experts [7].

The Mind Lab educational program is built on a strong theoretical basis in science education and psychology, making continual reference to the theories of renowned scientists and researchers such as Dewey, Gardner, Perkins and Feuerstein and applying them in educational practice.

The philosopher John Dewey already, at the start of the 20th century, recognized the urgent need to transform education into a more democratic practice. [2] In his Constructivist Theory, Dewey claimed that the child must be placed at the center of the learning process, and be allowed to learn from experience and not just from theoretical and academic resources. He viewed games as an excellent educational tool for achieving this goal.

Professor Reuven Feuerstein, pioneered the successful educational method Instrumental Enrichment and the crucial concept of Mediated Learning. [1], [3]. Feuerstein stresses the central role of teaching thinking processes (as opposed to the teaching of content) with the aid of a mediating, enabling environment, a concept that has been espoused and applied by the Mind Lab Group.

Professor Howard Gardner developed the Multiple Intelligences theory. This theory depicts the great variance existing between different individuals' personal talents and

learning styles - and consequently, the flexible teaching approaches that should be applied in order to effectively reach each and every pupil.

Professor David Perkins, in his work, stressed the need for teaching thinking processes and who particularly emphasized processes connected to understanding and transfer – two concepts which are also central in the Mind Lab philosophy and methodology. [5]

Professor Robert Sternberg has examined in his studies the idea of Successful Intelligences – those actual expressions and applications of intelligence in real life situations (as opposed to standardized intelligence tests).

We are identified the potential and usability of this program for managers to develop essential skills in leadership work.

3. How the Mind Lab Method works?

At the heart of the Mind Lab Method is the notion that the most effective way to learn is through an immediate and authentic experience that leaves one wanting more. Game-playing is the perfect example of such an experience – it is entertaining, engaging, and exciting, and therefore stimulates eager involvement. Game-playing also provides fertile ground for the training and application of thinking abilities and life skills.

In other words – the Mind Lab Method both *stimulates* learning and *simulates* real-life.

The goals of the method:

- **Developing awareness** – awareness of thinking processes is essential for personal enhancement in every walk of life. The Mind Lab Method enhances students’ capacity for reflective thinking and enables managers to be more aware of internal and external processes.

- **Imparting Thinking Skills** – in our information-rich age, an ever-increasing emphasis is being placed on the importance of basic thinking skills. The Mind Lab Method provides a broad range of these skills: problem-solving strategies, decision-making models, logical and mathematical thinking, verbal and communication skills, and more.

- **Strengthening Life Skills** – the game-playing experience is an extraordinary

simulator of emotional and social processes. It obliges us to deal with situations involving cooperation and competition, winning and losing, success and failure, and it reinforces our ability to effectively manage and control our emotions, to defer gratification, and to enhance our determination, perseverance and self-discipline.

- **Interdisciplinary Transfer** – the application of content and skills learned in one setting to another is considered by many researchers to be one of the most important learning abilities. The Mind Lab Method establishes an organizing base for many aspects of our lives. Through this method, it is developed the ability to identify links between different fields of human thinking and activity, and this consequently enables the managers to transfer knowledge and apply it to other fields.

Mind Lab’s learning process is simple, yet extremely powerful. The process begins with managers engaging in game-playing, which ultimately empowers them with skills and knowledge relevant to real-life situations. The Mind Lab Method is the bridge that connects the World of Games with the Real World.

The educational process consists of 3 powerful and research-proven stages [7]:

- **Stage 1:** involve the managers in the study group in a thinking game (selected from those included in the program);

In this first stage, the selected managers learn one of the many strategy games present in the program, and then go on to play in small groups. The facilitator provides them with a game kit and explains the game strategies underlying the thinking concepts. There are many examples of cognitive, emotional and social skills strengthened by the Mind Lab Method and very essential for managers: problem solving, decision making, forward planning, logical thinking; managing emotions, patience, perseverance, learning from failures, self discipline; teamwork and cooperation, dealing with competition, communicating efficiently.

- **Stage 2:** using one or more Mind Lab thinking methods to improve cognitive skills, emotional and social skills;

In this second stage, the facilitator and the managers summarize the game-playing session with the help of a thinking model,

such as:

- **The Detective Method** – orients managers toward the right questions, thus helping them to solve problems;

- **The Mirrors Method** – help managers learn from errors and failures and thus improve their continually;

- **The Stoplight Method** – help managers to make better decision.

This models relate to cognitive processes triggered by game-playing (for example, identifying and dealing with a problem, or having to make a difficult decision), or to emotional or social processes (for example, recognizing having made a mistake or the need to cooperate as part of a group).

- **Stage 3:** transfer learned methods to applications in daily management activities.

To consolidate, every day of the course ended with a reflective summary on the activity throughout the day. The facilitator and managers examine the game patterns and then initiate a discussion relating to relevant real-life situations. This helped the managers to reflect on ideas learned by comparing them with their previous thinking. In so doing, the managers succeed in applying the knowledge derived from the game experience to other aspects of their professional lives.

After testing the Mind Lab program for selected managers in the study group, companies can assess the impact of using this program within each company.

To analyze the impact of Mind Lab program use on managerial performance, it can compare two sets of results: the professional results of managers, found after the first performance appraisal process of the post program period and professional results of latest performance appraisal process before participation of the managers at the Mind Lab program. [4]

4. Conclusions

We believe that the Mind Lab Method can be very efficient for Romanian managers training and can help them to develop strategic thinking skills so necessary in daily managerial activities.

The application of content and skills learned in one setting to another is considered by many researchers to be one of the most important learning abilities. The Mind Lab Method establishes an organizing

base for many aspects of life. Through this method, the ability to identify links between different fields of human thinking and activity is developed, and this consequently enables the transfer of knowledge to other fields.

The efficacy of the Mind Lab Method has been put to the test in a number of comparative research projects carried out in conjunction with senior researchers, most notably with Professor Donald Green of Yale University. The research verifies that the Mind Lab Method significantly improves thinking abilities and life skills.

5. Acknowledgements

This paper is the result of research in the frame of the R&D project (nr. 667/06.09.2010) with the theme: "Study on the analysis of effectiveness and impact of the Mind Lab educational program usage, for managerial skills development, in order to promote the program on the management training market." The project is running under contract between “Dimitrie Cantemir” Christian University from Bucharest and a private economic operator from Timisoara – SC BIZEQ SRL.

Information and Knowledge - Catalysts of Organizational Environments Case Study - Team Work Association

Paul Marinescu

*Faculty of Business and Administration
University of Bucharest*
paulmarinescu1@gmail.com

Sorin George Toma

*Faculty of Business and Administration
University of Bucharest*
tomagsorin62@yahoo.com

Abstract

This paper aims to demonstrate the way in which knowledge and information become essential elements of building up a system (Students' Professional Association of the University of Bucharest - Team Work), contributing to strengthening its position and providing solutions for other systems that Team Work enters into partnership with through synergistic effect. Knowledge-based society requires each socio-economic entity to find solutions to adapt them to the situations they find themselves in, which are often outside the regulations. Knowledge offers us the chance to anticipate, thus avoiding crises situations. Therefore, Team Work becomes a system that creates people and contexts.

Keywords: informational system; information system; informational circuit; informational flow; knowledge.

J.E.L. classification: D83

1. Introduction

Nowadays globalized society unveils the importance of information and technology era. Thus, it is required to bring a new approach to the ways we perceive organizational development and build an architecture based on facilitating informational flows. Information has to be processed correctly and coherently.

From this point of view, an organization such as Team Work transposes a new state of mind related to professionalism and is a

catalyst for cohesion.

2. The informational system

The informational system represents all data, information, informational circuits, informational flows and means of dealing with the existent information within a company that aim to provide the necessary informational support to achieve the company's objectives.

The information which is used effectively within the decision-making process must meet the following conditions: to be accurate and trustworthy, to be complete, to arrive in real time, to allow information processing by means of modern facilities and procedures. Information depends on the quality of informational circuit which represents the route covered from the transmitter to the beneficiary.

3. The informational flow

The informational flow represents the amount of information exchanged between transmitter and information beneficiary and it is characterized by: content, volume, frequency, quality, direction, form and support.

4. The information system

The information system represents a unit in which information passes through a digital format - in other words, it transforms, it is processed or expressed in a digital form.

The management of information systems represents the mode in which the information

resources and the strategies related to the use of information technology at different levels are managed: end-user, organisation and global.

People who manage or use the information system should know the conceptual framework in at least five areas, namely: the fundamental concepts of the information system, technology, applications, the development and management of the information systems.

The information systems play a vital role in the success of an organization. Thus, they can provide internal, external or inter-organisational informational infrastructure for the business' needs. They play a significant role in providing management and operational activities within the business. The design of information systems will be carried out by taking into account the particularities of the informational circuits as well.

The length of an informational circuit is determined by several factors and of utmost importance are the following ones: the utility of the transmitted information, the position within the organizational structure of the transmitters and receivers, data processing speed, the performance of the communication channels, etc.

The informational flow represents all the information transmitted during a certain period of time, from the source of information to the receiver through a system of information channels. An informational system comprises several informational flows, as well as many connections that are established between various components of such flows. At the level of the economic unit, the informational flows are grouped based on the economic unit's functions.

The informational procedure represents a sequence of operators having a certain generalization degree and a routine nature whose performance ensures the solving of a given problem by means of specific methods.

The quality level of procedures is determined by the managers' and performers' satisfaction degree in relation with the necessary information, at the same time ensuring the performance of the decision-making process in optimal conditions and providing for each decision-maker the proper conditions for conducting activities in the best way.

5. Elements of knowledge-based management and the knowledge-based society

Knowledge management concerns especially the relationship between people and the results of their work directed to creating, disseminating and assessing the necessary knowledge in order to carry out development strategies.

A significant aspect of knowledge management is related to the process of creating an environment and culture that are favourable to positive practices and exchange of ideas. Knowledge management supports the increase of efficiency and effectiveness of knowledge units with the purpose of social and economic development up to the level where this factor becomes the key element in producing added value. Intelligence and creativeness, innovative ideas and rapid flow of information represent a competitive advantage that should not be neglected.

It is true that every society has always been a “knowledge society” in its own way, because either formally or informally, the progress of civilization was due to competition between technological knowledge, culture endowed with various forms and degrees of knowledge, which have massively contributed to the placement of these societies on a certain stage of social and economic development, but a distinctive feature of societies based on knowledge and information is based on the importance we assign to change management as well.

Knowledge management seems to be a special discipline and therefore organizations try to apply formal techniques and information systems in order to make their resources available and used as efficiently as possible (i. e. insurance systems with resources) and to use expertise techniques (the development of human resources, cooperation and group abilities development systems). Within the organizational environment, knowledge originates from information turned into effective action proficiency by those who own them, through assimilation and integrative comprehension, followed by commissioning in given contexts.

Knowledge management has emerged based on a continuously increasing interest to change the conventional/traditional format of

managing the owned expertise. At the beginning of the decade, numerous organizations have learnt that they are no longer able to keep pace with the level of increase of the complexity of the issues present on their business agenda, the dissemination of knowledge through consecutive “transfers” being essential for the concept of “technological society” in which we currently live in.

6. Team Work organizational context

The case study aims to demonstrate that an organization is the result of processing information in a context where a group of people realise that they can solve problems that emerge at the level of several processes. Thus, information can compete to the design and the strengthening of a system, but it can also facilitate the system in finding solution to problems that arise in the socio-economic environment.

From this perspective, Team Work emerged ten years ago as a necessity and it has constantly adapted to the dynamics of the global society. Dividing the Association on departments provided the occasion for setting up a project team to solve specific problems, but also problems from interdisciplinary border areas.

The biggest advantage of the Association was the fact that it used the potential of diversity: age, religion, sex, education and professional experience.

Team Work has thus become the source and processor of information. Information processing in various projects has created new spaces for analysis and has defined “virtual realities”. In order to receive and transmit information, Team Work has emphasized and used information systems through: partnerships, internships and employment opportunities, opportunities to participate in volunteer activities, training opportunities or various organized events.

Informational flows and procedures have become essential components in the communication process, thus, the aforementioned stages have created contexts in which students were able to develop abilities and skills for the future; at the same time, the benefits mentioned above have represented and still are the action vectors of the Team Work Association that were created

by people through interdepartmental and within departments collaboration.

Team Work Association has defined an information system which represents a set of data, information, informational circuits, informational flows and means of dealing with information existing within departments of the Association, but also in its relations with education, NGOs, business environment, family, state institutions and universities.

This Association has designed an information system in which information goes through a digital format being processed for future use and providing the necessary impulses in making decision on an organisational level. Computer network, website, newsletter represents only some of the components of the information system.

Managing the information resources and implementing the strategies regarding the implication and use of information technology on different levels: end-user, organisation and global represent Team Work’s objectives which are of utmost importance.

From the Association’s perspective the relationship between people and the results of their work meant to create, disseminate and assess the necessary knowledge in order to achieve the implementation of development strategies are related to the building up an environment and culture that are favourable to positive practices and exchange of ideas within projects and internships. The knowledge domain which is so vast provides the chance of systematizing contexts based on the informational disorder that surrounds us. Knowledge supports the growth of efficiency and effectiveness of the Action Centres with the sole purpose of social and economic development, but also to educate youth in order for them to meet the challenges of a market that is becoming more fluid.

Should we carry out an analysis of the Team Work’s organizational environment we would learn that informational flows play a significant role within the business and intra-departmental relations. During these informational flows we are also considering the documents flows that represent means of exchanging information.

All the projects made by Team Work (*Grandma’s Garden, The “Smile”*)

humanitarian campaign, DAAD Research Grant and Scholarship in Germany, The Spring Cleaning, etc.) are examples of the use of informational flows, informational systems, information systems, procedures, knowledge and knowledge management.

In conclusion, through its informational component and flow, Team Work successfully manages to be: creator of information (through contexts provided for people); processor of information (through partnerships and internships provided); user and receiver of information (both through partnerships and internships provided, but also through organizing volunteer activities, trainings and events).

Therefore, Team Work creates performance by using knowledge management systems to manage the business know - how - the, but also the principles of synergistic economy, based on responsibility, innovation, efficiency, effectiveness, efficient use of capital.

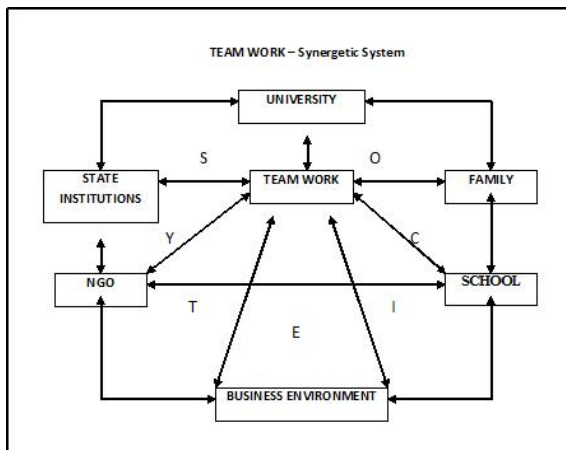

Illustration no. 1 - Team Work – Synergistic

7. Conclusions

We have proved that in an organization, information and knowledge are key elements which contribute to organizational

development. Team Work's activities have managed to successfully implement a system based on creating competences for its stakeholders: both internally and externally. Organizations adapt easier when they have access to information; used properly, it may become knowledge.

Another remark is that the quality of processes in an organization is also dependent on consistent procedures.

In essence, we are talking about three important aspects: to know, to do and to be. The first one is related to information, the second refers to action and the third is about mentality. Knowledge guides us towards the latter.

Organisational Culture – Formation, Adaptability and Integration

Mărăcine Mihaela Simona

“Constantin Brancoveanu” University, Pitești

Department of Management Marketing in Economic Affaires

mihaela.maracine@yahoo.com

Abstract

This paper aims to identify the elements that contribute to forming organisational culture and its universe, explaining the processes of external adaptation and internal integration, in order to enhance the organisation's functionality, its capacity to perform in an external, ever changing and competitive environment.

Keywords: organisational culture, adaptation, integration, external environment, performance

J.E.L. Classification: M1, M14

1. Introduction

Organisational culture is a phenomenon defined and treated in different ways by different researchers. There is not an unequivocal position on how an organisation can form culture.

2. Formation of organisational culture

Culture is formed when the organisation's members accept situations that provide the right conditions for solving certain problems. The solutions are developed from the interaction of employees, arising from their previous experience or they are provided by the formal or informal leaders. If these solutions can successfully solve certain organisational problems, they will be adopted in practice along with the associated values. Over time, the company staff accepts the values as organisational formal rules that they will respect in their activity and that will be assimilated by the new employees. In this case, the foundations of culture shaping are being laid, having a working atmosphere, “the way we do things here” type. [1]

As members of a family, organisations within certain branches or sub-branches – although similar in size, equipment, and technology – are very different. The personality and image of each organisation is created, first, by the people who are part of it. Once in the organisation with their own ideas about themselves, about the others, about welfare and happiness, about bosses and subordinates, they spread their beliefs while assimilating at the same time the habits, rules and restrictions existing within it. From this combination of beliefs, precepts, ideals, behaviours and languages, heroes and anti-heroes the culture of each organisation arises. [2]

An important cultural feature of young organisations, at an early stage of development, is due to the founders or their families. Personal beliefs, assumptions, the entrepreneur's or founder's values are imposed on the employees and, if the organisation is successful, they are shared by all the members of the group, becoming a benchmark for their jobs. The common beliefs, assumptions, values shared by the employees become the main organisational source that creates a sense of identity and the main way to form different skills. [3] The founders have a special role in the culture of a company, usually leaving an important mark of their personality on the firms set up. Even if the future generations sometimes bring important changes in the firm, the founder's role remains relevant. [4]

The organisation's founder, but also other leaders who have appeared during its functioning can have major contributions to the emergence or development of a certain cultural type. Many major cultural values of successful organisations have been shaped by their own founders: Walt Disney at Walt Disney Productions, Thomas J. Watson at IBM, William C. Durant at General Motors, David Packard and Bill Hewlett at

Hewlett&Packard, also known as HP. As David Packard stated: “*It is necessary that people work together to achieve common objectives and to avoid working in different directions, if it is desired to achieve the highest level of efficiency and success.*” (The HP objectives have guided the company in running the business even since 1957, when they were written for the first time by the co-founders Bill Hewlett and Dave Packard).

Chart 1. Formation of organisational culture

Source: created by the author

The American author Edgar Schein (1992) argues that leadership is an essential element in the process of creating, managing, and sometimes destroying and reconstructing the culture. In fact, he says “*the only important thing that leaders do is to create and manage culture*” and that “*their only talent is to understand and work within the culture*” [5]. Leaders must be able to assess how organisational culture evolves, as well as the moment when changes are needed. Assessing and improving organisational culture, as well as determining the need for major cultural changes is critical for achieving the long term organisational success. [6]

The specificity of each organisation is reflected in its beliefs, values and habits of its members. Organisational culture is derived from its past and present, from the people who currently work in the company, from technology and physical resources, as well as from the objectives and purposes of those operating within the company. Organisational culture is sometimes called corporate culture because this concept is used to describe the internal corporate environment. Organisational culture is important because the individuals act based on the values shared by them, their behaviour having a great impact on the activities within the organisation. [7]

Organisational culture is considered to be the invisible “force” behind the readily observable and tangible things within an organisation, the social energy that causes people to act. [8]

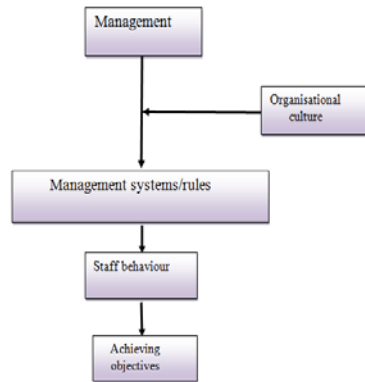

The question arises whether an organisational culture can be created to influence behaviour the way management desires. Managers usually try to establish the core values of the company. Management and culture are interdependent. There is a strong link between organisational culture, management, leadership and future performance of an organisation. As soon as a new company is set up, its culture is formed as well and it reflects its members’ way of thinking and imagination. Senior management, through the authority available to it, is able to take decisions that effectively affect any member of the organisation and to significantly influence the company’s organisational culture. Senior management develops next to a series of work processes also a culture of work, reflecting its image, its belief about what should happen in the organisation in order for it to survive and succeed.

The manager who is aware of the cultural dimension is an example, determining which rules are to be acquired and which are to be rejected. Culture is of interest to the management if and only if it allows increasing the chances of being effective through interventions at several levels:

- increasing the knowledge related to the organisation’s reality: understanding the social climate, analysis of trades, the auditing of the work assessment systems and management control are not the only ones passing through the filter of culture;
- stimulating strategic reflections by improving the diagnosis and its application; in this regard, it allows testing the adequacy of the decisions on the selection of what is likely to succeed;
- expanding the analysis field of the situations for the manager and stimulating the explanation of the organisation’s functioning before changing it; culture reunites the principles of intelligence and rationality in the organisation: this does not mean avoiding the change, but better knowing its effects;
- bringing a stimulating framework for managers in terms of ethics. In this way the manager, as a person, will develop his/her

own analysis of the facts, culture being a collective counter-weight, consisting of all the values that the group had formed and that it must take into account. [9]

Chart 2. The relationship between management and organisational culture

Source: Gavrilă T., Lefter V., Management of organisations, Economic Publishing House, Bucharest, 2004, p. 59

The quality of being a manager aware of the cultural dimension cannot be acquired within the training process unless the personality remains malleable. We identify three roles of managers: of the cultural spokesperson, of the cultural assessor and of the facilitator of the cultural change.

➤ The role of managers as cultural spokespeople is primarily one of recommendation, support and education. The spokespeople help the other members to identify and assess the symbolic “import” and the impact of events, things and actions on culture;

➤ The main role of the cultural evaluator refers to assisting the company in knowing its own culture. This can take many forms. For example, the managers in some organisations could assist their colleagues in determining what is appropriate for the culture and what does not have to encourage the feedback internal mechanisms, which helps to confirm the bad functioning of the organisation. The cultural evaluator is a person employed by the company whose sole responsibility is to “spread” culture within the company and beyond.

➤ Another role of managers is that of cultural facilitator. Cultures change and adapt to the organisation’s objectives and

circumstances and are therefore not truly static. The manager’s role as cultural facilitator also involves the active state of the change of culture and the members’ adaptation to these cultures. Their role is to identify what consequences there will be as a result of the changes taken related to the “cultural centre”, to the set of values, beliefs and assumptions that exist conceptually within organisational culture.

Managers should take into consideration the vital role of culture in affecting cooperation behaviour. Culture produces unity in work activities, in teamwork and loyalty, giving people a sense of who and what they are. [10]

The creation and development process of organisational culture is a psychological process that is associated with the members’ survival needs (survival and safety), creating human relationships and with the development process (self-development and self-realisation). The main factor of organisational culture formation can be considered the staff’s urgent need for: membership to a particular group, sharing certain beliefs, self-development and self-realisation, creating a sense of cohesion and unity leading to the achievement of the organisational objectives. [11]

As stated by Dutch Professor Geert Hofstede, organisational culture is “*the psychological assets of an organisation that can be used to predict what happens with the financial assets over the next five years*”. [12]

3. Organisational culture universe

1. External adaptation

To understand the formation of organisational culture it is necessary to provide answers to two major issues the organisation has to face:

➤ External adaptation and survival related problems;

➤ Internal integration related problems;

An organisation sets its own values and norms as a result of the environmental influences and of the various past and present circumstances. External adaptation and internal integration represent an ongoing and interrelated process. Organisational culture must continually adapt itself to the external

environment, to the market and to the various fluctuations. At the same time, it needs to integrate itself internally, to create common norms and beliefs, which will be shared by everyone in the organisation. These common assumptions and beliefs are the basis of organisational culture, creating cohesion and unity.

At least two additional influences that underlie organisational culture should be mentioned here:

➤ Firstly, in the initial stage of organisation development, the founders can deeply influence organisational culture. In the next stages of organisation development, its culture will reflect a comprehensive set of values, aspirations, and ideas of the founder next to those of the others’ members of the organisation;

➤ Secondly, the national culture, social customers and norms of the environment in which the company operates also influence organisational culture. In other words, the culture of a larger society influences the culture of the organisations within it.

The external adaptation and survival related problems refer to how the organisation finds a niche and faces the ever changing external environment. The dominant values of a national culture can be reflected in the constraints imposed on the organisation by the environment in which it has to function. For example, the form of government can have a dramatic impact on how a company does business in a country. In addition, the organisation’s members were raised in a certain society and they bring with them the prevailing values of that company. For example, individuals learn within the company values such as freedom of speech or respect for individual privacy, and the presence or absence of these values and of others within the company has implications on how the organisation will act. [13] The external adaptation and survival process is seen by the American author Edgar Schein as cyclical, each step can be addressed sequentially, but it is also possible to have a simultaneous approach, if it is required to have a rapid adaptation to the environmental changes.

Table 1. The steps of external adaptation and survival process

Stages	Interpretation
Step 1: Mission and strategy	The organisation’s members should share the same perceptions about the mission, the core objectives and the latent functions of the organisation.
Step 2: Specific objectives	To develop a common perception of the organisation’s members on the company’s objectives derived from its mission. In order to be able to see these objectives similarly and to work towards achieving them, the group should be based on a common language, on the existence of underlying convictions and assumptions.
Step 3: Determining the means necessary to achieve the set objectives	The group will not be able to achieve the goals set until there is consensus on the means and methods used to achieve the set goals. This step involves the adoption of certain decisions on organisational structure, division of labour, reward/sanction systems, communication system and authority system.
Step 4: Assessing the results	Defining a common perception on the criteria needed to assess the degree to which the group achieves the goals. This step also involves determining the information sources and how they are used to become effective in achieving

	the objectives.
Step 5: Establishing the corrective means	Identifying the necessary actions when there are situations in which the group fails to meet its objectives.

Source: adapted from Schein E., 2004, p. 87-91

External adaptation shows how an organisation, seen as a single group, faces changes, risks and uncertainties, exploring new possibilities and engaging in different competitive situations. [14] The external adaptation and survival process strongly influences the group’s internal integration. Within organisations, the external adaptation process and finding solutions for the internal integration related problems are interdependent and interrelated.

2. Internal integration

The internal integration process concerns the need to develop and maintain effective relationships among the group members.

The stages of an internal integration process refer to:

A. Creation of a language and of certain common conceptual categories. In order to function as a single group, individuals have to build a communication system and a common language, enabling them to interpret in the same way the different situations.

B. Defining the group boundaries and the inclusion and exclusion criteria. It is an important part of the internal integration process and it involves establishing a consensus of the group members on the inclusion and exclusion criteria from the group.

C. Distribution of power and of the status. The group members must build their own system of norms and rules governing the way in which power and authority are distributed and maintained and the existence of a consensus is crucial at this point to avoid uncertainty and anxiety related to achieving the set objectives.

D. Development of privacy, friendship and love rules. These rules are designed to create cohesion among group members, to lead to achieving the set objectives.

E. Defining a reward and sanction system. Consensus, at this point, is essential for each member to know the way of rewarding, motivating or sanctioning applied according to the activity they carry out.

F. Explaining the unexplainable. Each group, organisation, society has to face during its existence a series of unexplained events. It is important to find explanations and solutions capable of solving these uncontrollable and even inexplicable problems that will reflect through myths, stories and rituals exposing how the organisation dealt with these situations. They will deeply mark the organisation’s history, its value system, contributing to forming organisational culture.

4. Conclusions

Internal integration contributes to forming the feeling of belonging to a particular group, to developing team spirit and cohesion, to the birth of the belief that only by acting together can the organisation’s members exploit the existing opportunities, minimise the threats and cope successfully with any situation.

The ideas that arise from the stages of the internal integration process, along with the beliefs related to the necessary steps for external adaptation, form a set of dimensions which can be the basis of analysing and describing culture. [15] The cultural factors have a strong impact on management functions and on the actions of employees and managers.

Organisational culture is a factor of success or failure for the organization.

Emotional Marketing as a Strategy of Relational Marketing

Maruntelu Carmen Liliana,
“Ovidius” University of Constanta,
liliana_maruntelu@yahoo.com
Dumitrascu Elena
“Ovidius” University of Constanta,
elena_mam2006@yahoo.com

Abstract

Nowadays, emotional factors are important as classic functional aspects of customer purchasing behaviour. A new concept of marketing has emerged in the marketing domain: emotional marketing. Emotional marketing is the ability to communicate powerfully through the use of different techniques that evoke emotion. There have been psychological studies on the importance of emotions in every stage of decision-making in purchasing processes. Emotions play a key role in any kind of social or business decision. The emotions are manifested in verbal, facial and textual expressions. In the paper emotional factors are outlined. They are very important for business goals.

Keywords: emotions, emotional marketing, emotional factors.

J.E.L. Classification: Z00

1. Introduction

If we take into consideration the definition according to which emotions are a mental physiological state associated with a great variety of feelings, thoughts and internal behaviours (physical) and external (social), we realize that they represent a universal language spoken and understood. Emotions give an instant result as they stimulate decision taking three times quicker than rational thinking does. On a saturated market, wishes are more important than needs. Besides quality and price, modern consumer wishes trust, love, and dreams – intangible factors. The modern principle of satisfying the consumer leads to the rise of the importance of emotions which are to be

considered as distinctive elements that rise the value of products/ services. The consumer doesn't look for a product that should satisfy his rational needs and processes, but after produces and services with symbolic, psychological and cultural meanings, produces that become sources of feelings, relations and emotions that suit the consumer's personality.

2. Emotional Marketing Traits

Traditionally, consumers' buying decisions are taken according to two types of needs: functional – satisfied by the product functions and emotional needs.

At present, the products of diverse companies are approximately equal, being necessary to diversify them through other factors that imply ambiance, context, multisensorial stimulation (music, colours, symbols), forms and images with certain meanings, in one word – the intangible aspects of the product.

Emotional marketing, as part of relational marketing, deals with people's emotion stimulation to determine them to buy a certain product/ service, as emotions influence each stage of decision taking in the process of buying.

In our days, organizations have to build their marketing strategies on emotional basis, following two new directions: “capture the heart, not the mind”, “follow heart quota, not pocket quota” [1].

The use of emotional marketing as marketing strategy ensures profound personal relationships with the clients conquered by emotional aspect but also a competitive position on the market. The stress falls on the product no longer, but on the relationship of the client with the product and the emotions communicated by the product.” The modern

consumer looks for experiences rather than produces and sensations rather than values.” [2]

Emotional marketing answers questions like: “Which are the attitudes, behaviours, preferences and emotions of those who buy?”, “How does consumer’s mind react when being stimulated by advertising and promotions while he is in the supermarket or navigates on a commercial site?” “Can we measure their emotions before, during and after the moment of buying?” [3]

In order to answer this last question, the organizations must get accustomed first of all with all types of manifestation of emotions and their methods/ instruments of measure.

3. Textual Expression of Emotions

Emotions are expressed in more ways: facial, vocal and textual. For each of these ways special measuring techniques have been developed.

As far as it concerns the textual expression of emotions, we will make the following specifications:

-According to the last researches, the text offers an important modality of detecting emotional aspects. Textual information is a medium of communication, rich in emotions and can be obtained from more sources like: books, newspapers, web pages, e-mail messages etc.

- At present, textual channels are used intensely for virtual communication, being real drivers for social emotions.

-For emotional measuring of a text, there are taken into consideration words which express feelings and emotions directly or indirectly.

-Text analysis can be made in two ways: the separate analysis of the words or the analysis of the concept. For this analysis there have been developed new techniques and computerized instruments. (e.g.,EMV Headline Analyzer”)[4]

Textual expressions can and must be used by companies to their advantage, the emotional marketing helping them to write convincing ads.

The words that generate an emotional answer when they are read or heard determine specific positive thoughts or touch sensible domains for the target groups. They are words that generate sympathy for the product they describe and the necessary

safety for the trust in the company that promotes the product.

The introduction of these words in an advertising text generate the emotions necessary for the transformation of a potential client into a real one. The suggestion of time constraint is also important as it may lead to an immediate action of the client.

The words with an emotional impact have been identified and introduced in a data base (eg. For the English language there is a list of about 200 words), being known and used by big advertising agencies to create advertisements and slogans and also for the creation of specific marketing instruments.

