30 Years since the Convention on Sea Law

Constantin Anechitoae

Faculty of Law „Ovidius” University of Constanta
anechitoae@yahoo.com

Abstract

This year we celebrate 30 years since the CONVENTION ON THE LAW OF THE SEA was adopted and signed in Montego Bay – Jamaica, at 10th December 1982. As at 03 June 2012, the number of parties to UNCLOS stood at 162, including the Cook Islands and Niue including the European Community. United Nations Secretary - General Ban Ki-moon will launch the Oceans Compact—an initiative to strengthen United Nations system-wide coherence to deliver on its oceans-related mandates--on Sunday, 12 August, in Yeosu, Republic of Korea. “The world’s oceans are key to sustaining life on the planet,” the Secretary-General says in the Compact, “constituting a conduit for ninety per cent of the world trade, and for connecting people, markets and livelihoods.” But he adds that humans have put the oceans under risk of irreversible damage by overfishing, climate change and ocean acidification, increasing pollution, unsustainable coastal area development, and unwanted impacts from resource extraction, resulting in loss of biodiversity, decreased abundance of species, damage to habitats and loss of ecological functions.[1]

Key words: UNCLOS; Romania; Black Sea
J.E.L. classification: K33 - International Law

1. Introduction

On 12 August 2012, at the Yeosu (Republic of Korea) International Conference to commemorate the thirtieth anniversary of the opening for signature of the United Nations Convention on the Law of the Sea the United Nations Secretary-General, Mr. Ban Ki-moon, launched the Oceans Compact - an initiative to strengthen United Nations

system-wide coherence to deliver on its oceans-related mandates.

“The world's oceans are key to sustaining life on the planet. The ocean constitutes a conduit for ninety per cent of the world trade, and for connecting people, markets and livelihoods. In light of the ocean's interconnectedness, all nations of the world should strive to make the oceans places of safety and sustainability of maritime activities for all humankind.

Humans, however, have put the oceans under risk of irreversible damage by overfishing, climate change and ocean acidification (from absorbed carbon emissions), increasing pollution, unsustainable coastal area development, and unwanted impacts from resource extraction, resulting in loss of biodiversity, decreased abundance of species, damage to habitats and loss of ecological functions”[2].

2. Legal frame

All countries of the world are continuously striving to decide on proper legal norms for the international co-operation process, in order to piece up differences in an amicable way through negotiations based on legal equality according to art. 2 paragraph 3 of the United Nations Charter.

During different stages and phases of its development the social and economic life depends upon the maritime field where through common efforts of the entire humanity we are called upon to obey fundamental requirements regarding: a) the rights and duties of each state for the use of seas and oceans of the world b) the definition of practical forms and means to improve their riches. [3]

2.1. International legal frame

The most important international forum the United Nations' Organization has had preoccupations regarding the coding of legal regulations and norms in the maritime field.

In 1958 during the first UNO Conference on the Law of the Sea concrete norms were drawn up for the first time in all fields of maritime law, i.e. the territorial sea, continental shelf, high seas and fishing, and thus all maritime spaces have been included in a general concept envisaging both the issue of national area, with the rights and obligations of the neighboring states and the other states in the region and the issues of the free sea where the rights to sail, to fish, to lay cables and pipelines and to fly over were recognized.

After these regulations have been adopted some important issues such as those concerning the limit of the territorial sea [4] and the regime of submarine land [5] have been reconsidered in order to draw up new legal solutions. Thus, following debates during 1967 - 1970 regarding the legal regime of the submarine land which are beyond the limits of national jurisdiction, The General Assembly of the UNO adopted in 1970, the *Declaration of Principles*, through which the international area was established as „common patrimony of mankind”. Gradually, the issue of this patrimony has stirred more and more interest; ways and practical means to draw up and exploit the resources in these territories have been approached and the conclusion was that mineral resources should be capitalized on equal terms and under no circumstances should the resources „be acquired by certain states or individuals”[6].

Under the influence of sweeping changes in the world economy, as a consequence of the contemporary scientific and technical revolution when new resources have been discovered and due to the exacerbation brought about by the noxious effects of pollution on the marine benthos, further developments of maritime reports have determined the summon of the 3rd UNO Conference on the Law of the Sea in 1970 [7].

The Conference adopted in a constructive manner all maritime issues in order to obtain „real progress in setting an exploration and exploitation system of the resources of the oceans in *the interest of all nations*.

3. 30 years since the CONVENTION ON THE LAW OF THE SEA

This year we celebrate 30 years since the CONVENTION ON THE LAW OF THE SEA was adopted and signed in Montego Bay – Jamaica, at 10th December 1982.

When the CONVENTION ON THE LAW OF THE SEA was adopted everybody expected that an order will be established concerning the issues related to the sea and at the same time concerning a uniform exploitation of the riches of the Planetary Ocean in the benefit of all nations.

The reference period was scattered with many misunderstandings and disputes regarding the settlement of issues according to the provisions of this Convention.

During this period all institutions mentioned in the Convention have been designed to deal with the solving of this problem and have made efforts in this respect.

Although the issue of limiting some maritime areas between riverside states to the seas and oceans of the world have not yet been finished and, as a consequence we appreciate that these may cause a potential conflict.

We can also mention as novelty a new area which may bring about a potential conflict. This is determined by the climatic changes which call forth the thawing of the ice cap, and thus disclose new possibilities to explore and exploit resources with restricted access in respect with the economic potential of certain states.

This is also a present reality since the objectives of the convention in what concerns the exploring and exploitation of seas and oceans of the world unconventionally dissociate between the economic advanced countries in respect with the expectancies of the countries under development which have not practically capitalized on the advantages of these international provisions.

Illegal fishing and other maritime offences are activities which violate the provisions of the CONVENTION ON THE LAW OF THE SEA and which are still going on in certain maritime areas without the real possibility to prevent or sanction them by applying corrective forces of maritime world.

Some clarifications regarding military and security activities are expected that should clearly state rules concerning foreign military operations and intelligence activities in the Economic Exclusive Zone.

Also, measures envisaged for the maintaining of security at sea are still not clearly defined, thus enabling threats of international terrorism on land extend to sea as well.

Many states have no logistics to perform control to impose measures and to maintain a state of safety regarding the navigation of tankers in adjacent areas of the Contiguous Zone and Territorial Sea, respectively.

In areas restricted to certain rules under the control of riverside states through their political and economic pressures a threat regarding the freedom of safe navigation can be foreseen in the interest of the countries which owe tankers with drafts over the maximum admitted limits.

The problem of „innocent passing” and the situation of mines on the seabed which have not yet been detected and destroyed must be also considered in what regards maritime safety and the international authorities should revise their approach in this respect.

If till the adoption of the CONVENTION ON THE LAW OF THE SEA the academic teams of experts have played an important part in promoting negotiation regarding maritime issues among states, after 30 years there is a decrease of their role. This role has been taken over by the 162 states (including the Cook Islands and Niue and the European Union Cook Islands and Niu) and the European Union [8] which have adhered or ratified this Convention so far.

The process to include the provisions of the CONVENTION ON THE LAW OF THE SEA in the national maritime law is closely linked to the act of its ratification. In this respect, we consider that most provisions of this Convention contain legal norms which in a certain degree support the initiatives of the under developed countries but they still remain ineffective because of their reduced economic potential.

The legal norms edited by the Convention have imposed all states to accept obligations on equal terms in order to perform maritime activities but they disregard economic and political realities of the industrialized countries. In this respect we can singularize

the United States of America, a country which has not ratified the CONVENTION ON THE LAW OF THE SEA up to the present, although in the issues of international law and external policy they observe and promote its principles.

4. Conclusions

Twenty-seven years have passed since the conclusion of the United Nations Convention on the Law of the Sea, by means of which we reached a delicate balance among countries, in order to strengthen maritime security, to protect the oceans of the planet and to generate international cooperation on maritime issues.

The threats to maritime security and safety can only be addressed through the concerted efforts of all States. It is also important that those measures taken in order to meet such challenges have to be consistent with the international law.

The report concludes that sustainable fisheries development remains a significant challenge for the international community. Most of the world's main capture fisheries have reached maximum potential. Unsustainable fishing practices persist in most areas of the world, and vulnerable marine ecosystems are being adversely impacted by non-selective fishing gear and techniques. The demand for fish products is expected to increase, and more efforts are needed in order to set out the commitments in the Johannesburg Plan of Implementation, which have to be met by 2015. As such, it is imperative to address unsustainable fishing practices and promote universal participation in international instruments that provide for the long-term conservation of fishery resources.

The Protection of New Plant Breeds

Constantin Anechitoae
Faculty of Law „Ovidius” University of Constanta
anechitoae@yahoo.com

Abstract

New plant breeds created or discovered or developed by a person, may be protected in terms of industrial property law, only by requesting / granting a plant breed patent. In these circumstances, the owner of the plant breed patent - breeder acquires an exclusive right of exploitation, throughout the entire period of the breed protection, and he also has the right to prohibit to any other person to perform without his authorization acts on breeding, production, sale or resale or any other form of marketing, importation or exportation or storage for one of these purposes. The protection under the plant breed patent of a protected breed, whose plant breed patent holder may be any legal entity or natural person, has direct effects on a financial plan, by reducing the innovation costs and by boosting the research and innovation activities for research institutions, companies and inventors in this field.

Key words: breeder, plant breed patent, industrial property, plant breeds

J.E.L. classification: K11

1. Introduction

The patentability of new plant breeds is related to the authenticity and purity of the breeds discovered or altered, obtained through lengthy testing and assessments related to the professional capacity of researchers in this field [1]. The process of approval and certification of plant breeds requires several scientific stages which are universally available in the world of plants destined to agriculture and finalized with legal instruments for the protection in the field of industrial property law. Each year there are tested and retested thousands of breeds from the species for large scale culture, i.e. cereals, legumes, sunflower,

rapeseed, potato, sugar beet, fodder plants, medicinal and aromatic plants, vegetable species, fruit trees and shrubs, grape vine and ornamental species. The main creator of new plant breeds are research institutes, which, by their intellectual creation in conjunction with the application of legal concepts, are called primarily to ensure the health of new breeds and hybrids.

2. New plant varieties protection regulation

The protection of plant breeds was brought into discussion for the first time at international level by means of granting several exclusive rights to plant growers, by researchers in the United States of America [2]. Thus, since 1930, the growers' rights have been protected by a plant patent, which was representing a special form of exclusive law, available only to those plant breeds reproduced asexually, within a handful of European countries [3]. This group drafted on 02.12.1961 the International Convention for the Protection of New Plant Breeds, and it was revised in Geneva on 10.11.1972, 10.23.1978 and 19.03.1991; Romania adhered to it by Law no. 186/2000 [4]. Under the Act of 1978, the rights of plant growers are granted in each Member State for its own territory, and there was also established the International Union for the Protection of New Plant Breeds (UPOV). At the level of the European Community, there were found specific regulations which are not harmonized at Community level, regarding the industrial property regime applicable in each country, which led to the adoption of Regulation (EC) no. 2100/94 of the Council for the Establishment of a system for the protection of plant breeds through the Community Plant Breeds Office. Subsequently, several modifications were made by Regulation (EC) no. 1768/95 and Regulation (EC) no. 2605/1998 the

Commission of 3/12/1998. However, the Regulation (EC) no. 2100/94 has brought several clarifications for the sake of the consistency between the Community regime regarding the protection of plant breeds, the provisions of the European Patent Convention, and the Agreement on issues related to intellectual property rights regarding trade, including trade in counterfeit goods [5]. Nationally, plant breeds enjoy a special protection system governed by Law no. 255 of 30 December 1998 on new plant breeds (r1), as amended by Law no. 119 of 04 May 2006 and the Regulation for applying the Law no. 255/1998 on the protection of new plant breeds approved by G.D. 984 of 22 August 2007. The protection of plant breeds will be taken over by the State Institute for Breeds Testing and Registration, starting from 1st July 2011, according to Article 38 of Law no. 266/2002 (r1).

3. The protection of the new breeds on the romanian territory

Foreign natural or legal persons registered with the office or domicile outside the Romanian territory shall enjoy the Protection of new breeds in Romania, under the International Conventions to which Romania is party. The plant patent holder is entitled to royalties or to equitable remuneration for the exploitation of the protected breed in case of licensing on a contractual basis and the licensee is obliged to pay the agreed sums of money. The disputes shall be settled by common law Courts.

4. Conclusions

The protection of new plant breeds is achieved through a plant breed patent application to the State Office for Inventions and Trademarks or to the Community Plant Breeds Office. The main conditions to be met are: novelty, distinctiveness, uniformity and stability and it has to be designated by the generic name proposed by the manufacturer, under the examination which certifies that the respective name is eligible.

The Downside of "Think Global, Act Local" in Multinational Environments

Baca Eleonora

"Ovidius" University of Constanta

eleonorabaca@yahoo.com

Abstract

The purpose of the present paper is to investigate some of the issues raised by a number of analysts who either consider globalization as beneficial (opening numerous cultural possibilities, multiple identities and choices) or as a threat (the loss of individual thought and local culture caused by the growing bias in favor of the visible and vociferous elements of civil society).

Key words: globalization, culture, economics, international environments, critics of globalization

J.E.L. Code: Z19

Globalization most often refers to the growth of transnational politics, the integration of the world economy, and a subsequent blending of cultures around the world. remote areas still untouched by free trade, television, or migration, might still exist, however, the scope of globalization's impact is by definition global. Commentators have asserted that globalization, above all, creates cultural possibilities that might have been impossible in the modern era when state, economy, culture and people were more tightly aligned. The effect of globalization is to increase the number of choices for actors to the extent that '[m]ultiple identities and the decentering of the social subject are grounded in the ability of individuals to avail themselves of several organizational options at the same time' [1].

Since have concluded that global culture is additive to local culture, a logical consequence would be that actors throughout the world effectively become bi- or poly-cultural. The idea of globalization has long been debated and issued a large number of

theories: Thomas Friedman (1999) sees globalization as the dreamed-of opportunity for economic development and political liberalization for 'backward' peoples around the world. Postcolonial scholars see crypto-imperialist motives in the exploitation of subaltern labour markets and natural resources (Antonio and Bonanno 2000). Arjun Appadurai (1996) sees globalization as the unravelling of the quintessential modern project of nation-building, undermined by a myriad hybrid identities and cultures. [2] The question becomes 'which globalization?' The answer, according to Roland Robertson (1992), is that globalization deserves to be considered in terms of the intellectual and practical terrain on which actors draw their conclusions about globalization, thereby leaving open the possibility of multiple images of globalization. From our perspective, Robertson is right to acknowledge the variety of images of world order with resonance in contemporary society. Yet, despite the wide variety of theory on globalization, it is possible to distill a few key propositions concerning contemporary global culture:

-the world is more pluralistic than the hegemonic world-views of modern social theory had previously allowed. Globalization theory is exceptionally sensitive to differences within and between its analytic categories.

-individuals have more power to adapt, innovate and manoeuvre within a globalized world than the top-down perspectives of modern social theory had previously allowed. Globalization theory takes individuals into account as self-creating agents.

-social processes are relational and contingent. Cultural globalization provokes a variety of reactions—ranging from nationalist entrenchment to cosmopolitan

embrace—that feed back on and transform globalization.

-the key cultural changes of the late twentieth century are the increasing commodification of social life and the increasing velocity and centrality of media. Commodities and media became the material of self-creation as well as legitimate objects of social scientific inquiry .[3]

Economist David Henderson of the Melbourne Business School expands the definition into five related but distinct parts:

- * the increasing tendency for firms to think, plan, operate, and invest for the future with reference to markets and opportunities across the world as a whole;

- * the growing ease and cheapness of international communications, with the Internet the leading aspect;

- * the trend toward closer international economic integration, resulting in the diminished importance of political boundaries. This trend is fueled partly by the first two trends, but even more powerfully by official policies aimed at trade and investment liberalization;

- * the apparently growing significance of issues and problems extending beyond national boundaries and the resulting impetus to deal with them through some form of internationally concerted action; and

- * the tendency toward uniformity (or "harmonization"), by which norms, standards, rules, and practices are defined and enforced with respect to regions, or the world as a whole, rather than within the bounds of nation-states.[4]

Obviously, the main beneficiaries of the trend are the long-suffering consumers in those nations that had been "protected" from global competition. Purely theoretically speaking (and considering only the point of view of those in favour), it expands the range of choice, improves product quality, and exerts downward pressure on prices. Other foreseen advantages would be that it delivers an immediate gain to workers by raising the real value of their wages. Or that it transfers wealth from formerly protected producers to newly liberated consumers, with the gains to consumers exceeding the loss to producers because the deadweight losses to the economy are recaptured through efficiency gains.

Least developed countries, we are often told, have the most to gain from engaging in the global economy. Their first and most important gain would be: access to much larger markets, both for imports and exports. On the import side, consumers gain access to a dramatically larger range of goods and services, raising their real standard of living. As a result, domestic producers gain access to a wider range and better quality of intermediate inputs at lower prices. On the export side, domestic industries can enjoy a quantum leap in economies of scale by serving global markets rather than only a confined and underdeveloped domestic market.

Second, least developed countries that open themselves up to international trade and investment gain access to a much higher level of technology. This confers on least developed countries a "latecomer's advantage": rather than bearing the cost of expensive, up-front research and development, poor countries can import the technology off the shelf. They can incorporate new technology by importing capital equipment that embodies the latest advances and computers with the latest software. Subsidiaries of multinational companies also bring with them new production techniques and employee training that bolster the host nation's stock of human capital.

Third, engagement in the global economy provides capital to fuel future growth. Most least developed countries are people-rich and capital-poor. In a few countries in Asia, the level of domestic savings has been high enough to finance domestic investment, but typically the domestic pool of savings in an least developed countries is inadequate. Global capital markets can fill the gap, allowing poor nations to accelerate their pace of growth. In 1998, \$166 billion in foreign direct investment flowed from the advanced economies to the less developed. A poor country that closes its door or fails to maintain sound domestic policies will forfeit the immense benefits this capital can bring.

Fourth, openness to the global economy can provide the infrastructure a developing economy needs for growth. Foreign capital can finance more traditional types of infrastructure, such as port facilities, power generation, and an internal transportation

network, just as British capital helped to finance America's network of canals and railroads in the nineteenth century. But just as importantly, multinational companies can provide an infrastructure of what could be called "enabling services," such as telecommunications, insurance, accounting, and banking. As China and India have realized, a protected and inefficient service sector weighs down an entire economy, retarding the development of manufacturing and other industries. Least developed countries need to shed the mistaken idea that opening their economies up to international service competition is a "concession" to be made to gain access to farm and manufacturing markets in the advanced economies. In reality, liberalizing their service sectors by opening them to foreign competition is a favor least developed countries can do for themselves.

Fifth, engagement in the global economy encourages governments to follow more sensible economic policies. Sovereign nations remain free to follow whatever economic policies their governments choose, but globalisation has raised the cost that must be paid for bad policies. With capital more mobile than ever, countries that insist on following antimarket policies will find themselves being dealt out of the global competition for investment. As a consequence, nations have a greater incentive to choose policies that encourage foreign investment and domestic, market-led growth. New York Times columnist Thomas Friedman, in *The Lexus and the Olive*, his 1999 book on globalization describes these progrowth policies as "the Golden Straitjacket." The increasingly manifest rewards of engagement encourage nations to unilaterally restrict the scope of government action. As Friedman explains:

To fit into the Golden Straitjacket a country must either adopt, or be seen as moving toward, the following golden rules: making the private sector the primary engine of its economic growth, maintaining a low rate of inflation and price stability, shrinking the size of its state bureaucracy, maintaining as close to a balanced budget as possible, if not a surplus; eliminating and lowering tariffs on imported goods, removing restrictions on foreign investment, getting rid of quotas and domestic monopolies, increasing exports,

privatizing state-owned industries and utilities, deregulating capital markets, making its currency convertible, opening its industries, stock, and bond markets to direct foreign ownership and investment, deregulating its economy to promote as much domestic competition as possible, eliminating government corruption, subsidies and kickbacks as much as possible, opening its banking and telecommunications systems to private ownership and competition, and allowing its citizens to choose from an array of competing pension options and foreign-run pension and mutual funds.[5]

The advance of the globalization trend has not been a smooth or a pain-free process. The changes it has caused, or is perceived to have caused, have spurred a number of political backlashes. Two of the most common complaints against it are that it has undermined labor and environmental standards, and that it has exacerbated the gap between rich and poor, both among and within countries.

Critics of globalization quite often warn of a destructive "race to the bottom," as advanced nations are forced to weaken labor and environmental standards to compete with less-regulated producers in developing nations. This theory rests on the assumption that lower standards give least developed countries a significant advantage in attracting global capital and gaining export markets at the expense of more developed countries. The OECD has found that, in practice, a lack of core labor standards plays no significant role in attracting foreign investment or in enhancing export performance. The OECD did find strong evidence "that there is a positive association over time between sustained trade reforms and improvements in core standards." [6]

In other words, trade liberalization encourages higher standards, not lower standards. If anything, the real race may be toward the top. For reasons of internal efficiency as well as public perceptions, multinational companies tend to impose higher standards on their overseas production plants than those prevailing in local markets, thus raising average standards in the host country. Free trade and domestic liberalization--and the faster growth they create--are the best ways to encourage higher standards. As per capita incomes rise in less

developed countries, so does the domestic political demand for higher standards, and the ability of the productive sector to pay for them. Punishing least developed countries with trade sanctions would only cripple their long-term ability to raise domestic labor and environmental standards.

Some environmental activists complain that the global trading system, as embodied in the WTO, favors free trade at the expense of environmental protection. But WTO rules place no restraints on the ability of a member government to impose any environmental regulations determined to be necessary to protect its own environment from domestically produced or imported products. Article XX of the General Agreement on Tariffs and Trade 1994, the basic charter of the WTO, plainly states that members may impose trade restrictions "necessary to protect human, animal, or plant health." The Sanitary and Phytosanitary Agreement of the Uruguay Round does require that such restrictions be based on sound scientific evidence--a commonsense requirement necessary to discourage the use of health and safety issues as a cover for protectionism. If WTO members are found to be in violation of their commitments, they remain free as sovereign nations to simply ignore any adverse WTO rulings against domestic regulations that impact trade. A prominent example is the European Union's ban on the sale of beef from cattle treated with growth hormones. The EU has repeatedly lost in the WTO, but it has no plans to lift its ban, even though it has produced no scientifically sound evidence that the banned beef poses any hazard to public health. The United States retaliated against the EU in May 1999 by imposing sanctions on \$117 million worth of imports from Europe, but retaliation as a weapon of trade disputes existed long before the WTO. [7]

Antitrade environmental activists complain that several decisions by the WTO have undercut U.S. environmental regulations. In the so-called Shrimp-Turtle case, the WTO ruled against a U.S. ban on shrimp from countries the United States judged were not adequately protecting sea turtles from being caught and killed in shrimp nets. In an earlier, similar case, the WTO had ruled against a U.S. ban on tuna from Mexico that the United States claims

was caught through a process that endangers dolphins. Environmental critics of the WTO point to these two cases as proof of their claim. [8]

As we have seen, economic globalization proves to be a long contested and powerful trend. It is driven by a combination of technological developments, profit-seeking businesses, and generally supportive public policy. Despite these facts, it is also less pervasive and more fragile than is widely believed by both its supporters and its opponents. There are at least two counter arguments which can be brought into discussion: on the one hand it is not an irreversible trend (contesters fully prove that), on the other hand, national borders and policies continue to play a role in limiting and directing international transactions. The most extreme and active of globalization's opponents caricature it as the source of all that is wrong in the modern world, including poverty, injustice, inequality, violence, and war.

Therefore, a possible common sense conclusion about the trend, meant to calm down the spirits would be that it : „is not a magic cure-all for what ails a nation's economy, nor is it a plot by profit-hungry megacorporations to exploit workers and despoil the environment. Globalization is not the return of colonialism, nor is it the arrival of world government. At the most fundamental level, globalization simply means an expansion of the range of possible commercial activities. Acts of buying, selling, producing, borrowing, and lending that used to be ruled out by geographic, technological, or legal barriers have now become practical".[9]

Considerations on the Future of Globalization

Abstract

Globalization is generic concept for a variety of social processes, including internationalization of businesses, the raise of multinational companies, the convergence of business practices. The global interdependences are more tighten, fast-making and more complex ones. The global configuration comprises various local arrangements, either through standardization or adaptation. Globalization is not only an economic issue, is a complex one, multifunctional. It spreads across the entire socio-humane activities: the market and business dimension, the political and social dimension, the religious and spiritual dimension, the domestic and international law, the nation-state and the global society. But the future of globalization is generating a series of problems that we are addressing in this paper. Globalization effects' should be reevaluated.

Keywords: globalization, economic development, international trade.

J.E.L. classification: F43, F50.

1. Introduction

The movement of the space abolishes the time flow. According to Zygmunt Bauman, for some, globalization is something that we must necessarily accomplish if we want to be happy, according to others, the source of our unhappiness lies precisely in globalization. It is safe for everyone that globalization represents the implacable fate that awaits the world, an irreversible process which affects us all equally the same. The globalization divides and unites in equal measure. In

parallel with the rise of business, trade and information at world level, a process of „location" of fixing in space was started. Modern life floats according to global / local hierarchy: globality and locality became contrary and fundamental values, coveted or rejected, but in the center of dreams, nightmares and conflicts of life [1].

It is estimated that the globalization of economic activity and raised governance issues have started after the Second World War during the 1960s. Globalization represents a term often said, be they managers, journalists and, above all, politicians [2].

Other authors claim that globalization process has its origins in a long period preceding the First World War, characterized by a faster development of trade and financial flows, as well as the increasing of international migration. This trend manifested itself acutely in the period 1870-1914, when a strong expansion of European colonialism in Africa and Asia occurs, when the United Kingdom was the first economy in the world and many countries were under the domination of a single currency (gold standard) [3].

2. Meanings of globalization

The real challenge of the XXI century is the democratization of commerce. The clash between the forces of globalization and trade protectionism is a topical issue. One of the great paradoxes of international trade is that, although it brings great benefits to the society in general and to consumers in particular, the liberalization is still threatened by protectionism, which is even more subtle constituted. Despite the creation of WTO in 1995 and other reforms, the aspects of international trade system are far from being

solved, and the dispute between supporters of the liberalization of international trade and those of protectionism continues.

All economists agree that free trade is superior to any form of trade protectionism, i.e., it is the best policy of a country, even if all the others practice protectionism, arguing that the economy which remains open will earn more from cheaper imports, unless will lose from declined exports. The big fluctuations of the values of currencies have affected the finances lately, and the integration of world financial markets had a negative impact on the functioning of the international monetary regime. However, protectionism has never completely disappeared, but in the last two centuries trade restrictions have been a permanent feature of the global economy. They were especially acute in times of economic failure. This is because, with few notable exceptions, most of WTO members are part of regional trade agreements. Thus, the WTO should inexhaustible and objectively judge the compatibility of regional and continued multilateral trade agreements. The "full" structure of WTO has allowed all economic powers to often resort to ad hoc extralegal procedures outside the WTO. What will happen when Russia will be admitted as a member?

Until now, the free trade has worked only asymmetric, allowing the penetration on the markets in the developing countries of the products in the advanced industrialized countries without absolute reciprocal. We appreciate the fact that in the following period, the trade negotiations will focus on the issues of official barriers and especially of the hidden ones and what is called, the "new trade agenda".

The term "globalization" has become customary in the second half of the 1980s, correlative with the huge increase of FDI of NMC's. As an argument, we can show that FDI has grown significantly in the late 1980s, growing into a higher rate than world trade and global economic output. In this framework we should illustrate the fact that FDI is highly concentrated and very unequally distributed around the globe, the majority in the U.S.A., Western Europe, China, and modest, in some Latin American countries (the car sector in Brazil and

Mexico). Consequently, corporate globalization refers to only a few countries.

Globalization is perceived only as an economic phenomenon, although its major implications also focus the socio-psychological: as a proof, anti-globalization demonstrations in Seattle (December 1999), Washington (2000 and 2001), Quebec (2001), Prague (September 2000) and Genoa (2001). Among the latest are: over 15,000 people protested against globalization in London, the city which hosts the G20 summit of industrialized countries (March 29, 2009), anti-globalization protests took place in London and in Germany (March 29, 2009); protests with the heads in the sand to G20 meeting in Scotland (11/08/2009) 14 anti-G20 militants, arrested in Pittsburgh (24.09.2009); 8 June 2007, G8 summit gathered thousands of anti-globalization protesters in northern Germany, anti-globalization protests at Olympic Games in Vancouver (February 15, 2010), where hundreds of anti-globalization protesters clashed with the Canadian police in the Winter Olympics; chaos in the streets of Geneva due to anti-globalization activists (February 21, 2011); protests at the climate summit in Copenhagen : 400 young people required to stop the global warming (December 2009). It can also be mentioned the anti-Mc'Donalds protests: France (José Bové), bomb attempts at McDonald's in Indonesia that resulted in three deaths, attacks against restaurants in Pakistan.

AdBusters organization, organizes Buy Nothing Day "- The day in which I buy nothing", on the 26th of November each year, a time when people stop for a day at the so coveted status of a consumer: "Life is more than an accumulation of goods!" In this context we remember the names of some organizations opposing to the globalization: Greenpeace, Amnesty International, World Wildlife Federation, Clean Clothes Campaign, the World Social Forum, etc.

As a consequence of globalization, international trade increased at a rate almost double of the growth rate of world GDP. In order to prevent the strong balance of payments imbalances, the states are forced to increase the proportion of the prudential reserves for imports. For example, the minimum reserves must be equal to the value of imports for three months.

It is argued that the first proponent of globalization was the Venetian Marco Polo, who with his brother accomplished world trade from the east. As he returned home, he published the famous book of impressions of journeys, "Travels of Marco Polo". In general, there is a convergence of opinions in defining globalization. *The essence of globalization* is the free movement of people, goods, services and capital across the national borders [4].

3. Directions of globalization

From the economic point of view, there are three main trends which can be identified as causes of the increasing of international trade and globalization process. First of all, the one which has the deepest implications, is represented by the technological change. Second of all, more and more governments have promoted liberal policies, in order to open the markets and eliminate the administrative obstacles impeding the development of economic activities. Third, the joint action of new technologies and the existence of freer markets has allowed companies in more countries to internationalize their activity, creating the global economy level as a set of interrelated activities. These trends led to the emphasis of the interdependences which brought together the national economies, creating unprecedented opportunities but also new economic, political and social challenges (Table 1).

Table 1. New indicators of globalization

Economic integration - International trade, FDI, port capital flows and investments
Political commitment - subscription in international organizations, ratification of international treaties and government transfers
Technology connectivity - Internet users, access to wireless telephony and servers security
Personal contacts - international travel and tourism, international telecommunications traffic
Quality of life - access to increasingly broader health education systems. A longer life expectancy

Source: adapted from James Canton, „Provocările viitorului. Principalele tendințe care vor reconfigura lumea în următorii 5, 10, 20 de ani”, *Polirom, Iasi, 2010, page 206.*

The globalization of the world economy affects, without doubt, almost every aspect of domestic and international business. *Its supporters* converge on the assumption that no obstacle should block the free movement of goods, services and capital. Many agree that the globalization releases latent economic energies and leads to an efficient use of decreasing world resources, to maximize global wealth, to promote world peace and to economic benefits for all nations.

The critics of globalization see it as a triumph of the ruthless capitalist system marked by exploitation, domination and inequalities. Free market ideology has proved to be an excuse for new forms of exploitation. „Privatization”, a feature of the foreigners in buying fertile land, mines and oil fields in the developing countries, at moderate prices. Trade liberalization also meant that foreign companies could wipe out the embryonic industries from the Earth, stifling the entrepreneurship development. In fact, capital moves freely but not the same thing happens with manpower, except for the very gifted. Banks are often less interested in lending new industries, but to finance speculative investments, for example, real estate field or to credit governments [5].

The world is engaged in a contest between economic growth and population growth, and population growth seems to prevail until now. As the percentage of poor population decreases, the absolute number of poors increases. 40% of the world population lives with less than two dollars a day and a billion people with less than a dollar a day. From a historical perspective, Africa is the region most exploited by globalization [6].

The poors in less developed countries "subsidize" the rich in the developed countries. It is argued that the most important result of market globalization is the triumph of the market on the nation-state and, consequently, the end of national economic sovereignty. Economic policies and the welfare state are slaughtered in the name of corporate profits and international competitiveness. We bring as an example General Motors, which has been radically restructured and eventually nationalized as a result of economic recession in 2009.

A series of alarmist works present an obscure world of the cultural homogenization

and unleashed commercialism, pollution, if not even the destruction of Western civilization but also undesirable phenomena: the increase of economic inequality and unemployment, the collapse of social programs and welfare state, the destruction of national cultures, illegal migration, increased crime, etc. According to UNICEF estimates, it is estimated a number of 246 million working children. Almost three quarters of them work in dangerous situations - in mines, with chemicals and pesticides, in agriculture, or handle dangerous machinery.

Millions of girls work as maids and are particularly vulnerable to exploitation and abuse - can be trafficked (1.2 million), become slaves to debt or other forms of slavery (5.7 million), forced to prostitution and work in the pornography industry (1.8 million), to participate in armed conflicts (0.3 million) or other illicit activities (0.6 million). Most children (at least 70%) work in agriculture. Asia-Pacific has the largest number of working children in the age group five to 14 years: 127 300 000 (19% of children working in the region). Sub-Saharan Africa had 48 million working children", meaning one child of three, under 15 years (29%). Latin America and the Caribbean, with children as workers, approximately 17.4 million (16% of children who work in the region). Fifteen percent of the children in the Middle East and North Africa. About 2.5 million children in industrialized countries and countries in transition.

Populists wonder how Americans or Europeans workers are living, who earn at least \$ 20 per hour, to compete with the billions of workers from China, India, Indonesia, Bangladesh and others, whose income per hour does not achieve 20 cents. Countries like Mexico, China do not have standards imposed on the labor process or environment protection, factors that increase the production costs in developed countries. In Europe, socialists and neo-fascists often expressed their antipathy on opening economy and the fear for losing the national self-determination. Pope John Paul II believed that NMC activities and international trade lead to the emphasis of the international inequality; during his visit to Cuba (January 1998) he stated that the rich people from everywhere are getting rich and the poor ones become more poor. He even

speculated the concern about the fact that globalization might lead to rich countries with poor people.

One of the (political) economic approaches, the *Theory of the world system*, gives us a vision of the capitalist world divided into "central nations" and "peripheral nations", each topping, semiperiferia". This theory represents a neo-Marxist approach in which the accent moves from the study of the exploitation of the proletariat by the capitalists in a capitalist society, to exploitation between capitalist societies belonging to the capitalist world system. The supporters and detractors of the globalization have different expectations on the distribution of wealth and power within and between national economies. The prosperity of the developing countries which are rich in resources depends on how much they get in exchange of their resources. The prosperity of corporations in advanced industrialized countries depends on how less they pay for these resources. This represents a conflict in the center of the welfare paradox.

It is stated that many of the claims of supporters and critics of globalization, are either exaggerated or untrue, but many of them reflect some truth. For example, indeed, the great concentration of economic power is born from the merger of large corporations, the takeovers and alliances, this rationalization of corporate activities substantially transforms the global economy. The impact which globalization has on the distribution of power between nations (or dominant economies and subordinate economies) should also be correctly interpreted. In fact, a democratic and egalitarian international system has never been recorded in history, and is unlikely to occur, with or without the support of globalization. In an open global economy, there is a risk for a country to lose control over important aspects of its own economy. Norway, Australia and the Netherlands lead the world in the "*Human Development Index (HDI) 2011*", while the Democratic Republic of Congo, Niger and Burundi, are at the bottom of the league's annual Human Development Report, realised by the United Nations Development Programme (UNDP). United States of America, New Zealand, Canada, Ireland, Liechtenstein, Germany and Sweden, complete the top 10 countries. Try

to tell an inhabitant of Africa or in the Caribbean area about globalization...

The reason why international trade agreements have been unsuccessful is their imbalance: advanced industrialized countries were allowed to impose tariffs on goods produced by developing countries or which were four times higher than the tariffs applied on goods produced by other advanced industrialized countries. Although the developing countries were forced to abandon their subsidies designed to help the emerging industries, the advanced industrialized countries have continued to benefit from their large subsidies in agriculture, which led to the decrease of food prices and disruption of the living standards in developing countries. Prices are an important source of government revenues in less developed countries. Their cut brings negative effects in the amount of education funding, infrastructure and social benefits.

Table 2. The future of globalization

Economy based on innovation
Poverty
Higher life standards

Global security

Source: adapted from James Canton, „Provocările viitorului. Principalele tendințe care vor reconfigura lumea în următorii 5, 10, 20 de ani”, Polirom Publishing House, Iasi, 2010, page 191

The globalization limits the capacity of the nation- states to respond in many ways. Governments which try to control the flow of capital realize they are powerless, unlike individuals who seek ways to avoid rules. A country could want to increase the minimum wage, but discovers that this is not desirable, because foreign companies operating in its territory will decide to move to a country with lower wages. The inability of a government to control the actions of people or companies is limited by international agreements affecting the right of the sovereign states to make decisions. Signing international trade agreements may prevent governments to regulate the entry and exit of hedge, dynamic funds, even if capital market liberalization can lead to economic crises.

The globalization process requires the countries to create a strong image, a brand, in order to be better position for global competition. In some cases these images are stereotypes, extreme simplifications of reality that are not necessarily correct [8].

We have a chaotic, uncoordinated global governance system, without a global government, from a variety of institutions and agreements covering a range of issues, from global warming to international trade and capital inflows. The problem is, therefore, the deficit of democracy. Europeans learned with difficulty, how to regard themselves as Italian, French, German, Romanian but also European.

Although there is development, most people are on the breadline. *Gradual economic theory*, which supposes that with the development of society as a whole, everyone has benefits, proved to be erroneous repeatedly. According to some, globalization is inevitable and should be accepted with all its shortcomings. Taking into account that most of the planet lives in democratic regimes, whether globalization will have positive consequences for most of us, we will respond eventually. For a day or two, we can be fooled, with stories according to which, although we suffer today, benefits will soon appear. Globalization will never produce the convergence of economic institutions and practices in the world. Also, globalization can't lead to the "trade" of all aspects of existence, but can lead to some homogenization of values and human behavior.

4. Conclusions

The recent integration of some aspects of the international economy was extremely uneven, limited to certain sectors and not as comprehensive as some think. The only global economic field is the financial one, highly mobile, and the last crisis made credible the accusation that globalization has greatly increased economic international instability. The experience shows that when financial institutions and players move billions of dollars from an economy (or sector) to another one by a simple click, international financial markets can cause disaster in national economies and could destabilize the international economy. We

live in a world where the IMF, World Bank and other institutions could become an anathema of the global democratic civilization.

If we want globalization to work, an international economic regime is desirable in which the welfare of developed countries and of the developing countries to be easier ensured, i.e., a new global social contract between developed and less developed countries. Achieving this new vision will require a new economic model where sustainability will require a diminished emphasis on material goods for those who consume too much and a shift towards the innovative activities. Globalization should be restructured so that the individuals in developed countries and those in developing countries, both generations and the future together can benefit from it, although there are some special interests which will lose and their representatives will oppose these changes. It is time to have strong economies and societies which appreciate more values like culture, environment and life itself.

Romania in a More Globalized World

Botescu Ion

“Ovidius” University of Constanza
ion_botescu@yahoo.com

Abstract

Considered by some as a factor of progress and by others as the origin of many insufficiencies, globalization is an unstoppable phenomenon of the current times.

It would be counteractive from the part of many countries, not to try, under these circumstances, to use the opportunities brought by the process of globalization to their own advantage.

Through the economic openness which was assumed by Romania, the country has integrated itself more and more in the world economy. The indexes upon which this openness was based have been emphasized both in their dynamic but also in comparison with other countries in this study, without excluding the vulnerabilities which threaten our countries in a more and more globalized world.

Key words: globalization, economic openness, commercial, international commercial trade, foreign direct investments

J.E.L. classification: F01

1. Introduction

The acceptance by the majority of the world's countries of an open system regarding international trades, international financial flows, international technological transfers etc., represent irrefutable realities. The collapse of the socialist production block, starting with 1989, and the remarkable progresses in the area of communication and transportation are other factors which have allowed the amplification of economic interdependences between different countries.

International companies are regarded as being the vectors of the globalization process. The businesses of multinational

companies overcome borders, and their investments can be found everywhere in the world and they determine the geographic spread of the new technologies.

The amplification of the phenomenon of globalization must be linked to the activity, sometimes questionable activity, undertaken by global financial institutions.

The World Bank, but most of all the IMF, through imposing the Washington Consensus (deregulation, privatization, the diminishing of the government's role in the economy etc) on the countries with financial difficulties has determined on a medium and long term an economic and social worsening in most cases.

The World Trade Organization through its negotiation rounds in the course of time has managed to impose a liberalization of the goods and services trade on a global level. The economic opening of the world's countries has proved to have advantaged especially the competitive economies. In the same time the developed countries have been the ones to initiate the majority of tariff and non-tariff protection procedures, which in most cases have been ungrounded. It is obvious that from the liberalization of international trades, the ones with the least advantages have been the poor countries, thus opening the question regarding the fairness of this procedure.

Before 1990, the economic development of Romania was autarchic. The development of many sectors in which the competitive advantages of Romania were inexistent was pursued. The foreign direct investments attracted by our country were limited due to the restrictive national legislation. However, the necessity for imported raw materials supplies for industrial sites and the forced increase in exports in order to pay external debts determined the participation of Romania to the commercial international trades, participation which we can consider as being active.

The transition of Romania from a planned economy to a market one took place under the conditions of assuming the rules of the World Trade Economy and of entering the European Union. These factors have generated an increase in the interdependences of the Romanian economy with the exterior, fact which has imposed a significant economic opening of our country.

In order to make the analysis of the Romanian economic openness as suggestive as possible, apart from considering the

phenomenon in its dynamic, a comparison of the data with the ones recorded by the BRIC countries was also recorded.

2. The openness of Romania under the context of world economy participation

In the specialized literature a series of indexes are used in order to appreciate the level in which a national economy is involved in international economic trades.

Table no. 1. The international commercial openness of Romania and BRIC countries

	Romania		Brazil		Russia		India		China	
	'89	2010	'89	2010	'89	2010	'89	2010	'89	2010
Exports mill.	11,3	57,9	37,58	233,7	-	444,7	20,0	345,1	57,1	1749,4
Imports mill.	10,0	66,3	24,2	238,7	-	325,2	24,7	418,9	58,3	1477,8
Population mill.	23,1	21,4	147,0	194,9	-	142,9	855,7	1224,6	1108,2	1318,1
Exports/capita	489,1	2705,6	255,1	1199,0	-	3111,9	23,3	281,8	51,5	1327,2
Imports/capita	432,9	3098,1	164,6	1224,7	-	2275,7	28,8	342,0	52,6	1121,1
Weight of exports in GDP	19,9	35,8	9,9	11,1	-	30,0	6,6	20,0	12,4	30,4
Weight of imports in GDP	15,5	41,0	6,4	11,4	-	21,9	8,2	24,3	12,6	25,7
International opening of the economy	35,4	76,8	16,3	22,5	-	51,9	14,8	44,3	25	56,1
GDP	56,8	161,6	375,4	2088,9	-	147,8	300,7	1722,3	459,7	5739,3

Among the most used indexes we can state:

- The weight of goods and services exports in the GDP reveals the level of dependence of the analysed country on external markets. From this point of view we can see an accentuate evolution of Romania during the interval 1989-2010, given our analysis, in the last year, we can say that our country is situated over the world average and over the numbers which are representative for BRIC countries.
- The weight of goods and services imports in the GDP, represent the dependence on external markets, both regarding assuring population consumption but also assuring the national economy with production factors. Under this aspect, in 2008 Romania overcomes the world average, but most of all overcomes the BRIC countries.

- The international opening of the economy is calculated as a weight in the GDP of the sum between imports and exports and it basically represents the dependence of a national economy on external markets. If in 1989, Romania recorded a number of 35,4% for this index, which was close to the world average, in 2010 it reached a level of 76,8%, level which is significantly higher than the levels of China (56,1%), Russia (51,9%), India (44,3%) and Brazil (22,5%). These numbers prove the major dependency of the Romanian economy on external markets and therefore the vulnerability of our country to the changes in the global economy. It is observed that Romania has been deeply anchored in the process of globalization and has recorded levels of growth inferior to those of China, Brazil and India, countries with a more reduced level of international opening of the

economy, but that are acknowledged as being the main beneficiaries of globalization.

- When reporting the growth rhythm of the external trade recorded by a country to the growth rhythm of the GDP, under the aspect of real values, emphasis the level of integration of a national economy in the global economy. This index is dependent on the liberalization of the external trade of the country in discussion, phenomenon realized through the reduction of tariff and non-tariff barriers. In the case of Romania, the evolution of external trade and of the GDP (in prices for 2005) indicate an

annual evolution with a bigger amplitude of the external commerce than the GDP. Overall, in the period 2005-2010 the average growth rate of the Romanian external trade was 2,68%, inferior to the GDP annual growth rate of 2,87%. At first sight this evolution could indicate a reduction of Romania’s participation in the world economic circuit, but we should not forget the global financial crisis which determined on a part the reduction of the Romanian GDP in 2009 with 6,5% and on the other a much more diminished 11,1% external trade of our country.

Fig no. 1 The evolution of the Romanian external trade and GDP (%)

3. The financial dimension of the Romanian economic openness

The level of involvement of an economy in the global economy, from the point of view of capital flows, is based mainly on foreign direct investment flows. We have to

take into account that the values regarding foreign direct investments do not make any distinctions between the capital and/or brut assets which are transferred from an investor to another and that the capital has a novelty character.

Table.no 2. Economic openness under the aspect of FDI

Indexes	World level		Romania		Brazil		Russia		India		China	
	'89	2010	'89	2010	'89	2010	'89	2010	'89	2010	'89	2010
FDI Inflows	1838,4	17950,4	-	70,0	34,2	472,5	-	423,1	1,4	197,9	17,2	578,8
FDI Outflows	1934,0	20408,2	-	1,4	40,4	180,9	-	433,6	0,1	92,4	3,6	297,6
FDI Inflows/ Capita	355	2785	-	3258	233	2424	-	2960	2	162	16	439
FDI Outflows /Capita	403	2970	-	69	275	928	-	3033	0	75	3	226
Weight of FDI Inflows in GDP	9,22	29,7	-	43,9	9,13	22,9	-	28,7	0,4	12,9	3,7	9,8

Weight of FDI Outflows in GDP	10,1	31,8	-	0,9	10,7	8,78	-	29,4	0,04	5,6	0,7	5,0
-------------------------------	------	------	---	-----	------	------	---	------	------	-----	-----	-----

In order to appreciate the role of direct foreign investments in the openness of the economy of a country we are taking into account the following indexes:

- The inflows of foreign direct investments per capita represent the quality of national policies promoted in the direction of attracting foreign investors and the potential of the national economy to generate profit. Regarding this index, in comparison to both the world situation and the BRIC countries, Romania is recording superior values, fact determined by the lack of national powerful investors and the massive participation of foreign capital in the process of privatization.
- The outflows of foreign direct investments per capita represent the capacity of the national economy to generate investment flows abroad. Under this aspect, Romania is recording much lower values in comparison with the analysed entities, two of which occupying the first two positions in the world (China and India).
- The net position under the aspect of foreign direct investment results from the difference between the inflows and outflows of foreign direct investments. In 2010 Romania recorded FDI inflows of 70,0 billion dollars, a huge value when compared to the FDI outflows of 1,4 billion dollars. This difference is much more neglectable in the case of BRIC countries, where we can also find an exception, Russia, where the value of foreign direct investment outflows are bigger than the value of foreign direct investment inflows.
- The weight of FDI inflows in the GDP reflects the contribution that foreign capital has in the economic development of a country. This way the national economic dependence on foreign investors is emphasized. With a weight of 43,9% in 2010, Romania is way above the world average (31,8%) and over the values of Russia (28,7%), Brazil (22,9%), India (12,9%), China (9,8%).

- The weight of FDI outflows in the GDP express the economic power of a country’s multinational companies and their capacity to launch business abroad. With a value of 1% Romania is basically inexistent.

In order to appreciate the level of economic openness of a country we can also take into consideration other parameters.

The workforce migration, but most of all the inflows of remittances, represent elements which must be taken into account. It is estimated that over three million Romanians have the status of immigrant in other countries, the inflow of remittances being ranked in the top 30 annually. Moreover, the weight of remittances in the GDP is relatively important, having a value of 2,4% of the GDP in 2010.

Regarding the number of households with internet access, an increase of about 5% since 2010 was recorded in comparison to the previous year, emphasizing the increase of communication possibilities with the rest of the world. On the other hand, we must mention that Romania is ranked on the 26th position among EU countries under the aspect, Bulgaria occupying the last position.

4. Conclusions:

It is obvious that in comparison with the 90’s Romania is currently much more integrated in the world economy. Quantifying the phenomenon of globalization, taking into account its multidimensional character, is difficult to be done. In such a ranking, made on the basis of KOF Index of Globalization, Romania occupies the 35th position, overcoming the USA in a ranking comprising 208 states.

In the specialized literature, Romania is included in the category of ex-socialist countries which have entered the EU, being characterized as a country which has moderately taken advantage of the phenomenon of globalization.

The economic openness of Romania must be analysed from all the points of view, including the loss of sovereignty and the

negative effect generated by the contagious phenomenon of crises.

It is essential that Romania maximize the advantages offered by the globalization and reduce as much as possible the negative phenomena induced by it.

Authorizing the Activities With Significant Environmental Impact

Brasoveanu Florica

University „Ovidius” Constanta, Faculty Of Law, Administrative Sciences And Sociology
floriordache@yahoo.com

Abstract

Strategic environmental assessment has emerged as a precautionary measure, at the highest decision making level, because the assessment of impact at project level proved so far a quite exhaustive and weak measure and consequently, a failure. This is because of the late moment in the decision making process, when the EIA procedure is applied to projects. Thus, responses to questions raised at the highest level, such as "what kind of development should take place, where and when it should really take place" were often unsubstantiated in terms of protection environment

Key words: Environment, Sustainable development, Environmental protection, Environmental permit

J.E.L. Classification: K 32

1. Introduction

What is strategic environmental assessment? It is a tool used systematically at the highest level, which facilitates very early integration of environmental considerations in decision-making process leading to the identification of specific measures to mitigate the effects and establishes a framework for further evaluation of projects in terms of environmental protection.

Strategic evaluation is applied by some countries in policies and even legislation as a method of ensuring sustainable development. In this respect, an international instrument has developed that Romania signed in Kiev in 2003, The Protocol on strategic environmental assessment - it refers to plans, programs, policies and legislation that may be subject to environmental assessment.

The National Environmental Protection Agency, a public institution with legal personality, financed entirely by the state budget, is the specialized body for the

implementation of policies and environmental legislation, under the central authority for environmental protection

2. Content

Environmental Assessment or "strategic environmental assessment" applies to the highest level and planning, for example in developing policies, strategies and obviously, plans and programs. In this way you can focus on the "source" of environmental impact and not "solve" the symptoms appeared after production. One of modern techniques currently used to prevent or limit harm to the environment is the obligation to obtain a special permit prior to conducting certain activities or use of products and services with ecological risk.

Public authorities, that carry the interest of protecting the environment, check the fulfillment of certain requirements, establish a series of technical and technological parameters of operation, establish a control of activities in order to protect the environment. In terms of objectives subject to authorization, the trend is that they be broad, going to the requirement of prior authorization of all facilities constructed and operated so as to avoid serious environmental harm or risk, inconvenience or disturbance to the neighborhood or community. The goal is to protect human beings, goods, fauna and flora against any environmental damage, to the extent that they may be harmed because of the activities subject to authorization, and protect against any risk, inconvenience or major disruption. At the same time concern goes to prevent any possible environmental damage. All activities hazardous to the environment, regardless of their owner (individual, corporate or non-profit) shall undergo the procedure of prior authorisation

One problem that arose was that the ratio of the new licensing system established and existing polluting activities, national laws have opted for a special exception to the rule

of retroactivity, meaning that the new mandatory authorization requirements apply to all cases prior to the new rules, so as is the case with OU no. 195/2005 modified and completed environmental protection. The specific areas considered for assessment of certain plans and programs are: spatial planning and urbanism, land use, agriculture, forestry, fisheries, transport, energy industry including quarrying minerals, waste management, water telecommunications, tourism. Environmental authorities provide information and public participation in environmental assessment procedure.

It is possible that environmental authority have other environmental information relevant to the plan or program in question, than those provided by the plan or program owner. As such, the authority is obliged to provide, where required, information and present information that is disseminated by default. The legislature considered it necessary that during the public debate of the plan / program and environmental report to participate, in addition to the environmental authorities and health authorities, also those involved in the screening stage, to allow these authorities to "take the pulse" of the public. In this way it enables those authorities to consider public comments and opinions, especially when they relate to their area of responsibility. As such, it made it compulsory to the owner to invite at public debate the aforementioned authorities. To enable effective public participation and if the plan / program may have transboundary effects, the holder is required to invite public debate competent authorities for environmental protection and health of potentially affected States, and to inform the public (in those states) affected, likely to be affected, or having an interest in decision-making about public debate. The notice shall be made through state environmental authorities likely affected, if anyone is interested in public debate, participation is permitted.

3. Conclusions

Most authorization systems are not designed to eliminate any pollution or risk, but rather to act against serious pollution and minimize their levels. They are considered an intermediate path between unregulated

industrial practices and absolute prohibitions.

Informing the public of regulatory procedures for plans, programs, projects and activities are carried out under specific legislation in force.

Public consultation is mandatory during procedures for issuing regulatory acts. Procedure for public participation in decision making is established by specific legislation.

Administrative authorizations are based on preliminary assessment of the environmental impact of proposed projects or activities concerned. Application of a formal authorization requirements is based on environmental impact assessment of the activities concerned, for which impact assessment is an integrated part of the licensing process and its conclusions are part of the decision granting or refusing authorization.

Actions and Ideas: Building a Global Quality Culture in Education Following New Institutional Prescriptions

Bundă Nicoleta Ramona
„Ovidius” University of Constanta, Faculty of Economic Sciences
bundaramona@gmail.com

Abstract

Quality culture encompasses a more implicit consensus on what quality is and how it should be maintained and promoted. Nonetheless, this paper is based on the conviction that quality culture can be consciously promoted. The procedure of promotion described here after is based on the agreement of common goals from which indicators of success and quality measures are derived. By a conscious promotion of a common quality culture in international cooperation, potential failure of the partnership can be diminished because contradictions with existing quality cultures at partner institutions are avoided and the partnership is firmly based on common goals as the focus of cooperation.

Therefore a common quality culture or, more broadly, a global quality culture may emerge if the mentality of confrontation is abandoned. The single suitable rule is the cooperation. Applying this rule each step towards a global quality culture should be taken cautiously. There is need of an entire process based on intercultural dialogue. The agents of each culture should interact until the harmonization of their values, believes, standards etc. As a result, a new culture will take form which is not a mere sum of the former ones.

Key words: quality culture, global intelligence, formal education

J.E.L. Classification: B15, B52, I25.

1. Introduction

At national and regional levels the education is important for its promises for future economic growth and development.

Even the neo-institutional theories depart from the human intrinsic cognitive systems and follow all the way to the same end point: economic performance.

This is not the only way, but it is one of the most sophisticated economic demonstrations for the role played by education in the contemporary world.

2. The call for mentality and paradigmatic shifts

Yet there is a growing awareness that we all are lost if continue to follow the economic way. Some global approaches to world education change the direction toward a global intelligence. That is: “the ability to understand, respond to, and work toward what is in the best interest of and will benefit all human beings and all other life on our planet. This kind of responsive understanding and action can only emerge from continuing intercultural research, dialogue, negotiation, and mutual cooperation; in other words, it is interactive, and no single national or supranational instance or authority can predetermine its outcome. Thus, global intelligence, or intercultural responsive understanding and action, is what contemporary nonlinear science calls an emergent phenomenon, involving lifelong learning processes”. [7: 3]

How can global intelligence be acquired?

It involves remapping traditional knowledge, accumulated and transmitted by various educational disciplines, and finally dropping out the disciplinary mentality. The global intelligence presupposes a holistic mode of thinking, a trans-disciplinary or integrative one, and also new kinds of knowledge from an intercultural perspective.

Yet, a global mode of thinking will emerge from “local” knowledge with its own historicity. Knowledge is always bound to a

specific time and place, to a specific culture or system of values and beliefs or, indeed, to a specific lifestyle. A global approach attempts to identify the cultural specificities of knowledge, explore commonalities and differences among them, and negotiate, if need be, among such specificities. It also presupposes that, in the process of exploration of cultural commonalities and differences in the way in which we acquire and utilize knowledge, new kinds of cross-cultural knowledge emerge through intercultural research, dialogue, and cooperation, and new kinds of integrative cognitive and learning processes become possible. [7: 8]

Then there is a need for designing educational models to foster the kind of local-global learning environments and intercultural, intellectual climate that are needed for sustainable human development in the next few decades.

The current educational system privileges imitation students, not creative, critical, and analytic professionals with a broad and disciplinary free understanding of society at large. The core challenge for educational institutions is to turn away from conventional lecturing to learning situations based on the search for solutions to real-life, open-ended problems. [4: 134]

Innovative education practices for sustainable human development covering all three types of education (formal, informal, and non-formal) must be encouraged. These practices will be configured to provide a good spread of activities focussing on all three pillars of sustainable development: environmental, economic and social. Their innovative character should come from mission and objectives assumed, the delivery method of educational services and the institutional frameworks.

There is a large scope for systematic and trans-national educational reform to change the current situation of powerful constellation of forces through cooperative and innovative practices.

Paradoxically, the ongoing economic determinism of development process can be counterproductive. All the demonstrations of the economic development theories formalized or not, are very interesting intellectual exercises that unfortunately bring just little long termed benefices for human

beings. Even more these benefices are not shared equally and equitable to all the people of the world. It is high time for return to natural and simple things. People always had the inclinations to struggle for survive or to cooperate for surviving. The economic institution – market is probably the most populated field of battle throughout history. Are we prepared to imagine a world in which competition is totally replaced by cooperation? And yet we wonder the project of global economy undertake only the disappearance of many types of frontiers? In market terms this means that finally we'll have a larger battle field.

This is the call for mentality and paradigmatic shifts. It should be abandoned the mentality of confrontation and look for other ways of organizing human relations, as well as our cognitive and learning processes. The shift will take place gradually, much impeded by the tendency of path dependence. This shift enhances a learning process that changes the national cultural filter and prepares the emergence of a global culture. Once such conditions installed, it will enable proliferate of global intelligence. From the paradigmatic perspective, in our opinion the neo-institutional approaches still find a place in this landscape of scientific inquire based on mutually, intercultural cooperation. A new set of economic, social and politic institutions should be crafted to guide all of our future interactions on this planet. This new rules of game borne from cooperative actions, but not confrontational selection process will naturally lead ourselves to the achievement of the final goal – that of the sustainability of human development.

3. Toward a quality culture in formal education

Within the economic, social and ecological axes of human sustainable development, quality has a significant importance and represents a challenge since quality assurance in formal education has more and more come to the fore in recent years.

Quality is a multi-faceted concept, difficult to render operational in educational terms. In general, there are a number of quality concepts as regards formal education programmes. All of these are seen as relevant

and competing. In fact, there is a strong belief that a ‘one-fits-all’ concept of quality is not desirable. Instead, differentiation is much welcome in view of differences of needs and in order to match a broad spectrum of individual and economic demands.

Among the quality concepts of formal education are – just to mention only the most common ones here –, according to broadly accepted typology: quality as (a) perfection or consistency, which is linked to notion of reliability and to conformity through compliance with set standards; (b) the exceptional or excellence, which bears an element of elitism; (c) fitness for purpose, often linked to the need to address to a required reference point; (d) value for money, which is sometimes linked to the notion of value for time invested, both of which relate more closely than other definitions of quality to the quality concept of – partly rational and partly emotional – customer satisfaction; (e) transformation, considering the individual gain accrued in the course of a learning experience.

Positive definition of quality approaches are necessarily paralleled by negating or abandoning others. Here the slogans ‘from input factors to learning outcomes defined in terms of competences’ and, which is partly related when seen from the viewpoint of process and approach, ‘from teaching to learning’ and ‘student-centred learning’ come to mind. Despite profound and serious difficulties in defining the content of learning outcomes and relevant competences, in validating them, in making them operational, in installing fit-for-purpose learning devices and environments, and in measuring their accomplishment, the shift to learning outcomes and to student-centred learning rather than focussing on input and teacher perspectives has been one of the key mantras in the quality debate. However, there is still no denying of the relevance of input factors, such as qualification and numbers of staff, of equipment, or of student intake. So in practice, from case to case, there seems to be considerable ambivalence between rhetoric and traditional reality in defining and measuring quality features.

The likely key to consolidating all these approaches is that all factors need to be linked in a methodically correct manner. This is done by not taking input factors as isolated

starting points for developing and judging quality. Instead, input factors should rather be seen as elements to be considered incidentally when addressing the question as to whether or not the envisaged educational purposes could, in terms of underpinning both at the level of concept and of its subsequent implementation, feasibly be accomplished.

It clearly results that quality cannot be solely evaluated by calculating quantitative indicators, such as: the number of students per member in the teaching staff, educational spaces etc. Other specific indicators are even more important: the professional and methodological competence of the teaching staff, the cultural, ethical and social accountability of education, student satisfaction. Consequently, a quality education depends, to a large extent, by the synergic harmonization of three elements: institutional capacity, educational efficiency and quality management.

To this end, a functional emerging educational system should capitalize on the following aspects:

- educational goals, curricula, teacher competence and the efficiency of educational practices;
- educational spaces, equipment, libraries and reading rooms;
- performance criteria, standards and indicators, internal and external evaluation pertaining to such standards and causes of dysfunction;
- the amount of financial resources.

The success in setting up a “quality culture” is influenced by objective and subjective factors, by national and global trends. Some countries have set the trend and the others need to follow in their footsteps. This is about the assertion that the majority of countries have understood the expectations of the minority of leading countries in the world economic hierarchy. Each of them is just a piece in a puzzle called the Global Economy, which needs to adjust to fit in. Very much like a diligent student who learnt his/her lesson well, the governments set priority action plans which will directly impact upon the future development of the national education system.

How can such plans be accomplished? How can we achieve a global quality culture? The necessary steps are easy to set, hard to

achieve and impossible to quantify, as tangible results become visible in many years. Firstly, one should improve the quality assurance system at pre-school, primary, secondary and tertiary levels, by assisting schools to improve their management and supply relevant jobs for the labour market. Secondly, improving teaching competences and the competences of the people involved in the educational system by supporting them in their life-long learning process. Thirdly, one needs to extend the life-long learning framework by assisting the agents/suppliers of life learning education to reach the standards of quality management assurance. Fourthly, young researchers should be encouraged to develop their competence by increasing their doctoral and post-doctoral educational opportunities. This enumeration can continue indefinitely. It will be interesting to note, however, whether such desires, expectations and actions pertaining to a “quality culture” will ever take effect in a national culture. In retrospect, forthcoming generations will easily solve this problem.

For the time being, the majority of countries are currently importing patterns and solutions created by developed countries. Although quality assurance activities have not had a long tradition worldwide, some countries or groups of countries have obtained worthwhile results. Therefore, the mission lies in promoting “compatible quality assurance systems” meant to render national education internationally recognized. In more concrete terms, we need to set in motion a mechanism meant to ensure that educational establishments observe national and international quality assurance standards. To this end, quality assurance strategies mirror the ability of an educational supplier to be accountable to internal clients (pupils, students, teaching staff) and external agents (employers, society) and ensure that standards are met. This quality assurance becomes an important factor in the invisible competition between nations in terms of culture and education.

Consequently, judging by the promise of progress it delivers, we consider that the implementation of a quality assurance system is necessary, yet far from being accessible, due to certain specificities: the school is not a factory, students are not goods/commodities, there are multiple clients (students, parents,

employers, the society) and so one cannot identify precisely all the elements of a manufacturing process. Despite such specificities, quality management can be functional in education as well. The educational process can be improved, teaching efficiency can enhance and teacher/student satisfaction can increase. Quality management stands for a different way to organize and harmonize efforts so as to ensure that people fulfill their tasks enthusiastically and actively contribute to improving their techniques. It might look rather impossible, yet practice provides us with plenty success stories for this type of management. To increase the chances of success, one needs to observe a simple principle - the process should prevail over the product. Such management will capitalize on the learning process as such, rather than on the results evinced by tests and examinations. From this perspective, the human factor is in the foreground again, and we consider that the weak spot which management should address is individual attitude towards the educational process. We need to consider that both the student and the teacher act and interact under complex incentive structures. We need to identify those mechanisms to induce perceptions and values meant to ensure the quality of the teaching activity. Quality culture derives from this; it stands for cooperation and responsibility.

4. Conclusions

Educational discourse is replete with references to the process of building a quality culture inside the educational system. In particular, the issue of educational quality has become an area of great interest and concern due to the conviction that education plays a pivotal role in global economy sustainable development. In choosing to investigate continuity and change surrounding learning process, the questions rely on the contextual and evolving character of the process. The ideas elaborated in this chapter point to the fact that education is a “path dependence” phenomenon. Knowledge acquisition is underlain by perceptions derived from the process of collective learning across generations. The act of learning is a cumulative process subject to social and cultural filtration. The overall

social approach to the benefits of expanding knowledge (in various stages of historical development) is the major source of long term change. Likewise, educational improvements are dependent on the features of social institutions and the institutions are variables strictly influenced by the level of education. Hence social institutions are likely to become inertial to change. How can one overcome this obstacle? Economics can provide at least one solution: joining the efforts of researchers coming from different economic areas can lead to worthwhile progress with respect to unveiling the causes and mechanisms of change. Thus, progressing onto a continual ladder of discovery and learning, horizons will broaden, and the prevailing patterns of thinking and perception will become more flexible.

The distinctiveness between formal, non-formal and informal education determines a shift in focus. Learning is a culturally – filtered and cumulative process. Most reforms should be targeted at informal education. The pre-school, primary, secondary and tertiary levels of education form a complex edifice which needs to be built in gradual stages.

Meeting international quality assurance standards is not against this principle; on the contrary, it is quite compatible. It will make us aware that we are in competition with other participants/players worldwide and only quality players win. According to the guidelines developed by this paper, the authentic and enduring progress in the quality formal education is only triggered by reforms targeted at informal aspects pertaining to the national institutional paradigm. This is the unique way to create a real global quality culture: the continuity of national specific reforms and the gradual change towards “universal” values imposed by the winners of global competition.

The global quality culture is fully compatible with the global intelligence. One emerges as a result of the other. This is the supreme stage, but we haven’t reached that point yet. For the moment we could speak mainly about different national quality cultures and common quality cultures of joint educational programmes. Some steps are made toward the global quality culture, but in the light of neo-institutionalism, they are

illusory because even the international standardization of education is just a formal initiative. Merging standards and processes doubled by the promotion of intercultural enquiry especially through non-formal/informal education will conduct us to a global culture, in general, and a global educational culture, in particular.

Structural Implications of Economic Crisis on Container Throughput. Evidences from Port of Constanta

Crăciun Alexandru Mădălin

*Department of International Business and Economics, The Bucharest University of
Economic Studies*
craciun22@yahoo.com

Abstract

Ports have become a key element of modern supply chains through the important role they play in coordinating material and informational flows. However, because of the fixed nature of port assets, they can rarely control the supply chains dynamics, which are most often affected by the strategies of other players in the network. In this context, we try to explain the adverse effects of the economic crisis on the container traffic volume in the Port of Constanta, one of the hardest hit European port, on this segment of traffic.

Key words: Seaport, Economic Crisis, Supply Chain, Port of Constanta, Container.

JEL Classification: R41, L91, L14, O14.

1. Introduction

In late 2003, the most advanced container terminal in the Black Sea basin and Eastern Mediterranean region came into operation in Port of Constanta. The results did not wait to appear, the throughput of containers in Port of Constanta (summation of all containers handled by a port either as imports, exports or transshipment) increasing in 2004 with 104.17%, compared to 2003. Increases continued until 2007, when the peak of the throughput for containerized shipping was obtained. During this period, the proportion that this type of throughput recorded of all operating activities increased from 3% in 2003, up to 22% in 2007. Between 2007 and 2008, for this type of cargo, Port of Constanta managed to be on an unexpected 16th place in the top of the European ports, surpassing many with a background in handling containers and which were enjoying a much more developed hinterland in terms

of infrastructure and were positioned near major shipping routes. With the onset of the economic crisis in 2008, Port of Constanta was a direct hit, with an overall traffic drop of 32% in 2009, but managing to return on a 13.2% increase in 2010 compared to 2009.

On the container segment in 2009 the decline was much steeper, registering a deficit of approximately 55% of the volume of 2008, and continuing in 2010 with another 0.17% deficit relatively to 2009.

This decrease is unusual if we relate it to generic performance indicators of the Port of Constanta (total transfers and total cargo ships operated) and of the Romanian economy - Constanta Port's main hinterland. The new circumstance takes a dramatic dimension when analyzing the throughput of containers from the Romanian port in the context of European ports. Thus, on this transfer segment, Port of Constanta dropped in 2009 from number 16 to number 23, followed in 2010 by losing of another position up to 24th (according to [1]). However, even more surprising is that the rate of traffic loss of 55%, ranks Port of Constanta first in this respect from the 39 analyzed European ports. Also, in 2010, only 7 of the 39 analyzed ports failed to increase the volume of container handled, Port of Constanta being among them.

To find an answer to the problem of decreasing container throughput in the Port of Constanta, once the effects of the economic crisis of 2008 triggered, we will have to go beyond port boundaries and analyze changes in the port industry before the economic crisis, stressing the importance that container traffic has in modern supply chains.

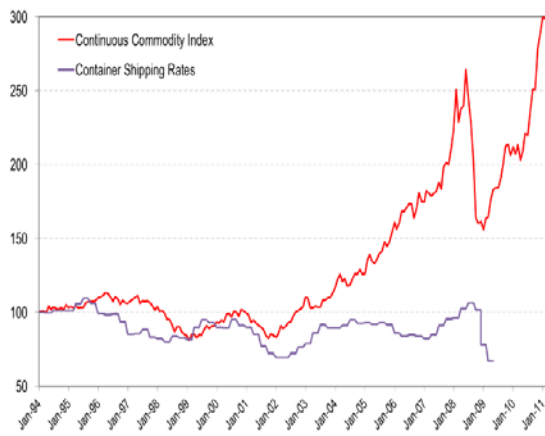

Thus, in this paper we examine the role played by containerization in supply chains and the tendency of integration in these networks, first of the shipping lines and

second of the port terminal operators. Secondly, we analyze the effects of the economic crisis on the two major players (shipping lines and terminal operators) in the supply chains and how they responded. Part 3 will be devoted to analyzing the effects on the containers throughput in Port of Constanta in the context of global industrial change mentioned in previous sections. In the final section we draw the conclusions of this research on new problems that the financial crisis has revealed.

2. Containerization and supply chains

Containerized cargo movement is a result of manufactured goods and subassemblies transported from supply to retail markets. Between these locations there is a whole range of distribution activities managed in terminals and distribution centers. Spatial distribution flexibility and efficiency were the two attributes that have supplied mobility to containerized goods, driving the development of global production and distribution networks ([2], [3]). With increasing proportion of containerized cargo, this transport type has become cheaper, as Figure 1 shows.

Figure 1: Continuous Commodity Index and

Average Container Shipp. Rates, 1994-2011
Source: [4]

Container shipping rates were obtained by calculating the un-weighted average rates for the shipping of one containerized freight unit (one TEU) on four major sea transport routes (Asia-USA, USA-Asia, Asia-Europe, Europe-Asia). CRB Index or Continuous Commodity Index (CCI) is a composite index of futures prices of 19 basic commodities, with different shares in the index. It was developed by the Commodity Research

Bureau in 1957 and is one of the most cited indicators of overall commodity prices. The decline of container shipping rates between 1995 and 2002 is due to the effects of economies of scale that have reached maturity in container shipping.

Even if, in the same period Continuous Commodity Index also shows a similar trend, starting with 2002, this index is at a rising trend, while the rates for containers shipping are continuing the downward trend. Thus, if we compare the evolution of the value of goods to the cost of transport per TEU, we note that container transport has become more convenient, even after severe corrections occurred in 2008-2009.

With the increase of containerized transport, the container has become a distribution unit, which has led to radical changes in the distribution of goods, focusing on time-based management strategies, the most stricken example being given by the implementation of *Just in Time* models of production and distribution ([5], [6]). The concept behind this strategy is simple - the shorter the transit time, the lower the inventory level, hence, significant cost reductions.

Although this concept has proved his utility in a boom period, his usage on a large scale reducing inventory costs and increasing the speed of deliveries, we will show on what follows that, faced with a crisis of overcapacity, result of the recession started in 2008, shorter transit time was not the rule who guided the actors in the supply chain.

3. New roles for freight shipping lines in distribution systems

The intermodalism resulted from the high grade of mobility of containerized cargo, but also the elements which have led to the success of container transport (including relocation of global output amid globalization of economic activity), have changed the perception on maritime shipping.

Therefore, this service is no longer viewed in terms of its attributes on a specific commercial route (trust, capacity, speed), but rather by the coverage of increasingly diverse logistics services, integrated in a distribution network. According to [7], shipping companies' response to the new challenges induced by the dynamics of the international

economic environment that evolved after the year 2000 was made on three main issues.

First, the growing needs of shippers to access supply and retail markets using an increasingly lower number of carriers in the distribution system were confronted by the maritime carriers' offer of transportation services provided on a wider geographical area.

Second, as shippers have sought to integrate and improve supply chain performance, maritime carriers had to widen the range of services offered, this generating in turn, a number of issues relating to the organizational integration that had to be established between various services provided.

Third, maritime shipping lines had to find new ways to reduce costs, this actually meant effort to achieve economies of scale and scope, key dimensions of business in any industrial network. Systematic confrontation with these three problems turned the industry of maritime shipping lines from one that addressed the costs from a ship-based perspective into one where the cost approach is made through a network perspective.

In a transport industry already dominated by high capacity ships, mergers, acquisitions and strategic alliances, cost reduction potential at sea becomes increasingly small, pressure to detect new sources of reduction - in the field of landside logistics, was increased. In addition to considerations of costs and revenues, the pull force of the market demand is the main force that drives the carriers to integrate services across commodity chains ([2]).

4. Ports integration in global supply chains

Ports are complex organizations made up of several parts in which various institutions and functions are intersecting at different levels. As integrated supply chain management is at the epicenter of the business transformations from the last decade ([8]), more companies surpass the boundaries established between internal company functions and even the company itself and key partners in the supply chain (customers, distributors, suppliers, carriers etc.). One of the main purposes of such an approach is the agglomeration of all the actors in the supply chain in a common platform characterized by

logistical transactions and information systems.

Viewed in this sense, competition is no longer held between individual firms as autonomous entities, but rather as supply chains. According to [9], supply chain is a network of organizations that, through connections upstream and downstream, produce value in providing products or services to the final consumer. According to [10] supply chain can be defined as a set of companies that facilitate the advance of goods.

As transportation is an integral part of the supply chain, ports have become a key element, through the important role they play in coordinating material and informational flows in the supply chain ([8], [11], [12], [13], [14]). Therefore, they have evolved from the traditional function of facilitating the loading /unloading of ships, turning into a connection interface of wider logistics chains due to the fact that through their location, they are ideal points for positioning logistics services that add value to goods in transit, thus facilitating the meeting and interaction of members coming from different transport channels.

Although operating terminals are key elements of supply chains, rarely they can hold the control in this network of organizations. This is primarily due to the fixed nature of port property assets compared with the dynamic environment in which they operate. According to the study of [12], in terms of issues of cooperation and networking channels, port terminal operators are seen only in the 5th place as importance among supply chain actors, first topping shipping lines ([12] - p.59). The results of this study underlines the fragility of the place occupied by terminals operating in the supply chain, explaining to some extent why a large number of operating terminals have been more seriously hit by economic crisis installed in 2008, than their counterparts in the supply chain.

5. Structural implications of the economic crisis on the supply chain actors

With the falling of the world trade, seaborne cargo volumes have experienced a serious decline, the overall decrease in shipping activity in 2009 being 20% lower

than in 2008. As an immediate consequence, ships began to sail with unusually low load factors, shipping rates recording unexpected decreases.

The financial crisis caused by the credit crunch of 2008 determined a crisis of overcapacity in the shipping industry. If before 2008, the main problem facing the maritime industry was finding funding for development of infrastructure necessary for the increasing flow of container traffic and eliminating the congestion effects, after 2008 the situation reversed, all shipping lines and terminal operating companies facing an acute underutilization of existing capacities.

According to [15], against the crisis of overcapacity faced by shipping lines in 2008-2009, the measures taken were aimed mainly at increasing cost savings. They consisted of: closing secondary routes in order to concentrate freight volumes on main routes, increasing transportation strategic partnerships, giving up the chartered ships, reducing logistics and port costs and optimization of capacities in line with transport demands.

On the other hand, [16] argues that the first step of shipping lines to reduce costs, was the delaying of construction of ships already ordered, action combined with the removal from service of obsolete ships. In 2009, the world fleet that was idle reached the figure of 1.3 million TEUs, or 10.4% of the total fleet of container vessels ([17]). The most affected shipping route was Far East-Europe. On this route, the maritime shipping lines have drastically reduced their transport services due to the downturn in demand, the total capacity decrease occurred between October 2008 and March 2009, being of 21% (Table 1).

Table 1: Far East-Europe capacity Situation

	October 2008	March 2009	% Change
Total no. of weekly services (North Europe/Mediterranean)	64 (36/28)	45 (26/19)	-30%
Total ships deployed	549	406	-26%
Total capacity (TEU)	3.58 million	2.97 million	-17%
Average weekly capacity (TEU)	405,90	319,30	-21%

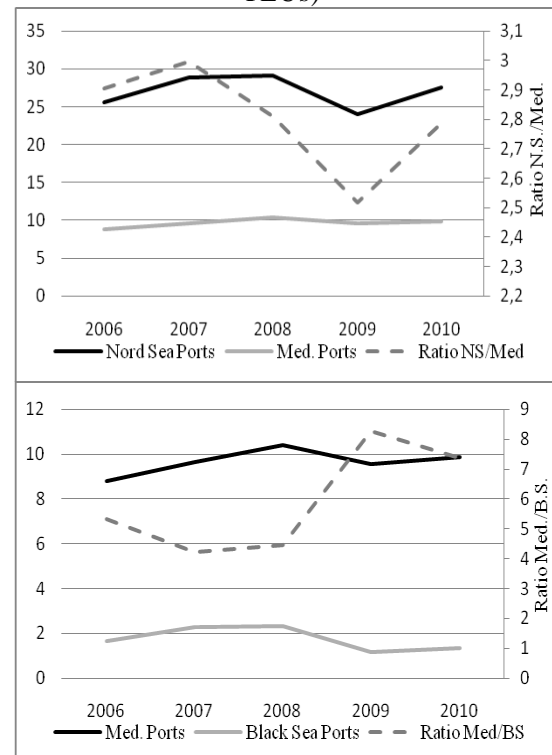

Source: Author, based on [16]

Following the substantial decrease in demand for transport registered on Far East-Europe trade route, maritime shipping lines have tried to absorb some of the existing transport overcapacity by lowering the transport speed of ships, coupled with changing the pattern of routes. Thus, in early 2009, a significant part of shipping lines covering this route, have opted to avoid transiting the Suez Canal on their way to European ports, altering their route around the Cape of Good Hope, South Africa.

The change was made only for the eastbound leg of the route, due to considerations related to lower tariffs for this purpose, the low price of bunker fuel in early 2009, but also in the context of the purpose to absorb excess capacity by increasing travel time.

Changing strategies of shipping lines had a domino effect on the throughput registered by the sea ports, the next link in the supply chain (Fig.4).

Figure 2: Comparative traffic of the first three Nord Sea, Mediterranean and Black Sea Ports 2006-2010 (left axis – in million TEUs)

Source: Author, based on data from [1]

For the realization of the chart, the annual container traffic (expressed in TEUs) was summarized for the first three ports (chosen according to the throughput level), in each of the specified areas. Thus, for the North Sea

were considered the ports of Rotterdam, Antwerp and Hamburg, for the Mediterranean Sea, the ports of Valencia, Algeciras and Gioia Tauro and for the Black Sea, the ports of Constanta, Odessa and Novorossiysk.

Analyzing the evolution of the two ratios - Nord Sea/Mediterranean throughput and Mediterranean/Black Sea throughput, we note that the changing strategies of shipping lines led to a redistribution of container traffic in the three studied areas. Thus, in the first quadrant we see that since mid 2009, the equalization trend of trade between the two regions started in 2007 is discontinued abruptly, because some of the lost traffic in 2008 was recovered by the ports of North Sea, on account of the Mediterranean ones.

In the second quadrant, we note that traffic is evolving simultaneously in both areas, at a change in activity in the Mediterranean ports, Black Sea ports responding in the same direction and in a larger proportion. This is a normal phenomenon, given that most shipping lines entering in the Black Sea, have crossed the Mediterranean coming from Far East, and have made at least a call at a port from this region. After the evolution of the two ratios, the first with an ascending trend for the North Sea ports, the second for the Mediterranean ports, we observe a tendency towards concentration of traffic in major ports - traditional hubs, highly integrated in supply chains, as opposed to smaller ports.

This trend manifests itself amid the maritime shipping lines transport strategy to abandon the secondary routes and to avoid additional expenses of port fees.

6. The case of Port of Constanta

Port of Constanta is the largest port at the Black Sea and one of the largest ports in Eastern Mediterranean basin. If until the year 2004, container throughput in Port of Constanta reached modest proportions, with the development of a new container terminal and the long-term lease of this facility by an international terminal operator company, the container throughput has seen spectacular growth rates, reaching as far as 104.17%/year (source: [18]).

Shortly after the opening of the new terminal, Constanta Port has become a regional distribution center of containers in

the Black Sea basin, reaching in 2007 an throughput of containers with approx. 40% higher than the throughput made by the following two ports combined (Odessa and Novorossiysk, According to [1]).

Thus, shipping lines that connected markets in Ukraine, Bulgaria and Georgia with Far East were using port of Constanta in a hub and spoke system ([19]). The containers brought from Far East with large capacity vessels (mother vessels) were distributed from the Port of Constanta to other Black Sea ports, with smaller vessels (feeders), which in turn brought containerized goods and empty containers for export to the Far East area. Thereby, by occupying a focal point on a secondary route, the port of Constanta was integrated into a network of logistic chains, becoming a junction point of it.

With the beginning of economic crisis in 2008, one of the first cost-cutting actions taken by container shipping lines was giving up at secondary routes and focus on main ones, so that the ports situated in the center of the Mediterranean basin, within a relatively small distance to the exit of the Suez Canal, became the terminus point for many ships that before were advancing into the Black Sea.

Another action taken by the shipping lines, with repercussions for the container traffic in the Black Sea was the changing of the eastbound leg of the commercial route Far East-Europe.

Thus they were not transiting the Suez Canal in the return voyage anymore, using instead the alternative route around the Cape of Good Hope in South African continent.

This action had the effects of concentrating a large part of commercial traffic on this route in the northern ports, as well as those located in the western Mediterranean. The concerted effect of both actions was a drop in container throughput in Port of Constanta in 2009 by 55% compared to 2008, while the throughput of other cargoes was down by 26% (Figure 5).

Figure 5: Total vs. Container throughput in Constanta Port: 2004-2011

Source: Author, based on various sources

The main explanation for the decrease in the volume of container throughput is given by the loss of transit traffic, the port of Constanta being no longer a regional center for distribution of containers in the Black Sea basin, rank lost in the benefit of Mediterranean ports, positioned near the main trade route Far East-Europe.

7. Conclusions

On the background of reorganization of shipping logistics activities occurred in the last decade, the immediate impact of the crisis was unexpected and stunning, transforming container transportation and handling capacities shortages in overcapacity in just a few months. Concepts that led to the development of the entire logistics system based on the container - the shorter the transit time, the lower the inventory level, hence significant cost reduction was the first sacrificed to maintain a minimum load of the ships and equipment now over-abundant. Maritime trade routes were limited by removing the secondary ones, keeping only the routes linking the best integrated ports in supply chains.

Effects of the first phase of economic imbalance on international supply system did not hesitate to appear in Romania, Port of Constanta registering the highest drop in container throughput in the first 39 ports of Europe. This reduction in container throughput is synonymous with loss of the status of regional platform for distribution of containerized cargo in the Black Sea basin, Port of Constanta coming in this first phase of the economic crisis out of the sight of the

major shipping lines linking Far East to Europe.

In the context of the post-crisis adjustments, in which the overcapacity problems will be overcome, the long-term effects are significant for maritime ports in general and Port of Constanta in particular, being linked especially with the way in which supply chains will resize and change their patterns. Judging by the extent and persistence of declines in container throughput, the port of Constanta post-crisis adjustments seem to have more of a paradigm shift than a temporary correction.

Abstract

This article examines the changes that have occurred in international trade terms – INCOTERMS 2010.

The authors make an analysis of the changes and the new clauses in international trade and divide these into two broad categories: structural changes and conceptual changes.

In this analysis we present an exhaustive approach, taking into account developments of International Commercial Terms from its first edition in 1936 to the latest revision in 2010.

Key words: International Commercial Terms, domestic trade, clauses, DAT, DAP.

J.E.L. Classification: M16

1. Introduction

The complexity of the problems related to negotiating and signing goods sales contracts results in a special care while selecting and including the more favourable terms in these contracts for both the seller and the buyer. Some of these terms are specifically agreed upon, others are chosen from those used in the current, integrated practice of international trade.

2. The significance and evolution of the INCOTERMS delivery terms

The delivery term is one of the essential terms of the international trade contract, thereby specifying, in fact, the place and time in which takes place **the costs and risk transfer** from seller to buyer, including the

legal and economic consequences generated.[1]

The delivery term does not refer to the moment of transferring the ownership of goods, which is generally determined by the date of payment.

Given that the implementation of each specification, from the different ways of delivering the goods, represents costs that are not negligible; their inclusion in the contract must be clearly stated. To this end and to contribute to simplifying the negotiation and the conclusion of the commercial contracts, even since 1928, the International Chamber of Commerce of Paris has developed a number of 6 delivery terms (terms of trade) and laid the foundation of certain interpretation uniform rules of the international sales principles.

This was imposed by the fact that, in the interwar period, international trade and especially the transatlantic one have experienced extraordinary development. In the international trade practice there were some customs, but they did not have the same meaning for the traders from different countries. Thus, FOB for a trader in the UK means that the seller fulfils his/her obligations when loading the cargo on the ship in the port of embarkation and the trader in the U.S. could interpret FOB as the clause obligating the seller not only to load the cargo on the ship in the port of embarkation, but also to pay the freight to the port of destination. The difference in interpretation arises because it refers only to some practices which were not mentioned in writing.

In 1923 the International Court of Arbitration was created near the International Chamber of Commerce of Paris. It was

responsible for resolving the disputes arising between the participants in international trade. The different interpretation of the logistics practices in international trade has conditioned the steadily and galloping increase of the number of complaints to the International Court of Arbitration. Thus, the International Chamber of Commerce was forced to intervene and put on paper the customs relating to the transport of goods in international trade. Thus, in 1936 the international trade terms known as **INCOTERMS** (International Commercial Terms) were published for the first time and the traders, referring to one of these terms cannot interpret the rights and obligations other than as required by the International Chamber of Commerce. It is often wrongly considered that the INCOTERMS rules could replace the national laws governing the business operations in each country. They act only in contracts for carrying out transport operations.[2] In other words, INCOTERMS represent a set of rules that govern and describe the rights and obligations of the parties participating in international trade.

Since 1936 until today INCOTERMS have been revised seven times, approximately once every 10 years (in 1953, 1967, 1976, 1980, 1990, 2000 and 2010). The last review took place in 2010, being the subject of Publication no. 715 of the International Chamber of Commerce in Paris. It came into force on January 1, 2011 both nationally and internationally, marking a new beginning in international trade. However, the contracts signed before January 1, 2011 and which refer to INCOTERMS 2000 will be completed under the old provisions of the international trade terms.

INCOTERMS 1936 contained eight delivery terms (EXW - ExWorks, FOR - Franco wagon, FAS - Free alongside ship, FOB - Free on board, C&F - Cost and freight, CIF - Cost, insurance and freight, EXQ - Ex quai, EXS - Ex ship). They have been changed to 13 in **INCOTERMS 2000** (EXW - ExWorks, FCA - Free carrier, FAS - Free alongside ship, FOB - Free on board, CFR - Cost and freight, CIF - Cost, insurance and freight, CPT - Carriage paid to, CIP - Carriage and insurance paid, DAF - Delivery at frontier, DES - Delivered ex ship, DEQ - Delivered ex quai, DDU - Delivered duty unpaid, DDP - Delivered

duty paid) and to 11 in **INCOTERMS 2010** (EXW - ExWorks, FCA - Free carrier, FAS - Free alongside ship, FOB - Free on board, CFR - Cost and freight, CIF - Cost, insurance and freight, CPT - Carriage paid to, CIP - Carriage and insurance paid, DAT - Delivered at terminal, DAP - Delivered at place, DDP - Delivered duty paid).

As legal power, these rules are optional; applying only if the parties have made express reference in the contract to a certain INCOTERMS rule. INCOTERMS rules were created to avoid any disputes that may arise as a result of the fact that the contracting parties are not aware of the different business practices in force in their partners' countries. The scope of INCOTERMS is limited to the issues related to the sales contract rights and obligations and to the delivery of the goods sold.

The advantages of using the INCOTERMS delivery terms are the following:

- saving contractual time and space – the parties instead of negotiating the content of the sales contract and the obligations of the seller and of the buyer, only negotiate the type of sale, namely the INCOTERMS rule they intend to apply;
- safety of the transaction; no matter how well the parties negotiate such a contract, they cannot eliminate the risk of inconsistency between the different provisions. INCOTERMS rules, being the work of specialists, totally eliminate these risks.

There are several reasons that justify the changing of the terms of international trade in 2010. The first argument is a new reality of the EU countries which no longer have borders for the movement of capital, goods and people. Thus the trade between, for example, Germany and the Czech Republic is not an international one anymore but a “domestic” (internal) one. Another argument in favour of the new edition of INCOTERMS is the need to adapt the language and the terms to the new realities of information technology. Thus, the new review takes into account electronic commerce and electronic billing and data transfer (Electronic Data Interchange). The changes in transportation practices, which are increasingly combined, used to lead to disputes and difficulties in interpreting the INCOTERMS 2000

rules. Thus, a new edition of these clauses eliminates these ambiguities. Terrorist attacks, becoming more frequent, condition a better security and monitoring of the freight transport, INCOTERMS 2010 managing to better comply with this reality. Another argument adds to the ones already mentioned, namely that of the usage because many of the Incoterms 2000 clauses were not used in practice.

The new delivery conditions defined by INCOTERMS 2010 clearly establish the obligations of the parties, thus reducing the risk of legal disputes between the parties. The variety of the goods subject to international transactions, the new methods and transportation technologies, the business practices and the national and international ports give a general character to INCOTERMS 2010, which allows their application in all cases with the help of additional provisions expressly stipulated by the partners in the international sales contracts. In addition to the 11 rules, Incoterms 2010 includes:

- Extensive guidance notes and illustrative graphics to help users efficiently choose the right rule for each transaction;
- New classification to help choose the most suitable rule in relation to the mode of transport;
- Advice for the use of electronic procedures;
- Information on security-related clearances for shipments;
- Advice for the use of Incoterms 2010 in domestic trade. [7]

3. Changes in INCOTERMS 2010

Compared with INCOTERMS 2000, INCOTERMS 2010 has undergone major changes, both conceptual and structural.

The main **structural changes** made by INCOTERMS 2010 are the following:

- reducing the clauses from 13 to 11 (Figures 1 and 2);
- within group D, out of five clauses only one remains, DDP (Delivered Duty Paid), and two other ones undergo radical changes. The DAF, DES, DDU clauses are replaced by DAP (Delivered at Place)

and DEQ by DAT (Delivered at Terminal). The two new clauses shall be applied to all modes of transport and they have the following meaning:

DAP – Delivered at place – Delivered undischarged and unpaid upon import in named place of destination

The seller shall bear all costs and risks for the delivery of the goods to the named place, the buyer assuming the costs and risks of discharging the cargo and the customs formalities to import it. [6]

Intrastat - Acquisitions: The value of transportation is subtracted from the Romanian border to the point of destination. Statistical value < Invoiced value

Intrastat - Deliveries: The amount of transport is subtracted from the point of dispatch to the Romanian border. Statistical value < Invoiced value. [8]

DAT – Delivered at the terminal - Delivered unloaded and without clearance to import at named terminal

The seller shall bear all costs and risks for delivery and unloading the goods at the named terminal, but not the import customs formalities. The terminal means any place, such as quay, warehouse, street, railroad terminal, CFR terminal. [6]

Intrastat - Acquisitions: The value of the transport from the Romanian border is subtracted until the point of destination. Statistical value < Invoiced value

Intrastat - Deliveries: The value of transport from point of dispatch is subtracted until the Romanian border. Statistical value < Invoiced value.[8]

- another change, which is at the intersection of the notions of structure and concept, refers to the adjustment of the trade terms to the realities of technological progress. Thus, electronic invoices and electronic signatures are recognized and may provide evidence in settling disputes, furthermore, the language itself of INCOTERMS 2010 aims at using the electronic interfaces in international trade.

The conceptual changes made by INCOTERMS 2010 are the following:

- INCOTERMS 2010 clauses are no longer only international trade clauses, but also

for “domestic” (internal) trade in order to adapt to the new realities when different EU countries trade within the same free trade area. Thus, the delivery terms contained in INCOTERMS 2010 are likely to become susceptible terms for use even internally, which increases their importance. [3] In this context, the EXW delivery term is indicated for domestic trade and FCA for the international one;[4]

Figure 1. Incoterms 2000

Coverage	Delivery term	Loading at the seller's premises	Export clearance	Moving to the departure	Loading at the departure	Subsidiary transport	Insurance	Discharge at the arrival point	Moving to the buyer's premises	Import clearance	Discharge at the buyer's premises	Mode of transport

	DDU Delivered duty unpaid											all

Source: Made by the authors

- concerning the implementation of the new delivery terms, special attention should be paid to calculating the customs value. This should include the transaction value, the insurance cost and the freight costs until the goods enter the European Community. Nevertheless, when calculating the VAT for payment in the customs, the dutiable base must also include the domestic spending, incurred up to the first destination of the goods in Romania. For more customs procedures (export, release for free circulation) the mention of an INCOTERMS delivery clause in the customs declaration is mandatory; [5]
- in accordance with INCOTERMS 2000 the clauses were divided into 4 groups: E, F, C, and D. In INCOTERMS 2010 the division into these classes is preserved in terms of form, but in terms of conceptual level only 2 groups are formed: the group of clauses that may apply for all modes of transport (EXW; FCA; CPT; CIP; DAP; DAT; DDP) and the group of clauses that may be applied only for waterway transport (FAS; FOB; CIF; CFR). It should be noted that for the containerized shipping it is not appropriate to use delivery terms specific to containerized waterway shipping because the seller does not control the movement of containers from the port warehouses along the ship (FAS) or on board (FOB, CFR, CIF). It is therefore advisable to use instead the FCA term instead of the FAS and FOB terms, the CPT term instead of the CFR term and the CIP term instead of the CIF term;
- the seller's and/or buyer's obligation to guarantee the security of the transported goods.

4. The influence of INCOTERMS 2010 rules on accounting and taxation

In accounting, the revenues from the sales of goods are recorded upon handing the goods to the buyers, upon their delivery based on the invoice or under other conditions specified in the contract, confirming the transfer of ownership over the respective goods to the customers. [9]

Although they were not designed to provide guidance on revenue recognition, INCOTERMS 2010 rules can be used to identify whether the revenue acknowledgment criteria are met or not (table 1).

Table 1. The relationship between INCOTERMS 2010 rules and the acknowledgment of revenue and expenditure

INCOTERMS 2010	Acknowledgment of revenue and expenditure
<i>All types of transport</i>	
EXW	When the products are available to the buyer and all the other terms for acknowledgment of the bill and of the sales on hold were met. If the billing and storage conditions are not met, the revenue is not acknowledged until the buyer pick up the goods.
FCA	When the products are cleared for export: - if the named place is the seller's warehouse/factory, then the revenue is acknowledged when the products are loaded for transport to that place; - otherwise, the revenue is acknowledged when the seller delivers the goods to the place specified.
CPT	When the products are delivered to the carrier employed by the seller, cleared for export.
CIP	When the products are delivered to the carrier employed by the seller, cleared for export and with complete insurance.
DAT	When the products are unloaded from the means of transport to the named terminal.
DAP	When the products are unloaded from the means of transport at the named

	place.
DDP	When the products have been delivered at the named place and have been cleared for import.
Waterway Shipping	
FAS	When the products are shipped over the ship in the port of embarkation and they are cleared for export.
FOB	When the products are loaded on the ship in the port of embarkation and they are cleared for export.
CFR	The revenue is acknowledged when the products have been loaded on board, they are cleared for export and the seller has contracted the transportation expense is acknowledged on the same date on which the acknowledgment of the revenue takes place, even if the transportation bill was not received.
CIF	The revenue is acknowledged when the products have been loaded on board, they are cleared for export and the seller has contracted the transport and insurance. The transport and insurance expense is acknowledged on the same date on which the acknowledgment of the revenue takes place, even if the transportation bill and/or insurance reimbursement were not received.

Source: http://www.avocatnet.ro/content/articles/id_27883/Influenta-regulilor-INCOTERMS-asupra-contabilitatii-si-fiscalitatii.html

From the fiscal point of view, INCOTERMS rules are particularly important for **triangular operations**. Thus,

in order to benefit from the simplification measures for these operations, one of the conditions is that the relationship of transportation of goods from the first Member State to the third Member State exists between supplier and reseller purchaser, either of them being likely to be responsible for the transport of goods, in accordance with INCOTERMS 2010 or in accordance with the contractual provisions. If the transport is covered by the beneficiary of the delivery, the simplification measures for the triangulation operations are not applicable. Therefore, if the application of the simplification measures in a triangular operation is desired, the use of INCOTERMS rules: EXW, FCA, FAS and FOB is not recommended.

5. Conclusions

In conclusion, we can say that the new structural and conceptual changes that the INCOTERMS 2010 delivery terms have undergone make them easier for use by traders, contributing to the ease of the business language.

The Anglo – Saxon Space in the Context of Globalization

Mihaela Duțu

„Constantin Brâncoveanu” University

Faculty of Management and Marketing in Economic Affairs

Râmnicu Vâlcea

elamica67@yahoo.com

Abstract

The present work aims at presenting the impact of the Anglo-Saxon Space over the complex process of globalization.

The basic nucleus of this is Great Britain which, was successively, by colonial conquests, transformed into a vast Empire with a big hegemonic power. Its influence sphere was generated, inclusively, by the Industrial Revolution, by the capital accumulation and by the extension of trade and centralized markets. We must neither neglect the civilization elements with influence over the life – styles of the peoples from their former colonies. In the meantime, the British citizens obtained themselves affiliation reflexes with the peoples from the colonies.

The phenomenon of the Empire’s becoming lasted till the Second War when, following the newly constituted force reports, the supremacy began by the conquer of U.S.A. Presently, it is “de facto” successor of Great Britain, imposed by the “exceptionalist” with promoting, by assumes the legitimacy of imposing its own values at a planetary scale.

Key concepts: globalization, colonialism, hegemonical power, civilization, “exceptionalist” myth

J.E.L. classification: F00 - General

Introduction

This present work aims at analyzing the impact of the Anglo – Saxon space over the globalization process.

By its proportion, it seems to be the essential premise of valorizing the welfare chances for more and more peoples from all the continents.

In this context, we must neither neglect the fact that this process was constituted and matured in an organic way, as a result of the multiple changes succeeding at the scale of the history. It’s everywhere recognized the fact that this process may be studied by considering the necessity of identifying the economical and geographical nucleus of Great Britain and, then, of the British Empire. So, the Anglo-Saxon space extinction at a planetary scale is the result of an evolutive process unrolled over a few steps: the colonial conquests, the commercial treaties, the industrial revolution.

Then, the second world war marks the beginning of the British Empire unweaving, generated by the independence conquests by the colonies, at which we may add the modernization process determined by the international trade, technical progress and the post – industrial revolution. The Anglo-Saxon Space is still representing the principal link by which the specific culture and civilization elements are transmitted, situation which confirms the hegemonical power of Great Britain, with a big impact over the peoples’ daily life.

Nowadays, we are present at a taking of the influence sphere by USA which, in the meantime, it conquered the big power role. This situation is confirmed by the American multinationals proportion and extinction over the world.

I. Historical and geographical references

Approaching globalization as a functional reality of the post-capitalist society by which the possibilities of valuing the chances of prosperity and civilization are multiplied for more peoples, firstly imposes the identification and the analysis of the factors that determined its growing and maturity. Though it seems as imposed by force process

which no one can refuse and which generates a relatively standardization of current life¹, its complexity is given by the differences between nations, concerning traditions, cutumes, cultural, economical and political values and juridical systems.

The present work aims at understanding the evolutive process of globalization by identifying the economical and geographical nucleus and of the factors that determined its extension as well as the assimilation process at the world scale. The historical, economical and political research has it that the main part of the above mention phenomenon was played by the British Empire. The central point of this phenomenon is Great Britain, nominated for the first time during Queen Ann' s reign (1702)² by the union of England and Scotland. From this moment, both countries were having the same monarch the same parliament customs and trade laws. It is presently the largest island of Europe, made up of England, Scotland, Wales and Northern Ireland – they all make the United Kingdom of Great Britain and Northern Ireland (the name of Great Britain is used with reference to the whole United Kingdom)³.

The military forces contributed to the founding of the British Empire when they intervned into the Colonial War from 1655⁴ and Jamaica was firstly conquered by Spain. Then, during the XVIIth and XVIIIth centuries, it was taken back by the English, who were interested in trade by practising a colonial conquering policy.

The appearance of the Second Empire takes place at the end of the XVIIIth century, by conquering the colonies from India and Australia, followed by the colonies from Canada, China and Tibet. Then, a considerable surface from Africa, was colonized - the Head of Good Hope (using Africa as source of slave trade). It is the top period of the British Empire, when it becomes a super prower, due to the the development of the mercantile trade with the other coutries. And thanks to the English intervention, the Industrial Revolution became a reality. In fact, that contributed to the creation of the biggest empire of history which, at its best time, covered 1/5 of the world' s territory and ¼ of its population were the sailors, the traders, the explorers and the colonists.

After that, the period of Napoleon' s wars was marked by the transformation of the military glories into political victories of the European leaders. It was determined by the growing of the republican values promoted during the French Revolution and by Napoleon' s conquests. The Brithish foreign policy consequently became a means of maintaining “the power balance”. Any territory conquered by Britain, after Napoleon' s defeat - at the sea by Admiral Nelson, in Trafalgar 1805, and on the land by General Wellington in Waterloo 1815 – rather meant the other powers' control over the British territories. These territories of the post – Napoleon British Second Empire, from Asia, Africa and North America, which had a huge growing in the XIXth century, are considered by the historians rather parts of a political empire than of a commercial one⁵. This included India, Benegal, Ceylon and Singapore, the Mauritius Island, considered trans-oceanical strategic points which made Britain the supreme maritime power. Australia' s transformation into a penal colony and the incorporation of 13 American colonies from the French should not be neglected either. Also, by annexing Ireland in 1801, the local disorders and violences came to the end.

We can draw the conclusion that wars were used as a means of dividing the influence spheres or for buying new lands like the ones from the New World and Alaska (bought from Russia by the Tzar Alexander II).

Referring to Alaska, it is worth mentioning the contribution of the Romanian leutenant Gheorghe Pomut who, in 1866, was appointed as a U.S.A. Consul in Russia, at Sankt Petersburg. In 1866, Russia crosses a severe economical crisis which determined the Tzar Alexander II to agree with the selling of Alaska to the Americans for the sum of 7200 U.S.A. The Romanian born consul had personally led several negotiating rounds between the two powers. ⁶

The extension of the British influence power also become possible thanks to the following wars: the Opium War at the end of 1830 (to ensure the free passing of the British to and from India), the Afganistan War (1839-1842) with the aim of controlling the influence of Russia and Asia, the Crimean War in 1854, in which Great Britain and

Turkey fought against Russia and the invasion of the Suez Channel made by the British, in 1882.

These territorial conquests are followed by profound movements of the industrial revolution, a phenomenon that led to the development of mass production corroborated with the growing of transports. In fact, the main economical progress is being represented by the building of the first iron bridge from the world (1776), by the connection of the industrial zones of railways and navigation from London (1863). The above mentioned progress was generated both by the tendency of isolation and by the growing continental ambitions, the British government being more preoccupied with obtaining maximal economical results, including the protection measures for the internal competition (Corn Laws)⁷. Yet, France succeeds in signing (1860) a commercial treat with England, which abolishes prohibition and cuts or reduces the custom taxes, an agreement that stayed at the genesis of liberalization in Europe.

II. The consolidation and the maturity of the Anglo-Saxon Space

The period from after the Second World War is marked by the germs of the unweaving of the British Empire, a phenomenon inaugurated by the independence of India which was conquered in 1947. It was followed by other colonies in the next two decades (many of them stayed back in Commonwealth, having the same Queen as a leader). In 1956, Egypt nationalized the Suez Channel and, in 1962, Jamaica and Trinidad won their independence and the inhabitants of these islands became the first colour immigrants from Great Britain who found a workplace in the textile and automobile industries.

All these changes took place under the impact of the modernization⁸ process which, at a historical scale, proved to be irreversible. From this perspective, we can state that the beginning of our modern world dates back to the XVIIth century, and the multiple economical and social changes begin to be completed in the XIXth century, a period that witnesses the building of a radically changed world.

The first defining zone of modernization is connected to the transformation of the North-European economics from the form of survival to the form of multiplying changes. England, then Britain fully participated to these transformations, going through successive stages: passing from the subsistence agriculture to the extended properties or to the manufacturing of the raw material in order to use them as changing instruments with the whole world. After this evolution, the interest for the big economical entities for markets, became more important than the private and the family business. The commerce brought the first changes in agriculture, then in industry, generating the appearance of manufactures and centralized markets. Till the end of the XVIIIth century, the commerce was managed by the companies created in the old world which contributed to the growing of the incomes of the European monarchies. But, by this time, gradually, the central control diminished and the new principles of changings were based upon the self – positioning of the market and upon the promotion of competition. Consequently, the free market economy starts to be the engine that puts production into moving, money and capital accumulation as an essential condition of the emergence of the industrial revolution from the XIXth century. It was followed by the promotion of some economical and financial power of the middle-class. In the XIXth century, the progress of technology, guided by the market and money, determined two new revolutions: the communication revolution, spread by media and the post-industrial revolution, which channelled the efforts of society towards monitorizing information and extension of services.

The extension of economical competition between countries generated profound moments in society, which puts its seal both upon civilizations and life – styles so the Anglo-Saxon space seems to dispute its priority.

For instance, the first coffee house from Western Europe opened in the university town of Oxford, where a Libian started a business with this product in 1660 and was followed two years later by the one from Pasqua Rose, from London, opened by the Armenian servant of the English salesman, Daniel Edward. He started to like coffee

during his travellings in the Middle East⁹. This phenomenon caused the overthrowing of Amsterdam as the biggest financial center of the world, by London (by socializing businessmen). It is also worth mentioning that Adam Smith inclusively, the father of political economy, wrote a good part of his book “The wealth of Nations” in the British Coffee House.

The British Empire also contributed to the coagulation of the “tea civilization”, the first loading of green tea being brought in England in 1650.¹⁰ Until the XVIIth century, it was a luxury product, one cup of tea being five times more expensive than a cup of coffee. The main delivery of tea in England was the Oriental Indian Company, which had at that time a much bigger income than the British government’s budget. Along centuries, Great Britain influenced its former colonies to use this drink. Ireland, Australia, New Zealand were among the first consuming countries from the world.

Later on, Coca - Cola¹¹ invented in 1886 by John Pemberton, a chemist from Atlanta, is spreading all over the world, without particular preferences among the social categories. Currently, this drink is the result of a serial product and it is being sold everywhere, without any need of adapting itself to each country’s specific, this contributing to the extension of globalization.

This picture is completed by the American show-bizz that had its debute by imposing jazz and mute films in the noisy years 20^{ies} of the last century. Coming back to the Brithish territory, the celebrity of the Beatles has to be mentioned, a group that had turned the city of Liverpool into a pilgrimage place. All these phenomena have not only passed unattended but have produced major changes in economy and society, confirming the military hegemony of Great Britain (in the XXth century) and U.S.A. (in the second half of the XXth century).

As far as Great Britain concerns, the tendency of hegemonic extension is also reflected into the political reflexes of the British citizens based on the arhipelago’s unity, on the colonial imperialism and on the naval supremacy.¹² Subsequently, in London, the news about Zimbabwe, Sri Lanka, India or Pakistan have a different impact than the news coming from Paris, Berlin or from some other world capital. The reason is

connected to the fact that on the British territory are living many communities coming from these countries and, even more than that, they were under the imperial power of Great Britain. On the other hand, the British know quite well that the time of empires has gone and the former colonies are independent and their interests are not the same with their ex – conquerors.

The relationship with the white Commonwealth countries is quite different. It is now consisting of 48 states, organised into an “association”.¹³ The passing from the imperial formula to the association goes back to 1931, after the winning of independence by Australia, Canada, New Zealand and South Africa which continue to recognize the monarch as their chief of state. The profound movements are being brought by the adoption of The Atlantic Cart, in 1941, which contained common principles of English and American policies. By means of this, England transferred its hegemonic role to a recovered America, after the economical shock from 1929-1933, confident in its power and in her destiny. This transfer was accompanied by a general overtaking of the positions once detained by the British in the whole world by the Americans.

Presently, the U.S.A. holds the main role on the international scene, a situation mostly relevated by the fact that one of 100 newly founded multinationals, 24 were based in U.S.A.

All these tendencies operate the same way for both countries, U.S.A., being today the “de facto” successor of Great Britain by the role it plays into the Anglophone world. Today the Anglophone space has no full significance and develop its whole power only by America’s participation, as an ultimate order factor, into the chaos of the global interdependence.¹⁴ This tendency is generated by the “exceptionalist”¹⁵ myth – a phenomenon with deep roots into the enlightenment, but in the case of U.S.A., it is founded upon the idea that “the greatest nation from the history of humanity” can assume anything, including the right of modelling the world as it wishes. Though, in order to stay exceptional, U.S.A. has to answer efficiently the four major provocations of the XXIth century: globalization, information technology

revolution, growing budgetary deficit, and huge energetical consume.

In the future, history will confirm the possibility that another American government should emerge from the “globalization trap” by creating a balanced report of forces at the world economy scale, able to generate a competition based upon the equality of chances. As for the part Great Britain plays, we are indebted to its contribution to the development of modern philosophies, to the extension and promoting democracy, to the upholding of individual values as essential assets of progress and civilization.

Conclusions

It may be appreciated that the globalization phenomenon is old and complex, determined by the competition between the countries for economic supremacy. This motivated the peoples from all over the world to fight for the resources control, for new territorial conquests and, implicit, for the influence sphere division. The fact that the primordial role was played by the British Empire and, then, by the Anglo-saxon Space is linked by its assuming the winner conscience and its own values supremacy.

Abstract

The economic and financial evaluation of industrial investment projects in developed countries with market economy is based on the combined use of traditional and modern, rational methods, characterized by the scientific and reliability, tested and validated by long practice.

This article present the indicator of economic evaluation of industrial projects, economical and financial rate of profitability and its method of calculation through a case study. The rate of profitability is a significant indicator in assessing the economic and financial performance of a project or a company both internally and in the diagnostic tests requested by external partners. Also, the results of the enterprise activity in all the stages of the economic cycle are reflected in the profit and the rate of profitability. The results of the case study can be put into practice as they have been, or may be interpreted depending on the nature of the project.

Key words: industrial project, economic evaluation, rate of profitability, management

J.E.L. classification: M21, G31

1. Introduction

In recent decades extensive studies have been undertaken to establish principles and research methods and techniques and improving economic and financial analysis of projects in phase of initial investment. Analysts currently operate with concepts and techniques generally accepted in all

developed countries and are taken up by other countries, including Romania [1].

The decision to invest is born of necessity or interest to make an investment. Any decision to invest must be subordinated of the private finance objective, which of the maximization company value. The way in which an organization grow and develop, the ability to survive and even being competitive will depend on the ability to generate steady streams of ideas for new products, better products or lower costs, that is to get the best investment decisions [1] and [2].

Regardless of the method of approach, there are four basic concepts that guide an investment analysis [3]:

- the ability to create value for the enterprise and shareholders;
- its profitability, defined by its ability to generate results from the effort;
- investment recovery period, which is intended to be as small;
- risk, which also must be as small.

Evaluation of investment projects is done through a system of indicators. The system contain efficiency indicators designed in economic and technical specifics of the area in which the project is realized, with economic significance and relevance for the characterization and expression of purpose and investor interests. In formulating the system of indicators for evaluating projects is taken into account also the relative importance that decision-maker is giving one or other of the indicators of efficiency, compared with other possible indicators to use, develop or use of economic theory in practice [4].

Study of profit in absolute sizes is only a preliminary stage of profitability analysis, for

relevance of rationament is required the reporting to other indicators, the results providing information of economic and financial problems. The rates method consist mainly, in the possibility of making a simple and efficient way of comparison in all three dimensions: rules, time and space [3].

In all economic and financial indicators, the rate of economic profitability ranks among the most efficient synthetic indicators of activity of the enterprise. The results of enterprise activity in all stages of the process are reflected in profit and profitability rate. Compared with the costs per product, which reflected the results of the stage production, the rate of profitability summarizes also the results of the stage distribution.

2. Rate of economical and financial profitability

Profitability rate as an indicator of efficiency, can gain different forms, as in considering the gross profit or net income from char, or change the reporting effort or expense, which express the process of production. The various models used for expressing the rate of profitability have different informative power, reflecting on the different sides of economical activity of the enterprise. The indicators build depending on the advanced or occupied capital, express the interests of investors predominantly, and while the indicators build depending on the consumed resource express the economic interests of the enterprise managers.

The rate of economical and financial profitability of investment projects, r_i , is determined based on average annual economic benefit of the project and investment efforts, on project versions [2] and [3]:

$$r_i = \frac{\overline{R}_g}{I_j},$$

where: \overline{R}_g - represents the annually average value of economic advantage

$(\overline{PB}_g, \overline{PN}_g, \overline{CFB}_g, \overline{CFN}_g)$;

I_j - investment effort, in euros;

\overline{PB}_g - gross profit;

\overline{PN}_g - net profit after tax;

\overline{CFB}_g - gross cash-flow;

\overline{CFN}_g - net cash-flow;

It is assumed that proceeds from the liquidation value of fixed assets is zero, so:

$$\overline{R}_g = \frac{\sum R_g}{D},$$

where: D - economic life or expected life of efficient production and service capabilities, years;

R_g - value of economic advantage in g year determined based on expected values of incomes and annual costs.

Will be calculated:

$$r_1 = \frac{\overline{PB}_g}{I_j} \cdot 100; r_2 = \frac{\overline{PN}_g}{I_j} \cdot 100;$$

$$r_3 = \frac{\overline{CFB}_g}{I_j} \cdot 100; r_4 = \frac{\overline{CFN}_g}{I_j} \cdot 100;$$

Project / investment option is considered acceptable and are retained for further economic and financial analysis, along with other options or projects, if the conditions are meet $r_i > (r_0, r_s, r_{need})$, where [5]:

- r_o – rate of return actually achieved in the entity or other projects of the investor;
- r_s – idem, in sector or area the investment project belongs to, which is analyzed;
- r_{need} – idem, considered by investors as an acceptable or desired limit by him.

In the literature of our country, it is recommended the use of “e” coefficient of efficiency for characterize the profitability of investment project [4] and [6]:

$$e = \frac{P}{I_j},$$

where: P - annual income, average or constant.

The coefficient of efficiency (e) compares the annual flow of profit that is obtained from the evaluated project with the volume of initial effort and investment required to achieve that project.

When evaluating investment projects aimed at upgrading, modernizing existing capacities would be incorrect to attribute the entire volume of new investment benefits, profit will be obtained after achieving of those projects [8] and [9]. Therefore, in such

cases, the coefficient of efficiency (e) shall be calculated by the relationship:

$$e = \frac{\Delta P}{I_j},$$

where: ΔP - increase annual profit volume produced by modernization investment project, complete endowment, development, restructuring and re-engineering existing production capacity.

3. Case study

A company wants to increase the production, so it needs another industrial building. The investment project involves a financial effort of 400 thousands euros. The time of project execution is two years.

Timing of investments is scheduled as follows: first year - 150 thousand euros, second year - 250 thousands euros, which the working capital fund is 100 thousands euros. Expected duration of use is $D = 10$ years.

The gross cash flow stream determined based on projected revenues and operating costs (V_g, CE_g) during the 10 years is characterized by the following levels (table 1) in thousands euros/year:

Table 1. Evolution's gross cash flow

Year g	1	2	3	4	5
CFB_g	350	400	400	390	380
Year g	6	7	8	9	10
CFB_g	370	360	330	300	280

We calculate:

$$r_0 = 0,45; r_s = 0,5; r_{need} = 0,55.$$

$$\overline{R}_g = \frac{\sum_{g=1}^{10} CFB_g}{10} = 356000 \text{ euros};$$

$$r_3 = \frac{CFB_g}{I_j} \cdot 100 = \frac{356}{400} \cdot 100 = 89\% ;$$

We observe that :

$r_3 = 0,89 > (r_0 = 0,45; r_s = 0,5; r_{need} = 0,55)$, and the project is acceptable to the investor.

4. Conclusions

Investment rate of economic profitability indicator is commonly used in project fundamentation; it is easily to calculate, is simple and can be easily perceives by the

decision makers, it direct linking between economic benefit that the investor wants to acquire and necessary investment effort, respectively the future fixed capital. This indicator is a static one, although it is calculated based on average annual economic effects produced in D years. It characterizes the intensity of the benefits on 1 euro investment costs. The higher rate and coefficient of efficiency, the project is more attractive.

Among the weaknesses of the indicator include the following aspects:

- it doesn't take into consideration the impact of time between realizing the works stipulated in projects, and doesn't reflect the size of the execution duration;

- it doesn't make contact with the opportunity cost of the goods or investments acquires capitalised;

- it doesn't reflect the actual dynamics of investments and economic benefits, and the financial and economic situation in time;

- in assessing the results of calculations are necessary levels of reference of this indicator (r_0, r_s, r_{need}), that often are hard to set properly.

The case study shows clearly how the indicator is applied on a particular project, according to the initial data, and how the results are interpreting.

The article can be useful for managers, economists, engineers, etc. and for all who learn to evaluate an investment project, by presenting one of the most important indicators of economic evaluation and a way of calculating it.

Quality of Life in United Kingdom and Romania. A Comparative Study in Rural Areas

Ignat Raluca
Stoian Mirela

The Bucharest University of Economics
Department of Agrofood and Environmental Economics
raluca.ignat@ase.ro
mirela.stoian@eam.ase.ro

Abstract

Between United Kingdom and Romania there are strong economic differences. A comparative study upon the most representative macroeconomic indicators was run, using statistics. The study revealed the gap between the two economies and, in the same time, two different approaches for macroeconomic policies. While British rural areas are seek given their life conditions, in general, Romanian rural areas are not attractive for any inhabitant. It is true that the traditions are diverse and the premises of the countries were never similar. But the expectancy of their inhabitants, no matter the urban or rural environment, for quality of life is the same: high.

Key words: quality of life, rural development, agriculture, public policies, comparative study

J.E.L. Classification: O52, E01, E21

1. Introduction

According to First European Quality of Life Survey: Quality of life in Bulgaria and Romania, quality of life has three main strengths, after Fahley, Nolan and Whelan (2003):

- it is, mainly, at individual level, while authorities' actions for increasing quality of life have macro perspectives;
- it is a multi-dimensional concept and encompasses many life domains, like economic, health, social care, education, environment, alimentation, and, in the same time, confronts their inter-actions;

- it is measured using both subjective living conditions and objective well-being, succeeding or, at least, trying to succeed in harmonizing authority's policy to individuals' expectations.

Quality of life may represent what a person cumulates in order to have economic security, social care, and a general welfare impression. Thus, studies (Stiglitz, J. and co., 2009) demonstrate the differences between what authorities think about the offered quality of life and people's expectations.

2. The research methodology

Between United Kingdom and Romania there are strong economic differences. A comparative study upon the most representative macroeconomic indicators was run, using data from National Institute of statistics and Eurostat. The study revealed the gap between the two economies and, in the same time, two different approaches for macroeconomic policies.

The Organisation for Economic Cooperation and Development (OECD) on a regular basis reports the quality of life in the OECD countries. Meanwhile, Romania is not part of this study, even if is EU member.

Starting this point, the research question naturally appeared: what are the differences between quality of life in United Kingdom and in Romania, especially in rural areas, so important for both countries.

The research runs a comparative analysis between United Kingdom and OECD indexes values. Afterword, a comparative analysis between British and Romanian ruralities was conducted.

The conclusions reveal that United Kingdom is one of the countries reporting the

best values on quality of life indexes, and the gap between British and Romanian ruralities is huge. In order for Romanian rural areas to fulfil the same quality of life, the approach for public policy should become more pragmatic.

3. Data analysis and interpretation

United Kingdom had at 1st of January 2012 62 million inhabitants, and around 30.2 million visitors/year, uses 3,33% of the total energy consumption from alternative sources.

In the same time, Romania has 21,5 million inhabitants and more less visitors.

Table 1 – Population at 1st of January (million inhabitants)

Item	2000	2008	2009	2010
UE 27	482,8	497,7	499,7	501,1
United Kingdom	58,8	61,2	61,6	62,0
Romania	22,5	21,5	21,5	21,5

Source: România în cifre 2011, National Institute of Statistics; Eurostat

The two analysed economies have strong differences. During 2008-2009 economic crises, the United Kingdom succeeded in obtaining a low inflation average, while Romania skips over 7% in 2008. These may be caused by the two different types of economies: the British one based on production, while Romanian was, or even is, based on consumption (Table 2).

Table 2 – Inflation average rate (%)

Item	2000	2008	2009	2010
UE 27	1,9	3,7	1,0	2,1
United Kingdom	0,8	3,6	2,2	3,3
Romania	45,7	7,9	5,6	6,1

Source: România în cifre 2011, National Institute of Statistics; Eurostat

It is true that United Kingdom was the country that applied anti-clicle economic policies, while Romania applied the International Monetary Fund policy which was the partner during this crisis. The effects are quite obvious. The British GDP/capita is

considerably higher than the EU-27 average; while Romanian GDP/Capita is twice lower (Table 3).

Table 3 – Gross Domestic Product / inhabitants (in PPS)

Item	2000	2008	2009
UE 27	19100	25100	23600
United Kingdom	22700	28700	26500
Romania	5000	12000	10700

Source: România în cifre 2011, National Institute of Statistics; Eurostat

The annually GDP growth rate was negative in both countries over the last three years, but the decreasing rate was higher in Romania (Table 4).

Table 4 - GDP growth rate (%) (last year =100)

Item	2000	2008	2009	2010
UE 27	3,9	0,5	-4,2	1,8
United Kingdom	3,9	-0,1	-4,9	1,3
Romania	2,4	7,3	-7,1	-1,3

Source: România în cifre 2011, National Institute of Statistics; Eurostat

The industrial production indices (Table 5) and agricultural production indices (Table 6) revel that Romania has better results than United Kingdom.

Table 5 - Industrial production indices (without constructions)

Item	2008	2009	2010
United Kingdom	98,07	88,12	90,53
Romania	123,74	116,95	123,36

Source: România în cifre 2011, National Institute of Statistics; Eurostat

If we correlate these results with GDP situation, we may consider that United Kingdom added value is much higher for both sectors, industry and agriculture.

Table 6 - Agricultural production indices
(1999-2001=100)

Item	2000	2007	2008	2009
United Kingdom	101	95	100	98
Romania (1)	88	97	118	115

Source: FAO Statistical Database; (1) According Eurostat

Another explanation may be that United Kingdom productivity is much higher than in Romania, British being more efficient (Table 7).

Table 7 - Labour productivity per employee
(GDP in PS per employee (UE 27 = 100))

Item	2000	2007	2008	2009
United Kingdom	110,7	109,5	108,6	106,6
Romania	23,6	43,2	48,7	47,9

Source: România în cifre 2011, National Institute of Statistics; Eurostat

And, because we are talking about efficiency, the results that the two countries obtain are strongly different.

Figure 1 – Life expectancy (years)

Source: România în cifre 2011, National Institute of Statistics; Eurostat

The life expectancy is in United Kingdom with seven years higher than in Romania.

Table 8 - Average annual gross earnings
(Euro)

Item	2000	2007
United Kingdom	37676,5	46050,5
Romania	1732,0	5062,0

Source: România în cifre 2011, National Institute of Statistics; Eurostat

In the same time, the British average annual gross earnings is almost ten times bigger than Romanian. The quality of life, even just from this perspective, is better for United Kingdom.

Figure 2 - The degree of participation in the educational or training of persons aged 25-64 years (%)

Source: România în cifre 2011, National Institute of Statistics; Eurostat

And the high standards of quality of life are supported by the degree of participation in the educational training of persons aged 25-64 years (Figure 2). The EU-27 average is 9,3, while United Kingdom has a degree of 20,1, meaning twice higher, and Romania has only 1,5, which is almost ten times less.

Doubtless, these are strong enough reasons for the existence of United Kingdom in the OECD analysis of quality of life reports, and for the absence of Romania from the same reports.

OECD developed the OECD Better Life index, a sum of 11 “topics reflect what the OECD has identified as essential to well-being in terms of *material living conditions* (housing, income, jobs) and *quality of life* (community, education, environment, governance, health, life satisfaction, safety and work-life balance)” (<http://oecdbetterlifeindex.org/about/better-life-initiative/>, accessed on 20th of April 2012).

Each index will be analysed further in order to reveal the situation on United Kingdom compared to OECD average.

For *Housing*: 74% of British inhabitants live in their own house, while the OECD average is 67%. The rents are high and not affordable for each person. Given the credit policy and the economic growth before the financial crisis, British accessed their own houses.

For *Income*: the Household Net-Adjusted Disposable Income in United Kingdom is 27208 USD/year, while OECD average is 22284 USD. The *Household Financial Wealth* is 60382 USD bigger than OECD average of 36808 USD. The economic and social levels may be empirically observed while you are in United Kingdom. For each of them there are certain supermarkets for food and dairy products, brands for clothes to be brought and worn, different neighbourhoods, ways of spending free time etc.

For *Jobs*: 70% of the persons between 15-64 years old have a paid job. The Long-term Unemployment Rate is 2,59%, slightly lower than the OECD average. This index will be further analysed together with the *Work-Life balance*.

For *Community*: 95% of British declare that they know one person that they can rely on in time of need, more than the OECD average. 59% of them reported having helped a stranger in the last month, also higher than the OECD average and 5% of people in the United Kingdom, lower than in most OECD countries, reported ‘rarely’ or ‘never’ spending time with friends, colleagues or others in social settings. If we take into consideration the number of visitors, the history of United Kingdom, we will find reasons for this approach: the tolerance and the acceptance are not qualified, but they exist at high levels in the United Kingdom.

For *Education*: 70% of adults aged 25-64 have earned the equivalent of a high-school degree, close to the OECD average of 73%. British curricula enforce that children and pupils and even students spend more and more time in schools and universities, and less time in holidays and days off. Only three weeks in August are free of compulsory presence in schools and universities. Also, the individual study has a great importance and time during each day. All these results were reached after several reforms of the educational system, as the Blair administration’s recruitment campaign run in order to fight against shortages of teachers.

For *Environment*: PM10, tiny particulate matter small enough to be inhaled into the deepest part of the lung, levels are 12.7 micrograms per cubic meter, lower than the OECD average of 22 micrograms per cubic meter. United Kingdom has tradition in the

field of air pollution, especially in London. The local policy imposes the congestion charge, a tax for each car entering the heart of the city, except cabs, buses, and local riparians, which pay a less tax. This is a measurement able to fight against pollution as well as traffic congestions.

For *Governance*: 65% of inhabitants trust political institutions, compared with 56% the OECD average, and voter turnout in the United Kingdom was 61% of those registered. This figure is lower than the OECD average of 72%. The existence of monarchy may facilitate the trust in public institutions, as they are not changing one at every four years.

For *Health*: life expectancy at birth in the United Kingdom was 79.7 years, just above the OECD average of 79 years. Higher than the OECD average of 69%, more than 76% of inhabitants declare that they are in good health. At macroeconomic level: the total health spending accounted for 8.7% of GDP.

For *Life satisfaction*: 68% of British were satisfied with their life and 79% believe that their life will be satisfying five years later. An index with a major qualitative component is that 76% of people in the United Kingdom reported having more positive experiences in an average day than negative ones, and the OECD average is 72%.

For *Safety*: 2% of people reported falling victim to assault over the previous 12 months, lower than the OECD average of 4%, and 31% of people feel unsafe on the street after dark, higher than the OECD average of 26%.

For *Work-Life Balance*: People in the United Kingdom work 1 647 hours a year, lower than the OECD average of 1 749 hours. People in the United Kingdom devote 66% of their day, or 14.8 hours, to personal care (eating, sleeping, etc.) and leisure (socializing with friends and family, hobbies, games, computer and television use, etc.) – in line with the OECD average of 14.8 hours, according to the same report.

All these situations and all these public policies that were applied for United Kingdom and Romania determined high differences in rural areas.

For Romania, rural areas are weak points considering the economic situation, the unemployment and the quality of life indicators:

- there is a lack of job opportunities and the infrastructure is neither available, nor time and cost efficient for commuters; in United Kingdom majority of rural inhabitants are commuters, or work at their desk at home;

- there are bad living condition, or the investments for higher living conditions are huge and have no source, in general; in United Kingdom there is no difference between living conditions in urban or rural areas, according to house needs;

- there is a bad safety, given the public cuts that affected the number of policemen for each village, and the return of the delinquents from other EU countries were they emigrated over the last years;

- there is a huge abandon of education, at primary and secondary schools, and insignificant number of high-schools in rural areas, just to determine an increased number of uneducated inhabitants, with no true possibility of obtaining a well-paid job;

- there is no easy access to medical services in rural areas and a big pressure on the number of beds from urban areas;

- there is almost no access to cultural activities, a poor existence of cinemas, theatres, museums, exhibitions etc., the community relations are based on participation to weddings and funerals, and some fairs occasionally organised.

The nominalization may continue, these being just few of the weaknesses that were revealed.

While British rural areas are seek given their clean air, unpolluted waters and soil, silence and life conditions, in general, Romanian rural areas are not attractive for any inhabitant.

4. Conclusions

The differences between United Kingdom and Romania are important, even the two countries are partners within European Union.

Different public policies in the field during time, different approaches of the same situation with opposite solutions determined the current different situation.

It is true that the traditions are diverse and the premises of the countries were never similar. But the expectancy of their inhabitants, no matter the urban or rural

environment, for quality of life is the same: high.

A Financial Instability’s Theory in the Global Economy

Ionescu Gr. Ion

iionescu_levant@yahoo.ca

Abstract

Financial instability is a phenomenon which disconcerts business environments, in general, and banking-financial business environments, in particular. The generalization which acts in a evaluated capitalist system, in the phase of market determination, represents a factor which potentiates the financial crises, daring at any time to cause the big disintegration. The financial instability is determined by a mechanism which influences it and sends disturbing factors, thus: the increasing of those incertitude, the competition could determine the companies not to found provisions for unpredicted risks, the lack of strategy on long term, the competition of capital on the market.

The continuance of the global market development, of the intertrade, in general and of the international intertrade, in particular, has slowly conducted, but surely, to some mutations in the economical plan being detected the disappearance of many small businesses and of the low range companies, but without increasing noticeably the markets. Making an analysis of the money market, it turns out that international integration “is less conceived by the very specialized or capitalistic companies, the expansion at global scale puts spurs to the multinational companies to accelerate the concentration with the purpose of reducing the fixed expenditures [1].

Key words: financial instability, global economy, financial market, financial flood

JEL clasifications F15, G15

1. Global market development

Complied to this continuous pressure, small companies have two options: to leave the

market or to interfuse with groups or with more important and more powerful companies. This way, company position on the market appears as an element which determines the duration and its price. The appearance of the unique European market has constituted an example in what concerns the interest of the large groups for acquisitions and fusions “overcharging the small companies”.

Starting with the last decade of the past century, the the global integration has fortified. Some authors of economical theory have transformed the global integration process into a real market determination [2].

Market determination, as a new concept of the economical doctrine, flowed from the perfect competition theory. In the perfect competition model “the markets reach their standing balance through a correct and fair rapport of the demand with the supply, and the price represents the most efficient allocation of the resources, at a specific moment [3].

Market determination appears as a exaggeration of the market adjusting role, a belief in the “laissez faire” ideologies and in the Hayekian conception over the freedom. The notion has its genesis in perfection, in absolute values and in the conviction that everything can be made to functionate better, in the man’s need of security and authority, expressed in the balance state, balance which can be economical, social, political etc. The determination is a remanence of the conservation instinct, of the “either...or” judgments, in which is absent the third variant, and in economical plan, the judgment of value have concentrated in the conception of “self adjusting of the global markets by the act of the invisible hand, considered the best natural mechanism of function and adjustment of the economy [4].

Global economy has conferred the currency a global value, characterized through three classical functions: method of measuring the value, method of change and method of

hoarding/depositary of the wealth. From all that, the function of measuring the value and depositary of the wealth have developed to superior dimensions, in the global economical system.

According to the classical theory, money's value reflects the value of the interchangeable assets and services, based on a finite diversity of goods and services, complied to the rational choice, in which people estimated for a relative long period of time, the necessities which needed to be satisfied, so that the acceptance of the change was realizing, according to some traditional methods, the values of change being better outlined, and the money represented the method of reaching the purpose and not a purpose as it self.

For the global world or in progress of becoming global, the values are not easy to appreciate, traditionist models have collapsed, arising a diversity of goods and services in exponential increase, which are continuously multiplying and they are complied to some updating and re-updating, on a shorter and shorter period of time. People have a bigger and bigger freedom of choice, they are challenged by more proposals, the choice involving, besides rationality, a lot of energy expense. Some chose money-as purpose as it self, demonstrating the tendency of replacing the values of interchange-of the goods and services, with the money as itself- the tendency to liquidities, while others need confidence to invest in productive activities or to speculate (bull) on money markets. This way, the market determination is educing the most concrete in the need of confidence, still the need could create excesses as well, and the confidence can be obtained through attraction or through the presentation of the financial information in a different format, at some specific periods of time.

2. Financial instability phenomenon

Financial instability is a phenomenon which soars permanently over the financial system, creating perplexities in the business environments, in general and in the financial-banking environment, in particular. Referring to the phenomenon of financial instability there is a whole and a true literature of speciality [5] which studies the different theories of the financial instability, each theory having its own contribution to the

comprehension of the financial crises. The global integration which acts in a developed capitalist system, in the phase of market determination, represents, on itself, a factor which potentiate the financial crises, taking the chance at all times to produce the great disintegration.

3. The mechanism which influences financial instability

Financial instability is determined by a mechanism which influences it and sends disturbing factors, thus:

- *The expansion of the new entries' activity on the financial markets* could induce the creditors a change of the way of appraisal of the credit relations and the offering of some credits at low prices (extracredit), based on the existence of some information less pertinent. It is what it is called “the cannibalism of the new creditors” which tend to offer credits based on some asymmetric information during the initial stages of the lending, in their wish to “eat”, all that is possible in the specific market, which in the final conducts to the credit standards relaxation, as well for the new entries, as for the other creditors;
- *The incertitude could be increased by the new entries.* The new entries' lack of experience could create a even larger incertitude. The incognizance of the market, respective of the demand and supply dynamics, could encourage the appearance of hoarding (herding?) (the lending of the same type of customer), which takes to the non-division of the credit risk;
- *The competition could determine the companies not to constitute adequated provisions for unpredicted risks,* such as financial crises for ignorance reason or for the desire not to lose the competitive advantages (the provisions conduct to the decrease of the shareholders' profit in the establishment moment;
- *The lack of strategy on long term, the sufficiency and the activity planning on short term* conduct the companies towards a deficient calculation of the risks that could appear during the

economical circle , and again, through the competitors, helps to reduce de prudential standards for the entire market;

- *The competition for capital, on the market, stimulated by “the game” of frequent efforts, adopted by the new entries or the markets’ development, could conduct to a cumulative reduction of the market prices, until these are changed with losses for the participants and with a retreating of those from the market or even a re-lay.*

The increase of financial instability, inside of the global capitalist system, in was superimposed as well on the background of an acute need for resources of the great companies –SUA, European Union, Japan-reality which flows from the system entropy itself which is 500 years old and which tends to transform “the centre” into an enormous black hole, ready to swallow up the system’s periphery, inside of some deep mutations.

4. International financial floods

Referring to the international financial floods, the literature of speciality focused on the apprehension of the financial instability on the exchange rate crisis[6] which makes possible gains from speculations against the depreciation at fixed parity of some currencies, reported at the monetary stocks of some countries, at the variation of some factors, among those: external net assets and the expenditures balance⁷ [Ibidem.]. The contribution of the international floods of capital to the financial instability has introduced a group of additional elements which affects the mechanism of transmission of the crises, among those:

The authorities policy of counter-balancing the pressure over the exchange rate, through the interest rate increase, fact which could conduct towards an aggravation of the financial instability.

The complications introduced by the financing of the public and private sector, in external values, consists in the fact that the standing balance position is sensitive to the exchange rate and conducts to a potential link between depreciation, in the context of a monetary crisis, and financial instability. The danger is as acute as the monetary funds in external values are low for covering the

external debts or are already consumed by the precedent crises. It can be remarked the fact that the creation of a more liberal financial institutions has accomplished, many times, connected to a surveillance over the movements of capital, allowing the new financial liberal mediators to acknowledge more the risk of lending in foreign currency.

5. The role of international investors

Thirdly, the role of international investors increased, once with the increase of the migration of the international capital floods, which determine an increased pressure over the markets, being possible to appear fast retreats of this investors from the markets being in decline process, making unstable internal finances and the exchange rates. Also, it is possible a markets contagion, explained by a homogeneity of the paternalistic models [8].

6. Conclusions

In conclusion, we can say that the features remarked by the internal theories of the financial instability can be generalized at international level, as much as the new financial institutions, entered on the credit market could not meet good enough their customers, to that it is added the role of confidence, banking panic and the contagion at international level, the credit’s limitation and the moral hazard.

The cantitative analisys of the influencing factors highlight the factors presents in unlocking all the financial crises-factors of great frequency and factors which acted only in the case of certain crises [9]. Among the first it can be mentioned: the debts increase, the change of the regime, the concentration of the risk, the decline of the financial institutions solvability, the entrance of the new mediators, the act of settlement of the authorities, the monetary policy and the credit limitation (the collapse of liquidities), banking panic, and in the second category of factors: the increase of assets expenditure, evinced, during the great Depression, as well as in the collapse of the market [10], in the American economies crises, in the collapse of the stock market, in 1987 and in the banking system crises from Australia, Norway, Sweden, Finland and Japan.

Once with the capital floods became international, new factors appeared, such as: the import of financial crises, the macroeconomic impact, derangements of the financial systems, economical crises.

Abstract

At the beginning of the new millennium, tourism has been noted as one of the most dynamic areas of activity, generating jobs and foreign exchange resources.

Every country is interested to develop its tourism industry and to turn to profit its natural, cultural and economic potential on the global market. Tourism could be a source of economic development only for those countries which, yet undeveloped, could attract a large number of tourists so as to generate a sufficient volume of receipts in order to contribute either to the remission of trade deficit or to the stimulation of other upstream activities in the tourism industry.

This paper aims at highlighting the premises of tourism internationalization, the scale and impact of international tourism growth, the overall situation of the global tourism industry as well as an analysis of the international tourism as seen as a component of foreign economic relations.

Key-words: globalization, internationalization, tourism, tourism services

Clasificare JEL: L83, M16, M21, N10

1. Introduction

The production of "recreational goods" has had a special role in the doubling of the world product in terms of international trade. In the collective organizational structures and within

requirements of profitability, tourism economy also develops its own forces in order to integrate in interested and pressure groups, such as the ones which are most important in the shaping of the global market, so as to benefit from a number of privileges.

In addition, it is sustained by a new logistics in what concerns the field of transportation and interchange, despite the fact that many industrial and commercial groups, such as SMEs, heavily depend upon networks of subcontractors both in the country of origin and country of destination. Therefore, a real trend of "de-territorialization" has occurred as a result of "space homogenization," as influenced by the development of transportation and informational systems, an evolution marked by numerous asynchronies between the transformational rate and the process of activity coordination. Hence, the main programmes - as for example, those of air transport networks - recompose space and are likely to perfectly coordinate the poles which drive the global economy as well as to marginalize irrelevant territories.

2. The dimensions of tourism internationalization

Tourism internationalization relies on the actions and reactions of large pools likable of issuing and receiving flows of tourists. Industrialized societies, capable of providing the capital and technology necessary for providing travel packages to consumers who afford to pay the travel costs, place themselves at the incipit with regards to these exchanges and continue to fuel the flows of people seeking leisure.

Major cultural, sport, scientific, business events, etc. keep on being touristically exploited and turned to profit, in creating new market segments, evincing once again the originality of tourism activities [7].

The emergence of mass tourism has made it possible to overcome the limitation of the service to the so-called privileged class, so that from the 1950s the number of international visitors plainly increased from 25 to 919 million in 2010.

Fig.nr.1. The worldwide evolution of in-comers and income for international tourism

	1950	2010
In-comers (millions)	25.3	940
Variation from the 1950s	1.00	37.15
Income(billions- dollars)	2.1	919
Variation from the 1950s	1.00	437.62

Source: *Tourism highlights*, 2011, UNWT, Publications Department

While in the first three postwar decades, whether it was international or domestic travel, tourist flows focused on the triad U.S. - Western Europe - Japan, new regions of the world now appear to enter the list of preferences for tourist destinations.