4. Emotional Marketing Techniques

Emotional marketing depends on experience. You cannot really use emotional marketing unless someone has already experienced your product or service. You cannot use poster printing pieces and brochures that talk about how your product has saved a life unless your company has already experienced that.[5]

A few marketing techniques work well in emotional marketing:

a. Word of mouth - people trust other people that tell them your product works or if it is the best.

b. Forums - this is basically electronic word of mouth.

c. Trials - if you have concrete results, and the people who participated in the trials are satisfied, you have proof that your product works, which appeals to people's skeptical side.

d. Testimonials - again, people trust other people. If people are willing to take the time to give a testimonial, others will know you have a great product.

e. Emotional Marketing Copy

When you write your brochure copy or flyer copy, use emotional words, such as "pride," "happy" and "confidence." Use feelings you know that your customers want to feel (this should come from your target market research).

f. Emotional Marketing Colors

Everything about your marketing materials, including your choice of colors, affects your customer. Green makes people think of money and greed;

turquoise can make people feel tranquil and peaceful; dark blue is generally connected to feeling depressed. You can search for "colors" and "meaning" on the Internet to find lists that will tell you what colors are associated with what feelings.

g. Emotions Do Not Have to Be Sad

When people think of emotional marketing, they most likely think of sappy, cry-worthy long-distance type of commercials. But, that is not the only emotion you can appeal to. Why not make people smile and even laugh? When people laugh they release endorphins, which are compounds that make them feel good. If people feel good while viewing your marketing materials, they'll in turn feel good about you and your product.

Emotions can be powerful motivators to do, or not do, something.

So it is not surprising that using emotions in marketing can yield equally powerful results.

5. Five Emotional Factors of Marketing

The primary emotional factors in marketing are fear, guilt, pride, greed and love. Here is a look at how each emotion can play into marketing.

Fear

This is a big one in emotional marketing, and can be based on a fear of the bad that can happen if you don't act in a certain way. An example is a hosting company that may try to sell you a dedicated server account over the less expensive shared server account by listing all of the potential problems that can result if your site is hosted on a server with other sites.

Guilt

While marketing can be effective when based on creating feelings of guilt for not doing something, another effective route is showing how to remove guilt. An example is a working parent who has little time to prepare home-cooked meals, but sees an ad that states purchasing ABC Frozen Food that is packed with wholesome and nutritious ingredients is just like cooking yourself.

Pride

Marketing that uses pride as an action-enticing emotion is focused on making the

consumer want to use or purchase something because of the sense of power, accomplishment, envy or respect they feel it will generate. An example is a private, exclusive membership that is costly, but will give the purchaser notoriety and can be used as a powerful marketing element on its own, once purchased.

Greed

We have all seen marketing that focuses on appealing to a greedy emotion, and it's very effective. An example is a "package" price for a group of products, or a list of over-the-top bonuses with your purchase. The claim of a specific product or service helping you make more money and become more successful is another example.

Love

Love in marketing is sometimes underplayed, but a good example is products and services that are presented as the top of the line, the best options for providing the very best for the loved ones in your life or even yourself.

6. Examples of Ways to Use Emotions in Marketing

Here are seven creative ways to use emotional factors in marketing. Use these as a jumping point to think about different ways you can introduce more emotions in your marketing activities.[2]

- Share or create a story about how your product or service saved or can save the day for a client
- Use a current event to stoke fear (i.e. DoS attacks on MasterCard, "If this can happen to the big guys, it can happen to you...")
- Make your service seem essential and the payoff huge so your potential clients have a guilt-free reaction to saying "yes"
- Show some emotion yourself by speaking from the heart and letting your passion and enthusiasm come through in your marketing copy, prospect calls, customer service, etc.
- Go dramatic by making a video that shares a story that is touching, eye-opening or fear-inducing
- Be inspirational and talk to your prospects one-on-one, walking them

through the process of working with you and outlining all they have to gain

- Create a character that mirrors your prospects and use it/him/her as your business mascot, providing a familiar touch point, answering questions, and solidifying your brand.

7. Conclusions

In recent years, many authors have intensified their studies on emotional intelligence and emotional marketing. The emotions, like the functionality of the product/service, influence the decision-making processes of customer purchasing. Nowadays the customer is very fond of the company brand with which he/she lives unique emotional experiences.

After examining emotions that affect customer purchases and the emotional marketing techniques, the paper outlines technical measurements of emotions either from textual or from facial expressions. These measurements are very important for the enterprise to understand the buying motivations of customers.

Abstract

Marketing communication is for competitors from Europe a strategy for highly competitive markets where they operate.

The use of different marketing tactics of the communication involves choosing those communication techniques aimed at positive results consistent with objectives. In this respect, events marketing and sales forces form the communications tactics beneficial for the companies that pursue marketing objectives in the reference markets.

Knowing the advantages and the specific techniques of sales events and forces constitute an advantage given to those competitors who adopt these communication techniques.

Keywords: marketing communications, events marketing, sales forces.

J.E.L. classification: M31

1. Introduction

A highly competitive environment of the European space raises big adjustment problems and finding solutions to maintain or gain a competitive position on the relevant market. So often companies are moving towards adopting and implementing promotional communication techniques to rapidly achieve their objectives. Combining more effectively the communication techniques through a communication

program can positively meet the objectives of the communication requirements, firstly, and the sales goals, secondly. Choosing the events marketing and the use of the sales forces are justified by the attributes and characteristics of the two techniques of communication, mentioned above but also by the positive results that can be obtained after the implementation of specific tactics both to the events and the sales forces.

The difficulty using the two techniques of communication comes from the failure of the managers to take them into account as a real potential for communication and to develop and implement a program based on coherent and consistent communication. Also, the human resources involved, especially for sales forces, require appropriate training to assume the role of communication, on one hand, and the competitive strategy on the other. In other words, the aim to use sales forces and marketing events by companies, should be linked, mainly, to obtain a competitive advantage in the relevant market, but also to gain, retain their customers and develop strong long-term relationships with them. This vision involves responsibility to make decisions on choosing and implementing the most appropriate communication techniques to achieve the proposed goal and an adequate correlation between the activities and tactics that can be achieved through events and through sales forces.

2. Attributes and characteristics of marketing events and sales forces

Events marketing is an effective way of communicating with internal and external target public, in order to achieve communication on corporate image, its reputation or its business objectives.

Due to their attractiveness to the public, managers often resort to this communicational technique based on specific attributes [1]. These events attributes have in view the following:

- involvement, which means both organizers and audience to resonate emotionally with the brand, event or the experience;

- interaction both with the audience and the brand or products advertised;

- immersion, all senses are oriented towards the communication message sent by the company and isolated from other messages of the competitors;

- intensity, when the event is unique and memorable;

- individuality, the event is customized to communicate with each participant;

- innovation in everything that means, content, location, audience, event;

- integrity, the event is based on authenticity and reliability, giving real benefits to consumers.

All these attributes can be considered components of communication strategy viewed and respected when implementing. In terms of target audience, the event must be able to provide major rewards, real benefits, so as to contribute to changing the consumer's buying behavior and consumption behavior in the desired direction.

If we consider the internal public of the company, in particular those employees working in sales department, then we can discuss about the role of sales forces in the marketing of the company. Through its sales forces, the company is trying to promote its products by applying the techniques and specific marketing tactics, such as prospecting, identifying target groups of consumers, their profile description, conducting merchandising activities, providing consulting, contracting and negotiation etc. All these objectives can be achieved only if the management of the company provides its sales forces, the specific tasks through specialized training, the role of communication mix component.

Thus, sales force will be selected and trained for this purpose, to meet the demands of strategic communication and consistent with business objectives. Assuming all the aforementioned objectives, then the sales forces will gain as dominant features, flexibility and selectivity. Selectivity refers to the fact that in their work, they can apply market segmentation techniques, targeting only those groups of consumers who may be treated as potential or prospects. Flexibility supposes a greater adaptability to the requirements of each type of identified consumer and in addition, a rapid adaptation to the conditions of their sales process steps.

Furthermore, the communication sales forces can develop strong relationships, with their long-term customers, contributing to the implementation of relationship marketing in the company's activities.

3. Categories of events and marketing techniques and the sales forces

Specific techniques and organized public events are internal trainings and teambuilding sites, annual conventions, conferences, symposia, webinars, Happy Hours.

Regarding the external public, the marketing events are designed to attract consumers to the products promoted through various interactive spectacular and attractive techniques, offering to solve the identified problems among the target audience in a unique way. Thus there are used techniques such as sponsorship, fairs and exhibitions, product launches, conferences, seminars, symposia, workshops, touring shows, Open Day.

Choosing specific communication techniques involves setting clear objectives and almost perfect correlation of these events with the target customer profiles.

The sales forces carry out the prospecting of the market identify potential customers and describe their profile by a series of predetermined criteria. Customers can be divided into distinct categories: actual customers, customers who once bought the company's products, customers who repeatedly purchase, loyal customers who buy a wide range of the company's products.

Depending on the stage of life cycle in which the client is in relation to the company can be organized the following events can be

organized [2]:

- to the prospectors, fairs and exhibitions are recommended because they can achieve marketing objectives such as informing the public of the advent of the new product or on product characteristics, first attempts to stimulate the trial of the promoted product.

- for customers who have purchased for the first time, traveling shows are particularly effective because they are subordinated to marketing objectives that have to satisfy customers and persuade them to repeat the purchase.

- for customers who repeatedly purchase, organizing meetings of consumer groups is a technique commonly used because it can be thus achieved the goal of satisfying customers and those objectives that have in view the customers to purchase other products from the same range.

- Actual customers represent a distinct and very important because they attract other clients to the company's products by recommending the products promoted. Those customers are loyal, which is the major consumer group that praised the company for being able to develop strategies they preferred.

In their activity, the sale forces use selling strategies based on different models. The classic stages of the sale based on a model relatively easy to handle and to implement any type of products advertised. This model is based on knowledge and proceeding sequentially through stages in which both the seller and the customer will go in order to complete the sale in a positive way for both partners. From this perspective can be identified as distinct phases, phase of exploration, the actual sales stage and closing stage of the sale.

In the exploration phase, when the sales force is aimed at identifying potential customers and their distribution in the different categories as sociodemographic and behavioral characteristics, there can be used events like fairs and exhibitions, traveling shows, techniques that are effective in achieving the sale. A simultaneous approach of these two types of communication techniques, events and sales force, requires a plan of different activities and objectives of common communication. It is considered that the sales forces have as support, in the exploration stage, other tools such as

catalogues, brochures, promotional offers, all of which are presented at trade fairs, exhibitions and traveling shows. These communication tools help to attract potential customers and convince them to try the products promoted for the first time.

The actual sales phase, the sales forces have to resort to selling techniques based on strong arguments, able to convince customers to buy advertised products. Now they have to take advantage of demonstrations on these products, which can be achieved through workshops, seminars. To demonstrate competence, persuasion and communication skills, sales forces need at this stage, appropriate training programs on teambuilding or specific training. Organized in the form of publicly available internal events, such programs are to enhance the level of professional performance of the sales force, but also to accomplish the objectives of marketing, communication and sales adopted by the company.

In the closing stage of the sale, events for clients are useful to be organized in order to prolong the positive effects of the sale, to develop an appropriate follow-up and create databases with major customers of the company.

Meetings of the customers with the sales representatives can be held in a special circumstance designed to create a favorable atmosphere, open communication between partners, vendor and client and can generate sufficient information to determine the client to return to the company's products. Long-term customer loyalty remains a prime approach pursued by competitors through various techniques, actions or sales marketing and communication tactics.

4. Recommendations on the use of event marketing and sales forces by companies

In a fierce competition existing in Europe, to gain markets and customer groups, more and more companies use the advantages of using communication techniques based on consistent communication program that consists of combining the most effective techniques. In events marketing and sales forces, companies that have addressed these practical techniques have proved highly effective if combined properly, planned and implemented. Thus, the first issue to be

considered deals with the clear activities to be carried out by sales representatives and their objectives to be attained. Then we will choose appropriate techniques consistent with the events for the objectives initially set. It should be stressed that considering we have to consider both the specific sales objectives such as attracting new customers, increase sales volume for the advertised product, etc. and communication objectives such as enhancing brand image, increase company awareness.

These objectives can be achieved if the advantages of the events and sales forces are clear. In marketing events, the advantages refer to the relevant benefits (relevant) and participation (involving) the customer must experience strong personal character and implicitly for sale too. These advantages are related to specific attribute of the sales forces: interactivity (personal interaction), relationship cultivation (cultivation) and obtain the answer (response), thus developing a strong relationship with customers [3].

Knowing the competitive context is also an important element in decision making about the nature of the events to be adopted and sales techniques that will be addressed by the sales forces. Capitalizing on existing opportunities in the competitive environment must be an objective pursued by the company's marketing team, as well as a communication plan to avoid threats from other competitors should be considered.

Identifying potential customers and choosing proper events geared to the profile and sales approach appropriate methods are key elements in achieving positive results in marketing communications. Customers should not only be attracted to the company's products, but they have to be helped to have a positive experience vis-à-vis the relationship with the company's sales representatives, in order to develop a long-term relationship based on trust and satisfaction of both parties. Sales forces can significantly contribute to these objectives through training and the role being undertaken at the same time, supported by the sales specific techniques marketing events. The creativity, involvement and adaptability to the particular customer, sales forces will monitor each client, putting into practice the concept of relationship marketing. Through marketing events, the spectacular, dynamic customization and

development will contribute decisively to strengthen the customer's relationships and corporate's image. Thus, competition will determine the orientation of the companies towards a planned simultaneous approach of the two promotional communication techniques, events marketing and sales forces.

Marketing Tourism Services in Romania. The Opportunities and Challenges of the Current Context

Andreea Daniela Moraru
Ovidius University of Constanta
amoraru@univ-ovidius.ro

Abstract

The Romanian tourism activity does not measure up to the tourism potential of the country and the efficient marketing of tourism services is often mentioned as a means to improve and develop tourism. In our opinion the current international context generates both opportunities and challenges for tourism services marketing. This paper aims at identifying and at presenting the key aspects that tourism services marketing faces in Romania, considering the main characteristics shaping the current context.

Keywords: tourism services marketing, tourism competitiveness, quality, human resources, tourism organizations

J.E.L. Classification: M31

1. Introduction

The instability and dynamism of the present tourism market and the changes in consumer behavior bring to attention the tourism services as competitiveness factor and tourism services marketing as a direct consequence.

Marketing tourism services in Romania faces numerous challenges, especially in the current context shaped by the global crisis. In our opinion the marketing of tourism services in Romania should focus on three key issues in order to face the fierce competition in the tourism sector – the quality of tourism services, the aspects concerning human resources, and the difficulties encountered by the organizations producing and delivering tourism services.

The paper aims therefore at briefly presenting the current context and the recent evolutions of international tourism and at presenting the three identified key factors that must be paid particular attention to for an

efficient tourism services marketing in Romania.

2. International Tourism -The Current Context

In the context of a difficult international environment, influenced by the economic crisis, international arrivals reached a peak level of 913 million in 2008, but starting with its second half international tourism entered a period of uncertainty. The situation continued to deteriorate in 2009 when international arrivals dropped by 4%.

But tourism has proved its resilience once again, with international arrivals situating on a growing path in the last quarter of 2009 after 14 months of negative results. And in 2010 tourism recovered spectacularly with international arrivals going up by approximately 7%, to 939 million, according to the data released by UNWTO. Although 2011 was characterized by a rather slow economic recovery, major political changes in the Middle East and North Africa, and the natural disaster in Japan, international tourist arrivals reached 980 million. Moreover, according to the first results disclosed by UNWTO, in 2012 international tourism will continue its growth despite the difficult economic conditions and the forecast at the beginning of the year projects an increase of international arrivals by 3-4%.

In Romania, the number of tourist arrivals in accommodation structures dropped by 14% in 2009, and continued to drop by another 2% in 2010, due to the effects of the economic crisis. In 2011 a growth of 16% was recorded, allowing an optimistic forecast for 2012. However, tourism figures remain at an unsatisfactory level in Romania, where the tourism potential allows for a superior valorization.

3. Key Factors in Approaching Tourism Services Marketing in Romania

Quality represents one of the key elements in the buying decision, and the increasing competition in the tourism services market has determined an augmentation of consumers' exigency. Consumers have become increasingly aware, demand high quality services and the organizations producing and delivering them must acknowledge the importance of quality as a competitiveness factor.

The conceptualization of service quality and especially of tourism services is rather difficult and complex due to their intangibility. In the case of services quality cannot be measured until the consumption actual takes place, and the buying decision is subject to a higher degree of risk than in the case of tangible goods.

Another issue in defining service quality is the tendency consumers have to evaluate not only the quality of services but also the organization that delivers them, the two being impossible to separate. [1]

A peculiarity of the concept of service quality is related to the contribution of each employee, more or less visible, to the positive or negative perception of quality, to the extent up to which the entire personnel forms a “quality chain”. [2]

In tourism, the notion of quality has new valences due to the peculiarities of tourism services, implying its definition based both on the process of service delivery and results quantified by consumer satisfaction. In other words, consumers' assessments are the results of comparison between clients' expectations and real services performance. [3]

Moreover, given that services unlike goods, are felt, rather than consumed satisfaction or dissatisfaction following consumption is determined by the consumers' perception on performance. It is necessary therefore for organizations to identify the elements that are most important to consumers when they evaluate service quality and to act to improve those particular elements.

The quality of tourism services in Romania is one of the most debated subjects when tourism comes up and unfortunately many times in a negative tone.

Although raising the quality of tourism services in Romania is signaled as priority strategic objective since the early 90's, the problems in this area are not by far solved, the strategy for improving tourism services being still in the elaboration stage, according to the Multiannual Program for marketing and tourism promotion of 2012.

The most important accomplishments in the direction of tourism services quality improvement are represented by the implementation of the two programs “Marca Q” in 2004 and “Blue Flag” in 2006.

The human factor has become an extremely important aspect in all activity sectors and especially in tourism which is characterized by increased involvement of human resources in developing and delivering tourism services. Due to the increasing competition in international tourism it has become apparent that the decisive element in creating and delivering high quality tourism services is represented by the human resources. High profile organizations in tourism lay at the top of their priority list the continuous education and specialization of the personnel who becomes more and more a differentiating element.

Regardless of the delivery method the role of human intervention (individually or as a group) is almost universal.

Using efficiently the human factor under the current circumstances dominated by emphasis on quality becomes both an opportunity and strategic element. The role of human resources played in the field of quality has been recognized as one of the most important factors in increasing organization competitiveness. [4]

Tourism was and is still considered an intensive work force consuming activity, but also an important jobs generator. Studies elaborated so far show that as far as the capacity to create new jobs is concerned tourism is superior to other industries.

At the same time an opposite tendency is manifesting, that of substitution of the human factor by technology, part of the tourism industry generating an e-service environment where human intervention is reduced or even eliminated. [4]

Tourism and human capital are intertwined and braided in a complex relationship, each of the two playing the part of both cause and effect. Therefore, the

stimulation of tourism growth is an important means of reviving the labor force and on the other hand the development or the retrenchment of tourism activity is directly tied to human resources availability or lack of it.

As a consequence the analysis of the relationship between tourism and human capital must take into account a series of key issues related to the peculiarities of tourism and its implications on human resources management: the skills and knowledge necessary for tourism employees as well as the lack of needed qualifications, aspects regarding education and professional training of tourism employees, the recruitment policy, remuneration and permanentisation of tourism employees, the information technology and communications impact. Other elements in approaching human resources management in tourism include the cultural, economical and social peculiarities of the reference zone.

The percentage of tourism employees differs from one country to another being subject to a series of factors: the tourism potential of the country, the tourist policy and the level of economic development, the level and dynamics of the labor productivity in the tourist sector, and the tourism development perspectives.

But more important that the number of tourism employees are other aspects such as the characteristics of tourism industry professions, the professional training, the cost of the training, the permanentisation and the attenuation of the seasonal character.[5]

National and international experience has demonstrated that under the circumstances of increasing competition among tourism services providers the commercial success of a tourism product cannot be ensured solely by the attractiveness of its components and price but depends on the professionalism of the human resources involved, on their hospitality, attitude and promptness in reacting to tourists' demands.

World Travel and Tourism Council estimated that in 2011 travel and tourism in Romania directly supported 184 500 jobs, 2.2% of total employment and the figures are expected to rise by 7.5% in 2012. [6]

Nearly 60% of the tourism labor force is represented by women and most of the tourism employees (75.1%) are 15 to 44

years of age, according to the data available in 2008.

In the case of Romania, the dynamics of the tourism personnel is a reflection of the tourism activity at national level. Since only around 2% of the working population is active in the tourism sector, one may assert that the labor force structure in the economy is atypical, but the development of the service sector will determine in our opinion a future increase in the tourism labor force.

Related to the development perspectives of the human resources in tourism the need for further investments in training is obvious.

It is also important to improve the image of the industry as employer at present tourism being appreciated less than other sectors in this regard. The general perception is that tourism industry is exceeded by other industries as far as remuneration level, advancement and career opportunities, work schedule and job security are concerned. [7]

The smallest average gross salary in Romania remains the one in the hotels and restaurants sector.

There are also other considerations that contribute to the reduced attractiveness of tourism as employment provider such as socio-psychological factors related to the servitude assumed by the jobs in the tourism industry. [8]

Due to the complexity of tourism in the framework of tourism services creation and delivery a multitude of participants are involved, and their activities are intertwined. Under these circumstances it is essential that the central coordination of the national tourism activity be seconded by the coordination of tourism organizations acting at local level.

Moreover, in tourism beside public sector organizations there are also numerous private organizations, tourism being positioned at the confluence of the two sectors. The activity of all these organizations has a profound and direct impact on tourism, its development directions and operations, flexible and efficient management practices being called for. Most organizations creating and delivering tourism services have as main objective the maximization of their economic results. To this end the management operations focus on the valorization of organization resources, mainly its human

resources in order to create and deliver the services.

In our opinion, in Romania tourism organizations are confronted with two main difficulties – change and change management and building a reputation as tourism services providers.

Change is a key element for tourism organizations, the permanent research of a vast series of influences being called for – social, cultural, economic, demographic, legal, political, technological, and competition factors. The resilience of an organization and its response to the changing environmental conditions and market uncertainties are fundamental for its survival.

The delivery of services to the consumers may be conceptualized as a system in which separate elements are created, put together and delivered and within this system the delivery is the visible side for tourists, that which determines the level of satisfaction thus contributing to the construction of organization reputation.

The uncertainty characterizing the present global environment adds to the already known arduous conditions for tourism organizations: fierce competition, constant necessity for quality improvement, and preoccupation for adequate price setting.

4. Conclusions

The current international context is molded by the global economic crisis and its obvious effects. Although international tourism has proved its remarkable resilience in the face of the crisis, its presence generated a series of effects that emphasized the already recognized challenges of the tourism market – fierce competition, dynamism, and changes in consumer behavior.

In this framework it is even more difficult for Romanian tourism to prosper, one of the most important issues for its development being tourism services and tourism services marketing. Considering this setting we identified and presented in this paper the consequential aspects of three factors that in our opinion are of vital importance for tourism services marketing in Romania - the quality of tourism services, the issues concerning human resources, and the

difficulties encountered by the organizations producing and delivering tourism services.

Strategic Marketing in Tourism

Silvia Muhcina

Faculty of Economic Science, Ovidius University of Constanta

muhcina@gmail.com

Brailoiu Liviu

Abstract

Tourism is a very dynamic economic sector because is very depended of environmental changes, especially now, when the global economy pass through successive crises. For the competitive organizations, the success means to transform their specific activity in a more market oriented business. The objectives of any organization must be fixed going from a better understanding of the markets. Strategic marketing means to know and analyze the consumers' needs and the market which organization refers and suppose to realize some important activities, such as market segmentation, differentiation and positioning. A very important step in strategic marketing is to identify the sources of comparative and competitive advantage and to design the strategy framework.

Key words: marketing, strategy, segmentation, differentiation, positioning.

J.E.L. Classification: M31

1. Introduction

Considered a very important sector for today economy, the tourism activity is very complex, includes various resources, many participants and involves a diversity of decisions. These decisions are specifying to several factors situated on different levels of responsibility, and must be integrated and harmonized corresponding to all tourism actors: local communities, firms, local and central authorities.

To get the best results for anyone of these actors, it's indicating to realize a strategic marketing approach.

2. Conceptual Element of Strategic Marketing

There are many opinions concerning the

concept of strategic marketing. Among the time, the specialists considered that strategic marketing approach can has different dimensions.

In a management approach, relevant is the strategic planning, market analyze and segmentation, differentiation and positioning, design strategy [1].

For other authors, strategic marketing means marketing studies, segmentation and positioning [2].

As an evolution process of marketing, strategic marketing means a phase of permanent and systematic analysis of market needs, in which are developed those concepts of performing products and services that ensure the qualitative development to customers and target different categories of consumers, in terms of increased welfare for them and for society [3].

Many authors consider that strategic marketing means strategic and operational processes in the marketing planning process [4].

The key instrument of this process is the strategic marketing plan.

3. The Process of Marketing Strategic Planning and the Marketing Plan

The strategic marketing planning process means to create and maintain a good relationship between objectives, goals and resources of an enterprise and its marketing-mix, going from the market situation.

The strategic planning is realize on several organizational and decisional levels, such as: the superior level (named the strategic plan of the enterprise), the level of strategic business unit (named unit strategic plan), and the functional marketing level (named marketing strategic plan or product strategic plan) [5].

For tourism, this work is more complex, because there are many decision factors which are involved: tourism services

suppliers, tour-operators, local or central authorities etc.

Generally, the central authorities (usually tourism ministry, office etc.) conceive a strategic plan (going from tourism organizations' needs and opinion), and every tourism enterprise has its own plan, conform to general plan.

The essential goal of strategic planning is to elaborate the marketing strategy.

Developing marketing strategy to create customers is a very complex process. Based on an understanding of the markets (customers and competitors), organizations establish objectives. The traditional view is that marketing is essentially about responding to buyer needs, and doing so will create competitive advantage. Successful competitive strategy helps to define and redefine the competitive game [6].

The strategic planning is a complex process which includes successively operational phases, values and hypothesis, in which, based on enterprise situation analysis, are identified and established its marketing objectives and strategies, is assessed and controlled the degree of achievement of proposed objectives [7].

The strategic planning means the process of creating and maintaining the strategic balance between the objectives and possibilities of the organization, on the one hand, and the opportunities arising from a dynamic market, on the other hand [8]

The results of strategic planning process are materialized in marketing strategically and operational plans.

Generally, the strategic plan covers a period of 3-5 years, and tactical plan concern a period no more than one year.

The strategic plan in tourism is the tool that allows materializing the strategic planning process. This process involves several steps or phases, such as:

- settling marketing objectives (the mission and the generally objectives);
- analyzing the current situation (marketing audit, SWOT analyze and the important assumptions);
- settling the marketing objectives and strategies (designing marketing strategy , identifying marketing plans and marketing mix);
- allotting the marketing budget;

- settling the marketing program, and marketing control [9].

In the same opinion, there are some important aspects that must be followed: a clear definition and description of activities and resources of the organization, a clear formulation of objectives, a good identification of future opportunities, a good description of marketing environment, a clear description of the means that allow to fulfill the objectives, good recommendation for short and long terms.

4. Segmentation, targeting and positioning

After the analyze of business portfolio (using several methods such as Boston Consulting Group, General Electric-Mc Kinsey, Arthur D. Little Methods etc.), the tourism organization must realize a good description of its market.

Segmentation process means to divide the market of potential customers into homogeneous groups and subgroups. For tourism organizations (hotel chains, tour-operators etc.) is important to identify those subgroups whose needs the firms have the capacity and capability of addressing and designing offerings according to there's needs. The criteria that can be used in segmentation operation are: geographic areas, demographic characteristics, psychographic profile, behavioral [10].

For example, for a hotel chain, the segmentation criteria that can be used are: tourism motivation, age, marital status, family dimension, geographic location, dimension of personal income, education, occupation, frequency of travelling etc.

The segments that are identified require distinct marketing strategies.

With the support of marketing research, marketers can understand consumers and markets create appropriate products and services, get a distinct and solid position on target-market.

Positioning means placing the organization's offer in a multidimensional market model, assuring a distinct place in consumers' psychology [11].

The positioning concept is often difficult to be explained.

Al Ries and Jack Trout think that positioning starts with a product or even a piece of merchandise, a service, a company,

an institution, or even a person, but positioning is not what can be done to a product. Positioning is what it can be done to the mind of the prospect [12].

Positioning is very important for the case when a new brand is introduced to the market and tourists try to connect it to familiar brands or products.

For example, a new hotel in a resort, that has the same classification with many other hotels from a tourism resort.

For realize a good positioning, the marketers can used several methods, such as: maps of perceptions, multiple regression etc. [13].

But positioning is not enough; the marketers must find the points which make the difference between brands, products, services etc.

For example, when tourists must choose between spending a holyday in similar tourism mountain resorts, they can make differences going from level price, services quality, accessibility etc.

In choosing a point of difference, marketers prefer to find benefits that reflect an existing consumers' belief.

For brands positioning, marketers try to find these products' attribute which is important to consumers and distinguish the brand from alternative offers.

For brain-marketing there are seven categories of goals that represent the ingredients for needs cocktail: product category, time of use, place of use, application, attributes, emotional benefit, and experiential benefit. Together, all of these elements activate the brands that compete for choice [14].

Many new products are failing because advertising campaigns do not register anything distinctive in the customer's mind. Creating distinctive brands requires more, an entirely new - and sensory – vision, one that appeals to emotions [15].

Positioning brand it's an operation that refers to the specific and distinctive meaning of the brand in the mind of customers.

After segmentation, targeting and positioning, marketers must analyze the competitive strategies, going from target-market and the elements of marketing-mix.

Abstract

The idea of making a study about sales management was inspired by the existing reality of many companies from Romania. In this context, the increasingly deepening crisis, sales activity and its management becomes an essential role in the activity of a competitive firm. The idea that sales represent a vital problem for many companies must be solved by an adequate approach to the growing globalization relations. Amid the market transformation from "seller market" in "buyer's market", the sales problems started to become more acute. Today, when the buyers' market poles were moved from one continent to another (e.g.: market development in China) sales means more than to close a deal, selling pursue to achieve customer satisfaction and loyalty. Thus, we propose in this article systemic research, combined with some pragmatic guidelines concerning contemporary sales management company.

Keywords: sales management, seller's market, buyer's market, contemporary business

JEL Classification: M51

1. Introduction

The deepening economic crisis caused the contemporary company to develop increasingly commercial function by setting the strategic function with other functions, sales activity occupies its essential place in

the company's business, bringing a decisive contribution to business competitiveness.

Competitiveness of a company is its ability to increase revenues due to increased sales and/or profit margins in competing markets in order to gain better position or defend the held positions (Bradley, 1995, p 299). It is so obvious that sales activity is a factor in business competitiveness, something that requires the responsible attention to this activity. Therefore, the selling can not and should not be left to chance, it is a very important activity within the firm, which depends directly on its success or failure.

Selling through specific techniques and procedures, aims fruition of production results, its final passage as soon as possible, thus contributing to the full technical - productive potential of company that has constantly attempt to offer merchandise to the buyer to the terms and conditions required and not least provide a real gain at least the extent of efforts.

Equally, sales department, by policy and strategies must respond continuously to the requirements of financial effort in support of all company activities, because it is engaged in an ongoing effort to recover the value of goods sold (especially since the sale takes place while the buyer does not pay for the goods when their purchase). From this point of view, Sales Department is an important lever in helping the firm's financial system.

Thus, the paradigm sale - production - customers, is functional if used as a tool for production the mechanism production-market to its advantage, which maintain, develop and diversify relations of production

results in company environment. In such circumstances, the sale, as a whole economical- organizational system, is properly to commercial function of contemporary company. In this sense, each element of the marketing mix has its importance: a product or service with lower quality indicates more than any advertisement, the price is used by buyers as an indicator of quality, the place matters: a thing bought in Madrid has a different value than one bought in Târgoviște.

During his visit to Romania, in 2005, Ph. Kotler was asked "which he believes that is the most important element in marketing's mix". Kotler said that "each of the 4P is important as long as the organization aims to satisfy consumer needs and their loyalty. Kotler added that the market changes, so marketing changes, but customer care should never change. "

We believe that in any business, whether selling products or services which should take priority is customer care, satisfying its maximum! This simple philosophy is essential that ensure competitive success of firms during this time.

Summarizing, we can say that sales management is critical both in material flow and in the information. Initially the role sales target the circuit of material in particular, but with market development and continued growth of competition, selling (via the sales force) becomes a real source of gathering information on market (consumer customers).

Sales management must develop simultaneously relations with market, know and perceive market needs to provide timely information needed for production. It is essential that this information is qualitative and fair in order to cost-effectively meet market requirements. Selling as organization - functional business company, through its systemic components, provides permanent database and information from buyers-consumers market, stating the requirements and conditions for specialization and progress of the company (depending on specific elements or variables conditioning markets geographical areas, types of consumers, restrictions and freedoms in terms of consumption structure and legal regulations, the terms and conditions of implementation of acts and deeds of trade

and service organization for marketing network and after sales service and / or demonstration conditions use and operation of products, goods and / or services performed).

Sales management is part of the overall management of the company as an essential component, a component that has greatly expanded in recent years came to be an area that adapts itself to the specific sales general management principles.

If initial sales management is achieved through the overall management of the company, the current economic reality push things in a direction that sales management is an independently field. This field uses general concepts of the company management that develops at specific sales activity.

Consequently, between company management and sales management differences are not essential but rather are differences of scale.