Fig. nr.2. The zone distribution of international tourist flows and their alteration in time

Zone	Year	
	1960	2010
Africa		
-in-comers	1.1	5,4
-income	2.6	3,4
America (N+S)		
-in-comers	24.1	15,9
-income	35.7	19,8
Asia and the Pacific		
-in-comers	1.3	21,7
-income	3.4	27,1
Europe		
-in-comers	72.5	50,7
-income	56.8	44,2
Middle East		
-in-comers	1.0	6,3
-income	1.5	5,5

Source: *Tourism highlights*, 2011, UNWT, Publications Department

Invisible flows in general and of tourists in particular are characterized by a concentration in developed countries (two thirds of the world tourist flow), the fact that the factors of

dynamism are of economic and especially non-economic nature (such as political, psychological, natural); that they are measured in units and with specific physical indicators (usually indirectly, by making use of units of time and space), have a bidirectional nature (for each country is at the same time, both importing and exporting), the sign of balance of payments being relatively stable at large intervals[2].

The internationalization of tourism services is achieved by moving across the border the consumers from the importing country towards the exporting tourism country. As part of the international flow of services, the international institutions involved in the regulation and liberalization of service-based trade focus their attention on tourism, and the main role here is attributed to the General Agreement on Trade in Services - GATS [6].

The internationalization of the touristic offer was part of the strategy of developing countries. With exotic destinations they could fold to the consumers' demand. A number of regions have been and are less prepared for receiving large tourist flows, for cultural or economic reasons. "Hard" tourism, as opposed to "soft" tourism - which respects the local values and characteristics - has caused many critical reactions [9]. It was shown that globalization cannot dismiss the socio - cultural roots of the communities involved in the management of tourism activities.

The internationalization of tourism has thus faced the protests of those supporting the environment and calling for an alignment of these activities to the principles embodied in the concept of *global environment*. The environment, before being a physical element is first of all the existential space of the whole society, communities and individuals, which in turn belong to certain cultures that rely on physical environment [10].

3. The effects of the international mass tourism expansion

Like any phenomenon of this magnitude, mass tourism has both positive and negative effects. It is of high importance not to completely remove the negative ones (an objective that would be unrealistic), but to reduce them and opportunities be seized and exploited.

Among *the positive effects of an increase of foreign investments in tourism* one might

include the *creation of job positions, rising incomes and improving living standards*. But the opening to foreign investors does not necessarily have immediate major positive effects: "In the Mediterranean countries, over 65% of revenues in tourism go into the pockets of approximately ten companies from countries which send the tourists, as they own or control the touring and air transport companies, along with the hotel structures" [1].

So the money will not go to the respective country but in a very small amount and even then, those who benefit from these profits are some large hotel and transportation companies etc. Foreign investment proves thus less profitable than one could ever hope. Obviously, the increasing number of foreign investors also leads to an improvement of country image, whose greater credibility in the eyes of other potential investors will expand afterwards. To help develop the local tourism industry and thus reduce the external control, national authorities of many countries have come to the support of local entrepreneurs through counseling, granting and subsidy programs. Mention should be made upon the fact that such policies can be regarded as protectionist unless they meet certain conditions stipulated in international agreements such as GATS (General Agreement on Trade in Services).

The very fact that certain countries or regions are touristically attractive, gave them an extra chance in their fight for survival. Perhaps one of the most important merits of tourism is the promotion of cultural exchanges, peace, understanding between peoples and the idea of "global community" [5]. Many see tourism as a means of saving the national economy, which is a mistake, because a "healthy" economy cannot rely only on one economic sector. Countries that exclusively depend on tourism are considered fragile environments, and any outdoor event adversely affecting tourism, can thus have devastating effects on them.

Tourism cannot develop unless its social and economic environment is favorable [8]. Once the necessary foundation for its development exists, it will directly contribute to economic growth and the improvement of living conditions. It is difficult to make a clear distinction between what is positive and negative with regards to tourism development because quite often the short-term impact is positive while on the long-term it turns to be detrimental. Let us consider a very attractive natural area.

Tourists will come, attracted by the natural beauty of the scenery, but if this wealth is not protected, the environment will degrade and the destination will lose its attractions. One should not forget that a country's natural heritage might attract tourists, but once it is degraded, tourists will depart as quickly as they came, leaving behind a population that must bear the consequences of a degraded living environment, of scarce natural resources and decline in revenues in the tourism sector. Sometimes, in spite of a first sight positive impact, further analyses reveal that things are not indeed so. Thus, although the development of the tourism industry could create new jobs, most times it is a seasonal and poorly paid work [4].

The following table shows what main positive and negative effects the development of mass tourism within the context of globalization might have. Since the causal relationship between two complex events is difficult to prove and given the fact that each field is influenced by many others factors, one could not accurately 'measure' the impact of tourism development. Therefore, in most studies, the assessment takes into account various "actors" involved in tourism activities: local residents, hoteliers, transporters, local authorities etc., as well as the comments made by international bodies, researchers and experts in tourism.

Fig.nr.3. The main positive and negative effects of the mass tourism development within the context of globalization

Positive
- The slowing down of youth emigration and even the return of some migrants to work in the tourism industry
- Creation of job positions
- Increased income and higher living standards
- Contact with other cultures. Intercultural changes
- Protection of natural areas that were doomed to degradation and, ultimately, extinction
Negative

- Rising prices, preventing the access of local people to tourism products
- Tourists are money-bringing actors, but not development agents
- Local people complain that the Government has not created the infrastructure necessary for the improvement of the living standards, particularly in terms of health, education and transport
- The abandonment of certain occupations, resulting in a loss of traditional jobs, especially in agriculture and fisheries
- Differences between the rich and the poor are becoming larger and more obvious
- Degradation of morality
- Young people are attracted by the modernism of foreign tourists, adopting their behavior
- Creating a negative image of the "Northern" tourist*
- The degradation of the environment
- Sex tourism, involving children
- Loss of regional and national identity
- Tourism maintains inequalities between people

Source: Tsartas, P. Socio-economic Impacts of Tourism on Two Greek Islands, *Annals of Tourism Research*, vol. 4, n^o2, 2005: 74-105; WTO, Service trade: http://www.wto.org/english/tratop_e/serv_e/serv_e.htm

4. The general condition of the global tourism industry (T&T - Travel and Tourism)

The transport and international tourism services T & T - Travel and Tourism make two separate entries in the balance of payments (i.e. in the TSA - Travel & Tourism Satellite Account). This particular feature stems from the fact that the activity of T & T is not characterized by uniformity, since the industry offers to consumers both goods (including durables) and services (transportation, accommodation, food, cultural services, etc.).

Fig.nr.4. Indicators of the T& T industry worldwide (estimates for 2007/ forecast for 2017)

World Total	US\$ bn 2007	US\$ bn 2017
Personal Travel & Tourism	2,977	5,169
Business travel	743	1,314
Government expenditures	334	546
Capital investment	1,155	2,393
Visitor Export	968	1,805
Other Exports	880	2,001

T&T demand	7060	13,232
Direct industry GDP	1851	3,122
T&T economy GDP	5391	9,781
Direct industry employment	76,083.6	86,637.4
T&T economy employment	231,222.2	262,634.4

Source: World Travel&Tourism Council, The 2007 Travel&Tourism Economic research, Spain

There are two concepts used in this field in reference to the T & T activities: *the T & T industry* (which reflects only the direct contribution of these activities at the macroeconomic level and it is strictly linked to touristic consumption) and *the concept of the T&T economy*, encompassing both the direct and indirect effects of the T & T activities, and reflecting their ability to also stimulate other industries in the economic system.

The world demand for tourism services in 2007 stood at approximately U.S. \$ 7060 billion and its projection of increase for 2017 is up to U.S. \$ 13, 232 billion.

The contribution of tourism industry (T & T - Travel and Tourism) to the creation of a global product in 2007 was of 3.6%.

In what concerns the "labor" factor, T & T is an intensive industry, it requires trained personnel and it is listed among the activities with great potential to generate jobs. In 2017, one of 11 jobs worldwide will be generated by tourism and transport activities. Currently this industry directly generates a number of 76.08 million jobs worldwide and is expected to create further 2.4 million jobs by the year 2017.

T & T is a large export activity, the inbound tourism ensuring the injection of significant foreign exchange resources in the receiving economies. Moreover, the T & T is an industrial catalyst for manufactured products and constructions. Thus, the overall public and private investments in the T & T sector reached the level of US \$ 1.155 billion in 2007 (9.5% of world investments) and will grow, during the next 10 years, up to 2.393 billion in 2017 (representing 9.9% of the world's total investment).

T & T is both a generator and a recipient of government funds. Around US \$ 334 billion were allocated from government resources for the T & T sector worldwide and by 2017 the T & T government expenditure will amount to approx. US \$ 546 billion.

5. International tourism– a component of foreign economic relations

International tourism is part of the service-based trade, counting all activities generated by the tourists who cross the borders in order to visit certain touristic destinations.

International tourism is an important source of foreign currency without requiring special internal efforts, a source of more favorable conditions for the production of means designed for export out of domestic resources; the tourism activity manifests itself as an important chapter of exports, called " internal export", giving outlet to a wide range of products and services which in other circumstances, may not be exported in such large quantities without great efforts and high risks – due to the perishability of goods, the seasonality of products, the huge distances to the consumer markets, the uncompetitive prices[10].Tourism services are consumed at the very moment of production, in accommodations, during catering, therapies and recreational activities. Other goods are bought by tourists to be taken home (souvenirs, electrical goods) or to be offered as gifts to friends and relatives. These services and goods, for which foreign tourists visiting the country pay in foreign currency, represent, for the host country, exports of goods and services, and constitute importation for the country of origin.

Certain transport-, promotion-, customs charge, and fee-related expenses are eliminated through these types of internal exports or inbound tourism forms, expenses which are to be absorbed by any export transaction of goods and services subject to touristic activities.

Tourism could be a source of economic development for those countries which, although underdeveloped, could attract a large number of tourists likable to generate a sufficient income volume so as to contribute either to the remission of trade deficit or to the stimulation of other upstream activities in the tourism industry.

A landmark of quality tourism exports is the unit price charged for each export and respectively by in-comer, on visitor arrival.

Fig. nr.5. Average outgo per tourist (touristic export)

	Country Category	Outgo units(\$)
1.	Underdeveloped countries with low income per capita	296
2.	Countries with low income per	319

	capita	
3.	Developing countries	404
4.	Countries with medium income per capita	416
5.	Industrialized Countries	695

Source: worldbank.org

The low efficiency of tourism exports in countries with low income per capita obstructs the financing of tourism infrastructure projects; the quality of service is rather poor, particularly for accommodation services, so that tourism, as part of national exports, does not have the capacity to contribute to the growth of the economy. In addition, countries in this category are forced to import most products needed for tourist consumption. The competitiveness of the touristic offer is almost exclusively represented by the low cost of labor, which also gives way to the marketing of the touristic offer at low prices onto the world market.

An analysis of the world trade structure in general, and of services in particular, highlights that tourism plays an important role. Although it is not yet possible to measure the entire volume in the structure of touristic trade, this role is related in particular to the touristic income, which largely corresponds to external consumption, as well as to the international transport and travel income.

According to the international statistics compiled by the World Trade Organization (WTO), the total tourism revenue, including those arising from international affairs, were constituted by the most important domestic exports worldwide. In 2008, international tourism has accounted for over 4.8% of the total world exports and 25% of the total services exports.

Fig.nr.6. Tourism services in the world trade of goods and services

	Amount
	2008
Goods	15775
Services	3730
- transport	875
- international tourism (i. t.)	945
% i.t. of total	4,8
% i.t. of services	25,3
- other services	1910

Source: World Trade Report 2009, Trade Policy Commitments and Contingency Measures, WTO, p.30

International tourism accounts for US \$ 945 billion, placing tourism on an enviable position among the most exported goods.

World Travel and Tourism Council (WTTC) has quantified on the basis of the Tourism Satellite Account methodology and shown that in fact, that contribution is much larger, international tourism accounting for 11% of total exports, the equivalent of US \$ 2103 billion, and a remission up to 10.3% is expected in the year of 2018, which is up to US \$ 4174 billion [11].

The value of all services which presuppose exchanges between countries is noted down in the balance of payments, in the service balance. The exceptions are *international tourism* and international transport, which are marked in separate posts [3].

As regards the transactions with international tourism, these accounted in 2008 for over 25.3% of the international service-based trade, tourism taking the first place in the classification of business services.

6. Conclusions

In the context of a rapidly expanding internationalization of the service sectors, the size and scale of operation of a country's firms are important attributes of their competitive position in the global market, which also explains for the *dominance of transnational corporations on the international market of tourist services*. But equally true is the fact that *the need for local service providers will always exist*, given that the latter have specialized knowledge about the local market which international companies do not have.

Therefore, the process of internationalization of the service sector,

including tourism, will not rely solely on the giant service companies, which imitate the companies from the manufacturing industry in their global expansion, but will also include *a network of smaller service providers on the local markets*.

Financing of Investments – A Starting Point for the Economy Development Practical Application of EOP Biodiesel

Istrate Luminita Gabriela
The Bucharest Academy of Economic Studies
F.F.A.B.B.V.
istrate_luminita@yahoo.com

Abstract

Liquidation is one of the most important indicators of the companies.

The fact, that the financial resources, as well as the valutory or the material ones are limited, and the destinations are competitive, claims their usage under extremelly efficient conditions. On expenses commitment for accomplishment of an objective or of an action, there must be carefully analyzed all the susceptible solutions worthing to be taken into consideration for choosing the optimum variant that presents the most advantageous report between the required effort and the obtained effort as its result. The financial policy must follow the systematic growth of all expenses efficiency.

Keywords: own financing sources, profitability, capital, biodiesel industry, investment project.

JEL Classification : D24; M21.

1. Introduction

Without a capital adequacy, any small or middle business has less chances to be successfully marketed and to be developed. But attraction of the necessary financial funds raises several problems to the enterpriser, both under the discovering and access aspect to the financing sources, and under the aspect of advantages and disadvantages implied in each source separately. The main disadvantage that results in case of using funds, other than the own ones, is the decreasing of the rights of control and property of the enterpriser upon the business.

The own funds represent the most frequent starting point in case of small and new business. The financial institutions are less opened – especially during periods of economic instability – to the firms that are at the beginning than to those with a “history” already known.[3]

Size decrease of the assets balance-sheet items or increase of the liabilities balance-sheet items value is equivalent to ready money release for the enterprise, and as a result, it can be considered a ready money source.[5]

Thus, in the category of ready money source, it is included: the sale of fixed assets from the enterprise ownership, the clearance of the stocks of raw materials and/or finished goods, the decrease of receivables volume, the increase of the contracting credits from the third parties or of the capitals attracted from the shareholders, the increase of payment gaps towards providers, employees, associates.[4]

2. The historical evolution of EOP Biodiesel and delimitation of its object

EOP Biodiesel, a German producer of biofuel, anticipated a high potential of development in the baltic countries, like Romania and Bulgaria, countries that do not have sufficient capacities of production in order to comply with the objectives of the European Union concerning the use of the alternative fuels. The Beteiligungs EOP Division operates in Romania by EOP Farms și EOP Siloz that work with rapeseeds.

After 1973, when the first important world oil crisis took place, the scientists and specialists turned their attention, searches and researches towards finding any inexpensive

and promising alternatives for the limited crude oil reserves of the Earth. Lately, these efforts have been added to the ones for the environmental protection whose pollution reached life-threatening levels in some parts of the world.

And thus, as a result of these sustained researches of the specialists all over the world, it appeared one of the saving solutions: Biodiesel! This is an alternative, non-polluting fuel which is obtained from regenerable resources (crops of rape, corn, etc.) and can successfully be used in diesel engines, being combined in different proportions with diesel fuel in order to create, thus, a mixture of fuel for the vehicles.

More foreign companies showed their intention to produce biodiesel in Romania. Likewise, the businessmen from Romania can see an opportunity in biodiesel production for their own companies as well as for Romania, that, according to the European Directives, they must take measures for replacing the gasoline and diesel fuel used in transportation with biofuel, from 2% in 2006 to 20 % in 2020.

A company listed at the Stock Exchange since 14.09.2005, EOP Biodiesel AG has been producing more than 400000 liters per day of quality biodiesel based on rape oil. This corresponds to the highest quality standards.

3. Description of the investment project

The main working hypothesis include both estimations at the macroeconomical level for the general evolution of national economy, and estimations specific to the biodiesel industry from Romania.

3.1. The main working hypothesis

1) *Hypothesis at the macroeconomical level*

Basic macroeconomical data used in construction and evaluation of the investment pattern, are:

- a) Evolution of inflation rate in Romania during planification. Estimations of this indicator are made by international forecasting institutions and are based on a short-medium term horizon reflected through the prism of the current market

situation (corresponding to the situation at the moment of evaluation).

- b) The medium exchange rate RON-EUR during planification period is based on the current futures quotes, for different maturities, and it is provided by the Bloomberg financial information network. The necessity of selecting a medium rate exchange derives from the complete calculation of the investment rentability proposed in EURO currency, fact that corresponds to a normal calculation option from the perspective of an EU investor in the Romanian economical environment and to the emission of initial capital in the European currency. Choosing a specific temporary rate exchange, instead of a fixed rate exchange for all period, is convenient due to inclusion of a considerable time horizon (in comparison with the present value, affected by the current market situation).

2) *Hypothesis at the level of biodiesel market from Romania*

The working hypothesis specific to biodiesel refer to the sustainable volume of biodiesel production in Romania and to the share evolution held by the EOP investment on the local market of biodiesel.

By sustainable production, it is referred to the accomplishment of a lasting development of biodiesel industry, without any negative impact on other economical branches. The main raw material for obtaining biodiesel is vegetable oil, a good but with a wide use also in the alimentary field, respectively in securing the human food necessity.

The main steps followed in estimation of the working hypothesis specific to the biodiesel market from Romania, are:

Step 1 : Forecastings regarding the national production of biodiesel during the analysis period – are based on the national production of oleaginous seeds, estimations regarding the level of exports of these goods and the conversion rates for seeds – vegetable oil and respectively vegetable oil – biodiesel.

A basic influence factor in the positive evolution of biodiesel production is the agricultural yield of the oleaginous seeds,

expressed in accordance with the quantity obtained per a hectare cultivated with these seeds. In comparison with an EU average, the actual level of this yield is over 2, lowered, fact that reflects not only the low efficiency of the agricultural branch, but also an opportunity of getting more efficiency and obtaining a higher production of seeds, without having a negative impact on the alimentary branch (in the working hypothesis, the cultivated surface is not modified, thus, the increase of the obtained quantity being only by means of a superior agricultural efficiency).

The main factors with a direct influence on the sustainable biodiesel production from the internal resources of raw material are not only the efficiency of oleaginous seeds but also the level of these seeds export (being high at present, due to the requests from other EU members for covering the own biodiesel need)

Step 2 : Forecastings regarding the market ratio held by the investment project of EOP in Romania - are based on estimations made in the previous step for the national biodiesel production, and on the production capacity taken into consideration by the EOP investment from Romania.

The market ratio held by EOP Romania has a positive evolution till 2011, when it reaches approximately 27%, corresponding to the capacity of maximum production of investment (*45 thousand tones*).

After 2011, the market ratio decreases and reaches the level of 18,5% in 2015. The negative evolution of the ratio is due to a constant level of EOP production, limited at the maximum capacity of investment, while the market is recording a continuous increase of the national production.

Step 3: Estimation of the investment project earnings and of the main variable cost positions.

The main earnings of the investment project come from the sale of biodiesel as a base product, and of glycerine as an alternative product.

The produced and traded quantities of biodiesel by EOP Romania correspond to the level estimated in the previous step. The trade price for 2009 corresponds to the current market price, and for the following

planned years, the price was adjusted by the annual inflation previously estimated.

The final price forecasting of biodiesel used in the financial planification is based on the Euro currency and transformation of the national price in an Euro equivalent price, by means of the futures quotes.

The glycerine price is directly expressed in Euro currency due to the European outlet and it has been yearly adjusted by a constant annual inflation of 1%, as the glycerine price reports to the entire European market, and only limitedly to the Romanian one.

The glycerine quantity resulted from the biodiesel manufacturing process is forecasted to approximately 10% from the quantity of used vegetable oil.

The main variable expenses of biodiesel production are connected to the vegetable oil acquisition, with the highest contribution to the cost structure, and to those for methanol.

Calculation of vegetable oil price is similar to that for biodiesel trade price (National price - > Adaptation to the inflation level - > Conversion of national price in Euro currency).

The necessary volume of methanol for securing the biodiesel production is estimated to 10,4% from the necessary quantity of vegetable oil.

3.2 Structure of the project financing

For the achievement of the EOP investment project, there are taken into consideration 3 financing sources:

- **Equity capital:** it is constituted from the initial capital inflow and the distribution of the annual net profit / loss (working hypothesis: no other capital accretion)

- **Initial bank loan:** it is performed for covering - the financial gap, due to an insufficient capital inflow, - the initial investment in acquisition and development of the investment placement infrastructure and the necessary production equipments. The initial bank loan has a redemption period of 6 years, with rate payment at the end of each calendar year. The interest taken for this loan is 10%.

- **Bank credit line:** it is made for covering the current necessity of ready money for a normal functioning of biodiesel production (securing the working capital), and the loan redemption is flexible, according to the

EOP needs. The interest taken for this loan is **11%**.

The equity capital inflow has an unfavourable evolution due to the loss reported during the first years of the financial planning and of the working hypothesis regarding the dividends distribution (100% of the net profit distribution is starting in 2011).

The bank loan should be totally repaid till the end of 2013, while the volume of the credit line increases considerably, due to the covering of the ready money need for the project.

3.3. Planning of the investment performance

The main earning sources (biodiesel and glycerin) and the sources generating variable expenses (vegetable oil and methanol) were presented in the previous sections.

Project evolution during the first years was negatively affected by a low level of production, mainly caused by the installation and operation process at normal parameters of production (in these calculations there were also included the initial production loss as a result of some technical problems, specific to a starting investment or to a local level of an insufficiently developed know-how). Other direct expenses are forecasted at a constant annual level, depending on the obtained earnings and they correspond, in percentage, to the research results in the field of biodiesel (feasibility and research study at a scientific level).

EBITDA margin was negative in 2009 as a result of a low production level corroborated with a high level of the fixed expenses, corresponding to a production of maximum capacity or close to it.

A normalized EBITDA margin is to be recorded in 2011, when the market is penetrated by EOP products and the equipment of production operates at high parameters. EBIT margin records a similar evolution, but it is additionally affected by the fixed expenses for amortization.

As a result of the loss recorded in 2009 and 2010, and of the opportunity to use the accumulated loss from the calculation of the profit tax in 2011 (hypothesis of deductibility of loss from the profit of the following 5 years), the planning forecasts tax expenses only starting from 2012. The complete tax

ratio of 16%, proper to the fiscal field from Romania, is applied to the profit before tax (EBT) from 2012.

3.4. Capital cost

The capital cost was estimated by means of the weighted average cost of capital on the basis of the initial capital structure, mentioned here as WACC (57% - loan capital, 43% - equity capital)

The cost of the equity capital for investment in biodiesel market from Romania was estimated by CAPM. Their basic elements are:

- **The risk free-rate** - corresponds to the yield offered by the Austrian government bonds, the main outlet market for biodiesel production from the source company, with a long-life maturity (the life period of investment project in biodiesel is considerable).
- **The country risk premium** - corresponds to the spread between the financial instruments issued in a developed country and a country of investment placement, in this instance, Romania.
- **The Unlevered Beta** – was estimated on the basis of the linear regression of 60 samplings of monthly observations, by means of of a company group listed at the Stock Exchange, having the same field of activity as EOP biodiesel. The final value of this indicator corresponds to an arithmetic average of beta values obtained for each company from the group, and the ulterior elimination of the effect upon beta, due to the particular financing structure. Thus, the resulted value reflects only the operational risk.
- **The relevering process** – is based on reintroduction in the beta indicator of the risk caused by the structure specific to the financing of investment in the local production of biodiesel (D/E 1.33 due to an initial superior level of the loan capital for financing the equipments and the placement of location).
- **The market risk premium** – is forecasted to 5,5% and corresponds to the recommendations of The Auditors Chamber from Austria for a long period of time, for a mature capital market (a

standard reached by Romania on a medium-long term).

4. Conclusions

Maintenance of the investment activity in Romania, as well as valorization of the oportunities specific to the present situation, can constitute important measures for reducing the impact of the economical and financial crisis.

In the present international situation, it has been highly emphasised the strategic orientation of investments which implies that, the managers must know not only the present social-economical environment, but also the future one, and identify the causes of changes. There shall be accomplished only those projects that have successful chances, that means, the ones which will generate useful effects during their entire economical life, in a social-economical environment that is in a continuous change and that is sometimes hostile.

This approach is of greater importance in the public working field, where each project must fit in the strategic axis of the social-economical development on a local and/or national plan.

In grounding of the investments decisions, the emphasis is put on the quantitative techniques of modification and quantification. The analysis on the basis of the cash flow generated by the project becomes a classical in the field from now on.

Whether the time limit of the project is longer, (the case of the research development projects of the territorial placement ones) the traditional techniques of decisions grounding are difficult to apply and do not give the best results.

Recent Evolution and Forecast of International Tourism in Europe

Jugănaru Ion Dănuț

"Ovidius" University of Constanta, Faculty of Economic Sciences

juganarudan@yahoo.com

Abstract

In spite of numerous challenges and threats faced in recent years, international tourism has managed to recover from the decline caused by the global financial and economic crisis. Rates of growth in the number of arrivals and tourism receipts, international tourism recorded in 2010 and 2011 entitle hopes that in the next period will be no such increase, even if rates will be more modest.

Analyzing the most important studies and forecasts of international tourism organizations, we find that Europe continues to be the most visited regional destination of the world, but is expected to reduce their market share in coming years due to new competition of the World especially in countries belonging to Asia-Pacific region, but also because of the weakness of many European economies, especially the countries of the Eurozone.

Key words: international tourism, evolution, Forecast

J.E.L. Classification: L 83

1. Introduction

Tourism, as economic activity began to develop in Europe, then in other Western countries (especially U.S. and Canada), before becoming an extensive business on all continents.

After more than two decades of almost uninterrupted growth in the number of international tourism arrivals, the impact of the terrorist attacks of September 11, 2001 was not as strongly felt in 2002, but especially in 2003 when they are registered worldwide, 691 million international tourists, from 702 million in 2002.

There was a continuous period of increase in arrivals between 2003 and 2008, then in

2009, a decline of 4% worldwide, Europe being the most affected tourist destination, with the Middle East (lower being 6% in 2009 compared to 2008).

The returning in 2010, however, was spectacular, and growth continued in 2011, being anticipated a continuation of growth, however modest pace, and in 2012, the year is expected to reach number "magic" of one billion arrivals of international tourists[2].

The World Tourism Organization and World Travel & Tourism Council predicts that, in 2012 and beyond, will be a growing number of international tourist arrivals, although growth will be lower, to the last two years. Europe will continue to be the main tourist destination in the world, but loses gradually its market share due to increased attractiveness of other destinations in the world, particularly Asia-Pacific region.

2. Recent developments in international and european tourism

After four years of continuous growth of international tourism (from 2003 to 2007), due to the manifestation of economic and financial crisis, 2008 saw, in the second half of his, beginning a decline that was experienced and strong in 2009.

2.1. The evolution of international tourism worldwide

According to World Tourism Organization (UNWTO Tourism Barometer World), the evolution of international tourist arrivals in the period 2008-2011 was as follows[9]:

- In 2008 was a relatively modest increase (+2.1%) worldwide over the previous year based on increases of 2.7%, the Americas region, 3.4% in Africa and 20, 1% in the Middle East, while in Europe the increase was only 0.5% and Asia-Pacific 1.2 %.

The evolution of international tourism in 2008 was spectacularly. So, after the first half, tourism activity was supported following growth trends from previous years, in the second quarter saw a strong rebound, a trend that was maintained even increased in the first half of 2009.

Even the evolution of the number of jobs in tourism declined in 2008, but not as brutal as the decrease in industrial sectors. But the situation was much different from one country to another. In countries like the Netherlands, Ireland, Iceland, Czech Republic, New Zealand, Japan have dropped by over 2% of the number of jobs. On the other hand, in countries such as Portugal, Finland, Mexico, Slovakia, Sweden, Switzerland, Germany and Italy there were substantial growth in the number of jobs, 2% or more [6].

- In 2009 there was a decrease of 3.8% worldwide by continuing increases achieved during 2004 to 2008. If the 1.5% decrease in the number of international tourist arrivals worldwide, was due to cumulative effects of the Gulf War and the SARS – epidemic in 2009, lower - more severe (- 3.8%), to due to economic and financial crisis, triggered from the second half of 2008. Regionally, the most significant decreases were registered in 2009 in Europe and the Americas (by - 4.9%), followed by Middle East (- 4.6%) and Asia - Pacific (- 1.6 %), while in Africa there was an increase of 3,2 %.

- In 2010, tourism, global recovered much better than expected after the shock, in 2008 and 2009 financial crisis and global economic recession.

In 2010, growth of 6.5%, the number of arrivals of international tourists, worldwide exceeded the most optimistic expectations of tourism professionals, the highest increases were recorded in the Middle East (+ 15.1%) , Asia - Pacific (+ 12.9%) and Africa (+ 6.7%), followed by the Americas (+6.5%), the modest increase being in Europe (+ 2,9 %).[10].

- Despite economic difficulties, registered in most countries in 2011 recorded significant increases in the number of arrivals of international tourists, worldwide expansion was 4.4%, based,

in particular, the growth of 6%, in Europe, followed by the Asia - Pacific (+ 5.6%) and the Americas region (+ 4.2%), while in Africa there have been increases over the previous year due to crisis and social movements some countries of North Africa and the Middle East was a significant decrease of 7,9 %.

According to World Tourism Barometer, published by the WTO[8], international tourist arrivals amounted to 980 million in 2011 worldwide, compared to 2010, when there were 939 million arrivals.

2011 was characterized by a mild global economic recovery, the major political changes in the Middle East and North Africa as well as major natural disasters in Japan.

The most significant increases in international tourist arrivals were registered in 2011, in South America (+10%) and Europe (+ 6 %). Contrary to developments in previous years, growth was stronger in 2011, in advanced economies (+5%) than in emerging economies (where growth was only 3.8%), which is mainly explained by evolution good of Europe and the decline in the Middle East and North Africa.

Secretary General of WTO, Mr. Taleb Rifai, noted that international tourism has marked new records in 2011 despite the difficult conjuncture: “For a sector directly responsible for 5% of the world’s GDP, 6% of total exports and employing one out of every 12 people in advanced and emerging economies alike, these results are encouraging, coming as they do at a time in which we urgently need levers to stimulate growth and job creation”[7].

On receipts from international tourism, which, as tourist spending in 2011, followed closely the positive developments in the number of arrivals. Of countries considered to be top 10 tourist destinations of the world, revenue increased more strongly in 2011, the U.S. (+ 12%), Spain (+ 9%), in Hong Kong - China (25%) and the United Kingdom (+ 7 %).

Even if costs increase from Germany (+4%) and U.S. (+5%) was higher than in recent years, the highest increases in tourism expenditure occurred

transmitters emerging markets: China (+ 38%), Brazil (+ 32%), India (+ 32%) and Russia (+ 21%), followed by traditional markets.

2.2. Evolution in Europe

In Europe, in recent decades, tourism has been relatively modest, the growth rate of international tourist arrivals compared to other tourist regions of the world. The weakest performance in this regard were recorded in Western Europe, which continues to receive, however, the most important actual tourists. Instead, the countries of Central and Eastern have registered strong growth, while growth remained significant even countries of South and North Europe.

In Central and Eastern Europe, increasing inbound tourism has gained momentum in the early '90s, after the fall of the Berlin Wall.

South, especially the countries bordering the Mediterranean, has always been an area with a strong inbound tourism. In the last decade, however, was felt, for these countries, an increasingly strong competition from countries of North Africa (Egypt, Tunisia, Morocco) and even other new destinations such as Croatia or Slovenia. Despite this competition, the most visited traditional destinations such as Spain and Italy, have managed to maintain their positions held, registering growth rates of about 3% per year, even higher in Spain. Also, Turkey and Greece have recorded growth rates above average in this area [5].

Despite persistent economic uncertainty, international tourist arrivals in Europe, have reached 503 million in 2011, capturing 28 of the 41 million additional arrivals recorded worldwide. The best results occurred in destinations in Central and Eastern and Southern Europe around the Mediterranean (with 8% increments), and removing the tourists took advantage of high-risk destinations in Africa North and Middle East. European destinations in the Mediterranean have also benefited by increases in the number of arrivals of tourists from issuing markets and Scandinavian countries, Germany and the Russian Federation.

3. Forecast for 2012

According to WTO forecast (WTO - World Tourism Barometer), international tourism will continue its expansion in 2012, although there will be a slower growth. So, we expected an increase of 3-4% in the number of arrivals of international tourists, so it is expected that during 2012 to achieve the long awaited psychological threshold of one billion arrivals.[8]. The most significant growth rates are expected to register in emerging economies in Asia - Pacific region and in Africa (between 4% and 6%), followed by the Americas (between 2% and 4%), while the Middle East will have to begin to regain some lost ground in 2011.

3.1. WTTC estimates the evolution of international tourism in 2012

World Travel & Tourism Council, in his World Economic Impact Report [12], is expected to turn that 2012 will mark a milestone in the history of international tourism, since the contribution of tourism and travel the world economy is expected to exceed 2 000 billion in GDP and amounted to over 100 million jobs.

According to WTTC forecasts, global tourism and travel industry [the Global Travel & Tourism (T & T) Industry] will increase by 2.8% during 2012, slightly above the projected growth rate of the global economy, 2,5 %.

Taking into account the indirect impact of tourism and travel industry, WTTC estimates that globally, the contribution to the world economy in this sector will be USD 615 000 million and will generate about 260 million jobs (that is one of 12 existing jobs worldwide).

According to estimates by David Scowsill, WTTC President, “In 2012, when international travellers are expected to surpass one billion for the first time, the industry will pass two other major milestones: a direct contribution of \$ 2 trillion to the world economy and 100 million jobs. But these numbers are dwarfed by the total forecast contribution of the industry - \$ 6,5 trillion to the global economy and 260 million jobs”. [11]

Predicted increase in T & T in Europe, in 2012, shows a poor growth of only 0.3% of

the sector's direct contribution to GDP of the region, overall, led growth, however, the contribution of some growth based on of the "new economies" like Poland and, in particular Russia, because, across EU countries, is expected to fall 0,3 %

Consumer spending will continue to decline, due to austerity measures taken by governments in most European countries and the evolution of these costs remains uncertain about the future of the Eurozone countries, especially in countries like Greece, Spain, Italy and Portugal.

In the medium term, WTTC forecasts are more optimistic, anticipated to average annual growth of 4% by 2022, when the Tourism & Travel Industry will employ 328 million people, or one of 10 existing jobs at the time the globe.

3.2. Prospects for international tourism development in EU

Tourism is a key sector of European economy. The UE tourism industry generates more than 5 % of the EU G.D.P., with about 1,8 million enterprises employing around 5,2 % of the total labour force (about 9,7 million jobs). Taking into account the indirect contribution of tourism to GDP creation, it is estimated that it generates over 10% of the European Union GDP and provides about 12 % of the labour force in EU[4].

According to Eurobarometer in tourism research, conducted by the European Commission [3] 72% of EU citizens have traveled, in 2011 and 80% of them stated that they intend to travel in 2012, whether they choose to travel by short term or spend long vacations.

Eurobarometer also shows that, from the previous period in 2011, many EU citizens chose to remain in Europe to spend their holidays, and even more said they would do the same in 2012.

The European continent has sufficient natural and cultural attractions to attract Europeans (and not only them) to visit and travel and tourism is Powerful drivers for the European economic recovery.

In many EU countries, European travelers preferred to spend their holidays in their own countries (Greece 80%), Italy 74%, Croatia 73%) or have chosen to visit another EU country. The most visited country in Europe

was, in 2011, Spain (11%), followed by Italy (9%), France (8%), Germany and Austria (5%) and Greece (4 %).

Eurobarometer also showed that 73% of the respondents said that in 2012 despite the crisis, will not give up going to leave, even if 33% of them had to change their original plans for the destination.

In the holiday period, 41% of respondents who intend to travel in 2012 plan to have longer holidays (having from 4 to 13 nights), compared to 27% who plan short stays. Preference will be still be their own countries (52%) or other EU countries (37%). Most preferred destinations are expected to be in 2012, Spain (10%), Italy (7%), France (6%), Greece (4%), Austria, Britain and Germany (with 3% of options).

Given the current economic situation EU countries, these estimates of future demand for tourism in member countries for 2012 seem to have slightly optimistic.

Following the severe measures to strengthen public finances in many EU countries, the purchasing power of most inhabitants of these countries (not just budgetary employees, but also retirees and even some employees of private companies) has decreased considerably and is expected to decline further, especially in countries like Greece, Spain, Portugal and Italy.

If spending cuts will continue to apply measures of availability of a significant number of state employees, they complained, they will intensify protests (demonstrations, strikes - the sectors, localities and even general).When these demonstrations become violent and the strikes paralyze the activity in airports and train stations, when all the roads are blocked, all these disturb the tourist activity.

How many tourists from Europe or other regions will want to spend vacations or holidays in Greece, for example, when they know that it will be may remain trapped for days at an airport due to strikes? Or how many of them will like to walk the streets of Madrid or Barcelona knowing that whenever they can break protests in a country (Spain) the unemployment rate exceeded 24% - the highest in Europe? Obviously no one can have a precise answer to such questions.

Holiday budget cuts, the effect of economic recession, will inevitably lead to shorter stays and travel, reducing travel

during the year and the abandonment by a significant proportion of tourists (of the disadvantaged as income), to a certain degree of comfort, so they accept lodging in the structures of more modest economic class. If Europe is to maintain world leadership, as a tourist destination, it will need to increase efforts to promote and simultaneously pay attention to reducing operating costs in the tourist reception, to launch the most tempting offers factor price sensitive tourists.

4. Conclusions

Europe's leadership in international tourism remains undoubted, given that, in 2010, registering 50.7% of arrivals and 44.2% of the proceeds international benefit. Intra-European tourist flows are not only important in size, but complex, diverse as motivation, and many European countries are situated at the crossroads of such flows and benefit from exceptional tourist attractions such as the Alps and the Mediterranean beaches [1], and the true treasures of world culture and civilization. All these are just some of the reasons why forecasts are entitled according to which Europe will maintain its position as the most visited tourist region of the world, even if will diminish in coming years the market share held worldwide.

Abstract

The Romania-Bulgaria Cross Border Cooperation Programme 2007-2013 is co-financed by the European Union European through the European Regional Development Fund. Under this program, the project “TRANS-TOUR-NET: Creation and Marketing of Pilot Cross Border Tourist Products in Dobrudzha” has been developed between September 2010 and February 2012. The five project partners (represented by high-school and university education institutions, business and cultural organizations) participated in research activities aimed at achieving through tourism the exploitation of historical, cultural and natural heritage of the Dobrudzha region shared by Romania and Bulgaria. The promotion of cross-border tourism activity has been regarded as an optimal way to achieve cohesion in the region, the project aiming at creating new tourism products, achieving awareness of this common heritage and intensifying the socio-economical development of the region.

Key words: marketing, tourism potential, Dobrudzha

J.E.L. classification: M 31

1. Introduction

The project *TRANS-TOUR-NET: Creation and Marketing of Pilot Cross Border Tourist Products in Dobrudzha* has been developed over a period of 18 months (September 2010-February 2012) and has been financed by the Romania-Bulgaria Cross Border Cooperation Programme 2007-2013. The Romanian

partners in this project are: Constanta Chamber of Commerce, Industry, Shipping and Agriculture; Ovidius University of Constanta and Ovidius High School of Constanta; and the Bulgarian ones are: Higher School International College – Dobrich and the Regional Museum of History – Dobrich. The project budget is 459 010, 52 Euro.

The project proposed to implement its activities in the territory of North Dobrudzha (in Romania) and South Dobrudzha (in Bulgaria), which have in common a unique cultural-historical destiny and a common natural heritage, insufficiently explored and fairly unknown especially in the inland of the region. These resources have been identified, explored and promoted within the project framework.

The membership of Bulgaria and Romania in the European Union allows both countries and to overcome the historical past and to construct active exchange and cooperation on new grounds. The implementation of the project aimed to bring together the cross-border communities and stakeholders towards sustainable cooperation in the field of tourism development and to make important progress on their common actions oriented toward overcoming long-time existing socio-economic and cultural barriers.

The project also intended to create new partnerships and to deepen the existing ones between Academic Institutions (International College in Dobrich and Ovidius University in Constanta), with expertise in tourism related educational courses and research, the Historical Museum in Dobrich and Ovidius high school in Constanta which have studies on the ethnical and cultural features of Dobrudzha. Moreover, it was meant to be a continuation of the currently implemented

project “Establishment of Bulgarian-Romanian Research Center for Sustainable Tourism” funded under the CBC program “Sustainable development and Biodiversity conservation”.

The project aimed at developing the cooperation with the local and regional authorities and relevant NGOs, concerned with the environment, cultural and historical heritage and nature conservation. It has also involved the active participation of other public bodies at all levels, like ministries, local authorities, scientific institutes, museums and tourist offices, some of whom might be suitable for a wider partnership. Tour operators, hotels and restaurants have been also consulted and, later, trained to embrace the new opportunities.

The Romanian-Bulgarian cross-border region is in an increased need for implementing joint actions as response to the identified needs, obstacles and problems of the area. The proposed activities initiated with the common efforts of all Bulgarian and Romanian partners to contribute to finding solution to the problem related to: unbalanced development of the tourist sector in the Dobrudzha region; lack of professionalism in marketing and low quality of the services provided by the tourism SMEs in the cross-border region; the unequal distribution of tourism income; the poor promotion and valorization of the tourism potential.

2. Project overall objective

The overall objective of the project is to integrate the natural, ethnic, historical and cultural resources of Dobrudzha into joint tourist products that emphasize the common identity of the region, and to encourage joint initiatives among both public and private regional stakeholders in order to bring those tourist products to the market. The project also aims at developing a sustainable partnership between tourism entrepreneurs, local and regional authorities, educational institutions and organizations that administrate tourist sites belonging to the national heritage, as well as to improve communication and coordination among stakeholders both in Romania and Bulgaria. At the same time, it seeks to promote and draw attention to the Dobrudzha region as a

tourist destination. The valorization of the historical, cultural and natural heritage of North and South Dobrudzha, separated by the Romanian-Bulgarian border, as well as the promotion of joint tourism have been regarded as an optimal way to achieve cohesion in the region. Besides the creation of new tourism products, the project aims at raising awareness of this common cultural heritage and at enhancing the socio-economical development of the entire region.

3. Project specific objects

The specific objects of the project are:

- (1) To develop 5 integrated pilot tourist products (tourist routes) based on Dobrudzha’s 50 most attractive tourist sites: a cultural/historical route; a craft route; an eco route; a culinary route and a festival route;
- (2) To increase the capacity of the administration of the identified 50 tourist sites and the related businesses to offer better services and advertise their products;
- (3) To raise awareness on the tourism advantages of Dobrudzha region among the local population and potential tourists.

A group of eight Romanian and eight Bulgarian experts, selected according to their experience and professional competence has been set up. The main task of the expert group was to identify the 50 most attractive tourist sites of Dobrudzha and to include them in the five tourist products (tourist routes). After an extensive individual study these 16 experts had two meetings, one in Dobrich and the other in Constanta. The aim of the meetings was to adopt the common list of objectives underlying the creation of pilot tourist products.

The list made by the expert working group includes the following tourism objectives:

I. Cultural and historical sites in Romania:

- (1) The Museum of National History and Archaeology in Constanta – The Roman Edifice with Mosaic;
- (2) Callatis Archaeological Museum in Mangalia;
- (3) The Romanian Navy Museum in Constanta;
- (4) The Archaeological Complex Trophaeum Traiani in Adamclisi;
- (5) Histria Fortress.

II. Cultural and historical sites in Bulgaria:

- (1) The Historical and Archaeological Complex in Durostorum – Silistra including the National Archaeological Reserve

Durostorum- Drustar, the Roman Tomb – Durostorum and the Mejidi Tabiya Fortress; (2) Kaliakra Archaeological Reserve (near Kavarna); (3) The Historical and Archaeological Complex in Balchik including Balchik Historical Museum and the exhibits found at the temple of Cybele; (4) The Historical Complex in Dobrich including the Regional Historical Museum, the Ethnographic Complex and the collection of icons in the Art Gallery; (5) The Historical Complex in Tutrakan: “Tutrakan Epopee” Memorial Cemetery in the village of Shumentsi, the Ethnographic Museum “Danube Fishing” and the Historical Museum in Tutrakan; (6) The Tekke of Akyazili Baba – St. Atanas in Obrochishte in the region of Dobrich; (7) Thraco-Roman Cult Complex – “The Sacred Valley of Zalmoxis” build in rocks, near Strelkovo in the region of Silistra.

III. Culinary sites in Romania: (1) Crama Murfatlar; (2) “Nunta Zamfirei” Restaurant – Eforie Nord Resort; (3) “La Protap” Restaurant – Constanta; (4) Insula Neptun Restaurant – Neptun Resort; (5) ”On Plonge” Restaurant– Tomis Tourist Port, Constanta.

IV. Culinary sites in Bulgaria: (1) Dalboka Mussel Farm – near the village of Balgarevo in Kavarna; (2) the Ethnographic Complex Chukurovo Chiflik - village of Prilep in the region of Dobrich; (3) The restaurant of “Drastar” Hotel – Silistra; (4) The Restaurant complex at the Open-air Theatre in Dobrich; (5) HRC Culinary Academy- Dobrich.

V. Festivals in Romania: (1) ”Mamaia” Pop Music Festival; (2) The Marine Days; (3) Mangalia Music Festival; (4) Stufstock Festival in Vama Veche; (5) The Liberty Parade.

VI. Festivals in Bulgaria: (1) International Youth Music Festival "Hopes, Talents, Masters" Dobrich – Albena Resort; (2) International Youth Music Festival “Folklore without Borders” Festival - Dobrich and Albena; (3) Rock Fest – Kavarna; (4) National Kukeri Festival – village of Kalipetrovo; (5) International Children’s Dance Festival entitled “Peace of Tomorrow Begins with Friendship Today” – Silistra.

VII. Sites presenting traditional crafts in Romaia – (1) The Folk Art Museum in Constanta; (2) Handcrafts Fair in Mamaia; (3) The Vine and Wine Museum in

Murfatlar; (4) Mihail Kogalniceanu Rural Crafts Workshop and Museum; (5) The Folk Art Music and Dance Festival – Mamaia.

VIII. Sites presenting traditional crafts in Bulgaria – (1) Open-air Ethnographic Museum “Old Dobrich” in Dobrich; (2) The Guesthouse in the village of Bezmer – Tervel municipality in Dobrich District; (3) The Dobrudzhian House in the village of Dabovik – Toshevo municipality in Dobrich District.

IX. Eco Tourism Sites in Romania: (1) Vama Veche – Marine Aquatorium; (2) Techirghiol Lake; (3) Histria Ornithological Reserve; (4) Hagieni Forest;(5) Fantanita Murfatlar Reserve.

X. Eco Tourism Sites in Bulgaria: (1) Srebarna Biosphere Reservation (Srebarna Lake, near Silistra); (2) Yaylata Archaeological and Nature Reserve (near Kavarna); (3) Green Training Center – Shabla (Dobrich region); (4) Botanical Garden in the Balchik Castle; (5) The Center for the Protection of Nature and Animals – Dobrich.

4. The Project Activities

The activities of the Trans-Tour-Net project have been developed in three stages. The first stage lasted from September 2010 until April 2011 and included:

(1) The management activities – it has been established the project management structure and the Steering Committee has been constituted; Kick-off meeting was held to launch the project preparation (30th September) and an international conference in Dobrich with 50 participants (10th December 2010). Moreover, a working group involving 8 Bulgarian and 8 Romanian experts has been formed; and the communication campaign was launched on the site: <http://www.dobrudzhatour.net>

(2) Identification of criteria, studying and mapping out the 50 tourist attractions of Dobrudzha. It has been organized an initial meeting of the working group in Dobrich and then a meeting in Constanta to summarize the results: there have been three information meetings (Dobrich, Silistra and Constanta) with 30 participants each and a public consultation has been launched.

The second analysis stage of the project took place between March and June 2011 and included: study of the objects with regard to

infrastructure development, accessibility, level of promotion, administrative capacity, training needs of the involved human resources; partners meeting and a meeting of the Steering Committee in Constanta; two roundtables with regional stakeholders (in Bulgaria and Romania with 40 participants each); elaboration of Final Analysis by the project’s experts and evaluation workshop in Constanta with 30 participants each.

(3) The third implementation stage took place between June and September 2011 and represents the development of 5 common integrated pilot tourist products and formation of clusters. It has been accomplished a direct study of the objects and the related services, as well as two workshops with the regional stakeholders (in Romania and in Bulgaria with 30 participants each). There was an elaboration of five integrated products and producing a report, followed by the meeting of the Steering Committee and the project management team in Constanta.

Between September and November 2011 the Dobrudzha’s 50 tourist attractions network has been established. There have been organized two workshops with the regional stakeholders (in Romania and in Bulgaria with 40 participants each) and a networking event in Dobrich. It has been created a database of network organisations and there was also the market implementation of the integrated tourist products. Moreover, training sessions have been organized (one in Bulgaria and one in Romania) involving 40 school and university students.

Of great importance are the promotional activities undertaken between December 2010 and February 2012. Out of these we should remember the preparation of five DVD films (one for each route) in each of the languages – Bulgarian, Romanian and English and the development of bilingual marketing brochures of the five tourist routes.

In this stage also took place the development of network identification tools such as: identification sign for each of the 50 tourist attractions; training of touristic guides for each of the 50 tourist attractions; and booklets for each of these sights. Also for promotional purposes, there have been organized two demonstration tours for media

and tour-operators (one in each country) and a pilot dissemination event in Dobrich – a mobile Fair “The Colours of Dobrudzha” for promotion of the 50 tourist attractions, as a show of music, traditions and crafts specific to Dobrudzha, which aims to facilitate access of the Romanian participants to the objectives in Bulgaria and access of Bulgarians to the objectives of the Romanian Dobrogea.

5. The activity of the Ovidius University of Constanta - partner in the Trans-Tour-Net project

The Ovidius University of Constanta, partner in the Trans-Tour-Net Project, has participated in all project’s meetings and events organized by the project manager and the other partners; it has selected 3 experts in the cultural-historical, ecological and festivals – events related fields; it has contributed to the selection of the 50 tourist attractions in the Romanian region of Dobrudzha; it has visited all sights (cities, museums, culinary sites) together with the Bulgarian partners and experts and it was involved in the organisation of info trips in Constanta for media and tour-operators.

As a partner in this project Ovidius University organized on 20th and 21st of February 2012 a training seminar entitled “Tourism Marketing and Strategy for Implementation of the Cross-border Tourist Networks in Dobrudzha. This training seminar attended by more than 40 persons (representatives of the selected sights, tour-operators, local administration representatives and media operators) aimed at developing the tourism marketing related skills of the organizations that manage the selected tourist objects within the project, as well as of all stakeholders involved in the local tourism. The training was also directed towards the combination of theoretical and practical elements in order to offer the participants the opportunity to use subsequently this knowledge in the field of tourism marketing within their professional activities. It can be argued that the objective of the seminar was to send information dynamically about the tourism marketing activity and to develop strategies of effective implementation of joint tourism products that

integrate Dobrudzha located attractions in both Romania and Bulgaria.

6. Target groups

Among the project’s target groups we can mention: the administration of municipal tourist objects and tourist offices; the SMEs in the inland area offering tourist services in the cross border region; the local communities in the Dobrudzha region; and the tourists visiting the region.

The tourist objects are the first contact point for the tourist and local populations. This is why they must provide competent information on the developed alternative products and services planned in the project. There have been trainings planned in the project schedule in order to inform the personnel of the municipal tourist sites on the specificity and advantages of the pilot tourist products.

The SMEs are the main business structures which provide tourist services and products. They suffer from an economic and social isolation. This project was a significant opportunity to encourage the SMEs to enlarge the range of their offered products and to motivate them to be more innovative and to increase the quality of their business activities. Moreover, we should acknowledge that the local population of the inland area is facing all economic, social and demographic obstacles typical of the region. This is why the project purpose was to develop its activities in target communities from the cross border area in order to contribute to their economic and social progress by benefiting from the project advantages.

The free movement of people between Romania and Bulgaria increases the number of the tourists flow in Dobrudzha region, while an important number of foreign tourists from the coastal regions are close to the Dobrudzha region. The enlargement of the perimeter of target tourists groups will contribute to the wider promotion of the alternative tourist products and will increase the international interest in these products. As a consequence, there will be a multiplication of the tourist visits in the region and the local tourist products will increase their business competitiveness at international level.

7. Project expected results

The project aimed in the first place to develop a successful partnership that will benefit the tourism related business, local and regional authorities, educational institutions and institutions responsible for national heritage objects in the trans-border area. Therefore, the planned project activities included the participation of different highly qualified specialists and decision makers from North and South Dobrudzha who actively communicated and worked together. During the project implementation, the established partnership relations have been upgraded while new ones arose. The project has established a network of the 50 tourist attractions of Dobrudzha. The contacts established during the network maintenance and upgrading has created sustainable cooperation.

It was also expected that the border region to be better presented and information to be disseminated among interested parties. In this respect, the project promotional materials have served to overcome communication barriers and information lack about the resources of the target region, and have been preconditions for increased interest and motivation for active tourist exchange. For this purpose there have been made and distributed DVDs containing five films of the tourist routes selected within the project in each of the languages: Bulgarian, Romanian and English. Moreover, there have been edited brochures of the individual tourist sites and of the 5 tourist routes.

The tourist motivation to visit the 50 attractions was laid on the ground of the so called people’s “collection passion” – collecting symbolic signs from the 50 Dobrudzha tourist attractions in order to be rewarded for this. It was one of the implicit strategies and innovative approaches for increasing the tourist flow.

Another expected result was to improve image and raise awareness among the tourists for the potential of the border region. Viewed by the tourism perspective, the tangible border between North and South Dobrudzha has been “demolished” through the elaboration of the 5 integrated routes which are thematic and not geographical. In this way the tourists have been able to get closer to the region nature, culture, history and

habits. Nonetheless, the strong marketing campaign intends to play a very important role in the process of raising the awareness of the tourists on the hidden treasures in the region of Dobrudzha.

The project also aimed to improve communication and coordination between regional stakeholders on both sides of the border with regard to sustainable tourism development and regional tourism planning. Therefore, the survey on the tourist attractions state which was presented to the stakeholders summarizes important information for better planning of their development as well as of the tourism supporting activities on national and on trans-border level. The trainings of the different target groups supported the creation of a common approach for promotion of the developed project products and the building of a unique communication platform.

Nevertheless, the project sought to improve interaction and cooperation between business, tourist offices, tour-operators, managers of public objects of national cultural heritage on both sides of the border. The common work among the stakeholders planned in the project brought them together to build the grounds of an innovative network including the 50 Dobrudzha tourist attractions disseminated in five tourist routes. During the planned seminars and trainings, the professionals from the tourism business have been permanently involved in actively interacting and exchanging information, know-how and experience. Thus, they have been able to adjust their activities to each

other in order to provide a more coherent and strategic tourism policy.

8. Conclusions

The research conducted within the Tran-Tour-Net project proves that both the Romania and Bulgarian region of Dobrudzha has a powerful tourism potential and a unique character in Europe, but it is, unfortunately, poorly exploited and almost unknown. This situation is due to several causes; however both countries are aware of the fact that a solution would be practicing good marketing in terms of structuring and promoting cross-border tourism products.

Among the project results we can mention: the elaboration of a list with the 50 tourist sights (25 for each country); dissemination research in project undertaken by partners; and promotion of the selected tourist sights in order to improve the image of Dobrudzha as a cross-border tourist destination.

Abstract

As it has been noticed, the global economic crisis has affected seriously commerce, not only at global level, but also at regional level, aspect valid also in the case of Romania. These aspects have been noticed also in the estimates made by the World Trade Organization which have showed that the trade flows of goods at global level have been compressed in the first three quarters of the year 2009 with 30% in comparison with the annual average.

The theme of the article falls within a topic discussed and analyzed on the influences of exports on economic growth of Romania. The purpose of this article is to highlight a number of issues relating to the influences of exports from Romania. We can state that an increase of export in Romania will represent one of the most important engines of the economic growth.

Key words: exports, imports, economic growth, crisis.

J.E.L. Classification: F4 Macroeconomic Aspects of International Trade and Finance

1.Introduction

Foreign trade for all nations is one of the main ways to connect to the global economy and at the same time, the culture and development world. Undoubtedly in this development, whether it is viewed nationally or internationally, the economic opening is a consequence of the natural development of human society and is a fundamental requirement for all nations who are proposing to keep pace with global developments. [2]

The international context of trade has

changed dramatically in the years in which Romania has done efforts to access the European Union. The liberalization and globalization have induced a higher mobility of the factors, quick reallocation, higher fragmentation and specialization of the activities on the values chains of products and services. It has also been extended the services trade area. Retaining value at national level becomes even more difficult to obtain due to the proliferation of global value chains in the attempt to minimize costs and maximize profits.[1]

The competition between countries, regions, groups of companies and individual companies is becoming increasingly complex due to the globalization and liberalization of trade. Constraints on the level of competitiveness of firms, in particular SMEs, are more difficult to identify and overcome. In a world increasingly globalized, companies tend to realize late many of the new constraints that may arise as a result of the modification of some conditions of access to markets, the introduction of new regulations such as those related to reducing greenhouse emissions or even related to the emergence of new business models focused on information technology, to cite only a few. Even more, few companies realize the opportunities arising from such constraints if they do not adopt a creative position in business.[7]

Globalization and liberalization have determined the transformation of international trade into a powerful engine of growth and an important mechanism for integrating countries into the global economy. A large number of developing countries have taken advantage of opportunities obtaining a rapid growth of their economies. Still, not all countries have been able to benefit from these opportunities.

In the same time, it is widely recognized that the accession and full participation of them and of other developing countries and in transition to the world economy would contribute substantially to the expansion of world trade of economic relationships.

In the strategy of any economy, using the most efficient use of external economic relationships as exogenous factor of production growth, revenues and consumption is the synthetic expression of national quality management, firstly of the macroeconomic one.[1]

2. Body of the paper

2.1.General considerations regarding exports of Romania

International trade is one of the most important areas of economic reform in countries in transition. From this point of view, Romania has adopted a series of economic policies aimed at adjusting its geographical and commercial exchanges aimed at improving the terms of trade through a cross-branch restructuring of the goods exported. However, Romania is currently a net importer which records a permanently trade deficit. This is caused by the insufficient restructuring of the economy and the high share of State enterprises in the production of goods for export.[8]

The current context requires radical changes both in the way of involvement in international trade and also in export, both at the level of companies, groups, and in the manner in which institutions support to companies to apply for the best solutions for creating and maintaining some durable competitive advantages. We must remind that both in the perspective of the European Union, and also in the national one, important changes in the world trade (appearance of new commercial powers and increasing importance of non-UE markets), redirecting a part of the exports towards non-UE target markets, is extremely important.[10]

We all know that the volume of exports has always influenced the economic growth of Romania, these creating a complex process that regards not only the Romanian economic system in its ensemble, but also in its dynamics. An economic growth means

always a positive evolution, upward of a national economy, without excluding the cyclical oscillations and even some temporary regressions.

Speaking of the particularly important role of exports in boosting the economy it is desired that these should lead to a process of training the economy, meaning export companies should make investments, develop activities and not last should pay their employees better.

Exports can be viewed as the sum of commercial relationships that Romania has with the countries from the European Union, but also with those from outside it. The role of exports in the development of the Romanian economy is that of progress factor that puts its mark in all the existent domains, from economy to politics and culture.

2.2.The analysis of the context and exports situation in Romania

Exporters have saved Romania from the recession last year and have also assured an economic increase of 2,5%, situation which is not the same in the year 2012.

According to the European regulation, a country enters into recession if it has, in two consecutive quarters, a negative increase of the economy. The Romanian economy has contracted in the forth quarter from 2011 with 0, 2% and is expected a similar tendency in the first three months of the year 2012, the exact data appear in April. The only in which our country could have a positive economic increase would be the stimulation of consumption.

„Romania has too much consumption and less production, which means that any stimulation of the consumption produces the imbalance that it has to overcome. It is a vicious circle created by the foreign banks trough the loans given to the population and not to companies”, has stated the analyst Ilie Serbanescu.[11]

The economist Aurelia Dochia has drawn the attention over the fact that we are too dependent of the European market, which has many problems, and the consumption should not be stimulated trough unsustainable decisions.” The most important is not to make mistakes because it is an election year. In Romania it is noticed a favorable evolution of internal consumption and we

could, on this basis, hope that we will have an increase, even if exports will not have the same evolution. But the internal consumption should not be stimulated artificially, though revenues increase, that prove to be unsustainable and could have unfavorable impact on the budget”, has explained Aurelian Dochia.[11]

The economic growth from last year, only frail, Romania has recorded an economic growth of 2,5% in 2011, the main engine being the agricultural production, which has been based on favorable weather conditions. But this factor is an unstable one and hard to predict, so that our country can not expect to have the same performances in 2012 as last year, especially because the snow from the winter months has destroyed many greenhouses and plantations.

”But not only the weather has had consequences, we notice a reduction on other plans, exports have slowed, as the industrial production, foreign investments do not give too encouraging signs, so even if we eliminate the weather factor, there are still concerns in what regards the possibility of economic growth in the next months, has warned Aurelian Dochia. Also, he has stated that we are, greatly, dependent on what happens in Europe, although the perspectives have improved in some countries from the old continent, especially with the intervention of the European Central Bank, which has injected a large amount of liquidities in the banking system.[11]

From the issues above results that there is a tendency to minimize this evolution, but must be taken seriously, because there are some indicators that have a high inertia, dynamic of exports, foreign investments, industrial production, all these are slowing from a large period, which means that there can not exist, by miracle, a reversal of the factors.

The analyst Ilie Serbanescu has stated that the advance of the economy has been a fragile one, in 2011. The crisis is a structure question, the recession is a question of time. We have moved out from the recession slowly, and as proof is the fact that immediately when it has intervened an unfavorable factor we have come back to the recession. If it were a healthy increase, of 3-4%, we could have avoided this thing. [11]

Romania can not reach the targets planned

for the budgetary plan of 2012. In the conditions in which the economic indicators are decreasing, it will be difficult for Romania to reach its planned targets in the budgetary plan for 2012.

Already the Government, through the National Forecasting Commission, has revised the economic growth of Romania, at 1,7%, from the interval 1,8-2,3%.

2.3. Main causes that have led to the reduction of exports and measures for their recovery

As we know the crisis has put its mark also on the exports from Romania. The main sectors on which the crisis has put its mark determining the reduction of exports are: metallurgy, chemistry, construction materials, but also furniture and glassware. But, as a replica of this reduction it appears also an increase of the following branches: cosmetics industry, medicine, and of telecommunication equipments, which have obtained increases of the sales outside the country.

The main causes that have led to the reduction of exports have been:

- the decrease of external demand towards national products as a result of the economic crisis and also the decrease of the internal demand in the countries that are commercial partners for Romania;
- ending export commercial relationships with some external partners;
- the decrease of product and services quality on the Romanian market and lack of continuity in delivering the quantities requested by the foreign partners
- reducing investments activities of exporting companies, situation which has been reflected over the process of employment and procurement of new equipment and in this way influences the local demand for imports from Romania;
- the crisis, that has affected negatively the process of credits, by limiting the access to necessary finances for consumers and commercial intermediaries;
- improper actions of the authorities from Romania which can not influence in a direct way Romania’s exports, but which can adopt an efficient set of measures intended for promoting this activity of exports as : giving special credits or with low interest, preferred

exchange rate and tax exemptions, fiscal facilities, etc.

The trade and stimulation policy of exports results in the sum of instruments and measures adopted both by the state, and by the producing and export companies, with the purpose of pushing the global export of a country. The purpose of these regulations is to influence potential importers, of increasing exported goods competitiveness and of interesting exporting companies.

A series of stimulating measures for exports in Romania can be the following:

- budgetary measures that have as purpose increasing competitiveness of exported goods and increasing interest for producers and exporters;
- fiscal measures that follow the increase of the exports competitiveness by reducing or eliminating some taxes or duties, having as aim interest for exporters by increasing net earning realized at export.
- financial-banking measures with a higher applicability due to the increase of competition at global level.
- currency measures that follow to increase competitiveness of exported merchandise through the reduction of external prices and through the increase of interest exporters, due to additional earnings in national currency.

The main measures that will be at the basis of the national export strategy of Romania 2010-2014 in the current internal and international context are: [7]

- increasing the export culture in the local business community;
- consolidating the institutional collaboration for a better efficiency of SNE;
- the approach of the initiatives in programs and projects that should be the object of a multi-year approach from the perspective of project management;
- the capitalization of resources in a sustainable way in the export activity;
- the consolidation of national value chains in order to increase value added of exports;
- promoting innovative local companies;
- the continuous and efficient approach of resources on long term;
- the consolidation of the actual market share and exploring new international markets.

3. Conclusions

A demand for Romanian exports is determined by the variations of the gross domestic product of the main commercial partners of Romania in direct relationship and of the variation of the price competitiveness. The exchange rate of the national currency appreciates the exports tend to decrease, the same thing happens when the ratio between internal prices and those from the world market increase.

An important element of the macroeconomic development is the evolution of foreign trade, reflected through the volume of exports and imports, as also their structure on sales and products markets. In this sense, it can be noticed, from the following figure, the evolution of the Romanian exports.

Figure no.1: Romanian Exports in the period
2000-2014
(mil. euro - estimative)

Source: INSSE, National Forecasting Commission (2009).

It is obvious the increase tendency of the volume of exports, in the total of the national economy, in an average rhythm of 16, 71% during the period 1998-2008. Also, it should be noticed the restraint of the export activity in the period of the economic-financial crisis from 2007-2009, and also the optimism in forecasting a comeback of them starting with 2009.

In what regards the National Forecasting Commission, this forecasts in a certain matter the international trade in 2012. So that it anticipates that exports will increase this year with 3,3 bill. Euro, while imports will increase with almost 6 bills. Euro, which will lead to the deepening of the commercial deficit with 2,5 nil. Euro and to a deterioration of the current account deficit with 1% from GDP, to 7,2 bill. euro.

The increase rhythm of exports will

decrease significantly, from 20, 5% to 7, 4% as a consequence of entering in recession of the euro area, the main commercial partner of Romania. In the same time, the National Forecasting Commission estimates that imports will reduce their advance with only 5, 6%, to 11, 1 %. This, the commercial deficit is expected to increase almost 10 bill. euro (FOB/FOB), or to 12,5 bill. euro (FOB/CIF). The National Forecasting Commission anticipates that the current account deficit will not take over the entire shock of the commercial balance and will increase with only 1,6 bill. euro, to 7,2 bills. euro, respectively 4,2% from GDP to 5,2% from the gross internal product.

Exports continue to be a point of support for Romania and have to remain the engine of the national economic growth. There must be a tight relationship between expectations regarding the economic growth of a country and its capacity of attracting investments; Romania should attract more foreign investments through comparison with the gross domestic product. For Romania to record a growth tendency it is necessary that internal demand to record more and more a positive evolution and take step by step the role that industrial production and exports have had until now. The growth rhythm of private consumption will depend on the comeback of the population buying power. Romania has to be aware of the important role of Romanian exports in the process of reviving the economy.

In the last years there have been highlighted important modifications in the structure of the commercial activity, as a consequence of the macroeconomic context, the new economic context has imposed, to all the economic agents that perform in the trade area, a reflection both of their economic role, and of the initiation and implementation of adaptation strategies. The different structure of the export in comparison with the import materializes the transfer function of foreign trade, resulting in changing the structure of national production outcomes, some of the social product created in the entire national economy being exported and imported replaced by other values, leading to diversification fund required domestic goods.[5]

Thus, in conclusion, the importance of trade as factor of growth and development

becomes more obvious for the European Union. Also, trade policies, if they are accompanied by a favorable internal policy and if they are used correctly, can offer clear opportunities of promoting economic development and of reducing poverty.

The development should remain the fundamental principle of the external trade strategy of the European Union, and its scope on medium term- the gradual integration of emerging economies in the multilateral commercial system, where, due to the regulatory framework and the one of multilateral negotiations, the European Union will fight with more success for trade principles to be respected by all its competitors and for the liberalization of their trade, with the purpose of ensuring the development of the trade potential that the member states of the European Union have, among which is our country. Globalization Between Agony and Ecstasy

Meghișan Flaviu
University of Pitești

Barbu Cătălin Mihail
University of Craiova
catarom@yahoo.com

Abstract

Globalization is a mix of opportunities and perils for the national economies. The countries are more and more vulnerable to external shocks and they don't know how to fight against these new dangers. Globalization is affecting the efforts of the states and private agents through velocity and amplitude of change, both internationally and at the domestic level. Domestic institutional reform must be done in order to be able to capitalize the external opportunities, without the associated risks. In this paper we make an analysis of some of the risks of globalization and then we discuss how these risks can be minimized. Globalization should work both for the elites but also for the non-elites.

Keywords: globalization, economic development, international trade.

J.E.L. classification: F43, F50.

1. Introduction

The debate about globalization has evolved from a general recognition that it does not work very well and there is real fundamentals for at least one part of the unsatisfied ones at a profoundly analysis that associates certain strategies with some failures. Globalization is not the problem, but how it was carried so far. As we shall see, a part of the problem are the international economic institutions, the IMF, World Bank and WTO, which participate to the establishment of the rules of the game.

The reform of globalization is a mainly political issue, referring to: future chances of unskilled workers and the impact of globalization on inequality, democratic

deficit in global economic institutions, which impaires even democracy and the human tendency to think from a local perspective, while we live in an increasingly globalized economy.

According to the „*Dictionary of International Relations*”, the term globalization expresses the fact that certain phenomena are global, go beyond solving at the state level and involve appeal to international or supranational authority. It is, somehow, about applying the concept of economies of scale, but also the idea that once the Cold War ended and bipolar world disappeared, the economic liberalism and democracy triumphs spread all over the planet. The result of the development of trade, financial flows and creating global information networking, the globalization questions the international division of labor, marked by the emergence of new regional powers and of the default relocation of which multinational companies profit. However, the globalization also involves other types of exchanges than the economic ones from culture to information, through technology, so the world becomes the global village, of which the Canadian McLuhan was talking about. Through international financial institutions, the G7 group and its avatars and the GATT, the globalization affects a large number of actors from industrialized countries to less developed countries, that live from delocalizations and multinational strategies [1].”

Professor Robert Gilpin from Princeton, USA, uses the term globalization to refer to "connections more and more stronger between national economies through trade, financial flows and FDI of multinationals" [2].

The globalization is a multifaceted concept, as this trend includes both economic

phenomena and social political and distributive consequences. Strictly economic the globalization can be measurable by international flows of goods, services, capital and migration of international labor .

A sense of globalization, made by Ritzer is: "the global spread of practices, the widening of relationships beyond the continents, global organization of social life and the increase of a shared global consciousness." According to Stiglitz, "the phenomenon of globalization is the greater integration of countries and their populations due to significant reduction of transport and communication costs and the elimination of artificial barriers in the path of movement of goods, services, capital, knowledge and (in a lesser extent) people between states. George Soros is an ardent proponent of the globalization, as the *global-opened society* can provide a greater freedom than any other individual state." According to Soros, the globalization represents the free movement of capital accompanied by the increasing dominance of global financial markets and multinational corporations on national economies. The primary feature of the globalization is that it allows financial capital to shift free. Conversely, the movement of individuals is strongly regulated. Because the capital is an essential ingredient in the production, the countries must compete in order to attract it, which results in a reduction of their capacity to tax and regulate it. The globalization is desirable from many points of view. The private enterprise is able to produce wealth more than the State. The globalization offers a degree of individual freedom that no state can provide. (...) Globalization has been uneven. (...) I think that the global capitalist system under its current form is a distortion of what global open society should be [3]. ” Other authors assert that at the base of the process of globalization and regional integration are two phenomena: one of technological nature (in particular explosive progress of transport and telecommunications infrastructure), the other one of economic essence, reflected by the reducing or removing of barriers [4].

Globalization has been accompanied by the creation of institutions that have already joined those existing on the world stage. Globalization is determined in a large measure by international corporations, which

doesn't move only capital and goods between states, but also technology [5].”

2. Poverty and economic inequality

In less developed countries, many have suffered from globalization without receiving support for social security system. Many others have been marginalized by the global markets. Globalization has produced a poor allocation of the resources between private and public goods. The markets are able to create wealth, but are not intended to address to other social needs. (...) Markets are amoral: they allow individuals to act in accordance with their interests and impose some rules on how to express them, but without issuing any moral judgment about the interests. (...) But society can not work without distinguishing between good and bad.” Markets themselves have nothing in them in order to ensure a humane attitude: on competitive markets, wages are determined by the junction between supply and demand, with no guarantee that the "balance salary" will be the minimum necessary for a decent living. Workers who are desperate for a job will finally accept to work for a company that does not meet health and safety standards. Although Henry Ford (1863-1947) believed that people needed to go about their work and not look beyond the functional parapets, and introduced the \$ 5 wage for his workers, representing about twice the industry average at that time [6].

In Romania, hundreds of workers die on construction sites (seasonal work), „working under the table”. The rules of the game that govern the globalization are unfair, as they are in the benefit of advanced industrial countries. About 80% of the world habitate in developing countries. People's vulnerability to risks depends largely on the goods they have on hand. Approximately 70% of people who live with less than a dollar a day are women. Women, especially those in rural areas, are responsible for half of world food production, achieving 60-80% of food in most developing countries. The developed countries use 90% of world's resources - water, food, energy and capital. The income inequality has widened over three-quarters of OECD countries between 1985 and 2005 and in the last five years we are witnessing the increasing of poverty and inequality in two

thirds of OECD countries. In this respect, in September 2000, 150 heads of states or government attended the Millennium Summit, organized by the United Nations in New York, signing the Millennium Development Goals, a commitment in order to reduce poverty by half by 2015. It should be noted that opening markets alone will not solve the poverty issue, but also it may worsen it. It needs more support and a foreign trade regime more equitable. There are some who say that the UN is an independent body, as it is claimed in its statute, because its decisions can be countered by a veto of any of the five permanent members, the richest countries in the world: U.S.A., UK, France, China, Russia. Its noble goals are expressed in the Preamble of the Charter, being preceded by the words, "We the people". After episode 11, the U.S.A felt the need for action outside the UNP, whenever it desired.

3. Globalization puts material values in front of other values such as the concern for the environment

Environmental activists in developed countries call for universal standards for the environment, but poor countries will not meet these standards. (...) Where global participation is required, such as in the case of tropical forests or endangered species, public funding can be justified¹⁵. The first important step is to promote an international political action on climate and gender discrimination. Negotiations on putting in place a structure for climate action after 2012, under aegis of United Nations Framework Convention on Climate Change (United Nations Framework Convention on Climate Change - UNFCCC), should include equity programs and equality between genders at all stages, from research and analysis to design and implementation of attenuation strategies of climate changes and adaptation to new climate conditions [7].

While China enjoys a national savings rate over 40% of GDP, the U.S.A stands at about 14%. The ratio between federal debt and GDP in the U.S. increased from 35% in 2000, to about 60% in 2009 and it is expected that this report will reach 70% in 2019. Even at a moderate rate of 5%, the debt service

will swallow 3.5% of GDP the counterpart of 20% of tax revenues.

Within the theory of Modigliani - Miller, the companies could reduce the amount of taxes due to corporate and individual buying back their actions, rather than to provide dividends („the dividend paradox"). In Singapore, it was required the investement of 42% of wage income in a savings fund. Those who militate against the nets to catch shrimp, but nets which catch also turtles (endangered species), WTO says that such regulation would be an unwarranted interference in free trade development [5].

The doctors reported that 24% of men and 27% of women are obese. Four populations of penguins in Antarctica are under pressure because of climate change and loss of habitation areas and overfishing affects their patterns of reproduction and feeding. Nuclear disaster caused by the biggest earthquake in the documentary recorded history of Japan and tsunami from nuclear plant Daichii Fukushima in Japan, March 2011, caused the emissions of radiations in both air and water, which were impossible to annihilate, despite international support . Over 22,000 people were killed and entire towns in the north-east of the country were devastated. In December 2007 - January 2008, Chinese officials say they are facing the worst drought in a decade. China has issued reports which show that congenital malformations have increased by 40% compared to 2001 due to pollution and worsening of environmental degradation phenomena [7].

4. Flagrant inequalities in health care, crime and global corruption

In Romania in 2012 dozens of drugs used to treat cancer are missing, missing that could bring malpractice lawsuits for doctors. Romania losses about 18.6 billion euros, meaning 15% of GDP in 2010 due to poor health conditions, and if public health would reach the EU average, Romania would have the economic surplus of 6.7 billion euros.

In 2007, the proportion of Americans detained in prison was among the highest in the world. Although the U.S.A. enjoys the best university system in the world, it's students (tomorrow's workers) are weaker in math and science than the average of most industrialized countries. James Canton

warns: "Young Americans will lack the necessary education for the future in order to be competitive in the global economy [8]."

Apparently, it is assumed that if something is legal, then it is morally correct. Perhaps the citizens of developed countries do not care about the hypocrisy of leaders who talk about a free trade, eradication of hunger and poverty and other topics, however, citizens of states who barely "have pulse" are not indifferent. The fact is that prisons are crowded with people belonging to lower caste of society, who have committed loosely defined, "traditional" crimes, which are difficult to detect and especially difficult to prove. They seek people joined by mutual complicity („*esprit de corps*"- Solidarity), people who take effective measures to identify, to put in silence or eliminate potential informers. Global elite enjoys an advantage: when "local laws" are not favorable, they call on the version of movement from locality, to "global laws, mobility meaning the ability to escape [9].

Armed conflict financed by mineral and oil resources is worse than corruption. We all know, but prefer silence over the fact that all weapons designed to transform the distance areas in the theaters of war, massacres and civil wars, have been provided by the weapons plants in the world, proud of their productivity and global competitiveness. The five permanent members of UNO Security Council - the U.S.A., Great Britain, France, China and Russia are the largest weapons manufacturers in the world. Of these, China has made profits from the sale of nuclear technology and export of weapons and long-range missiles to Iran, Pakistan, North Korea, etc., in exchange for energy supply contracts on long term [10]. International community has the responsibility to check the supply at source (producers of weapons) and origin of the money with which payments are made.

A worrying fact is the frauds committed by banks employees, the resultant of two forces: the emergence of online transactions and fierce competition between banks. For example, Great Britain lost 1.5 billion dollars annually because of these frauds.

5. The negative impact of globalization on agricultural life and on environment

The statement of Mario Puzo should be noted ('The Godfather'), 1920-1999 "Behind a great wealth is always a great crime". In 1979, National Academy of Science in U.S.A, issued in „Charney Report " its first warning about global warming. United Nations Framework Convention on Climate Change was adopted on May 9, 1992 and signed at the Earth Summit in Rio de Janeiro, enjoying almost universal participation, with over 190 signatory countries. The climate change and global food security are closely linked. Moreover, food production and natural fibers are the main sources of emissions of greenhouse effect gases, they have a „climate mark" larger than the transport sector. Also, buildings are responsible for 40% of global energy consumption and it is for them, almost as in greenhouse effect emissions. Great Britain required that all homes which will be built after 2016 and all commercial buildings built after 2019 to be zero- carbon emissions buildings. Note that there is no general agreement on environmental issues, it was even suggested the establishment of a World Environment Organization, but without any echo. On March 29, 2008, 50 million people worldwide participated in Earth Hour, extinguishing the lights in 370 cities in more than 35 countries, aiming to increase the awareness on climate change. On June 1st, 2008, China prohibits the production and use of plastic bags in supermarkets and shops, part of the campaign against „white pollution". The year 2010 meant the end of a decade, the warmest in the history. Hardly replaceable natural resources are treated as if they still are not lacking. Prices expressed on the market do not reflect the rarity of these natural resources. In Romania, after all these years of „local and government efforts", how many blocks are insulated, thereby reducing gas consumption? The world is facing a huge threat in the long run, the one of the stability from the ecological perspective. Global warming has become a real challenge of globalization. We can mention the efforts made in this respect, "Earth Summit in Rio" in 1992, "Kyoto Protocol" in 1997 and, "the Copenhagen Summit" in November 30th to December 11th, 2009. „ Joint Implementation " is an initiative of the Kyoto Protocol that allows industrialized countries to obtain credits by investing in emissions

reduction projects in other industrialized countries, it is related to the Clean Development Mechanism (established in Kyoto), which involves reduction projects in developing countries. Kyoto Protocol, signed by over 180 countries, had as an effect the assertion of a number of 37 countries and the EC to reduce greenhouse effect gas emissions by 2008-2012 produced by humanity to 5% below the year 1990. The fight between the developed and underdeveloped countries show a global conflict that will lead to permanent differences, as long as we allow the proliferation of threats to the environment.

The concept of "additionality" refers to greater emissions reductions than those which would have occurred in a context where economic practices go as usual. For example, in order to grant emission credits, the projects ruled in the Clean Development Mechanism or Joint Implementation must show that any emission reductions are additional to any that would have occurred without the project. The additionality can also be used in order to describe other added benefits resulting from the projects, including financing, investment and technology.

Environmental technology represents that smart public relations strategy, complying with consumers' requests, meaning higher profits for environmental cleaning. Recently, *the profile of the consumer of organic products was outlined*. The business environment will realize that balance environmental restoration is an opportunity and an obligation at the same time as the world's consumers will choose brands offered by companies concerned by environmental protection. Unlike the other problems associated with globalization, global environmental issues affect both developed and developing ones. We could say that the atmosphere is unbiased: it takes carbon dioxide and other greenhouse effect gases that trap heat, produced by man, and disperses them evenly around the world. However, this feature of the atmosphere can be interpreted as a sign of inequality. Pollution has no boundaries and there is no other planet to migrate, we have to stay here, on the Blue Planet, which we celebrate annually on April 22 („Earth Day"). In late 1980, the world has experienced a further test in climate talks, because nations have

negotiated and ratified the Vienna Convention for the Protection of the ozone layer and then the Montreal Protocol (1989) on substances that deplete the ozone layer. Kyoto Protocol was adopted in 1997 and became effective on February 16, 2005. The refusal of the American Senate to ratify this protocol should be noted.

6. Conclusions

The nation-state is responsible to make globalization feasible both nationally and internationally. Following the economic crises, a new wave of relementation is installed across the world. The nation-state must collaborate with the private actors and other international bodies.

The national economic policies remain very important even if the methods, the principles and the functions did change. The international cooperation favors the stability of certain policies because of their predictability and uniformity. However the nation-states must work together overcome the challenges described in this paper.

The globalization is important but more important is show globalization will be in practice. The global market is a source of profit and opportunities but in the same time is an opportunity for growth and economic growth. It is the role of relementations to ensure that the opportunities are valued and that the perils can be avoided.

Economic Sanctions – Weapon or Instrument of Diplomatic Relations

Moşnianu Cristian
„Ovidius” University of Constanta
cristianmosnianu@gmail.com

Abstract

The most important implication of international law, in particular human rights and humanitarian law, as regards the sanctions is that the right to impose sanctions is not unlimited. The theory behind economic sanctions implies that economic pressure on civilians will in turn evolve in pressure on the government, thus requiring a change within the framework of it

Key words: weapon, economicrelations, policy.

Clasificare J.E.L.: C70 – General

"The era of globalization has dissipated. The reason is the Americanization of globalization as a political project, the outcome of the foreign policy of the Bush president with the focus more on the protection of American interests and less on promoting the values of democracy toward far placed locations of the planet."

John Gray observed that globalization missionaries did not take into account its dark facet, thus interfusing the ephemeral successes of the grant with the total victory of globalization and the end of history. In addition, economic protectionism practiced by Americans, along with anti-Kyoto policy caused disappointment in Europe, that had seen the years after the fall of the Berlin Wall as a period of spreading "democratic capitalism" in the world by Americans.

But what if globalization was never a intended as project of a charitable company?

Perhaps such a vision would have saved from deception university scholars, namely Ulrich Beck, Gray's colleague at LSE. The article that was written soon after the terrorist attack of September 11, 2001, *Chernobyl of globalization*, with reference to the wave of distrust in point of nuclear power after Chernobyl. Beck goes further than

Gray: suicide terrorist attacks have revealed the world "vulnerability of Western civilization", and not just American, thus highlighting conflicts that globalization can poke.

Beck identifies the neoliberal perspective, according to which to economy prevails over politics along with the diminishing role of the state in a globalized world. The idea of a free market economy is the panacea of universal human problems that has proved the lack of foundation, and furthermore, it is a "dangerous illusion".

The issue might be more complex if we consider the actors on international stage. The role of the U.S. State is likely to diminish on local ground but in no way can afford the same thing abroad. The same cannot be said about small states without high ambitions. In their case, it would be impossible to anticipate a strengthening of the state in a globalized world that requires permeable boundaries. Globalization might be said to be characterized by a wide range of speeds. Unfortunately, Beck considers all countries altogether, that have not been and will never be equal, and in addition, antagonism of globalization might create tension and even terrorism. Is globalization itself the cause of terrorism? Beck wonders. Article 39 of the UN Charter allows the Security Council to take measures, namely the sanctions that are applied only "to maintain and restore international peace and security" after their determination.

The most important implication of international law, in particular human rights and humanitarian law, as regards the sanctions is that the right to impose sanctions is not unlimited. Therefore, an examination of relevant international law standards involves the review of the inherent limitations in respect of sanctions, especially international law operations. Moreover, the "threat" can not be determined in subsequent political grounds – there must be an

"international concern" that underlie real sanctions, not political considerations and internal politics of a State or group of States.

Sanctions might not be imposed to ensure everything but Purposes and Principles of the United Nations as they were established in Article 1 of the Charter, unless there is a credible determination of a threat, breach of peace or act of aggression. In addition to these limitations, other projections which will limit the sanctions are found within the lines of the Charter. Article 24 requires the Security Council to "act in accordance with the Purposes and United Nations Principles ". So, any act of the Security Council can not be exempted from verification so as to determine if agrees the Purposes and Principles of the United Nations.

The theory behind economic sanctions implies that economic pressure on civilians will in turn evolve in pressure on the government, thus requiring a change within the framework of it. This "theory" is not functionable both legally and practically, because of many acts that stand for the inefficiency of comprehensive economic sanctions as a coercive measure. Traditional calculation that analyses the suffering of civilians in comparison with the desired political effects provides means of achieving of the fact according to which the effectiveness of economic sanctions is inversely proportional to the adverse impact on civilians.

The case of Iraq reveals serious issues in the traditional theory of the economic sanctions. In regimes where political decision making is not democratic, there is no way to pressure civilians to bring changes in the Government.

The government target, especially if is marked by a strong control over mass- media will eventually determine the citizens to unite in an act of defiance as regards the foreign states. Sanctions might be used by the government target as a scapegoat for its problems and as material for political extremism.

"Under sanctions, the middle class is eliminated, and the poor become poorer and the rich get richer if they make use of the black market and illicit trafficking. Government and elite might benefit economically from the sanctions due to the monopoly on illegal trade. As many

commentators have indicated, on long term, as democratic participation, independent institutions and middle class are weakened and under the circumstances in which social destruction leaves population in a position that cannot resist the government, the likelihood of democratization decreases. In conclusion, the suffering of civilians that is regarded as a factor of economic sanctions determines sanctions to become inefficient and might so aw even strengthen the government and its policies ".

Trade Flows of Emerging Economies in The Current Economic Context- Developments and Trends

Năstase Luiza Loredana
University of Craiova
Faculty of Economics and Business Administration
năstase.luiza@yahoo.com

Abstract

Consumption is currently soaring within rapid growth markets, due to demographic evolutions and an increase in real income.

As economic growth has been very low in developed countries, investors turned their foreign capital inputs towards emerging countries. It is estimated that emerging economies will stand for more than half of the global increase in the following three years.

BRICS countries (Brazil, Russia, India, China and South Africa) are especially important within the group of emerging countries, but also at a worldwide commercial level, as they include about 45% of the world's population and stand for a quarter of the global economy (13,500 billion \$).

Key words: emerging economy, BRICS, sustainability, economic growth.

JEL classification: F14, F17.

1. Introduction

Whereas, in the past, **the concept of emerging economy** was considered a euphemism for the optimistic presentation of poor countries, an emerging economy is currently seen as an economy undergoing economic and financial structuring, able to provide for both internal sustainability and mitigation of external economic shocks.

Emerging economies are experiencing a strong development phase, in comparison to developed economies. One should not forget that an unanimously accepted definition of emerging economies is difficult to provide, given the complexity and variety of such economies. When talking about emerging economies, we are currently referring to

countries such as Brazil, Russia, India, China, Mexico, Argentina, etc. However, these are only some of the emerging economies.

Moreover, various economic specialists and political stakeholders refer to an emerging country as “a country which is too poor for being rich and too rich for being poor”.

Emerging economies have lately been the actual drive of global economic growth, with far better results than industrialised economies. Thus, their public debt was much lower and their tax policies were satisfactory, so that they captured the interest of financial markets.

The main features of emerging economies are the following:

- the goods market, but also the labour, capital and money market have a great extension potentials, so that an economic behaviour requiring outlets is boosting;

- the intrinsic goal of emerging economies refers to recovering the delay between them and developed economies; this is why the main nominal variables (inflation, bank interest rates, national currency depreciation rates, etc.) are still high;

- a tendency to adopt pro-cyclical measures at an economic level, with a view to obtaining immediate advantages;

- a high percentage of consumption within internal aggregated demand;

- a wide use of discretionary policies, to the detriment of implicit macro-stabilisation policies, i.e. the design and implementation of automatic stabilisers.

2. The Place and Importance of Emerging Economies in a Global Context

It is expected that emerging economies should increase by approximately 5.3% during 2012, while an increase of 6.3% is

foreseen for 2013. According to the “Rapid-Growth Markets Forecast Spring edition” report of Ernst&Young, these forecasts are accomplished giving due consideration to the fact that the financial decline of June-December 2011 is still balanced by the impressive progress of consumption on rapid growth markets, determined by demographic evolutions and an increase in actual income. At the same time, after an expected growth of 1.4%, the International Monetary Fund reconsidered the issue and currently estimates a 0.1% decline of economy for 2012. Comparatively, the United States of America expect their economy to grow by 1.8% this year.

Thus, demand and commercial flows will develop between rapid growth markets, especially in Asia, due to the extension of the middle class within these countries. The Ernst&Young report provides an example to this purpose: the number of Chinese households with an income ranging from 30,000 to 50,000\$/year will increase from 1.6 million in 2010 to about 26 million by 2020.[1]

It is currently seen that, in most emerging countries, consumption is higher than the consumption of developed economies. This trend is likely to continue in the future as well. Economists consider that the increase of consumption in rapid growth countries will be twice as quick as increase in the United States of America. Remarkably, China will display a four times quicker increase of consumption.

The issue of oil supply is worrying in the current context of globalisation and geopolitical tensions, especially as the economic and financial crisis of the Euro zone bears a negative influence upon the oil demand. For this reason, any fluctuation or unexpected progress in the price of oil will increase the vulnerability of markets, given a limited offer thereof.

The deliveries of the Organization of Petroleum Exporting Countries (OPEC) will increase with the decrease of geopolitical tensions, so that global growth will remain at a low level, in the short term. The above mentioned report estimates an average price of 112\$/barrel of oil for 2012. However, a decrease of 7\$ may occur by the end of the year. The forecasts of economists show that the price of oil will increase in 2013,

reaching 135\$ by 2020.

The importance of emerging economies will display an impressive rhythm of growth in the following 3 years, so that they will generate more than 50% of the global growth. The best results for 2013 are expected from economies such as Brazil (+5%) and Chile (+4.8%) – South America; Kazakhstan (+7%) and Qatar (+7%) – Middle East and Africa; India (+8.5%), China, Hong Kong (+8.6%) and Vietnam (+7.1%) – Asia. Negative values of development shall also be recorded, as well as reductions in FDI in Egypt and some emerging European countries. A reduction in the increase is also foreseen for Poland and Czech Republic, while a high inflation is expected in Vietnam, Egypt, Turkey, Nigeria and Indonesia.

Table no.1: Economic Growth and Inflation in the Main Emerging Countries - Forecast for 2012 and 2013 -

Country	Economic growth		Inflation (%)	
	Year 2012	Year 2013	Year 2012	Year 2013
Argentina	3,9	11,4	9,7	4
Brazil	3,1	5,5	4,8	5
Chile	3,8	3,1	2,9	4,8
Continental China	8,4	3,5	2,6	8,8
Czech Republic	-0,3	3,2	2,4	1,5
India	6,1	6	5	8,5
Kazakhstan	5,8	5,9	6,3	7
Poland	2,4	3,8	2,6	2,7
Russia	4	5,6	7,2	3,3
Turkey	2,2	9,4	5,5	5

Source: Data processed by the author, based on the Ernst&Young report, “Rapid-Growth Markets Forecast Spring edition”, April 2012.

As it can be noticed, the data displayed in table 1 is obtained based on the estimation of a lower demand on the Argentinean market, a reduction in competitiveness and offer-related restrictions in comparison to the official forecast, of 5%. Moreover, Brazilian economy is likely to witness decrease, due to a worsening of global economic conditions. However, the gross domestic product may increase faster than it was initially forecast, due to the counter-cyclical policies.

As for the Chinese state, a fall of the real estate sector is apparent, as the price of

houses decreased at the beginning of 2012 for 48 cities out of 70. Tax transfers could come to the rescue, if the above mentioned situation actually occurs.

The president of the European Central Bank (ECB) and the head of the US Federal Reserve (Fed) declared that emerging economies are fundamental to global financial stability. They consider that global economy is more dependent than ever on emerging markets, for maintaining a solid internal growth and for financial and economic stability.[2]

An interesting situation for 2012, in comparison to 2000, when rapid growth markets imported less than half of the total imports of developed economies, is related to the fact that emerging economies will come to import goods and services to a higher extent than all developed countries. However, it is hoped that this will be helpful for developed countries as well, so that the profits of companies established on developed markets should increase simultaneously with the development of purchase power in emerging countries.

Chart no. 1: Global Imports (% of the total)

Source: WTO, The Economist, 2011

Remarkably, rapid growth countries (China, India, Saudi Arabia) are not willing to help the West if they do not get more influence in global economy-related decisions. Thus, as it has been noticed, an acute economic and financial crisis appeared and soared in the West, affecting the whole globe nevertheless. This is why I consider that this is relevant to the fact that emerging powers should be better represented within global bodies, such as G20 (the group of large industrialised countries) and the Financial Stability Council (for the regulation of banks and financial markets). The conclusion is simple: if emerging economies are allowed to have more influence within global bodies, the possibility that they should

make a financial contribution to the fight against the economic and financial world crisis increases as well.

Figure no. 1: The Contribution of Emerging Economies to the Growth of Global GDP

Source: Ernst&Young report, “Rapid-Growth Markets Forecast Spring edition”, April 2012.

3. The Part of BRICS within Global Economy

The BRICS group is highly significant among emerging countries. This group reunites the strongest emerging markets of the world, as follows: Brazil, Russia, India, China and South Africa. The most recent BRICS summit took place on March 29, 2012, in New Delhi, India. One of the outcomes of the summit was the decision to establish a joint development bank, for purposes of a better connection between local stock exchanges. Such an achievement would allow countries to obtain infrastructure resources, as the development bank, similarly to the European one, would act as a lender in times of financial crisis.

A joint stock exchange index was launched at the above mentioned summit, for all BRICS countries. The index will be listed in all five countries and shares may be acquired in local currency.

Even though important trade exchanges occur between BRICS countries, the representatives of these economies consider that a solution for the economic problems on the European continent would be an ever higher increase of the trade exchanges between member states, especially as BRICS reunite 40% of the world’s population. Thus, emerging countries still displayed a high

level of growth, while demand is decreasing on European markets.

BRICS representatives consider that Western countries managed the financial crisis in the wrong way. They are of the opinion that Westerners adopted aggressive expansionist monetary policies (such as the reduction of the key interest), resulting in a decrease of the global competitiveness of emerging countries. Likewise, the leaders of emerging countries consider that measures of austerity, tax consolidation or even quantitative easing are not proper solutions for the current situation.

Opposite to the opinions of BRICS leaders, IMF representatives are of the opinion that rapid growth emerging economies are starting to display signs of overheating. This is the case of China, but also of other emerging economies, who make every effort to keep inflation under control and manage the massive cash flow.

After the global economic decline of 2008-2009, recovery takes place at different steps, with a quicker rhythm for emerging markets and a slower one for developed economies. Provided that the economic growth of developed countries was unusually low, investors assaulted emerging markets, supplying the extremely necessary foreign capitals, but also inflationary risks [3].

After analysing the current situation, one may reach the conclusion that emerging European markets have succeeded due to the taken reforms. Thus, whereas highly developed economies were hit by crisis, enhanced growth, living standard improvements and an increase in the investors' confidence marked the economy of emerging European countries. However, one must be cautious, as the private sector may display sudden and unpredictable behaviour changes. It is, hence, better to prevent than to cure.

BRICS countries may represent the new global economic equilibrium. This is the opinion of economists, who consider that BRICS countries are the new force that may reorganise the global financial order.

4. Conclusions

Pursuant to the presented and analysed data, we may reach the conclusion that the current growth of emerging economies

proves the importance of the adopted tax policies and discipline, as well as the advantages of the free market.

For this reason, most of these economies must not be considered small markets, without a major influence on neighbouring markets, but they should play a more important part in the stability of world economy.

Therefore, emerging economies aim at promoting a sustained and balanced economic growth at a world level.

Abstract

Criminality is nowadays a current phenomenon in everyday life. Understanding the way it manifests itself can be a prerequisite but that is not enough to avoid or decrease the negative effects it may have upon people.

Each human pursues the identification of investment instruments providing a guarantee of proper profit regarding the amounts invested and the risks taken. In this respect, capital market supports such concerns by various instruments. Building and keeping a high level of trust are attributes of the market regulatory and supervisory authorities.

Key words: capital market, market abuse, manipulation, privileged information.

JEL classification: G02, G28

Introduction

Globalization is a phenomenon characterizing the current economic and financial society. To speak about globalization nowadays means to understand both the positive and the negative effects which are generated by the phenomenon as such.

This is a society where business takes place rapidly, where a mere keyboard click can transpose one into a real, yet unreal world from the perspectives of earnings and also losses which might occur. In this

context, investors, either authorized or unauthorized people, are concerned with the financial system’s stability from the perspective of legislative risks.

Ensuring the right investment instruments has generated the development of capital markets within financial markets. Besides, such as it is necessary for each country to have an airport, one can equally appreciate the need for capital markets because they will be able to ensure economic growth from the perspective of the benefits they supply to all players (issuers, investors and brokers).

As far as the capital market concept is concerned, two approaches are used: capital market – for the systems organized according to the European standard, or financial market – for the systems set according to the Anglo-Saxon model.

Attracting investment capital is an ordinary issue. The governments of many countries involved in privatization programmes have lately used global placement techniques in order to attract portfolio investments. These investments best respond to the complementary concerns shown by national and international investors, involving restructuring and modernization by means of funds received from foreign markets.

Capital market importance can be evaluated by various indicators, either absolute or relative degrees. It is believed that an important indicator is the one related to the share of stock exchange capitalization in GDP.

Table 1. Importance of capital market

Country	Market capitalization; % of GDP			
	2001	2006	2008	2010
Belgium	71.3	99.6	33.0	57.4
Bulgaria	3.6	31.6	17.1	15.2
Canada	97.9	133.0	66.7	137.0
China	39.5	89.4	61.8	80.4
France	87.8	107.7	52.7	75.3
Germany	57.0	56.4	30.6	43.6
Greece	66.5	79.5	26.5	24.1
Hungary	19.7	37.3	12.0	21.5
Japan	55.0	108.3	66.0	75.1
The Netherlands	114.4	115.0	44.5	84.8
Poland	13.7	43.6	17.0	40.5
Romania	5.3	26.7	10.0	20.0
Russia	24.9	106.8	23.9	67.9
England	147.2	155.2	70.3	137.4
USA	135.2	145.7	82.9	117.5

Source : www.data.worldbank.org

Table 1 shows three periods of capital market growth: period between 2001 – 2006 characterized by increases often due to transactions’ rising prices, the year 2008 which had a decrease, and subsequent to it, the situation began to improve but did not reach the level of 2006.

The data mentioned above emphasize the decreases faced by capital markets as a consequence of the economic-financial crisis commencement. It started in the USA, in the banking sector, and then it expanded onto capital markets, therefore the economic-financial crisis has proven once more that one cannot touch the sky on a capital market.

The economic and financial crisis has had not only objective, but also subjective effects which are related to the trust in capital markets, and in the funding and investment opportunities they entail.

There are opinions in the financial world according to which capital markets’ collapse is not only the consequence of the banking market crisis, but it is also the effect of market abuses (market manipulation, use of privileged information).

Economic and financial criminality in its complexity has actually covered all the areas of a national economy, starting with the technical, material supply in the economy and ending with the process of privatization and development of banking, financial operations. It is more and more often seen there is an intercrossing of violent criminality

(murders, burglaries, kidnappings etc.) with financial-economic criminality. Authorities are trying to cope with such a phenomenon of economic-financial criminality and their attitude is often reactive, rather than proactive. As far as criminal deeds occurring on capital market are concerned, the authorities regulating and overseeing the market are making special efforts both to legalize the phenomenon and to identify criminal and common actions with each EU member state in order to reduce or remove this trend.

Thus, the present paper aims at explaining criminality manifested on the capital market by means of market abuses and to exemplify its regulatory way in the EU in general, and in Romania, in particular.

1. Market abuses

If one wants to make a transaction on the capital market, then one should generally try and contact an authorized broker who is to transpose one’s goal into reality. Investors’ decisions to act on the market rely on certain information related to:

- ◆ the historical development of an asset price which is about to be transacted;
- ◆ the financial, economic growth of an asset issuer;
- ◆ the status of a market where the transaction is meant to take place;
- ◆ the status of national and/or foreign economy.

Certainly, it could be stated that all this information along with everyone’s hunch can lead to making the wisest decision.

However, financial reality proves there are circumstances where market growth may be entirely inadequate to the decision one has communicated to a broker due to certain aspects which could take the form of criminal deeds, namely market abuses. Those who perform activities beyond legality can be people among issuers or the brokers themselves. As far as employees are concerned, fraud circumstances can be caused by the access to privileged information referring to the economic and financial performance of companies, and as to brokers, manipulation occurs when they conclude transactions for others, purchasing significant stocks before such information is made public. As a rule, this type of

information positively influences the price of assets' transaction on the market.

The situations when somebody attempts to infringe the capital market can be:

a) the position of transaction originators in a company/public institution personnel – namely, their chance to access information which is unknown by others and whose publication would considerably influence prices both in terms of going up and going down.

An example in this respect is the case of Claudiu Eugen Iuliu Silaghi, the former Vicepresident of Transylvania Bank's Board of Directors who, during 15 May - 10 December 2009, acted in conformity with the privileged information procured from Sergiu Dan Dascăl, namely he repeatedly acquired a total number of 43,646,740 securities of Transylvania Bank issuer on the Bucharest Stock Exchange (BVB), in the account of his mother-in-law, an amount which was worth almost 75 million Lei in order to ensure his dominant position over these securities' supply and demand and to set improper transaction circumstances, hide the identity of their true holder, and to use the privileged information which he had known ever since the autumn of 2008 (as he was a Member in Transylvania Bank Management Council), all referring to the intention of Bank of Cyprus to acquire a significant stock of Transylvania Bank (dealt with the symbol of TLV). On 7 December 2009, Silaghi by means of a specialized company sold all the shares acquired that he was holding at that time (33,600,000 TLV securities) at the price of about 80 million Lei to the Bank of Cyprus, the buyer, thus raising a profit of 5 million Lei. Another example in this respect is Wolfgang Rutenstorfer, the manager of OMV, investigated by Austria's Regulatory Authority of Financial Markets for having manipulated the capital market. Wolfgang Rutenstorfer was suspected of having bought company shares of more than 600,000 Euros when he precisely knew their value would rise, by selling the Austrian company's participation to MOL. The German press stated that after the announcement, OMV shares rose by 3.33% and the virtual profit made by Rutenstorfer was almost 45,000 Euros.

b) the easy access to monetary resources – here, the mechanism is as follows: since the

access to banking resources is more facile, manipulators borrow on the banking market and use the amounts obtained this way on the capital market by acquiring assets. Including more acquisition than sale orders shall generate the increase in prices, therefore manipulators shall decide to sell their assets and thus the history repeats itself.

2. Related legislation

The phenomenon of capital market manipulation is especially important from the perspective of the effects it leads to and that is why the authorities that regulate and oversee capital market have included adequate regulations in the related legislation.

As a matter of fact, Directive 2003/6/EC in the European Union indicates that ensuring true economic growth relies on the proper operation of securities markets and on the people's trust in these markets, as market abuses affect the integrity of financial markets and impair people's trust in securities and derivatives. The adoption of this Directive has pursued the implementation of several common norms to fight against the abusive use of confidential information and market manipulations because it is believed this is how the same framework within the Community would be provided to distribute responsibilities, apply norms, and cooperate.

Using confidential information can mean acquiring or supplying financial instruments by a party involved that knows or should know the information it holds is strictly confidential. The mere fact that market creators, bodies entitled to act as counterparties, or people authorized to execute orders for third parties that have confidential information confine, as far as the first two categories are concerned, to running legitimate activities of buying or selling financial instruments, or, as to the last type, to executing an order in conformity with applicable norms, should not be regarded as use of confidential information.

In order to implement the European Directive regarding market abuses, the Committee of European Securities Regulators (CESR) has drawn up two series of measures so far. The former CESR guideline (CESR, April 2007) aims at

explaining three issues regarded as priorities: market practices accepted in connection with market manipulation, suggestions of CESR members referring to what they think of as market manipulation, and also the way suspicious transactions can be reported when they are identified. The latter guideline (CESR, July 2007, p.4) aims at clarifying the way “privileged information” is perceived by the Directive regarding market abuses.

Market abuses must be analyzed from the perspective of the type of market practices which are accepted by each regulatory and monitoring authority for capital market. Thus, preamble 20 of Directive 2003/6/ concerning market abuses states that a person making transactions or issuing orders for market manipulations can decide that the reasons for making the respective transactions are legal and the transactions and orders comply with the practices allowed on the respective regulated market. “Market allowed practices” mean the practices which are difficult for being used on one or several financial markets and are accepted by a competent authority in compliance with the orientations adopted by the Commission. Allowed market practices “make up a process set up at national level, that is why a practice which a competent authority regards as accepted may be seen otherwise by another competent authority, and the purpose of including the accepted market practice is to avoid the penalization of operations which could mean market manipulation but can be justified in certain circumstances, whereas the people doing such things can be exonerated from administrative responsibility or criminal responsibility, if necessary.

It is well-known that criminal organizations use a financial system for their illegal activities.

In order to improve measures’ efficiency and transparency for preventing economic crimes, it is requested that states and international organizations should cooperate. Their cooperation can be represented by exchanges of information and expertise, legislative compliance, common activities for the monitoring and investigation of economic crimes and frauds across borders. Moreover, the analysis of the current economic crisis emphasizes major flaws of monitoring in the financial sector, both in individual cases and within the overall system, as it is shown in

preamble 1 of Directive 2010/78/EU. National monitoring models have not succeeded in keeping up with financial globalization of the reality of European financial markets based on integration and interconnection within which numerous financial institutions perform cross-border activities. Directive 2010/78/EU entails several amendments to Directive 2003/6/ regarding market abuses, namely it grants certain rights to the European Supervisory Authority (European Securities and Markets Authority) (hereinafter referred to as ESMA) set up by (EC) Regulation no.1095/2010 of the European Parliament and Council, regarding the drawing up of technical standard projects referring to allowed market practices, the supply of uniform circumstances to apply the Commission’s acts. In addition, there is the obligation of supervisory authorities to collaborate and timely provide the ESMA with all the necessary information to help it fulfil its tasks.

In Romania, market abuses are incriminated by Law 297/2004 concerning capital market, with subsequent amendments and annexes. The set of crimes generically called market abuses is made up of market manipulation and use of confidential information.

Manipulation as a component of market abuses is defined by Article 244, fifth indent as being:

a) transactions and transaction orders:

1. which raise or might raise false questions that mislead one in relation with the demand, supply or prices of financial instruments;

2. which, by the action of one or several people together, maintain the price of one or several financial instruments at an abnormal or unreal level;

b) transactions or transaction orders which involve fictitious procedures or any other form of fraudulence;

c) dissemination of information by means of the mass-media, Internet, or any other way, showing false signals that mislead one about financial instruments, including the dissemination of misleading rumours and false news when the disseminating person knows or should know that a piece of information is untrue or deceptive. As far as journalists doing their jobs are concerned,

information dissemination is taken into account in conformity with the rules governing their performance, except for the people who use such information in order to directly or indirectly gain some advantages or profits.

What is also noteworthy is law makers' intention to exemplify various operations which can be regarded as market manipulatory by Article 244, sixth indent.

Since the performance of capital market can also be influenced by certain people's use of information that the others cannot access, the category of crimes aiming at capital market also includes initiates' offence meaning the use of privileged information.

Privileged information is defined as precise and never made public, directly or indirectly referring to one or several issuers, or one or several financial tools and, if made public, it could have a significant impact upon the prices of such tools or upon the prices of derivatives it is connected with (Law 297/2004, Article 244, first indent). Since the transaction activity on capital market envisages derivatives for commodities, too, then "privileged information" is concerned with precise information which has not been made public and directly or indirectly refers to derivatives, whereas it is expected by the players on the markets where the respective derivatives are transacted, in compliance with accepted market practices (Law 297/2004, Article 244, second indent).

Conclusions

Market criminality trend is highly important due to the effects it generates both at microeconomic level (the control over certain companies taken by certain groups, or the raising of huge profits), and at macroeconomic level in a context where prices' decrease can lead to financial markets' collapse, there is investors' reticence of participating on the market, and the relocation of funds towards other financial markets thought to be more stable, and even worse, keeping funds to one's own interests and emergence of crises whose consequences cannot be estimated from the beginning.

The major economic change for the integration in the global economic system

and for the liberalization of trade and investment has made Romania face a substantial increase of world trade and capital flows.

The world economic crisis has entailed increasing criminal deeds especially in organized ways and economic criminality means a threat to a state's economic and social stability.

Once information technology has progressed, the criminal networks of cross-border organizations have been internationalized as well.

Cross-border organized criminality has diversified its operations and it aims at: drug trafficking, gun trafficking, human smuggling, trading of smuggled goods, fraudulent commercial practice, informatics criminality, counterfeiting, stealing, money laundering.

Criminal organizations have acquired great financial powers which allow them to get involved in human and capital resources, to access privileged information, influence political and economic decisions in order to get revenues by means of their own activities, money laundering and speculations of the legal framework's flaws.

IMF Role in the Context of the Romanian Financial Law

Popa George Dorel

„Ovidius” University
popageorgedrd@yahoo.com

Abstract

Today, as we know, credit takes the form of a loan of money to be returned in a future period established in the loan agreement, which is a document under private signature. Credit operation is also considered to be the operation we take into possession resource using as payment a sum of money called interest.

Lending operation necessarily refers at two parts; one part receives money while the other borrows money. Lending can occur in various forms, among individuals in the form of simple personal agreements, but also using the form of lease transactions involving complex credit contracts. Parties involved, tools used by parties, the guarantee used for credit, the terms of restitution and interest, are often very different.

Financial credit as an institution is essential for good working of economy, but also means taking a risk by providing money from banks or financial institution. For this reason, the bank must act as a financial analyst or "loan officer" in order to ensure its future. Financial resources must be directed towards the most efficient investments. With each loan, banks face a number of risks: default risk, illiquidity risk, interest rate change market risk, capital risk etc.

Key words: Financial Law, Credit, Crisis, IMF, Depression;

JEL Classification: Law and Economics General; K 30

1. Romanian Financial Law, the Credit and IMF.

Credit appeared thousands of years ago with the general using of the money as a medium of exchange of the merchandise. The

credit had a constant evolution. Today the credit has a crucial role in global economical development and trade mechanisms. Taking in account the world economy, there were different stages in the development of credit. At beginning, the majority of the members of the society produced goods and services for their own consumption. Today the world economy has reached a place where trade is carried out using bank transfers and "electronic money"(Ion Turcu, Mădălina Stan - "Current issues in banking law"). If initially, national banks were important, today an increasing role is played by international banks.

International banks are banks that have headquarters in one country and branches in many others. The main banking operations carried out by them are: banking for transnational corporations, loans to companies in other countries, the preferential trade credit and other foreign currencies.

Among these international banks, the International Monetary Fund plays a key role due to its huge financial force and international representation.

With its near-global membership of 188 countries, the IMF is permanently helping member states and governments around the globe. This organization is observing all the time global economic trends and performance, showing its member states the main problems and difficulties, providing a non-political platform for financial and economical dialogue. From the very beginning, IMF was preoccupied by the ways to identify the main financial problems and to show to its member states the ways to pass the crisis and "stop over" moments.

Globalization from the perspective of economical integration and financial crisis might be the general terms used to describe the worldwide situation. The actual globalization brought a plenty of benefits, has increased international trade and cultural

exchanges, removing political and economic obstacles. Increasing interdependence in international relations, besides positive aspects undoubtedly brought some negative aspects related to economy, financial market, labor market, commerce and tax policies. The present economical and financial crisis has emphasized this huge interconnection between the member states of the world. The IMF is the “financial angels” of the world permanently helping the states facing difficulties and giving specialized advices in this regard. Another important role of IMF is the financial support provided to the members and also the economical advices for developing nations in order to help them to achieve macroeconomic stability and reduce the level of the poverty and to create a better environmental conditions for economy, financial market and life in general (Florica Iordache – „*The environment – a must be protected resource*”).

2. The international crisis and IMF.

The IMF, as international financial organization is permanently supporting its member countries trying to offer:

- assistance and programs for training to support member states to improve the management and development of their economies.
- financial, economical and administrative advices for banks, financial institutions, Ministers and governments based on studies and analysis taking in account economic trends and tendencies.
- financial credits to help states facing economical and financial difficulties and crises;
- statistics, forecasts, studies and analysis based on tendencies of global, zonal, and individual economies and financial markets.
- long time financial credits to help fight poverty in developing countries.

The IMF has been on the first place lending money to different states to help boost the global economy as it suffers from a deep crisis and economical convulses. The beginning of the 21st

century, allowed the international financial credits to help the globalization and economical development that enabled many countries to pay back the credits from the IMF and other international banks. Moreover, these credits have been transformed in economical opportunities causing the accumulation of financial reserves, on national level, to protect the natural resources and to use in efficient way the current opportunities (Anechitoae Constantin – „*The geopolitics of the maritime systems*”). The present global economic and financial crisis began in 2007 with the collapse of mortgage lending in the United States, and due to globalization spread around the world. The crisis was possible, as well, because of huge imbalances in global financial credits. The private financial credits would never have again the crucial role they had in the nineteenth and early twentieth centuries, and the IMF had traditionally offered credits to members facing economical and financial difficulties.

3. Conclusions.

The present global crisis revealed the instability of financial markets that soon led to the worst global depression ever. The IMF has been assaulted with requests for stand-by arrangements, financial requests and other forms of financial and support. The IMF's lending capacity increased in 4 years with 300%, reaching the record level - \$750 billion. In order to manage this huge amount of money, IMF should create new flexible mechanisms and new accreditation rules offering a modern financial policy for its clients.

The global economy was forced to admit, after decades, that the IMF's financial resources were the main “financial protector” of the nations and a reliable engine in the fight against this great depression.

Tax Havens and the Financial Law

Popa George Dorel
Dica Alexandru Manuel
Faculty of Law, Public Administration and Sociology
„Ovidius” University
popageorgedrd@yahoo.com

Abstract

After the beginning of the financial crisis, the topic of tax havens has been emphasized as priority and put back in financial and economical debate. The participating countries requested update of the "black list of tax havens" in Europe, some voices calling for the addition of Switzerland. Previous list contained only three countries, namely Monaco, Andorra and Liechtenstein

Tax havens are using easily convertible national currency and fiscal and financial control is dedicated only for the residents. The effect of tax havens in the context of current economical crisis requires more points of view. In the analysis, should be considered, also, the off shore territories, due to the fact that, in the current globalization, tax havens have become a part of the global economy

According to some views tax havens, primarily generates and encourages tax evasion in off shore territories. Permanent fight to reduce taxes, avoiding taxes is not all the time tax evasion. It is obvious that, essentially, evasion is an unlawful act, in all tax systems, assuming a tax fraud for the financial system.

Key words: Financial Law, Tax havens, Crisis, Tax evasion, Off shore companies;

JEL Classification: Law and Economics General; K 30

1. Tax havens and off shore companies versus financial law.

Theoretically, should be admitted that, can be tax evasion through legal means, i.e. using the vulnerabilities and gaps of the law. In terms of legal doctrine, a company could get more income by paying lower taxes,

respecting the law, not committing a fraudulent act. For this, the administrator should be an excellent book-keeper person having good knowledge of financial and tax law.

When taxpayers, respecting the law, placing their business in tax havens using off shore centers, to pay less taxes, they do nothing then exercising a right. This right is the right to establish the company wherever business pays lower taxes. In these circumstances, exercise a legal right is not "tax evasion", because distort the notion of "tax evasion" and distort the exercise of rights itself

The disadvantages of the existence of tax havens, with global impact include - increase tax evasion, increasing corruption and organized crime (including money laundering), creating preconditions of the financial crises, the emergence of imbalances in operating systems markets. There are other significant side effects - tax losses of the world, marketing illegal or prohibited products, the illegal placing of capital etc

The existence of these areas enables financing of illegal activities or terrorist acts, which, due to banking secrecy are almost impossible to prevent and detect them. The current financial crisis highlighted the importance of supervision to maintain the functionality of financial systems. Wealth tax havens adversely affect the budget revenues of countries with high taxation - especially in the context of the economic crisis.

Due to the internationalization of off shore funds, appeared disadvantages and difficulties in applying national monetary policies

The tax cut is the main advantage of being tax havens because it is done by optimizing fiscal and financial systems worldwide, off shore territories contributing to capital mobility.

Status of an off shore company offers benefits to investors and the state where there are such companies. Investors bring tax advantages, minimal accounting formalities, avoidance of double taxation, privacy, anonymity of ownership, reduced risks, flexibility and efficiency in company registration without rigorous controls.

States of the world where there are such companies have several advantages: receiving registration fees, taxes operation, taxes for licensing, increasing the level of employment, use of the local economic potential, eliminate poverty, etc.

The main advantages of tax havens are:

- Developed infrastructure. They hold advanced telecommunications, developed and stable banking system;
- Low bureaucracy. Off shore companies are exempt from the obligation to keep accounts or to sign the balance sheet, or all of these are formal;
- Reduced taxation. In all tax havens, the law tax regime is guaranteed by law. Taxation is zero or near zero;
- Protection of property rights. Income and assets offshore company can be used anytime after the free will of the beneficiary company.
- Anonymity. Identification of shareholders and directors is not allowed;

Among other advantages are: increasing foreign revenue, accelerating economic development, increase employment and income levels of the population etc.

Organization for Economic Cooperation and Development has identified some key factors that are precise criteria for determining and defining those territories practicing a favorable tax system.

First, the OECD established that the level set for any taxes is much reduced or is totally missing. Level of business transparency is very low. OECD has established as a tax haven is characterized by the existence of a legal vacuum in the area of finance and taxes. This organization has determined that another feature of tax havens is the secrecy of financial operations. There is always a reluctance of companies to provide financial information about their activities, confidentiality being protected by law in this respect. From this perspective, the OECD urged countries of the world to adopt laws allowing the exchange of information in legal

interest to be facilitated. Thus, the OECD has issued “white”, “gray” and “black” lists for different countries, depending on their willingness to collaborate.

2. Conclusions.

The debates on the positive or negative effects of tax havens may continue. Beyond these arguments, the question remains whether the phenomenon of tax havens should be encouraged or denied and if the world needs to react in favor of these territories?

Globalization in the Field of Legal Language: the European Legislation and the Strive towards a Pan-European Legal Taxonomy

Alina Popescu

Universitatea Ovidius Constanta, Facultatea de Litere

alinadpopescu@yahoo.com

Abstract

Generally speaking, translation plays a fundamental role in the interaction between law and other domains, between different peoples and cultures. Given its important role in the intellectual and institutional development in EU countries and its pragmatic importance in the economic field, legal translation deserves close analysis. The present paper attempts contribute to the investigation of this field since its main purpose is studying legal translation as both an intellectual pursuit and a profession in our increasingly globalized world.

Key words: multilingualism, legal translation, source language, target language, aquis

J.E.L classification: Z00

1. Introduction

Multilingualism and linguistic equality among European Union (EU) Member States has been one of the underpinning values and practices since the foundation of the EU. Linguistic and cultural variety is what gives the EU its specific personality (Wilson 2003: 20). As legislating body, the European Parliament promulgates laws that turn into national laws and have direct binding force on the citizens of the Member States. To this end, EU laws are translated and published in its Member States' official languages and, thus, translation is essential for the functioning of the European Parliament. At another level, the demand for legal translation is on the increase around the world due to globalization and the increased connection and exchange between peoples and states. Therefore, it should be pointed out that EU laws are inconceivable without

translation (cf. Correia 2003: 40) since, at present, not only does the EU have twenty official languages, but also the demand for translation in the EU is growing with the addition of new Member State (see Wagner et al. 2002: 78).

Obviously, translation plays an integral part in the interaction between law and other spheres, between different peoples and cultures. Given its important role in the intellectual and institutional development in different countries and its pragmatic importance in the economic field, legal translation deserves close analysis. These pages attempt contribute to the investigation of this field precisely since its main purpose is studying legal translation as both an intellectual pursuit and a profession in our increasingly globalized world.

It is commonly accepted that legal translation is intricate, and it requires special skills, knowledge and experience on the part of the translator to produce such translation. As we are going to see, daring claims have been made about legal translation (Harvey 2002: 177). It has been described as a category in its own right, and as 'the ultimate linguistic challenge', combining the inventiveness of literary translation with the terminological precision of technical translation (Cairns and McKeon 1995, Gémard 1995, Pelage 2000, cited in Harvey 2002: 154). Indeed, as already mentioned, the translation of law has played a very important part in the contact between different peoples and different cultures in history, and it is playing an even more important role in today's globalized world. One major problem with the existing classifications of legal translation is that they are based on the function or use of the original legal texts in the source language (SL), without due regard to the various target language (TL) factors, such as the functions or status of the translated texts. Legal

translation can be classified according to different criteria, such as the subject matter of the SL texts. First, these can be: (1) private legal documents; (2) domestic statutes and international treaties; (3) legal scholarly works; and (4) case law. Second, legal translation can also be divided according to the status of the original text: (a) translating enforceable law, e.g. statutes; and (b) translating non-enforceable law, e.g. legal scholarly works. Moreover, according to Sarcevic (1997), legal translation can be classified according to the functions of the legal texts in the SL into the following categories: (A) primarily prescriptive, e.g. laws, regulations, codes, contracts, treaties and conventions—these are regulatory instruments containing rules of conduct or norms and therefore represent normative texts; (B) primarily descriptive and also prescriptive, e.g. judicial decisions and legal instruments that are used to carry on judicial and administrative proceedings such as actions, pleadings, briefs, appeals, requests, petitions etc.; and (C) purely descriptive, e.g. scholarly works written by legal scholars such as legal opinions, law textbooks, articles etc. However, as stated by Roberts (1992), there is a need to distinguish the functions of the SL text from those of the TL text and it is necessary to consider the TL variables, in addition to those of the SL. Another problem of the existing taxonomies is that many documents such as documents used in court proceedings that are used in the legal process and translated as such are excluded from the classifications. A third key problem is that some of the classifications such as Sarcevic’s exclude communications between lawyers and non-lawyers (clients). The restriction in Sarcevic’s ‘legal texts for specialists only’ excludes some text types that account for a big part of the legal translator’s workload in his/her daily activity: private agreements and correspondence between lawyers and clients, for instance (see Harvey 2000).

2. Strategies in translating legal texts

Due to the nature and function of law, legal language has acquired particular linguistic features—lexical, syntactical and pragmatic—in order to fulfill the demands of the law and accommodate the idiosyncrasies of law and its applications. Such linguistic

characteristics of legal language have profound repercussions for legal translation. If we examine legal language as a whole, common and singular linguistic characteristics can be recognized across different legal languages, traits which become manifest from the point of view of the vocabulary, syntax, pragmatics, and style.

2.1 Lexicon

In terms of legal vocabulary, a distinctive feature of legal language is the complex and unique legal lexicon found in different legal languages. This is a universal feature of legal language but different legal languages have their own unique legal vocabulary. This can be considered as the most visible and striking linguistic feature of legal language as a technical language used for specific purposes.

The legal vocabulary in each language is often extensive as it results from and reflects the law of the particular legal system concerned. Because of the differences in legal systems, in translation, many of the legal terms in one language do not correspond to terms in another a fact that gives way to the issue of non-equivalence, a major source of difficulty in translation. Furthermore, within each legal lexicon, there are also peculiarities which do not always match in different legal languages.

For instance, studies have identified specific linguistic characteristics of the English legal language. The English legal lexicon is full of archaic words, formal and ritualistic usage, word strings, common words with uncommon meanings and words of over-precision, among others (see Mellinkoff 1963, Danet 1980, Bowers 1989), Tiersma 1999). On the other hand, in legal German, the terminology is often highly abstract, with a high frequency of the use of nouns (Smith 1995).

2.2. Syntax

When analyzing legal language, a common feature of its syntax is represented by the formal and impersonal written style coupled with considerable complexity and length. As noticed by Salmi-Tolonen (2004: 1173), in general, sentences in legal texts are longer than in other text types, and they may serve various purposes. For example, in statutes, often long and complex sentences are required due to the complexity of the subject matters and the prospective nature of

legislative law. Using conditions, qualifications and exceptions extensively are the additional linguistic features of legislative language, commonly employed to express complex contingencies. According to Bhatia (1997), these peculiar linguistic features, often create barriers to the effective understanding of such writing for ordinary people, translators included. Thus, in order to understand and translate legislative provisions, one is required to take into account the typical difficulties imposed by some of these factors (Bhatia 1997: 208).

Apart from long and complex sentence structures found in most legal languages, there are also syntactical peculiarities to each legal language. In legal English, complex structures, passive voice, multiple negations, and prepositional phrases are used at length.

2.3. Pragmatics

As stated earlier, law depends upon the performative nature of language. Legal utterances perform acts and generate facts, rights and institutions. Typically, legislation is a prime example of ‘saying as doing’. Statutes, contracts and wills are other examples of legal speech acts in action. For instance, a statute is a master speech act with each provision constituting individual speech acts. It should be pointed out therefore that ‘performativity and modality are the linguistic means which express the institutional ideology of the role relationships involved in legislative rule-making’ (Maley 1994: 21).

Words in legal language differ in meaning, their importance and effect depend on the person who utters them, on where and when (Hart 1950). Of these speech acts, a prominent linguistic feature is the frequent use of performative markers. For instance, in English legal documents, ‘may’ and ‘shall’ are extensively employed. Performative verbs such as ‘declare’, ‘announce’, ‘promise’, ‘undertake’, ‘enact’, ‘confer’ and ‘amend’ are also common. Another pragmatic consideration in legal texts is ambiguity, vagueness and other uncertainties found in statutes and contracts, which are often points of legal contention. The courts often have to deal with such linguistic problems in their search for uniform interpretation and legal certainty.

2.4. Style

Legal style refers to the linguistic aspects

of the written legal language and also the way in which legal problems are approached, managed and solved (Smith 1995: 190). Legal style results from legal traditions, thought and culture (Smith 1995). As already mentioned, legal writing is characterized by an impersonal style, with its extensive use of declarative sentences pronouncing rights and obligations.

To sum up, the abovementioned description of legal language is a general account of the linguistic markers believed to be common in most if not all legal languages in varying degrees. Nevertheless, it is important to take into account that major differences also exist in different legal languages and such differences represent a source of difficulty in legal translation.

3. Striving for a pan-European legal language

As far as private law is concerned, the link between language, law and cultural identity is considered to be strong. It is not therefore surprising that the greatest resistance to the harmonization of European law has been in core areas of private law relating to contract law.

This section examines basic terminological problems in the present acquis and the new approach to language in the ‘academic’ DCFR, which was published in 2008 as a model for a ‘political’ Common Frame of Reference (CFR) to be completed by the Commissions and adopted during 2016. Although it remains to be seen whether and to what extent the CFR will be used in future EU legislation, Professor Christian von Bar, chairman of the Study Group on a European Civil Code is optimistic that it will eventually lead to the creation of a new *ius commune europaeum* (von Bar 2005:17 on the *ius commune*- debate see Smith 2007: 219-230). This reference to the common law of continental Europe formed by the reception of Roman law in the 17th and 18th centuries raises questions as to the feasibility of such an ambitious project under the present conditions. Namely, at that time lawyers in large parts of continental Europe were all part of one unified culture and used the same language, i.e. Latin.

Today the common drafting language is English; however the new pan-European

legal language is not intended to be a process of ‘Anglification’. Therefore, the project can be successful only if the EU policy of multilingualism is upheld and to that end high quality translations are required.

Specialists such as Van Hoecke/Warrington (1998:525) regard the development of some conceptual legal meta-language as “a necessary condition for a real development of comparative law”. A linguist, Anne Lise Kjær, joined the debate on the possibility or desirability of developing a common European legal language. Discussing the topic outside the framework of a European private law, she rejects the creation of a meta-language, calling instead for a European legal discourse across languages as a means of promoting a “common understanding” between lawyers of different legal systems (2004:396; cf. 2008: 153-156).

Multiple references occur especially when EU legislators do not succeed in defining the specific meaning and scope of application of a EU term or provide unclear, vague or inconsistent definitions, “forcing” national judges to interpret the notion in accordance with their national law, a practice which unavoidably leads to different results in the Member States. Deeply rooted in the legal culture and history of each state, private law terminology has different meanings and different usage and it is sometimes classified differently in different national legal systems (cf. Pozzo 2003:756-763; 2006: 7-12). This is also true in regard to legal terms belonging to the common core of all legal systems, such as contract, consumer and damage. For instance, a type of damage which qualifies for compensation in one national legal system is not necessarily as such in another, although the legal systems are closely related and even the same language is spoken as in Austria and Germany (Heutger 2003:7; 2008:12). As for the EU law, the term ‘damage’ is defined differently in the defective products Directive (85/374/EEC). More recently, the environmental liability Directive (2004/35/EC) provides a non-technical definition of ‘damage’ which fails to specify clear criteria for its usage (Pozzo 2006:14), thus enabling the national courts to term in accordance with their national law, at least until the European Court of Justice

(hereinafter: the ECJ) provides a clear definition for the purpose of the Directive.

Later the Commission changed its strategy and introduced the first detailed directive requiring maximum harmonization in consumer protection. Nevertheless, Directive 2005/29/EC on unfair commercial practices also contains general clauses drawing on a „code of conduct” based on „honest market practices” and/or “the general practice of good faith”. In an attempt to achieve maximum harmonization, national legislators are required to faithfully reproduce the words of the detailed provisions as closely as possible when transposing such directives and incorporate word-for-word the long back (=binding) list of aggressive and misleading commercial practices which are deemed unfair in all circumstances. As stated in the Unfair Commercial Practices Directive, the objective is to remove internal market barriers by replacing Member States` divergent general clauses, thus putting pressure on the ECJ to introduce an autonomous interpretation of good faith that would eventually lead to a consistently applicable criterion for determining which commercial practices qualify as aggressive and misleading for the purpose of the Directive. Whether this is possible and desirable has recently been challenged by cultural experts who stress the need to take account of variations of consumer culture in Europe (Wilhelmsson 2007:265-268).

Another shortcoming of the *acquis* is the EU legislator`s use of different terms to express the same concept within the same directive and in other directives. Terminological inconsistency on the part of the EU legislator results in multiple references causing incoherency leading to legal uncertainty and inevitable linguistic diversity in the translations (Šarčević 2006:128). For example, Art.4 of the Doorstep Selling Directive (85/577/EEC) governs the right of cancellation whereby the consumer is released from all his obligations; however, the term ‘right of renunciation’ is used in Article 7 to express the same concept, although the term ‘renounce’ has a special usage indicating the possibility of renouncing a right or interest, for instance, when someone renounces an inheritance (Black`s Law Dictionary 2000:1041). In Article 5 of Timeshare Directive 94/47/EC, the verbs

withdraw and *cancel* are used as synonyms in tandem with right to withdraw and right to cancellation. The EU term right to withdrawal finally appears by itself in Article 4 of the Distance Selling Directive 97/7/EC and has been used consistently thereafter by EU drafters (Šarčević/Čikara 2009: 204-206), although the time period allowed for withdrawal differs in almost every directive on consumer protection.

Another flagrant inconsistency is the use of different terms and definitions in respect of the parties to a consumer contract. Although one party is always a consumer, the term is defined differently for the purpose of each directive (see Denkinger 2007:261), causing confusion and encouraging litigation. In fact, one party is always a professional; however, instead of using the generic term professional in the English texts of the directives, as in some French texts, more specific terms are used, such as ‘trader’, ‘seller’, ‘supplier’, ‘vendor’ and ‘retailer’, thus resulting in considerable terminological diversity in the various language versions of the relevant directives.

It shouldn't be overlooked that legal concepts are abstraction of the generic legal thoughts and rules within a legal system. With Weisflog, legal concepts are the “authoritative categories to which types or classes of transactions, cases, or situations are referred, in consequences of which a series of principles, rules and standards become applicable” (1987:207). Therefore, they play an important role in delineating each branch of the law. For our purpose, as legal translation involves specialized or technical language, the technical nature of legal language stems largely from the extensive use of concepts (cf. Weisflog 1987: 207). Consequently, a frequently encountered challenge in legal translation is the translation of legal concepts because they are often legal system-bound. Take for instance, as cited in Weisflog (1987), the concept of ‘theft’ in English law and its equivalent ‘Diebstahl’ in German law. There are considerable differences in the respective laws as to what constitutes ‘theft’. As Weisflog explains, in English law, ‘theft’ is the ‘dishonest appropriation of property belonging to someone else with the intention of keeping it permanently’ under the English Theft Act 1968. Under the German law, a

person is guilty of ‘Diebstahl’ (theft) if he or she takes away movable property belonging to another with the intention of appropriating it unlawfully. Furthermore, how the two legal systems define ‘property’ and other concepts contained in the definitions also differs (see Weisflog 1987: 210–211).

The problem of translating legal concepts is not new and efforts have been made to find possible solutions.

Recently, various terminological databases have been developed with CAT technology, for instance, Eurodicautom of the EU, but they remain at the terminological, not conceptual level. However, we are reminded that legal translation is not the automatic transposition of a concept from one language into another, but rather it requires thorough knowledge of the two legal systems that interface with one another as well as a comparative analysis of the text and the terms to be translated (2001).

It can be suggested that a legal concept is three dimensional (Cao 2001) based on Peirce's semiotics, meaning that it has linguistic, referential and conceptual dimensions.

To ascertain whether a concept in one language can be translated as a concept in another language, we need to consider whether they are equivalent or similar in these three dimensions. However, in translation, words from different languages are rarely the exact equivalent in all three dimensions. There are two major scenarios in translation here: firstly, when there are no existing equivalent concepts and words in the TL, that is, they are linguistically or conceptually absent, new words must be created or new meanings introduced; and secondly, when there are existing words in the TL that are linguistic equivalent to the SL, these words in the two languages may only carry partially equivalent meanings in law or sometimes may not be functionally equivalent in law at all. This can be seen in terms of the conceptual dimension of a term and its referential dimension, that is, how it is realized in the legal system and how it is understood by the users of the language (see Cao 2004).

The lesson here is that when trying to identify and ascertain the meaning of a particular word with both ordinary and legal meanings or a word with several legal

meanings, one can make use of the context in which the word occurs. This includes both the wider legal context, such as a particular area of law, and the immediate linguistic context such as the sentence, the paragraph and the entire text in which the word is used. A legal dictionary will also be of great help. However, if one is not aware of the additional legal meaning that a simple everyday word may have, and assumes, wrongly, that it is the ordinary usage, one may not enlist the help of the dictionary or reference materials in the first place. So, in translating legal texts in general, the translator, especially those who do not have legal training, should not readily assume that ordinary and common words are always used in the ordinary way. To conclude, general reading of and cross-reference to the relevant existing laws and other legal texts and their translations are always recommended.

ilie.rotariu@ulbsibiu.ro

Abstract

This study reviews the findings of longitudinal field research in Sibiu on the cultural profile of tourists during and after the European Cultural Capital Programme (ECOC) and the effects of the event on local tourism. The impact of the event can be gauged through the growth of tourism stimulated by infrastructure improvements and product development, not only in terms of increasing tourist numbers but also by the increase of local income from tourism and related sectors. The ECOC has turned into a model followed by many European cities seeking tourism growth and image change. The ten years of research conducted in Sibiu have highlighted the variety of long term effects that can result from such a complex development model, including tourism growth, changes in tourist profile, image improvement and increased social cohesion.

Keywords: cultural events, European Cultural Capital, impact on tourism, Sibiu ECO.

J.E.L. classification: L83, O17

1. Introduction

The literature encompasses many explanations for the rise of culture as a force for local development. In Europe, one particularly prominent model of cultural event-led regeneration has been the European Capital of Culture (ECOC), a year-long celebration of civic and European culture which rotates between the member states of the EU. This model has been seen as particularly successful in delivering a range

of benefits, which has led to interest in, and competition for, the ECOC growing markedly [6]

This paper reports on a long-term monitoring project for the Romanian city of Sibiu, which was ECOC in 2007. This case study is of particular interest as the first city in Central and Eastern Europe to host the ECOC, the co-occurrence of the event with the entry of Romania into the European Union (EU) and the development of a growth coalition related to a specific cultural group in the region. The paper aims to evaluate the impacts of the ECOC relative to the aims set for it by local stakeholders and to assess the success of the event and the overall strategy in regenerating the city over the past decade.

The literature on ECOC and its follow-up on local economies and EU as a funder are wide and sometimes controversial. All the ECOC organisers have provided reports and conclusions to the European Commission by the end of the project and some of these reports were used for theoretical and field researches

The Palmer report [6] which evaluated the ECOC from 1995 to 2004 saw the event as one of the most successful EU programmes of all time, delivering huge benefits against a minimal investment from Brussels. The ECOC in Luxemburg in 2007 commissioned an extensive programme of research, which included monitoring of resident and visitor attitudes before and during the event [4]. Stavanger [8] undertook extensive research with local residents before, during and after the event [9]. In Liverpool a major research programme was set up to monitor the long term impacts of the event, with baseline measurements before the event, stakeholder studies during the event and monitoring after the event.

The ECOC has not been without its critics, who have argued that the event tends to cater to well-off, frequent cultural consumers rather than the whole population [1, 5]. The event arguably also has shifted from cultural motives to economic ones. The recent evaluation of Stavanger [9] complained that the European Commission is no longer interested in the cultural content of the event, but would rather hear about success stories in urban regeneration.

What is lacking in much previous ECOC-related research is a link with the broader development of the host city. This paper reports on longitudinal research undertaken in the Romanian city of Sibiu, host to the ECOC in 2007, over a ten year period from 2001-2010. This is the first study to be undertaken of a city hosting the ECOC in Central and Eastern Europe, the period of the research therefore also covers a period of considerable structural change in Romania as a whole and Sibiu in particular.

2. Methods

It is not enough to use official statistics to measure the impact of a major event in tourism development of a city. The statistical data series that intend to figure the evolution of the tourism were examined for their accuracy and checked by several sources. There are some significant limitations with the use of official statistics on economic impact in Romania, the most important of which is under-reporting in order to limit tax liability. For example, Ivan-Ungureanu [2] assumes that for hotels the number of non-registered tourists is about one third of the total.

In addition to measuring different aspects of the relationship between a city and its event(s), there is also a need to develop a longitudinal component to research using field interview. In order to investigate the more qualitative aspects of the effects of the ECOC we have used questionnaires for by passing people downtown and deep interviews among the main stakeholders. The monitoring has started in 2001 as a project for the cultural profile of the tourist of EU covering. After Sibiu was nominated as ECOC organiser with Luxembourg for 2007 the investigations were enlarged and focused on the effects, and long time effects later of

the cultural event in this tourism destination. The research was extended to cover a greater range of stakeholders, and measures were made of the image of the city in other parts of Europe comparing with data from the regular surveys carried out by ATLAS

In this paper we look back over ten years of data collection and analysis to assess the effectiveness of Sibiu's cultural and tourism development strategy

3. Results

Our annual reports have tried to evaluate the extent to which the city has met its specific aims, which in the case of the ECOC were: raising the international profile of Sibiu, long term cultural development, attracting international visitors, enhancing feelings of pride and self-confidence, growing and expanding the local audience for culture, improving social cohesion and creating an economic downstream, improving cultural and non cultural infrastructure, developing relationships with other European cities/regions and promoting European cultural cooperation, promoting creativity and innovation.

The city therefore had a mix of economic, image, cultural, social and physical regeneration goals. In this paper we look back over ten years of data collection and analysis to assess the effectiveness of Sibiu's cultural and tourism development strategy. In this work in progress we highlight some of the major impacts of the ECOC cultural event in Sibiu tourism development.

3.1 Impact on local population and major stakeholders

The major impact might be considered the influence the ECOC had on the local community as reflected in the opinions of major stakeholders and residents during the depth interviews. A total of 170 interviews were completed yearly between 2007 and 2011 with stakeholders, the vast majority in Sibiu and the surrounding region and a few number in the rest of Romania. The main interview groups were: cultural operators, travel agents and tour operators, banking and insurance, media, hotels and restaurants, businesses and tourism organizations. Some ideas were found each year that underline the

power of the impact. A short selection of major themes from the data base of ATLAS and Lucian Blaga University of Sibiu as reflected in the annual rounds of data collection [7, 8] include:

Pride in the city: Being from Sibiu was suddenly something to take pride in, especially as the city was recognized not just as national, but also European level. “I developed a special sensitivity for everything you call “my city”. The fact that Sibiu was named European Cultural Capital together with Luxembourg is a proud moment. Also, the image to make a potential cue ball in Romania” or “I gained a sense of pride, a kind of: here as you can, you can do something good, something of quality, here we are appreciated”.