2. Creating a model for the evolution of sales

To emphasize more strongly the importance of sales management will form a model of evolution of past sales and determine, by extrapolation of the future path of this development. The method, in its simplest form is to determine the moving average (average sales in the previous months for which the forecast), as:

$$M_t = 1/6 (dt + dt-1 + dt-2 + \dots + dt-5),$$

where:

- M_t - forecast for a period;

- d - request for prior periods.

Next we will use, to overcome the non-registration disadvantage of the significant increase in some months, a variant of the moving average formula, where the variables are weighted to the most recent months. This variant of the method is called weighted moving average or exponential attenuation.

$$M_t = a_1 dt + a_2 dt-1 + a_3 dt-2 + \dots + a_6 dt-5, \text{ where:}$$

- $a_1 > a_2 > \dots > a_n$ and

- $a_1 + a_2 + \dots + a_n = 1$

The values suggested here could be 0.2 for a_1 , 0.16 for a_2 and 0.128 for a_3 . This means that 20% of the change is real, and 80% due to other factors.

The conclusion is that progress is essential, both for those who made products or services and for distributors, staff and departments, such as procurement, finance, marketing and research - development.

Following a research field analyzed on a sample of companies from Dâmbovița was a lot of the sales management failures, failures that require real improvement, not merely cosmetic. Starting from the reality extensively researched, the last step of this article was aimed precisely to identify real opportunities to improve Dâmbovița sales management industry.

A simple solution that we recommend refers to diagnosis sales management resources in enterprise in two forms: diagnostic functionality in the enterprise sales management and sales management system diagnostics in the industry from the enterprise is.

The scope of first goal of diagnosis is to identify key issues (priority) and certain solutions (tracks) addressed to sale management functionality in this area, and diagnostic steps will be to: identify key points, retaining key issues, identifying causes of failure and establish consequences. The second aspect of the diagnosis must be made in the context of overall system management diagnosis, since any issue arising therein, directly or indirectly affect sales management. This part of the diagnosis include: diagnosis information system (diagnosis conditions for correct operation of information systems and diagnostic information flows), which is designed to detect problems in the system and determining how to resolve them, resolution which will lead to improve sales management within each company. A second step is diagnosis decision system (power) in sales management, which aims to: assess the power system in terms of compatibility with strategic segmentation, evaluate the suitability of power to critical strategic positions, horizontal power relations assessment, evaluation allocation of decision power in elaboration of development strategies of Sales System and evaluation allocation (delegation) of power in top management sales between the various levels of management.

The third step is to diagnose structural organization, diagnostics comprising:

assessing the existence of a formal organization in an organization, evaluation of all functions necessary for each decision unit, properly defined and written, evaluation of control and decision procedures (if they are clearly identified and recorded in documents), assessment of critical functions and positions (if properly defined). The fourth step that diagnosis management style, may include: assessment of the development of sales strategies, given the type of decisions, relations between the centers of decision, type of methods and tools used for analysis and planning, time horizon; the assessment process strategic sales from how to deal with it, evaluating the type of manager.

A second solution that they consider appropriate to the theme analyzed in this article is the Total Performance Scorecard (TPS). Total Performance Scorecard (TPS) is a holistic process of improvement and change management, improvement, development and learning in this concept are treated as cyclical and ethical processes where the development of personal competence, organization and internal involvement is mutually reinforcing. If we improve TPS sales management, this method can be a viable solution. In this case, Balance Scorecard Organizational changes in Balance Scorecard of Sales System, which includes: mission, vision, critical success factors, objectives, performance indicators, targets and actions to improve the sales system. In this sense, the concept would include continuous improvement and functional process control of System Sales, and developing strategies that focus on achieving competitive advantages of sales activity. Or, Personal Balance Scorecard includes the same elements but on sales staff level, TQM (Total Quality Management) will cover the operation of disciplinary Sales System, with continuous improvement as a central pillar.

Obviously the Total Performance Scorecard of Sales System depends on TPS of the organization, influencing each other. The process starts from the whole organization and development on department level, team and employee, so that improvement and change sale management to occur due to the improvement and change of overall management of companies from Dambovita.

This concept can be more successful than traditional methods of improvement, because real change and organizational improvement is obtained if people change and improve in the interior, this involvement is an integral part of the TPS whose purpose aims at maximum involvement and dedication of all involved, and encourage individual learning, team learning and creativity. The main argument we brought to this theory is that if an employee's personal purposes is consistent with the organization, he will think and work towards the shared goal of the organization.

A third solution at this time of globalization is the sale over the Internet that starts to develop more and more in Romania, on sites trading a series of industry specific products. Also, many companies from Dambovită have web pages on the Internet, making it available to customers 24 hours of 24 and 7 days of 7.

Improving sales human resource is also a real solution to improve sales management companies from Dambovită. To increase competitiveness on foreign markets, industrial producers will have to combine improved sales management with a number of key measures for the future.

3. Conclusions

The research is based on classical methodology: descriptive and analytical methods in studying the topic addressed in this article. The study aims to provide in a personal manner all aspects of sales management within the company, and especially those from Dambovită, and to identify those opportunities to highlight the sales management that produce a real improvement in its and their community. In this sense, was elaborated a personal tool research to serve the purpose.

Sales management was analyzed in relation to the management company, noting that the current economic reality pushed things in a direction that sales management has become a field of its own, using concepts of company management, developed the specific sale. So, between company management and sales management are not essential differences, but differences of scale.

The originality of this approach in this article consists in sales management approach of two angles: strategic and operational, and providing relevant solutions enabling increased sales performance management activities.

Abstract

With the advent of products and services offered online, buyers have the opportunity to purchase goods of lower prices than the traditional environment. Online market has grown exponentially in recent years, but in Romania, had a weight gain. One of the most important reasons in online shopping stagnation in Romania is distrust of online payment methods.

Key words: internet, online buyers, online payments, online frauds.

J.E.L. classification: M21, L81

1. Introduction

Speed Internet technology evolves is impressive. If now there are millions of people who use Internet services at any time, the number is growing exponentially every year.

Number of users of Internet services, including Internet shoppers, increased exponentially from year to year. With increasing number of online buyers, are increased also the problems: payments online frauds, hackers stole customer database online paying, in order to use them fraudulently. But over time and improve online payment options, they were obviously secure.

Over time they developed several online payment options, due to two reasons: ease (convenience) and security of payment transactions. The payment methods currently

used, usually, there are: credit card (Visa, Visa Electron, MasterCard, Maestro, JCB, Dinners Club), Internet Banking (with instant confirmation of payment), Mobile, Wire. Each online payment method, in part, underwent changes and adaptations over time, from when it first emerged so far. Depending on ease of use, credibility provider, transaction security, awareness of how to pay, online shoppers have improved, in turn, preferences for one or other online payment methods.

2. Frauds on internet and ways to prevent them

A new type of attack on personal computers and especially on corporations is how to "catching" of information in computer and information about the user. Phishing is usually used with spoofing, representing the process which send fake emails that appear to be sent from a legitimate company and the recipient is redirected to different sites where the victim is convinced false by different methods, to disclose personal information such as passwords, credit card number, bank account.

Spoofing, generally, refers to counterfeit an email, which seem to have been sent by another person. The two methods, phishing and spoofing, are somewhat similar, as both refer to counterfeit or falsify electronic documents.

The term "phishing" emerged with the development of online interactions, and especially with the development of online payment options. Users of "phishing" site uses e-mail spam in order to direct victims to

websites created by hackers, web sites, at first glance appear to be reliable. The targeted sites are ecommerce. The hackers sent an urgent message from a "fisher" transvestite in a reliable representative of a recognized ecommerce company site, in an attempt to capture the personal information to taxpayers on the Internet, under some pretext.

"Fishermen" have developed methods and techniques of "catching", using malicious code hidden in the photo files or Web applications, applications that install various applications ghost, which are activated as soon as e-mail that is opened, and accessing pages Web that seem harmless at first glance. Because phishing is a method of identity theft, it is expected that such attacks will be oriented to data centers and, especially, to large companies. But ultimately, are targeted users who make online payments. Information obtained from these sources is successfully used to substantiate other attack schemes to that user. For example, sending an e-mail spam a list of clients, which are known to use the same banking service, is more efficient for "fishermen" than to choose people at random.

This method has proved effective in bank frauds, poorly protected systems are vulnerable to a big "robbery". Attackers use ads and spam to install a trojan virus that captures passwords and other bank details. The method is practiced mainly for transferring illicit funds in various bank networks.

Regular Internet users, who are shopping online, are vulnerable to these attacks, because, first, the lack of information. Any payment made on the Internet, any personal data requested by various entities, can lead to fraud. Therefore, both ecommerce sites and buyers are increasingly vulnerable to these attacks, creating a phenomenon increasingly stronger against attacks.

One of the most important ways to combat phishing is to educate users. This method is closely related to the notion that users have utility unknown e-mails received. Internal users are the weakest link in network security chain. However, many have learned that you should not open e-mails coming from unknown addresses or with strange titles, and those with questionable content. In the long run, ecommerce companies, first, must come to an agreement to use a widely

accepted way to authenticate legitimate e-mail. A trusted sender certificate can work with S / MIME, an application supported by most email applications. The most useful is that each e-mail include a sender's digital signature, and the signature is an authentication standard.

According to a report by Symantec (<http://www.videotutorial.ro/?p=957>), 5% of all phishing sites were detected in Romania, which makes our country to rank third in world, after China and the United States. One way to combat lies is in explaining and education users to react to such attacks. Another effective measure is to check the authenticity of electronic message with the person or business or financial institution concerned. There are technical ways to combat phishing by using specialized software, included in new versions of Internet search engines (Microsoft Internet Explorer, Mozilla Firefox). Also, there are legal methods and legal reach, through which information to deter fraud in Romania.

Another type of fraud recorded in Romania are credit card frauds. This type of fraud has increased exponentially, registering numerous cases of people found at ATM in Romania using credit cards fraudulently. As the main operating modes exist:

- The skimming, which involves the installation of POS terminals and that data is copied onto the magnetic strips of credit cards, which are then used to mark the new credit card;

- Phishing, which is the creation of Web pages and sending false messages to different people, in order to obtain data for Internet identity or credit cards.

Once obtained credit card information, user accounts, e-banking accounts, they can easily be used to pay for services or purchase of goods via the internet, making money transfer or use of the identity whose data were stolen.

Also, for these attacks there are recommendations to customers on the Internet:

- Do not access the link sent in e-mail content;

- Check the site name in browser to see the difference from the original site of the institution, to access the original site directly, not by clicking on the fraudulent link;

- To contact the bank or financial institution to verify if such messages has been sent; in the policy bank not practice such procedures for requesting confidential data;

- Do not ever disclose confidential information about the card account (card number, expiration date, PIN).

Even if there are always new ways to defraud Internet shopping, there are at hand, always, also methods to combat such fraud. Control methods are relatively simple, but have always brought to the attention of buyers and potential buyers on the Internet.

3. Internet payment methods

One of the most important and also the surest ways to make payments online is PayPal.

Using PayPal Payment:

- to opening of account, for once, it send their own credit / debit cards data. In this way, the data must be sent whenever a user buy something from the Internet, greatly reducing the likelihood that they are intercepted by a hacker;

- PayPal Buyer Protection Policy exists (buyer protection policy) which allows, within 45 days from buying the product or service, using PayPal to claims that the product / service was not provided on this site under site where it was bought (qualitative or quantitative). For no temptation to abuse this service, PayPal Seller Protection Policy is in operation, through traders are given a similar protection against tampering started from customers.

- if someone wants additional protection, the user can purchase the optional key system safety, which is provided by a device received from PayPal. This function can be used to access accounts and eBay, for example.

- buying online is faster because of ease of payment method.

It is possible to use PayPal even by mobile phone (smart phone)!

Payment via PayPal it can:

- make payments to merchants and service providers like the system;

- send money anywhere in the world, to other users who have a PayPal account;

- can raise money in various activities (charitable event management, including

Personal Information, such as parties or meetings);

- can receive money from customers. The only requirement is that the person from whom money is required must have a PayPal account;

For merchants on the Internet there are many ways to use the system with clients. In Romania, this system is implemented so ecommerce sites, as well as other e-business sites.

In addition to PayPal, there are other online payment products / services, including: credit card, Internet Banking (with instant confirmation of payment), Mobile. One of the most used means of payment in Romania is the bank card. Thus, when performing a purchase on the Internet, the vendor's site offers to buyer a payment section. Buyer completes its data card (debit or credit), complete the payment amount for the product or service purchased and waiting for payment confirmation. In most cases, these operations are performed in conditions of maximum safety.

4. Romanian consumers' preferences about online payments

Although there are very aware of the many options that it offers online shopping, personal experience of Romanian buyers to buy, such that way, is quite limited. Studies show that almost all Internet users from Romania have learned about the opportunity to shop online. However, only 54% of them said they shopped online at least once (<http://www.dailybusiness.ro/stiri-new-media/romanii-precauti-in-ctiea-ce-priveste-cumparaturile-de-pe-internet-69018>).

A comparison with similar studies conducted in 2009 shows that, in those two years, there was an increase of only 4% of online buyers.

In 2011, nearly 44% of Romanians who know about the opportunity to buy products online, consider that this method is risky, compared to 2009, when they accounted for half of Internet users in Romania. Moreover, a significant proportion of those surveyed felt this way to buy the one that consumes less time and over 30% of them said that it is cheaper than the traditional.

While buying Internet users from Romania are concentrated on acquiring the best quality

products at the lowest possible price. Another important factor while shopping, it brings pleasant experience. Female respondents found this aspect more important than economic factors.

Although the Romanian Internet users can not boast an impressive experience in the field of online shopping, they often use the Internet as a source of information for planning some acquisitions.

Experienced online buyers prefer to buy from online stores, rather than the auction sites, sites with classifieds or social shopping sites. Over 65% of them had at least one transaction from an online store, listing the main reason for this choice that purchased products are delivered at home. Electronics and appliances are among the most purchased products in this way. The popularity of auction sites is much smaller than online stores, and although for many Internet users auction sites have low prices, many are aware and disadvantages: possible false information about the product and deficiencies of the chosen product site and not delivered.

The recent expansion sites of social shopping help, in turn, to increase in online trading activities. Many market players will transfer their offline to online activities in the next two years, developing the market further. New products, that will facilitate and secure online payments, will help overcome the main obstacle to market maturity - lack of confidence - and thus will help develop e-commerce in Romania.

MasterCard and financial portal Conso have developed (<http://www.retail-fmcg.ro/retail>), recently, an online survey to find out the perception of readers about innovative methods of payment. Questions were both, payments with contactless card or device, such as a stick or keychain, and mobile payments, a new field for Romania, but quite visible abroad. Participants responded to questions on where they would like to pay quickly, without giving the card in hand, or if they would be interested to use a pay phone for everyday shopping. According to the survey, 64% of respondents are aware of what is contactless payments, and a percentage of 53% say they would use a contactless card that the bank would offer this possibility. High percentage confirms that contactless programs, which have extended acceptance network especially in

2010-2011, improved transaction process, especially in places where they make daily payments lower, and this led an increase in the number of users.

Even during the economic crisis, innovation in the payments remain stimulating factor - products that add novelty, comfort and safety are Romanian favorites, especially if it simplifies life. In the past two years, contactless technology has spread to areas where, traditionally, payments made with cash - as the means of transport or access to the stadiums where transaction speed is very important. Basically, users can make payments quickly, conveniently, lost no time in queue and without giving the card in hand. Supermarkets (67%), gas stations (60%) and public transport networks (55%) are the places where most Romanians would prefer to pay using a contactless card. Follow theaters / cinemas / concerts (54%), and restaurants / cafes (52%), railway ticket (47%) and taxis (45%), where the Romanians would like to make fast payments.

Figure 1. Places where Romanians buyers would pay with credit card

Source: original

Contactless technology is advantageous not only for users, but also for accepting merchants - efficient cash management process, time for collection and transportation of money and waiting time of customers.

In addition to traditional credit card, contactless payments can be made with a card attached for hanging keys as a sticker stuck to your phone or wallet, or cell phone, was introduced a chip inside it. Thus, the payment instrument can be used more easily at hand and decreases the chances of losing. Also, payments made by mobile phone are a

topic of interest. 44% of online Romanians shoppers would be interested to pay using a mobile phone, while 28% would use this method of payment if they find out more information. Studies estimate that the worldwide number of mobile users, who will pay by these instruments, will reach 2.5 billion until 2015 - which means an increase of 40% since 2011.

5. Limitations of frauds made through online payments

Attempts to online payment fraud, in shops working with ePayment platform, were, in 2011, down 15% from 2010. Anti-fraud system ePayment protected the online stores from losses of about 520,000 euro, each month is identified, on average, 400 fraud attempts. To the number of identified fraud attempts to pay online, is adding a decent amount of pay than 15,000 incidents in 2011. Average response time on Hotline taking such an occurrence is 25 seconds, and the volume of transactions that have been recovered for clients amounted to 520,000 Euro in 2011.

The main types of incidents encountered in 2011 were related to:

- Unauthorized online payments (entering wrong data card, insufficient funds, the bank refused the transaction, the card has a limit amount for online transactions, etc.);
- 3D Secure incidents (how or who determined the password? How it works?);
- Details of online payment (check details of the order, the client wants to ensure that payment is completed, etc.).

The most interesting areas to those who tried to fool security vigilance ePayment system, were telecom (41% of attempts were directed towards this area, favorite sites are here to recharge prepaid cards), travel (22%) and other services (13%). The less prone areas to fraud attempts, were IT&C retail, entertainment and utility payments, each accounting between 1 and 4% of all fraud attempts. Cards used in fraud attempts are issued in 38% U.S., 21% in Romania, 10% in Italy, 10% in Great Britain.

Figure 2. Cards used in fraud attempts on internet

Source: original

The remaining cards used in attempts to overcome the ePayment system security, have been issued in France, Australia, Germany, Brazil and Canada. After locating people who have made attempts of fraud, it emerged from Romania (24%), United States (33%), Italy (8%), United Kingdom (7%) and in other countries like France, Brazil, Spain, Germany, Colombia.

6. Conclusions

Following, over time, the evolution behavior of online buyers, it see that one of the main obstacles in its development is method of payment. Whether, it use online payment card, mobile phone or either of e-payment, the Romanian buyers has doubts about online payments. This behavior is greatly influenced by distrust in online payments. This distrust was caused by the large number of frauds that took place online.

Between 2009 and 2011, the number of online buyers increased by only 4% in Romania. This means that, practically, the popularity of online commerce in Romania remained the same. Meanwhile, online commerce has great potential, especially with the decrease in the number of users who have doubts about the safety of online transactions. According to studies performed regularly, there are positive signs about improving online consumer behavior. This behavior, together with confidence for online shopping, getting better every year, is directly proportional to the decrease in crime on the Internet and increasing security of payment options.

The Place and Importance of the SMEs Sector within the National Economy

Nicolae (Gîju) Elena Daniela
University Valahia of Targoviste
nicolaeelenadaniela@yahoo.com

Mitroi Loredana Georgiana
University Valahia of Targoviste
loredana.mitroi@yahoo.com

Abstract

The experience accumulated worldwide and also the recent researches funded by the European Commission highlights the important role that small and medium enterprises occupy within the market economy and within providing alternative employment of human resources. This article aims to show the characteristics of SMEs, which are their criterial bounds, as well as what is their place and importance in the Romanian economy.

Keywords: SMEs, knowledge economy, quantum leap, qualitative leap, innovation.

J.E.L. Clasification: O10

1. Introduction

Although SMEs have been assigned a peripheral role in the 70s, being widespread the idea that large companies are those that provide the economic development, today is widely recognized the reality according to which SMEs have a vital contribution to economic growth of a country. Revealing the economic and social benefits of SMEs have yet changed radically the opinions and perceptions towards them, coming now to consider the SME sector as an area of strategic interest for the economy.

Eleventh century also marked economically the expected time of occurrence of **major** and **irreversible mutations**, with implications in many fields: social, cultural, ideological, religious. Some of these mutations were anticipated for a long time, but became effective only in recent years. Naturally, contemporary economy is the one that takes all these mutations, once

with the causes producing them and turn them into new, useful, interesting, convenient, profitable business opportunities.

The effects of gradual transition from classical to the contemporary economy, where the role and relevance of knowledge are fundamentally different from any other historical moment of human existence and its forms of expression, are still partly unknown. SMEs are a decisive factor in turning the Romanian economy.

They have already won a well-defined position, especially because of the possibilities of adaptation, the large number of jobs provided, the flexibility in technology and management and also the ability to work with industrial giants. Everyone agrees that SMEs are more dynamic and flexible, so can easily withstand to any kind of competitive pressure. A large number of SMEs give together more stability to the Romanian economy than a large international company operating in Romania (Grama, Fotache, 2006).

2. SMEs - limitations, features

Ordinance no. 27 of 26/01/2006 to amend and complete Law no. 346/2004 on stimulating the establishment and development of small and medium enterprises sets new criteria for defining the micro and SMEs in accordance with the European regulations in the field. To fit for SME, the annual net turnover of an enterprise should not exceed 50 million Euros or the value of assets held by it must be less than 43 million Euros. Under previous regulations, the ceiling was 8 million Euros. The normative act takes into national legislation the European Commission Recommendations 2003/361/EC concerning the definition of

micro, small and medium enterprises.

Under the new regulations, small and medium enterprises are classified not only according to the average number of employees, but also in terms of annual net turnover or total assets they hold, in the following categories:

a) micro enterprises - have up to 9 employees and obtain an annual net turnover or have total assets of up to 2 million Euros, equivalent in lei;

b) small enterprises - have between 10 to 49 employees and obtain an annual net turnover or have total assets of up to 10 million Euros, equivalent in lei;

c) medium enterprises - have between 50 to 249 employees and obtain an annual net turnover of up to 50 million Euros, equivalent in lei, or have total assets not exceeding the equivalent in lei of 43 million Euros.

Most features of SMEs in Romania are common with SMEs in economically developed countries. The main characteristics of small and medium private enterprises, found in all economically developed countries are the following (Istocescu, 2008, 123):

- SMEs are created by entrepreneurs, alone or in association;
- SMEs are managed, most times, by an entrepreneur, much less by a manager or a specialist/ management consultant;
- SMEs are highly personalized, as they are created to reflect the personality of the entrepreneur;
- SMEs serve to achieve, first, certain personal or group goals;
- SMEs are founded/created in various areas of economic and/or social life;
- SMEs try to exploit existing business opportunities, usually local;
- SMEs are based on the entrepreneur's intuition, flair, skill, experience, vision, education, intelligence, charisma, professionalism (any combination is possible);
- SMEs often assume the role of contractor or subcontractor for big companies, under whose umbrella they operate, most times;
- SMEs are flexible, adaptable to exogenous conditions of the entrepreneurial environment;
- SMEs have specific legislation and in

many countries or in some difficult situations, they benefit even of the attention of the authorities (in order to obtain advantages, facilities or other support);

- SMEs prefer to hire generalists, able to accept rapid change at the expense of specialists, preferred by large companies;
- SMEs create usually jobs as these companies “grow”, they are developing, expand their business, associate with other companies, enter into other businesses;
- SMEs sometimes stand for stronger competitors even for large companies, especially on short or medium term;
- SMEs generate some new institutions or companies whose activities are partially or totally dependent on their very existence and functioning (credit institutions, financial, legal or management consultancies, government agencies or civil society, employers).

Among features (only) of small and medium private Romanian companies, we mention a few that we consider, in fact, responsible both for their success and failure in the current period (Istocescu, 2008, 125):

- SMEs are created, often without mature consideration, without careful analysis of the business environment, even without a very strong motivation of the entrepreneur himself;
- SMEs are based too heavily on current business opportunities and no future perspective;
- SMEs are burdened by cumbersome legislation, dozens of types of taxes they must pay, usually by state bodies or by various types of “funds”;
- SMEs use employees not having, most times, the necessary training and motivation suited to the task;
- SMEs are empirically driven, not scientifically, at the mercy, at random, often by entrepreneurs confused and without knowledge of management;
- SMEs do not use elements of scientific management unless the exception, especially when management is guaranteed by the developer;
- SMEs do not seek the transfer of managerial knowledge, although it is relatively easy and less “expensive” than

technology transfer.

3. SMEs in the Romanian economy

It is widely acknowledged that SMEs are currently the most generous source of jobs, both in Romania and in Western countries. Turning our attention to SMEs only as a means to absorb labour is to considerably reduce their role in the economy and society. SMEs help to develop a culture of competition based on high flexibility and productivity. Extending the approach angle, SMEs promote changing the individual and organizational behaviour (Romanian Government SMEs Annual Report, 2007, pp. 45-53).

SMEs contribute largely to the achievement of fundamental objectives of any national economy. They play an important role in the economy for the following reasons (Sima, 2009):

- Structure flexibility that give them high capacity to adapt at the changes of the economic environment;
- They can integrate relatively easy into a regional industrial network, which contributes on the one hand to the economic development of the region and secondly to reduce unemployment and improve living standards as they provide jobs;
- Their small size helps to avoid excessive bureaucracy and dehumanization;
- SMEs form at individual level a set more easily to control/manage;
- SMEs foster innovation and flexibility;
- Are practical created in places where staff are improving;
- Stimulate competition;
- Help at the good functioning of large companies providing various services or producing different parts;
- Manufacture products and provides services in terms of efficiency.

For small or medium-sized private organizations should be given extra attention in order that inherent disadvantages in this type of company to not get worse, but to be transformed into potential benefits by the adequate assessment of the most appropriate business opportunities generated by knowledge-based economy.

In fact, there will be a natural separation

so that some opportunities will be preferred to the attention of large organizations; others will be used almost exclusively by small or medium enterprises. Ownership does not matter in this situation, but “understanding” business opportunity that can generate.

For Romania some exceptions have to be made, as the speed and pace of transition to knowledge economy are much lower than in developed countries (EU countries or other geographical or economic regions) and will remain so for many years, even decades. In Romania, both quantum and qualitative leap must be produced for the economy to move in the end (meaning after making necessary efforts), in a committed and determined manner, towards a knowledge-based economy (Istocescu, 2008, 121-122).

By quantum leap we can understand, in the context of preparing the Romanian economy for the opportunities generated by knowledge-based economy, one (possibly more, cumulated) of the following conditions/assumptions:

- creating conditions (legislative, administrative, social, financial) necessary for strong growth, in numeric sense, so quantitative of the entrepreneurship, especially in young people, educated, willing to engage in business;
- increasing the number of small and medium private enterprises established annually, number that is going to reach the average European country with economic and social conditions identical or similar to those in Romania;
- growing concerns for development in the education system of the initiative spirit, curiosity, concern for innovation, research, change;
- achieving a massive, even aggressive management knowledge transfer from economically developed countries, especially from those countries where there is already (strong) positive effects, beneficial, of the opportunities generated by knowledge-based economy.

By quantum leap, in sense of moving from the Romanian economy to enhance the capitalization of knowledge in turn, it should understand the insurance, at least on medium-term (but more secure, on long term), of one/some of the following assumptions/conditions :

- “selecting” (based on excellence criteria),

among the potential entrepreneurs through education, counselling or specific training, those who have the necessary potential to intuit, sense, adapt, apply and exploit rapidly and advanced a business opportunity specific to knowledge-based economy;

- creating, especially, those small and medium private organizations, that by the potential of entrepreneurs, managers, shareholders, employees, business partners, interest holders, can turn into true assessors of business opportunities generated by knowledge-based economy;
- associating small and medium private Romanian companies “followers” of the knowledge-based economy with organizations in other countries, who are already familiar with this guidance.

The increased flexibility of SMEs, the entrepreneur’s permanent contact with the organization, the ability to produce goods and services to meet different needs and demands, the organizational environment favourable to change and innovation, are the elements that explain the increased performance of the SMEs’ sector. Unlike large organizations, SMEs enjoy of a number of advantages such as reduced number of employees, which fosters communication and propagation of changes in the organization, a smaller proportion of tangible goods, simple and economic management, entrepreneurship, adaptability and changing the changing external environment, growth potential, and intense interpersonal relationships and cohesion (Sanchez et. al., 2011).

To perceive more accurately which is going be the position and role of these enterprises in the 21st century, we point out the main factors that determine their economic and human ascent to the forefront of economic development (Nicolescu, Nicolescu, 2008, 403):

- Congruence of SMEs’ features and the knowledge-based economy;
- Increase the preparedness of the population and new economic and social culture;
- Increasing individualization and customization of products and services;
- Technical and technological changes;
- Computerization of the economy and

society;

- Outsourcing organizations’ activities;
- Regionalization and local development;
- Internationalization of economic activities;

Even if Romania is, at this time, disadvantaged compared to other European countries especially in terms of preparation and ability to capitalize business opportunities and create specific knowledge-based economy, the recent accession to the European Union (accompanied by a much longer integration) created an important prerequisite for the amplification process. It is understood, however, largely that the internal efforts are those that can provide, in time, the success of the Romanian economy adaptation to the requirements/demands of the knowledge-based economy.

4. Conclusions

The SMEs’ sector has a definite identity in configuration of the Romanian economy, contributing to structure renewal and to increase its competitiveness. Moreover, the organization and operation of an articulate and dynamic SME sector, conditions in a large manner the health and vigour of the Romanian economy.

Small and medium enterprises are a balance factor at micro and macroeconomic level. Having as correspondent the middle class society, small and medium enterprises counteract monopolies and oligopolies, reducing the ability of large companies to control the market. After rising in the last three decades, it is estimated that, in the period ahead, small and medium enterprises will be the key driver of economic development both in developed countries and those in transition. On the one hand, small and medium enterprises’ features situate such organizations at the forefront of economic development. On the other hand, the coordinates that define the new configuration of the global economy are favourable to the expansion of small and medium sector.

Thus, change is needed both internally, related to rethink the company’s management system, and also support measures from local government and central government and especially support SMEs financing programs. Without this support, efforts made by firms will have a temporary effect.

The Role of Leadership in Knowledge Organizations: Advanced Methods in the Management of Technology and Innovation

Oncioiu Ionica
Tomis University Constanta
nelly_oncioiu@yahoo.com

Abstract

Leaders play a central role in the process of managing organizational knowledge. Leaders provide vision, motivation, systems and structures at all levels of the organization that facilitate the conversion of knowledge into competitive advantages. Examining the role of leadership in converting knowledge into competitive advantages is important to our understanding of leaders and organizations. The aim of this research is to investigate the critical role of leadership in identifying the knowledge organizations and to give an increased understanding of what the main barriers are that stand in the way of examine the basis for rewarding employee performance at result of knowledge leads to innovations. Today, the role of leadership in knowledge organizations is regarded as more vital, less vulnerable and more successful.

Keywords: leadership, knowledge, innovation

J.E.L.: D22,O32

1. Introduction

Managing knowledge requires a conscious effort on the part of leaders at all levels of the organization to manage three key knowledge processes: creating, sharing and exploiting knowledge. Transformational leadership theory and transactional leadership theory provide a foundation for understanding how leaders impact the cultivation of knowledge (Bass, 1985; Conger & Kanungo, 1998; House, 1977; House & Aditya, 1997). Conger (1999) recently argued that researchers should continue developing transformational and charismatic leadership theory and doing exploratory research in this

area.

The new concepts of knowledge organizations are knowledge building, knowledge sharing, knowledge creation, knowledge management. Is this just another fad? New buzz words for the millennium? They could easily become so unless we understand the role of leadership in knowledge organizations in organizational performance and set up the corresponding mechanisms and practices that make knowledge sharing a cultural value.

A new perspective in roles of managerial behaviour proposed. It is built upon an emerging view of the organization as a matrix for knowledge creation. In this context in a modern organization the leadership interact with other people of their organization and create knowledge.

The objective of this paper is to emphasize the importance of the role strategic leader's play in forming a company's social structure, and improving corporate power and profit through technological innovation.

As a result, that more the 60 percent representing the value and importance of training and producing effective leaders, and the processes of management innovation.

The methodology of research was focused on two directions: first, we tried to probe the existing literature regarding how the transfer of knowledge within modern organizations is influenced by leadership; second we analyzed the barriers that stand in the way of implementing advanced methods in the management of technology and innovation by the firms.

2. Literature review

In the international literature there are few studies on how well known to exploring the impact of transformational and transactional leadership on organizational knowledge. This

paper builds on the knowledge-based view of the firm (Boisot, 1998; Grant, 1996; Teece, 1998) as a foundation for understanding why managing knowledge helps firms create sustainable competitive advantages. It then explores the connection between leadership and three keys organizational knowledge processes-creating, sharing and exploiting knowledge-and suggests that firms can use both transformational and transactional leadership styles to effectively manage knowledge. Several propositions connect leadership styles with organizational knowledge processes.

Knowledge resources are an especially valuable category of resources and meet Barney's (1991) criteria for resources capable of providing sustainable competitive advantages: valuable, rare, inimitable and unsubstitutable (Edvinsson and Malone, 1997). Knowledge resources and capabilities include worker know-how, product designs, customer knowledge and efficient processes (Boisot, 1998; Grant, 1996; Teece, 1998; Davenport & Prusak, 1997). Organizations that manage their knowledge more effectively than their competitors will be able to achieve competitive advantages (Boisot, 1998).

Organizational knowledge includes all the tacit and explicit knowledge that individuals possess about products, systems and processes and the explicit knowledge codified in manuals, databases and information systems. Organizational knowledge also includes the tacit knowledge that is shared collectively in the firm in the form of routines, culture and know-how embedded in social processes (Nahapiet & Ghoshal, 1998; Grant, 1996; Nonaka & Takeuchi, 1995). There are several key organizational knowledge dimensions to consider: tacit and explicit (Polanyi, 1966; Nonaka, 1991; Boisot, 1998); individual and social (Spender, 1996; McEvily, et al, 2000); public and private (Matusik & Hill, 1998); and the nature of knowledge at multiple levels of the firm (Crossan, Lane and White, 1999).

Nonaka & Takeuchi (1995) provide four modes of knowledge creation, and Crossan & colleagues (1999) provide four learning processes that operate at each level of the organization and impact strategy. We can examine the role of leadership styles in

managing knowledge creation, sharing and exploiting processes at different levels of the firm (individual, group, and organization).

A review of research demonstrates that leadership has been regarded as one of the most important factors to determine organisational learning and creativity (e.g., Berson, Nemanich, Waldman, Galvin & Keller 2006; Bryant 2003; Shin & Zhou 2003, 2007). Little research attention, however, has been given to further our understanding of the implications of leadership for effective knowledge-creation and its underlying processes (e.g., Jung, Chow & Wu 2003).

Another good example from the review of literature on managers is Gagne (2009), who examines management tasks by employing leadership theories.

On this basis, the existing literature appears to suggest that both open-mindedness norms and LMX relationships are equally important and each plays an important role in the knowledge creation process.

3. Methodology

The survey instrument used in this study was a model in which we propose open-mindedness norms and leader-member exchange (LMX) relationships as mediators linking the relationship between transformational leadership and knowledge creation. There are seven propositions illuminating the theoretical logic of each of the proposed relationships between the variables in the model. The propositions were developed based on the mediation procedures outlined by Baron and Kenny (1986) including the following steps:

1) Independent variable (transformational leadership) needs to relate to outcome (knowledge creation) - P1;

2) Independent variable (transformational leadership) needs to relate to mediators (open-mindedness norms and LMX relationships) - P2 and P3;

3) Both mediators (open-mindedness norms and LMX relationships) need to relate to outcome (knowledge creation) - P4 and P6; and

4) The effect of independent variable (transformational leadership) on outcome (knowledge creation) will reduce when

mediators (open-mindedness norms and LMX relationships) are included as part of the test.

Given that this is a theoretical article, we only focus on discussing how open-mindedness norms and LMX mediate the leadership-knowledge-creation relationship for P5 and P7 instead of testing the mediating effect.

4. Results

This study analyses the transformational leadership behaviours strengthen the open-mindedness norms, which in turn influence followers' perceptions and experiences about the importance of knowledge creation, and behaviours that are likely to lead to knowledge creation in their organization.

The effect of LMX on knowledge creation is premised on the idea that LMX between a leader and follower is an interpersonal exchange relationship that constitutes social capital enacted in a larger social system in organizations. Of particular relevance to LMX effect is the relational dimension of social capital, which refers to assets created and leveraged through interpersonal relationships - the 'bonds' that influence the behavior of both parties within relationships.

For each aspect of the methods associated variables used to construct a scoring variable for the respective aspect. In the same time, the constituents of the scoring variables was undertaken a factor analysis, and the resulting factors would be the input of the management of technology and innovation.

5. Practical implication

We attempt to make three contributions to the literature on leadership and knowledge creation. First, as Peteraf and Barney (2003) and Zollo and Winter (2002) suggest, although research on knowledge creation has been studied extensively over the last decade, the relationship between leadership and knowledge creation has not been explicit and fully established.

Second, our model provides insights into the role of open-mindedness norms and LMX relationships in the underlying process of transformational leadership and knowledge creation. In addition to this, the exact nature

of how dyadic exchange relationships are developed within a knowledge creation process is largely unknown in the literature.

Third, the relative importance of open-mindedness norms and LMX as underlying mechanisms determines what leaders should rely on to optimize individuals' abilities and experience for knowledge creation in teams.

The practical implication is related to the idea of LMX quality as an underlying mechanism of transformational leadership and knowledge creation. It appears to be essential that leaders learn how to develop high-quality LMX relationships with their followers by exhibiting transformational leadership in training programs.

Such programs can be specifically designed to educate managers to better exhibit transformational leadership behaviors and develop effective LMX relationships over time.

Future research should examine whether the relative importance of open-mindedness norms and LMX relationships as underlying mechanisms for knowledge creation are contingent upon the size of teams.

6. Conclusion

This study provides insights into the role of transformational leadership in knowledge-creation processes. We developed a model theorising the differential mediating effects of LMX relationships and open-mindedness norms in the relationship between transformational leadership and knowledge creation. The model suggests that both open-mindedness norms and LMX relationships are important underlying mechanisms illuminating the effectiveness of transformational leadership for knowledge creation. So, those managers need to form open-mindedness norms and develop dyadic interpersonal exchange relationships with followers, as well as engage in all aspects of transformational leadership in order to better leverage their time and resources for knowledge creation. The proposed model will stimulate more research attention to exploring the theoretical and practical implications of transformational leadership for knowledge creation in organisations.

Whatever knowledge is, wherever it resides or however it is managed, few would disagree that knowledge is an essential part

of our individual and organizational ability to innovate, compete and succeed. Given that, few would doubt that the roles and responsibilities of knowledge leaders are an essential ingredient of competition in the next millennium.

In future every national jurisdiction has to answer to questions like: "Do I need knowledge leadership?", "What kind of leadership do I need?"

Proposed Legislative Changes in Romanian Higher Education System

Păcuraru Raluca Olguța

“Spiru Haret” University – Faculty of Accounting and Financial Management Constanța
raluca_pacuraru@yahoo.com

Abstract

“Bologna objectives” mean not only the adoption of necessary legislative changes, but also increase institutional autonomy and accountability, ensuring adequate funding for higher education and a strong culture of quality in all institutions of higher education. The proposed amendments to the Romanian legislation presented in this article aims to describe a general legal framework to ensure the functioning of higher education institutions in order to meet the requirements and objectives for European higher education and to meet the identified global trends in knowledge society.

Keywords: higher education-Romanian legislation, higher education-European legislation, development of the Romanian higher education.

J.E.L. Classification : I23, A22

1. Introduction

The governing bodies of the European Union have long supported the creation of a European Higher Education Area. But this is not meant to impose rigid patterns to the EU members or candidates.

In order to harmonize national specificity and autonomy of universities to the achievement of the European Higher Education Area, subject to rigor and community constraints, there were many rounds of meetings between the stakeholders of European higher education, so that in 1999, it was drafting the Declaration of Bologna. Bologna process meant for all participating countries profound reform of higher education, marked by changes in legislation and reconsideration of the basic principles of the educational process for a knowledge society.

Bologna objectives mean not only the

adoption of necessary legislative changes, but also increase institutional autonomy and accountability, ensuring adequate funding for higher education and a strong culture of quality in all institutions of higher education.

2. Strategic development projects for the Romanian higher education

The strategic development projects involve various national agencies and institutions of higher education, national and international experts who will continue and intensify transformation processes that takes place in the Romanian university space. Below is a list of strategic projects co-financed by European Social Fund through the Sectorial Operational Programme Human Resources Development 2007-2013 which are being implemented in 2011 and their main objectives:

- 1) *Quality and Leadership for Romanian Higher Education.* The overall objective of this project is that by involving all relevant partners to develop a vision for the Romanian higher education, which to base policies and medium and long term actions - contributing essentially to the improvement of the strategic, financial and human resources management and to the educational resources of the universities – to promote innovation, cooperation and partnership between universities, businesses and research centers for knowledge society in Romania. The specific objectives of this project are:
 - Building a vision document with time horizon 2025 and set strategic recommendations for higher education in Romania.
 - Develop the capacities of foresight and leadership of the decision-makers in higher education through specific training of "learning by examples".

- Develop a methodological framework for institutional differentiation of the Romanian universities through the establishment of typologies which ensure diversity in higher education service offerings.
 - Developing a transnational collaborative platform for the knowledge society foresight - FORwiki (www.forwiki.ro).
- 2) *Improving academic management.* The project aims to improve academic management through the design and implementation of an adequate training system of the representatives of universities with different decision-making responsibilities, in order to streamline the management activities of higher education institutions. The specific objectives are:
- Improving the capacity of managerial decision by improving the staff training in the management structures of higher education institutions.
 - Development of the integrated information system and making it operational.
 - Strengthen cooperation intra-university and between universities.
- 3) *The Unic Matriculation Registry.* The project aims to develop and implement a unique integrated national system regarding the participants in the higher education system, that will provide timely, reliable and objective information and findings to the decision makers and other interested individuals or institutions, following the first contact of the student with the institution of higher education until the labor market placement in the first three years after graduation..
- 4) *PhD Studies in Romania - Organization of Doctoral Schools.* The overall objective is the restructuring and strengthening of the national system of PhD studies in order to identify and develop appropriate institutional infrastructure and to support and improve the implementation of Bologna third cycle. The specific objectives are as follows:
- Develop and pilot models of integration of doctoral programs in Bologna cycles in the research, development and innovation and in the European area by defining, developing and piloting a specific model of an advanced, flexible, networked Doctoral School.
 - Supporting the implementation of doctoral studies cycle by improving the structure of the national system of doctoral studies and construction of a adaptable, modern institutional infrastructure, in accordance with the requirements of knowledge society.
 - Development of training capacity and strengthen cooperation within the networked Doctoral School through the construction of an e-learning platform to help support doctoral students and researchers to participate in PhD programs.
 - Strengthening of PhD studies by identifying strategic tools, including assurance of performance, common pillars of a successful partnership structures.
- 5) *PhD in Schools of Excellence - Evaluation of research quality in universities and increasing the visibility through scientific publication.* The project's overall objective is the elaboration, testing and implementation of a methodology to ensure the international evaluation of research quality in universities, support the schools of excellence as well as increase the capacity of scientific publication at institutional and individual level, with impact on the quality of doctoral programs. The specific objectives are as follows:
- Developing, testing and implementing an evaluation methodology at international standards, in areas, of scientific research quality in Romanian universities, taking into account their classification based on performance in research and propose a model to support performance.
 - Developing and testing methodology framework for implementing a program of excellence in universities in Romania.
 - Strengthening the editorial capacity of a group of 30 Romanian publications in order to enter the

mainstream of knowledge through indexing in scientometric database. Is intended to create the REP platform ("Romanian Editorial Platform"), a platform compatible with internationally prestigious platforms SpringerLink, and ScienceDirect.

- Developing the capacity of scientific authoring to publish in scientific journals of mainstream knowledge of more than 1,000 young researchers.

6) *The graduates and labor market - National Monitoring Study*. The purpose of this project is the development of tools to monitor the socio - professional path of higher education graduates for their implementation at national and institutional level. The specific objectives are:

- Identify the competencies of the graduate at the completion of his educational path.
- Establishing the correlation between educational route and skills acquired and socio-biographical profile of the graduate.
- Setting the level of use in professional career of skills acquired during educational path of the graduate.
- Developing, piloting and strengthening the institutional tools at national and university level, to carry out regular monitoring of labor market insertion of the higher education graduates.
- Promote and support methodological approaches at national level, on the studies of entering of the graduates in the labor market.

3. The identified trends in the Romanian higher education system change

According to the existing definition in Education Law, the knowledge society is a society where knowledge is the main resource being created, shared and used to generate prosperity and welfare of its members. Education is seen as a path to sustainable development and, in fact, this process of change and development of education is about looking for innovative solutions to ensure the country's international

competitiveness.

At the higher education institutions these solutions require increased customize training, diversity and institutional responsibility. These goals may not appear only under conditions of new organizational forms or in the context of changing existing organizational structures. Given the organizational arrangements in force in the Education Law at present and trends identified in different studies, in the future would be made legislative changes aimed at:

- Clear policies and strategies developed on medium and long term, that would offer more predictability and anticipatory spirit.
- Institutions capable of evaluation in a flexible higher education system, allowing many types of education.
- Quality assurance systems that meet international standards, but that also take into account the peculiarities of each type of institution of higher education.
- Establish a framework to ensure the diversity of missions to be assumed by universities.
- Partners that are not necessarily in the education system, but are keen to enjoy the fruits of it, partners to participate directly in designing policies, strategies and institutional objectives.
- Development of consortia and partnerships to increase efficiency through joint management of resources, but also to develop expertise in a particular field.
- Strategic management, performance-oriented.

4. Proposed legislative changes

Relaxation of rules relating to the organizational structure of higher education institutions will lead to the emergence of several forms of organization needed to achieve different missions assumed by universities. The following proposed amendments relate to changes in legal status, tax and administration status of higher education institutions:

- *Creation of thematic consortia* - for example to achieve a certain goal on research, or to purchase certain types of

resources and sharing them, or simply for reasons of business efficiency.

- *Outsourcing of various services:* management, marketing, accounting, etc. A management specialized company can lead university activities better in terms of revenue and expenditure management, but also of existing business opportunities. Thus, a specialized team will turn to maximize existing incomes (this component is currently associated with the number of students), but perhaps more importantly, to find new revenue sources (sources that are not allowed in the current law).
- *Giving up rigid organization in faculties and within the faculties in programs of study.* Possibly, for institutions with very large coverage range of fields of study can be arranged flexible, consultative structures, each covering an area sufficiently large
- Given the above proposal, the law may specify *the existence of types of higher education other than the Bologna type.*
- The existence in the structure of universities of *specialized departments*, other than those specified in the current law. These new departments can take over and organize in another form the activities of former chairs, but also other offices, services and existing departments such as: quality assurance department, department of academic evaluation, internal audit, training department, marketing office, technical service, secretarial etc.
- *Freedom of human resources management* as needed, without the constraints of current legislation on the mandatory existence of a number of certain academic degrees, the number of enrolled students or other criteria. Also, recruitment and remuneration of teachers should be differentiated according to criteria established by each university management team individually.
- *Autonomy in the administration of financial resources*, both in the private universities and in the state universities.
- *Encourage attracting and diversification of funding sources*, coupled with financial incentives that

would increase the attractiveness of cooperation between business and academia (donations, service contracts, partnership agreements, training their own employees in the process of lifelong education, etc.).

- *Changing the ARACIS methodology* in terms of flexibility and differentiation depending on the specifics of each university individually.
- Establishing a general framework with principles and rules that allow *new ways of defining internal evaluation* that takes account of the mission undertaken by each university individually.
- *The obligation to provide quantitative data* (about the resources available to students and the results of those who have graduated) and *qualitative* (ie nature of the results of those who attended the courses and their professional course) for each university to ensure transparency in relation to all stakeholders: students, Ministry of Education, Ministry of Labor, business. These data will be integrated into complex databases, allowing searches by different criteria and thus obtain different types of required aggregate information

5. Conclusions

For the future, in accordance with objectives set by the Bologna Process and the Lisbon Agenda, it is desirable to have university structures to be strong suppliers of higher education and research, competitive both nationally and internationally. Thus, Romania's scientific potential can be better exploited and promoted in Europe but also worldwide.

Proposals that have been made in this article aim to describe a general legal framework to ensure the functioning of higher education institutions in order to comply with the requirements for European higher education and to meet the global trends identified in the knowledge society.

Relationship Marketing in Educational Services

Pariza - Manea Natalia

„Spiru Haret” University, The Faculty of Marketing and International Economic Business
nataliamanea@yahoo.com

Abstract

This article aims to analyze the existence of relationship marketing in educational services. This type of marketing focuses on building a lasting relationship with the customer and continuous communication with it. Relationship marketing can focus on the university's relationship with the end consumer (companies that hire graduates) and other client organizations (schools, universities, research centers).

Key words: relationship marketing, educational services, university, student

J.E.L. Classification: M31, I21

1. Introduction

Relationship marketing has been first evidenced in 1983 by L. Berry. Beside him a decisive contribution to the conceptualization of the relationship marketing have had U.S. researchers (A. Parasuraman, Ph. Kotler), and Western European experts, especially those of Nordic school (Gronroos C., E. Gummesson to), UK (A. Payne, M. Baker) and more recently in Germany (T. Henning-Thur, U.Hansen). The strategic orientation that focuses on preserving and improving current customers rather than attracting new ones is called the relational marketing. The relational marketing objectives are to "identify and establish, maintain and develop relationships with customers and other stakeholders in smooth running of the organization, achieving a profit so that the objectives of all parties involved are met" (Gronroos, 2005). Another related view is that the relational marketing is: "... a policy and a set of tools for determining individual and interactive relationships with customers, suppliers and stakeholders for creating and maintaining a positive attitude to them and on sustainable company, the products and

brands that" (Pop. Al, 2000). Pathmarajah (1991) has defined relational marketing as "a process by which the seller and buyer join into a profitable, personal, professional and mutual long term relationship".

In the educational services, especially in the higher education, relationship marketing philosophy changes meaning that consumer retention can be on definite term. The customer is the undergraduate student who will remain in the university to study the master, doctorate and eventual postdoctoral studies. In the field of educational services we can talk more competitive advantages than financial benefits. Competitiveness is achieved by strengthening the university to university status and placed in echelon traditional universities nationally and internationally, by improving the quality of teaching and research. It can be achieved by encouraging students to a more accountable, participatory and constructive criticism, as key partners in university life.

2. The advantages of implementing relationship marketing in the universities

To persuade the universities of relational marketing implementation is necessary to be shown the benefits they bring to the organization (university) and its customers (students, graduate and PhD). Finally, the university has gained, because its advantages to the customer satisfaction increases, which mean it will become loyal to that university.

Advantages for customers

Customers have the power to decide who "buy" educational services, customers will remain loyal to those universities that offer a higher value than its competitors.

The customer is the result of what he gives and what he receives back from the university. The customer is the result of what he gives and what he receives back from the university. This meant customers private

universities or state university students who pay fees in exchange for educational services received. Many students go to universities abroad because they believe that they will get what they're looking for (quality, satisfaction, specific benefits). A part of the former students continue to be teachers or university researchers. In this case, a lasting relationship is when family members are at the same university over a period of time. The relationship with the university can continue when graduates are employed on the labor market in large companies and provides practice at the university where they have studied.

Benefits to universities

This category includes many benefits for the university: the increase of student's number thus increase income growth, recommendations for existing students, keeping teachers and research staff the most deserving students. Also, universities are promoted for free, which is much more effective than any other type of promotion used by the university, also leading to lower costs and attract new customers. Keeping employees is a side benefit. It is easier for the university to keep employees when there's more and more satisfied customers. It forms a spiral of satisfaction, because a happy employee leads a satisfied customer and vice versa.

3. Characteristics and relationship marketing objectives

Characteristics:

- Focus on customer loyalty
- Ensuring good positions in the customer's expense budget
- Permanent dialogue with the client, which is included in the act of purchasing
- Custom Marketing
- The focus is on a brand with high recognition level
- Managing customer oriented resources

Relationship marketing objectives

Relationship marketing objectives are determined and succeeded each other. To be able to achieve the objective, that of building and maintaining a client base of universities

has the following objectives: attraction, satisfaction, retention and improvement (increase) the relationship with consumers.

Fig. 1. Relational marketing objectives

Source: Zeithaml, 2000, p. 140

a) **Attraction** First, universities need to attract those "consumers" with which most likely will build long term relationships. This can be achieved through market segmentation, choosing university and most profitable market segments where it operates. For example: universities to promote their economic profile and try to attract high school students economic students have already formed economic thinking. Technical universities reach out to high schools of mathematics - computer science or technical profile. Other universities have faculty with different areas of specialization, biology, chemistry, law, geography, history, foreign languages can "attract" customers among all schools. With the increasing number of relationships, loyal customers and they will become tools for attracting potential new profitable customers, acting as personal sources of information for them. Here we refer to relatives and friends who have graduated from the university.

b) **Satisfaction** Once attracted by the offer of the university, students can be convinced that its offer is that university and what fits best. In other words, customers are satisfied with the offer and the relationship they have with the university. Satisfaction leads to customer loyalty, which translates into return to university to graduate students remaining here all educational levels. A solid foundation for customer loyalty is to good portfolio of customers, to attract good students, future students from among the

Olympians and those with very good school to create competition that university. This can be achieved by building social ties or loyalty rewards (financial and non-financial recognition and appreciation). In universities this is done through merit scholarships, scholarship or social as well as participation in various scientific events where students are rewarded with prizes consisting of books, diplomas and money. Fundamentals of fidelity based on customer satisfaction. Satisfied customers will most likely become fidei university and also promote its offer in the relatives, acquaintances, family.

There are three areas of loyalty, influenced by customer satisfaction. The first area, called the "failure" which customer satisfaction goes from "very dissatisfied" to "whatever", and on a scale from 1-10, loyalty does not exceed the number 3. Customers in this category changes common service provider, except where this exchange involves a high cost or when no other alternative service provision. The dissatisfied customers can be even dangerous for the company because they take their bad experience to share with other potential customers. Is the case of scandals from universities, with corrupt professors and students who pay bribes to pass the exam.

The second area, the "indifference", includes satisfied or very satisfied customers, with a degree of fidelity between 3 and 7 (on a scale from 1 to 10). Here we talk about students who have not studied for the exam even though they "lucky" to get high marks for "having failed" on the subject. Here we talk about students not necessarily interested in the note but which assimilates during the studies. Although their grades are not the best, they are satisfied that they learned something useful that will help further their careers.

A third area, the "condition" includes very satisfied customers with high fidelity over 8. Customers in this area are not looking for alternatives for switching current. They praised the university's public services, trying to convince others to become its customers. Here we talk about Olympic students, the scholarships, who know exactly what they want for their future career. They dream of small banks to reach the respective university and once there, make the most of knowledge of teachers, libraries and reading rooms to

their goal. They also engage in activities administration in, express their views and public advocates representing their colleagues.

c) Retention. If you are satisfied with the university and its offer, students will be tempted to remain in relationship with it as long as they receive quality services, in other words become loyal customers of the company. So it reduces the likelihood that these customers would be attracted by competition if they feel university that understands the changing needs and is prepared to invest in relationship with them by constantly improving its services. This is for students who complete undergraduate studies and remain at the university to graduate and doctoral courses that remain as to its employees (teachers, IT services, research).

d) Growing. Regarding the objective of increasing customer service, we can say that. loyal customers not only a sound basis for the university, but they can bring growth potential. For example, students who attend a university, their friends, relatives knowledge to study there if satisfied with its services.

4. The customer and time evolution stages of customer-company relationship

As products or services, and client relationship goes through several stages, moving from stage to stage to become a relationship becoming stronger and lasting. This indicator is calculated based on the concept that customer's contribution to company revenue and profit over their relationship.

Can be identified 5 stages of customer life cycle: contact, attraction, conversion, retention and loyalty.

Ideally, a prospect (lead) going through all these stages, the company trying to, through its offer to meet his needs and so the client to repeat steps when it launched a new offer to the company. In our case this cycle is carried out since she is promoting university in schools. Prospective customers are attracted by the university offer, although that is a private university offers scholarships and fellowships abroad, offers attractive base material and tuition fees are acceptable. Others prefer public universities because they offer more security. In reality, there are

"leaks" at all stages of this cycle, some consumers prefer to "buy" from competition. It is important that these "leaks" to be as rare as possible, the university retaining most of the customers, who are loyal to the company and its offer.

Contacting potential clients is by sending messages, often advertising, through which the university presents its current offer. It is assumed that there has been contact with potential client when he noticed the message, be it broadcast on television, radio, online or in print, the university managed to attract attention with the offer made. Also, young teachers not only promote their university profile visits to high schools which have educational offer.

Attracting customers requires adding it to the company's sphere of influence. Many service professionals say that this happens only when a series obtained customer identification information such as name, address, telephone number. If universities We believe that attracting a customer when it register at our university and you pay a subscription fee.

Conversion of a person paying customers is by highlighting the potential customer if eligible purchases. Here is an integrated part students have already paid the first installment of tuition and those who are different courses in the departments university (eg Training Department Teacher or Department of Foreign Languages).

Following acquisition of customer service get a greater or less satisfaction. If the customer was satisfied, it tends to tell friends, acquaintances, family is satisfied with the service that brings new customers or more courses of the university is concerned.

The next step is customer loyalty programs designed for this purpose. University student becomes a loyal and wants to share the positive experience of other consumers of educational services, highlighting the advantages to becoming a client focus and to develop a long-term relationship with it.

5. Conclusions

Educational services "need" marketing relational. What is worthy to remember is that an organization, a university should be concerned to build and maintain a

relationship with the client. It should always investigate demand, preferences and competition for its students in order to adapt always to dynamic market environment. A loyal customer may be lost if the company does not offering him the expected services.

An Estimation of the Influence of Relational Factors on Loyalty

Petrușcă Claudia Ioana
“A.I.Cuza” University, FEAA, Iași
petrusca_claudia@yahoo.com

Abstract

The main objective of relationship marketing is to establish and maintain long-term relationships that translate into customer loyalty. Following the above introduction of describing the significance of customer loyalty, this article discusses the conceptualisation of relational determinants of loyalty within the three common approaches used in the loyalty literature, for business to business market. This represents the theoretical framework that is the basis for formulating the research hypotheses that emphasize the connections between relational determinants of loyalty. This discussion is then followed by an empirical test of a model of business loyalty on a sample of 60 clients of accounting firms.

Key words: loyalty, business to business, service quality, Relationship marketing, Trust
J.E.L.Classification:M31

1. Introduction

Relationship marketing has developed as an area of marketing that analyses the building of long-term relationships with customers and other parties. The process of establishing a relationship with a customer, involves first the attraction of the customer and then the building of the relationship with that client so that the economic goals of that relationship are achieved[1].The main objective of relationship marketing is to attain high levels of customer satisfaction through collaboration of the parties involved[2].

The relationship-marketing literature focuses on the agreement that the quality of the relationship between the client and the firm is an important determinant of the permanence of this connection and the

consequent success of relationship-marketing practices[3]. Initially, the concept of relationship marketing emerged within the fields of service marketing and industrial marketing. Nowadays, relationship marketing is considered as a strategy in which it aims at enhancing long time relationships and profitability[4]. A profitable sales revenue for an accounting service provider can be achieved by having superior market performance outcomes such as a good position on the market. This indicator of market performance outcomes is directly related to service loyalty[5].

Oliver defines loyalty as “a deeply held commitment to re-buy or re-patronize a preferred product/service consistency in the future, thereby causing repetitive same-brand or same brand-set purchasing, despite situational influences and marketing efforts having the potential to cause switching behaviour”[6]. Under these conditions, the concern for maintain the existing customer base and retaining customer loyalty appears to be an important competitive advantage. Customer loyalty can be considered a key component for a brand’s long-term viability. Further, the meanings associated with “customer’s loyalty to a service provider” and “brand loyalty” are used synonymously in this study because the product is the primary brand for packaged goods, while the company itself serves as the brand for services[7].

Achieving and maintaining loyal customers particularly significant in a business-to-business market. Nevertheless, there are opposing viewpoints in that loyal customers are not always seen as profitable despite arguments that loyalty makes customers less price sensitive.

In loyalty literature there are several models that centre on constructs closely related to brand loyalty that explain why customers stay with their product or service providers. Some of these include

commitment, switching costs, relationship quality, relationship commitment, and satisfaction of the relationship. The major underlying consideration throughout most of these constructs and research streams is the development of a relationship between a firm and its clients that leads to continued exchanges. Thus it could be argued that loyalty research now occurs under disguises such as relationship marketing, loyalty, relationship commitment [8].

The determinants of service loyalty and their effects on loyalty in a business-to-business context are at the centre of this research. The conceptual model of loyalty as well as the specific hypotheses tested in this research are discussed in detail in the following sections.

2. Service quality

Service quality is an important determinant of loyalty and it is a relational latent variable that is widely used in the construction of loyalty models. The study conceptualises the construct of relationship quality by providing a theoretical framework that constitutes the heart of the present research model. The main purpose is to bring together various relational variables that have been widely used in the relationship-marketing literature under the one umbrella of relationship quality. These various elements can also be conceptualised individually, and they represent wide-ranging tools of relationship measurement. This study is a pre-test of the interdependence of these variables and, at a higher level, their importance is emphasized in building business loyalty.

The relationship marketing theory considers that relationships are not just about the goods and services that customers buy from a supplier. In consequence, the various aspects of service quality are not the only elements that influence business loyalty.

Nonetheless, service quality is often considered in the literature as an antecedent of customer/service satisfaction[3].

Delivering quality service is considered to be an essential strategy for success in today's competitive environment[9]. In the present study, the service quality construct is presented on five dimensions: “commercial service”,

“communication”, “administrative service”, “delivery service” and “service provided”, proposed by Parasuraman et al. (1985). This approach identifies many of the dimensions proposed by Parasuraman et al. (1985) in Gronroos' (1984) two-dimensional proposal: the technical and functional dimensions. It is apparent that evaluations of service quality are complex processes that operate at various levels of abstraction[3].

Some authors have also argued that service quality is an industry-specific concept[4]. Taking these views into account, we can consider that these dimensions are adequate for the case of accounting services.

The following hypotheses are therefore proposed:

H1. The service quality is a multidimensional construct;

H2: Service quality has a positive effect on business loyalty.

3. Relationship commitment

Commitment is positively related to loyalty and repeated purchase and, because relationship performance is critical to repurchase decisions in a relational exchange, business loyalty is similar to relationship commitment [10].

The concept of commitment is included in the definition of loyalty. This is described as “a deeply held commitment to re-buy or repurchase a preferred service consistently in the future, thereby causing repetitive same-brand or same-set purchasing, despite situational influences and marketing efforts having the potential to cause switching behaviour”[6]. Oliver describes the consumer who “ferently desires to re-buy a product or service and will have no other”, as a consumer who will pursue this quest “against all odds at all costs”. These latter conditions define the concept of “ultimate loyalty”.

The following hypothesis is therefore proposed:

H3: Relationship commitment has a positive effect on business loyalty.

4. Relationship trust

The concept of trust plays an important role in relationship marketing, and in particular in the context of business to

business markets. In consequence the construct of trust has received great attention in the research literature. Trust plays an important part in maintaining profitable relationships[2], thus understanding the nature of trust and the importance of its contribution to loyalty is of particular interest to managers and has a major impact on how business to business relationships are developed and managed.

Relationship commitment involves achieving a considerable degree of trust in the service provider. The relationship between the two constructs was empirically tested and demonstrated by many authors beginning with Morgan and Hunt (1994).

Trust has been recognized as an important factor in relationship commitment and hence in customer loyalty[4]. The argument is that, if one party trusts another, it is likely to develop some form of positive behavioural intention towards the other. In consequence, when clients trust their service firms, they are also likely to have positive buying intentions towards them.

The following hypotheses are therefore proposed:

H4: Relationship trust has a positive effect on business loyalty;

H5: Relationship commitment has a positive effect on relationship trust.

5. Switching costs

Switching cost is formally defined as the cost involved in changing from one service provider to another[11]. According to Jackson, it represents the sum of economic, psychological and physical costs. These perceived penalties for disloyalty deter customers from switching to another firm[12].

Switching costs include not only those that can be measured in monetary terms but also the psychological effect of becoming a customer of a new firm, and the time and effort involved in buying new brand[11].

Economical or financial switching cost can be thought of as a “sunk cost”, which appears when client changes the collaboration firm[11].

Switching cost confers some advantages for firms, and they have a direct effect on client loyalty level. It can decrease clients’ sensitivity to price and satisfaction

level, and they perceive the functionality of an activity in changing costs.

These arguments state that switching cost is the factor that most directly influences clients’ sensitivity to price level and therefore influences customer loyalty.

The following hypothesis is therefore proposed:

H6: Switching costs have a positive effect on business loyalty.

6. Methodology

In order to obtain valid results from a scientific study and to test the proposed hypothesis, it is very important to choose the adequate method. The model tested in this article is an theoretical one, and it was tested in other fields of activity. The chosen model of loyalty was developed by Caceres & Papanoidamis (2005) and it was empirically tested on advertising agencies. In order to adopt this model to the case of accounting firms we added the construct of switching costs because it is a factor that influences loyalty presented in the literature of financial services.

The research instrument was a questionnaire containing 35 items. The measuring scale was a ten-point Likert-type scale that ranged from “1” (“completely disagree”) to “10” (“completely agree”). Items evaluated the following constructs: *commercial service, communication, administrative service, delivery service, trust, commitment, switching costs* and *loyalty*.

The methodology presented in this article represents a pre-test of the research instrument which will be used for testing the loyalty model in the case of accounting firms. The first step consists in choosing an adequate scale for each construct that forms the model.

To measure the constructs, procedures were derived from the research literature, and multi-item scales were employed. Caceres & Papanoidamis (2005) developed a customer loyalty scale based on a two-dimensional model of loyalty : service quality and recommendations. Trust commitment and satisfaction form the construct of relationship quality.