Transformation: “This programme helped the evolution of the organization of events and highlighted the organizational capabilities of companies in this area”; “My personal life has changed in the sense that in my spare time walking on downtown Sibiu noticed different people from different corners of the world”; “Sibiu has changed a lot lately, mostly due to the great event held in 2007”

Image of Sibiu: There was a widespread feeling that the ECOC had put Sibiu on the map not just nationally but internationally as well. Typical remarks were: “Another positive aspect resulting from Sibiu European Cultural Capital Sibiu in 2007 is to increase visibility both nationally and internationally through cultural events of the highest class”. The image impacts were not just external, but internal as well: “Of course Sibiu has a good image because of its history and medieval atmosphere that persist through the beauty of places, the hosts, etc., which has aroused the curiosity of many Europeans, bringing them here in 2007. I think this programme has been exploited bringing many benefits to residents of the town. I am from Sibiu and attended many events held in 2007 in Sibiu and I was pleasantly surprised by the seriousness and extraordinary ideas”.

Cultural and social impacts: Many interviewees emphasized that the impacts of the ECOC were wider than just economic: “Sibiu-European Cultural Capital in 2007 was designed so as to provide opportunities for issues of inclusion and social cohesion, education, heritage tourism and urban

regeneration at all levels. The programme puts culture at the heart of city life and looking into her inspiration for driving community forward” or “The ECOC in 2007 as well as 2008 both gave the opportunity for me and other one thousand inhabitants of the town to watch shows and events culture that otherwise would not have been present in Sibiu (i.g. the Vienna Philharmonic)”

Renovation: One of the crucial elements in improving the image of the city was the renovation of the old town. “Very visible in the eyes of the people was the renovation historical centre which otherwise would not have happened very quickly. Both the historical centre and the renovation of an impressive number of monuments and cultural organization of the various events had a favorable effect on the town”; “After renovations are completed, Sibiu has restored life ... or so it seems to me”; “large investments in conservation, renovation and highlighting the historical centre, has attracted a number of investments that have led to the development of tourism, both in Sibiu and its surroundings”

Role of the Local Authority: Many stakeholders emphasized the important role that the civic administration had played in the development and the success of the ECOC. “Locally, in my view local authorities were very much involved, have managed to attract funds and manage them as effectively all in the interests of the community and the city that was very visible in the eyes of the people was the renovation of the historical centre”.

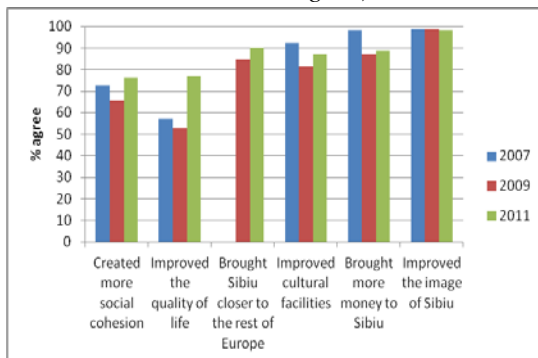

The feeling that the ECOC has had a positive and determinant impact is still high even after five years. Interestingly, there was also an increase in the quality of life and social cohesion benefits of the ECOC among residents in 2011 compared to 2009.

2. Statements about the impact on Sibiu
2007, 2009 and 2011 (residents only,
% agree)

Source: (Richards & Rotariu 2011) page 41

3.2 Tourism Development Effects

The impact of the ECOC on the general growth in tourism supply before, but mainly after the event focused on hotels and other accommodation facilities in terms of number of hotels' beds but also in terms of the standard of the accommodation establishments. Since 2001 the number of hotels has more than doubled and the total registered accommodation units have grown by 40% to fit the increased demand.

Source: (Richards & Rotariu 2011) page 39

All figures show the same major trends: increase of capacity; increase of high level of comfort units; a faster increase of investments in neighborhoods of Sibiu comparing to the town; a trend of enlargement and development and improve of comfort of existing capacities; a relatively slow increase in 2010. Specially notable is the operating of global hotel brands in the city: Hilton, Ramada, Golden Tulip, Best Western, Ibis and national brand Continental.

The growth of hotel accommodation in Sibiu itself also had a strong impact on the surrounding region. Growth in the regions close to Sibiu was just as strong as in the city itself. The Sibiu neighbourhoods (up to 25 km radius) has achieved the same capacity as the town itself, but the accommodation is mainly guest houses and pensions that offer much lower rates, offering both green holidays and easy access to the intense cultural life of the town.

3.3 Tourism economic impact

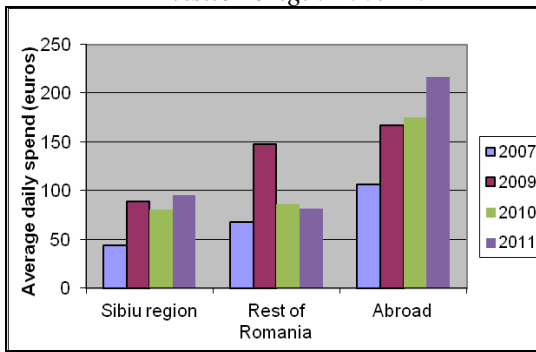

All major events are supposed to boost the tourists' arrivals and increase the income of the organizing area. All ECOC have had this result. Statistical data and field research have shown that Sibiu has enjoyed significant outcomes in spite of the effect of the global crises. And the effect is still visible even after five years. The tourists' arrivals reached a pick in 2007 as a result of the large number of events organized. Figures on average visitor spending show that spend levels increased particularly sharply during the ECOC in 2007, largely because of the influx of high spending foreign visitors

2. Spend by hotel guests in Euros

	Travel spend	Admission	Food and drink	Shopping	Accommodation
2007	212.1	21.53	126.2	87.9	250.2
2009	157.7	62.44	145.3	277.9	269.4
2010	249.5	82.67	187.5	167.9	310.0
2011	227.3	47.95	157.1	147.2	310.5

Source: (Richards & Rotariu 2011) page 32

3. Average spend per day (Euros) by visitor origin 2007-2011

Source: (Richards & Rotariu 2011) page 31

Taking the figures for tourists staying in Sibiu and their average spend, we can estimate total tourism spending at €26 million in 2010, which is actually higher than 2007, the ECOC year. This indicates that the ECOC had a strong and stable positive impact on local tourism development over the longer term (Richards & Rotariu 2011 pag 36)

We have also to point out that the field research has clearly shown that almost one third of the visitors stay with friends and relatives. This allows us to estimate the total tourist expenditure at almost €50 Million, which is 40% more than in 2007, in spite of the global economic crisis

3.4 Visitor behavior, quality of the visits experiences

Sibiu was known as a medieval city. Classic tours included a walk downtown and a visit to Bruckenthal Museum. The ECOC changed the cultural consumption of cultural attractions. Previously the town have hosted a couple of traditional events: Theater Festival, Jazz Festival, Potters Faire etc. After 2007 the cultural agenda has become more organised all year round and has become more related with the tourism seasons. Since 2007, it is clear that visitors to the city have been visiting an even wider range of attractions. In particular, visits to ASTRA Museum, the Lower Town and the Fortifications have increased, reflecting the investment in these areas, but also the Orthodox and Evangelic Cathedrals.

4. Sites visited in and around Sibiu (% of visitors)

	2007	2008	2009	2010	2011
Bruckenthal Museum	27	71	61	57	62
Orthodox Church	27	40	46		39
Evangelic Church	25	60	46	39	41
The Lower Town	25	35	52	47	51
ASTRA Museum	20	58	58	54	57
The fortification	19	25	38	33	32
Fortified Churches around Sibiu	12	24	24	19	22
Street animation		50	42	43	43
None of these	36	4	7	4	4

Multiple responses allowed; Source: (Richards & Rotariu 2011) page 27

As a result of the modernization of the museum offer, the number of visitors – locals and tourists – has constantly increased: the National Bruckenthal Museum had almost 3000,000 visitors (one of the most frequently visited museums in the country) and ASTRA Museum had 250,000 visitors.

The number of visitors coming especially for events has steadily increased, and most of the shows sold out all their tickets, which has led to a diversification of booking systems. The experience acquired for and after ECOC has developed more expertise in the local administration and created strong collaboration with stakeholders involved directly in tourism activities. This has led to a higher quality of tourism experiences.

5. Quality of visit (scale 1-10)

Source: (Richards & Rotariu 2011) page 28

The new expertise and the ability to work in the community has encouraged the local authorities to launch a new major event for 2012; the “Sibiu Baroque Update”, which is addressed to the national market that supplies the majority of the tourists (around two thirds of total visitors).

4. Conclusion

Our research indicates that the Sibiu ECOC in 2007 and the programme of cultural development leading up to it had substantial impacts on the city both in the short and longer term. In the short term there was a significant economic boost from tourism and an improvement in the external image of the city. Levels of social cohesion rose and feelings of local pride increased and cultural activity in the city reached record levels. Over the longer term there has been increased cultural, hotel and infrastructure investment and a qualitative change in tourism flows towards cultural visitors with higher spending power.

The Sibiu experience emphasises the importance of creating internal and external networks. Sibiu has made good use of its links to rest of Europe, helped by its cultural ties with Luxemburg and the linguistic links with Germany. This situation may seem extraordinary in Romania, but it does to some extent mirror the experience of cities elsewhere.

This seems to confirm an important conclusion of the Palmer Report (2004) evaluation of the ECOC, namely that political stability and commitment are vital to the success of the programme.

In the case of Sibiu this seems to have delivered an event which is perceived to have a tangible legacy, and which has not been quickly forgotten by residents or external observers. This is an important factor in the current adverse economic climate, which in many other cases might lead to the ECOC being associated with the economic slump that followed it.

viorela.vaidean@econ.ubbcluj.ro

Abstract

An economy like that of China started out a lot of controversies and a lot of analysis. Recently, the monetary policy led by China gave birth to a series of disturbing questions, as follows: for how long can the fixed exchange rate be sustained? what will be the consequences of the continuous increase in foreign exchange reserves? is the expansionary monetary policy reliable? will the inflation bubble explode? In this article we apply an econometric model using the Eviews software in order to illustrate that the increase in money supply will eventually lead to inflation. This analysis is the basis to be followed up in the future if this co-dependence relationship between money supply and inflation continues. It would mean the end of the economic stability and growth of China. On the long run this model could prove that the Chinese economy is in fact a bubble ready to explode.

Key words: monetary policy, money supply, inflation, econometric model, expansionary monetary policy.

J.E.L. classification: E27, E47, E51

Introduction

A country such as China that relies on strength, on stability, on exports, on supremacy to evolve and especially a country that uses every mean necessary to develop usually hides a lot of problems. A lot of times it has been said that an economy like that of China will „explode” because the economic growth is not sustainable on the long run and

the attitude of great power is premature. In this article we focus on the monetary policy and we will show that the expansionary monetary policy that China adopted in the last years would eventually lead to the beginning of the destruction of the „bubble” often associated to this economy. We will focus on the relationship between the increase in money supply and inflation to sustain a model that could enforce this idea.

We sustain the idea that the unjustified growth of the monetary mass will in the end lead to high and uncontrollable inflation and the price stability would be history.

Literature review

Across the economic history, there were a lot of definitions for inflation, and even more theories stating the connection between inflation and the monetary mass. Even since 1752 David Hume stated that, when there is an increase in the money, then in time we will automatically witness an increase in the prices. Furthermore, the supportive theory developed from the quantitative theory of money to the theory of the purchasing power of Irving Fisher. According to this theory, the increase in the money supply will be automatically transposed in an increase in the prices, inflation being a monetary phenomenon. From Keynes on other elements were discussed, like the theory that the increase in the monetary mass will not exclusively reflect itself in the prices, and will have effects both upon income and upon the interest rate [1]. After that, the neo-monetary theories stated that the economic development can only happen if there is a stable evolution of the monetary mass, and that a non-justified increase in this mass will

generate inflation and will threaten the economic stability.

Research methodology

There are a lot of factors that contribute to inflation like the interest rates, the costs with labor and the exchange rates. Moreover, the effect of an unjustified increase in the monetary mass in stimulating inflation is a little more subtle. In an economy like that of China, this connection is difficult to be observed due to the constant intervention of the authorities in order to maintain stability of prices. In the short run, the solution to use the monetary mass as an instrument could prove to be effective. This was the case here. The problem was the abuse of this temporary solution. But, in the long run, a constant increase in the monetary mass correlated with the fix exchange rate could threaten the economic stability of the country and even generate inflation. China proves instead that it does not obey to the classical rules of the economy because China does not have a free market economy, as the communist party and the state intervention through the monetary policy have always been active.

Without an econometric analysis this connection is difficult to be observed, and that is why we propose a model in order to see if this connection exists and what are the potential consequences of it. The real economic climate of China showed that, whenever the economy had signs of stagnation or decline, the authorities reacted through open market operations and by authorizing unlimited bank loans. The monetary policy that China adopted was an expansionary one, by increasing its money supply. According to Keynes, every increase in the money supply moves the LM curve to the right, the interest rate drops, the investments will increase, and through the multiplier effect, it will lead to an increase of the income, and therefore consumption. This solution is only a temporary one, and in the long run it is a damaging one.

All the interventions in the monetary policy of China have been targeted towards sustaining an economic rise of 10% every year. During the economic crisis, the authorities increased the monetary mass monthly in order to encourage consumption, and the rate of growth was significant,

especially in 2009 when the turbulences on the partners' markets caused a decrease in exports. According to the People Bank of China, M1 and M2 had an ascending trend; the tip of the iceberg was during the crisis as we can see below. The main reason was the reluctance of the people to consume. Normally, the people of China are used to save money and nowadays China has the highest savings rate in the world: 56%. Adding this to the crisis in all the countries, the consumption dropped significantly. As we can see, in 2000 and 2001 (the highest economic growth) when the authorities did not had to intervene to encourage consumption, the monetary mass had diminished, as well as in 2011, when the exports regained their force.

Figure 1 Evolution of the monetary mass in China

Source: Authors' processing using Eviews based on the data from PBC

And this is not the only problem of China. There is still the exchange rate policy. Whenever a stabilization of the Yuan was necessary, the authorities intervened by purchasing dollars. This caused a massive accumulation of foreign capital, mainly dollars. In the last trimester of 2011, the foreign exchange reserves of China reached 2.85 trillion dollars. As the mission of maintaining the fixed exchange rate become more and more expensive, China had to print more and more national currency in order to buy these dollars. In reality this means that, the constant increase of these reserves with the undervaluation of the national currency will be a threat to the independence of their monetary policy. A fixed exchange rate, according to the economists Goldstein and Lardy would put pressure upon the monetary

policy due to the variation between the internal interest rate and the external interest rate which would destabilize the capital flows. They argue that, if the control mechanisms prove efficient in limiting capital inflows and outflows, a country with an under-evaluated national currency like the Chinese Yuan) faces two problems. First, it would have an increase in the domestic money supply due to the high acquisitions of foreign currency (because of the lower internal interest rate the investors sell local currency and buy foreign currency). Secondly, that massive sale of local currency without an efficient control will lead to an increase of the liquidity in the banking and financial system that in the end will cause inflation and the appreciation of the exchange rate [2].

Results and comments

The first signs of an increase in inflation have been obvious in the last three years, starting with 2009 when there was an obvious increase in the prices. It is interesting that, during the economic turbulences in the partner countries, there was a decrease in the prices, especially for the real estates, fuel and consumption goods. But still, in order to maintain a high targeted economic growth of almost 10%, another boost was needed. The answer was, of course, an increase in the money supply, except for 2011. More accurate, the authorities adopted a stimulus package of 586 million dollars, with a lot of side effects. As we can see below, the most important side effect was an increase in inflation.

Figure no. 2 Evolution of inflation in China

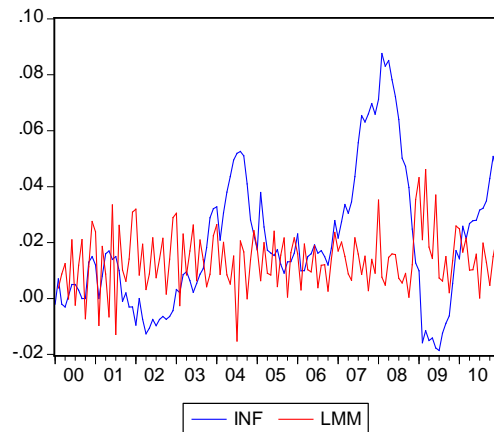

Source: Authors’ processing using Eviews based on the data from PBC

As we can see, the data are very contradictory. For several times, People Bank of China was accused that the statistic data do not accurately reflect the economical reality. We based our analysis on the data provided by the PBC. As we stated above, the connection between the money supply and inflation in China is not obvious to the naked eye. That is why we propose an econometric model to prove this connection. The data used are provided by the National Bank of China and represents monthly values for the 2000-2010 period. The variables are $Y = mm$ (monetary mass) and $X = inf$ (inflation rate).

We start our analysis from the premises that inflation is influenced by a series of variables, among which the monetary mass (Lmm). So, in the figure below, we can analyze how exactly this variables evolved during the analyzed period.

Figure no. 3 Evolution of inflation and monetary mass in China

Source: Authors’ processing using Eviews based on the data from PBC

As we can see, the two variables seem to „evolve together”, meaning they have a common similar tendency. So, it may be possible for a cointegration relation to exist between them, which means that these two variables involved in the regression equation move together, so they do not drift apart during time.

All this is the result of the expansionary monetary policy and in the end it could threaten the monetary and economic stability of China. We have to apply a cointegration test, in order to avoid false regressions. In 1987 Engle and Granger proved that a linear

combination of two or three nonstationary series can be stationary. The relation of co-dependence between them is stable. Next, we will test the nature of casualty between the two variables. Two series, Y_t, X_t integrated of the same order $I(d)$ are co integrated by the order $CI(d,b)$ if there is a linear combination $Z_t = aY_t + bX_t$ which has a smaller integration order. $I(d-b)$ [3]. In order to verify that there is a cointegration relation between monetary mass and inflation, we will take three steps.

The first step checks to see if the both variables are co integrated. We will use ADF test. Then, we will estimate the simple regression in order to obtain the estimation of the co integrated relation. The existence of such a relation will be shown by MMP. The third step is to see that the residues are stationary. If the hypothesis of the unit root in the series of the residues is rejected, then, between the monetary mass and inflation there is a co integration relation. After estimating the coefficient regression relations and the residues, we apply the ADF test with another type of unit root in order to detect the nonstationary residues. In this order, we will check if the variables are stationary applying Unit root test/ Adf (trend and intercept):

Null Hypothesis: INF has a unit root
Exogenous: Constant, Linear Trend
Lag Length: 12 (Automatic based on SIC, MAXLAG=12)

	t-Statistic	Prob.*
Augmented Dickey-Fuller test statistic	-2.281770	0.4402
Test critical values:		
1% level	-4.036983	
5% level	-3.448021	
10% level	-3.149135	

*MacKinnon (1996) one-sided p-values.

The result, a probability of $0.44 > 5\%$ denotes that INF has unit root (stochastic tendency)

Null Hypothesis: LMM has a unit root
Exogenous: Constant, Linear Trend
Lag Length: 11 (Automatic based on SIC, MAXLAG=12)

	t-Statistic	Prob.*
Augmented Dickey-Fuller test statistic	-2.118659	0.5298
Test critical values:		
1% level	-4.036983	
5% level	-3.448021	
10% level	-3.149135	

*MacKinnon (1996) one-sided p-values.

Probability $0.5298 > 5\%$ illustrates that LMM has unit root (stochastic tendency).

Next, applying the test has several aspects. We differentiate the series one time and they become stationary, as we can see from ADF. For dlmm we have $t=9.74$, none, for dinf, $t=-5.42$). dlmm(differential equation).

Pairwise Granger Causality Tests
Date: 02/07/12 Time: 13:25
Sample: 2000M01 2010M12
Lags: 2

Null Hypothesis:	Obs	F-Statistic	Probability
DLMM does not Granger Cause DINF	128	0.61858	0.54038
DINF does not Granger Cause DLMM		0.34997	0.70541

1. H_0 : DLMM does not Granger Cause DINF, probability= $0.54 > 0.05$. The null hypothesis is accepted, therefore, monetary mass is Granger cause for inflation. The decision upon this hypothesis is maintained also for lags equal 3 or 4.

2. H_0 : DINF does not Granger Cause DLMM, probability= $0,7 > 0,05$, null hypothesis is accepted, therefore, inflation is not Granger cause for monetary mass. This hypothesis is accepted even if we increase lags to 3 or 4.

Next, we will determine the integration order of the two series. We estimate MMP between the variables observed. $INF = a + bLMM + \epsilon$ where ϵ is the residue. So, the „ce” equation is:

Dependent Variable: INF
Method: Least Squares
Date: 02/07/12 Time: 18:12
Sample (adjusted): 2000M02 2010M12
Included observations: 131 after adjustments

Variable	Coefficient	Std. Error	t-Statistic	Prob.
LMM	-0.263359	0.201895	-1.304435	0.1944
C	0.023780	0.003491	6.811885	0.0000

ADF test on residue shows that prob=0.05=5%, further indicating that the residue from the regression is stationery.

Null Hypothesis: RC has a unit root(RC being the critical region-if the numerical value of the test does not fall in the critical region, then the null hypothesis is accepted.

Null Hypothesis: RC has a unit root
Exogenous: None
Lag Length: 11 (Automatic based on SIC, MAXLAG=12)

	t-Statistic	Prob.*
Augmented Dickey-Fuller test statistic	-1.923597	0.0523
Test critical values: 1% level	-2.584539	
5% level	-1.943540	
10% level	-1.614941	

Figure no. 4 Cointegration relation

Source: Authors' processing using Eviews

After this analysis, we can state that between these two variables there is a cointegration relation, meaning there is a codependence relation. MMP identified one cointegration relation: $INF=0.023-0.26LMM$.

This analysis on the economic model of China proves that, in the long run, this permanent increase in the money supply will lead to an evolution in the same way of inflation.

Conclusions

In the end, the biggest problem of China is that it relies exclusively on economic growth using every means necessary. There are a lot of problems that China needs to address before aspiring to the status of a great economic power and leader. The economic growth of almost 10% each year is not enough. Our analysis proves that China needs a stable and confident monetary policy. Assuring growth by pumping money into the economy is not a solution. The result of our analysis that there is a codependence relation between this two variables in the long run could prove that, without an intervention of the monetary authorities to stop this trend of permanent increasing money supply, will in the end lead to a fall out of the entire system.

It is clear that this country has a lot of problems to address; we would like to state here an important one correlated with everything in regards to our paper: capital account liberalization. Capital flows liberalization is an image of a modern country with a stable and clean monetary policy. In regards to the monetary policy, a lot of arguments state that China will never have a complete liberalization of the capital account. One reason could be the banking system. As the vice-president of the administration board of PBC, Xiao Gang stated: “the growth policy by using every mean is the best way for the Chinese banks to make a lot of money in the current economic conditions. This model of growth, however, does not assure long term sustainability, and does not fulfill the needs for a balanced economic and social structure”. One solution could be the relaxation of the control mechanism for the interest rate [4].

Another reason is the entire financial system of China, that is highly under evaluated. Roubini states that, by 2013, 30% of the loans given by the Chinese banks will be nonperforming loans. Another motive is obviously the highly under-evaluated Chinese renminbi. A liberalization of the capital account without an appreciation of the currency could lead to speculative attacks by massive capital inflow, which would lead to the impossibility of maintaining price stability. As we can see, there is a vicious circle in the monetary policy of China. They cannot have a liberalization of the capital

account without a relaxation of the fixed exchange rate and allowing the Chinese Yuan to appreciate. And they cannot let the exchange rate fix without sacrificing price stability and endangering the precious 10% economic growth. China wants to prove that great accomplishments in an economy can be made without sacrifice. This article states that in the end China could sacrifice its entire stability and existence.

All in all the monetary policy of China in the third millennium reflects a sick system and a dangerous one in the end for the whole world. An economy that in the end, will not full anyone anymore and the great power attitude will be just an unsustainable attitude.

Abstract

In analyzing the evolution of the degree of specialization of regional imports in Romania in the period of time 2000-2010, we started from the study of the modifications made in the structure of the sections included in the CR for regional imports. In order to quantify the degree of regional specialization, we determined Onicescu's informational energy, and in order to offer a synthetic view of the dynamic of regional import specialization, we calculated the Balassa indexes for each section.

Keywords: Balassa indexes of specialization for imports, Onicescu's informational energy – corrected formula, sections of the Combined Register.

J.E.L. Classification: F14, R11.

1. Introduction

The assessment of the regional inter-industrial specialization processes from the point of view of import distribution on the sections listed in the Combined Register is necessary in order to know and to diagnose a regional economy (such as the Romanian one) which is going through an intense modernization and development process due to the integration into the economical and institutional structures of the European Union, as well as due to the more intense involvement into the international trade flow.

2. Evolution of the structure for each section of the Combined Register for regional imports

During the last years, in the *structure of the imports on sections listed in the*

Combined Register (CR), the highest percentage, over 25,0%, was that of the section „Machines, devices and electrical equipment; machines for recording sound and picture and reader machines”, and the regions with great contribution to the imports in this section are the North-West, West and South Muntenia areas.

This aspect proves the existence of a certain degree of specialization in the import of such goods in the areas mentioned above, since this section also has a great percentage in the regional imports. According to figure 1, almost 50% of the imports in the North-West region since 2010 consist in products included in this section. We should mention that the region increased its imports of electrical machines and devices, especially during the last 5 years, since at the beginning of the period subjected to this analysis the section we are talking about had a low percentage in the regional imports (for example: 18,5% in 2000).

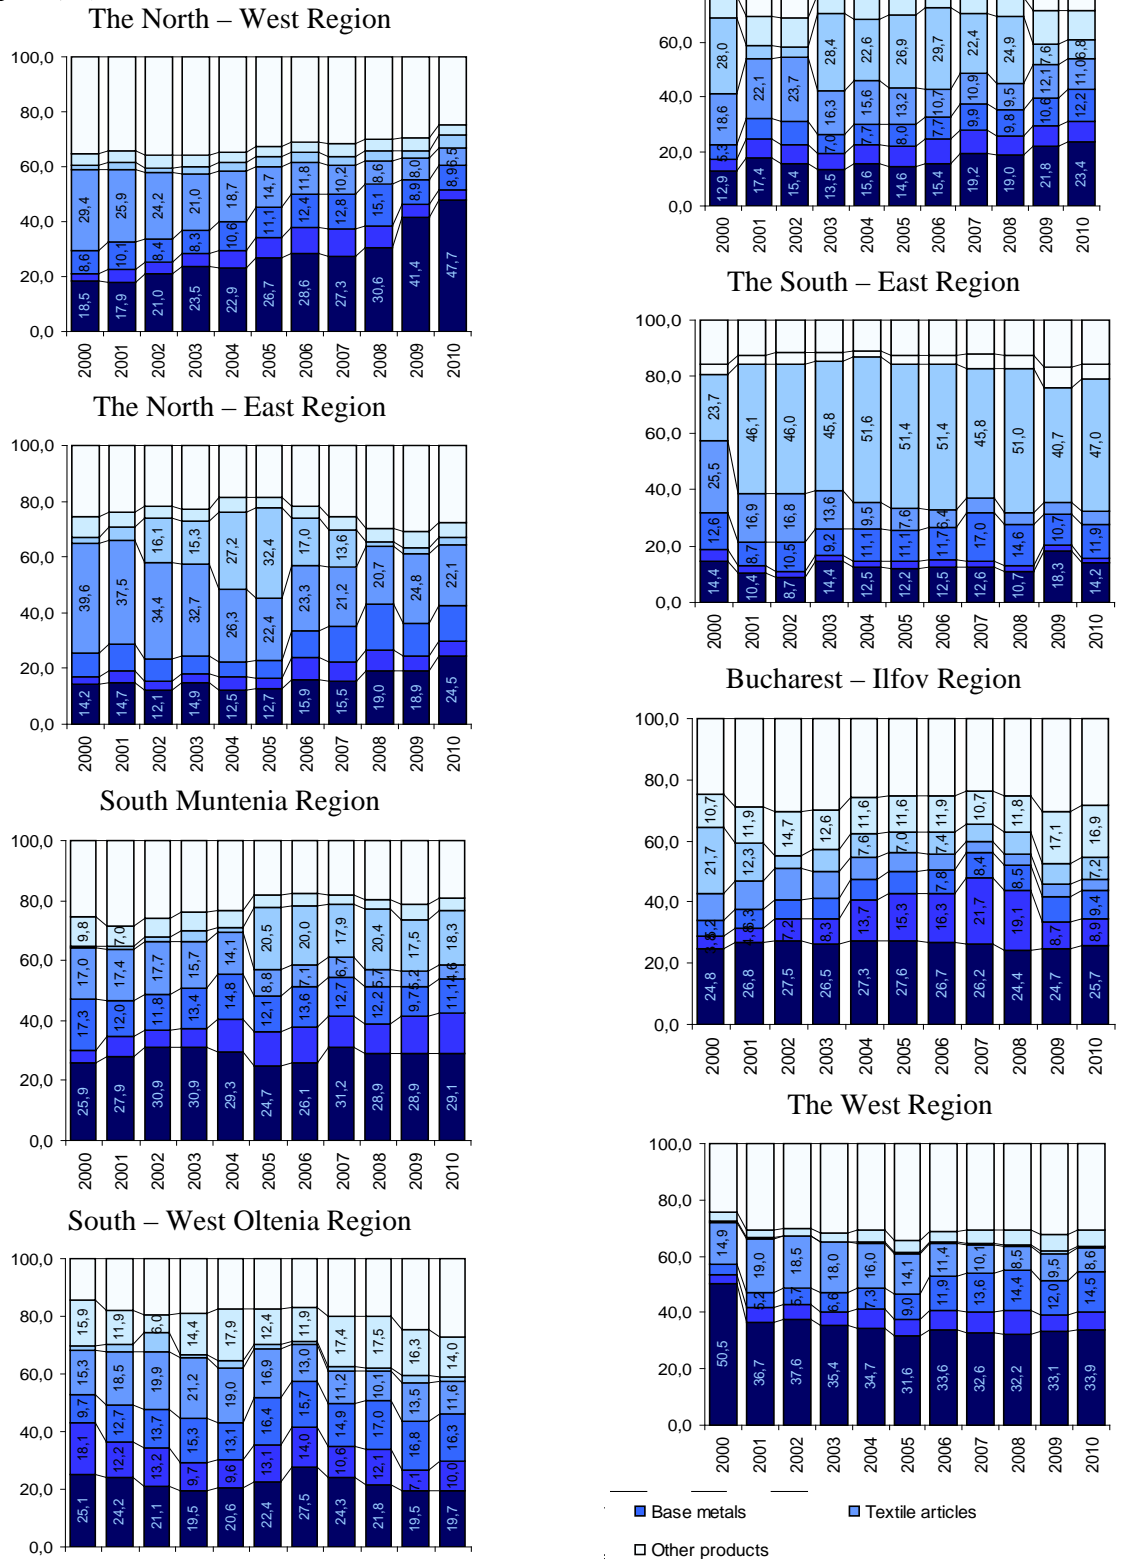

The same phenomenon happened in the South Muntenia region, as in 2000 the percentage of such goods in the regional imports was of 25,9%, while in 2010 in increased up to 29,1%. On the other hand, in the West area, the imports of such goods are a tradition of this economy, since during the whole period subjected to the analysis the percentage of this section in the regional imports was over 30%, reaching even 50,5% in 2000.

Other sections with great percentage in the total imports registered in Romania are:

- „Common metals and articles made of these metals” are over 15% of the total imports, especially during the first years. Contributions of about 15% of the total regional imports are registered in the South-East and the West. In the South-East and in South Muntenia regions, the

imports of metal products are a tradition, since percentages of about 15% in the regional import are registered in these areas during the whole period.

Figure 1. Evolution of the percentage of the main sections in the CR in the regional import (%)

Source: personal processing of NIS data

- „*Mineral products*” are over 10% of the total imports, during the whole period of time subjected to this analysis. The regions with great contributions to the imports in this section are the South-East (47,0% of the regional imports for 2010 are mineral products) and South Muntenia (18,3%) regions.
- The “*Means of transport*” are about 10% of the total imports, especially during the last few years. The regions with great contributions to the imports in this section are South Muntenia (13,6% of the regional imports in 2010 are means of transport), Bucharest Ilfov (8,9%) and South-West Oltenia (10,0%).
- The „*Textile fabrics and textile products*” registered great percentages at the beginning of the period analyzed - over 15% - and the regions which still have great contributions to the imports in this section are the North-East (22,1%), Central (11,0%) and South-West Oltenia (11,6%) regions.

3. Assessment of the degree of specialization of regional imports for each section in the Combined Register

In order to express in numbers the *degree of specialization of the imports for each section included in the Combined Register* we calculated, for each region, the **Balassa index of specialization** [1] **Iapadre P.L.** [2] – *believes that this index can also be applied to imports*. It is determined by reporting the import percentage for that product within the total imports in the region to the import percentage of the product within the total imports in Romania. When the index has positive values, the region has a *high degree of specialization in the import of a certain product*; when the index is higher than 1, the *degree of specialization in manufacturing that product is low*.

As we showed in the first part of this analysis, the section „*Machines, devices and electrical equipment; machines for recording sound and picture and reader machines*” has a high percentage in most regional imports; consequently, we can suppose that the regions did not specialize in manufacturing such products, and by calculating the Balassa index we can establish the degree of specialization in each region. As we can see

inn figure 2, *the highest degree of specialization in the import of electrical machines and devices*, during almost the whole period subjected to the analysis, is recorded only in the North-West and West regions, the other regions having a higher degree of specialization in other products.

Another section with high percentage in the structure of regional imports is the section „*Mineral products*”. *The continuous specialization of the South-East region* in the import of such products is obvious. A high degree of specialization is also registered at present in South Muntenia region (the specialization of imports increased starting in 2005), while in the North-East and the Central regions there was a high degree of regional specialization in the period of time 2002-2007 and 2003-2008 respectively. As to the section “*Textile materials and textile products*”, it has the highest degree of specialization for imports, during the whole period analyzed, only in the North-East region, the other regions having a low degree of specialization.

The main trends, on regional level, in the evolution of the degree of specialization of imports for each section in the CR, are:

- *in most regions there is an increase or a stagnancy of the degree of specialization for the import of **electrical machines and devices** (except for the South-West Oltenia and the West regions, where the degree of specialization is highly reduced). The highest increase of specialization for the import of such products is registered in the North-West (from 0,75 in 2000 to 1,68 in 2010) and Central (from 0,52 in 2000 to 0,82 in 2010) regions. Great decrease in the degree of specialization is registered in South Oltenia (from 1,01 in 2000 to 0,69 in 2010) and in the West region (from 2,04 to 1,19).*
- *in most regions there is an increase or a stagnancy of the degree of specialization for the import of **mineral products** (except for the Central, the North-East and Bucharest-Ilfov regions, where the degree of specialization oscillates). The highest increase of specialization for the import of such products is in the South-East (from 1,63 in 2000 to 4,21 in 2010) and South Muntenia (from 0,06 to 1,64).*

Figure 2. Evolution of the Balassa indexes of regional specialization for each section

The Central Region

The South - East Region

Bucharest - Ilfov Region

The West Region

--- Base metals
 --- Chemical products

Source: personal processing of the data offered by the NIS

- *in most of the regions there is a decrease of the degree of specialization for the import of **means of transport**. The largest decrease was noticed in the South-East (from 1,06 in 2000 to 0,21 in 2010) and South-West Oltenia (from 4,27 in 2000 to 1,34 in 2010) regions, and increase is registered in South Muntenia (from 0,91 in 2000 to 1,82 in 2010) and Bucharest Ilfov (from 0,91 in 2000 to 1,19 in 2010) regions.*
- *in all the regions there is a slight increase of the degree of specialization for the import of **textile products** (except for the South-East and South Muntenia regions, where the degree of specialization decreased). The largest increase of specialization for the import of such products is registered in the North-East (from 2,42 in 2000 to 3,44 in 2010) and South-West Oltenia (from 0,93 in 2000 to 1,80 in 2010) regions, while in the other regions the specialization increased only slightly or remained relatively constant during the whole period of time.*

4. Analysis of the degree of specialization of the regional import from the point of view of the value of Onicescu's informational energy - the corrected formula

Elaborating the analysis of the regional imports in Romania and starting from the previous conclusions, we can notice that the first 5 sections with the highest percentage cumulate about 75,0% of the whole value of imports; consequently, we can ask the question if there is *a specialization of the regional imports*, and respectively a concentration of the imports of a certain region. In order to express this phenomenon in numbers, we calculated for each region *the value of Onicescu's informational energy [3] of the distribution on each of the sections listed in the CR, applying the corrected formula.*

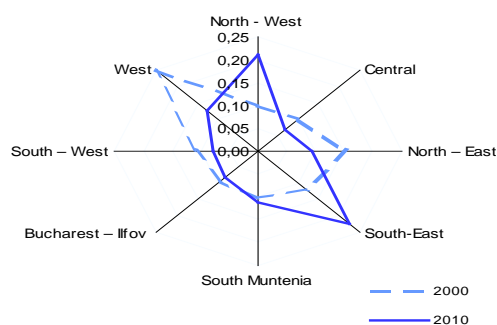

The index calculated on regional level measures the degree of specialization for each region according to the percentage of imports of each of the sections listed in the CR within the total regional import. Consequently, the index calculated for a region is not influenced by the type of specialization pertaining to Romania.

The index oscillates on the interval (0,1); a *concentration of the import* of a certain region on a small number of sections included in the Combined register makes the *value of Onicescu's informational energy to tend to 1*. According to figure 3, the *North-West* (47,7% of the total imports in the region in 2010 are goods from the section „Machines, devices and electrical equipment; machines for recording sound and picture and reader machines”) and the *South-East* (47,0% of the total regional imports in 2010 was included in the section „Mineral products”) regions were in this situation in 2010.

On the opposite pole, with a decreased degree of specialization (concentration) and a *value of Onicescu's informational energy which tends to 0* – due to the dispersal of regional imports on a large number of sections included in the CR –, are *Bucharest-Ilfov* and the *Central* regions.

In 2000, unlike during the last year of the period analyzed, there was a *high degree of specialization (concentration)* of the import in the *North-East* (39,6% of the total imports of this region in 2000 were from the section “Textile fabrics and textile products”) and *West* (50,5% of the total imports of this region in 2000 were from the section “Machines, devices and electrical equipment; machines for recording sound and picture and reader machines” and 14,9% from “Textile fabrics and textile products”) regions.

Figure 3. Evolution of Onicescu index of specialization on each region

Source: personal processing of the data offered by the INS

The classification of the degree of regional specialization (concentration) of imports on 4 categories according to the values of the quartiles – low degree of specialization (values between minimum and Q1), medium-low (values between Q1 and Q2), medium-

high (values between Q2 and Q3) and high (values between Q3 and maximum) – offer a synthetic image of the dynamic of regional import specialization.

Making a comparison between 2000 and 2010, the evolution of the degree of import specialization is as follows:

- in *only one region the degree of import specialization (concentration) does not change* (a low level is registered in the Central region).
- in *4 regions* - the North-West, the South-East, South-Muntenia and Bucharest Ilfov regions – *the degree of import specialization (concentration) increases*.
- in *3 regions* - the North-East, South-West Oltenia and the West regions - *the degree of import specialization (concentration) decreases from a high level to a medium-high or a medium-low one*.

According to figure 3, **the main conclusions** concerning the regional specialization **from the point of view of Onicescu specialization (concentration) indexes pertaining to regional imports**, are the following:

- *the classification of the regions according to the degree of specialization (concentration) of imports changes. Thus, in 2010, the most specialized regions were the North-West and the South-East, while, at the beginning of the period analyzed, the most specialized regions were the North-East and the West.*
- *in most regions, the degree of specialization (concentration) of imports decreases or remains constant during the period of time analyzed, except for the North-West, South-East and South-Muntenia regions, where there is an increase of the degree of specialization.*
- *the region with the highest degree of specialization (concentration) of imports during the whole period of time 2000-2010 is the South-East, and the trend is towards an increase in the specialization of imports. The regions South-Muntenia, the North-East, the North-West and South-West Oltenia, have close values of the average specialization indexes, but their evolution is different: the North-West and South-Muntenia specialized, while in South-West Oltenia, the West and the North-East there is a rather high*

despecialization of imports. The lowest values of the degree of specialization (concentration) of imports are registered in the Central and Bucharest-Ilfov regions, and their trend is towards a continuous decrease.

5. Conclusions

Such an evolution of the degree of regional specialization of imports, meaning an increase of specialization for the imports of goods with low or medium-low technological level and a slight increase or stagnation in the case of goods with medium-high or high technological level is not beneficial for the regional economy, since the increase in the market share of „foreign” human-capital-intensive and high-technology goods are not premises for increasing the level of economical development.

Abstract

As the global economic environment is permanently changing and evolving, the educational system must prepare young people to face the challenges of a real job.

The traditional approaches for teaching international business in universities is focused on sharing knowledge and as far as creating student competencies, the educational method is mainly static. The purpose of this article is to analyze a relative new learning method, which can be applied in the area of international economic environment and consists of using business simulation as a dynamic component of the educational process.

We aim to present our researches regarding the use of this method in universities and focus on a case study of how this method was implemented in The Bucharest Academy of Economic Studies.

Using the data collected from participants in an internship project, which was based on business simulation in virtual enterprises, we will decide upon the benefits of applying this educational method in universities.

Key words: international business, educational process, business simulation, teaching methods

J.E.L. classification: A23, F23.

1. Introduction

The learning system in Romania is considered by specialists rather static, from the point of view of the educational methods that are used. Social studies have identified a problem which affects both graduates and employers: the students have theoretical knowledge that they have learned in the university, but their practical skills are lacking. This problem has led to the situation when over 35% of university graduates are unemployed in an year after graduation.

The European Commission has set up a human resources development funding program, part of the European Social Fund, known as POSDRU.

Since 2008, Romania has received from the European Commission only 200 million Euros for projects implemented within the human resources program, out of total sums available of 3.47 billion Euros.

Obviously, the poor attraction of funds for projects for this area is also considered a problem in Romania. So let's take the two problems that we encountered so far and see what possible solutions we can identify: lack of practical skills on university graduates and poor absorbing of funds for human resources development program.

A possible solution seems to be the use of business simulation in the educational process from universities, as a complementary method of teaching, financed by applying to the funding from the

European Social Fund.

Several consortiums of universities have already identified this solution, and projects for students internships in virtual or real enterprises have been financed and implemented starting with last year.

2. Research methodology

First, the stage of documentation and literature review consists of researching the data bases for articles that addressed the topic of business simulation.

We will present the manner of implementation of a project financed by European Funds, that uses business simulation as a method for developing skills in international business area for students or master students.

In order to analyze some results of this teaching method we will focus on a case study about the implementation of a student internship program, that uses business simulation in virtual created enterprises.

Based on the answers that participant students gave in questionnaires, we will collect and analyze data that can show how efficient is this learning method, from the perspective of its results.

3. Literature review

The main data base used to research the papers that make references to the business simulation method and other teaching methods in international business, was JSTOR and also ANELiS.

Traditionally, the first dimension in education for international business has been the textbook-lecture-discussion approach. (Dowd, L.P., 1973).

The second dimension in education for business is the use of case-studies in which students are given actual, or hypothetical, business examples and are asked to make decisions. This is an evolution in international business education, as it forces the application of economic principles into business situations. (Herreid, C. F., 1994).

The main weaknesses of case studies are: the historical nature of most cases that leads to freezing of environment conditions, though they are continuous changing, the information is limited and this tends to rigidify the thinking process of students.

The third dimension is the use of management simulation games, which introduces dynamic developments into decision making processes. The most important improvement in this teaching method is the introduction of planning-decision making for the future and not for the past. (Jain, L. C et al., 2002).

The fourth dimension that has been described consists of involving students in dynamic day-to-day management decision making and providing them with the experience of working as a "team". This would be very close to the concept of internship in a real company.

We shall canalize our attention on the third dimension of education for international business, as identified in the literature review. The main challenge is to identify and describe the actual methods used for implementing the business simulation as a teaching method in universities.

In most cases, students are assigned to teams and each team represents a virtual enterprise, with a predefined object of activity, social capital and an economic environment with certain characteristics.

The main activities for students in an international business game are tasks as: forecast sales, perform cash flow analysis, and develop operating strategies based on relevant operational concepts. The student team must consider factors as: political stability in forecasting, possible exchange gains and losses in cash flow analysis.

The material basis on which the activity of enterprises is sustained, consists of an informatics program, that creates a virtual economic environment, with defined economic, social and political factors. Depending on the decisions that students make for the enterprises they manage, the result is different. The interaction between the virtual enterprises must also be taken into consideration, as the firms may be cooperative, competing or complementary as economic actors.

4. Is business simulation an effective method to prepare students for their future jobs?

As Ronald D. Klein (1984) states in his article, there is widespread controversy over the effectiveness of using business simulation

games as a learning medium. Games are recognized as excellent motivators and as providers of valid decision-making experiences, but the accumulated evidence concerning their learning effectiveness is inconclusive and divided.

We will try to answer this question, by bringing new data on the matter. This data was collected from applying a questionnaire to students and master students that have participated to a program of internships in virtual enterprises. This project is implemented in the Bucharest Academy of Economic Studies (and also other universities) and is financed by the European Social Fund through the Sectoral Operational Programme Human Resources Development 2007-2013, Priority Axis 2 "Linking lifelong learning to the labor market necessities", Key area of intervention 2.1 "Transition from school to active life". The title of the project is "REAL ACCESS TO LABOUR MARKET BY SIMULATED ENTREPRISE", Contract no. POSDRU/90/2.1/S/63442, and the university that coordinates the implementation of the project is Ovidius University from Constanta.

The questionnaire we applied contains 13 questions, 9 of them are YES/NO answer, 2 are multiple choice ones, 1 is likert scale type and one is with open answer.

The target group was formed of 200 students, who completed the questionnaire. From the 200 questionnaires, 161 were valid completed, and used for further analyze.

We synthesized the answers and analyzed the information that was relevant for the main question addressed in the subtitle: *Is business simulation an effective method to prepare students for their future jobs?*

The results indicated that over 70% of the participant students considered that the information received in this internship would be useful at their future jobs (question 1). Over 60% thinks that the guidance received from their tutors, regarding the way an enterprise functions, helped them in the decision-making process and will continue to be useful when they will work in a real company (question 2).

Still, only 30% of the respondents think that they have become more of a entrepreneur (question 3), and only 20% say that they want to start their own business (question 4).

Figure 1: The percent of affirmative answers to questions 1,2,3,4 from the questionnaire (YES/NO type questions)

Source: by the authors

From the information gathered using the questionnaire, we can conclude that the business simulation method definitively brings an improvement in the understanding of economic principles by students. The dynamic interaction with an enterprise functions, even if they are virtual, gives students more confidence about their knowledge and as far as their perception goes, this experience will help them find a job and perform at it.

Of course, the main deficiency of this questionnaire is that it only addresses the perception of students on how effective the internship program is, and it cannot predict their future evolution on the labor market.

This problem shall be addressed in a future article, based on an already existing questionnaire, regarding the future insertion on the labor market of present participants at the internship. Of course, this questionnaire cannot be applied until the students have graduated from the university and go out on the labor market, looking for a job.

Then we can find out whether the participants in this program have more chances at receiving a job, and if it is better paid than for the graduates who haven't benefit from this type of complementary business education.

As for the possibilities of improving the manner of implementation, we centralized the answers to the questions that targeted the qualitative elements, in the table below.

Table 1: The average level of importance granted by students to the following rules applied to the activity of virtual enterprises

Rule	Average score
Assigning a team leader for the entire period of business simulation	3
Assigning a team leader for each period of business simulation	2
Everybody works in the same time and for the same objective	4
Everybody works in the same time but for different objectives	2
Each person works with the purpose of optimizing the collective result	3
Each person works with the purpose of optimizing his own result	5
The responsibilities are assigned inside the team using each one preferences as criteria	5
The responsibilities are assigned within the team using each ones abilities as criteria	2
The desired result is established from the beginning by the team	5
The means that are to be used for achieving the result are established from the beginning by the team	5
The person considered to be the best one in the team must be rewarded	4
The person considered to be most incompetent in the team should be lectured	1
Each document from the activity of the virtual enterprise should be carefully and correctly noted	5

Source: by the authors

The scores interpretation is:

- 5: most important
- 4: important
- 3: indifferent
- 2: less important
- 1: not important

If we take into consideration the average scores, we can conclude that students prefer to have a leader from the beginning, they wish to be a part of the decision making process and the criteria for assigning responsibilities should be individual

preferences. Also, they would like to be rewarded if they are the best, but do not consider appropriate to be penalized if they prove to be incompetent. Most students agree on the importance of completing documents carefully and correctly.

5. Conclusions

The research we conducted on the subject of effectiveness of business simulation as an educational method, indicates that students who benefited from an internship in a virtual enterprise, found this experience enriching to their theoretical and practical knowledge. Also, it made them more self confident that they will find their place on the labor market and that they are well prepared for their future job.

We consider that the varieties of business situations that can be simulated, as well as the similarity to real world companies, are positive points in favor of using this teaching method, complementary to the traditional ones. The simulation games can play a supportive role adding decision-making relevance to the lectures and text.

The conclusion is that business simulation is a value-adding learning method that helps students gain self-confidence and have a better understanding of enterprise functions and correlations between them.

Whatsoever, more insight is needed on this issue, so we propose, as further research, the analyze of data regarding the insertion of internship participants on the labor market. Obviously this information will only be available after a period of time, and maybe aggregating data from more universities may share light over the issue of the success at the employment process, for students who were part of teams that worked in virtual enterprises.

Abstract

In order to keep up with the changing economic environment, graduates from business schools must be prepared to face different challenges.

In fact, it is the educational system that must be configured properly, so it can create student competencies in a dynamic way. A research has already been conducted on the subject of dimensions in education for international business, and identified the most important ones (Tartavulea et al, 2012).

The purpose of this article is to analyze some of the informatics solutions for business simulation and compare their mechanisms and results in terms of student satisfaction regarding the preparation for the labor market.

As the economic environment is becoming more complicated in terms of financial markets and products diversification, the new comers in the labor field must have the knowledge to understand the mechanisms of the market and the skills necessary to keep businesses on top of the wave.

Key words: international business, comparative analysis, business simulation, informatics solution

J.E.L. classification: A23, F23.

1. Introduction

Business simulation, as an educational method, permits the creation of relevant market conditions, although artificially imposed to a virtual enterprise. It can be focused on a single discipline or with a variety of disciplines.

Griffin and Williams (1964) identified three conditions that must be fulfilled in order to consider the business simulation an effective pedagogical method:

- it requires the presence of one or more sensitive problems which are meaningful to the student
- it requires the assembly and assimilation of all information that may be usefully brought to bear upon each specific problem's solution
- It assumes the existence of an integrating methodology for logically ordering and analyzing these data in the decision process.

The scope of business simulation is to help students achieve and consolidate technical skills and prepare them for a real decision-making process.

Specialists in educational methods believe that relating various disciplines and considering their corporate effects and complementation gives value to the pedagogic experience. The complementary character of several related elements from management, marketing, statistics, finance, macroeconomics, etc. represent important

landmarks that should be used in the process of finding a solution to complex business problems.

The purpose of this article is to find relevant informatics solutions that can be used in the process of business simulation and conduct a comparative analysis between them.

2. Research methodology

First, the stage of documentation and literature review consists of researching the data bases for articles that addressed the topic of informatics solutions used for business simulation, as well as further understanding of the concept and its applicability in the educational process.

As we stated in a previous research, the main challenge is to identify and describe the actual methods used for implementing the business simulation as a teaching method in universities. In order to achieve this goal, we must identify the most notorious informatics solutions that are being used in the process of business simulation in universities. Also, we will present short descriptions of the manner that the software can be implemented in the educational process, in order to generate positive effects on the learning system and to create and develop practical skills for students.

In order to analyze some results of the implementation of informatics solution for this teaching method, we will focus on a case study about the development of a student internship program that uses business simulation in virtual created enterprises.

The data collected from questionnaires applied to participant students will be analyzed, in order to find out how effective was the informatics solution in the process of acquiring skills and knowledge through business simulation. Also, based on the literature review regarding the most common used informatics solutions for business simulation, we can carry out a comparative analysis between these programs and the one that has been used in the project "REAL ACCESS TO LABOUR MARKET BY SIMULATED ENTREPRISE", Contract no. POSDRU/90/2.1/S/63442 that is coordinated by the Ovidius University from Constanta, and implemented also in The Bucharest Academy of Economic Studies.

3. Literature review

We researched mainly the databases JSTOR and also ANELiS for papers that make references to the business simulation method and the informatics solutions used in business schools over the world. Other sources were also consulted as listed in the bibliography section.

As the preliminary research has shown, the business simulation is not a very new concept, as it appears in the topics since the 1960. Still, it generates new research directions, as the evolution of information technology has given innovative solutions for creating virtual enterprises that can run on multiple economic scenarios. This has led to a whole new dynamic dimension of business simulation that can work in favor of students, helping them to prepare for the demands of a changing economic environment.

Interactive computer applications and simulation exercises are used to supplement the traditional case study preparation (Leider, D.E. and Jarvenpaa, S.L., 1995).

According to Jain, L. C et al., (2002) management simulation games introduces dynamic developments into decision making processes. The most important improvement in this teaching method is the introduction of planning-decision making for the future and not for the past.

Software used in IESEG School of Management and MIT Sloan School of Management for business simulation is SIMUL8. Teachers that used it consider its graphical interface is intuitive and its animation capabilities are very useful to develop intuition.

From the point of view of students, the expected results of the program are the development of their critical thinking about business processes, retaining the ability to create complex models in a short time in class. The use of this software in their education system enriches their competence as future managers.

From the teachers point of view the benefits of this program are learning to ask the right questions, verifying the rigor of simulation models and appreciating their importance in a modern business environment.

Another informatics solution for business simulation is proposed by Harvard Business

School and it allows students to play the role of a business unit manager at a company who faces the dilemma of balancing a portfolio of investment strategies across products.

The student must decide which market opportunities to pursue, each of which offers the student varying levels of short- and long-term profit prospects. Students manage the investment portfolios over eight simulated years. Throughout the simulation the student is forced to address a number of challenges including timing and level of investment across both mature and new businesses, choices regarding market opportunities and inherent product performance characteristics, requirements to meet constraining financial objectives and constant trade-offs between investment options, all in the context of uncertain market information [6].

The company BTS declares to be the world leader in customized business simulations and discovery of learning solutions. They developed several informatics solutions for business simulation.

Board simulations are board games that represent a company's operations and simulate its business. During simulation rounds, participants literally pick up and move money (chips) through the different areas of their company. This hands-on approach allows participants to visualize the cash-flow cycle in action.

Scenario simulations, sometimes called "best-practice" simulations, are used to build leadership, project management, and sales capabilities. These simulations leverage decision tree structures in realistic story lines, enhanced with text, audio, still photography, and video. As participants read and observe real-world business situations, they have the opportunity to react to the issues presented. When participants choose a course of action, the simulation immediately presents the impact of their decisions on the ultimate goal.

Web-based business and scenario simulations engage participants in highly interactive learning. In these competitive, game-style programs, students and master students participate as teams or individually. As participants and teams set their own pace throughout the simulations, they receive feedback on their performance and experience the impacts of their decisions on leadership, operational, and financial performance. [5]

Another company is Innovative Learning Solutions Inc., which provides state-of-the-art learning tools for business schools and business professionals, called Marketplace.

Marketplace® simulations are a family of business simulations for undergraduate, graduate and executive level business courses. Used by over 300 business schools and 180 corporations in 35 countries worldwide, Marketplace simulations deliver a realistic hands-on learning experience. The simulations are designed to fit both the distance learning and the classroom format. Marketplace simulations are fully web-based, so there is no software to install and no hassles to administer it. The company located their Processing Center in the premier data center facility in the area, Digital Crossing (Tennessee, USA). [7]

An impressive number of informatics solutions have been developed for the purpose of business simulation. Some of them are oriented towards the companies that want to improve their processes or make well-founded decisions and others are directed to the educational system.

4. The selection process of an informatics solution for business simulation

The process of selection for simulation software can be defined by a sequence of steps (adaptation after [8]):

1. Clearly state the problem that needs to be addressed

It is important that we establish the scope that should be achieved by using the simulation software, because this will help narrow the search to a certain type of informatics solution, which is the role of the next step.

2. Determine the general type of simulation tool required

Because simulation is such a powerful tool to assist in understanding complex systems and to support decision-making, a wide variety of approaches and tools exist.

The general purpose tools can be categorized as follows:

- Discrete Event Simulators: are generally designed for simulating processes such as call centers, factory operations, and shipping facilities in which the material or information that is being simulated can be described as moving in discrete steps

- Agent-Based Simulators: agents have both attributes and methods (e.g., rules for interacting with other agents). An agent-based model could, for example, simulate the behavior of a population of animals that are moving around and interacting with each other.
- Continuous Simulators: Although these tools usually have some mechanism to represent discrete events, they are most appropriate if the material or information that is being simulated can be described as evolving or moving smoothly and continuously, rather than in infrequent discrete steps or packets.
- Hybrid Simulators: These tools combine the features of continuous simulators and discrete simulators. That is, they solve differential equations, but can superimpose discrete events on the continuously varying system.

3. Carry out an initial survey of potential solutions

Identifying the potential software that can serve the purpose that has been established in step no. 1 can prove to be a difficult task. Before starting analyzing, a list of possibilities must be completed. In order to help the ones who are at this stage we offer some recommendations of places to start from.

The Institute for Operations Research and the Management Sciences (www.informs.org) publishes an online Resource Directory that includes most simulation software vendors. Another good resource is a list of simulation tools assembled and maintained by Andrea Emilio Rizzoli, a research scientist affiliated with IDSIA in Switzerland (<http://www.idsia.ch/~andrea/simtools.html>).

4. Develop a list of functional requirements

A functional requirement is a necessary feature or attribute of the simulation software solution that is necessary for the fulfillment of the purpose it is being used for.

5. Make a selection of informatics solutions that appear to best meet the functional requirements

Using the list created at the previous step, a verification of each tools feature must be made, followed by a comparison with the requirements defined in step 4.

6. Carry out a detailed evaluation of the screened tools

The final step in the process involves carrying out a detailed evaluation of the tools screened in step 5 and selecting the most appropriate tool.

This is actually the most difficult part, as the “Selecting Simulation Software” paper [8], doesn’t give much information about the way that the evaluation should be conducted. There are other papers that address this topic and propose criteria that can be used in the process of selection.

We propose a new evaluation framework, which is easy to complete. For each of the products that are on the narrowed list from step 5, we must complete a table that will help establish the most suitable informatics solution, based on the highest score.

For each criterion, a score between 1 and 5 should be assigned. Basically, a likert scale is used to measure the fulfillment of the criteria proposed for evaluation. The scale is defined as follows: 5- very well accomplished; 4- well accomplished; 3- accomplished; 2- poorly accomplished; 1: not accomplished.

Table 1: Framework for evaluation simulation solutions

Nr	Criteria	Score
1	Input capability and flexibility	
2	Data analysis capabilities	
3	Standard statistics generation	
4	Interactive debugger for error checking	
5	Support provided by the supplier	
6	Low cost of simulation software	
7	Ease of model editing	
8	Simulation speed	
9	Graphical display of input and output	
10	Interfacing the simulation package with external systems	
11	Friendly user interface	
12	Software compatibility with operating systems	
	TOTAL	

Source: by the author

This table should be included in a

questionnaire that must be completed by the potential users of the software for each software included on the narrowed list from step 5, before deciding which one to acquire. After synthesizing the results, the medium score can be calculated for each possible informatics solution and the higher score will indicate the most appropriate one to fulfill the needs defined in step 1.

5. Comparative analysis of Topsim software and other informatics solutions available for business simulation

The research question could be defined as: is Topsim the most appropriate informatics solution for the process of business simulation conducted by the Bucharest Academy of Economic Studies, through the project "Real access to labor market by simulated enterprise"?

We conducted a comparative analysis between the following informatics solutions: Topsim (1), SIMUL8 (2), Strategic Innovation Simulation (3), BTS (4), Marketplace (5).

We will follow the steps defined in section 4 of this article. First, we must define the purpose that needs to be fulfilled: students should acquire competences and skills in the area of international business by facing simulated economic scenarios that challenges them to make decisions, regarding the activity of virtual enterprises, in certain market conditions. After consulting the general types of informatics solutions, we decided that the one we need is from the Discrete Event Simulators category.

The initial survey on possible solutions has already been conducted in the previous section of this paper.

Next we must put together a list of functional requirements:

- the possibility of creating a virtual enterprise
- input data about the general market should be edited by the trainer
- students must be involved in decision-making processes, based on various economic factors
- the software should offer data analysis capabilities
- output data should be presented graphically and with the possibility of

standard statistics generation

- software compatibility with operating systems
- support provided by the supplier

The selection of informatics solutions that fulfill the functional requirements mentioned above include: Topsim, SIMUL8, Strategic Innovation Simulation, BTS, Marketplace.

For each of these we will complete table 1.

Using the total scores obtained by the software we can decide upon the most appropriate one to fulfill the requirements of the human resources development project.

As the project "REAL ACCESS TO LABOUR MARKET BY SIMULATED ENTREPRISE", is financed by the European Social Fund through the Sectoral Operational Programme Human Resources Development 2007-2013, Priority Axis 2 "Linking lifelong learning to the labor market necessities", Key area of intervention 2.1 "Transition from school to active life", there is a contract (POSDRU/90/2.1/S/63442) that requires that all expenses to comply with the budget. Because of this constraint, we have decided to give different importance on the criteria. The importance of criteria is defined by a percent, written in the last column of the table.

Table 2: Comparative analysis of selected informatics solutions for business simulation in the educational system

Criteria No.	1	2	3	4	5	Percent
1	3	3	5	4	4	8%
2	4	4	5	4	4	8%
3	4	3	5	4	4	8%
4	3	5	5	3	3	8%
5	3	4	3	4	5	8%
6	5	1	2	3	4	12%
7	4	4	5	2	2	8%
8	5	4	5	3	3	8%
9	4	5	2	5	3	8%
10	4	3	4	3	4	8%
11	4	5	2	5	5	8%
12	5	4	4	5	5	8%
Average SCORE	4	3.7	3.9	3.7	3.8	
Weighted SCORE	4.0	3.6	3.8	3.7	3.8	

Source: by the author

6. Acknowledgment

The research and publishing of this article has been financially supported from the project "REAL ACCESS TO LABOUR MARKET BY SIMULATED ENTREPRISE", Contract no. POSDRU/90/2.1/S/63442, that is coordinated by the Ovidius University from Constanta and financed by the European Social Fund through the Sectoral Operational Programmed Human Resources Development 2007-2013, Priority Axis 2 "Linking lifelong learning to the labor market necessities", Key area of intervention 2.1 "Transition from school to active life".

7. Conclusions

The comparative analysis conducted on five informatics solutions, selected based on functional requirements from a larger list, has proven the choice of Topsim software for the process of business simulation for students, to be correct.

We can observe that the competition was very tight, as all software scored between 3.6 – 4. Still, we must mention that there was a slight distortion of competition because we attributed a higher importance to the price criteria (12%) in comparison with the others (8%). This decision was made based on constrains from the project's budget.

The evaluation of projects was made by the authors, based on the analysis of data available on the software official web sites. A better understanding of each software's functionality could be achieved if students were given access to free trials and a future analysis can be conducted based on answers on questionnaires.

As the research has demonstrated, simulation games can play a supportive role in the educational system, adding value to the theoretical knowledge for students.

Foreign Direct Investments. Does the Form of Entry Matters? Evidence from Central and Eastern Europe.

Vintila Denisia

Academy of Economic Studies Bucharest

denamv20@yahoo.com

Abstract

If most of the literature regarding foreign direct investments (FDI) investigates the trend of FDI, the motives and their effects on development, little has been analyzed regarding the composition of FDI and the influence it has on the evolution of FDI's trend. The current paper tries to analyze this issue in the case of Central and Eastern Europe Countries between 2000 and 2010. Equity capital proves to be the most stable form of capital, feature evident even during the financial crisis, where the drastic reduction of FDI in the region was determined most by fluctuations in the other two forms of FDI (meaning reinvested earning and inter- company loans)

Keywords: Foreign direct investments, Central and Eastern Europe, equity capital, reinvested earnings

J.E.L. Classification: F21, F23

1. Introduction

Countries of Central and Eastern Europe have certain characteristics that have had an impact on the type of FDI received and the time they occurred. (Sels, 2006). The status of "countries in transition" implies a distinction from other states, meaning that they are in the process of transforming their economy from the centrally-planned one to the market economy. In order to accomplish this goal, these states would first need capital. The domestic capital was extremely low so that foreign capital was the most viable solution.

The main advantages of the CEE in attracting investors were cheap labor and privatization of the state companies. With the rapid development of some countries and

their classification among middle or high income countries, FDI have been attracted by other features: investment environment, high profitability and various incentives offered to investors. (Suder and Sohn, 2006) FDI has three main forms: equity capital, reinvested earnings and inter-company loan (other forms of capital). The market entry form is particularly important in analyzing FDI, as they can explain a series of fluctuations from one year to another. In recent years, FDI have changed the structure and the share of the various forms of FDI in total FDI. The different composition of FDI depends on several factors related to the host country or country of origin among which we have: the taxes, the control level, regulations on investment, exchange the or macroeconomic situation (WB, 2004).

The literature is little on this issue, especially taking into account that the booking of the three forms of investments in the balance of payments is not made in all states and thus we do not have very accurate data, creating difficulties in their analysis.

This paper presents an analysis of FDI's composition during the period 2000-2010 in the states of Central and Eastern Europe, with focus on the new member states of the European Union. The article is structured as follows: the first chapter presents an overview of the evolution of FDI in the region, while the second chapter analyzes the composition of FDI and the motivations of the investors in choosing one form or another.

2. How important is FDI to the region?

Despite official assistance provided by international organizations, the main source of capital for Central and Eastern Europe came in the form of foreign direct investment. But not all countries have

proved to be as attractive to foreign investors and in the first 10 years of transition the gap between countries grew. Natural resource endowments, the proximity of the European Union or cheap labor, these are some of the reasons why countries have attracted FDI differently. (UNECE, 2001)

Most investments were directed to a small group of countries and this trend has been preserved in the second part of the transition, although the level was lower, and new countries have entered into the category of most attractive countries.

Following the global trend, also the Central and Eastern Europe region booked a new record in 2000, FDI heading, as in the past, especially towards two countries, which absorb half of all FDI: Poland and the Czech Republic. Poland proved to be extremely attractive to foreign investors since the early years of transition, being along with the Czech Republic and Hungary the performers of the region and since 1996 it took over the leadership of FDI inflows (WIR 1997). Among the Visegrad countries, Poland was the first to pass over the shock of transition, and recorded both economic growth and a significant increase in FDI (WIR 1996). Romania, along with the rest of Southeastern Europe is one of the states for which FDI were absolutely poor in the first half of the transition.

The uneven distribution of FDI depends on some factors among which: the transition to market economy, the speed at which this occurs, the privatization, investment climate and current negotiations on EU accession and harmonization of policies. The Visegrad countries were those that met most of these criteria and this was noticed also in the level of the FDI inflows (WIR, 1995)

Between 2000-2008, CEE experienced a period of real progress in attracting FDI. Although initially the received values were modest, recording even a decline in 2003, between 2004 and 2007 the region saw a real boom in FDI, which increased three times.

Although the regional evolution of FDI is somewhat stable between 2000-2003, Poland registered a period of decline in foreign direct investments since 2001. This was a result of unfavorable current global conditions and probably due to privatization coming to an end and the macroeconomic problems it was facing. (UNCTAD, 2002).

From a 34% share in total FDI in 2000, Poland attracted only 13.50% in 2002, the year in which the leading position of FDI inflows in CEE is taken by Czech. Given the fluctuations between states and the same state during years, we see that the changes from one year to another are given mainly by the levels of mergers (in this case privatization). A major privatization in one year may explain a peak in that year and may be higher than many low privatizations carried out before. (Estrin et al, 2000) The decline of FDI inflows on 2003 in CEE region is due to the end of privatization in the Czech Republic and Slovakia (UNCTAD, 2004) and the new values attracted by the two countries in 2003 are just normal (peak reached in 2002, is uncommon).

The domination of the Czech Republic, Hungary, and Poland began to reduce, other countries coming back strong. (UNCTAD, 2003). Since 2004, FDI have begun an increasing trend, in conformity with the trend recorded worldwide. Although some of the countries of the region have become European Union (EU) members, they continue to have high risks that influence negatively foreign investors. The competitiveness of these states is threatened by corruption, poor infrastructure or loss of benefits of cheap labor and the costs for solving all these problems are high. The new EU regulations regarding taxes and costs of labor force can also erode the competitiveness of these countries and directing investors to other countries, also from CEE that are not yet EU members.(UNCTAD, 2005)

All states have received record levels of FDI between 2004-2007. The new 10 countries which joined the EU during 2004-2007, the in two waves of accession, continue to be the main recipients of FDI, but their share is declining from 90% in 2004 to about 82% in 2007. Romania, has become the second most attractive country after Poland since 2006 Poland and joins the group of the best performers in attracting FDI. So does Bulgaria, which evolution is similar to Romania's one. CEE countries recorded a peak in FDI inflows in 2007, up by 13%, from the previous year, while for Romania the peak will be reached next year, in 2008.

The financial crisis erupted in developed countries is felt in the CEE through a reduction in FDI, as a result of the reduced profitability of the companies. Although in 2008, the decline of FDI in the region accounts for only 14%, in 2009 the region records a drastic decrease of 52%. In 2010, there is a modest growth in FDI inflows, with different developments at individual level, the Czech Republic being the one that recorded the best performance.

3. The composition of FDI in Central and Eastern Europe

Foreign direct investments are preferable to other forms of investment, because on long term they are much more stable. But, FDI have different forms and this may affect in various ways the level of the investments placed. The question now we ask is which is the composition of FDI in different countries? Which of these forms is the most stable?

All three forms under which foreign direct investment take place are important. If equity capital has always been the predominant form in which company realize FDI, reinvested earnings and intra company loans have increased their importance in the recent years. This has a direct impact on the balance of payments, which in the majority of cases is a negative one.

Generally, privatization related FDI and greenfield investments are realized through *equity capital* (Hunya, 2004.) Investments in equity capital seem to be most stable and secure form that can be achieved through FDI. They require a long time horizon and acquiring of foreign assets in the host country. And, in general, this form of investment is also associated with technology transfer, job creation and increased productivity.

Until 2000, the largest share in total FDI in CEE was held by equity capital, with percentages above 80%. The share of FDI in the form of equity in CEE has been decreasing in the second decade of transition, having values between 45 and 60% of total FDI. In the 90s, in the first years of transition, most of the FDI inflows were related to privatization. As already mentioned above they were achieved as equities. The coming to the end of privatizations in the

main host countries: Hungary, Poland, Czech Republic and Slovakia led to a reduction in this type of investment in the following years. For example in 2000, when the largest acquisition and privatization of the region was made in Poland and was represented by the acquiring of Telekomunikacja Polska by France Telecom (UNCTAD, 2001), the equity share in total FDI of Poland was 94%. The same is noticed in 2002 in the Czech Republic and Slovakia, where high values of FDI due to privatization have led to 74% and 98% of total FDI to be realized as equities. In 2003, when FDI returned to "normal values" for the two countries, equities fell sharply, in the Czech Republic having even negative values.

During the boom in FDI, equity level was relatively stable, even if their share in total FDI was declining. Basically, the increases registered by the region in terms of FDI inflows is due to other forms of capital: reinvested earnings and inter-company loans (see figure 1).

Foreign direct investments affect directly the balance of payments. The inflows produce a unidirectional effect and then there is a "funding out" through the repatriation of profits, the interest payments or the return of the loans received. Reinvested profits are not found among the initial forms of investment (Hunya, 2004). These take place only after the foreign subsidiaries became profitable, meaning, after passing a few years from the investment.

Profits of foreign affiliates in host countries lead to different choices: the company either pays dividends to the mother company or reinvests in the host country. Until 2000, the share of profits reinvested in the region amounted to about 10%. During this time the largest share of reinvested profits was held in Hungary, with 35% of total investments. This is explained by the fact that Hungary was first to complete privatization and received large sums of foreign direct investment since the beginning of transition, those investments showing in this period "its fruits". Since 2003, the share of profits reinvested in the region reaches 30%, with different percentages at individual level. Basically, during the boom of FDI 2003-2007, the corporate profits increased and a good proportion is reinvested in the host countries. Strategies, generally involve

transnational companies receiving dividends from subsidiaries always, while reinvested earnings fluctuate depending on the income of foreign subsidiaries (WB, 2004) Usually, when mother companies have financial problems there could be an increase of repatriation of profits (Hunya, 2004).

In 2008, with the outbreak of the crisis, the value of reinvested profits accounted for only 8% which means that either the share of repatriated profits increased significantly, or the profitability of foreign affiliates was extremely low.

Figure1- FDI by form in CEE

Source: created by author (wiiw database)

Lundan (2006) identifies five factors that determine the reinvestment of profits in the host country:

- investment opportunities which are considered the most important factor in determining the investment decision and are determined by the growth rate of host country or the growth differential between the two countries: home and host (if the best investment conditions are found in the host country, profit can be reinvested here, otherwise the repatriation of profits and investment to the country of origin or third countries may be more viable options)
- the profitability of foreign subsidiaries, a factor which is determined by the characteristics of the firms, (such as productivity) and high profitability encourages new investments. An important element in determining profitability are transfer pricing, that may influence investment decisions of the company.

Internalization and conducting of research and development activities involve the use of current transfer prices between different branches of transnational companies and the impact on company profitability can be significant.

- exchange rate: exchange rate depreciation may lead to the reinvestment of profits, because his return would be inappropriate at this time. On the other hand, as we talk about long-term investment, currency depreciation may influence the time the return is taking place and not the "quantity" to be distributed as dividends. (Dunning, 1993 in Laudan, 2006)

- corporate governance: companies that are interested in short-term financial gain lead to repatriation of profits, while the option of reinvesting is a feature in a coordinated market system and not in a liberal one.

- Tax on foreign subsidiary income: income tax system has a great influence on the repatriation or reinvestment and in determining the form of the repatriation: dividends, interest or royalties. On the other hand, the host country taxes can influence both achievement of foreign direct investment and their level. Companies seek to reduce costs of taxes on profits and reinvest trying to benefit from the deferral option. (WB, 2004) Dividends are those kind of capital transfers that are state-controlled, especially by currency convertibility (WB, 2004)

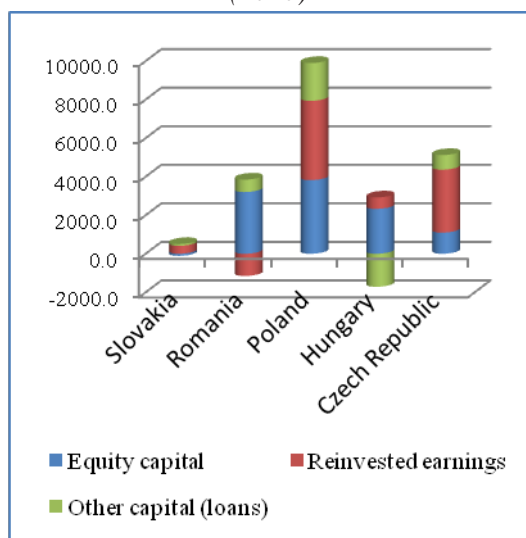

Laudan's research (2006) suggests that subsidiaries of European companies, unlike the U.S. ones, use profits for new investments only in a certain period of time, then they are repatriated.

Other capital form: the existence of restrictions on capital, may encourage loans to equity. (Extractive industry is the best example, as being a key industry, host countries try to limit foreign capital) (WB, 2004). In general, inter-company loans are extremely volatile. Companies can add capital to the subsidiary, but also this can be removed easily. (Hunya, 2004). As seen in figure 1, the share of inter-company loans increased sharply after 2005 in the CEE, during boom of FDI. But high levels in one year may be followed by massive withdrawals next year. This is seen in 2008-2009, when once the crisis hit, lending weight decreased significantly from

39% to 25% of total FDI, in 2010 represented only 2%.

At individual level we can see a different composition of the three forms of FDI (see Figure 2). Poland recorded a steady decrease in equity from 99% in 2003 to only 23% in 2010, while reinvested profits presents fluctuations between -7% and 48%, having in 2010 a share of 70% of total FDI. The composition recorded in 2010 by Poland, is also found in the case the Czech Republic or Slovakia. For the Czech Republic, 2010 is both a revival of the total flows, and of the levels of reinvested profits. These features are found in mature countries, where FDI are considered less risky for investors, in normal economic conditions. (Hunya, 2011)

Figure 2 - FDI by form in selected countries (2010)

Source: created by author (wiiw database)

Slovakia and Slovenia in 2009 recorded negative values of FDI received as a result of massive withdrawal of intercompany loans, but in 2010 managed to return to a positive trend due to increased of reinvested profits. After reaching in 2009 a record of reinvested profits Hungary accounts in 2010 a sharply decrease, these values reaching to be negative.

If Poland and the Czech Republic attracted FDI in the form of loans and reinvested profits, reflecting favorable investment conditions, Hungary and Romania have been preferred for new investment, an effect that is observed by the high share of equity capital. (Hunya, 2011).

4. Conclusions

Equity capital are characterized by being a stable form of capital and investors are expecting to obtain profit. The decision regarding the reinvesting of profits shows the confidence in the host economy for short term of the foreign investors, along with the capital needs of the parent company. Other forms of capital (inter- company loans) reflect short-term decisions and varies strongly from year to year. (Hunya 2011)

If CEE boom in FDI during 2004-2007 was due to a significant increase of the last two form of capital, they are also the "guilty" part for the FDI decline during the crisis. Although mature states, are characterized by a significant share of profits reinvested, the stability offered by equity capital is preferable, especially for the CEE region.

Abstract

The question one should ponder on is to know how to keep what Monnet proposed and realized in the last 50 years, as current economic and political situations require. The European Union is the laboratory of successful experiences regarding unification. It started from a collaboration between two competing countries and went to today's 27 accessions and perhaps many more in the near future. Jean Monnet himself concluded that from an economic union, states will want to switch to a political union. History has proved that the union of peoples will remain strong just based on common values. The current European Union was a product of a conspiracy of the elite, with good intentions and remarkable results.

Keywords: Freedom, community law, european union

J.E.L. Classification: K 32

1. Introduction

During this study we tried to emphasize issues related to free movement of goods, persons, services and capital and that led to these conclusions:

- The studying of the evolution, of the concepts, of the Community institutions in the context of globalization is most present, it results from the socio-political situation of today, it does not need be directly proven, it is notorious.
- Schengen area should not be confused with the European Union and the reasons as we are to find out in the study.
- Public opinion believes that although Romania was integrated on 1 January 2007 it still has a long way ahead to adhere de facto to the principles of

community, according to a study conducted in due.

2. Content

The evolution of the European Union today is interesting, but more interesting to know is what freedom of movement of goods, persons, services and capital really mean. The growth registered in the EU concerns regarding finding the most effective approaches in both the legislative and social, practical problems faced by European citizens is remarkable. News of the chosen subject lies not only in the fact that it evokes the title of the first four chapters of the *acquis communautaire*, but also in the fact that free movement issue is on the agenda of European officials.

The importance of free movement within the European Union is still a natural given, established in rules, but to maintain this right one must fight. Violation of the meaning of EU legislation means restricting the free movement proportional to the infringed rule.

The phenomenon is of pressing current and the resulting conclusion is that the existing legal and institutional will be in a continuous improvement.

The situation of migrants, the unemployed, asylum seekers, students, employees and employers in general and in particular, has not remained unanswered, on the contrary, the analysis is supported by practical support Diversification of social services favours competition, it is how we analyzed the relationship between free movement of services with free movement of capital. It is also interesting to study the free movement of criminals correlated with the attitude of the authorities to prevent and combat criminal behaviors.

The study would not be complete without a qualified approach in the field, that is why we consulted official documents, opinions of experts drawn from conferences, debates on

European issues. The research is based on case study findings, designed to draw attention to public perception about the current situation of Romania in the European context of globalization.

Although we can travel anywhere in the Community, we can not travel freely. Airport rules are required in order to ensure citizen safety against terrorism and other criminogenic factors.

We know that Romania liberalized access to foreign citizens, but we don't know what countries impose travel restrictions, why and until when. Writing about Europe and European Union from its origins to the present, about the viability of institutions that handle all the strings of an international theater is a distraction that requires information, inspiration, analysis and objectivity. The research covers different historical places, so we made a retrospective and current insight. We invite the reader into a success story where the height is given by the free circulation within the Union and the outcome is open, allowing the shaping of their opinions.

3. Conclusions

The conclusions we stopped at are but a few, as the topic causes new debates and thinking subjects, so I will conclude asking the following questions:

Where can we travel? What papers do we need when crossing the border? What services may we provide inside the EU? Are we allowed to start a company in the EU?

We hope that this study brings a modest contribution to the dissemination of community law among those interested in this important area. Given the contents recorded in the study and the findings above, these recommendations are required *de lege ferenda*: to clarify the meaning of the concepts of freedom of movement not only through rules but also by implementing it the mind of citizens, to develop a strategy of bringing to the attention of the EU citizens of their rights and freedoms in a more practical and easy manner such as information through the media.

It is true that the treaties, conventions and many other regulations provide legal freedoms to citizens of Europe but many people do not know how to apply them. It is

a wide range of people who either do not have access to the media or are disinterested.

I propose that the *theme of free movement of goods, persons, services and capital* be no longer on the table of officials, but be carefully debated by citizens.

And this will happen when the *kings* of today will facilitate access to information to deprived areas, where in fact the situation is worrisome. Lack of information on the other hand leads to criminal To inform the public on free movement in particular is not only sufficient but also necessary in a democratic society. Do you want to know the European Union? It is an open invitation to all who wish to move freely in the European spirit. That is why, at least for these benefits, we should thank the founders of the yesterday Europe for the Europe today.

Some Critical Aspects on Monetary Maastricht Convergence Criteria

Bucur Iulia Andreea

Stângaciu Oana Anuța

„Vasile Alecsandri” University of Bacău, Faculty of Economics

anca_stangaciu@yahoo.com

Abstract

So far, we can say that although the euro area has resisted even more than some of its critics believed, this does not make it invulnerable. In the context of current major macroeconomic imbalances, nominal convergence problem has received many analyzes and reflections. Insufficiency of the Maastricht criteria to reflect the ability of European Union Member States in achieving the economic development required by the EMU integration and also in compliance with strict fiscal and monetary policy governing its operation, is the primary consideration of the intention to highlight some of their critical aspects.

Key words: nominal convergence criteria, price stability, inflation rate, long term interest rate, exchange rate

J.E.L. Classification: E31, E43, F15

1. Introduction

While the exchange rate criterion and fiscal criteria (government deficit and gross debt) require a fixed reference value, the inflation and long-term interest rate reference values are defined in relation to the average of the three best-performing EU Member States in terms of price stability.

A notable feature of the last two aforementioned criteria is related to the change above their reference value in the context of EU enlargement. Accession of a new Member State may reduce the reference value (if it has a sufficiently low inflation rate in the reference group), but never

increase it. EU enlargement from 15 to 27 Member States has led, on average, to a lower reference value. The importance of this effect was emphasized in May 2006, when two states outside the euro area, Sweden and Poland, were included in the reference group for reference value calculation, below which Lithuania amounted to 0.1 percentage points [6]. If the reference group was limited to the 15 states of EU or EMU members, Lithuania would be located within the reference value.

2. HICP inflation – a real challenge for the New Member States of the European Union

Meeting the inflation criterion is a real challenge for new EU countries from Central and Eastern Europe for the following reasons: on one hand, price convergence exerts pressure on inflation, especially in countries with fixed parity against the euro [1], and on the other hand secondly, the EU enlargement process gradually reduced inflation criterion reference value. A lower benchmark assumes that its fulfillment by the EU Member States to become increasingly more difficult.

Using available data on annual inflation rate in the 27 EU Member States we intend to realize, taking into account the last two waves of enlargement, a comparative analysis of the evolution of inflation during three time periods: 1999-2011, 2004-2011 and 2007-2011.

In this respect, we determine the average annual inflation rates (measured by HICP) and the dispersion of inflation to the average value for each Member State in each calculation period.

Tabel 1. Statistical calculations on the HICP inflation rate in EU-27 during 1999 and 2011 (%)

	1999-2011		2004-2011		2007-2011

EU-15 average	2.23	1.03	2.17	1.08	2.19	1.29
EU-10+2 average	5.17	3.61	4.17	2.24	4.16	2.53
EU-27 average	3.54	2.18	3.06	1.60	3.07	1.84

Source: Own calculations, based on data available on Eurostat

Firstly, these results show that the average HICP inflation rate in the 27 EU Member States is relatively stable over time. Also, average inflation in the EU-10+2, except Romania, has a certain relative stability during analyzed periods.

Secondly, average inflation in the EU-15 is below EU-10+2 average and also the EU-

15 average inflation is lower than EU-27 average, difference that diminishes over time due mainly to the reducing of the inflation rate in Romania.

Thirdly, dispersion of inflation rates in the EU-10+2 is higher than in the EU-15 and also standard deviation in the EU-27 is higher than in EU-15.

Figure 1. Average of HICP inflation rate in EU-27, EU-15 and EU-10+2, 1999-2011

Source: Own calculations, based on data available on Eurostat

EU enlargement has brought countries with high levels of inflation, but with greater variability, which allows us to appreciate the

low possibility that a new Member State is one of the three best-performing countries in terms of price stability.

Table 2. Average of HICP inflation rate in the best-performing EU-15 and EU-27 Member States in terms of price stability during 1999 and 2011 (%)

	Average inflation rate in the best-performing EU-15 countries (%)	Average inflation rate in the best-performing EU-27 countries (%)	Average inflation rate difference between the EU-27 and EU-15 (%)

The impact of EU enlargement in terms of inflation rate criterion can be expressed, on one hand, by substantial changes in average inflation rates of the three best-performing countries, in the EU-15 and EU-27, between 0.0% and 2.6%, so that setting a fixed reference value would be appropriate. Triandafil (2011) believes that it would be appropriate to establish the reference value for the inflation rate criterion as a specific range of variation for the, mainly envisaging mainly extending the corridor by about 3 percentage points, except the case when inflation spikes could occur, which would cause the exceedance of the reference [5].

Moreover, Jonas (2006) emphasizes that the existence of a unique benchmark for EU-27 is not appropriate and considers to be more relevant the establishment of two reference values, depending on the stage of the business cycle, a benchmark for countries experiencing an overheating of the economy and another benchmark for other countries

passing through the descending phase of the economic cycle [2].

On the other hand, the difference between average inflation rates of the three best-performing Member States in the EU-27 and EU-15 in terms of price stability varies significantly during 1999 and 2011, between -0.6% and 0.0%.

Graphical representation of the results shows that average inflation rate in the EU-27 is lower than in the EU-15 or at most its maximum level. This situation confirms the previous statement, that the probability that a New Member State, especially from the EU-10+2, to be one of the three best-performing countries in terms of inflation is lower. Average values for EU-15 and EU-27 are identical in 1999, 2004-2006, 2008-2009 and 2011, and the negative values of the difference indicate us an unfavorable aspect on inflationary phenomenon in the context of EU enlargement.

Figure 2. Average inflation rate in the best-performing EU-15 and EU-27 Member States in terms of price stability, 1999-2011 (%)

Note: Member States with negative inflation were excluded from analysis.

Source: Own calculations, based on data available on Eurostat

Countries in the last wave of enlargement, Bulgaria and Romania, have a notable change in the inflation rate and also a high average. Therefore, it is obvious that none of these two countries has been found in the three best-performing countries group during 1999 and 2011.

A quantitative more complex estimate of the EU enlargement impact on inflation rate reference value is made by Lewis and Staehr (2007) using Monte Carlo simulations. Experiments undertaken in their study showed that in EU-27 instead of EU-15 the reference value for price stability criterion was significantly lower during 1999 and 2004 and since mid 2006. Monte Carlo simulations indicated that the expected reference value decreased by 0.15-0.2 percentage points due to EU enlargement from 15 to 27 countries, with the likelihood of significant reductions [4].

Another feature on monetary convergence criteria related to the stringency of control over inflation, which typically involves an increase in interest rates and an appreciating exchange rate, thereby causing a violation of the nominal convergence criteria, while interest rate creates long-term inflationary pressures. Lewis (2007) highlights some natural tension between nominal convergence process and simultaneous fulfillment of exchange rate criterion and the inflation rate. Authorities can use monetary policy to meet one of the target-criteria either inflation or

exchange rate so that later will subsequently “hope” to fulfill another criterion [3].

3. Long-term interest rate in the enlarged European Union

Meeting long-term interest rates criterion in the frame of EU enlargement also raises challenges for the New Member States.

An issue for long-term interest rate criterion is using long-term government securities or other comparable securities since there are no bonds with maturity close to 10 years in all Member States. Therefore, different securities with various maturities are compared, which implies a high degree of flow.

Also, in the absence of a mature bonds market denominated in Estonian crowns and reflecting low public debt, harmonized long-term interest rates for Estonia are not available, making it difficult to assess the sustainability of convergence process prior to the moment of entry into EMU.

Given the available data on long-term interest rates in the EU-27 and taking in consideration the last two waves of enlargement, we analyze in a comparative manner the evolution of the indicator during the same three time periods: 1999-2011, 2004-2011, 2007-2011, by setting the average of long-term interest rates and the dispersion to the average value for each Member State in each calculation period.

Table 3. Statistical calculation on long-term interest rate in EU-27 during 1999 and 2011 (%)

	1999-2011		2004-2011		2007-2011

EU-15 average	4.44	1.00	4.15	1.01	4.37	1.14
EU-10+2 average	5.82	1.31	5.58	1.11	5.89	1.12
EU-27 average	5.03	1.13	4.75	1.05	5.01	1.13

Note: : – data not available

Source: Own calculations, based on data available on Eurostat

Our results firstly indicate a relatively stable average of long-term interest rates over time for all Member States and in the EU-27, EU-15 and EU-10+2, in the context of a downward trend. Also, the average of long-term interest rates in the EU-15 is below the average in EU-10+2, difference that reduced slightly over time. Secondly, the dispersion

of long-term interest rates appears relatively stable with a slight decreasing trend during the three periods of calculation. Deviation from the average value is higher in EU-10+2 than the EU-15 and also in EU-27 standard deviation is stronger than in EU-15, with a downward tendency for all groups.

Figure 3. Average of long-term interest rates in EU-27, EU-15 and EU-10+2, 1999-2011 (%)

Source: Own calculations, based on data available on Eurostat

Limiting the interest rates corresponding to long-term securities involves a high opportunity cost by sacrificing the opportunities to valorize the short-term interest differentials [5], reason for which we

aim to identify taking into account short-term interest rates the potential Member States on their way to EMU to fulfill a high degree of convergence.

Table 4. Short-term interest rate (one month) in EU-27 and EA during 1999 and 2011 (%)

Source: Eurostat

Except for Hungary, Poland and Romania, whose annual short-term interest rate levels are more distant from the EU-27 average and the Euro Area, all other Member States

indicate a high degree of convergence, the size indicator tends to average level so that the potential for interest rate harmonization can increase by taking into account short-

term indicator, unlike the classic indicator of nominal convergence.

4. Exchange rate stability criterion

In order to achieve the exchange rate stability criterion, as a consequence of sustainability of monetary and also fiscal indicators, it is necessary the correlation with the other indicators. However, an excessive tendency to stabilize the exchange rate may result in removal of the economy from the natural steady-state, jeopardizing its self-regulating capacity. Also, a reduction in inflation leads to an increase in real interest rates which determine the attraction of foreign capital in the context of currency appreciation, but with negative effects on net exports.

Possible adjustments [5] to the exchange rate criterion could be an increased flexibility, by maintaining the system of managed floating and coexistence of trend appreciation in real terms with the variability of quotations on short term. Thus, it provides a high degree of independence of monetary policy, with increased effectiveness in controlling inflation phenomenon. Also the managed float exchange rate regime is consistent with choosing the nominal anchor, which allows a flexible response to unforeseen external and domestic shocks that may occur.

Reducing the gap between the economy of financial flows and real economy indicates that the state has the ability to achieve real convergence criteria, so that cost-benefit ratio should favor the euro adoption.

5. Conclusions

Consequently, due to current financial crisis, euro area countries experience different problematic situations generated by a brisk increase in the share of government deficit and public debt in GDP and by the economic downturn that *limited character of the nominal convergence monetary criteria*.

Also, Member States wishing to join the Euro Area should be aware of the importance of dynamic criteria, not just their level during the evaluation.

Faculty of Economics and Businesses Management, University „Al. I. Cuza” from Iași, Romania

maria_lia24@yahoo.com

Abstract

Active ageing policies, together with health-related technological advances and improving living conditions have led to increased life expectancy for the EU's elderly population.

Furthermore, there is a great deal of variation in the way that healthcare services are provided and funded across the Member States.

An ageing population is expected to result in additional demands for a range of health and health-related products and services.

With no change in the overall health status of the EU population and without any future reform of social security systems and labour markets to promote healthy and active ageing, demographic developments will likely result in increased pressure on public budgets for health and long-term care.

In the case of Romania, "The 2008-2010 multi-annual national statistics program" includes nothing about healthcare satellite accounts or indicators for ageing population.

Key words: health satellite accounts, healthcare indicators, EU, Romania.

J.E.L. Classification: A10; H50; H51; H53; H75; I1; I13; I18.

1. Introduction

For the EU Member States, EAS is the standard for submitting national accounts data to international bodies. The EAS concepts are focused on describing the economic process in easily observable monetary terms.

On the other hand, for some specific needs

in terms of data, the best solution is to have separate satellite accounts. These needs relate to data requirements for: the analysis of the role the tourism plays in the national economy, the analysis of the cost and financing of the health care, the analysis of the importance of the research and development (R&D) and the human resources for the national economy, the analysis of revenue and expenditure for households taking into account the microeconomic concepts of income and expenditure, the analysis of the interaction between the economy and the environment, the analysis of the production within households, the analysis of the changes in citizens' welfare, the analysis of the differences between the national accounts and the business accounts and their influence on stock and exchange markets, the estimation of tax revenues. Besides, there has been recently introduced the satellite account for the social economy. [1]

Article 152 of the Treaty establishing the European Community states that „a high level of human health protection shall be ensured in the definition and implementation of all Community policies and activities”, thus acknowledging that public health is heavily dependent on policies in many other areas, including environment, agriculture, industry, trade, and social and economic policy. [2]

The current version of the EU health strategy [3] presents three strategic themes intended to meet the major challenges facing health in the EU. The first theme focuses on the promotion of healthy lifestyles to improve healthy ageing. The second, concerned with the protection from health threats, is an explicit objective in the

Sustainable Development Strategy (EU SDS) and covers related subjects such as food security and environmental pollution. The third looks at the sustainability of health systems and the role of technological development in improving their efficiency.

Active ageing policies, together with health-related technological advances and improving living conditions have led to increased life expectancy for the EU's elderly population.

There is no doubt that poor health is perceived as a key driver of early retirement. As such, maintaining the autonomy and independence of the elderly generations has become a goal for some policymakers, as better health has the potential to: improve the well-being of individuals; extend their working lives – providing a stimulus for economic growth; reduce the overall strain on health and social care systems.

The EU supports healthy ageing as part of its health strategy ‘Together for health: a strategic approach for the EU, 2008-13’ and through the open method of coordination on social protection and social inclusion. Healthy ageing is based on a two-fold approach: the promotion of health over the whole of an individual's life, aiming to prevent health problems and disabilities from an early age (promoting a healthy lifestyle through actions that seek to increase levels of physical activity, encourage the adoption of a healthy diet, or reduce individual's dependence on the use of tobacco, alcohol or illicit substances); a commitment to tackle health inequalities that are linked to social, economic and environmental factors.

An ageing population is expected to result in additional demands for a range of health and health-related products and services. For example, as people live longer, a larger number will become very old (aged 80 or over) and therefore it is likely that many will become frail and require more social care services in the form of support at home or in long-term residential centres. This development is likely to be intensified in the future, with a higher proportion of very old persons projected to live alone, reflecting the break-up of family units and a reduction in the willingness/possibility for family members to provide care to their older relatives. With no change in the overall health status of the EU population and

without any future reform of social security systems and labour markets to promote healthy and active ageing, demographic developments will likely result in increased pressure on public budgets for health and long-term care. [4]

2. Healthcare satellite accounts and indicators in EU statistics

Health is an important priority for Europeans, who expect to be protected against illness and disease at home, in the workplace and when travelling. Health issues cut across a range of topics-including consumer safety, health and safety at the workplace, environmental and social policies. [5]

Information about healthcare systems and, ultimately, about the health of a population is a prerequisite for monitoring the performance of health policy. The regional indicators currently available for health provide an insight into similarities, particularities and contrasts across regions in Europe. There can be big differences between regions in the same country, while regions in different countries may be very similar. Thorough analysis of trends and variations in health indicators at regional level is therefore indispensable for planning and monitoring action and programmes, formulating new policies, developing new strategies and, all in all, contributing to ‘evidence-based health policy’. Eurostat's work on health statistics is focusing mainly on further improvements in the quality, comparability and completeness of the data and further extension of the regional coverage. [6]

Eurostat statistics is including in „Population and social conditions” chapter some health indicators for public health. [7]

Public health is providing as structural indicators: healthy life years in absolute value at birth-females; healthy life years at birth in percentage of the total life expectancy-females; life expectancy in absolute value at birth-females; healthy life years in absolute value at birth-males; healthy life years at birth in percentage of the total life expectancy-males; life expectancy in absolute value at birth-males; healthy life years in absolute value at 65-females; healthy life years at 65 in percentage of the total life expectancy-females; life expectancy in

absolute value at 65-females; healthy life years in absolute value at 65-males; healthy life years at 65 in percentage of the total life expectancy-males; life expectancy in absolute value at 65-males.

The above ones are completed by causes of death: causes of death-absolute number (annual data); causes of death-standardised death rate (per 100,000 inhabitants) (annual data); causes of death by region-crude death rate (per 100,000 inhabitants) (annual data); causes of death by region-standardised death rate (per 100,000 inhabitants-3 years average); causes of death by region-crude death rate (per 100,000 inhabitants-3 years average)-females; causes of death by region-crude death rate (per 100,000 inhabitants-3 years average)-males; causes of death by region-crude death rate (per 100,000 inhabitants-3 years average)-total; causes of death by region-absolute number (3 years average)-females; causes of death by region-absolute number (3 years average)-males; causes of death by region-absolute number (3 years average)-total.

Health care expenditure is including as first mention the health care expenditure-summary tables: health care expenditure by provider; health care expenditure by function; health care expenditure by financing agent; health care expenditure on long term care. Expenditure of selected health care functions by providers of health care, expenditure of selected health care functions by financing agents in health care and expenditure of providers of health care by financing agents in health care are provided in millions, in percentage and per inhabitant.

Determinants of health are incorporating: body mass index (BMI) by sex, age and educational level (%); body mass index (BMI) by sex, age and income quintile (%); daily smokers by sex, age and educational level (%); daily smokers by sex, age and income quintile (%); smokers by number of cigarettes by sex, age and educational level (%); alcohol consumption by sex, age and educational level (%); consumption of fruits by sex, age and educational level (%); consumption of vegetables by sex, age and educational level (%); practice of daily physical activity by sex, age and educational level (%).

Health care is including: vaccination

against influenza during the past 12 months by sex, age and educational level (%); breast examination by X-ray by educational level among women 50-69 (%); cervical smear test by educational level among women 20-69 (%); colorectal cancer screening test by sex, age and educational level among people aged 50-74 (%); consultation of a medical professional during the last 4 weeks by sex, age and educational level (%); consultation of a psychologist during the last year by sex, age and educational level (%); use of medicines during the past 2 weeks by sex, age and educational level (%).

3. Healthcare satellite accounts and indicators for ageing populations in EU statistics

The prevalence of physical health problems is higher among older people. Many of the illnesses that cause poor health (and in some cases death) are preventable, for example, cardiovascular disease or type II diabetes. Many of the conditions leading to death are the outcome of risk factors accumulated over a lifetime.

Even in old age it is possible for individuals to achieve health gains-for example, through taking up a physical activity. The share of the population aged 55 to 64 that undertook exercise on a regular basis was often slightly higher than the average for the whole of the population aged 15 or more. However, from the age of 65 onwards, there was a marked reduction in the share of the population undertaking regular physical activity.

Although life expectancy is increasing and most Europeans may realistically hope to live longer than previous generations, it is perhaps more important from an active ageing perspective and from the perspective of most individuals to consider the years of retirement that can be experienced in good health.

The consumption of various medical goods and services is expected to rise as the EU's population ages in the coming decades. Whether this is financed privately or from the public purse, the expanding number of older persons in the population may have significant consequences on the number of healthcare professionals that are required to care for the elderly - and this during a period

when the overall size of the EU’s workforce is expected to contract.

One measure of the supply of healthcare services is the number of practising physicians or doctors per 100 000 inhabitants, which generally ranged from 270 to 380 in the majority of the Member States. Information on the number of nursing and caring professionals per 100 000 inhabitants is available for a smaller number of countries, with a much wider variation in staff numbers.

Out-patient healthcare services may be analysed from the demand side through the use of an indicator on the proportion of the population that had consulted a general practitioner (GP) or medical specialist. A higher proportion of the older population tended to visit a doctor more frequently, with almost half (48.2 %) of the population aged 65 or above having visited a doctor at least six times in 2009.

The number of hospital discharges per 100 000 inhabitants is a commonly used measure for the utilisation of hospital services, reflecting the demand for in-patient care and services. Discharge statistics do not provide a measure of the success of an intervention or cure, as discharges may result from treatment being finalised, but also when a patient signs out against medical advice, if a patient is transferred to another institution, or if a patient dies.

Furthermore, there is a great deal of variation in the way that healthcare services are provided and funded across the Member States. As such, while it may be commonplace to treat a particular illness as an in-patient in a general hospital in one country, such a procedure might be provided through a specialised out-patient facility in another. The number of in-patient hospital discharges generally rises as a function of age in most countries, to such a degree that by the age of 95 there are some countries where on average each person visits hospital more than once a year.

Healthcare spending is linked to technological progress, as new methods of diagnosis and treatment impact on expenditure, in some cases introducing cheaper, simpler, quicker, more effective, less invasive techniques, in others introducing new technologies with a very high capital expenditure. Expenditure on

healthcare needs to be considered in the context of long-term savings that may be associated with a healthier population. Healthcare expenditure (current and capital spending) ranged from 5.7 % of GDP in Romania to 12.0 % of GDP in the Netherlands in 2009. Care for the elderly - based on information relating to social protection expenditure devoted to old age care (which includes expenditure to cover care allowances, accommodation and assistance in carrying out daily tasks) – accounted for 0.4 % of GDP in the EU-27 in 2008, peaking at 2.3 % in Sweden; the only other Member States where care for the elderly accounted for at least 1 % of GDP were Denmark and Austria.

Care for the frail and old is often provided on an informal basis - by spouses, relatives or friends. However, changes in family structures, higher labour force participation (especially among women), and increased geographical mobility, may reduce the provision of informal care in the coming years. As such, the ageing population may require additional formal care provisions and providers of these services. Increasing care facilities for the old within the community and making greater use of information technologies may encourage older people to remain within their established community.

Healthcare expenditure can also be analysed according to purpose - for example, health promotion activities, curing illnesses, or long-term care.

The final section presents the results of a survey conducted in March 2009 concerning intergenerational solidarity and more specifically opinions relating to the provision of pensions and care for the elderly. Some 58.5 % of people aged 15 or more in the EU-27 agreed that governments would no longer be able to pay for pensions and care for the elderly in the coming decades. Despite this, 83.6 % of those surveyed agreed that governments should provide much more money for pensions and care for the elderly; it is interesting to note that the highest proportion in agreement with this proposition was recorded among those close to retirement (persons aged 55 to 64 years, 86.0 %). The same survey indicates that just over one third (34.3 %) of the EU-27 population aged 15 or more agreed that there were sufficient social services to support frail older people so that

they could stay in their own home; it is interesting to note that the age group that had the highest proportion agreeing that there were sufficient social services for this purpose was those aged 65 or more. A far higher percentage (84.5 %) agreed that frail, elderly people could not live autonomously because their homes were not adapted to their needs.

A survey conducted in September and October 2011 provides details of how Europeans think governments should help people care for older family members. Of the solutions proposed, the highest proportion (44 %) of persons aged 15 and over thought that providing some form of financial remuneration to those providing care would be the most useful thing that governments could do. [4]

4. Conclusions

For Romania, "The 2008-2010 multi-annual national statistics program" includes some extremely shy actions on health satellite accounts for 2008 (implementation of data collection on health expenditure, harmonized with OECD methodology and with the most recent methodological recommendations of EUROSTAT), yearly (for the collection of health expenditure of the three areas: funding sources, health functions and services, health service providers; an additional field is the collection of expenditure on health human resources in the standardized format), for 2009 (review the national methodology of the System of Health Accounts, following the preparation and publication of the second edition of the OECD-EUROSTAT-WHO methodology) and for 2010 (dissemination of statistics on health expenditure).

There's nothing about healthcare indicators or satellite accounts for ageing population in Romania.

Abstract

The history of the European monetary integration process reveals the fragile foundation for constructing such a union in terms of economic and political vulnerabilities, which have accumulated over time. In this paper, we mention some of the problems concerning the governance in the euro area, based on the principles underlying its performance, to highlight the risks that enhance the split euro area.

Reconsidering the European integration as a political project, with huge responsibilities arising from this, represent a solution to maintain the euro area on a sustainable path, at least in the medium term.

Keywords: Eurozone, governance, single monetary policy, budgetary deficit, public debt.

JEL Classification: E61, F36.

1. Introduction

The principles underlying the functioning of the euro area are included in two European treaties – one is the Maastricht Treaty, whereby the countries entering into the third stage of economic and monetary union (i.e. adopting the common currency, the euro) is conditioned by the achieving a *sustainable* nominal convergence in the candidate countries, and the Amsterdam Treaty, which established "The Stability and Growth Pact", represented by a set of detailed rules and procedures to ensure budgetary discipline of the euro area countries.

During negotiations on the Maastricht Treaty, Germany, the main catalyst of European integration, insisted on the establishment of rules - as conditions for

joining the euro area, in return for giving up their own currency. These rules have resulted in:

- assurance of the European Central Bank independence, meaning its separation from the political pressure;
- establishing a low inflation target (2%);
- designing budgetary rules, which were originally part of the whole set of nominal convergence criteria for the euro, and afterwards were included in "The Stability and Growth Pact".

In the economic literature, the terms *governance* and *good governance* received a special attention in the last years. Very often, *bad governance* is percept as a reason for all problems in the modern society. Furthermore, the lending decisions of the international financial institutions are increasingly based on conditions that ensure good governance practices. Nevertheless, it is worth to mention that even the *good governance* become imperative, it is an ideal difficult to achieve it, entirely.

The economic governance has been progressively put in place in the European Union and it is a system that has distinctive characteristics. According to Begg (2008) these can partly be explained by the manner in which integration has evolved, partly by reference to the experience gained as the European Union has evolved from the customs union to European Monetary Union, partly by the manner in which ideas about economic policy-making have changed, and partly by how policy actors have *learned-by doing*. From their perspective, six facets of governance can be distinguished in a framework for appraising the system as a whole [1].

In order to sew up the functioning of Monetary Union, the undertaken policies

should consider both, the national and the area level. After the last events, appeared the recognized need to reinforce the economic governance within the euro area.

2. The Ground Rules for Eurozone Performance

The euro area is characterized by a high level of monetary authority, represented by the European Central Bank, and by the lack of fiscal authorities. In such conditions, there is no coordination between fiscal and monetary policies, the monetary authority being still more important, by the fact that the interest rates are set and modified to compensate for the lack of a common fiscal policy. The independence of the European Central Bank and of the national central banks largely limits a possible coordination between macroeconomic policies in the euro area.

However, there is a coordination of the national fiscal policies through The Stability and Growth Pact, which makes up for the lack of a single tax policy in the euro area and through the meeting of the Economics and Finance Ministers of the Member States (Ecofin Council). Such coordination concerns however the budgets' "control" in order to obtain an average balance or a surplus, and not to manage the problems of inflation and unemployment in the monetary area through coordinated corrective measures of these indicators. National budgetary policies should support the stability-oriented monetary policy.

The single monetary policy, attributed to the European Central Bank, as a supranational authority, has a complex framework of objectives, instruments and procedures for decisions making. According to the Maastricht Treaty, the primary objective of the single monetary policy is the price stability in the euro area. Governing Council should support the economic growth and the employment, without affecting its primary objective, as outlined in the second paragraph of the Maastricht Treaty. In reality, it is reinterpreted in a general way, that monetary policy's objective of maintaining price stability contributes to the meeting of the community's objective [4].

However, the European Central Bank has no specific features of a genuine central

bank. For example, the European Central Bank may not issue banknotes denominated in euro (as shown in its balance sheet), but they are issued by a national central bank, and some of these bills are "statistically allocated" to the European Central Bank. The European Central Bank does not have public or private debt instruments to the active side, which could be used for open market interventions, and cannot act in the position of a lender of last resort for commercial banks. Moreover, the monetary policy is the responsibility of the Governing Council and is implemented by national central banks, and not by the European Central Bank.

3. The Discipline of the Member States

Analysing the Member States' discipline regarding the principles of the two European treaties, it is noted that they were not protected as much by the German Government. Although the requirements set by Germany on monetary policy have been met, considering that in this way, the euro area and thereby the euro become credible on financial markets, fiscal and budgetary criteria were often violated.

In terms of monetary policy, Germany has remained intransigent on the status of the European Central bank and on inflation target. It always refused to Heads of Government to put pressure on European Central Bank. It refused to define a common exchange rate policy, although the Governing Council may do so in the treaties. From this point of view, the German influence was felt in the European Central Bank, as the Bundesbank's governor has always defended the established policy – a policy designed for inflation targeting and to strengthen the credibility of monetary policy in Europe. Indeed, the European Central Bank inflation target was systematically performed in the euro area during 1998-2007.

When, in 2008, the recorded inflation exceeded the annual target of 2% due to the rising of raw material prices, the European Central Bank reacted by increasing interest rates, arguing that, so would avoid a wage-price spiral. However this decision was in some sense "unfortunate" because the effects began to manifest financial shock. In May 2010, the European Central Bank's decision to purchase Treasury bills on secondary

market in certain Member States who were in difficult positions was controversial both in Germany and within the European Central Bank [2].

Regarding the budgetary rules, the Germany’s vigilance was much weaker. It was accepted a political compromise that allowed countries that were not fulfilling the Maastricht convergence criteria, to join the euro area, as statistics show. Thus, according to Eurostat, Italy and Belgium had, in 1999, a national debt of over 110% of GDP, while when Greece was admitted to the Eurozone in 2001, had a debt of 103,7% of GDP. After the first phase, the public debt criterion began to be breached by more and more countries, including France and Germany after 2002 (see Figure 1).

Figure 1. Frequency of exceeding the reference level of public debt criterion in 1999-2008 (%)

Source: Eurostat Data, authors’ calculations

Regarding the budget deficit, as Figure 2 suggests, countries have often exceeded the reference value of 3% (Greece, Italy, France, Germany, Netherlands, Austria, and Portugal).

Figure 2. Frequency of exceeding the reference level of budget deficit criterion in 1999-2008 (%)

Source: Eurostat Data, authors’ calculations

Repeated failure to comply with the set

criteria show that often, other governments have ceased the pressure to achieve budget adjustments for fear of being fined themselves when they face such problems.

The limits’ overcoming was tacitly accepted. Germany has registered, according to Eurostat, exceedings of the budget deficit in 2002-2005, which required the revision of the Stability and Growth Pact in March 2005, contrary to the Bundesbank’s behaviour. It should be noted that after this episode, the German budget deficit come back below the reference.

Conditions induced by the current crisis faced by Eurozone are a test about the sustainability of monetary integration in Europe based on the relationships between the main drivers of the euro area economy, France and Germany.

Political crisis is manifested not only through raised tensions between the two countries, but also through tough reactions from other euro area countries, reactions to the policy of the large European countries. Such a situation calls into question the development of a European political community that should extend beyond the institutional framework.

Fiscal policy coordination, by the Eurogroup, has become more difficult as further austerity measures, taken individually by each member country, are far from having had a common denominator. In these circumstances, we actually are witnessing a trial, at least temporarily, of divergence between the tax policies of European Union countries [3].

There is, however, a formal compromise, especially in the euro area countries, whereby the European Commission gained skills for national budgets analysis, before being submitted for approval by the national parliaments, a process that could be defined as a verification of their constitutionality from the current Stability and Growth Pact or from an improved Stability and Growth Pact.

The measure practically exceeds the formal commitment made by Member States through the Treaty, which rather induces the perception of distrust in the government behaviour "tormented" by austerity measures, than understanding of an assistance form from the European Commission, in a critical period for the European Union. The disagreements between France and Germany

merely highlight that the problem of economic policy coordination within the European Union and the euro area remains a delicate one on long term, despite the prepared consensus of G-20 meetings.

The "Europe 2020" declarative urges to speed up the fiscal sustainability and the fiscal consolidation plans, taking into account the risks. It should be stressed however that it insists on the need to observe the potential GDP as a benchmark indicator for sound economic policies, and that the increasing of the growth potential will be made in conjunction with the long-term fiscal consolidation.

4. Financial Evolutions

According to the recent analysis, in 2011 the euro area financial system was affected by the increased market sovereign debt crisis, manifested in the overall trend of decline in the European financial integration process [5]. Internal affairs of member countries weaken the motivation for monetary integration.

No doubt that poor governance of the euro area reflects investors' perception about the capacity of countries from the union to manage economic and financial problems within the union, including the existence of sustainable levers by which to support vulnerable countries.

The hesitations regarding the way of financial support, the political divisions between countries and the domestic economic problems deepened tensions in financial markets, pointing out the tendency of differentiation by country of financial options for investors. Thus, the surge in the euro area differences between yields on government bonds was determined mainly by:

- national factors, the differentiated perception of member countries regarding both the sustainable fiscal position and the national economy perspective;
- the phenomenon of overestimation of risk and the growing demand for "safe" assets. Such a phenomenon is specific periods of tension and uncertainty in the market.

The distrust of foreign investors is manifested by the massive selling of

government bonds of those countries having vulnerable position, particularly Italy and Spain, securities that are purchased mainly by the local investors. Such a trend of concentration of financial problems to the country in need weakens the motivation for the financial support coming from other euro area countries, dragging along an increased risk for disintegration of the euro area.

5. Conclusions

Shortcomings in the governance of the euro area, caused and exacerbated by the global financial and economic crisis have brought into attention the current importance of political will behind the single currency project. This political will has remained firm on monetary policy, but clearly weakened regarding the budget balance.

The effects at the country level have become crucial in the evolution of sovereign bond market yields, reflecting differences in the fiscal position and economic outlook for the euro area and an increased aversion to risk among investors, with their portfolio orientation to safe assets, with the role of protecting against risk.

Given the problems of governance in the euro area, with its financial implications, we consider that the split of the European currency area is not any more an impossible event.

There is a predisposition to manifest a chained phenomenon: national economic problems, which are clearly a priority for national authorities, weaken motivation to keep them in the euro area, inducing a distrust sentiment related to the common governance of the union.

The solution to this situation remains the policy – the willpower of the national authorities will solve the current crisis, with a reconsideration of integration based on genuine cooperation and solidarity between countries.

The euro area is a public "product" [2], and this requires responsible governance from the part of decision makers, taking into account the political discipline.

The debate on European governance was intensive and often divergent, emphasizing the need for clarity and simplicity in governance, as the Sapir report (2004) noted: *„the picture that emerges is one of confusion*

and tension – confusion created by the complexity of the system and diversity of the roles performed, tension in the gap between goals and means” [6].

Foreign Direct Investments – Determinant of Economic Growth for the New Member States

Dârzan Mihaela
Romanian – American University
mihaela.darzan@yahoo.com

Abstract

Global economy is strongly influenced by the capital flows between states, impacting on their development

Even if the motivation of international investment is the wish of investors to obtain higher income and profits in the host country than in the origin country, these earnings are positive for both sides, generating benefits for host country also, by: capital and technologies transfer, implementing a performing management, higher productivity and higher wages.

The countries receiving FDI feel, after a longer period, the effects of these capital intakes, through higher GDP and labor productivity.

Key words: globalization, foreign direct investments, exports, transnational companies.

J.E.L. Classification : E22, O11.

1. Introduction

Global economy is strongly influenced by capital flows between countries, impacting on their development. Various aspects of this exchange were the main issue concerning renown economists (A. Smith, D. Ricardo) in the last centuries, but theories regarding capital exports and imports have only been formulated in the last decade, this phenomenon becoming viable only after World War Two. David Ricardo's studies show that profit can be obtained from foreign commerce or from relocation the production, or from relocating the production function, on competitive advantage, base on the differences in the cost of opportunity between states.

Adam Smith analyzes the issue of free trade, considering it to be a way in which we can all win, a way to bring well being. In his

work „The wealth of nations” (1776) he issues the theory according to which the wealth of a state is represented by its production and commerce, thus encouraging the idea of exchanging

Foreign capital flows start at the beginning of the 21st century, mostly as portfolio investments and loans. This was determined by the need to finance economic activities. Those times, United Kingdom, but also France, held the largest part of this type of investments, especially made in recession or economic crisis periods.

After World War and the economic crisis of 1929-1933, the top of capital exporting countries change, United States became number one, for exports, and Germany became number one, for imports.

The motivation on international investment is the wish of investors to obtain higher income and profits in the host country than in the origin country. Both exporters and importers of capital benefit from it, the latter receiving the advantage of having a scale economy, of eliminating customs borders by getting closer to the final user, or by the access to resources, which can lead to lower production costs.

2. Transnational corporations, promoter of globalization.

Transnational companies are one of the main engines of the globalization process, involving the entire market in terms of production and capital. This issue is intensely analyzed in specialty literature, in different approaches, sometimes controversial.

Globalization is passing to a system based on networks of interdependence and interconnecting. The motivations of the companies for internationalizing the assets, are getting the highest profit with the lowest costs, and also an increase of rentability.

Countries with low costs for raw material and labor force are preferred.

Transnational companies generate a series of advantages for the host country: capital and technologies transfer, implementing a performing management, higher productivity and higher wages. The higher quality of products adds to the list – therefore higher exports competitiveness and higher production volume.

Transnational corporations lead to the globalization of production, organization competence and systems. This is why they are considered promoters of globalization

In the specialty literature, professor. Noritake Kobayashi's study [1] stands out, which analyzed the model of Japanese corporations starting from 1978. His research led to determining 5 phases for transnational companies development:

1. Export from the origin country
2. Localizing the production in the host country
3. Integrating in the economic activities of the host country
4. Coordinating regional activities.
5. Developing methods and means and methods for organizing and managing global activities.

In N. Kobayashi's opinion, only the companies with the origin country in Europe and North America managed to reach level 5, while the rest only managed to reach the level if integrating in the economic activity of the host country (level 3).

There are also negative effects, such as: transfers to other countries of a part of the transnational companies' assets, or short term reducing the jobs, at the same time, increasing the unemployment. These are the effects of the restructuring of the privatized companies, for increasing the efficiency. On the long run, the increase in competitiveness may generate new jobs, as a consequence of the developments of the upstream and downstream activities. The budget may be negatively influenced. Fiscal facilities, that reduce budget income, are used in order to get investors.

With the restructurings and privatization, new expenses appear, with the unemployment fund. On the long run, this situation can be fixed.

Another disadvantage for the host country is the lack of research and development

activities, which TNC prefer to have in the origin country.

Transnational companies (TNC) play an important role in the globalization process, through the capital, technology, managerial skills transfer to the host country. Even if the specialty literature identifies 5 development levels for these companies, there are mainly 3 directions: increasing the exports, globalizing the production and globalizing the organizational systems.

TNC get to obtain higher added value in the host country, because internationalizing the production leads to lower costs, because of the lower wage level in the FDI receiving country [2]

Liberalizing commerce, capital markets, investments, a lower control of multinational companies brought advantages for the TNC and determined the creation of strategic partnerships, mainly in the automobile, aeronautic and IT industry.

A strong connection between the host country and the TNC is represented by FDI. Starting branches in various countries generated jobs; transfers generate an increase of productivity – decisive contribution to improving the wage level in the host country. Among other benefic aspects we can mention developing and modernizing the means of transportation, as well as improving the training and skills level of the labor force.

3. Foreign direct investments – dynamic tool of TNC in the process of globalization.

“Foreign direct investment is a category of international investments that reflects the goal of an entity residing in a country (direct investor) of getting a lasting interest in a company residing in another country (direct investment)”[3]. In this case, the author identifies the direct investor as the TNC, which, through its branched, invests abroad (FDI).

The goods and services manufactured in the receiving countries do not bear custom fees, this way avoiding the protectionist measures and may keep the market easier than through exports.

FDI had an accelerated worldwide dynamics. If in 1980, their value per capita was 170 USD, in 1990 the grow by 131%, becoming 394 USD per capita. Ten years later they reach 1221 USD per capita and in

2010, 2785 USD/capita, 16 times higher than 30 years ago. [4]

Compared to the FDI, GDP doubled between 1980 and 1995, and in the next 15 years, it grew by approx. 75%, reaching the value of 9178 USD/capita in 2010.

As far as international commerce is concerned, this grew in the last years, reaching the value of 12.4 billion USD (2010) compared to 5.1 billion USD in 1995.

In conclusion, the analysis of the three indicators shows that the FDI intensified, having an yearly growth rate higher than the one of international commerce and real GDP.

The UNCTAD international statistics reports show the interdependence between FDI and globalization. Both integration and globalization favor the free movement of capital, technology, information, goods and services.

4. Determinant factors and consequences of the FDI evolutions in the new EU Member States

EU investments in the CEE countries prove the efforts for integrating these regions. There is an increase in capital flows to these regions, due to the policies adopted by the two parties, but also as a consequence of the Single Market regulations, which favor this kind of investment. (table 1)

As it can be seen in the previously mentioned table, as the relations with EU consolidated FDI grew, especially in Romania, Slovakia and Hungary, but the contraction period came soon so that these investments didn't get to reach the expected results.

The economic and financial crisis, felt much earlier in the developed countries, because of the accentuated interdependence with the large powers, determined investors to be more prudent, preferring to withdraw from the CEE market, not willing to take the risk on this region, where the economical and financial problems that were to appear would have left much more significant marks.

Economic integration leads to scale economies, cuts in production costs, increasing the competitiveness, all these leading to the increase of profit.

Table 1 - Inward foreign direct investment flows (mill EUR)

	2005	2006	2007	2008	2009	2010
Bulgaria	2,345	5,197	7,691	5,762	1,966	1,579
Czech	8,937	3,896	5,996	3,972	1,501	4,913
Cyprus	526	487	1,019	298	1,400	117
Estonia	2,252	1,407	1,994	935	1,212	1,138
Lethonia	365	978	1,477	682	-417	190

Hungary	5,909	5,015	2,342	4,197	-3,500	503

Source: Eurostat[5]

As it can be seen both in Table 2 as well as in Picture 1, in 1999 only Poland and the Czech Republic owned over 0.5% of the global FDI, and Hungary, 0.3%. The rest of the CEE countries had under 0.1%. Over the years, with the accession of these countries to the EU, the situation changed. In 2005, Slovakia and Estonia reached values of 0.25% and 3% respectively, from the total global FDI. It is important to analyze Romania and Bulgaria, which recorded much higher values than other countries in the area.

Romania recorded record values in 2004 (0.867%) but also in 2008 (0.798%). Like our country, Bulgaria had an upward trend starting with 2002 reaching in 2007 the maximum value of 0.629% of the total global investments.

Most of the new member states had to suffer from the shrinkage of the FDI after 2007, as a consequence of the economic and financial crisis.

From the total value of global FDI, the new member states draw led FDI than in the pre-crisis period, reaching in 2010 values under 0.4%, from the total FDI.

Picture 1 – FDI weight in total global FDI

Source: UNCTAD

According to UNCTAD, the economic shrinkage after 2008 did not affect Poland significantly, which in 2008 has almost 0.8% of the total global FDI.

Picture 2 – FDI percentage in total EU FDI

Source: UNCTAD

Analyzing FDI in the European Union we notice that there are a series of differences among the new member states. Poland is an atypical case, which, from values under 1.5% of total EU FDI reached 4.15% in 2009, and continues to keep this value over 3%.

Based on Eurostat, another country whose FDIs seem to not be affected by the economic crisis is the Czech Republic; on the contrary, if the other countries are decreasing (in terms of FDI), the Czech Republic manages to reach 2.64%, which is much higher than the one before the start of the global economic crisis.

5. Conclusions

Foreign direct investments have a great importance in the globalization process, benefiting both the investor and the receiver.

These types of investments are considered to be the most profitable for both partners, but also for the economic, social and political climate.

As previously shown, FDI became the base element for TNC, more important than foreign trade, because they lead to increased productivity, new jobs, higher budget income for the host country, through taxes.

If in the past, the exports were the main connection mechanism between countries, their place is taken by FDIs, source for economic growth and progress for the developing countries.

European Merger Policy

Abstract

Laws designed to protect/generate competition to varying extents have appeared in most parts of the world. In Europe such competition policies mainly emerged after the Second World War, not only at the national level but also at the supra-national level. From a governance perspective, competition policy constitutes nothing less than the most developed example of supranational regulation.

In the first part of the paper we focus on the different views and philosophies that have influenced EU competition policy. Further, we present the actual Merger Regulation - an example of separate jurisdictions agreeing to analysis of certain mergers in one supra-national framework. In the second part of the work, we present the details regarding the European Commission exclusive jurisdiction to review concentrations with a Community dimension and the mergers that do not have a Community dimension, reviewed by the competition authorities of the Member States applying national law. Here, we show that, in several cases, national Governments set aside merger control rules to facilitate the creation of “national champions” or used them as a protectionist tool to disrupt undesirable transactions. Finally, we remember that the competent authority in Romania for the review of mergers is the Competition Council. nu va depăși 150 de cuvinte și se va redacta cu caractere de dimensiune 11 pt., scrise la un rând, italic.

Keywords: concentration; competition policy; merger control.

1. Introduction

It is a generally accepted principle that competition is desirable. Competition tends to lead to cost efficiency, low prices and innovation. Markets that are competitive tend to lead to a higher level of consumer welfare in both the short-run and the long-run than markets that are not competitive. In its First Report on Competition Policy (1972), the Commission wrote : „*Competition is the best stimulant of economic activity since it guarantees the widest possible freedom of action to all. An active competition policy makes it easier for the supply and demand structures continually to adjust to technological development. Through the interplay of decentralized decision-making machinery, competition enables enterprises continuously to improve their efficiency which is the sine qua non for a steady improvement in living standards. Such a policy encourages the best possible use of productive resources for the greatest possible benefit of the economy as a whole and for the benefit, in particular, of the consumer*”. [1]

The competition law was intended to guarantee freedom of competition and to prevent the emergence of economic power, to protect opportunities and relationships as well as to promote efficiency. The focus on structure, relationship, and freedom of action is consistent with the long-standing political support for competition law from industry, and particularly from the small-business sector.

The traditional view of competition law is that it contrasts with this regulatory activity by being primarily negative and using only ‘second order’ incentives. Opting for competition law entails some belief that in most cases the market will produce the correct amount of competition and innovation, and competition law does not need to concern itself with substantive industrial policy but simply ensure that the

market functions reasonably well. As such, competition law does not embody decisions about whether firms should build plants or distribution mechanisms, or about the nature of their products. It simply sets a few global limits to behaviour, based not on the substance of commercial activity but on abstract notions of economic decency, and reactively enforces these.

It is intuitively appealing to proxy the level of competition a particular firm faces with the number of competitors it has. Current market shares can provide a very misleading picture as to the level of current competition. Equally, where barriers to expansion by existing players are low, current market shares are not a good proxy for market power. Finally, highly variable market shares indicate that a high current market share may only be transient and suggest the existence of significant competition between firms, thus implying relatively little market power. The two most common measures of market concentration are concentration ratios and the Herfindhal-Hirschman Index (HHI).

“Mergers” or “concentrations,” usually includes structural combination, such as share or asset acquisitions, joint ventures, cross-shareholdings and interlocking directorates. Merger control tries to prevent the creation, through acquisitions or other structural combinations, of undertakings that will have the incentive and ability to exercise market power. In some jurisdictions, the test of legality is derived from the laws about dominance or restraints; in others, there is a separate test phrased in terms of likely effect on competition generally. The analytic process applied typically calls for characterising the products that compete, the firms that might offer competition, and the relative shares and strategic importance of those firms with respect to the product markets. An important factor is the likelihood of new entry and the existence of effective barriers to new entry. Most systems apply some form of market share test, either to guide further investigation or as a presumption about legality. Mergers in unusually concentrated markets, or that create firms with unusually high market shares, are thought more likely to affect competition. And most systems specify procedures for pre-notification to

enforcement authorities in advance of larger, more important transactions, and special processes for expedited investigation, so problems can be identified and resolved before the restructuring is actually undertaken. [2]

2. Economics of Market Concentration and State Intervention

In static neoclassical theory, market concentration - irrespective of the reasons of it - was considered harmful. Neoclassical theory clearly indicates a case for competition policy. In essence, strong scepticism towards market power should guide competition policy. [3] In '30, the concept of workable competition emerged from the literature as a concept to counteract the view that perfect competition is not a reliable basis for making normative appraisals of the working of actual markets (J. Clark). The authors of the Treaty of Rome used the concept of workable competition, moreover, many of the distinguishing features of European competition policy seem to fit into this theoretical framework. It is noteworthy that the European Court of Justice, in its leading *Metro* judgement, referred to the concept of *workable competition* as being the type of competition that was necessary to achieve the economic objectives of the EC Treaty.

In '40, an ordoliberal policy was developed based on the work of W. Eucken - "Fundamentals of the national economy" which has established a "theory of order" as the foundations of a "ordering policy." For the author, economic liberalism that is found in the market economy is the economic system that made the best possible allocation of resources. Ordoliberal policy is based on building a full order of competition. Ludwig Erhard has been revealed between ordoliberals, considering the social market economy as a specific form of economic order and rules. He is considered the "father" of the law in Europe against restraints of competition, struggling to enforce competition law against all opposition. In the especially striking example of competition policy, Katja Seidel (2008) has shown how the entrepreneurial leadership of Commissioner Hans von der Groeben and Director- General Pieter VerLoren van

Themaat helped to unite their civil servants behind a broadly ordoliberal conceptualization of a „competition society” which has guided Directorate-General (DG) IV policy to the present day.

After the emergence of neoclassical price theory, a fundamental step forward in competition theory dates back to the Harvard School’s Structure – Conduct – Performance (SCP) paradigm somewhere around the 1940’s. The SCP paradigm was developed by Edward S. Mason at Harvard University. The original empirical applications of the new theory were by Mason’s colleagues and students, the most famous of whom was Joe S. Bain. *“Market structure is a term used to define the characteristics within which firms operate in a given product market. The principal characteristics are the number of firms and their size. Also relevant is the market power of the firms’ customers, the ease with which new firms can enter the market and old ones can exit it”*. Adherents of the Harvard School correctly observed a relationship between industry concentration and profits, but erroneously inferred that those profits were the result of artificial market power. Bain aggravated the mistake suggesting that entry barriers were pervasive, and found that necessary up-front capital expenditures, incumbent efficiency, and other difficulties frustrated entry into concentrated markets and perpetuated market power.

According to Piraino, the Harvard School approach had many advantages. If antitrust analysis under the Harvard School was not perfect, at least it was certain. The courts were able to indulge in a presumption of illegality for many types of conduct without engaging in a complicated analysis of the economic circumstances in the relevant market. Since the outcomes of trials were so predictable, business executives understood the type of conduct they should avoid. Firms in concentrated industries were effectively deterred from transactions that increased concentration levels in the relevant market. The Harvard School approach, however, also had serious disadvantages. Harvard School jurists were too quick to find fault with aggressive competition. The courts and agencies prevented large firms from engaging in competitive conduct that could have benefited consumers and would have been perfectly permissible for firms with

lower market shares. In European policy, the Harvard ideas that the structure of the market has an impact on the ultimate performance of the market is clearly reflected in the field of merger control. This result forms the emphasis of the inquiry on whether the concentration *„creates or strengthens a dominant position”* (Regulation 4064/89). There is no explicit efficiency defence. Efficiencies are often seen as evidence of market power, rather than as benefits which may outweigh the anti-competitive consequences of mergers. *“The implications of the SCP paradigm for competition policy is that we can identify which market structures lead to anticompetitive results and devise a competition law that is designed to modify or prevent market structures that are linked with poor economic performance.”* [4]

The theoretical weaknesses of the structuralist approach and the lack of empirical support for the SCP led in the late 1960s and early 1970s to extensive criticism of antitrust policy and the Harvard School by a number of influential economic and legal scholars at the University of Chicago (A. Director, R. Bork, R. Posner, F. Easterbrook and G. Stigler). In Chicago approach, merger control is partially denied, although the school did not argue in favour of total abolition of competition policy. Only very large horizontal mergers leading to monopoly are seen *“worthy of serious concern”*. [5] The control of vertical or conglomerate mergers is as such rejected.

Researchers working in the tradition of the Chicago school of industrial economics maintain that high profitability in a concentrated industry has to be interpreted as a reflection of superior efficiency of larger firms over smaller ones, not as a reflection of market power. In addition, Posner argued that there was no basis for automatic judicial intervention against a merger where the combined market share of the four largest firms in the market was less than sixty percent. One of the most influential researchers in this tradition is Demsetz (1973) who argued that if a high concentration industry enjoys high profitability then the profitability of large firms in that industry should not be different from the profitability of small firms. He found that the profitability of larger firms was in fact higher than smaller firms

which he regarded as proof that larger firms were more efficient than smaller firms.

The contestable market theory also had implications for merger control. In principle, the message of contestability theory is that policy intervention in market processes is unnecessary, if entry and exit are free and easy. In this case, potential competition as well as actual competition will influence market performance. In practice, the prescriptions of contestability theory seem often to have been applied in a free and easy manner, without the kind of detailed analysis necessary before it would be safe to conclude that a particular market could be treated as “workably contestable.” S. Martin stated in his article “The Theory of Contestable Markets” that *“a simple way to summarize the insights that contestability offers to policymakers is to say that public authorities should make markets as contestable as possible, given the constraints imposed by other (and possibly noneconomic) goals”*. [6] By the early 1990`s, the Chicago School had completed a revolution in antitrust analysis. In US the Merger Guidelines were revised several times (in 1982, 1984 and 1992) to take account of developments in economic thinking concerning the competitive effects of mergers. In the 1992 Guidelines there is no longer an explicit reference to the S-C-P paradigm; there is also explicit scope for an ‘efficiency defense’, which clearly reflects the influence of the Chicago School.

In Europe, the fact that the economic doctrine of the Chicago School has not influenced European competition law at that time is clearly apparent from the decisions in *AKZO* and *Tetra Pak II*. The Court of Justice accepted a price-cost comparison as the yardstick by which to establish predatory pricing. Abuse of dominant position must be deemed to be present once prices fall below the level of average variable costs.

Beginning in the `80, economists developed new game theoretic models of imperfect competition and industrial organisation which supported concerns by an increasing number of antitrust scholars and practitioners that the efficiency explanations of the Chicago School, while valid in certain cases and circumstances, were insufficient and inadequate explanations of firm conduct or market structure and generally led to a too lenient interpretation of antitrust law. Largely

derived from an analysis of competition in oligopolistic markets, many of these new game theoretic models by “Post-Chicago School” economists identified both the ability and incentives of firms to act anti-competitively through strategies designed to exploit unilateral or collective market power. Contributions to the literature include horizontal mergers (Farrell and Shapiro 1990); vertical mergers facilitating collusion (Nocke and White 2007); and anti-competitive vertical mergers (Riordan and Salop 1995).

A less direct but also important influence of these modeling techniques is in the specific prediction of a merger’s effects. Some of this work has been purely theoretical, looking at the effects of mergers in models where merger is an equilibrium outcome and not merely an assumption (Farrell and Shapiro, 1990). Some applications have been in the development of simulation techniques to predict the effects of mergers, that rely on demand models calibrated to match current industry data regarding price, market shares, elasticity of demand for the product as a whole, and cross-elasticities of demand between products (Werden and Froeb, 1994). These demand models have also led to econometric techniques for estimating brand-specific demands, particularly as they may be affected by the prices of other brands (Baker and Bresnahan, 1985; Bresnahan, 1989) and thus provide estimates of the effects of mergers that eliminate independent pricing. As Brennan stated, these techniques are the result of theoretical advances and increases in computing power, but a major contributor has been the vast quantities of retail purchase data from bar-code scanners at checkout counters.

In general, merger analysis became more heavily economic in the 1990s. Economic concepts now pervade the federal merger guidelines, and merger analysis, whether performed by prospective merger partners or antitrust agencies, routinely involves close collaboration between economists and attorneys.

A new economics doctrine - innovation economics has emerged in the last decade through the work of a wide range of scholars and postulates that innovation (the development and adoption of new products,

processes, and business models) drives growth. As a result, it makes an explicit effort to understand and model those forces and factors conducive to innovative activity, seeing such advances as a result of intentional activities by economic actors, including Government. Adherents of the innovation doctrine argue that antitrust policy — and merger policy specifically — need to incorporate analysis of longer-term dynamic effects. The innovation doctrine makes it clear that the focus of antitrust thinking should be on the long-term trajectory of product value and price, not just current consumer welfare measured by short-run prices. Again, as Porter argues: Since the role of competition is to increase a nation’s standard of living and long-term consumer welfare via rising productivity growth, *the new standard for antitrust should be productivity growth*, rather than price/cost margins or profitability. [7]

In recent years, antitrust enforcement has increasingly focused on innovation issues. In September 2009, for example, the FTC and the Antitrust Division asked whether the Merger Guidelines should “*be updated to address more explicitly . . . the effects of mergers on innovation.*” [8]

3. Brief Overview of European Merger Control

If competition is a force which is widely considered to have many positive effects it is thus not something that can be taken for granted to exist. Laws designed to protect/generate it to varying extents have therefore appeared in most parts of the world. In Europe such competition policies mainly emerged after the Second World War, not only at the national level but also at the supranational level with the establishment of the European Coal and Steel Community in 1951 and the European Economic Community in 1957. Gradually, a competition policy ethos has developed in which the Commission, or rather its Directorate-General for Competition (henceforth; the Competition DG), has far-reaching powers to regulate mergers. It is undeniable that competition policy is at the core of economic governance in the EU and has been so for quite awhile. The Treaty of

Rome made no explicit provision for merger control. It was only in December 1989 that the EC Merger Regulation (ECMR) brought explicit merger control at the European level. The primary legislation governing mergers is Council Regulation 139/2004 (the “Merger Regulation”) which came into force on 1 May 2004 (replacing ECMR).

In Romania, the Competition Council, as national competition authority, enforces and ensures the application of the national and Community rules on competition. The activity of the Competition Council is fulfilling two main functions: a preventive one, involving the surveillance of the markets and of the respective market players and a corrective one, aiming at re-establishing and developing a normal competitive environment. Therefore, the mission of the Romanian Competition Authority can be synthetically defined as to protect and to stimulate the competition on the Romanian market so as to develop a normal competitive environment, finally ensuring a better promotion of consumers’ interests. The competent authority in Romania for the review of mergers is the Competition Council. The substantive test applied by the RCC in merger control proceedings is whether a concentration leads to significant impediments to efficient competition on the Romanian market or a substantial part thereof, especially by the creation or strengthening of a dominant position on the Romanian market or a part thereof.

Regulation 139/2004 - Make the Administrative Processes more Effective

Regulation 139/2004 has reaffirmed the division of jurisdictional boundaries between the national and supranational competition regimes. Put simply, merger policy remains a core EC competence. The revised ECMR reinforced the degree of European governance and incorporated several refinements to make the administrative processes more effective. One of the most noticeable additions directly involves undertakings who are now entitled for the first time to trigger the referral process themselves.

From May 2004, concentrations which would not otherwise fall within the Community dimension, but which are

capable of being reviewed under the national competition laws of “*at least three Member States*”, can be dealt with by the Commission at the request of the merging parties (Article 4(5) ECMR) so long as all merging parties are in agreement. Alternatively, in the pre-notification stage and according to (Article 4(4) ECMR) the merging parties may, via a so-called reasoned submission, request the Commission to refer the concentration to a Member State “*where the concentration may significantly affect competition in a market within a Member State which presents all the characteristics of a distinct market*”.

In both instances the companies will therefore continue to benefit from ‘one stop shop’ merger control. In this sense the revisions to the ECMR are expected to produce a more streamlined and improved system of referrals. In practice this change means more cases will be referred to the Commission as the key competition regulator. [9]

Transactions Caught by Merger Regulation

The generic term used for transactions caught by the Merger Regulation is “concentrations”. The European Commission has exclusive jurisdiction to review concentrations with a Community dimension. Mergers that do not have a Community dimension may be reviewed by the competition authorities of the Member States (“NCAs”) applying national law. The examination of concentrations by the Commission is conducted by officials in the Directorate-General for Competition (DG COMP). There are currently five units specialising in mergers, broadly speaking along sectoral lines (e.g. DG COMP Unit B3 handles merger cases in energy and environment, Unit C5 handles mergers in the field of information, communication and media ...), which report to the Deputy Director-General for Mergers and Antitrust. They are supported in harder cases by members of the Chief Economist’s team.

According to European competition policy, „*a concentration shall be deemed to arise where a change of control on a lasting basis results from: (a) the merger of two or more previously independent undertakings or parts of undertakings, or (b) the acquisition, by*

one or more persons already controlling at least one undertaking, or by one or more undertakings, whether by purchase of securities or assets, by contract or by any other means, of direct or indirect control of the whole or parts of one or more other undertakings. The creation of a joint venture performing on a lasting basis all the functions of an autonomous economic entity shall constitute a concentration”(Council Regulation (EC) No 139/2004, art. 3).

Control shall be constituted by rights, contracts or any other means which, either separately or in combination and having regard to the considerations of fact or law involved, confer the possibility of exercising decisive influence on an undertaking, in particular by: ownership or the right to use all or part of the assets of an undertaking; rights or contracts which confer decisive influence on the composition, voting or decisions of the organs of an undertaking. Control is acquired by persons or undertakings which: (a) are holders of the rights or entitled to rights under the contracts concerned; or (b) while not being holders of such rights or entitled to rights under such contracts, have the power to exercise the rights deriving therefrom.

A concentration has a Community dimension, if [10]: the combined aggregate worldwide turnover (from ordinary activities and after turnover taxes) of all the undertakings concerned (in the case of the acquisition of parts of undertakings, only the turnover relating to the parts which are the subject of the concentration shall be taken into account with regard to the seller(s)) is more than EUR 5 000 million (special rules apply to banks), and the aggregate Community-wide turnover of each of at least two of the undertakings concerned is more than EUR 250 million, unless each of the undertakings concerned achieves more than two-thirds of its aggregate Community-wide turnover within one and the same Member State.

In case these thresholds are not met a concentration has nevertheless Community dimension, if: the combined aggregate worldwide turnover of all the undertakings concerned is more than EUR 2 500 million, and in each of at least three Member States, the combined aggregate turnover of all the undertakings concerned is more than EUR

100 million, and in each of at least three Member States included for the purpose of the second point above, the aggregate turnover of each of at least two of the undertakings concerned is more than EUR 25 million, and the aggregate Community-wide turnover of each of at least two of the undertakings concerned is more than EUR 100 million, unless each of the undertakings concerned achieves more than two-thirds of its aggregate Community-wide turnover within one and the same Member State.

Concentrations with a Community dimension must be notified to the Commission prior to their implementation. Where a concentration raises serious doubts as to its compatibility with the market, the Commission can carry out detailed on-the-spot investigations.

The competition authorities may measure market concentration using the number of pregnant competitors in the market. This measure is most useful when there is a gap in market share between significant competitors and smaller rivals or when it is difficult to measure revenues in the relevant market. The competition authorities also may consider the combined market share of the merging firms as an indicator of the extent to which others in the market may not be able readily to substitute competition between the merging firms that is lost through the merger [8]. The competition authorities often calculate the Herfindahl-Hirschman Index (“HHI”) of market concentration.

It should estimate of the market share in value (and where appropriate volume) of all competitors (including importers) having at least 5 % of the geographic market under consideration. On this basis, provide an estimate of the HHI index pre- and post-merger, and the difference between the two (the delta). After this, it must be indicated the proportion of market shares used as a basis to calculate the HHI and the sources used to calculate these market shares and provide documents where available to confirm the calculation.

The *Guidelines on the assessment of horizontal mergers* therefore indicate, in Section III, specific market share and concentration levels to specify in which situations the Commission is likely or not likely to have competition concerns. According to well-established case law, very

large market shares — 50 % or more — may in themselves be evidence of the existence of a dominant market position. However, smaller competitors may act as a sufficient constraining influence if, for example, they have the ability and incentive to increase their supplies.

A merger involving a firm whose market share will remain below 50 % after the merger may also raise competition concerns in view of other factors such as the strength and number of competitors, the presence of capacity constraints or the extent to which the products of the merging parties are close substitutes. The Commission has thus in several cases considered mergers resulting in firms holding market shares between 40 % and 50 % (Case Nestlé/Ralston, points 48-50) and in some cases below 40 % (Case Rewe/Meinl, 1999), to lead to the creation or the strengthening of a dominant position.

Certain mergers, by reason of the limited market share of the companies concerned, are not likely to significantly impede effective competition. An indication to this effect exists, in particular, where the combined market share of the merging firms does not exceed 25%. This indication derives from Recital 32 of the EC Merger Regulation. However, it does not apply to cases where the proposed merger is likely to give rise to co-ordinated effects.

To complement the above indicia, the Guidelines also apply the Herfindahl-Hirschman Index (“HHI”), and the change in the HHI from pre-merger to post-merger (“delta”) as first indications of the change in competitive pressure in the market following the merger.

The Guidelines indicate that the Commission is unlikely to identify competition concerns in a market with a post-merger HHI below 1.000, and that such cases normally do not require extensive analysis.

The Commission is also unlikely to identify competition concerns in a merger: with a post-merger HHI between 1.000 and 2.000 and a delta below 250; with a post-merger HHI above 2.000 and a delta below 150; except where some special circumstances are present, which somehow invalidate the HHI as a useful proxy for the change in competitive conditions. This may relate, by way of example, to the following instances: (a) a merger involves a potential

entrant, or a recent entrant with a small market share; (b) one or more merging parties are important innovators in ways not reflected in market shares; (c) there are significant cross-shareholdings among the market participants; (d) one of the merging firms is a maverick firm with a high likelihood of disrupting coordinated conduct; (e) indications of past or ongoing coordination, or facilitating practices, are present; (f) one of the merging parties has a pre-merger market share of 50% or more.

The HHI indices accordingly give a useful indication to the parties to the merger as to when a merger is unlikely to cause concerns. They do not give rise to a presumption of either the existence or the absence of such concerns.

Non-horizontal mergers pose no threat to effective competition unless the merged entity has a significant degree of market power (which does not necessarily amount to dominance) in at least one of the markets concerned. The Commission will examine this issue before proceeding to assess the impact of the merger on competition.

Market shares and concentration levels provide useful first indications of the market power and the competitive importance of both the merging parties and their competitors.

The Commission is unlikely to find concern in non-horizontal mergers, be it of a coordinated or of a non-coordinated nature, where the market share post-merger of the new entity in each of the markets concerned is below 30 % and the post-merger HHI is below 2.000.

In principle, when the jurisdictional thresholds are satisfied, notification is mandatory and must be made prior to implementation. The notification itself can be made at any time once a recognised “triggering event” has occurred. There is no filing deadline. The Commission may impose a fine of up to 10% of the aggregate turnover of the undertakings concerned where those undertakings, either intentionally or negligently, fail to notify a concentration in accordance with Article 4 or Article 22(3) prior to its implementation, unless the parties are authorised to implement the deal either under Article 7(2) (public bids) or Article 7(3) (derogation). Notification must be made by the merging parties. The notifying parties

(or their representatives) sign a formal declaration at the end of Form CO. In the case of a hostile bid, where the target business does not cooperate in the preparation of the Form CO, DG COMP will verify the accuracy of the notifying party’s estimates by sending requests for information to the target business. [11]

4. Conclusion

The competition policy was intended to guarantee freedom of competition and to prevent the emergence of economic power, to protect opportunities and relationships as well as to promote efficiency. EU competition policy can rightfully be said to have been influenced by many different views and philosophies. The most influential schools in the US – Harvard, Chicago and post-Chicago – have most likely left prints in the application of merger control. Likewise, Austria and the German city Freiburg were important outposts for competition law thinking in Europe. It is undeniable that competition policy is at the core of economic governance in the EU and has been so for quite awhile.

Merger control tries to prevent the creation, through acquisitions or other structural combinations, of undertakings that will have the incentive and ability to exercise market power. The Treaty of Rome made no explicit provision for merger control. It was only in December 1989 that the EC Merger Regulation brought explicit merger control at the European level, which was replaced with Council Regulation 139/2004 (the “Merger Regulation”). The new legal framework reinforced the degree of European governance and incorporated several refinements to make the administrative processes more effective. The Merger Regulation is an example of separate jurisdictions agreeing to analysis of certain mergers in one supra-national framework.

The European Commission has exclusive jurisdiction to review concentrations with a Community dimension. Mergers that do not have a Community dimension may be reviewed by the competition authorities of the Member States applying national law. The competent authority in Romania for the review of mergers is the Competition Council.

Abstract

Increasing research and development activities, especially in the private sector, it is possible through tax incentives for companies with unfold research and development activities. A tax incentive represents an important determined in innovative behavior. For designing and measuring public support to research and development activities it is often not sufficient to focus only on tax rate effects of research and development activities, tax incentives and the design of a tax incentive must be in accordance with the framing tax system in order to be effective. Though this research is revealed that the tax incentives brings no increase innovation.

Keywords: innovation, tax incentives, research and development

J.E.L. classification: E62, O32

1. Introduction

Economic and fiscal instruments specifically targeting innovation will increase research and development activities. Governments as drivers to create innovation policies, tax planning, including transferring intellectual property to low tax jurisdiction, spill over positive effects in the economy.

When we talk about innovation we are referring to change that can take different forms:

- product innovation – changes in the products or services which an economic entity offers;

- process innovation – changes in the ways in which they are created and delivered;

- position innovation – changes in the context in which the product or services are introduced;

- paradigm innovation [1] – changes in the underlying mental models which frame what the economic entity does.

Supporting innovation is an important objective in all countries. Governments use tax systems to help overcome barriers to innovation by reducing the cost of undertaking innovative activities.

2. Tax incentives for innovation

It is undeniable that existing regulations have certain deficiencies and that they have contributed to a certain extent the emergence of the global crisis.

Many studies have focused on the reasons that investments in R&D indicating that they are due to the fact that they can be directly linked to enhancements in the “knowledge-based economy.” These studies have showed that 30 to 50 percent of today’s economic growth can be directly linked to product innovation development and innovation technologies. The “knowledge-based economy” and R&D activities have a very clear impact on these new business drivers.

To streamline R&D activities companies choose their research location taking into account the level of technical expertise and transparency of regulations and ruling.

There are many more choices for placing an R&D facility. First, through all of these operational issues, then ending up focusing on the bottom line and figuring out where is it most cost effective. So, the operational and

infrastructure issues narrow the field for where you can select an R&D facility, and then ending up with cost as the final issue. National Academy of Sciences did a ranking of various companies in their approach to figuring out where is the best location to put an R&D facility. So, they had stability of the economy and the government, as one of them. Market for products in the country meaning, that company wants to be where your customers are or where you think your customers will be. The company focus is on quality of the R&D personnel, intellectual property protection, university collaboration, import and export restrictions, and then cost [2].

To streamline costs and obtain some economies the companies carries out R&D activities in specialized centres. Additional tax allowance for R&D expenses are relevant to the activity of many multinational groups present in Romania.

Incentives are established by organisations outside the company, usually public administration bodies or insurers; these incentives may act at national, regional or sector level. With regard to the economic aspect of incentives, there are two major categories:

- financial incentives (positive or negative), such as insurance-related incentives, funding schemes, and tax-based incentives (tax reduction or specific taxes);
- non-financial incentives, including recognition schemes such as awards; aiming at positive recognition but not having substantial direct financial implications.

The main focus of this report is on external financial incentives (insurance-related incentives and public incentive schemes), and to a lesser extent on non-financial incentives.

Tax incentives for R&D activities is to reduce the taxable income for eligible taxpayers, by deducting additional 20% of the expenditure incurred by them in the current fiscal year for research and development activities, and by applying the methods of accelerated depreciation for equipment and equipment for research and development.

Tax incentives are granted for research and development activities that led to getting

research results, recoverable by taxpayers, oneself, in order to increase revenues.

Eligible expenditure in determining the deduction is given additional taxable income are:

- depreciation of tangible fixed assets acquired or created by taxpayers in new condition, used in research and development;
- expenditure on wages of personnel directly engaged in research and development;
- expenditure on tangible fixed assets maintenance and repairs performed by third parties;
- depreciation of intangible fixed assets, purchased by the taxpayer, used in research and development;
- operating costs, including: expenditure on consumables, expenses on materials of small inventory, raw material costs, expenditure on experimental animals and other similar products used in research and development activities;
- Overheads expenses that can be allocated directly or proportionally of research results by using an allocation key.

Only those eligible expenses recorded in the accounts, on the basis of supporting documents, according to the applicable accounting rules.

To be eligible for tax incentives for research and development the costs shall be costs incurred by the taxpayer for the purposes of the income. Additional deduction is calculated quarterly/ annually, as appropriate.

Eligible expenditure taken into account the deduction is additional to the profit taxation determination are as follows:

- depreciation of tangible assets created or acquired by the taxpayer as new and used in research and development;
- costs of staff wages directly engaged in research and development activities;
- costs of maintenance and repairs performed by third parties;
- depreciation of intangible assets, purchased by the taxpayer, used in research and development;
- operating costs, including costs of consumables, expenses related to the materials of small inventory, raw material costs, expenditure on experimental animals, and similar products used in research and development.
- Overhead costs which can be allocated directly or proportionally, of research results by using an allocation key.

In order to determine the amount that represents additional deduction in calculating taxable income, eligible expenses are added together and will be included in tax register.

Accelerated depreciation for equipment and equipment for research and development activities are carried out according to art. 24 of the Tax Code.

3. Conclusions

Fiscal policy are generally considered the most effective environmental policy tool available to governments. Where well-designed environmental taxes have been levied, these taxes have been show to be effective at inducing innovation. So, governments need to consider how to best improve their approach. Skilfully harnessing the tax system offers a robust and inded innovative way forward.

Fiscal policy stabilization is a necessary but not sufficient condition for sustained economic growth.

Technological innovation is an important factor in the competiveness of a company and the main driver of growth in productivity and in increasing standard of living.

Human resources and new technologies, in conjunction with the innovative capacity and to generate future benefits of investments represent the essential details of the process of economic growth, which can be mentioned in particular the principles of sustainable development in the “knowledge-based economy”.

Sovereign Debt Crisis in the Eurozone– Towards an Inevitable Reforming of the Euro Institutions

Maria Halep

The Academy of Economic Studies – Doctoral School

mariahalep@yahoo.com

Abstract

The Eurozone is facing the deepest crisis since its foundations. The subprime crisis that surged in the United States spread into a banking, then economic crisis. Markets were won by panic and overreacted to risk, generating the European sovereign debt crisis.

The article is structured as follows. In the first section, I revisit the main causes and factors that made the sovereign debt crisis possible. In the second section, I study the challenges the Eurozone is facing in the process of restabilising market confidence and putting European peripheral economies on a sustainable path. Third section assesses the main proposals, such as the introduction of the European Monetary Fund and the creation of a Eurobond market and considers the advantages and the drawbacks of these solutions. Finally, the last section concludes and makes an assessment on possible outcomes for the Eurozone. Reforming its institutions appears compulsory for its future survival should a further crisis emerge.

Key words: Euro Zone, sovereign debt, fiscal union, budget deficit, eurobonds

J.E.L. classification: G01

Section 1: Emergence of the Crisis: constructing factors

Until the burst of the subprime crisis, the Eurozone was considered a stable area for investment, benefiting from markets confidence. The creation of the Eurozone, together with the Lisbon Strategy, was aimed at enabling sustainable growth for member countries, stimulate innovation and creating real convergence within its members, all this through common monetary policy. It has

proved a bitter failure. European growth was weak and real convergence, notably on competitiveness, did not see light, the opposite happened. Blind confidence in financial markets virtues and fiscal competition are the main causes of the European Crisis. The theoretical convergence mechanism was the following: interest rates in countries where they were high prior to the Eurozone construction should follow a downward trend to converge towards Germany's low interest rates. This did indeed happen. This allowed very low capital costs in these countries. Increasing profitability in productive sectors would generate capital inflows financing highly productive investments. This in turn would facilitate productivity catching-up and therefore competitiveness on international markets. Productivity increase would generate real wage adjustments harmless to competitiveness, as they would at most be equal to labour productivity gains. Therefore, raising internal demand, due to revenue increase, should have been compatible with maintaining external equilibrium. A virtuous circle would enable progressive catching-up by countries with lower living standards towards the level of advanced Eurozone economies.

Unfortunately, this virtuous circle proved to be inconsistent with reality. Divergence accumulated within the Eurozone exacerbated financial and economic crisis effects on some fragile European Countries: financial liberalization with no macro prudential controls found fertile land: low interest rates, low and stable inflation, financial innovation allowing risk transfer (mainly through the titrisation process). For example, in Spain lowering interest rates were accompanied by large external capital inflows, coming especially from Germany and France. They all grubbed in housing

speculation, mainly through the financing of Spanish banks private debt emission.

What resulted was a sore in the housing prices, a collapse in saving, increased internal demand, high inflation compared to the European Central Bank’s goal, real wage increase, competitiveness loss, a digging current account deficit and therefore the necessity of external capital to support excess demand (deficits). Similar phenomena occurred in Greece and Ireland, in an environment of total indifference of the banking supervision.

These factors caused profound fragilities in the peripheral countries when the crisis burst. Having accumulated large public debts, they had less manoeuvres to put their economies onto a recovering path. Having tied hands on the possibility of using currency depreciation in order to regain competitiveness, their only weapon available was fiscal policy. Or, these policies worsened public debt levels and made debt sustainability unforeseeable for financial markets.

Another element that is less mentioned by European Authorities is the heterogeneous fiscal system within the Eurozone, generating asymmetric effects during the crisis. Indeed, in the Eurozone we may distinguish between three groups of countries, according to their fiscal strategy:

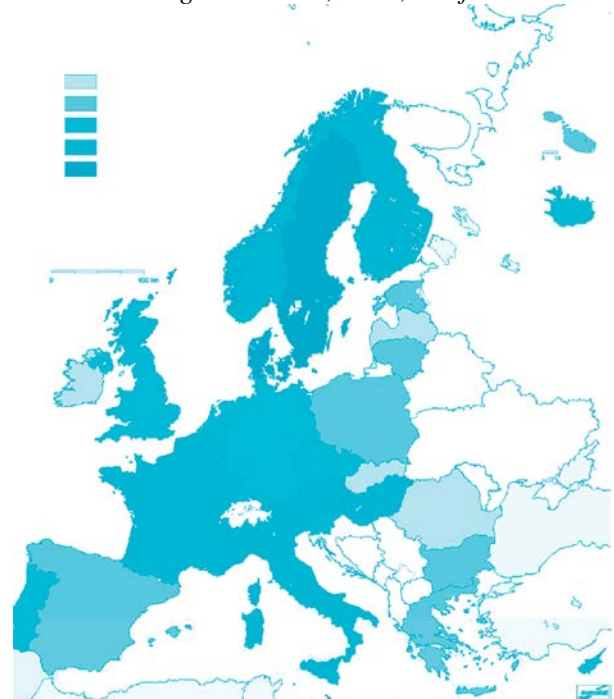

- One group of countries with low tax incomes (Spain, Portugal, Ireland)
- A second group of countries with very high tax incomes (Belgium, Italy, France, Austria, Finland)
- A third group of moderate taxation combined with favourable investment tax policies (Germany, Holland)

It is striking to observe that the most affected economies during the crisis are the ones with the lowest fiscal revenues rates in their GDP. These low rates are either the result of very low labour/investment taxation (Portugal, Spain, and Ireland), either a mix between low taxation and high fiscal evasion (Greece).

It is worth mentioning that the fiscal revenue contribution to GDP is an important factor, as noted above, but is not the only one, as the fiscal revenues’ structure also gives us hints concerning difficulties undergone by peripheral Eurozone countries.

Indeed, it appears that the most fragile countries are the ones with low labour taxation. Ireland, Greece, Portugal and Spain all tax relatively little labour comparing to other EU member states. Nonetheless, the beneficiaries are not the same: in Ireland low taxation concerns both employees and employers, and specially the last ones (Ireland has been doing fiscal dumping for many years now. For example, employers’ contributions amount to 11% in Ireland, whereas in France they represent 45% of the gross wage). On the contrary, Portugal and Spain support mostly employees. In Greece, taxation is low on both employers and workers.

Table 1: Budget revenues, 2008, % of GDB

The darker the blue marks, the larger the taxation charge is.

Debt crisis development

Starting 2009, spread on sovereign debt within the Eurozone started to increase, reaching dramatic levels through mid 2010. Thus, sovereign bonds with the same maturity, issued by different national governments were starting to be considered as imperfect substitutes. This spread boom reflected two separate but interconnected risks: a liquidity risk and a default risk. Considering the first one, it is the obvious result of the market panic and “flight to

safety” syndrome. Following the subprime crisis, markets turned to very safe assets, i.e. governments bonds of developed countries (United States, German, and to a less extent, France). This crowding-out of government bond demand increased prices of German and American government bonds, lowering the liquidity on the other European Government Bonds and thus decreasing prices and raising yields. Nevertheless, considering public debt

Source: « Dette publique, politique monétaire et stabilité financière »: Banque de France – « Revue de Stabilité Financière » – No 16, April 2012

We may notice from the graphic above that, while the most affected economies are those of Greece, Ireland and Portugal, Spain and Italy also suffer from relatively high increases in bond spreads, though less significant than the first group. It is nevertheless noticeable that these former economies are much bigger thus posing an increasing risk for European Zone Stability, should markets lose confidence in their capacity to reimburse their debt.

Eurozone Economies’ response to the crisis

Following the economic crisis, budgetary responses made by European governments have known various stages: the first one, started in 2009, was focused on sustaining economy through recovery plans. Or, their importance and structure was different from the first beginning. Programs adopted within the EERP (European Economic Recovery Plan), diverged on more than 9% GDP! For example, when Ireland was already in an austerity cure, Luxembourg and Spain were just starting recovery programs. However, starting from 2011, austerity or at least budgetary neutrality prevailed in the

accumulation and macroeconomic disturbance the peripheral economies are suffering, the default risk became real, all the more that these countries’ defaults could have a contagion effect on the Eurozone as a whole.

Figure nr. 1: 10 Years Government Bonds Yields (base points)

Eurozone.

BCE’s monetary policy was very active as well. Having cut interest rates to historical low levels, the BCE embarked in audacious unconventional policies, from assuring unlimited liquidity to European markets (de facto replacing the inter-bank market) to buying equity in order to support the public and private bond markets. The two main programs were The Covered Bonds Purchase Programme (CBPP) and the Securities Markets Programme (SMP). The BCE also adopted other measures, known under the name of “Enhanced Credit Support”: extending the range of collateral accepted in the main refinancing operations, increasing the horizon of the MRO through 3 months, 6 months, 12 months and 2 exceptional 36 months Long Term Refinancing Operations.

Section 2: Challenges and difficulties facing the Eurozone in restabilising market confidence

In order to fully understand specific difficulties faced by the Eurozone and the reasons for the persisting Sovereign Debt Crisis, one must come back to the Structure of the European Institutions.

The advantages of a single European currency were as follows:

- A decrease in transaction costs: no

more need to change money when arriving in another country; no more uncertainty on the part of importers about what a contract would actually end up costing or on the part of exporters about what promised payment would actually be worth.

- Beneficial effects on trade

However, a single European Currency also had drawbacks, mainly giving up economic flexibility. When the single European currency was first proposed, an obvious question was whether it would work as well as the dollar does in America. And the answer, clearly, was no – as Europe is not fiscally integrated: German taxpayers don't automatically pick up part of the tab for Greek pensions or Irish bank bailouts. And while Europeans have the legal right to move freely in search of jobs, in practice imperfect cultural integration — above all, the lack of a common language — makes workers less geographically mobile than their American counterparts.

That is the main reason for which many American and British economists have always been sceptical about the euro project. U.S.-based economists had long emphasized the importance of certain preconditions for currency union — most famously, Robert Mundell stressed the importance of labour mobility, while Peter Kenen emphasized the importance of fiscal integration.

That being said, dismantling the Eurozone would have important costs and the issue is rather to find solutions. Nonetheless, it is true that not taking into account in the texts of the different treaties the possibility of a Eurozone country to go out was a big mistake. Denying a problem doesn't make it disappear, it just postpones it, risking bursting with an even more violent force.

What started as a Greece crisis culminated in a Euro Crisis as a whole. While there is no doubt on Greek authorities' responsibility on the nature of their budgetary problems, it is worth noting that financial markets and Eurozone authorities also bear their part of responsibility, for letting this crisis degenerating in a systemic risk. Concerning the role of financial markets, it is well known that they overreact to economic conditions: periods of euphoria alternate with periods of depression amplifying movements in asset

prices that are not always related to economic fundamentals. It is worth noting the role of rating agencies, which systematically failed to foresee coming crises. And after the crisis surged, they overreacted, by downgrading countries notations, leading to a significant increase in government bonds rate and deepening their recessions and macro-economic problems.

Section 3: Assessment of the main proposals: the European Monetary Fund and the Eurobond market

In the face of the Greek crisis and the risk of contagion to other non-core Eurozone economies, 2 main proposals are interesting, the creation of an EMF (see Gros & Meyer, 2009) and the emergence of a Eurobond market (De Grauwe & Moesen, 2009). Daniel Gros and Thomas Mayer have suggested establishing a European Monetary Fund (EMF) that could, under certain conditions, financially support Member States Euro Zone

In detail, the proposal suggests the financing of the EMF through contributions (in terms of penalties) from those States that do not comply with the budgetary discipline as laid down in Union law. Only those Member States that do not meet the reference values for government debt (60% in relation to GDP) and for the budgetary deficit (3% in relation to GDP) would be required to make a payment. Moreover, the Fund shall be allowed to borrow money. If a Member State encounters financial difficulties, it could, upon submission of an adjustment programme, call on the guarantees of the Fund in an amount equivalent to its previously deposited contributions.

Additional drawings would be possible only if the State agreed to further conditions and financial budgetary disciplinary restraint. In case the financial support provided by the Fund does not suffice, Gros and Mayer have suggested rules to make an orderly sovereign default possible.

Currently, no such procedure exists. Thus, the insolvency of one State would have incalculable consequences for other Member States, giving it a certain potential for extortion. According to the proposal, the European Monetary Fund shall guarantee an amount equivalent to 60% of the GDP of a Member State, which would make sovereign

default a manageable risk.

The main drawback of this proposition consists in its legitimacy. Indeed, one may argue that this proposition goes against the “no-bailout” provision of the Maastricht Treaty.

However the proposal has the merit of making the no-bailout rule credible and thus gives teeth to the threat not to bail a country out. The drafters of the Maastricht Treaty had failed to appreciate that, in a context of fragile financial markets, the perceived (and real) danger of a financial meltdown makes a “pure” no-bailout response unrealistic. As with the case of large, systemically important banks, market discipline can be made credible only if there are clear provisions that minimise the disruptions to markets in case of failure.

Authors identify two key advantages to their proposal: first, the funding of the EMF should give clear incentives for countries to keep their fiscal policies in order at all times. Secondly, and perhaps even more importantly, the EMF could provide for an orderly sovereign bankruptcy procedure that would minimise the disruption resulting from a default. However, one must take into consideration the organisational and legal constraints (for detailed analysis of the Treaties’ Articles, see Ulrich Häde, 2010). Furthermore, to make only delinquent countries pay for assistance would be politically untenable. Sooner or later the payers would claim possession of the fund and deny any right in deciding how to use it to those who had not contributed to it. The two aims of strengthening the hand of the virtuous countries and of making the non-virtuous pay for assistance are mutually incompatible.

The Greek Crisis and the soaring of government bond spreads also brought to light the idea of creating a Eurobonds market. The issue of euro denominated bonds would be guaranteed collectively by the governments of the euro Zone. These could be issued by a European institution such as the European Investment Bank (EIB), or directly by the member states’ governments. In both cases the guarantee would be provided by these Eurozone governments which have the taxing power to back up such a guarantee. The advantage of such a

Eurobond issue is that countries which now face high spreads would have an easier and cheaper access to the financing of their budgetary stimulus programme. But this feature is also its drawback. Countries like Germany object. They fear that such a joint euro bond issue will create a free-riding problem. The governments of Ireland, Greece, Portugal, Italy etc. which today face high spreads will have fewer incentives to conduct sustainable fiscal policies. As a result, the countries with low spreads, and especially Germany, may have to bail out the governments of these countries in case of default.

Whatever one may think of the motives of Germany, the German resistance to a joint euro bond issue is a fact of life. The question then is whether this opposition can be reduced by going some way towards relieving the German fears that it will have to pay the bills. De Grauwe and Moesen make an interesting proposal, resumed hereinafter:

- First, each euro government would participate in the issue on the basis of its equity shares in the EIB.
- Second, the interest rate (coupon) on the euro bond would be a weighed average of the yields observed in each government bond market at the moment of the issue. The weights would also be given by the equity shares in the EIB.
- Third, the proceeds of the bond issue would be channelled to each government using the same weights. Fourth, each government would pay the yearly interest rate on its part of the bond, using the same national interest rates used to compute the average interest rate on the euro bond.

What are the advantages for the different countries?

Concerning Germany, much of the fear that a common euro bond issue would lead to a free riding problem forcing Germany to pay the bill disappears in this scheme. Greece would pay the interest rate it faces in the market today. Thus the incentive to free ride on Germany would decline. In addition, Germany would pay the same interest rate it pays when issuing government bonds on its own. Thus contrary to other proposals for joint euro bond issues, Germany would not be penalised by a higher interest rate. This

leads to the question of what the benefits are for Greece. The main benefit for Greece arises from the fact that Greece faces the problem that it may be shut out from the market, as long as the flight to safety syndrome exists. Thus the common euro bond issue is a gate for Greece to access funding, which it may not have as easily when it issues bonds on its own.

Conclusions: Eurozone’s necessary reforms

Currently, none of these proposals has seen light. Greece has been receiving support from the IMF and the European Financial Stability Facility (meant to be replaced by a permanent rescue organism starting 2013 – European Stability Mechanism). However, risks in other fragile economies persist and markets may soon attack these bonds markets, or even countries like France, considered as one of the safest.

While political union is not reasonably foreseeable in the short/medium term, fiscal integration appears essential for the Eurozone survival. Reasonable but strong steps must be taken in order to convince the markets on the future of the Eurozone. One may start with converging taxation schemes in different European countries. Another important working would be on financial and credit regulation in the Eurozone and macro-prudential policies.

As Krugmann put it in a Times article “The Europeans have shown us that peace and unity can be brought to a region with a history of violence, and in the process they have created perhaps the most decent societies in human history, combining democracy and human rights with a level of individual economic security that America comes nowhere close to matching. These

achievements are now in the process of being tarnished, as the European dream turns into a nightmare for all too many people”. European Governments and people may as well think about these words when refusing to cooperate and reform Europe’s institutions.

Management Strategies of Country Risk within Financial Institutions

Iliescu Elena Mihaela

“Nicolae Titulescu” University, Bucharest, Romania

mag_mihaela@yahoo.com

Abstract

Financial institutions, like any other company for that matter, have as a main objective the diversification and expansion of revenue and profit sources. To this purpose they have expanded ever more their activity across national borders.

But, as it is well known, especially if we relate to the current economic-social and politic circumstance, this strategy increases the risk of financial loss, exposing the bank to country risk.

And as “the secret of success for a company is to be prepared for any risks, when they will occur”, all banks must possess a country risk management process which, although it varies depending on the volume and the complexity of the international activities include a series of steps which must be implemented mandatory.

Key words: country risk, financial institutions, country risk management

JEL Classification: F21, G24, G32

1. Introduction

“It is true that on a road not everyone can be a railway engine, therefore, as the English politician Benjamin Disraeli (1804-1881) stated, “One secret of success in life is for a man to be ready for his opportunity when it comes”.

This statement is very important also for the risk management theory if we extrapolate it and we adapt it to the specific of the economic theory, as follows: “the secret of success for a company is to be prepared for any risks, when they will occur”.

Since today’s business world relies on the markets’ expansion at a global level more and more companies participating to the international economic activity, the

management activity was faced with new challenges.[1]

This is because, as it is well known, especially if we consider the current economic, social and politic conjuncture, this strategy increases the risk of financial loss, exposing the company, regardless of its field of activity, to country risk.

Therefore, a key mechanism, an integral part of all decisions in international affairs is represented by country risk management.

A component of the international management, country risk represents the totality of strategies undertaken by companies which are becoming internationalized in order to reduce their operations [2]. Adopting such appropriate measures has the effect of reducing the company’s vulnerability.

2. Minimum principles to be taken into account in developing the country risk management systems

The financial institutions are expanding more and more their activity abroad, in order to diversify and expand their sources of revenue and profit.

But, it is well known that this strategy increases the risk of financial loss, exposing the bank to country risk.

Therefore, all banks must have a process for managing country risk which, even though it varies depending on the volume and complexity of the international activities, mandatory includes:

- Written policies and procedures for risk management;
- Supervising the board of directors;
- A system for assessing country risk;
- A system for analyzing country risk;
- A system specially created with the purpose of reporting the country’s exposure;
- The country’s exposure limits;

- Permanent monitoring of condition on the partner country;
- Internal and audit controls.[3]

For example, currently, the rules regarding country risk management for the banks in India, only when the net exposure is equal or greater than 2% of total assets, it is required to formulate a management strategy for country risk. The exposure is calculated by subtracting from the gross exposure the guaranteed, credit insurance, etc.

The policies and strategies, clearly defined, well documented and approved by the board of directors, should focus on indentifying the problems, their measurement and monitoring, and also on establishing the risk tolerance limits. For this purpose it is required to draw clear lines in terms of the responsibility for the country risk management decisions, establishing thus and equilibrium between the local branch managers, the regional management committees and the headquarter management.

The country risk assessment should be undertaken at least once a year. It is advisable to rely on internal systems, but also to relate to the external agencies assessments. Therefore, the local “trends” must be monitored and even those from different countries with similar characteristics.

When conditions deteriorate, the institutions must increase the frequency of monitoring.

If the risk is high, the monitoring must be performed in real time.

The sources of information for conditions monitoring come from subsidiaries, respectively from the reports of local employees, of local country risk assessment departments, but also from external sources.

The level of the allocated resources for conditions monitoring should be directly proportional with the level of exposure and with the recorded level of risk.

Also, the procedures should include the limits of exposure to risk, which are established by the bank’s General assembly. These are, periodically reviewed, at least once a year and should not be greater than the accrue capital. [4]

The frequency for assessing the risk profile of a country must be based on the nature and the volume of exposure of the bank towards this country. For smaller

exposures or countries with a higher degree of transparency, the bank can use the foreign rating agencies.

Furthermore, these limits should not be treated as binding targets, but as maximum limits.

Following the analysis of individual countries, the bank must establish the exposure limits taking into account the followings:

- The bank’s strategy regarding its international activities;
- The bank’s availability to expose itself to risk towards the respective country;
- Understanding the opportunities to operate in the respective country;
- The bank’s predisposition to support international business needs of bank’s local customers.

These exposure limits are proposed for approval by the bank’s executive management board and subsequently are made available to subdivisions and to the involved staff. [5]

Although the exposure limits “country by country” are commonly used, the banks should establish also correlation due to systematic factors. This is because it is recognized that the problems of an unstable country affects also all the countries with which it has close economic ties, debtor profiles, capital markets and similar structures of the financial system.

Sub-limits may be established, which can be classified under the following criteria[6]:

- Due date (short term, long term);
- Type of company (financial institutions, corporation, state owned);
- Country risk type (sovereign, transfer);
- Product type (commercial loans, project finance, derivatives, etc);
- Secured or unsecured;
- Region;
- The economic sector of the debtor;

The banks should monitor regularly the compliance with the exposure limits, and each change must be reported to the board of directors for approval and should be published in the “Annual Report” whereas is important for establishing the value of the bank’s assets and earnings[7].

The procedures comprise as mandatory steps also stress tests and planning scenarios.

This involves early identification of issues that can occur as a result of country risk materialization and of solutions to reduce damage and risk.

Through stress test it is assessed the potential impact of different scenarios created according to the country risk profile.

3. Methods of protection

A protection alternative, in terms of exposure to the risk in the host country, is represented by the provisions.

For example, in the Risk Management Guide for the banks in India it is provided a percentage of net exposure, depending on the degree of risk as follows [8]:

Table.1. Categories of risk for banks in India

Risk category	Class risk ECGC	Provisions percentage (%)
Insignificant	A1	0,25
Low	A2	0,25
Moderate	B1	5
High	B2	20
Very high	C1	25
Restricted	C2	100
Without credit	D	100

Source: Financial Intelligence Unit-India

Banks use 7 ratings, drawn by the Export Credit Guarantee Corporation of India Ltd. (ECGC).

Another option for protection is represented by the subjection of external debtors to the warranty criteria.

To be accepted as provision substitutes in the bank account, the securities must meet the following conditions [9]:

- to cover total exposure;
- to be unconditional and irrevocable;
- guaranteed to meet on demand the obligations;
- to demonstrate they meet the legal requirements;
- the securities must be approved by the board of directors of the guarantor, who undertakes the obligation to inform the bank when changes occur in the financial situation, changes that could negatively affect the ability to honor the guarantee.

In order to check the compliance of these internal rules, the members of the board must ensure that the country risk management process includes also an internal and external audit process, which will provide an opinion on the accuracy of the information used when monitoring the countries, to determine whether the limits of exposure are well defined and reasonable, if there are adjusted according to the rating evolution, etc.

The results are presented in the audit report and are sent back to the bank’s board of directors. But, these steps are reviewed annually, taking into account for their implementation the bank’s experience.

If a few years ago, banks, like all other companies interested in the expansion of their investments across national borders, were more relaxed and less prudent when establishing the investment strategy in a developed country, currently the situation has changed.

This is because the perception towards risk must be reconsidered [10].

Thus, the mere cataloging of national economies in developed/developing countries, unsafe/non-risky is no longer efficient, if we consider that today a developed country can be more risky than a developing one.

We recall in this respect Greece who is far more risky than India, situation which was not true a few years ago, Australia, who increased fees and charges for the sale of resources, even though it is not an unstable economy, poor or corrupt.

Also, the time has passed, when the standards and the best practices for managing the risks had as a source the “Occident”, countries like Brazil, India, China, registering important progress in this direction. Therefore, the increase of country risk is threatening especially the developed countries, and the emergent economies may benefit if the governments continue to improve their policies for attracting foreign investments.

Important in this context is the creativity, the ability to adapt quickly to the new global context because, as A. Einstein argued, “it’s in crisis that inventive is born, as well as discoveries, and big strategies. Who overcomes crisis, overcomes himself, without getting overcome.”

4. Conclusions

Thus, a clear identification strategy, assessment, monitoring and country risk controlling constitutes an essential lever, but not sufficient, through which the bank can avoid engaging in excessive risks due to its international activities.

An important condition for insuring the efficiency of this activity is that the rating given to a country shall reflect its true risk profile whereas, the rating is used as a basis for determining the exposure limits. Precisely why, even though bank can use the assessments made by leading rating agencies, they should not consider them as a substitute for their own assessments.

Reality has shown that when country risk management is not implemented, the cost for compensating loss far exceed those for implementing and application of country risk mitigation strategy.

The most important role of country risk management is represented thus by the opportunity growth which is added to the general management.

In conclusion, “our life is the result of the choices we make. To put the blame on those around us, on the environment, on other external factors, is to give these things the power to control”[11].

Low Costs on the European Shipping

Ion Gr. Ionescu

iionescu_levant@yahoo.ca

Abstract

The freight rates and second hand prices in the dry bulk market seem to be stationary. By unit root tests, an established tool for testing for random walk in economic time series, the random walk hypothesis can be rejected in most cases for the freight rate samples. This result is in contrast to the findings of a number of papers. However, the results confirm classical shipping market that indicate stationary in freight rates, which is not the case if the freight rates follow a random walk. By transforming all observations from US\$ to Japanese yen detrended freight rates and prices seem to become stationary and volatility is reduced.

Key words: shipping, market, costs, freight rates, perspective

J.E.L classification: M16

1. Introduction

There is a large literature on the stochastic property of shipping freight rates and asset value. Recently, a number of empirical studies have questioned the result of many classical papers. The classical view seems to be that freight rates and prices have mean-reversion or trend-reversion properties, whereas the new empirical studies mainly conclude that freight rates and prices follow random walks. This study focuses on the price dynamics of the international dry bulk shipping markets. That is, the paper focuses on the international markets for sea transport of coal, iron ore, grain, bauxite, alumina and phosphates, i. e. the five large major dry bulks, and residual group often referred to as “minor bulks”. Minor bulks comprise a large number of products transported in bulk, e.g. steel, forest products, cement and metals.

If a price process follows a random walk the probability distribution will be independent of its path, i.e. history, and present level. Hence, the probability of a given change in the price process is identical irrespectively of whether the price is high or low. This implies that the price does not change. For example, if the freight rate follows a random walk there is no force that pushes unusually high or low freight rates towards a normal level or a trend.

Early empirical studies of the bulk shipping markets are Tinbergen’s type from 1931 and 1934. These papers are a part of Tinbergen’s major contribution to the development of business cycle theories, but are also seminal from the perspective of maritime economics. The 1934 paper mainly focuses on the freight rate formation during the years 1880 to 1991. The major commodities traded at that time are almost the same as today, even though trade volumes and patterns have changed significantly. Tinbergen derives relations between the freight rate development and demand indexes, tonnage capacity and fuel costs. During the period that Tinbergen studies, there was remarkable technological and organizational development, which reduced transportation costs. This includes lower crew/tonnage ratios, increased fuel efficiency and declining shipbuilding costs. As Tinbergen points out, the competitive pressure in this close to perfectly competitive industry implies that decreasing costs means a downward trend in freight rates.

In the 1931 paper Tinbergen introduces the “durable good cycle”, exemplified by the shipbuilding cycle, in contrast to “non-durable good cycles”. High freight rates trigger ordering of vessels, which will cause a downward pressure a freight rate when the vessels are delivered. But, as it takes time from ordering a vessel until delivery, the fall in freight rates will not be instant and in the meantime very high freight rates may occur. Eventually, freight rates

will return to lower levels and in some cases, even a freight rate depression may follow if too much capacity is constructed. The speed of reversion after a depression will depend on how fast demand catches up with any surplus capacity or in extreme cases surplus capacity may be demolished. Due to the "time to built" effect it is hard to match demand and capacity at all times. Tinbergen argues that both freight rates and shipbuilding tend to move in cycles, and he suggests modeling these patterns as sine waves.

See also Hawdon [1] for a classical paper on related tanker market. The suggestion that freight rates, as part of their stochastic nature, have a downward trend when they are high and have an upward trend when they are low has been referred to as the "mean reverting" nature of freight rates. The assumption of mean reversion in freight rates has been used in theoretical asset valuation papers, e.g. Bjerksund [2] and Tvedt [3].

Tinbergen's two fundamental assumption about dry bulk shipping market prices, the downward trend in price due to increased efficiency and the cyclical or mean reversion pattern due to delayed capacity adjustment, do not seem to hold empirically according to recent studies. On the contrary, results indicate that dry bulk shipping market prices follow random walks.

2. Overview of the modern empirical literature

Berg-Andreassen [4] studies the dry bulk markets by investigating freight rate observations from the Baltic Freight Index (BFI). This index was compiled from freight rates on different dry bulk shipping routes, and was used for futures trading in freight rates at the Baltic International Freight Futures Exchange (BIFFEX). Daily observations from April 1985 to December 1988 are studied for ten selected routes in the BFI. Using the augmented Dickey-Fuller test, which has become the standard tool for testing for random walks, Berg-Andreassen concludes that the freight rates follow random walks. This implies that the process is non-stationary but the first difference is stationary, i.e. it is integrated of order one. Berg-Andreassen also studies quarterly observations from 1980 to 1989 of freight rates and of second

hand prices for dry bulk vessels. The result are equal to those of the daily observations of freight rates, i.e. all series seem to follow random walks. In Berg-Andreassen [5] ten years of quarterly observations from three BFI routes are tested for order of integration. For each of routes both spot freight rates and time charter [6] freight rates are available. Berg-Andreassen concludes that all freight rates are integrated of order one, which indicates that the variables follow random walks. Kavussanos and Nomikos [7] also argue that the BFI follows a random walk. The focus of their paper is to investigate the unbiasedness hypothesis of the BIFFEX futures prices.

Veenstra and Franses [8] study monthly freight rates for three capsize and three panamax [9] routes. Observations cover the period September 1983 to August 1993. using an augmented Dickey-Fuller test without a time trend on the natural logarithm of the observations, they conclude that all series are non-stationary at a 1% level. At a 5% level the null hypothesis of non-stationarity can be rejected for two of the panamax routes. Despite this, Veenstra and Franses assume for the rest of their study bulk markets that the log of the freight rates are integrated of order one. Their main conclusion is that the freight rates follow random walks but are co-integrated. This is also the general result of Veenstra [10].

Kavussanos [11] studies the volatility in dry freight rates, both spot and time charter freight rates. He uses monthly data from 1973 until 1992, where the time charter market is represented by an aggregated freight index and the spot market is represented by an aggregated index as well as data series representing each of the three vessel types; capsize, panamax and handysize [12]. The log of all of these data series is reported to be integrated of order one and are co-integrated.

Glen and Rogers [13] study freight rates index for the Cape size market and find that for all routes the freight rates in level form are non-stationary, but for the first difference the unit-root hypothesis can be rejected.

Hale and Vanags [14] focus on the stochastic nature of relation between the second hand values of handysize, panamax and capsize vessels. They study monthly observations from October 1970 to July 1988 for each of the vessel types, and conclude that all variables are

integrated of order one and, hence, seem to follow random walks.

Glen [15] extends the data set used by Hale and Vanags to cover monthly observations for the period 1979 to 1995. Basically, he confirms the result of Hale and Vanags that the log of the second hand values are integrated of order one. He also concludes that the asset prices are co-integrated.

Kavussanos [16] studies the volatility in dry bulk second hand values. Monthly observations from 1976 to 1995 are studied. When using a methodology for seasonal data Kavussanos reports that the log of all second hand prices are integrated of order one. In the paper time charter freight rates are also studied and are found to be stationary, which contradicts the results of Kavussanos' 1996 paper, but no test of this is presented.

With only a very few exceptions, the evidences seem very strong from the modern literature that freight rates and second hand values in the dry bulk shipping markets follow random walks. This means that high prices not necessarily are followed by lower prices and vice versa. The next section of this paper re-establish the result from the empirical shipping literature as regards the lack of stationarity in dry bulk freight rates and second hand values. For completeness new building prices are also included in this study. Thereafter an alternative perspective is suggested: the study is carried out on the same set, but the denomination of the observations is changed from US\$ to Japanese yen.

3. Data

The dry bulk data set used in this paper are all observations from the SeaWin database, which is based on observations from Clarkson Research Studies Ltd of London, Fearnleys of Oslo or Gothenburg Chartering. Three new building price series are available; the new building price of a 30,000 dwt handysize bulk carrier, a 60,000, to 70,000 dwt panamax bulk carrier and a 120,000 to 140,000 dwt capsizes bulk carrier. The quarterly new building prices in million US\$ are available from 1st quarter 1970 to 3rd quarter 1999, i.e. 119 observations. The three second-hand value series that are available are: the price of a five old 30,000 dwt handysize bulk carrier, a

five year old standard panamax bulk carrier and a five year old standard capsizes bulk carrier [17]. The freight rates are represented both by time charter (TC) equivalent spot rates [18] and spot rates in US\$ per tonne. The time charter equivalent spot rates are denoted in US\$ per day, for a 30,000 dwt handysize bulk carrier, a 60,000 dwt panamax bulk carrier and a 120,000 to 150,000 dwt capsizes bulk carrier. The time charter equivalent spot rates are available from 1988, to 1999 on a weekly basis, a total of 591 observations. The spot rates in US\$ per ton include the cover of voyage related costs and three routes are studied; coal 120,000 tons from Hampton Roads/Roberts Bay (HR/RB) to Japan, coal 65,000 tons from US Gulf? ARA and grain 55,000 tons from US Gulf to Rotterdam. Observations of the spot rate in US\$ per ton are available from 1984 to 1999, a total of 748 observations. In addition, the Baltic freight Index (BFI) is studied. The index has been compiled on a daily basis from 1985. data from 4th January 1995 to 5th October 1999 are studied, i.e. 3722 observations.

The price series of new building and second hand values, that are reported monthly and quarterly by shipbrokers, are based on a very low number of observations. The number of new building contracts and second hand sales fluctuate substantially, and during some months no transactions are carried out at all, or the contracts are related to non-standard tonnage. Hence, data are in many cases not based on actual observations but on the brokers' best estimate of current market. It is more appropriate to use monthly or weekly data for the spot freight rates due to the high number of freight transactions in the market. When it comes to the daily observations of the BFI index, sub-index values are occasionally substituted by the ship brokers' best estimate of the current market in the cases that no transactions has been carried out.

4. The traditional perspective on freight rates and values

To test for random walk, the augmented Dickey-Fuller test is used. This method is applied in most of the empirical papers presented above. Both the augmented Dickey-Fuller regressions with and without a trend are studied.

Generally, it is not possible to reject the random-walk hypothesis. The only exception in our study is the spot rate in US\$ per tones for the coal, 65,000 tones from US Gulf/ARA, rout and grain, 55,000 tones from US Gulf to Rotterdam, rout for which the null hypothesis of non-stationarity can be rejected at 5% and a 10% level, respectively, in case of no trend. This is in accordance with the findings of Veenstra and Franses, that spot rates for the panamax vessels seem to be stationary. Hence, our study confirms the general result that shipping freight rates and values seem to follow random walks but study also confirms that the panamax spot rates may be an exception.

5. The perspective on freight rates and values

Demand for the large dry bulk vessels are mainly generated by transport to Asia and Europe. Iron ore, coal and grain dominate the dry bulk trades. The main exporters of iron ore are South America and Australia (together about 70%) and the main importers are Japan, other Far East and Europe (total about 90%). North America contributes to only a very marginal share of world iron ore trade, about 7% of export and less than 4% of imports. Coal export is dominated by Australia, North America and South Africa (total about 70%) and the main importers are Japan, other far East and Europe (total about 90%). Grain export is dominated by North America (above 60%) and imports re dominated by Asia (above 50%).

North America is unique since the region combines a huge natural resource base with a high degree of industrialization. Hence, the region is almost self sufficient as regards commodities transported in dry bulk vessels and is therefore close to independent of dry bulk shipping services for imports. However, dry bulk vessels are used for exporting coal, grain and some other commodities like forest products, from North America. Japan, on the other hand, is totally dependent on the dry bulk fleet for importing almost any commodity used by the domestic industry.

In the early 1970's European yards were still major players in the market for bulk carrier construction, but for most of the period studied here Japan has dominated the international market. Due to a continuous improvement in

efficiency, Japan has been able to keep its large market shares despite rising wages. Today, also South Korea and China are major suppliers of bulk tonnage in addition to Japan. Europe has a very minor role in this market and the USA has not constructed large bulk vessels for free international trade for decades.

Both from a demand for shipping services and from a ship building perspective Japan is major player in dry bulk market, and in an over-all perspective, Japan together the rest of Asia, is most probable more important for the dry bulk market than the USA. Most transactions in international shipping are, however, carried out in US\$. On the other hand, if the fundamentals in dry bulk shipping, both regards demand for shipping services and the construction of new capacity, are mainly influenced by Asia in general and Japan in particular, then an Japanese yen perspective may be more appropriate when studying the log run relations in the dry bulk markets than usually US\$ perspective.

Below the unit root analyses are repeated but all observations of new building prices, second hand values and freight rates are converted from US\$ to a Japanese yen denomination, using each periods' end Yen/US\$ exchange rate.

By changing the denomination of the data from US\$ to Japanese yen the dry bulk freight rates seem to be stationary. Time charter equivalent spot rates for panamax and handysize dry bulk carrier seem to be stationary around a trend, i.e. trend-reverting. The trend seem to be slightly downward, as we should expect from gradual improved efficiency in a close to perfectly competitive market. The freight rates, measured in yen per ton, for 65,000 tons of coal and 55,000 tons of grain, i.e. panamax lots, seem to be stationary, maybe a slight downward trend. For time charter equivalent capsize spot rates we cannot rule out the random walk hypothesis, even from the yen perspective. The freight rate in this market seems to be more volatile than the freight rates in the market for the smaller dry bulk vessels. The number of capsize vessels is much lower than the number of panamax and handysize vessels and long-term contracts are more frequent. Hence, the capsize spot market may be more exposed to short-term market imbalances than the markets for smaller vessels. This may explain the lack of structure in capsize freight rates. However, at a 10% level the yen

per tone freight rate of 120,000 tons of coal, i.e. a capsized lot, seems to be stationary.

The BFI in this data set is a combination of capsized, panamax and handysize freight rates and of US\$ per ton freight rates and short time charter freight rates. At a 5% level of significance the random walk hypothesis can be rejected for the BFI. Hence, the stationarity result for the BFI is not as strong as for the panamax and handysize freight rates but stronger than for the capsized.

For the newbuilding and second hand values we cannot reject the random walk hypothesis when values are measured in Japanese yen. The only exceptions are the capsized and panamax values at a 10% level of significance. The second hand market does not directly influence the total transport capacity or the utilization of the existing capacity, as the new building and freight market fundamentals, which to such a large extent are governed by the development in the Asian economies. The main asset players in the bulk markets are independent owners in Europe, especially Greek shipowners. Traditionally, they have a US \$, or local currency, perspective on their investments. Nevertheless, in the long run second hand values should follow a pattern consistent with the trend in new building values and freight rates. A five-year-old vessel, like in the available data, may for another 15 to 25 years, and therefore, the value of the vessel is in most cases heavily influenced by new building prices. From the unit root tests, it seems as if the new building prices follow a random walk whereas the freight rates are stationary. Hence, it seems reasonable that there are only weak indications of stationarity in second hand values.

6. Conclusions

By changing the perspective from US \$ to Japanese yen freight rates in the dry bulk shipping industry seem to be stationary. These results apply to all “deep sea” dry bulk vessels sizes, i.e. handysize and panamax vessels. Hence, the empirical result confirms what traditional models of the shipping markets suggest. That is, high freight rates trigger increased supply via new building and increased utilization of existing tonnage and low freight rates trigger reduced supply via lay-up and

scrapping of vessels. Therefore, freight rates are mean reverting.

The dry bulk shipping markets are mainly influenced by Asia, both as regards demand for shipping services and ship construction. Non-Asian ship owner generally view international shipping as a US\$ industry. This study indicates that this perception may be somewhat misleading, since yen denominated prices probably better reflect the fundamental changes in the industry and, hence, give more valuable feedback to the market agents. Investing in a shipping asset probably means to go long in a yen related asset, which implies a substantial exchange rate risk from the perspective of an investor who wishes to maximize his US\$ fortune.

In recent years China’s position in the dry market has increased significantly. Hence, future studies along these lines may include a basket of Asian currencies, not only Japanese yen. For prices in other markets the choice of the most appropriate currency, or basket of currencies, may not be straightforward. Nevertheless, the currency that for historical reasons is used for international transactions may very well be inappropriate when searching for long run economic fundamentals.

[17] The size of the representative cape size carrier is increased from 120,000-140,000 dwt to 155,000 dwt, after 1994.

[18] The time charter equivalent spot rate is the income of a ship on a daily basis less voyage related costs. That is, bunker and harbour and channel charges are deducted from the transport

revenue. This makes the spot freight rate comparable to the time charter freight rates.

Is the Adhering to the EU a Way to Face the Crisis’ Challenges ?

Ionescu Romeo
Danubius University, Romania
ionescu_v_romeo@yahoo.com

Abstract

The paper realises a comparative analyses between an EU member state, a candidate one and Switzerland, in order to point out the importance of the adhering to the EU under the present global crisis using the main economic indicators during 2007-2011 and to understand why Switzerland is better placed as Germany under the crisis’ impact. A distinct part of the paper deals with the analysis of the recovery packages implemented by these three economies in order to face the crisis and their effects. Moreover, the paper realise forecasts for 2012 and 2013.

There are two main conclusions of the paper. First, it is not necessary to adhere to the EU if the economy is efficiently. Second, Switzerland will not adhere to the EU on short-term and it has pertinent argues to do this.

Keywords: business efficiency, economic recovery, national identity, foreign exchange intervention.

JEL Classification: F15, F43, O11.

1. Introduction

The Central Europe represents, by its position, the geographic, political and economic nucleus of the EU27. All countries from Central Europe adhered to the EU, excepting Switzerland. This is why we consider being usefully to realise a comparative analysis between Germany and Switzerland. Both countries are placed in Central Europe. First of them is foundation member of the EU and one of the most important economies in the world. Switzerland is not member of the EU, but it is one of the most efficient economies in the world. On the other hand, Iceland became an active candidate country to adhering to the

EU.

The latest report of the World Economic Forum ranks 139 countries by assessing business efficiency, innovation, financial markets, health, education, institutions, infrastructure and other factors [1], [2].

In this top, Germany ranks the 6th position with a score of 5.41. It ranked the 11th rank in the world according to basic requirements and the 13th rank according to the efficiency enhancers. The best German economy rank (5th) is based on innovation and sophistication factors.

Switzerland achieved the 1st rank in the same top, with a global competitiveness score of 5.74. It held on to the top spot in 2011, thanks to high ranks for basic requirements (3rd); innovation and sophistication factors (1st) and the second-most efficiency enhancers in the world, per the WEF.

Iceland had the 30th rank in the top with a global competitiveness score of 4.75. Its best rank (21st) is connected to innovation and sophistication factors. According to basic requirements and efficiency enhancers, Iceland ranked 31st and 33rd ranks in the world economy.

But Germany is the “steam engine” of the EU’s economy. Still the early industrial era, the German economy was a leader, an innovator and a beneficiary of the world economy globalisation. Nowadays, services support about 70% of GDP, industry – 29.1% and agriculture 0.9%. The German representative goods are cars, mechanical systems, metallurgical products and chemicals.

Germany has a strategic geographic position; it adjoins Denmark, Netherland, Belgium, France, Luxembourg, Switzerland, Austria, Czech Republic and Poland.

Switzerland became a member of the UN in 2002. It adjoins Germany, France, Italy, Austria and Liechtenstein [3]. Its economic policy is based on the idea: “thinking

globally, working in partnership and acting nationally”.

Switzerland economy depends on the foreign processes, especially of globalisation. The country has a modern approach of the international relationships. As a result, the Swiss foreign economic policy is focused on three axes: the agreements with the EU, the free trade agreements with EFTA and the international trade progressive liberalisation under the WTO. Even that the EU is the main trade partner, Switzerland refused to adhere to the EU still 1992.

On the other hand, the Swiss economy is very stable, with a stable currency and with the “legendary” financial transactions’ secret, which transformed it into a “financial Eden” for investors and investment. Practically, the Swiss economy is based on the constant FDI flux. Nowadays, Switzerland became a model for other countries, based on precision and fine industry, trade and finances. As a neutral country, Switzerland offers a safe banking climate and good investment environment.

R&D is very important; the Swiss economy spends 2.9% of GDP to these activities. Only four other countries in the world have greater expenditures to R&D than Switzerland: Israel, Sweden, Finland and Japan.

Almost whole labour activates in services and in SMEs. 99.7% of the Swiss enterprises have less than 250 workers. On the other hand, Switzerland has 12 companies in Global 500 top in 2010 [4]. These companies are the following: Nestle, Novartis, Roche, Credit Suisse Group, UBS, ABB, Zurich Financial Services, Syngenta, Holcim, Richemont, Swiss Re and The Swatch Group.

Germany has 20 companies in the same top: Siemens, E On, SAP, Deutsche Telekom, Basf, Allianz, Bayer, Daimler, RWE, Deutsche Bank, Volkswagen, Munich Re, BMW, Henkel, Deutsche Post, Linde, Metro, ThyssenKrupp and Fresenius Medical Care.

Iceland started a powerful economic recovery in 2011, which is forecasted to continue in 2012 and 2013. It will be supported by high private consumption growth rates and a important gross fixed capital formation process.

2. The evolution of the German, Iceland and Swiss economies during 2007-2011

In 2007, the German economy had a GDP growth rate of 2.7% and the Swiss economy of 3.1%. The economic conjuncture was favourable during the first months of 2008, but the Swiss economy was not able to avoid the negative effects of the crisis from the financial markets and the global economy’s slowdown. Iceland was the same economic growth rate as Germany in 2008.

During 2008-2009, the GDP growth rate decreased in Germany, from 1.1% to -5.1%. In 2010, the German economy emerged from the crisis and the GDP growth rate was 3.7% (2.9% in 2011). The EU forecasts talk about GDP growth rates of 0.8% in 2012 and 1.5% in 2013 [5],[6].

Switzerland faced to the same lower GDP growth rates in 2008 (1.8%) and 2009 (-1.9%) as a result of the global crisis’ impact [7]. In 2010, the economic growth rate was 2.7% and in 2011, 1.7%. The forecasts are optimistically: 1.9% in 2012 and 1.8% in 2013 [5],[6].

Figure 1. Economic growth rates in Germany, Iceland and Switzerland (%)

Source: personal contribution using EC information

Iceland started with a GDP growth rate of 1.3% in 2008. It was followed by two difficult years, 2009-2010, when the economy achieved negative growth rates (-6.7% and -4.0%). The forecasts talk about positive growth rates: 1.5% in 2012 and 2.7% in 2013 [6]. The trend of the GDP growth rate in Germany, Iceland and Switzerland is presented in Figure 1.

Practically, the three countries will have the same economic evolution during 2012-

2013, even that only one of them is member of the EU27.

An important effect of the global crisis is that on the labour market. The unemployment rate in Switzerland was relatively low. It varied between 2.8% in 2008, 3.8% in 2009 and 4.2% in 2010. The unemployment rate started a decreasing in 2011. The unemployment rate will decrease, from 3.2% in 2012, to 3.0% in 2013.

Germany faced to higher unemployment rates: 7.5% in 2008, 7.8% in 2009 and 7.1% in 2010. The forecasts talk about a relative decrease of the unemployment, from 6.1% in 2011, to 5.9% in 2012 and 5.8% in 2013 [5].

The unemployment rate in Iceland was lower in 2008: 3.0%. It increased to 7.2% in 2009 and 8.0% in 2010. The same recovery process started in 2011, when the unemployment rate was 7.6%. The forecasted unemployment rates will be 7.3% in 2012 and 6.7% in 2013.

According to this indicator, Switzerland had a better position. Moreover, the forecasts are better for Switzerland than Germany (see Figure 2). The unemployment rate in the Swiss economy is lower than in many other EU's member states, as well.

Figure 2. The unemployment rate trend (%)

Source: personal contribution using EC information and www.tradingeconomics.com/Economics/Unemployment-rate.aspx?symbol=CHF

Another important economic indicator is the inflation rate. Germany achieved low inflation rates during 2008-2011: 1.8% in 2008, -0.8% in 2009, 0.2% in 2010 and 1.4% in 2011. The forecasts talk about 0.7% in 2012 and 0.8% in 2013.

Switzerland performed negative inflation

rates: 2.4% in 2008, -1.7% in 2009, -0.4% in 2010 and -0.3% in 2011 [7], [8]. The deflation from 2009-2011 was supported by core measures which were closed to deflation. Moreover, Switzerland began to intervene in the currency markets, buying up large amounts of Euros between March 2009 and June 2010. The forecasted inflation rates will be 0.1% in 2012 and 0.4% in 2013.

Iceland started to high inflation rates: 11.8% in 2008 and 15.3% in 2009, but succeeded to decrease them, from 6.5% in 2010, to 3.1% in 2011. The recovery process will continue: 2.6% in 2012 and 1.8% in 2013 (see Figure 3).

Figure 3. The inflation rate trend (%)

Source: personal contribution using EC information

During 2008-2009, Switzerland had inflation rates greater than Germany. Moreover, both economies faced to deflation in 2009. The forecasts are more optimistically for the Swiss economy. As a result, the differences between the inflation rates in Switzerland and Germany will grow.

Many specialists consider that the greatest impact of the present global crisis is on the foreign trade. The German economy quick recovery was supported by the world trade terms improvement and the high competitiveness of Germany's export sector. The German exports grew by 13.7% in 2010, after an important decrease in 2009 (-13.6%). Some moderation of export growth is projected for 2012 and 2013, reflecting still relatively weak demand from some key trading partners which are exiting the crisis

more slowly and a certain normalisation of the situation after the sharp post-crisis bounce-back in global trade. On the other hand, the imports are projected to grow faster than exports in 2012-2013. As a result, the growth contribution of net exports would move close to zero (-0.6% in 2012 and -0.2% in 2013). The recovery of world trade will remain crucial to sustain the upswing of the German economy, including domestic demand.

Switzerland succeeded in exports rebounded strongly in the second quarter of 2010, mostly due to strong growth in pharmaceutical and machineries exports to Asia. The exports' growth rate during the present crisis, had the lowest level of -8.6% in 2009, but it achieved a peak of 8.4% in 2010. The real growth in exports of goods and services is expected to continue more moderately in 2012-2013. On the other hand, the imports will grow in a similar way, albeit slower than exports, and subsequently, the net external contribution to Swiss GDP growth should be slightly zero towards the end of the forecast period.

Figure 4. The foreign trade trend (%)

Source: personal contribution using EC information

Iceland succeeded in achieving exports positive growth rates during 2008-2011, with a peak of 7.0% in 2008. The trend will be positive: 2.1% in 2012 and 3.0% in 2013. On the other hand, the imports had high negative growth rates in 2008 (-18.4%) and 2009 (-24.0%). The recovery started in 2010. The imports annual growth rates will be higher than those of the exports: 3.3% in 2012 and 3.9% in 2013 (see Figure 4).

3. The economic recovery packets implemented by Germany, Iceland and Switzerland during the present global crisis

Under the European Economic Recovery Plan, Germany implemented two stimulus packages (autumn 2008 and January 2009) which covered measures connected to incomes and expenditures, in order to support the households, to improve the access to financing, public investment and training.

The German government approved a big stimulus package (50 billion Euros) and a supplementary budget which covers tens of billion loans. The next package covers infrastructure investment, tax decreasing and support for the automotive.

The supplementary budget was connected to loans of 36.8 billion Euros in 2009 and 50 billion Euros in 2010. As a generally point of view, the funds are oriented to the most affected areas. Some instruments are temporary, but others are permanently. The main economic measures implemented by the German government are:

- funding protection: at the end of 2009, Kreditanstalt für Wiederaufbau (KfW) created a supplementary financing instrument of about 15 billion Euros;
- investment stimulating: still 2009, the German government decreased the depreciation rate of the movable assets by 25% and extended the special depreciation facilities for SMEs, by increasing the asset and income thresholds to 335000 Euros and 200000 Euros, as well. The Federal Government stimulated supplementary investment for the building energy efficiency and the CO₂ pollution decrease using 3 billion Euros in 2009-2011. Moreover, KfW will finance the less structural financed regions with other 3 billion Euros;
- tax incentives for families: still 01.01.2009, the German Government grew the taxable income deductions' level for those traders which use maintenance and renovation services and doubled the taxation decrease to 20% of 6000 Euros. This measure will operate during 2009-2011;
- automotive facilities: exemption of payment of first registration for 1 or 2 years for those cars which achieve Euro 5 and Euro 6 auto standards. The German government will action in order to establish acceptable

regulations related to the CO₂ emissions at EU level in 2012;

- SMEs’ supporting: Germany signed agreements with EIB in order to obtain loans from SMEs: 5 billion Euros in 2007, 8 billion Euros in 2009 and 8.5 billion Euros in 2010;
- jobs’ security and training: extension of the special program for those workers with advanced age and low skilled, in order to prevent their reduction.

The Swiss government announced first stimulus package on November 2008. It was about 890 million CHF. In 2009, Switzerland implemented another recovery package of 700 million CHF. The main reason to implement the second package was the worst economic outlook and it used short-term target measures. The second package supported the rail and road infrastructure, R&D, environment, energy and tourism. Other measures were focused on strengthening export risk insurance, access to buildings and property encouraging, allowances extension related to the work time reduction and specific fiscal measures for families. The CHF appreciation decreased the Swiss exports. On the other hand, the financial problems of the UBS represent challenges for the Swiss economy under the global crisis. As a result, the government prepared the third economic recovery package.

The National Bank of Switzerland decreased the interest rate, from 0.5% to 0.25%, a historic minimum, and bought foreign currencies and bonds in 2009 [9]. It was for the first time when a central bank from a developed country included the foreign exchange intervention as a component of the monetary policy.

After this action, the National Bank of Switzerland announced that it remains ready for a steady action in order to prevent an irrational appreciation of the franc against the Euro [10].

In the context of the three-year collective wage agreement adopted in spring, the Iceland government took additional spending commitments, comprising additional public investment as well as social protection, active labour market policy and education measures. As a result, expenditure adjustment measures in 2011 are expected to account for 1% of GDP instead of 2% as initially foreseen, and total spending is likely

to exceed the initial level. A continuation of fiscal consolidation is, however, assumed for 2012 and 2013, leading to a gradual reduction of the fiscal deficit and allowing for a marginal decrease of the general government debt-to-GDP ratio below 90%.

As a result of the recovery packages, the three countries tried to improve their general government gross debts. The EU forecasts talk about the Switzerland’s success in decreasing this debt. Germany and Iceland will face to the same high general government gross debt (see Figure 5).

Figure 5: The general government gross debt trend (% of GDP)

Source: personal contribution using EC information

4. Conclusions

The Switzerland’s position is difficult to explain related to its geopolitical position, because it has common borders with France, Germany and Italy, which are foundation members of the EU. Moreover, Switzerland is not an island as Iceland. On the other hand, Switzerland represents a success story of multiculturalism, because it adopted French, German and Italian religions, languages and cultures, as well. From the political point of view, Switzerland has a political regime and political parties like its neighbours.

From a demographic point of view, 870000 EU citizens are residents of Switzerland and 700000 citizens cross the borders in both directions every day.

The Swiss economy is powerfully integrated in the EU: 60% of the Swiss exports and 80% of the imports are related to the EU.

All these above elements can support an easy adhering of the Switzerland to the EU, but it is far from being realised yet. The main element which supports it is the “national

identity”, because Switzerland didn’t faced to wars, dictatorship, foreign occupation and colonisation during the latest two centuries [12].

On the other hand, the Swiss political regime is very interesting: a law can be put under a referendum if 50000 of Swiss citizen do not agree it. Practically, this direct democracy represents one of the most important obstacles against Switzerland’s adhering to the EU.

There are important economic reasons to deny the integration. The Swiss employers are the only European employers which do not agree the adhering, because it would cause an important VAT increase (from 7.6% to 15%) and a more important financial contribution to the EU budget of 3.5 billion CHF.

On the other hand, Switzerland signed 120 agreements with the EU. Under the present global crisis, the EU’s position became more aggressively and the cooperation the Swiss economy more difficulty.

As a result, the short-term adhering to the EU is impossible, as long as the Swiss citizens benefit of a lot of the EU advantages and are not forced to face the inconveniences.

On the other hand, Iceland forced the adhering to the EU27. It is able to achieve and to maintain the EU economic standards, but it faces to a high gross public debt (92.4% of GDP in 2011). We really cannot see the advantages of the adhering for Iceland.

An indication would be made: it is relatively simple to adopt a position like Switzerland made, but only the economy is able to achieve the same results like the Swiss one. For Romania, for example, such a position is impossible.

Nowadays, the adhering to the EU is the best solution for two kinds of economies: those which are able to achieve at least the same economic performances as the EU average and other economies, which are not able to find another solution to their economic environment improvement [13].

The Role of Knowledge and Innovation for Sustainable Development. Research on European Union Countries

Kardos Mihaela

„Petru Maior” University; Faculty of Economic, Juridical and Administrative Sciences
mihaela_kardos@yahoo.com

Abstract

In contemporary society knowledge and innovation are seen as vital sources and driving forces for sustainable development, one of the major goals in the world we live today, a subject of great interest for researchers and policy makers. Given this context, the paper aims to analyze and determine the role of EU countries performances in innovation, in generating knowledge, in promoting and using high “green” technologies for their progress towards sustainable development, as evaluated by different systems of measurement for both issues of interest.

The methodology is based on methods of analysis and synthesis, of interpretation and relevant comparisons. The paper focuses on identifying the successful key factors of knowledge and innovation systems in determining a sustainable approach and behaviour in society. The results of the research may have a large impact for scientific community preoccupied with knowledge, innovation and sustainable development issues.

Key words: knowledge, innovation, sustainable development

J.E.L. Classification: Q01, O32

1. Introduction

Achieving sustainable development, most common defined as “the development that meets the needs of the present without compromising the ability of future generations to meet their own needs” [1] requires an understanding of the complex interplay of environmental, economic, and social processes at different scales, from local to global.

While many factors play an important role in development, knowledge and innovation have always been recognized to be critical tools for advancing sustainable development. In contemporary society knowledge and innovation are seen as driving forces for growth and changing factors through new technologies, generating worldwide a higher and higher interest for research, development, information, technology and their roles in society [2].

In this generous context of analysis we bring into discussion the way in which the performance in knowledge creation and innovation is reflected in the progress towards sustainable development, in order to identify the successful key factors of knowledge and innovation systems for sustainable development. The subject, of great interest for scientific community and policy makers, is obviously extensive and complex and needs to be approached from different perspectives. The paper cannot and does not attempt to offer answers to all questions, rather it sets a stage for discussion, exploring some of the many ways in which knowledge and innovation are used in connection with sustainable development.

The paper is structured in two parts: the first part presents some landmarks from literature regarding knowledge and innovation roles for sustainable development and the second part approaches a research on this topic for the European Union (EU) countries, using methods of analysis and synthesis, of interpretation and relevant comparisons. The paper ends with a section of conclusions regarding the main ideas of the empirical research, with implications for further research.

2. Knowledge and Innovation for Sustainable Development: Literature Review

Making knowledge and innovation serve sustainable development is a complex challenge, because all concepts cover several aspects which need to be addressed.

Debates about the relationship between science, knowledge, technology, innovation and development have a long history, with formal discussions going back more than 40 years, a period of time of great interest for determining the potential of science and innovation to address development challenges.

Before making any analysis on the topic, it would be necessary to clarify some of the concepts involved. Amongst many possible definitions, *science* can be defined as the process of generating *knowledge*, *technology* refers to the application of *scientific knowledge*, while *innovation* refers to developing new ways of doing things in a place or by people where they have not been use before. Innovation makes use of science and technology, but it goes far beyond them [3]. Thus, innovation could be considered the embodiment, combination or synthesis of knowledge in original, relevant, valued new products, processes or services [4].

Different studies have showed that knowledge and innovation offer powerful opportunities for developing and disseminating approaches which help the transition towards sustainability [5]. Innovation can foster and promote sustainable development as long as it is not limited exclusively to environmental technologies, but considers a combination of all forms of innovations potentially conducive to sustainable development: process innovations, product innovations, organizational innovations and market innovations [6]. Innovation is, therefore, not simply a matter of installing devices, but of transforming society and its value systems [7], it isn't just about developing new technology, but includes new processes and new ways of solving old problems through creative thinking [8].

Innovation combined with scientific research has always constituted a driving force of transformation in our societies, as any form of innovation involves change [9], but the scale of innovation is also relevant. It is considered that only disruptive, unpredictable innovation can change our unsustainable patterns [10], [11].

We live in a time of unprecedented advances in knowledge creation, technology and innovation, all playing a prevalent role in the globalization of exchanges, in the creation of new living patterns and in the distribution of assets, knowledge and products. The world is globalised and interconnected more than ever, but, in spite of great efforts and the evident progress worldwide, there are still socioeconomic disparities, both within and between countries.

First research agendas on the subject [12] argued that focus should be oriented towards increases in investment and funding, as well as building up of institutions and infrastructure - to support science, technology and innovation in and for the interest of less developed countries. This kind of initiatives contributed to significant achievements in time, as the scale of science and technology for development has increased.

However, dimension has proved not to be the most important feature. Due to a combination of factors, as well as socio-political environments and education systems discouraging creativity, innovation and entrepreneurship, globalization does not concur with a widespread reduction of inequalities.

Current pattern and debates about the linkage between science, innovation and development argue that much more attention should be given to the *direction*, *distribution* and *diversity* of scientific, technological and innovative activities [13].

Moreover, education reform should be a top priority, aiming to focus on initiatives which stimulate creativity, sustainability and original thinking. New models of intellectual property protection need to be devised in order to stimulate technology diffusion to all areas of the world. Resources should be channelled towards generating new tools and technologies into the hands of people who need them most. Generally speaking, we need social and political environments respecting human rights, freedom of speech, justice and the rule of law, as without these kinds of reforms sustainable development initiatives are less effective [14].

As stated by “A New Manifesto”, a new critical global politics of innovation is needed, requiring fundamental redistributions

of attention, resources and power. The result will be a flourishing of a more vibrant and creative diversity of pathways – scientific, technological, organizational and social.

3. The Relation between Innovation and Sustainable Development in European Union Countries

Both innovation and sustainable development are difficult issues to measure and there is no one method agreed upon, as both are very complex, multi-dimensional concepts.

Still, there are different systems of measuring and evaluating the level of sustainable development or the innovation performance at country level.

3.1. Research Methodology

In order to establish the research sample – two groups of EU countries: one group of countries appreciated as more sustainable developed and another group of EU countries considered less sustainable developed, we approached the following methodology. We took into consideration the country rankings according to two of the most relevant indicators of sustainable development: Human Development Index (2011 Ranking) [15] and Environmental Performance Index (2010 Ranking) [16].

In the research sample of the group including more sustainable developed countries we chose to include the countries found in both of the rankings, considering the top 10 EU countries in each ranking. Thus, these countries are: Austria (AT), France (FR), Germany (DE), Netherlands (NL) and Sweden (SE).

Applying the same procedure, but choosing the countries found in both of the rankings among the 10 EU countries with the lowest scores (at the bottom of the rankings), we established the research sample of the group including less sustainable developed countries: Bulgaria (BG), Estonia (ES), Hungary (HU), Malta (MT), Portugal (PT) and Romania (RO).

In order to evaluate the innovation performance of the selected countries and to highlight the type of connection with their level of sustainable development, we took into consideration the results presented by

The Research and Innovation Union Scoreboard 2011 [17].

This report provides a comparative assessment of the innovation performance of EU countries, based on The Summary Innovation Index (SII), which distinguishes between three main types of indicators, measuring eight innovation dimensions (*Enablers*: ‘Human resources’, ‘Open, excellent and attractive research systems’, ‘Finance and support’; *Firm activities*: ‘Firm investments’, ‘Linkages& entrepreneurship’, ‘Intellectual assets’; *Outputs*: ‘Innovators’, ‘Economic effects’) with a total of 25 different indicators.

For data interpretation we used methods of analysis and synthesis, of interpretation and relevant comparisons.

Although providing a synthetic, relevant imagine for the connection between innovation and sustainable development, the research methodology generates some limitations, as the dimension of the analyzed groups of countries and the research character might not lead to generalised results. However, it may be a starting point for further research, by analyzing other dimensions of the topic using complementary methodology.

3.2. Research Results

For the selected countries, innovation performance is presented in Figure 1, as follows.

Figure 1: Innovation performance of the selected countries (SSI 2011)

All investigated countries in the group of those more sustainable developed score

above the EU average and place themselves as innovation leaders (Sweden – the highest score in EU, and Germany) or innovation followers (Netherlands, Austria and France). Innovation leaders and followers share a large number of strengths in their balanced national research and innovation systems, with a key role of business activity and public-private collaboration, reflected in their level of sustainable development.

Also, all investigated countries in the group of those less sustainable developed score below EU average and place themselves as modest innovators (Bulgaria and Romania) or moderate innovators (Malta, Hungary, Estonia, Portugal), being characterized by unbalanced research and innovation systems, with impact and consequences for their development.

In order to identify the strengths and the weaknesses of the research and innovation system of the selected countries, in correlation with their level of sustainable development, we present their innovation performance according to the eight dimensions mentioned above (Figure 2).

Figure 2: Innovation performance per dimension of the selected countries (own calculations according to SSI 2011)

The investigation of the selected countries regarding their innovation performance per dimension highlights that all countries in the group of those more sustainable developed

prove relative strengths in all of the eight dimensions, with the highest scores for “Research systems” and “Intellectual assets” indicators. This demonstrates their interest and capacity in building open, excellent, attractive research systems, as well as in supporting development of intellectual capital, both reflected in the outputs of the innovation activity, given also the high level of human resources qualification.

The investigated countries in the group of those less sustainable developed, for all dimensions score much lower than those in the group of more developed countries. The lowest scores are registered for the following indicators: “Linkages& entrepreneurship”, “Innovators” and “Finance and Support”, suggesting weak linkages between the science base and enterprises, insufficient and/or inefficient use of R&D funding, particularly reflected in the very low shares of SMEs introducing product or process innovations, as well as SMEs introducing marketing and organization innovations.

The most visible differences between the two groups of the selected countries are recorded for the following dimensions: Intellectual assets, Research systems and Finance and Support, all reflecting weaknesses at the level of inputs for innovation performance.

Our analysis, as presented above, emphasizes the strengths and the weaknesses of the innovation systems in the investigated groups of countries, suggesting the key factors of success in generating innovation performance. Thus, one of the priorities aims the reform of the research system, for a better administrative capacity and infrastructure, for making it more attractive to quality human resources. Increasing the volume of funding and financing for research, development and innovation (public or private) is also very important, but more important is their efficient allocation and use. Another engine of the innovation mechanisms comes from the private sector; therefore, it is necessary to strengthen innovation capacity of companies by stimulating applied research for innovative products and services, by improving cooperation between industries and research centres. One of the solutions is partnerships and scientific collaboration, supported by a creative friendly environment.

4. Conclusions

Generating and using knowledge is a vital source of sustainable development. Knowledge creation and innovation generate the emergence of new ways of thinking, new approaches and new solutions, which influence our thinking, acting and living sustainable.

Our research points out that countries with more sophisticated innovation systems are placed in the top of the rankings for sustainable development, while countries with weaker innovation performances have lower scores of sustainable development.

To support sustainable development, knowledge and innovation systems need open, flexible, performant research systems, better and more efficient financed, as well as supporting innovation initiatives and activities in the business sectors, both interconnected through partnerships and scientific cooperation. All these work as engines for change in the new development paradigm, to address both present and future challenges.

Decent Incomes in the European Union

Marcean Dana - Elena
dana_marcean@yahoo.com

Abstract

Income is one of the basic pillars of the global economic system. Whether it is salary, profit, dividend, interest rate or rent, the main purpose is to obtain an income as big as possible.

Current open market economy lead to the fact that incomes considered satisfactory just a few years ago, became today insufficient. Changes in the availability of natural resources, national and international economic context, inflation, unemployment, fiscal policies, Griffen and Veblen effects and a lot of other factors of different nature determine the reducing of purchasing power of money, subjecting income to a range of pressures.

The risk of poverty, exacerbated by the international economic recession, has led the international organizations to pay special attention to this macroeconomic segment.

Key Words: work, income, risk, poverty.

JEL Classification: E24, J31, J83.

1. Introduction

The world is permanently changing, economic conditions evolving independent of the general-human will, which follows continuous economic development. Contrary to the wishes of all, the cost of living follows an upward trend, not always correlated with the income trend.

The general characteristics of global income are divergence and diversity. Thus, in some parts of the world if a particular activity is remunerated with a sum of money, in other parts, the same activity can generate a revenue much different.

Although the starting point of this problem is the standard of living specific to each economy in part, its effects have manifested at multidimensional level, economical, social,

demographical and educational, affecting the society as a whole.

2. The concept of „decent work”

The concept of "decent work" was developed by the International Labor Organization (ILO) in 2000. At the Millennium Summit it was adopted the Agenda for Decent Work. The term "decent work" contains a international objective in order to support the improving of working conditions, beyond the fundamental social rights, regarding these two issues separately.[1] In conjunction with the elimination of discrimination at work, guarantee of social protection, abolishing exploitation, ensuring a good dialogue with unions, decent work focuses on the ensuring of decent wages for workers and their families, allowing them a decent living.

Although brought in discussion recently, this concept has its source in art. 23 of the Universal Declaration of Human Rights adopted on 10th of December 1948 by the UN General Assembly which states: "Everyone has the right to work, to free choice of employment, to just and favorable conditions of work and protection against unemployment. Every people without any discrimination, has the right to equal pay for equal work. Everyone who works has the right to just and favorable remuneration that would provide for himself and his family an existence worthy of human dignity and supplemented, if necessary, by other means of social protection ". [2]

Annually, on 7th of October, it is celebrated the International Day of Decent Work. Although the economic and social world is at a crossroads, the world is faced with a situation that seems apparently paradoxical: although globalization opens new opportunities for economic and technological development there is an increase in the debates and promotion of the quality aspects of this development, its impact on the environment and social stability.

Agenda for Decent Work stipulates the uniformity of the comprehension of "decent

work", all the measures managed by now in this project standing at a conceptual level. Its medium term goal is to achieve a single system in order to assess all the progresses of the participating countries in implementing the principles of decent work. [3]

3. Romania in European context

In David Copperfield by Charles Dickens, one of the characters, Micawber, says: "The annual income is 20 pounds, annual expenditure is 19.96, results happiness. Annual income is 20 pounds, annual expenditure are 20.06, results mess." [4]

"Decent" is a purely subjective term. If a so-called average value is higher than what a household earns, then that value is the decent, the desirable one. In modern terms, if the annual expenses are less than the income, you have a good life. People can always spend more than they have and then consider themselves unhappy with their own revenues.

Figure 1: Household Net Income (2011)

Source: World Economic and Financial Surveys, International Monetary Fund, Press Report Release, September, 2011.

As shown in Figure 1, incomes had an upward trend during 2002-2006. The year 2007 was marked, in addition with the world economic crisis, by a deep reduction of incomes. This can be explained, in conjunction with many other elements, by the continuous migration of multinational companies. Their goal is to achieve minimum production costs. This is a generally true fact, but it was overly stressed by the economic crisis. Thus, different countries with developing economies are permanently competing to be chosen as the location for various suppliers in order to

provide cheap workforce and other favorable conditions for businesses, but often disadvantageous to workers.

In conjunction with this issue, ambiguous legislation may offer the possibility to be violated. Therefore, to achieve the proposed targets, multinational companies are constantly relocating. Initially, they relocated within the European Union, then in developing countries outside the EU, depending on the country that offered the “best” conditions.

All these elements lead slowly, but surely, to poverty. According to a Eurostat survey 8.6% of EU workers were at risk of poverty, in the year 2010. Therefore, from the whole of 81 million Europeans situated at the risk of poverty, 17 million are workers. [5]

Figure 2: Percentage of the Population With High Risk of Poverty (2010)

Source: <http://ec.europa.eu/social>

Romanian experts in this field say that the number of workers at risk of poverty is 50% of the total Romanian workers; they are paid the minimum wage - 700 lei. "They cannot afford the basket containing those expenditures absolutely necessary for living, shopping cart which we have calculated at about 950 lei. This means that they, the 1,7 million Romanian employees, are living below decent conditions". [6]

Figure 3: The Evolution of Minimum and Medium Gross Wage in the Economy in Romania (2005-2011)

Source: <http://www.mmuncii.ro/statistici-55-view.html>

Between the minimum wage and the average there is an indissoluble connection. The percentage that the minimum wage represents in the average salary is a very widely used indicator. Thus, the European Union has set a target close to a ratio of 50%, concluding that the minimum wage should be half of the medium one.

Table 1: Average Gross and Net Wages in Romania in Lei (2005-2011)

Year	Gross	Net
2005	968	746
2006	1146	866
2007	1396	1042
2008	1761	1309
2009	1845	1361
2010	1902	1391
2011	1963	1471

Source: <http://www.insse.ro/cms/rw/pages/castiguri1938>

In 2008, only Malta easily exceeded this percentage. Romania was situated on the last position, with a minimum wage of only 30.5% of the average. In 2010, the countries that were closest to this value are Slovenia, Malta and Luxembourg.

Figure 4: The Ratio of Gross Minimum Wage and the Gross Average Wage in the Economy (2010)

Source: http://epp.eurostat.ec.europa.eu/statistics_explained.

The degradation of the European economic situation in the conditions of the global economic crisis made the target of 50% impossible to reach; nowadays no EU member state does not approach this percentage.

4. Romanian legislative regulations

In Romania, stipulations relating to remuneration are set by the Constitution and Labor Code. Thus, art. 41 of the fundamental law of the country contains provisions regarding the right to work and the right to be remunerated. Article 41 - Employment and Social Protection of Labor states that: "The right to work cannot be restricted. The choice of profession, trade or occupation, and employment is free. Employees have the right to social protection. These rights regard the health and safety of employees, working conditions for women and young people, establishing a minimum gross salary per economy, weekends, paid holidays, work in special conditions or special training and other specific situations, established by law." [7]

According to art.154 from the Labor Code, the salary represents the consideration for the work of the employee, according to the individual labor contract, and for his work,

each employee has the right to earn a salary expressed in a specific quantity of money.[8]

The gross guaranteed minimum wage in Romania is 700 lei as of 01/01/2012, which corresponds to a net income of about 540 lei. Therefore, 18 lei per day will provide an individual and his family a decent living, which includes at least 3 meals per day, rental costs, facilitate maintenance, clothing, footwear, transport, etc. Suitable with the Universal Declaration of Human Rights, which states "the right to just and favorable remuneration that would ensure both the individual and his family an existence worthy of human dignity", in conjunction with the situation in Romania, mentioned above, but also with the fact that decent living is an abstract and absolute subjective term, in own opinion, I consider that any conclusion in order to analyse this information results directly from the mentions above.

5. Conclusions

In the current economic and social context, there are substantial concerns about the evolution of global revenues, about both short term consequences on employers and long-term consequences on workers and their families.

In the European Union, Bulgaria and Romania have the biggest poverty risk among the population, defined by the strategy Europe 2020. However, both countries are represented in an European study by at least one city in which citizens have an optimistic view on the perception of poverty, considering that this risk is minimal. On the other hand, in Belgium, considered among the countries with decent and very decent income, poverty is seen as a significant problem for most people.

Closely related to the income, Romania is facing different problems. These problems include the existence of high unemployment rate - along with Spain, southern Italy, Greece, Poland, Hungary, Bulgaria and Malta and the largest number of citizens living under the poverty line (severe lack of material resources) 32% of population, along with Bulgaria, 42% of the population.

Aside from these, it is developing an increasingly more pronounced difference in poverty risk between rural and urban areas; for example, 40% of the country population in Romania has difficulties accessing primary health care, compared to 15% in the city, a weakness point being also considered the

decrease of birth rate, along with Hungary, Croatia, Bulgaria and southern regions of Italy.

There is a number of organizations worldwide, international, national and regional which deal with the evolutionary aspect of income. International Labor Organization has paid attention to the implementation of common consistent and realistic social and economic policies. Developing and actively supporting the project Agenda for Decent Work is intended to be an alternative to global sustainable development, aiming the integration of this chapter in the whole of social and economic issues which the countries of the world are faced with.

Abstract

The process of economic integration between Romania and the Euro area has supposed the emphasis both of the trade and the financial linkages between these economies, especially during the period 2003-2008. Prior to the economic crisis, the foreign financial flows in have generated a fast increase of the non-governmental loan which determined the increase of the private consumption, investments, imports, respectively of the current account deficit and of the foreign private debt. The economic crisis started in 2008 emphasized the significance of the financial channel for the transmission of shocks as the increase of the Romanian economy's foreign exposure supposes additional financial flows to finance the service of debt. In order to assess the economy's degree of exposure to the financial shocks we have determined the degree of banking intermediation in Romania and the degree of banking integration with the economies of the Euro area.

Keywords: real convergence; banking intermediation; non-governmental loan; exposure to shocks; financial crisis.

Jel Classification: F41; F42

1. Introduction

The financial integration constituted an opportunity in supporting the process of convergence of the Central and Eastern European countries during their expansion period, but it can also represent a threat due to the problems generated by the sequence of

crises within the Euro area. The financial flows which the emerging economies benefited from increase their financing dependence on foreign banks, especially from the Euro area, and this also generated their vulnerability to the financial shocks. This evolution is in compliance with the neo-classical view upon the effects of the economic integration. Thus, the decrease of constraints regarding the capitals circulation determines the capital owners to react according to incentives and to prefer the emerging economies in which the rhythm of increase for the profit is higher than in the advanced economies [16]. Thus, the emerging economies will record faster economic growth rates under the terms of emphasis of the current account deficit and of the increase of the foreign debt. The service of debt will be able to be easily financed as long as a withdrawal of capital to the original economies will not occur [11]. The attractiveness of the CEE economies has not been generated by their fast increasing potential only but also by other factors such as acceding the European Union, the liberalization of the capital account, the perspective of accession to the Euro area and the presence of foreign banking entities in this economies [6], [7]. The financial flows attracted by the emerging economies do not have the same degree of risk, the foreign investments making the emerging economies the least vulnerable [2], [12]. Thus, the entries of foreign direct investments in the CEE economies contributed to encouraging both of the economic growth and also of the structural convergence with the European Union under the terms of the changes which are specific to the sectoral structure and to

the trade structure. Moreover, the foreign direct investments constituted a stable financing source for the increasing current account deficit during the economic boom period. The economic literature asserts that the bank loans coming from foreign sources prove a high probability to be stopped during the economic recession periods – the emerging economies suddenly become extremely risky and the parent banks will reduce their exposure with respect to those economies [1]. Along with the increasing presence of the foreign banks in the CEE economies, a phenomenon of fast loans increase occurred, especially in the economies recording a low degree of financial inter-mediation at the beginning of the period, as it was the case of Romania, Bulgaria and the Baltic States [4], [5]. On the one hand, this process has been considered a normal one, being necessary to reach the intermediation levels recorded by the other CEE economies or by the countries within the European Union, and on the other hand it became excessive, thus determining the overheating of the beneficiary economies and the emphasis of the macroeconomic unbalances [9]. When the second perspective became significant, the central banks interfered and adopted measures to limit the expansion of the loans [3], [8]. However, the efficiency of these measures has been interpreted as a reduced one as they generated limited effects only upon loans. According to IMF, approximately 75% of the economies which recorded boom periods for loans also recorded banking crises or foreign currency crises, and the consequence is a tough landing after an expansionary period based on foreign savings [10].

In the first section of this study we have compared the structure of the financial-banking system from Romania with that of the other CEE economies and with that of the advanced economies from the Euro area. The objective was to determine the gaps among the degree of banking concentration, the degree of financial intermediation and the degree of exposure of the bank financing. If the differences between these indicators are bigger, a shock upon the financial banking sector (such as the financial crisis) will determine more asymmetric effects for the private economic agents from Romania and from the Euro area countries. However, there

is another factor increasing the relations between the banking systems, namely the increase in the share of the domestic bank assets owned by banks coming from the Euro area countries, and this aspect has been analyzed in the second section of this study. Its increase generated the emphasis of the financial relations, thus balancing a part of the gaps referring to the structure of the banking system.

2. The features of the Romanian Banking System. Comparative Analysis

Romania is characterized by the lowest degree of financial intermediation (determined at a share of the loans/assets in the GDP) in the European Union, in spite of an extremely high rhythm of increase of loans during the period 2001-2008. As for the financial-banking integration, more than 80% of the bank assets from Romania are owned by banks belonging to economies from the Euro area, respectively EU-27. The result is that there is a potential symmetry with the financial shocks which influence the economies with exposure upon Romania, but this creates the probability of occurrence of significant contagion effects upon the bank financing in the Romanian economy. If before the economic crisis from 2008, the presence of foreign capital in the domestic banking system was considered as an opportunity for the Romanian economic growth process, at present, this may constitute a threat to the economic re-launching under the terms of the decrease of capitalization achieved by the parent banks.

The degree of financial intermediation, calculated according to the share of the assets, loans and deposits in the GDP of the banks activating on the Romanian territory, continues to be much below the average of EU, of the Euro area and even below the values recorded by the new member countries. Thus, in 2010, the share of the bank assets in the GDP was of 65%, the share of the loans in the GDP was of 40%, and the share of deposits was of 34%. Generally, the highest values of financial intermediation degree are recorded by the advanced economies of EU, respectively of the Euro area. As for the entire Euro area, the share of the bank assets in the GDP was of 340% in 2010, that of the loans was of 142%, and that

of the deposits was of 125%. As for the CEE countries, the average bank assets were approximately equal to the GDP, while the loans were approximately 65% of the GDP (figure 1). As for the new EU member countries, there are also a few exceptions regarding the direct relation between the level of economic development and the degree of financial intermediation. Thus, two of the Baltic economies (Latvia and Estonia) have bank assets by 74%, respectively 36% higher than the GDP, and the bank assets from Bulgaria are approximately equal to the GDP from 2010. With reference to the loans, the two Baltic economies are quite close to the level recorded by economies belonging to the monetary union, such as Germany or Belgium. Even though it has a low degree of financial inter-mediation, Romania is characterized by a quite high share of loans in the total bank assets. This indicator recorded an increase in all the CEE economies, considering that it decreased up to the level of the entire Euro area, becoming stabilized at approximately 43% during the last five years.

Figure 1. Degree of banking intermediation in the CEE countries and in the Euro area core countries

Source: CEE Banking Sector Reports 2006; 2009; 2011

As for the CEE economies (as an average), there was an inverse relationship between the share of the private loans in the GDP in 2001 (considered as reference year) and the increasing rhythm of this indicator during the period 2001-2010, according to figure 2. Thus, economies such as the Czech Republic

and Slovakia recorded a slower rhythm in increasing the share of the loans in the GDP, considering the quite high initial values of this indicator. On the contrary, the degree of financial intermediation recorded by the Baltic economies, Bulgaria and Romania are mostly due to the increase of its value during the last ten years, thus increasing their vulnerability, in case of decrease of foreign capital flows. It is not an accident that these economies, along with Slovenia, significantly contracted during the first year after the occurrence of the economic crisis. Generally, most of the CEE economies recorded the highest dynamics of loans during the period 2005-2008, when the degree of financial intermediation increased by 17.6% in Romania, by 30.1% in Bulgaria, respectively by 33.4% in Slovenia. An exception is the Baltic economies which recorded a higher dynamics during the period 2001-2005. Starting from 2008, the rhythm for the increase of loans decreased below 10% in most of the CEE economies, and this resulted in the restriction of the banking intermediation degree. Poland recorded increases of loans exceeding 13% during the period 2008-2010, and the increase of the inter-mediation degree was higher than that recorded during the period 2005-2008.

Figure 2. Evolution of the share of private loans in the GDP for 2001-2010

Source: CEE Banking Sector Reports 2006; 2009; 2011

The low level of the financial intermediation from 2010 (calculated as a share in the GDP of the non-governmental loan given by the domestic loans institutions) may be explained by the occurrence of initial conditions characterized by a difficult access to loans of the Romanian private economic

agents. Under the terms of a high inflation rate and of a low macroeconomic stabilization, the share of loans in the GDP was of 10.1% of the GDP only in 2001, and the loans to the population was of 7% of the total level of the non-governmental loan only (figure 3). During the period 2003-2007, the rhythm of increase for loans was of more than 40% per year, generating doubling of the intermediation degree in 2005, respectively in 2008. As a consequence, the annual variation of the loans induced certain vulnerabilities to the Romanian economic growth process, which materialized in the tough landing started in the 4th quarter of 2008. The relation between the evolution of loans and the economic growth process is a two-ways one. Thus, the increase of revenues resulted in an increase of financial reliability of the possible customers, respectively in optimistic expectancies regarding the macroeconomic evolution, which generated an increase of loans, which also encouraged consumption and investments. The apparently virtuous relations have been blocked by the economic and financial crisis, resulting both in the decrease of revenues and also in the decrease of private loans rhythm. Under these terms, the share of the private loans in the GDP has been restricted during the last three years to approximately 40%. In its structure, half is represented by loans given to population and half to companies, and, if considering their purpose, only 5.7% of the loans were on mortgages. The loans given to the population recorded the highest dynamics during the period 2005-2007, when their share in the GDP increased by 2.5 times, to approximately 18%.

Figure 3. Evolution of the private loans in Romania

Source: CEE Banking Sector Reports 2006; 2009; 2011

The main determinants in the evolution of the non-governmental loan during the last three years have been influenced both by the offer and also by the demand of loans. With reference to the offer, it is a matter of persistence of aversion to risk of the banks, as a result of accumulation of a high volume of non-performing loans and of the negative influence upon the profitability indicators exercised by the costs associated to provisions. We should not pass over the impact of increase which is 4 times higher than the governmental loan during the last 4 years, which induced the orientation of the banks' resources not towards the real economy but towards the coverage of the budget deficit and of the service of public debt. As for the demand, the non-governmental loan has been negatively influenced by the contraction of the population's revenues, as a result of the measures adopted in order to achieve the fiscal consolidation, and also of the persistence of the uncertainties regarding their level during the next period. Moreover, the private economic agents proved a higher caution in managing their available financial resources and the effect of this attitude was the restriction of consumption and the increase of saving tendency.

The fast increase of the private loans, with rhythms which even exceed 50% per year, induced certain vulnerabilities both to the banking system and also to the real economy. Some of them were increased by the majority share of the foreign bank capital in the domestic one, respectively by the higher share of foreign currency loans if compared to those in the national currency. The vulnerabilities specific to Romania were exceeded in intensity by those of the Baltic economies, however being less present in the Czech Republic and Poland.

3. Exposure of the Romanian banking sector

In the CEE economies, the banking sector is mostly owned by the banks with foreign capital, as they own more than 80% of the total bank assets in Hungary, Slovakia, the Czech Republic or Romania. In Poland, the share owned by banks belonging to the state is approximately 34%, while in Slovenia,

their share increased as a result of recapitalization, reaching approximately 63% of the total assets. As a consequence of the privatization of the Romanian banking system, the share of the foreign capital in the total domestic bank assets became a majority starting from 2000. The increasing tendency recorded for the share of the foreign capital became moderately higher until 2006, when, along with the privatization of the BCR, it increased, in an accelerated manner, reaching 88% and becoming stabilized to approximately 85% during the period 2009-2011, according to figure below.

Figure 4. The share of the foreign capital in the bank assets in Romania

Source: NBR database, 2011

As for the foreign capital stock invested in the Romanian bank system, there is a high exposure on Greece, Austria, the Netherlands and France. If compared to 2000 year, the share of the foreign capital stock owned by Austrian banks recorded the highest increase, reaching a maximum of 30% in 2008, and then decreasing to 21% in 2010. The Greek capital remains the majority (30 percents) with reference to the banks with foreign capital, however proving a decreasing trend, the same trend being followed by the representatives of the Austrian (21 percents) and French (4.3 percents) capital. The share of the Netherlands capital in the total foreign capital recorded a significant increase during 2010 (up to 15 percents), due to the supplements given when setting up the GE GarantiBank S.A. Subsidiary in May 2010.

Referring to the market shares, outlined by the share in the total Romanian bank assets,

the banks with Austrian capital continues to have the highest market share in the aggregate asset (38.8 percents), being followed by those with Greek capital (15.5 percents). In 2010 the banks from France had a share of approximately 15%, and those from the Netherlands of 14%, while the share of the Romanian bank capital in the total bank assets was of 14%. Greece records the highest market share in Bulgaria and in other Southern European economies, while in Poland, Hungary or the Czech Republic there is a more significant presence of banks from Belgium, Italy, Germany or France. In the first two economies, the highest market share is owned by banks with state-owned capital, with 30.9%, respectively 28.8% of the total national bank assets. According to the statistics of the Bank for International Settlements, Austria is the most exposed economy from the Euro area among the CEE economies, as the Austrian banks record 20.6% of the total Bulgarian exposure, 35.4% of the total Romanian exposure, 33.1% of the total exposure of the Czech Republic, respectively 26.7% in Hungary and 5% in Poland. Belgium is the most exposed in the Czech Republic (24.5% of the total exposure), Hungary and Poland, while Germany records the highest exposure in Hungary, with approximately 20.4% of the this economy's total debts.

4. Conclusions

In conclusion, the brief analysis made in this study showed that the CEE economies, including Romania, are highly integrated from the banking point of view with entities coming from the EU countries, especially from the Euro area, which supported the recovery of the gaps recorded during the period 2001-2008. However, they induced a certain dependence of the banks from the emerging economies on the capitals coming from the parent banks, so that 90% of the debts of the banking system from the new member countries belong to banks from EU. Considering the high integration with these economies, the CEE region will be negatively affected by the current situation within the monetary union. Besides the increase of the sovereign risk in some countries, the maintenance of the vulnerabilities in certain European financial

systems may hinder the access to the foreign financing for the domestic banks.

Intra-Community Carousel VAT Fraud

Mihu Stefan

“SPIRU HARET” University of Constanta

stefan.mihu@yahoo.com

Abstract

The carousel fraud regarding the value added tax related to intra-community purchases is an undisputed presence, although unwanted, in the EU space. The mechanism in itself is structured on the transitory current condition for taxation of intra-community exchanges, which supposes, as a rule, the taxation of intra-community exchanges of goods performed between taxpayers, in the destination Member State. When our country adhered to the European Union, part of the economic agents in Romania sought to assimilate the fraud practices regarding tax liabilities, which have been noticed for many years in the EU space. As the phenomenon in itself occurs nowadays, I have proposed to analyze it, although due to the complexity of the phenomenon analyzed, I am aware that the present approach is neither exhaustive nor perfect, but, on the contrary, perfectible.

Key words: fraud, intra-community acquisitions, taxation transitory condition, tax liabilities, reverse VAT charge, recapitulative statement, intra-State statement

J.E.L. classification: E62

1. Introducing - “Carousel” fraud

This type of fraud is apparently based upon a simple mechanism: the economic operator from the origin country invoices without charge of VAT (since he performs an intra-community delivery, which falls under the category of VAT exempt operations entitled to deduction) and the economic operator from the destination country shall apply the reverse VAT charge for such an operation (because he performs an intra-community acquisition, calculating and recording the VAT related to intra-

community acquisitions to the taxation rate in his country, both as VAT collected as well as VAT deductible, without paying it in reality). Following the performance of the intra-community acquisition, the economic operator involved disappears without having registered, declared and paid the VAT collected related to subsequent deliveries performed on his domestic market. This economic operator is called in the investigation practices of carousel fraud, due to his volatile “phantom” type behavior, as the “missing link” of the intra-community trade.

The carousel VAT fraud regarding the VAT related to intra-community transactions supposes a chain of successive operations of cross-frontier sales – purchases, which are performed within the community market by a group of economic operators that sometimes also seek to exploit, apparently in a legal manner, the differences between the taxation rates practiced by the EU Member States.

1.1. Romanian legislation in such a field

Our country’s adherence to the EU economic structures imposed a series of modifications in the national tax legislation, in order to be harmonized with the European regulations in the field. The modification of the normative content of certain already existent regulations or the insertion of new ones referred to the legislation regarding the value added tax, since it was more alike the national legislation. Due to such reasons, by the modifications incurred to the Tax Code as of 1 January 2007, the following was aimed: the takeover of the community acquis regarding the value added tax in the content of Romanian tax provisions. The novelty of some concepts or mechanisms embedded in such indirect tax aims to accelerate the implementation of community directives. The transposition of VAT related European directives in the national legislation supposed,

in a priority manner, the conceptual definition of the following terms: “intra-community acquisition” and “intra-community delivery”.

1.2. “Intra–community acquisition ” and “intra – community delivery” operations

The intra-community delivery is defined in article 128 paragraph (9) of the Tax Code as “a delivery of goods, which are dispatched or transported from a Member State into another Member State by the supplier or the person that performs the delivery or by another person on their behalf”. Actually, paragraphs 10 – 13 of article 128 of the Tax Code also define a series of cases related to intra-community deliveries, more emphasized on defining the non – transfers that do not fall under the category of intra – community deliveries. Both theoretically and practically, an economic agent from Romania who delivers goods to an economic agent from another EU Member State shall not perform anymore an export operation, but an intra – community delivery. This operation performed by the economic agent from Romania falls under the category of VAT exempt operations entitled to deduction provided that the terms foreseen in article 143 paragraph 2 letter a and paragraph 3 of the Tax Code are complied with and provided that the beneficiary communicates to the supplier in Romania a valid registration code for VAT purposes, which is assigned by the tax authorities from the Member State where he belongs to and in addition, there is a document that makes the effective proof of the goods’ transport.

The economic agents in Romania shall benefit from VAT exempt operations entitled to deduction for intra – community deliveries , even without complying with the terms previously mentioned, solely in the cases exhaustively enumerated in article 143 paragraph 2 letter a points 1 and 2 and letters b, c and d of the Tax Code. Although the general rule sets as principle that VAT payability occurs on the date when the generating fact occurs, and the generating fact occurs when the goods are delivered, pursuant to the provisions corroborated of article 134 paragraph 1 and article 134 paragraph 1 of the Tax Code, in case of intra –community delivery of goods we have an

exception from the general rule, pursuant to provisions of article 134 paragraph 1 of the Tax Code, in the sense that the payability of the tax occurs in the 15th day of the month that follows the one when the generating fact occurred, with the mention that the payability occurs upon delivery of an invoice if the invoice is delivered before the 15th day of the month that follows the one when the generating fact occurred.

It is very important to retain that pursuant to provisions of article 156 paragraph 1 of the Code, each taxpayer must draft and submit to the competent tax authorities by the 25th of the month that follows a calendar quarter, this date included, a revising statement concerning intra – community deliveries, according to the pattern settled by the Ministry of Public Finance, which shall contain the following information:

- total amount of intra – community deliveries of goods exempted from taxes, given the

- terms of article 143 paragraph 2 letters a and d, per each purchaser for which the payability of the tax was issued in the related calendar quarter;

- total amount related to delivery of goods performed within a triangular operation,

- foreseen at article 132 paragraph 5, letter b, which is performed in the Member State where the goods dispatched or transported arrive, per each beneficiary of the subsequent delivery to which a code T is assigned and for which the tax payability was issued in the related calendar quarter.

Pursuant to provisions of article 156 paragraph 3 of the Tax Code, the obligation to submit the revising statement previously mentioned refers only to the periods for which the tax payability for such operations occurs.

Pursuant to provisions of the Tax Code enforceable as of 1 January 2007, a company in Romania that purchase from another company situated in an EU Member State (the goods are transported in Romania), is not obliged to physically pay the VAT involved, but to register it by means of the mechanism called reverse VAT charge (both as deductible VAT, as well as collected VAT), as it results from the corroborated provisions of article 146 paragraph 1 letter e

and article 157 paragraph 2 of the Tax Code, including of methodological norms given for the application of the two legal articles. For that matter, the article 146 paragraph 1 letter e of the Tax Code regarding the terms according to which the deduction right is exerted for the tax related to intra – community acquisitions of goods mentions the purchaser’s obligation to possess a purchase support document and to record the tax as collected tax in the expense account related to the tax period in which the payability occurs.

Article 153 paragraphs 1 – 10 of the Tax Code regulate the general duties regarding the registration of taxpayers for VAT purposes and the main idea is that an economic agent must request the registration for VAT purposes to the competent tax authority within 10 days as of the end of the month when he reached or exceeded the limit of 35.000 Euro. Apart from the persons hereinabove mentioned, the obligation of registration for VAT purposes also comes, according to provisions of article 153 paragraph 1 of the Tax Code, to the taxpayer that is not recorded and that is not bound to be recorded pursuant to article 153, as well as to the non-taxpayer legal person, which intends to perform an intra – community acquisition in Romania over the limit of 10.000 Euro (we have to mention that the related obligation comes before the performance of the related intra – community acquisition). The conditions in which the persons registered for VAT purposes, pursuant to article 153 paragraphs 1 and 2 of the Tax Code, may request to the competent tax authority the cancellation of such a registration are regulated at article 153 paragraphs 5 and 6 of the Tax Code.

1.3. Reporting obligations related to intra – community transactions

Related to those hereinabove mentioned, regarding the registration obligation for VAT purposes, new obligations appear, as follows:

- in case of those persons registered for VAT purposes, pursuant to article 153 of the

Tax Code, they shall submit the VAT related expense account (form code 300), the revising statement (form code 390) and the Intra-State statement;

- in case of those persons registered for VAT purposes, pursuant to article 153 of the

Tax Code, they shall submit the special VAT related expense account (form code 301), the revising statement (form code 390) and the Intra-State statement;

1.4. VAT related expense account

The obligation for the draft and submission to the competent tax authorities of such an expense account comes to all taxpayers registered for VAT purposes, as they are defined in article 153 paragraphs 1 – 10 of the Tax Code. The model and content of such an expense account (also assigned in form 300) was modified and approved by Decree of ANAF President no. 273/2007, following to be used as of the statement of tax liabilities related to month May 2007.

There are some questions regarding the date when such expense account must be submitted. As a rule, from the provisions corroborated of article 156 paragraph 1 and article 156 paragraph 1 of the Tax Code, it results that the due time for their submission to the competent tax authorities is the 25th of the following month for the current month (this day included).

By waiver from the general rule, the taxpayers registered for VAT purposes, pursuant to article 153 of the Tax Code, shall proceed to the quarterly submission of VAT expense account provided they comply with the following requirements:

- pursuant to provisions of article 156 paragraph 2 of the Tax Code, the turnover from chargeable operations and/or exempted with deduction entitlement did not exceed the equivalent in lei of the 100.000 Euro limit, during the previous calendar year;

- pursuant to provisions of article 156 paragraph 6 of the Tax Code, the taxpayers registered for VAT purposes who meet the requirements in the hereinabove mentioned paragraph, must submit to the competent tax authorities, by the 25th of January (this day included) of the following year, a notification regarding the turnover recorded for the previous year;

Taking into account the legal text, it results that the taxpayers registered for VAT purposes and that fulfill the condition mentioned in article 156 paragraph 2 of the

Tax Code do not have the possibility to choose for the monthly or quarterly submission of VAT related expense account, as they must submit it quarterly and notify it according to the provisions of article 156 paragraph 6 of Tax Code.

Article 156 paragraph 2 of the Tax Code mention the data and information that the VAT related expense account must contain, and the following paragraph indicates the methods to correct the data incorrectly registered in such an expense account, in the sense that it may be corrected by the expense account of subsequent tax period and it shall be registered in the regulations case.

Article 156 paragraph 7 of the Tax Code mentions that by means of the Methodological Norms to apply the Tax Code, the following is settled: the cases in which the tax period for the submission of VAT related expense account is another one than the month of the quarter, and it shall not exceed the calendar year. To this regard, the tax period can be the following:

- semester, if the taxpayer only performs chargeable operations on a maximum period of
3 calendar months from a semester;
- calendar year, if the taxpayer only performs chargeable operations on a maximum
period of 6 calendar months from a period of one calendar year;

An extremely important aspect is found in the regulations of article 157 paragraph 2 of the Tax Code and it refers to the cases in which the taxpayers registered for VAT purposes, pursuant to article 153 of the Tax Code, perform intra – community purchases: they shall register in the VAT related expense account, both as collected tax as well as deductible tax, the tax related to intra – community purchases for which the related person is bound to pay the tax.

1.5. Special VAT expense account

The pattern and content of such an expense account type (also assigned in form 300) was modified and approved by ANAF President Decree no. 254/2008, following to be used as of statement of tax liabilities related to the month January 2008.

The obligation to submit such a form pertains to the persons non – registered for

VAT purposes pursuant to article 153, but registered pursuant to article 153 of Tax Code, pursuant to provisions of article 156 paragraph 1 of the Tax Code;

As general rule, which is stipulated by provisions of article 156 paragraph 5 of the Tax Code, the VAT special expense account is only submitted for the periods in which the tax payability occurs, by the 25th (this day included) of the month that follows the one in which the operations’ payability occurs.

1.6. Revising statement

Regarding this form, the following questions arise: who is targeted by the obligation of his submission, when does such an obligation occur and which is the legal term to submit the revising statement?

The obligation to draft and submit the revising statement to the competent tax authorities occurs in case of intra – community deliveries of goods (issue that has been previously tackled), as well as in case of intra – community purchase of goods.

Regarding the intra – community purchase of goods, the obligation to submit the revising statement pertains to the persons registered for VAT purposes, both pursuant to article 153 as well as article 153. The related form is submitted by the 25th of the following month and it shall contain the following:

- the total amount of intra – community purchase of goods, per each supplier, for which
this taxpayer is bound to pay the tax and for which the tax payability occurred in the related calendar quarter;
- the total amount of goods’ purchase performed in case of a triangular operation, for
which the supplier has assigned the beneficiary taxpayer as a person obliged to pay the tax.

As a rule regulated in article 156 paragraph 3 of the Tax Code, we have to retain that the revising statements are only submitted for the periods when VAT payability occurs for the related operations.

1.7. Intra – State Statement

The new tax regulations regarding the intra-community purchases triggered, as it has been previously mentioned, a series of new obligations that shall determine additional administrative costs for the companies, to this regard, in the category of new obligations we can insert the Inter – State statement. This is regulated by Law no. 422/2006, by Decree no. 747/2007 of the President of National Institute of Statistics, regarding the settlement of value related thresholds for the collection of statistic data regarding the intra – community trade of goods in 2008 and Decree no. 748/2007 of the President of National Institute of Statistics, regarding the Norms concerning the completion of Intra – State Statistic Statement for year 2008.

1.8. Ways of carousel fraud performance

Taking into account those hereinabove mentioned regarding the definition of intra – community delivery and intra – community purchase, registration and reporting related obligations for the persons that perform intra – community transactions, all of them represent the theoretic grounds for eth occurrence of carousel fraud. Next, we shall present a few ways by which such a fraud is being committed.

A first method, which is frequently met in our country and due to which it was called as the classic method refers to the intra – community acquisitions performed by an economic operator from Romania. A company from Romania, registered for VAT purposes pursuant to article 153 of the Tax Code, wishes to make an intra – community purchase from B company, which is located in a Member State. According to those previously mentioned, it results that A company could very well perform the related intra – community purchase, provided it is an honest economic agent acting in good faith and provided that it agrees upon registering its VAT liabilities. In reality, to drive through these tax liabilities, the decisional factors of A company shall found another “arrow” company, that is C company, of which the sole shareholder and administrator is a “puppet”, since the C company is actually controlled by all representatives of A company. Upon foundation of C company, it shall be optionally registered as VAT

taxpayer, but it declares an annual turnover under the limit of 100.000 Euro, in order to benefit from the possibility of quarterly submission of VAT related expense account (form code 300), pursuant to provisions of 156 paragraphs 2 and 3 of Tax Code. Later on, C company performs the intra – community purchases from B company and C company applies for such operations the reverse VAT charge. The merchandises thus purchased are later on invoiced to their real beneficiary, that is A company. For such internal delivery operations, C company hypothetically collects the related VAT and A company shall deduct, using as support document the invoices issued by C company, pursuant to provisions of article 155 paragraph 5 of the Tax Code. The hereinabove mentioned operations have a “precisely determined “service time”, that is a maximum period of 3 months, up to the due date foreseen regarding the duty of C company to submit the VAT related expense account. Just before the fulfillment of such a term, C company shall disappear, without being identified later on and without having registered, declared and paid the VAT collected following the internal deliveries performed by A company. Practically, the “sole object of activity” carried out by C company is the supply of support documents to A company with the purpose of VAT deduction by the latter.

Certainly, the company that commits the fraud is C company. Then another question arises: if A company can deduct the VAT related to supply invoices from its direct supplier, to the involuntary carousel fraud (without realizing it), it is entitled to deduct (and implicitly to compensate or reimburse) the VAT related to upstream operations. From this perspective, each company from the transaction chain related to intra – community operations shall be individually and distinctively analyzed, especially that in practice, between C company (the document supported intra – community purchaser) and A company (the actual intra – community purchaser and the “brain” of the entire mechanism), a series of other trade companies may be interposed (obviously, under different forms of support documents), with the purpose of dissociating the illicit character of the facts and of dissipating the cause liaison between C and A companies.

Taking into account those hereinabove mentioned, it results that the participation in the carousel fraudulent mechanism is not presumed, but it must be proved, starting with the correlative analysis of the cash flows, of documents' circuit and of the effective route of the products. The relevant clues to this regard are the following:

- the correspondence between the delivery and payment terms are carried out, since the beginning, between the representatives of A and B companies;

- the merchandises are effectively directly dispatched from B company to A company (where they are accepted upon the dispatch date), and their payment is directly made to B company from A company, upon the order of C company;

- the information regarding the means of transport or delegations which are registered on the invoices/ waybills drafted by C company to A company is not real;

- the persons empowered to perform operations in the bank accounts of C company are the representatives of A company, who withdraw amounts of cash money, under different reasons: part withdrawal, payments to individuals according to the purchase tally sheets (obviously containing unreal data), payments of dividends, etc;

- the amounts cashed in the bank accounts of C company from its client A company, returns to A company in a direct manner or by means of other companies, according to certain service provision invoices that do not reflect real economic operations (generally, service provisions).

The second method regarding the carousel fraud is actually represented by an improvement of the one hereinabove mentioned, in the sense that the products finally reach from A to B company, i.e. their initial forwarding agent. This method may be identified with self – generating carousel fraud mechanism, with visible effects over the deduction in the price of the products, which make the object of such a transaction. This mechanism is structured on the fact that the delivery price of A company to B company (we shall take into account the delivery price VAT excluded because when A company sells to B company, A company performs an intra – community delivery, which falls under the category of VAT

exempt operations with deduction entitlement) is lower than the sales price initially practiced by B company to C company. A company may “support” such delivery price from “VAT income” collected following the transactions carried out, in upstream, with C company. Apart from the illegal tax implications in the income pertaining to the consolidated general budget, this method induces distortions (due to the prices) in the companies with evasion behavior (due to the “fake” price practiced on the market).

A third method in such a fraud type refers to simulated deliveries, which are performed by an economic agent in Romania registered with VAT purposes pursuant to article 153 of Tax Code, to an economic agent from a Member State, registered for VAT purposes pursuant to the specific legislation of the Member State he belongs to. To this regard, the company in Romania shall perform an intra – community delivery, it issues an invoice without charging the VAT pursuant to VAT code that pertains to an external economic agent from the community space, but actually he sells the related products on the black market. This method may be performed both by complicity of the external partner (that communicates his VAT code) or without his knowledge (for example, by the procurement of VAT code from different informational means). Obviously, the so – called “inter – community” delivery has to be identified by the economic agent from Romania in the VAT expense account, by the revising statement and by the Inter – State statement (the last one, according to each case, according to the cost limit, as it has been previously mentioned), and the data reported to public authorities in Romania shall be confronted later on with those reported by the external partner to the public authorities in his country. Nevertheless, in such period of time, the economic agent involved shall request the VAT reimbursement and later on, he shall “volatize” (by changing the social headquarters and by cession of his shares to hardly identifiable persons and that generally are not in the country anymore upon the date of tax verifications). We do not exclude that in reality, the converse situation may occur, that is the issue of an invoice by the external economic agent from the community space to

a company in Romania, either with the latter's complicity, or without its knowledge.

In brief, a fourth method, which is situated at the extremely sensitive boundary between legal and illegal (from the standpoint of the probation force) refers to the case in which an economic agent from Romania, registered for VAT purposes pursuant to article 153 of Tax Code, performs an intra – community purchase and declares all operations to this regard from legal point of view. Later on, it registers a very low trade margin and simulates the retail trade by means of electronic cashing devices. Actually, the related products are traded on the “parallel market” for much greater prices than those registered in the accounting evidence sheets (but situated under the market prices for the related products). The damage in such case is recorded in both profit tax as well as VAT (obviously, the one pertaining to the non – declared price difference). The “classic” example to this regard is represented by the intra – community flour purchase, simulating its retail trading (by means of electronic cashing devices, to individuals of whom the subsequent identification is not requested by law, and thus, they cannot be practically identified anymore), but in reality it is sold to different units of bread manufacture and pastry (which, in their turn, shall trade the finished product outside the tax charge area).

2. Conclusions

The effects of the measures regarding the confinement of such a field are not very visible. In March 2008, the European Commission adopted a series of proposals with the purpose of, if not eliminating, but circumscribing the phenomena within controllable limits. All related measures are, predominantly, administrative, aiming to strengthen the Inter – State cooperation in the

field and to track in due time eventual dysfunctions, by shortening the reporting period (by the economic agents) of performed intra – community transactions and to transfer between the Member States that information regarding intra – community transactions. Will they be enough to reach to the proposed target? Can we be optimistic given that the VIES monitoring system proved its restrictions in time? Haven't we started from the effect and not from the cause? The time is the only element that can provide answers in such directions, but regarding ourselves, we consider that we must tackle the cause of the phenomena, that is the radical change of the current taxation system by changing the taxation system to the destination with the taxation system at the origin. Nevertheless, for the implementation of such a desideratum, the unanimous consent of the Member States is needed, and from this point, the discussion becomes much more extended, given that certain Member States prove reticence in such direction.

Abstract

Economic growth is a key concept in developing countries and in designing growth models becoming more efficient. This paper begins by defining the concept of growth, identifying and presenting the factors that contribute to achieving it, and finally the European growth model is outlined for attaining this objective. Given the global financial crisis started in 2008, were analyzed performance of growth models used in Central and Eastern Europe, an attempt to identify causes and effects. Thus, we have outlined three growth models: robust, moderate and a model with economic contraction.

Key words: economic growth, crisis, GDP

J.E.L. Classification: E27, F43

1. Introduction

Robert Lucas, said that "once people begin to think growth will be hard to think about something else."

Literature attaches great importance to economic growth because it creates the potential to achieve major objectives such as exit from poverty of the underdeveloped countries or contribute to raising living standards in developed countries. To achieve these objectives it is necessary that this increase is accompanied by increased productivity, investment in technology, investment in human capital and correlating macroeconomic policies.

According to the American economist S. Kuznets, economic growth of a country is given by the ability to provide increasingly different economic goods, this capacity is based on high technology, but also on the

institutional and ideological adjustments required.

H.V. Arndt believes that the economic growth means income growth as average per capita, growth measured typically by GDP reported to population.

Economic growth refers to those changes taking place in order to increase macroeconomic results that are not expressed independently but closely with its determinants. Among these factors we mention the human factor (quantity and quality, as human capital), material factors (investment, existing real capital), information-technical factor (currently holds a key role). Growth results are measured through synthetic indicators such as gross domestic product, gross national product, national income (total or per capita).

In economic literature are often used the terms "zero economic growth" and "negative growth". The term "zero economic growth" was first used in a report for the Club of Rome and presented the situation where the absolute economic results and total population registered the same rate of growth per capita that the results remained constant. "Negative growth" shows that situation in which, during a certain period of time, macroeconomic results per capita know a downward trend, maintaining in the normal range a series of fundamental correlations of equilibrium, which requires reasonable compromises regarding efficiency and welfare[3].

Most times, economic growth is regarded as similar to economic development, so it is necessary to point out that the scope of economic development is much higher than the concept of economic growth.

In 1969, Dudley Seers emphasized the difference between growth and development concept. The concept of economic

development is multidimensional, encompassing the living standards of population growth, increasing incomes, reducing poverty and increasing continuous economic opportunities of individuals. So, economic development itself involves growth, there is no economic development process without an increase in long-term of macroeconomic results, but growth is independent of economic development[8].

2. The European model of economic growth

In the European model, stability, growth and social cohesion are complementary processes. Thus, macroeconomic policies and cohesion are well designed and underlies sustained economic growth. Also, high economic growth rates lead to economic stability and social cohesion in the long run. A fundamental pillar of sustainability of the European model is rapid economic growth, this model is focused on cohesion[1].

Classical and neoclassical theories of economic science gave a pessimistic nature of science, these theories considering that:

- the economy is stable and tends to full use
- leaves the neoclassical microeconomics models, taking into account the wishes of households, market structure,
- the investments have a short term effect on national income
- savings lead to lower consumption and aggregate demand, thus reducing national income in the short term.

Modern theories are more optimistic, highlighting the importance of technical progress, industrial knowledge. They stress that:

- technological progress is an endogenous variable that responds to market signals;
- there are increasing returns of production factors,
- increasing employment, income redistribution and economic growth are interrelated.

According to this model, institutions and policies governing the market are fundamental to sustained economic growth. The current European economy, is an information economy, information technology, putting the value of hard unconventional exhaustible resources or

inexhaustible, and the potential for knowledge and innovation capacity of human capital.

Europe 2020. Europe 2020 contains fundamental targets for the EU aims to achieve the economic and social fields, in 2020, that is during the interval 2011 to 2020, the whole Union. Europe 2020 is the successor to the Lisbon Agenda 2010, which has the same purpose, for the period 2000-2010.

Europe 2020 proposes three priorities for the next decade:

1. *smart growth* – economy based on knowledge and innovation;
2. *sustainable growth* - based on a competitive, clean and efficient economy;
3. *inclusive growth* - based on an economy that will generate higher rates of employment growth and economic, social and territorial cohesion.

Europe 2020 proposes five objectives for 2020. These objectives are:

- a. *occupancy rate: 75% (in the age group 20-64 years) through:* increased participation of young people, participation of older workers and less skilled, better integration of legal migrants;
- b. *total share of funds* (public and private) been allocated to research and development: 3% of GDP;
- c. *trinomial "20x20x20"* reducing greenhouse gas emissions by 20%, 20% energy efficiency or reduced energy consumption by 20%
- d. limit up to 10% of early school leaving rate of the population aged 18-24 years and achieve 40% share of the population completing tertiary education or equivalent and is aged between 30-34 years;
- e. 25% reduction in the number of people at risk of poverty.

Europe strategy 2020 lays down the institutional and economic policy conditions designed to achieve the objectives. These conditions are mainly: to restore macroeconomic stability, redirect public finances to a sustainable development, extensive coordination of economic policies between member states, labor productivity growth.

3. Models of economic growth in Central and Eastern

Taking into account variations in the main indicator of economic growth, gross intern product, in Central and Eastern Europe, there are distinguished three models of economic growth: sustainable growth, moderate and economic contraction.

a. Poland, the strongest economy

Poland has the highest economic growth, being the only EU country which had no negative growth since the recession.

Poland was the only state that managed to avoid economic Great Depression, and in the last quarter of last year registered the highest growth of GDP of EU countries.

What is the secret of Poland? One is the strength of domestic demand, which in case of weakness may be covered with exports competitive because Poland has a freely fluctuating currency. Poland has also strong links with Germany, the largest European economy, and a young workforce and receptive to new. Also, banking rules to prohibit foreign banks to take capital from Polish subsidiaries to cover losses elsewhere[5].

Table 1. Main macroeconomic indicators of Poland 2009 – 2010

Indicator	Poland
Economic growth 2010(%)	3,4
Economic growth 2011(%)	3,7
GDP (2009, billion euro)	310
GDP /capita(2009,euro)	8.131
Budget deficit (2009,% GDP)	7,1
Budget deficit(2009,billioneuro)	22,01
Public debt (2009,% GDP)	51
Public debt (2009, billion euro)	158,1
Minimum wage (S2 2010,euro)	317,58
Local stock market capitalization (billion Euro)	202,6

Source: IMF, Eurostat, INSSE

Poland will continue to benefit from domestic demand and investment growth and see it can be seen in this economy one sweet centers of Europe. Country perspective is attractive if compared to the region and even other emerging countries[6].

b. Moderate economic growth - Romania, Czech Republic, Slovakia

Czech economy contracted for the third consecutive quarter, while Romania is back in recession during January-March 2012 as the crisis in the euro area government adopted austerity measures hit domestic demand and reduced exports to Central and Eastern Europe.

Czech Republic, where the government cut spending and increase taxes to reduce the deficit this year of 3% imposed by the EU, has declined more significantly, by 1%, compared with the previous quarter. It was the third consecutive quarterly decline.

In Romania, the second poorest country in the EU, in 2009 economic crisis reached marginal areas of the economy such as services, tourism and tertiary sector, bringing a drop of 6% of Gross Domestic Product (GDP), 2010 was more serious, because there has been collapse of the construction sector and building materials, trained real estate collapse. Other areas affected were the insurance, banking, stock exchange, in a word and the financial sector was accompanied by a remarkable decrease in consumption, which led to a decrease of 10% of GDP this year[4].

In the first quarter of 2012 declined 0.1% compared with the previous three months, after the harsh winter led to the decline in production in January and has affected demand for its exports in the euro area.

In Romania and Bulgaria, where the pre-crisis boom was fueled by capital inflows from foreign banks, which increased domestic consumption, foreign lenders have reduced their exposure, leading to a decline in lending, affecting growth.

Table 2. Main macroeconomic indicators of Romania and Czech Republic 2009 - 2011

Indicator	Czech Republic	Romania
Economic growth 2010 (%)	2	-1,9
Economic growth 2011 (%)	2,2	1,5
GDP (2009, billion euro)	139	118
GDP /capita (2009,euro)	12.852	5.390
Budget deficit (2009,% GDP)	5,9	8,3
Budget deficit(2009, billion euro)	8,2	9,79

Public debt (2009, % GDP)	35,4	23,7
Public debt (2009, billion euro)	49,2	27,9
Minimum wage (S2 2010,euro)	311,39	137,3
Local stock market capitalization (billion Euro)	53,6	21,9

Source: IMF, Eurostat, INSSE

The only country that has resisted the trend was Slovakia, the euro area member state whose economy grew by 0.8% from the previous quarter, after opening a new production line at Volkswagen plant in its territory.

c. Economic contraction - Estonia, Lithuania, Latvia, Hungary, Bulgaria

Preliminary data on the evolution of GDP in the emerging European Union shows that Hungary's economy contracted on an annual basis for the first time since the peak of the global economic crisis in 2009[10].

Hungary, whose center-right government is trying to negotiate to obtain a loan from the IMF and the EU, the economy declined by 1.3%. Analysts warned that fourth quarter data may be revised downward, which would threaten the government estimates regarding the stagnating in 2012[9].

Bulgaria also affected by bad weather and weak euro zone has stagnated compared to the previous quarter and the annual rate of growth rate slowed to 0.5%.

By the start of the crisis, year after year, Estonia, Latvia and Lithuania were among the highest growth rates in Europe. For example, in 2006, Estonia's GDP grew by 11.2% and the economy of Latvia and Lithuania grew by 11.9%, respectively 7.5%. Moreover, unemployment in all three countries was below the EU average[2].

In addition, Estonia's economy is classified as part of the ten "most liberal economies in the world". At the same time, Estonia has adopted the euro in January 2011, while Latvia and Lithuania are cautious regarding entry into the euro area[11].

The global economic crisis, the Baltic economies have become, since 2008, more fragile, from spectacular increases in the previous period to recession: Estonia and

Latvia (until the end of 2008), followed by Lithuania (in 2009).

Since 2009, all three countries face unemployment rates "double-digit": 13.7% in Lithuania, 17.3% in Latvia and 13.8% in Estonia. Also in 2009, GDP decreased by 14.8% in Lithuania, with 18% in Latvia and 13.9% in Estonia, compared to an overall decrease of 3.7% among all countries in the "European emerging group".

Recoveries and returns are expected primarily from Estonia and Lithuania, IMF data for 2010 indicate a real increase of 3.1% in Estonia and Lithuania by 1.3%, while in Latvia the impairment is indicated by one percentage point, country that has responded to pressure from the EU and the IMF through a loan of 7.5 billion euros[7].

4. Conclusions

The current financial crisis started in 2007, we analyzed the performance of European growth models applied in Central and Eastern Europe trying to identify causes and effects that led to economic growth or contraction against a. There have been highlighted three types of models of economic growth: a model of robust growth, sustainable (Poland); model with moderate growth countries (Czech Republic, Slovakia, Romania) and those with an economic contraction (Bulgaria, Hungary, Baltic States).

Being located in a central area and being able benefit both the structural and cohesion funds for modernization, development and attracting Western investors because of the human capital that they have, the countries of Central and Eastern Europe enjoy an advantage competitive compared to other emerging markets. Thus, for the economic recovery, Eastern European countries need to improve their models, either following the Polish model or finding variables that must be followed depending on their economic profile.

Analysing Romania’s Performance on Delivering the Economic and Social Targets of *Europe 2020* Strategy

Maria Mirona Murea
Academy of Economic Studies Bucharest,
Department of International Business and Economics
m_mirona@yahoo.com

Abstract

After the deadline of the Lisbon Strategy was reached, its’ main objective is still actual, being maintained and promoted by its’ succesor, Europe 2020 Strategy. Employment is the most important component of welfare state policies and it supports both economic and social objectives. One of the most important factors to overcome the economic and financial crisis, starting the year 2009, was employment. Lisbon Strategy since its’ beginning, has been targeted towards acheiving an economic growth and creating new jobs, the EU leaders concentrating their efforts upon the future of economic growth and developing employment strategies post-2010. As a member state, Romania assumed the general targets of Europe 2020 alongside the national development tragets subsumed to this European document on delivering the social and economic target of Europe 2020. This paper presents a brief analysis of Romania’s performances for fullfilling the two flagship innitiavies that have an economic and social nature.

Keywords: Europe 2020, employment, economic objective, social objective

JEL Classification: J20, J21, J22

1. Introduction

Two years after the deadline of the Lisbon Strategy was reached, its’ main objective is still actual, being maintained and promoted by its’ succesor, *Europe 2020 Strategy*. The political and economic ambition of the EU leaders was summarized inside this new strategy, as a response to the challenges of globalization and aging population,

phenomena with which EU is faced to the day. The realistic goals set in Lisbon Strategy₂ (2005-2010) – *economic growth* and *employment* – prevented the trap of the first Lisbon Strategy, which was too general.

Employment is the most important component of welfare state policies and it supports both economic and social objectives. Social protection expenditures are a result of tax revenues and social contributions paid by the employed population, so the social budget becomes sustainable depending on the number of employed persons on the labour market. Maintaining a long-term unemployment rate, early retirement and a reduced integration of social minorities on the labour market, this mechanism is breakable, due to the increased social spending and decreased social income, which leads to an increasing state debt [10]. One of the most important factors to overcome the economic and financial crisis, starting the year 2009, was employment [2] and globally, since year 2000 there has been an increase in overall employment rate. However, the crisis will show wether this was a structural increase, induced by reforms of the labour markets and social systems, or a conjunctural one, due to the positive macroeconomic developepment [10].

The financial and economic crisis led to the reduction of employment and at national level, the unemployment situation got worse, even though, from a theoretical point of view the unemployment rate is placed around its’ natural trend [9]. Since 2008, when the financial and economic crisis began, millions were left unemployed, situation that brought new pressures on EU’s social cohesion, exposing, at the same time, a set of fundamental thruths about the challenges that the EU faces in this moment of transformation [11].

Romania, as a member state, but also as a EU-candidate, incorporated the Lisbon Strategy objectives and policies inside the national employment policy, being one of the Central and Eastern European Countries where the initial adjustments were visible in real wages and the employment decline was limited. In 2000, the Romanian employment rate was higher than in other CEECs, the average was 63%, comparable to the EU average – 63.4% [8]. Also, as a member state, Romania assumed the general targets of the *Europe 2020* Strategy alongside the national development targets subsumed to this European document [4].

2. Theoretical aspects of employment in the context of Lisbon Strategy and *Europe 2020*

Lisbon Strategy since its’ beginning, has been targeted towards achieving an economic growth and creating new jobs, even though its’ core was the creation of a knowledge-based society, the creation of a European Social Model and innovation, the EU leaders concentrating their efforts upon the future of economic growth and developing employment strategies post-2010 [7].

From a theoretical approach, in the specialised literature two extreme views have emerged, regarding the transition to the market economy. The first view states that the main force behind the reform process involves the collapse of the public sector, combined with a slight increase of the private sector, which does not cover the losses of the public sector, but leads to higher unemployment rates and influences other public reforms, by blocking them. The second view states that the main force behind the transition is the rapidly growing private sector, which would be sufficient to absorb redundant workers of the public sector, therefore, the high unemployment rate would be a consequence of a “healthy” process of reallocating human resources [1].

The functioning of the EU market economies is influenced by the “flexibility” of the labour market, allowing it to be associated with rapid reallocation of human resources in the most efficient way possible, being responsible for generating economic growth [5]. For Romania, these factors are highly important, as a result of the reform

process and due to our country’s preparation to access the EU alongside adopting the Lisbon Strategy objectives: reallocating economic activities, open markets, reforming the labour market and restructuring the national business environment.

Romania’s transition to the market economy and the ongoing and dynamic process of integration in the EU, altered significantly the labour demand by decreasing the employment rates and the participation rate to the labour market, resulting the search of possible mechanisms of balance: interregional labour mobility and regional wage flexibility [6].

3. Analysing Romania’s performance on delivering the economic and social targets of *Europe 2020* Strategy

The European Commission, through *Europe 2020* Strategy, puts forward two flagship initiatives to catalyse progress in the social inclusion area. First, there is „An agenda for new skills and jobs”, which aims to modernise labour markets and to allow people to develop their skills throughout their active life. This agenda also states to increase labour participation and aims to better match labour supply and demand, including labour mobility. *Europe 2020*’s 7th flagship initiative is the “European Platform against poverty”, and its’ main target is to ensure social and territorial cohesion, so that all EU citizen can benefit from economic growth and the creation of new jobs [11].

The *Europe 2020* economic objective states that at a EU level the employment rate should be of 75% of the population, and the social objective plans to reduce the number of people exposed to risk of poverty by 25% as presented in the table below.

Table No. 1
Basic objectives of the *Europe 2020* Strategy,
by nature

Objective	Objectives Nature	Main Provisions
Employment rate	- economic	- employment rate should be 75% of the EU population (age range 20-64 y.o)
Decrease the number of people at risk of poverty	-social	- decrease the number of people exposed to the risk of poverty by 20 million (25%)

		of the EU population)
--	--	--------------------------

Source: Author’s conception, based on [2], p.32.

Achieving an economic growth generates earnings of the EU citizens, with an immediate impact and decreasing poverty, thus generating high levels of social inclusion. However, if using alternative methods poverty is being reduced (for instance through autonomous growth of social assistance), increases consumer demand but also labour supply from the population. Therefore, analyzing the two goals (economic and social) an indirect proportionality can be observed and their creation is not contradictory [3].

In Romania, the national target was set according to the *Europe 2020* Strategy, under two conditions: first to take into account the starting point in early 2011 and second, the existence of bottlenecks or other restrictions on the performance target. These targets were also determined based on the realistic scenario approved by the Romanian Government and by 2020, our country expects a men’s employment rate of 74.8%, women’s employment rate of 65,5% from the total of Romanian population, which means a total employment rate of 70% of workers aged 20-64 [3]. The fact that our country does not deliver 100% of this objective will not worsen the EU situation, it still delivers 93,3% of it, however, it has no active contribution to the creation of new jobs and increasing the employment rate.