The construct of loyalty is measured by using a five item scale focused on the likelihood of continuing doing business with

the supplier and recommending the supplier to a partner. This scale is also used in business to business domain of activity by Lam, Shankar, Erramilli, & Murthy(2004).

The functional dimensions of *service quality* construct were measured with scales fervently used in the service literature and the technical aspects were operationalized during the interviews of the accounting experts.

The construct of *commitment* was measured with a scale used by Caceres & Paparoidamis (2005) for business to business domain. This scale was adapted after the one build by Morgan and Hunt in 1994.

The construct of *Trust* was measured using a scale adapted from Morgan and Hunt (1994).

For the construct of *satisfaction*, a single item is used and it is focused on the global perception of the relationship. The method based on the use of a single item for measuring the concept represents a limitation if we compare it with the multi-item scale. The results of the studies of Yi & La (2004), who compared the reliability of various scales of satisfaction with one or more items, showed that those using one item are acceptable.

The construct of *switching costs* was measured using a scale adapted for the specific of financial services from Bell, Auh, & Smalley (2005).

For the latent variable of *communication* it was chosen a scale tested by Dwaine, Coelho and Vilares (2006), on the business to business sector of activity. This scale was adapted after the one used by Morgan & Hunt (1994).

The sample consisted of 60 companies which are clients of accounting firms. Because the relationship between relational factors and loyalty was demonstrated in other research studies as well, it is appropriate to test the theoretical model proposed in this article with confirmatory factor analysis.

This method is used to verify if each indicator can comprehend the dimensions of latent variables. In this manner the validity of the scale is verified.

Confirmatory factor analysis was conducted using the statistic software called AMOS 18. This demonstrates that the hypothesised model fitted the data reasonably well (see Table 1), and that the overall fit of

the model is adequate.

For testing the goodness of fit of the model GFI (Goodness-of-Fit index) and RMR (root mean square residual) tests were used. These represent absolute indicators that can be interpreted in order to establish the correspondence of the empirical data with the structural theoretical model.

GFI test is one of the tests that are generically called GOF “Goodness of fit”, which assesses the model degree of correspondence and its prediction value. RMR test or “Root Mean Square Residual” represents the absolute value of the average of covariance errors. For the GFI coefficient the optimal value must be higher than 0.9 and for RMR it is recommended a value close to zero[13].

Table no.1-Test of goodness of fit

Scale	RMR	GFI
Loyalty	0.354	0.765
Commitment	0.217	0.995
Commercial Service	0.158	0.855
Administrative service	0.024	0.997
Delivery service	0.215	0.891
Communication	0.042	0.978
Switching Costs	0.024	0.997

Source: Amos Output

In table no. 1 we can observe that the values for the two indicators are close to value of zero respectively 0.9 for *Commitment*, *Commercial Service*, *Administrative service*, *Delivery service*, *Communication*, *Switching Costs* scales, which means that each scale has an appropriate goodness of fit. For the *loyalty* scale we obtained values of these coefficients that are significantly different from the optimal values. Because the Cronbach-Alpha test for this scale showed a good level of reliability, we decided to keep this scale because the problems could be explained by the dimensions of the analysed sample(only 60 cases).

For testing H1 hypothesis, a confirmatory factor analysis was conducted on the structural model of *service quality* which has five dimensions: *commercial service*, *administrative service*, *delivery service*, *communication*, *service provided*. These are measured through observable variables that are grouped as constructs. In

table no. 2 we can observe that the value of the coefficients for each dimension is significant. For the analysis and the interpretation of the results we must consider the value of the regression coefficient. This means that an increase with one unit of *service quality* leads to an increase of 1.000 units above the *communication* component, 1.113 units above the *delivery service* component, 1.122 units above the *Administrative service* component, 1.126 units above the *commercial service* component and 1.157 units above the *service provided* component.

Table no.2- Estimated coefficients of Service Quality

Relationship			stimate	
communication	---	quality	.000	.001
delivery	---	quality	.113	.001
administrative	---	quality	.122	.001
commercial	---	quality	.126	.001
service provided	---	quality	.157	.001

Source: Amos Output

For testing H1 hypothesis, we also checked goodness of fit for the *service quality* construct by using GFI and RMS tests. The result show that the value of these indicators are lower than the optimal values (0.225 respectively 0.725). We can conclude that, at these stage of the research, H1 hypothesis is not confirmed. This situation could be explained by the use of a small dimension sample of 60 cases.

In table no. 3 we notice that all the coefficients are statistically significant at the level of 0.001, less the one that defines the relationship of *trust* and *commitment*. As a result, H5 hypothesis is not confirmed for this stage.

H2 hypothesis is not confirmed because the value of the regression coefficient is negative. Therefore, at an increase with one unit of the *service quality*, *loyalty* decreases with 1.547 units.

The rest of hypotheses are confirmed for this stage of the research. Thus, the influence of the relational factors on loyalty is given by the value of the regression coefficient (table no. 3). Thus, when *commitment* increases with 1 unit, *loyalty*

increases with 0.12 units (H3 hypothesis-confirmed); when trust increases with 1 unit, *Loyalty* increases with 0.800 units (H4-confirmed); when switching costs increase with 1 unit, *Loyalty* increases with 0.279 units (H6-confirmed).

Table no.3 -Regression Coefficients

Relationship		P	H	Result
loyalty-quality	-,547	0.001	H2	unconfirmed
loyalty-commitment	0,120	0.001	H3	confirmed
loyalty -trust	0,800	0.001	H4	confirmed
commitment-trust	0.095	0.580	H5	unconfirmed
loyalty-switching costs	0.279	0.001	H6	confirmed

Source: Amos Output

As regards the model goodness of fit, the results were not favourable, the indicators having GFI and RMS values that show that the data are not adequate to the specified model.

5. Conclusions

From the researches on loyalty presented in the specialty literature, we analysed the business to business sector and the financial services market because these fields of activity, through their specificity, are relevant for the particularities of the financial-accounting services. A synthesis of the models tested in this framework emphasized the variables most frequently used by the researchers: service quality, trust and commitment. In order to complete the proposed model, we added a frequently used variable on the financial services market: switching costs. The results obtained show that the relations between relational factors and loyalty, as they are presented in the research literature, are not confirmed in the case of accounting firms.

In conclusion, there are many ways to measure loyalty . Choosing between them is a difficult decision. Even after the choice is made, there are many tests to run to ensure the validity of the used instrument. This study presents a summary description of the relational factors and some instrument test results.

Methods of Measuring Competitiveness

Podasca Raluca
Academy of Economic Studies
raluca.podasca@yahoo.com

Abstract

Any approach to measuring competitiveness and competitive advantages must take account of one hand of the covered analysis: microeconomic, mezo-economic, macroeconomic, and on the other hand that they are the result of many variables that are interconditioned directly or indirectly. Measurement methods attempt to quantify the impact of competitiveness and the variables considered relevant. Among all methods of measuring global competitiveness stands Global Competitiveness Index and Economic Freedom Index.

Key words: Competitiveness, Global Competitiveness Index, Economic Freedom Index

J.E.L. classification: M10; M21

1. Introduction

Issue of competitiveness of national economy is highly disputed in economic theory and practice. Beyond the many debates and diversity of the criteria used, we believe that the economy is competitive if its market share increases (in particular, its export share in the world), thanks to its price with a relatively favorable development compared with those of competitors (so, it has a competitive, price, and consequently inflation, below) and the quality, diversity and timeliness of goods offered.

Beyond the company's specific and specific factors of the branch economic, in recent years globalization emphasized the importance of country specific factors as determinants of performance. As an example we mention the following specific factors that influence a country's performance: institutional and regulatory framework, access to markets, resources, labor and production factors' costs, financial and

technological infrastructure, etc.. Different dimensions of competitiveness are strongly linked: for example, competitiveness factors of a country determines the factors of international competitiveness of a company.

2. Index for measuring competitiveness

For over thirty years, the World Economic Forum published annually the Global Competitiveness Reports which studies and compares the factors that determine national competitiveness. The goal is to find the best strategies and policies to improve national competitiveness. Since 2005, World Economic Forum analyzed competitiveness based on the Global Competitiveness Index (GCI). This indicator examines and evaluates the economies' potential worldwide, noting the areas of sustainable growth on medium and long term being centered on three fundamental elements: a stable macroeconomic environment in each country analyzed, the quality of public institutions and their policies and technological efficiency country level.

Table 1. Romania's Global Competitiveness Index

Year	Rank	Score (1-7)
2011	77 (from 142)	4.1
2010	67 (from 139)	4.2
2009	64 (from 133)	4.1

Source : The Global Competitiveness Report 2011-2012

We notice that Romania's scores between 2009 and 2011 are almost constant, which means that it failed to become more competitive on international market.

The concept of competitiveness involves static and dynamic components: although the productivity of a country determines its ability to sustain a high level of income it is also a central determinant of investment performance, which is one of the key factors explaining growth potential.

Global Competitiveness Index includes a number of components each measuring different aspects of competitiveness. These components are grouped into 12 pillars of competitiveness as:

1. Institutions

Quality of institutions has a great contribution to the competitiveness and growth. This affects investment decisions, playing a role in how companies distribute their profits and costs for developing policies and strategies.

2. Infrastructure

An efficient and extensive infrastructure is critical to ensure effective functioning of the economy. A well developed infrastructure reduces the distance effect between regions, integrating national markets and connecting them to lower prices in markets in other regions and countries. Quality infrastructure provides entrepreneurs purchasing goods and services market in a reliable and punctual, facilitating the movement of employees to the most appropriate job.

3. Macroeconomic environment

Stable macroeconomic environment is important for business and also for the country's global competitiveness. Although it is known that only macroeconomic stability can not increase productivity of a nation, the macroeconomic instability has a bad effect on the economy. Government can not provide efficient services because it has to make very important payments or outstanding debts. Companies can not operate efficiently if inflation is elevated.

4. Health and primary education

Health workforce is vital for the competitiveness and productivity of a country. Sick employees can not rise to the desired level and will be less productive, resulting in increased business costs. Primary education increases the efficiency of employees. Employees who have little education can make only simple manual tasks and adapt more difficult to the advanced techniques production processes.

5. Higher education and training

High quality education and training are essential for economies that want to develop. In the globalized economy, higher education employees adapt quickly to the changes of environment and of the production system.

6. Goods market efficiency

Countries with efficient goods markets

have a good competitiveness, because they produce the right mix of goods and services according to the demand. Market efficiency depends on consumer trends and their refinement. For Cultural or historical reasons, consumers may be more demanding in some countries to others. This may create an important competitive advantage because it forces companies to be more innovative and customer oriented.

7. Labor market efficiency

Efficiency and labor market flexibility are critical to ensure that employees are allocated in the best way in economy and are provided with appropriate incentives for their efforts. The labor market must have the flexibility to change employees from an economic activity to another quickly and at low cost and to allow wage fluctuations without social disruption.

8. Financial market development

The recent crisis has highlighted the central role that it has a well-functioning financial sector for economic activities. An efficient financial sector allocates financial savings in the most productive way. It will channel resources to those investments or business projects that have the highest rates of profitability and not to those who have political interests.

9. Technological development

For a company to develop and prosper is essential to develop technology. Companies with activities in a country should have access to advanced products and have the ability to use them.

10. The market size

Traditionally, companies were limited by available markets across national borders. In the era of globalization, international markets have become a substitute for domestic markets, especially for small countries. Trade liberalization is positively associated with economic growth

11. Business sophistication

Business sophistication focuses on two elements which depend on each other: the quality of a country business networks and quality of operations and strategies of individual firms. These factors are particularly important for countries that have achieved a high level of development and who have exhausted the sources of productivity improvement. When companies

and suppliers form a particular sector and are interconnected geographically in close groups called clusters, the efficiency is very high, opportunities are created for process and product innovation and entry barriers for new firms are low.

12. Innovation

The last pillar of competitiveness is technological innovation. Innovation is particularly important for economies that are closer to the frontiers of knowledge. Although less advanced countries can improve their productivity by adopting existing technologies or making improvements in other areas, for countries that have reached the stage of development of innovation is not enough productivity. Firms from these countries must design and develop next generation products and processes to maintain a competitive advantage. This development requires an environment that is favorable to innovative activity, supported both by the public and private sectors. This means investment in research and development, especially by the private sector, the presence of high-quality scientific research institutions, expansion of cooperation in research between universities and industry, protection of intellectual property rights.

These twelve pillars of competitiveness are not independent, they support each other, and a weakness in one of the areas has a negative impact on other areas. For example, a strong capacity for innovation (pillar 12) will be very difficult to obtain without a healthy workforce, better educated (pillar 4 and 5), without appropriate technological development (pillar 9) or without sufficient funding (Pillar 8).

Next we present the most competitive countries in 2011:

Table2. The Global Competitiveness Index rankings

Rank	Country	Score
1	Switzerland	5.74
2	Singapore	5.63
3	Sweden	5.61
4	Finland	5.74
5	USA	5.43
6	Germany	5.41
7	Netherlands	5.41
8	Denmark	5.40
9	Japan	5.40

10	United Kingdom	5.39

Source : The Global Competitiveness Report 2011-2012

It has been made a survey to determine the factors that hinder business development. From a list of 15 factors, respondents were asked to select the five most problematic factors hindering business development in their country. Next we present factors that impede business development in Romania and Switzerland, which is the country which ranks first in terms of the Global Competitiveness Index.

Table3. Factors that hinder business development in Romania and Switzerland

Factor	Respondents from Romania (%)	Respondents from Switzerland (%)
Tax rates	15.5	7.1
Inefficient government bureaucracy	13.0	14.6
Policy instability	11.9	5.8
Access to financing	10.8	10.3
Corruption	9.7	0.3
Inadequate supply of infrastructure	8.9	4.4
Tax regulations	8.7	12.1
Inflation	5.5	2.5
Poor work ethic in national labor force	4.4	3.6
Inadequately educated workforce	3.6	18.3
Restrictive labor regulations	2.8	14.6
Government instability	2.3	0.7
Foreign currency regulations	1.8	4.2
Crime and theft	0.5	1.1
Poor public	0.5	0.4

2011-2012

It is noted that in Romania, the main factor hindering business development is the level of tax rates, with 15.5% of respondents, while in Switzerland the main factor is inadequate education of the workforce (18.3% of respondents), factor in Romania is ranked 10 with only 3.6% of respondents. Corruption is the 4th factor that impede business development in Romania with 9.7% of respondents, but in Switzerland is the least important factor that impede business development with only 0.3% of respondents.

Heritage Foundation and Wall Street Journal determines the Index of Economic Freedom starting from the axiom that economic freedom is a condition for prosperity of individuals and a factor of competitiveness. Economic freedom is defined as the absence of state coercion on the production, distribution or consumption above a threshold considered necessary to protect citizens and freedom itself.

Economic freedom index is based on 50 variables grouped into 10 categories:

- Trade policy;
- Tax rates;
- Government intervention;
- Monetary policy;
- Capital flows and foreign investment;
- Finance and banking;
- Wages and prices;
- Property rights;
- Regulations;
- Informal market activities

Table4. Ranking countries according to the
2012 Index of Economic Freedom

Ra nk	Country	Score (1-100)	Growth rate compared to the previous year (%)
1	Hong Kong	89.9	0.2
2	Singapore	87.5	0.3
3	Australia	83.1	0.6
4	New Zealand	82.1	-0.2
5	Switzerland	81.1	-0.8
6	Canada	79.9	-0.9
7	Chile	78.3	0.9
8	Mauritius	77.0	0.8

9	Ireland	76.9	-1.8
10	U.S.A	76.3	-1.5

Source: 2012 Index of Economic Freedom,
www.heritage.org/index/

In classification, Romania is ranked 62 of 184 countries with a score of 64.4 in 2012.

For global competitors, innovation has become one of the factors that help companies keep competing. The core of this approach is the development of skills and abilities.

One way to use the knowledge and skills in innovative ways is to create new products and gain good positions in the market or new markets. Another way is to create an innovative organizational structure by maintaining a balance between structure and strategy adopted by the company.

3. Conclusions

Competitiveness is a complex concept, long debated by economists worldwide and is one of the key dimensions of business performance. Considered as Michael Porter, “competitiveness is the key factor of success or failure in business”.

Creating and strengthening the competitive advantages –of costs, technology, quality, brand image, etc. became the strongest strategic weapon in facing international markets and is based precisely on progressive specialization of economic entities listed, on the essential idea that the acquisition of a higher level of competitiveness is conditioned by deepening specialization in areas that have actual or potential competitive advantage against competitors.

Abstract

Economic, sociological and even psychological research revealed that entrepreneurship is a process, a dynamic phenomenon, a science based on evident models of manifestation and development. And entrepreneurship represents a behavioral characteristic of an entity.

As a result of that, a research became necessary regarding the role and importance of failures in entrepreneurial individual success and, of course, to promote and develop entrepreneurship. As such, this paper focuses on this topic, based on identifying the determinants of entrepreneurship and how it contributes to their failures.

In the context of the knowledge economy, entrepreneurship at the individual level is crucial, is essential for development of entrepreneurial phenomenon at organizational and societal level. Failure is the most highly motivated individuals' only steps to success.

Keywords: antrepreneurial spirit, success, failure, entrepreneurship, entrepreneurial culture

J.E.L.: L26, L25, M14

“1. Introduction”

Known is that, currently, to achieve a competitive economy, focus is on three key factors: *knowledge, innovation and entrepreneurship*. Obviously, competitiveness is the productivity growth in resource use and the use of knowledge generation and exploitation of innovations. In this context, the developer/contractor is a

source of innovation, creativity and change, generating economic growth. The concept of business or entrepreneur is related to knowledge, relevant information, flexibility, adaptation, creation of conditions and opportunities in the hope of ensuring a real competitiveness.

Entrepreneurship contributes to job creation and competitiveness, and therefore generates a point of interest to local communities. In fact, studies have shown that poor or developing countries, the main obstacle to economic growth is lack of entrepreneurship that can trigger synergy of those countries resources (capital, labor, information, etc.). Of course, entrepreneurial developing implies not only creation of new enterprises, but also developing existing ones. In both cases, entrepreneurial development involves activities improvement, encourage boost skills, knowledge enrichment, creative development, relationship inventory, etc., of the individual in the organizational framework. Obviously, same importance is allocated to the existence of competitive markets and specific mechanisms, absolutely necessary event to successful entrepreneurship[10].

The literature on entrepreneurship studies conducted from different perspectives: sociological, psychological, economic, managerial etc. have revealed key aspects of the elements in the entrepreneurial process, personality traits of the entrepreneur and entrepreneurial skills[1], entrepreneur skills, the role of entrepreneurs[3, 4, 7], culture influences entrepreneurship, business events, factors that influence entrepreneurial behavior, etc.

Obviously, knowing the relevance of failures in entrepreneurship requires a detailed analysis to identify those determinants that may contribute to the development and successful entrepreneurship. In this respect, consider that entrepreneurship is dependent expression of direct and indirect action on the environmental conditions of the entity (internal and external), how to deal with failure-successful relationship is directly influenced by the personality and culture considered entity, failure is defined differently depending on the scope of the entity, personality and culture, each entity had at least one failure.

The study was based on interviews conducted with different entities in different industries, but also the analysis of documents (Curriculum Vitae and the various certificates, diplomas, etc..) (Including personal, where the case), in order to reveal how the failures contribute to the development (through learning) of entrepreneurial skills.

“2. Issues concerning the promotion and development of entrepreneurship in the context of the knowledge economy”

Although there is no accepted definition of the entrepreneur in the literature [2], mainly due to changes in economic theories on this subject, however it is estimated that functional-descriptive definition is presented by Wennekers and Thurik in 1999: “... *ability and willingness of individuals, on their own, in teams within and outside existing organizations, to perceive and create new economic opportunities (new products, new production methods, new organizational schemes and new product-market combinations) and introduce their ideas on the market, despite the uncertainty and other obstacles, by making decisions on the location, form and use of resources and institutions.*”(46-47). Starting from such a definition of the entrepreneur, it is assumed that any individual who manifests his ability and willingness to create new economic opportunities, new ideas, new combinations and even new opportunities and guidance in achieving the targets is the entrepreneur (as theoretically frame of Global

Entrepreneurship Monitor are entrepreneurs in training or in early stadium).

Entrepreneurs are motivated by the need for independence, largely financial, need to contribute to the family and therefore to society, to have free time for family, not to be unemployed in the crisis conditions. They have initiative and ambition to succeed, anticipate change, are willing to change, and feel inclined to profit again. In other words, the entrepreneur is the person who creates, organizes, manages and assumes the risks of an enterprise. In this context, the entrepreneur assumes all responsibilities for the effective functioning of the entity. It must be creative, inventive, innovative and courageous in making best use of the opportunities offered by that act. He is a bearer of value; culture, capital, governor, and chief factor of resource allocation. As such, the entrepreneur has a multitude of roles: creative, innovative, organizer, coordinator, owner, manager, leader, motivator, etc.

That is why real interest for this phenomenon is revealed even by the fact that the first of the essential principles of the “*Small Business Act for Europe*” European Commission (EC) - which underlines the political will to recognize the fundamental role of small businesses in the EU economy and establish for the first time, a strategic framework for the Union and its Member States - refers to “*create an environment in which entrepreneurs and family businesses can thrive and entrepreneurship is rewarded*”. Thus, one of the measures the European Commission aimed at *promoting entrepreneurial culture and facilitating exchanges of best practices in entrepreneurship training*[11]. Moreover, entrepreneurial culture and entrepreneurship are recognized and promoted in Europe 2020, as some of the basic skills that involve innovation, creativity, risk taking and the ability to start and manage a business in order to create an economy based on knowledge and innovation. Culture of competitive entities must be an entrepreneurial culture in which innovation and creativity are fundamental cultural component. Therefore, the EC states that entrepreneurship is the key to job growth, reflected in economic development and ensuring prosperity.

In the knowledge economy entrepreneurship requires perseverance, ingenuity and a predisposition to take towards the objectives set. Also, entities must be based on power and their ability in order to identify and exploit opportunities arising in the environment in which they occur. Obviously, the entity must have a certain attitude, personality (temperament) to take something and be successful. In fact, any entity to generate changes that affect not only the entity, but also other entities, and even society in general.

Known is that spirit and entrepreneurial potential exists in all environments and fields, identifying OECD in this regard a number of specific indicators, namely:

- *determinants of entrepreneurship*, namely the contextual factors that may positively influence attitudes, actions, innovation, start-ups, new markets: access to finance, entrepreneurial skills, market conditions, specific regulations, entrepreneurial culture, entrepreneurial climate etc.;
- *entrepreneurship performance*, showing that elements of the dynamics and evolution of new business: establishing a firm rate, the rate of bankruptcies, types of firms, employment, etc. working population;
- *impact generated of entrepreneurship*, i.e. economic and social effects in long term: job creation, economic growth, poverty reduction.

Entrepreneurship manifestation is directly dependent on internal environmental conditions (organizational culture, characteristics of the organization, work group, managers, owners, personalities within the organization, processes of recruitment, socialization and integration, the beneficiaries of the organization, the organization's philosophy, the motivational, management organization, models of organizational behavior, organizational relationships) and external (technical, technological, socio-demographic, economic, legal, institutional).

Therefore, ways to promote and develop entrepreneurship can be structured at both national and organizational/community and individual. At national level, all major policies to stimulate entrepreneurial capacity focus on macroeconomic conditions and access to finance. But the study shows that

entrepreneurship requires a shift to reward nationally operating entities, seeking new methods and models for success and develop their skills, capacities and positive attitudes towards objectives. And the reward system requires certain specific framework conditions appreciation primarily values (data including entrepreneurial skills). Framework to ensure these conditions are relevant legal regulations, administrative and specific markets and support programs of governments and other organizations.

The literature states that one of the key ways to promote entrepreneurial spirit and culture refers to strengthening the entrepreneurial traits of individuals.

“3. Relationship failure-successful in development of entrepreneurship”

Entrepreneurship, whether learned or inherited, is a matter of choice of entity, according to the theory of "administrative man" by Herbert Simon[6], applying its innovative concepts of the theory of human choice and administrative decision that solve specific organizational problems. Theory that proposes "administrative man" instead of "economic man" of Taylor, an individual seeking to educate themselves, knowing only a few alternatives for the decision and decided to apply appropriate solutions than to seek the best solution[6].

Entities decide to have an attitude, to do something to achieve success in their field of action. Often, the difference between achieving or missing goals is given by the attitude. Failure is a way of strengthening entrepreneurship, the accumulation of knowledge, models and learning success.

According to experts, the classical elements of the entrepreneurial process are: identification and opportunity (idea) evaluation, developing the business plan, defining and determining the necessary resources and business management. Regarding the first step: identifying and evaluating the idea, Peter Drucker, in "Innovation and Entrepreneurship" believes that a new business opportunity may occur as an unexpected event: success, failure or unexpected action in the environment of the entity. Obviously, favorable opportunities arise as a crisis, a situation seemingly hostile or as a failure. History shows that in fact,

many successes arose from failures. "Failure is the stepping stone that life offers you to help catapult you to success - favorable to new opportunities"[8].

Considering the failures importance in developing entrepreneurial spirit is leading in the fact that entrepreneurial events goes to the elimination of economic equilibrium, according to Schumpeter[7], which can lead to some failures, on the short terms.

Also, entrepreneurship can be approached as an entity in the direction of environmental action that reveals at least three dimensions of the phenomenon of entrepreneurship: innovation, risk (assumed to be calculated) and proactive orientation. Innovation intends to generate creative solutions to problems faced by the entity (individual or organization) and to all involved. In this respect, the entity shall allocate the resources required to implement the solutions found, taking into account the probability of failures, of course, to a reasonable level. Proactive orientation refers to the fact that an environmental cause changes so that these become favorable to them to ensure high performance.

Failures are nothing but **real opportunities for personal and professional development**. Success is the result of lessons learned from failures. Of course, failures should not become obstacles to recovery potential available to each individual. Any success inevitably means taking a risk, that fail to approach, but that does not mean that people should no longer act for fear of mistakes. Therefore, in the context of the economic crisis have been forcedly imposed the need to include failures **in the statement of activity of each individual (CV)[5]**. Once made, **failure experiences are necessary to achieve success**. Failures say about each individual's aspirations, the efforts made to achieve the objectives, the will, perseverance and dedication they have shown.

However, analysis of CVs subject research subjects revealed the fact this component dedicated to professional failures is missing. So the interviews were taken to address professional failure in several ways: number, size, mental, relationship with the effects and causes of failures (causes: fear of change, giving easy, goals and unrealistic goals, lack of motivation, unrealistic expectations, self

ignorance, lack of planning, etc.; effects: changing direction, individual introspection, understanding and accepting the consequences, identifying new resources, skills and competencies, etc.) and triggers (business: insufficient resources, limited time, unquantifiable objectives; contextual: general economic crisis, unusual family situations, social, organizational: organizational change, mismanagement, etc.).

Generally, it is considered that failures are the fault of others, bad luck or fate and no fault of our own. Of course, this is because people are afraid of failure, and often refuse to talk about it. It is noted that individuals who knows themselves very well (they know their capabilities, capabilities, skills, etc.) have no registration of failures, i.e. they have not considered their experiences as failures, but periods of stagnation in their path to success or benefits to ensure future success. On the other hand, failures of some subjects are the result of their own limitations that were submitted, but these findings were favorable entrepreneurial skills. This is because failure is a period of stagnation, the reassessment of the past and looking for new prospects. It states that an individual has more chance of success each has accumulated failures. Failures have generated some new ideas, trends, development, new capabilities, knowing the success in other fields. Each individual has a spirit (mindset), the power to choose, to decide what to do, to think, to take. Is said to make good decisions every individual must learn to make choices and failures are ways to learn to decide to face the consequences and choices, but also to anticipate them.

Sooner or later, subjects had learned something from their failures in life (personal and professional). Moreover, in interviews they were self-analysis, revealing the limits that they have imposed and the potential they have, identifying consequently new resources and directions of action and development.

"4. Conclusions".

The main idea of this paper is to underline that entities exhibiting entrepreneurial spirit are those socially responsible and achieve high performance and have successfully overcome failures, learning from these

mistakes and failures as steps marked success. Although the approach is the notion that entrepreneurship is a necessity in certain situations, such as rapid changes in the technology, the customer values, situations of uncertainty, chaos, crisis, etc. high complexity. However, from the direct relationship between failure entrepreneurial orientation and entrepreneurial success is essential to any entity and economy.

In the knowledge economy considering failures as steps to entrepreneurial success requires developing a learning system failures, including a subsystem for generating and storing knowledge, ideas and information, a subsystem of developing attitudes, skills and behaviors of a entrepreneurial successful, a subsystem to communicate with other entities from the same action or in different environments and a subsystem for disseminating knowledge and entrepreneurship development models to all concerned.

The study provides a broad framework for action and practical scientific approach of analyzing entrepreneurship, offering courses of action to develop successful models of entrepreneurship based on failure to provide ways of enhancing the human potential and change all the entities attitudes. In this respect, require at least the following lines of research: analyzing the relationship between entrepreneurial orientation and performance of the entity, identifying the basic conditions for successful transformation of failure, identifying patterns of learning entrepreneurship in terms of failures (this is because few entities learns from their mistakes).

Abstract

In the current socio-economic context, the importance of SMEs derives, at least, of their fundamental role in any economy. Therefore, in the knowledge based economy, it is necessary to complete the organization of these small and medium entities according to the social model, which integrates cultural model of organization based on intelligence, creativity and knowledge, the emphasis is being put on individuals making up the entity, to a higher performance insurance.

Currently, in Romania, most SMEs are profit-orientate, not to people, despite that exists some entities driven by performance, creativity and innovation; but also exist SMEs in which entities and employees' goals are inconsistent and do not take anything for the purposes of changing the status quo. There are also SMEs which not assumes great risks, but respond quickly to changes in their environment action or, conversely, firms that do not take risks intelligent nor adapt quickly to environmental requirements.

Keywords: organizational intelligence, social model, SMEs, organizational culture

J.E.L.: L26, M14

"1. Introduction"

Known is that intelligence it is both a real fact and potential one, can be considered and addressed as a process or phenomenon, skill or ability. Obviously, intelligence can be defined so as a mental organization attribute (in psychology), but also as a behavioral organization. The study is based on research

undertaken specialist John McCarthy and Patrick J. Hayes, who in 1969 define entity intelligence closely related to the existence of an appropriate model of the world, to help it respond to a variety of questions, with the necessary information acquired from outside world and to conduct certain activities to achieve objectives, taking account of its possibilities[4]. Obviously, there are now several studies on models that underlie the emergence and development of organizational intelligence: social, structural, systemic, etc.

The research involved case studies of different models of organization of Romanian SMEs, cultural diagnosis (analysis of organizational cultures) and analyze their collective capacity to generate, integrate and apply knowledge to achieve high performance.

Currently, the Romanian economy is based on the existence and development of SMEs, due to their presence in large number in all the areas of activity. Of course, in order to develop a competitive economy, SMEs need to develop and turn into very large companies having high performances. A sure way to success is due to the development of these SMEs intelligence, a strong culture, creativity and individual and organizational innovation. In this respect, it is necessary organization, coordination and effective management of SMEs, to generate and develop strong organizational cultures and multiple intelligences. It also appears necessary to develop emotional intelligence[3] in the Romanian SMEs. This is because the Romanians, the collectivist genesis Latin people, have symptoms of excessive emotions. Developing the ability to

use emotions intelligently requires not only knowledge and management of their emotions, that emotional self-control, but also recognizing emotions in others (empathy) and social competence (positive interaction with others and handling relationships). Developing emotional intelligence is necessary for Romanian SMEs because they are usually a first job, a first step in career and a first step towards world entrepreneurs to individuals. Obviously, any individual under the first employment or business position itself as the family, emotional, experiencing organizational relations under the impact of family relational experience. Hence it becomes necessary to organize the Romanian SMEs as models to ensure the development of individual and organizational intelligence, to achieve high performance.

“2. Romanian SMEs in global crisis - sources of organizational intelligence?”

Importance of SMEs derives from their fundamental role in any economy. Thus, SMEs meant for large firms, the world they came from and where their competition will occur tomorrow, as individuals, is a first job, a first step in career and a first step towards world entrepreneurs. Also, for any economy, SMEs are generating new ideas and new assembly processes, which accelerate growth on more efficient use of resources. The information economy SMEs are:

- carriers offer the most products and services needed by the population of a country;
- main value-added in any country;
- entities that have a major contribution to the GDP;
- generating jobs for most of the population;
- units by their performance, condition and performance status of each country's economy and living standards of its population within;
- factor of micro and macroeconomic balance (counteract monopolies and oligopolies, reducing the ability of large companies control the market);
- entities with a flexible and adaptable than favored by small size and rapid decision making;
- entities that fosters innovation and flexibility, helping to avoid dehumanization;
- businesses which easily adapts to the needs and demands of consumers, being closer to the market;
- entity that generates a large proportion of the applicable technical innovations in the economy.

SMEs are the engine of the European economy, the most important generator of jobs and economic growth. As such, the European Commission, through its actions, put the needs of small businesses in the center of its policies: improving the financial environment, enrich regulations to SMEs in Europe in terms of facilitating their work, increasing EU funds for SMEs.