Analysing the Romanian economy and labour market illustrates the reason why these final data were proposed, preventing more ambitious targets. First, there is a moral hazard generated by high and not judiciously public benefits on social assistance, which reduces the opportunity cost of giving up work and leads to a reduced attractiveness of employment, thus affecting the patterns of job search. Second, the mechanism of the collective agreement at national level (established through primary legislation) brings nominal rigidities at economic level, reducing labour market flexibility and preventing rapid and effective redeployment and the restructuring of employment. Third, an important share of the national economy

belongs to the black market, therefore, an important part of the actual employment, which is not recored at an official level, remains inconspicuous in terms of the government. The natural consequence of this aspect is that the employment rate of workers reported to the official government institutions is lower than the actual employment rate. On a medium and long term, the government’s lack of ability to solve this issue at an administrative level would maintain a high level of low skilled workers, thereby reducing the effect of increasing employment submitted on labour productivity, reduces the positive correlation between the inclusive growth (affected by the employment rate) and sustainable growth (affected by labour productivity). Fourth, for the ellabouration of curricula for the secondary and tertiary level, there is little anticipation of the labour market demand, therefore, a high rate of inadequacy in the supply of skills is generated. The consequence is that the graduates are rejected on the labour market and a pressure for retraining or upgrading skills through training programmes throughout the working life, is created [3].

The speed for increasing the employment rate in Romania, for workers aged 20-64 y.o is higher compared to the average speed of increasing the same rate at EU₂₇ level, which means that our country will not generate bottlenecks for achieving the *Europe 2020* target.

In Romania, the target regarding reducing poverty was set at the level of reducing the number of persons that are relatively poor and the Romanian Government approved the pesimistic scnario, which stated that our country could decrease the relative poverty rate by 16.01%, meaning, that for the decade 2011-2020 only 580,000 persons will not experience poverty and social exclusion. These data correspond to 64% from the EU target.

The figure below represents Romania’s performance in fullfilling *Europe 2020* Strategy targets, at a social and economic level.

Figure No. 1
Romania's share in fulfilling the
Europe 2020 social and economic targets

Source: Author's conception, based on [2], p. 84.

In Romania, the employment rate had, over the "Lisbon decade" (2000 - 2010) a descending trend, the lowest level of the employment rate was registered in 2002 (63,3%), the national average for this period of time being of 65.975. In 2006 the employment rate grew up to 64.8%. The financial and economic crisis influenced also the Romanian employment rate: by 2009 this was 63.5% and in 2010 its' value was 63.3%, the standard deviation was 3,075 and the variation 9.459.

As a member state, Romania began to modify the laws of employment, in 2011 elaborating a new Labour Code, according to EU's standards. Romania's main challenges are regarding the legal requirements concerning full or partial work, employers having to adapt themselves to difficult economic conditions, which represented a way to overcome the financial and economic crisis.

4. Conclusions

The results obtained by the Lisbon Strategy were modest, and the new *Europe 2020* Strategy aims to answer to the question "Where did Lisbon Strategy go wrong?". This new strategy is optimistically oriented towards the future decade. Close to other documents, that were initially rejected, then redefined and readjusted, also the Lisbon Strategy has its' natural sequel, represented by the *Europe 2020* Strategy, which maintains alive the main objective of the LS, but brings out more realistic deadlines, gives up on an overloaded agenda and conflicting priorities, while enhancing coordination between member states[13]. The main target of the *Europe 2020* Strategy is to create better jobs, welfare and is

concentrating itself to generate a smart, sustainable and inclusive growth in order to offer a new direction for action for the member states[11].

Romania's performances in the economic and social area of this strategy, as a member state, can be improved, by correlating the EU processes to the national ones, that exist simultaneously to these flagship initiatives.

Common Agricultural Policy Post-2013: Scenarios Regarding Romanian Agriculture

Oana-Marilena Niculescu
Bucharest Academy of Economic Studies,
Faculty of International Business
[oananiculescu24@yahoo.com](mailto: oananiculescu24@yahoo.com)

Abstract

Common Agricultural Policy (CAP), the centerpiece of the European integration, has been considered the strongest common policy of the European Union. However, due to its long history, it has been reformed several times, the most important being McSharry Reform in 1992 and Fischler Reform in 2003.

The paper aims to analyze the CAP after 2013 in the view of big European think-tanks as well as the position of the European Commission regarding a new EU agricultural policy. The objectives of the CAP reform are deeply connected to the “EU 2020 Strategy”.

The analyze of the Romanian agriculture using different scenarios reveals the fact that the development of the middle, family farm sector is a solution for the convergence with the European model of agriculture and for the development of this important economic branch.

Keywords: CAP, reform, think-tank, agriculture, scenarios

JEL Codes: Q18, Q13, F59

1. Introduction

CAP has been the most analyzed, debated and controversial European policy. Through its long history of over 50 years, it has been reformed many times (1992, 2000, 2003, 2008).

Despite of that, a new reform post-2013 is compulsory having in view that Health Check is already a matter of past.

In this context, the analyze of Romanian agriculture reveals the fact that it is less developed in comparison to the agriculture of other EU countries and has a dual character

which can be considered an odd feature for a modern European member state.

2. Literature review

The paper is related to the national and international research that analyzed these aspects of one of the most important EU policies. The opportunity of a new agricultural policy and the need to carry on the reform has been deeply debated by different member states as well as by Romanian Center for European Policies, Centre for European Policy Studies, big European think-tanks, the European Commission and European Commissioner for Agriculture and Rural Development Dacian Cioloș.

3. Research method

The research methodology consists in collecting and analyzing of internal and international data. In order to analyze the Romanian agriculture after 2013 I used the method of scenarios.

4. The results of the research

Nowadays, new economic, social and environmental challenges need to be addressed in Europe, agriculture being in the front line for these challenges. This dynamic policy, reformed on many occasions, resulted in a multi-functional policy; though, it has been often criticized for its efficiency in achieving its objectives. The initial objectives have remained unchanged but the importance given to different objectives and instruments used for its achievement have changed radically. Intervention prices are set at low levels, whereas direct payments combined with cross-compliance contribute to

providing basic public goods, delivered through sustainable farming. CAP is facing challenges like: food safety, environment and climate changes and territorial balance. Although CAP has developed, many changes are still needed in order to answer to new challenges like: improving of the sustainable management of natural resources (water, biodiversity, soil), maintenance of competitive spirit in the conditions of globalization growth, recovery of the diversity of agricultural structures and output in EU, strengthening the territorial and social cohesion in the rural areas of EU, increasing the support of CAP for member states, farmers and active farmers. Responding to these challenges, CAP will also contribute to the “EU 2020 Strategy” concerning:

- **smart growth** (by increasing resource efficiency and improving competitiveness through technological knowledge and innovation, developing high value added and quality products, developing green technologies and using information and communication technology, investing in training, providing incentives for social innovation in rural areas and improving uptake of research);
- **sustainable growth** (by maintaining the food, feed and renewable production base, ensuring sustainable land management, providing environmental public goods, addressing biodiversity loss, promoting renewable energies, fostering animal and plant health, increasing resource efficiency through technological development and using results of research, further reducing emissions, enhancing carbon stocks and fully developing the potential of rural areas);
- **inclusive growth** (by unlocking economic potential in rural areas, developing local markets and jobs, accompanying the restructuring of agriculture and supporting farmers’ income to maintain a sustainable agriculture throughout Europe [5])

The Commission’s Communication on the “CAP toward 2020” recommends the following strategic aims: to guarantee long-term food security for European citizens and to contribute to growing world food demand; to provide European citizens with high quality and diversified products, in line with the requirements of natural resources and public health; to maintain viable rural communities, contributing to employment and to territorial balance, the increase of CAP support of member states, farmers and active farmers. Based on these aims, the Commission has formulated three objectives for the future CAP: viable food production, sustainable management of natural resources and climate action and balanced territorial development.

4.1. Different views regarding CAP

In June 2009, at the informal Council in Brno (Czech Republic), in the debate regarding the future of Europe, several European think-tanks were involved, with interests ranging from commercial and international affairs to land use and food security with studies, reports and conferences.

Some of them expressed their position even before that moment, an example being Notre Europe which prepared some years ago several studies regarding the future of European agriculture.

Groupe de Brouges (reflection group regarding EU agriculture and sustainable development) launched in 2008 the paper “The dilemmas of globalization” that underlines the multifunctional role of agriculture as well as the fact that conserving landscapes and biodiversity requires public intervention in agricultural production. The core-business of farming is and should remain the sustainable production of food.

Food security and food sovereignty are important matters on Europe’s agenda and on the world’s having in view that the growth of the world’s population will probably be higher than the growth of rate of food production. In a report of a workshop held in Athens (Greece) in April 2011 it was stated that CAP must try and find a better balance of the differences between northern and southern countries, must try to find a way to make small farmers more competitive. There

is a lack of vision, strategy and policy concerning green development, new technologies should be available for all inhabitants of rural areas. There is still a big difference among EU countries to be competitive and market transparency must be improved. Other goals are: an increased quality of products, a safe environment, a sufficient income for farmers. More emphasis should be put on education both for farmers and consumers; policy must be aimed more at keeping young farmers in rural areas, especially in southern and Eastern Europe. There is a too much emphasis on Pillar I. That is why we should give more importance to quality of life issues (Pillar II). The real reform would be a reduction of direct payments/reduction of budget, a new way of thinking about competitiveness, agriculture and food sector. The competition on land is becoming an important issue. Utilized agricultural area represents an important percent, so that there is a lot of pressure on it, both from within the agricultural sector as from outside to use this cheap land for other uses such as housing, infrastructure, industry and recreation. The interconnection with other policy fields in order to increase competitiveness and sustainability is important as well as the role of farmers unions in order to increase horizontal integration of farmers and their role in the CAP. There is a lack of policy instruments within the CAP. We should first make an ex-post assessment of the current CAP measures (cross-compliance, agro-environmental schemes, farm modernization schemes); secondly, we should make an ex-ante assessment of reform proposals. From these assessments we should be able to say whether we need to improve current measures or develop new measures. Criteria to determine levels of sustainability are needed. We need to integrate the cultural dimension in the CAP reform and to find a way to bring an integrate model defined as a integrated strategy (economic, ecological, cultural, educational, etc.). Regarding the territorial balance, its multidimensional character has been provided by geographical mobility, the resulting disequilibrium within an area may be caused by the movement of its population for various reasons. The negative trends within the less favored areas lead to a declining number of

farm holdings that are securing a subsistence level of living and to increasing levels of unemployment. The role of innovation has been of crucial importance for rural areas due to regional imbalances. Rural development activities can contribute to the promotion of innovation in various areas, the role of education and research being stressed in this respect.

L’Institut Francais pour les Relations Internationales (reflection centre regarding international affairs) organized in 2008 a seminar regarding CAP, the conclusion being that it represents an appropriate response to the complexity of challenges that agriculture is facing. In September 2011, at the international conference held in Brussels, it was stated that CAP post-2013 should improve the sustainability and long-term competitiveness in the agro-food sector.

Land Use Policy Group launched in 2009 its own acknowledgement regarding CAP, focusing on rewarding the environmental services resulting from land management. The new policy should ensure the addressing of climate changes, promote the sustainable use of natural resources, the preservation of biodiversity, the use of new and smarter technologies with a positive impact for the environment, the integration of land management in the economic and social policies, the monitoring of these objectives and the support of the entire land management system; it should avoid the export of environmental problems by developing high international standards.

In June 2010, *SAF Agriculteurs de France*, a French agricultural think-tank, recommended the replacing of single farm payment with an agreement built around an European agricultural contract based on two elements: food security and environmental conservation. This contract will be supplemented by a system of “specific contracts” for those who wish to undertake new measures for environmental conservation. These contracts will be elaborated and negotiated after consulting all of the stakeholders. This fundamental change offers a new chance to the relation between society and farmers through clarifying public spending, to farmers as suppliers of services, to political actors who will find a new action field.

European Centre for International Political Economy (ECIPE) had an interesting contribution through its study regarding the winners and losers from CAP reform. The study argues the phasing out of single farm payment and proposes the replacing of the existing structure of CAP based on 2 pillars, with another one containing a public goods pillar (containing all efficient policies to be preserved) and a discretionary pillar (containing all inefficient policies to be removed over time). The paper also assesses the criteria likely to guide future allocation of CAP payments, such as GDP per capita, agricultural and forest areas, areas with Natura 2000 status and estimates the share of member states in total CAP payments under different post-2013 scenarios. This reveals differences between the negotiating positions that countries adopt and the payment receipts they can expect from the reform.

The conservative scenario assumes that two third of the funds should be allocated according to the procedure till 2013 and one third according to the size of agricultural area and to the size of GDP/capita. The progressive scenario reverses these percentages, being less addicted to the past. The scenarios differ through the importance given to the GDP/capita related to the agricultural area. Allocations are equally influenced both by the past and by the combination area/GDP but GDP/capita has a higher contribution in the case of scenario based on a high GDP.

The study with the highest impact - Bureau and Mahe / **Notre Europe** proposes a new vision regarding direct payments, by introducing an integrated system of contractual payments consisting in three levels:

- decoupled payments with a view to maintain the agricultural area;
- payments connected to the natural handicapped areas (concerning less favored areas);
- "green points" payments for areas which adopt certain production techniques.

It is expected that the redistribution of payments on this basis would allow farms located in areas with a particular social value and in environmentally sensitive zones to be sustainable, to provide the expected

identified public services and to contribute to food diversity. This contractual payment scheme would develop a set of incentives for the delivery of positive externalities on the environment.

The suggestions are made in the way that agriculture should become more competitive, the current payment schemes must be replaced with a simplified and smaller one, public intervention must be maintained to guarantee a floor price (safety net).

On **October 12th, 2011**, the Commission presented a set of **legal proposals** designed to make the CAP a more effective, efficient and understandable policy for a more competitive and sustainable agriculture and vibrant rural areas in order to help the farming sector to become more competitive and to deal with the economic crisis and increasingly unstable farm-gate prices. The proposals aim to strengthen the competitiveness and the sustainability of agriculture and maintain its presence in all regions, in order to guarantee European citizens healthy and quality food production, to preserve the environment and to help the development of rural areas. Following a debate in the European Parliament and the Council, the approval of the different regulations and implementing acts is expected by the end of 2013, with a view to having the CAP reform in place on January 1st, 2014. The involvement of the Parliament in the process of taking decisions will better respond to the expectations of farmers, inhabitants in rural areas, European citizens in general.

Different points of view recommended, among the main objectives, to preserve the food production potential through the territory of EU in order to guarantee the long term food safety for the European citizens in terms of crisis and to contribute to the growing food demand at global level as well to support the farmers communities that supply the European citizens with quality and diverse food in terms of sustainability, according to the environmental demand.

Dacian Ciolos, the Commissioner for Agriculture and Rural Development, underlined in his speech the statements on the key points: better targeted income support, tools to address crisis management which are more responsive and better suited, a “green” payment for preserving long-term

productivity, additional investment in research and innovation, a more competitive and balanced food chain, encouraging agro-environmental initiatives, facilitating the establishment of young farmers, stimulating rural development and entrepreneurship, better addressing sensitive areas, a simpler and more efficient CAP.

4.2. Scenarios for the development of the Romanian agriculture in the period 2014-2020

Development of large agricultural holdings

Subsistence farms disappear gradually in favor of competitive, large commercial farms leading to a significant increase of the middle agricultural area utilized per farm, agricultural activity being focused in the favorable areas for agriculture while the number of less favored areas decrease and might disappear.

Consequences: an increase of the agricultural output, a decrease of the population employed in agriculture; the fertile land is intensively exploited, an increase of GHG emissions.

Development of middle, family farms

The utilized agricultural area cultivated by farmers representing agricultural holdings between 10-50 hectares increase, supplying local and national markets. Large farms become more market-oriented at international level while small farms concentrate on direct sales, traditional products at national level. In this way, the convergence with the European model of agriculture can be obtained.

Consequences: increased agricultural output, a more developed rural area and a more sustainable agricultural sector, young farmers are encouraged to settle in the countryside.

Keeping the actual model

The number of small farms remains high while an important part of the utilized agricultural area is cultivated by large commercial farms.

Consequences: the contribution of agriculture to the GDP decreases, low quality of the agricultural equipment, any improvement of the food chain, young people tend to migrate to urban area while the population in the rural area is represented by old farmers.

5. Conclusions

Some adaptations appear necessary, in streaming and simplifying the actual instruments as well as introducing new policy elements with a view to a better functioning of the food chain. CAP should put in place instruments in order to protect farmers of extreme volatility.

CAP reform must continue in order to promote competitiveness, efficient use of resources, adoption of appropriate measures with a view to ensure food safety, social and territorial balance in the context of climate change, taking into account the limited budget resources and the economic crisis in agriculture. In this way, it will contribute to building a more sustainable, smarter and more inclusive growth for rural Europe.

For the Romanian agriculture, the development of the middle agricultural sector and the convergence with the European model of agriculture might represent a solution to modernize this important branch of the economy.

Romania’s Activity in Community Trademark Registration

Nițu Valentin Ionuț

The Bucharest University of Economic Studies

nivalentin@yahoo.com

Abstract

In the current economy, the competition for attracting new customers on the Community market by gradually removing tariff and non tariff barriers became very strong. Since companies are no longer operating on a small national market, they must pay a particular interest to protect the intangible patrimony in order to be successful. The trademark, part of the intellectual capital of a company, makes products distinguish from each other depending on the manufacturer by using symbols, thus acting on the consumer and providing it with information in the selection process. Trademark registration in the Community system offers broad protection on the throughout the present Member states territory as well as its extension to countries that will subsequently accede the registration. This article aims to make an analysis based on empirical data of the way in which brand holders in Romania have applied for registration in the Community system, class structure, nature and comparison of this data with OHIM’s total activity data.

Keywords: Community trademark, intellectual property, evolution, OHIM

Jel Classification: O34, M31

1. Introduction

The research subject is to analyse the activity of trademark holders in Romania of trademark protection in the Community system. EC Regulation 40/94 on Community trademark has introduced an unitary system of trademark protection throughout the Member states. The basic characteristics of Community trademark are:

- unitary characteristic – to register a Community trademark one shall submit a

single application; following the favorable settlement one can obtain a single title that offers protection throughout the European Union territory. Therefore, the decisions concerning trademark existence have a unitary characteristic.

- coexistence with the other two systems of protection – the national and the international systems; the protection of the Community trademark system is not compulsory and it exists independently of the national and international trademark systems, but there is certain correlation between the three.
- claiming the seniority of a national trademark by which the holder of an identical national or international trademark may invoke the age of that trademark.
- transforming Community trademark (CTM) into national brand – in order to be registered as a CTM, the acceptance of all national offices of the Member States is necessary, thus the refusal of one of them could lead to rejection. In this case the solution given to the holder to benefit from the filling date or claimed priority is submitting to the national offices that have not refused registration and so transforming the CTM into a national trademark. There are direct benefits, because the filling date and the protection of each country are not lost but the holder loses the trademark unity and the prestige in owning a Community trademark[4].

The system effectively started to function in 1996. Romania became an EU member in 2007 and there is sufficient empirical data to analyze how the trademark owners understood the importance of this system and have introduced it in the development strategy. It should be noted here that trademark proprietors from non-EU countries may require Community trademark

registration. The analysis of these applications may reveal the interest of countries worldwide in the Community market and the importance given by them to protect their own brands.

With the removal of tariff and non tariff barriers to trade, the free market with approximately 350 million customers from 27 Member States opened in front of the companies. Thus trade policy must be rethought. It is very important the way customers are attracted and made loyal. The trademark should be the foundation of this strategy and more precisely, in the context of current analysis, the Community trademark. With an extensive and unitary protection a strong brand can be developed and in the same time it provides the legal bases for economic development.

The way in which trademark proprietors from Romania acted to break into this market and have applied for trademark registration as well as time evolution of those applications will be analyzed below. The data are taken from the OHIM statistics and represent the status at 29.02.2012 [5].

2. The evolution of applications and registered trademarks

The applicants for Community trademark registration may be from Member States as well as beyond EU. Relevant for the analysis carried out is the evolution of the applications submitted by proprietors from Romania since the introduction of the system, in the last three years before the accession and the modifications produced after it when all previously registered Community trademarks extended their protection on Romania’s territory.

Table no. 1. Submitted applications and registered Community trademarks

Year	CTMs-Submitted applications	RegisteredCTMs
1996	1	-
1997	1	-
1998	5	1
1999	1	1
2000	4	2
2001	4	5
2002	8	4

2003	3	7
2004	29	2
2005	46	14
2006	129	37
2007	315	97
2008	285	189
2009	334	216
2010	411	398
2011	631	335
2012	98	63
	2305	1371

Source: <http://oami.europa.eu>

Data analysis regarding submitted applications for registering Community trademarks shows the following:

- from 1993 to 2003 applications to OHIM were sporadically submitted, up to 8 applications per year in 2002, showing little interest of holders from Romania for EU-wide protection of their trademarks.
- the period 2004-2006 is marked by a percentage rate of growth exceeding in some cases 100% of the number of applications. This is also due to the political changes, accession perspectives had an important role in the interest to apply a development strategy to overcome national borders and be a Community one.
- the post-accession period 2007-2011, except 2008, increases are recorded from year to year, the most significant one being in 2011 compared to 2010, from 411 applications to 631. After accession, Romania as part of EU came into direct contact with the Community system of protection and was more able to notice its benefits.

The number of applications for Community trademark registration gradually increased from year to year with one exception – seen as a percentage. Instead, in terms of volume, the total number of 2305 is low and shows the limited interest of Romania in protecting the trademarks at the EU level. Slovenia, Slovakia, Hungary, Cyprus, Bulgaria are countries with which we can compare our number of applications. As culture of the intellectual property, Romania is an emerging market. Creating a Community trademark requires time, protection is the first step for a future asset

that can bring considerable income. The trademark is inherently an element of trust conveying information within a short period of time through symbols that determine the customer to make the choice.

Globally, intellectual property assets share in the total company value have dramatically increased because of its promotion policy based on strong brands.

There is a difference of 934 between the submitted applications and the registered Community trademarks. This difference has two sources:

- the time required to follow the registration procedure from the time of application pending the decision
- refusal received by some submitted applications after their analysis

3. Class structure and number of applications by classes

A trademark can be registered for at least one class and at most 45 classes, according to Nice Classification. The 2305 application filled by Romanian proprietors requested protection for a total of 6676 classes, representing an average of 2,90 classes/application submitted. This can be explained by the fact that the standard tariff for a trademark registration allows applying for three classes, for each class beginning with the fourth one must pay an additional cost.

Table no. 2. Top 10 classes with the most applications submitted by the proprietors from Romania

1-35. Advertising, business management, business administration, office functions.	1127
2-30. coffee, tea, cocoa and coffee substitutes, rice, tapioca, sago, flour and preparations made from cereals, bread, pastry and confectionery, ice cream, sugar, honey, treacle, yeast, baking powder, salt, mustard, vinegar, sauces(condiments), spices, ice.	410
3-39. Transportation, packaging and storage of goods; travel	406
4-29. Meat, fish, poultry and game, meat extracts, canned, frozen, dried and cooked fruits and vegetables; jellies, jams, compotes, eggs, milk and dairy	404

products, oils and fats.	
5-42. Scientific and technological services as well as research and design services relating thereto; industrial analysis and research services; creation and development of computer hardware and software.	354
6-32. Beers, mineral and aerated waters and other nonalcoholic drinks; fruit drinks and fruit juices, syrups and other preparations for making beverages.	337
7-41. Education, training, entertainment, sporting and cultural activities.	294
8-9. Scientific, nautical, surveying, photographic, cinematographic, optical, weighing, measuring, signaling, checking (supervision), safety(rescue) and teaching equipment and instruments; devices and instruments for conducting, distributing, transforming, accumulating, regulating or controlling electricity; devices for recording, transmission or reproduction of sound or images, magnetic recording media, discs; compact discs, DVDs and other digital recording media, mechanisms for coin-operated apparatus; cash registers, calculating machines, data processing equipment and computers; computer software, fire extinguishers.	242
9-33. Alcoholic beverages (except beers).	239
10-43. Services for providing food; temporary accommodation services.	225

Source: <http://oami.europa.eu>

Making a top10 most frequently used classes to it can be noticed that 5 of them are service classes. From this fact emerges the idea that services can have a greater degree of delocalization and a much faster territorial expansion with not a very high cost. The first place is by far occupied by class 35 with 1127 applications. Because the market it is still at its beginnings, the first who understood the importance of Community trademarks were the proprietors activating in advertising industry, business management, business administration. From the total applications, this class occupies the second place with 213.853 applications. One may notice a difference that is more than double between the share of this class in Romania

and its total share which shows the early stage in which our country with a larger share of class 35 applications.

There is another group in the top 10 of 4 classes (30, 29, 32, 33) grouped two by two – they are complementary: the first two are related with food products and the following with nonalcoholic and alcoholic beverages. All this shows that Romanian producers of food products and beverages want to protect their own brands in the European Union. This condition is explained due to Romania’s potential in these sectors of activity and the high quality products of some brands. Protection on an extended territory combined with an adequate quality can be profitable.

Table no. 3. Top 10 classes with the most applications submitted by total and the situation for Romania

No	Clas	Total applications submitted	% from total	Top no.	% from total
1	09	279,474	10.04	8	3.62
2	35	213,853	7.68	1	16.88
3	42	195,507	7.02	5	5.3
4	41	150,507	5.41	7	4.4
5	16	149,348	5.36	13	2.74
6	25	128,047	4.60	15	2.41
7	05	97,890	3.52	11	3.16
8	38	95,648	3.44	17	2.35
9	03	85,810	3.08	18	1.91
10	36	77,408	2.78	16	2.35

Source: <http://oami.europa.eu>

Class 9, which is on first place by total with 279.474 applications, occupies in Romania eight place with 242 applications submitted. This class is for equipment and scientific measuring instruments, and includes brands of products incorporating high added value and so the density value is high. Only eight place in Romania, with a share of 3.62 compared to a total of 10.04 shows that the producers from our country either do not have strong brands in order to be protected by Community registration or this industry is too little developed in Romania and protection on the Community market would not bring significant future benefits due to high competition.

Table no. 4 . Applications submitted by the CTMs nature- Romania

CTMs nature	Number of applications	%
Figurative	1,367	59.31%
Verbal	921	39.96%
3D	11	0.48%
Others	5	0.22%
Colour	1	0.04%
Total	2,305	100.00%

Source: <http://oami.europa.eu>

Table no. 5. Applications submitted by the CTMs nature -Total

CTMs nature	Number of applications	%
Verbal	627,947	60.89
Figurative	394,789	38.28
3D	6,708	0.65
Colour	866	0.08
Others	839	0.08
Sound	162	0.02
Holograms	9	0.00
Olfactory	7	0.00
Total	1,031,327	100.00

Source: <http://oami.europa.eu>

By the CTMs nature, Romania has the largest number of figurative trademarks, 1367, with a share of 59.31% of total applications. This situation can be explained in two ways: mainly Romanian proprietors address to the internal market, but with expanding perspectives to the Community. For a marketing strategy that uses such an approach, the figurative trademark is the most appropriate because it overcomes the linguistic barriers of perception and understanding, considering the markets desired for competing and the language differences between them. On total, the situation between the figurative and the verbal trademarks is the opposite from that of Romania. In OHIM’s statistics, the main types of trademark are the figurative and the verbal ones, both overall and in Romania, with 99% share; the other types of trademarks have below 1%.

4. Conclusions

The trademark is the most important mean of legally recognized business reputation. The way in which proprietors from Romania applied for protection throughout the EU shows a growing interest but at a lower level compared with the other countries. A valuable trademark is built in time which means a development strategy perspective spread on several years. A small number of CTMs show that Romania is more a sale market for products of the other states than a producer that can compete with strong brands. Romania registered the most CTMs in the class of advertising, business management, business administration, office functions, being more than double of the total applications submitted – in percentage terms. The number of applications grew with the accession indicating that the accession to the Union had a direct influence upon the trademark protection strategy. The benefits of extended protection throughout all the Member States provided by the Community trademark system had effect on the evolution of the number of applications submitted by the holders from Romania. The benefits of CTM system are creating a legal framework for development strategies in the EU market and in the future for the countries that will join later.

The Status of Road Transport Companies. Aspects of the Direct Application of Community Rules

Adina Laura Pandele
Ovidius University of Constanta
The Faculty of Law, Administrative Sciences and Sociology
adinapandele@yahoo.com

Abstract

Road transport liberalization implied a reconsideration of the conditions for carrying out the activities in this field. Ensuring open and non-discriminatory access to the road transport market implies the existence of national regulations that allow the direct application of European regulations for carrying out the activity of road transport operator.

Keywords: road transport, liberalization, transport operator, company

J.E.L. Classification: K 10 - General

1. Introduction

The need to directly apply Community rules and, consequently, to implement the conditions required at European level for road transport activities entailed a further review of the existing legislation in this field. The importance of road transport activities in the national economy and the need to ensure the general principle that any transport company should comply with several requirements led to the harmonization of regulations on the fulfillment of road transport activities in conditions that ensure free market access and control at the Community level. Therefore, the field of road transport knows, at present, a new regulation by the provisions of G.O. no.27/2011 on road transports (published in the Official Gazette no. 625/2011), which meets European requirements.

At present, this new regulation allows the fulfillment of road transport activities of goods and passengers, in accordance with the EU regulations transposed into the national law. The reassessment of the road transport legislation targeted the status of transport companies which, usually, can not fully fall

in the categories classified in the common law, since they follow a set of derogatory rules imposed by their activities.

2. The Access to the Road Transport Activity

Establishing the conditions of the road transport activity involves, primarily, the fundamental distinction between public transport, own account transport and transport in own interest.

The selection criterion in this case is represented by the pursued social interest. Thus, any natural or legal person can carry out road transport activities in order to move persons or goods for personal gain. Also, any legal person, any company can carry out road transport activities of goods or persons in order to achieve its purpose. However, public transport can be performed only by those persons who meet the legal requirements for the conduct of this activity.

Related to the commercial nature of the activity, road transports may be carried out on payment, by road transport operators in “non-discriminatory access conditions for third parties, under a contract of transport”^[1] and own account road transports may be carried out by road transport companies for moving goods or persons in own interest.

The legal framework for carrying out road transport activities establishes the rules and limits under which these activities can be carried out, activities which should be circumscribed to several requirements of good repute and financial and professional standing, certified by the registration in specific registers. In addition, any own account road transport operator or company should hold a document which allows the fulfillment of a certain type of road transport.

In accordance with the laws in force, the road transport of goods or persons may be

carried out only by companies authorized to access the occupation of road transport operator.

The term company, within the meaning of the European regulations, refers to any natural or legal person engaged in the occupation of transporting persons or goods for commercial purposes (see the provisions of article 2, section 4 of the Regulation (EC) no. 1071/2009 establishing the common rules on conditions to be complied for the occupation of road transport operator, directly applicable in accordance with the dispositions of article 3, section 19 of G.O. no.27/2011 pct.19). Regarding the road transport activity, it should be noted that the legislator does not use the generic name of company, but makes a distinction between road transport on payment and own account road transport. Thus, for the road transport activity on payment the term “company” is equivalent to the one of road transport operator, the latter referring to the work performed "by collecting a fee or the equivalent in kind or in services" (see article 3, section 40 of G.O. no.27/2011). However, for own account road transport, the term “company” is kept, complete with the indication that this is a company of own account road transport. In both cases, the road transport companies with headquarters in Romania, whether as road transport operators or road transport companies, should comply with the rules set by the relevant European regulations.

In the following, using the generic name “company”, and given the above distinctions, we will identify the conditions that allow the fulfillment of road transport activities.

The analysis of directly applicable Community provisions in national law reveals that a company may be authorized to carry out road transport activities of goods or passengers on payment, subject to the requirements for the admission to the occupation of road transport operator.

According to Article 7 of the Methodological Standards for applying the provisions on the organization and performance of road transports and of their related activities established by G.O. no.27/2011 on road transports (approved by the Order of the Minister of Transports and Infrastructure no.980/2011, published in the Official Gazette no. 854 bis/2011, hereinafter

the Standards), the access to the occupation of road transport operator is obtained under the provisions of article 3 paragraph 1 of the Regulation (EC) no.1071/2009.

Firstly, the company’s real and stable head office should be established on the territory of a European Union Member State. According to Article 9 of the Standards, for this condition to be fulfilled, it is not enough for the company concerned to have its head office established under the deeds of incorporation or under the status in Romania.

The specificity of the activities entails other adjacent requirements. On the one hand, it concerns the possibility to control the activity, in the sense that the head office of the company should correspond to the place it keeps the documents which may be verified by the public authorities empowered in this field (controls are made by the inspectors of the State Inspectorate for Road Transport Control, abbreviated I.S.C.T.R). On the other hand, it is worth noting that the company must have a fleet of vehicles registered in Romania, regardless of the form in which they are held, and maintained in proper technical conditions, in activity centers established in Romania.

Secondly, the company must meet the requirement of good repute. The good reputation is a condition designed to ensure that both the company and the person who will coordinate its activities enjoy the necessary integrity and morality. This condition is in accordance with the provisions of article 6, paragraph 1 of Regulation (EC) no.1071/2009 in conjunction with article 10 of the Standards, in that the company or its manager were not convicted or punished for breach of the national provisions in force. In this case, the legislator refers not only strictly to the company's business activity in Romania and in the EU Member States, but also considers other types of illicit acts (human trafficking, drugs).

Thirdly, the company must have financial capacity. An essential feature of the principle of free trade is represented by the right of any person to engage in a commercial activity [2]. In this context, the subordination of the exercise of road transport activities to a financial condition could be seen as an exception to the above mentioned principle. In order to meet the condition related to the

financial capacity, within the meaning of article 14, paragraph 1 of the Standards, the company should to prove that it has a certain amount both for the commonly used vehicles and for the supplementary used vehicles. The proof of its financial capacity is made through the annual accounts certified by accredited persons or through certificates certifying a bank guarantee or insurance (see article 14, paragraph 2 of the Standards in conjunction with article 7, paragraph 2 of the Regulation (EC) no .1071/2009).

Such a restriction could be explained by the legislator's desire to ensure the access to this occupation only to those companies which can prove that they have the funds necessary to ensure qualitative services, with high reliability.

The last condition regards the manager's professional competence, demonstrated by a relevant certificate (article 15, paragraph 1 of the Standards). The company's transport activity must be coordinated by persons who hold certificates of vocational competence, obtained on the basis of their initial vocational training, which will be periodically updated by means of specialized courses (article 16 of G.O. no.27/2011).

3. Data Registration in Electronic Registers

The statutory provisions also provide for the company's obligation to register its corresponding data in electronic Registers. These registers differ by the type of transport which will be made by the company.

For the road transport on payment, the road transport operator will record it in the electronic Register of road transport operators, provided that it has obtained the Community license.

The term “Community license” appears as a novelty in the current regulation of road transports (G.O. no.27/2011). In accordance with the provisions of G.E.O. no.109/2005 (repealed by G.O. no.27/2011), the fulfillment of road transports on payment was permitted under the transport license proving that the conditions of the access to the public transport, established by the national competent authority (Romanian Road Authority, abbreviated A.R.R) have been met. The standardization of the applicable rules and the exclusion of the existing

restrictions in the fulfillment of intra-Community road transports were achieved by new legislative changes. The harmonization of national and EU legislation also meant the obligation to carry out road transport activities on payment only under a document that permits free and non-discriminatory market access to the Community road transport market, and the control of these activities.

Carrying out road transports on payment only when there is a Community license is a consequence of the free movement of services, which, with the overall title, meant that "in order to operate throughout the European Union, it is enough for the companies in a Community country to hold the license to operate in the country of origin"[3].

It should be noted that the Community rules on the free movement of services have excluded from the benefit of their application the field of transports (article 58 of the Treaty on Functioning of the European Union/ the former Article 51 of the Treaty establishing the European Community), the latter being, from the very beginning, subject to separate regulations (articles 90-100 of the Treaty on the Functioning of the European Union/ articles 70-80 of the Treaty establishing the European Community). From a juridical point of view, this distinct regulation of the field that we refer to is explained by the features that distinguish transports from other services. Thus, transports, although have the legal nature of services, are different, in particular, from the category they belong to by the transport operator's main service and by the professionalism (article 3 of the Civil Code provides that there are considered professionals all those who operate a company, in that they systematically exercise an organized activity) involved by its activity, respectively the movement of goods or persons, as services available to the public [4]. Economically, the special regulation, as sector policy, is explained by the influence of transport activities on other economic sectors [5].

The Community license shall be granted only to those companies that carry out road transport activities on payment and which prove that the conditions relating to the access to this occupation have been met. The proof of the fulfillment of the admissibility

conditions is made by the documents attached to the application presented to the competent authority. If after the analysis of the documents filed under the law (article 21, paragraph 2 of the Standards) it is noted that the requirements have been met (article 7 of the Standards), the competent authority shall issue the Community license valid for 10 years. The compliance with the Community requirements, even after obtaining the Community license, is ensured by the mandatory control of the company. In this respect, article 23 of the Standards provides for the obligation of I.S.C.T.R to perform a control to the company's head office within 3 months after granting the Community license.

For own account road transport, the own account road transport company will be registered in the electronic Register of own account road transport companies, provided it has obtained an own account road transport certificate (article 47 of G.O. no.27/2011, in conjunction with article 3 of the Standards).

The own account transport certificate is the document that allows the company to make such transports and it is obtained under conditions similar to those imposed on road transport operators. Compared to the activity of road transport operators, own account road transport companies are exempt from the requirement of financial capacity, being enough to meet only the requirements of good repute and financial competence (article 3, paragraph 1, letter b of the Regulation (EC) no .1071/2009).

Getting the Community license or, where applicable, the own account transport certificate, is a necessary but not sufficient condition for the free access to the road transport market. The harmonization and control of such activities at the Community level require the advertising of data on the providers of such services. This is done by the competent authorities by entering the appropriate data for own account road transport operators and companies in the national electronic Register of road transport operators and in the national electronic Register of own-account road transport companies. In Romania, the competent authorities for the registration, management and updating of the data entered in those registers are the Romanian Road Authority

(ARR) and the State Inspectorate for Control in Road Transportation (I.S.C.T.R).

The company's application for the registration in the electronic Register corresponding to the activity it holds may be legally qualified as an attribute for the identification of the service provider company required by law, in relation with the nature of the activity, within the meaning of article 230 of the Civil Code.

The specificity of road transport services is also characterized by the fact that the exchange of information at the Community level is very complex.

From this point of view, the data recorded in the electronic Records can be grouped into three categories.

The first category of data concerns the identification elements of any professional, i.e. name, legal form, seat (article 4, letter a, b of the Standards; see the Civil Code and articles 225-227 of the Civil Code).

The second category of data refers to documents attesting the company's right to perform road transport activities. The electronic Register will record the number and the series of the Community license, or, where applicable, of the certificate of own account transport and the type of the transport to be performed by the company, respectively the road transport of goods or passengers. The accessibility to the actual fulfillment of road transports requires the existence of several documents on board of the used vehicle. Under the legal provisions (see articles 19, 29 of the Standards, articles 24, 47 of G.O. no.27/2011), the road transport on payment and the own account road transport can be carried out only with vehicles for which certified copies have been issued, customized with the registration marks of the Community license or of the own account transport certificate held by the company. The numbers and series of the certified copies and the registration marks of the vehicles for which they have been issued, will also be entered into the electronic Registers (Article 4, letter e of the Standards).

The last category of data regards the company management and the compliance with the conditions for the exercise of specific activities. In this respect, the name of the manager and any penalties imposed on him/her or on the company (Article 4, letters

c, f, g, h) are entered in the electronic Register.

The implementation of the Community measures concerning the conditions of access to the road transport market, which outlines the status of service provider companies, and the ways in which the electronic Records ensure the exchange of information with other EU Member States, are regularly reported by the competent authorities, to the European Commission (see article 6 of the Standards, in conjunction with article 26 of the Regulation (EC) no.1071/2009).

4. Conclusions

The need for national regulations in full compliance with the EU legislation has imposed a reassessment of the existing legal provisions in the field of road transports. The new changes have aimed, among others, to provide the legal framework for the direct application of Community rules regarding the fulfillment of road transport activities and the access to the market in this area.

Considerations on the Legal Status of the Forwarding of Goods. Regulations in the New Civil Code

Adina Laura Pandele
“Ovidius” University of Constanta
The Faculty of Law, Administrative Sciences and Sociology
adinapandele@yahoo.com

Abstract

The efficient fulfillment of transports, from an economic and legal point of view, involves, in most cases, the existence of an intermediary between the owner of the goods and their transport operator. The intermediary's activity, traditionally assimilated to the commissioner's, knows a special regulation once with the entry into force of the New Civil Code.

Keywords: transport, forwarding, commission, warrant

J.E.L. Classification: K 10-General

1. Introductory Aspects

Moving goods by using various means of transport is a complex process, in whose execution an important role is played by the intermediation activity.

The intermediation activity, as an independent activity in organizing and carrying out transports, known as the forwarding of goods, aims to "ensure the circuit of goods by the expeditionary, for the benefit of its client (sender)" [1].

From a legal perspective, the forwarding activity is analyzed as an intermediation operation, similar to the commission, which facilitates, mainly, the fulfillment of transport related activities.

The intermediation activity involves the representation, by the intermediary, of the person for whom he/she works. As a technical and legal process, the representation is translated into the operation by means of which any person appointed as representative concludes legal documents on behalf of another person named the represented person [2]. The representation may originate in a legal provision or it may

result from the agreement between the parties. In transports, the representation can only be voluntary, originating from the parties' agreement, their willingness to seek a means to achieve the contractual relations through another person, in order to provide safety and expediency.

In this respect, most often, in international transports, there are used the services of a specialist undertaker. Because the work it performs, the intermediary in this area is called the "architect of international transports", which shows that it recommends to its client the best achievement solution [3].

The representation may be direct or indirect. For the direct representation, the representative concludes the legal document on behalf of, and at, the represented person. For the transport activity, the representation is usually indirect, in that the representative (the intermediary) concludes the legal documents with third parties on its own behalf but on the represented person's account [4].

2. The General Framework for the Organization and Performance of the Forwarding of Goods

The intermediation operations in the field of transports are performed on the basis of the legal instrument known as the forwarding contract.

Prior to the adoption and entry into force of the New Civil Code, the forwarding contract did not benefit from a special regulation. The only direct reference to this activity was in the definition of the transport contract (articles 413 of the Commercial Code - now repealed), which referred not only to the carrier, but also to the person "who makes any object to be transported". In the absence of express provisions, the forwarding activity was equated to the trade

commission, which aimed at "the handling of the commercial business by the commission agent in the account of the principal" (article 405 of the Commercial Code - now repealed). The classification of this activity in a legal structure was imposed particularly in the transports of a certain complexity, where there is the need for specialist advice in organizing the required transport.

The entry into force of the New Civil Code widened the field of special civil contracts. On the one hand, the new Civil Code governs the contracts usually reserved for professionals. On the other hand, as a novelty, the Civil Code gives a special regulation to some varieties of these contracts.

The forwarding contract is currently experiencing a special regulation, as a subdivision of the contract of mandate without representation (articles 2064-2071 of the Civil Code). These provisions can be completed, where applicable, with the provisions regarding the mandate and the commission. Also, in practice, there are used standard conventional rules (the General USER Conditions, the General Conditions of the F.I.A.T.A expeditionary).

3. The Characteristics of the Forwarding Contract

Under article 2064 of the Civil Code, the object of the forwarding contract is the conclusion of a transport contract and the fulfillment of several operations ancillary to the transport, by the sender, on its own behalf and on the principal's account.

Similarly to the mandate without representation (article 2039 of the Civil Code), the object of the forwarding contract is to conclude a legal document (the transport contract) by the sender, on its own behalf, without representing the principal, but on the latter's account, directly committing itself to third parties.

In addition, the forwarding contract is similar to the forwarding agent, its object being also to provide for transport related operations, for a remuneration called commission (article 2043 of the Civil Code). This similarity of the work performed by the sender with the one performed by the commissioner has made possible the application of the provisions governing the

trade commission (articles 405-412 of the Commercial Code - now repealed) in a special field.

In the context of the new special regulation, the forwarding contract is concluded between the sender and the principal. The name "expeditionary", commonly attributed to the person whom is transferred the possibility to take all decisions necessary to move the goods to their destination, was abandoned and replaced by the legislator with the one of "sender". The one who takes this position is a *del credere* commission-agent because he/she commits himself/herself to his/her client to ensure that goods reach their destination [5], namely to exercise due diligence to achieve the desired results.

Replacing the name of "expeditionary", with the one of "sender" can create however some confusion.

Typically, the other contracting-party of the transport operator in the contract for the transport of goods is the sender. Usually, this quality belongs to the person who disposes of the goods and who directly concludes the contract of transport. In connection with the current regulations, the intermediary, who works on his/her own, but at the expense of the principal, although in reality the goods belong to another person, may be a party in the transport contract. In this situation, the intermediary, designated by the term "sender", also holds the quality of party to the contract concluded with the transport operator, until the final execution of the obligations under this contract. In any case, the client (principal) must be the owner of the goods or, at least, he/she must have the authority to act on behalf of the owner.

Typically, by concluding the forwarding contract, the sender assumes only the transport organization. There are also exceptions from this rule, meaning that the sender can make the so-called transport. In the latter case, the sender will have the additional rights and duties of the transport operator (see article 2070 of the Civil Code).

The forwarding activity should be authorized (article 22, paragraph 1 of G.O. no.19/1997 on transports, republished with subsequent amendments). For this reason, we believe that the sender (intermediary) must be a professional within the meaning of Article 3 of the Civil Code, as it is pursuing a

professional activity of intermediation, as a company. Moreover, in international transports, the quality of expeditionary is held by international forwarding companies, authorized to exercise this profession.

The contracting party of the sender is normally the person interested in the movement of goods, designated by the term “principal”. The quality of principal belongs to the natural or legal person that has the right to require the organization of the transport fulfillment (see also the provisions of article I, section 2 of the General USER Conditions).

The valid conclusion of the forwarding contract requires, like any other agreement, the fulfillment of the conditions of substance and form prescribed by the law.

In practice, the rule is that the conclusion of the forwarding contract is equivalent to the mere adherence of the client to the conditions pre-established by the forwarding company, the order made by the principal in this sense being sufficient (Chapter I, points 3 and 4, USER Conditions). This is completed, at present, with a special requirement. In accordance with the dispositions of article 2065 of the Civil Code, the forwarding contract can be considered concluded only when the forwarding order can not be revoked anymore. This moment coincides with the conclusion moment of the contract of transport for the benefit of the principal.

Under the principle of mutual consent, the mere agreement of the manifested wills creates the contract. However, the forwarding contract shall take the *ad probationem* written form (Chapter I, point 4, USERS).

The valid conclusion of the forwarding contract gives rise to rights and obligations on the contracting parties and their breach attracts the parties' liability.

The sender's main obligation is to advise the principal on the best way of moving the goods. The failure to do so shall entail the transport operator's liability, irrespective of the type of guilt (see the provisions of article 2068, paragraph 1 of the Civil Code referring to "negligence in fulfilling the forwarding").

When choosing the route, the means and the modes of transport, the sender will take into account any instructions given by the principal. In the absence of these instructions, the sender will work in the principal's interest (article 2067, paragraph 1 of the Civil

Code). Compared to the provisions in the field of the forwarding agent (article 2048 of the Civil Code) which clearly provides for the exceptions to the commission agent's obligation to exactly follow the principal's instructions, the sender may exceed the limits of the received empowerment only for good reasons. Without explaining what "reasonable grounds" mean, the legislator regulates the sender's liability for all damages caused to the principal by failure to respect the received instructions. Furthermore, the sender will be liable for fortuitous losses, unless it proves that this could have been produced even if it had followed the instructions.

The sender is obliged to exercise, at the request of the principal, the right to countermand, applicable to the transport contract (article 2066, of the Civil Code). The right to countermand is represented by the possibility recognized under the law, for economic reasons, of the person who holds the goods, to unilaterally modify the transport contract. Legally, the possibility to unilaterally change the transport contract is an exception to the principle of the binding force of the *pacta sunt servanda* contract, provided for in article 1270, paragraph 1 of the Civil Code. The right to countermand (article 1969) falls under the category of "cases authorized under the law" (article 1270, paragraph 2) which allows the unilateral modification of the original agreement.

The sender may also have the obligation to ensure the goods, if the principal instructed it to do so (in this respect, see article 2067, paragraph 3 of the Civil Code).

Although the special regulations governing the field of the forwarding contract do not expressly provide it, we believe that, in case of non-fulfillment or improper fulfillment of the obligations assumed by the sender, the principal can choose between terminating the contract with recovery of damages and performing the contract on the sender's account. The second alternative is equivalent to an indirect enforcement, in nature, of the burden which rests on the sender (article 1528, paragraph 1 of the Civil Code, in conjunction with article 1530 of the Civil Code).

The principal's main obligation is to pay for the services rendered by the sender

(commissions), including the additional expenses incurred by it. The commission may be provided for in the contract or it may be determined in accordance with the professional fees of the specialized freight forwarding or left to the court's assessment, in accordance with the operations done by the sender (article 2069 of the Civil Code).

Compared to the situation of the commission-agent who benefits from a lien on the principal's goods (article 2053 of the Civil Code), which assures the recovery of fees and other amounts payable by the latter, for the sender the new regulations do not provide for this possibility. Even in the absence of special provisions in the Civil Code, this guarantee could be invoked by the sender by applying the standard contractual clauses concerning the right of pledge and retention of the assets belonging to the principal, found in its possession (see Chapter VIII, USER).

The actions resulting from the execution of the forwarding contact are extinctive prescriptible. For these actions, article 2071 of the Civil Code establishes two special prescription periods. Thus, for the organization and transportation in the EU, the period is one year reckoned from the date of rendering of goods at their destination or from the day when their rendering should have been made. For forwarding contracts covering the organization and carrying out of transports which begin or terminate outside the European Union, the prescription period is 18 months.

4. Conclusions

Internally, the forwarding contract must follow the rules set by the new provisions of the Civil Code. The forwarding contract may not be completely separated from other legal instruments which facilitate intermediation operations.

The new regulation thus appears as a common law of the forwarding contract, which, together with the commercial usage, will provide solutions to the participants in transport activities.

The Impact of Post-Enlargement on the Romanian Labour Market

Abstract

One of the fundamental principle of the European Union is the free movement of workers. The liberalization of labor force movement to Europe increases the migration towards the developed countries and this phenomenon affects the economic growth. The labor market of European Union is influenced by migration and immigration of the workers from one country to another one. EU enlargement had a significant impact on migration flows from Romania to old member states. Migration contributes to growth prospects of the EU. They are restrictions some countries but they did not stop migrants from coming. The result is the change of the composition of the immigrants and a change in the structure of our national labour market.

Key words: labour market, migration, European funds

J.E.L. classification: J01, J6

1. Introduction

EU enlargement was a turning point in Romanian migration history with the implication in Romanian labour market.

There are specific circumstances which explain partly the sensitivity of migration issue among the general public as well as policy makers across Europe, who feared economic, social, cultural and political consequences of free east-west migration in the EU: the population size of the acceding countries was large, the differences in income between the old EU member states and the EU8 and EU2 were major, the new member states underwent a complex process

of societal transformation to a free society and a market-based economy before their EU accession. [1]

The 2005 Act of Accession of Romania and Bulgaria to the EU allows the EU-25 Member States to temporarily restrict free access of Bulgarian and Romanian workers to their labor markets in countries providing these restrictions in their legislation. Despite restrictions imposed by the transitional arrangements, a Member State must always give priority to Romanian and Bulgarian workers in front of workers from non-EU countries, in the priority of access to employment. No restrictions apply to workers from EU-2 (Romania and Bulgaria) in the Member States of the EU-2.

The seven years' transitional period is separated into three distinct stages („2+3+2”). The first two years following accession, the access to the labour markets of the incumbent depends on their national law and policies; national measures may be extended for a further period of three years and could continue for a further two years, but only if there are serious disruptions in the respective receiving labour market. [1]

The paper is structured as follows. The first section provides an overview of statistical evidence of labour market in Romania. The second section presents the effects of EU Funds on Romanian labour market

The last section concludes.

2. EU Enlargement, migration process and Romanian labour market

Migratory movements are the result of disequilibrium on the labour market. The workers don't have jobs and they go abroad

to find something better for them and to have better living conditions.

The post accession East -West migration in European Union significantly altered the migration landscape and was dubbed “one of the most spectacular migratory movements in contemporary European history” [2]

There is a new profile of migrant after the post-enlargement of Romania into the EU. There is a change in the typical characteristics of people leaving the country in the 1990s and 2007. [1] [2]. The pre-enlargement migrants were typically middle-aged with vocational education and previous work experience and the post-accession migrants were predominantly young people with tertiary education. [3].

The structure of Romanian labour market after European Union Enlargement is changed. We propose to study some structural changes of employed population and employment rate between 1990-2009.

The detailed structure of the total employed population in Romania, gender and area (urban / rural), 1999-2009 is presented in Table 1. We note that employment declined during 1999-2009 period, the lowest value recorded in 2008 (2029 thousand less in 2008 compared to 1999). After Romania joined member of European Union the employment population was lower. The borders were open for the workers and they left the country to work mostly in Spain and Italy.

Table 1. Employed population structure of Romania during 1999-2009 (thousands of persons)

Employed population	1999	2000	2001	2002	2003	2006	2007	2008	2009
Total	10776	10764	10697	9234	9223	9313	9353	8747	9243
Gender:									
Male	5799	5772	5719	5031	5057	5074	5116	4703	5100

Employment rate dropped in Romania from 59.6% in 1998 to 51.0% in 2003 increase to 59% in 2008, and dropping in 2009 to 58,6%, amongst demographic decline amid Romania's population combined

with continued restructuring of the industrial sector in our country, loss of breadth and depth vary from one region to another, from one district to another.

Employment rate dropped in Romania from 59.6% in 1998 to 51.0% in 2003 increase to 59% in 2008, and dropping in 2009 to 58,6%, amongst demographic decline amid Romania's population combined with continued restructuring of the industrial sector in our country, loss of breadth and depth vary from one region to another, from one district to another.

Figure 1 highlights the evolution of the employment rate of population aged 15 and over, by age over, by age group for 2003-2009

Figure 1: Evolution of the employment rate of population aged 15 and over, by age group, 2003-2009

Source: INSSE, Tempo-Online database

The employment rate of working age population (15-64 years) in 2009 was 58.6%, down from the previous year (-0.4 percentage points). This indicator has, as in previous years, higher values for men (65.2% vs. 52.0% for women) and people in rural areas (60.7% versus 57.1% in rural urban). The employment rate of young people (15-24 years) was 24.5%. The employment rate of older people (55-64 years) was 42.6%.

If the cumulative percentage share of group 65 + with the share of group 55-64 years and the 35-49 years group in total employment one would conclude that the active population in Romania is characterized by increased aging. It is a negative phenomenon with major implications on the future development and economic growth. Installation of the active aging phenomenon extending to old age, accompanied by the low representation of young people on the labor market leads to lower labor vitality and its aging. Increased participation of older persons (65 years) for female employment is

even stronger than in male employment, meaningful situation if we consider that the retirement age for women is lower than men's retirement age.

Analyzing the employment rate of Romania's population for 2009 we notice that the highest employment rate for people of increased working age was in the higher education graduates (84.1%). As the level of education decreases, employment decreases as well. Thus, 62.2% of the people with medium level of education were employed and only 42.0% of those with low education.

Gender based structure of the employed population of Romania showed an increase in the share of total employment in the male population in 2002, 2003, 2008 2009 compared to the year 1999 as a result of the higher retirement age for men, from 60 to 65 years. A higher share of male employment in total employment is due to a smaller number of men compared to women registered in Romania on the one hand, and can be explained by the still existing labor market discrimination of women in our country, together with the female's traditional household role - deeply impregnated in mass psychology, particularly in rural areas, and on the other hand with a higher active lifespan of men compared to women (an extra five years).

Employment structure by sector of activity in Romania highlights the phenomenon of de-industrialization and restructuring of the country's economy, without finding any real progress in the services sector.

Figure 2. Employment structure by sector of activity, 2000-2008

*Data source: INSSE, Tempo-Online database
Note: Agricultural activities include hunting, forestry and fishing. Industry includes mining, oil extraction, production of electricity, gas water. Services include construction, trade, restaurants hotels, transport,

storage and communications, financial, insurance and stock, real estate and other services, public administration and defense, education, health other activities of the national economy.

There is a decrease in the number of people employed in agriculture, given that households have on average small areas of farmland. Employment rate in agriculture decreased from 41.39% in 2000 to 28.17% in 2008. Since the beginning of transition in Romania, job losses occurred in industries less than in services. Since 2000 employment in industry increased slightly until 2006 when the occupancy rate was 23.26%, amounting in 2008 to 22.36% in services employment was an upward trend. In services during the survey period one would notice an increase in the share of employment in this sector, the employment rate increased from 35.37% in 2000 to 49.45 in 2008.

From the analysis of employment by sector of Romania's population one would notice highlighted a growing trend in the share of population employed in services, share exceeding 50% of the employed population in industrialized countries, aging and the feminization of of the population employed in agriculture.

After 1990 the evolution of employment in Romania the been influenced by several factors such as decrease in the country's total population, the emergence of foreign investment flows that generated new jobs, extend the working life from 57 years to 60 years for women and 60 to 65 years for men, small and medium enterprise development and the expectation to have that will make a positive contribution to increasing employment, especially in terms of non-wage labor. Restructuring and privatization process started after 1990, but permanent pressure on employment generated by the wave of layoffs hit the economy of Romania. Despite real economic growth in post-communist Romania, the job market remains relatively tight, mainly due to the structure by age and profession of the unemployed, not correlated with the applications of the Romanian economy. For these reasons currently particular attention is payed to retraining and reconversion of the workforce. [4]

3. European Funds as a solution for the dynamization of labor market in Romania

HRD priorities were established in line with the Lisbon objectives: full employment (overall employment rate increased to 70%, increase the employment rate among women at 60% and increase the employment rate among the elderly to 50%), increasing quality and labor productivity, increase social cohesion and inclusion. Romania, as EU Member State, implement the revised Lisbon Strategy, the implementing the National Reform Programme 2007-2010 (NRP)

HRD contributes to the implementation measures set for 2009-2010 in the NRP, the following activities:

Improving student assessment systems and the acquisition of key competences;

Curricular reform;

- Facilitate transition from school to active life;

Training for staff continues to enhance the adaptability workers and enterprises;

- Ensure health and safety at work of employees;

Strengthening the administrative capacity of public employment;

Development of tools and methods to analyze and anticipate the changes labor market;

Increase the chances of labor market integration of young people by implementing ESF funding projects;

Active employment measures for disadvantaged workers, particularly disadvantaged and with disabilities and long-term unemployed, including those in rural areas;

Development of social economy

Given that almost all financial allocation by the ESF for the period 2007-2013 (93%), distributed HRD priority axis, is sustain the goals Lisbon can evaluate participation HRD to achieving this strategy, the end of 2010, the following data:

ESF contribution to the value of the contract for projects implemented in the Axis 1 "Education and training in support of growth and development company based on knowledge "was 885,696,140.80 euros, representing 111.01% of allocation 2007-2013;

ESF contribution to the value of the contract for projects implemented in the PA 2 "Linking life long learning with labor market" was 470,822,997.40 euros

representing 51.62% of allocation 2007-2013;

ESF contribution to the value of the contract for projects implemented under PA 3 " Increasing adaptability of workers and enterprises "was 494,770,002.40 euros representing 109.90% of allocation 2007-2013;

ESF contribution to the value of the contract for projects implemented in the AP 4 "Modernising public employment services" was 65,214,828.41 euros, representing 36.91% of allocation 2007-2013;

ESF contribution to the value of the contract for projects implemented in the AP 5 "Promoting active employment measures" was 362,358,745.50 euros, representing 76.06% of allocation 2007-2013;

ESF contribution to the value of the contract for projects implemented in the AP 6 "Promoting social inclusion" was EUR 393,852,684.60, representing 72.95% of 2007-2013 allocation.

European Commission sent last country-specific recommendations in 2009. Module the measures supported by ESF contributed to the implementation of recommendations of country formulated by the European Commission presented the Annual Report MASOPHRD Implementation for 2009. Year 2010 was a year of transition to EU 2020 and therefore were not Country recommendations made by the European Commission. Romania submits the European Union, in 2010, the draft Programme National Reform 2011-2013, which transposes the national objectives of Europe In 2020. European Commission will make its first recommendation on Country Program 2011-2013 National Reform in the months June-July 2011.

4. Conclusion

Although Romania's labor market progressed a lot in the years following the EU integration, there a still structural and operational issues to be addressed. The EU Funds contributes to the achievement of the goals of Lisbon Strategy, but difficulties still persist.

Abstract

The European normative framework in company matters was adopted with the purpose of harmonization of national laws in the context of international affairs development, in order to integrate the supranational business forms on the Single Market. Yet, in the present economic context, regulating the European company, form of organization of the activity involving a major capital concentration, appears as insufficient, compared to the necessity of adopting specific European norms for the development of small and medium sized companies, the European Union profiling proposals concerning the regulation of the European private company.

Keywords: European Union, *Societas Europaea*, *Societas Privata Europaea*, supranational business forms.

JEL Classification: F23, K22.

1. Introduction

The legal framework within which is constituted the *Societas Europaea* (SE) is given by the Regulation (EC) no. 2157/2001 on the statute of the European private company (OJ L 294, 10.11.2001), altered by means of the Regulation (EC) no. 885/2004 of the Council on the 26th of April 2004 (L 168, 1.5.2004) and the Regulation (EC) no. 1791/2006 of the Council on the 20th of November 2006 (L 363, 20.12.2006).

The reason of the conception of a new business form at a communitarian scale was that of adjusting the production structures at the dimension imposed by the accomplishment of the internal market, on the purpose of eliminating the barriers on the commerce's way and by that, the development of the European economy.

What expresses the occurrence of the present analysis is yet the possibility of a conceptual integration of this partnership in the international economical conscience, psychologically yet objectively submitted, the actual circumstances of development, in a Europe hit by a system crisis, in which the economies of the Member States gear together, and by that, the indirect and direct investments.

Even more than that, is it imposed an analysis of the European company as a form of accomplishment of certain purposes of the international affairs, as long as it can be foreshadowed the exacerbation of an economical context within which, though unstated, the existent capitals are imposed to concentrate, in order to survive the potential economical shocks hitting the world economy.

The economical context of the last few years delineated the projection of a new form of accomplishment of the legal framework of unreelment of economic relationships, by promoting a more relaxing manner of organizing international affairs financially speaking, in the sense of proposing for enactment the “*Societas Privata Europaea*” (SPE), which is first of all a business form still outside the incipient status of regulation.

2. The Societas Europaea Regime

As long as the accomplishment of the European Union's objectives imposed the necessity of creating a company of an European dimension, free of the obstacles resulting from the differences and the limited applicability of the national company law, it has been imposed the elaboration of a legislative basis which should regulate the statute of the European private company. Thus, according to the Council's regulation (EC) no. 2157/2001 this is a partnership, similar to the share company, conducting a commercial activity, with the participation of private companies governed by different national laws.[1]

Pursuant to articles 1.1 of the regulation, a European private company can be set up on the territory of the Community only under the form of a share company. The minimum subscribed capital shall be inferior to 120 000 euros. A European private company can only be constituted by public or private companies from different Member States, and not by private individuals.

However, the regulation enlists four ways of set up: by merger, when at least two of the companies involved are governed by different national laws; by constitution of a holding if at least two of the promoting companies are governed by different national laws or they have a subsidiary under a distinct jurisdiction for at least two years; the incorporation of a subsidiary SE company, when at least two of the founding partners belong to distinct jurisdictions or they own a subsidiary in another state for at least two years; or by transformation, when the company submitted to transformation has a subsidiary under a distinct jurisdiction for at least two years.[2]

Generally speaking, on the grounds of a technique reference, the European private company is conceived following the model of the company on shares and its memorandum of association contains compatible provisions with this form. In such sense, the European Regulation traces exactly the form of the company template represented by this type of European company. There are profiled provisions regarding the attributes of identification – head office, name – constitution and the minimum value of the social capital, the type of liability assigned

for the shareholders for the company's obligations, organization and functioning.

In what concerns the head office, the European company can be set up exclusively on the territory of the Union, under the jurisdiction of any of the Member States, under the conditions of the European Regulation. The European private company with the head office in Romania is constituted according to art. 5 of Law no. 31/1990, by means of memorandum and articles of association or by means of a single entry, and shall comprise the elements stipulated in Art.8 of the same law.

Ulterior to the constitution of the European private company, the head office can be transferred from one Member State to another, according to the procedure instituted by regulation, so that this transfer does not lead to the dissolution of the company and the constitution of a new legal entity.[3]

As in the case of national companies, the European company acquires juridical personality since the date of its registration in the appointed national register. In such sense, pursuant to art. 16 para. 1 from the Regulation, the European private company acquires juridical personality since the date of its registration in the register provided by the legislation of the Member State on which territory it establishes its head office.

As for the European company with the head office settled in Romania, it acquires juridical personality exactly the day of its incorporation and registration to the Registrar of Companies. It should be noticed the fact that the company can be incorporated to the Registrar only after signing an agreement regarding the involvement of the shareholders in the activity of the company, under the circumstance established by G.D. no. 187/2007 which started from the Council's directive no. 2001/86/EC of completion of the European private company statute in what concerns the implication of the agents.[4]

By means of the European private company statute can also be adopted a monist or dualist system of organization. The dualist system involves the existence of the following authorities inside the European company: a General Meeting of the Shareholders, which competences can be established by a regulation and the legislation of the Member State on which territory the

company has its head office; an executive authority, responsible of the management of the company. Its members are appointed and dismissed by the supervisory board. In the same time, internal law of the Member State on which territory the European Company has its head office can provide the possibility of appointment and dismissal to the General Meeting of the Shareholders of the executive authority; a supervisory board controlling the activity of the executive body. In the same time, it is worth mentioned the fact that the surveillance body does not have the competence to ensure the management of the company.

In exchange, the adoption of the monist system of organization of the European company determines the existence of the following two authorities: a General Meeting of the Shareholders, which competences are established by regulation and the legislation of the Member state on which territory the company has its head office; an administrative authority ensuring the management of the company.

The regulation does not comprise provisions referring to the functioning of the European company, since the dispositions of art.9 para. 1 letter c). are incident. According to them, the non-regulated aspects enter under the incidence of the legal provisions adopted by the Member State on the territory of which the respective European company has its head office. Consequently, legal internal provisions are to be applied in priority to the community measures regarding European companies, and in the absence, to those applicable of share companies constituted in the respective State.

A special provision is comprised in Art. 61. The text of law makes a reference to the law of the Member State on which territory the European company has its head office in order to regulate the issue of annual accounts, the report of, the audit, as well as the disclosure of the respective accounts.

3. Societas Privata Europaea

Because small and medium sized enterprises represent the proven foundation of the economic development during periods of crisis when large capital decentralize, the European idea of creating an institutional

framework for their development turned out to be forecasting.

Furthermore, since 2000, European preoccupation in matter took shape in the setting up of a Paper of small enterprises, and in 2003, the European Commission concluded on the necessity of awarding a new perspective to the process of harmonization of European law in matters of company.

The European Commission's communication for the Council and the European Parliament entitled “Modernising Company Law and Enhancing Corporate Governance in the European Union – A plan to move forward, 21 May 2003, COM (2003)” put the regulatory basis of this legal provision of institutionalization of the SPE, unfortunately not yet entered into force, but of maximum interest from the point of view of the capital's flexibility in terms of interest for investments.

Such new supranational form of deployment of international affairs facilitates the spirit of competition, its advantages rising higher, when compared to lower costs of implementation of the investments on the Single Market, but also to the regulatory unification of the establishing rules.

At the beginning of the global crisis, as long as these desiderata were defined, the European Commission presented the First Draft Regulation of the SPE statute, on the 25th of May 2008 (European Commission, First Draft Regulation of the SPE statute, June 25th in 2008).

SPE is conceived either as an act of will of a single entity, or a partnership of private individuals and/or legal entities (with or without juridical personality, private or public), inclusively SE, SCE, GEIE or another SPE, constituting in a form of private limited company, with juridical personality, in which fractions of capital (named “shares”) are not transactional.

SPE can be set up either *ex nihilo*, under the Regulation, or by the transformation (without dissolution or loss of the juridical personality), division or merger of certain existent companies (regulated by the applicable national law), with the condition that the head office and central administration is on the territory of one of the Member States.

The Commission had in view the Decision *Centros* of the ECJ, thus statuting that the head office and the central administration or the main office of the SPE can be on the territory of different states, the head office can be moved in another state, by means of agreement of the shareholders. [5].

The juridical personality of the SPE is achieved in the moment of consenting the constitution in the register designated by national law of the Member State where is the head office. In the circumstance of merger by absorption, the absorbent company becomes SPE in the moment of registering the merger, and in the circumstances of division, the beneficiary company becomes SPE in the moment the division is registered.

What rises the interest in this Draft Regulation is the new conception regarding the protection of creditors, thus being eliminated the traditional demand of the existence of a minimal capital of protection. [6].

Consequently, the limit of the capital does no longer represent, in the opinion of the Commission, the essence of the creditors' guarantee, as there are accepted the aspects derived from practice, which are the confidence of the creditors on other patrimonial elements, (such as cash flow). In conclusion, the SPE can be constituted with a symbolic capital of 1 euro.

The social capital can be subscribed by contributions in cash or in nature, full payments not being compulsory for the constitution. The exoneration of the obligation to make payments in full can intervene exclusively in the situation in which, as a consequence of the non-submission of the contribution, it is decided the decrease of the social capital.

The protection of the creditors against excessive distributions to the shareholders is circumstantiated by the report on the active/passive assets inside the SPE, so that the Draft Regulation do not allow the distributions after which the passive assets are superior to active assets. Before the distribution, the shareholders can ask the management of the SPE to issue a certificate of solvency, attesting the company's possibility to cover the short-term liabilities, before the maturity date, but in a maximum term of one year since the date of distribution of benefits, which certificate is disclosed.

The registration of the SPE enjoys a maximum flexibility, yet censored by the principles of the outlined disclosure of the Directive 2009/101/EC.

The draft provides one single verification of the legality, alternative, either by checking the legality of the documents and items of information of a SPE by an administrative or judicial authority, or by Notary certification, at the moment of the SPE registration.

Owning fractions of capital confers a higher level of freedom inside the SPE, while adapting to company tendencies, doubled by the principles of corporate governing, (ulteriorly adopted expressly by the Green Paper – Corporate governance framework of the European Union, 2011), allowing the shareholders to statute by means of the memorandum of association, the respective rights, included those regarding the transfer of shares and the protection of the minority shareholders' interests.

Thus, the Draft Regulation does not provide the shareholders' right to force the minority shareholders to sell their shares (“squeeze-out”) and does not force the majoritarian shareholders or the SPE to buy shares from the minority shareholders (“sell-out”), yet the provisions referring to such right can be established by will of shareholders, in the memorandum of association [7].

Inside the SPE, the decisions are adopted by the shareholders (it is noticeable that a SPE does not know the idea of institutionalization of the General Meeting), as a rule, with the observance of the principle of majority, decided upon by means of the memorandum of association or, in certain circumstances, imperatively qualified (2/3), by means of the Draft Regulation.

Thus, the qualified majority is imposed for the decisions having as object the alteration of the shareholders' rights, the exclusion, the withdrawal of a shareholder, the decrease of the social capital, the transfer of the head office to another Member State, the transformation of the SPE, the merger, the division or the dissolution of the SPE.

The Draft Regulation contains, in annexe, the orientative model of the memorandum of association, by indicating the compulsory clauses of the articles of incorporation.

Despite all these, though in appearance such form or organization of the investments

seems enough regulated, it is obvious that there are imposed certain modifications of the SPE statute, demanded by the business market.

As a consequence, there are outlined a series of legal draw backs concerning the regulation of the national applicable limits of encroachment, since it is noticeable the necessity of decreasing them as much as possible during the functioning of the SPE.

However, although it offers flexibility to the European regime of investments, the Draft Regulation should ensure an increased protection for the creditors’ rights, left almost in full charge of the principle of good faith of the shareholders, who, in a capital world, it is plenty of times defeated.

The almost total report to the company theory brings also a decrease of the shareholders’ protection, especially the minority shareholders – without excluding yet the abuse of minority position. As a consequence, it is imposed a certain normative limitations of the manner of decision making inside a SPE, so that any partnership should not become a manner of compulsion.

Such arguments come to justify why, for more than four years, the European Commission has not reached a form that should be adopted.

Yet, this normative framework should not be neglected, because it may represent a future basis of development of economic relationships, which should be enough convincing.

4. Conclusions

The way that it is statuted in the European legislation, the purpose of creating a European company was that of allowing the insertions of concentrated capital on the Single Market, by setting up companies at European dimensions, aiming to eliminate the barriers imposed by national laws, such form already being adopted by a series of companies among which we mention Allianz. The main argument in favour of a specific form of regulation for the international affairs’ development of small and medium sized enterprises is represented by its particularities by comparison to the European company, with the advantages given by the

flexibility of setting up and the inexistence of capital limits.

Abstract

From the analysis of annual reports as a result of implementation in the period 2007-2011 to include indicators on the lines of funding varies depending on the duration of the implementation of the project, the project level to reimbursement payments, the overall level of reimbursement. Indicators give us information about the results obtained through the fulfillment of the objectives of the financing applications, about equal opportunities, sustainable development, closing the partnerships. The level of reimbursement and achievement indicators and finally determine the absorption of European funds.

Key word : optimization indicators FSE

J.E.L. Classification: L 66, Q13.

1. Introduction

Through this research study I watched to identify factors that determine trends adapting human resources involved in implementing projects with European funding, as well as optimizing absorption of European funds. The conclusions of the research say that in order to optimize the implementation of European projects are required to be undertaken the following: conducting trainings with the beneficiaries or host institutions of projects to prepare teams of management and implementation of projects, devising a coherent legislative framework, fluent, flexible for streamlining financial repayments, providing for the

dissemination of the results of meetings and a experience gained, the establishment of national and regional formations of coordination of tutoring in terms of legislative regulations subject to readiness and opportunity. In the present work we quantify the actions recorded and I estimated possibilities of future action for maximum efficiency.

Studies shows that the availability of financial resources is occurring at a pace very slowly due to the following aspects: the beneficiaries of the proposed and approved projects are insufficiently prepared for the absorption of funds grants and social environment, adapt to hard and is reluctant to request the legislative and regulations imposed by the European Union, as well as the requirements submitted by the managing authority of the existing projects at national level the trend of change in mentality and training for streamlining activities is very little developed, the lack of solutions for the deployment. State institutions-municipalities and banks involved in the management of European funds, insufficient financial resources at the national level in order to support the financing of projects, the lack of confidence in trade due to the delays in the registration of transactions, the evolution of management teams and implementation of projects in a very slow pace in comparison with their capacity for organization, mobilization and motivation, a positive trend in terms of innovation and creativity, orientation towards short-term strategies, medium-and long-term prospects of development, technology transfer, partnership. It is noted that the number of ten

dices coercion are larger than the tendency to support innovative activities in the regions studied.

2. Material and method

Use of funds from the ESF in accordance with article 34 (2) of Regulation (EC) No 1083/2006 watching the performance indicators: increase in the value of cumulative physical completed in 2010 from the cumulated at the end of 2009, the share value made in late 2010 in the value-target scheduled for 2010. Thus, in the year 2010 achievements have been recorded for the following characteristic indicators: the number of long-term unemployed participants in integrated programmes, of which women/young – increase of 14.8 times, i.e. 25.7/35.6 times, the number of participants in integrated rural programmes – increased 3.8 times. Insignificant progress in achieving the targets set for 2010 were recorded for the pointer to the share of participants in those rural areas where integrated programmes, which had obtained a job. In the year 2010 have been posted for progress: the number of long-term unemployed participants in integrated programmes and number of participants 24,32% in rural areas from integrated programs, 2-22%. Insignificant progress in attaining the indicators have been found: the share of participants in those rural areas within the integrated programmes which have obtained a job with target 1.89 by 15%.

3. Results and discussions

Achievements on financial indicators show that the amount of ESF funding grants for projects contracted was 362,5 million, representing an increase of 8.4 times over the figure recorded at the end of 2009. In signatures and all projects are implemented, the principle of equal treatment between women and men has been promoted, both as regards members of the deployment team and with regard to the target group. In accordance with the financial and technical reports of the total transmitted 27024 people in the target group in the period reported, 11946 (44.2%) are men and women are 15078(55,80%).

From the analysis of the persons involved in the training activities shall observe the highest number that is occupied by the total

number of inactive persons, followed by qualification/requalification occupied and the inactive in education and training. A considerable number of people about the unemployed. The lowest level was registered by the long-term unemployed and liberii professionals.

Figure 1 - Labour market status

Figure 2 - Breakdown of participants depending on age

As regards the involvement of the target group members according to age, there is a greater participation of young people aged 15-24 years-84,61-85,75%, and a little more participation of senior citizens aged between 55-64 years-14,25-15,39%.

Figure 3 - Breakdown of participants depending on the vulnerable groups

In figure 3 it appears that the highest level is occupied by immigrants and other disadvantaged categories, followed by the vulnerable group of people. The lowest level is occupied by immigrants.

Fig.4 - Breakdown of participants depending on the educational level

In terms of category of people in the target group according to the level of training school that most mulțe people are those that have graduated the school whether primary or secondary ISCED 1 and 2, then people who have graduated high school ISCED 3. Lowest share was occupied by persons with higher education and post-secondary course and nontertiary ISCED 4.

Fig.5 - Indicators to include in the period 2007-2013

In terms of promotion and advertising materials must be noted that the highest share was recorded in the number of published brochures, then monitorizari, and finally the number of promotional campaigns. The main obstacles encountered in the implementation of projects OI ANOFM were related to: - unable to attract the necessary human resources projects: implemneting;

-number of servants which may provide implementing of projects in the institution is insufficient. For solving problems has made reconciliation management teams and finding a viable solution for the continued of the signed contracts.

-attraction of external specialists is hampered by the lack of a legislative framework to be expressly stipulated mode of engagement conclusions.

4 Conclusions

For efficiency the activities of projects financed from EU funds can be taken a number of actions, such as

:-using a touch screen computer system to provide people without jobs a database with job vacancy, condițiile employment, address and contact details of potential employers, industries;

-the use of Job clubs by employers and employees, as a tool for access to new occupational opportunities;

-the development of an innovative electronic tool and evidences of management and professional skills of the initial, intermediate and final target group, to identify individual training needs and their subsequent integration of the labour market, competence in the diagnosis of deficit and to identify a professional development plan.

For and Against a New Framework for Banking Supervision

Săveanu Cristina
Doctoral School of Economics
University “Al.I.Cuza” Iasi
cristina.saveanu@bnro.ro

Abstract

Offering a critical perspective, this paper presents the new strategy in European Union’s banking supervision as response to the financial market tensions, describing the results of this redefinition process on different areas: the revision of supervision institution and international banking standards and the strengthening of corporate governance in banking.

The cooperation between macro and micro prudential authorities represents a solution for sustaining the financial stability in the euro area. The paper also analyzes the newly implemented capital standards - Basel III, a way for assuring a better management of systemic risk.

The efficiency and success of this reform in banking are subjects of doubts and strongly debated in the current context. and problems concerning its independence attract adverse opinions.

Far from being on one side or the other, this paper gives a full description of the process, leaving its advantages and disadvantages an open subject.

Keywords: banks, supervision, crisis, new framework

JEL classification: D78, E44, E52, E58.

1. Introduction

The current financial crisis has shown the deficiencies of banking supervision at European level revealing a fragmented way of control and risk management. It has sent a resonating wake-up call throughout the European Union urging all stakeholders to address the growing inconsistencies between Europe’s (fragmented) regulatory and supervisory approaches and the realities of growing financial market integration.[13].

The national model of the banking authorities could not keep up with the financial globalisation process, based on international institutions with worldwide activity. It has become imperative in this unbalanced world, the need of a process of redefining the framework of supervision, both microprudentially, and macroprudentially. At a microeconomic level, the attention focused on structural elements, using specific instruments such as on-site and off-site supervision. Macroprudentially, it was necessary to limit the possibility of the financial system to break down as response to systemic risk, being compulsory an aggregate treatment of risks.

Taking into account the importance of the european financial system in the world’s banking system, the new framework for banking supervision appeared with the primary purpose to ensure common supervision standards.

All the disfunctionalities of the existing institutional structures created the need to build structures capable to internalize the negative externalities [14].Internalization in this context would require centralization of regulation and supervision in the EU, meaning establishing cooperative and coordinated decision-making processes.

Starting from the idea that a perfect internalization needs a good centralization of supervision rules, the European Union answered to the financial crisis by establishing a new institutional framework.

2. The redefinition process of banking supervision

Analysing at the changes in the european banking system due to the challenges of the present crisis, it appears that these changes generated the development of some new structures for banking supervision, in a

process of redefinition for the whole banking system.

This redefinition process can be analysed through different aspects:

- the revision of the architecture of financial supervision;
- the reform of international capital standards;
- the strengthening of corporate governance.

The first aspect of the reform process, meaning the change of the supervision's architecture is the result of 2009 Larosiere Report (“Report of the High Level Group on Supervision”) and presumes the existence of an architectural package in which the microeconomic supervision components mix with the macroeconomic ones in order to create the financial stability.

The supervision revision process can be understood from two points of view: an institutional side and a practical side of stress testing resistance of the European banks.

Institutionally, the paper European Economic Governance issued by the primevicegovernor of the National Bank of Romania presents the new architecture which has become operational since the 1st of January 2011. This new architecture is represented by *The European system for Financial Supervision* with its different substructures: *The European Council for Systemic Risk* - responsible for the macroprudential supervision at european level, *The European Supervision Authorities* which include: *The European Banking Authority*, *The European Insurance and Occupational Pensions Authority*, *The European Security and Markets Authority*, *the Common Committee of European Supervision Authority* and *the National Supervision Authorities*.

When it comes to the different roles and responsibilities of these structures, the macroprudential and microprudential roles are very well deserved by the substructures of the system [3]. *The European Council for Systemic Risk* has duties concerning the analysis of relevant information in order to identify, monitor and evaluate the threats and potential risks for the financial stability of the European Union. It also gives warnings to the supervisors, makes recommendations and monitors the measures taken by the responsible authorities. *The European*

Supervision Authorities are responsible for the microprudential part of supervision. Their role is clearly stated and means consistent applications of EU rules and regulations in case of breaking down the european standards and legislation, ensuring a coordinate response to crisis. *The European Banking Authority* is a distinct entity in this new framework having an important role in compliance with the european standards, standards that once respected maintain the whole sistem's stability.

The role of national authorities is not lost in this new framework. They are still responsible for everyday supervision of individual banking institutions. That is why this new system still keeps decentralization elements through the presence of the National Authorities in their area of competence.

The Common Committee of ESA is a linking structure having a particular role in increasing the cooperation and consistent supervision approaches, in coordinate the exchange of information and to ensure a common culture of supervision and also to collect microprudential data from national supervisors.

All these bodies constitute an overarching framework for financial supervision combined with expertise of local microprudential supervisory bodies closest to the institutions operating in their jurisdictions[6].

This process could not have been done only on theoretical basis. The practical aspect meant the stress test of the main european banks, through an exercise that studied the influence of the stress factors over a number of 91 banks. The test was needed in order to evaluate the state of the financial system and in order to adapt the necessary measures to the real situation.

The results showed a strong resistance of the european banking system, revealed by the positive results of the study. It was a step forward in the convergence policy of the european banking system as all the stress testing practices were convergent. This stress test was a significant tool for ongoing supervision.

The new framework of banking supervision intended to remove the limits of Basel II Capital Standards Agreement, limits that were obvious during the financial crisis. there were many aspects that questioned the

viability of Basel II Capital Standards Agreement [2]. First of all the importance of systemic risk was underestimated and in this context the apparent diversification of risks through securitization facilitated the development of important channels of contagion. There was also overestimated the capacity of credit institutions to precisely assess major risks. There has been identified a model risk caused by structural factors (the lack of the macroprudential component) and by the calibration failure of the internal mechanism for risk measurement that generated the unsustainable risk exposure compared to the capital basis. There also has been overestimated the true nature of the assessments made by the rating agencies under the circumstances of the lack of some minimum professional standards and supervision of them. Towards the liquidity risk, concerning the financing component and the one of assets recovery, it was not properly reflected in prudential reports.

The reform of international capital standards brought as a solution the new Capital Agreement Basel III, issued by The Basel Committee from The Bank of International Settlements. Both the theoretical approach and the reports of the Bank for International Settlements reflect a series of advantages of the new agreement comparing to the former[24][25][26][27]:

- the quality, consistency, and transparency of the capital base will be raised (Tier 1 capital: the predominant form of Tier 1 capital must be common shares and retained earnings; Tier 2 capital instruments will be harmonised; Tier 3 capital will be eliminated);
- the risk coverage of the capital framework will be strengthened by: strengthening the capital requirements for counterparty credit exposures arising from banks' derivatives, repo and securities financing transactions; promote more integrated management of market and counterparty credit risk; add the CVA (credit valuation adjustment)-risk due to deterioration in counterparty's credit rating;
- introducing a leverage ratio requirement that is intended to achieve the following objectives: put a floor under the build-up of leverage in the banking sector;

introduce additional safeguards against model risk and measurement error by supplementing the risk based measure with a simpler measure that is based on gross exposures;

- introducing a series of measures to promote the build up of capital buffers in good times that can be drawn upon in periods of stress;
- introducing a global minimum liquidity standard for internationally active banks that includes a 30-day liquidity coverage ratio requirement underpinned by a longer-term structural liquidity ratio called the Net Stable Funding Ratio.

A third aspect that was redefined at european level was the corporate governance of the financial banking system. At the european Banking Federation, the romanian professionals, the Bank for International Settlements reflect the same idea which is the need to improve the corporate governance especially in banking field, illustrating at the same time the malfunctions and their effects during the crisis.

It was a necessity to take into account in the new framework some elements:

- elements linked with the activity of the The Board of Directors; within the new framework it has to clearly understand its role, to have the necessary competence for its responsibilities, to establish the main directions for the activity, to respect the corporate values, to ensure that the supervision process is coordinated to the commercial and risk policies, to prove a good knowledge of all the operational structures and markets on which the bank operates;
- the revision of remuneration policies of the executive board [17]; for this reason the motivational process through bonuses must be dependent on the medium term results, not on the annual financial results which can overestimate the effective performance. The guaranteed bonuses are not consistent with a rigorous policy of risk administration and potential earnings must be adjusted with the cost and the volume of the liquidity risk. At the same time, the temporal scheme of remuneration must be consistent with the time horizon of potential risks and only a small part of

them must be offered in cash. The largest part must be offered as shares which cannot be sold for a period of at least three years, or as options of buying a part of banks' shares, at a higher price (10 percent higher) than its usual price.

The global financial crisis has increased the focus on the compensation policies of financial institutions.

Moreover, banks agree that measures should be taken to correct any existing misaligned incentives due to remuneration policies. They believe that their risk management should be aligned with their long-term objectives. Remuneration must not be excluded from the scope of risk management.

At European level these new standards were applied in different financial fields. A study issued by the European Banking Federation revealed the fact that at all staff levels in the European institutions not only in banks has been implemented a process of coordination between risks and revenues.

This process of change at European level has been a natural response to the financial crisis. The crisis has emphasized the role of systemic risk, this type of risk being a global problem, on the conditions of an international financial system. Under these circumstances, the measurement and monitoring of risks must have an international dimension, if we do not want to give up the advantages of globalization and turn back to a system with only a national function for markets and institutions. It has appeared even the idea of an international risk map. This concept was introduced by Stephen G. Cecchetti, Ingo Fender, Patrick McGuire in their study *Towards a global risk map* [1], and concerns the necessity of international exchange of information and of a larger framework for statistical reporting for the same purpose of data exchange process.

The events which took place during the crisis revealed lacks and disfunctionalities not only in banking supervision systems, but also in the use of intervention tools. The actions taken for solving the problems of the institutions with crossborder activity had been ad-hoc actions, not coordinated. That is why the need is for a crossborder cooperation during the crisis, avoiding great dimensions shocks and international contagion. Even the European Commission admits that financial

stability is not any more a problem of national interest, but a European problem. [19].

3. Controversies

There are different problems that appear when we refer to the new framework for banking supervision. One problem is whether such a great institutional change is not „too big to fail”, and this is the idea developed in the study of *Dr. Elaine Fahey*. Grand institutional reforms, may prove the paradox of being “too big to fail” [6].

The EBA (European Banking Authority) is subject to most of the controversies, mostly by reason of its high-profile status, its functionally-singular activity and its direct role as to the banking and finance industry.

Another problem refers to the independence of the new authorities. That is because of the fact that functioning within the borders of European Union the rules and regulations are issued after a collective decisional process between the European Council, The European Commission and The European Parliament. Once again, especially EBA is questioned when it comes to independence.

The Authority's institutional independence can be challenged on four grounds [8]:

- First, by the presence of national supervisors on its board considering that they will be recipients of its decisions;
- Second, by the lack of specification of the grounds for dismissal of its head. The regulation only mentions that the ultimate decision belongs to the powers of the European parliament following a decision of the board.
- Third, the arrangements for legal immunity for its staff – they will have the same statute as staff working under the EU Treaty – might be insufficient, taking into account that the Authority has the power to investigate alleged incorrect or insufficient application of Union law obligations by national authorities and to adopt decisions that affect individual banks.
- Finally, the presence of the EU Commission on the board – albeit without voting power – raises the issue of potential political interference on the

policy decisions.

On the other hand, the exchange of information attracts diverse opinions as it is not done directly from one credit institution to another, but through national supervision bodies.

There is another problem linked with the independence that refers to the funds of these new authorities. The Authorities funding mainly comes from the general EU budget and obligatory contributions from national supervisory authorities. These institutions do not have their own budget, they are bounded by the national agency budgets, whose contributions are made in accordance with a formula based on the weighting of their votes in the board, limiting the Authorities budgetary independence.

Continuing with the critiques to the new system, we selected one of the negative opinions came from an American economist Barry Eichengreen, who considers the new framework cumbersome and unworkable because of the national interests which are contradictory [16]. As a solution this economist proposes that The European Central Bank should become the banking regulator for the euro area. He also considers that a common view could be obtained by a faster admission of members in the euro area and the exclusion of the ones that do not want to be part of this group (as an example Great Britain). There are voices against this proposal, one of them from the IMF, considering the fact that additional power for the European Central Bank would harm their own interests and purposes.

4. Conclusions

The establishment of the new European Framework for Banking Supervision is certainly a significant step on the road towards fully internalizing the potential negative externalities that result from the existing decentralised national supervisory frameworks in an integrated financial market.

The objective of changing the look of supervision in the European Union was based on three pillars [20]:

- an improved and harmonised set of preventative and resolution tools;
- clearly defined roles of authorities at the national level accompanied by balanced coordination mechanisms at EU level;

- financing arrangements that limit reliance on public budgets to future crises.

If we take into consideration the fact that at the origins of the crisis there were the banks and that they all benefited from financial aids then, they had the obligation to conform to rules and regulations and to accept a closer monitoring [16].

By this new supervision environment the European Union ensured a concrete set of measures for the financial stability of the whole Union, assuring the same technical standards in order to identify the systemic risk in an early period for better action in emergency situations and solving the disagreements between the supervision authorities. The EU clearly needed better tools to address the problems in banks more effectively.

The maintenance of a stable and reliable financial system are the essential prerequisites to keep the confidence and consistency in the European banking environment.

These exceptional and bold measures have helped to sustain financial intermediation in the euro area and have been instrumental in maintaining the availability of credit for households and companies, while remaining fully consistent with the ECB's primary mandate of ensuring price stability in the euro area over the medium term [20].

However, the operation and success of such authorities may bring stability, global cohesion and popular confidence in respect of European regulatory powers.

The Evolution of Banking Competition under the Influence of European Union Regulations

Scântee Roxana

Faculty of Economics and Business Administration,
„Alexandru Ioan Cuza” University, Iași, România
scanteeroxana@yahoo.ro

Abstract

The European directives are a challenge to the study of competition in banking and financial industry. Many regulations were implemented in the last 20 years in European countries by the need to obtain the level of harmonization required for develop a single competitive financial market. The purpose of this study is to underline the influences of regulations from European banking framework on banking competition. What are the main influences of the banking directives on competition? What are the changes appeared in the European banking field after the implementation of integration policy? Those are some questions that I tried to answer. In this study section 1 analyses the competition regulatory framework in European Union. The second section presents the European directives and investigates their impact on banking competition and the third one concludes.

Keywords: European integration, banking competition, regulatory framework, financial market, European directives

J.E.L. Classification: E44, F15, G18

1. Introduction

During the last years, the banking consolidation process from Europe determined the evolution and the development of the European banks in national economies more than cross border, despite the encouragement of European regulations considering the EU banking expansion thorough a common regulation of the banking system and other financial services and by removing barriers between banking system, the insurance and capital market.

The bases for the existence of a European common market were created by the Treaty of Rome. The main interest of national players belonging of the Single Market is to grow during the next period by expanding into foreign markets. One of the reasons that created this trend is that internal expansion opportunities have entered into a slowdown phase.

Despite the measures taken over the time considering the increasing of financial integration, the European Union continues to be characterized by fragmentation due to technical, regulatory or administrative barriers in different national financial systems. The euro introduction and the measures adopted by the Financial Services Action Plan (FSAP) contributed to the increasing of financial integration, but the specificity of each national economy and the legislative diversity delayed the full integration of financial markets.

The Financial Services Action Plan of European Union launched in 1999-2005 period, had as main objective to create a single market for financial services specifically designed for industrial consumers based on a single legal framework for securities markets and derivatives, for mergers and acquisitions and in the same time to provide access to all consumers at a European financial market for individual consumers, which would imply a reduction of differences considering the rates between EU countries the harmonization of prudential regulations, especially in insurance and reinsurance fields. The regulatory areas included European investment company statute, tax savings, banking privacy, pension funds, and acquisitions, financial services' distance communication.

Europe 2020 strategy for smart, sustainable and inclusive economy and its sustaining represents one of the main

challenges for the competition policy, considering the strong global competition and the financial crisis (European Commission, ec.europa.eu/europe2020/reaching-the-goals/targets/index_ro.htm accessed on 13.02.2012).

The competition policy and the strengthen competition reforms are an important part of economic governance. It has the ability and the influence to make an important contribution, is an essential factor for a proper function of the markets through efficient allocation of resources

It has the ability and the influence to make such a contribution is an essential factor for proper functioning of markets through efficient allocation of resources and increasing productivity and innovation. This policy supports the competitiveness of the European Union, which is becoming increasingly important to maintain the economic and financial stability.

2. Analysis of the competition regulatory framework in European Union

Competition is the key element to stimulating the competitiveness of European industry considering the demanding goals set in Lisbon Strategy. New approach of the competition policy entered into force on 1st May 2004, coinciding with the accession of ten New Member States. This was described by the European Commission as pro-active and is characterized by:

- To promote an intense economic activity with impact in increasing the results, a wide diffusion of knowledge, better conditions for consumers and efficient economic restructuring all over the internal market requires an improvement of the competition regulatory framework;

- To stimulate competition are necessary steps in eliminating entry barriers and the obstacles appeared during the process (Stoica and Palma Martos, 2009).

Since 1990, the Commission followed a dual strategy: developed and strengthen bilateral relations with major trading partners and made important investments in multilateral bodies such as OECD (Organisation for Economic Cooperation Development) or Internal Network Competition (INC).

During the first half of the twentieth

century, the authorities from many European countries had a much more tolerant view about monopoly and restrictive practices than those from USA. Since the Second World War there was a gradual strengthen consolidation of the antitrust legislation in Europe. Ironically, since the beginning of the 21st century the European approach can be characterized as stricter than the one from USA considering various aspects. Many European governments had a hostile view about non-interventionist approach, approach that has been dominant started with the eighties. They also had being sceptical that the market should select the most efficient firms, unless it is provide otherwise.

The main objective of The European Union's competition policy is to promote this approach in the European Single Market. Main pillars of EU competition policy are represented by 81 and 82 articles from the Treaty of Amsterdam, which was developed in 1999. These two articles incorporate the 85 and 86 articles from the Treaty of Rome. In accordance with the subsidiarity principle, the scope of 81 and 82 articles is limited to the companies with the headquarters in EU's member states, which are developing commercial operations in other EU's countries.

Article 81 refers to restrictive practices, which prohibit agreements between the banks from EU's member states which prevent or restrict competition. The interdiction refers both at the vertical agreements and also to the horizontal ones.

Article 83 regulates the potential abuses due to the existence of the monopoly, such as monopoly prices, unfair pricing and price discrimination. A bank is considered to be market dominant if it can prevent competition, acts independently of its competitors and exercises control over production and prices. In practice, is developed an investigation in the case when a single bank has 40% market share. Pricing or technical development in customers detriments, the refusal to work with certain clients and restrictions or unfair terms imposing are forms recognized as dominant position abuse.

European Commission, together with national authorities impose the rules that govern competition in EU, namely the 101 to 109 articles of the Treaty of European Union,

considering a better functioning of the markets and providing a framework where banks compete equally and fairly. These regulations benefit consumers, banks and European economy as a whole. In European Commission, the General Directorate for Competition is mainly responsible for direct application of these regulations.

The articles mentioned below, but especially Articles 101 and 102 (previous articles 81 and 82 from the Treaty of EU) (<http://eur-lex.europa.eu/en/treaties> accessed on 11.02.2012) have as main direction of regulation the following:

- Article 101 of the Treaty prohibits anti-competitive agreements between banks (e.g. market sharing). Often, the cartel cases start with a tolerance request of a bank, with the main objective of obtaining a lenient treatment;
- Article 102 prohibits abusive comportment of the banks with a dominant position on the market, for example, that force the consumers to buy a package of products that could be sold separately by the competitors or influencing the exit of competitors from the market by signing exclusive agreements. If a bank has a market share less than 40% is unlikely to be dominant.

New regulations on anti-trust procedures were introduced by Regulation (EC) no. 1/2003 and were designed for a more effective enforcement of competition rules in European Union and to operate in interests of consumers and banks and in the same time to reduce the administrative burden (http://europa.eu/legislation_summaries/competition accessed on 11.02.2012). The competition rules will be applied decentralized and together with closer retrospective monitoring applied through this regulation, the Commission's administrative workload will be eased, which will result in a concentration of its resources considering the monitoring of the worst violations of competition. Also, through this regulation, the role of competition authorities and national courts in implementing de EU's competition legislation and its effective and uniform application will increase.

Mergers are governed by Regulation no. 139/2004, which entered into force in May 2004 and refers to mergers and acquisitions. This regulation was amended by regulation

no. 1033/2008 (Official Journal L279, 22.10.2008, pp. 3-12, European Commission, <http://eurlex.europa.eu/LexUriServ/LexUriServ.do>, accessed on 02.10.2012). A horizontal merger is taken into consideration only if it has a significant impact on European Union's competition. Through Article 30 of the Regulation no. 139/2004 "European Commission is responsible for transparency and effective advice provided to Member States and for the information of the third parties interested in full compliance of the procedure" (Regulation no. 139 of the European Council, 2004).

The main goal is to simplify and to improve the merger investigations' transparency; this is an essential thing in a growing and cross-border expanding market of the Member States. Also, this regulation contains the main lines in evaluating the concentration degree resulted from mergers, based on economic indicators, as well as for rights of the banks in the case of an unauthorized merger.

The involvement and the help of the state is still an important component of the EU competition policy, governed by Articles 86 and 87 of the Treaty. Through the Article 86 is established that a Member State has the right to deliver public services, but in the same time provides that the suppliers of the public services to be the object of the same rules about collusion and market power abuses like the companies from the private sector. Article 87 refers to the implementation of one rule that restricts the state aid and the subsidies if the competition is distorted, but in the same time it offers exemptions in a number of cases where the state intervention is necessary to maintain good functioning of the economy.

EU's capital requirements for credit institutions and investment firms aimed as main objective the implementation of a comprehensive and sensitive at risk framework and in the same time to encourage a good management of the consolidated risk between financial institutions. This will maximize the efficiency of the capital standards and the continuity of the financial stability, maintaining in the same time the confidence in financial institutions and consumer protection (European Commission, ec.europa.eu, accessed on 29.01.2012).

European competition policy should

contribute simultaneously for the benefit of the consumers and for the commercial interests through the merger process. Concentration degree brings some competition limitations, but in the same time it improves the efficiency. (Stoica and Palma Martos, 2009). The financial system of the countries from South-East Europe is characterized by the dominant role of the banking sector. Capital market segment for long-term funding is illiquid and in some cases even underdeveloped, and the non-bank financial intermediaries such as insurance companies and private pension funds are in early stages of development. European Commission is empowered by the Treaty of EU to apply the limitation rules. From May 2004, all national competition authorities are empowered to fully apply the Treaty provisions to ensure that it won't be a distortion or restriction of the competition (European Commission, 2011).

3. European directives and their impact on banking competition

Number of the European directives appeared to regulate the banking system increased, countries in integration process and Member States must harmonize nation legislation step by step, and institutional structure to meet the EU's conditions. The technology transforms the products offered by banks and computing platforms, and the regulations transform banking services markets. This was also underlined by the recent financial crisis, on an integrated financial market the propagation and “contamination” risks threatening the financial stability (De Larosiere Report, 2009).

Treaties – cooperation based on democratic principles. Main treaties that helped and governed the formation of the European Union are: the European Coal and Steel Community (1952), Treaties of Rome: the European Economic Community (1958), the European Atomic Energy Community Treaty (1958), the Single European Act: Single Market (1987), the European Union Treaty – Maastricht (1993), Amsterdam Treaty (1999), Treaty of Nice (2003) and the Treaty of Lisbon (2009) (www.europa.eu accessed on 30.01.2012). EU Treaty is the base for euro system; this is the reason that it

has an important role in prudential supervision and financial stability.

Harmonization in banking and finance began with Directive 77/88/EEC from 12 December 1977 – First Banking Directive, which coordinates the laws, regulations and administrative acts related to the access and monitoring of the credit institutions. A credit institution is defined as a business with an activity consists in receiving deposits or other repayable funds and in providing loans on their own (Article 1, First Directive). Through this regulation was intended to increase cross-border competition, access and conduct of the business on banking markets of the EU's members in the same way as on the national markets. Harmonization of legislation at European level would facilitate the penetration and the cross-border activities. This directive is governing the fair competition between comparable categories of the credit institutions. To have a fair banking competition which can be followed by all participating banks as an example at the national transactions, but also at cross-border ones was absolutely necessary that at the directives base to have the principle of fair competition.

Another important pillar in the European banking regulations is the second banking Directive entered into force on December 15, 1989 which harmonises the authorization rules. This establishes the existence of a single operating license all over European Community – a bank authorized to operate in EU country can operate in any Member State without requiring a local authorization. This directive has a direct impact on competition; national banks were forced to modify their strategies regarding offers, costs and cross-border products. The impact of foreign offers is positive for competition, because the national players will improve their final costs for consumers to stay in the game.

In order to complete the framework for a good development of the activity, other directives were adopted: Own Funds Directive (89/299/EEC of 17 April 1989) which is in strong connection with Solvency Ratio Directive (89/647/CEE of 18 December 1989). The first Directive establishes conceptual equity standard, which Member States have to use it in the moment of enforcement of the European Economic Community and the second one sets the

minimum solvency ratio which has to be maintain by the credit institutions.

Comparing USA and Europe, in terms of transformation, the first seems to be more advanced in deregulation process – not only because of the market segmentation regarding the currency, but also because of the European Single Market Directives, substantial only on paper, they haven't been until now as efficient as on the paper (Danthine, J. and Giavazzi, F., 2000).

A step forward in integration process is represented by SEPA (Single European Payment Area), which was established especially to reduce cross-border costs. The main objective of SEPA is to eliminate all the existing barriers between national payment markets. Using technical and commercial standards, SEPA will improve the payments industry and in the same time will bring competitiveness on the market. Promoting the new payment instruments, SEPA will conduct to a single efficient market. This infrastructure consolidation will stimulate the competition and one of the main consequences will be the fact that banks will negotiate in a better way the settlement costs.

The main directive from the banking sector is the one of the capital requirement, composed by two directives: Directive 2006/48/EC of the European Parliament and Council from 14 June 2006 about acquisition and tracking of the credit institutions business model and Directive 2006/49/EC of the European Parliament and Council from 14 June 2006 about capital adaptation for investment firms and credit institutions (ec.europa.eu, accessed on 29.09.2011).

The main direction on banking evolution will be international consolidation. The players form national field will build their strategies taking into consideration the local and foreign competitors. In the same time, the competition policy will play an important role in monitoring the activities development and when necessary will restructure the inefficient banks.

4. Conclusions

The interest of the national players from Euro Zone to foreign markets will probably grow in the next period and one of the reasons is that the intern growing opportunities will pass by a slowdown

period.

In Europe there are still some fears from banks to involve in mergers and acquisitions on other national markets because of political interference and national protectionism of the banking systems.

The European directives appeared to regulate this sector are more numerous, nevertheless the countries in integration process or member states have to harmonize their legislation and institutional structure step by step to meet the conditions imposed by those.

The European financial integration is an important problem, both from regional and global implications. One of the main objectives of the European Union is to create a single market for financial services. Considering that banking system is important in resources allocation and on the basis of evolution, innovation, performance and efficiency is competition, a single banking market with transparent and easy regulations to all the players can offer to clients products and services of high quality and low costs. A single European banking market with a cross-border competition leads to economic growth, based on efficient allocation of the resources, not an economic growth based on excessive consumption, both on national and European Union level.

Economic and Social Cohesion, Determinant of Human Development

Teodorescu Ana-Maria
Oil-Gaz University
amy_80ro@yahoo.com

Abstract

Economic and social cohesion has been addressed in the official documents concerning the welfare of European citizens: the Treaty of Rome (1958), Single European Act (1986), Lisbon European Council (2000), Treaty of Nice (2001), Renewed Sustainable Development (2006), Treaty of Lisbon (2007). The concept was discussed as a determinant of human development and therefore sustainable development.

This article deals with social evolution "tools" for measuring: Human Development Index, calculated for the first time in 1990 and the Human Poverty Index, calculated by ONU. Also, there is presented the comparison of HDI for Romania and other European countries.

Keywords: human development, social cohesion, sustainable development, human development index

J.E.L.Clasification: O15, I15, I25, I30, J 16

1. Introduction

Economic and social cohesion is presented on the official site of the European Union as an "expression of solidarity between Member States and EU regions. EU goal is balanced development by reducing disparities between regions and promoting equal opportunities for all."

Economic and social cohesion policy is the amount of public initiatives and actions taken towards reducing economic and social development disparities between regions and proximity to the living of their inhabitants, through actions aimed at increasing the competitiveness of these regions and creating new jobs better paid for the inhabitants of these regions for incorporation of sustainable development objectives as defined in the

Lisbon European Council (March 2000) and Gothenburg (June, 2001).[1]

Economic and social cohesion was promoted in the text of the Single European Act by inserting a new Title (XIVth of the Treaty on European Union, became the XVIIth in consolidated Treaty), entitled "Economic and Social Cohesion", developed in the text of the Union Treaty European Union (Maastricht Treaty).

The concept of social inclusion incorporates multidimensional set of measures and actions in social protection, employment, housing, education, health, information and communication, mobility, security, justice and culture, to combat social exclusion.[2]

Social exclusion includes not only lack of material resources, but also the inability to actively participate in social, economic, political and cultural society.

Aiming to achieve sustainable development, each country aims to overcome gaps of other European Union member states on three pillars: social, economic, environmental.

Based on the definition contained in the Brundtland Report on sustainable development and objectives of the European Strategy of Sustainable Development can be drawn definitions of sustainable economic development (economic development as providing satisfaction to the consumer without compromising or prejudicing those of future generations) and sustainable human development in a knowledge society characterized by healthy, social cohesion, opportunities for education and employment, unpolluted environment.

In the Treaty of Nice, in February 2001, it has been revealed that "people are the most valuable asset of the European Union, investments in people will be at highly important for the wellbeing and place they will occupy in the economy of the future." [3]

Human Capital is an important determinant of economic development through its participation in the production process, helping the growth rate of added value through its innovative capacity.

A high level of employment and quality jobs are the link between economic and social dimension of sustainable development and can be quantified by GDP and employment levels, the primary macroeconomic indicators, but also the health of the population index - regarded as reservoir long-term labor [4]

Human development is an intrinsic part of sustainable development component that defines the purpose and outcome of its.[5]

Human development involves enabling people to live along and healthy life, access to education, participation in social and political life of society, freedom of speech. Fighting poverty, education and health and gender equality are central concerns of human development, focusing on six of the eight Millennium Development Goals: eradicating extreme poverty and hunger, universal access to primary education, promoting gender equality, reducing child mortality, improving maternal health, combating HIV/AIDS, malaria and other diseases. Restriction poverty is unanimously regarded as the aim of developing a fair and impact on poverty is a major criteria for assessing the quality of growth..

2. Human development index

Human development index is a measurement tool of social evolution in terms of health, education and income.

It was calculated for the first time in 1990 by combining indicators of life expectancy at birth, GDP per capita and level of education (literacy, school enrollment level of school-age population).

Variable *Life expectancy at birth* is the basis for calculating the HDI, taking into account so far. Since 1991, it was introduced a new variable to calculate the HDI, namely *The average amount of schooling* that with *Adult literacy rate* is used to determine the *education index*. The year 2010 brought changes in the variables used. Thus, the education variables were replaced *Gross enrollment rate in education* and *Adult literacy rate* variables average *schooling*

period and *The expected period of enrollment*. In terms of variable income, *per capita GDP* was replaced by *Nation gross income per capita*.

Specific index for each dimension of human development in part is calculated as follows:

$$S_i = \frac{\text{Real}_v - \text{Min}_v}{\text{Max}_v - \text{Min}_v}$$

where

S_i = specific index, Real_v = real value, max_v = maximum value, Min_v = minimum value .

Minimum and maximum values have changed over time, in accordance with developments globally.

Table 1 Minimum and maximum values

Variables	Um	1995-2009		2010	
		Min	Max	Min	Max
Life expectancy at birth	years	25	85	20	83,2
Adult literacy rate	Percent	0	100	-	-
Gross enrollment ratio	Percent	0	100	-	-
Mean years of schooling	years	-	-	0	13,2
Expected years of schooling	years	-	-	0	20,6
Gross Domestic Product (GDP) per capita	Purchasing power parity(\$)	100	40000	-	-
Gross national Income (GNI) per capita	Purchasing power parity(\$)	-	-	163	108211

Source: Mirela Lazar, Cornel Lazar, *Human Development in Romania in the Context of the New Methodological Approaches*, Review of research and social intervention, 2011, vol33, p.144

According to the Annual Human Development Reports based on HDI,

countries were classified for 2009-2010 as follows:

- ✓ very high human development: 0,788 – 1;
- ✓ high human development: 0,677 – 0,784;
- ✓ medium human development: 0,488 – 0,669;
- ✓ low human development: 0 – 0,470

European Union is a community of countries with high and very high human development, so in 2011 Romania was classified 3rd in the category of countries with high human development with an index value of 0,781, positioning us 50th of 187 countries ranked. Health factor has recorded 0,85 value, education was 0,83 value and revenues have amounted to 0.67. Hungary, EU member in 2004, classified 38th in 2011, is one of the countries with high level of human development, while Bulgaria, EU member from 2007, as Romania, is classified in countries with high human development.

Figure no 1 Comparison of HDI Romania, Bulgaria, Hungary 2011

Source:

<http://hdrstats.undp.org/en/countries/profiles.html>

Romania recorded increases in human development from the value reached 0,704 in 2000 to now, the biggest jump was in 2005 when HDI reached 0,748. Rise of the index of human development is welcome, but must be considered the gap still existing between Romania and other EU countries.

By comparing the development index for the period 1990-2011 between Romania and EU neighboring countries, Hungary and Bulgaria, there is advance what we have to close the gap with Hungary and Bulgaria, the country ranked in those with high level of development.

Figure no 2 Evolution of HDI 1990-2011 Romania, Bulgaria, Hungary

Source:

<http://hdrstats.undp.org/en/countries/profiles.html>

Spending on health and education are investments in human capital accumulation and avoid providing its depreciation. In health, public expenditure in Romania during 2005-2009 were 3.8 percent of GDP, under 5 years mortality rate for 2009 recorded 12 percent, down from 34 for 1980, 32 for 1990, 22 for 2000, 18 for 2005, 15 for 2007 and 13 in 2008, average life expected was 74, based on the value of 69,6 for 1980. Average expenditure for Bulgarian citizens health was 4.3 percent of GDP for 2005-2009, while the Hungarian government covered the expenses of 5,55 percent of GDP. The largest proportion of spending was for Norway, namely 7,45 of GDP and EU member country with the highest value is Germany with 8,07 percent of GDP.

Education plays an important role in sustainable development being an objective of the strategy. Education level is measured by combining data on literacy rate, accounting for two thirds and combined proportion enrolled in various forms of education in accounting for one third. Expenditure on education in Romania has grown from 2,9 percent of GDP for 2000 to 3,5 percent for 2005 and 4,3 percent for 2007, keeping the value for 2009. In the period 2000-2009, Hungary spent 5,11 percent of GDP for education and Bulgaria spent 4,26 percent, while Sweden has

reached the highest values by 7,21 percent of budget spending.

By 2010, GDP per capita income was the size indicator, the highest value of our country was \$ 11,780 (PPP) for 2008 which led to the achievement of income of 0,682 index. For 2011, GNI per capita was 11,046, up to 2010 when it reached 10,863.

Although countries signed the Treaty of Lisbon are aware of their obligations to eliminate poverty population in terms of exposure to poverty risk indicator, countries like Hungary, Slovakia, Slovenia, Spain, Portugal, Malta, Latvia, Lithuania, Greece, France, Finland, Denmark, Czech Republic, Belgium suffered an increase in population at risk living in poverty. Fortunately for Romania, Luxembourg, Italy, Germany, Estonia, Bulgaria, Austria, is the percentage decrease in 2008-2010. However, in 2010 Romania has the highest percentage of poor population in the EU, socially excluded, 41,4 percent with a decrease of 1,7% compared to 2009.[6]

A percentage of 0,5 romanian people had the day income 1.2 dollars for the period 2000-2009 [7]

With an increase in national income per capita of only 1 percent per year, time to eliminate absolute poverty could also spread the next century. If, however, the objective is to ensure that the world is on the road to sustainable development by early next century, it is necessary to follow a minimum of 3 percent of national income per capita. Thus, the number of years required to bring down the poverty rate from 50 to 10 percent range from:

- 18-24 years if per capita income grows at 3 percent,
- 26-36 years if grow this achieved at 2 percent,
- 51-70 years, if it gets only 1 percent [8].

In the Treaty of Lisbon in December 2007, the emphasis is on respect her rights citizens' Member States in a society in which pluralism, non - discrimination, tolerance, justice, solidarity and equality between women and men. It shall combat social exclusion and discrimination and promote social justice and protection, equality between women and men, solidarity between generations, promote economic, social and territorial. [9]

Gender inequality index value for 2011 was 0,333, as Romania was ranked 55th.

In 2009, labor market participation rate for women was 45,4 percent and males 60% [8]

In the fifth cohesion report was presented Human Poverty Index (HPI) calculated by the UN for all EU regions based on a probability at birth of no reaching age 65, in the risk of poverty rate, unemployment long term the proportion of people aged between 25 and 64 years with only a primary education.[10]

The highest levels of human poverty, according to these measurements, were recorded in southern Spain, Greece, southern Italy and Portugal. The lowest levels were observed in highly developed Member States, those with moderate growth and the least developed - in the Czech Republic, Germany, Slovakia, Slovenia and Sweden.

3. Conclusions

Human welfare is measured using the Human Development Index which reflects the health, education and income. Since the Single European Act was intended that member countries should be characterized by economic and social cohesion. Romania is in the category of countries with high human development index value taking a rise from year to year.

Abstract

Under the impact of all the tensions generated by the global financial crisis that degenerated into an economic crisis, the EU is subject to new tests of strength, due to increased risk of sovereign debt of the countries belonging to the PIIGS Group. The year 2011 had a maximum strength for the EU and mainly for the Eurozone countries, the macroeconomic imbalances influencing many of them, and the EU leaders admitted the lack of some legal levers that could determine the guilty countries respond for the situation created. Moreover, the legislative lack, by which the European countries are forced to correct the budget imbalance and to meet the imposed macroeconomic convergence criteria, led to a deep sovereign debt crisis in the EU. Basically, the Eurozone initially created as an area of macroeconomic stability has become a region full of uncertainties and subject to risk collapse.

Key-words: unemployment; GDP; sovereign debt; creditors; crisis

J.E.L. Classification: E60; F36;

1. Introduction

The PIIGS countries (Portugal, Italy, Ireland, Greece, Spain) are mainly responsible for the sovereign debt crisis in the Eurozone, and now, they are an increasing threat to the economic stability of the EU. Therefore, analysts recommend that they leave the euro area before it is too late. The compliance with the budget deficit target of 4.5% of GDP imposed by *Portugal*, in agreement with the IMF, seriously affects the

country's economy, according to an IMF report. Despite the economic recovery measures taken in *Italy*, the country went into recession after seeing a contraction of 0.7% of its GDP in the last quarter of 2011. *Ireland* re-entered recession and its economy shrank by 0.2% in Q4 of 2011 and by 1.1% in Q3 [1], in spite of all the reform efforts made and praised by Mario Draghi, Chairman of ECB. In *Greece* tensions continue after obtaining the second financial aid from the EU and the IMF and after it managed to successfully restructure a part of the state private debt. Greece represented an important challenge for the European leaders, although it is a country with a small economy. *Spain* launched its first emission of bonds, and the verdict for the budget was unfortunately not favorable. The demand was weak, the prices went down and the yield for securities with maturity at 10 years reached only 5.7%. The government in Madrid launched another emission of bonds with maturity at 10 years in April 2012, wanting to get 5.5 billion euros. Unfortunately, Spain is back in recession in the first quarter of 2012. The domestic demand is weak, and unemployment reached 22.85% in January 2012. [2]

2. The PIIGS countries under the pressure of sovereign debt

Table 1. Debt of the PIIGS countries in 2011

	Portugal	Ireland	Italy	Greece	Spain

GDP	200 billion euro (0,2 tn)	200 billion euro (0,2 tn)	1200 billion euro (1,2 tn)	200 billion euro (0,2 tn)	700 billion euro (0,7 tn)
External debt	more than 400 billion euro ~ 251% of the GDP	1700 billion euro ~ 850% of the GDP	2000 billion euro ~ 166% of the GDP	more than 400 billion euro ~ 252% of the GDP	1,9 tn. euro ~ 272% of the GDP
Public debt	106% of the GDP	109% of the GDP	121% of the GDP	166% of the GDP	67% of the GDP
External debt per capita	38.081 euro	390.969 euro	32.875 euro	38.073 euro	41.366 euro

Source: <http://www.bbc.co.uk>

2.1. Portugal – a general perspective

In recent years, the Portuguese economy has undergone a difficult period, especially in terms of budget deficit considered to be too high. Divided into sectors of activity, *the GDP has the following structure: 72% services, 25% industry and 3% agriculture.*[3]

Foreign trade has a deep deficit, 72% of it being oriented to the EU. [4] *The main trading partners* are Germany, Spain and France, and the main creditors are: Spain (65.7 billion euro), Germany (26.6 billion euro) and France (19.1 billion euro).

Portugal recorded in the last decade, *the slowest economic growth in the euro area*, defined by an average annual rate of only 1%, due to some structural problems that have persisted in the economy. Therefore, Portugal has become *extremely vulnerable to the effects generated by the global economic crisis*, recording: a high budget deficit, an increasing debt and a high unemployment rate. The labor market presented *a trend of deterioration* in recent years, and in January 2012, the unemployment rate reached a record of 14%. [5]

In 2011, Portugal avoided the economic collapse, *receiving financial aid from the EU and IMF*. They have imposed *strict*

conditions to the Portuguese government: *a reduction of the budget deficit to 5.9% of the GDP in 2011, as compared to 8.6% registered in 2010, and to 3% of the GDP by 2013.* [6]

According to previsions made by the European Commission, the realization of the current plan for fiscal consolidation depends both on *the materialization of the ambitious targets regarding the budget expenditures and the avoidance of a more accentuated decrease in the real GDP.*

2.2. Ireland – a general perspective

After joining the EU, Ireland has turned from a predominantly agricultural country, into a modern, technologically advanced country, entitled the “Celtic tiger”. It is the country which, in the last two decades, has recorded *the highest growth rate of industrial production* of nearly 10% per year. *Foreign trade* is in surplus and 74% is export-oriented and 60% is EU import-oriented. [7] *The main trading partners* are: the UK, the USA and Germany, and *the main creditors* are: the United Kingdom (104.5 billion euro); Germany (82 billion euro), U.S. (39.8 billion euro). Divided into sectors of activity, *the GDP has the following structure: 70% services, 27% agriculture and 3% industry.*[8]

In the crisis that rocked the world since 2008, the Celtic Tiger is the second Eurozone country after Greece, which asked for the common support of the European Commission and the IMF to save its money found at great risk. After the massive growth between ‘90-‘03, Ireland has not administered money well, which led to *huge imbalances in the financial system and economy*, by increasing the budget deficit and the external debt. Much of the losses were determined by the real estate developers whose properties have been seriously affected when the speculative real estate bubble burst. *Ireland’s problems* are related to the banking system that has a high debt and a high unemployment rate of 14.3% in March 2012. [9]

2.3. Italy – a general perspective

Italy is a dual country with a developed and diversified economy in the north and

with large backlogs in the south. The northern regions are among the richest areas in Europe, but the country's economy is weak from a competitive point of view, the production is low, the legislation is ineffective, and the investors have low interests.

The GDP has the following structure: 70% services, 27% agriculture and 3% industry. Foreign trade registers deficits and 59% of it is oriented to the EU. [10] Germany, France and the Netherlands are the most important trading partners, and France (309 billion euro), Germany (120 billion euro) and the UK (54.7 billion euro) are the main creditors.

Italy has a very large debt, but it is a relatively rich country in comparison with Greece or Portugal. The doubts regarding the possibilities of the Italian political class to manage the crisis and the fears that the debt could grow to such a level that the economy can not sustain it have caused panic on the markets. France is the most exposed to Italy's debt. The annual growth rate is 0.75%, lower than the rate paid for the debt, and the economy could not sustain it. In the past, this has not become real due to the high inflation, which produced income from the collected taxes.

The global economic crisis deepened the economic problems of this country, which has faced some structural weaknesses for a long time. The IMF estimates, for Italy, an increase of 1.3% in 2012, but the reality shows that they face a huge public debt and the austerity program imposed by the government and the precarious situation of the labor market *could negatively affect private consumption and the investment in fixed assets and influence the estimations.*

However, *Italy's problems* are major as the country has one of the highest rates of GDP debt in the euro area (121%). Besides, considering that its economy is double the size of that of Greece, Ireland and Portugal put together, a package of financial support would generate too high costs.

2.4. Greece – a general perspective

For Greece, 2010 was the second consecutive year of absolute reduction rate of the GDP and a year of severe austerity measures necessary *to consolidate the fiscal*

system and reduce the budget deficit and level of the public debt. [11]

Greece's economy entered a severe decline within the global economic crisis and the difficulties in identifying the sources to finance public expenses.

Greece's unemployment rate climbed to 21.8% in January 2012, which was double in comparison with the euro area average, and unemployment among young people exceeds the number of those with jobs. [12] According to the estimations, the economy shrank by about one fifth since 2008, when it entered the strongest recession since World War II. Nearly 600,000 jobs, more than one tenth of the total, were eliminated in this period.

Although the Greek economy is not an important player in the vortex of the debt crisis, the disaster it might cause to the other countries in the euro area is extreme, mainly because of the fear to touch larger countries such as Italy.

Divided into sectors of activity, *the GDP has the following structure: 71% services, 23% industry and 6% agriculture. Over 50% of the Greek industry is concentrated around Athens and the country's main economic sectors are agriculture, tourism, construction and shipping. Foreign trade has a chronically deficit balance and 65% of it is directed towards the EU. [13] The main trading partners are Germany, Italy, the United Kingdom, and the main creditors are: France (41.4 billion euro), Germany (15.9 billion euro), Britain (9.4 billion euro).*

The perspective of future development is not very encouraging, because of the poor competitiveness of the Greek products on the international market.

2.5. Spain – a general perspective

Since joining the EU (in 1986) the Spanish economy has experienced a rapid growth and diversification, *the engine* being represented by the foreign direct investment and consumer demand. *The GDP has the following structure: 67% services, 30% industry and 3% agriculture.* [14]

Foreign trade is weak and is directed 70% to exports and 59% to imports from the EU. [15] *The main trading partners are: France, Germany, Portugal, and the main creditors are Germany (131.7 billion euros), France*

(112 billion euros), and the United Kingdom (74.9 billion euros). Trade in services recorded a surplus, in exports, tourism is to be noticed (54%), and in imports, services of communication, information and commerce (45%). Spain is traditionally *the second European tourist destination* after France. 2011, amid social revolts in the Arab countries, has turned the Canary Islands into the main Spanish tourist destination.

For Spain, the years 2010 and 2011 marked a period of *large structural reforms* after *the biggest economic recession registered in 2008 and 2009*, considered to be unique by experts. Basically, the economic boom made housing and construction sector push Spain into a deeper recession than many other European countries.

In 2008-2010, Spain was *the country with the highest unemployment rate in the EU*, and in January 2012 it reached 22.85%. [16] Basically, in 2010 *Spain's unemployment rate was double the average in the euro zone*. [17] Moreover, *the public debt exceeded 60% of the GDP*, and *the budget deficit*, although it decreased as compared to the previous year, *was the third largest*, after Ireland and Greece, and *work productivity* continues to be lower than the EU average.

3. Conclusions

After Greece, Ireland and Portugal *have received financial assistance* from the EU and the IMF, the investors' attention was drawn by Italy and Spain. Financing costs for these two countries reached record levels for the euro area. However, unlike Greece, a possible payment incapacity of Italy, *the third euro zone economy*, or of Spain, *the fourth largest economy*, would produce a real shock in the European economy and on the financial markets.

Taxation in Spain is *lower than* in other EU countries, which allows *freedom of action* in order to achieve the fiscal targets set by government. *Fiscal consolidation* appears to be essential in order to increase confidence among national and foreign investors and, on a short-term, it slows down the economic recovery which is so necessary in generating new jobs. Over time, scientists have found that *price stability* is the way to maximum sustainable economic growth. [18]

The perspective of the PIIGS countries continues to remain under a fairly high degree of uncertainty and the perspective of the euro area is strongly influenced by their economic development. Considering the current state of production, labor productivity and unemployment, at a high historical level, one may take into account the scenario in which the PIIGS countries could go out of the monetary union, but if one leaves the euro area, it can create a chain reaction that would involve other countries, too. Even if Greece has not started the process of dismantling this area, Spain and Italy, two major economies, will be able to generate major problems, and the crisis of confidence could lead to the recognition of the vulnerability on the “Old Continent”.

Regional Development Strategies

The Development of the Romanian Agriculture by Adopting a New Type of Rural Economy

Aceleanu Mirela Ionela

*The Department of Economics and Economic Policy
The Bucharest Academy of Economic Studies, Romania
aceleanu_mirela@yahoo.com*

Abstract

The development of the Romanian agriculture also depends on the development of a new type of village economy that requires in addition to the agricultural development the development of the non-agricultural activities, the development of industry, services and infrastructure in the rural areas. Starting from the realities of the Romanian village, the paper presents the elements necessary to develop a modern rural economy in Romania.

Key words: rural economy, agriculture in Romania, agriculture development

J.E.L Classification: Q15, Q18

1. Introduction

Agriculture is an important area for Romania, considering having a large number of agricultural lands and the size of the population employed in agriculture.

In many specialized studies the development of this sector is considered an opportunity for Romania's progress, agriculture being an important area that can be exploited for qualitative transformation of the Romanian economy.

On the other hand, the quality of Romania's European Union membership implies Romanian farmers adapting to the requirements of the European and world agriculture. In this respect the existing gaps should be eliminated both in the level of development of agriculture and in the one of the village.

The specialized Romanian literature by the studies of some authors such as Păun I. Otiman, Dinu Gavrilescu, Cristian Hera, Gheorghe Zaman present the importance of

developing a healthy rural environment, by training of professionals by developing infrastructure and services.

It is paid particular importance to the development of the rural area at the level of the European Union, through various policies and regulations, especially through the Common Agricultural Policy.

Thus, the rural development is one of the most complex contemporary economic concern because it involves balancing the requirement of preserving the rural, economic, environmental and cultural areas of a country on the one hand and the trend of modernization of the rural life on the other hand.

This study aims to capture some aspects of Romanian rural economic development, and finally propose some means of action for the development of a modern rural economy in Romania.

2. The rural economy in România

In the context of the social change in the Romanian society registered in the last two decades, the rural environment goes through a sinuous phase of redefining, determined by a number of socio-economic processes, such as: the re-allotment, restructuring the economy, the migratory urban-rural movement, the external migration, the intensive development of towns located near the major cities and the depopulation of the isolated villages. All these put their imprint on the type of farming applied, on the type of farmer, on the level of rural development and on the quality of life in the countryside.

The economic and social dynamics of all countries has shown that important changes occur constantly in the economic structure of regions. The structural changes caused by the rural economic life raise questions relating

to: local and regional development, integration strategies in regional and cross-border development programs and economic reconversion of regions and labour.

For Romania, which is in the process of economic reform, the dynamics of the sector, regional and local restructuring is much more accentuated. The reconversion-restructuring programs have some features determined by the transition from one type of employment to another one, from one branch to another, from specialized activities to multiple activities or from a focused activity to other territorially dispersed ones.

The rural agriculture and development in Romania are cardinal components of the evolution of the Romanian economy.

The Romanian village faces problems related to agriculture – such as the existence of the subsistence agriculture, increased uncultivated land, the shortage of spaces for production and storage, the loss of the genetic potential of animals, desertification of areas, but also problems related to the aging of the rural population, the reduction of qualified labour force, increased poverty, underdeveloped infrastructure.

These imbalances have shown that the reform process in agriculture and the rural development are challenging and require a slow evolution. Therefore, the Romanian agriculture can not be compared in terms of yield and level of development with the agriculture of the EU countries.

Romania still has a subsistence agriculture, 35% of the farmland being owned by small and very small farms that have less than 5 hectares and the work in agriculture is predominantly family-type and and it involves the production of goods for self consumption. The products of these households are excluded from the market because they do not meet the demands of the *acquis communautaire* regarding trading. They were attracted into the economic circuit through association and cooperation on a contractual basis to become viable and the sector of the market-oriented family holdings is still underdeveloped.

Statistics show a downward trend of the active population in agriculture and also an aging workforce, half of which is over 45 years. This trend will continue, according to the demographic forecasts, due to the decrease of birth rates and increased aging of

the Romanian population and amplification of migration. These phenomena influence the degree of openness to innovation, occupational mobility, retraining.

Even if the employment recorded in the Romanian agriculture has a high level, the qualified agricultural workforce has a low share. In this respect the agricultural legislation has not yet introduced the certified agricultural producer and has not set up structures and mechanisms to promote it. At the same time, the banking and financial law does not link the loans for farmers also to their skill level (similar to the EU farmers` green certificate), but only according to material collaterals system.

On the other hand, the small and medium rural businesses corresponding to the upstream and downstream industries and services of agriculture have created few jobs requiring skilled labour, with low absorption capacity of the available workforce in the rural areas.

The agricultural product processing industries are largely obsolete technologically, with low technical and economic performance, to the limit or, most often below the limit of profitability. Many of these companies without the financial capacity to upgrade or the attractiveness for privatization are on the verge of bankruptcy, liquidation and closure, generating further rural unemployment.

The efficient private family agricultural holding is not sufficiently developed because of the inadequate technical facilities and low investment capacity. Eventually the agricultural area`s profitability and efficiency do not depend so much on its size, but rather on the quality of production, farm management, agricultural exploitation as company and its participation in the market competition.

Even if, in terms of economic structure in the rural area the agricultural activities occupy the largest areas, the development of services is also very important, especially the agro-touristic ones in the development of the Romanian countryside.

Job losses from the agricultural activities can be reallocated in the industrial, social and services activities in the rural areas. A series of non-agricultural activities have developed harmoniously in the countries where there have been applied specific policies to keep

the population become non-agricultural in the rural areas. They should be complementary to the agricultural activities.

The Romanian rural non-farm economy (industrial enterprises, in services or rural tourism) has a low share.

Unlike the EU, where the non-agricultural rural economy is almost 60% of total rural economy, in Romania it accounts for about three times lower (21.8%).

The non-agricultural rural economic development contributes to gross value added growth by processing the non-agricultural and raw materials from the local resources, but also to the creation of jobs by using and stabilizing the local workforce (rural), to the revitalization of the rural communities, particularly those in the disadvantaged and peripheral areas.

3. A new type of rural economy

The quality of the Romanian agricultural area is the natural premise of the competitiveness of the Romanian agriculture. Thus, the Romanian village should be removed from the closed natural economy and introduced into the business environment. The rural economy should be transformed gradually from subsistence economy to commercial economy.

Romania needs a multi-functional and competitive agriculture complementary to the other European countries' agriculture. It is necessary *to change the agriculture which is dominated by subsistence household with an agriculture made up of commercial private-family farms* that are technically, economically and financially efficient.

It is also necessary a modern infrastructure correlated with the current needs of the rural life and with a complex rural economic activity in the Romanian rural area.

Creating and maintaining an adequate infrastructure is essential for the economic and social development of the rural areas and for achieving a balanced regional development.

Romania presents major discrepancies between the urban and rural area both in terms of physical infrastructure, as well as the social one.

The infrastructure for transport services, telecommunications, electricity, water and waste management is essential for business

development and attracting investment in the rural areas. An improved public infrastructure could serve as a basis for creating new economic activities and in turn could generate new jobs.

The human capital is crucial for the economic development potential of a region. The diversification of the rural economy also depends on the level of education, skills and qualifications of the rural workforce.

The modern European vision on agriculture gives an important role to the modern farmer, which is defined by the Frenchman Bertrand Hervieu (former president of the Institute for Agricultural Research in France) as being a farmer who practices a job of synthesis that is specialized and complex. This job requires new skills that are not inherited, but rather are learned. From this point of view, the farmer is a modern entrepreneur. The rural development, the improvement of life quality and the diversification of the rural economy depend on the modern farmer. All the requirements and obligations imposed on the new type of farmer converge towards achieving a higher level of professionalism. This requires a systematic, continuous and multidisciplinary education from the farmer.

The professional sphere of the modern farmer must exceed the field of agriculture which he needs to master in depth; he must also know the environment, both in terms of its conservation and current challenges regarding global climate change.

The specialists' continuous education and training in the agricultural sector provide the foundation for the long-term sustainable agricultural development

On the other hand it should be sought both the stimulation of investments in the development of agricultural activities and also the non-agricultural ones, so as to contribute to the development of the rural economy.

It is also very important the attraction of European funds, but the changing of the Romanian agriculture and of the rural background can not be done only through the support from the European funds. The internal factors' effort is the one that can change the current state of our country's agriculture.

Thus, a new type of modern rural economy (village) requires measures aimed at the following actions:

- developing activities and promoting competitive agricultural products,
- better regulation of the rural markets,
- compatibilizing the rural economy with the one of the European Union,
- implementing some projects based on public-private partnership,
- developing rural education, developing the access to training,
- participating in continuing vocational training,
- developing the services in agriculture (both services for agriculture and industrial services and services for the rural population),
- upgrading for agriculture,
- supporting research and innovation in agriculture,
- better funding of the field, especially by attracting European funds;
- training for the information society by connecting the rural school to the Internet and multimedia equipment,
- developing leading industries targeting ecological agricultural products, rural tourism, creating alternative energy sources.

These actions will support the improvement of agricultural holdings, increase the quality of agricultural products, increase farmers' income, reduce agricultural depopulation, improve working and living in the rural areas.

4. Conclusions

Romanian rural economy is in a very large extent dominated by agriculture, whose prominent feature is the large proportion of subsistence farms, which produce mainly for own consumption. Given the dominance of agriculture, the rural economy remains very poorly integrated in the market economy. In addition, the subsistence farms accede very difficult to other sources of income and therefore the welfare of a significant part of the rural population depends solely on the level of profitability of farms.

On the other hand, we are facing a great compatibility dilemma, between the new Common Agricultural Policy (CAP), adapted to the present situation of agriculture in the European Union (high technical

performance, increasingly high technical performance, increasing higher material consumptions and costs, presence of large stocks of agricultural products with significant economic consequences upon the farm economy) and the Romanian agriculture situation, which should target other objectives (deep farm restructuring and farm consolidation, massive support for increasing the EU market).

The functional implementation of the Common Agricultural Policy involves the following: increase of agricultural production contractualization level, diminution of underground market and fiscalization increase in agriculture, as well as the improvement of the agri-food chain operation by promoting the agriculture based on harvest contracting.

Therefore their efforts to develop programs, strategies and projects viable and integrated in the European context are extensive and very important for the development of the Romanian rural areas.

Features of the Regional Development and Decentralization in Romania. A Comparative Analysis of the Regions of Romania

Andronic Maria Letiția

“Transilvania” University of Brasov, Faculty of Economic Sciences and Business
Administration

letitia.andronic@unitbv.ro

Abstract

Nowadays, global economy has to face some difficulties, especially since the financial crisis is still a present factor in our economy. This research paper emphasizes the importance of adopting, especially during instability periods, coherent measures by all those who have the power of decision in terms of local budgetary revenue collection and expenditure destination. It is necessary that the regional development dimensions to be conceived according to the diversity of nations, their historical background, but also the cultural, economic and social development discrepancies. We have also underlined the connection between regional development, local autonomy and decentralization, mainly the administrative decentralization, as these concepts define the transfer of responsibilities for the planning, financing and management of certain public functions from the central Government to subordinate units or regional and local authorities. The article focuses on the Global Index of Development and its specific indicators which reveal region's social-economic and financial performance.

Key words: regional development, local autonomy, decentralization, local needs

J.E.L. Classification: H71, H72, R58

1. Introduction

Perhaps nothing has sparked more divergence among economists than the relationship between state and individuals or the relationship between state and economy.

Concepts concerning liberalism, free market, state intervention, or, more recently, local autonomy, fiscal decentralization and regional development have generated

ambiguity and conflicts in certain time periods. In the past years, the dispute between economists is frequently related to, on the one hand, the failure of the market – how serious it is, and, on the other hand, the failure of governance – how effective or ineffective public policies have proven to be.

Regional development is a relatively new concept that aims at stimulating and diversifying economic activities, stimulating investments, helping to reduce unemployment and, eventually, lead to an improvement in the standard of living.

Another important concept presented in this paper is the regional development policy, a concept that describes a set of measures planned and promoted by local and central public administration authorities, in partnership with various actors (public, private), in order to ensure a dynamic and sustainable economic growth, through maximizing the regional and local potential, in order to improve living conditions. The main areas which may be affected by regional policies are: enterprise development, labour market, investment attraction, transfer of technology, improving infrastructure and the quality of the environment, rural development, health, education, culture.

The daily political discussion about decentralization and local development in Romania frequently brought about disagreement between the central government and the elected local authorities. For instance, local governments complain about having autonomy in virtually all local affairs except for financial ones. The central government, in turn, refers to numerous laws and decrees that establish local autonomy in expenditure and revenue and deplors the fact that local governments do not make sufficient use of their legal rights (1).

This research explores the meaning of financial autonomy from the regional point of

view, the major contribution being that of offering a structured overview of factors that may potentially diminish the freedom of local and regional authorities with regard of their budget decisions.

The article has two main parts. The first one describes some features of the Romanian regions and the difficulties they face, making some comparisons in terms of local development with the other EU regions and taking into account the most relevant policies concerning the local public sector. The last part of the paper includes a more pragmatic approach, as it analyzes the indicators of the Global Index of Development both for each region, but also for the whole country. Finally, the conclusions and proposals present measures we found appropriate to be taken by those responsible for the economic development of the regions in order to cope with the lack of resources, the financial crisis and, why not, the global economy challenges.

2. Stage research and research methodology

Starting from the assumption that the relationship between decentralization and regional development may guarantee the stability of a real democracy, we came to the conclusion that it does not present a unified approach in the specific literature, aspect that creates practical obstacles in defining it.

One of the multiple mistakes made consists in simply understanding what the term “region” refers to. It does not show only the national area regionally marked, but it also defines multinational regions of neighbouring countries which are bounded by commercial transactions, economic partnerships or by common culture and traditions (2). The region is a territory which forms, from a geographical point of view, a distinct unity or a similar assembly of areas characterized by continuity, in which the population possesses certain common elements and is dominated by the desire of keeping their individuality and develop it in the future, with the purpose of stimulating the cultural, social and economic process.

In fact, one definition refers to the regional development as the provision of aid and other assistance to the less economically developed regions. Regional development may be domestic or international in nature.

Therefore, a correct understanding of regions might identify more precisely the regional development implications because these vary according to the definition of regions and the way a region and its boundaries are perceived internally and externally.

By analyzing the specific literature, we noticed that many studies focus on finding the financial resources needed to sustain the development of the regions. Firstly, financial decisions are the expression of financial policies pursued by central or local authorities (3). Secondly, local or regional public financial management became an important matter of concern especially in the context of decentralization (4). As a result, two other authors (5) stated that there are at least two targets to achieve: a balanced, sustainable system, able to provide local and regional delivery of qualitative services for citizens and an increase of local government’s financial solvency in order to ensure an optimal development. During the financial crisis, some economists turned towards EU grants, which can contribute to overcoming the difficulties triggered by reduction of budgetary revenues (6).

Regardless the way chosen to fundraise, the purposes are unanimously recognized and very well specified by the Regional Development Agency (RDA) in the Regional Operational Program’s (ROP) general presentation. The most important issues considered are:

- developing and modernizing small and medium sized companies;
- creating and modernizing infrastructure;
- offering support for developing cities and villages in achieving their social policies and implementing technologies;
- promoting tourism.

Using Romanian and European statistical data offered by specialized institutions, information revealed in the specific literature and other sources, this research paper highlights some economic facts related to the regional disparities and to the absolute need to promote and apply jurisdictional strategies of development.

We used some of the indicators of the Global Index of Development in 2010 for Romania and for its regions. We retrieved information for this purpose mostly from the Romanian National Institute of Statistics.

3. The decentralization process and the regional economic development

In the public administration system, an important role is held by the connections established between the Government and local authorities, i.e. between the centre and the periphery of the system.

We often hear about the need for local and regional interest to obey the general interest. Hence, the administrative law doctrines (7) have established the types of relationship that exist between central and local governments.

In essence, there were two such relationships established: centralization and administrative decentralization, which are also principles of organizing the regional public administration.

Decentralization represents a system of organization that allows human communities and public services to manage themselves, but under state control and authority, giving them the necessary resources.

Decentralization is the transfer of administrative action and decision from the central government to the public authorities of the local governments (8).

At international level, decentralization is seen as a long-term gradual process (9) involving various components, such as political, technical, administrative, fiscal and financial decentralization.

Closely related to our study are the administrative decentralization and the financial decentralization. In a recent study, two authors (10) have defined the administrative decentralization as involving the transfer of the decision-making authority, as well as the resources for providing public services or functions to other levels of administration, local government agencies or offices. This means that local authorities can engage and dismiss its staff, without the intervention of the competent ministry.

Financial decentralization is an important component of decentralization because local authorities have the most complete information on which decisions regarding local financial resources can be better justified. It also involves the transfer of responsibilities to local authorities based on the principle of bringing public services closer to citizens and resources, the international practice using the custody/allocation method and the revenue

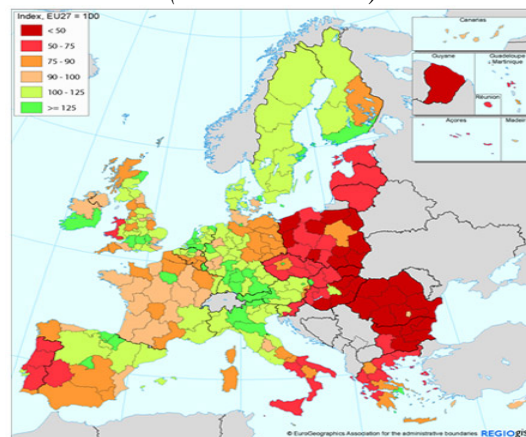

sharing method, under which a certain tax will be transferred to the authority that is able to administer and collect more efficient (11).

The financial and administrative decentralization are related. Local public administration authorities are invested with the right to establish and manage some taxes in order to provide the necessary resources to cover the expenses of the regions.

In Romania, the theme of decentralization has been increasingly invoked in the recent years. However, this economic, political and social objective failed to be efficiently implemented. Until now, our representatives could not identify clear solutions to respond promptly to the specific requirements of regional and local communities.

The European Commission is the institute that created and developed the concept of regional policy as being an investment policy. It supports competitiveness, economic growth, job creation, improved quality of life and sustainable development. These investments support the delivery of the Europe 2020 strategy. Regional policy is also the expression of the EU's solidarity with less developed countries and regions, concentrating funds on the areas where they can make the most difference, for example in the regions illustrated by red (index<50, EU27=100) in the following figure:

Figure 1. Regional Disparities across EU (GDP/inhabitant)

Source: European Commission website, available at <http://ec.europa.eu>

Their desire is to reduce the significant economic, social and territorial disparities that still exist between Europe's regions. Leaving these disparities in place would undermine some of the cornerstones of the EU, including its large single market and its currency, the euro.

During the period 2007-2013, the EU has invested and will invest a total of €347 billion in Europe's regions (12).

The funding helps, for example, to improve transport and internet links to remote regions, boost small and medium-sized enterprises in disadvantaged areas, invest in a cleaner environment and improve education and skills. EU funding is also invested in innovation, developing new products and production methods, energy efficiency and tackling climate changes.

All these contemporary international development dimensions are subject to globalization and integration, aspects that enforced countries to find homogenous ways to structure regions from different national areas. In Romania, we use the Nomenclature of Territorial Units for Statistics (NTUS) created by the EU Statistic Agency with the purpose of creating a unique classification guide for the regional statistics of the EU.

4. Romania's regions and the economic and social disparities between regions

Accumulating the essential elements of the National Regional Development Strategy with the aim of reducing disparities between regions, 2007 – 2013 ROP approved a total budget of 19.2 billion euro from EU structural funds for our country. In addition, Romania benefited also of 10 billion euro from the national contributions of the state budget, local budget and private sector (13).

Romania is currently divided into 42 counties contributing to the state budget. Each county has in turn its own budget, just as cities and municipalities that are part of these districts have their own budgets. Local budgets are fed by local taxes, such as land tax, building tax, fees for advertising panels, but also by amounts transferred from the central government budget.

Such territorial division involves relatively high costs of all structures and it does not fulfil the efficiency requirements. Reforms of public administration need to be carried out to reduce public expenditure and to increase effectiveness and efficiency of some new and larger administrative divisions.

In addition, it encourages the relations of subordination between local and central authorities and, therefore, an excessive dependence. In this context, it is

understandable why the EU wanted a new territorial division. The new regions would be much larger and could handle more responsible the structural and cohesion funds.

In Romania, the institutions that have responsibilities in this area are:

- the National Council for Regional Development – a national partnership structure, with decision-making on development and implementation of regional development policy objectives;
- the European Integration Ministry - the institution that has powers towards developing, coordinating, implementing and monitoring policies and strategies of regional development;
- the Regional Development Council - a deliberative regional institution without legal personality, which functions in each region to coordinate different activities resulting from development policies;
- the Regional Development Agency - a non-profit, legal personality body, acting for regional development.

Currently, we are talking about dividing the territory - NTUS level I - into eight development regions - NTUS level II - where the policies to be applied.

Romania's territorial structure consists in 320 cities. These are basic administrative levels corresponding NTUS level IV. Municipalities, towns and villages are grouped into 41 counties, which, together with Bucharest, represent NTUS level III.

Table 1. Levels of administrative organization in Romania

NTUS	Unit	Number of units (July 1 st , 2011)
I	Romania	1
II	Regions	8
III	Counties	42
IV	Municipalities, towns and villages	3,179

Source: <http://ro.wikipedia.org> – the administrative-territorial division of Romania

The proposal about creating the eight regions became a fact in 1998. The regions are administrative-territorial units with no legal personality and were formed through the voluntarily association of counties. Institutional framework, objectives and instruments of regional development policy were revised in 2004, in the context of

negotiations on Chapter 21 "regional policy and structural instruments", by approving the regional development law in Romania (14).

Table 2. Total surface and population of each region

NTUS I	Region (NTUS II)	Total surface (km ²)	Population - January 1 st , 2010
RO		238,391	21,462,186
	N-W	34,160	2,719,719
	Centre	34,100	2,524,418
	N-E	36,850	3,712,396
	S-E	35,762	2,811,218
	S	34,453	3,267,270
	B – Ilfov	1,821	2,261,698
	S-W	29,212	2,246,033
	W	32,033	1,919,434

A more relevant analysis reveals the situation of some indicators of development at regional level.

Table 3. The analysis of regional development indicators in 2010

Region	Unemployment rate (%)	Percentage of urban population (%)	Infant mortality (no of persons)	Human pressure index
RO	7	55.07	9.8	0.6819
N-W	5.9	53.31	8.9	0.761
Centre	8	59.39	8.7	0.7533
N-E	7.8	43.15	11.2	0.572
S-E	8.1	55.08	12	0.8271
S	8.8	41.44	10.9	0.7464
B-Ilfov	2.4	91.97	6	0.0465
S-W	9.2	47.9	9.3	0.8011
W	5.9	63	10.4	0.9755

Source: own adaptation after the Romanian National Institute of Statistics database

All four indicators presented in the previous table are part of the 17 indicators taken into account when evaluating “the Global Index of Development”.

The region represented by Bucharest and Ilfov has the best results, except for the human pressure index which has a low value, aspect which shows that human activity has a strong impact upon natural resources (there is an average of 465 m² of agricultural area per inhabitant). The least significant pressure is in the W Region, as the average of agricultural area per inhabitant is of about 10,000 m². Such differences between regions

are to be observed to all the regional development indicators evaluated.

In 2010, the unemployment rate was only 2.4% in Bucharest-Ilfov Region as compared to the national average (7%). Below the national average we find also W and N-W.

In terms of dividing the population between urban and rural areas, the regions present a quite balanced situation. As expected, Bucharest-Ilfov Region is an exception as almost 92% of the inhabitants live in the urban area. Rural population is more frequent in the S Region (about 59%), N-E (about 57%) and S-W (about 52%).

Infant mortality is of 6 persons per 1,000 live births in the case of Bucharest-Ilfov, while in the rest part of the country, the number is higher, ranging between 8.7 in Centre and 12 in S-E, so that, at country level, we obtained a percentage of almost 1% (i.e. 10 out of 1,000 children die early).

Although statistics show some variation over time, due to local factors, economic growth had a significant geographical component, the underdeveloped areas being concentrated in the N-E part of the country, on the border with Moldova, and South, along the Danube River. Underdevelopment appears to be strictly correlated with unemployment, rural activities and the inability to attract foreign direct investments.

The region situated in N-E suffers from its dependence on agriculture, as well as from its position near the border with Moldova and Ukraine. Western and central parts of Romania are closer to Western markets and are not so dependent on the primary sector.

These differences between regions, associated with fiscal policy mechanisms, led to increasing underdevelopment and disparities. Investments in deprived areas have decreased substantially due to a sharp drop in public expenditure caused by fiscal problems. This decline has affected investments in infrastructure and it prevented the modernization of key public utilities.

5. Conclusions and proposals

For this millennium, the World Bank experts consider the following trends: globalization, competitiveness and decentralization. All have a direct impact, but the last one requires multiple resources.

Decentralization is a process of

rationalization in the public administration, a sign of modernization. Regional organization and decentralization are not to be perceived as independent one from another; they are the product of the efficient functioning of the state. As a consequence, state control on a determined social and geographic area is more active if the territory is split into several administrative units.

Regional strategy has multiple purposes:

- the disparities between Bucharest-Ilfov Region and the other ones;
- the unbalanced development between regions, i.e. between N-E, S, S-W and W, N-W and Centre;
- the massive decline of small and medium towns, particularly mono-industrial cities, generated by the industrial restructuring;
- the degradation of the social-economic development of many large cities, contributing to the reduction of their role in developing the surrounding areas;
- low level of attractiveness for investors.

We consider that the overall objective of each institution should be the support and promotion of social and economic balance, the improvement of infrastructure, the encouragement of investments, especially in the areas where development delays are recorded. The main way to achieve all these would be an allocation of funds differentiated by region, according to their GDP/capita, so that the less developed regions to benefit from greater financial allocation.

The funds will provide resources for the implementation of projects which may produce a major impact for regional development: rehabilitation, modernization, education and health, transport infrastructure, improvement of the business environment, stimulation of entrepreneurship and opportunities for areas with growth potential.

Following the dynamics of regional disparities in Romania, the general objective of ROP

Poles of Competitiveness Policy of the European Union Member States

Asaloş Nicoleta
„Ovidius” University of Constanta
nasalos20@gmail.com

Abstract

Both at micro, meso, macro or megaloeconomic intensity of competition coupled with the phenomena of globalisation of economy, fast technological changes, especially of computers and telecommunications, prograssive liberalisation of international trade are key elements that influence competitiveness on all levels. The complex determinants of competitiveness refers to: exploation of creative and innovative potential of regional/territorial/national, making connections to regional/territorial by stimulating the clusters/competitive clusters, national and cultural heritage, using innovative research potential. Competitive clusters shaping new roles to local authorities and governments because they represent the most effective way for a convergence between the companies, government agencies, educational institutions such as universities or academies, research centers and public authorities.

Cuvinte cheie: competitiveness, competitive clusters, regional development, innovation, research-development

Clasificare J.E.L.: M21

1. Introduction

Recent developments, both in terms of public policy and the concepts of economic theory places the regions as centers of economic growth and improve living standards, governing key points, organize and decisions. The latest studies made in the European Union deepens further element of territoriality, emphasizing the role of cities and urban areas in general, the main source of economic competitiveness. Thus, it was concluded that the classical theories of

competitiveness, that absolute advantage theory of Adam Smith developed the theory of comparative advantage developed by David Ricardo and even the theory of endowment with production factors Heckscher-Ohlim-Samuelson (HOS) are no longer able to meet new specific problems have arisen. Thus, modern theories of competitiveness have emerged, highlighting the theory of competitive advantage by Michael Porter (1998) which suggests that obtaining such an advantage is not only natural resource endowment factors but the efforts of investment and capital formation and quality of these efforts prevail over their quantity.

Thus, countries with a weaker feature in inputs can find key sectors to stimulate investment and innovation, investing in infrastructure, research and development and creating supply highly qualified workforce. This task is mainly companies, but government can help to achieve them by creating a favorable business environment and investment climate to encourage firms to specialize and to become world leaders. The importance of knowledge, innovation and research is undoubtedly recognized for economic development.

2. Competitiveness poles in Europe and Regional Competitiveness

Regional competitiveness as a concept should include as a basic principle of territorial cooperation and strengthen coordination between sectoral, national and Community. An integrated inter-sectoral and inter-institutional territory is difficult to achieve but can generate endless possibilities for analysis and intervention measures default. Since the first EU report on competitiveness, which reported worrying trends in terms of competitive advantage both in global and local, to the current strategic directions of the Union, giving priority to

regional competitiveness, the key issue became subject to the formation of European policy.

New Lisbon Agenda requires that "the EU to mobilize all appropriate national and Community resources, including social cohesion" and argues that greater ownership of the Lisbon objective is possible only by involving local and regional stakeholders and partners social (European Commission 2005). Lisbon Agenda was originally thought to help Europe to become "the most competitive knowledge-based economy" by 2010, but subsequently underwent a review by the emphasis has shifted to economic growth based on technological progress and employment. Also, the European Commission and Council have identified a set of indicators to monitor progress divided into six groups: economic environment, employment, innovation and research, economic reform, social cohesion and environment. Later, they added a spatial dimension, which integrated strategies for competitiveness and sustainability in the European Spatial Development Perspective.

Analysis of factors generating regional competitiveness is to provide a current in the European Union in dealing with spatial planning and new policies at European level aimed at reducing disparities and more appropriate distribution of development funds within the region. Determinants of competitiveness refers to: using creative and innovative potential of regional / territorial / national level, making connections to regional / territorial by stimulating the cluster, natural and cultural heritage, research and innovation potential use and improve accessibility.

Theory clusters / poles of competitiveness in countries such as France, Belgium, Portugal became visible after the paper's appearance M.Porter (1990), relies on the idea that competitiveness at regional level derives from the presence and dynamics of geographically localized activities, among which there fierce competition, benefiting from favorable conditions of production factors, the strong demand and strong and competitive sectors horizontally. The more localized the cluster / pole, the more intense interactions between these components of competitiveness and therefore the diamond region is more competitive.

3. France - promoter of competitiveness poles

Emergence of poles of competitiveness / competitive clusters in Europe was a new stage in regional development of Member States that have implemented and put into practice these concepts as the main vectors: innovation, research and entrepreneurship - Governmental projects generated innovative, sustainable growth, new jobs, competitiveness and international visibility of businesses and local products.

Policy support French competitiveness poles was established in 2005. However, in 1987, long before the arrival of the pole term competitiveness, was an initiative in this regard. Through "Productifs Locaux Systemes", the French government supported the structural changes in regions affected by the decline of industrial sectors. The final beneficiary has not been a single company but a network of companies in a given field and in a certain region, called "local system of production-SLP".

The objectives of this program were increased competitiveness of SMEs, increase the attractiveness of the region and creating / maintaining jobs in sectors faced with problems.

Thus, this program has already established two important features of the pole of competitiveness: the geographical proximity and collaboration between member companies.

In over 20 years of the program (1987-2007), were held about 110 SLP. In 2005, France has shifted policy in local production systems, developing the first version of French policy in competitiveness poles.

Appropriate policy, the Ministry for Planning and the Ministry of Industry launched the poles of competitiveness, which was a pretty significant change in orientation from the traditional approach, by pro-growth approach. The objective of this program is to improve the innovative potential of French public by concentrating all efforts on the poles of competitiveness, create wealth and new jobs.

The operating principle of the pole of competitiveness lies in collaboration and key actors in the geographical concentration of

innovation more effective service by encouraging and supporting projects in order to access a leader in the field of France and internationally.

Each pole has its own legal personality, often form an association. Association has a team (permanent staff) who has a role in:

- Facilitating actors collaboration within the competitiveness pole design and implementation of joint projects;
- Coordination and selection of research projects offers that public funding is requested specific pole of competitiveness policy;
- Developing and implementing the overall strategy of the pole of competitiveness;
- Providing international communication;
- Ensuring communication with other police in France or other countries.

Poles of competitiveness strategies are established for a period of five years. Relations between the poles of competitiveness, state and local authorities involved are set in a framework contract.

Thus, in 2005-2008 the French government has provided funding of around 1.5 billion euros to finance research and development projects in the poles of competitiveness. In this period were financed:

- 544 R & D projects since 2005 (national funding) worth of 3.6 billion. Euro, involving 112.000 scholars;
- 1343 R & D projects funded by agencies, in 2006-2007.

In 2008, the French government-issued version 2 of poles of competitiveness policy. Corresponding new version were established axes of the second phase of funding, namely: new methods funding specifically for innovation platforms; building poles of competitiveness through performance contracts; creating an ecosystem of innovation and development notably through private funding.

For this second phase, the French government provided, 5 billion for 2009-2011. It was established at the French National Agency Cluster-CDIF, meant to coordinate the poles of competitiveness. This association brings together 60 poles of competitiveness and its mission is to facilitate mutual learning and sharing experience and providing information and training services. In addition, CDIF supports

the creation of new poles of competitiveness in France.

Currently in France are 71 competitiveness clusters (17 are international and 54 national), involving 5,000 enterprises, of which 80% are SMEs. These poles of competitiveness active in 16 sectors.

4. The Belgian competitiveness poles

As noted previously, we can say about France that is the promoter of the concept of "competitiveness poles" concept enjoys a success and has inspired other countries to adopt it. As is the case in Belgium, Portugal and Romania in the near future and the Operational Programme Increase of Economic Competitiveness will implement "Operation competitiveness poles".

And in Belgium, the poles of competitiveness means business partnerships, training centers and research units, public or private designed to create synergies in joint innovative projects within a geographical area (Wallonia). These partnerships allow: enterprises to connect to a high level of excellence, increasing individual awareness of each individual actor in Wallonia and therefore part of the cation part of the pole of competitiveness contributes to the increased visibility of Wallonia, the region and the economy in Europe and international gathering skills needed to launch and success of ambitious projects, innovation based on these skills together with their partners and thus improvement of workers.

Assists the world economy and is dominated by two phenomena, namely the internationalization of trade and production processes on the one hand and knowledge-based economy on the other side and their results based on exacerbated competition between companies. Thus, research and innovation are two new pillars to strengthen competitiveness.

Confronted with these developments, the Walloon region launched in 2000 a real strategic spatial development plan which was updated in 2005, a plan is built on four transverse planes. The Belgian government selected priority actions under the program including the creation and implementation lies competitiveness poles established a policy in Wallonia Development Strategy, this policy having a budget of 280 million

euros.

Implementation of this policy in the Walloon region is part of government approach that involved first of all identifying priority areas of performance. These are: aviation and space, agro-industry, mechanical engineering, health, transport and logistics, chemicals and sustainable materials. At the poles, is organized by a management council government.

For each field are working groups be created at the initiative of established business networks in the form of clusters, large companies have the initiative established areas or on the initiative sectoral federations. Each pole has a governance council made up of a president belonging to the domain industry, deputy scientist is required. Walloon Region is represented by two members appointed by the Walloon government. Government has established a procedure whereby annual competitiveness poles are monitored and evaluated. Also, an external agency makes a new assessment every two years the poles.

Funding competitiveness poles is committed by government to cover some operational costs of poles on the one hand and on the other hand deals with funding by regional projects initiated and undertaken by private firms in the poles.

5. Conclusions

Emergence of poles of competitiveness / competitive clusters in Europe was a new stage in regional development of Member States that have implemented and put into practice these concepts as the main vectors: innovation, research and entrepreneurship - Governmental projects generated innovative, sustainable growth, new jobs, competitiveness and international visibility of businesses and local products. The fundamental objectives of competitiveness poles that already funcționează some countries focused on:

- Realization of partnerships between stakeholders with expertise in competitiveness poles;
- Promoting a global environment conducive to innovation;
- Availability of strategic research and development projects that would benefit from government support.

European Union countries need strong industries, competitive and innovation-based competitiveness poles / cluster competitive recognized as key drivers of innovation and growth through development of collaborative and multi-sectoral approach. Poles of competitiveness and especially a policy attribute is their responsibility to policy makers at local, national and European and global crisis is proof it can be a catalyst for collaboration and motivation in an innovative and entrepreneurial company.

Romanian Entrepreneurship in the Years of Economic Crisis: a Regional Approach

Burcea Marin

University of Bucharest, Faculty of Administration and Business

marinburcea67@yahoo.com

Abstract

The entrepreneurship spirit is a key element to ensure the dynamics of the economy and the society, both at worldwide and regional level.

The entrepreneurship activity has the potential to respond to the challenges of an environment in a continuous change and ensures both local and regional development.

The aims of our paper are to present in short the impact of the economic and financial crisis on the Romanian enterprises and to analyse its effects at the regional development level. A set of two hypotheses were tested and validated during our research by using the information provided by the National Trade Register Office. Our research shows, through the analysis of statistical data, a decrease of the interest for the entrepreneurial development and a dramatic fall in number of companies over the years 2008-2010, as a result of the economic crisis.

Key words: entrepreneurship, entrepreneurial activity, regional development, economic and financial crisis, Romania

J.E.L. Classification: M19, O18, R12,

1. Introduction

One of the threats which the Romanian entrepreneurs confronts with during the present economic and financial crisis, are the growth of interest rates for loans granted by banks, foreign exchange rate volatility etc. [1]. Moreover, “the high level of investor’s aversion towards risks and the incertitude of economic perspective, together with administrative barriers negatively influenced the evolution, activity and performance of Romanian entrepreneurship” [2].

That is why “the majority of Romanian established entrepreneurs are also pessimistic in terms of starting a business, growing a business and in terms of perceived business opportunities” [3].

In Romania, entrepreneurship has become a key element both in the development of the market economy and revitalization of some underdeveloped regions after 1989. The consequences of the economic and financial crisis upon Romania’s entrepreneurship have been negative, but we still do not have an exact situation of those effects.

Having as a starting point the ideas mentioned above, two interconnected questions arise:

(1) Which was the impact of the economic crisis on the intention of starting a new business?

(2) Which was the impact on establishing new businesses in terms of regional location of the premises of the company?

To have an answer to these questions we used a methodological approach based on the existing statistical data at the National Trade Register Office for the years 2008, 2009 and 2010.

The structure of the present paper is the following: the introductory part which presents the two tested hypotheses using the information provided by NTRRO, the second chapter which presents the research methodology. The results of the research are analyzed and explained in the third chapter followed by the final conclusions.

2. Research Methodology

Starting from the objectives of the research, the author developed a set of two hypotheses, they are:

a. The lower the development level of a region is, the effects of the economic crisis on an entrepreneurial development are smaller.

b. The lower the development level of a region is, the number of bankruptcies is higher.

When developing the research, we did a statistical analysis of the data related to the number of companies newly registered and deregistered as they are recorded at The National Trade Register Office over the years 2008 – 2010. In order to obtain the necessary data for our paper, we submitted an application to The National Trade Register Office for this purpose. Eventually, the data were aggregated at region level and the information obtained were processed using Excel.

3. Entrepreneurial dynamics

3.1. Companies newly registered at The National Trade Register Office

The first hypothesis shows the effects of the economic crisis on the development level of a region and starting up a new business. Considering 2008 as the year when the economic crisis began, we see that the crisis mainly affected the most developed regions. For instance, in Bucharest-Ilfov region they make half of Romania’s turnover figures (Burcea, et al. 2011) and the potential entrepreneurs were reluctant to start a business in a developed region such as Bucharest-Ilfov (see table 1).

Table 1.Number of newly registered firms as per regions, 2008-2010

Development region	2008	2009	2010
Bucharest - Ilfov	20.8	19.2	18.9
Centre	12.0	12.1	12.2
North-East	12.8	13.3	12.9
North - West	14.8	14.2	15.2
South Muntenia	13.6	14.1	13.8

South-East	9.7	10.1	9.9
South-West Oltenia	7.3	7.7	8.3
West	9.0	9.4	8.9
National	100	100	100
Total newly registered firms at national level	144222	116019	123022

Source: [4]

If we process the data presented in table 1 we can see that the rate of renewal of the economic environment (newly registered firms) is of 6.7 firms at 1,000 people. In 2009, the first year of economic recession, the value of this index goes down to 5.4, then in 2010 it slightly rose to 5.7. All over Romania, in all development regions, there was recorded a decline in the entrepreneurial intention in 2009 and 2010.

It was noticed that in the Bucharest-Ilfov region where the intention to start a business was two times higher than the national average, the percentage reached is 1.8. The intention diminished in poor regions, such as North-East and South West in Oltenia region where we have only 0.8% out of the average. The data obtained confirm the hypothesis about the stronger effects of the economic crisis upon more developed regions.

Practically, the economic crisis mainly affects regions with entrepreneurial potential, those connected to the global economy.

3.2. Deregistered firms at The National Trade Register Office

A common phenomenon in a market economy is registration of new companies on one hand and bankruptcy on the other. What makes the difference is a positive economic climate and a negative one. Also the number of deregistered companies as they are recorded at the commerce register.

The analyzed period 2008-2010 is characterized by a significant reduction in number of the companies in Romania. The reasons for that are the economic crisis correlated with the government policy of rising taxes for companies. The introduction of the poll tax led to very many family firms being deregistered. In 2008 the number of registered firms were 661,702 (according to NTRO), in 2009 their number decreased by 10.8%, to 626,557. For the year 2010, although we do not have information about the number of existing firms nationwide, we estimate a high percentage as the number of deregistered firms rose compared to 2009 with 25%, and the newly registered firms with only 6%, resulting in an effective loss of 14% compared with 2008. So we have the measure of the economic crisis upon the economic environment in Romania (see table 2).

Table 2. Relative distribution of deregistrations shown on development regions, 2008-2010

Development region	2008	2009	2010
Bucharest - Ilfov	11.4	15.4	12.7
Centre	15.4	14.4	13.1
North-East	11.4	13.9	15.6
North -West	18.2	16.0	16.8
South Muntenia	11.1	11.2	12.9
South-East	12.5	12.2	11.0
South-West Oltenia	8.8	7.6	8.5
West	11.3	9.2	9.4
National	100	100	100
Total deregistered firms	58923	202203	252594

Source: Source: [4]

One can notice that the shock of the early days of the economic crisis was strongly felt in the most developed region in the country, Bucharest-Ilfov, as well as in the least developed region – North-East. The crisis continued in the North-East region.

The data confirm the hypothesis that the less developed the region is, the effects of the crisis are more powerful.

4. Conclusions

The economic crisis impacted the potential entrepreneurs who can mainly be found in the developed regions and led to shut down a great number of businesses. In 2008 the difference in number between the registered and deregistered firms was positive resulting in 85,299 registered firms. In 2009 there was recorded a deficit. The most powerful effect of the economic crisis for the analyzed period was recorded in 2010: the difference between registered and deregistered firms was a negative one, at the end of 2010 there were recorded a number of 215,756 companies who were lost. If we take into account that at the end of 2009 a number of 626,557 companies submitted their balance sheets, we can state that one third of the Romanian firms had been lost!

The early stages of the crisis were felt by the most developed regions such as Bucharest-Ilfov and the least developed North-East. The only difference is that the poorest region increasingly sank in the crisis.

Nowadays, the government, the business associations and the NGOs have to help in building a new generation of entrepreneurs. Promoting and stimulation of the entrepreneurial spirit should constitute a valuable tool in challenging the economic and financial crisis.

Our research validated a set of two hypotheses. Firstly, the entrepreneurial intentions decreased in the years 2008-2010. Secondly, the great number of deregistered companies showed how strongly the crisis was felt especially in the poor regions. With a low entrepreneurial pool and poor attention given to the development and promotion of the entrepreneurial spirit, the poor regions become even poorer.

This research, limited by its scope, represents a strating point in the study of the effects of the crisis as a whole. The obtained

results can constitute work hypotheses for research of different sectors and residential environments.

Abstract

The workplace plays an important role in people's lives, not only because it provides a decent lifestyle, but also it is the place where they spend most of their time. Therefore a good job is a necessary condition in obtaining satisfaction and good quality of life. According to a study, it has been proven that most employees consider the ideal workplace, one that offers them the possibility to prove their intellectual skills. Unfortunately, the economical crisis has left a strong mark upon this environment leading to great disturbances in balance in many countries. Concerning the EU area, all the countries within have been affected, some more than others.. Countries like Spain and Greece are dealing with some real issues and as far as Romania is concerned it seems to be just below the European average. There are also some countries such as Germany where the situation is about to stabilize.

Keywords : unemployment, flexicurity, Euro Zone, intellectual skills, satisfaction.

J.E.L Codes.: J2, J6, J8.

1. Introduction

Efficient and innovative companies need motivation and content employees. So, along the usual indicators of the workforce market, data concerning the quality of the job from the employee's point of view is taken more and more into consideration, due to various forms of employment. The quality aspects regarding jobs is being represented by seven dimensions: safety in the work place and

equality of chances; income and benefits; work schedule and the balance between work/life; the assurance of employment and social protection; social dialogue; skills and training; interpersonal relationships at the workplace and motivation towards work.

2. A current analysis of unemployment in the European Union. The problem of long term unemployment.

The crisis took a high social toll in Europe, with a high increase in unemployment. In 2008, unemployed represented 7% of the workforce of EU-27. By 2010, their numbers grew to 10% and with the perspective of maintaining a rate bigger than 9% until 2012.

The unemployment rates are especially high, over 12%, in Estonia, Ireland, Greece, Slovakia, Latvia, Lithuania and Spain. Long term unemployment - people that haven't had a job in over one year - has grown considerably and is currently approximately 40% of the total unemployment in the EU. This fact shows a considerable risk of a long term exclusion from the work force market. The rate of unemployment is especially high amidst the low qualified persons, immigrants and young people.

Figure 1. Unemployment rates in the countries belonging to the EU (November 2011)

For Estonia, Greece, Latvia, Lithuania and the United Kingdom, no data were available at the time of publication.
Results of the labour force survey;
Source: Eurostat, last update: January 2012

Source: Eurostat

The most recent data released by Eurostat changes the hierarchy for the countries regarding their levels of unemployment. As a result, Spain remains the head of the list with a growth of the level of unemployment reaching 22.85%, and Greece with a rate of 21%. Portugal and Slovakia have switched places, Portugal with an unemployment level of 14% and Slovakia 13.6%. The growth in the levels of unemployment points to an aggravation of the economical situation despite all the measures taken towards reaching an acceptable level of employment.

Figure2. The unemployment rates in countries of the EU area. (March 2012)

Source: Tradingeconomics.com

The problem of long term unemployment. The social and economical costs of unemployment are higher when the reasons are of a structural nature more than when they are cyclical or frictional, and even higher when the average unemployment period is longer. A common aspect of the European work force market is the impact of long term unemployment.

Finland and Denmark together with Austria and Great Britain have succeeded in containing the problem of long term unemployment to less than 30%. This feature reveals the fact that it is possible to identify groups in the work force market with the highest risk of long term unemployment periods. The British Government has financed ongoing politics on the work force market with the purpose of increasing the chance of employment for the people that had been unemployed for long periods-including the 6 billion pounds "New Deal" program of the "Welfare to Work" strategy.

Long term unemployment is considered a serious economical and social problem. This tends to be concentrated on a reduced number of workers and may cause inequalities in revenues (relative poverty)

-long term unemployed tend to detach themselves from the work force (outsiders) and, as a result, they have little influence in establishing salaries and inflation. This means they may increase the natural rate of unemployment.

-the longer they are unemployed, the less attractive they become to the potential employers even when they are plenty of employment perspectives in the economy.

-most of the times, the national disparities are greater than the international ones, but the data based on national unemployment may hide the major problems in local and regional

unemployment. In England’s case there are few regions (including the South-East) that are operating under full employment and other (like Merseyside and the North-East) that show unemployment rates three times larger than the country's average.

3. Tendencies and developments regarding the unemployment in the EU area in the context of the economical crisis

The crisis effects on unemployment in the EU area. In the EU area (EA17) the cyclically adjusted unemployment rate was 10.7 % in January 2012, compared to 10.6% in December 2011, while in January 2011 it was 10%. Eurostat has estimated that approximately 24 million men and women in the EU27, 17 million of which were in the EU area, were not unemployed in January 2012. Comparative to December 2011 the number of unemployed has grown with 191 000 in UE27 and 185 000 in EA17. In January 2011, unemployment has increased by 1.4 million in EU27 and by 1.2 million in EA17.

Amongst the member states, the lowest unemployment rate was registered in Austria (4.0%), Holland (5.0%) and Luxembourg (5.1%), and the highest level rates were recorded in Spain (23.3%), Greece (19.9% in November 2011), Ireland and Portugal (both with 14.8%).

Compared to last year the unemployment rate dropped in 10 member states, remained unchanged in two and recorded an increase in the rest 15 EU member states. The biggest decrease was registered in Latvia (from 18.2% down to 14.7% in the period between the third quarters of 2010 and 2011), Lithuania (from 17.5 % down to 13.3 % for the period between the fourth quarters of 2010 and 2011). The biggest increase took place in Greece (from 14.1% up to 19.9% between November 2010 and November 2011), Cyprus (from 6.3% up to 9.6%) and Spain (from 20.6% up to 22.3%). ^[1]*Euro Area Unemployment Rate* by Eurostat.

In January 2012, 5.5 million young people (with ages below 25) were unemployed in EU27, of which 3.3 million just in EA17. Comparative to January 2011, the number of young unemployed has grown by 269 000 in EU27 and 141 000 in the EU Area. In January 2012, the rate of unemployment

amongst young people was 22.4 % in EU27 and 21.6% in EA17, and in the same month of the previous year rates of 21.1% and respectively 20.6% were registered. The lowest rates have been observed in Germany (7.8%), Austria (8.9%) and Holland (9.0%), and the highest were in Spain (49.9%), Greece (48%), and Slovakia (36%).

Figure 3. Evolution of unemployment rates in the Euro Zone

Source: Tradineconomics.com, Eurostat

Tendencies regarding unemployment in the Euro Zone countries. In the economical crisis period, the unemployment in the Euro Zone had extended from 7, 2% in March 2008 to 10, 1% in March 2010. This level exceeds the norm of the Organization for Cooperation and economical development, where the unemployment rate reached 8, 7% in March 2010. This growth is felt in each member state even though the **sovereignty** degree varies a great deal between states and groups. Clearly the men are more affected than the women, and the young people seem more vulnerable to this.

After three years of continual unemployment decline, Europe is on the verge of seeing the impact of the economical crisis on the work force. In the European Union as in the Euro Zone the number of the unemployed has increased each month form the minimal number recorded in 2008. Since then the unemployed from the Euro Zone has risen by 3, 7 million reaching a total of 15 million unemployed in May 2009.

Figure 4. The rate of unemployment in the Euro Zone

Source: Eurostat

The historical record in absolute numbers of 15, 8 million unemployed in the Euro Zone in the month of May 2010, had occurred after a decline of 6000 in the month of April, according to the Eurostat statistics. In the next month though an additional 35.000 unemployed. The timid try of the economic growth in the last months seem to be insufficient, for now, to determine an increasing volume of the employed in the Euro Zone. According to a specialist's theory, in the labor market, only after a resumption of the GDP with a minimal of 2% will there be new work places. Although, after the profound economic recession in the euro Zone a surplus under 1, 5% of the GDP, like the one now, will not help restore the balance of the labor market. At the beginning of the economic restoration, the employers developed their production without hiring new workers, increasing just the number of hours worked by their current employees. The projections realized by the World Economic Forum do not see a spectacular economical recovery in the Euro Zone. In insert 5 can be observed EA17 a growth of the output of only 0, 8%, and the biggest growth is estimated for Germany, of 1.5% for the year 2013. ^[6]*Labor Force Statistics*

Unfortunately because of the economical crisis in Greece and the austere measures from a number of states from the euro zone that have induced a negative effect on the labor market. The austere measures in different states, with budgetary constraint and reduction expenses like in Greece, where the debt crisis is taking proportions, it has slowed down growth and is threatening again with the increase of unemployment alongside

consumption reduction and the demand in the economy. ^[7]*Monthly Labor Market Fact Sheet*, European Commission, February, 2012

4. The Labour market in Romania reported to the Euro Zone

Contrary to some public opinions started at the beginning of the economical crisis, which stated that all the member states outside the eurozone will rush in to take part in the unique currency for stability and credit worthiness guarantee in the crisis vortex, Romania postponed for at least a year the admission to the euro zone. The elite club, to which we aspire, has also had difficulty regarding the labor market, which has deep scars after the recession that passed.

In the EU of the 27 member states, the unemployment rate in the first trimester of 2010 of 9,6% is situated under the average eurozone of 10,1%. It would be simple to say that the unique currency would defeat the labour market, but this reality can not be ignored.

Romania with 8, 1% in the first trimester of 2010, though increasing from the first trimester of the previous year (7, 5%), and the year before that (6, 9), it still remains under the European average. Some Romanians from Spain and Italy returned back home after the market syncopation over there, though the impact on the Romanian labor market was not felt so dramatically. Probably the registration system of the unemployed makes more people of an active age existent outside the labor market to „elude” the unemployment statistics. Officially, Romania bears an easier

unemployment burden unlike the majority of the EU and the majority of the euro zone.

Figure 6. The compared evolution of the unemployment rate in Romania, the euro Zone and the EU

Source: Eurostat

Table 7: The unemployment rate in Romania, Euro Zone and the UE during 2006-2011

Period	2006	2007	2008	2009	2010	2011
Romania	7,3	6,4	5,8	6,9	7,3	7,4
UE 17	8,5	7,6	7,6	9,6	10,1	10,2
UE 27	8,3	7,2	7,1	9,0	9,7	9,7

Source: Eurostat

5. Flexibility of the labor market?

A flexible market of the work force has many specific characteristics:

a. Flexible occupation structures-from an hour flexibility point of view and forms a vocational flexibility point of view at the work place

b. The cost and easiness of hiring/laying off – the hiring rules can be altered to make hiring/laying off the work force more cost efficient- these reduce the employers costs to make changes regarding the work force hired. Production and occupation can be correlated easier during the duration of the economic cycle.

c. Short term work contracts- in different industries where workers receive work contracts for predetermined periods which can be changed from month to month.

d. A high flexibility of the payment schemes. This can be observed in the payment expansion reported to performance and to decentralized bonuses so that the salaries reflect the difference between work demand and offer from different industries and regions.

e. Locative flexibility- a lot of businesses allege employees that they can move from one region to another as part of their professional development – this may be facilitated through subventions for relocation.

The 2020 European strategy introduced the concept of flexicurity on the labor market. Flexicurity is an integrant strategy which combines flexibility and security on the labor market in the attempt to make a compromise between the employers need for work flexibility and de employees need for security. The member states can implement the principals of flexicurity through the medium of four components: flexible and secure contractual arrangements; continual teaching programs, efficient policies on the labor market; modern systems of social protection. Through flexicurity a lot of part-time-jobs have been secured, and most of them have been in Germany. In insert 7 lower down the part-time and full time jobs are presented.^[2]European Employment Strategy

Flexicurity is a major element of the European Strategy for occupation. The integrated flexicurity policies play an important role in modernizing the work force and contribute towards reaching the 75% occupation target established through the European strategy 2020. Countries that have made major changes for a more flexible market like UK, Holland and Spain, growths of the inequality income have been recorded and deductions of the qualification of the work force which cannot be seen as optimal from a social point of view.

Figure 7. Distribution of the part-time and full-time jobs of the EA-17 states in the year 2010

Source: OECD

6. Conclusions

Regarding occupation, this objective will be evaluated by the quantitative measures of the unemployment rates on the long-run, unemployment among young people and the rate of participation of the work force. This objective can be reached by promoting the flexicurity model, through reduction of the work taxes and implementing some measures that facilitate the participation of the work force in more jobs. Some tendencies, on diverse member states of the Euro Zone prove a high dispersion rate of unemployment reflecting a reduced amortization of occupation of the work force between the states that use the same currency.

The primary objectives of the Euro Pack- (plan elaborated UN 2011) are competitively growth, occupation growth, sustaining public finance and financial stability consolidation. An additional objective is coordinating the fiscal policy at an EU level. Most fiscal adjustments during 2009-2011 were made in Greece, mainly because of the supreme debt problem.^[10] *The Private Cost of Unemployment*, by Wendell Lewis. Regarding competitively a primary target is cost reduction using the work force alongside productivity growth. The work costs are reduced by reforming the decentralization degree of salary negotiation, index mechanisms and reducing the salaries in the public sector. For example in 2010, Germany lowered the work force costs by 0.4% from 2009. ^[11]*The Social Cost of Unemployment*, by Wendell Lewis. Productivity can grow through deregulation of the industry and through infrastructure and education improvement.

Even though the year 2012 will be a challenge for the Euro zone, with the need of a high refinancing percentage of public and private debt, restrictive conditions for credit and deepening of fiscal austerity, returning on the growth side is possible in 2013, according to the Euro zone Forecast rapport (Previsions for the Euro Zone) launched by Ernst and Young.^[8]Raport: Eurozone Forecast (Forecast for Eurozone), Ernst & Young, 2012

For this to become reality, the European Central Bank (ECB) has to keep playing a central role through interest reduction and

buying shares emitted by the government in the peripheral countries of the Euro Zone.

Opportunities for Using Alternative Energy Resources and Models for Estimating the Fair Value of a Green Energy System

Din Alina-Valentina
University “Lucian Blaga” of Sibiu - Romania
alinavdin@yahoo.com
Diaconu Mihaela
University of Pitesti-Romania

Abstract

The term “alternative” presupposes a set of undesirable energy technologies against which “alternative energies” are contrasted. The nature of what was regarded alternative energy sources has changed considerably over time, and today, because of the variety of energy choices and differing goals of their advocates, defining some energy types as “alternative” is highly controversial. In a general sense in contemporary society, alternative energy is that which is produced without the undesirable consequences of the burning of fossil fuels, such as high carbon dioxide emissions, which is considered to be the major contributing factor of global warming according to the Intergovernmental Panel on Climate Change. Determining the fair value for the assets of an entity is very often a real challenge.

Keywords: green energy, alternative resources, sustainable development, cash flow.

J.E.L. Classification: C2, G17, O1, Q42.

1. Introduction

To promote a sustainable development was the concern of international forums since the 80's, when the reality led to conclusions, not encouraging at all regarding the mankind's future, if the development has been continued with the same rates of the years 60 – 70 of 20th century, by depletion of some essential resources, the threat of starvation, suffocation in waste etc. The immediate conclusion was: the uncontrolled growth and the neglect of the environment,

threatens the future of the planet and the equity between the generations. The rapport of the World Commission on Environment and development since 1986, led by G. Brundtland, offers the definition of the sustainable development as: "the development that aims to meet the needs of the present without compromising the ability of future generations to meet their own needs" Identifying and using alternative solutions to provide energy needs, in a universe moving with high speed on the route of development and progress, is today the forefront of the European and the global agenda. A form of energy increasingly considered is green energy or renewable energy. The advantages of using this type of energy are becoming more evident in the context of depletion of traditional resources and the increase in prices of conventional energy production. Green energy production systems are beginning to be used not only by home users, but also by companies that invest in such systems to replace traditional electricity consumption. Installing a system for green or renewable energy production by an entity leads to a tangible asset recognition if it satisfies the requirements for recognizing assets included in the accounting regulations in accordance with Directive IV of EEC, part of the accounting regulations in line with European directives approved by Ministry of Public Finance. 3055/2009, as amended and supplemented. Economic benefits expected from the activity due to its recognition, are represented by its potential directly or indirectly, contribute to the cash flow and cash equivalents of the entity. When installing a system for producing green energy to be used exclusively for the entity's own consumption, the economic benefits generated by the system are the ability to reduce cash outflows, namely the amount

paid for the consumption of electricity from conventional sources..Preparation of this study starts from the analysis, based on literature of valuation models and determining fair value for items in the annual financial statements.To achieve the research has made a documentary on national regulations and the International Financial Reporting Standards applicable to this study.Research methodology contains two steps: presentation of the main evaluation methods used to estimate fair value, focusing on income method, the estimation method used in practice.The next step is a practical step, to customize its application method for an item of income which by its nature does not generate direct income through use by the entity.The proposed method for evaluating a system of non-conventional energy production focuses on future profits generated by the enterprise of such a system and not only by market conditions at a given time.The determination of the evaluation model starts from general to particular, from the specific rule, from theory to practice.

Purpose

Based on the purpose of sustainable development, which may occur only as a part of an organization form: state, economic, administrative, we may detach the role of these organizations in **the drawing and shaping the economic and social system the way that natural resources and life support systems to be maintained**, in promoting new consumer attitude, which impacts the future of the planet and equity between generations, the quality of life, the development and environmental protection.

2.Wind energy. A local unconditional resource.

This paper tries to identify an approach to the possibilities of action and sustainable development requirements related to settlement of the ecological crisis, caused by intense industrial exploitation of resources and the continuous environmental degradation.We started from the picture gives us the physical map of the Romania's eastern area, with the neighboring states.Identifying the community's development potential and creating favorable conditions for efficient use

of all available resources for a sustainable growth is in the government's competence, being responsible for removing barriers which stands in the way of the economic development of the administrative-territorial unit.Especially, a cooperation structure such as Euro, must be concerned with ensuring the development of large geographic areas including administrative units of several neighboring countries, by identifying solutions that highlight common points of these territories and which are adapted to periods of financial crisis that we are crossing. The current economic crisis, widespread worldwide highlights more the need to adapt rapidly and, inclusively, where appropriate, the managerial deficiencies, which does not ensure the proper functioning of the system in the conditions generated by the crisis.Crisis management will be possible only through a rational constructive approach according to the values that support sustainable development in accordingly to the society and nature.This approach is contained in the document European Commission-Europe 2020 "A European strategy for smart, sustainable and inclusive growth" from which we quote: "An efficient Europe in terms of use of the resources as to allow decoupling the economic growth from resource use, to support the transition to a low carbon economy, to increase use of renewable energy to modernize the transport sector and to promote energy efficiency" In this European context of setting the objectives that will mark the next 10 years, is necessary to channel our attention to the objective of increasing the use of renewable energy as part of sustainable development, and to identify the potential resources in the Euroregion N.-E. Romania.An indication of existing resources in the Euroregion is the hilly terrain, favorable appearance of a natural phenomenon such as wind. According to the Ministry of Environment, after Dobrogea, Moldova is one of the regions with the highest wind potential. The average wind power usually exceeds 5-6 m /s. for a period of from 3,000 to 4,000 hours per year.An investment in a wind farm to be profitable, the average wind power has to exceed usually 4 m/s, for a period of more than 3,000 hours annually. These technical conditions are met, the advantages of using wind energy are the relatively low costs per

unit of energy produced (1,600 euro / MW), emissions of pollutants - zero not producing of any kind of waste and decommissioning costs reduced. Nature helps us to meet the conditions for wind power installation, but amazing steps depends on the administration and regulations. The representatives of the Romanian Association for Wind Energy believes that the main barriers that slows down the development of wind energy in Romania are the poor legislative framework, the limitations imposed by Transelectrica to connecting to the network, lack cadastres to purchase land, bureaucracy(1). According to the analysis, "The corruptibility of law - Case study - use of wind energy in Romania "(2), for the commissioning of a wind farm requires about 85 notices, and excessive bureaucracy in the field, overlaps the delayed reaction of the local authorities, leading to a period of about 2 years since the initiating the permitting process, until the implementation. Facing of this situation that occurs in an area that could be one of the solutions by making even small progress in sustainable development even in conditions of crisis, but also constitutes a priority for the European space, any representative of local authorities and any structures and cooperation at local level must take action and initiate emergency public information campaigns and stakeholder consultation, legislative initiatives to amend the regulatory framework and even the development of local strategies / regional related to use wind energy.

3. Energetic willow (osier) - An opportunity for the Euroregion N.-E.

Adequate solutions during times of crisis are those that exploit the existing potential, without requiring high investment costs, ensuring, where possible, maximum benefits in several areas: social, energy, economic. Geographical conditions of the Euroregion N.-E. Romania ensure favorite position in the fight with the crisis, relief and soil nature (river beds, flood plains unused) suitable for the cultivation of plants which in the last 3-4 years, has entered into the attention of many agricultural experts from different countries being nominated in a leading position in the EU, where it was decided to be subsidized as energy plant: energy willow. Energy willow (*Salix*

viminialis energy) is a hybrid of willow, fast growing, 3 cm/day reaching 7 m long and 7 cm diameter base in one year, the harvest being 40-60 t/ha. Is planted once and harvested annually with combines and chop is used as fuel in power plants based pellets. Calorific value is 4900 Kcal / Kg reason for using as briquettes or pellets in central power plants and individual schools, kindergartens, homes. To assess thermal benefit, for example Hungary which, through the energy program for 2007-2013 has provided 36,000 ha of willow cultivation of energy in order to obtain pellets of 1,000,000 tons, equivalent to 4.9 million Gcal of heating providing 145,000 suites.

The most important characteristic for which cultivation has gained ground in her last years in several European countries (Hungary Suedia.. Poland, Baltic etc.) is the rapid growth stems, both in length and in volume, but in addition this major advantage; we can enumerate a number of other advantages:

- Cultivation on permanent or periodically wetlands due to evapotranspiration capacity for 15-20 liters of water/day/m². This advantage gives an undisputed place as a plant that makes usable thousands of hectares of land that are in decay, this was notified by countries like Sweden, where the energy willow is grown already 28-year, on the surface of over 50,000 ha., finding an efficient use of the lands unusable before, and on the other hand getting economically, a very profitable source of unconventional energy.

- Capacity of the 20-30 tons/ha of mud per year - from wastewater. This property, along with the advantage that in an area where plantation can be flooded with sewage from wastewater treatment plants, grows faster, has the great advantage that the waste water should not be treated biological being very expensive, on the other hand, the results from water wastewater treatment plants, gets into rivers very clean, avoiding water pollution.

- The willow cultivation creates new jobs for people with lower qualifications.

- The spread of energy willow crop, protects forests from deforestation caused by continuous chasing for cheap firewood.

- Is a safe alternative energy sources (heating) for settlements being used as

biomass (and chop) briquettes or pellets. High calorific value (4,900 kcal / kg) is comparable to other sources of fuel such as natural gas, coal, oil. Besides the energy use, energy willow is used successfully in these areas:

- As a source of cellulose.
- For fixing steep slopes and prevent landslides.
- To manufacture of aspirin.

4. Measurement of green energy production systems, after the initial recognition

The initial cost of the system contains the cost system components (panels, batteries, cables) and related labor. Given the very specific nature of this system and that none of its components may be used independently of other components to produce electricity, according to their destination, the entire system will be treated as an asset or cash-generating unit. On initial recognition system will be recognized at cost. The initial cost includes all costs necessary to bring the asset into working condition. After initial recognition of the asset will be amortized according to the entity's accounting policy for depreciation of tangible assets. At later recognition in the entity's annual financial statements, it can determine the fair value revaluation of fixed assets by performing revaluation according to allowed evaluation alternative treatment allowed by the national accounting regulations. Thus, fixed assets may be presented in annual financial statements at cost less accumulated depreciation and adjustments for depreciation when using the evaluation model based on historical cost, or fair value at date of revaluation, if the entity chooses the revaluation.

5. Estimating the fair value

Fair value is determined, usually, as the market value of the asset, for those assets for which there is an active market, with recent transactions. For assets for which no market exists, and is no available information about recent transactions, mathematical models are used to estimate fair value. Green energy production systems specific characteristics determined by the location, need of

electricity provided equipment used to achieve this, specific weather conditions in the area, the energy potential of the area. In conclusion, it can be said that such assets are unique assets, consisting of a set of other assets with a specific use, and not active with general characteristics. As methods for estimating the fair value of tangible assets for which there is no quoted price in an active market and are not frequently traded between the parties can use either method income or replacement cost. Income approach is considered a complex and comprehensive evaluation method, since it takes into account the concrete conditions of the market, on the one hand, and utility assets for the enterprise, on the other hand. The starting point of this method arises directly from the definition of the asset or "asset is a resource controlled by the entity as a result of past events and who is expected to generate future economic benefits to the entity" (3). Based on this definition, fair value income method is determined as the monetary expression of the asset's capacity to generate future cash flows to the firm. In the application of income method for estimating the fair value are required three steps:

1. Estimating future cash flows which will be generated by the asset by the enterprise;

2. Determining the life of the asset and therefore the period for which the estimate;

3. The choice of appropriate discount rate

Typically, future cash flows are given by estimates of future revenues generated from use of the asset, minus the expenses required for the asset. In this case, energy production systems for the use of green electricity by the entity, estimated cash flows are not given the revenue generated by such a system, but are represented by the savings entity realizes due to the reduction or even eliminating payments to electricity suppliers for classic consumption of electricity. The economic benefit resulting from the use of such asset is not productive of benefit, but its ability to reduce cash outflows.

To obtain estimates of cash flows for the entire period determined is necessary to take account of market trends, changes in electricity price forecast, and any other factors that may influence the size of flows. In estimating cash flows for a green energy production starts from electricity expense

that would have supported this year, determined according to actual consumption of energy and energy current market price. So, we can say that the cash flows of a system of green energy production can be determined for the current year, from which the assessment starts, by the formula:

$$FN_i = Q_i \times Pe_i$$

Where, FN_i = cash flow in the year i

Q_i = quantity of electricity, measured in the kWh, supplied by green power generation system in the year i

Pe_i = standard consumer price of electricity in the year i applicable entity (price / kWh)

Where some components of green energy production have useful life shorter than the period for which the estimated cash flow, cash flow forecast should take into account the costs of replacement of these components. Thus, for it is known that a replacement will be part of the system, in the scope of this article called "Part A", we consider cash flow as determined by the following formula:

$$FN_j = Q_j \times Pe_j - C_A$$

Where, FN_j = estimated cash flow for the year j

Q_j = the amount of electricity, measured in the kWh, supplied by green power generation system in the year j

Pe_j = electricity price in the year j (price / kWh)

C_A = cost occasioned by the replacement of components A

6. Determination of Discount Rate

The discount rate used for discounting cash flows should reflect the estimated cash flows associated risks. Discount rate should reflect the risk that cash flow estimates are not obtained. A common method used to determine an appropriate discount rate is the weighted average cost of capital (WACC). The formula for determining the weighted average cost of capital is (4):

$$CMPC = Cc \frac{Cp}{Cp + D} + Cd(1 - t) \frac{D}{Cp + D}$$

Where, CMPC weighted average cost of capital

Cc = cost of capital

Cp = own capital

D = debt

t = tax rate

Cd = cost of debt tax rate

Unlike the cost of borrowed capital, which can be easily identified because it is the interest rate, cost of equity is more difficult to estimate, because it has a fixed price to be paid. Shareholders hope to gain income as a result of investments made in the past. In terms of entity this expectation is a cost because, if the entity will not provide the expected return to shareholders, they will give up their investment, will sell shares and could lead to lower future market value of the entity. As a result, cost of capital is the cost to maintain a certain level entity of its share price. Capital cost can be evaluated using equation whose general CAPM (5) model is:

$$Cc = Rf + \beta (Re)$$

Where Rf = risk-free interest rate (usually for government bonds)

β = systematic risk

Re = extra yield premium offered by the market or market

The cost of borrowed capital is determined more easily, which is the current market interest rate applicable to the entity. Since interest is an expense to reduce taxable entity and the cost of borrowed capital will be considered net of related tax. The average cost of capital thus obtained can be used as discount rate (r_a) for the entity's estimated cash flows. So, taking into account the formulas above, we conclude that the fair value of green energy production system is expressed as (6):

$$V_j = \sum_{i=1}^n \frac{FN_i}{(1 + r_a)^i}$$

Where V_j = fair value of the system

FN_i = cash flow for the year i

r_a = discount rate

The fair value thus obtained is revalued amount of the asset at the date on which to do this.

7. Conclusions

From the aspects presented, shows that the most important and vital measure to be taken urgently is that to change the legislation. Mainly Law 220/2008 for setting the system for promoting energy production from renewable energy sources, published in "

Official Gazette" no. 743 of 3 November 2008, which even now, has no application rules, is contradictory and uncorrelated with related regulations, meaning its alignment to the Community. It also requires maximum care and judicious management of the energy sector, which needs certainty and predictability considering that the investments involve high costs and long amortization periods, investors being tempted and avoid the a sector that involves high risks through the lack of stability. Wind energy is an undoubted opportunity for the entire society and for the world economy, being crucial to its operation at the required parameters, considering the cost - benefit balance tilting towards benefits: clean energy, inexhaustible, low costs approx. 40% compared to conventional energy sources. Especially when the price of oil is growing, energy independence and a source for new jobs and local development. In the context of a more difficult period for agriculture, in conditions in which Romanian farmers do not receive the same support as other European farmers, thus being forced to bear an unfair competitive markets where food products can not be competitive, energy willow plantations, especially on flooded or derelict lands, may be a saving solution for users of those areas and the area economy, by encouraging investments related: briquettes or pellets factories, workshops, power stations based on pellets / briquettes or pulp and paper factories .

The Basic Framework of Economic Agglomerations and Regional Development

Dirzu Mădălina-Ştefania

Alexandru Ioan Cuza University of Iaşi, Doctoral School of Economics, Centre for European Studies

dirzu_madalina@yahoo.com

Abstract

Geographers, economists and regional scientists have long been concerned with uneven regional development and the ways by which the unequal regional distribution of economic activity across space influence the process of economic growth among regions. A dominating feature of economic activities is certainly that of agglomerating in certain areas in order to exploit new opportunities like proximity to communication networks, to large population concentrations or to reduce transactions costs, all these leading to localized positive externalities. Benefits of these sorts, known more generally as agglomeration economies, generate increasing returns that seem to stimulate the economic performance of those regions where these agglomerations are located.

In this sense, the purpose of this paper is to explore the issue of economic agglomerations and its relationship to regional development. Through a variety of relevant theories and qualitative arguments, we substantiate the reasons why we should have strong expectations about finding a favorable connection between agglomerations and regional development.

Keywords: agglomeration economies, regional development, location theories, new economic geography, endogenous growth.

JEL Classifications: R10, R11.

1. Introduction

Geographic agglomeration of economic activities on the one hand and regional development on the other hand represent two processes difficult to disconnect. The fact that a lot of industries are geographically concentrated in a particular region gives the

principal evidence for the existence specific agglomeration economies that stimulate companies to co-locate in the proximity of others and function as an unified organism. Definitely, the emergence and dominance of concentration of economic activities in certain regions constitutes one of the facts that scientists associated with modern economic growth. This complex binomial has long been researched by economic historians [1], especially in relation to the industrial revolution that took place in Europe during the nineteenth century. However, there are some observers who have argued that the new treatment of agglomerations and regional development indeed represents a truly rediscovery by different economists with a long pedigree in economic geography. Although following various approaches, our attempt is to provide a comprehensive assessment of different theoretical framework in which this relation economic agglomerations-regional development has been discussed and researched. In this sense, we point out that the modern notions and modern treatment of economic agglomerations and regional development build upon previous classical visions, while at the same time also introducing new insights. In order to achieve this aim, we structured the present paper in the following way. In Section 2 we will thoroughly review the classical and neoclassical insights into regional development by presenting the sources of agglomerations advantages. Section 3 is devoted to develop two similar theories concerning the spatial concentrations of economic activities in particular areas, respectively new economic geography (NEG) and new growth theory. Finally Section 4 reports some general conclusions in relation to all these different competing theories, highlighting the potential of economic

agglomerations to foster the economic performance at regional level.

2. Classical and neoclassical views on regional development

The main insights in economic geography and spatial economics from the late nineteenth century up to the 60's are derived from diverse traditions and from various analysts. Concerning the location of economic activities, major contributions were provided by different location theorists like Weber, Losch, Isard and Christaller [2]. Moreover, related work on the causes and regional development effects of the agglomeration of economic activities was also undertaken by scientists like Lichtenberg, Vernon and Chinitz [3]. Their analyses focused on the features of different sorts of agglomeration economies and, more than that, their studies were developed within the traditional analytical framework of agglomeration phenomena, which had emerged as a mix of the contributions of Marshall and Hoover [4]. So, Marshall paid attention to the role of local knowledge externalities generated into an agglomeration, and the presence of non-traded local inputs and also a local specialized labor pool. Hoover along with Ohlin and Isard attributed the sources of agglomeration benefits into internal and external economies of scale or the so called *localization and urbanization economies*. Specifically, localization economies imply efficiencies which come from the concentration of firms in a given sector, while urbanization economies refer to efficiencies which result from the agglomeration of many different kinds of economic activities in a given region. In the vocabulary of more recent scientists, these two types of economies are generally known as *Marshall-Arrow-Romer (MAR) externalities* and *Jacobs externalities* [5]. Concretely, MAR externalities refer to knowledge spillovers generated among companies agglomerated in a spatially concentrated industry. In a dynamic setting, MAR theory claims that local monopoly is more favorable for economic development than local competition, in consequence of the fact that local monopoly inhibits the flow of ideas to others, allowing innovator-internalization. Additionally, Porter admits

the relevance of localization economies, sustaining the conviction that knowledge spillovers in specialized, geographically agglomerated industries foster growth [6]. Unlike the MAR approach, Jacobs theory defines diversity as a crucial source of agglomeration economies, arguing that the most valuable knowledge transfers come from outside the own industry [7].

Moreover, it must be emphasized that agglomeration economies feature four important characteristics [8]. The first one concerns *scale economies* which are de facto the principal rationale for the existence of productivity growth in agglomerated industries [9]. Without these scale economies obtained in production, economic activities would be dispersed at random in space in order to save transportation costs. The second feature is related to *minimizing transportation costs*. If these costs are very high, then the activity is dispersed. On the contrary, if transportation costs are insignificant, companies can be distributed randomly in space because the proximity to markets or suppliers is unimportant. Economic agglomerations will be formed under conditions of intermediate transport costs when the spatial mobility of labor is reduced [10]. Thus, we expect a reversed U-shaped relationship between the expansion of agglomerations and transportation costs. The third feature is represented by *shared inputs* in production and consumption. Due to localization economies, these shared inputs can augment and will be used to produce more various consumption goods in agglomerations connected with fashion, culture and style. The last characteristic concerns the *potential reductions in transaction costs* [11]. When transaction costs are proving to be low, necessary inputs can be channeled into areas where the costs of production factors are maximum.

In a nutshell, all these attributes of agglomeration economies provide legitimate rationales as to why regions characterized by agglomerations will exhibit higher growth than regions without such valuable features.

3. New economic geography and new growth theories

After this cycle of analytical developments up to late 1960's in regional science, the

interest in spatial economics issues waned for an interval of two decades. But, twenty years later, it came up a renewed interest in spatial economics in the form of new economic geography, and also regional economics as a whole science experienced a renaissance through the medium of a fusion of fresh developments in both new economic geography, on the one hand, and new growth theories, on the other hand.

New economic geography (NGE) proposed and promoted by Paul Krugman assumes that a region is more developed than other regions as a result of its ability to agglomerate new companies with skilled labor and because exploits efficiently economies of scale and their variety [12]. Krugman's contributions take into account economies of scale resulted into an agglomeration and consumers preferences for diversity. These new approaches to economic geography show that the formation of agglomerations occurs when increasing returns to scale are significant, companies have the ability to set prices, transport costs are minimal, and customers, suppliers and workers are geographically mobile. Thus, if economies of scale are high and transport costs are reduced, this induces a circularity effect that tends to keep agglomerations in the same location. The reason is that companies belonging to large economic agglomerations have certain advantages, since the size of local demand allows them to benefit more of economies of scale and, thus, firms can achieve higher nominal wages. A greater local demand for products stimulates a wider range of different goods, which induce real income effects that concentrate new workers, consumers and companies. These processes are manifested in a larger range of *local forward linkages* (the supply of a higher diversity of products augments the worker's real income) and *local backward linkages* (an extensive pool of consumers attracts more firms) because pecuniary externalities generate scale economies at the individual company level that are transformed in increasing returns at regional level [13]. Usually, this effect will be stronger when local demand is higher and internal economies of scale are greater.

Moreover, it must be stressed out that the self-healing mechanism of formation of agglomerations leads to a reorganization of economic activities as according to the

scheme *center* (where there is a tendency of localization of activities) - *periphery* (where there is a relocation of economic activities). Agglomeration of economic activities in the center region is the expression of a balance between *centripetal forces* that determine economic polarization in the center, and *centrifugal forces* that influence the dispersion of economic activities to the periphery. The description of spatial agglomerations is also consistent with the observation that different producers manage to concentrate and survive in peripheral locations. A first explanation is that peripheral producers exhibit particular local benefits outside the big agglomeration due to increased transportation costs, this meaning a reduced competition for their local demand. The second explanation refers to negative externalities like congestion or high land rates in big agglomerations that may conduct to decreasing returns to scale [14].

Furthermore, a related recent body of literature connected with geography and space has been initiated on the basis of the new or endogenous growth theories [15]. According to these approaches, when individuals or companies accumulate new capital, in this way they contribute to the whole productivity of capital held by others. Such positive externalities may appear in the case of investment in physical or human capital [16]. If such spillovers are sufficiently strong, the private marginal product of human or physical capital may maintain always above the discount rate [17]. When endogenous growth theory is applied at regional level, it appears that increasing returns to scale represent a feature of agglomeration economies. Thus, local external economies are not necessarily associated with market size or pecuniary external economies, but may be associated with the transfer of knowledge or technological externalities [18]. By incorporating research and development activity into Krugman's models, local factor accumulation may have a similar role played by labor migration [12] or input-output links [19], which eventually stimulates agglomeration via local demand linkages. All these arguments provide possible explanations in elucidating the reasons why some regions are more developed than others,

some of them even holding leadership in a particular activity.

4. Conclusions

Even if the differences among the approaches of neo-classical theory, new economic geography and new growth theories related to this binomial economic agglomerations-regional development seem to be completely incongruous, common ground between these distinctive competing theories can be found on several key points. Primarily, in each of these different literatures, as presented in previous sections, the role played by economic agglomerations is seen as a paramount element of regional performance, and the common factor here is represented by the local knowledge generation, accumulation and positive spillovers. Secondly, and connected with the first point, concerns the issue of the high level of interactivity among the agents belonging to an agglomeration. Creating ties between companies concentrated in space represents a solid way for firms to become more competitive and to improve the economic performance across regions. This value chain formed of strong linkages is regarded by all these three theories as being extremely important. Thirdly, a last point of agreement consists in transactional relations which involve flows of certain sorts of business information inside an agglomeration. Untraded interdependencies of these kinds are crucial because they seem to underpin many processes of learning and innovation whose cumulative effects significantly reinforce local competitive advantages.

To sum up, regions characterized by agglomerations are apt to exhibit strong increasing returns effects that lead to superior competitive advantages as they grow.

Abstract

A research upon the status of tourism in our country is very useful. Thus, a qualitative analysis was carried out by means of organizing focus groups in the counties of Braila and Constanta.

The discussions with the participants to these focus groups referred to the personnel's need for training and lead to the idea that this need represents a necessity of the present.

The employers expect that their employees should have practical skills and competences as well as a professional training meant to increase their professional performance.

Keywords: human resources, tourism, skill, qualification, training

J.E.L Classification: O15

1. Introduction

The modernization of tourism plays a major role in Romania's economic development. Therefore, a research upon the status of tourism in our country is very useful. In this respect, in 2011 we have carried out such a research choosing as reference points the counties of Braila and Constanta.

Our purpose was the identification of the employers' position regarding the training needs, the skills and competences necessary for the employees in the touristic field since their professional training contributes to development of the employees' new abilities. [1]

A qualitative analysis was carried out by means of organizing focus groups [2] in the counties of Braila and Constanta. The method used was the "brainstorming". Thus, in both counties meetings were held with the representatives of the firms from the touristic sector (touristic complexes, touristic agencies, commercial facilities etc.).

The discussions with the participants to these focus groups referred to *the personnel's need for training* and lead to the idea that this need represents a necessity of the present. In order to face the competition the personnel needs training.

The counties of Braila and Constanta are very different from a touristic point of view. The opinions expressed during the focus groups have many aspects in common (even if the activity of the provider of touristic services is essentially the same regardless of the area) as well as dissimilarities (enhanced by the characteristics of the two areas).

2. Qualitative analysis carried out in Braila county

The representatives of the touristic complexes in Braila consider that more attention should be paid to the activities of checking-in, accommodation and maintenance of the respective facilities. The personnel's training should be improved with respect to the hygienic and sanitary conditions as well as labour protection. Moreover, the necessity to gain more knowledge concerning the culinary production or the food hygiene should not be ignored. The personnel's training should focus

upon the practice in the kitchen, more precisely upon the furnishing of such a space and upon the technology of the culinary products.

The managers of the touristic agencies consider that there are some aspects which are imperative. Among them, they mention: the development of the competences necessary for the promotion of the Romanian touristic potential, the identification and correct usage of the documents required in a touristic agency and the coordination of the touristic activity. The employee should have communication skills, should speak foreign languages in order to keep informed from external sources and to provide descriptions as clear and detailed as possible upon a large number of topics from his domain carrying dialogues with tourists from home or abroad.

The merchants expressed their need that during his training period the worker should acquire that knowledge necessary to identify the quality of the merchandise, to recognise the brand of each group of merchandise and to know the merceological characterization of the different groups of merchandise. They would also need their employees to be better trained in emphasizing the conditions regarding the packaging, the ticketing, the labelling, the transport and the storing of the merchandise as well as the reception of the merchandise and its display to the consumer (merchandising).

Regarding the *employees' training*, the participants showed that the personnel who is active in the county of Braila is mainly qualified according to the norms in force. Although the firms have employees in possession of a certificate, they are interested in being permanently connected to all novelties from the field of the personnel training in order to face the competition. Thus, these organisations have expressed their wish to participate to any new course proposed by the trainer.

An obstacle frequently met in the firms' answers to the question “Which are the main *obstacles* you are facing in your activity and what will help you successfully overcome them?” was related to the quality of the training courses because the graduates have not proven the necessary skills after they have got their qualification certificate. Qualification courses in the field are more than welcomed, but these courses should be qualitative and the evaluation should be strict with an emphasis upon the practical side

Another obstacle which was invoked was “the difficulty of accessing the European funds for the development of the activity”.

The touristic and commercial firms in Braila do not deny the importance of personnel training. The courses by means of which the employees can easily and appropriately serve the food and drinks are necessary. For example, this is a permanent necessity in restaurants in order to maintain your customers and to satisfy as many of their needs as possible. The employees have to be familiarized with the secrets of making of different menus.

Other problems which should be eliminated refer to the competences of communicating with the customers in a civilised and decent manner, the employees' gestures, mimics and language. Likewise, even if they have graduated some courses, the employees do not know the steps to be followed in order to sell, to display and to exhibit the merchandise.

Some other aspects should not be overlooked either. These aspects refer to: “the brushwood” of the bureaucratic system in contact with the governmental institutions and not only; the problems of the economic life, especially the one in Braila which unlike the one in Constanta represents a less developed region with an insufficiently valued touristic potential; the lack of sufficient means to promote the firms and their products due to the lack of financial resources.

The employers have to become aware of the fact that the employees need *skills* specific to their job because otherwise the firm will lose on short and medium term. In this respect, we can refer to the necessity for an employee:

- to have fundamental knowledge regarding the touristic management;
- to speak foreign languages;
- to have skills by means of which to ensure a favourable atmosphere for his clients and to provide accommodation and food services of a high quality;
- to have knowledge about notions of personal hygiene and an adequate posture and apparel.

3. The diversity of the instruction needs in Braila County

The instruction needs are among the most diverse according to the problems the employers meet such as:

- free courses for a qualification as a salesman;

- among the objectives of the training courses one should consider those regarding the knowledge about the law in force with respect to the use of the electronic cash registers;
- courses regarding the technology of the activities such as accommodation, food services and tourism;
- developing competences regarding the techniques specific to the activity of front - office and applying the legal regulations specific to the touristic activity;
- qualification courses in communication techniques.

According to some employers from the touristic and commercial agencies, *the IT courses* are welcomed depending on the nature of their activity. Both the IT courses and the foreign language courses are necessary due to their dynamic character.

The IT and the foreign language courses are always necessary, but not at an advanced level. The computer/ Fidelio competences are necessary during the activity and therefore the employees have to follow such courses. In the front-office activities and in other activities specific to tourism, the technical knowledge about computers are more than necessary. For some firms it is vital for the employee to know more aspects concerning the use of the Internet.

Very interested in such courses are the ones with businesses in the field of hotels and restaurants. The linguistic courses and qualifications are necessary because the touristic operators need to take part in any conversation or discussion without any effort, to be familiarized with colloquial expressions and to speak fluently. In the touristic agencies, the employees should be spontaneous, fluent, without visibly looking for the right word and they should connect their interventions to the ones of their interlocutors. In addition, if they have to book holidays abroad, the need to speak foreign languages is even more important.

The discussions with the participants to the focus group have revealed the fact that *the personnel's training need* represents a necessity of contemporary life. The training need refers to the need to train and motivate your employees, to offer continuous training because this is the only way to survive, to beat the competition and develop your business. The conviction of those who participated to these discussions is that the investment in people and the development of human intelligence and

skills ensures the firms' competitiveness in their powerful competitive environment.

Regarding *the training of their employees*, most of the participants have claimed that their own employees are qualified for their jobs. The qualification is frequently achieved by the employees from their own financial resources since most firms do not have a budget destined to the instruction and development of their personnel. The crisis is invoked as a cause for the lack of funds for the training and development courses.

The employees who finance their training courses make use of this method because on employment they are asked to have a qualification certificate for the job they apply. If the applicant does not have the certificate, but he has the necessary qualities for the job, then he should qualify as soon as possible in order to be further employed in the firm.

There are firms which partially support the qualification costs sharing the expenses with the employees. Those firms which access different programs for qualification and development of the human resources with national or international financing do not spend a thing for the instruction of their personnel.

The identified *obstacles* could be divided into two categories: obstacles specific to the touristic activity and general obstacles each firm can face. The obstacles specific to the touristic sectors are:

- the increased fluctuation of personnel;
- the lack of qualified personnel;
- the seasonal nature of the activity;
- the compulsoriness to open the hotels on May 1st even if there are no customers;
- the presence of stray dogs in the resorts;
- the disappearance of towels and lingerie;
- the lack of attractions on the seacoast.

Among the general obstacles we can mention:

- the continuously changing legislation;
- the difficulty to access the European funds;
- the excessive taxation.

4. Qualitative analysis regarding training and development needs in Constanta county

In their turn, the employers in Constanta have enhanced the importance of the communication skills in different foreign languages, especially English as well as the importance of computer competences.

The employers praise *the communication skills* taking into consideration the fact that the employees should be coherent when addressing their customers and to know to listen to them when they express their wishes. The employers consider important a series of qualities which can not be achieved as a result of some qualification courses. Among these we can mention: seriousness, the pleasure of working in a team, the ability to act as part of a team. The employees should be persons aware of the importance of a thing well-done and of the importance of tourism in economy. The employers expect their employees to have the mentality of the thing well-done, but at the same time they are aware of the fact that finding persons with such a mentality is difficult and the cultivation of such a type of thinking is difficult too. Changing the employees' mentality is a complex and lasting process and this is hard to achieve in the firms in which the fluctuation of personnel is rather high.

According to their *training and development needs*, the employers asked for courses of receptionists and maids, IT courses, foreign languages courses, communication courses and public relations courses.

Regarding the methods, we have considered the participative methods adequate because they involve the students during many hours of practice which should have the biggest percentage out of the total number of classes.

Free courses after the working hours would be ideal because the employers do not afford to furlough their employees during working hours.

There have been problems regarding the quality of the courses, some employers being confronted with the situation in which they did not notice any major differences between an employee who has been to a qualification course and one who has not participated to such a course. This happens due to the fact that all the applicants to these courses are accepted and the final evaluation is not so strict. It has been suggested that the selection should include a psychological evaluation as well in order to see if all the applicants have a bent for the job they are training. Another proposal was that the final evaluation should be made in front of a neutral commission whose members do not know the organizers of the course and that they should be from a different region. The tutor for the practical courses of qualification is important as well. This should be a specialist, should have pedagogical training and should be paid for his tutorial activity.

The usefulness of the IT courses was extremely appreciated by the employers who

consider that training in this field is necessary even for the employees who have some knowledge in the field because this is a domain which is rapidly expanding.

For many firms, the relationship with the suppliers of services, the clients and even the employees is possible by means of computer programs. This is why the employees have to continuously develop their computer skills.

Precise and short computer programs are required in order to teach the employees to use a program in the field. Likewise, these courses are thought to develop the students' ability to use certain programs, but not at an advanced level.

Similarly, *the usefulness of the foreign languages courses* was emphasized by the employers who consider that the employees should know the basics of at least one foreign language, preferably English. In many firms, the personnel speaks foreign languages, but does not have a certificate to attest their skills.

The employees for whom speaking a foreign language represents a condition to be employed still need to develop their linguistic competences.

As far as its evolution is concerned, the course which offers greater flexibility in choosing the materials, the time intervals and the transfer of teachers to the company's headquarters will be a course appreciated by both the employers and the employees.

Some employers have highlighted the importance of speaking one, two or even three foreign languages even for basic communication in ordinary life [3]. French or Spanish would be of great interest, but the perspective of having tourists from the countries of Eastern Europe does not exclude the learning or re-learning of Russian.

5. Conclusions

As a result of this qualitative research, one can assume that the personnel's training needs are extremely important and the employers' requirements are related to the employees' competences and skills.

The employers expect that their employees should have practical skills and competences as well as a professional training meant to increase their individual professional performance reflected in their remarkable organizational performance.

The Relationship Between Employment and Economic Development in Romania: A County Level Analysis

Herman Emilia

"Petru Maior" University, Tg. Mures, Romania, Academy of Economic Studies, Bucharest
emilia_herman@yahoo.com

Abstract

In this paper, we aim to highlight the peculiarities of the Romanian counties from the point of view of employment. Moreover, we intend to analyse the relationship between employment (under the aspect of structure and efficiency) and economic development in order to show that disparities at the counties' level of development can be explained by disparities in employment. The results of the study highlight the necessity for change in structure and quality of employment (especially in the counties from the North-East, South-East, South Muntenia and South-West Oltenia regions), in order to assure the conditions for a balanced regional development.

Key words: employment, unemployment, economic development, labour productivity, counties.

J.E.L.Classification: E24, J21, R23

1. Introduction

The labour is and will remain the supreme value that will characterize the society we live in. Every country and region's progress and development is due to the work that its inhabitants do. The more this labour reaches a higher qualitative level, the more visible results are, and the better the quality of life is.

In highlighting the quantitative, qualitative and structural aspects of labour which the human resource performs in society, in other words when appreciating the value of a man's labour, we need to take into consideration the concept of employment, which is an extremely complex one. Thus, in the sphere of employment we find all persons aged 15 years and over, who carried out an economic activity producing goods or services of at least one hour during the

reference period (one week) in order to get income as salaries, payment in kind or other benefits. We mention that for self-employed and contributing family workers who work in agriculture, the minimum duration is 15 hours [7]. We notice that in the sphere of labour force employment we find salaried work, full time work, permanent work, as well as non-salaried work, or even unpaid work, part-time work and temporary work.

In the economic literature and practice, there is the opinion according to which employment, which assures a high level of economic and human development, is the employment that is characterized mainly by a sectoral structure favourable to services [5], a high labour productivity [1], a high share of salaried work and implicitly a low share of self-employed and unpaid family workers, a low share of temporary and part-time work, a high level of tertiary education [8], low risk of poverty in work, etc.

The employment level and the efficiency of using the labour resource at national level are the result of the situation manifested at the level of the Romanian counties. For this reason, our purpose is to highlight the peculiarities of employment in Romania, at county level, focusing on the following elements: sectors of activity, professional status, labour productivity, employment and unemployment rate. Moreover, we intend to analyse the relationship between employment (in terms of structure and efficiency) and economic development in order to show that gaps in the level of development of the counties can be explained by gaps in employment.

2. Labour market in the context of economic development at county level in Romania

According to the national legislation on the territorial administrative organization,

Romania is divided in 41 counties. These counties, according to Law 151/1998, are grouped in eight development regions. These regions constitute the creation, implementation and evaluation framework of the regional development policy.

As in other European countries, the most developed region is the one that includes the capital, and the less developed are the border areas. In Romania, the underdeveloped areas are concentrated in the north-east, at the border with Moldova and in south, across the Danube. Except for the Bucharest-Ilfov region, whose situation in the economic landscape is completely special, economic growth followed a west-east direction (having a significant geographic component), the west markets' proximity acting as a growth spreading factor [2]. Benefiting from their closer position to the western markets and their more reduced dependence on the primary sector, West, North-West și Centre regions have attracted more foreign investors, fact which has significantly contributed to their development.

In spite of the economic growth recorded in the 2000-2008 period, most of the counties recorded significant gaps compared to the national average. Thus, in 2009, according to data in figure 1, which presents the ranking of the 41 counties in relation to GDP per capita (expressed in lei/capita), the Ilfov County holds the first place, followed by Timiș, Cluj, Argeș and Brașov. Vaslui, Botoșani, Giurgiu, Neamț and Vrancea counties are on the last five places. These counties are part of the north-east, south-east and South Muntenia regions, which depend on agriculture, having a high degree of ruralisation. It can be easily noticed that only ten counties have a GDP/capita above the national average, whereas the level of economic development in most of the counties is below the national one.

Taking into consideration that economic development is strongly influenced by the human resource, we shall analyse the main regional gaps in the labour market, at the level of the Romanian counties.

Figure 1. GDP/capita in Romania's counties (lei/capita), 2009

Source: Own calculations based on data from [6] and [7]

Appreciating the general characteristics of the labour market entails highlighting the main statistical indicators that measure the labour force: the employment rate and the unemployment rate. Analysing data in figure 2, we can observe that the civil employment rate of population of working age (15-64 years) records values between 43.3% (in Bacău County) and 69.7%. Only in 15 counties, the employment degree is above the one existing at national level (of 56%).

Figure 2. Civil employment rate (15-64 years), in 2009

Source: Own calculations based on data from [7]

In general, we notice that counties with a higher level of development are characterized by higher employment rates, and counties with a lower level of development have a lower degree of employment. An unusual case is

Teleorman County. Despite the fact that this county has a higher employment rate of the population of working age (of 58.4%), it is characterized by an inefficient employment determined by the extremely high employment in agriculture (55% of the total employed population), reduced labour productivity (62% of the national average) and reduced GDP/capita (60% of the national average). Beside the inefficient employment, this county also has a high rate of registered unemployment, of 11.5% respectively [7].

Moreover, in terms of the unemployment rate, there are significant differences from one county to another (figure 3). Vaslui and Mehedinți counties recorded the highest unemployment rate (13.9%), and Ilfov County the lowest one. Mehedinți and Dolj counties, both part of the south-west Oltenia region, have a high unemployment rate (13.9%, and 11.3% respectively). These were affected by the economic crisis in 2009, recording, at the same time, also a lower level of development (65%, 77% respectively of the national average of GDP/capita). Galați County was also affected by high unemployment (11.3%), as well as by utterly reduced employment of the population of working age (44.2%). Bacău County recorded the lowest employment rate in Romania, of 43.3%, by 12.6 percentage points (p.p.) below the national average. All these four counties have in common a lower employment rate and a higher unemployment rate, as well as a reduced level of development (with GDP/capita between 65% and 77% of the national one).

Figure 3. Registered unemployment rate in Romania's counties, 2009

Source: Our processing based on data provided by [7]

On the contrary, although the *Botoșani* County (in the N-E region) records a lower unemployment rate of 7.2%, the degree of employment of the population of working age (of 49.8%) is by 6 p.p. below the national average. This fact confirms that aggregated indicators of the labour force do not always reflect the real problems of employment. Thus, an analysis of the employment structure is necessary.

3. The implications of employment structure on economic development at the level of the Romanian counties

In the last decade, the tendency recorded in the employment structure, from the point of view of the sector of activity where the employed population works, was positive, meaning that the employed population in agriculture decreased and the one employed in the secondary and tertiary sector increased [4]. This reorientation of the labour force towards non-agricultural sectors can be correlated with the creation of new jobs in the urban area, in the context of the growth of the private sector in economy, but also of the fact that some localities were declared towns [2]. However, compared to the average level reached by the EU-27, Romania has a significant gap to recover.

The highest shares of employed population in services are recorded in Brașov, Constanța, Ilfov and Cluj [7], but only in Brașov county, the services sector is the main supplier of jobs. The share of employment in services is of 50.1%, by 7.3 p.p. above the national average (of 42.8%).

We have carried out a statistical analysis, based on the Spearman correlation coefficient, in order to establish the intensity of the relationship between the share of civil employed population in services and GDP/capita (figure 4). The results of our analysis highlight that, at the level of the 41 counties, in 2009, there is a strong direct correlation (Spearman correlation coefficient = +0.811) between employment in services and the level of economic development.

The counties with a low employment in services are characterized by a low level of development (Teleorman, Giurgiu, Vaslui, Olt, Botoșani, etc), and in the ones where the share of the employed population is high also the level of development is high (Ilfov,

Constanța, Cluj, Timiș, Brașov, Sibiu). The level of GDP/capita is usually lower in the counties that record a higher degree of ruralisation and employment in agriculture (Teleorman, Giurgiu, Botoșani, Călărași, Vaslui etc.), and the other way around. This fact confirms the economic theory [9], according to which there is a negative relationship (Spearman correlation coefficient = -0.899) between employment in agriculture and the level of development.

Figure 4: Direct correlation between employment in services and economic development at county level, 2009

Source: Own calculations based on data from figure 1 and [7]

Significant gaps are also recorded in terms of the efficiency of using human resources at county level in Romania. Labour productivity, calculated as ratio between GDP and civil employed population, is above the national average only in ten counties (in approximately the same counties as in the case of GDP/capita). Data, in figure 5, reflect the fact that a strong direct relationship is identified between labour productivity and GDP/capita (Spearman correlation coefficient = +0.892), at the level of the 41 counties, in 2009.

We notice that a high level of labour productivity is the basis for a high level of GDP per capita (in the ten counties that have a labour productivity and GDP/capita above the national average). On the other hand, the inefficiency in using the labour force in Vaslui, Botoșani, Teleorman, Vrancea, Neamț etc. counties was reflected in the low

level of economic development existing in these counties.

Figure 5. Direct correlation between labour productivity and GDP/capita, at county level, 2009

Source: Own calculations based on data from [6] and [7]

The direct correlation identified between labour productivity and employment in services (Spearman correlation coefficient = +0.788) confirms the fact that a sectoral employment structure favourable to services assures the conditions for reaching a higher productivity.

Gaps in terms of sectoral employment structure are reflected in gaps existing in the professional status of the employed population. The existence of a high employment in agriculture determines, on the one hand, a decrease in the salaried population, and, on the other hand, an increase in the number of self-employed workers and unpaid family workers.

The employees constitute a very important segment of the labour market, a segment where the supply is really confronted with the demand for salary-earning jobs. This market segment registered tendencies regarding the number and structure of employees, by sex distribution, residence environments or sectors and types of economic activity, as well as by salaries.

These tendencies are major guides that can explain some tendencies in other social spheres of interest, such as the evolution of the income levels and structures, the demand, the access to certain social services, etc, and finally they can explain the level of economic development of a country [3].

As for self-employment, in Romania, this can be seen as the only solution for survival, as a consequence of the situation that no other form of employment is attainable. Many of those eliminated from the salary system or those who did not have employment opportunities, from the very beginning, became “un-employed” people or employed at the limit of the formal labour market, exposed to fluctuating and small incomes [10].

In figure 6, we notice that, in 2009, Teleorman, Giurgiu, Botoşani, Vrancea and Vaslui counties had a share of employees in total civil population below 40%. This reflects the fact that less than 40% of the employed population had a salaried status, the rest of it, over 60%, were self-employed, sole traders or unpaid family workers. Moreover, we notice, that in half of the Romanian counties, salaried work was below 50%, and that it was over the national average level of 56.8% only in 12 counties.

Figure 6. The share of employees in total civil employment (%), 2009

Source: Own calculations based on data from [7]

According to data presented in figure 7, in the counties with a low and very low level of development (Vaslui, Teleorman, Giurgiu, Botosani, Olt, Vrancea, Suceava, etc), the salaried work expansion rate is reduced and very much reduced. These counties have, generally, a low employment in services and secondary sector, but a high one in the

primary sector. At the other pole, we have counties with a high level of development accompanied by a high rate of the share of employees in employment. The higher salaried work expansion rate is obtained either because of the high share in services (Constanţa, Timiş, Braşov, Ilfov, Cluj, etc counties), or a high share in industry and constructions (Prahova, Hunedoara, Galaţi, Gorj, Bihor, Argeş, etc), being known that, in Romania, most of the workers in agriculture have the status of either self-employed, or contributing family workers. At the level of the 41 counties, in 2009, between the share of employees in total employment and GDP per capita, a direct strong correlation is identified, thus confirming that at county level the direct relationship between the level of development and the level of salaried work (Spearman correlation coefficient = +0.845).

Figure 7. Direct correlation between salaried work and GDP/capita, 2009

Source: Own calculations based on data from figure 1 and 6

We consider that increasing the share of salaried work in total employed population is necessary, in most of the Romanian counties, if we take into consideration the fact that the salaried status is superior compared to the other categories of employed population, from the point of view of income security and social protection and that expending salaried work corresponds to a high level of economic development.

4. Conclusions

The results of the comparative analysis at county level confirm the hypothesis according to which it is not enough to highlight only the level and evolution of the aggregated data on employment and unemployment (the employment rate and unemployment rate) in order to appreciate the state and evolution of the labour market. The reason is that behind these indicators there are severe problems in employment.

The extremely reduced work in salaried conditions (35% - 50% of total employed population), in half of the Romanian counties, is a severe problem of employment, which affects the entire economy. The negative consequences are to be found on the level, structure and security of the income, on the capacity of saving, investing respectively, on the system of social insurance and education, on forming budgetary incomes, in other words on socio-economic development.

Furthermore, the results of the statistical analysis confirm the fact that disparities in the level of development can be explained by disparities existing on the labour market, at the level of the Romanian counties. The hypothesis, according to which there is a direct relationship between the level of economic development and an efficient employment structure, is confirmed. In the counties with a higher level of GDP/capita (Ilfov, Timiș, Cluj, Brașov, Argeș, Constanța etc), there is efficient employment, based on services and industry, under the circumstances of a strong tendency towards work in salaried conditions. Predominantly agricultural employment (in Teleorman, Giurgiu, Botoșani counties) or higher employment in agriculture, to the detriment of the secondary and tertiary sector (in Călărași, Vaslui, Olt, Mehedinți, Ialomița, Suceava, etc. counties) accompanied by reduced labour productivity, determine a low level of economic development.

Some measures must be taken in order to increase the level of development, but moreover a balanced regional development. These are meant to transform the structure and quality of employment, meaning the growth in the share of employed population in services, labour productivity, salaried work, level of education etc. (precisely in the counties in the less developed regions of

Romania: North-East, South – East, South-West Oltenia and South-Muntenia).

Center-Periphery in Terms of Spatial Peripherality. Analysis at the Romanian Counties Level

Horodnic Adrian Vasile

„Al. I. Cuza” University, Faculty of Economics and Business Administration
adi_horodnic@yahoo.com

Abstract

This paper aims to analyze the degree of spatial peripherality of Romanian counties, at European level. Thus, in a first stage, are classified the indicators which measure the accessibility (spatial peripherality). Then, are selected four accessibility indicators. In the second part of the paper is analyzed the accessibility of Romanian counties in Europe, through factor analysis and cluster analysis. The main conclusion is the identification of a clear center-periphery model in terms of spatial peripherality.

Key words: center-periphery, spatial peripherality, spatial peripherality in Romania.

J.E.L. Classification: R11, R12, O18, F15

1. Introduction

The literature considers peripherality an inverse function of accessibility: when the accessibility is higher, the region in question is less peripheral.

Wegener believes that "accessibility indicators describe a particular location taking into account opportunities, activities or assets in other locations and the location itself (these areas may be a region, city or a corridor) [1].

The researches in the area have stopped on the methods to analyze the spatial peripherality through some indicators. Copus A. K. divides these indicators in two groups [2]:

- the first group includes the indicators that estimates the "economic potential" or "market potential". In this case, it is assumed that the potential for economic activity for any location is a function both of its proximity to other economic centers as well as the economic dimension. The

analogy with the law of gravity is explained by the fact that the influence of each center on the economic potential of a location is assumed to be directly proportional to the volume of economic activity and inversely proportional to the distance separating them.

- the second group includes indicators such as "travel time / costs" and "accessibility." This group of indicators has been developed greatly in recent years and there's even a "soft" that estimates the peripherality.

Another classification of indicators to measure accessibility (spatial peripherality) was made taking into account the complexity criterion. Thus, can be identified [3]:

- simple indicators of accessibility: only consider transport infrastructure in the area. Quality of infrastructure is determined by the total length of roads, highways, railway lines, the number of railway stations or airports number. These indicators can express important information about the area itself, but they do not reflect the fact that many destinations of interest are located outside the area.
- complex indicators of accessibility: take into account connectivity of transport networks, making a distinction between itself and the network activities or opportunities that may be affected by this. These indicators include always the term of "spatial impedance", term that describes the ease of reaching other destinations of interest. Impedance can be measured in terms of travel time, cost or inconveniences.

Spiekermann et. al. (2011) emphasizes that accessibility is composed of two functions: a function that aggregates the activities or opportunities that could be accessed (activity function) and a function that includes the effort, time, distance or cost

needed to be able to access them (impedance function). The same author, based on the premise that accessibility is composed of two functions, divided the accessibility indicators in three types [4]:

- travel cost: if destinations are considered only a particular type (for example, regions of a certain size) and the impedance function is the time or cost of travel (the impedance function is linear), the indicator of accessibility is represented by the average or total trip cost for a predefined set of destinations.
- cumulated opportunities: if only destinations within a certain travel time are considered (the impedance function is rectangular), and the destinations are taken as is (the activity function is linear), the accessibility indicator measures the number of potential destinations (customers, business contacts, tourist attractions, etc.) that can be reached in a given time, e.g. a day.
- potential: If the impedance function takes travel behavior into account, i.e. the diminishing inclination to travel long distances (the impedance function is nonlinear, e.g. exponential), the accessibility indicator is a potential indicator. The activity function may take account of agglomeration effects or economies of scale (i.e. may be nonlinear, e.g. a power function).

In this study will be used indicators of potential accessibility type.

2. Variable selection

Criteria for selection of indicators were [5]: relevance, robustness, notoriety, complexity, accessibility, actuality.

The four indicators selected for analysis spatial peripherality are: potential accessibility by road, potential accessibility by rail, potential accessibility by air and multimodal potential accessibility. These indicators have been proposed as benchmarks of potential accessibility by Working Group "Geographical Position" of the Study Programme on European Spatial Planning (SPESP) and developed by ESPON 2006 [1].

The main criterion for selection of these indicators is the high degree of awareness and robustness, since they are frequently used and studied in the field [1][3][6]. In

addition, these indicators are the most complex [4] and are most recently developed and quantified.

Table no. 1. Data available for selected indicators

Indicator Criteria	by road	by rail	by air	Multimo dal
Availability				
NUTS 0	unavailable	unav.	unav.	unav.
NUTS 1	unavailable	unav.	unav.	unav.
NUTS 2	unavailable	unav.	unav.	unav.
NUTS 3	available (2001, 2006)	av. (2001, 2006)	av.(2001, 2006)	av. (2001, 2006)
Type of data	quantitative	quant.	quant	quant
Source	ESPON	ESPON	ESPON	ESPON

Source: author's representation

If the decision about the selection of indicators by theoretical criteria did not raise special problems, the same can't be said about choosing the level of analysis (NUTS 3, NUTS 2 etc.), the only data available are for NUTS 3 level (as shown in Table no. 1).

For four indicators analyzed were not identified missing values for any of the 42 cases (counties)

3. Analysis at the level of Romanian counties

For statistical analysis was used the SPSS software. The database includes 42 cases (counties of Romania) and five variables (four indicators of potential accessibility by mode of transport and the counties of Romania).

Nature of the data is as follows: nominal data (county variable) and data rate (potential accessibility indicators). Indicators values were taken from the ESPON database, where was used as a method of normalizing the distance from a reference value. Indicators values for each county are normalized. The European average is considered 100, counties assigning grades in proportion to the European average. Therefore, regions with a score above 100 are above average, while those with scores below 100 are below average (with a low degree of accessibility and therefore a high degree of spatial peripherality).

Table no. 2. presents descriptive statistics for the analyzed indicators recorded for the 42 counties of Romania. Notice that the potential road accessibility (ROAD_IND)

mean value is 27.75, with a minimum of 14.6 and a maximum of 46.1. Rail accessibility (RAIL_IND) average is 24.17, with a maximum of 43.8 and a minimum of 13.0. Air accessibility indicator (AIR_IND) recorded an average of 51.39, with a maximum of 119.7 and a minimum of 21.1. Multimodal accessibility (MM_IND) average is 47.88, with a maximum of 106.7 and a minimum of 21.5.

Table no. 2. Descriptive statistics

Descriptive Statistics					
	N	Minimum	Maximum	Mean	Std. Deviation
RAIL_IND	42	13.0	43.8	24.171	6.329
ROAD_IND	42	14.6	46.1	27.755	6.721
AIR_IND	42	21.1	119.7	51.398	24.703
MM_IND	42	21.5	106.7	47.888	21.195
Valid N (listwise)	42				

Source: author's calculations (SPSS output)

The essential condition to apply factor analysis is that variables to be correlated. To test the correlation is necessary a prior test of normality.

Table no. 3. Testing normality of variables

One-Sample Kolmogorov-Smirnov Test					
		RAIL_IND	ROAD_IN D	AIR_IND	MM_IND
N		42	42	42	42
Normal Parameters ^{a,b}	Mean	24.171	27.755	51.398	47.888
	Std. Deviation	6.329	6.721	24.703	21.195
Most Extreme Differences	Absolute	.171	.129	.152	.147
	Positive	.171	.129	.152	.147
	Negative	-.122	-.051	-.110	-.107
Kolmogorov-Smirnov Z		1.109	.834	.983	.950
Asymp. Sig. (2-tailed)		.171	.490	.288	.327

a. Test distribution is Normal.

b. Calculated from data.

Source: author's calculations (SPSS output)

Normality test can be performed by One-Sample Kolmogorov-Smirnov test. Statistical assumptions of this test are:

- H0: no significant differences between the shape of variable distribution and the shape of normal distribution
- H1: there are significant differences between the shape of variable distribution and the shape of normal distribution

According to the table no. 3, the value of sig is greater than 0.05 for all four indicators (0.171, 0.490, 0.288 and 0.327), which means that it accepts the null hypothesis H0: there are no significant differences between

the shape of variable distribution and the shape of normal distribution.

Table no. 4. Correlation matrix of the four indicators

Correlation Matrix					
		RAIL_IND	ROAD_IND	AIR_IND	MM_IND
Correlation	RAIL_IND	1.000	.678	.531	.550
	ROAD_IND	.678	1.000	.701	.733
	AIR_IND	.531	.701	1.000	.998
	MM_IND	.550	.733	.998	1.000

a. Determinant = 2.338E-04

Source: author's calculations (SPSS output)

Coefficients of correlation matrix indicates: high values of these coefficients (greater than +0.5, less than -0.5) shows that between the variables considered are significant statistical links (direct link if the value of these coefficients is positive, reverse link if the value of this coefficient is negative). In this case, all coefficient values exceed the value of +0.5, and principal component analysis can be applied (table no. 4).

Following factor analysis three factors were obtained (Table no. 5). Decision to be taken at this level is the number of factors to keep in the analysis.

Table no. 5. Factors derived from factor analysis

Component Matrix ^a			
	Component		
	1	2	3
MM_IND	.944	-.320	8.224E-02
AIR_IND	.930	-.349	.116
ROAD_IND	.881	.196	-.431
RAIL_IND	.762	.595	.254

Extraction Method: Principal Component Analysis.

a. 3 components extracted.

Source: author's calculations (SPSS output)

Factor analysis rules for choosing the factors are the following [5]:

- to have eigenvalues greater than 1,
- kept factors must explain more than 10% of the total variance,
- selected factors must explain cumulatively more than 60% of the variance.

From the analysis of table no. 6 can be

seen that the optimal solution for this case is keeping a single factor, which: has eigenvalues of 3112 (> 1) and explains more than 60% of the total variance (77.802%> 60%).

This shows that the four indicators are best represented in a single common factor which may be called “total potential accessibility”. In the event that had retained two factors, the four indicators were divided into two groups, each representing a different side of total accessibility.

Therefore, this analysis shows that the selected indicators help to define the same concept and have been carefully selected from the literature.

Table no. 6. Factors selection

Component	Initial Eigenvalues		
	Total	% of Variance	Cumulative %
1	3.112	77.802	77.802
2	.617	15.423	93.224
3	.271	6.764	99.989
4	4.500E-04	1.125E-02	100.000

Extraction Method: Principal Component Analysis.

Source: author's calculations (SPSS output)

Component matrix, presented in table no. 7, shows differences in factors loads. Factors' loading is the basis of their names [7].

Table no. 7. Component Matrix

	Component		
	1	2	3
RAIL_IND	.762	.595	.254
ROAD_IND	.881	.196	-.431
AIR_IND	.930	-.349	.116
MM_IND	.944	-.320	8.224E-02

Extraction Method: Principal Component Analysis.

a. 3 components extracted.

Source: author's calculations (SPSS output)

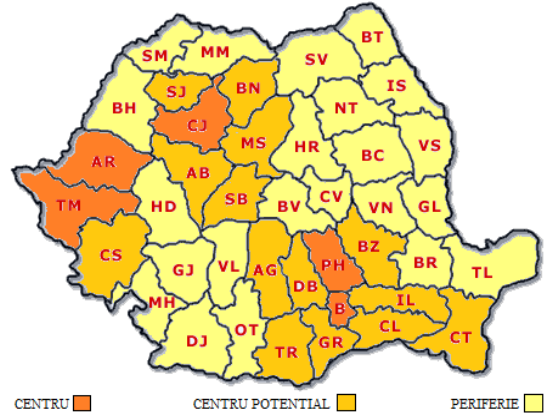

In this case, we can see that the four indicators of peripherality are best represented by factor 1, and they have an approximately equal weight in its composition, which may justify calling this factor “total potential accessibility”.

In conclusion, should be kept all four indicators (because they are strongly

interrelated), being represented by a single factor, which we can call “total potential accessibility”.

Therefore, by the non-hierarchical analysis (K-Means Cluster Analysis) were obtained 3 clusters. Obtained clusters are represented graphically in figure no. 1.

Figure no. 1. Center-periphery structure by total potential accessibility for Romanian counties (2006)

Source: author's calculations

As can be seen in figure no. 1:

- cluster 1 includes the following counties: Buzau, Constanta, Arges, Calarasi, Dambovita, Giurgiu, Ialomita, Virginia, Severin Nasaud, Salaj, Alba, and Sibiu;
- cluster 2 includes the following counties: Bacau, Botosani, Iasi, Neamt, Suceava, Vaslui, Braila, Galati, Tulcea, Vrancea, Mehedinti, Olt, Valcea, Hunedoara, Bihor, Maramures, Satu-Mare, Brasov, Covasna, Harghita;
- cluster 3 includes the following counties: Prahova, Arad, Timis, Cluj, Bucharest and Ilfov.

Figure no. 2. Mean values of the four indicators on clusters

Source: author's calculations

Figure no. 2 contains the mean values of each cluster, on each of the analyzed indicators: potential accessibility by road (ROAD_IND), potential accessibility by rail (RAIL_IND), potential accessibility by air (AIR_IND) and multimodal potential accessibility (MM_IND). For cluster 1, the mean values of the four indicators are: 22.8 (RAIL_IND), 28.1 (ROAD_IND), 57.4 (AIR_IND) and 52.8 (MM_IND). These values give to cluster 1 a middle position.

For cluster 2, the mean values of the four indicators are: 22.6 (RAIL_IND), 24.9 (ROAD_IND), 33.9 (AIR_IND) and 33.0 (MM_IND). Thus, as we can see in figure no. 2, cluster 2 occupies an inferior position. For cluster 3, the mean values of the four indicators are: 33.2 (RAIL_IND), 37.1 (ROAD_IND), 101.1 (AIR_IND) and 90.58 (MM_IND). Therefore, the same figure shows that cluster 3 records best values.

Therefore, based on cluster analysis, three clusters were obtained. The mean values recorded for accessibility have allowed a possible name of the clusters: center, potential center and periphery.

Also, in figure no. 1 and figure no. 2, can be seen a center-periphery structure, arranged in three levels, where cluster 3 shows a high degree of accessibility in the European context, on the transport modes analyzed and can be considered CENTER. On the same considerations, cluster 1 includes potential centers and cluster 2 represents the periphery.

4. Conclusions

In conclusion, the analysis of spatial peripherality at Romanian counties level highlights a clear center-periphery model.

Also, can be identified three centers located in the west of the country (Timis, Arad), center of Transylvania (Cluj) and around the capital (Bucharest, Ilfov, Prahova). We see that around the center with high accessibility (low periphericity) are positioned potential centers (Buzau, Constanta, Arges, Calarasi, Dambovita, Giurgiu, Ialomita, Virginia, Severin Nasaud, Salaj, Alba, and Sibiu). Peripheral counties are considered: Bacau, Botosani, Iasi, Neamt, Suceava, Vaslui, Braila, Galati, Tulcea, Vrancea, Mehedinti, Olt, Valcea, Hunedoara, Bihor, Maramures and Satu-Mare, Brasov, Covasna, Harghita. We note

also a low degree of accessibility (high periphericity) for the entire Northeast Region.

Abstract

Regional development is a long process, but while difficult, is a continuous process of compromise and consensus solutions to identify realistic development potential for each region, which means: transparency, information, communication and cooperation. But to put these principles requires regional partnerships with regional actors. They are designed to identify common interests and issues to act accordingly. We as Europeans must think regionally and full employment of labor resources increase income for each region. Therefore, in this paper we made a short analysis of employment in the regions of Romania.

Keywords: regional development, region of development, sustainable development, unemployment.

JEL classification: R23

1. Introduction

In Romania concerns the study of regional problems dating from the first part of the twentieth century. The precursors regional issues nationally, we remember the eminent Romanian sociologist Dimitrie Gusti, that since 1925 rural coordinates the preparation of monographs, and after 1945 start preparing urban monographs (first is the Reșița). From the regional perspective, the merit of these

works is that "the social order", monographs become a necessity pragmatic, results from these investigations are required to base the development of sustainable development programs in rural communities studied. They are also points of support to attract funding from national and international bodies involved in supporting "sustainable development".

In the paper "Fundamental problems of Transylvania" (1945), Victor Jinga made a complete, economical, social, political and history of Transylvania, and this in turn represents a referential of studies on regional issues.

L. Tiganescu by his "input-output" founded using input-output method in regional economic analysis.

Very important is the contribution of Ion Blaga in regional economic analysis work "territorial distribution of productive forces in Romania". The paper stresses that rational territorial distribution of productive forces is required to solve two problems simultaneously: economic efficiency and population growth and a fair allocation of its territory. The author supports the balanced development of the counties to stop migration from less developed counties to other counties, especially for large cities, making it difficult to solve in the future lifting of economic and social problem areas lagging behind.

"Arranged space systems. Modeling - Optimization - forecasting", teachers Baptism, M., Celac, M represents an important

contribution to the grounding of planning and regional economic development.

After 1990, from the perspective of Romania's integration into EU structures, there were concerns in the preparation of studies led to the development programs. First studies teachers mention Nicholas Valentine, Daniela Luminita Constantin, Parlog Cornelia, Matthew Lucka, Anghelescu Stoica and others.

Very important are the studies made at the Institute of Economic Forecasting of the Romanian Academy by recognized experts in the field (Phd. Dorin Jula, Phd. Gabriela Frenz, Phd. Carmen Păuna) who had a great impact on the development of the first documents on regional development in Romania. After the 90 have been developed valuable thesis on regional issues such as thesis Luminita Constantin, of Dorin Jula, Ailenei Dorel's thesis, Mariana Voineagu, Daniela Antonescu and others.

Although a number of researchers in the field have great interest for regional development of Romania, and this was the complete success of transition and economic restructuring, the period immediately following 1989 was not for the authorities in our country dedicated to this trial period.

The year 1995 was the year the were taken into account explicitly the problems of regions, local issues in the draft strategy to prepare Romania's EU accession. That was the period when the gap between words and deeds beyond the debate about decentralization, local self-government, on the one hand and on European integration, cross-regional networks, on the other hand [1].

In the Phare program , external advisors appointed by the European Union together with representatives of the ministries have prepared in 1997 a set of guiding principles for regional development in Romania in the Green Paper. Result of measures taken in the program led to the development and adoption of *Law 151/1998 on regional development in Romania*, which has shaped the content of regional development, has created the legal framework for establishment *development regions* and have established regional and national structures to develop Regional.

As I said, in Romania, could be applied to regional development policy was established eight Development Regions [2]:

- Region 1, North-East includes six counties: Bacau, Botosani, Iasi, Neamt, Suceava, Vaslui
- Region 2, South-East includes six counties: Braila, Buzau, Constanta, Galati, Tulcea, Vrancea;
- Region 3, South includes seven counties: Arges, Calarasi, Dambovita, Giurgiu, Ialomita, Prahova, Teleorman;
- Region 4, South-West includes five counties: Dolj, Gorj, Mehedinti, Olt, Valcea;
- Region 5, Western includes six counties: Arad, Caras-Severin, Hunedoara, Timis
- Region 6 includes 6 counties North-West: Bihor, Bistrita Nasaud, Cluj, Maramures, Satu Mare, Salaj;
- Region 7, the Center includes six counties: Alba, Brasov, Covasna, Harghita, Mures, Sibiu
- Region 8, Bucharest - Ilfov including the capital Bucharest and Ilfov County;

Development Regions is the implementation, development, monitoring and evaluation of regional development strategies and programs of economic and social cohesion which they are implemented. Regional development in Romania, is defined as "all policies and local public administration authorities, designed to improve the economic performance of some geographical areas established development regions and supported by Government, EU and other institutions and national authorities and international interest "[3].

A special role in the process of accession to the European Union have had studies prepared by the European Institute of Romania in 2001-2004, some of them referring to regional development.

Another stage important developments in research on regional development in Romania was the establishment in 2000 of the Romanian Association of Regional Sciences (ARSR), an association member European Regional Science Association (ERSA) and create research centers of regional development in Bucharest, Timisoara, Iasi, Galati, Suceava, Alba Iulia and other counties. In the four

national symposia (2001-2004) ARSR managed to meet specialists in regional development theory and practice in our country and abroad (each national symposium was attended by senior representatives of RSAI and ERSA).

For Romania, the integration European Union was one of priorities. Time integration into the European Union has brought joy to become members of European and responsibility to live up to other EU countries. The fundamental challenge is for Romania, operating capacity of regional policy on independent axes and influence the political dimension.

Romanian regions are below the economic development of regions in European Union countries. Therefore, the integration time required to reduce these discrepancies, in this respect is necessary to adopt measures of economic policy, social and administrative reform processes to sustain.

Approach to economic, social, political and administrative region aim to certain limits disciplinary, but can and should be supplemented by those due to certain general processes of this unification and European integration, problems of religious fundamentalism and state or, last but not least, the phenomena of poverty and economic migrationismul.

In order to achieve regional policy objectives [4] in 2007-2013, Romania has three instruments: the European Regional Development Fund (ERDF) which finances infrastructure projects generated, innovation and investment, European Social Fund (ESF), which finances projects for training and other assistance programs for employment and the Cohesion Fund (CF), which finances large infrastructure projects, environmental and transport in new Member States, Spain and Portugal (living standards are under 90% of EU average).

One Romanian Operational Programmes agreed by the European Union is the Regional Operational Program (ROP) [5], which is a very important tool for implementing the national strategy and regional development policies. Is applicable to all 8 regions of Romania.

2. Indicators for regional development

Starting from the idea that not all regions and all countries are identical, so between disparities occur, which can be analyzed from different perspectives: the unemployment rate or employment rate, which are relevant indicators for the general welfare productivity / capita, which measures relative performance or economic efficiency of the regions, the indicators introduced recently in the European Commission reports addressing disparities in terms of demographic trends, educational attainment of the population, level of investment in R & D and number of patent applications. Although comparisons between these indicators can be useful in establishing trends in economic development, national and regional major criterion for regional policy intervention is the disparity in terms of income and production. Without insisting on many indicators that can measure differences for the categories mentioned, I review some such alternative instruments that can quantify the notion of regional development:

-a long time, the main indicator used by the European Commission to establish eligibility for support through regional policy was GDP / capita, calculated using the exchange rate, measured both at national and regional

- GDP / capita, calculated using purchasing power parity, is another indicator used to have reduced the considerable differences. Development disparities are reduced, but more standard purchasing power is calculated at regional level. In many states, there are significant variations in terms of purchasing power between different geographical areas and between cities and rural areas. Because it was very important to determine whether redistributive efforts of Member States or not considered when defining the processes made regional policy, has introduced a new indicator: Regional GDP per capita, adjusted for taxes, transfers and other expenses public. Additionality principle, the contributions of European funds should not replace national investment, but to supplement and extend them. There are studies showing that the regional distribution of income after deducting taxes is more humble than disparities for

regional GDP values. Disposable income (individual) is an indicator that, unlike other indicators, including private capital flows, which may be relevant for less developed regions, where the local population is dependent on financial support of those who emigrated.

Obviously, these indicators, regardless of the successive attempts of use in a correct and representative in regional convergence process analysis provides only an image synthesis, predominantly economic.

3. Regional development in Romania

In recent decades, gaps emerging from developed countries, but also increase disparities within them. When our country decided to join the European Union, the national economic space organization in the appropriate unit of regional development policy implementation and development of appropriate statistical system have become key elements of Romania's development policy in the European context.

Administrative structure Territorial our country is made up of a regional (41 counties and Bucharest) and local (263 municipalities, of which 84 municipalities and 2688 communes). As we have discussed in a previous chapter the 8 regions are defined as "areas which correspond to groups of counties", established by their voluntary association based on agreement signed by representatives of county councils and that general council of Bucharest.

4. The regional unemployment rate in Romania

Employment indicators are used in analysis to measure sustainability social dimension of this concept so broad. The importance of employment is fundamental, both individually, bringing value to the individual and is considered reason "to live", but also at company level, while the taxes come mostly in the profitable activities. According to a survey by Eurostat [6], in Romania, the unemployment rate registered in 2009, 6.9%, while the EU average was 8.9% that year. In

2010, noted a slight increase in the unemployment rate in our country, to 7.3%, and in the media union, which increased to 9.6%. These increases are largely due to the current economic crisis.

Transition to market economy has negatively affected the employment of Romanian regions population, employment has become one of the most tense areas of transition. In the period 1992-2004, employment has fallen continuously in most regions of our country as a result of economic restructuring, the regions most affected by a high share of industry in GDP, because in these regions have been massive restructuring mining. In an analysis of Eurostat [7], in 2010 in Romania, the lowest unemployment rate was registered in the Bucharest-Ilfov (4.8%), and the unemployment rate was registered in the Central Region (10.5%). For example in this study note that there are some disparities both among developing regions in each EU country and between regions of our country.

One of the visions of sustainable regional development is to increase employment. The chart below show the evolution of unemployment in each macro development during 2007 -2014, the last four years are forecasts made by the National Commission for Prognosis [8].

Chart. 1

Source: Statistical Yearbook data after Romania and those offered by the National Commission for Prognosis, 2011.

As shown in the graph above, in 2009 compared with 2008, they felt the current economic crisis As the unemployment rate has increased in most regions of our country. The only region which has greatly increased the unemployment rate is the Bucharest-Ilfov, here

I might say that employment increased from 1.225 million people in 2008 to 1,231,000 people in 2009. Bucharest-Ilfov region has the lowest unemployment rate in our country. National Prognosis Commission [9] published a set of regional forecasts, namely "the territorial Forecast 2011-2014", where there is a recovery in employment situation in all regions of our country since 2011. However, in the persistence of the current economic crisis is likely that these forecasts may not exactly reflect reality.

Can say that the employment situation in the regions of Romania are brought into balance economic development in recent years, the new process of globalization, it is and threatened by two major phenomena: aging population and labor migration continues. Those who choose to migrate are mostly young high school graduates or higher. The most common form is the inter-regional migration. In particular high school graduates going to continue studies in cities that are part of the developed regions and do not return, finding a job better paid and more secure in these regions. Employment policies come to counteract undesired effects of phenomena present and focuses mainly on the situation, not taking into account a lot prevention and creating a long term strategy.

5. Conclusions

These development regions have similar sizes of population and territorial units are large enough to constitute a good basis for developing and implementing regional development strategies, enabling efficient use of financial and human resources, and to see if it develops sustainable.

Today, almost everything takes place under the banner of sustainable development, the company develops the application of sustainable development must become sustainable education, industries and develop sustainable agriculture, research needs to support sustainable development, water resources are used sustainably and more .

Thus, in our country will see below that the large disparities between regions.

A Spatial Perspective over the Creative Economy of the Eastern Europe

Mazilu Sorin

„Alexandru Ioan Cuza” University, Center for European Studies
mazilu.sorin@yahoo.com

Abstract

The objective of this paper is to provide a spatial distribution of creative economy in European Union, in 2011. For this purpose, we measure creative economy by proposing a five dimensions index.

The results are displayed in the Creative Economy Map of EU. The further discussions highlight the position of Eastern developing economies in this context.

Key words: creative economy, Five Dimensions Creativity Index, talent, technology, tolerance, information society infrastructure, intellectual rights.

J.E.L. classification: R12, O10, O30, O34, F02.

1. Introduction

An increasing number of studies and papers shows the growing importance of a *new economy* in the nowadays society, called *creative economy* [1].

Even there are several acceptations concerning the definition of this concept, all opinions agree that creative economy concerns the activities based on intellectual rights exploitation.

From historical perspective, The Labor Department of UK (headed by Tony Blair) was the first in Europe which formulated the term “creative industries” as a specific concept to the new cultural industries. By its demarche, the British government aimed to assert the creativity’s potential in creating wealth and employment. Its example was followed by other European states, which defined the activities concerning creative economy in their own way.

According to the KEA European Affairs’ Report (entitled The Economy of culture in Europe), the main European acceptations for referring to the creative economy are:

“creative industries” (as the components of creative economy), “copyrights industries”, “the economy of experience” and “sector of specific studies” [2]

Table no. 1. Spatial distributions of creative economy acceptations, in Europe

“Creative industries” approach	Austria Flemish Community of Belgium Denmark (2000) Estonia Latvia (2005) Lithuania Sweden (2002) Romania Bulgaria
“Copyrights industries” approach	Denmark(2006) Finland Hungary Latvia (2005) Norway
”Experience economy” approach	Sweden (2004) Denmark (2003)
Sector specific studies	French Community of Belgium France Ireland Poland Portugal Spain Slovak Republic

Source: “The economy of culture in Europe”, KEA European Affairs, 2006, p. 48.

No matter the specific view over it, all perspectives agree that creative economy has become a major force of economic growth, with a contribution to national economies, which often overcome all others sectors.

Table no. 2. Contributions of the creative economy to the GDP (percentage)

	Food Man.	Textiles Ind.	Real Estate act.	Creative ec.
Denmark	2.6	0.3	5.1	3.1
France	1.9	0.4	1.8	3.4
Germany	1.6	0.3	2.6	2.5
UK	1.9	0.4	2.1	3.0
Bulgaria	2.2	2.0	0.4	1.2
Romania	1.9	2.1	0.5	1.4

Source: “The economy of culture in Europe”, KEA European Affairs, 2006, p. 68.

2. Creative Economy Measurement

In order to reveal its influence over the human development, in general, one important step in creative economy’s analysis is to measure it. This attempt presents many difficulties regarding data collection and comparison, the different statistical systems applied by countries, the penury of in-depth research studies, etc.

The main creative economy indexes used in scientific literature are: Global Creativity Index [3], Euro Creativity Index [4], European Creativity Index [5], Hong Kong Index [6] and Flemish Index [7].

This paper proposes a new index for creative economy measurement, which aim to reveal the EU 27 creative potential and their capacity to attract creative class.

Our Index is a development of Global Creativity Index, proposed by Richard Florida [3], by including other two Indexes (Information Society Index and International Property Rights Index), near the other three, represented by 3T model of economic development (Technology, Talent and Tolerance). Each Index, part of the Five Dimension Creativity Index, contains several other Sub-indicators.

Technology Index (TI, proposed by Richard Florida) uses three variables for measuring the technological countries level: R&D investment, researchers and innovation.

R&D Investment (RDI) measures the R&D spending as share of GDP in EU members’ economies.

“Researchers” Index (RI) represents the number of professional researchers, engaged in R&D, per million capita.

Innovation (II) variable measure the patents grated per capita in the considered regions.

Talent Index (TaI) represents a mix of human capital and creative class variables.

Human capital (HC) is determinate by the standard measure of educational attainment.

Creative class (CC) consists in the share of a country’s labor force that is engaged in a higher degree of problem solving in their everyday work

Tolerance Index (ToI) implies the measurement of tolerance toward ethnic and racial minorities (TERM) and toward LBGT community (LBGTT).

Both sub-indicators are measured by Gallup Organization, on the basis of a international survey applied annually.

Information Society Index (ISI) measures the information society degree of development and combines three variables: Information technology expenditure, broadband penetration rate and level of internet access.

First sub-indicator represents **Information technology expenditure** (ITE) in millions of euro and as a percentage of GDP.

Broadband penetration rate (BPR) shows how widely broadband access to the internet has spread in the European countries on the general level, not specifying by user group.

Level of Internet access (IA) is the percentage of households who have internet access at home. Target population considered are the households with at least one member in the age group between 16-74 years. The data is collected by the National Statistical Institutes or Ministries and is based on Eurostat’s annual model surveys on ICT (Information and Communication Technologies) usage in households and by individuals which has been carried out once a year since 2002. Data for countries other than EU Member States is provided directly by National Statistical Institutes.

International Property Rights Index (IPRI) is concerned with the countries’ respect for intellectual rights, whitout which creative economy cannot prosper. It is elaborate by Property Right Alliance [8]and contains other three components: Legal and Political Environment (LP), Physical Property Rights (PPR) and Intellectual Property Rights (IPR).

Legal and Political Environment (LP) is determined by the variables Judicial Independence. Rule of Law, Political

Stability and level of Corruption.

Physical Property Rights (PPR) is concerned with the country’s strength of the rights property systems and includes Protection of Physical Property Rights, Registering Property and Access to Loans variables.

Intellectual Property Rights (IPR) The IPR component evaluates the protection of intellectual property. In addition to an opinion-based measure of the protection of IP, it assesses protection of two major forms of intellectual property rights (patents and copyrights) from de jure and de facto perspectives, respectively. [8].

Table no. 3. The main Indexes and Sub-Indicators of the Five Dimensions Creativity Index (FDCI)

	Main Indexes	Sub-Indicators	Data source
FDCI	TI	RDI	Eurostat
		RI	The World Bank
		II	
	TaI	HC	UNESCO institute
		CC	International Labor Organization
	ToI	TERM	Gallup’s Organization
		LGBTT	World Pool
	ISI	ITE	Eurostat
		BPR	
	IPRI	LP	Property Rights Alliance
	PPR		
	IPR		

Source: author

The overall Creativity Index combines all five dimensions, giving an in-depth perspective over the creative economy.

The measurement methodology is:

- Each of the 13 sub-indicator value is collected, for all the EU member states;
- The values are ascending ranked. (The country with the best values receive 1st rank, and so on);
- The values are normalized by division with the total number of records (27,

when data are available for all the states);

- The index is calculated as the difference from the maximum value (1) and the average score (for all 13 variables) obtained by each state. There will result values between 0 and 1; as an economy will have a more developed creative economy, its score will be more close to 1.

3. Results

By using the briefly presented methodology from the section before, we succeed measure the Five Dimension Creativity Index for 2011.

Because some of the data are not yet available, we approximate some indicators by regression.

In the top of the list, we find Sweden, with the highest FDCI score (0,9). Other studies, conducted in 2004, respectively 2010, found Sweden in the same position. It appears that Sweden has not only a strong creative economy, but owns the meanings for its sustainability, too.

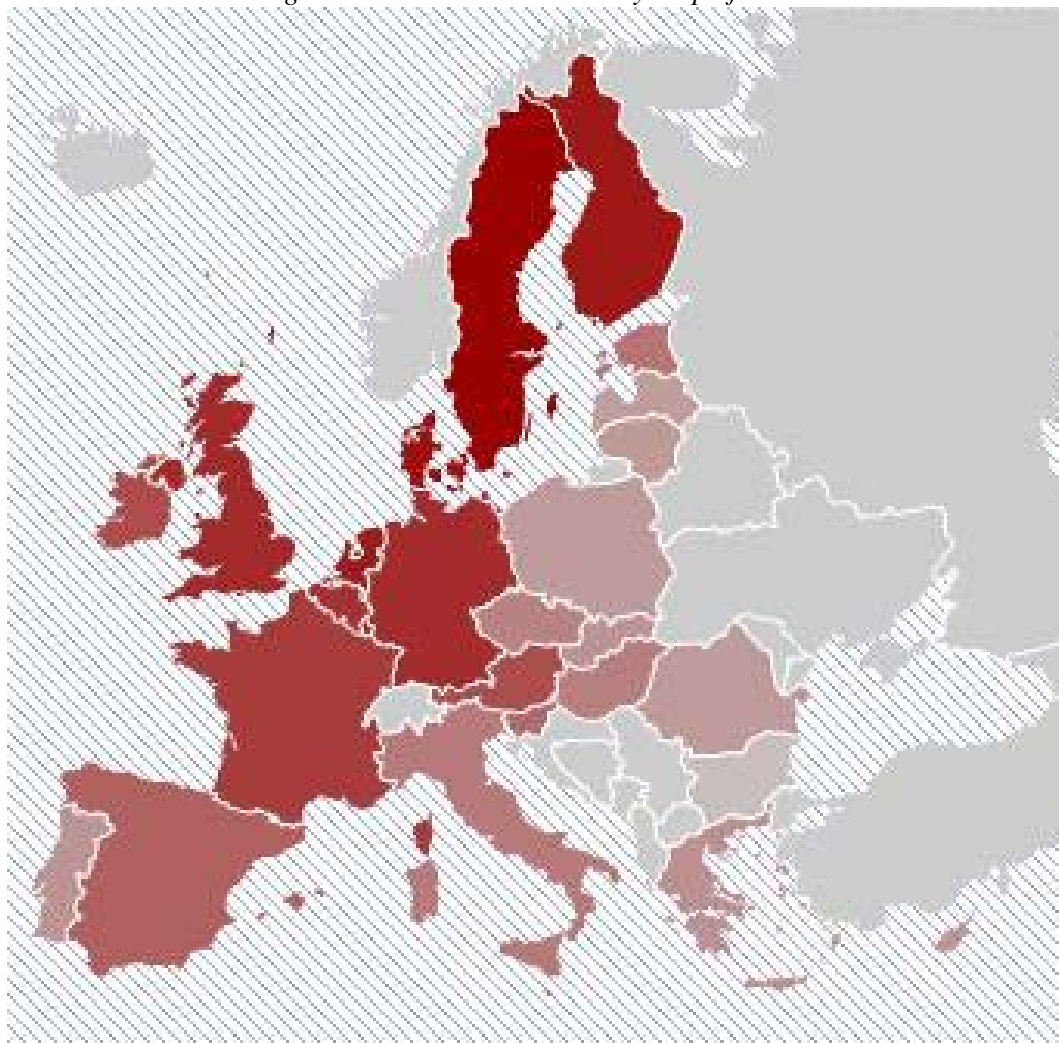

Also we may observe that the most powerful creative EU members are, specifically, Nordic Countries and the most developed EU’s members, generally.

Table no. 4. The top 10 European Countries concerning creative economy

Country	FDCI
Sweden	0.90
Denmark	0.84
Luxembourg	0.82
Finland	0.80
Netherlands	0.79
United Kingdom	0.72
Germany	0.71
Belgium	0.69
France	0.64

Source: author calculations

Figure 1: The Creative Economy Map of EU

Source: author

Figure 1 shows The Creative Economy map of EU, in 2011. The zones where red color intensifies to brown are the regions where creative economy is more developed.

We can observe a concentration effect of creative economy in the North-West of European Union. As we approach to the Eastern borders, the RDCI levels are strongly decreasing. According to this observation we can classify EU members in three categories, regarding their creative economy development:

- Highly developed creative countries;
- Countries with a developed creative economy;
- States with a developing creative economy;
- Countries with a low developed creative economy.

Table no. 5. The EU countries classification, according with the level of creative economy development

Highly developed Creative economies	Sweden, Denmark, Luxembourg, Finland
Developed Creative Economies	Netherlands, United Kingdom, Germany, Belgium, France
Developing creative economies	Malta, Austria, Ireland, Spain, Slovenia, Estonia, Italy, Czech Republic, Hungary
Low developed creative economies	Greece, Portugal, Slovakia, Cyprus, Lithuania, Romania, Poland, Latvia, Bulgaria

Source: author calculations

Romania’s Creative Economy has one of the lower levels from EU (0.22). The small numbers of researchers, the high grade of corruption, the low compliance with the intellectual rights and the spreading of piracy affect strongly the development capacities of this country.

A similar situation is shared by Bulgaria, Latvia and Poland.

Even they are included in the “countries with a low developed creative economy” category, Greece, Portugal, Slovakia, Cyprus, Lithuania record better FDCI results.

4. Conclusions

Our research reveals, in part, the importance of creativity in reshaping European Union development.

By measure the Creative Economy in Europe, using the proposed Index (FDCI), we observed an effect of concentration in the north-west part of EU. Surprisingly, the center of this core-periphery pattern is in the North Europe (Sweden), in accordance with the EU’s real economic peripheral pattern. This underlines once again the high importance of creative economy development for enhance the general development of the states, in actual context.

For attuning to the new *creative age*, the developing economies from Eastern Europe should improve their intellectual rights compliance, diminish piracy, stimulate the creative activities, increase the valorization of their human capital and enhance the tolerance and understanding toward certain social groups (like ethnic minorities and gay or lesbian communities).

5. Acknowledgment

This work was supported by the European Social Fund in Romania, under the responsibility of the Managing Authority for the Sectorial Operational Programme for Human Resources Development 2007-2013 [grant POSDRU 88/1.5/S/47646].

Labour Market, Where?

Pivodă Roxana Mihaela
Spiru Haret University
roxana_pivoda@yahoo.com

Abstract

Creating conditions for employment factor to be active and creative is a socio-economic problem facing all countries today. Government management efficiency and quality of governance must be assessed in terms of results in the use of labor resources of the country.

The complexity of the concept of labor market and determine its development involves the need to use a complex system of specific indicators, which highlight the many issues raised in the labor market.

Keywords: labor market, labor resources, the working age population

J.E.L. Codes: J68

1. Introduction

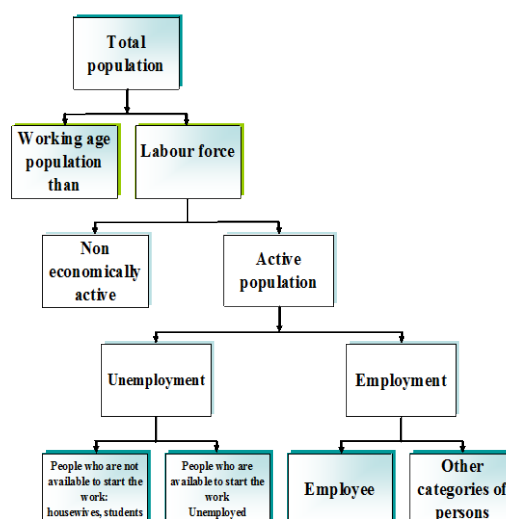

Important area of the market economy of any country, the labor market has an important role in providing dynamic interdependencies economy of any country. The labor market reflects the multiple facets of economic and social life, offering an insight into key issues and interdependencies that occurs within it, and the influences it may have on other sectors or areas of actin in its direction. Economics generally, and science macroeconomic economy and human resources management were increasingly concerned demografico-economic problems and social behavior of the potential labor supply. Literature published in recent decades, labor resources devoted to employment is extremely rich and diverse. Have undergone an extensive critical analysis, the older theories of employment and new theories were developed, which capture aspects of change current quantitative and qualitative structural employment of labor resources.

2. Classification employment indicators and nonemployment

General background to the dimensioning of employment and labor resources is neocupării demographic factor. Starting from the total population of a country can highlight indicators of employment and the labor nonemployment, as shown in graphic 1.

Labor resources, have the general background population, ie number of people of working age and their ability to provide specified services needed in society, regardless of legal working age, ie those below and above the legal working age in activity. Although the plot does not show a distinct category of manpower, they are the result of aggregation of employment, with a segment of the working population covered outside working age but are performing an activity, especially the common situation where retired people from different reasons, continued active life.

Graphic 1- Population breakdown

Removing from the labor resources, those working above the age prescribed by law, and although people are in legal age of employment, pursue any activity due to

inability to work, get an overview of stock potential labor force, resulted in the active population, which includes the unemployed population structure, consisting in turn of people do not want or can not find work and employment consists of summation of those working as employees and other categories of persons practicing as employers, self-employed, unpaid family workers, members of agricultural societies or cooperatives.

Labor supply of those resources is practical work, the potential for work that is available to start an activity. In fact, labor resources are identified active population willing to engage in existing working conditions and wages offered by the market, being influenced both by demographic phenomena and processes and the economic situation, the size and structures of social and economic activities.

3. From theory to reality

Analysis and labor market developments, require the submission of a system of indicators measuring quantitative and qualitative elements, general human resources and labor resources in particular, indicators are based on the information system.

Numerical expression of an indicator can not be assessed as more or less, unless you are able to make a comparison with other periods of time, with different areas within the national, or when not the case with other countries .

In essence, the need to monitor key labor market indicators and their trends shaping allows a study of the evolution of these indicators and to determine possible factors of influence are behind these changes and taking action to influence the meaning desired evolution of these indicators.

4. Labour force

In Romania, the evolution of labor resources presents an upward trend, suggestive aspect highlighted in Chart 1. At the end of 2010, the labor resources in Romania recorded an increase of 830,700 thousand people compared to 1990, the number of people who carried out certain activities in the national economy was 13216.9 thousand [1].

Chart 1 – The evolution of labour resources in Romania during 1990-2010

Source: <http://www.insse.ro>, FOM101A

This increase in the number of labor resources in Romania is the effect of several causes such as: Law no.19/2000, which provides for gradually increasing the retirement age, active measures taken in the employment policies in terms of stimulating active life extension or more people outside the legal working age, which for various reasons wish to pursue a particular activity.

Table 1 – Dynamics of labour resources in Romania

	1990	2000	2010
Total population (number of people)	23211395	22455485	21462186
People who are not engaged in (number of people)	9994495	9097085	7414586
Population carrying on a (Labor resources) (number of people)	13216900	13358400	14047600
Resources for work / total population *100 %	56,94	59,48	65,45
Dependency ratio (number of people)	1,32	1,47	1,89

Source: <http://www.insse.ro>, POP101A, FOM101A and own processing

It should be noted however, that during the 20 years of the analysis there are slight decrease in the absolute level of labor resources. Thus in 1991, the labor resources decreased by 138,700 persons over the previous year, something that reveals a large number of people emigrate. Deviations from

the general trend of evolution of labor resources is recorded in 1998, 2000, 2002 and 2007, when the labor resources decreases, either because of diminishing active population or reducing the number of people outside the legal age labor willing to work [2].

A highly sensitive indicator is the dependency ratio of people working and not working, ie labor resources. This indicator can be interpreted as the number of people carrying out any activity that returns to a person performing an activity and the number of those doing some activity back to a person not engaged in any activity. The table above dependency ratio is calculated as the number of labor resources per one person not engaged in any activity.

As can be seen from Table 1 data during the 21 years of the analysis, the absolute value of labor resources in Romania is increasing, also the share of labor resources in the total population evolving upward [3], both on account of the shrinking, but also on the rise in the number of people in work.

As the figures in the table above, the dependency ratio evolving positively in the sense that if in 1990, 132 people in the category of labor resources supporting 100 people who does not work in 2010, 100 persons not work are supported by 189 people performing an activity.

Increasing the share of labor resources in the total population and dependency ratio effects outlined above is extended working life for some people able to perform useful work, and increasing labor market entry for some categories of young people.

5. Total population aged 15-64 years

According to Law no.19/2000 on the public pension and social security retirement age, increasing in stages from 2000 to 2014, both women and men, the women from the age of 57 years in 2000 to 60 years in 2014, and the men from the age of 62 years in 2000, up from 65 in 2014. Now, in 2012 [4], the standard retirement age is 64 years and four months for men and 59 years and 4 months for women.

Analysis of this indicator reflects a level overview of labor available to a country. The generality of this indicator is derived from the fact that its structure includes persons

who are above age limits, but for various reasons does not work, as students, teachers, housekeepers, people with temporary disability, individuals of freedom, so that will not dwell too much on it.

Workers in Romania [5], represented the working age population, as the figures in Table 2, has seen the past 20 years, a slight and insignificant involution, with variations over time.

Table 2 - Evolution of the total population aged 15-64 years in Romania between 1990-2010

Indicator	1990	2000	2010
Total population	23211395	22455485	21462186
Men of working age	7227313	7231646	7191849
Women of working age	6559136	6643058	6513562
Total population aged 15-64 years	13786449	13874704	13705411
Young + elderly population	9424946	8580781	7756775
Economic dependency ratio	68,36	61,84	56,59

Source: <http://www.insse.ro>, POP101A, POP101C and own processing

In 2010, there is a decrease in the number of men of working age people with 35.4664, which represents a decrease of 0.5% and a decrease in the number of women of working age with 45,574 people or a reduction of 0.7%, compared to 1990.

Regarding the economic dependency ratio, ie number of people aged between 0 and 16 years and men aged over 62 and women older than 57 years per 100 people in working age in decline accentuated.

Decreasing value of the indicator has currently positioned in the sense that fewer young people and elderly people per 100 working age, but do not forget to keep in mind that the population structure ie working age in 2008, includes persons born until 1992, when the birth rate in Romania was still quite high, it decreases gradually as we age and life expectancy at birth record a growing population.

The evolution of labor can be highlighted by analyzing the population replacement rate of working age, an indicator that expresses

the contribution to the renewal of the young working age population.

Replacement rate of population in working age population is younger than 16 years, reported a third of working age, the evolution of this indicator in Romania are presented in Table 3.

Reduction in working age population, already presented issue is further highlighted by the progress of the replacement rate of working age population. Young population, in 1990, as seen from the calculations in Table 3, provide a replacement rate of 128.55% of the working age population, while in 2010, the value of this indicator decreased by 52.32 percentage points [6].

Table 3 - Evolution of the replacement rate of working age population in Romania

Indicator	1990	2000	2010
Male 0-15 years	3018588	2293862	1787950
Men 16-62 years	7227313	7231646	7191849
Girl 0-15 years	2888452	2192360	1695038
Women 16-57 years	6559136	6643058	6513562
Population 0-15 years	5907040	4486222	3482988
Working age population	13786449	13874704	13705411
Replacement rate înlocuire	128,55%	97%	76,23%

Source: <http://www.insse.ro>, POP101C and own processing

Marked decline in the rate of replacement of the working age population in Romania, proves once more reduced the labor, the effect of reducing the number of births after 1990.

Offsetting this effect is considering working longer, result in the implementation of measures to increase the capacity of older workers between 55 and 64 to remain in business for more time promoted especially by gradually increasing age retirement and early retirement limit.

6. Active population

In Romania, the present absolute level of active population and other indicators of labor is determined by two different calculation methodologies, namely: on the Balance Employment [7] and the Survey on

Household Labour Force - AMIGO [8], the methodology used since 1996. This is because since the pre-accession to the EU, Romania started harmonizing Romanian statistical system with the European Union, research AMIGO [9] is just one of those examples.

To emphasize the difference between the two methodologies in terms of absolute number of active population, due to the fact that the two indicators that compose the active population that is employed population and unemployed, have different definitions [10] we constructed Figure 2, which activity indicates that the population of Romania between 1996-2010, shows a general downward trend with some oscillations at certain times, regardless of the indicator is considered for the analysis.

Chart 2 – Differences between PA-EU and PA-RO

Source: <http://www.insse.ro>, AMG101A and FOM102A

Active population calculated in accordance with EU methodology, is higher than that calculated according to national methodology, throughout the analysis, recording it in 2010, a decrease of 12.76% compared to 1996, while the active population calculated according to national methodology falls in 2010, with only 10.35 percentage points. Differences in value between the active population sizes, based on two methodologies, varies throughout the period analyzed, levels of active population is approaching or leaving, depending on the dynamic components.

Currently unavailable due to statistical data for 2011, as the sheer size of the active population, but that analysis is as complete and as accurately reflect reality, in Figure 3

will be presented evolution rate enabled the population of Romania, until year 2011 inclusive.

Chart 3 – *The level of activity in Romania*

Source: <http://www.insse.ro>, AMG155A

As was natural, the relative level of activity follows the same trend with the absolute level of the active population. In 2011 recorded with decrease by 0.34 percentage points over the previous year and a decrease of 16.21% from the beginning of the analysis.

The downward trend of the active population in Romania, regardless of method used to determine them, is due to continuing population decline is due to the decrease birth or due to negative migration balance, demographic phenomena that influenced the population of Romania, after 1990.

7. Opinion

E volute of manpower in Romania, are on an upward trend overall, as recorded in late 2008, an increase of 530,500 thousand people compared to 1990, when a certain number of persons carried activating the national economy was 13216.9 thousand people, which demonstrates the effectiveness of employment policies undertaken by Romania in the promotion of equal opportunities in employment, increase participation rates of women in the workforce; objectives in the policy field in Europe. By 2015, the growth forecast of manpower under the two scenarios presented in Chapter acestestui varies between 100.27% and 100.48%, the difference in absolute value being 218,835 people.

Workers in Romania, represented by the working age population, has seen the past 20 years an involution slight, but insignificant. In 2009, there is a decrease in working age men with 15,162 people, representing a decrease of 0.21%, and an increase of women of working age with 69 people or an increase of 0,00,105%, compared to 1990.

Replacement rate of working age population represented the population under the age of 16 years, reported a third of working age, subtract the last two decades from 129% in 1990 to 76 percentage points at the end 2009, compensation of this effect in view of longer working lives, reflected in gradually increasing the retirement age and limiting early retirement.