Regarding the Romanian SMEs, they are manifested now in a negative social and economic context, very dynamic, with significant changes in all areas. According to experts, over 90% of Romanian SMEs have bigger or smaller problems in the economic crisis. SME records progress during 2007 - 2009 shows that, when economic crisis hit since September 2008, the number of registered SMEs decreased in 2009 compared to 2008 with 17.50%, while the number of erasures increased with 146.75% and the number of suspensions increased by 109.59%.

Year 2010, characterized by instability legislative tax changes and the impossibility of making realistic predictions made the SME sector in Romania still being in decline. Also, in the first quarter of 2011 versus the same period last year, the number of companies struck up 7%, because there were 10,656 of canceled, the canceled 9950 to first quarter last year. SMEs represent 99% of all companies registered with the Trade Register, i.e. 630,000 SMEs.

In the first quarter of this year were only 32,298 registered SMEs, which represents an increase of 15% over the same period last year[6]. The largest number of newly established SMEs registered in the distribution of water, sanitation and waste management and the insurance and financial intermediation.

Obviously, is looking for solutions to get out of the SMEs crisis, SMEs being those which support over 60% of the existing jobs[7]. In this respect, employers relate

positively with governments, social partners, financial and banking institutions and all interested entities: nonprofit organizations, communities, outside businesses, etc., in order to define a coherent sector development of micro, small and medium.

For survival and development of SMEs is given special attention financing from structural funds, looking at the same time, new ways of lending and help from other decision makers at national, European and international. This government strategy to support development of SMEs in 2009-2013 includes principles to guide the design and implementation of policies to support the Romanian SMEs.

However, an analysis of the culture of SMEs shows that organizational culture is both positive and negative organizational culture within SMEs. There are also SMEs with driven performance, creativity and innovation, and organizational cultures in which the objectives of the entity and employees are in disagreement. Moreover, there are SMEs for which the term "organizational culture" does not exist or is unimportant. Whether or not entities are aware of the existence of organizational culture and its importance in providing high performance, within each organization *there is a more dominant culture and subcultures that occurs depending on the characteristics of different subunits within the organization, the members of the occupation as training, etc.* There are also SMEs which not assumes great risks, but respond quickly to changes in their environment action or, conversely, firms that do not take risks or no risks and adapt quickly to environmental requirements.

Also, in most SMEs with flexible and functional structure, management style is democratic - participative. These managers present organizational problems to employees, receive suggestions and make decisions based on them. Even democrats, some managers define limits and ask employees to make decisions. Democratic managers allow subordinates to act in certain clearly defined limits to them, encouraging employees to become more creative and full of personal initiative. Many managers - owners of small businesses assume the role of mission leaders, because they are directly interested in the mission on which he assumed, and socio-emotional leadership

role, is interested in reducing tensions, conflict resolution, resolving disputes and maintaining morale in the company they manage.

The analysis undertaken reveals that Romanian SMEs development requires the creation of favorable environment for organizational intelligence. And one of the key requirements is the focus on people. But SMEs oriented employees should not ignore the purpose, but rather must be alert and discharge of the company. Thus, developing a strong culture that not only offer environmental adaptability, but also the ability to act proactively (influencing the environment to create favorable conditions, finding new outlets and building solid ensembles to join).

3. “ Factors and considerations to ensure organizational intelligence development in Romanian SMEs ”

Due to the small number of employees, it is clear that the central axis of the appearance, manifestation and development of organizational intelligence is individual SMEs. It may be a verbal/ linguistic intelligence, logical/ mathematical, visual/ spatial, bodily/kinesthetic, musical/rhythmic, interpersonal, intrapersonal, and naturalistic emotional as Gardner's theory of multiple intelligences[2]. Individual intelligence being manifested in a certain context, having the following dimensions: *the organizational dimension, technological dimension, the cultural and linguistic dimension.* These entire dimensions include factors to ensure and develop the organizational intelligence in Romanian SMEs: skills and individual skills, experience, individual/ organizational, organizational culture, leadership (crucial in creating positive relationships), organizational learning, communication, innovation and creativity.

Obviously, all entities (individuals and organizations) have a certain amount of absorption and inclination to oblivion, absolutely necessary for the renewal of knowledge and organizational learning efficiency. Of course, management and leadership SME is responsible for organizational effectiveness, processes and activities within the organization.

Thus, the *organizational context* concerns a framework defined by a system of organization, structure and communication, open, dynamic and adaptable. So, individual form a dynamic organization, evolving under the effect of three forces: individual impulses of each individual, indirect impulses transmitted by the actions of other members, internal changes caused by management decisions and changes in the external environment of the organization. This means that the system is SME, there are changes, voluntary or involuntary, resulting in a process of generating knowledge and new skills to solve problems and carry out specific activities and field profile company. The organizational learning in SMEs most naturally created in stocks of knowledge and experience to solve problems, accumulated cultural elements.

In small firms, due to the easy interaction of all employees is remarkable the benefits of networking (transfer of ideas, information, knowledge, know-how) in the development of organizational intelligence through organizational members roles and position, technology, and by the influences and power each employee separately. Also, in the flexible structure of the Romanian SMEs, individuals get to work together, to know and to interact positively and become capable of transmitting information and knowledge, but their development (personal and professional).

Romanian SMEs benefit is the interest of individuals to knowledge and development, based on the native intelligence of the Romanian people. People fear change, but are willing to learn to cope with, as demonstrated by the current. Of course, all those because in the organizational context, employees are being specialized and each of them evolves (through learning and permits organizational culture) knowledge and skills that others do not possess. At the organizational level, all individually developed intelligences have obvious synergy capable of performance that any intelligent individual would not be able to get one.

In the context of the global crisis and the knowledge-based economy, in which the individual is a carrier of culture, knowledge, being creative and innovative model that can be successfully addressed in the development

of organizational intelligence in Romanian SMEs is an integrated social model. This model explains the emergence and manifestation of organizational intelligence impact on increasing the profitability of SMEs in the current context.

”4. The social organization of SMEs - crucial in the development of organizational intelligence”

Developed as a reaction to the knowledge economy, where innovation is more important than the production, that model emphasizes on people and their knowledge. Although addressed simplistic, definition of organizational intelligence organization as collective capacity to generate, integrate and apply knowledge[1] is relevant for the model under investigation.

In this sense, considering intelligence entities as something that they have by inheritance, but also as something that can be through learning is a basic assumption of the model. It is obvious that some people have interpersonal skills and/or intrapersonal. They develop easily a friendly relationship inventory, given that they can relate with others. Of course, others can learn how to develop positive relationships with other entities. Evolve, through qualitative and quantitative leap, the result of learning in a specific cultural context, can occur in all aspects of the development entity.

In SMEs organized social (integrated) employee takes the lead, but in terms of a single cell living organism that is firm, but the complexity of the individual who has, in addition to social and organizational life has a inner life, fears, is expected, has prospects, has attitudes and behaviors, has values that are reflected in the way that works, they connect and is identified with the organization.

SMEs with an organic structure can develop such models. An organic structure allows the generation and development of interpersonal relationships through communication, and developing a strong organizational culture. It is known that any entity has a certain culture, which can be defined from several perspectives and guidelines. Successful entities that have demonstrated a strong culture, positive, adaptive strategy directly relate to high

organizational performance. Also, these entities have successfully developed culture based on cultural differences and systems; the focus is on value, knowledge, innovation, creativity and learning. Model characteristics are:

- flexible organizational structure;
- high degree of creativity in their activities;
- high degree of cooperation between sub-entity, based on teamwork. If the entity is an individual, it is clear that intelligence is a prerequisite for the development of good health, although there were times when just physical problems have generated a development of some kind of intelligence (emotional intelligence, naturalist, music, etc.);
- proactive environmental approach;
- diversification and flexibility in tasks and approaches and points of view;
- effective leadership and strategic management participation;
- entity based on knowledge, innovation and creativity;
- transparency in disseminating information and knowledge;
- the individual is most important for the organization and the focus on human capital development through training and personal development;
- philosophy, mission and vision of the organization are based on people;
- entity is socially responsible and has an ethical behavior;
- individuals are properly motivated performance, creativity and innovation;
- communication is strategic, with a communication strategy and policy in this area.

SMEs have analyzed in greater or less integrated social model characteristics, but cannot say that their organization is conducted in accordance with that model.

This social integrator model is crucially emphasizes on values, knowledge, intelligence and creativity. Integrator aspect of the model aims in fact to address organizational culture and communication in systemic perspective and as a system entity. Obviously, socio-economic entities are primarily unique due to cultural differences and differences in communication systems. Systemic approach of an organizational culture reveals the

complexity of cognitive, emotional and behavioral.

Systemic approach of communication not only trying to make sense of actions within the entity or to provide all important communication, which coordinates its components in a precise meaning, but to exploit and capitalize elements of communication process, revealing interdependencies and internal connections communication, generating synergies and complex structures needed to develop intelligence entity, especially in the current context[5].

Communication systems are of a great diversity in time and space in relation to many human groups and ways of combining elements of communication process. The communication is developing not only the personalities of individuals but also socio-economic entities, regardless of the context of occurrence, although bear influence that context. Sure, effective communication system is based on many determinants that make the difference between these systems. This means that differences in communication systems lies at least in: culture employees, all members knowledge, technique and technology, language (scientific and technical) used, the media, the value system of each member and the organization, role each employee and the entity, the entity and employee ethics.

Important factor in ensuring organizational intelligence through its components, organizational culture affects most policies, decisions and activities of the company and thus has a major effect on business success. The organizational culture focuses on two types of components: components visible members of the organization (beliefs, values, rules, etc.) and members of the invisible components (premises). In other words, cultural values, customs, traditions, symbols, especially to cultural differences influence perceptions of interpersonal relationships at individual and thus organizational intelligence dimensions. Cultural differences are results of fact that there are procedures, formal rules, norms and values stated in each organization's impact on performance actants. Thus, cultural differences are highlighted by the many existing organizational culture types. The main cultural differences of entities can be

considered socio-economic climate, norms, values, human goods, material, financial, information, activities, policies, organization and management.

Culture transmits in which measure its employees assimilate values and behaviors, but also assesses the extent to which top management company declared values sent to employees so that they are assimilated and internalized by them, to develop organizational intelligence and thus the efficiency of the organization.

Also, this model of development of organizational intelligence shows that the individual is the bearer of culture, abilities, skills, experiences and, especially, generating innovation and creation. Innovative and creative spirit, man is the difference between success and failure of various businesses.

“5. Conclusions”

It is rightly states that the development of organizational intelligence is more complex than individual or collective, but it can be addressed as the development of intelligence entities (and individuals) to be placed into an organizational context, culture, technology and language. Identifying and summarizing the determinants of organizational intelligence to ensure the Romanian SMEs need to develop a social model reveals integrated organization to develop their intelligence and achieve high performance.

We can sustain the idea that intelligence entities partly inherited, partly learned underpins the development of integrated social model of organization of SMEs, which provide, at least, the conditions of occurrence and development of organizational intelligence, thereby ensuring organizational competitiveness increased.

The study opens new avenues for reflection on the importance of the organizational entities of any kind in providing intelligence and organizational development, thus ensuring high performance.

Also, given the different cultural and communication systems can be configured specific organizational models that determine the development of organizational intelligence.

Abstract

Outsourcing may be the present and the future of the companies, speaking of the globalization. Based on the idea of delegation, service specialized enterprises can bring something extra to the companies, thanks to the IT solutions they propose. We will explain the success of outsourcing, speaking of Egypt, a country that invested in the preparation of human resources and maintained a stabile economic environment, based on the Business Process Outsourcing solution. Also, Brazil offered a different perspective, investing in the make-up of the country, by introducing IT at all levels, while the success is expected at World Football Championship in 2014. Analyzing, the ideas promoted by outsourcing of these two countries, we gathered a few points about what Romania could do to reduce the differences between our country and the rest, when we refer to outsourcing management.

Keywords: Outsourcing, BPO(Business Process Outsourcing), IT, Brazilia, Egipt.

Jel Classification: J5, M15

1. Introduction

Outsourcing from theory to practice. Outsourcing can be defined as the delegation of tasks or objectives of organizational segments belonging to foreign entities, which offers an excellent quality - better price, or have expertise in the fields. Another definition states that outsourcing is "a strategy by which an organization entrusted major functions to external providers,

specializing in certain areas and makes them partners, „valued business”.

Currently, most managers consider outsourcing as the most convenient solution for a company interested in becoming more efficient by reducing costs and access to the latest technology without spending significant funds for research and development. Moreover, outsourcing is the simplest solution to the problem of lack of specialists facing occidental countries[1].

The advantages of outsourcing are low cost (company no longer has to devote resources to activities not related to the activity of the enterprise, more spending can be planned and anticipated), access to technologies, methods and qualified personnel, focus company (different segments of business requires a great deal of time and attention of company management, hazardous situations hangs somewhere in the "middle management", which means a financial loss for the company, so the idea of leaving some details to an expert seems more than relevant), improvement of production and delays, resources diverted to other purposes, risk reduction (companies turn to outsourcing, soon become more flexible, more dynamic and more willing to change to make with the new changes imposed by the current economy)

Globalization of business has been possible due to the elimination of all traditional cultural barriers, time and space. Labor can be distributed through mobile technologies that allow coordination and communication of people working together to achieve a set objective. As we said earlier, outsourcing is a top trend in business and requires the acquisition of specialized services of any kind, from external

companies[2].

If we were to classify them, we highlight two main categories, which have merged over time, making outsourcing as it is today. There are:

- *Information Technology Outsourcing* (ITO in English, Information Technology Outsourcing), this classification refers to outsourcing of services related to computers and the Internet, as, for example, create or improve programs software companies.

- *Outsourcing of business services* (BPO, Business Process Outsourcing). This classification criterion is associated generally with activities that require fewer technical skills than ITO, and results in the transfer of activities and responsibilities of a company to a third company, specialized.

2. The recipe for success in outsourcing: Egypt

Partnership with business. Egypt's road to success in outsourcing began with a limited number of steps. The first experience was developed with IBM. The company began operations in Egypt through a small application development center, which was a forerunner of outsourcing. It has grown faster in the late 1990s with the development of IT outsourcing. The first project undertaken by IBM in Egypt was to "arabic" some IT projects, followed by other software development projects.

The outsourcing strategy's components and initiatives. A more detailed analysis of Egypt's strategy related to BPO market offers important lessons on how a country can become a regional leader in outsourcing, while maximizing benefits within their national economies. The key components of this strategy, worth to analyze are[3]:

- *National strategy* set for market development in Egypt, is defined by key strategy of ADIT including the following pillars:

- ✓ Ensure that all requirements (human resources, infrastructure, legal issues, etc.) are available.

- ✓ Increase in amount and quality of local talent, the training of 4500 students to enhance their skills in order to make them able to contribute to market development;

- ✓ Offer incentive packages tailored to suit all investors, according to the number of jobs

that will be implemented in Egypt, staff training costs and telecommunications, and others;

- ✓ Encourage local companies in cooperation with foreign investors;

- ✓ Provide government licenses, in cooperation with government agencies and authorities.

- *Key initiatives* are related to:

- ✓ Preparation / vocational talents: National Telecom Institute (INT), Information Technology Institute (ITI), and E-Learning Competence Center (ECC-L) provide specialized training in ICT.

- ✓ Developing research: MCIT has promoted the establishment of Nile University, an institution of high-tech, non-profit research and development, specializing in engineering and business administration.

- ✓ Provide strategic training: Competence Center for Software Engineering (CCIS) provides services to improve internal processes model entitled "Capability Maturity Model" (CMM), and "Capability Maturity Model Integration" (CMMI) for local companies software.

Success in BPO

- **Operating costs attractive**

The cost of competitiveness of Egypt is not only durable, is expected to grow. Is due primarily to low cost human resources, telecommunications and infrastructure (Figure 1). It may be employed in Cairo high quality BPO agents pay with 225 to \$ 250 per month, while in developing countries - like the Philippines and India - with up to twice as much. Market costs of electricity and communications are also competitive.

Figure 1. The cost of electricity in 2008 (\$/kWh)

Source: McKinsey Global Institute, 2008

- **A strong emphasis on human resources** Egypt's population (80 million) is young, with a average age of 24 years (Figure 2).

This is a major advantage in a world where talent must be built or upgraded at a rapid pace. Egypt is rich in skilled and talented workers who are eager to work and build their skills. Egypt was able to rely on his familiarity with Western culture and education institutions established for a long time (universities and high schools teaching in English, French and German).

Figure 2.Total population in 2008 (million)

Source: UNFPA (UNFPA), 2008

Furthermore, about 330,000 students graduate each year in Egypt, so the total number of students who speak languages talent willing to work in BPO industry in Cairo is estimated at 24,000 people. In combination with a solid IT knowledge and technical skills, it gives Egypt a wide range of talent for global BPO industry. In addition, an advantageous geographical position (Egypt lies at the crossroads between Europe, Middle East and Africa, with a favorable time zone for companies based in Europe) have helped Egypt to become an attractive proposition for global BPO industry.

• **guarantee a stable macroeconomic environment;**

With an average growth rate of 7-8% per year (Figure 3), a relatively stable currency, a strong financial and credit market, Egypt has been an attractive business location and investment in the last decade. This was reinforced by government policy to dedicate a substantial public investment in developing and improving infrastructure, especially telecommunications[5].

Figure 3.Evolution of total investment, 2003-2008

Source: McKinsey Global Institute, 2008

3. Brazil - a different approach to outsourcing

Brazil in figures. Brazil has a population of approximately 200 million inhabitants and 85% in cities. GDP per capita is about \$ 7,000 and has recently been growing at an annual rate of 4 percent. The trade surplus has allowed the country to raise 188 billion in reserves by 2008 and helped the government to survive tough global economic crisis[4].

The country has over 150 million mobile lines in 2009, this number is growing by an incredible 1.3 million per month, despite the economic downturn caused by the global economic crisis. Although the number of computers has increased dramatically, helped by government credit programs (until the last quarter of 2008) the favorable exchange rate developments, Internet access is growing, but at a slower pace. Only 20% of households now have Internet access. But there are differences on household Internet access by both regions and income classes as data highlights for 2007 provided by the national samples (Table 1).

Table 1.Households with Internet access

Region of the country	Number	% Population	Percentage of Internet use
Brazil	56.344	100,0	20,2
South-East	25.151	44,6	18,9
South	8.879	15,8	16,9
Central-West	4, 163	7,4	12,1
North-East	14.252	25,3	5,4
North	3.900	6,9	4,4

Source: Government Brazilian Institute of Geography and Statistics (IBGE), 2008.

Electronic voting and tax system. Development of e-government (electronic government) in Brazil and the full use of information and communication technologies (ICT) by the population highlight the paradox of this country: one of the most elaborate electronic voting systems in the world and an online tax system operations coexist with the introduction of the Internet across the country and related to the illiteracy of computer use in many parts of the country, especially among the poor. There are two major projects, drawing hearts and minds of all, projects that can help reduce the social gap with ICT and e-government: e-Brasil Project and Programme Bis 2014.

Brazil's electronic voting system. In 1986, ESC (Brazilian Electoral Supreme Court) has initiated a process leading to municipal elections, electronic territory of Brazil. Since that year, all elections in Brazil were conducted on electronic voting and full results are available the same day, when elections were held. At the last municipal elections in October 2008, the electorate numbered nearly 129 million votes, registered 400,558 voting sites.

Electronic tax filing of income tax in Brazil. Almost all tax returns in Brazil, are submitted on-line. Even in 2003, 95.6% of statements were filed electronically, either online or on disk. In 2008, 23.9 million statements for that calendar year, or 98.8% of the total, were filed on the Internet, using software available from federal tax agency.

The E-Brasil Project. E-Brasil project aims to raise awareness about the benefits of e-development strategies consistent. This will help in building a fair and economically competitive society. The project is a joint effort of a network of over 61 international and Brazilian practitioners, united by the belief that with intensive use of TIC's, it is possible for Brazil to overcome the obstacles that prevent to be among the most developed countries .

Of activities we can mention: digital inclusion and e-development, e-education and lifelong learning, e-public safety, e-health, e-public services and management, e-procurement of goods and services, e-justice, e-commerce, encourage the development of ICT sector strategy coordination and management.

The BIS -2014. The program was called, 2014-BIS program, in conjunction with the first aircraft ever flew - the 14 Bis, piloted by inventor Brazilian, Santos Dumont in Paris, in 1906. Program motto is "How to amuse the world in 2014". The idea would be to present all that is creative and innovative in Brazil, coming from two sources: new based initiatives that any country trying to achieve, and projects that exist only in Brazil. The main activities of the 2014-Bis Program: electronic passport, experience the Amazon, virtual soccer game, play green, green football, social guides, Brazilian music for all.

4. Five lessons for Romanian management

Investing in talent. Investing in talent development can increase the opportunity of our country, and has a vital character to ensure long term sustainability of the country's service delivery strategy.

Expertise - the decisive factor. International companies and expert advice should be used in launching and implementing the initial phase of the strategy so as to bring the country much needed know-how and open up different opportunities[6].

Promotion - the key. A promotional campaign is essential after make sure all requirements are already addressed. Many impact programs such as stimulus packages, you can encourage BPO foreign investors, and for this you need to be prepared to develop the industry.

Fair and transparent legislation. There is a clear need to focus on a fair and transparent policies, without forgetting the international law. A good example may come in the regulations on the supply contract, web services, covering the provider's speed or the minimum and maximum price.

Safety economic system. According to data taken from the Economist Intelligence Unit, IT spending in Brazil have a rate of 1.7% of total GDP. However, it is estimated that the country will record a third of world economic growth rate by 2020 - which brings good news for local technology industry, since it is known that GDP growth will lead to an increase in IT market demand. In Romania, the cost ranges between 20 439-42 430 EUR for IT staff costs are lower in

countries such as Czech Republic, Slovenia and Hungary[8].

5. Conclusions

TIC offer companies the opportunity to access new markets regionally and globally and to promote and sell products and internal services electronically. Development will cause a decrease in production costs, administration and sales from the use of TIC can result in a significant increase in productivity of the factors used. Following this work, we can conclude a few ideas[7]:

○ With globalization there is a gradual and complete interconnection of all economic activities worldwide, affecting not only national economies as a whole, but any business activity;

○ IT and the emergence of global networks radically change the mobility equation by introducing new ways to combine talents across borders, outsourcing (especially the business process) is one of the main beneficiaries of this phenomenon;

○ Egypt's efforts to build a first class competitor in the outsourcing led to measurable success;

○ How Egypt chose to follow this path can be a source of inspiration and reference for other emerging economies. A central feature of Egypt's strategy was to focus on several strengths (its young population, high education and the availability of a source with knowledge of youth taletate international languages) and combine them with a series of specific government measures;

○ Brazil's key to success is strategic communication in all media, especially television and the Internet;

○ 2014-Bis Program intends to create a stronger country brand, demonstrating the evolution of Brazil in terms of technology, scope, approach, and social impact, while preparing the 2014 World Cup.

Corporate Social Entrepreneurship as an Incubator for Tomorrow’s Leaders

Popovici Veronica

Muhcina Silvia

„Ovidius” University of Constanta, Faculty of Economic Sciences

verovnp@yahoo.com

muhcina@gmail.com

Abstract

This paper aims at analyzing and identifying the core aspects of Corporate Social Entrepreneurship (CSE) as a process able to bring about radical organisational change. The supported assumption is that the business world needs to evolve into a stage where the new generic type of organization puts financial and social objectives on the same strategic level, by implementing this into its core models and processes. Consequently, it focuses on the specific characteristics defining Corporate Social Intrapreneurs (CSIs), the change agents within organisations able to initiate and carry through this transformation. At the same time, we look at CSE as an advanced approach to Corporate Social Responsibility (CSR), implying a total alignment between corporate mission and values and employees’ personal values, all with the purpose of creating an enabling environment for CSIs, one in which they can develop and the leaders of a new generation. Last but not least, the article offers an overview of how this is done in the practical case of Sandbox, the leading global network for the most inspiring leaders under 30, offering a viable pattern for other organizations to follow.

Key words: Corporate Social Responsibility (CSR), Corporate Social Entrepreneurship (CSE), Corporate Social Intrapreneurs (CSIs), shared value, generation Y

J.E.L. classification: M14

1. Introduction

Reflecting upon our complex socio-economic context at a global scale, we find ourselves forced to admit to the vicious cycle

characterizing the relationship between business and society at large. This is the cause of a misfortunate development over the past few decades, during which business has been increasingly viewed as creating profits at the expense and not in the benefit of the communities, leading to it being perceived as the root of all social, environmental and economic evil. And what probably accentuated this perception problem even more was the way in which business chose to respond to it. The trend of corporate social responsibility (CSR) widely embraced by business in recent years has been understood as a defensive, almost falsely apologetic approach, which obviously didn’t manage to restore the legitimacy of business, but it only accentuated the diminished trust and its blaming for society’s failures.

It must be said, the core of the problem lies with companies themselves. From this point of view we haven’t come a long way from old Milton Friedman’s times (1970), when maximizing profits was equivalent with the social responsibility of business, so what was good for business was axiomatically good for society. Over the last 20-30 years businesses have argued that, with increasing profits as their primary goal, most of the time there isn’t much more they can do for the benefit of society than maybe giving back at some point. Actually this is how classical CSR ideas were born, on this almost exclusively philanthropic logic of “first do well, then do good”. But beyond this, it is clearer than ever that companies are trapped in an outdated approach, like in a bubble where optimizing short-term financial performance is elevated to primary concern. In this narrow view, the real important aspects like customer needs and broader external influences that determine a

company’s long-term success remain at the periphery or ignored.

On the other hand, it is true that government and civil society have also often amplified the problem. During decades we assisted at the instauration of a false dichotomy between economic efficiency and social progress, with policy choices undermining economic progress in an attempt to solve social weaknesses.

Hence we found ourselves in the middle of this complicated debate and realized it’s about time for a shift of paradigm. The socio-economic context we live in may be complex and tangled everywhere we look around, but we also have the capacity to analyze and understand what was wrong in the past, as well as innovative minds proposing promising alternatives. Why not trying to find the synergies between business and society instead of constantly focusing on the presumed trade-offs between them? Why not identify the wrong directions that have been followed in the past and replace them with new viable strategies?

We intuitively started off from the idea that companies must take the lead in bringing business and society back together and that it should be done in way that also brings social responsibility at the core of their preoccupations. So after devouring entire pages of change management and CSR literature we came across Porter & Kramer’s thorough analysis of the exact problem we were trying to figure out.

In “Strategy and Society. The Link Between Competitive Advantage and Corporate Social Responsibility”, the two authors are arguing there is no point in focusing on all those aspects increasing tension between two partners that in the end are actually dependent on each other – business and society. Instead of getting lost in the unending vicious circle of what’s good for business is not good for society, they plead for a different manner of thinking, one according to which we embrace that what’s good for society is actually good for business. This may sound like a play on words, but there is a profound difference in perspective there. Creating societal benefit is a powerful way to create economic value for the firms. There are so many opportunities for creating profits “in the *right* way” that have been missed so far, profits that come

from meeting fundamental societal needs. The obvious example is the environment – businesses can be more than just compliant, they can reduce energy costs and unnecessary logistics, while creating products that are good for the consumer, thus achieving the right way to make economic profit (Porter & Kramer, 2006).

Attacking this sort of subject might seem like a very strange preoccupation coming from Porter, after all one the most renowned contemporary strategic management scholars. But when thinking better about it, it is actually just another proof of the fact that we can no longer function as before, that our socio-economic system is ripe for evolution. This is the next chapter of thinking about strategy, competitive value chains and creating competitive advantage; involving societal needs as a value dimension in the company’s strategy is maybe one of the most important development axes in the years to come.

But who will be guiding all of these efforts and under which framework? Who are tomorrow’s leaders and how can we train them today so that the goal of reconciling business and society becomes an attainable one? The moral beauty of this purpose, as well as the theoretical linking framework proposed by Porter & Kramer inspired us to reflect beyond just the general principles level into the realm of putting it into practice. What are the resources at our disposal and what innovative processes need to be implemented so that we bring this paradigm shift into the concrete world? We proposed ourselves to analyze the complexity of these subjects and hopefully shed some light on a few interesting aspects that might play a bigger role than apparent in the overview.

2. From creating shared value to Corporate Social Entrepreneurship (CSE)

Departing from Porter & Kramer’s view, we completely embrace the idea that it is in the self interest of the company to think about the right way to do things, a way that not only satisfies their intrinsic profits maximization calling, but also takes into very serious consideration the underlying societal needs. This translates to the principle of “shared value”, which involves creating economic value in a way that also creates

value for society by addressing its needs and challenges (Porter & Kramer, 2006). Creating shared value thus becomes synonymous with identifying the copious opportunities that companies have been missing so far to reconnect company success with social progress and escape the old trade-off conviction.

Theoretically, it all sounds great, elevating, it is clearly the right thing to do and it almost makes us wonder how come businesses are not there yet? Well, the recognition is there among sophisticated business and thought leaders and promising elements of a new model are emerging. What is still missing is an overall framework for guiding these efforts, like a salvation compass much needed in order to break the generic patterns of social responsibility / philanthropy / sustainability stuck in a façade mind-set in which societal issues are kept on the outside borderline of a company’s pursuit, not at its core.

Therefore, in our attempt to dissect the problem, we realized that, in order to create shared value, companies must first change their attitude towards the whole concept of corporate social responsibility and CSR practices at large. This means going beyond charitable initiatives, beyond trying to be the “good guy”, beyond anything that in the end can be labeled just as a marketing exercise and that actually encompasses what we would like to call the “old” CSR.

We have only come around to talking about Corporate Social Responsibility over the past two decades, which in itself represented a significant evolution labeled in many different ways, such as corporate citizenship, triple bottom line or strategic philanthropy (Carroll, 1999; Zadek, 2001; Visser, Matten et al., 2007; Googins, Mirvis and Rochlin, 2007). But in spite of obvious concern and affluent literature dedicated to this subject, too little has been achieved in practice beyond the simple compliance level. As Googins and Rochlin (2006) assert, “what is clear is the widespread agreement on the need for a more active and strategic citizenship”. Unfortunately, there is no dominant model or framework to follow and doing more of the same will not bring about the needed changes.

Consequently, we believe it is the perfect timing to inaugurate a parallel with the

concept of Corporate Social Entrepreneurship (CSE) as the “new”, improved form of CSR. We dare to call CSE the “new” CSR because we believe it stands for mobilizing the whole business in a sustainable direction, as opposed to the more superficial work done in this sense nowadays in any regular company only by the CSR department. But actually this formulation might be a little bit forced, as what CSE aims to provide is only a different approach, one that will accelerate the CSR journey; it is not another form of CSR but rather a process for invigoration and advancing the development of CSR to the new, escalated standards and into the role we needed it today, that of primary engine for creating shared value.

According to Austin & Reficco (2009), the ultimate purpose of CSE is that of “enabling business to develop more advanced and powerful forms of CSR and to accelerate companies’ organizational transformation into more powerful generators of societal betterment”. Fully adhering to this opinion, we will further on use it as a strong basis for our argumentation according to which CSE might just be the answer everyone is looking for in achieving this major paradigm shift amply described in the first part of our paper. But before explaining why that is and how it can be practically achieved, we will proceed by first of all elucidating the complexity of such an interesting concept – corporate social entrepreneurship.

3. Corporate Social Entrepreneurship (CSE): conceptual roots and underlying premises

In their article with the homonym title, Austin & Reficco (2009) explain that corporate social entrepreneurship (CSE) “emerges from and builds upon three other conceptual frameworks: entrepreneurship, corporate entrepreneurship and social entrepreneurship”. The first one takes us back to Schumpeter and his “creative destruction” necessary to fire a nation’s innovation and technological change (1912 / 1934). Schumpeter foresaw the shift of entrepreneurial spirit from individuals to corporations with more resources, something that did happen. At the same time, no matter their size or organizational structure, companies will always be more rigid and

resistant to change than individuals and over time corporate bureaucracy was especially seen as stifling innovation. This is how Corporate Entrepreneurship emerged within companies, from a need to maintain the presence of that innovation-baring *unternehmergeist* (fiery spirit) with the objective of “rejuvenating or redefining organizations, markets or industries in order to create or sustain competitive superiority” (Covin & Miles, 1999).

Accordingly, corporate entrepreneurship represents a renewal process, changing the organization over time by taking advantage of its existing capabilities, while also pursuing sufficiently divergent initiatives to stimulate organizational learning (Burgelman, 1991). The process begins with autonomous activities usually at middle and operating level, where change and inertia collide, retained within the organization as part of official strategy only if they prove to be efficient in the face of organizationally-relevant criteria (Burgelman, 1991; Venkatamaran, MacMillan and McGrath, 1992).

Concomitantly, the concept of Social Entrepreneurship was also born, describing the recognition of a social problem and the uses of entrepreneurial principles to organize, create and manage a social venture in either the private or non-profit sector, or across both, in order to achieve a desired social change (Munoz, 2010; Abu-Saifan, 2012).