The activity of the population of Romania between 1996-2008, is experiencing a steady decline due to continued population decline is due to the decrease birth or due to negative migration balance, demographic phenomena that influenced the population of Romania, after 1990. Urban focus most of the active population aged 25 and 49 years, male employment a priority in this age range. Young people and the elderly, labor is the dominant rural areas, women over 65 are prevalent in this group of active population.

roxana_pivoda@yahoo.com

Abstract

The Romanian economy's transition from centralized economy to market economy, started 22 years ago, was a difficult time for our country, which caused significant changes in all areas of society: political, economic and social, manifesting a series of disturbances across the economy, labor market is one of the most affected by this transition and the emergence and development of unemployment is only one of these consequences.

Keywords: inactivity, unemployment, imbalance

J.E.L. Codes: J68

1. Introduction

Both the character table and the contents of the complex, labor market leads to a huge human potential, with important implications in the evolution of economy and society, while the labor market is strongly influenced in turn by the state and economic change any boom or economic decline nationally and worldwide, affecting one way or another level of employment and unemployment.

2. Inactive population

Gradual reduction of the active population, both in absolute terms and as percentage of total population, as was naturally led to increasing levels of inactivity in Romania, the inactive population is a very important indicator of progress which should be considered in analysis of labor market dynamics.

Inactive population trends in Romania for the period 1996-2011, shown in Diagram 1, shows a sharp rise inactive, both in absolute and in relative size throughout the period, the

significant increase of 1,024,074 since the inactive 2002, to those recorded in 2001. If in 1996 the rate of inactivity, determined as a percentage of inactive population in total population was 47.17% at the end of 2011 the value of this index increased by 6.58 percent, which represents an increase of 811,946 inactive [1].

Chart 1 – Evolution of the share of inactive population in total population

Source: <http://www.insse.ro>, POP101A, AMG145A, Press release no. 131/27.06.2011, 202/26.09.2011 and 275/22.12.2011

Inactive or non-active population comprises all persons, regardless of age, who are active in seeking work, and this is a factor of pressure on the working population and especially of the employed population, and also causing higher costs for those working to support inactive people.

Determined at the same scale of values for the images can be more intuitive and easier to compare, Figure 2, represents an evolution in the last 16 years of inactive population, compared to the active population and the occupied.

A first look at changes in the three categories of population, shows us that the differences are more pronounced when comparing inactive population with

employment than with the active, they mainly from dynamics of unemployment.

Regarding evolution inactive compared to the active population, is observed up to the year 2001, higher values of the active population, because after 2002 the situation to change in favor of the inactive population. If in 1996, was inactive population surpassed the population with 732,084 people at the end of 2011, the number of inactive persons is 1,607,899 higher than the active ones [2].

Chart 2 – Evolution of inactive population during 1996-2011

Source: <http://www.insse.ro>, AMG145A, AMG101A and AMG1101

Evolution of inactive compared to employment, showing differences more apparent than in present. Employment has values higher than inactive only by the end of 1997, the inactive population increased by 94,781 persons to the number of employed. These differences remain relatively small until the end of 2001, for early next year with employment to 2,500,511 people from the lowest idle, the difference at the end of 2011 to reduce the amount of 2,331,161 people.

Therefore we can say that the number of inactive people have a general upward trend and uneven with many variations over time, the end of 2011, the inactive population increasing by 107.59% from early 1996.

Inactivity amplification phenomenon in Romania, due largely to the aging population in general and especially of the working age, many people benefit from the legal conditions for retirement, which meant changes in the ratio of activity and inactivity.

3. Unemployment

The Romanian economy's transition from centralized economy to market economy, started 22 years ago, was a difficult time for our country, which caused significant changes in all areas of society: political, economic and social, manifesting a series of disturbances across the economy, labor market is one of the most affected by this transition and the emergence and development of unemployment is only one of these consequences.

Initially it was thought that the transition from centralized economy to market economy, lead to rapid economic growth, especially to improve the living standard of most of the population, but since 1990, unemployment in Romania, become a reality and a priority when there came the first surplus labor, amid restructuring and privatization of national economy and in particular industries, something that required the development of a new legislative framework.

Introduction in 1991, Law no. 1 social protection of unemployed and their professional reintegration, constituted the legal framework that serves to protect the unemployed, but also offered at the same time a source of statistical data, highlighting the evolution neocupării labor, which is why to Figure 3, showing the evolution of unemployment in Romania since 1991 and not 1990, when they actually showed the first signs of unemployment in Romania, some characteristics of the unemployed will be available later as improving and improving year Alizee depth.

In the first four years after 1990, has been issuing a large number of jobs, number of unemployed in Romania increased by 886,485 people by 1994, when a total of

1,223,925 registered unemployed, which is the maximum recorded history of this indicator in Romania [3].

Chart 3 – Evolution of unemployment in Romania

Source: <http://www.insse.ro>, SOM101B and <http://www.mmuncii.ro>, Quarterly Statistical Bulletin on Labour and Social Protection, trim IV./2011

For a short time in 1995 and 1996 respectively, the labor market in Romania there is a positive development of unemployment, meaning that during this period there is a decrease of 556,361 unemployed, representing a decrease of 46.28%, then until 1999, the unemployment phenomenon is strongly felt, as a result of socio-economic imbalances that were created when closing other productive structures, recorded the second maximum number of unemployed who Romania has registered so far, that is 1,130,296 people.

Processes of restructuring and privatization of economic activities, especially in large companies, leading on the one hand the availability of a large number of labor, but also contributes to the creation of new jobs, it is only one issues raised in the labor market in Romania contributed to reducing unemployment after 1999.

For seven years respectively in 2000-2007, the employment of labor in Romania, has experienced continuous growth and sustained reduction in the number of unemployed as a consequence of this development. Thus, in late 2007, the number of unemployed in Romania was of 367,838 people, which means a decrease of 762,458 unemployed than in 1999, and an increase of 30,398

persons for the first year of existence and manifestation of unemployment in Romania.

With the development of the legal framework in 1991 and so far, while relying on statistical data and aggregate unemployment developments in Romania, is characterized by three periods of expansion manifested between 1991 and 1994, 1997 and 1999, 2008 and 2009, which is due to various causes. If the upward trend of unemployment in 1991 and 1998 is mainly due to deep economic and social transformation as a result of our country's transition from a centralized economy to a market economy system, which generated a significant force redundancy work mainly in the industrial sector as a result of restructuring and privatization processes running and the closure of unproductive structures especially in the mining sector, growth in the number of unemployed since 2008, takes place at the expense of installation and the crisis in Romania economic exhibited worldwide, which is why the unemployment phenomenon will be analyzed expression from that period.

4. Unemployment during the financial crisis

Both the character table and the contents of the complex, labor market leads to a huge human potential, with important implications in the evolution of economy and society, while the labor market is strongly influenced in turn by the state and economic change any boom or economic decline nationally and worldwide, affecting one way or another level of employment and unemployment.

It is known that the impact of financial crisis that was unleashed in the United States in the second half of 2007, deepened and entered a tempestuous phase in 2008, spreading rapidly worldwide, damaging economic performance throughout the world.

In this sense, the global economic crisis have been felt ever more intense and the Romanian economy, since 2008. The economic recession caused a slowdown in economic growth, which affected key sectors of national economy, its effect is more extensive repercutându both on economic indicators and the human factor.

Lack of financial resources, lower foreign and domestic investments, shrinking demand

for some goods and services led to lower production and restricting access to credit, which has an immediate impact on firms that tend to develop on this basis, gradually led the closure of units, the loss of jobs and reduction of others, to release every year a significant number of force, unemployment sizes with increasingly higher in Romania and strong labor market knowledge imbalances.

As a result of the labor market is the main source of income for an important segment of the population and demand for labor is derived from production and demand for goods and services, any impact on this market has shown both direct and indirect effects labor market. Reducing the demand for labor, also constitutes an important factor of pressure on employment levels, meaning that many employers intend to respond to this crisis by reducing labor costs, which inevitably affect wage levels or by reducing it, either by reducing working hours, thus also contributing to the deterioration of living standards of employment. The severity of these impacts depend upon the initial level of unemployment, a system of social protection, the adoption of strategies and creative measures labor market.

After a period of eight years in the evolution of unemployment had a downward trend [4], due to positive growth rates, which were made by our country, while providing a certain stability of employment, in 2008 global economic crisis began to be felt and the labor market in Romania, but especially damaging level of employment was manifested in 2009.

As can be seen from Figure 4, compared to 2007, the total number of unemployed expressed in thousands nationwide increased by 9.6% in 2008, the most significant increase recorded in the first quarter but 2010, the number of unemployed was higher 208.07% compared to 2007.

Regarding evolution quarters of unemployment shows that the largest increase occurred in the first quarter of 2009, the number of unemployed persons increased by 110,180 from the previous quarter. Also be noted that since the Second quarter of 2010, there is a positive development in terms of unemployment, the number at the end of 2011, being 304,272 less compared to the third maximum period.

Chart 4 – Evolution of unemployment in Romania in 2007-2011

Source: <http://www.mmuncii.ro>, Quarterly Statistical Bulletin on Labour and Social Protection. 61-69, quarter I-IV 2010, quarter I-IV 2011

Seen from the same diagrams that the unemployment rate over the period analyzed is characterized by an increase of one percentage point, the greatest growth occurring in the first quarter of 2009, when the unemployment rate was 5.6%, more higher by 1.2 percentage points from fourth quarter 2008 unemployment rate of 8.4%

recorded in the first quarter of 2010, being higher by 3.3 percent from the end period.

Table 1 – The top ten occupations affected by unemployment

2008		2011	
Occupation	No. unemp loyme nt	Occupation	Nr. unemp loyme nt
unskilled workers in manufacturing	10201	unskilled workers in manufacturing	71157
manufacturers and installers of steel structures	7170	unskilled workers in agriculture	66403
shop and market vendors	6052	unskilled workers in the maintenance of roads, highways, bridges, dams	32184
unskilled workers in agriculture	4616	unskilled workers in housing	27467
workers from grinding machines, grinding and sharpening	4105	transport laborers and freight handlers	26219
unskilled workers in the maintenance of roads, highways, bridges, dams	4080	manufacturers and installers of steel structures	13295
mechanics, installers and repairers of agricultural machinery	3798	shop and market vendors	12500
unskilled workers in housing	3309	staff for care and supervision at home	8239
carpenters and workers assimilated	3258	unskilled workers in public services	7683
transport laborers and freight handlers	3109	mechanics, installers and repairers of agricultural machinery and industrial	6468

Source: <http://www.mmuncii.ro>, *Quarterly Statistical Bulletin on Labour and Social Protection*. 65, 69, quarter IV. 2010 and quarter IV 2011

Increasing the number of unemployed since 2008 and increasing this phenomenon in 2009 and first quarter of 2010, is due mostly collective and individual dismissals

that took place in Romania, but also because of the lower of employment, due to reduced demand for some goods and products, due to the reduction of financial resources generated by the current global crisis, which affected our country, while the absolute and relative reduction of unemployment, which took place after the first quarter of 2010, the labor market due to absorption of a number of 377,772 people in 2010 and 366,113 in 2011, achieved by implementing the National Programme of Work Employment of NEA.

Closely related to the level of unemployment experienced in Romania, statistical data presented in Table 1, reveals the top ten occupations in Romania, affected by unemployment.

In the past four years and beyond, most people affected by unemployment in Romania, are those with lower levels of education, something highlighted by the statistics presented in the table above and the explanations given by the Occupations Code in Romania in the level of training required for the ten occupations.

Training of an important part of all unemployed in Romania, shows a preponderance of persons with primary, secondary and vocational [5]. This can be interpreted as meaning that anyone can perform unskilled labor, but not mutually valid, meaning that anyone can perform and skilled labor.

Thus as can be seen from the figures in Table 1, the top ten occupations affected by unemployment in Romania, have a bigger high ranging from 12.31% in 2008 and 58.95% in 2011, demonstrating and mutations of the industry due to rising labor share complex, involving a higher level qualification, while restricting and even the gradual disappearance of simple labor, unskilled or routine tasks. The training provides both a growing employment security rather than job, knowing that fewer and fewer people today, a job for life. The training of human resources in general, but especially those working in particular, contribute to increased employment opportunities in the labor market, people with secondary or primary level professional training, is at risk of unemployment to an extent higher than workers with a higher education.

5. Opinion

Inactive population trends in Romania for the period 1996-2009, shows a marked increase both in absolute and in relative size throughout the period. If in 1996 the rate of inactivity, was 47.17% at the end of 2009 the value of this index increased by 5.13 percent, which represents an increase of 554,898 people dead. So if in 1996, employed 100 people claimed that 55.96 100.18 inactive in young adults and 17.5 26.69 elderly, in 2009, increasing pressure on employment in that 100 people are employed need support in the 46.31 118.01 inactive young, 42.28 and 28.72 older adults. Amplification phenomenon inactivity was due largely aging population in general and especially of the working age, many people retirement benefit of legal conditions, leading to changes in the relationship between activity and inactivity.

Since 1990, unemployment in Romania, became a reality and a priority when there came the first surplus labor, due to restructuring and privatization of national economy and in particular industries. Until 1994, has been issuing a large number of jobs, number of unemployed increased by 886,485 people, compared to 1991, bringing to 1,223,925 unemployed, which is the maximum recorded history of this indicator in Romania . For a short time in 1995 and 1996 respectively, the labor market in Romania show a positive trend in unemployment, then until 1999, the unemployment phenomenon is strongly felt, as a result of socio-economic imbalances that have created with the closure of other productive structures, recorded the second maximum of the registered unemployed that Romania so far, that 1,130,296 people.

Most affected by unemployment, are people with low education level and in terms of sex, since 1997, men are more exposed to unemployment than women.

Global economic crisis have been felt ever more intense and the Romanian economy, since 2008. The unemployment rate in the period between the first quarter of 2008 and fourth quarter 2009 increased by 3.7 percentage points, the greatest growth occurring in the first quarter of 2009, when the unemployment rate was 5.6 %, 1.2 percentage points higher than the fourth quarter of 2008.

Territorial Arrangement and Sustainable Urban Development

Popa Florina

National Institute of Economy – Romanian Academy
florinacarina@yahoo.com

Abstract

Local economic and social development is a process which refers to the development of a local or regional economy capacity to stimulate a stable economic growth, and, therefore, to create jobs and conditions for harness the opportunities of fast changes in economic, technological and social field. Local administration, community-groups based aim at the efficient administration and management of existing resources, entering, if necessary, into a partnership relationship with the private sector.

Sustainable development approach aim at social progress and quality of life, a process that, when meeting present needs, there are also taken into account the future generations problems and economic constraints.

The paper presents aspects of territorial arrangement issues, spatial development and sustainable urban arrangement - components of local development - as well as the conclusions regarding the items outlined in the study.

Key words: territorial arrangement, sustainable urban development.

J.E.L. classification: R- R1-R10-R11-R12

1. Introduction

Increasing pollution, greenhouse gas emissions and risks related to water provide, due to a bad management, have a negative impact on climate change and, therefore, determines deterioration of environmental conditions. Thus, the link between environment, energy efficiency and assuming accountability determines advanced cities to take into account the matters related to sustainability, such as: clean public transport, encourage efficient energy buildings, a better management of facilities (equipments,

infrastructure), which contribute to the important benefits of climate change. Unsafe areas in terms of the environment, like polluted sites close to solid waste stores with drains and open sewers, near industrial areas, increase the impact of climate change, through the sea level rise, higher temperatures, uncertain effects on ecosystems and a high climate variability and volatility, making difficult the recovery after disaster. The lack of informations, of national support policies, of the access to financing and other assistance types hinders the action of local authorities who have not enough resources and information to identify and give priority to actions for energy consumption reduce, through efficient measures and an improved urban planning. Actions should help to create the necessary resources to improve the city, area services, to socio-economic benefits, such as improving air and health quality, a "green" community space, increase competitiveness by reducing energy costs.

2. Territorial arrangement and development

After World War II, the objective of each society was of development, designed to an economic way, in order to increase production through industrialization. In time, the term was redefined as a process which leads to welfare increase, beside the economic activity and material wealth, as important as education, culture, health, environment. The phenomenon involves mobility, change in order to achieve economic and social objectives. From this perspective, government (central, local) should provide a sustainable economic, social, institutional development on the areas and throughout the territory, leading to an increased quality of life, locally and nationally.

Local economic and social development is a process in a specific region or geographical area, which refers to the development of local

or regional economy capacity to incentive a stable economic growth, and therefore, create jobs and conditions for harnessing the opportunities of rapid change in economic, technological and social field. Intended objectives refer to the economic prosperity and social welfare, by creating a favorable environment for business, integration of vulnerable groups in community, engage people in their own regions problems. Also, there are taken into account the social and cultural features of development.

In this process, local administration, groups-based communities pursue the efficient management and household of existing resources, hiring, if necessary, a partnership relationship with the private sector aimed to stimulate regional or local economic activities, creation of jobs.

Among the actors involved in the actions there are the authorities and public administration bodies (at local, county, central level) responsible for sectoral policies in the industry, environment, labor, public works, transports etc., the economic activities and public services representatives (enterprises, banks, unions, educational institutions, NGOs etc.).

We speak about sustainable development that when meeting the requirements of the present generation, it facilitates also the fulfilment for future generations options. It focuses on both economic and social development and the environmental conditions protection and improvement.

Sustainable development is, actually, an outlook objective, in relation with the notion of development based on qualitative and quantitative progress at the same time. Approach aims at social progress and quality of life, addressing the needs of present, while taking into account the future generations problems and economic constraints. The objective of this policy is to facilitate implement of a way of production and development in a perspective for a long time; attention is centered on the individual.

Sustainable development is firstly a responsible patrimonial conception of our times, without limit to the environmental protection or ecological behavior of works. In this sense, public policies should establish the measures which meet the present needs without compromising those of the future generations too. It is a way of growth that

ensures economic, social and environmental progress of society for a long-term.

There are retainable five essential purposes taken into account in sustainable development texts:

- fight against climate change and for atmospheric protection, representing a major stake of solidarity between people, territories and generations;

- preservation of biodiversity, a major component of ecosystems sustainability;

- satisfy all human beings, objective which corresponds to Rio Declaration, which states that these are at the heart of sustainable development matters; they have the right to a healthy and productive life in harmony with nature;

- social cohesion, solidarity between territories and generations, conditions of social progress;

- a rhythm of development, referring to the responsible ways of production and consumption, respectively: less pollution, reduced resources consumption, maximum reducing of environmental risks.

Local development requires existence of a regulatory framework, of local development strategies and of resources.

Sustainable development undertaking takes place in all sections of the territory, so it must be defined on each of its areas, because the objectives differ dependent of the level it refers.

In territorial arrangement issues it can not be a separation between the space use (natural, agricultural, urban) and the activities which are taking place in the area (trade, construction, production). Neither stakes nor goals may be similar, so that have to be developed different methods and means for each project, for each area. For example, considering a region arrangement project is different from that of a lot. (bounded to a restricted area).

Currently, the major guide of sustainable territorial development is Local Agenda 21. The implementation of the procedures of this program aims to mobilize interested actors (economic, social) towards the strategic development objectives achievement, including land development; the objectives must take into account a sustainable heritage value and resources of a land harness. In the context of local development, a sustainable territory arrangement involves consideration

of the following elements: Local Agenda 21, the human settlements, land development projects, agriculture and the countryside, tourism and transports.

A project or a program of action achievement in the field of territorial arrangement, requires comply with sustainable development criteria, as follows:

- research in territorial arrangement, policy development, strategies, studies of documentation and of territorial arrangement specifications;
- creation and development of database and documents;
- endorsement and approval of documentation developed;
- territory actors participation throughout the period of the project, from the start, to the moment of put into practice;
- cross-cut approach, clearly expressed by disarticulation of working methods;
- evaluation of the project;
- monitoring and control related to put into practice strategies, policies and operations of territorial planning;
- an ongoing improvement strategy.

As such, territorial arrangement is a component of local development. These activities of territorial arrangement and urban planning imply implementation of strategies, policies and programs for sustainable development in spatial profile, throughout the national territory, as well as monitor their put into practice according to the branch specifications.

In the context of territorial planning and sustainable development, it must be also considered the **spatial development** issues. Sustainable development encompasses not only an economic development to respect the environment and to protect current resources for future generations, but a **balanced spatial development**, too. Aspect involves harmonization of spatial needs of the economy and society with ecological and cultural mission of areas, which contribute to a sustainable and balanced spatial development.

Prospects for the European Union are towards a gradual evolution from an Economic Union to an Environment Union and, further, to a space that integrates the social dimension, saving regional diversity.

Since 1999, it have appeared new ideas about cities development while the EU

ministers responsible for spatial planning and cities development adopt the European Spatial Development Perspective (ESDP).

Essential concepts of ESDP aimed at integrated multi-sectoral strategy for spatial development consist of:

- an integrated approach in which sectors specific to development activity (economic transport, environment development) influence each other;
- a wider horizon of development, essential for an integrative model;
- strategy elements - actions interconnected in order to achieve balanced and sustainable development;
- the responsibility of developed regions and territories to implement the fundamentals of development.

There are considered three guiding principles for spatial development policy in the European Union:

- development of a urban polycentric and balanced system, strengthening of new urban-rural relationship;
- promoting integrated transport and communication concepts in order to ensure parity of access to infrastructure and knowledge;
- rational management of natural and cultural heritage, to contribute to regional identities and cultural diversity preservation.

As regards integrated spatial development policy, the European Union Territorial Agenda adopted in 2007 focus on exploiting the potential of European regions and cities for sustainable economic growth and provide more jobs, one of the priority consisting of balanced development and innovation strengthening by the network of cities and cities-regions.

Taking into account the definition of the European Regional / Spatial Planning Charter adopted since 1983, “regional/spatial planning is the geographical expression of economic, social, cultural and ecological policies of society”^[4]. It is also a scientific discipline, an administrative technique, an interdisciplinary model towards a balanced regional development and a physical organization of space, based on an overall strategy.

3. Sustainable urban development, a local development component

Cities play a vital role in the development of European regions. They are key of the European Union competitiveness growth, they are the space of most jobs, firms and institutes of higher education while their action is decisive in achieving social cohesion. In the conditions of sustainable economic development provided through a series of measures designed to reduce the poverty, social exclusion, environmental issues, an integrated approach of urban development, not only encourages growth and jobs throughout Europe, but also includes issues related to the social and environmental objectives.

The concept of **integrated model** of urban development occurred in the early 1990s, along with urban renewal projects for disadvantaged areas. The notion of **regeneration** is related to overall or partially degradation of the city. It may be the case of degraded central areas, due to aging buildings and public spaces gradual deterioration, or of neighborhoods with social buildings. The regeneration process is, therefore, designated to revitalize the areas-problem, mainly by taking into account the shortcomings the natural and built environment face, heritage preservation, social integration and employment, as well as the economic activities of cities and their neighborhoods, but also in rural areas. The developed actions combine economic measures (injections of business), social (constructions of better quality buildings, reconstruction of residential areas), urban planning measures (restructuring of public spaces etc..).

The integrated approach takes into account both the environmental impact and the social impact of urban development. The complex feature of integrated urban development stay in expanding of its actions in several areas which cross the boundaries of a development project. For example, green spaces are seen in line with renovation of abandoned constructions and lands, clean transport systems should cover not only passenger services, but alternative models for transport, but also items related to energy efficiency, renewable energy and phonic and air pollution. This principle to identify untapped potential applies both for the assembly of cities and for the neighborhoods considered individual and for inner-cities areas.

Thus, the process has progressed and its use has expanded to the urban projects as a whole, from the renewal of disadvantaged areas to other urban issues (transport, planning, economic development).

Subsequently, the idea of sustainability has become an inevitable requirement due to the impact of urban development on the environment and on quality of life.

Sustainable cities must achieve, simultaneously, economic competitiveness and social and environmental progress in the context of socio-economic transformations expressed by reshaping industrial structure and transition to service economy. The aim is to remove the significant challenges, determined by changes, respectively, lack of opportunities for access to jobs, poverty, labor migration, households decline, abandoned land, lack of local business and trade, poor quality of natural and built environments and vandalism increase.

Integrate sustainable development into urban projects means, firstly, a political approach that is based on a vision of social progress, human development, based, in turn, on the need of human settlement at the center of concerns. A step of this process means to launch an organization, an operating approach supported by a joint, equitable, participatory and universal action; means starting a project where taking into account the three pillars of sustainable development (economic, social and environmental) should be decided interdependent and not by juxtaposition.

Based on the European Sustainable Development Strategy 2001 (Göteborg Strategy), reviewed in 2004, referring to environmental and sustainability issues of the integrated approach, the European Council has adopted the EU Sustainable Development Strategy in 2006, for towns and cities, with important themes: climate change, clean energy, sustainable transport, sustainable production and consumption, preservation and management of natural resources, public health, social inclusion, demography and migration as well as problems of global poverty.

The European Union ministries, the European Commission, the European Parliament, the Committee of Regions and other European institutions develop actions to support the development of European

cities and regions, in order to achieve the new sustainable development strategy goals, which, according to the "Leipzig Charter on Sustainable European Cities", recommends: (European Commission, 2009, quotes Leipzig Charter on Sustainable European Cities).^[5]

- widespread use of integrated urban development policy approaches (by creating and providing high quality public spaces, modernizing infrastructure networks and improving energy efficiency, innovation and educational pro-active policy);

- a special attention focused on disadvantaged neighborhoods, through ongoing strategies to ennoble physical environment, to strengthen the local economy and local labor market policy, to promote an affordable and efficient urban transport;

- creation and maintenance high quality of public spaces which held an important role for the environment of urban populations. They can attract business, tourism and labor;

- a modern infrastructure network to achieve an affordable quality transport system which include a network for a city-region link; improving the supply of networks, such as waste water treatment and water supply;

- improving energy efficiency, including an efficient use of natural resources.

As important partners in the target for economic growth and sustainable new jobs, cities, towns and metropolitan areas play a crucial role in removing obstacles in growth and employment, such as social exclusion and environmental degradation; they also attract investments, offering new economic opportunities and the perspective of life quality growth. Faced with competition, they work with authorities and administrations from adjacent areas to form city-regions, these meaning a better framework for activities related to developments and complex actions, in a large urban area, developing new forms of regional governance.

4. Conclusions

In approaches about urban regeneration and development, problems processing imply an integrated and comprehensive way and not according to political and administrative responsibilities. In practical terms, this means

that the main problems related to physical regeneration to be considered in relation to social, economic, environmental and cultural aspects of life and urban development. It is also necessary, public and private sector join, working with affected local communities and their involvement in joining actions.

Partners involved in urban medium and long term development plans have to design, from an early stage, a strategy for ongoing development after the public investment programs period, too. Monitoring and evaluation are an integral part of each development plan; they develop and reinforce each other, on clearly defined bases, they allow the assessment of progress, achievements and shortcomings.

adelindely@yahoo.com

Abstract

In recent years there are being discussed various aspects of regional development in our country. Thus, plans and strategies were made for developing our country regions, with influence in their localities. It is the case of Pitesti and Nehoiu both belonging to different development regions, but having an important role in the local and regional development.

Regional development attracts a number of positive consequences for both localities, such as rehabilitation and expansion of road and rail traffic routes, housing development through collective or individual housing, upgrading and development of certain technical aspects of the urban system, tourism, and not least the industry.

"Cities recorded four stages of community development - building, recruiting people, transition and maturity" [3], but over time there had been added others such as "the fifth stage companies called decay, also as suggested the sixth stage - leaving "[1].

Keywords: regional development strategy, implementation projects, functional diversification.

Classification J.E.L.: O18

1. Introduction

Regional development is an increasingly debated topic in the last decade by different authors and researchers from various fields. Authors like Ioan Ianoş, Radu Săgeată, Sorin Filip, Vasile Cucu, Nicolae Ilinca, Popescu Claudia, approached various issues of regional development of the country. Besides the previously mentioned authors, who

analyzed various regional issues, important data on local development are found in various studies such as General Urban Plan of the two cities, Integrated Urban Development Plan of the City Pitesti, made by competent authorities. These documents include a complete description of the two settlements and other information needed to be studied in order to take into account when drawing up regional development strategies.

2. Materials and methods used

The materials used for this study are the statistics on economic activities, the financial resources involved in local development and the public opinion on certain activities that can be locally developed.

As methods used in the current study we can mention the collecting of recording statistical data method from various organizations in the two localities, the information examination method, the questionnaire method and the explanation method.

3. Case study

Placing the two localities in the regions related development, Pitesti, in Wallachia South Development Region and Nehoiu in the South – East Region, is an important point in local development. Both localities are crossed by roads with national importance, which have a great contribution to their development as settlements. While, Nehoiu city is crossed from north - south by DN 10 (Buzau - Patarlagele - Nehoiu - Intorsura Buzau - Brasov) and crossing Buzau's Valley and Brasov's Depression, Pitesti is located at the intersection of several roads of national (DN 7, DN 65, DN 73) and

international importance (E 81), representing "old trade routes" [5], which interconnected the Romanian Country and Transylvania, but also between Pitesti and other important cities of the Romanian Country (Bucharest, Craiova Curtea de Arges, Campulung).

With respect to development strategies of the two cities forecasts can be made that may lead to important changes but long-term sustainable development is difficult. For more sustainable communities in the two settlements, in the planning process should be adopted long term policy and economic diversification. Thus, following a detailed analysis in the development of the two cities outlines some prospects of improvement and development of services sector, especially tourism, but also joining these villages to the projects implemented at the national, regional or local level.

For an upward trend in the national urban hierarchy and an increase in the development capacity, both cities need local authorities and economic operators investment interested in areas such as public or private nature, or mixed. Another solution for the development of these settlements is the proper exploitation of local resources (both as to material and human) that will lead to new businesses, especially SMEs and infrastructure improvements.

Long-term sustainable development is achieved through planning which aims to functional diversification. Experts believe that at present moment, the only opportunity for the development of cities is the diversification of economic activities but it has many implications both in the economic and social branch. This solution was adopted since the socialist period when the process of industrialization began. In the case of the town Pitesti, an important aspect that influenced the development of the village, was its location at the intersection of "two different geographical and agrarian regions, the fields and hills, so that trade was practiced with products from different areas" [2].

These two important reasons mentioned above, had a significant impact on village local and regional development, in time becoming the most developed urban center in the county of Arges.

In the case of the town Nehoiu there had been found several ways of diversification of

development activities of related industries that are a dependent branch of the dominant center (wood processing industry) and this will ensure economic efficiency and achieve vertical integration in the city but also the development of complementary industries with a different profile from the dominant activity. Even if some of these activities will be related, most are based on branches using female labor surplus (the city relies mainly on male labor force, creating an imbalance in the relationship between the two labor categories). In addition to these sectors an important role is played in tapping the surrounding region (forest resources) by the development and revitalization of small industry and handicrafts, which can lead to imbalances in the attenuation of the center now.

Over the time, economical speaking, the town Pitesti experienced some changes, namely the transition from an economy based on industry to the tertiary economy. An important role was played as Romania joined the European Union, which has involved taking some well-established term commitments. There have been changes both in economic, in the urban and social field. Local development assumes a match between "socio - economic objectives set out from local priorities arising from European, national and regional level, as well as changes currently occurring in the dynamics of spatial, economic and social at the county level and development region under the influence of global economic crisis" [3].

"Detailed and comparative studies, modern methods, factorial analyzes have demonstrated the importance of functional diversification in identifying the features of settlement systems. It was found that the unequal presence of specialized functions in cities creates large differences in the settlement systems, which can be as important as those determined by the size and centrality. From the beginning specialization may occur due to an accident or a community of courageous decisions, then it will take local specificities footprint and will remain attached to the town for a long time" [2].

As a result of the research, the town Nehoiu was constantly evolving, and maintaining its specific industry. The global economic crisis started in U.S. in 2007, made his presence felt in Europe. In Romania,

including the two analyzed cities, "the effects of the crisis have been felt since 2009, at the beginning but have deepened over time" [1]. This has some negative effects on local and regional development projects, affecting the two cities. Returning to the urban development process in Pitesti some projects were adopted, which are to solve "problems faced by medium and long term city, population reduction, competition exerted by the global economy, global warming and energy dependence" [3]. The problems regarding the situation on the town Pitesti were structured into three major components, namely society, economy and habitat, characterized by different strategic objectives, aiming to develop Pitesti by the year 2020.

The town Nehoiu is looking for a new identity because of the economical problems that it encountered, in conjunction with existing national (both political and economic). With the bankruptcy of some industrial units, it has also occurred in this city, the private sector (tourism companies, forestry industry, bakery, trade), which represents an important opportunity in developing its economy.

From the strategic goals that contribute to the development of the three major components the most important for both cities are: the company focus is on development of public services, education and social care - health to improve the quality of life and cultural and sports development objectives; the economy focuses on competitiveness and sustainable performance through innovation and technological development, and promoting diversification of the economic sector and tertiary sector development, which, according to General Urban Plan "are turning to third sector" [4]; is intended also to improve habitat quality housing through the development of well-established urban areas, equipment and technical facilities - municipal, development of accessibility by public transport and increase environmental quality.

Most of the projects designed for the two localities are funded by the European Union and have established deadline, some of them have also their own funds available in each local municipality.

Following the implementation and completion of the projects it is expected that

Pitesti "will become a pole of economic development, innovation, knowledge, communication and culture, logistics hub, both regional and national" [5].

In the year 2000 was amended the criteria for deprived areas which have been declared by the Emergency Ordinance no. 75/2000. This ordinance provides that, for declaring an area as deprived it must meet at least one of the following conditions: the area needed to lack means of communication, a weak infrastructure, the percentage of unemployed in the area to be at least three times the national percentage of unemployed in the last three months before the preparation of the declaration of the deprived area. "These criteria reduced the chances of regions affected by industrial decline to be declared disadvantaged areas, while limited reliability due to statistical indicators, unemployment rate, taking into account" [6].

As a result, the wider countryside has been advantaged in this regard because of reduced accessibility and underdeveloped infrastructure. A geographical area may be declared disadvantaged area for a period of 3 years (minimum) and 10 years (with the possibility to extend this period by Emergency Ordinance no. 24/1998).

The economical restructuring issues have convinced local authorities to take the necessary steps in declaring the city Nehoiu a disadvantaged area. Therefore, by GD. 661/2001, the city has become a favored area for 3 years (22.10.2001 - 22.10.2004). The area has been granted certain tax incentives under specific legislation (exemption from customs duties and VAT for machinery to modernize processes, returned duties for imported raw materials or necessary components for local production; income tax exemption, exemption from fees for change of destination or sealing of land for investment; grant amounts in the Special Development Fund to stimulate the export business of finished products and industrial services, funding programs special financing investment projects of companies through co-participation in the state capital), facilities that have boosted investment thus, by the end of 2002, a total of nine companies, most of which are SRL and all members of the SME (8 were between 10 and 49 employees and only one has between 50 and 249 employees) were created. Contrary to the specific of the

area only two of them regard the wood industry (one deals with the exploit and process timber and the other deals with the production of furniture) and 7 of the companies are engaged in manufacturing in one of the sub-branches.

The investment attracted in the period when the city was declared disadvantaged area were 1.6 million, while facilities granted was only 59,824 euro. However, businesses that have turned to the most important flows of investment (over 1 million) were the wood industry, furniture factory and the timber thus recording the highest values of exports and turnover.

Cheap skilled labor and the existence of communication that connects with the rest of the country have attracted foreign investors in the town Nehoiu. Recently, the representative corporation IKELA, S.A Nikmob has invested in the city and provides mobile production activities with supply contracts in 24 countries.

The other companies that have invested in the area engaged in trade, construction, agriculture, real estate, auto and motorcycle repair and maintenance of personal goods, mainly services rendered and rental companies. After local social capital subscribed in MDL, these companies fall in group size up to 10 million.

4. Conclusions

To initiate the creation of such regional or local development projects, the local and county councils should be more actively involved in providing facilities (under applicable law) to investors willing to develop businesses in these areas in order to develop local economies.

The administrative system of the two analyzed cities has a certain openness and interest to attract investment, both economic and urban-household.

Abstract

This paper aims to explore the way in which the objective of making regions visible actors at the European level can be achieved in Romania through the absorption of Structural funds. Firstly, we will highlight the importance of coherent and effective policies for the development of regions. Secondly, we will examine the way in which the actors involved in the implementation of regional development project can promote a proactive and transparent dialogue. Previous studies have shown that a weakness and main risk of such projects is the fact that the continuous collaboration with managing authorities is deficient. Hence, the way in which the stakeholders understand the importance of maintaining a close contact for the good functioning of the projects is crucial

Keywords: regions, Managing Authority, absorption capacity, regional and local authorities, collaboration.

JEL Classification: R11

1. Introducere

The purpose of this paper is to present the role of proactive and continuous communication during the implementation of regional development projects. We will examine the way in which the political split and lack of effective communication can stop all initiatives in regions development and the quest for proactive policies at a European and national level. The arguments and conclusions presented here are according to those of well known authors like Gheorghe Zaman, Stephen Weatherill and Ulf Bernitz. They discuss the local challenges for national authorities in order to foster a cohesion

policy, where the foundation is given by regions as key factors for increasing the state's efficiency. The European Regional Development Fund allocates resources to sustain the economic growth of European countries. European Development projects taking into consideration the limited absorptive capacity, the vulnerability of a discriminative behavior at the hands of politicians and administrative officials. [1]

We ground our present study on the interminglements of a clear communication policy between partners and the absorption capacity of regional actors. Thus, we will also focus on the close and continuous collaboration of central and local authorities subordinated to the Ministry of Regional Development and Tourism that manages the Romanian policy for regional growth. The Ministry carries out the European Regional Development Fund through the general Managing Authority and has as intermediary organisms (i.e. The Regional Managing Authority) the 8 agencies for regional development [2]

The majority of the European states have encountered difficulties in absorbing the European funds within their first years after adhesion, especially due to a "lack of a long-term perspective" from the part of the central authorities, due to the insufficient human resources when having to co-finance projects or after the austerity hit the European expenditures, the low administrative capacities at central and local level. The scholars underline the relevance in fund's absorption of the lack of inter-institution coordination, the failure of public-private partnership and limited abilities from the part of the human resources, etc.[3] Obviously, among the above mentioned dysfunctions, Romania has its uniqueness, adding to this list the disregard of the

administrative system for the absorption of structural funds. Taking in consideration the above mentioned, our analysis can be done through a clear-cut delimitation of the conceptual dimensions of the term "capacity of absorption", as well as the favorable context to our country on the process of decreasing the difference between the western and the eastern part of Europe. [4]

2. The Implementation of Regional Development

The European Regional Development Fund (ERDF) is one of the Romanian operational projects, agreed by the European Union and a very important instrument concerning the implementation of the national strategy and the policies for regional development. At the same time, it is the strategic document that implements elements of the Strategy for Regional Development within The National Plan for Development (NPD) and helps, among other operational programs, to achieve the objective of the National Strategy for Regional Development and the Strategic National Framework of Reference.

In this paper the economic region is relative and changing, but is not "spontaneous", as sociologist Vladimir Pasti referred to "the spontaneous transition and the compulsoriness of a firm intervention towards shaping interior-oriented transition with the direct objective of imposing development, so that Romania's faith is not decided for many years ahead from now on".[5] This might result in the rupture of the Romanian Transition from any strategy for development if is connected with weaknesses such as the low administrative capacity, lack of inter-institutional coordination, rigidity and incoherence.

Soon after the early '90, a large "institutional transformations" have taken place, and today, after 5 years from Romania's integration to the EU, we are preparing to reposition the role of these institutions with the regional administrative authority, in order to adjust to the process of decentralization, and facilitate the process of absorbing the structural funds. Lazăr Vlasceanu defines development as: "a system of institutional transformations produced in the most diverse social sectors with the

purpose to increase the performances of humans and organizations". [6] As Stephen Weatherill and Ulf Bernitz said in *The Role of Regions and Sub-National Actors in Europe*: "the regions have an enduring interest in achieving some measure of compensation for the centralizing tendencies of the process of European integration. The issue for the regions and sub-national actors is how they can affect the EU law-making process in a manner that satisfies their aspirations. This will be clear after the year 2015 rapports concerning the structural funds, for each operational program in turn. And the more effective such associations are shown to be in driving forward regional interests the more one would wish to challenge the notion that the EU harms regional power. It may in fact provide an arena within which regions may go over their States' heads, individually (by opening offices in Brussels) or, probably more effectively, collectively, in so far as functionally comparable groups emerge." [7]

The natural rapport between development and social-economic policies will be noticed only after the completion of the first 7 year cycle (2007- 2013), in which Romania has revived structural funds. The question that rises is: are we going to succeed or not in implementing the projects according to the National Plan for Development, so that they affect the regional economic growth?

At the same time, the shaping of the National Plan for Development (2014-2020) it is an important moment (2011-2013) for Romania's Government, because they will have to enforce the strategy for development according to the directions imposed by the "Europe 2020" strategy and will have to strongly negotiate the next budgetary activity (i.e.2014-2020) in which again it will benefit from more or less structural funds.

According to Traian Rotariu, "the territorial disparities consist in the differences among various regions, geographic territories at the level of a territorial entity, highlighted through relevant indicators connected to the level of socio-economic development of that given society, differences that are considered undesired from a functional point of view or in rapport with the accepted principles of social equity." [8]

Consequently, the series of actual regional disparities that are the rationale of these funds, are the result of historical evolutions, generated by the geographic conditions and increased by those socio-economic and political. After Romania's European integration, both the Romanian Government and the European Commission have tried to implement the policy for European cohesion by adopting a series of crucial documents (i.e. the National Plan for Development 2007-2013, in December 2005, The Regional Operational Plan 2007-2013, in June 2007 and the National Plan for Rural Development 2007-2013, in February 2008), which aimed the reduction of regional unbalances, through a transfer of communitarian resources, made an appeal for proactive measures in order to increase the absorption capacity for structural instruments (structural funds FEDR and FSE as well as the cohesion fund). A crucial instrument for understanding the *E.U.'s Regional Policy and economic disparities is the NUTS* (i.e. Nomenclature of statistical territorial units). All the regions that belong to the European Union can be found in the Nomenclature of statistical territorial units (NUTS). The purpose of this classification is to facilitate the gathering and harmonization of statistic data, in order to realize socioeconomic studies and analysis, as well as to allocate structural funds, the allocation of these being made on the criterion of the existence of a GDP/ inhabitant, at regional level, under 75% of the UE average. The Nomenclature is grounded by the next principles: favoring each member state's its specific administrative organization, on the grounds of the institutional division at a given point and creating a hierarchic level on three stages: NUTS 1 NUTS 2, NUTS 3.

In Romania there are four micro regions at NUTS 1 level (micro region 1- The North-West and the Center Region, micro region 2- East Region and South East Region, micro region 3- Region Bucharest-Ilfov and South-Muntenia and Micro region 4- West Region and South-West Region), taking into account the existent administrative structures and the 8 regions at NUTS 2 level, the 8 regions being declared as development regions, with a certain statistic role. According to the OUG no.75/2001 concerning the functioning of the National Institute of Statistics, whose activity will make possible the economical-social

analysis, from the above-mentioned indicators. The strategic goal of European Regional Development Fund, is supporting an economic, social, territorially balanced and durable development of all Romania's regions, according to the specific needs and resources, focusing on the support of sustainable development of the urban economic centers, consolidating the business environment and basis infrastructure, in order to transform Romania's regions, especially the poor ones, into attractive places for foreign investments. [9]

In order to achieve the general objective of regional development, this strategy aims the following specific objectives:

- To increase the economic and social role of urban centers, through a multidimensional approach, in order to stimulate a more balanced development of the regions;
- To increase the accessibility of investments into regions and especially to urban centers and their surrounding areas;
- To increase the quality of the regions' social infrastructure ;
- To increase the regions' competitiveness by enlarging the number of business-friendly locations;
- To increase the role of tourism in the regional development.

The implementation of the Regional Development program in Romania will ultimately lead to the reduction of interregional disparities. The rationale is to make sustainable economic poles within the interior of the regions, by decreasing the disparities between the urban and rural environment, among the urban centers and the adjacent areas, and in what concerns towns, the disparities between the investment-friendly areas and those that are not.

The financing from EU has represented during 2007- August 2011, approximately 84% from the European Regional Development Fund budget. The rest originated from national funds, public co-financing (14%) and private co-financing (2%). This was the case until 19 August 2011, when the European Commission took a series of measures that had a significant contribution in reviving Romania's, Greece's, Portugal's, Ireland's, Latvia's and Hungary's economy. The Commission has

made possible a supplementary co financing of 714 million euro. [10] After 15 November 2011, the European Parliament decided the vote of a rapport that contains the reduction of public co financing costs from 15% to 5% for the 6 above mentioned states.

The distribution of funds is made on the basis of the priorities that the Regional Operational Program has set. Each priority has a certain allocated budget and contains a number of key domains for intervention that aim the achievement of development objectives. According to the principle of subsidiarity, through regional politics, the UE member states preserve competences in solving the identified problems at the level of their own regional structures (that in Romania are still on hold, being very few state institutions endowed with regional authority in the administration), in supporting the development of infrastructure and job-creating investments.

The most popular indicators in comparing regions are: GDP/inhabitant, the standard power of acquisition, unemployment rate, the level of educational, the average life span, the degree of urbanization, entrepreneurial spirit (number of companies per 1000 inhabitants), direct foreign investments and poverty. [11]

The existing differences in the EU and the policy of convergence applied through the institutionalization of structural and cohesion financing represent the actual framework of reference in defining the capacity of absorption. There are differences among the interpretations of the capacity of absorption term at global and European level.

At a global level, it is thought that the term refers to “the capacity of the countries with low incomes to absorb a great volume of external assistance in a productive way”, the main issue in this situation being a priority in terms of receiving the help. The structures for regional development play a special part in implementing the structural funds, yet, the diversity of institutions at European level leads to different results. In this way, in states defined by a strongly- centralized administration in managing the community funds (Ireland, Portugal, Greece), the territorial structures play a minor part, whereas in the countries with a very low level of centralization (Sweden, France, Great Britain) bigger responsibilities are assigned at the level of regional bureaus of

national administration.[12] At the same time, within the federal states that have a decentralized system, it is noticeable that the regional authorities cover the problems triggered by implementing the structural funds partially or totally, situation present in the non-federal countries as well, but which apply the principles of regional autonomy.

On trying to realize a certain structure that classifies the different systems of implementation, Taylor, Bachtler and Rooney (2000) have proposed another typology grounded on the “administrative complementation”, respectively, the measure in which the system of structural funds implementation is designed together with the national programs. In this way, the following situations are acknowledged at European level:

- differentiated systems- the cohesion policies operate outside the context of national policy (specific to Belgium, Denmark, Holland, Sweden, Great Britain);
- subsumed systems- both the structural funds and the national policies are unified (applied in Netherlands, Austria and Spain);
- Composite systems- the differentiated system is structured at the top of the hierarchy of the national system (in France, Finland and Italy) [13]

In order to give answer to the challenges triggered by the economical crisis that has affected the whole world economy and EU economy as well, the European Commission has elaborated a European plan for economic Recovery, containing a set of proposals aimed to adapt the economic cohesion policy to the newer economic realities. At national level, the Romanian Government has taken over the following measures from the European Plan of Recovery:

- raising the standard level of national initial founding given to beneficiaries (from 15% to 30% out of the eligible value)
- introducing the possibility to prefinance beneficiaries in the case of projects that are subordinated to help from state/ minimal (up to a degree of 35% of the entire help value)
- accelerating the public acquisition procedures for the major projects of infrastructure;

- rules for improving the budgetary and financial management;
- making the internal coordination for the Managing Authority of the Regional Operational Program more efficient.

The analysis of the requests of financing and the average value of these, at regional level, on the 31st of December 2009, highlights the following:

- In the South, South West and West regions, although a relatively small number of financing requests were handed in, their average value is greater; this situation could raise bigger interest in these regions for projects with greater regional impact;

- In the North West, Centre and North East regions a greater number of financing requests has been handed in, yet, with lower average value, compared with the average at program level. This situation could represent a greater interest in these regions for local development projects ;

- The Bucharest-Ilfov region is characterized by a small number of requests and with smaller average values as well. This situation can find its explanation in the small number of potential beneficiaries in this region (only 48 local public authorities), compared to the other regions (for example: 574 in the Centre region or 557 in the North East region). [14]

An important issue is that of the long period of time that passes between the handing-in of the project and the signing of the financing contract, in some cases this period reaching 1 year. In comparison, the red-tape practice in other European countries has managed to render efficient this process and shorten the time, as in the case of Ireland (30 days at maximum). In Romania, the last years' practice reveals that on numerous occasions, there are situations in which certain beneficiaries, especially the small city halls, the poor county councils or the private enterprises and NGO's lacking resources, even though they had signed the contract of financing, they encounter serious problems in obtaining rapidly a credit necessary for starting their project, and, at the same time, the financial conditions (rates, bank guarantees, etc.) are difficult, mainly restrictive, generating financial difficulties prone to affect the project and its conclusion.[15] Usually, in the practice of banks, there is a restriction, concerning the projects that benefit from structural funding, in the way that, the investment within that project (land,

buildings, and equipments) cannot be introduced in the bank guarantee.

In our case the target population have included: project managers, financial managers, experts hired in project implementing teams projects unfolded on all the priority domains of ERDF, within the all the Romania's regions), projects won by beneficiaries as institutions (central or local public administration, NGOs, schools, universities, research institutes, small or big enterprises, social service providing associations) .[16]

The average length for the evaluation of contracted projects (starting with the submission of the request and up to the signing of the financing contract) in this period (2007-2009), has been of 346 days, within which:

- the stage of evaluating the administrative conformity and eligibility - 35 days;
- the stage of technical and financial evaluation- 53 days;
- the handing-in and the analysis of the Technical Project- 120 days;
- visiting the actual place- 18 days;
- the stage of pre-contracting-120 days.

From the analysis of the evaluation project unfolded up to the 31st of December 2009, it is revealed that 31.5% out of the financing requests have been rejected throughout the different stages of this process. The financing requests that have been rejected during the stage of evaluating the administrative conformity and eligibility represent 50% of the total of the rejected requests, until the 31st of December 2009. The main causes involved were: 50% - the lack of and/or the vagueness of some documents, 20%- inability to respect the standards from the solicitant's guidelines, 15%- ineligibility, 5%- not respecting the minimal/maximal value, 10%- other (over-term handing in, lack of answer for clarifications, etc.)

In our study we have sent an electronic survey to a group of selected managers in the implementation of regional projects from local city hall of the 8th regions. We aimed assessing the way in which they appreciate their collaboration with the Managing Authority for implementation of the regional development projects. In order to make a qualitative assessment of this situation, we asked them to appreciate the way in which they have cooperated with the Authority

during the implementation, as this was indicated as the main problem during the project implementation. On a Likert scale from 1 to 10, the majority of 53% the collaboration was assessed as a 3 or 5 from 10, so it can be regarded as deficient. More than 20% stated that the collaboration can be assessed as a 4, pointing out the lack of efficiency in the institutional organization for regional growth. The measurement of the quality of collaboration between Project Managers and the Managing Authority

3. Conclusions

In conclusion, it is predicted that all these changes in the general context of Romania's economy will have a negative impact over the European Regional Development Fund implementation, through the reduction of the co-financing possibilities of both public (local authorities, regional or central) and private beneficiaries, and this will determine them to revise again their priorities and adapt them to the new economic situation of the country.

During this paper we aimed presenting the opportunity of making regions a visible actor in the sustainable development. Moreover, as the Romanian policy is lacking the clarity of objectives for making regions a crucial factor in accumulation structural European funds, a major impact is the dependency from the central administration. Previous studies underpinned the idea that the main problem of successful implementation the projects is having a good collaboration with the Managing authority in order to facilitate the overcome of difficulties in achieving the program's objective. Managers have indicated that they have to deal with uncertainty in the project's cycle of life so this can be avoided by planning, participation, leadership, and investment.

Innovative Clusters and Foreign Direct Investments in the Nord – East Region

Trufin Ovidiu Serafim

„A.I.Cuza” University, Center of European Studies, Iași

ovidiu_trufin@yahoo.com

Abstract

Research on the competitiveness of regional clusters of Foreign Direct Investments (FDI) in the same and related industries has been dominated by a profoundly optimistic view, concerned far more about the integrative possibilities of dense social networks than the dysfunctional consequences of such networks.

The aim of this paper is to offer a description of relationship between Foreign Direct Investments and innovative clusters in Nord-East Region of Romania and the new result of interactions between different actors from the innovative systems. In this matrices, in host countries, Foreign Direct Investments have to follow efficiency seeking type and not labor and market orientated FDI.

Key words: Innovative Clusters, Foreign Direct Investments, Nord-East Region, research & development (R&D),.

J.E.L. Classification: F23, F43, R58

1. Introduction

The cluster concept has a long history. Over the years it has received many names, including “pole of competitiveness”, “industrial district”, “concentration” etc. Today, a popular name is “cluster” or “pole of competitiveness” (in France and Belgium), but the most frequently used term is “cluster”. Professor Michael Porter is considered to be the inventor of the “cluster” term; he defined it as “a geographical concentration of interlinked companies and institutions from a certain economical field”. Clusters have the following components: [1]

- Interlinked industries and other entities, such as specialized suppliers and the according infrastructure;

- Distribution channels and customers, complementary product and service providers and companies affiliated as competencies, technologies etc are concerned;
- Linked institutions, such as research institutions, universities, benchmarking organizations, training entities and others.

The most important dimension of a cluster is the distance between the companies and as a result the entire cluster theory is based on the geographical proximity. Nevertheless, there are also other dimensions like technological gap (how similar are the technologies used by the two enterprises), differences between the firms in regard to the labour force qualification, market position and social relationships, which determine clusters.

2. Methodology

This article aims to identify the relationship between clusters and Top 100 FDI in Nord-Est Region. In order to achieve this goal a content analysis of 10 relevant articles have been made. The analysis was focus on identifying a definition of clusters, the new diamond of innovation and witch type of FDI are involved in innovative clusters. The selected articles were selected during 1998 – 2010 from Harvard Business Review, Discussion paper, Report of Ministry of Romanian Economy. The results of this analysis will be showed in part five and six of this article. So, the third part will focus on the concept of clustered while the fourth part concentrates on the new diamond of innovation, the new concept of clusters.

3. The concept of clusters: background and different approaches

With the transformation from an economy based on material production to an economy

based on knowledge, research in organization theory and strategic management on competitive advantage has been extended from firm-based approaches focusing on intrafirm capabilities to perspectives which see distinct advantages in the firm’s embeddedness in inter-organizational networks and the way these are managed. In many industries, inter-organizational networks are geographically concentrated in the form of clusters, which are considered a source of regional competitiveness.

Most research on clusters has adopted Porter’s definition of a cluster, focusing on interdependencies and complementarities in exchange relations. The literature reveals a tendency to interpret the competitive advantage of clusters with respect to the benefits obtained from a coherent and stable collective order, sustained by inter-firm behaviour that is oriented to building interpersonal trust, sharing tacit knowledge and institutionalizing exchange along a common standard. The key terms used in this literature include concepts indicating social closeness and stability in the form of organizational routines, connectivity, social capital, collective identity and untraded interdependencies.

4. The New Diamond of Innovation

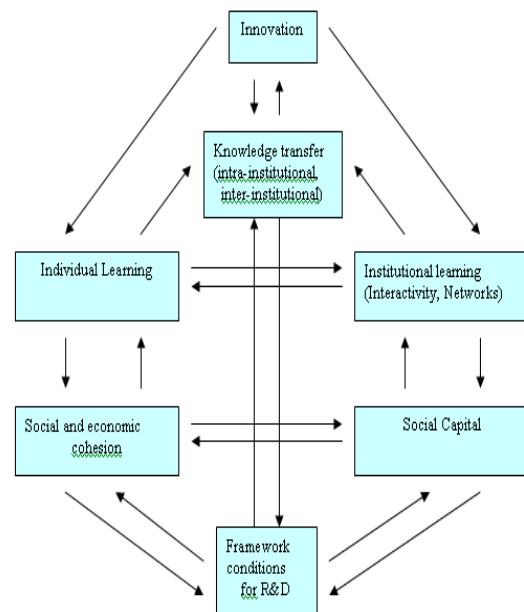

In today's economic context, one does not only speak about clusters. Often the discussion goes about innovative clusters. Innovation can be seen as a result of interactions between different actors from the innovative systems. The systemic view of innovation was first promoted by Lundvall (1992) and Nelson (1993), and more recently by Guth (2004). Considering these new ideas, the traditional linear model of innovation becomes less relevant. Learning, trust and social capital turn into foundation piles of this model.

The “New Diamond of Innovation” Model taking into consideration the competitive advantage theory of Porter and the individual and institutional learning concepts. [2]

Without oversimplifying we can summarize main characteristics for success as follows:

- Clusters are unique. They follow different objectives and approaches and they are built on the national socio-economic and cultural framework conditions.

Figure 1 New Diamond of Innovation

Source: Guth, 2004

- High level of trust between companies and between the private and the public sector as well as influential local government decision makers are clearly related to good performance.
- Cluster initiatives supporting strong clusters (high concentrations, strong value chains, high visibility) are more successful. Those initiatives which focus on sectors which are already advanced usually do achieve better results. [3]

5. Romanian experiences in innovative clusters

In Romania, the planned and autarchic economy before 1989 was leading towards a certain type of clusters, namely the former "industrial centers". The period after the Revolution was marked by a huge decrease of the industrial activity, by a relocation of resources and a repositioning of the economy. It is only after 2001, when the economical growth has finally started, that a discussion about industrial concentrations makes sense. In total we found 55 clusters or potential clusters in the eight regions. Although the results of the different workshops should not be used too much for comparing the single regions, we see that we have identified on average seven clusters per region. This speaks for a rather coherent regional distribution.

What we see is, that the experts assessed the labor force situation as rather favorable. We can make out in total nine clusters from five regions:

- in Bucharest/Ilfov the food cluster;
- in the North West the clusters clothes, tourism, wine and wood;
- in the South West agriculture and tourism
- in the South glass;
- in the South East also tourism

In three regions labour force in the field of tourism seems to have some potential for further improvement. Also the wider agriculture and food sector (incl. wood and wine) could profit from a more sophisticated labour force. [4]

6. FDI and clusters in the Nord-East Region

We identified the following clusters in North-East Region:

- clothing and footwear cluster: are present in the counties Bacau, Iasi, Vaslui by several local companies. The triple axis of the cluster is highlighted innovative collaboration with the Faculty of textile, leather and industrial management, Univ. Technical “Ghe Asachi” and cooperation between schools and industry by providing equipment no longer used in production, an example being Astrico program;
- clusters in medicine: the medical centers present in Iasi, Bacau, Neamt. The obvious example of innovative cluster in this area is the existing collaboration with Univ. of Medicine and Pharmacy "Gr. T. Popa ", Inst. "Petru Poni" Iasi, Inst. of radiology Iasi, Hospital “St. Spiridon” Iasi. Another innovative element of the cluster is given by the institutional dimension involving North-East Regional Development Agency by development projects;
- clusters of turism: are present in Neamt and Suceava counties. Institutional involvement in innovative cluster is highlighted by collaboration with the Faculty of History and Geography “Stefan cel Mare” Suceava, University “A.I. Cuza” Iasi, Inst. “Ghe. Zane” Iasi and the involvement of “Bucovina Turist Association” through specialization and cooperation with local tourism firms. The

result was the establishment of local tourist information centers;

- clusters in the food industry are present in Botosani, Vaslui, Iasi. Institutional support is provided by Univ. of Agricultural Sciences and Veterinary Medicine "I.I. Brad "Iasi, Faculty of History and Geography “Stefan cel Mare” Suceava, Suceava Agricultural Research Center, Agricultural Research Center in Iasi. One of the projects implemented in this cluster was tele-learning between Science and Agricultural High School of Veterinary Medicine „Podul Iloaiei”. Also it is a continuous support of county agricultural offices by specialists in agriculture;
- Cluster wine sector is currently present in Iași by local companies and collaboration with Univ. of Agricultural Sciences and Veterinary Medicine “I.I. Brad” Iasi and Iasi wine research center.
- Cluster in pharmacy: Piatra Neamt and Iasi. Innovative cluster is complemented by cooperation between local firm “Antibiotice” Iasi and University of Medicine and Pharmacy Iasi.
- IT Cluster in Iasi and Bacau. Local authorities were involved in the creation of business centers, for exemple, business center “Tehnopolis” Iasi, Iasi business incubator business and IT industrial park in Bacau; projects between the Univ. “A.I.Cuza”, Univ. Technical “Ghe Asachi” and local businesses.
- Cluster of wood industry in Suceava, Neamt and Bacau. Institutional support is provided by the Forestry Department of Suceava and local chambers of commerce and industry.

The analysis of foreign direct investment FDI in the Top 100 North – East FDI show several aspects of FDI. FDI were identified from the Amadeus database in terms of percentage shares of at least 10% owned by a foreign shareholder. Classification was done according to the revenue in 2011. The largest FDI of the North - East is “Altex Romania SRL”, owned by “Abacus Ltd.” from Netherlands with 74% of shares. The income amounts is 189,934 thousand euros. The distribution of FDI is as that follow: in Iasi FDI are 37%, in Neamt County 17%, 16% in Bacau County, 15% in Suceava County, in Botosani County are 11% and only 4% of

FDI in Vaslui County. There is a concentration of more than 1/3% in Iasi, in Suceava and Bacau County have approximately equal number of FDI and less FDI are in Botosani and Vaslui County. (Figure 2)

Figure 2 FDI in Nord-Est Region of Romania

Source: own calculation, 2012

The top five investing countries by nationality in Nord-Est Region of Romania in 2010 are: Netherlands, Austria, Germany, France and Greece. Investor first country is Italy. Netherlands and Germany are also present in the NE Region. Netherlands is the second largest investor. Belgium, which is ranked 13 in Romanian industrie by FDI, here is the third country investors. This picture of FDI is explained by the presence of Italian FDI in the textile industry. Most active FDI in manufacturing, followed by services and distribution. This shows that FDI in the NE region are the type of markets and resources seeking and the type of efficiency. In terms of expansion and expansion into other markets, more than 20% of FDI own branches, most on the local market. Only one ISD, „Ball SA” has opened branches abroad, in neighboring countries. This shows poor orientation of FDI in capital outflows. Local FDI is still orienteted for own market expansion It should be noted and regional market presence of FDI in the same representative industry like “Egger Romania SRL” Radauti, the first manufacturer of wood panels in Romania and one of the biggest in CEE, “Bearings SA” Barlad, present in the top 500 CEE companies, “Ambro SA” Suceava, the largest paper producer in Romania, “Rompak” Pascani, one of the largest producers of ingredients for baking industry in Romania, “Rafo” Onesti, one of the largest refineries in the country, “Sercomf SA” Botosani, one of the largest textile producers in Romania, “Mecanica Ceahlău” Piatra Neamt, the largest manufacturer of agricultural machinery in Romania .

7. Conclusion

The question of FDI in the North – East Region is if these companies are involved in local clusters, research centers or if the FDI presence is only isolated island in search of only markets and labor. This raises the question, if we can really talk about the connection between innovative clusters and FDI in the North – East Region. We found this link in same economic sectors that are dominant in a county as: textiles industry in Botosani, wood industry in Suceava, Neamt and Bacau, food industry in Iasi. In terms of the relationship between FDI, local businesses and economy of scale, a particular problem is the lack of local service specialized in technological fields FDI. Such deficiencies are recorded on the lack of service providers available in the country, and the refusal of Romanian companies to use business services, especially support services for innovation. This is particularly regrettable in terms of "international best practices" which shows that innovation services providers can make the difference between success and failure in innovative clusters. An example would be the regional development agencies and chambers of commerce which not provides highly specialized services to businesses, in a target area and this feature reduces their importance in innovative clusters.

The Impact of Clusters on the Development and Competitiveness of the Tourism Industry in Romania

Asalos Nicoleta
„Ovidius” University of Constanta
nasalos20@gmail.com

Abstract

This paper propose an analyse of tourism clusters impact on regional development and competitiveness of tourism industry in Romania and a comparison with some tourism clusters from another traditional touristic european countries.

Tourism is an extremely important economic activity, which may play a decisive role in certain development areas, effects of tourism need to be considered, in general, from their relationship with the fundamental objectives of the whole economic system. The contribution of touritic sector is characterized by the enormous possibilities that have to produce direct, indirect and induced effects in an economy, to the creation and use of national income, its effects on inflation, investment or diversification of economic structures, its role in enhancing the quality of life.

Cuvinte cheie: regional competitiveness, clusters, sustainability, cooperations

Clasificare J.E.L.: M21, O16

1. Introduction

Tourism cluster is a geographic concentration of companies and institutions interconnected in tourism activities. This includes suppliers, services, governments, institutions, universities and competitors (Capone, 2004). Beni (2003) defines tourism cluster as a set of attractions with touristic differential, concentrated in a limited geographical area with facilities and services of quality, collective efficiency, social and policy cohesion, with coordination of the production chain and of the cultural associations, and with excellent management of companies' networks that generate comparative and competitive advantages.

Clusters are a group of tourism resources and attractions, infrastructure, universities, equipment, service providers, other supporting sectors, and administrative bodies whose integrated and coordinated activities contribute to providing customers with the experiences they expect from the destination they choose to visit. If we translate this definition to romanian tourism industry we'll find a few attributes of tourism clusters: **diversification and innovation ; rise of competitiveness; cooperation; promotion; regional tourism development** that contribute to sustainable regional growth and prosperity and stimulate the growth of other clusters of high importance in the region, including the construction, retail and transportation clusters. Partnership and alliances at cluster level is, undoubtedly, the most critical area of cooperation and its must improve competitiveness and secure sustainability.

2. Regional competitiveness and clusters

Regional competitiveness as a concept should include as a basic principle of territorial cooperation and strengthen coordination between sectoral, national and Community. An integrated inter-sectoral and inter-institutional territory is difficult to achieve but can generate endless possibilities for analysis and intervention measures default. Since the first EU report on competitiveness, which reported worrying trends in terms of competitive advantage both in global and local, to the current strategic directions of the Union, giving priority to regional competitiveness, the key issue became subject to the formation of European policy.

New Lisbon Agenda requires that "the EU to mobilize all appropriate national and Community resources, including social cohesion" and argues that greater ownership

of the Lisbon objective is possible only by involving local and regional stakeholders and partners social (European Commission 2005). Lisbon Agenda was originally thought to help Europe to become "the most competitive knowledge-based economy" by 2010, but subsequently underwent a review by the emphasis has shifted to economic growth based on technological progress and employment. Also, the European Commission and Council have identified a set of indicators to monitor progress divided into six groups: economic environment, employment, innovation and research, economic reform, social cohesion and environment. Later, they added a spatial dimension, which integrated strategies for competitiveness and sustainability in the European Spatial Development Perspective. Analysis of factors generating regional competitiveness is to provide a current in the European Union in dealing with spatial planning and new policies at European level aimed at reducing disparities and more appropriate distribution of development funds within the region. Determinants of competitiveness refers to: using creative and innovative potential of regional / territorial / national level, making connections to regional / territorial by stimulating the cluster, natural and cultural heritage, research and innovation potential use and improve accessibility. Theory clusters / poles of competitiveness in countries such as France, Belgium, Portugal became visible after the paper's appearance M.Porter (1990), relies on the idea that competitiveness at regional level derives from the presence and dynamics of geographically localized activities, among which there fierce competition, benefiting from favorable conditions of production factors, the strong demand and strong and competitive sectors horizontally. The more localized the cluster / pole, the more intense interactions between these components of competitiveness and therefore the diamond region is more competitive.

3. Impact of clustering in Romanian tourism. Case study Carpathian Tourism Cluster

The concept of cluster is adopted to the specific characteristics of tourism activity, whose product is linked to its local base and

to the joint action of an agglomerate of enterprises involved in the region's tourism product.

Porter defined agglomeration as: ...a geographical assembly concentrating inter-related enterprises, correlated institutions in a determined area linked to common and complementary elements. The geographical scope varies from a single town or state to the whole country or even a net of neighboring countries. The agglomerations assume diverse ways, depending on their deepness and sophistication, but most of them include enterprises of products and final services, specialized input suppliers, components, equipment and services, financial institutions, enterprises and correlated sectors. The agglomerations generally also include companies up and down in the supply chain, producers of complementary products, suppliers of specialized infrastructure, governmental institutions and others, devoted to specialized training, education, information, research and technical support (such as universities, study centers and workers on vocational training), and standardization agencies.

The governmental institutions with main influence over the agglomeration would be one of its members. Finally, many agglomerates include commercial and other private associations which support its members. [Porter, 1998]. To Zacarelli in 2004, a complete cluster must include some other technology-related characteristics as well as characteristics related to competitiveness, environmental and cultural sustainability, quality of life and synergy as a result of systemic relations. The variables presented, Porter adds: the habit of reusing recyclable materials or sub-products; intense competition among cluster actors and from them to other clusters; similar technological pattern among enterprises; society culture adapted to cluster activities; high correlation and synergy among activities, agents and widening benefits concerning quality of living.

Carpathian TOURISM CLUSTER ROMANIA actively supports the tourism development and promotion of the Carpathian regions. The target is to establish the Carpathian Mountains as "Tourism destination of excellence". This means for us standards and quality of tourism services and

– at the same time – preservation of the regional identity and uniqueness (nature, history, culture, tradition). Carpathian TOURISM CLUSTER ROMANIA is based on Romania’s national cluster development strategy which is supported by the European Commission. The marketing measures will be in line with the national tourism and brand strategy “Romania – Explore the Carpathian garden”.

The main objectives of the cluster are innovation and diversification in order to attract new tourists to the Carpathian region. This shall be reached by the development of modern tourism offers and the improvement of the quality of touristic service according to European standards.

The main objectives of Carpathian TOURISM CLUSTER :

1. **Innovation and diversification:** Development of innovative touristic offer and services to attract new tourists to the area of the Carpathian Mountains;
2. **Rise of competitiveness:** optimize the value chain in the local tourism industry;
3. **Quality:** improve the quality of the touristic services (European standards);
4. **Cooperation:** exchange of ideas and joint projects between the touristic regions of the Carpathian Mountains and international tourism destination;
4. **Promotion:** promote the Romanian Carpathian Mountains as “destination of excellence” within the national tourism promotion strategy “Romania – explore the Carpathian Garden”;
5. **Regional tourism development:** contribute to sustainable regional growth and prosperity.

The cluster is integrated in an international tourism network and especially intends to promote the Carpathian Mountains abroad. All cluster projects have a supra-regional character. In the launching phase, the cluster concentrates his activities on the Carpathian and Subcarpathian districts of Brasov, Buzau, Sibiu, Covasna, Arges and Prahova.

A tourism cluster is a platform for networking and strategic cooperations along the whole tourism value chain. The advantages of cooperation nets in tourism activities allow for the effective exploitation of the collective efficiencies and/or the development of external companies from the enterprises (entrepreneurial cooperation, work productive specialization, collective infrastructure, service specialization etc.) and

also makes it possible to benefit from the increased ability to negotiate collectively with suppliers of inputs and components. Carpathian TOURISM CLUSTER ROMANIA provides the following services to its members:

- Organisation of regular meetings of regional and national tourism stakeholders
- Regional, national and international matchmaking events for specific tourism topics
- Organisation of an annual Tourism Cluster Day
- Online cooperation forum to search for partners or specific services/products

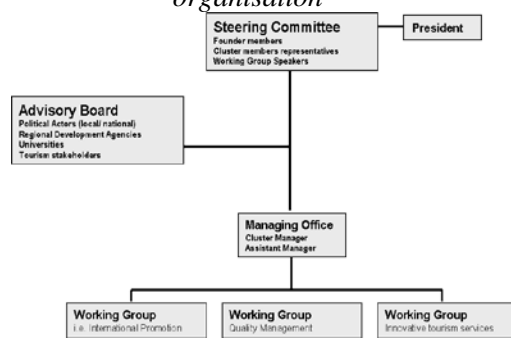

Carpathian Tourism Cluster has been founded in 2010 based on the initiative of the Tourism Association Brasov (Asociatia pentru Promovarea si Dezvoltarea Turismului din județul Brasov (APDT) and the Tourism Association Monteoru Renaissance (Monteoru Renaissance- Asociatia pentru dezvoltare regionala durabila in turism – Judetul Buzau). Carpathian Tourism Cluster is an independent network of regional and national tourism stakeholders and Romania’s first supra-regional tourism cluster of national interest.

Carpathian TOURISM CLUSTER ROMANIA encourages the set up of working groups. Working groups are formed by interested cluster members in order to develop new tourism services and products and to boost the tourism marketing of the region. So, cluster working groups in preparation:

1. **Innovation:** Development of innovative tourism products and services for the region of the Carpathian Mountains;
2. **Quality:** HR development and quality management;
3. **Marketing:** Promotion of the Carpathian tourism regions as “Destination of Excellence”.

Carpathian Tourism Cluster Romania has the following organisation:

Fig. 1 Carpathian Tourism Cluster organisation

Carpathian Tourism Cluster Romania is a non-profit and non-governmental organisation (NGO), organised as association according to Romanian law. As a cluster member your organisation/company has the following benefits:

- Exclusive access to information, services and contacts of Carpathian Tourism Cluster
- Opportunities for strategic cooperation with other tourism companies and service providers along the whole tourism value chain
- New ideas and knowledge for the diversification and quality improvement of your services
- Access to European structural funds
- Special offer/rates for seminars and trainings
- Joint purchasing activities (bundling of buyer interests)
- Joint promotion activities (i.e. national and international trade fair participation)
- Joint national and international marketing and sales activities for the Carpathian tourism region.

This cluster like all tourism clusters promote sustainable tourism and create added value for the tourism industry in the region of the Carpathian Mountains. The function of tourism causes direct impacts that affect both the territorial system and the production of tourism itself. The environmental spoiling of a beach does not mean only the deterioration of the territorial system but also competitiveness of the function of tourism in the region. [Ivars, 2004]. Sustainability is a fundamental concept when reassessing the role of tourism in contemporary society. The World Tourism Organization defines sustainable tourism in this way: Sustainable tourism is understood as the kind that

satisfies the present needs of tourists as well as preserving the destination regions while incrementing future opportunities. It has to be conceived in a way to guide management of all available resources in order to meet economic, social and aesthetic demands, maintaining cultural integrity of essential ecological processes, biological diversity and life supporting systems. (OMT, 1998). The local development model based on sustainable tourism involves very complex relationships and can only be accomplished if the dimension reality of a certain region or territory is taken into consideration.

4. Conclusions

- Analiza factorilor generatori de competitivitate regională constituie un demers permanent al oricarei regiuni și țări în ceea ce privește abordarea în domeniul planificării spațiale, reducerea disparităților de dezvoltare și o distribuire mai adecvată a fondurilor pentru dezvoltare în interiorul regiunilor;

- Creșterea competitivității regionale implica automat: valorificarea creativă și inovativă a potențialului regional/teritorial/național; realizarea de conexiuni la nivel regional/teritorial prin stimularea apariției clusterelor; valorificarea patrimoniului natural și cultural; utilizarea potențialului de cercetare-inovare și îmbunătățirea accesibilității;

- **Tourism cluster** has many definitions but the most relevant seems to be the following (*Eulogio Bordas*): “accumulation of tourist resources and attractions, infrastructures, equipments, service companies, other supporting sectors and administrative organism whose integrated and coordinated activities allow to provide the customers with the experience they expect from the destination they choose to visit”.

- Carpathian TOURISM CLUSTER ROMANIA is based on Romania’s national cluster development strategy, which has been founded in 2010 to: 1. promote sustainable tourism and create added value for the tourism industry in the region of the Carpathian Mountains; 2. innovation and diversification in order to attract new tourists to the Carpathian region. This shall be reached by the development of modern

tourism offers and the improvement of the quality of touristic service according to European standards.

Abstract

This paper analyzes the relationship between resources allocated to health care and quality of health services in 15 EU member states. We use quantitative secondary data describing the level of several financial, human and material resources allocated to health care and people positive evaluation for the overall quality of healthcare, as variables and principal components analysis, as statistical method. The results display significant differences in the perception of health care quality among analyzed countries. They also confirm the existence of a relationship between financial and real resources allocated to health care and respondents' evaluations of health care quality.

Key words: financial and real resources, quality of health care, patients' perception, inequality.

JEL Classification: H51, I11, I14.

1. Introduction

The issues of access and quality of health care are a priority on international agenda. They are considered as key elements for improved health outcomes and efficiency in health care services delivery in any health system.

Quality is defined as “the degree to which health services for individuals and populations increase the likelihood of desired health outcomes” [1]. Consequently, any research aiming at identifying the factors influencing health outcomes and to suggest

ways to improve them can be considered quality-related research and there is a large body of literature dealing with this issue.

The studies referring directly to quality in health care are mostly concerned with micro clinical level. They focus on finding ways to improve quality at organizational level ([2],[3],[4],[5] etc.)

Fewer studies are concerned with relating the health system macro characteristics with overall quality in health care [6].

Even if it appears simple to define it, measuring quality in health care is not an easy issue. On the contrary, many attempts to measure it fail since the concept is much too complex, involving too many questions and determinants [7].

This paper analyzes the relationship between resources allocated to health care and quality of health services in 15 EU member states, taking into consideration the interaction between macro and micro level

We start from the premise that the level of the resources allocated in health care impacts upon the perceived quality of health care. Consequently, we aim at investigating if and to what extent several macroeconomic indicators related to the level of financial and real health care allocated resources influence people' perception of quality. Another objective of this study is to highlight the similarities and disparities among several EU countries, with a special focus on Romania.

We use quantitative secondary data describing the level of several financial, human and material resources allocated to health care and people positive evaluation for the overall quality of healthcare.

The statistical method used in the paper to test the relationships between health care

resources and perceived quality of health care is principal components analysis (PCA).

The findings confirm the existence of a relationship between financial and real resources allocated to health care and respondents’ evaluations of health care quality. They also point out an unfavorable situation for the Romanian health care system from the point of view of its capacity to provide high-quality services.

2. Data and methodology

Variables

Health care quality is analyzed in this paper using as indicator the percentage of positive evaluation for the overall quality of healthcare retrieved from Special Eurobarometer 327 - *Patient safety and quality of healthcare*. This stands for the dependent variable of our analysis.

As independent variables we use five indicators of which two of financial expenditures on health namely, Health expenditure per capita (current US\$) and Health expenditure, public (% GDP), two indicators of material resources (Hospital beds per 100 000 inhabitants and Medical Equipment – Total density per 100 000 population: Magnetic Resonance Imaging) and one variable describing the human resources in health care (Practicing physicians per 100 000 inhabitants).

The data used are obtained from international databases and are registered for 2009, unless otherwise stated (Table 1). The data are available for 15 EU member states: Austria, Czech Republic, Denmark, Estonia, Hungary, Italy, Latvia, Lithuania, Luxembourg, Malta, Poland, Portugal, Romania, Slovenia, and Spain. Statistical data processing was conducted using SPSS software.

Table 1 presents the descriptive statistics for included variables.

Table 1. Descriptive statistics for included variables

	Mean	Min	Max	Std. dev.	Reference year	Source
Perceived quality of healthcare - good (%)	60	25	95	24,73	2009	1
Practising physicians per 100 000	318,8	217,0	467,1	65,18	2009*	2 **
Hospital beds per 100 000 inhabitants	549,8	319,3	765,0	155,05	2009	2
Medical Equipment – Total density per 100 000 population: MRI	0,9	0,1	1,8	0,54	2010	3
Health expenditure, public (% GDP)	6,1	3,9	9,0	1,52	2009	4, 5
Health expenditure per capita (current US\$)	2576	432	8262	2322,59	2009	4, 6

* Data for Denmark are registered for 2008.

** Data for Portugal were obtained from World Health Organization.

Source:

- 1 European Commission
- 2 Eurostat
- 3 World Health Organization
- 4 World Bank
- 5 HNP stats
- 6 World Development Indicators

As can be observed in the table above, the allocation of health resources is unequal among the analyzed countries, approximately two times higher in the best of than the worst of if referring to human resources, 18 times higher between the two categories when it comes to medical equipment and 19 times higher if considering the level of health expenditure per capita.

Despite the fact that using patients’ opinions in order to evaluate the quality of health care has several methodological limitations that should be taken into consideration [6], the choice for such a dependent variable is justified by the fact that the evaluation is provided by the patients’ who are the ones situated “at the front lines of care” [8]. Besides, the differences than can be noticed between countries, although evaluated subjectively, are significant and contribute to a certain understanding of the realities in EU health systems (Figure 1).

Figure 1. Evaluation of health care quality in analyzed EU countries, in 2009

Source: European Commission (2009), Special Eurobarometer-327: Patient safety and quality of healthcare.

The percentage of positive evaluation for the overall quality of healthcare ranges from 95% in Austria to 25% in Romania, the sample average being of 60% (Table 1).

Statistical analysis

In order to identify and describe the relationships between variables and also similarities and differences between statistical units, from the perspective of the analyzed variables, we use a multivariate statistical method, Principal Components Analysis (PCA) [9].

Before applying PCA, a preliminary analysis is performed, aiming at verifying the adequacy of data for a factorial analysis. The χ^2 test is used to test the null hypothesis that the variables in the correlation matrix of the population are uncorrelated, and the indicator MSA (Measure of Sampling Adequacy) of Kaiser-Meyer-Olkin to evaluate in which degree each variable may be predicted by all the other variables.

If Sig value is smaller than 0.05, (conventional value associated to χ^2 test), the null hypothesis is rejected and it can be guaranteed with a risk of 5% that there are significant statistical relationships between the variables. The identification of the relationships is made with KMO statistics. If KMO is higher than 0.5, the PCA can be applied.

After processing the data in SPSS we obtain the Initial Eigenvalues corresponding to the 6 factorial axes (there are 6 variables included in the analysis), the variance

explained by each factorial axis, and the graphical representations which allow us to identify and describe the relationships between variables and statistical units.

3. Results

The results obtained with SPSS (Table 2) show a significant value associated to Bartlett's test of sphericity, with χ^2 statistic, Sig = 0.000 that is smaller than 0.05 (conventional value), which means the null hypothesis of variables' uncorrelation is rejected, and the considered variables are adequate for a PCA. Thus, with a probability of 95%, we can say that there is a significant relationship between the statistical variables. The value of the indicator MSA of KMO (KMO=0.612), higher than 0.5, shows that the solution obtained with PCA can be accepted.

Table 2. Values of KMO test and χ^2 statistic

Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		.612
Bartlett's Test of Sphericity	Approx. Chi-Square	42.252
	df	15
	Sig.	.000

Source: Output obtained in SPSS with PCA

Factorial solution indicates variables' grouping in two principal components which have an explicative power of 76.311% of the total variance.

Variables coordinates on the first two factorial axes are presented in Table 3. They show variables positioning on the factorial axes. The variables Practicing physicians per 100 000 inhabitants, Medical Equipment – Total density per 100 000 population: Magnetic Resonance Imaging, Medical Equipment – Total density per 100 000 population: Magnetic Resonance Imaging, Perceived quality of healthcare - good (%) are located in the positive quadrants of both factorial axes. The variable Hospital beds per 100 000 inhabitants is located in the negative quadrant of the first factorial axis and the positive quadrant of the second while the variables Health expenditure per capita (current US\$) and Health expenditure, public (% GDP) are located in the positive quadrant

of the first factorial axis and the negative quadrant of the second.

Table 3. Variables’ coordinates on the first two factorial axes

	Component	
	1	2
Practicing physicians per 100 000 inhabitants	.609	.638
Hospital beds per 100 000 inhabitants	-.528	.750
Medical Equipment – Total density per 100 000 population: Magnetic Resonance Imaging	.893	.041
Health expenditure per capita (current US\$)	.826	-.092
Health expenditure, public (% GDP)	.887	-.073
Perceived quality of healthcare - good (%)	.812	.138

Source: Output obtained in SPSS with PCA

Displaying high values of the coordinates, the variables Medical Equipment – Total density per 100 000 population: Magnetic Resonance Imaging, Health expenditure per capita (current US\$), Health expenditure, public (% GDP) and Perceived quality of healthcare - good (%) are strongly correlated with the first factorial axis showing that there are significant differences among the statistical units. Between these variables there is a strong positive relationship. The second factorial axis is explained by Practicing physicians per 100 000 inhabitants and Hospital beds per 100 000 inhabitants.

Variables’ positioning in the plane of the first two factorial axes is presented in Figure 2.

Figure 2. Variables’ positioning in the plane of the first two factorial axes

Variables’ positioning on the first factorial axis from Figure 2 shows a negative relationship between the variable Hospital beds per 100 000 inhabitants, on one side and

the variables Practicing physicians per 100 000 inhabitants, Medical Equipment – Total density per 100 000 population: Magnetic Resonance Imaging, Health expenditure per capita (current US\$), Health expenditure, public (% GDP) and Perceived quality of healthcare - good (%).

The graphical representation of the statistical units on the factorial map is presented in Figure 3.

Figure 3. Countries’ position in the plane of the first two factorial axes

The first factorial axis in Figure 3 above points out the “opposition” between countries like Austria, Luxembourg, Italy, Denmark on one side and Romania, Poland, Hungary, Latvia and Lithuania, on the other. The most significant differences among the statistical units from the point of view of the analyzed variables are explained by this axis.

Overlapping of graphical representation of countries on the factorial map (Figure 3) and variables map obtained with PCA (Figure 2) allows us to identify several characteristics of perceived quality of health care and resources allocated to health care in the analyzed EU members. Thus, countries such as Austria, Luxembourg, Italy, Denmark register high values for the perception of the overall quality of health care, Practicing physicians per 100 000 inhabitants, Medical Equipment – Total density per 100 000 population: Magnetic Resonance Imaging, Health expenditure per capita (current US\$), Health expenditure, public (% GDP), Perceived quality of healthcare - good (%) and low values for Hospital beds per 100 000 inhabitants. On the contrary, countries like Romania, Poland, Hungary, Latvia and Lithuania register low values for the positive

perception of health care and all the variables positively related with it and high values for Hospital beds per 100 000 inhabitants.

4. Discussions and conclusions

The purpose of this paper was to analyze the relationship between resources allocated to health care and quality of health services in 15 EU member states, taking into consideration the interaction between macro and micro level

It started from the premise that the level of the resources allocated in health care impacts upon the perceived quality of health care.

The findings confirm the existence of several relationships between the two categories of variables. There is a strong positive relationship between material resources measured by Medical Equipment – Total density per 100 000 population: Magnetic Resonance Imaging, financial resources Health expenditure per capita (current US\$) and the share of public health expenditure in GDP and people positive evaluation of quality of health care. Also there is a negative relationship between the number of hospital beds per 100 000 inhabitants, and the variable mentioned above.

The performed PCA shows differences between the analyzed EU members from the perspective of people perception of the overall quality of health care and the factors describing the resources allocated to health care.

We can state that the higher the level of allocated resources, the better evaluation people provide for the overall quality of health care in their country.

The most significant differences are between Austria, Luxembourg, Italy and Denmark, on one side and Romania, Poland, Hungary, Latvia and Lithuania, on the other. These countries register low values for the indicators positively correlated with perceived quality in health care and high values for the ones negatively correlated with quality.

This aspect points out an unfavorable situation for Romania with a health system in continuing transformation, with high opportunity costs of each percentage in GDP allocated to different components of health care and with an economic situation which

does not allow major increases in the level of allocated resources in order to improve health outcomes and quality. This aspect leads to the need to improve efficiency by getting higher value for the invested money.

This study contributes to the existing literature related to identifying factors associated with quality of health care and suggesting ways to improving it. One of its limitations consists in using a subjective indicator for measuring quality which makes the comparison of the differences between countries to be “altered” by the cultural dimension.

Academic Rankings - Are Romanian Universities Competitive?

Badea Liana

The Bucharest Academy of Economic Studies
badea.liana@gmail.com

Abstract

The nowadays globalization process leads to increasing competitive pressures on higher education institutions, in particular related to their position on global university league tables, for which their research performance currently is almost exclusively the measure.

There is no doubt that the arrival on the scene of global classifications and rankings of universities has changed the world of higher education. Since the emergence of global rankings, universities have been unable to avoid national and international comparisons, and this has caused changes in the way universities function. In many strategies of the universities one may find the goal of obtaining a better position in some international rankings.

Thus, this paper aims to emphasize some features of the relation existing between rankings and the competitiveness of universities, taking into account the fact that Romanian universities are not to be found in the top 500 of the best universities of the world.

Key words: education, university, ranking, economy

J.E.L. classification: A19, I20

1. Introduction

In a world in which day after day specialists speak about the role and importance of globalization, of creating a strong EU, of the economic crisis etc., one must see that a factor with a strong influence on all these phenomena is higher education.

In a world driven by competition, the higher education area does not make a discordant note. Ones of the most mediatised issues during the last years were the international rankings phenomenon and the evaluation. It is generally accepted that

evaluation and ranking are two different but related concepts. They differ in their purposes and outcome. Ranking shows a university's relative strength and weakness as compared to its peer institutions in the areas represented by the indicators. It clearly indicates a university's relative location at a scale representing its strength in the measured aspect [1].

Since the early parts of the 20th century, rankings and league tables of higher education have existed, starting in the U.S.A.[2]. An overview on existing ranking systems by the Institute for Higher Education Policy (IHEP) lists more than 30 countries in all continents with a few countries (like the UK) producing a number of competing rankings.

Whether the ranking phenomenon is a good or a bad one, time will tell, but for the moment what it may be seen is related to its advantages and disadvantages, especially if we are analysing the universities of developing countries.

2. Academic rankings

Lately, there are different discussions about the place that university X is occupying in the ranking Y; often the nowadays press incorrectly presents the competitiveness of a university as the place it occupies in a national or international ranking.

Thus, nationally, according to National Education Law nr.1/2011, universities are classified into three categories, namely:

- universities focused on education;
- universities focused on education and research and universities of education and artistic creation;
- universities focused on advanced research and education.

According to an assessment made in a very short time by the European University Association, only a fifth of the educational

programs offered on the Romanian market can be considered in the top group, but like any top, this one implies too the existence of relativity and subjectivity. While the B category is collecting nearly 22.1% of the total of 1075 programs, in the C category fall approximately one quarter of the study programs.

The stake of implementing such national classification is quite high (financing, reorganization of education levels etc.). Therefore, these tops, seen as a potential indicator of competitiveness, are always hotly disputed. The national ranking was based on several criteria, which put more emphasis on research and less on the teaching issues and on the extent to which graduates of these universities are compatible with in the labour market requirements, complying with the requirements of the potential employers.

In addition to national rankings, more or less disputed, there are a series of international rankings, in which, unfortunately, no Romanian university does appear in the Top 500, as one could observe in the following table.

Table 1: Few international rankings

Ranking	Site	Are there any Romanian universities?
<i>Academic Ranking of World Universities -ARWU (Shanghai Jiao Tong University, China) (2011) [3]</i>	http://www.shanghairanking.com/ARWU2011.html	There is no Romanian university in top 500!

<i>THE Thomson Reuters World Ranking of Universities (UK) (2011) [8]</i>	http://www.timeshighereducation.co.uk/world-university-rankings/2011-europe.html	There is no Romanian university in top 500!

Source: Author’s researches using the sites above mentioned

For the ninth consecutive year, Harvard was considered in 2011 the best university in the world, this accumulating the maximum of points in the most important rankings.

The media and the academic staff is trying to find explanation for the place Romanian universities occupies in the international tops and in the same time they are trying to find solutions in order to achieve a better score in the rankings to come.

Till some years ago, the general created image was that the Romanian higher education system was an excellent one [9], being competitive at a global level. During the last years, the numberless reforms, the news in the media concerning the corruption existing in the system, the increasing number of students declaring they want just a diploma, the lack of a proper financing of the system [10] etc. and the results of the global studies concerning the ranking of universities destroyed the positive image of the higher education system.

In the same time, the public trust in the Romanian universities started to reduce. The place of Romanian universities in the international rankings is explainable, given the force of Romanian universities (see, for example the number of Romanian Nobel Prize laureates).

In carrying out international ranking, there are emphasised indicators such as:

- the number of publications SCI & SSCI, Scopus etc.,
- the total number of citations,
- the number of articles / teacher,
- the number of citations in journals with high impact,
- the number of graduates of doctoral schools,
- the income for research and development,
- the results of some questionnaires on the university's reputation,
- the number of alumni who received the Nobel Prize,
- the salary of professors,
- the number of students / teacher,
- the university dropout rate,
- the number of years in order to obtain a graduation diploma
- etc.

It is important to mention that the financing of the Romanian educational system, did not pass 3.5 % of GDP, as compared to the financing of the education system in other states, such as those from which the top universities come from. According to EUROSTAT data, although the expenditure slightly increased between 2001 and 2007, overall Romania is investing less than 1% of GDP on higher education positioning itself below EU average [11].

Figure 1. Public expenditure on education (ICED 5-6) as % of GDP

Source: Eurostat, Education statistics, UOE data collection (educ_figdp)

To complete the picture one should also take into account the gross domestic expenditure on research and development which shows that in the first decade, Romania invested on average less than 0,5% of GDP while the average EU investment stood at nearly 2% of GDP.

Figure 2. Gross domestic expenditure on R&D as % of GDP

Source: Eurostat data

Moreover, the international impact of Romania's R&D output is not an important one. Although Romania is present through relatively many published papers, they have a minor impact on the international community. The echoes of Romanian scientific publications coming from the international academic community are reduced. For that matter, taking into consideration the number of scientific citations per article, Romania is placed on the 15th position from 23 countries in Eastern Europe, according to Scimago source, for 1996-2009. The specialists say that there is a growing tendency for Romanian academic staff to publish in journals which, although are present in the Web of Science, do not meet all the editorial standards of a high quality evaluation.

Another problem to be taken into account is related to academic staff salaries, which are one of the lowest in the EU [12] and even

they are at a low level, they were cut with 25%.

There were mentioned only a few of the problems of the higher education system in Romania as they are numerous.

3. Impact of academic ranking

It is obvious that ranking has several advantages and also a lot of disadvantages. Among the most obvious advantages, one may notice:

- ranking makes it easy for viewers to compare and contrast the performances of the universities being evaluated;
- indicates each university's relative achievement in certain aspects and thus helps a university to diagnose problems and/or suggests directions of development;
- fulfills the need for a clear indication about a university's performance;
- offers information for policymaking and for students/families/academic staff etc.

Rankings also influence national and international partnerships and collaborations.

At the same time, reliability of the ranking methodology and the validity of indicators used in a ranking system are two major issues causing debates.

Several ranking systems rely on anonymous opinion polls, which are notoriously difficult to influence relying, as they do, on subjective opinions of people who may never have even visited the institution they are ranking. Moreover, it's more than pleasant to know that a past graduate of your university won the Nobel Prize, but it is hard to see how that affects students in the classroom today.

As one may observe, the criteria used in the achievement of international rankings are based on subjective items. In addition, the same criteria are not relevant in different periods of time. It is obvious for instance that the market of publications is extremely volatile! (See how the impact factor and the score are changing)

Moreover, the total score given to a university is relative, because it reflects the subjective opinion on the quality of those who have made the methodology used in preparing the rankings.

Also it is important what kinds of quantification are using the authorized organizations in achieving rankings:

- Some rankings are using absolute values and thus they favour some large universities (ARWU, Webometrics).
- In some cases, relative values are used, in this case being in advantage the universities with higher efficiency and not necessarily of considerable size (THE-QS).

However, the rankings are measuring past performance and are not focusing on the available potential to each university; they are taking into account only relevant statistics for the chronological history of the university.

It is said that the purpose for which rankings were created was to increase the transparency in the higher education area, but in this case a question arises: how to do this, since the methodology they use, remains partly a mystery to the public?

Moreover, university performance is affected by the larger socio-cultural and politico-economic context. Whether ranking indicators are fair for all universities is open to question.

Ranking determines many universities to implement some strategies in order to increase their competitiveness, but, unfortunately, many universities set their aim of achieving the optimal level of indicators used in the international rankings, and forget to focus on:

- the quality of teaching;
- the stress of the teaching staff;
- the involvement in the regional development;
- some social issues;
- the lifelong learning etc.

Today, we hear more and more the fact that rankings favours elite universities focused on research. Therefore, some international organizations are trying to offer some alternatives. *AUBR EU Research Assessment*, *U-Map*, *U-Multirank* and *AHELO (OECD)* are not yet implemented, but they promise to consider other indicators, with higher relevance for the academic environment.

By reviewing only a few of the features of international rankings, this paper attempts to draw attention to an important aspect:

education policies should not rely only on tops/rankings!

Starting from the definition, we may observe that competitiveness means much more. A competitive university is not only situated in a top, given that in such tops are included about 1000 universities from the total of 17 000 existing in the world, but it is able to meet the needs of economic and social environment, focusing both on research and on obtaining answers that are necessary to achieve the compatibility with the labour market demands.

4. Instead of conclusions

Among the conclusions, it is easily to observe that education is inextricably linked to the welfare and quality of life and that it is influenced by several factors such as corruption, historical evolution, demography etc. Some studies show that countries that have invested over time in education are now reaping the rewards of the economic development. At the same time, specialists in the educational market and fair organizers insist in promoting educational policies based on "opening doors to the private sector and internationalization" as solutions to increase the visibility of Romanian universities and their performance.

Policymakers and some of the members of academic staff are starting to be preoccupied by achieving a goal – a good place in academic rankings among the best universities in the world. The existence of rankings no doubt encourages universities to improve their performance, but at present, it would be difficult to argue that the benefits offered by the information that rankings provide, as well as the increased ‘transparency,’ are greater than the negative effects of the so-called ‘unwanted consequences’ of rankings.

In this context, according to Education Law no. 1/2011, in our country is gaining more ground the idea that, on medium and long term, universities should aim: to attract professors from famous universities, to invest in effective career centers, to involve employers in university work and to capitalize the knowledge they have through consulting activity, products, services etc.

It is obvious that the role of education is extremely important and that is why

Romania is trying to increase the access to higher education forms. According to the Memorandum on approval of final values of the objectives of Romania for Europe 2020, approved by the Government in July 2010, Romania aims at increasing the percentage of graduates of higher education compared to total population to 20.25% in 2013 and to 26.74% in 2020[10].

The fact is that currently, higher education must meet several challenges: to achieve a quality that stand to the test of international comparison, to improve the management and to be more responsible, to increase funding and to diversify the funding sources. These goals involve major changes in higher education, as we are at a crossroads: either we admit that it's time for vigorous action to identify and stimulate the quality of education, where available, and to improve the quality, there where needed, or we preserve in a state of complacency, which may plunge us into a uniform consistency, characterised by a lack of perspective and competitiveness.

A Brief History of the Balanced Scorecard: Tradition and Modernity

Carmen Mihaela Boteanu
Valahia University from Targoviște, Doctoral school
carmenboteanu@yahoo.com
Petrescu Marius
marius.petrescu@orniss.ro

Abstract

Strategic Planning is a continuous and systematic process where people make decisions about intended future outcomes, how outcomes are to be accomplished, and how success is measured and evaluated.

The Balanced Scorecard represents a management and strategic planning system used on a large scale – in private companies, governmental institutions and NGOs – that aims to harmonise economic activities with the vision and strategy of the organisation, the improvement of internal and external communication and the monitoring of the performance of the organisation beyond its strategic objectives. A simple definition of the BSC involves three aspects: a communication tool, a measurement system and a strategic management system.

Keywords: strategic planning, the strategy focused organization, the Balanced Scorecard, measuring performance.

J.E.L. classification: M41

1. Introduction

Balanced Scorecard (BSC) is in the sense of specialists in management, system management and strategic planning widely used in business and industry at government and nonprofit organizations that seeks to harmonize economic activities with the vision and strategy organization, improve internal and external communication and monitoring performance across the organization strategic objectives. A simple definition of the BSC involves three aspects: a communication tool, a measurement system and a strategic management system.

This evaluation system was proposed in

1992, in an article published in Harvard Business Review, has a great influence in literature and in practice today. On this model, the authors - Kaplan and Norton - say:

“Traditional accounting indicators like return on investments or dividends can provide misleading signals about the company's ability to have an upward trend in relation to the requirements of the current economic environment. Financial indicators have traditionally been very suitable for the industrial age, but become obsolete in the context of skills and competencies that companies today are trying to measure“.

The basic idea of this model is to place several traditional financial variables with non-financial indicators, likely to generate future financial performance. Traditional indicators provide information about the company's past performance, while non-financial indicators can be measured, for example customer satisfaction, innovation and improvements to various process in the company. Combining the two types of indicators allows managers to get a balanced on company performance.

2. The importance of using Balanced scorecard

In the model it was designed, Kaplan and Norton, is not a general system of indicators to measure intellectual capital, the argument being that a comprehensive system of indicators could leave out certain aspects of each company related to the objectives, its processes and the context in which it acts.

The Balanced Scorecard is represented graphically in Figure 1:

Figure 1: Presentation by the Balanced Scorecard Business performance

As shown, the Balanced Scorecard performance of the company's presentation proposes four perspectives:

1. customer perspective - answer the question „How do customers see us?”
2. internal perspective - answer the question „In what areas need to excel?”
3. innovation and learning perspective - answer the question “can continue to create value and to improve it?”
4. financial perspective - answer the question “how shareholders see us?”.

Within each of the four perspectives, the company will set targets and establish a number of specific indicators, financial - the financial perspective and, in particular, non-financial - for the other three perspectives, these indicators are useful for measure how each company exceeds its initial objectives.

The content of each perspective is presented in detail below:

1. Customer perspective: Today many companies are focused on customer strategies. Objectives that a company may determine; in terms of customer satisfaction may be related to the following: new products - how fast the company responds to consumer needs, quality, performance services to customers, and the price of products.

2. Internal perspective: This perspective includes all internal operations that the company must perform to meet customer expectations, in this perspective is given the interest of all processes (life cycle of business, product quality, productivity, employee competence) and technologies used the company. Since these results are strongly influenced by the work of employees, to determine the extent to which business objectives are met, requires that

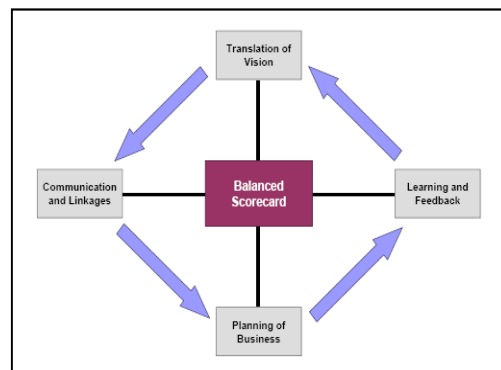

employee performance is determined by the lowest organizational level. In this context, information system plays an important role in obtaining all necessary data model, helping to identify the origin of any problems arising.

3. Innovation and learning perspective: current socio-economic context requires companies to continuously improve products and production processes, and on this basis, be able to penetrate the market with new products and services completely new and thus to determine profit growth.

4. Financial Perspective: Financial objectives that companies must follow are usually related to the development of profit and shareholder value. Although these financial indicators have been criticized because they offer a short term and are oriented to the past, however, they consider fundamental Kaplan and Norton as financial performance is always related to operational performance.

In 1996, Kaplan and Norton offered an advanced version of Balanced Scorecard model, presenting it as a management tool, so important that it becomes part of the company's strategy formulation. This new concept has come of age in 2001, when the two authors have explained that the Balanced Scorecard is a management tool particularly important and can only indirectly be used as a means of measuring the company's intangible assets and intellectual capital. Place that this model plays in company strategy is shown in Figure 2:

Figure 2: Develop corporate strategy through the Balanced Scorecard model

However, it cannot be neglected that the Balanced Scorecard plays an important role in providing non-financial indicators of corporate performance evaluation, something

on which all atomistic methods for assessing intellectual capital. Interest awarded the Balanced Scorecard as a method of measuring the intangible assets increased in the late '90s, as a result of the evaluation of intangible assets is essential in the strategic development of the company.

Braam points out that the diffusion of innovative practices of management and managerial accounting, such as Balanced Scorecard, can lead to a discrepancy between the “label” concept implemented and its contents. In other words, it is possible that some organizations that claim only use balanced Scorecard, while ignoring the substance implementation just considered defining characteristics Balanced Scorecard (linking indicators to strategy, causal relationship between indicators, etc.).

Therefore, assessing whether the Balanced Scorecard is used in practice depends on the definition and clarification of the concept, i.e. the unambiguous identification of the characteristics that define a Balanced Scorecard.

The relatively new, we can mention the contribution of authors in the organization department of strategic management (OSM) and benefits from implementation such a department.

Innovative ideas about performance management through a strategic management department coordinates the planing, implementation and piloting strategy into strategy maps and Balanced Scorecard led to the bppk „Alignment”.

Authors such as Bontis, Petty and Guthrie have shown that this model can be used for evaluating intellectual capital. Comparison made between Balance Scorecard and intellectual capital valuation methods reveal other similarities such as recognition strategy as an essential component of performance management need to find a concise and fully expressing the company’s situation, attention to intangible assets and knowledge.

However differences between Balanced Scorecard and intellectual capital valuation methods can be summarized in table 4:

Table 1: Benchmarking Evaluation Balanced Scorecard and intellectual capital method

Balanced Scorecard	Assessment of intellectual capital
Logic: economic and financial	Logic: organizing knowledge
Watch the effects of a new strategy through different indicators (not just financial and economic)	Aims to create intellectual capital by identifying the determinants of value, both internal and external (intangible indicators)
Use performance indicators	Use performance indicators and indicators "status"
It is a monitoring tool	It is a tool for development
Its effects are internal	Its effects are both internal and external (recovery value of intellectual capital)
People create income	People create value

Moving from theory to practice, the question perhaps becomes: What are the informational advantages and disadvantages of the practicable proxies to fair value, value, both when applied consistently, and when applied pragmatically on an item-by item basis? This takes us back to the academically traditional debates on the pros and cons of the various theories of income measurement and asset valuation.

The credibility regards a reasonable evaluation, the using of market information in all possible situations for evaluating and justifying the subjective arguments. Starting from these concepts, the users of the accountancy information had demanded the elaborating of a model for a general appliance of the fair value.

In essence, therefore, this concept in context of new economy gives a significant push towards current values in general and towards fair value in particular, but also strongly insists that fair value, as such must be genuinely based on market expectations, i.e. again, not entity- specific.

In terms of local literature on the Balanced Scorecard, authors like Ionascu et. al, Diaconu et. al., Caraiani et al., Albu and

Albu, introduced in text books university concept of Balance Scorecard, while Vasilescu, Anghel et al. and Mihai discuss the concept in magazines dedicated to professional accountants. A common feature of these materials is given by inclusion in the category of modern Balanced Scorecard, and probably desirable, managerial accounting and management control without a prior investigation of the suitability of the instrument for different business environments, especially for the local.

3. Conclusions

Traditionally, companies have measured performance only by financial perspective, for example by measuring the evolution of profit or cost effectiveness.

The leading companies in the study and Kaplan and Norton have been convinced that the dependence of performance measurement in financial terms would affect the ability to create value.

The group discussed a series of choices, but decided on the idea of a scorecard to measure performance and provides the possibility, including the following aspects: organization-customer relationship, internal business processes, employee activities and concerns course ownership.

Note that the Balanced Scorecard is not the only measuring instrument and performance management practices design to overcome deficiencies and to support implementation of the budget strategy. Conversely, under the idea that measuring instruments and performance management are dependent on several factors such as environment, organizational structure, organizational culture, etc.

According to Otley D.T., contemporary managerial accounting practices include a variety of similar tools Balanced Scorecard but presents its own particularities, sometimes around issues other strategy. Balanced Scorecard but stands in relation to alternative tools of measurement and performance management through its global success, due to several methodological features.

The Living Logical System Paradigm (SLV) – Economic Process and Economic Subject

Brătian Vasile

bratianvasile@yahoo.com

Tănăsescu Cristina Roxana

„Lucian Blaga” University of Sibiu, Faculty of Economics

cristina.tanasescu@ulbsibiu.ro

Abstract

The Paradigm of the Living Logical System (LLS) puts into debate the logical and ontological bases of the orthodox economic models concerning the knowledge of the economic processes.

The restraining of the living logical system concept operates with a series of new concepts concerning the subject.

Within the current material we attempt to define the concept of economic process, and to define the concept of economic subject. Aside from this endeavor we also consider to define the following concept: cultural process, social process, process of the economic organization, cultural subject, social subject, institutionalized subject. The definition of these concepts is necessary within the required framework of the LLS.

Key words: living logical system, economic process, economic subject

J.E.L. Classification: B41, B52

1. Introduction

The restraining of the *Living Logical System* concept operates with a whole series of new concepts in defining the species of this genre.

The objective of this paper is to define the following concepts: *cultural subject, social subject, economic subject, institutionalized subject*, with the purpose of increasing the comprehensibility of our endeavor within the paradigmatic framework of the Living Logical System.

Together with this desire, we believe that it is necessary to define the following concepts: *cultural process, social process,*

economic process and the process of the economic organization.

This approach of the categories of subjects correlated with the categories of processes generated by them is justified because the action subject is the cause for the process (the action subject is the cause, and the process is the effect). In this term of ideas, to speak about the cause of an effect without knowing the effect does not make logical sense and it is precisely because of this that we will treat our subject as such.

2. About the process and act

In his paper *Economic Studies – Logical, epistemological and methodological analysis contributions* (Dinga, 2009) we are made attentive to the fact that between process and act there is no qualitative difference. In other words, both the process and the act are produced within a time frame and as a result the usual definition of the process, ergo the temporal development (evolution) is associated with an act, seems to lack perseverance. This happens because it is introduced within the act, as a specific difference, a property which is not at all specific, because it is found in a process (we speak about the temporal dimension). As a result of this, one mentions that, from the logical perspective, *this is an act or equivalent process.*

Note: *In the following, in order to illustrate the concept of process we use the concept of act.*

3. Definitions: act (process), social act (social process), economic act (economic process), act of the economic

organization (process of the economic organization).

Let us try to identify the proximal genre of the social (social process). We believe that this could be the action of a cultural subject (which possesses conscience). Through cultural subject we understand any entity from the universe which has this characteristic (even if it is conscience). For now, *the human being* is the only being we know which has conscience, meaning that it is a *cultural subject*.

The action of the cultural subject (the action of the human being) *refers to any act* (or activity, defined as a convergent ensemble of acts) *which have the human being as a subject*.

One can observe, concerning the proximal genre, thus characterized, several important aspects (Dinga, 2009):

- *Is not relevant to the nature of the act:* it can be an intervention/modification, an act of reflection, of imagination, an act of moral positioning, etc;
- *Is not relevant to the object of the act:* the act can be exercised on any entity, be it external or internal to the subject;
- *The structure of the action subject is irrelevant:* the subject of the action is the human being, individual or aggregate;
- *The act is of cultural origins:* it represents the exteriorization of an intention.

The definition of the act (the cultural process)

On the basis of the aspects presented above, we believe that we can conclude on the act (cultural process) as follows: *the act is that which involves the intervention/modification, reflection, moral positioning, etc. of the cultural subject (the human being) in its environment.*

Obs.

- *As the subject of the act is the cultural subject, the act is of cultural origins;*
- *Through the change of the cultural subject we understand it's internal and environment.*

In the following, in order to obtain the definition of the social act, ergo for the identification of the specific difference of the social in relation with the proximal genre, we will do as such: we will try to identify the sufficient predicates of this species.

In fact, looking for the specific difference mean the particularization of the common established in defining the proximal genre. We have though, the following distinctions:

- *The social act refers to the intervention of the subject of the act within a society and / or nature;* in other words, the act of social type realizes (or tries to realize) a modification within the society and/or nature, in its broader sense;
- *Is relevant in the structure of the action subject:* the action subject is the social subject;

Defining the social act (the social process)

Based on the above, we believe that we can conclude on the social act (social process) or the social, as a phenomenon attribute, as such: *the social act is that attribute of an act which implies the intervention of the social subject in society and/or nature.*

We believe the proximal genre of the economic act is the social act.

In the following, in order to obtain the definition of the economic act, ergo for the identification of the specific difference of the economic in relation with the proximal genre, we will do as such: we will try to identify the sufficient predicates of this species.

In our opinion there are two sufficient attributes:

- *The economic act refers to the intervention of the subject of the act within a society and / or nature;* in other words, the act of economic type realizes (or tries to realize) a modification within nature, in its broader sense;
- *Is relevant in the structure of the action subject:* the action subject is the economic subject;

Defining the economic act (the economic process)

Based on the above, we believe that we can conclude on the economic act (economic process) or the economic, as a phenomenon attribute, as such: *the economic act is that attribute of an act which implies the intervention of the economic subject in society and/or nature.*

We believe the proximal genre of the economic organization is the economic act.

In the following, in order to obtain the definition of the economic organization, ergo for the identification of the specific difference of the economic organization in relation with the proximal genre, we will do as such: we will try to identify the sufficient predicates of this species.

In our opinion there is one sufficient attribute:

- *Is relevant in the structure of the action subject:* the action subject is the institutionalized subject.

The definition of the act of the economic organization (the process of the economic organization)

On the basis of the above, we believe that we can conclude on the act of the economic organization (the process of the economic organization) or economic organization, as an attribute of the phenomenon, as such: *the act of the economic organization is that attribute of the economic act which involves the intervention of the institutionalized subject in nature.*

4. Definitions: cultural subject, social subject, economic subject, institutionalized subject.

Several notations:

- The act represents the exteriorization of the intention of the action subject and takes the form of an effect of the cause;
- The cultural subject (human being) is the cause of the act;
- The social subject is the cause of the social act;
- The economic subject is the cause of the economic act;

- The institutionalized subject is the cause of the act of the economic organization.

The definition of the cultural subject (human being)

In our opinion, the cultural subject has the following sufficient attributes:

- *Has a dissipative character;*
- *Has a conscience;*
- *Has a cultural purpose;*
- *Is theoretical and practical;*
- *Is contingent.*

Axiom:

- *The cultural purpose is to realize the entropic exchange with the internal and external environment.*

The cultural subject represents that action subject which satisfies the sufficient attributes above.

The definition of the social subject

We consider that the proximal genre of the social subject is the cultural subject.

In order to obtain the definition of the social subject, thus to identify the specific difference of the social subject in relation with the proximal genre, we will try to identify the sufficient attributes of this species.

The sufficient attributes are:

- *It is a cultural subject;*
- *It is multiple or composed;*
- *It is practical;*
- *It has social purpose.*

Axiom:

- *The social purpose is the realization of the entropic exchange with society and/or nature.*

The social subject represents the subject of the action which satisfies the sufficient attributes above.

The definition of the economic subject

We consider that the proximal genre of the economic subject is the social subject.

In order to obtain the definition of the economic subject, thus to identify the specific difference of the economic subject in relation with the proximal genre, we will try to identify the sufficient attributes of this species.

The sufficient attributes are:

- *It is a social subject;*
- *It has an economic purpose;*

Axiom:

- *The economic purpose is the realization of entropic exchange with nature.*

The economic subject represents the subject of the action which satisfies the sufficient attributes mentioned above.

The definition of the institutionalized subject

We consider that the proximal genre of the institutionalized subject is the economic subject.

In order to obtain the definition of the institutionalized subject, thus to identify the specific difference of the institutionalized subject in relation with the proximal genre, we will try to identify the sufficient attributes of this species.

The sufficient attributes are:

- *It is an economic subject;*
- *It has an organizational purpose.*

Axiom:

- *The organizational purpose is the realization of entropic exchange with nature.*

The institutionalized subject represents the subject of the action which satisfies the sufficient attributes mentioned above.

5. Conclusions:

The definition of the economic process:

The economic process (the economic) is that attribute of a social process which involves the intervention of the economic subject in nature.

The definition of the economic subject:

The economic subject is a social subject which has an economic purpose.

Axiom:

Economic purpose is the realization of entropic exchange with nature.

Consequence:

The economic process (the economic) is that attribute of a social process which involves the intervention of the social subject in nature, with the purpose of the realization of the entropic exchange between these and nature.

Using BPMN in Modelling the Trading Process

Brinza Georgiana
Academy of Economic Studies

Bucharest
georgiana.brinza@gmail.com

Abstract

The worldwide concerns regarding safety and counterfeit products conduct to new rules and regulation on the worldwide trading market. Customs are setting short accepted delays, situation that creates a higher need of paperless trading. This is why an improved process and software tight relation accross the different roles in a trading chain (customer, supplier, Customs etc.) is needed. The first step in assesing the objective consists in process modelling. The present reasearch paper represents a guide for creating a business process model and it is based on using BPMN (Business Process Modelling Notation) for modelling all types of flows (physical, financial, information, documentary flows). By using BPMN, business patterns for the international trading are proposed.

Keywords: BPMN, supply chain, Model Driven Architecture

JEL Classification: M210

1. Introduction

The information exchanges between the different actors from an international trading environment (suppliers, customers, importers etc.) have increased. It is very important for them as, for example, the time lost during container transport due to waiting for documents generates capital cost. Additionally, Customs play an important role in national economy: companies will remain domiciled in the country concerned if there are easy administrative procedures for them; otherwise, they will move to another country. This is something very important since some

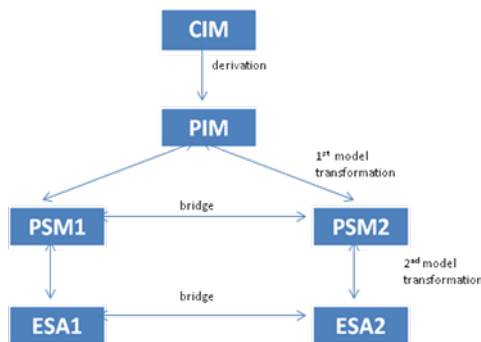

of the taxes collected come back to the country where the firm is domiciled. Another aspect is the evolution of the Customs regulations in order to ensure safety of exchanges and to fight against terrorism, or counterfeiting products. These are the reasons for which the interest for paperless trading is growing faster.

The problems appear between the information systems of the different actors. A model driven approach beginning with company modelling is recommended [2]; this approach is based on MDA (Model Driven Architecture), a development process that is based on several levels (Fig 1): CIM (Computation Independent Model) that models an organization, PIM (Platform Independent Model) that models the subset of the organization that will be concerned by the software development, and the PSM (Platform Specific Model) that takes into account the specificities of the development environment. The last level is the ESA (Enterprise Software Application). The logic of MDA is to allow automatic model transformations between the PIM and PSM levels and also between PSM and ESA levels.

This reasearch focuses on modelling the process at CIM level. In the second part of this paper the architectures, methods and formalisms in the domain of enterprise modelling are shortly presented. In part 3, a pragmatic guideline to generate successfully the business process model with BPMN is presented, taking into account all types of flows (information, documents, physical flows, financial flows) spread between the different stakeholders of trading; this guideline uses business pattern designed specifically for international trading purposes. An example illustrating the exchange between a commercial company

and one of its partners is presented in part 4 and finally part 5 concludes and gives some perspectives related to future works.

Fig 1. MDA process in 4 levels

2. Architectures, methods and formalisms

Modelling the company processes can be seen as an prerequisite in achieving integration; it can also help to solve interoperability problems beginning with a higher level of abstraction than code. Vernadat [3] defines it as the art of externalising company knowledge and know-how, which represents the company in terms of its organisation and functions (activities, information, resources and organisation units, system infrastructure and architecture).

The first objective is to create a rough picture of the existing organisation (“as-is” model) and then to propose evolutions (“to-be” model) to optimise performance of the organisation. Several “to-be” models can be compared, possibly by using simulation tools. Then, the way to go from the “as-is” to the “to-be” organisation has to be prepared, taking into account the problem of change management.

The Object Management Group (OMG) proposed two generic formalisms that provides good guidelines for processes modelling: UML® and BPMN. UML® is basically more software-oriented, while, in practice, a lot of reluctance about UML® can be noticed among non-specialists who are today attracted by BPMN. That is surprising because, for example, an UML® activity diagram seems more understandable than a BPMN diagram. That reality must be taken into account, and BPMN is here chosen at CIM level, even if that will need a subsequent transformation in UML®, which is not detailed in this paper.

The main objective of BPMN is to provide a standard notation that is easily understandable by all business stakeholders and thus independently of the tool used. The basic elements of representation of BPMN are the following: *Flow Objects*: Events, Activities, Gateways; *Connecting Objects*: Sequence Flow, Message Flow, Association; *Swimlanes*: Pool, Lane; *Artifacts*: Data Objects, Group, Annotation.

3. Modelling business process using BPMN

3.1 Modelled flows

Modelling a business process consists in defining a set of coordinated tasks or activities, all conducted by people and/or equipment in order to accomplish some desired end-result identified by the company.

Usually, the flows modelled with BPMN are essentially information and documentary flows, which is a pity. To overcome this lack, this proposition aims to represent other flows (physical flows: goods, material, equipment..., financial flows) clearly on the BPMN diagrams. The proposition is to use BPMN as the main and, perhaps, unique model at CIM level for quality management, production management, computerization. Since BPMN has rich graphical elements, it offers several possibilities to represent those flows. The major difficulty lies in the choice of the best alternatives to have understandable models. If one considers two activities in a process that are related to goods moving, the physical flow can be represented using a data object that mentions the type of goods and quantity.

For the documentary and financial flows, the use of a data object is sufficient insofar as it offers the possibility of indicating if this flow is compulsory or not for the start of the activity. These different types of flows are represented on an example of a BPMN diagram in Fig 2.

Fig 2. BPMN example diagram

Source: Modelled with TIBCO Software

The process corresponds to the transport of goods from the quayside to the warehouse where goods will be stocked. For this, two main activities were identified: the first is the activity of loading the trucks and it starts once the message containing the BAE and the load order has arrived. The second activity is the transport and it is completed when trucks arrive at the warehouse.

Different flows appear in this process; the physical flow indicates for example the quantity of goods transported, while the financial flow “Transport payment” and the information flow “Vehicles loaded” indicate that the action of transport cannot start before they have been completed. Two other flow-type documents are connected directly to the activity of transport; these documents must accompany the goods and could be demanded when there is a Customs’ check.

3.2 Modelling steps

The main steps proposed to achieve the “as-is” process at CIM level are the following:

Step 1: This consists in interviewing the stakeholders in the company in order to identify the main offered services and products, the organization (human resources, hierarchy, roles), the different processes, the customer types, the means to exchange the information, the various actors’ functions and the circuit of decision-making.

Step 2: Once the information has been collected, a report is drafted that will be afterwards validated by the stakeholders of the company.

Step 3: The aim of this step is to give a first synthetic and global vision to better understand the flows without entering into the detail of who emits and receives them.

Step 4: This is a translation in BPMN framework. At this level, the pools will correspond to the internal and external actors of the company. In each pool, lanes will be identified that correspond to the organizational units which are mostly roles or internal departments.

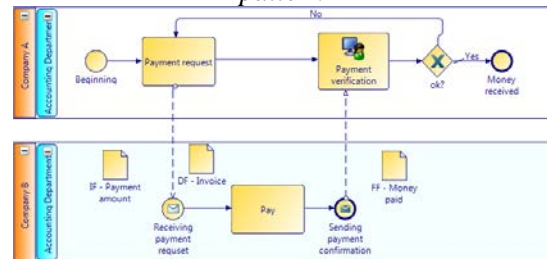

3.3 Supply chain business patterns

There are some workflow patterns (like basic control flows, branching patterns, structural patterns, cancellation patterns), that

form practical rules for the correctly using BPMN.

But here the purpose is different: in the supply chain domain there are many similar organisations and flows. This is why building generic models is very important, as they can be adapted to particular problems. A business pattern is a generic description of a business organization part used to produce solutions related to the business itself. Several business patterns have been proposed, for example for “transport payment” (Fig 4), which is described hereafter corresponding to the formalism of representation recommended in this reference [1].

Fig 4. “Transport payment” business pattern

Source: Modelled with TIBCO Software

The pattern of “transport payment” aims to describe the procedure of payment of diverse types of expenses. The pattern can be used in the various cases of expenses payments in the framework of an activity concerning logistics. It can be related to the transportation, storage, Customs declaration, Customs clearance etc.

The process begins when Company A sends the invoice and asks Company B for the payment and indicates the amount of its services that can correspond, in our case, to transportation, storage, Customs declaration. The accounting department of Company B proceeds to the payment and sends the payment confirmation. A verification of the amount paid is carried out by the accounting department of Company A. Once the amount matches what was requested, the process is finished. Otherwise, the accounting dept. will notify and ask for the payment a second time.

4. Case study

The case study concerns a Commercial company importing textile products from China, storing these goods in its warehouse

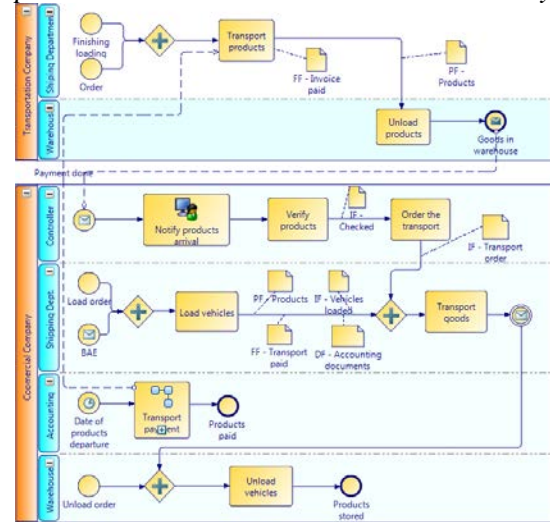

under a specific Customs system allowing it to postpone the payment of taxes and finally dispatching these goods to its own stores. A scenario representing the most frequent cases was chosen, in order to provide a global understanding of the complete supply chain. Once this scenario had been validated, the flows began to be identified with the help of the table as shown in step 3.

In the BPMN model obtained in step 4 (Fig 5), the pools correspond to the actors of the project who are: the transportation company and the commercial company. In each pool, the lanes are represented as follows: for the transportation company: the shipping department and the warehouse and for the commercial company: the controller, the shipping department, the accounting dept. and the warehouse. According to the fixed perimeter, the business process begins at the exit of the goods from the harbor and finishes at the arrival in the store where goods are going to be sold.

Some similar activities were identified when modelling the business process; for example the payment of transport explained previously. In fact, it occurs the first time when paying the maritime transport costs and a second time when paying the Customs taxes. The generic business pattern called “transport payment” has been used to suit the different payments made.

Based on the guideline detailed in this paper, the modelling of a business process has been completed. Once this “as-is” model, in Fig 5, is validated by all the stakeholders of the company, it will be used to establish the “to-be” model (not detailed in this paper) by performing all the necessary modifications. After all, the “to-be” CIM can be derived to obtain the “to-be” PIM as indicated in Figure 1:

Figure 1: Extract from the whole trading process modelled in the case study

Source: Modelled with TIBCO Software

5. Conclusions

The company modelling is the first step that has to be made in the Model Driven Interoperability method, at CIM level. This research proposes the use of BPMN whose formalism is enriched in order to take into account all types of flows. In addition, business process patterns have been developed in the framework of the supply chain in international trading.

The additional features given to this BPMN formalism makes it possible to highlight the relations between the process view and the other domain specific views (product, information, document). But, from this process view, all the manipulated flows are presented without any structure. The enrichment with ontologies and/or some UML® diagrams seems to be an interesting topic to be investigated in order to obtain a full description of the system at CIM level. This full description is needed for transforming the models at lower levels (PIM, PSM). The aim of these multiple model transformations is to generate code that can be used for example for Service Oriented Architecture (SOA).

The Organizational Change from the Perspective of Neoinstitutionalism

Bundă Nicoleta Ramona
Faculty of Economic Sciences
Ovidius University of Constantza
bundaramona@gmail.com

Abstract

In the last couple of decades, there has been a substantial revival of interest in institutional analysis, being outlined three major theoretical paradigms: rational choice new institutionalism, historical new institutionalism and sociological new institutionalism. In the present paper, we focused on the last paradigm mentioned, coming from outside the economic science, from sociology. Why this option? We thought it was inspired from time to time to take a look to others books with the intention to complete our creation. Dominant thesis that emerged from this is that the formal organizational structure is shaped by institutional forces, rational myths, knowledge, and by the legal system. The sociological approaches provide an alternative to the rationalist and individualistic ideas and by essential economic explanation that dominate contemporary theory. The central concept around which our paper is built is the one of institutionalization, meaning the institutional reproduction. Institutionalization was defined as the processes of habitualization, objectification and sedimentation by which a stable pattern achieve cognitive and normative fixity and become taken for granted. Throughout the paper we combined structural perspective and agency perspective to discern the mechanisms by which the institutional change of any kind to mimetic, normative and coercive takes place. Finally, we launched a challenge for future research on the conceptualization / construction of that institutional project focused on values, symbols, myths of sustainability and cooperation.

Key words: Institutions, organizations, institutional entrepreneurship, legitimacy, isomorphism, discursive strategies

JEL Classification: A13, D02, D23

1. Introduction

Over the past couple of decades, institutional theory has become one of the most prominent theories in organizational analysis. Focused in the 1980s on the mimetic process whereby organizations eventually adopt the same kind of behavior within a field of activity, its emphasis has shifted over the past decade to issues of institutional change and agency.

Institutional theorists assert that the institutional environment can strongly influence the development of formal structures in an organization, often more profoundly than market pressures. Innovative structures that improve technical efficiency in early-adopting organizations are legitimized in the environment. Ultimately these innovations reach a level of legitimization where failure to adopt them is seen as "irrational and negligent. At this point new and existing organizations will adopt the structural form even if the form doesn't improve efficiency.

To study the ongoing and cumulative institutional and organizational change, first we should make a conceptual delimitation between institutions and organizations.

For the institutions the most widely used definition is the one who pithily described them as “rules of the game” [1]. Institutions exhibit both a formal nature (constitutions, rules, regulations, laws, rights) and an informal nature (sanctions, customs, traditions). We can describe them as they are societally determined and govern social, political, cultural and economic exchanges and interactions. The institutions define the range of choices, regulate risk and

uncertainty and determine transaction and production costs and hence the feasibility and profitability of engaging in economic activity. They evolve incrementally, linking the past with the present and future and provide the incentive structure of an economy and set the tone of societal development.

The organizations, on the other hand, are “the players” [1]. They refer to a group or association, formal or informal, in which there are defined and accepted roles, positions and responsibilities structured in some relationship to each other in order to achieve some specific objectives. Organizations exist to secure and advance the interests of their members within a certain institutional framework, while constantly seeking to influence that framework so as to achieve greater advantages and benefits. They are found in all sectors of society – private (family, commercial entities and corporations), civil (associations, membership-based groups) and public (government and its various organs, government-owned enterprises). They are also found at all levels, extending from the micro (family, community, community-based organization) to the mezo (local, regional), to the macro (national) and international level (e.g. United Nations, World Trade Organization, multilateral organization).

Following Douglass North’ view, we see a clear distinction between institutions and organizations, and we realize that is hardly conceivable a play without rules or the rules of the play without the players. So the words ‘institution’ and ‘organization’ cannot be used interchangeably and if it is this often lead to misunderstandings or misguided interventions.

Why is important to be aware about the importance of institutions, or about the institutional theory when studying the organizational change? There are rich series of arguments that emphasize the salience of symbolic systems, cultural scripts, and mental models in shaping institutional effects, but remain somewhat vague with respect to the mechanisms by which culture and history cemented the social order and constrained organizational choices. This is the fertile terrain that was exploited in an interdisciplinary manner by the researcher

that called their program as new organizational institutionalism.

Keeping in line with the main thesis of new organizational institutionalism, our focus is on the way the process of institutionalization takes place and enables some social, economic or cultural patterns achieve normative and cognitive fixity, and become taken for granted by the majority entities from a society. In this respect, firstly we show the „initial formulations” of the new organizational institutionalism and finally the issue of institutional isomorphic change on the organizational level.

2. 'The Initial Formulations' of the new organizational institutionalism

According to Powell and DiMaggio [2] 'the initial formulations' of the new organizational institutionalism belongs to Meyer and Rowan [3], Zucker [4], DiMaggio and Powell [5] and Scott and Meyer [6]. These expositions show continuity with the forerunners, but also a distinct break. To appreciate, in part, the 'neo-' label that is often attached to this tradition, it is useful to recall the dominant lines of sociological theorizing and research on organizations up to the mid-1970s.

Meyer and Rowan [3] drew on Weber's analysis of rational-legal authority in modern economies, and DiMaggio and Powell [5] also start from a Weberian view of rationalism as the major force in industrializing and modernizing societies, and echo Weber's idea of such rationalism becoming an 'iron cage'. This new orientation proposed that formal organizational structure reflected not only technical demands and resource dependencies, but was also shaped by institutional forces, including rational myths, knowledge legitimated through the educational system and by the professions, public opinion, and the law. The core idea that organizations are deeply embedded in social and political environments suggested that organizational practices and structures are often either reflections of or responses to rules, beliefs, and conventions built into the wider environment.

Hence Meyer and Rowan argued that in modern societies, rules about how organizations 'ought' to operate and the kinds of structures they 'should' have arisen from a

variety of sources. Among these, Meyer and Rowan discuss the effects of complex relational networks (interconnections among organizations that facilitate the spread of ideas and understandings), the collective organization of the environment (the rise of powerful states that can pass and enforce mandates that affect organizations), and the leadership of local organizations (non-government organizations that have power and/or legitimacy to promote prescribed organizational arrangements). Organizations experience pressure to conform to these rules in order to maintain their own legitimacy; thus, formal structure, Meyer and Rowan suggest, can be viewed as the result of conformity to such rules or 'myths.'

Like Meyer and Rowan, DiMaggio and Powell argue that the creation of institutional templates serves to drive processes of isomorphism, thus resulting in a high level of structural homogeneity among organizations. Their specification of different sources of isomorphism - mimetic, normative and coercive - elaborated and clarified distinctions pointed to in Meyer and Rowan's work. Perhaps more importantly, their notion of organizational field helped to draw attention to the array of interacting organizations that give rise to, shape and re-shape institutionalized definitions. They define a field as [3, p. 148], 'those organizations that, in the aggregate, constitute a recognized area of institutional life: key suppliers, resource and product consumers, regulatory agencies and other organizations that produce the services or products'.

Zucker [4] considered the phenomenon of institutionalization and conceptualized it as a process by which individual actors transmit what is socially defined as real and, at the same time, as a variable of how much an action can be seen right in a given social reality. This author also defends the position that generally the institutionalization process occurs as a sub-product of the creation of other structures, but that once institutionalized, the structure or activity is maintained without any need for further actions.

We hold the belief that institutionalization is a compulsory process that forces social structures to become assimilated to other structures who are facing the same

challenges, an idea that will be explored under the denomination of isomorphism.

3. Legitimacy and isomorphism. The Mechanism of Institutional Isomorphic Change

In order to enable the understanding of the gradual institutional change within the organizational environment we consider here the three stages of the institutionalization process proposed by Tolbert and Zucker [7]:

1. Pre-institutional / Habituation – Includes the innovations and changes made in response to specific organizational problems that results in structures at the pre-institutionalization stage, limited in terms of operation and, generally, not permanent. Takes into consideration the solutions adopted in other organizations with the possibility of the occurrence of mimetic behaviour.

2. Semi-institutional / Objectification – Consists of the development of social consensus between decision makers in the organization on the value of the structure from obtaining and analyzing information and its dissemination in other organizations of the same field (interorganizational monitoring), implying the diffusion of the structure. At this stage, the leaders (defenders of change) play an important role, carrying out the tasks of theorizing that aim to attribute general cognitive and normative legitimacy.

3. Full institutionalization / Sedimentation – Is characterized by the virtually complete propagation of its structures for the whole group of theorized actors as suitable adopters and the perpetuation of structures for a considerably long period of time.

These sequential stages of the institutionalization process leads us to a factor that is closely linked to it, respectively legitimacy which can be defined as a generalized perception or supposition that actions of an entity are desired or suitable within some system of norms, values, beliefs and socially constructed definitions [8]. Generally legitimacy is a product of institutionalization or contributes to it, but in some cases it is not connected to it, seeing that illegal elements may be institutionalized such as corruption, fraud and organized crime without being legitimized.

According to Scott [9], legitimacy was primarily recognized as being centrally important in social life by Weber, who identified its sources in tradition, charisma and rational-legal devices. Also according to Pfeffer [10] reaffirmed the idea of legitimacy and adaptation of organizational goals to social values. In the search for legitimacy and social acceptance, organizations seek to make their actions, structures and practices become closer to the patterns held to be socially correct [9]. This conformity, for organizations, would be more efficient in the sense of guaranteeing their survival through improvement and recognition by society than performance itself, the reason why it is utilized in turbulent and risky times.

Suchman [8] proposes the following interrelated typology of legitimacy:

1. Pragmatic legitimacy – Based on the interests of the actors who are more closely linked to the structure or policy;

2. Moral legitimacy – Reflects a positive assessment of the organization and its activities, based on the socially constructed values;

3. Cognitive legitimacy – Considering that the acceptance of the structure is inevitable from the point of the determined cultural framework. The actors no longer imagine its non-existence.

Also according to Suchman [8], the three types of legitimacy co-exist in most of scenarios and are interrelated. As it moves from pragmatic to cognitive, passing the moral, legitimacy becomes more difficult to obtain and manipulate because the latter two factors depend on a more consistent cultural framework. In some cases, these types are reinforced each other while in the opposite case they come into conflict with each other.

The phenomena of the institutionalization and social legitimacy are deeply influenced by the external and internal factors of the social environment. In order to become a ‘natural’ structure or a ‘right’ policy in Jepperson’s terms [11], there is a need for all segments of the structure to become homogenized. DiMaggio and Powell [5] emphasized that, ‘once a field becomes well-established there is an inexorable push towards homogenization’.

‘Isomorphism’ – is the most suitable concept that explains the homogenization process. It is fundamentally a term deriving

from abstract algebra. Isomorphism encompasses the mapping between complex structures where the two structures contain equal parts, and is a constraining process that forces one unit in a population to resemble other units that face the same set of environmental conditions’ [5]. The institutionalized legitimacy can be ensured only by the socially acceptable isomorphic structures and policies. DiMaggio and Powell [5] identified three institutional isomorphic processes:

1. Coercive isomorphism – It is a process caused by the formal and informal pressures and influences made on the organizations by other stakeholders upon which these organizations are dependent. In addition, organizations are deeply influenced by the cultural expectations of the society within which they should function. The pressure can appear in a form of force, persuasion or invitation. A good example of coercive isomorphism is the establishment of education standards for the secondary and high schools. The imposition of a mandate by the government may oblige schools to establish certain steps to conform to set standards.

2. Mimetic isomorphism – ‘Uncertainty is also a powerful force that encourages imitation’ [5]. The ambiguity of goals, symbolic uncertainty set by the social environment, success of other structures may cause the mimetism (modeling) of organizations to established ones. The mimetic process is not always intentional. The organization may not even be aware that it is modeling other more successful or socially acceptable structures.

3. Normative isomorphism – It primarily stems from a professionalization. Due to the internal and external competition, members of one profession may collectively struggle to define the requirements a person should possess to ‘join their club’.

The institutional isomorphic change on the organizational level is greater when the presence of some predictors can be recognized. In practice, these predictors may be: The more dependent on another organization, the more alike it will become; The greater the centralization of resource supply, the more it will change to resemble the organizations it is dependent upon; The more uncertainty the more an organization

will model its structure after successful firms; The more ambiguous the goals, the more an organization will mimic a successful one to establish legitimacy ; The greater the reliance in using academic credentials to choose staff, the greater will be similar to other organizations.

In the present paper we envisaged the organizational change like a process that reveals 'natural' structure or a 'right' policy and take place gradually. Looking to the real life we inexorably reach to some questions: Who are the actors that drive the whole process? Are those actors acting as catalysts for structural change and giving direction to change? Answers to these questions can be identified in an extension of the present work which capitalizes on the concept of institutional entrepreneurship.

4. Conclusions

Organizational change from the perspective of institutional theory is both a matter of innovation, design and construction on an existing base by developing alternative or additional structures, value systems, and symbols. Change is happening very slowly but at the same time, it is seen as possible and likely when not involving complete replacement of an institution with another institution, with very different values. Especially when it is driven by key actors, the change is not unidirectional, occurring amid endless succession of processes of institutionalization, de-institutionalization followed subsequently by re-institutionalization.

Actors have the power of "agenda setting" and to set priority to issues submitted for discussion. However, preferences are rooted in rational behaviour, identity, roles, they are not autonomous and therefore are not autonomous from the social context in which they occur. This statement highlights the fact unequivocal: from the emergence of future discussion topics on the agenda until the sedimentation of institutional arrangements is a very long way. At the end of the paper we invite the reader to recall the stages of the processes of institutionalization (followed / preceded by deinstitutionalization and re-institutionalization) intended to give an overview of the institutional changes needed to occur at the organizational level to

transform into reality the goal of sustainability and to achieve the replacement of competitive mentality with the one based on cooperation.

Determinants of Internal Migration in Romania: A Microeconomic Analysis Using a Social Survey

Bunea Daniela
Bucharest Academy of Economic Studies
daniela.bunea@yahoo.com

Abstract

Internal migration is appreciated in the literature at national, regional or individual level. This paper focuses on the micro level and uses as main tool a social survey in order to determine the main determinants of this phenomenon within Romanian borders.

Data for this preliminary study was collected using an online questionnaire addressed to members belonging to different working or educational entities. The survey comprises questions related to various aspects investigated on the existing literature and also some final questions related to the personal experience of the respondents.

The main results confirm some of the previous findings, such as married people, with dependents, aged 50+, employed, homeowners, etc. are relatively less willing to migrate. Further, the physic costs of moving are more important than the money costs, physical distance is viewed as a factor with a moderate impact and contracted migration overwhelmingly dominates the speculative type.

Keywords: migration, determinants, social survey, Romania, SPSS.

J.E.L. Codes: R23, C80

1. Introduction

Migration is a means to improve the allocation of human resources and, along with education and training, is a form of investment in human capital.

Either internal or external, this phenomenon is of great importance nowadays due to two main perspectives: its factors of motivation and its consequences in the economy. Its determinants can be both objective and subjective whereas its main consequence reflects on the evolution of

regional disparities. Moreover, migration can be affected by regional disparities and, in turn, regional disparities can affect migration, i.e. generating a causal relationship.

This paper employs a **non-probabilistic quantitative investigation approach** with the main objective to establish what motivates Romanian people to change residence within national borders. Data collection was carried out using a web questionnaire, during the period August 12, 2011 – February 5, 2012 and included a total of 251 volunteer respondents.

The main features of this research technique are:

- the sample used is not representative (small number of respondents);
- I do not need a sampling frame;
- I cannot compute the sampling error;
- I use a circumstantial sampling formed by volunteers.

The remainder of the paper is structured as follows: section 2 makes a review of the existing literature on the main determinants of internal migration in order to offer valid arguments for my study, section 3 performs a general presentation of the social survey, mainly the variables employed, while section 4 carries out a comprehensive analysis of the collected data; finally, section 5 offers an advance on further research.

2. Theoretical background on internal migration

Migration can take two forms: *speculative migration* and *contracted migration*. The former consists in searching for a job in another place, while the latter is provoked by already finding a job in another place (Silvers, 1977). Molho (1986) considers that speculative migration is part of the job-search process whereas contracted migration is the result of this process.

Etzo (2008) considers temporary and

permanent migration. *Temporary migration* implies commuting from one place to another whereas *permanent migration* implies changing address to another residence. Longer moves take place mainly for job-related reasons whilst shorter moves take place mainly for family reasons (Korkiasaari, 1991 in Nivalainen, 2004).

Sjaastad (1962) divided the private costs of migration into two categories: *money costs* (expenses of movement, food, lodging, transportation, etc.) and *non-money costs* (foregone earnings and psychic costs of changing environment). Money costs are very difficult to know, unless micro data is available or certain distances are given. Non-money costs can be broken into *opportunity costs* and *psychic costs*. The former costs represent foregone earnings while travelling, searching for and learning a new job. Additionally, one should not ignore time spent during these activities. The latter costs, very difficult to estimate, arise from leaving familiar surroundings, family and friends, and from uncertainty.

The **gravity models of migration** include as main variables the physical distance and the population size. The former impact negatively on migration as costs and distance go hand in hand. The latter affects positively on migration as regions with large populations experience both high in-migration and high out-migration.

According to the neoclassical approach, migration decreased with age and increases with educational attainment. Elder people find it more difficult to migrate because of higher costs of moving, especially psychic costs, and shorter periods of enjoying the benefits. Moreover, younger people migrate more because they have a longer period over which they can benefit from the returns to migration investment, i.e. an increase in net gains. Highly-educated people have more possibilities to find job throughout the national territory as they possess a higher capacity to assess opportunities in different labor markets (Borjas, 2000) and their human capital is easier to transfer to distance places (Shields and Shields, 1993).

Persons that have a house in their own property are less eager to migrate as this change implies selling or renting it. The same lower incentive to migrate is specific to those persons that have dependents or are married.

Wages and migration. If wages in a certain region rise, the gain from moving into that region increases whereas the gain from moving out of the region decreases, thus in-migration is favored while out-migration is disfavored by a rise in wages (Parikh and Van Leuvensteijn, 2002).

(Un)employment and migration. The employed migrate less than the unpaid unemployed, while paid unemployed constitute an uncertain category. Any rise in the unemployment value (e.g., an increase in unemployment benefits) or the employment value (e.g., a reduction in wages) dissuades migration and boosts unemployment (Dohmen, 2005). In general, the unemployed migrate more as they bear lower costs compared with the employed.

Borjas (2008) distinguishes between tied mover and tied stayer when referring to family migration. *Tied stayer* is that family member who sacrifices better employment opportunities in another place because his/her partner is better off in the current location. *Tied mover* is that member who accompanies his/her partner in spite of her/his better opportunities in the current residence.

DaVanzo (1978) demonstrated that: families whose heads are unemployed or looking for work are more prone to migrate than those whose heads are employed or do not search for another job; and among job-searchers, the unemployed migrate more because of lower opportunity costs of moving, less job-specific capital and a greater responsiveness to opportunities elsewhere. Also, recent migrants are more sensitive to migration because they should have more information about job opportunities and a greater capacity of acquiring it, i.e. learning-by-doing effect. Hence, recent migrants are also “eligible” to repeat migration.

Among households, the most eager to migrate are young families with no children.

3. Presentation of social survey

The social survey carried out comprises 25 questions related to:

- personal characteristics (first 6): age, sex, marital status, educational level, homeownership, and number of dependents;
- labor market condition (next 7): labor

- market status (employee/ unemployed/ self-employed/ inactive or student), length of experience, job satisfaction, intention to change job, unemployment allowance and duration of unemployment;
- financial satisfaction (1);
 - where to migrate (1): inside the country, or outside, don't want to move or undecided;
 - internal migration issues (next 10):
- availability of professional reconversion and / or residence change,
 - importance level given to physical distance between actual residence and possible future residence,
 - importance level given to monetary and psychic costs of moving,
 - choosing between contracted migration and speculative migration,
 - the three most important criteria appreciated in the possible new location, to choose between regional differences in average gain, unemployment rate, employment rate, vacancies, house prices (including rent), relative amenities (business environment, local taxes, public services, recreation activities, infrastructure, climatic conditions, pollution, etc.), personal and family situation, or other;
 - to choose between being tied mover or tied stayer or none,
 - residence change real experience: alone or with the family? and why?, for studies, for employment or other reason, was the move a good decision and why or why not?; if not, what was decided?.

The entire questionnaire is available at https://docs.google.com/spreadsheets/viewform?hl=en_US&formkey=dHRLMzAydFJwSWg0YVJxdWE0VDhQQIE6MQ.

4. Data analysis in SPSS

The majority of respondents are 20-29 year-old (59%), unmarried (59.8%), women (79.7%), have at least a university degree (97.6%), do not have a house in their ownership (53.4%), do not have dependents (69.3%), are employees (74.9%), work in the services sector (45%), have more than a 5-

year experience (44.2%), are satisfied with their current job (56.6%) and are not willing to change it (48.6%), 63.7% are relatively happy with their financial situation, 56.6% are willing to reconvert professionally and also to change their place of residence, 40.6% give a moderate importance to the physical distance between the current residence and another possible residence, 56.2% consider more important the psychic costs of moving than the monetary ones and an astonished percentage of 95.2% would migrate only if they find a job beforehand.

Moreover, 40.6% give a good appraisal to the regional differences in average gain as a key issue in the migration decision, 59.4% are in favor of differences in relative amenities whereas 61% base their decisions on their personal and familial circumstances. Unless the financial situation worsens, 86.9% and 81.3% of the volunteers would accept to be tied movers and, respectively, tied stayers.

As for the migration experience, 31.5% of respondents have never migrated, 47% have migrated for studies, 15.1% for employment issues and 10% have followed their family. As for those who migrated at least once, 74.9% argued that the benefits have arisen as time went on, 16.8% immediately and the rest consider migration as a bad decision in which they did not accomplish their purposes and/or incurred high costs (8.4%). Moreover, these last individuals who were not satisfied with their decision said that 77% of them continued to live in the same place, 19.7% decided to move to a new place whereas only 3.3% returned to their home residence.

At the question *Where to move?*, 45% of respondents would choose to go abroad, 28.3% do not want to migrate for the moment, 14.7% were undecided whether to move and/or where, and only 12% would choose an internal destination.

Because those who are unemployed or those who have only a primary and secondary education degrees represent each only 2.4% (6) of all respondents, I decided to ignore them and treat them as lost entities in order to optimize more my analysis.

15.7% of men and 11% of women would make an internal change of residence, whereas 49% of men and 44% of women would go abroad. Further, 26.7% of possible domestic migrants are men and 73.3%

women.

Table 1 is a contingency table which shows the percentage distribution of respondents according to their migration preferences, sex and age group. Thus, 37.5% of men opting for internal migration are aged 20-29, another 37.5% are aged 30-39, 12.5% are 40-49 year-old and another 12.5% are 50 year-old or older. Similarly for internal migrant women, 72.7% are aged 20-29, 18.2% 30-39, 9.1% 40-49 and none is 50 or older. Overall, 63.3% of total possible internal migrants are aged 20-29, 23.3% 30-39, 10 40-49, and 3.3% 50 and more. Instead, 15.8% of people aged 20-29 opting for internal migration are males and 84.2% are females, and so on. For the rest of the table, interpretations are similar.

Table 1. Contingency between to decision to migrate, sex and age groups

Destination	Sex	Age group			
		20-29	30-39	40-49	≥ 50
Internal	Male	37.5	37.5	12.5	12.5
		15.8	42.9	33.3	100
	Female	72.7	18.2	9.1	0
		84.2	57.1	66.7	0
	Total	63.3	23.3	10.0	3.3
		100	100	100	100
External	Male	48.0	20.0	24.0	8.0
		18.2	16.1	54.5	40.0
	Female	61.4	29.5	5.7	3.4
		81.8	83.9	45.5	60.0
	Total	58.4	27.4	9.7	4.4
		100	100	100	100
No move	Male	38.5	30.8	23.1	7.7
		13.2	20.0	27.3	50.0
	Female	56.9	27.6	13.8	1.7
		86.8	80.0	72.7	50.0
	Total	53.5	28.2	15.5	2.8
		100	100	100	100

Source: Own elaboration based on SPSS results

Table 2 is another table of contingency which relates the migration preferences with the marital and the homeownership status of the respondents. Thus, 66.7% of married respondents with at least one house in their

ownership would migrate to another national residence or 75% of total homeowners are married people who would make an internal move. Additionally, only 9.5% of single/divorced/widow with a house would migrate internally and an overall percentage of 73.3% of all respondents would change residence within the country. Instead when considering an external move, percentages of married homeowners fall by 2.1 p.p., of single+homeowners increase at 36.9% and of overall homeowners goes from 26.7% to 48.7%. If I consider the category of non-migrants, I observe a percentage of 81.3% for married homeowners, 38.5% for single+ homeowners and 57.7% overall. Therefore, I can draw the following conclusions: the majority of married migrants are homeowners while the majority of single/divorced/widow migrants are not.

Table 2. Contingency between the decision to migrate, marital and homeownership status

Destination	Marital status	Homeownership	
		Yes	No
Internal	Married	66.7	33.3
		75.0	13.6
	Single, divorced, widow	9.5	90.5
		25.0	86.4
	Total	26.7	73.3
		100	100
External	Married	64.6	35.4
		56.4	29.3
	Single, divorced, widow	36.9	63.1
		43.6	70.7
	Total	48.7	51.3
		100	100
No move	Married	81.3	18.8
		63.4	20.0
	Single, divorced, widow	38.5	61.5
		36.6	80.0
	Total	57.7	42.3
		100	100

Source: Own elaboration based on SPSS results

From table 3 I want to see what type of migration does people prefer according to their age and sex. Hence, 91.3% of men aged

20-29 opt for contracted migration and only 8.7% for the other one. The same holds for the other age groups except for the eldest one who prefer in its entirety the first form of migration. To note that females, no matter their age, are more firmly decided to migrate only with a job in hand. Additionally, 14.9% of “contracted” migrants are men aged 20-29 and 85.1% are women; 19.4% are men aged 30-39 and 80.6% are women and so on.

Table 3. Contingency between migration type, age and sex

-percentage-

Age	Sex	Migration type	
		Contracted	Speculative
20-29	Male	91.3	8.7
	Female	96.0	4.0
30-39	Male	92.3	7.7
	Female	19.4	33.3
40-49	Male	96.2	3.8
	Female	80.6	66.7
50 and more	Male	90.9	9.1
	Female	38.5	50.0
50 and more	Male	94.1	5.9
	Female	61.5	50.0
50 and more	Male	100	-
	Female	40	-
50 and more	Male	100	-
	Female	60	-

Source: Own elaboration based on SPSS results

When putting together the educational level and the appraisal to physical distance, 50% of the lower-educated respondents give a great importance to distance, while 16.7% consider it rather insignificant; instead, 37.1% of highly-educated respondents consider distance as having a reduced importance and only 22% exhibit a high interest. Thus, educated people do not see distance as a major barrier when evaluating their territorial mobility.

Table 4 links the working experience with the type of migration, contracted or speculative. Thus, 10.8% of respondents that would migrate only with a job in hand have less than 1-year experience, 40.1% have 1 to 5-year experience and 49.1% have more than a 5-year experience. Instead, those people with less than 1 year of experience prefer in their great majority to migrate only after getting a job (92%); the percentages are even higher for the other categories of experience,

e.g. 96.6% for those with less than a 5-year experience. The same hierarchy holds for “speculative” migrants.

Table 4. Contingency according to the type of migration and experience

-percentage-

Migration	Experience in the current activity		
	< 1 year	1 - 5 years	> 5 years
Contracted	10.8	40.1	49.1
Speculative	92.0	96.6	93.7
Total	16.7	25.0	58.3
	8.0	3.4	6.3
Total	11.2	39.3	49.6
	100	100	100

Source: Own elaboration based on SPSS results

Table 5 puts together the desire to change the current job and the availability to reconvert professionally and/or change residence. Thus, 61% of those who plan to change their job in the near future are open to both professional reconversion and residence change. 50.8% of respondents with double availability plan to change their current job while 49.2% refuse to do it. Additionally, 12.5% of those who reject both options plan to change their job while 87.5% want to keep it. Overall, it seems that people are indeed quite mobile both professionally and territorially.

Table 5. Contingency between job change and willingness to reconvert professionally or change residence

-percentage-

Job change?	Professional reconversion or residence change			
	Only to reconvert	Only to change residence	Both	None
Yes	18.0	17.0	61.0	4.0
No	51.4	48.6	50.8	12.5
Total	13.9	14.8	48.4	23.0
	48.6	51.4	49.2	87.5
Total	15.8	15.8	54.1	14.4
	100	100	100	100

Source: Own elaboration based on SPSS results

Table 6 compares job change and financial satisfaction. Thus, 43% of those who want to change job are unsatisfied with their financial status, 55% are more or less satisfied whereas only 2% are very satisfied. 60.6% of total unsatisfied plan to change their job next year while 39.4 do not. For respondents rather happy with their condition (first two groups),

the ratio is in favor of no job change.

Table 6. Contingency between job change and financial satisfaction

Job change?	Financial satisfaction		
	Very satisfied	Relatively satisfied	Unsatisfied
Yes	2.0	55.0	43.0
	22.2	38.7	60.6
No	5.7	71.3	23.0
	77.8	61.3	39.4
Total	4.1	64.0	32.0
	100	100	100

Source: Own elaboration based on SPSS results

Last table, 7, I can observe that employees who want to reconvert professionally and also to change residence represent a proportion of 55.9% and those who refuse both options are 14.4%. From all volunteers choosing only the professional change 81.1% are employees, 10.8% are self-employed, and 5.4% are inactive. For all categories, the availability to make both changes is superior to all the others.

Table 7. Contingency between labor market status and willingness to reconvert professionally or change residence

Labor market status	Professional reconversion or residence change			
	Only to reconvert	Only to change residence	Both	None
Employee	16.0	13.8	55.9	14.4
	81.1	68.4	73.9	79.4
Self-employed	13.8	27.6	44.8	13.8
	10.8	21.1	9.2	11.8
Inactive/student	7.1	10.7	71.4	10.7
	5.4	7.9	14.1	8.8
Total	14.7	15.1	56.6	13.5
	100	100	100	100

Source: Own elaboration based on SPSS results

5. Future research

The current study is part of a more complex analysis on internal migration determinants from the microeconomic perspective. Thus, further, I plan to extend my sample size and to amplify the questionnaire length, in order to obtain more representative outcomes.

Simulation Modeling Approach in the Research of Tax Influence on Enterprises

Galina Caraganciu
Chair „Finance & Banking”, UCCM
g.caraganciu@gmail.com

Abstract

This thesis is aimed to analyze the indirect taxes' influence on industrial firm's activity. In our country this problem requires a special attention. These taxes have a dominant share of fiscal burden. By-turn, fiscal burden is very important to assess the competitiveness level of inland industrial firms. But the taxing reduction will involve a decrease of national budget revenues. All these determine the opportunity to enhance the state attention on this sector's reformation.

Within the thesis, the author has studied the link between indirect taxes and economic units. The author has assessed that the fiscal regime is one of the main factors to enhance the national industry position.

In the study there have been suggested new methods to optimize the indirect taxes shares. Also, the author has elaborated as analyze instrument an original model. This model has allowed the prognostication of firms' activity in the environment of indirect tax systems reformation.

Key words: industrial enterprises activity, competitiveness level of inland industrial firms, national budget revenues, optimize the indirect taxes, fiscal policy in the global crisis

J.E.L. Classification: H21

1. Introduction

The establishment, distribution, perception and the use of taxes are state functions, which guide and coordinate the politics of imposable income establishment and appreciate the influence of these on the results of the activity of

economical agents.

The mathematic concept of tax transposition, from the methodological point of view, is based on the theory of marginal utility of goods, value and prices. For the research of cost formation, of the selling price and the relation of these on the prices of stability, is necessary to take into account the indirect taxes, which modify the end user stability price.

The consumer market where the made goods are being sold, is characterized by two counteragents: the economic object “producer”, who forms quantitative the global supply; and the generalized consumer, who forms the global demand. The increase in solvable demand is determined by the level of income and the value of use of the commercialized good.

The fiscal politic influences actively the rates of the consumer market. On one hand, it modifies the solvable demand through the indirect taxes, on the other hand, it forms the premises of future activity of the economic subjects, depriving them of a part of means for development. In this sense we are to conclusion that the indirect taxes, by the influence of the levels of sales, provoke damage to the enterprise; and direct taxes provoke damage to the problems concerning strategic development.

Taxes influence directly the evolution of reproduction processes, which is the main circuit of capital. Tax influence over the economic activity will be examined from this point of view.

2. The main principles of research of tax influence to enterprise behavior.

Theoretic bases for indirect taxation are quite complicated. In the first place, a stability point is to be found between fiscal interests and the

principle of social equity. These taxes are paid by the population, including the poorer social categories, who gain their means of existence from the state's budget. At the same time we have to mention that we do not agree with the opinion that states neutrality of indirect taxes towards economic activity. In conditions of price stability, the application of these taxes leads to the distribution of the potential benefit of the producer, in favor of the state, not to mention the cases, when the application of indirect taxes provokes the overcoming of the stability price.

The results of the research prove that there is a causal connection between the relation of tax distribution and the level of economic development, having established that in the total level of taxes, with the decrease of living standards, the indirect taxation share increases. This rule is common for Moldova and is explained by the fact that direct taxes are much harder to accumulate to the budget. In conformity to some estimations, the share of indirect taxes, in the total of taxes of a developing country is about 60% to 70%, as compared with the developed ones where this share is about 30% to 40%. Taxation systems from foreign countries are based in indirect taxation, considering it a factor of boost to affairs. These conclusions have a larger application in practice, thus the theoretical problem is much more complicated, because in the case of an absolute or partial monopoly, the companies have the possibility to transpose a part of the direct taxes into the end user price, therefore transforming direct taxes into indirect.

In case of an efficient activity, companies, cannot transfer to consumers the recovery of indirect taxes and are forced to cover them from their own revenue. So the change in the level and composition of taxes, as a consequence of a radical tax reform, is felt by the economy, population and enterprises and generated great discrepancies between the proposed goals and the realized ones.

Therefore, the exaggerated tax weight negatively influences supply and demand, and satisfaction of personal and production needs leads to decrease of the population's income and to the increase of the level of poor production. The classical requirement concerning the co

balance between the direct taxation and the indirect one, presumes that of the state prefers indirect taxation, it is obliged to protect the consumer from the negative influence of prices. The analysis of the theory of tax transposition allows to conclusion that the problem of tax weight transfer influences directly the stability of the taxation system.

Thus the main goal is the elaboration of such a regime of imposition, which could ensure an optimal coordination of the interests of all subjects and more precisely: the state, the economic agents and the population. In this sense, in the limits of modeling, we are to demonstrate how the tax level influences the production realization.

For the validation of the model, we are to use the Model enterprise (hypothetical data), thereby, the model proposed contains a generic character and its application to a certain enterprise is a different research. This approach allows determining general algorithms peculiar to this economic phenomenon without any dependence on the specific of the concrete economic object.

Taking into account those exposed, we are to continue to the description of the problem. The influence of taxation on supply and demand, on the market, is manifested through direct and indirect taxes.

Such direct taxes reduce the net profits of economic agents; influence the capacity of these to extend their economic activity. As a consequence, they stop the growth in perspective of the supply. The taxes on individuals reduce the capacity of these to create solvable demand. Respectively, the global demand is reduced. On the other hand, after accumulating the income in the budget, the taxes are redistributed in the form of expenses, which at their turn form the income for the vulnerable social strata in the form of pensions, compensations etc.

Indirect taxes, however, influence directly the structure of the global demand through the increase of the stability price.

3. Modeling approach. The case study.

For the **modeling of the 1st factor “solvable supply”** we are going to set up our indicators as follows:

RM – the amount of the good sold at stability price (MDL);
 RMD – the rate of profit which needs to be invested in development;
 M – the global supply on the consumer market (units);
 MS – the solvable supply on the consumer market (units)
 S – the reproductive expenses in the structure of the unit good (MDL);
 RIND – the indirect tax rate, balanced to the reproductive costs in the product’s structure;
 RID – the direct tax rate, balanced to the level of profit. Conforming to the last initiatives of the president of the country, we equal to 0.

At the same time for the **modeling of the 2nd factor “solvable demand”** we are to use the following indicators and note them as presented below:

P – the total solvable demand of the consumers;
 D – the global income of the consumers;
 RI – the savings tendency, balanced to the global income;
 MS – the solvable supply on the consumer market (units);
 PE – the stability price.

Then:

$$P = D \cdot (1 - RI) \quad (1)$$

$$PE = f(M, RIND, P) \quad (2)$$

$$MS = P / (S \cdot RIND \cdot RMD) \quad (3)$$

$$PE = P / MS \quad (4)$$

After the modeling of the stability price we return to the initial model. In this certain case, as an output parameter we calculate the commercialization of production by the stability price. From the initial model, we use the level of overall supply and demand.

To determine the influence of the indirect taxes on the realization of goods, we compare the commercialized levels at different rates of the indirect tax. To further increase the accuracy of calculation of the impact of indirect taxes on the company’s profit in the effectuated calculations, we reduce and increase only the rate of the indirect tax, leaving all the rest of the data untouched.

We present an example of calculation of influence of the indirect taxes on the sales of goods at the initial rate of the indirect tax, applying formulas presented earlier. Presuming that the global income of the consumers

constitutes 100000 lei, in the base of the formula (2) has been calculated the stability price with a level of 31.2 lei, in this case the volume of the sales at the stability price was an amount of 93600 lei. In conditions of realization of total production, the price would be 30 lei per unit, and the amount of sales of 90000 lei. By diminishing the indirect tax rate with a percent we obtain the dynamic of the sales volume, which is presented in figure 1.

Figure 1. The dynamic of the sales volume at the stability price, in lei

Source: Elaborated by the author

The study of the calculation made and presented in figure 1 attests that the enterprise loses profit until the indirect tax rate doesn’t lower by 5%. Every next point of decrease changes the company’s profit further (the enterprise registers profit). The data presented below, in figure 2, indicate the amount of the lost profit by the economic agent.

Figure 2. Lost profit, in lei

Source: Elaborated by the author

As a result it has been found that the decrease by one percent of the rate of the indirect tax ensures a growth of company’s profit by 780 lei, and every increase of these taxes (by one percent) diminish in the same measure the profit.

Following the calculations made, by the model described earlier, we obtain the results of the influence of indirect taxes over the

enterprise’s activity, majoring and lowering the indirect tax rate by one percent. These results were exposed in figure 3.

Figure 3. The influence of indirect taxes on the company’s income

Source: Elaborated by the author

4. Conclusion

Summing up the results of the calculation of the elaborated mode, we state that by diminishing the sums paid for indirect taxes, the economic agents have the possibility to invest, supplementary, in the development of their activity larger amounts of money, as a result, obtaining more profit. In our opinion, the reinvestment of this profit will lead to a considerable increase in profitability in case of the investments as much as in material assets (on long term), as in current assets.

As a result of the effectuated research concerning indirect taxes and their effects over the producers, we find that the majority of the prices for the goods, depending on the level of indirect taxes can decrease, under certain conditions, the demand for these goods. As a result it will decrease the level of sales and respectively the level of profit. Thus it will affect the further development of economic agents.

It is necessary to mention that, from the conceptual and economic point of view the

taxation system is a mechanism of insurance for the economic and financial stability, manifesting itself as a donor of financial resources, as an instrument of promoting for the economic policy and as a resource of great force of the public authorities. In our opinion, for the assurance of a good entanglement of economic policies, which will assure the durable development of the state, it is needed an adequate taxation mechanism which would allow the increase in industrial production.

The taxes applied in exaggerated levels deprive economic activity of profits and makes it not worth continuing. The application of high tax rates for indirect taxes not necessary increases the income to the budget. At the same time, when there aren't taken into account the traditions and the way to live of the population in a certain country, the differences in indirect tax rates influence negatively the fiscal incomes.

Taking into account the regressive character of indirect taxes, as well as of its negative effects, which are fully felt by the national producers, we propose a diminishment of fiscal pressure through this type of taxes. A reduction in indirect taxes would fall, as well, into the tendency of harmonization of fiscal law in the Republic of Moldova with the European one.

Abstract

In this paper we wish to fix and underline the nature, causes and effects of the so called "theoretical limitations" of standard economics related to environment, without losing the focus on the impact – both present and potential – that this may have over the natural and social systems.

Key words: market failure, transaction costs, property rights, development, rationality.

J.E.L. classification: B 13, P 14, Q 32, Q 52.

1. Introduction

In order not to produce confusion of any type, first we must clarify two important aspects: *the narrow sense* given to the economical science is represented by the standard economics which identifies with the neoclassical school of thought and mainstream economics; the other aspect regards the purely theoretical causal relationship between economy and environment and must be pointed that this is the desired interpretation and not the debates between economists and environmentalists *per se*.

The neoclassical economists adopted, with several exceptions, a general neutral attitude on environmental matters, which has its implications over today's society. The existence of market failures embodied in an inefficient resource allocation together with an incomplete attachment of economic value to some natural resources, may lead to social

and environmental disequilibrium with considerable potential impact over economy, society and last but not least, environment. The main causes results from the existence of significant *transaction costs* together with the difficulties of defining *property rights* in this matter. One of the effects of the existence of market failures is the presence of uncompensated negative *externalities*.

Based on these assumptions we will tackle the subject of the standard economical theory limitations from the perspective of market failures. Thus, in the first part we will focus on the causes, following, in the second part, by a discussion of the derived effects.

2. Market failures

Keeping the perspective from which the subject is analysed, the market failure phenomenon emerges when the market fails to attach economic values, present or potential, to environmental goods and services or/and in the case when property rights are not properly defined and assigned to these goods and services, following thus an inefficient resource allocation. The presence of transaction costs, the absence of adequate defined property rights and negative externalities, are some of the factors that fuel the emergence of the phenomenon.

2.1 Transaction costs

What kind of role does the transactional costs play and what implications appear by failing to include them in the economic processes? In spite of the fact that there is no consensus regarding the way in which they

should be defined, many authors agree upon the idea that these mean in fact the costs for using the mechanism of the price or the exchange of property rights. They can be transaction costs on the market, associated with the negotiation process, preparation and application of contractual obligations, *management and political* transaction costs. The last two categories include those costs for adjustment and maintenance of the organisations, and accordingly of the institutions [9].

Apart from their classification, we should also mention that the magnitude and typology of the transactional costs depend on the institutional environment [3]. In this respect, the higher the transaction costs become, the more probable it will be that the parties of an exchange will invoke informal restraints for establishing the transaction. In extreme cases, as a consequence of too high costs, it can be considered that the transaction will not take place any more. We understand thus that the extension of the costs determines the exchange volume that means, on a production level, an influence on the output level. “In our real world, transaction costs determine property rights, ownership, the extent of trade, specialisation and productivity. If transaction costs decrease, property rights will be more clearly defined, more goods and services will be traded, the benefits of specialisation will increase, and greater economic gains will be realised” [2].

Consequently the role of the transaction costs is a central one in the discussions regarding the property rights and failing to include them in our equation (zero transaction costs – the neoclassical assumption regarding the transaction of environmental goods) can have undesired consequences, hindering a better definition of the property rights, and from here the emergence of externalities, that perfectly describe the imperfections of the market.

2.2 The problem of defining property rights in connection with the environment

The concept of property rights occupies a central role in economic literature, with a broad spectrum of definitions, classifications and analyses being offered on the subject. From a *judicial* point of view, rights

represent certain social norms through which human relations are established and observed. In other words, the property right gives the owner the right to possess, use and distribute the good thus giving him the freedom to deploy the good with exclusive and absolute rights, however, within the boundaries of the law. On the one hand, society recognises and respects property owned by an individual if s/he legally owns the property rights to that property; on the other hand, the owner of the property right has the right to defend his possession, within the law, meaning that s/he can take action against any other individual who has violated or abused the rightful owner’s property.

From an *economic* perspective property rights are at the root of all market exchanges therefore, allocating property rights in society affects the efficiency of the resources [4]. In reality, “what are owned are socially recognized right of action” [1].

To anchor the role played by property rights in our discussion about ecosystem goods, or natural resources we must **classify** property rights from the analysed perspective: thus, natural resources can be: part of private property, state-owned, public property, and with open access. Possession rights and the right to use the resources, derived from the first category, are conferred to an individual, community or private corporation. The owner has full management rights over the resources according to his will, including granting or forbidding economic or non-economic agents the access to use the resources for their benefit. In this way, economic decisions in relation to resources are decentralized; the coordination of individual plans is made through the market. An important asset that private property has over public management, in the case of resources, derives from the fact that “owners possess both the necessary information to put into practice an efficient allocation of resources and the necessary stimulus to manage these resources effectively” *our translation* [5]. When the market is not intervened in, the price becomes the most important piece of information sent from producer to consumer, so that the ones at the other end, the consumers, will have the opportunity to streamline the quantity and rhythm of consumption. This effect comes naturally into play only in a free market,

where the property rights of each natural resource are *clearly defined* and *easily transferable*. We can draw a final conclusion from here, namely that the problems related to the management of natural resources are not the result of deficient functioning of the market or its absence but the result of an inefficient defining of property rights.

State-owned natural resources are obviously managed exclusively by government institutions which control access to them and regulate their use [10]. Unlike the situation of public goods, where the state plays the role of mediator, in this case, we talk about a double role: that of player and another one of arbiter. Therefore, the state, as an independent organism, in a Popperian sense, can be tempted to play foully. The illegitimate behaviour of the state can have unfortunate, even devastating effects in connection with the management of natural resources under its administration, because the government, Ronald Coase said, “is, in a sense, a super-firm (but of a very special kind) since its able to influence the use of factors of production by administrative decision. [...] The government is able, if it wishes, to avoid the market altogether, which a firm can never do” [3]. Furthermore, in a certain context, we can talk about an authoritarian state or something even worse.

State monopole can be the result of state authoritarianism with multiple effects at the market level: (i) a price set arbitrarily cannot, as we discussed earlier, send those pieces of information so necessary for taking decisions production- and consumption-wise; in this case, an artificial price cannot reflect with precision the amount of resource(s) left in stock after the transactions; (ii) in a monopolist market it is very difficult, even impossible for business ideas to flourish.

We will further consider **goods** that are part of **public property**. As a general rule, access to these resources in order to use them is free. However, there are cases when exploiting public property is subject to regulations and certain commitments. In other words, the community whose task is to manage those public goods can choose to exclude outsiders, preventing them from using the resources. The problem of public goods is not about *who* should manage these resources but rather *who* they should be managed by. Due to the fact that all

individuals have access to these resources, no one supports the costs of the damages caused by their actions and there is a tendency to exploit these resources by plundering (Gerald Hardin in *The Tragedy of the Commons* vividly describes this possible scenario). In this situation, it was unanimously agreed that the problem resides in the need for rationing the use of resources. However, the ways to meeting this objective can differ significantly. „It is clear, De Soto declared, that the only solution to the tragedy of the commons is for them to become private property.” *our translation* [5]. In a remarkable article written in the mid-1980s, James Gwartney illustrates the effects of public property, writing about buffalo in the western part of the American continent. He wrote that “each hunter knew that a buffalo that was not captured today would probably be captured tomorrow by someone else. Since exclusive ownership was absent, so too was the motivation to exploit the buffalo in a manner that provided for the future posterity of the animal. The outcome: mass slaughter and virtual extinction of the species [7].

From this, we infer that the problem of public property is to do with the efficiency with which it is managed. A series of arguments reinforce this: *firstly*, it is said that property rights of common goods generate low productivity because nobody is stimulated to work hard to increase the efficiency of these resources. It is considered that this phenomenon works according to the „first come, first served” principle which stimulates a chaotic competition to gain as many resources as possible before anybody else, thus nobody thinks about conserving or investing in those resources; *secondly*, people who own a part of the communal rights will be tempted to exert their rights, completely ignoring the consequences of their actions. This type of property rights system raises, therefore, transaction costs [9].

When the community, whose responsibility is to manage **public goods**, is so large that it makes it impossible or difficult for it to control the goods, these goods become **open access resources**. The fundamental difference between the two, in the context of property rights, is the *nature* of these resources. It is the case of ecosystem goods such as the air, the water in the oceans, the ozone layer etc. that cannot be privately

owned just as they cannot be part of the property of any nation. As a consequence, the possibility of excluding an individual from exploiting these resources is practically non-existent. In the absence of this possibility of control, these resources run the risk of being plundered and exploited unjustly and in an unsustainable way. This also happens, as we have already shown, because individuals are not motivated to invest in or conserve the goods.

From the point of view of the *efficiency* of the economic process we conclude that this increases if the resources are part of the property of an agent. The more certain rights in connection to resources are defined the more the motivation to manage them efficiently increases. As a result, we mean to stress the fact that the role of property rights is to create stimuli for an efficient employment of resources, influencing economic behaviour [9]. From a different point of view, the role of property rights “is that of guiding incentives to achieve a greater internalisation of externalities”[6]. If transaction costs following the exchange of rights between two agents exceed the gain derived from their internalization then an externality (positive or negative) appears. Thus property rights develop in order to internalize the externalities when the gains obtained through internalization exceed the costs.

This spectrum of analysis helps us emphasise one of the main ideas of our discussion, namely, that market imperfections, in a real world, are determined by a degree of inefficiency in calculating transaction costs and the faulty application of property rights. In this context of market flaws, Ronald Coase has underlined the importance of clear and efficient delineating of property rights, claiming that, without a correct application, markets will prove incapable to reflect the total costs and all the benefits resulting from a transaction, thus generating externalities. Externalities are, therefore, associated with market flaws when economic activities in a market do not reflect transaction costs and do not attach property rights in an efficient manner.

2.3 The problem of externalities in the environmental context

By externality we understand a secondary uncompensated effect caused from an economic activity (of production or consumption) which affects other entities (individuals, economical agents, communities, etc.) uninformed in that economic activity. This effect may have positive or negative implications. On the “negative” side, these effects may be considered a negative externality if they meet two preliminary conditions: *first*, when the taken activity of one agent causes a loss of welfare of another, and *second*, when the loss of welfare is uncompensated, otherwise, the effect being internalised [11]. A good example of negative externality is pollution. From the economical point of view, pollution generates an additional cost and produces a loss of utility or satisfaction to the entities involved, being the result of a production process initiated by an economical agent, let's say A, attached to another economical agent, or individual, or community etc., named B. The identified problem does not consist in identifying the existence of the nature of these costs, but consist on the fact that generally they are not compensated.

As mentioned above, the associated effect of pollution is a loss of utility or satisfaction (or welfare, if judged in a broader view). If the problem is approached in the line with the neoclassical view, the solution lies in finding a equilibrium state, or a point of optimum, in which, both the polluter and the polluted are better off: the polluter, because the value of compensation costs, expressed in monetary units, do not exceed the gains obtained from the taken economical activity; the polluted, may be better off when the loss of welfare is compensated with a value large enough so that he or she accepts the presence of the polluter.

However, on the subject of externalities, one of the main critics derives from the fact that precisely the Paretian optimum is faulty. It is well known that standard economical theories, elaborated genuine elegant theoretical constructions, but the spectrum of analysis remained static and abstract. To reduce the analysis to some few variables, it is argued to be “Achilles’ heel” of neoclassical economy, since a static analysis, such as the case of a photography, regardless of the instrument used or the “photographers” ingenuity, is limited to

capture only a frame, or a limited part of reality. By contrast, a film brings a dynamic perspective, given that it consists from a succession of intimately linked and inter-dependent frames. In the same manner we can describe reality, where, a largely enough number of different economic agents simultaneously generate external costs between them and in society. In this case, it is not difficult to realise that problem of uncompensated negative externalities is of a completely different magnitude; this being the reason for which the Paretian optimum does not fit the analysed problem.

3. The „limitations” of the standard economical theory

In the light of our discourse we can set forth, punctually, the limits of the standard theory regarding the environmental issues. Thus:

- According to the standard economy the complete and objective defining of the property rights is performed in *the absence* of the transaction costs. This is why the right of using resources will be assigned automatically to the agent that offers a greater usage value. But the scenario of zero transaction costs belongs to a theoretical field. In reality, these costs appear, are positive, and the adjustment of the prices on the market cannot take place instantly, as the neoclassical economic theory suggests. The effect of the instant adjustment of the prices to the new market conditions is reflected in disequilibrium at the level of the offer and demand. According to this line of thought and extrapolating the analysis to the level of the markets of goods offered by the environment – as long as they exist – the establish that in this case the offer is inelastic (the environment goods are given and not produced). This inelasticity can be translated in high transaction costs, emerging thus the inefficiency of the market [9].
- From the property rights’ perspective, it is considered that they precede the act of transactional exchange on the market. When the property rights are taken into account and are positive, it results an imperfect definition and application of the rights that is, another cause for the

emergence of the market’s imperfections. We should highlight here that the phenomenon of the market’s failures and implicitly the presence of externalities, modelled by the standard economical theory, is in close connection to the existence of transaction costs.

- On the theme of externalities, the difficulties arise not from their identification, but from their internalization. There are two ways through which the costs may be internalized: through the taxes, subventions etc. and through the market’s mechanisms. The desired effect of the measures, regardless of their nature, is that of creating responsibility for those who provoked the costs. But the solutions of the standard theory regarding the issue of the externalities, through the mediation of the Pigovian taxes, suffers from a certain degree of inconsistency and this for at least two reasons: *firstly*, the logic of the Paretian analysis, which is being invoked, requires *a priori* the definition of the property rights, although the externalities are a result of the lack of rights or of a inefficient definition of those rights. In other words, if we suppose that the rights are from the beginning well defined, then the models that regard the issue of externalities are not justified, because these will not exist anymore. Secondly, at a theoretical level, the externalities describe a physical interdependence between the polluter and polluted. Given the complexity of the social construction, we may think that in reality it is almost impossible to identify and isolate the interdependence between two individuals [12]. In respect to the internalization of the externalities through market mechanisms, the standard theory suffers from the same inconsistency derived from the fact that, as well already mentioned at the first point, the transaction costs are *a priori* regarded to be zero.

4. Conclusions

We conclude that, if a well defined market of environmental goods and services is what we need, then clearly it must be created. The best way to achieve this aim is through establishing property rights in a coherent

manner, together with the creation of those social institutions to ensure their compliance. The State is invited to play its role of “night watchman”, with strict responsibilities with regard to property rights and to ensure a proper functioning of the market.

Heterodox Economics – A Dynamic Phenomenon

Ciote Cristina Steliana
„Spiru Haret” University of Bucharest
Faculty of Financial Management and Accounting Constanța
cristinaciote@yahoo.com

Abstract

All that has been proven to be thorough from the previous strains of thought has been continuously polished and integrated in what we call the dominant economic theory. Yet, there have been countless debates and contradictions regarding the economic ideas in mainstream (which includes classical and neoclassical economics and Keynesianism), the majority of the opponents arguing that these do not offer sufficient explanations for the understanding or anticipating macroeconomic phenomena and also, do not solve the problem of major differences between social classes.

The most impetuous objections regarding the above have led to the appearance of different strains of economic thought, philosophies and theories that have merged under the umbrella of heterodox economics, a reactive movement, which denies the validity and viability of the ideas within the dominant economic theory.

Key words: heterodox economics, mainstream economics, complexity theory.

J.E.L. Classification: B00, B24, B25, B41, B50.

1. Introduction

The dichotomy between orthodox and heterodox economics is found both in formal speeches (scientific publications, textbooks) and in informal ones (congresses, discussions among fellow members of the academic community). Beyond this dichotomy, current economic researches reveal a new approach to economic phenomena, which are more and more seen from a holistic perspective. Recent opinions of scientists converge to the conclusion that the systemic approach constitutes the efficacious principle of the

universe. In our own view, we are witnessing a paradigm shift, regarding the installations of a new vision of the economy, a progress of economics occurred not as a revolution, but as a progressive improvement on the methodological line. We are not dealing with an abandonment of the classic theories, but with a preservation of what has been proven to be thorough within orthodox and heterodox theories, an enrichment of the legacy of economics.

2. Heterodox economic theories

Among the official currents^[1] which compose heterodox economics we acknowledge: Marxism, Socialism, Sraffianism, Institutionalism, Evolutionary economics, the Austrian school and Feminism. Other authors further add to this list the bioeconomics and ecological economics (as sub-branches of Evolutionary economics), econophysics, thermoeconomics, neuroeconomics, post-Keynesianism, Georgism and binary economics. The last forty years have distinguished themselves through the renaissance of the heterodox strains of thought, the majority of which emphasize on the importance of history and institutions.

In an attempt to define the heterodox economic theories, we will undertake an incursion throughout time. The first stop will be made at the inevitable Kuhnian paper *The structure of scientific revolutions* which remains of reference for the science philosophy. As any other original creator, Thomas Kuhn has his own notional system^[2], the first order efficacious concept being that of *paradigm*. The author distinguishes within a paradigm between the firm part – „the hard core” and another, more flexible one, which plays the role of a „safety belt”. While the „hard core” remains still „through the methodological decision of its protagonists”,

the „safety belt” formed out of auxiliary assumptions „has to withstand the assault of tests”.

Starting from the Kuhnian thesis, Imre Lakatos makes a demarcation between *the minor heterodox theories*, compatible with the hard core of the orthodox theory and *the major or radical heterodox theories* which bring into question this „hard core”. By definition, all new theories are heterodox, since they do not integrate themselves into the dominant paradigm because of their inner novelty. These new theories are subject to testing, from which they either become orthodox, with the validation of the assumptions, or remain in the category of heterodox theories.

The syntality^[3] of heterodox economists is basically determined by the collective dissatisfaction regarding neoclassical rationality (which is considered to be exaggerated and unrealistic). The critiques in this respect are directed towards the pronounced mathematization of economics, which is accused of ignoring the essentially social character of the economy and of simplifying, in an unrealistic way^[4], the transactions, decisions and interactions within it.

In order to name a school of thought or another, the economic researchers often use a plethora of terms; prefixes such as „neo”, „new”, „old” or „post” and adjectives formed by derivation from the names of great economists like Ricardo, Marx, Walras, Keynes, Schumpeter, are used to define certain doctrines. Moving next, to the highest level of generalization, the used terms are „mainstream”, „orthodox” and „heterodox”. The distinction between the orthodox economic theories and the heterodox ones is relative and conventional; it is often related to the economic context, to the state of the economic thought at the time being, thus presenting significant variations throughout time.

The attempt to undertake a clear-cut demarcation between orthodox and heterodox economics often proves to be troublesome, the border line between orthodox and heterodox serving as subject for numerous debates. The countless controversies which have occurred on this matter have made it impossible to precisely define the orthodox economic theories and so, the heterodox

ones. The advocates of the dominant theory defend their point of view with an argument based on the appeal to authority^[5]. They underline that their theory is sustained by the most numerous group of scientists and practitioners. The heterodox economists take a critique stand regarding orthodox economics in order to emphasize their own originality and to highlight that the partisans of mainstream economics sustain their theory rather through conformism than critique reflection.

3. A definition only in the negative sense

The heterodox authors reject in an extremely radical manner the most part of theories and methodologies of the neoclassical economics, considering that explaining the economic reality through a mathematical, abstract approach is abusive. The neoclassic nature and manner of validating scientific knowledge are being brought into question here, the atomistic, individualistic perspective from mainstream being more and more disapproved. The holistic approach that incorporates the human being into society and recognizes the mutual influences which take place between the individual and the social institutions gains ever more territory in the contemporary economic thought.

Two principal demarches of radical heterodox economists are being outlined here, emerging from their will to reject the ontological and methodological bases of orthodox economics: *the Austrian approach* which contests the methodological and ontological position of orthodox economics for purely epistemological reasons and *the „anti-economic” approach* which brings into question the orthodox normative discourses, rejecting the scientific validity of its theoretical statements. Although the two approaches differentiate themselves by motivation and conclusions, the majority of the critiques brought to standard economics are formulated in a similar way by the exponents of the heterodox theories:

- *in the methodological plan*: orthodox economics is simplistic and unrealistic: through mathematical abstraction facts lose their pertinence. In the desire to impress economics with a scientific status, the neoclassic representatives often betrayed an

excess of quantitism, scholarly and coldness, trying to explain realities which did not need a scientific explanation. Economics needs mathematics, but „the object itself is far too complicated to be fully accessible to mathematics”^[6]. An economic reality trapped in mathematic models risks to be excessively abstract and biased: „The purpose of a model is not to be realistic. After all, we already have a completely realistic model – the world itself. But this «model» is far too complicated to be comprehensible. The purpose of a model is to offer explanations regarding certain aspects of reality. If by simplification the model determines incorrect answers, then this lack of realism becomes a flaw... [otherwise] the lack of realism is a virtue: isolating the effects, simplification facilitates understanding”^[7]. The orthodox methodology has to be abandoned in favour of an authentic economics which aims to construct realistic models which provide confirmable predictions by the confrontation between them and economic facts. Be that it takes the literary or quantitatively shape, a model is a way of thinking, and the appeal to abstraction has the same reasons: to explain a large number of economic facts through a small number of sentences^[8]. Axiomatization can and has to be only a precious tool of logical analysis, but not a purpose itself. Economics is a science of observation, of methodical contemplation on reality and data, facts and knowledge, and reality must be perceived as it is. It is pretty difficult, if not impossible, to discover universal objective laws in social sciences, and the validation of the afferent theories has to take into account a highly complex reality. Methodologically, heterodox economics opposes holism to individualism; certain economic dimensions can be properly captured only with a macroeconomic or systemic approach, which takes into considerations the emergent effects within the economy;

- *in the ideological plan*: the advocates of neoclassic economics formulate incorrect predictions and prove to be inefficient in anticipating economic and financial crises. The orthodox economic theory is more a religion than a science, containing a series of dogmatic statements which are subject to debate through a scientific demarche. The neoclassic suppositions and conclusions are classified by heterodox advocates as false,

unrealistic, ideologically situated, orthodox economic being nothing else, in their opinion, but a scholarly false translation of the liberal ideology in its demarche of justifying capitalism;

- *in the approach plan*: the economy is part of the socio-cultural system, therefore its approaches have to harmoniously integrate in the sociological, anthropological and historical analyses, for a true interpretation of reality. For a correct modelling of the individual behaviour and the interactions between individuals, economic science must also integrate the results of cognitive and social psychology.

4. Where does complexity theory stand?

The junction point of the theories from the mainstream with the heterodox ideas is, in terms of complexity theory, the orientation towards the future. The economists from both categories admit that in formulating predictions and modelling behaviours, and also in elaborating monetary and distribution of revenues policies, the essential factor which dominates and influences decisions is *uncertainty*.

Neoclassic economists have focused on eliminating uncertainty as much as possible. Through estimations, simplifications and calculations, they have tried to determine the coordinates of an „equilibrium” state, to which all participants within the economy should aspire. For this purpose also, efforts have been undertaken in order to elaborate certain linear models that use as reference points and universal rules which can be applied (and imitated) in any moment in which a change occurs.

On the other hand, heterodox economists have been aware of the difficulty (if not, the impossibility) of achieving such a state, provided that every individual is left to act freely on the market. People make decisions without being aware of an equilibrium point which they and/or their competitors „must” achieve. Thus, they propose the state’s intervention for the adjustment and adaptation of the situation in the economy at the point where a change occurs, this being considered the most proper solution for avoiding inconsistencies; the state, through the researches and statistical studies which it undertakes, has possession over the most

relevant information in order to take an appropriate decision.

The complexity paradigm concentrates both approaches into a new view which keeps the mathematical tools, but makes them more efficient, using computational modelling in order to analyze non-linear events on different temporal series, elaborating guiding predictions regarding the relation between certain apparently random phenomena and their evolution. At the same time, the complexity view admits the limited quantity of information which the individuals have to base their decisions on, but does not see this as a disadvantage; but it considers that, through the interactions which constantly take place between individuals, the knowledge disseminates itself and reaches all the participants. From these processes the structure of social institutions are being designed, structure which will sustain the emergent behaviour of the system and its adaptation to the new change.

5. Conclusions

Being characterized by a contradictory evolution and permanently widening its area of research, economics has always left the impression of a scientific building yard. This permanent renewal in the positive plan is the result of testing and verifying through economic policy; without validation in the normative plan, without „resisting” the tough test of the economic reality, any type of theory remains pure ideology. The demarche to draw borders between the theories from the so rich and vast realm of economics often proves to be troublesome, if not impossible. Source of theoretical debates, the demarcation orthodox-heterodox itself does not have a clear feature.

The comprehension of current economic phenomena which occur worldwide cannot find an explanation under the auspices of a single economic theory. The economist nowadays is often put in the situation when he has to oscillate between the traditional conceptions and methods of analysis of the market and the modern tendencies to explain economic processes.

This oscillation however, does not have to be seen as a variation of thought between extreme points, but a perpetual update and improvement of knowledge by integrating

both the theories and the ideas which made the object of former textbooks and the thinking and tools which are in the possession of specialists nowadays. We consider that in order to adopt a holistic appropriate view to penetrate the essence of the economic phenomena, economists have the duty to corroborate the contemporary approaches with the classic paradigms in the economic field and not only, in a fundamentally transdisciplinary and multilateral mix. Or, to put it differently, in the words of the great economist Friedrich von Hayek: „[...] nobody can be a good economist if he is only an economist [...]”^[9].

Marxian-Radical Economics. A Heterodox Approach

Ciote Cristina Steliana
„Spiru Haret” University of Bucharest
Faculty of Financial Management and Accounting Constanța
cristinaciote@yahoo.com

Abstract

Marxism emerged from the confrontation between the German philosophy, classic English economics and the French socialism. It was a philosophy, a scientific method, a new vision of economics, an economic policy and an economic system alike.

The Marxian economic strain of thought was assimilated not only by its advocates, but also by the critics of this radical current: in defence of capitalism, Keynes and Schumpeter both start from Marx's work.

Starting from the work of classic economists, Marx assumes the valuable scientific elements from the dominant economic theory, but emphasizes the historical, gnosiological and class limits of the classic doctrine. Although he uses the instruments provided by the classics, the German scientist defines his own personal notional system and comes to excel in terms of abstraction. Operating with his own concepts, Marx builds up an infallible logic, which is impossible to turn over if one does not affirm the starting point of the analysis itself – the labour theory of value.

Key words: heterodox economics, radical economics, Marxian.

J.E.L. Classification: B14, B24, B25.

1. Introduction

Marxism occurred as a critique reaction to classic economics; it represented both a doctrine and a socio-economic system, but also a widespread phenomenon of the twentieth century.

Ever since 1844, before discovering classic economics, Marx formulates in his *Economic and philosophic manuscripts* a harsh critique of the capitalist society based on alienated labour under three aspects^[1]: the

product of labour does not belong to the worker, the organisation of the labour is unknown to him and labour does not represent the meeting of a need, but a means to satisfy essential necessities situated outside the work sphere. The author does not stop at a simple critique, but transcends into therapeutics with the proposal to abolish the private property over the means of production and to eliminate commercial and money production.

As Marx deepened into the study of classic economics and discovered the labour theory of value, he announces his desire to know „the anatomy of the bourgeois society”, in order to lead a more efficient battle against the capitalist system.

2. Essential contributions brought by Marxism to the evolution of economic theory

Two great economists have influenced Marx in his assertions on economics: Ricardo and Quesnay. Although neither the advocates nor the opponents of ma Marxian work ever recognized this influence, Marx owes to Ricardo his initiation in the art of theorizing and the starting point for his own arguments, and to Quesnay the assimilation of his fundamental concept on the economic process as a whole^[2].

Starting from the principles of historical materialism^[3], the great economist lays the foundation of a new methodology – *dialectical materialism*, based on which the evolution of the world and the socio-economic relations must be seen only through their contradictory unity. His critique stance will become his own intellectual matrix; gifted with analysis tools and a personal method, Marx set out to desecrate the economic science and the capitalist society, thus beginning as a classic but ending as a heterodox^[4]. Armed with this

personal method, Marx starts a true revolution in terms of methodology in economics, with the help of which he historically and lawfully explains the evolution of capitalism, but also its fundamental concepts. If the classic economists assimilated economic laws with natural ones, postulating the irreversibility and perennality of the capitalist society, Marx succeeds in economically integrating history, bringing into foreground of analysis the *manner of production*, permanently subjected to changes and evolution, investigated both as a dialectical unity of production forces and in term of production relations^[5].

Explaining the dialectics^[6] of the relation between a phenomenon and its essence, the German scientist rises the scientific abstraction to its highest levels, showing that the main purpose of a science is to scrutinize beyond appearances in order to identify the cause of things.

The Marxian radicalism also resides in explaining economic categories based on the *labour theory of value*. The Ricardian successes in this respect have proven to be only partial because of the contradictions between the theory of value and obtaining profit, between the theory of value and the middle profit and between the theory of value and the existence of absolute rent. The distinction made by Marx between the labour force and work and between value and price of production manages to solve the contradictions to which the classic economist had arrived. While classics saw a *quantitative relation* in value, Marx defines it as a *social relation*, thus revolutionising the labour theory of value created by his predecessors.

Granting a maximum of importance to the sociological aspects of economic phenomena, Marx fundamentally changes the traditional paradigm of thinking; he defines economics^[7] as the science which studies the social relations of production on different levels of development of the human society.

The Marxian doctrine gains a solid scientific base through the theory of surplus-value. Marx sustains his theory with solid arguments in order to defend himself against any attempt to disproof. The surplus value occurs as an unearned gain which goes to the capital possessor by virtue of the property right over the means of production, the

theory of surplus-value essentially being a theory of exploitation^[8].

Manifesting preoccupation for the study of the reproduction of individual and social capital, Marx analyzes, for the first time, the process of economic growth, setting the ground for subsequent research on this subject. Inspired by the Marxian work, the radical French economists will much later recognize Marx's merit of being the pioneer of the analyses of the phenomenon of economic growth: „The Marxian theory is today the single synthetic and global theory of growth which is available^[9]”.

Marx's reproduction model shows that, theoretically, the market evolves towards achieving economic equilibrium. His theory on over-production crises proves however that, practically, the capitalist manner of production is fundamentally instable. If the classics identified as causes of crises „technical” aspects, Marx considers that conflicts in the social relations of production as the general cause of over-production crises.

Unlike Keynes, who nominated the paths and courses of action, Marx did not offer a therapeutic solution for economics so that through it, the theoretical bone structure of his original research to be put to work^[10]. His theory came to life through his disciples who followed the suggestions which arise from the critique analysis of the capitalist society, therefore engaging to verify his doctrine. Beyond the horrors of the communism imposed by Lenin and Stalin, what remains characteristic^[11] from the Marxian economic analysis are the study of long-term evolution on economic systems, the ideas on the nature of technical progress, economic cycles and the capacity of using labour.

3. The continuers of the Marxian ideas

The Marxian ideas were taken over by Engels who, besides having the merit of preoccupying himself of the supervision and publication of two of his mentor's and friend's books, also had personal contributions in the methodological plan^[12], (we especially refer here to the role of dialectics and the position of the state in the new manner of production).

A notable contribution on the theoretical level of this doctrine was brought by

Vladimir Ilici Ulianov, also known as Lenin, through his thorough analysis of the monopolistic-imperialist phase of the capitalism of his time – the capitalism at its last stage. The author develops the Marxian theory of reproduction, emphasizing on the role of the production of the means of production in order to produce other means of production in the process of economic development. Lenin manifested preoccupations for problems of the genesis of socialism and of the functioning mechanism of the socialist economy. For the transition period from capitalism to socialism, Lenin develops a program which stipulates the development of the technical-material base by industrialization, the socialist transformation of agriculture and the achievement of a cultural revolution. Socialism proposed a new system of repartition, which its adepts considered to be more equitable, more democratic, humanitarian, the first order efficacious criteria being labour.

Among the continuers of the Marxian ideas, we consider it to be inevitable the reminding of Stalin, Troťki, Rosa Luxemburg, but also Mao Tse Dong.

An attempt to thoroughly debate the methodological problems of the socialism economics was carried out by elaborating an economics textbook. The Stalinist paper *Economic problems in socialism in the USSR* contains many erroneous theses^[13], rejected by the social theory and practice: not considering means of production as being commodities, the necessity of eliminating the surplus of the kolkhoznik production within the system of the circulation of commodities, the dissolving of the international unique market and the forming of two parallel and opposite markets. Both theorist and man of action, Stalin advocated for the development of the industry and especially the production of weaponry, he himself being a torturer who masked his violence by sustaining noble causes such as the interest of the people.

Opposed to the Stalinist bipolarity socialism-capitalism, Mao Tse Dong brings his own vision of *The three worlds*, making a classification of the world states in *developed countries, developing countries* and *the third world*, of the undeveloped. Taking into account the physiological needs of the huge human mass represented by his people, the

Chinese communist advocated for the development of light industry but also the agriculture, in opposition to the Stalinist vision of expansion.

The Marxian doctrine has been revised repeatedly, taking the form of socialism, in a democratic-social formula, of French or Swedish socialism.

The French socialist Jean Jaurès supports his theory both on the Marxian materialism and on the Kantian idealism. Often qualified as being „humanitarian”, the socialism promoted by the French philosopher proposes an evolution through socialist reforms: deconcentration of the capitalist property, encouraging the union of the proletariat and intensification of social security measures.

In the view of the French Marxian economists^[14], the state is subdued to monopolies and through its leverages, such as inflation, the taxes and dues system, public investments and state orders, it can decide on the profitability of certain sectors or the cheapening of the capital on account of the revenues of the working class. The solution proposed by the French socialists is to eradicate the state-monopoly capitalism and to replace it with a democratic socialism which is self-managing through democratic reforms.

4. Conclusions

Marxian economics set out to decipher and study the contradictory functioning of the capitalist economic system.

Inspired by the classics Ricardo’s and Smith’s theories on value and repartition, Marx considerable distances himself from the dominant economic theory at that time which assimilated economic laws to natural ones, the scientist stating that all economic categories and laws have a historical character. The radicalism of the Marxian doctrine resides in the completely different view on economic laws which govern value, the repartition of revenues, economic crises and economic growth.

Beyond the horrors which the Stalinist dogmas caused, inspired from the Marxian doctrine, Marx’s work remains a reference point in the evolution of economics as a science. The German scientist exerted substantial influences on the economic way

of thinking from the last two centuries, especially through the unique tools of analysis, a new methodology and a new vision.

Endowed with excellent abilities of leading reason towards logical conclusions, Marx takes the scientific abstraction on its highest peaks.

The radicalism of the Marxian doctrine goes as far as to set out to desecrate capitalist economics, seen as a historical science, emerged with the appearance of the production of goods and which will perish with its progressive disappearance.

Abstract

In the current economic condition, performance of an organization depends on and is conditional on the quality and timeliness of decisions made by managers. Making the best decisions implies a large amount of data that enables the development of complex analysis. Obtaining this amount of data is possible because of a powerful system, providing users fast in presenting data and provide opportunities for complex analysis and tentative.

Thus, data warehouses and Tuesday in support of economic organizations to store such large amounts of data, to ensure analysis and extraction tools necessary and relevant information for decision making.

Key words: data warehouse, On-Line Analytical Processing (OLAP), multidimensional analysis, decision support.

J.E.L. Classification: C80, C82, M15.

1.Introduction

Due to use software solution that they have available, managers have understood that the data stored in operational systems, including databases, are a gold mine of information to be exploited. Data warehouses have been developed to meet the increased demand for complex analysis, which could not be

adequately achieved with operational databases [10].

With operational databases are made daily operations and also provides multiple users simultaneously access the data stored. Data stored in operational databases are usually detailed, historical data do not show because they were undergoing a process of normalization has lower performance when conducting complex queries. When users need to make an analysis on the behavior of the entire organization, pre-operation to achieve the integration of data from different operational systems.

2. Data warehouse

Data warehouse is "a class of specialized databases" [3]. The role of a data warehouse is to ensure information needs of users and are designed to support decision making within a company.

Enterprises in most economic sectors faced with customers increasingly demanding changes faster and with increasing competition. Thus, organizations are required to predict changes in economic and competitive changes. For this they need to have accurate and timely. All organizations have data, they are provisional in their operational systems or external sources. Thus, data warehouses will assist these companies to assist them to achieve their sector-specific objectives, making decisions

based on data they have and how they interpret.

Professor Dinu Airinei believes that "data warehouses are the product of advanced technology and economic environment. On the one hand, the economic environment is increasingly competitive, global and complex and requires information developed to support strategic decisions and on the other hand, developments in information technology solutions provide efficient management of large integrated data "[1].

Data warehouse technology includes a set of concepts and methods that provide users with information useful for decision making. The building of a data warehouse shows the need to improve the quality of information within the organization [11].

Leader in building data warehouse systems is WH Inmon, who said his reference in the paper "Building the Data Warehouse" (1996) "A data warehouse is a subject-oriented, integrated, time-variant and nonvolatile collection of time in support of management's Decision making process "[5].

Due to the large volume of data in data warehouse requires the use of appropriate techniques and data mining tools such as dynamic multidimensional analysis, mathematical methods to suit a lot of data and statistical methods in order to achieve forecasts. These techniques and tools for statistical data analysis and extraction of knowledge is called data mining or data mining.

According Vilana A [11] a data warehouse consists of databases containing from 1 to over 10 Terabytes sometimes repositories containing tens of Terabytes. So great a volume of data and is as cost on average between 3 and \$ 5 million. These costs can be divided into three parts: 1/3 is the professional service costs, third is the software necessary for the operations of extraction, processing, storage and data analysis and the latter is necessary for the acquisition of data storage hardware systems [7]. Studies show that in the first 12-18 months of data storage volume may be doubled and this growth leads to successful implementation of data warehouse but can not bring their problems if systems were designed from the start sufficiently flexible.

Figure 1: Breakdown of costs for creating a data warehouse

Source: based on the processed

Systems that implement such repositories should provide greater flexibility to allow simultaneous connections to different servers store the data set. Also, when the choice of architecture should consider possible changes that may occur (changes in performance, capacity and connectivity). Processes which can become cumbersome system to function effectively if it occurs every time new servers are added to the system.

To avoid these problems may be used to achieve data center which is called data marts. These subdepozite are made at modest cost compared to data warehouses have less lasting achievement and include only relevant data necessary for analysis.

3. Data mart

A data mart contains a subset of volume data in the organization, a specific group of users [6]. The data mart is usually on aggregate. Typically, departmental servers are implemented on cheaper required based on UNIX or Windows / NT.

According to Microsoft [8] Data Mart (Market Data) is a smaller version of the data store (data warehouse), which aims to retain only data that could be used only for a target group of users.

According to John Wang [4], Tuesday is a data warehouse limited in scope (horizon) and facilities in a restricted area.

Tuesday's change led to thinking company that creates data warehouses:
- Some companies folosec Tuesday as a intermediate piece to store data that are then in a centralized data warehouse, such as a data warehouse can evolve over time and include as much information necessary for the activity;

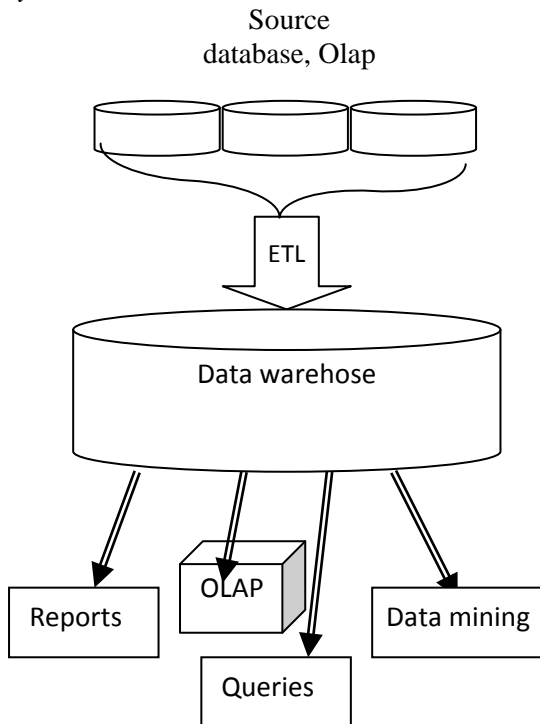

Some companies consider that their desfășoare can and just work on repositories without data warehouses and some smaller;

Other companies use Tuesday to move data to and from repositories aimed at achieving performance analysis based on certain criteria (regular, departmental, etc.).

For a better view of these concepts, in the following figure presents a system architecture data warehouse / OLAP and the following figures will present the changes to support this architecture to make way for Tuesday's.

Thus, the first figure we have a system architecture classical data warehouse / OLAP without the presence of a data mart.

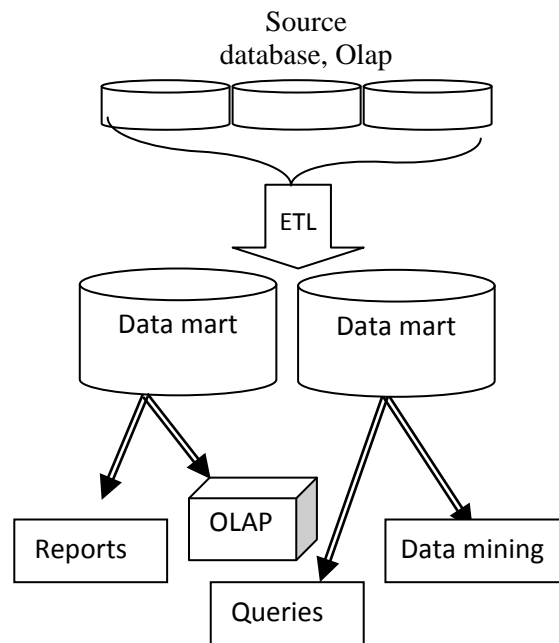

Figure 2: Architecture of a classical system data warehouse / OLAP

Source:Made by the author

The following figure shows a traditional Tuesday / OLAP und Tuesday is observed as the replaced data warehouse.

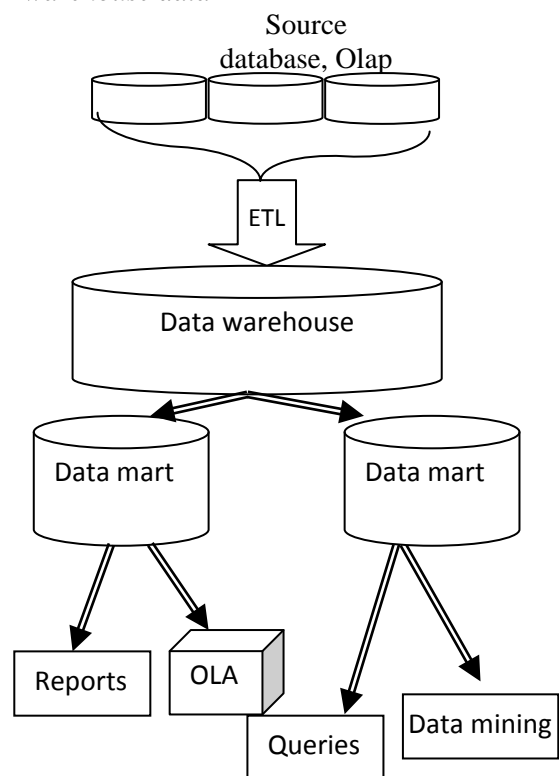

Figure 3: Arhitectura a classic Data mart / OLAP

Source:Made by the author

The diagram below illustrates a typical system architecture Tuesday / Tuesday OLAP that is populated with data from the data store.

Figure 4: Architecture of a typical system Tuesday / OLAPși populating the data warehouse data

Source:Made by the author

Any of the above solutions has advantages and disadvantages for organizations implementează. Astfel, regardless of the solution to that call, Tuesday's have similar characteristics to those of data warehouses except volume data. This is the reason why if Tuesday's, queries will be easier to implement.

The great advantage of repositories is their ability to do analysis on large volumes of data and these analyzes can be viewed from several points of vedere. Oricum, data warehouses have the great advantage of being able to analyze large areas information.

4. Comparative aspects of data warehouse and Data mart

There are two major differences between Tuesday and data storage. The first difference was shown above, namely the amount of data, respectively, on the mart contains a subset of data warehouse data.

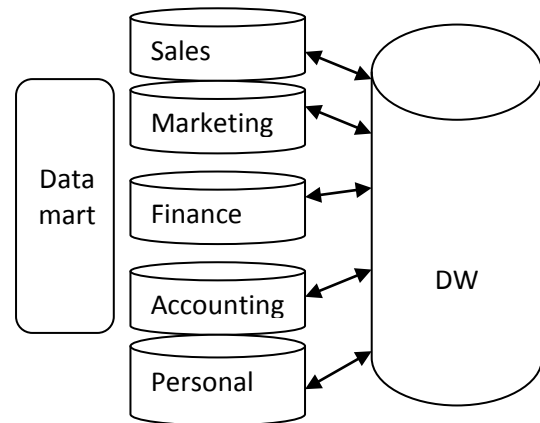

Such data are made Tuesday to meet certain requirements particulare. Depozitul database is designed as a strategic approach to planned, and Tuesday is designed as part of tactical plans to meet individual specifications [9].

The company can design Tuesday's without taking into account the overall strategy. If not, Tuesday's will be uninterrupted and will be very hard to integrate the data warehouse later.

The second difference is that since the data mart are more crumb than the data store. Since Tuesday's requirements are more accurate than the deposit, the user can afford to merge data known in advance as required and store query results that thinks he will run to make extraction as quickly and efficiently.

End user's Tuesday seem as repositories through their interaction with the data warehouse environment. Tuesday's are targeted to specific needs and requirements such as providing service to a department specific data (Figure 5) or a subset of data within a certain period of time.

Figure 5: Interacting data mart with data warehouse environment.

Source: Made by the author

Tuesday's have a similar structure to the data warehouse. The key difference is that Tuesday's are more focused on appearance company. For example, a data mart can store data about a specific department, data on a certain period of time, data for certain products, etc..

Tuesday's are much easier to control than data warehouses. Data volume is lower and the data model is reduced by a few tables. However, Tuesday's must be designed properly, the same database structure as the extended data model.

Tuesday's modeling should focus more on end-users than for modeling the data warehouse. End-users should be involved in shaping particular sites Tuesday that they will be those who would use them.

Designers Tuesday dimensional modeling sites recommended for development. Dimensional modeling (which is a powerful technique for modeling) is suitable for development sites that support Tuesday dimensional data analysis. Such analyzes may include OLAP tools for data analysis, organization and turning them into cubes for data access.

5. Conclusions

Most industry experts believe that Tuesday are an important step in the evolution of technologies relating to data warehouses and data analysis. Construction of distributed data warehouses (Tuesday) is growing. In the future, other techniques will be able to use parallel processing, automated delivery of information very large database, very good support expanding objectual online analysis

applications leading to more powerful and easier to use.

Abstract

In recent decades, all studies have shown that information, based on modern information technologies, have gained particular importance is seen as a strategic resource necessary for the development of the resource, which is sometimes considered more important than raw materials or energy. The impact of information technology on various areas of human and economic life is so great that it speaks of a new phase in the evolution of society, namely: information society.

Field studies show that information technology industry is one of the largest in the world and more than that have a tendency to increase in continuity.

Keywords: informatic/information technology, decision, business processes, information society.

JEL Classification: C80, C88

1. Introduction

Humankind is undertaking a historic process of transition to new society and new economic system. Historic progress is and will keep producing future radical changes in the core of economic science rapidly reflected upon specialists' economics training

level as well as upon people's way of thinking [1].

The world we live in is undergoing continuous, perpetual transformations which are sometimes deep and dramatic, and the information avalanches we are currently facing comprising all enterprise fields do not avoid the field of financial-accounting data either.

Information society concept, widely accepted today, was and is the subject of many works, of which we may mention "The Information Society" by Moore, where the author highlights four important features:

Information is based resource organizations and individuals, as responsible resource company and individual welfare;

Information is based on a new economic sectors, the continuous development;

Information is a resource unfit for consumption, may be used without being consumed; Progress ITC (Information Technology and communications) has an impact on the fundamental activities of human society such as business, education, business management, trade. Academician Draganescu Information Society proposes a structure on which applications are highlighted groups characteristic of the e-Business, including business services and integrated systems, e-Learning, e-governance, e-Commerce.

The special meeting of 23-24 March 2000 held in Lisbon Special European Council of

the European Commission received from the initiative entitled "eEurope - an information society" for all seen as a political initiative that represents a guarantee for the EU to take full advantage of the future developments related to information society. This initiative was adopted as an action plan [Feira 2000] will be updated in 2002, in Seville by the strategic document "eEurope 2005 - An Information Society for All".

This initiative was designed to accelerate the deployment of digital technologies in Europe and provide the necessary skills to use widely. Being involved in realizing these objectives set by the EU e-Europe initiative aims as new countries associated in Central and Southeastern Europe, including Romania, to achieve the objectives set by the strategic document "e-Europe 2005 - An Information Society for All".

In continuing in this paper I will stop on two technologies integrated information namely: Enterprise Resource Planning (ERP) and Customer Relationship Management (CRM).

2. ERP-type systems (Enterprise Resource Planning), a new stage in the progress of technologies' integration

Of all the informatic systems used for financial-accounting data, special attention should be paid to ERP-type systems as they place complete and complex solutions at users' disposal in terms of integrating the entire performance of a company.

ERP systems have become available in company applications in the context of the informational boom and the extraordinary uprise of information and telecommunication technologies since the early 90's.

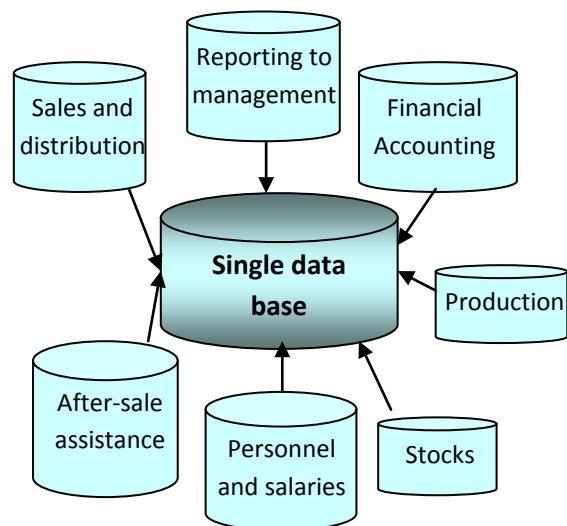

An ERP (Enterprise Resource Planning), "regarded as the most truthful expression of the interdependence between economy and informational technology, represents a software multimodular infrastructure which provides management and coordination support for the various structures and processes in a company with a view to accomplishing business goals"[2]. The main goal of an ERP system (integrated management system of business processes) is reaching better communication within a company, improving the cooperation and interaction among various departments such

as those in charge of planning production, acquisitions, sales and customer relations.

A company's ERP-type system means the planning of the four major factors in successful business: human, financial, technical and resource factors (the four M's – Man, Money, Machines and Materials), according to <http://www.cio.com/research/erp/>. [7]

The ERP systems developed until now are made up of several constituent elements: nomenclatures, cash inflows-payments, salaries, human resources, planning-production, project management, production monitoring, consumption's and costs' planning and monitoring, and also the financial-accounting constituent part or general accounting.

Figure 1: Conceptual scheme of an ERP system

Source: adapted by the author [4]

The main functions of this constituent are the following: the automation of financial-accounting information records taken from primary documents; the accomplishment of full book-keeping at analytical and synthetical level. More often than not, this constituent achieves only the functions of financial accounting, that is getting the synthesis accounting papers required by the legislation in force (balance sheets, VAT reports, fees and taxes to the budget) and the book-keeping ones (accounting reports, day books, account cards, cash books, sale and acquisition books, trial balances etc.). This constituent can be associated with an analysis

module in the form of an instrument panel (typical of a MIS or even EIS system) which provides synthetical, operative information on a company's performance, necessary to its manager during decision making. According to accounting data, several indicators are calculated which illustrate the financial outcomes of a company such as: revenues and spending for products/services, status of financial availabilities etc.

“The Financial-Accounting Module is the central element of any ERP application. All the system data are centralised in the financial-accounting module, providing the support of various legal reports. To small companies, the investment in a financial-accounting solution is the first step; yet, along with their development, resorting to an ERP solution to integrate all business processes becomes an obligatory requirement”, stated Raluca Ioana Komartin, Managing Director, LLP Bucharest in the review called “Market Watch”, February 2010, no. 122”. [8]

Beside the data integration and accomplishment of full reports about organisations' performance, as main advantages of an ERP implementation, the Financial-Accounting Model's major benefit is the automation of specific operations up to 95% according to the application's customisation level. Operations' automation is possible due to the high repeatability level of financial-accounting operations and involves the application of patterns already present in the application or predefined when implementing. Along with the increase in the operation speed, automation makes it possible for the people who do not have too much accounting knowledge to work in such an application anyway and it also does not allow human errors in certain operations.

The Financial-Accounting Department is very important in any organisation because each organisation's goal is to raise profit and it is exactly what this department does, taking care of the money in all organisational departments.

The main advantages of using an ERP within a company are [3]:

- Uniqueness of information, information is entered once into a database very large;
- Requires use of "best practices" in the industry;

- Allows customization;
- Functionality is provided on a reliable file structure;
- Provides users with tools for ad hoc queries and reports;
- Provides a reliable file structure;
- Provides users with tools for ad hoc queries and reports;

Provide and allow interaction with other modules.

ERP systems provide information necessary for the analysis and management activities and five major benefits of ERP systems [7]:

- Information on-line / real time for all departments of an organization;
- Standardization and accuracy data at the enterprise level;
- Applications include best practices in the industry;
- Increased efficiency that a record company;
- Analyses and reports obtained can be used for long-term planning.

The success of ERP packages' implementation in a company also depends on how much they allow the integration of several other system categories, such as Customer Relationship Management (CRM), Supply Chain Management (SCM), Business Intelligence (BI).

3. CRM (Customer Relationship Management)

Is a solution for customer relationship management to ensure their: support to develop business strategies and ability to connect front-office functions and back office business solutions in a component, which is specialized on customer needs. It also has the ability to store and analyze information in order to anticipate customer needs and have a profitable and long-term relationship with customers.

Traditional relationship between companies and their customers suffered significant changes due to transition from traditional business to electronic media.

Basic role of a CRM system is efficient management of information on society and information partner relations with them, ie, including: invoices issued and received, receipts and payments.

Customer Relationship Management System is seen as a strategy used for selecting and retaining clients, because their value is optimal for the firm, it involves a business philosophy that puts customer focus, by all processes, success is assured if the team leaders, strategy and organizational culture are appropriate and act simultaneously.

At the same can be seen as a process to implement a strategy that is in the foreground the customer, seen as "our lord".

Customer Relationship Management is a complex system that implements the business strategy of an organization which aims to establish long term relationships with profitable customers, information management is achieved through a single database providing complex customer records and oversees sales . [5]

There are three aspects of CRM, each of which can be implemented separately [6]:

1. *Operational CRM*: automation or support of customer processes involving sales or service representatives.

2. *Collaborative CRM*: Direct communication with customers not involving sales or service representatives

3. *CMR analytic*: analyze customer data for a wide range of purposes.

1. *Operational CRM*: provides operational support work processes "front office" including sales, marketing and services. Each interaction with a customer is generally added to a history of each customer, and employees can draw customer information database as needed. Focus on customer value is key to a successful CRM strategy. Different clients should be treated differently. Variables that customers position, actual and potential value are driving the strategy.

2. *Collaborative CRM*: covers the direct interaction with customers. This may include a variety of channels such as Internet, email or automatic takeover telefoanelor. Poate generally be equated with "self service".

The objectives of Collaborative CRM can be expanded, including reducing costs and improving services.

3. *Analytical CRM*: analyzes customer data from a variety of purposes, including:

- Design and execute marketing campaigns to optimize marketing effectiveness;

- Design and implementation of specific customer campaigns, including customer acquisition, reserves;
- Analysis of customer behavior to assist in making decisions about products and services (price, new product development, etc..)
- Management decisions, eg financial forecasting and customer profitability analysis;
- Risk assessment and protection against credit card fraud made.

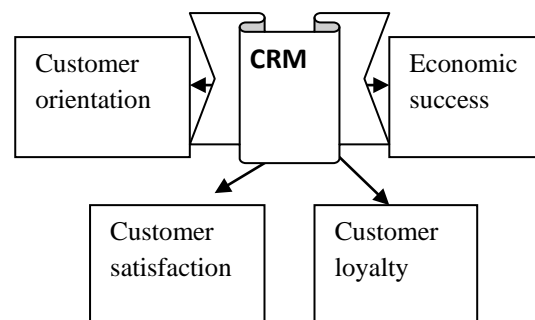

The main benefits from implementing a CRM solution are [4]:

Impact on data quality costs: use data integration solutions can produce a significant return on investment. Benefits from using data integration solutions are better identify customers, improving modeling, improving customer retention, improving to attract new customers.

Competitive Advantage: CRM is seen as a strategy to manage customer relationship and interaction with them in the most profitable way for both. There are few providers operationalo CRM solutions that enable the implementation of traditional CRM strategies. These strategies are supported solutions typically focus on how to be more efficient services, sales and marketing departments, thus increasing the profitability of the organization and its customers.

Schematically, the chain's success in customer relationship management can be presented by the following figures:

Figure 2: Chain CRM success

Source: Figure produced by author

4. Conclusions

As a general conclusion we can say that information technology has penetrated, with

all its instruments, in all economic fields, and not simply present case but as a leading actor in economic processes.

General information technology are used most often to obtain information which will then be processed for various business processes.

In most situations, information technologies used are not found in their "pure" but in a form that adapts and is more complete and more complex depending on the economic situation.

The Matrix of Romania’s Underground Economy. Working without Legal Documents

Condrea Elena

„Ovidius” University of Constanta, Romania
Faculty of Economics Sciences
elenacondrea2003@yahoo.com

Abstract

According to financial analysis conducted by the authorities, working without legal papers or "in black" is one of the main components of the underground economy matrix and one of the main crimes generating "dirty money".

The most common manifestation of the "black" employment refers to under declared employment, which is exercised at the limit of the relevant laws, with negative repercussions both upon the state budget and health insurance budget and therefore the general consolidated budget.

The causes of "black" employment are extremely varied, have a multifactorial determination and take the economic situation of the employee and employer at any given time, the level of their training and last but not least, the legal framework and enforcement regime.

According to a recent World Bank study, 45% of Romanian employees receive at least part of their salary in an envelope, and as in the public sector there is no black or gray employment, that the private sector, at least 60% of employees receive money for which they do not pay taxes.

In this study we tried to highlight some of the causes and factors that determine and influence at the same time "black" employment and features some of the manifestations of the informal economy in Romania.

Key words: “black” employment, tax evasion, underground economy.

J.E.L. Classification: E26, E62, M40, M41

1. Introduction

Now, more than five years since joining the European Union the underground economy problematic is at least as important to the national economy as 20 years ago, especially after the long period of transition that followed the global economic crisis, with multiple negative consequences on the level of living standards.

Broadly, the underground economy involves the carrying out of very different activities, most of them illegal activities such as tax evasion, money laundering, drug trafficking, corruption, prostitution, trafficking in currency and / or forged artwork, insurance fraud, trafficking in plants and / or animals protected by law, weapons smuggling, etc.; to them add some legal activities which are not considered by national accounting (work within the household, volunteer services, services mutual aid between neighbours / friendly one, household activities, etc..) and activities that are not declared for payment of tax and social obligations (tax fraud work without legal papers, etc..).

In Romania, in recent years, easing of income and the redundancies carried out and, respectively, announced by the government during 2012, illegal employment has recorded and shows, still, an increasing

trend, being present in many forms, in many areas. Under these conditions, many people are willing to compromise just to have a job.

2. "Black" employment. Concept. General features

According to the European Communities' Commission, undeclared work is defined as "any paid activity that is lawful in terms of nature but not declared to public authorities, taking into account differences in the regulatory system of Member States" [1]. This definition of undeclared work links with tax and / or social security fraud, covering various activities (from informal household services to clandestine work by illegal residents, but excluding offenses).

Thus, we can say that illegal employment is the work carried out in no compliance with the rules required by labor law, social security and tax [5].

The forms under which, this component of the underground economy matrix manifests itself are many, between them:

- Unnormed activity, without payroll and payment of obligations to the state budget, without clocking and standard documents for evidence of time and type of work;
- Work partially uncovered and not subject to taxation, through double registration, the so-called in "hand" payment;
- Exhausting workload (the worker is working for as long as the owner asks, not eight hours, as is legal);
- Casual work, seasonal, without filling in specific documents;
- Work in the known trial period or periods of apprenticeship, which are not covered in the documents.

The most common manifestation of the "black" employment refers to under declared work. Which is exercised to the limit of the relevant laws? With negative repercussions both to the state budget and health insurance budget and therefore the general consolidated budget [3].

The experience of the territorial labor inspectorates showed that "black" employment is favored in all sectors where cash is handled, context in which the commercial activities, in the widest sense of

the term, are the favourite area of manifestation.

The motivation for the practicing of black labor is also very varied, among the elements that determine the behaviour of citizens are: economic situation at a time, law, tradition, living conditions at the time.

To these are added and other labor issues that require significant compromises for the insurance of subsistence, including: periods of economic recession, the existence of underdeveloped areas, economic transition, economic readjustment, etc...

Usually, among those who practice "black" employment we find:

- People with low wages and low education level;
- Minors, students, unemployed people, retired people;
- Low skilled or unskilled people, forced to accept a job in any circumstances (often, such persons are not employed in the formal labor market);
- People experiencing difficulties regarding their social integration;
- Foreigners without papers in order;
- People who are employees, but who also carry out other paid activities for people other than the employer (or the employer, outside office hours)...

One can say that, in the short term, black labor allows the person practicing it to supplement his income, who uses it to reduce spending, both categories actually avoiding tax and social expenses.

In the long run, employee interests are affected in terms of his social security. Thus, if we relate to the employee, "black" employment can present numerous disadvantages, including [8]:

- No salary safety (the employee cannot act the employer in court for unpaid wages or violation of rights);
- Do not receive the minimum wage (in many cases);
- Do not receive wage increases due to seniority and working conditions;
- Do not have standard reduction of working time due to the existence of special working conditions;
- Have no legal right to paid annual leave as well as other leaves legally regulated for special events (marriage, death, birth of a child) and/or time off for study;

- Do not receive compensation for maternity and parental leave or sick child care;

- Do not receive free medical care, medication free or compensated;

- Are not paid daily allowances for travelling for business purposes and/or detachment, as well as transport allowance;

- Transfer do not receive compensation;

- Do not enjoy protective rights of health and safety at work, work equipment, protection and antidote food to which they would be entitled depending on the nature of the activity;

- Are not insured for predictable and unpredictable risks (disability, illness, accident, maternity, death);

- Are not entitled to compensation for temporary disability (due either to common diseases or accidents outside work or occupational diseases or accidents);

- Do not receive benefits and support for disease prevention and rehabilitation of work capacity such as compensation for temporary switch to another job, compensation for reduction of working hours and quarantine, various prosthetic aids, free or partly free spa treatment and vocational rehabilitation;

- Do not receive old age, early, partially early, disability or survivor pension;

- No granting of aid in case of decease;

- Do not receive unemployment benefits and support allowance;

- Are not entitled to free courses for professional reconversion, qualification and requalification and other active measures in order to exercise a legally regulated activity or employment for a job;

- Are not paid vouchers;

- Do not enjoy legal protection for women and children;

- Do not exercise collective constitutional rights such as freedom of association in trade unions, collective labor contract negotiations;

- Restricted right to bank loans, etc.

Although to a lesser extent, "black" employment involves risks for the employer, as well. Among these are:

- Civil penalty for violation of Art. 4 of Law 130/1999 (employer does not record civil conventions in the special register or does not establish through the collective management body's decision the areas of

work suitable to the atypical employment rapport, on civil agreement);

- Civil penalty for violation of Art. 15 of Law 130/1999 (the employer receives a person to work without concluding a contract of employment or a civil convention);

- Civil penalty under Law 19/2000 on pension rights and other social insurance;

- Civil penalty under Law 76/2002 for non vacancies;

- - Criminal liability according to law 130/1999 on measures to protect people in employment, 76/2002 on unemployment insurance system and employment stimulation, 87/1994 to combat tax evasion;

- Liability in tort for all damages caused to the third parties by employees, material responsibility consisting in the calculation and payment of contributions to the state with all legal influences (late payment penalties, penalties and interest). Following those inserted above we conclude that many forms of legal liability should be able to discourage employers tempted to taking the risk employing "illegally".

Also, it should not be neglected that long term, the organization's competitional performance will be mitigated by the questionable quality, creativity and commitment of some illegal employees for a firm to which they are not bound by anything.

3. Causes for “black” employment

The causes of "black" employment are extremely varied, have a multifactorial determination and take the economic situation of the employee and employer at any given time, the level of their training and last but not least, the legal framework and enforcement regime.

We appreciate as significant the following causes [8]:

- The demand for jobs is greater than the supply, especially after the redundancies made in the budgetary system and the private sector as a result of the crisis, the disappearance of large state enterprises or their restructuring. Add to this the large number of graduates seeking work because of the schooling that ignores market demand;

- Tax burden, respectively the high level of taxes and social contributions - currently, the share of social contributions in the gross wage (employer and employee) is at least 43.5%, it can get, depending on how dangerous the work performed is at over 60%, a level which virtually cancels the effects of introducing the flat tax;
- The existence of underground economy;
- The fact that the vast majority of employers are adepts to the policy of obtaining important short-term profits at the expense of the company's development strategies in the medium and long term;
- Economic and financial instability of private enterprises in the SME category;
- Incomes which are low for a substantial part of the active population and very low for retired persons and pressing need for their filling up to the acceptability of the individual;
- The large number graduates of different forms of education seeking work, as a result of enrolment figures which do not take into account the labor market demand, but are dictated either by the desire to maintain at any cost the institution of schooling, either from commercial reasons;
- System of enforcement only for the employer, not the employee;
- Excessive bureaucracy for recording documents;
- The desire to deceive the state. Many opt for illegal employment just to benefit from unemployment benefits at the same time;
- Ignorance of the law in force which is associated with failure to acknowledge the full consequences arising from failure to conclude an employment contract;
- Poor labor legislation, in particular concerning the employment of specific categories (day-laborers in agriculture, construction, catering);
- Few employers who offer of employment resulting in the acceptance of the supplying of undeclared work;
- Lack of consistent policies to encourage foreign investors (government should not create jobs, but the conditions, the legislative framework necessary for foreign businessmen to invest);
- Administrative constraints, such as limiting the accumulation of income or prohibiting a second job (e.g. civil servants);
- Tolerance towards this phenomenon by state institutions;
- misconception of the employers in business development (business focus on quantity and quality of production and less on human capital);
- Vulnerability to a wide of socio-professional categories (many Romanians had difficulties in finding work according to training and experience);
- Free time, mainly due to expansion of part-time employment practice (half-time, part time);
- Low level of retraining.

4. Statistical data regarding “black” employment in Romania

The labor situation in Romania, both now and at all stages of economic transition shows that although most of those employed at a job or retired produce income that can not ensure the beneficiaries' subsistence cases, these social groups manage additional financial resources than those officially declared through which they ensure their existence. The same is true for people who have unemployed status and whose income from unemployment benefits is at the limits of survival.

Analyzing the nature of unemployment, specific to the Romanian economy, it is notable that while the duration of unemployment benefits is limited, many people seem able to maintain themselves for long periods of occupational inactivity. Very often it was found that virtually unemployed persons are working in some format, often occasionally or a few hours a day.

In Romania, unemployment seems thus related to underground economy growth by enrolling in the black economy of non-taxable persons.

Estimates on the size of undeclared work in Romania [4], it increased steadily until 1999, moment which was the peak year of employment on underground labor market. For that year, estimating employment of illegal labor market turnover reached 1071 thousand people, representing 13% in that time as a share of official labor market in

Romania. Employment situation of the illegal labor market was relatively high in 2000, when although declining, was 11.4% of official labor market, respectively 938 000 people.

Black labor continues to dominate the Romanian economy. According to statistics, young people accept much easier to work illegally, enjoying the fact that they can receive a salary, even if it is not safe, is still a source of income. Romania entering the European Union has not diminished this phenomenon, specific too many other Community countries.

In Romania, illegal employment is common. Unions claim that over 30 percent of the national economy is based on illegal work [1]. Statistics provided by the Demographic Research Center contain data even more dramatic. If we consider the number of people active in our country which, according to studies, is 10,500,000, the number of illegal employees, amounted to 4,700,000, shows that in Romania, over 5,000,000 people work without benefit of an employment contract. And the figures are not far from the truth.

Romanians were forced to accept work under the table to have a standard of living more or less acceptable. Despite Labor Inspection controls, many employers continue to practice illegal employment, based on the fact that people need money. In 2006, labor inspectors have applied fines in the amount of 26,128,400 lei for undeclared employment. Given the scale of the phenomenon, the amounts are small compared to number of those who - by will, by necessity - working without the benefit of a legal contract...

In 2011, 106,486 checks were made, after which 82,762 were applied sanctions, including 17,294 fines of 125,545,100 lei (29,196,534 Euros - a sum more than double the fines in 2010) and 65,468 warnings [10].

More than 2,000 criminal cases were drawn, during 2011, following control actions designed to detect and combat illegal employment, tax evasion, according to a press release from the Ministry of Administration and Interior (MAI). Thus, in almost half of cases criminal investigation was ordered. Inspectors found in the companies controlled about 28,000 people

working illegally. Of these, nearly 100 were minors aged between 15 and 18 years [9].

5. Conclusions

Methods to combat this activity have a significant impact sphere and are linked to combating unemployment and creating sustainable jobs, properly paid employment through:

- organizing training courses tailored to real market with a strong practical character;
- preventing illegal immigration which has the effect of distorting the labor market and especially creating a very favorable environment for illegal labor recruitment;
- protecting young specialists in areas such as chemistry, physics, law, finance, to avoid attracting them within the underground sphere;
- Providing incentive pay.

Based on the identified causes we can outline a series of solutions to mitigate and / or stop this phenomenon, including:

- Reduced taxation;
- Intensifying the actions of control along with severe penalties for those who use illegal labor;
- Promote information on legal provisions to educate both employers and employees;
- Promoting and publicizing the risks and consequences involved in this phenomenon.

There are, among economic analysts [3], also voices that support the beneficial effect of this segment of the informal economy, through the employment in this sector of a certain number of people, the state is relieved (at least partially) of payment of money that would otherwise be caused by them. However, the presentation of the causes and forms of manifestation of undeclared work, we conclude that it is a form of tax fraud because by not declaring (hiding) all or part of income, indicating that socio-economic implications are much wide.

Particularities of the Romanian Money Laundering Phenomenon

Condrea Elena

„Ovidius” University of Constanta, Romania

Faculty of Economics Sciences

E-mail: elenacondrea2003@yahoo.com

Abstract

By analyzing the components of the underground economy matrix, we can say that its financial support is "money laundering" a comprehensive, dynamic phenomenon which lies in the desire of criminals to hide practiced illegal activities behind their sources of income, in order to allow a normal development in society.

In this study we tried to highlight some of the features of the phenomenon of money laundering, as well as some preoccupations concerning combating this phenomenon in Romania, member country of the European Union. In this regard, we analyzed the reports of the National Office for Preventing and Combating Money Laundering (N.O.P.C.M.L.) for the period 2006 - 2011, and numerous documents and papers produced over the years in this area, either by the researchers of this phenomenon, either by institutions / national and international bodies empowered for that purpose.

Key words: underground economy, laundering "the dirty" money.

J.E.L. Classification: E26, E62, M40, M41.

Acknowledgements

This work was supported by the project "Post-Doctoral Studies in Economics: training program for elite researchers - SPODE" co-funded from the European Social Fund through the Development of Human Resources Operational Programme 2007-2013, contract no. POSDRU/89/1.5/S/61755".

1. Introduction

Underground economy, parallel economy, informal economy, tax evasion, tax fraud,

working "illegally", laundering "the dirty" money, trafficking in counterfeit currency, drug trafficking, arms trafficking, human trafficking, corruption, organized crime etc. . are the subject of numerous articles in publications recognized at international, regional or national level, of several studies in the research projects conducted by teams of researchers from research centers / institutions of prestige, the reports prepared by authorities at national, European or global studies of economic, legal and / or social taken by many experts [2, 10].

If the underground economy issue is the topic of many specialists, the analysis of money laundering as a separate component the underground economy, are the main concern of institutions / organizations specialized in this issue, rather than specialists working individually or in small teams.

Another aspect found in the sights of specialists who study the phenomenon of shadow economy is the relationship underground economy - corruption - dirty money laundering.

Money laundering, as a form of the underground economy is a global phenomenon [8, 10], with a strong technical character while fighting it is an essential part of the general framework for combating economic and financial crime prevention, from early forms, culminating with another contemporary issue - financing.

Also, dirty money laundering is the last link of the criminal chain by which money from underground activities shall be reinstated in the formal economy.

Regarding the relationship between underground economy and money laundering, Nicolae Hoanță said: "The financial resources released by the underground economy are eventually used mostly to finance the surface economy, the operation known as money laundering" [7].

For this study I relied mainly on data in the report of the N.O.P.C.M.L. for the period, but also on information provided by other state institutions.

2. Money laundering. Concept

Directive CCE no. 308 of 10 June 1991 defines "*money laundering*" [1] as the next action, when committed intentionally:

- „Conversion or transfer of property about which the one who made it known to arise from a criminal activity or from participation in such activity, in the purpose of concealing or disguising the illicit origin of the goods or to help anyone involved in such activity to evade the legal consequences of his acts;
- Concealment or disguise of the nature, source, location, disposition, movement or ownership of the goods or rights with respect to them, knowing that they come from a criminal activity or participation in such activity;
- Acquisition, possession or use of property knowing at the time of receiving these goods, that they come from a criminal activity or from participation in such activity;
- Participation in one of the acts referred to in the previous three paragraphs, association to commit the act, attempt to commit that to help incite or advise someone to commit that to facilitate its execution”.

According to *Law no. 656/2002 on Preventing and sanctioning money laundering and to establish measures to prevent and combat terrorist financing* [4] by money laundering we understand:

- "Exchange or transfer of property, knowing that they originate from the proceeds of crime, in the purpose of concealing or disguising the illicit origin of such property or to help the person who committed the offense from which the goods come from to evade prosecution, trial or execution of sentence;
- Concealment or disguise of the true nature of the origin, location, disposition, movement or ownership or rights over their property, knowing that the goods come from crime;
- Acquisition, possession or use of

property, knowing that they originate from crime”.

In his book, "The Washing Machine: Money, Crime and Terror in the Offshore System" [3], the British investigative journalist Nick Kochan, classifies them by money launderers in the following categories:

- International corporations involved in fraudulent transactions;
- Corrupt governments and politicians;
- Organized crime which practices drug-trafficking, weapons, human beings etc.;
- Terrorism.

Some specialists in the N.O.P.C.M.L. define money laundering as: "Money laundering is the *de facto* financial part of crime through which comes profit. The process through which criminals attempt to conceal the origin and actual possession of income from their criminal activities. If successful, this work will allow them to maintain control over their income and, ultimately, will provide a legitimate cover for their income source. Money laundering is a process which gives an appearance of legality for the profits obtained illegally by criminals who, without being compromised further receive amounts obtained. It is a dynamic process in three stages, which requires, first - the transfer of funds obtained directly from infractions, secondly - hiding the traces of money to avoid any type of investigation, thirdly - availability of funds for criminals, hiding again the occupational and geographical origin of funds" [5].

3. Particularities of the Romanian money laundering phenomenon

Over the time it was found that in Romania, the typologies of money laundering are closely linked to the main areas vulnerable to economic and financial crime [2], namely:

- Tax evasion;
- Illegal VAT refunds;
- Fictitious or overvalued exports;
- Marketing and / or smuggling of petroleum products, alcoholic products and / or tobacco;
- Fraudulent privatization at the expense of state interests;
- Deception in banking, finance and insurance;

- Unlawful seizure of bank loans from their original purpose for which they were granted;
- Corruption and / or blackmail;
- Offshore companies;
- Organized crime.

According to data presented annually by the NOPCML, the number of suspicious transaction reports received by the Office is increasing since 2009 (Figure 1), after the period 2006 to 2008 there was a downward trend (3196 papers in 2006, 2574 in 2007 and 2367 respectively in 2008).

Figure 1. Evolution of the number of suspicious transaction reports received at the Office during 2009 – 2011

Source: Report N.O.P.C.M.L. the years 2011

To note, for the entire projection period, the increase in the number of cases solved and thus the decrease in the stock of papers under review at the end.

A major contribution in this regard was a 2008 application from a system of prioritization of works entering the analysis system, in fact, is the preliminary analysis of suspicious transaction reports.

The beneficial effects [9] resulting from the use of this system include the reduced stock of papers in the portfolio of financial analysts in the Department, leading to better management of work in analysis, thus addressing the Moneyval Committee recommendation.

The situation of the papers located in stock in analysis at the end of the period 2006 - 2011 is shown in Table 1.

Table 1. Stock papers in analysis in the period 2006 – 2011

An	2006	2007	2008	2009	2010	2011
Lucr.	3153	2625	1590	1995	680	710

Source: Data from the Report N.O.P.C.M.L. the years 2006 - 2011

From financial analyzes performed over the past years that, of all complaints submitted to the criminal investigation bodies, the main dirty money generating offense was tax evasion; this phenomenon is followed by acts of fraud; offenses under Law 31/1990 on companies; offense under the Customs Code; other offenses (drug trafficking, corruption, terrorism, etc.) (Table 2).

Table 2. Weight of the main "dirty money" generating offenses (%)

	2007	2008	2009	2010	2011
Tax evasion	66.41	74	64	65	79
Fraud	5.47	9.5	12	15	14
Offenses under Law 31/1990	7.81	5.3	7	10	3
Offense under the Customs Code	11.3	3.7	7	4	2
Other offenses	9.01	7.5	10	6	2

Source: Data from the Report N.O.P.C.M.L. the years 2007 - 2011

According to the Activity Report of N.O.P.C.M.L. for the period 2007 - 2011, the Office has received numerous requests by the EGMONT secure network of information on suspicious transactions.

If in 2006, the pre-accession year to the EU, 80 requests for information were submitted to the National Office, since 2007 their number increased significantly. In 2007 there were 128 requests for information; in 2,008 to 100 applications, in 2009-185 applications, in 2,010 to 188 requests for information, and in 2011-200 requests for information.

The share of geographical areas where the requests for information submitted to National Office originate is found in Table 3.

Taking into account that Romania is an EU member country, in order to have a clearer picture of the extent of money laundering, for Europe the situation is presented in detail, by region, both for highlighting the origin of information requests received by the NOPCML on suspicious transactions to be investigated as

well as in the geographical destination relating to requests for information on suspicious transactions provided by NOPCML for investigation.

Table 3. Origin requests for information on suspicious transactions received by the N.O.P.C.M.L. for investigation of FIUs in Europe, from 2007 to 2011 (%)

	2007	2008	2009	2010	2011
	%	%	%	%	%
Europe	92	82	87	83	85
Central Europe			41	40	20.5
South Europe			-	-	4
South-East Europe			14	18	9.5
North Europe			14	-	2.5
Western Europe			10	-	45.5

Oceania	-	2	-	-	-
Middle East	-	-	-	-	4.5

Source: Data from the Report N.O.P.C.M.L. the years 2007- 2011

The data in Table 3 shows that in 2009 and 2010 approximately 40% of applications originated from reporters in Central Europe, while in 2011, over 45% of inquiries came from Western Europe rapporteurs.

Regarding the request for information sent to the N.O.P.C.M.L. investigation the period 2007 - 2011 by speakers from Europe, America, Asia, Africa, Middle East and Oceania, is as follows (Table 4):

Tabel 4. Geographical destination of requests for information on suspicious transactions sent to N.O.P.C.M.L. for investigation during 2007 to 2011 towards foreign raporters (%)

	2007	2008	2009	2010	2011
	%	%	%	%	%
Europe	68	65	65	76	74
Central			26	26	25

Europe					
South Europe			-	-	1
South-East Europe			15	24	9
North Europe			6	-	2
Western Europe			11	-	28
South-West Europe			-	26	6
Eastern Europe			7	-	3
Asia	14	16	18	14	3
America	17	17	15	8	16
Africa	-	1	-	-	3
Oceania	1	1	2	2	1
Middle East	-	-	-	-	3
Total number request sent by NOPCML	525	417	337	145	199

Source: Data from the Report N.O.P.C.M.L. the years 2007 - 2011

Analyzing the data above we see that in terms of the destination of the requests for information sent by NOPCML in the period 2009 - 2011 about 25% of applications are addressed to rapporteurs from central Europe in 2010, a similar percentage also found in the reporting applications transmitted in South-Eastern and South-west respectively, and in 2011 the majority reporting that addresses fine Romania Office are in Western Europe (28%). Also, we found a higher ponder and reporters in Asia and America.

4. Concerns on combating money laundering in Romania

Throughout the period analyzed, especially in the last three years, NOPCML has directed its efforts towards actions aimed at strengthening its main operational capacity and to strengthen cooperation with all law enforcement authorities and raising awareness of reporting entities, as well as their supervision by law.

In legislative terms, the year 2011 [9] is distinguished by the Romanian Parliament adopting the *Law on the approval of Government Emergency Ordinance amending and supplementing nr.53/2008 Law 656/2002* on preventing and sanctioning

money laundering, as well as on measures to prevent and combat terrorist financing, respectively *Law nr.238/2011*.

In drafting this legislation, which has made important additions to the national framework in the field, to take account of the recommendations included in the Report of Moneyval-Council of Europe on the third round detailed assessment of Romania in combating money laundering and terrorist financing.

During 2009 - 2011 there have been actions to improve the activity in terms of prevention and respectively combating money laundering [6, 9], of which include:

- Supervision and control authorities have adopted measures related to secondary legislation to cover all aspects included in primary legislation in the field.
- In June 2010 the National Strategy for Preventing and Combating Money Laundering and Terrorist Financing and an Action Plan was adopted to strengthen, to optimize and reinforce the national capacity to prevent and combat money laundering / financing of terrorism.
- New legislative measures were adopted regarding the Office's competence to suspend certain transactions suspected of money laundering / terrorist financing at the request of a foreign FIU (harmonize Romanian legislation with the Warsaw Convention of 2005).
- Amendments to the legislation in the field have sought to achieve a high degree of harmonization of Romanian legislation with the provisions of Directive 2005/60/EC of the European Commission and the FATF Recommendations.

In 2012, NOPCML [9] has continued and will continue measures to strengthen cooperation with institutions component at national level in preventing and combating money laundering, by holding regular working meetings for the exchange of expertise, to identify the best methods to investigate of suspected cases of money laundering and / or terrorist financing.

It also envisages further development of information exchange between NOPCML and financial intelligence units (FIUs) from abroad, using secure networks (Egmont Secure Web and FIU.NET), and the conclusion by the Office of the new Memorandum of Understanding with

Financial Intelligence Units.

5. Conclusions

"The money laundering is the terminus on corruption and organized crime, which basically crowns the ingenious techniques in economic and financial crimes and is the glue connecting the cross-border economic crime." [7]

According to the Activity Report of the N.O.P.C.M.L. for the period 2007 - 2011, the Office has received numerous requests of information through the EGDMONT secure network on suspicious transactions, most of them coming from European FIUs, particularly in Central and South Eastern Europe.

Analyzing the sources of origin of amounts subject to recycling, established in 2007 - 2011 Activity Report of the National Office for Preventing and Combating Money Laundering [6, 9], results that the most vulnerable areas of activity are: domestic trade, foreign trade, real estate and service and investments.

From financial analyzes performed over the past years that, of all complaints submitted to the criminal investigation bodies, the main dirty money generating offense was tax evasion, this phenomenon is followed by acts of fraud, offenses under Law 31/1990 on companies, offense under the Customs Code, other offenses (drug trafficking, corruption, terrorism, etc.).

Historical Perspective on International Financial Centers

Cosma Sorinel

Faculty of Economics, „Ovidius” University, Constanta
sorinelcosma@yahoo.fr

Abstract

International financial services in their most basic conceivable forms have been provided, in one form or another, for at least two millennia. The growth of international finance as we know it (financial services, institutions and markets) has been shaped by history in response to requirements for capital specific to different times and different places. In early times, when there was no infrastructure, no central banking, and no financial regulation, merchants and bankers worked alone and had great difficulty in raising funds for their investments. They eventually diversified their sources of funds (to royalty, church, landed aristocracy and wealthy professionals) and began collaborating with partners in other locations. These early impulses resulted in incipient clusters of financial expertise that were later to evolve into what we call international financial centers (IFCs) nowadays.

Key words: IFC, trade, entrepôt, stock exchange, regulation.

J.E.L.: G15, N20

1. Introduction

There are several key elements to being a top global financial center these days: ready access to capital, a solid regulatory regime, and a large pool of professional talent.

It appears that most great international financial centers originated in cities with superior location and benefited from a deep financial transformation of economies that were leaders in the world economy. This transformation resulted from institutional changes that were driven by expanding markets and opportunities. From a historical perspective, a natural antecedent of a financial center is what has become known as a financial revolution, similar to those that occurred in Florence in the 14th century, Genoa and Venice in the 15th century,

Antwerp in the 16th century, Amsterdam in the 17th century, England in the 18th century, and the United States in the 19th century supported by three basic pillars: innovations in financial institutions, instruments and markets; an institutional mechanism through which the debtor commits not to renege on debt, and the presence of a public bank.

History also demonstrates that the hierarchy of financial centers appears stable, but in fact it is evolving all the time and that established IFCs are not immune to decline due to competition from new challengers. Examples include Sydney surpassing Melbourne, Toronto surpassing Montreal, Johannesburg surpassing Cape Town, and Sao Paulo surpassing Rio de Janeiro during the post war period. Such a shift of comparative advantage between competing cities should not come as a surprise considering that financial production is increasingly footloose thanks to the advancement of information and telecommunication technology, even though location still matters.

2. IFCs before the 19th Century

From the 12th through the 16th century Europe was economically dominated by **Florence, Venice and Genoa**. Though not a port city, Florence had very extensive trading and banking activities with the countries of Northern Europe. Genoa and Venice were maritime powers fighting for dominance of the maritime routes to West and East, respectively.

At the end of the sixteenth century, world trade shifted from the Mediterranean to the Atlantic. During that period the Netherlands gained commercial supremacy based on the fact that the port of **Amsterdam** became an entrepôt for merchandise coming from all the corners of the world and most of it being then re-exported. This, together with the high level of urbanization and the productivity of its agricultural and industrial sectors, placed the Netherlands in leading position ahead of its competitors. The growth of the international trade led to the growth of the

financial sector – loans and insurance prospered in the early 1700s.

The Dutch financial revolution was sparked by Emperor Charles V in his attempt to find new ways to borrow money. In 1609, the *Wisselbank* of Amsterdam received the monopoly on money changing, on bills of exchange valued in excess of 600 guilders, and on bullion transactions and soon became the center of the Dutch payment mechanism. Two centuries later, the center of gravity of international trade shifted from Amsterdam towards **London**, but Amsterdam still kept its position as the world’s dominant financial center. Interesting to notice that the two cities are both port cities and were commercial hubs of large empires.

The Glorious Revolution of 1688, the fact that the Parliament made property rights more secure, the creation of a public bank, the Bank of England in 1694, which, along with the East India Company began to issue shares that were well received by the public, all these elements opened the ascendancy of London as a financial center.

The cradle of the Industrial Revolution, colonial England turned into a genuine trading power. From that emerged an insurance market and a banking sector (bills of exchange, private banks).

The Napoleonic Wars left their marks on the history of financial capital. After the war, military spending dropped and thus liquidities increased.

In 1817 a loan denominated in francs to finance French war reparations was arranged. One year later, the first foreign loan in sterling was arranged by Rothschild for Prussia. Foreign loans were allowed to be listed on the London Stock Exchange in 1823.

As a financial center, **Paris** was appealing to British and Americans who bought here bills of exchange to pay for their purchases and to clear their debts with the Anglo-Saxon countries.

In the mid 19th century the banking world expanded through the creation of joint-stock banks, with limited liability, with far larger capital than private banks, and with the possibility of taking larger risks, of deposit banks, investment banks, and overseas banks. The railway revolution of those times triggered a substantial development of the capital market.

Berlin rose to the top ranks among international financial centers following the

unification of Germany in 1871, as a response to Germany’s fast pace of industrialization and growth which needed to have a financial center of such dimensions.

3. Historical Perspective on Modern Day IFCs in Europe

Both the Xinhua-Dow Jones International Financial Centers Development Index and the Global Financial Centres Index place **London** in first position in the top ten financial centers of the world. It appears that when companies seek to list their stocks, they would rather go to London before New York. London's location between Asia and the U.S. meant that it was particularly suitable when taking into account time zones.

London as a financial center took shape as an addition to (not a substitute for) its role as a commercial center. London's port, its insurers, its activities in the distribution of minerals and metals were complementary to its central position in international finance.

The London Stock Exchange is usually seen as the model example of an open competitive market, and many have argued that this model explains, at least in part, the success of London as a financial center.

Paris, considered until 1914 as the second international financial centre after London, declined more than the other ones after WW1.

The Bourse was established in 1801. From the early 19th c. onwards, the structure of the Parisian stock market was bipolar, including two very different markets, the Parquet and the Coullisse.

The Parquet was the regulated market organized by the *Compagnie des agents de change* (CAC), the semi-private body of 60 official brokers (agents de change) with a legal monopoly on transactions who were recruited on strict social and wealth conditions which provided high guarantees to the investors.

By contrast, the Coullisse was a loosely organized market (with no juridical structure until 1884), illegal *de jure* but *de facto* tolerated and even protected by the government. Its members (the coullissiers) acted both as brokers and jobbers. They were usually less wealthy than the official brokers. Their number was not fixed, and the admission procedure was loose.

The differences between the two markets led to a specialization, competition developing only at the margin.

This bipolar architecture remained quite steady over the century, than in 1893, the creation of a new tax gave to the *Coulisse* a legal status. The 1893 reform was reversed as soon as 1898.

The Paris Bourse escaped the 1907 crisis and remained more important at the international level than the French economy, emphasizing the capacity of dual market organizations in providing efficient services to the users of stock exchanges.

After 2000, the stock exchange has officially been dubbed the Euronext Paris and is the second-largest European exchange following the London Stock Exchange.

It is quite surprising to learn that the city of **Zurich** has a short history as a financial centre. It has gradually developed as a banking, industrial and financial center only since the 18th century.

The foundation stone for Zurich's banking center was laid in 1755 when Bank Leu & Co. was established. Then, in 1856, a second major bank was founded: Schweizerische Kreditanstalt (now Credit Suisse). Eidgenössische Bank (EIBA) was set up in Berne in 1863 and later transferred its headquarters to Zurich in 1892. Bank in Winterthur (established in 1862) became Schweizerische Bankgesellschaft (SBG) in 1912 and also moved its headquarters to Zurich.

As industrialization gathered pace, Zurich developed into the leading center of industry in Switzerland. After the Swiss Federal State was set up in 1848, Zurich began to take on the leading role in the country's economy.

In 1880, the construction of the stock literally laid the foundations for a prestigious financial center. However, it was not until after the Second World War that Zurich developed into one of the leading IFCs.

4. Historical Perspective on Modern Day IFCs in America

New York's Wall Street was leader of the financial world for most of the 20th century, but over the past decades numerous financial centers have challenged its position.

New York was founded in the early 17th century, by Dutch fishers and fur traders. Unlike most New World colonies, it was not an escape from religious persecution or a

state sanctioned colonial expedition but rather a purely commercial venture.

It is important to remember that the wealth created from New York's position as a trade center was not accompanied by financial activity. There were systems of rents and various forms of insurance offered as financial products, but nothing compared to the central banking system modeled by the Bank of England or the myriad of private and joint-stock commercial banks such as Barclays or Lloyd's. It was wealth born of agricultural entrepreneurship, the manufacturing of staples, and trade with Europe. In the period leading up until the Revolutionary war, financial institutions were almost nonexistent in America.

It was not until after the Revolutionary War that modern financial institutions began to form in the colonies where they first engaged in large scale government finance. In fighting the war against Britain, the American colonies had incurred huge war debts. It was from these primitive roots that American finance was born.

Chicago owes its existence to its strategic position: The patch of land where it stands straddles a key point along an inland water route linking Canada to the Gulf of Mexico.

Given the fact that the Chicago Mercantile Exchange (founded in 1898 as a non-profit organization and gone public in 2002) is the United States' oldest futures exchange and that the Chicago Board of Trade (established in 1848 for the business of trading futures and commodities options) acts as the largest trader of derivative products, it is easy to understand the position of the city of Chicago (founded in the 1830s) as one of the nation's financial centers.

It was not until 1826 in England, and 1867 in the United States, that the traditional futures market was established. In the US, Chicago was the natural locale as it represented the great railroad center for products grown in the West to be moved to the population centers in the East. It proved to be a huge commercial success for the city. Throughout its formal history, traditional futures were based on agricultural products.

Toronto

Toronto is both the financial services capital of Canada and the fastest growing financial centre in North America. The Toronto Stock Exchange is the third largest in North America, after New York and Chicago.

Toronto's central geographic location shares a time zone and borders the world's largest concentration of economic activity - New York, Boston and Washington- which makes Toronto an ideal market to head-quarter North American operations.

5. Historical Perspective on Modern Day IFCs in Asia

Asia's financial centers – **Tokyo, Hong Kong, Singapore, and Shanghai** - rank in the mid-part of the top ten IFCs.

Both **Hong Kong** and **Singapore** entered the modern era as colonies of Great Britain, Singapore in 1819 and Hong Kong in 1842.

A primary entry and exit point for mainland trade and investment financing, **Hong Kong** has particular strengths in banking, equity markets, funds management, and, increasingly, insurance. The main legacies of relevance to both of their financial markets today are the British common law tradition and the English language.

The East India Company made the first sea venture to China in 1699, and the region's trade with British merchants developed rapidly soon after. The bustling city of Hong Kong was just a collection of fishing villages when claimed by Britain in 1842 following the First Opium War with China. After being ceded by China to the British, the colony of Hong Kong quickly became a regional center for financial and commercial services. In 1841 there were only 7500 Chinese inhabitants of Hong Kong and a handful of foreigners, but by 1859 the Chinese community was over 85,000 supplemented by about 1600 foreigners. The economy was closely linked to commercial activity, dominated by shipping, banking and merchant companies. Gradually there was increasing diversification to services and retail outlets to meet the needs of the local population, and also shipbuilding and maintenance linked to the presence of the British naval and merchant shipping. From a relatively unpopulated territory at the beginning of the nineteenth century, Hong Kong grew to become one of the most important international financial centers in the world.

A boom occurred after 1945 and pushed forward the city's capacity to make the most of favorable economic trends outside the Chinese Mainland. Hong Kong's banking markets soon recovered from the war.

Having successfully ridden waves generated by instability in China and by global monetary turmoil associated with the end of the Bretton Woods exchange rate system and the oil price shocks of the early 1970s, Hong Kong emerged as a centre for offshore credit operations for the region's governments and expanding industrial corporations.

Hong Kong was severely tested during the so-called Asian crises of the late 1990s and affirmed by its outstanding performance during the worst global crisis since the 1930s, which began in the United States in 2007.

The government of Hong Kong created important tax advantages by dropping its previous 15% withholding tax on interest paid on foreign deposits.

In Hong Kong, government played the role of facilitator; it restrained its tax policies and kept individual and corporate taxes low across the board, it intervened directly in its economy on an *ad hoc* basis, mainly in response to emergencies, and it adjusted its regulatory framework as required by periodic scandals.

In Hong Kong, a government with widely distributed powers accommodated often opaque linkages between public and private sectors that, relatively speaking, permitted deep interaction between domestic and international markets.

Perhaps because of the turbulent financial history of Hong Kong, dating back to the 1866 crisis that saw six of eleven then-existing banks fail (including two note-issuing banks), the biggest licensed banks are now well-known for conservative management.

Modern **Singapore** was founded as a trading post of the East India Company in 1819. The British obtained full sovereignty over the island in 1824 and Singapore became one of the British Straits Settlements in 1826. Before its independence, Singapore was also the main British naval base in East Asia and hosted the largest dry dock in the world at that time, being described in the press as the 'Gibraltar of the East'.

Singapore was occupied by the Japanese in World War II and reverted to British rule after the war. It became internally self-governing in 1959. It united with other former British territories form Malaysia in 1963 and became a fully independent state two years later after separation from Malaysia. Since then it has had a massive

increase in wealth, and is one of the Four Asian Tigers and a strong Asian competitor, especially in foreign exchange and derivatives trading, international banking, and bonds.

In Singapore, government played the role of leader; it believed in industrial policy and it implemented such a policy through targeted tax concessions, strict regulation, and sectoral planning.

In Singapore a centralized government promoted new industries and encouraged the development of locally based ‘off-shore’ markets.

With 24 state banks, over 200 private lenders, trust companies and other financial institutions, **Shanghai** was the leading financial centre in Asia in 1949. The economic reform and opening to the world policies launched in 1979 gave a new lease of life to Shanghai. Now, after the launch of the Chinese open door policy, Shanghai is once again seeking to transform itself into an IFC. The stated objective of the Chinese government was to develop Shanghai into a leading international industrial, financial, and commercial centre by the year 2010.

Shanghai has already established itself as the domestic financial hub of mainland China. Its stock market has developed rapidly since 1991 to become the third largest in Asia, following only Tokyo and Hong Kong. Steps have been taken to transform Shanghai into the centre for many of the country’s other financial activities (interbank lending, bond trading, foreign exchange trading and fledgling futures and commodity trading).

6. Conclusions

International financial centers do not appear at random. They emerge and develop in places offering a cluster of attractive conditions to the financial actors that have established their activities there. And, it is but a small step from trade in commodities and manufactured goods to trade in services.

At world scale, before 1870, a large number of cities (including Amsterdam, Berlin, Florence, Frankfurt, Genoa, Hamburg, London, Milan, New York, Paris, Philadelphia, Rome, Turin, Venice, and Zurich) provided regional and global financial services, but none greatly dominated the others. Around 1870, London and Paris began to emerge as the strongest centers and competed against each other

vigorously. After 1870 (after the Franco-Prussian War and France’s defeat by Germany), London won out as the dominant IFC in the world and remained so until the outbreak of the First World War in 1914. After the war, New York City challenged London for the top spot and after the Great Depression of the 1930s it surpassed London. New York remained the leading IFC through and after the Second World War.

A New Social Class-The Knowledge Workers

Cușu Dorinela
„Ovidius” University of Constanta
cusudorinela@yahoo.com
Brailoiu Liviu
Bujduveanu Aurica

Abstract

In the new economy classical occupations (lawyers, engineers, economists, farmers, vendors, etc..) coexist with the new occupations (marketing specialists, computer scientists, analysts, teachers, doctors, managers, etc..), specific to the knowledge-based economy

In the new economy a certain category of specialists, called knowledge-based specialists is emerging. The usual employee works with his hands and produce goods or services. Instead a knowledge worker works with its head instead its hands and produces ideas, knowledge and information.

Key words: knowledge economy, knowledge workers, education unemployment.

J.E.L. Classification: D 8

1. Introduction

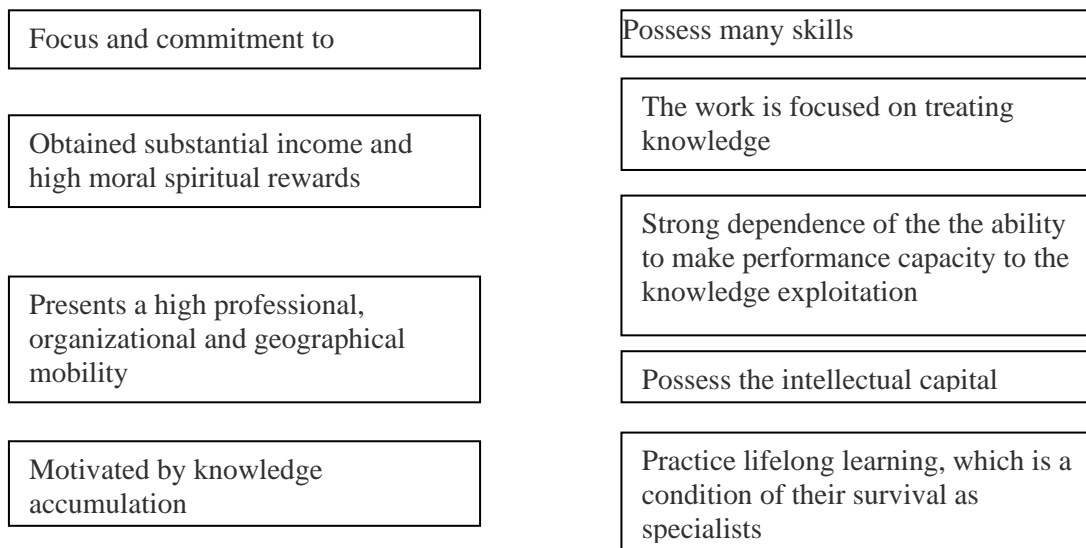

The characteristics listed in the figure conclude that knowledge-based specialists are both owners of the intellectual capital and active human resources participating in economic activities.

The knowledge workers possess knowledge and they constantly renew them through continuous learning in order to maintain their title of knowledge workers.

The essence, productivity and work performance of the knowledge workers lies in the collection, assimilation, creation, combination, use and exploitation of knowledge.

The knowledge workers present high mobility, meaning that they can change their job to another post or function within the same organization or in a different organization, they can change their profession, being available to change their home for their job.

Fig. no. 1- Characteristics of the knowledge-based workers

Source: Ovidiu Nicolescu, Luminita Nicolescu, *The knowledge economy, business and management*, Economic Publishing, 2005, p.65

Knowledge-based specialists are dedicated people to their job, get high incomes in the form of salaries, bonuses, shares in companies in which they work, concomitantly with a special moral treatment, all these rewards reflecting the knowledge and the intellectual capital they hold.

In the knowledge based economy, the specialized workforce is well trained in handling data, information, knowledge, which will lead to demand for careers such as scientists, engineers, chemists, biologists, mathematicians, scientific inventors etc..

Also, entities that use knowledge workers such as clusters, will be vital for the global economy.

2. Human resources in science and technological domains

In 2007, within the EU-27, 65.1 million people held positions in science and technological domains, representing approximately 29.8% of the total employed population within the EU-27. From the figure showed below you can see that the countries with a large number of human resources in science and technological domains is Germany, followed by France and Great Britain. Romania ranks the eighth place among the EU-27 countries.

Fig. no.2 -Human resources in science and technological domains in the EU-27 in 2008 per 1000 inhabitants

Source: Eurostat statistical books, Eurostat yearbook 2011, “Science and Tehnlogy” section, p. 587

* For the following countries: Bulgaria, Denmark, Poland, Slovenia, and Sweden the values refer to 2007

3. The unemployment rate in Romania

In the current economic crisis, the main problem facing the economy is unemployment (as can be seen from the table and chart below, the Romania's unemployment rate in Q3/2011 stood at 7.2%). Because old occupations can not be reborn, the solution is looking for new jobs according to the skills that people have.

Table no.1-The evolution of the ILO unemployment rate in Romania in the period 2009-2011 (%)

Q	T	M	F	U	R
Q3/2011 ¹	7,2	7,8	6,6	8,9	5,1
Q2/2011 ²	7,2	7,5	6,8	8,5	5,5

Fig. no. 3-Evolution of the ILO unemployment rate in Romania during 2009-2011

* According to the International Labour Office criteria

Education in general and especially the economic education are considered essential variables in the context of the development and progress of the knowledge based society and economy.

In most developed countries of the world investments in human capital in general, and investments education in particular are considered keys of the economic and social life-long development.

The analysis of the education raised the attention of economists since the beginning of the modern economic science, revealing the beneficial effects generated both on the individuals and on the society.

Fig. no. 4 - Public expenditure on education as % of GDP in Romania

Source: National Institute of Statistics

*The data for 2008 and 2009 are partially completed

The share of the public expenditures for education in GDP highlights the proportion of the annual national financial achieved allocated from the Government to the development of the education.

The share of the public expenditures for education in GDP is determined by dividing the total amount of public expenditure for education to the gross domestic product from a particular financial year and multiplied by 100.

From the above chart, we see that in Romania, public spending on education as a percentage of GDP recorded during the analyzed period, values between 3 and 4.5%.

4. Conclusion

In the new economy a certain category of specialists, called knowledge workers is emerging. A knowledge worker works with its head instead its hands and produces ideas, knowledge and information. They constantly renew their knowledge through continuous learning

In the new economy classical occupations coexist with the new occupations, specific to the knowledge-based economy

In 2007, within the EU-27, 65.1 million people held positions in science and technological domains, representing approximately 29.8% of the total employed population within the EU-27

In the current economic crisis, the main problem facing the economy is unemployment. Because old occupations can not be reborn, the solution is looking for new jobs according to the skills that people have and their education in this direction.

In the context of the knowledge-based economy, continuous access to education is considered extremely important. The role that education plays is ensuring what today is one of the most important elements for obtaining the performance in a economy –the competitiveness of an economy.

Information and Communication Technologies- Vector of Development of the Knowledge Based Economy

Cușu Dorinela
„Ovidius” University of Constanta
cusudorinela@yahoo.com
Chiriac Marius
Teliceanu Viorel

Abstract

The new economy is often assigned as the information economy due to the importance of the information as a resource in creating wealth. Thus, when speaking of the new economy, we refer to a world where people work with their brains instead of hands. Information and communication technologies bring together all the tools necessary for managing the information

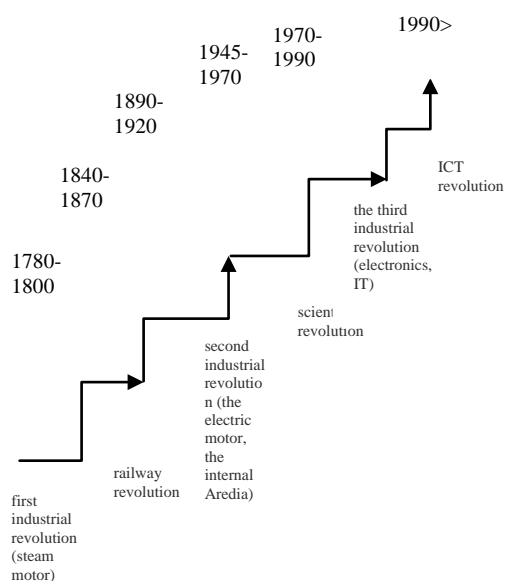

Key words: knowledge based economy, ICT revolution, ICT sector.

J.E.L. classification: D 83

1. Introduction

Today's ICT revolution shows both commonalities and differences with previous technological revolutions.

Fig. no.1- The succession of industrial revolutions

Source: Minodora Ursacescu, Information and Knowledge Economy, University Publishing House, Bucharest, 2009, p 160

The today's ICT revolution and the previous revolutions are characterized by the fact that no matter when it comes to electricity, transport or technologies, the first beneficiaries of the advantages of these revolution were the industrialized countries.

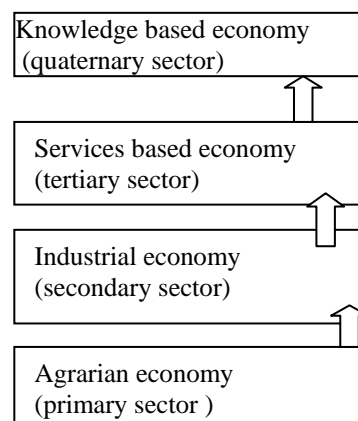

If we think at the differences between the previous industrial revolution and the current revolution, the first aspect to consider is the necessary time to generalize technological innovations.

If for the connection to the electricity it took 46 years (from 1873), the spread of television has lasted 26 years (since 1926), in exchange the development and dissemination of the modern technologies was done in short time: for example for the widespread use of personal computers were needed 16 years, 13 years for the expanding of the cellular phone, the extensively access to the Internet took seven years.

Secondly, while previous industrial revolutions covered a certain sector, ICT revolution presents the property of being transverse, and is quite extensive in all economic sectors.

The society as a whole is moving towards to a network society characterized by the significant weight of the quaternary sector (the knowledge sector).

Fig. no. 2-The transition from agrarian economy to knowledge economy

2. ICT impact on the new economy

ICT impact analysis on the new economy will be structured on three levels: economic, social and political. The ICT sector is the engine of **economic development** whose impact can be highlighted by the following elements:

➤ ICT sector generates due to the development of the Internet, new ways of production and forms of exchange;

➤ ICT sector presents a strong character of transversality. Unlike the previous industrial revolutions, the current technological revolution is quite extensive in all economic sectors.

Regarding the **social dimension**, ICT industries and services, bring new valences to the communication processes, within organizations and also between individuals due to the appearance of certain products (cultural products, media) with impact on the social aspects of life (eg. Education).

Because organizations, governments, and consumers are dependent of the use of TIC services and products, worldwide raise a number of security issues and reliability of the transactions made through them. In this context, the **political component** plays a crucial role to reform the legal framework regarding the use of TIC services and products.

Beyond the positive impact of ICT sector on the current economy cannot be ignorant that, its development is not equally worldwide disseminated. Even if the beginning of this century revealed a significant number of countries that have made progresses in all ICT areas, there are numerous disproportion between different geographical areas of the world.

In the context of the economic deterioration that began in 2008, essential in ensuring the balance of this sector are the investments in research, innovation and training of the human resources.

3. Analysis of ICT sector

Information and communication technologies (ICT) have developed and spread rapidly, especially in the last 20 years. Assumptions of this evolution have been the progresses in electronics, information and communications.

The development of the knowledge and information based society is the result of the considerable progress in the last three decades registered in information and communication technologies.

The ICT industries and services were accelerated after 1995 when a new wave of technologies based on the World Wide Web applications have expanded to the entire economy.

Expanding computer networks, the Internet boom after the 90, the miniaturization of electronic components, are just some of the most significant stages of the rapid advances in the technological transformation.

Opportunities offered by new information and communication technologies influence the new economy infrastructure, organizational processes, the competitive market behavior, revealing the potential of the ICT sector to accelerate global growth and performance of the organizations.

According to a general approach, ICT groups a set of activities aimed to produce goods and services through which is ensured the collection, processing, transmitting, receiving information through electronic means.

Continuing I will present statistics on computer, Internet, e-commerce by population in the EU and Romania.

Table no. 1- Level of competence in using the computer in Romania (% , 16-74 years)

	Level of competence in computing ¹⁾					
	2007			2009		
	low	medium	high	low	medium	high
Total	14	10	5	17	10	9

F	14	10	4	16	11	8
Age groups						
16-24	25	23	12	25	22	21
25-34	19	13	7	23	13	14
35-44	15	11	4	19	10	8
45-54	11	7	3	14	7	6
55-64	6	2	1	8	4	2
65-74	1	–	* ²⁾	2	1	–

Source: National Institute of Statistics

*1) the difference to 100% is the share of persons of 16-74 years who are engaged in activities other than the activities analyzed

*2) insignificant estimates

Fig. no. 3- Share of persons with computing skills in Romania (% , 16-74 years segment)

Source: <http://data.worldbank.org/>

The percentage of persons of 16-74 years, with computer skills (low, medium or high), as a total of 16-74 years persons using computer, assesses skills in using computer.

The level of competence in computing is obtained by reporting the number of people between 16-73 years with low / medium / high skills in computing to the total number of persons of 16-74 years using computers.

Low computer skills have people who have held one or two computer-related activities. Medium computer skills have persons who have held three or four computer-related activities. High computer skills have persons who have held five or six computer-related activities. The activities considered are:

- 1) Copying or moving files or directories;
- 2) Copying / moving text or objects in a file;
- 3) Using basic arithmetic operation formulas in a spreadsheet;
- 4) Compression / archiving files;
- 5) Connection and installation of new equipment;
- 6) Writing computer programs using special programming languages

The fig. no. 3 shows that in Romania, in 2009, 17% of the population aged 16-74 years has low skills in computing, 10% of the analyzed segment has medium skills in computer handling, and 9% of the same segment has high competence in computing. High level skills in computer handling were recorded within the population aged 16-24 years.

Fig. no. 4-No. Internet users in Romania between 2007-2010

Source: <http://data.worldbank.org/>

From the above table we can see that in the recent years (2007-2010), more and more Romanians started to use the internet, so that in 2010, we can say that about 40% of the population is using the Internet.

Table no.3 - Level of competence in using the internet in Romania (% , 16-74 years)

	Level of competence in using Internetului1)					
	2007			2010		
	low	medium	high	low	medium	high
Total	16	10	2	25	16	1
Sex						
M	17	11	3	27	18	1
F	16	9	2	25	16	1
Age groups						
16-24	27	25	7	36	33	2
25-34	23	13	3	33	26	1
35-44	19	9	2	31	14	-
45-54	15	4	1	24	10	-
55-64	6	2	-	13	4	1
65-74	1	-	*2)	4	1	*

*1) the difference to 100% is the share of persons of 16-74 years who conducted activities other than analyzed activities

*2) insignificant estimates

The percentage of persons of 16-74 years, with skill levels (low, medium or high) in Internet usage, in total people of 16-74 years is an indicator that assesses skills in Internet use. The indicator is calculated by reporting the number of people of 16-74 years with low

/ medium / high skills in the use of the Internet, to all persons of 16-74 years.

Low skills have persons who have held one or two Internet-related activities. Medium skills have persons who have held three or four Internet-related activities. High level skills have persons who have held five or six Internet related activities. The activities considered are:

- 1) the use of a search method to find information;
- 2) sending e-mails with the attachment of files;
- 3) posting messages on chat, group discussions;
- 4) the use of the Internet for phone calls;
- 5) the use of the share files in order to share movies, music etc.
- 6) creation of web pages.

Fig. no.5 - Level of competence in internet activities, Romania (% , 16-74 years segment)

From the above figure we can observe that most Internet users have low and medium skills in using the Internet.

Fig. no. 6-Individuals who use the Internet to buy or order products with online content (% of people aged 16-74) in the EU

Source: Eurostat

The chart above shows that e-commerce has recorded an ascendent evolution during the analyzed period (2008-2010). Leading countries in the year 2010 in which individuals purchase or buy products with on-line content are Denmark, Netherlands, United Kingdom, Luxembourg, France. Romania belongs to the category of countries where e-commerce recorded low percentages (2% in the year 2010).

4. Conclusion

The development of the knowledge and information based society is the result of the considerable progress in the last three decades registered in information and communication technologies. The society as a whole is moving towards to a network society . According to a general approach, ICT groups a set of activities aimed to produce goods and services through which is ensured the collection, processing, transmitting, receiving information through electronic means. In the context of the economic deterioration that began in 2008, essential in ensuring the balance of this sector are the investments in research, innovation and training of the human resources. Information and communication technologies (ICT) have developed and spread rapidly, especially in the last 20 years

Theoretical Framework for Corporate Governance

Georgescu Cristina Elena
„Ovidius” University of Constanta
cristina.georgescu95@gmail.com

Abstract

History has revealed that there is a never-ending evolution of theories or models of corporate governance. Companies are trying to instill the sense of governance into their corporate structure. This article is a review of literature on the range of theories in corporate governance. The fundamental theories in corporate governance began with the agency theory, expanded into stewardship theory and stakeholder theory and evolved to transaction cost theory. However, these theories address the cause and effect of variables, such as the configuration of board members, audit committee, independent directors and the role of top management and their social relationships rather than its regulatory frameworks. Hence, it is suggested that a combination of various theories is best to describe an effective and good governance practice rather than theorizing corporate governance based on a single theory.

Keywords: Agency theory, stewardship theory, stakeholder theory, transaction cost theory.

JEL Classification: D21, G34

1. Introduction

Corporations have become a powerful and dominant institution. They have reached to every corner of the globe in various sizes, capabilities and influences. Their governance has influenced economies and various aspects of social landscape.

In order to understand corporate governance, it is important to highlight its definition. Even though, there is no single accepted definition of corporate governance but it can be defined as a set of processes and structures for controlling and directing an

organization. It constitutes a set of rules, which governs the relationships between management, shareholders and stakeholders.

This article reviews various fundamental theories underlining corporate governance. These theories range from the agency theory and expanded into stewardship theory, stakeholder theory and transaction cost theory.

2. Definitions of Corporate Governance

The term “corporate governance” has a clear origin from a Greek word, “kyberman” meaning to steer, guide or govern. From a Greek word, it moved over to Latin, where it was known as “gubernare” and the French version of “governer”. It could also mean the process of decision-making and the process by which decisions may be implemented.

It is difficult to define the concept of corporate governance in a universally acceptable way because definitions vary from country to country. Moreover, countries differ from each other in terms of culture, legal systems and historical developments. This explains why there is a wide range of definitions of the concept of corporate governance.

Shleifer and Vishny (1997) define corporate governance in terms of the ways in which suppliers of finance to a firm assure themselves of a good return to their investment. This definition is shallow in that it emphasises the suppliers of finance and it does not recognize the relationships between a firm’s stakeholders and managers. Each firm has numerous stakeholders whose different interests must be taken care of. This is why corporate governance has also been referred to as a collective group of people united as one body with the power and authority to direct, control and rule an organization.

Corporate governance is, according to the Organization for Economic Cooperation and Development tenets:

- A set of relations between the company management, the managing board, its shareholders and other interest groups within the company;
- The structure by which company objectives are set as well as the means for achieving these objectives and monitoring performances;
- The stimuli system granted to the management board and administration in order to increase the objectives that are in the company's and shareholders' best interest and to facilitate monitoring, thus encouraging companies to use their resources more efficiently.

This definition is the most consistent definition, because it specifically integrates a company's relations to its internal environment, i.e. the shareholders and employees, as well as the outer environment, such as suppliers, creditors and, last but not least, the interaction between the two environments and management frames: management board, company management.

3. The Main Theories Underlying the Concept of Corporate