Integrating this last social component into the concept of corporate entrepreneurship we close the loop and arrive at a deep understanding of CSE, defined by Wei-Skillern, Austin, Leonard and Reficco (2006) as “the process of extending the firm’s domain of competence and corresponding opportunity set through innovative leveraging of resources, both within and outside its direct control, aimed at the simultaneous creation of economic and social value”. The key word here seems to be simultaneous, the same one we find in Porter’s definition of shared value: “policies and operating practices that enhance the competitiveness of a company while simultaneously advancing the social conditions in the community in which it operates”.

So then can’t we really say that we are dealing with the same thing here? Isn’t shared value creation just another phrase for

CSE and what it actually means? We believe it is and we intend to use what we know from the literature about CSE in order to map out the way of transcending shared value creation from a conceptual to a practical state. The main aspect we will be focusing on next is the effects of individuals in the CSE process, as in our view the purposeful behavior of individuals is central to understanding and successfully implementing initiatives that are beneficial for both business and society.

4. The distinct breed of Corporate Social Intrapreneurs (CSIs)

Looking at young professionals today, it can be said that we are witnessing an interesting set of characteristics defining an entire generation and playing a very important role in choosing the direction in which we, as society, are looking together towards the future. With the power shifting in the working place from generation X (the baby boomers) to generation Y (“why?”), a new breed of innovating leaders emerges right under our noses. These are people functioning according to a different mindset, people who question things and who want to put meaning into what they are doing because they need this to be relevant for those around them and for society at large.

We believe the CSE process is powered exactly by this kind of people, by true change agents with high morality and socially-oriented personal values. We can call them *Corporate Social Intrapreneurs* (CSIs), after the term “intrapreneur” first coined by Gifford and Elisabeth Pinchot in the beginning of the ’80 for defining the intra-corporate entrepreneur¹. According to Austin & Reficco (2009), a CSI is “an employee of the firm who operates in a socially entrepreneurial manner, identifying opportunities for and / or championing socially responsible activity, in addition to helping the firm achieve its business targets”. Austin, Leonard et al. (2005) identified some other key attributes of CSIs beyond just being cost-conscious and mindful of the bottom line, while at the same time

1

<http://www.intrapreneur.com/MainPages/History.html>

continuous advocates for the integration of the social component as a central tenet for the company. CSIs are also highly effective communicators and coordinators. They are very articulate in expressing their beliefs and convictions, they manage to initiate and consolidate relationships based on mutual respect with different stakeholders and they are able to effectively reach across internal and external boundaries, mobilizing and aligning interests and incentives.

All of these characteristics make of corporate social intrapreneurs the right persons at the right time, in the right place. They are the catalysts for change, the true leaders of a generation who might at last be able to inspire all of us to create the long dreamed synergies between business and society and expand shared value creation to the rank of general reality. The reason we are so optimistic about this scenario is being able to spot many different clues around us that this generation is unique in the sense it is characterized by an incredibly strong, positive, disruptive force unseen before. We believe this has a lot to do with a particular blend of personal values and the courage to stand up for them by taking adequate action no matter the external conditions.

In her article “Personal Values as a Catalyst for Corporate Social Entrepreneurship”, C. A. Hemingway (2005) speaks about the employee (at any level) as a moral agent and how sometimes this individual moral agency is sacrificed at work, compromised in deference to other pressures. This study shows us how personal values may act as drivers of our behavior and pays particular attention to the values of the corporate social intrapreneur. It suggests that, according to their dominant individualistic or collectivist personal values, individuals may be categorized as Active CSIs, Concealed (or Frustrated), Conformist and Disassociated (or Apathetic) CSIs. First of all, this underlines the fact that not everyone has the inner configuration for being a true corporate social intrapreneur. Second of all, we must emphasize that what we consider as true corporate intrapreneurs are mostly the individuals in the first category, that of Active CSIs. These are the highly principled moral leaders we’ve been talking about so far, who enlarge their own role to encompass a socially responsible agenda at work, who

demonstrate both awareness of ethical issues and involvement in them, the courage to speak and take initiative in this sense. This is because Active CSIs are driven first and foremost by their dominant self-transcendent values, while their self-enhancement personal values remain on a secondary place and usually come more into play outside of the working arena.

At the same time, Active CSIs are also characterized by the independence and risk-taking commonly associated with entrepreneurship, not shying away from operating regardless of an organizational context that is predisposed towards enhanced CSR. Therefore, they will not necessarily have a formal socially responsible job role, nor do they necessarily have to be in a senior management position to progress their socially responsible agenda. Acting like this, they are predisposed to creating innovative solutions, new configurations of resources, new disruptive status quos. And this is where real change actually begins.

But why should they have to do all this in spite of rigid, outdated organizational structures? Why is it that, for the first time, history makes us contemporary with this very rich socio-economical context, boosted up by the incredible openness all these amazing technologies offer us – all of which represents the most fertile soil so far for the emergence of active, determined corporate social intrapreneurs – and they are still pulled down by the weights of a system too reluctant to evolution? We have to admit that organizations as wholes also have to reassess and upgrade their current ways of functioning to better accommodate the needs of CSIs and the establishment of corporate social entrepreneurship as a core business pillar.

This is completely dependent on current leaders’ capacity to understand the complexity of the times we are living and to act accordingly, adapting visions, missions, processes, hierarchies. We felt the need to make the extra step into showing this is actually possible, that there are organizations out there who not only grasp the ideal of creating shared value through corporate social entrepreneurship, but who are also striving to create the practical structures allowing this ideal to become reality.

The following analysis is based on a qualitative study of Sandbox, the leading

global network for the most inspiring innovators below 30. Our information comes from secondary sources such as interviews, presentations and (guest) lectures delivered mainly by Christian Busch, co-founder of Sandbox, head of Sanbox Live!, special advisor for social entrepreneurship and community matters at the National Consortium of University Entrepreneurs (NACUE) and professor of entrepreneurship at the London School of Economics (LSE).

5. Creating new organizational models for a new generation

We have been talking a great deal about the personal values and missions empowering those expected to bring about the change we want to see in the world, a world flourishing on principles of collaboration between business and society, and not mutual exclusion. What we haven't really touched upon are the organizational values and everything else that is built upon their foundation. In order to benefit from the powerful impact of motivated, effective change agents within organizations and bring corporate social entrepreneurship at their focal point, these have to align their set of values to that of the individuals of generation Y, the leaders to propel them into a successful future. John Chambers, the CEO of Cisco, was showing a few years ago that he is perfectly aware of this, saying: "It's not an options anymore to have a mission to change the world. In 20 years from now it will be an absolute necessity to have this, otherwise you will not attract the best people, you will not be among the most innovative ones and you will for sure not be among the ones who will survive."

Getting organizational values right is vital to advancing into a world of reinvigorated CSR. What this means is ensuring that words are translated into action, that values are not just a shiny business card with no backing-up credentials, but rather a structural component, a cornerstone of the organizational identity. Empowering and unleashing the creative energies of true corporate social intrapreneurs involves adapting organizational strategy to a strong, authentic set of values, and not the other way around. This is no longer just an ideal, or a straight way to compromise, as it might have

been seen in the past. This is a deeply rooted need in the moral fabric of this new generation we've been describing and whose representatives we see advancing into position powers more and more nowadays.

Therefore, redesigning the organizational models we have today becomes an imperative in order to satisfy the needs of this generation and not cut the wind beneath its wings. The problem with the existing organizational models is rooted in the departing issue of our paper, the dichotomy between business and society. Consistent with this dilemma, organizational models follow two very distinct patterns: the preponderant profit-oriented organizations and their alternative, the socially-oriented organizations or traditionally social enterprises, like charities or foundations. With respect to how they can satisfy the needs of their employees, the former are very good at providing a clear professional trajectory and both personal and professional development, but the meaning is missing a lot of times, which is why a lot of brilliant graduates who go over to work for big banks or consultancies experience frustration and some degree of job dissatisfaction (Hemingway, 2005) because they usually don't do anything relevant for society. On the other hand, socially-oriented organizations fully respond to this need, putting meaning into what employees are doing, but lacking to offer a clear career path and real professional development, while the degree of personal development could also be improved.

Christian Busch, the co-founder of Sandbox, was very prompt in understanding that, although these two models either focus on profits or social impacts, both of them find their rationale in Abraham Maslow's old hierarchy of needs (1943)². This says that everyone functions according to a linear progression of needs, from physiological / material needs to safety needs, to love / belonging needs, to (self-) esteem needs and in the end, if we still have time and energy, we can self-actualize ourselves.

What Busch implies is that this linear thinking in terms of needs is no longer valid

2

<http://psychology.about.com/od/theoriesofpersonality/a/hierarchyneeds.htm>

for representatives of generation Y. It's not that we evolved into some sort of superior beings whose elevating needs come first, it's simply that our ideals managed to transform Maslow's hierarchy into a *cycle* of needs, meaning out needs should be fulfilled at the same time. Departing from this idea, we can very well see how employees, admitting to a cycle of needs to be simultaneously satisfied, will no longer be happy working in organizations guided by the “first do well, then do good” logic and will tend to break loose from such limitative environments and replace them with those where a “do well while doing good” logic characterizes the general mindset and course of actions.

But the beauty of it is yet to come. People at Sandbox recognized themselves as people with a cycle and not a hierarchy of needs and they also discovered that this cycle is relational. This means that everyone's cycle of needs depends on the cycle of needs of others, especially in respect to co-creation / collaboration. A simple realization like this one can be the creator of unlimited synergies. Once people realize that the fulfillment of their needs depends a lot on how the other person's needs are fulfilled, the incentives for them wanting to effectively collaborate and give meaning to their shared actions will be immediately propelled. And this is how we come to the idea of enlightened self-interest, something that Sandbox based its entire organizational culture upon.

But looking at Sandbox's example there is something much more interesting dawning upon us than the mere ideological epiphany. It seems that they found a way of translating these ideals into actual routines and processes and they've done it with the help of innovative technologies. They are convinced that the use of technological development and social media not only is a great way to accelerate individual and organizational impact, but it is also a very interesting way of holding people accountable. Through technology our actions become very visible, the digital footprints we leave become more and more decisive in terms of what we are able to do. Examples are countless, but think only about the very common practice among recruiters nowadays of checking out a prospective candidate's profile on different social networks in order to gain a little bit more insight on that person.

Bottom line is that it is in our deepest self-interest not to be very self-interested but to function according to a “lateral accountability” principle. Coined by David Stark (2001), this concept refers to a certain self-regulation on the horizontal level, rather than in hierarchical frames, where people self-regulate each other on a peer-to-peer base. Technology enables transparency, which allows people to observe each other so that they can correct themselves, not wait for some kind of an authoritarian, hierarchy-imposed figure to do it. Further on, flattening hierarchies for building leadership teams who hold each other accountable is the next step in creating an impact organization such as Sandbox. Last but not least, after hiring the right people, who embody the organization's key values, it is very important to reward their talent / success with opportunity, rather than only monetary means, to have the right people incentivized by the right means.

Looking at Sandbox's culture and organizational model we can thus easily identify the 5 key pillars of the impact organizations: impact mission, enlightened leadership, genuine values, lateral accountability, KPIs/incentives. The only remaining issue is how to make big corporations function along these same pillars. It's easy for start-ups, they just need to build it right from the beginning. But for the giants out there it surely will be more complicated, but the foundations consists of the same core principles. Orin Smith, former president and CEO of Starbucks, expressed it this way: “Aligning self-interest to social responsibility is the most powerful way to sustaining a company's success”. So the answer is incrementally working on building up each of these pillars. This will first lead to more innovativeness and increased employee motivation and with time, as Christian Busch puts it, “to an enlightened, self-interested model of capitalism, where we understand that ideally individuals and businesses contribute to society and society doesn't have an incentive to regulate them in any way, so that we get a virtuous cycle in the end”.

6. Conclusions

We departed our journey with the proud purpose of identifying all the details of an intricate puzzle. The goal was to arrive at an

image pointing us exactly towards how business and society can be at last reconciled. They have been pitted against each other for too long, partly because economists have legitimized the idea that to provide societal benefits, companies must temper their economic success. Moreover, firms have taken the broader context in which they do business as a given and resisted regulatory standards as invariably contrary to their interests. Corporate responsibility programs—a reaction to external pressure—have emerged largely to improve firms’ reputations and were treated as a necessary expense. Anything more was seen by many as an irresponsible use of shareholders’ money.

Fortunately, our academic inquiry brought us face to face with Porter & Kramer’s concept of shared value, which seemed to be the first attempt to a reconciliation. This concept recognizes that societal needs, not just conventional economic needs, define markets. It also recognizes that social harms or weaknesses frequently create internal costs for firms—such as wasted energy or raw materials, costly accidents, and the need for remedial training to compensate for inadequacies in education. And addressing societal harms and constraints does not necessarily raise costs for firms, because they can innovate through using new technologies, operating methods, and management approaches—and as a result, increase their productivity and expand their markets.

Our idea was to take this concept to the next level by analyzing the prerequisites and implications of putting it into practice. In other words, how exactly can we create shared value in today’s corporate environment, who are the leaders powering this movement, what motivates them and what conditions need to be fulfilled to support their actions? Reflecting upon these questions, we realized that companies need to rethink their current approaches to Corporate Social Responsibility (CSR), tapping into the creativity of every individual. This was the connection point to a tangential realm of literature, that of Corporate Social Entrepreneurship (CSE). Like all entrepreneurship, CSE is not about managing existing operations or CSR programs, but about creating disruptive change in the pursuit of new opportunities.

Most importantly, CSE is carried through by Corporate Social Intrapreneurs, a distinct breed of highly self-driven individuals with a unique set of values, with both entrepreneurial and managerial capabilities. They are the key vehicles for moving the company towards a more advanced state of CSR, fostering innovation and organizational transformation from within. The interesting thing here is that there is a very complex connection these individuals’ internal resources, or what actually makes them fit for such daring tasks, and the organizational environment meant to enable them to do just that.

This is how we have come to talk about Sandbox and value-based organizations in general. These see themselves as trustworthy, moral agents, capable of generating trust based on sustained ethical behavior and innovative solutions to social problems. Their goal is not just to comply with the law or to be responsive to key stakeholders; they seek to lead through example, to exceed expectations and to set new standards. They do that mainly by cultivating an entrepreneurial environment and fostering corporate social intrapreneurs. In parallel, corporate purpose and values are amplified, while vision and strategy are accompanied by changes in the company’s structures and processes.

Sandbox’s example shows us that all of this is not an unattainable goal from a practical point of view, as difficult as it might sound. Visionary leaders at Sandbox realized the key lays within corporate social intrapreneurs themselves, and more specifically in the fact that they need to operate in a purposeful environment where their entire cycle of needs are fulfilled simultaneously. Using technology to foster lateral accountability and flattening hierarchies to create enlightened leadership seem to be the main guidelines in their recipe for success.

Yet organizational transformation towards shared value creation is still in its genesis, facing many challenges. While start-ups such as Sandbox found the right way rather easily, more complex organizations have a long fight ahead of them with old, rigid organizational structures. Accelerated, fundamental change can be found particularly threatening and resisted.

However, it is continually becoming more evident that values-based leadership and synergistic generation of social and economic value are key ingredients to achieving sustainably successful business. Corporate Social Entrepreneurship is an incredibly interesting process that will greatly contribute to our collective quest for superior organizational performance and societal betterment. And because of all this, we believe it is also a sifting process for those who truly have what it takes to bring us there; or, in other words, CSE can be seen as an incubator for tomorrow’s leaders.

Trends in Advertising Budgets

Poștoacă Alexandra
Academy of Economic Studies, Marketing Specialization, Bucharest
alexandra_postoaca@yahoo.com

Abstract

The purpose of this article is to determine which were the global marketing budgets trends and also to establish how the Global Economic Crisis influenced the investments in advertising.

The investments in advertising can increase or decrease not only due to the Economic Crisis, but also due to other factors like: the development of technology, changes in consumer's media behavior and so on. We will see if the investments in the main media (print, TV, radio, internet, outdoor) were affected or not and which were the trends for the estimated expenditure starting from 2006 and up to 2012.

We will also debate the latest trends of the marketing budgets in 2012 as a result of the improvement of the global confidence.

Key words: marketing, advertising, budget, trend, media.

J.E.L. classification: M37

1. Introduction

The Global Economic Crisis 2007–2012 also known as the Global Financial Crisis (GFC) or the second "Great Recession", is considered by many economists to be the worst financial crisis since the Great Depression of the 1930.

The Crisis had a global impact, affecting the financial systems of many countries all over the world.

One of the segments which were affected by the Global Economic Crisis was the marketing budgets. In the next chapters we will see how the global marketing budgets evolved between 2006 and 2012.

2. Global Marketing Expenditures

The total expenditure in marketing fields divides in 2 parts: media advertising expenditures and marketing services. In the category of marketing services we will include: directories, direct marketing, telemarketing, sales promotion, market research, public relations, event sponsorship.

The total investment increased by 2% from 2007 to 2008, but then in 2009 decreased by 7% from 2008. The global expenditure in 2010 were approximately at the same level as they were in 2008.

A more obvious decrease we can observe for the major media investments. The expenditure in this segment decreased by 11% in 2009 versus 2008, by 6% in 2010 versus 2008 and by 2% in 2011 versus 2008. Starting from 2009.

Figure 1. Global Marketing Expenditure
Source: Advertising Expenditure Forecast
December 2011. ZenithOptimedia

In the chart below it can be noticed the share between the marketing services in 2011. The most important one is sales promotion (38% of the total), followed by direct mail (20%) and telemarketing (19%).

Figure 2. Marketing Services in 2011

Source: Advertising Expenditure Forecast December 2011. ZenithOptimedia

3. Media Expenditure

The media expenditures differ from one global region to another. The main investments in media are done in North America, followed by Western Europe, Asia & Pacific, Central & Eastern Europe, Latin America and Africa& Middle East (Figure 3).

For North America and Western Europe the trend was almost the same: decrease starting from 2007 to 2009, and then by 2009 small increases (between 2% - 4% from year to year).

We can observe even from the media budgets trends which global regions were the most affected by the Economic Crisis: just in North America and Western Europe there has been a drop in 2008 versus 2007 (in all the other regions there has been an increase).

The main media budget cuts were in 2009 in Central and Eastern Europe (25% decrease versus 2008).

Figure 3. Media Expenditure by Global Region

Source: Advertising Expenditure Forecast December 2011. ZenithOptimedia

Figure 4 shows the investment in internet, outdoor, cinema, radio, TV, magazine and newspaper from 2006 to 2011.

The advertisers invest especially in TV followed by newspapers. Depending on the year, the share for TV is between 37% and 41% in all the media expenditure. (and the

share is going up according to the analysis for the last three years).

The share for the internet has doubled in the period between 2006 (7%) - 2011 (15%). At the same time the share for internet, outdoor, cinema, radio and TV improved between 2006 and 2011, the share for newspaper and magazine has dropped.

Figure 4. The Global Investment in each Medium

Source: Advertising Expenditure Forecast December 2011. ZenithOptimedia

In the chart below (Figure 5) we can observe the evolution of print, TV, radio and internet expenditures between 2006- 2011.

Due to the Economic Crisis, TV expenditures had an important fall in 2009 versus 2008 (by 8%), but since 2009 they are following an ascending trend.

The most affected media due to the crisis was print (magazine & newspaper) . It has been registered a decrease of 5% in 2008 versus 2007 and 19% in 2009 versus 2008. Unlike the other media, print expenditures are following a descending trend. The crisis is not the only factor that caused the “fall” of the print; there are also other factors like: the development of technology which determined the change for the media behavior of the consumer. Nowadays consumers are more likely to read a book or the news online. This caused the increase in share for the online advertising, which had a continuous growth starting from 2006.

Radio had a descending trend starting from 2007 till 2010, but in 2011 it had a slight increase. The budgets allocated on radio had a share between 7% and 8% in the entire media expenditure during the analyzed period.

Figure 5. Global Media Advertising Expenditure

Source: Advertising Expenditure Forecast December 2011. ZenithOptimedia

4. Situations regarding the advertising expenditures for different countries

In Figure 6 we can notice which countries invested the most in advertising in 2009. As we expected, USA is the first country in this top, with an advertising budget 3.4 times bigger than the second one, Japan and 18 times bigger than the tenth country in the top, Canada.

This situation gives a clear conclusion about the importance of USA regarding the investment in advertising.

As we also expected from Figure 3, the countries that invest the most in this category are especially from North America (USA and Canada), Western Europe (Germany, France and UK) and also from Asia (Japan and China).

Figure 6. Top 10 Countries – Advertising Expenditures in 2009

Source: Advertising Expenditure Forecast December 2011. ZenithOptimedia

It is very interesting to compare the ten top countries from the point of view of advertising expenditure with the ten top

countries from the point of view of advertising expenditure as a % of GDP. (For the same analyzed year – 2009).

Not one country from Figure 6 is also in Figure 7.

The countries that have the higher advertising expenditures as a % of GDP are mainly from Central & Eastern Europe (Serbia, Bosnia& Herzegovina, Slovakia, Croatia, Czech Republic, Bulgaria, Slovenia, Lithuania).

To conclude, in absolute values countries from North America, Western Europe and Asia are very well positioned regarding the advertising expenditures. But media investments have a very important role in the economy of countries from Eastern and Central Europe.

Figure 7. Top 10 Countries – Advertising Expenditure as a % of GDP in 2009

Source: Advertising Expenditure Forecast December 2011. ZenithOptimedia

According with the chart below (Figure 8), Switzerland is the country with the highest advertising expenditure per capita in 2009.

USA which is the first country with the highest advertising expenditures is placed on the third place in advertising expenditure per capita.

Figure 8. Top 10 Countries – Advertising Expenditure per Capita in 2009

Source: Advertising Expenditure Forecast December 2011. ZenithOptimedia

5. Where are we heading for?

Global marketing budgets had a positive trend starting from March according to Warc’s Marketing Index. Although we are experiencing an increase with the marketing budgets, there are some discrepancies between the investments in traditional media versus the investments in digital or mobile for instance.

The global marketing budgets recorded an increase in March 2012 the first time in the last five months.

Figure 9. Global Marketing Budgets

Source: Global Marketing Index, March 2012, www.warc.com

A value of 50 indicates “no change” from the previous month. A index value of 58 reports a faster rate of increase than 52, while an index value of 40 reports a faster rate of decrease than 47. A value of 100 means the all the respondents indicated an increase.

The marketing budgets increase or decrease depending on the global region (Figure 10). For instance in the last months, the global marketing budgets in America and Asia Pacific had gone up, instead of Europe where they had dropped.

Figure 10. Global Marketing Budgets by Region

Source: Global Marketing Index, March 2012, www.warc.com

While the global marketing budgets have increased, for some traditional media we notice a continuous decrease. More precisely, the budgets allocated for print and radio in the last months are dropping (Figure 11).

Figure 11. Global Marketing Budgets by Medium

Source: Global Marketing Index, March 2012, www.warc.com

Digital (78.9) and mobile (71.2) continue to attract budgets while in the past they were allocated to other media. (Traditional media like press or TV). TV and out of home are just under the threshold of 50, but press and radio continue to have severe reductions in expenditure.

The allocation of marketing budgets varies from region to region. In America the trend for TV expenditure is positive (52.6), although the Global Index is under 50.

6. Conclusion

The Global Economic Crisis is influencing the global marketing and advertising budgets in a very clear way. Until 2007 all the investments in media followed a positive trend.

Along with the crisis, the marketing budgets began to drop.

The Global Regions were affected differently. Central and Eastern Europe was the most affected zone from this point of view (25% budgeting cut in 2009 versus 2008). With the exception of Africa and Middle East, all the other important regions had an important drop in 2009 versus 2008 due to the crisis.

Regardless the Global Crisis the most important medium continues to be TV (between 37% - 41% of the entire media budget). The only expenditures which were

not affected by the crisis were the ones for the internet. The internet continues to attract the budgets. The digital and mobile advertising are in a continuous development.

Along with the development of the technology the media behavior of the consumer has changed. So the drop of the print that continues nowadays comes as a natural reaction to this change. The trend for the investment budgets in newspapers and magazine is negative.

The country that invests the most in advertising is USA (approximately \$150.000 million in 2009), very much distanced from the second one, Japan (approximately \$43.000 million in 2009).

Although the Global Economic Crisis affected the advertising budgets, the investments in this category in 2011 are almost the same as the investment in 2007. That means the global confidence has improved. So, that means the forecast for 2012 is that the media advertising expenditures will follow this positive trend and will be above the level of those from 2011 or of those before the crisis.

Intelligent Systems and Accounting Knowledge in Forestry Units: A Qualitative-Heuristic Approach.

Postolache (Males) Daniela

“Alexandru Ioan Cuza” University of Iasi, Doctoral School of Economics

males_daniela@yahoo.com

Abstract

Our paper aims to establish a referential framework for optimal management of forestry accounting knowledge, in order to develop an intelligent system for forest accounting units. In our approach we pointed out advantages of using intelligent systems in accounting, and established forest accounting knowledge management areas that can be improved, within using intelligent systems in forest units, into a qualitative approach, with hermeneutic perspective.

Our research results are useful for researchers in the following areas: applied accounting in forestry, intelligent solutions for decision support, forest management, information technology management, knowledge management.

Our study is also useful in forestry accountants work, given the presentation of new technologies from their field of interest.

Key words: accounting knowledge management, knowledge-based technologies, forestry decision support systems, intelligent accounting systems.

J.E.L. classification: M40, M14, O33, Q50

1. Introduction

United Nations established in 1992 that sustainable forest management is one of the main goals of humanity. In 2011, the Ministerial Conference on the Protection of Forests in Europe, *Forest Europe*, have redefined sustainable forest management, as follows: „the stewardship and use of forests and forest lands in a way, and at a rate, that maintains their biodiversity, productivity, regeneration capacity, vitality and their potential to fulfil, now and in the future, relevant ecological, economic and social functions, at local, national, and global

levels, and that does not cause damage to other ecosystems.”

The same European Conference decided that the priority for protecting Europe's forests is sustainable forest management, to ensure multiple functions of forests, and increase the sustainability of goods and services provided by them [17].

Already operating under EU Council Secretariat, the Organization for Cooperation in Science and Technology (COST) is developing the project FP0804 - Forest Management Decision Support Systems (FORSYS). Under this initiative, by the end of 2012, researchers will make a comparison between the strengths and limitations of intelligent systems; they will identify ways of implementing innovative processes to extracting knowledge held by forestry experts, or from existing knowledge information systems; they will evaluate the methods of acquisition, verification and validation of knowledge; they will, also, evaluate the representation, inference and knowledge dissemination.

The purpose of these actions is to define and provide guidance and standards on forestry decision support systems. These intelligent systems should be a foundation for processes and information regarding the application of sustainable forest management. The goal of this action is to create standards for models and systems design, quality control, integration, sharing and use of intelligent technologies, in the field of forestry decision, to facilitate the sustainable forest management [6].

Being researchers who believe that institutional changes related to transition to sustainable forestry, are development framework to frequent uncertainty and error, to long debate and very slow progress, Thomson, Rauscher, Schmoltdt and Vacik [21] aim to optimize the interdependencies between knowledge management, the forest

inventory, effects of pollution on forests monitoring, statistical modeling and methodological regulations.

In their efforts to achieve a hierarchy of knowledge systems, useful for solving real problems, researchers noted that in this transitional period, we facing difficulties in terms of introducing new software for knowledge management and modeling, new sets of indicators or criteria on inventory and monitoring of the effects of pollution, new management policies or novel interpretations of existing ones. Therefore, the authors consider as a necessity of sustainable forest management developing "knowledge ecosystem", namely the multifaceted, complex and adaptive system, that includes people, institutions, organizations, technologies and processes, through which knowledge is created, performed, distributed, absorbed and used.

Throughout our research, we propose specific examples of practical forestry measures for sustainable knowledge, that are based on tools provided by intelligent technologies. In our view, sustainable knowledge depends on the adoption of technological innovation, which is also a prerequisite for adaptability imposed by the rapid changes taking place in social, economic or the natural biosystems.

According to Myers [18], in qualitative research, hermeneutics is an approach that contributes to a profound analysis of social and organizational aspects of management and economics. The author also believes that the purpose of hermeneutics is to clarify and understand a subject. Researching a phenomenon from inside, when a experienced researcher approaches a familiar topic, is considered most objective form of hermeneutics [5].

Using this methodology, we want to establish a framework for accounting knowledge management approach in the forestry units, and to determine coordinates of realizing a forestry accounting knowledge-based intelligent decision support.

2. Receptivity of forest units in intelligent systems

International concerns for sustainable forest management creates the conditions of globalization in forestry field. Along with

climate change, contemporary economic realities require, themselves, adopting an adaptive behavior in forest management.

While on the one hand, the European institutions is developing projects on standardization and harmonization of forestry decision support systems, and, in this process, intelligent technologies are integral part, on the other hand, Romanian forestry authorities face practitioners' reluctance to adopt new computerized solutions. It also noted the absence of research or initiatives for the implementation of intelligent systems to forest management.

Although the economic component is an important basis for decision-making process, using a wide range and variety of accounting information, however, are preferred traditional channels of accounting information request and transmission, through orders and documents, to cross all the links in the classical information system, so that, at the operational level, in each subunit, the accountant to be the last link that extract, process in various forms available accounting information and submit it to the information system as required.

Unfortunately, this organization of accounting information system, losing much of the potential recommendations and existing expertise in decision making. If the sale of raw materials is less efficient than processing and selling the finished product, so the accounting information provided by described above information channels are "gross", or insufficiently processed, and does not give maximum efficiency of decision making. Intelligent systems are able to remove this shortcoming.

Practical development of such an intelligent system, involving potential users in the design, prototype testing, development, and testing of the final solution, will be able to bring in the practitioners attention its valences.

Lawrence and Stewart [13] argue the importance of participatory decision making and technological progress, while the technical and social complexity of the decision forest is steeped, with the aim to provide forest goods and services on sustainable basis. In this vision, the conditions for technologies "usability", to assist decision are:

- designing a friendly interface that can be intuitively used;
- the analysis to understand users needs and abilities;
- participatory development, involving collaboration of potential users;
- application rating from the potential users[13].

3. Advantages of intelligent systems in forestry accounting

By using intelligent systems in accounting forestry units, these organizations can benefit from certain advantages, which we describe below.

Accounting regulations, accounting principles, internal working procedures, accurate models and certain recommendations of the expert accountant, in each important process (standing timber sales, timber harvesting, harvested timber sales, registration and settlement in forest injury, registration and settlement in forest contraventions, turnover planning, financial preventive control, etc.) can be stored, easily retrieved and updated even by the chief accountant, by an economist or an accountant, whenever needed. It is the advantage of *structured accounting knowledge accumulation, systematised according to specific processes and activities*. Thus, stored information and knowledge can be accessed anytime, whether, or not, at that time, there is a professional accountant at work, whether, if the accounting department employees are beginners, or having advanced knowledge.

In a forestry district, decisions made by leaders arise, in many cases, in consultation with internal technical specialists and from proposals coming from them. Formulation of a proposal by a technical specialist involved, sometimes a decision at this level. The decision from lower level, must be informed and must be consistent with regulations and accounting legislation. *Informed decision, at any level*, resulting from the intelligent system use.

Stored knowledge within the intelligent systems is very useful in *training new employees*, both for rapid familiarization with diverse specific activity, within a forest district, and to update the legal and procedural knowledge, that they have

acquired previously. Whether they will work in accounting department, or that they will provide the technical forestry activity, financial and accounting knowledge acquired from intelligent systems will help their efforts to achieve personal efficiency, but will contribute to unit economic efficiency, too. We must keep in mind that *continuous training of employees* is necessary, for the proper conduct of business, and an intelligent system that benefits from checking and updating the knowledge base, can do this easily, either by its use in instructor demonstration, or in each employee *self-directed learning*.

Intelligent system reasoning *can help procedural normalization*. Currently there is high heterogeneity in forest procedural normalization, each subunit following their internal procedures. A feedback recommendations component from intelligent system can provide "best practices", and can assist in normalization. Can be reached generalized procedures, as they are recommended by intelligent technologies.

Thus, intelligent systems can be very useful in "reduction of distance", promoting *intra-organizational collaboration* and *inter-organizational cooperation* (between practitioners, researchers and teachers). They have an important role in the optimal knowledge management and, also, in design of documented procedural rules.

Another possible advantage can be achieved using intelligent systems: *the auditors' work efficiency*. Structured knowledge stored within the intelligent systems gives auditors the ability to track the risks, in a fast and informed manner. *Standardization in auditors evaluation* can be achieved.

With working procedures storage functionality, and reasoning from legal field storage, intelligent systems *documents can provide legal evidence*, in case of commercial litigation, or the financial part of penal litigation.

The correct drawing of future work guidelines determine, in good measure, its success.

Assisting managers in the financial and economic forecasting is done by intelligent systems. This shall provide management specific judgments scenarios for achieving certain financial indicators, or even

forecasting recommendations drawn from past experience.

Romanian regulations on the annual accounts state that *the principles, policies and methods* should be part of the component called "Notes to the annual financial statements." Intelligent systems can be used in *designing and maintenance of accounting policies*, so that the National Forest District - Romsilva can provide to authorities a well documented set of accounting policies, with wide practical application in its subunits.

4. Impact on improving accounting knowledge management in forestry units

More recent studies and official documents [3], [7], [8], [14] have emphasized that the implementation of the noble vision of sustainable forest management requires new knowledge, and dissemination of knowledge gained from the previous activity. It is considered that, so far, knowledge in this area is limited, and exchanges of experience between regions and sectors are limited. New knowledge extraction, from the various case studies, has proven to be useful in their cross-disciplinary approach.

According to Grundstein [11] *knowledge management* is the management of activities and processes that improve the use and creation of knowledge, within an organization, to achieve two objectives strongly interconnected, with all their sides (economic, strategic, organizational, socio-cultural and technological):

- increasing wealth;
- sustainable innovation.

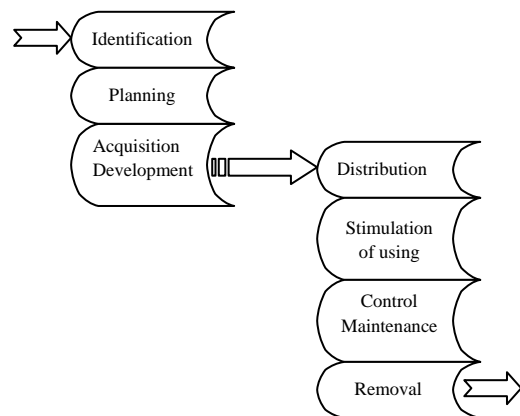

While Malhotra [16] made the following definition of the concept: *a collection of activities that are organized and arranged in accordance with the objectives of the organization*, in Darroch opinion [9], knowledge management is a function of management, through which the organization creates, identify and organize knowledge, taking into account long-term benefits.

Jennex's concept definition is more comprehensive [12]. It advances the idea that knowledge management *is the practice of selective application of knowledge, acquired in previous experiences, in current and future decision-making activities*, for the express purpose of improving the effectiveness of the

organization.

Among the tools used in modern knowledge management, could not miss knowledge technology, using intelligent systems to create, capture, convert, store, organize and disseminate knowledge [10]. Intelligent technologies support improving of the seven basic activities of accounting knowledge management (Figure 1).

Figure 1. Knowledge management activities

(source: Andone, I., et al., [2])

Developing such a system has strong impact on improving accounting knowledge management in forestry.

The work for *identifying appropriate and timely knowledge*, necessary for the proper functioning of economic activity, can be improved by using an intelligent system.

The administrator of intelligent system is considering setting up a viable knowledge base. He must design the intelligent system so as, continuous updating, to take into account the opinions and recommendations from experts and users. They can complete a small questionnaire, built on the intelligent system, helping technology itself to "learn" how to identify and filter knowledge.

This tool can assist managers in *planning of knowledge development and knowledge improvement*, using suggestions from the feedback process. Intelligent systems can be developed and dedicated to assist planning in knowledge management, offering management recommendations for various solutions, that can be taken in individual cases, to develop and improve both individual knowledge and collective knowledge. The use of an intelligent system

contributes to *knowledge acquisition and knowledge development*, because in this manner, each user enriches their knowledge.

Organizational knowledge develops, with increasing number of users, that have contact with the recommendations and explanations offered by the system, when users themselves actively participating, in developing the knowledge base. In this way *knowledge distribution* takes place, by knowledge translation from one person to another, from leaders to subordinates, or conversely, from trainers and researchers to practitioners, or conversely.

An intelligent system can provide the knowledge needed to make work easier or to improve economic efficiency, in an easily accessible form, using a friendly interface. In these conditions *the system users will be encouraged to enrich their knowledge* and even to improve system performance.

Accounting knowledge becomes visible through its inclusion in a structured intelligent system widely distributed, possibly with Internet or Intranet technology. In this case criticism from large numbers of users interferes. This improves *control and maintenance of accounting knowledge*, but also eliminate the knowledge that are outdated in domain progress, or no longer useful.

5. Conclusions

Management of forest areas involves a wide range of activities, subject to sustainability, due to the mission of forestry. A feature of the field is that many of these activities enjoy the benefit of natural environment. On the other hand, long distances and large surfaces determines the specificity of this sector.

Therefore, management of this sector must consider multiple ways of concentration of information and knowledge in key areas, permanently interconnected, so that the forestry decision to exploit the advantage of documented assisting, at any level, at any time.

In our work we have shown, in a heuristic-hermeneutic approach, the impact of intelligent systems use, on accounting knowledge management, in forestry units.

We emphasized the usefulness of intelligent systems for forest accounting, by

listing the advantages that this technology offers to forest units.

Our study showed the usefulness of incorporation of an feedback component into intelligent system framework, through which the user can evaluate the qualities, weaknesses and usefulness of intelligent solutions, and he can provide recommendations for system improvement.

An Organizational Strategy Conceiving Phase

Pricop Oliver Constantin
University ”Petre Andrei ” from Iași
opric24@yahoo.com

Abstract

During the strategy conceiving phase, the firm identifies an environment trend favourable to applying a certain strategy and altogether is a strategic potential within the functionality parameters of a certain strategy. The environment trend is given by the conditions of the socio-economic environment in which the organisation activates. The strategic potential analysis must give, on one hand, the description of the least requests to apply each strategy, and, on the other hand, it must describe the situation which the company is in..

Key Words: conceiving phase, environment trend, strategic potential.

J.E.L. Classification: M10, M 21, P 13

1. Introduction

In general, a strategy’s efficiency is evaluated upon the results it produces. But that moment is too late to have corrections, because the result is produced. Knowing the life cycle of a strategy would allow prior to producing some results the signalling of some aspects which show if an organisation is on the right track or not. Practically, the strategy’s life cycle brings a series of check-points which offers an image of the strategy’s stage and of the steps need to be taken in order for the strategy to maintain its efficiency for the organisation.

We consider that the strategy’s life cycle should be made by the following stages: conceiving the strategy, launching the strategy, strategic sustainability, redesigning/abandoning the strategy.

The most difficult phase is that of conceiving the strategy because within the latter are defined the analysis guidelines for the subsequent demarches.

During the strategy conceiving phase, the firm identifies an environment trend favourable to applying a certain strategy and altogether is a strategic potential within the functionality parameters of a certain strategy.

2. The environment trends analysis

The environment trend is given by the conditions of the socio-economic environment in which the organisation activates. The phrase “environment trend” means the evolution of the environment factors, analyzed as a whole, in a certain manner, a certain period of time. The environment trend is the activity constant from the analysis of the strategy’s life cycle meaning it has to remain favourable even until the phase of strategic sustainability. But considering it is a starting condition for the success of each strategic step, we will analyze it within the second stage, the launching one.

If it is foreshadows that the socio-economic environment is favourable, expansion and development strategies will be developed. If the socio-economic environment will show constant or decreasing levels, strategies of activity consolidation or restriction will be conceived.

We consider that, from the perspective of adaptability to environment trend, this typology of strategies can be as follows:

Within the expansion and development strategy category we may include the ones that lead to market development, product range development, activity efficiency or have a multiplying effect favourable to the set objectives:

Table 1. Typology of expansion and development strategy

Strategies of expansion or development	Motivation
Volume strategy	Must consider the

(cost domination)	growth of total physical output and the expansion of the market
Frontal attack strategy [1]	New competitive advantages and investment in their support – efficiency growth, must be identified
Strategies of extensive specialization by diversity	It considers a geographical expansion of the markets or the development of new couples of product-market.
Strategy of specialization by re-concentration (re-focusing)	Rethinking the strategic power and influencing centres at company level in order to reconfigure the success key factors and finding new solutions of market offering must be considered.
Strategies of vertical integration	It considers or the development of new supply or distribution chains, or their acquisition.
Amelioration strategy	It considers a perception of the offer at the whole market level, leading to its segmentation process according to the positive or negative value of this perception. Within this strategy, the focus is on the progressive decrease of the prices at the same time as achieving a certain difference in growth [3].
Strategy of concentric diversification	It considers entering a sector of activity relatively different to the existing one, from the activity portfolio's or products' or markets' perspective [3].
Strategy of diversification by conglomeration	It considers approaching certain different business sectors that have very few or none elements in common with the main sector [4].

Entrepreneurship strategies	Their purpose is business development by innovation, specialization or opportunity valuation.
Internal market expansion	It consists in using the forms of external transfer of the offered products or services made in their origin country.
Multiple markets strategy	Diversifying the markets geographically, by maintaining a relatively standard offer, or diversifying the offer with the purpose of adapting it to each local market particularities make this strategy.
Network strategy	The purpose of network strategy is identifying the development strategic axis. As it follows, the organisation applies integration, diversification or association strategies with the purpose of creating the affiliates network [3].
Offensive competitiveness strategies	It is meant to create competitive advantages of any nature in relation to the main competitors, by development actions.
Relational strategies in any form [5]: - complementary strategic alliances (horizontally or vertically); - strategies of reducing the uncertainties - strategies of reducing the competition - strategies of competitive reactions (strategic answers of	These are expansion strategies of win-win type in order to develop: - resources partnerships - production capacities partnerships - key competences partnerships - research&development partnerships

competitive kind).	
--------------------	--

a) The category of consolidation strategies considers those steps that aim the conservation and the strengthening of existing market position, the organisation’s profitability and the maintenance of planned strategic objectives. The following strategies are included in this category:

Table 2. Typology of consolidation strategies

Consolidation strategies	Motivation
The strategies of market leader companies in order to defend the occupied position	The company tries to maintain the existing market shares and the achieved technological advance.
The strategies of the adapting companies	It achieves the limitation of powerful competitors’ attacks at the same time as the adaptation of the offer, by a passive approach of the price and distribution policy.
The horizontal integration strategy	It considers the merger or acquisition of some companies that have products or services similar to the organisation’s ones or companies that have a similar technology or know-how.
The selective or global standardization	Selective standardization considers the adaptation of the offer to each market, at the segmentation level considered optimum by the company. Global standardization considers the offering in a global scale of the same products or services, their level of adaptation being null or very low.
The passive specialization strategy	It considers maintaining the existing level of

	specialization or its slight deepening, if possible.
--	--

b) The category of restricting the activity strategies will include those options that limit or modify the area of deployment of company’s activity, of markets, that reduces the production rhythms or the strategic objectives. There are the following strategies of restricting the activity:

Table 3. Typology of restricting the activity strategies

Strategies of restricting the activity	Motivation
The strategy of starting in another market or industry	It means the change of sector of activity or the market.
The strategy of regrouping by segmentation	It considers letting go those unprofitable or hard to protect segments of market and concentrating the forces on the markets the company can excel on.
Abandon strategy	It considers letting go the business from imposed or own reasons.
The strategy of restrictive specialization, niche kind	It considers implementing a volume strategy in a certain market sector.
The strategy of restrictive specialization, fortifying kind	It considers activity restricting upon competencies and not by market sectors.
The cleaning strategy	The elements of low added value in relation to the offered price are gradually expelled from the offer, thus identifying responding reactions from the market and the consumers segment.
The limitation strategy	It considers selecting the sector that can support a differentiation and suppressing the disposable elements in

	order to lower the price according to the reference offer.
--	--

In order to measure the conditions of the socio-economic environment we can use the concept of regional competitiveness because it contains a series of relevant indicators in order to generate a correct image of the socio-economic potential of a region and of the influence on the activity of that region's companies. This concept acknowledgement will be made according to the model submitted within the manual of evaluating the regional competitiveness, made for Romania in 2007 by GAE (The Group of Applied Economics) [6]. The analysis matrix of regional competitiveness submitted by this group contains two parts: one of "hard" indicators, based on statistic data available regularly at regional level and a matrix of „soft” indicators, based on information obtained through survey management, at sub-regional and local level. The „hard” matrix starts from the structural indicators of Lisbon Agenda, 125 numbered from which 13 have been selected, weighted in 3 indexes: economic, social and technological, as shown in the table below:

Table 4. “Hard” indicators of regional competitiveness analysis matrix

Economic Index (I _E)	GDP/inhabitant
	GDP growth rate
	Work productivity
	Net exports
	Gross fixed capital formation in relation to GDP
	Net income per inhabitant capita
Social Index (I _S)	The dispersion of regional employment rates
	Employment (total)
	Employment – women
	Medium life expectancy index
Technology Index (I _T)	Research & development expenses as % of GDP
	The employment in high technology sectors
	Tertiary education with advanced specialization in research

The calculating formula of the regional competitiveness index – **IC** is a weighted average of three indexes, economic, social and technologic. At their turn, each of these indexes are calculated as a weighted average of the variables selected among each group of concern (economic, social and technological) [6]. The values described by the regional competitiveness index have as an average value of reference the 1 value (the national average).

The „soft” matrix described by the GAE group starts from a series of communitarian indicators of regional development, having the purpose of introducing the indicators at local level, relevant for regional competitiveness diagnosis. These 15 indicators have been grouped in five categories referring to:

- development/ poverty fighting by projects
- social cohesion
- communication
- economic competitiveness
- social development

According to GAE, the index of communitarian competitiveness INDCOM is determined as a factorial score of the five indicators by using a factorial analysis with forced withdrawal of a single factor, and the index of regional competitiveness INDREG is calculated as an average of the INDCOM values, weighted by the localities' population [6]. The values described by INDCOM or INDREG have as an average value of reference the 50 value (communitarian average).

The environment trend, both regional, as well as communitarian one will be assessed according to the average measures specific to those two levels of analysis according to the table below:

Table 5. The environment trend matrix

		Level of regional competitiveness (I _c)		
		Above average	Average	Below average
communitarian competitiveness index	Above average	(+++)	(++)	(-)

	<i>Average</i>	(+)	(-)	(- -)
	<i>Below average</i>	(-)	(- -)	(- - -)

Legend:

- (+ + +) = Extremely favourable trend
- (+ +) = Very favourable trend
- (+) = Favourable trend
- (-) = Less favourable trend
- (- -) = Unfavourable trend
- (- - -) = Very unfavourable trend

The situations below the thick line are correspondent, in the above mentioned strategy's life cycle chart, to the strategies with an environment trend preponderant unfavourable and the ones above the thick line, to the strategies with an environment trend preponderant favourable.

3. The analysis of the strategic potential

In order to conceive a certain strategy, as we have already said, the strategic potential of an organisation must submit to the functionality parameters of the given strategy. In other words, an upstream integration strategy can't be conceived if the financial capacity of the organisation doesn't allow the acquisition or the development of certain production structures or if the current contracts with the current suppliers contain exclusivity clauses or they do not offer the possibility to cancel them.

Because of that, we must assess the strategic potential of the organisation before we select, from the area of possible strategies in line with the environment trend, the possible functional ones.

This analysis must give, on one hand, the description of the least requests to apply each strategy, and, on the other hand, it must describe the situation which the company is in.

For example, if it is seen that the environment trend is unfavourable, one of the strategies the company should consider is *the*

restrictive specialization, fortifying kind, which occurs when the sector is at maturity level or in decline and the competitive positions tend to weaken, in this case the contraction is subject to competences and not to market segments. In this case, the least requests to apply this strategy are the following:

- the sector is at maturity level or in decline
- competitive position in deficit
- well defined and protectable competences

From the strategic potential view, in order to conceive a certain strategy, the organisation should have the conditions of fulfilling the least requests in a reasonable degree. Thus, such a strategic option is purely theoretical, inapplicable and if used, the consequences are incontrollable.

4. Conclusions

The analysis within a strategy conceiving phase helps us position and segment the strategies from perspective of the environment factors that influence them and of the potential that the organization disposes of.

The environment tendencies must be studied through the competitive influences at the regional and community level. These influences are adjusted by the strategic potential of organizations and they can be transposed into sustainable competitive advantages.

This leads to the conclusion that from the strategy conceiving phase, the key success factors of a company success are identified.

Abstract

Although ergonomics has proven essential to increasing the productivity in every industry, worldwide, in contemporary organizations where managers do not perceive the ergonomic aspects or organizational design as some of their duties, there can still be effects of not paying it the right respect.

Acknowledging the importance of the relationship between ergonomics and human resource management in organizational behavior, this paper aims to briefly analyze the determinants of activity, so that interested parties have a clear view of their importance, to identify elements of the labor process that work well, so that they can be maintained in the future, and those elements which do not function well and which can be improved to the purpose of an improved labour process.

Keywords: ergonomics, determinants of activity, tasks and work requirements, environmental conditions and equipment, social environment

J.E.L Classification: J24, M12, M54, O15

1. Introduction

Ergonomics is a relatively new science that has evolved and developed with changes occurred in the labour process and with scientific progress, from the initial

conception, adaptation of labor to humans [5] to the contemporary, the optimization of the human-machine-environment relationship [1].

Ergonomics is a component of human resource management, which in turn, is part of the organizational management.

More and more specialists consider that the human resource management orientation to ergonomics is essential for the future of any organization, as managers' efforts to arrange the working environment are reflected in the motivation of workers, their working efficiency, and thus it can increase the productivity in the organization. Therefore, by attracting, developing and maintaining the human resources the organization needs, managers should be increasingly concerned with balancing economic performance, social performance, long-term business success being ensured only if the interests of employees are included in the organization strategy.

The multitude of definitions of ergonomics in the specialised literature have a common point represented by the fact that the main focus of this science is the man. As shown in these definitions, ergonomics studies the human interaction with the means and the working environment (physical and social), in order to increase efficiency and optimize the conditions of health, safety, satisfaction and comfort, which together provide increased organizational performance and reproduction of labor.

The purpose of ergonomics is, therefore, to improve the work process, to change it in order to make it compatible with the functioning of the human.

To implement this purpose, ergonomics uses an analysis of the professional activity of the individual as a whole, by integrating its dimensions: physical, mental and social, which are to be found in different degrees in the worker (the individual is physically positioned in space, they think, communicate, and interact with others, while performing their activity).

2. Determinants of activity

The **determinants** of activity are those aspects of a work situation that generate the way the person will perform the work [6].

Identification of determinants of work is an essential stage in the ergonomic approach because it will allow the process elements that work well to be sustained and those that do not work properly to be worked upon, to improve the work process.

Determinants that make up the framework are grouped by some specialists [6] in three categories as follows:

- tasks and work requirements;
- environmental conditions and equipment;
- social environment.

A.Task analysis is a major part of ergonomics as an applied discipline, which is supported by the fact that it is also called "the science of work".

The tasks, together with procedures and guidelines established by the organization, underlie all productive activities.

The specialized literature expresses the opinion of foreign authors (Llaneza Javier Álvarez), and Romanian experts agree with this opinion [2], [1], that, in terms ergonomics, **work** has two components:

- **the task**, consisting of the formal and theoretical description of work, which includes requirements, both physical (working position, the handling of loads, etc.) and psychic conditions (cognitive demands, psychological and psychosocial);
- **the activity itself**, which facilitates knowledge of facts and phenomena

through opinions and representations of workers, and which is never pure execution.

Performing the activity will lead to expected results in terms of quantity and quality, as long as the person who has been distributed the work task very well understands what is expected from them. In other words, the clarity and precision of tasks and requirements set by the organization, the conditions and expected results have a direct impact on the quantity and quality of the work the employee must perform, leaving them with a large or small interpretation space, which also depends on the individual characteristics of each worker.

In relation with work task analysis, some experts define the following concepts [3]:

- **external task or pressure of work**, representing the external conditions and requirements present in the working system, and which affect the human body;
- **internal task or tension of work**, consisting of the worker's internal response to exposure to the pressures of work, response influenced by their individual characteristics (size, age, work capacity, skills, etc.).

About the cases where the worker's ability to perform the tasks is exceeded by the requirements for its implementation, a work overload situation, as it is called in the specialized literature [3] distinguishes between:

- **quantitative work overload**, associated with the conditions under which the worker can not increase the pace of work or has too many tasks to deal with, in a relatively short time;
- **qualitative work overload**, relating to the performance of very demanding work, which the worker believes that they can not perform properly.

In addition to the main purpose consisting in understanding the tasks, specialists in the field believe that task analysis has some additional purposes, including: product design, design of security systems or work spaces.

In conclusion, through the work task analysis, ergonomics facilitates the knowledge of work tasks, how they can be achieved, the necessary conditions, and by

trying to bring them closer to the capacity, structure, features and functions of the human body, the science provides prerequisites for effective realization of the human potential.

B. Conditions and facilities offered by the job refer to the many determinants of the activity which have a different value, including: organization of work, organization of production, organization of training, physical environment, technical equipment etc.

Work organization includes several major activity determinants (the ability to work, the distribution of tasks to different positions, the relations between positions, the composition of work teams, the work program, the method of payment of employees, the job evaluation procedure, the system used to replace the absent workers, etc.), which may also influence the collective dimension of work (support, cooperation, coordination, etc.) or moderate the effect of the determinants involving the technical equipment.

One of the main elements of work organization and ergonomic design is **the ability to work**. This concept refers to the functional potential of the human body, which helps maintain an optimal level of intensity and efficiency of its performance, over a period of time as long as possible, even throughout the work program, in other words, it refers to all possibilities a person has to perform an activity, to a maximum [3].

The working capacity is determined by several factors, which can be grouped into three categories as follows:

- **biophysiological factors** that are intrinsic to the body, determining the internal labor capacity (age, sex, the build and functioning of the body, the content and organization of nutrition, health, etc.)
- **psychological factors** that influence the ability to work through individual personality (skills, temperament, motivation, etc.)
- **social, economic and technological factors** acting from the outside and reflecting the conditions in which the possibilities of the body are exploited (education level and training, ergonomic work organization, working and resting

conditions, physical work environment, etc.).

Among the biological factors, **the content and organization of food** has a special place, as it ensures the vital energy needed for the vital processes and for the professional activities.

Food organization is the number of meals and snacks throughout the day, their distribution and the hygiene prerequisites.

Personal hygiene includes, among other factors, the necessary factors for changing the body's position during the meal, to ensure proper rest and blood circulation.

Health is defined by the absence of disease, along with the welfare of the body as a whole (physically, mentally and socially).

Dynamic work capacity requires **organizing the work and the weekly rest** on a scientific basis so as to avoid accumulation of fatigue caused by incomplete restoration of daily functioning of the body's potential.

Organization of production of goods or services influences the organization as a whole, because the choice of manufacturing philosophy (timeliness, total quality, etc.) or organization characteristics (size, sector working experience, mission, type of goods, products or services, such as the production process - craft or in-line, labor costs, market position against the competition, etc.) made under an insufficient knowledge of the actual work can have negative consequences on both the production process, and the health and safety of employees.

Support determinants of the production process are also to be found in this category, including: maintenance, quality service, logistical and technical support, circulation of information.

Organizing the training and learning conditions also refers to a number of determinants of great importance. Although these determinants are included in the previous category, that of the determinants of support of production activities, some experts [7] prefer to deal with them separately to highlight their potential and the significance of any negative effects they may have on the organization, as, in practice, the importance of these determinants is often underestimated.

Business people spend most of their time outside their homes, at work. As the workplace becomes a second home, the way it is arranged is very important, as it can induce a state of comfort to the employee, if appropriate, or, on the contrary, causing fatigue and, consequently, a reduced ability to work, if improperly designed and fitted. Given these issues, the problem of **optimizing the working conditions**, so that they have a positive effect on employees, appears as extremely important.

The physical environment includes the spaces in which the work is carried out on the one hand, and the physical environment of the workspace, on the other.

The space available to an organization includes the space that is destined for performing the jobs, with their associated characteristics, and areas designated for specific uses, more or less definite, (such as, for example, storage areas for materials, raw materials, products in production or finished products, equipment) or alleys for foot passengers or vehicles. The existence of these areas within the organization generally facilitates the work in workstations (proximity to storage facilities the process by reducing unnecessary trips of employees), but they can also generate some drawbacks (traffic lanes too close to the workstations may present a risk to health and safety, there may be visual barriers, which may influence the way the employees work and the way they are monitored).

The physical work environment refers to the audio, visual and thermal, the air quality and the presence of physical stressors, chemical or biological, in the workplace. Their effects on health and human condition are known at present, as they have been the subject of numerous studies, but the impact of workers' exposure to combinations of these stressors is not very clearly established.

Some authors have grouped environmental factors, depending on their nature and their influence on the human body, in [4]:

- **physical environment factors**, including: lighting, noise, vibration, clean air, microclimate (temperature, humidity, air velocity, radiation calories) etc.;

- **mental environment factors** such as: color, functional music, variation - monotony, consideration - disconsideration, collaboration - non-collaboration, interest - disinterest, etc.

The ambient **noise** is a physical factor that is often responsible for the onset of fatigue and decreased activity results because its presence not only affects the auditory organ, but also many nerve centers or even the entire body causing biological and physiological changes that are reflected finally, in the work efficiency.

The seriousness of the action of these factors on the body is different. Thus, depending on the time necessary to restore the hearing after the annulment of the case, one can speak of a **phenomenon of adaptation** (when the interval is relatively short, at least 15 seconds and a maximum of 3 minutes) or **auditory fatigue** (the auditory analyzer fully recovers in more than 3 minutes).

But the presence of noise does not only affect the hearing exclusively, but the whole human body, its harmful effects (of a physiological, nervous and mental nature) can be extended to the general ability of the worker and the results of the work performed. Therefore, to prevent and control the effects of the noise, there must be taken several steps in this direction, as early as the stage of labor resources design.

Removing the harmful effects of noise and improving the body is an effective way of maintaining the health of employees and increasing their work efficiency.

The main purpose of **lighting** is to ensure adequate visibility at work, without overworking the eyesight. This factor has a physical environment importance since it may cause visual comfort at work, the degree of eyestrain of the employees, and thus, the efficiency of their activity.

The most suitable light sources at work are **natural light**, because it does not tire the eyes (which are best adapted to it), and it has a greater diffusion of light, it is hygienic and, last, but not least, more economical. However, natural lighting presents some disadvantages, namely: it is neither permanent nor constant, presenting

large variations throughout the day, and the luminous flux distribution possibilities are limited. The use of natural light can be determined by the size and position of the windows or by using external or internal blinds.

If it is not possible to ensure adequate natural light at a proper intensity, as well as in the case of workplaces without daylight, they have to use **artificial lighting**. Artificial light should be as close as possible to natural light, in terms of intensity, color and caloric radiation.

Lighting must be uniform so as not to produce a contrast between the workplace and the environment. Illumination uniformity is achieved by the number of luminaires and their location.

According to the specialized literature, the importance of visually protecting the human body is supported by the fact that approximately 90% of all information is gathered by humans through eyesight, which explains the special requirements.

Following the studies performed on this issue, it has been agreed that lighting influences at the same time: the health of the visual organ, the comfort at work and the health of the employees, the effectiveness of the work performed. On the other hand, reasonable lighting of the premises and working places may have an effect on preventing accidents at work, improving the working conditions and the quality of results, maintaining the work capacity and increasing the labor productivity.

As it has been demonstrated by research conducted to date, the work performed in poor lighting conditions has harmful effects, both on the visual organ and the whole body. Intense and prolonged straining of the organ of vision, especially in poor lighting conditions, can result in the following successive phenomena:

- **eye fatigue**, which is installed after unilateral and intense overworking of the eye, and it can be manifested by pain or eye burns, shedding, headache, diplopia (double vision), decreased ability to adapt to light, reduced speed of perception, reducing contrast sensitivity, decreased visual acuity;

- **nervous exhaustion**, which is generated by an activity that requires intense straining of visual perception, but not of the retina or the optic apparatus. The main symptoms of nervous exhaustion are: a decrease in the accuracy and speed of movement, a reduced capacity of visual perception, reduced reactions, the occurrence of the state of malaise, headache, dizziness, insomnia, etc.

Because lighting adversely affects the quantity and quality of the work performed, and the frequency of errors and accidents, job organization must use ergonomic principles, taking into account the specific work, the possibilities of the worker and the economic requirements.

Organizations must also bear in mind the fact that an excessive level of illumination is not necessarily effective, and assessing the efficiency of a lighting level is based on several factors including: the size of the object or its details, the contrast between the object and the background, the immediate environment of the reflectivity, the time required to perform the visual task etc.

Cromatic ambiance is a psychological environment factor influencing the degree of fatigue of the human body and the results of quantitative and qualitative work.

Studying the color functionality (their effects manifested directly and indirectly on the human and the results of their work), and their psychological and physiological influences, it was found experimentally that the various shades of colors produce different psychological reactions in humans, for which reason, they were divided into three main groups as follows:

- warm colors and cold colors;
- stimulating (or irritating) colors and soothing colors;
- light color and heavy colors.

Warm colors are orange, red and yellow, or those achieved by a combination of them. They give the feeling of closeness and they are used in very spacious rooms to create the impression of comfort. **Cold colors** such as blue, green and violet, have the ability to calm or comfort.

The ergonomic design of jobs, seeking to preserve the health of employees and their

normal working capacity, involves ensuring favorable **microclimate conditions**.

The microclimate conditions in which the work is performed comprise all the physical factors (temperature, humidity, air movement and radiant temperature) which exert their influence on the body, as stimulators of the body's thermoregulatory function.

The normal **temperature** is between the following limits: 18-24°C in summer and 17-22°C in winter, with maximum variations of 2-3°C on the horizontal and 1.5 to 20°C on the vertical, presenting up to 2-3°C differences for central heating and 4-6°C for local heating within 24 hours.

Humidity is given by the amount of water vapors in the atmosphere. In a pleasant microclimate, humidity values must be between 40 and 50%.

Air currents occur due to different volumes of air traffic in the area, caused by uneven heating and thus different density; it is measured in m / sec.

Calorific radiations are electromagnetic waves of propagation of small particles (quanta), which is, actually, heat in motion.

The microclimate conditions are assessed in relation to the quantity and quality of the **inspired air**. The most common causes of damaging the quality of the inhaled air: the presence of odors, fumes, dust, gas, lack of oxygen and the great carbon dioxide concentration.

Design and organization of ergonomic workplaces must also ensure **hygiene measures** designed to protect the employees.

Construction of a workstation should also consider the technical equipment necessary (raw materials, tools, safety equipment, machinery and other technical devices), which have a direct impact on the activity.

C. The social environment will be appreciated by the following two aspects:

- **The social structures and the organizational culture**, which refer to the process of consultation and decision making within the organization.
- **The various actors that workers interact with in their professional activity**, which are the people working in the same organization, or within another

service, co-workers, supervisors, unions, customers and people using the services offered by the institution.

3. Conclusions

The job requirements, the conditions and facilities provided by the workplace and the social environment are part of the work process that can be the direct cause of the workers' condition, and facilitators of performing their activities.

The Entrepreneur, Mobility and Flexibility Support of Small-Sized Companies

Costică Roman

Stefan cel Mare University of Suceava,
corpad03@yahoo.com

Abstract

In a market economy, the entrepreneur is seen as one of the most important vectors. He is actually the person who initiates or takes over a business, but at the same time takes upon himself some risks that most ordinary people would not do it, and sometimes by applying fundamental knowledge in a completely original manner to ensure business success, we can say that it keeps the economical organism dynamic and alive. In practice, careful analysis and lucid assessment of their own skills, abilities and availability of financial resources compared to the requirements to start a business envisaged enable potential entrepreneurs to assess their chances of success in starting and developing business that does not exceed a medium size. This paper takes into account based on the literature, several aspects of the above-mentioned circumscribed theme.

Keywords: *business opportunities, customers, SMEs, business decisions, profitability*

1. Conceptual elements of the entrepreneur

According to the literature, entrepreneurs are people with practical spirit, always looking for new opportunities for business combinations, being methodical and meticulous anticipation all actions (Sasu, 1998). They are described as promoters of changes that they consider common.

Typically, entrepreneurs do not make the changes themselves, but they analyse them and use this as an opportunity (Chivu et al., 2001). Some results of our entrepreneurial research indicates two categories of entrepreneurs (Rasca, 1998): specialists entrepreneurs (marginal) and dynamic entrepreneurs.

The first category generally has technical studies and what is called special „technical skills”, but their leadership skills and communication are lacking or less developed.

They exhibit the following characteristics during the decision-making process: they are paternalistic (they lead their business as it was their own family); are reluctant to delegate authority; they use few (one or two) capital resources to start a company; they identify marketing strategy with the quality and price of the products and the company’s reputation; they are in charge of sales, and also they count on a limited time horizon.

Dynamic entrepreneurs are those who supplement their technical education with the economic and/ or legal education (Peterson & Smith, 1987). They avoid paternalism, delegate authority, use different marketing strategies and varied sales methods, they use more than two resources of business capital and they set future long-term development plans.

Whichever category they fall, you should note the impact of the crisis phenomenon that manifests itself today on the entrepreneur. The following graphical representation takes into account this aspect, having as a study case Romania (Fig. 1).

Fig. 1 The psychological impact of the crisis on entrepreneurs

Source: White Paper on SMEs (2010)

2. Business opportunities and orientation towards small-sized companies
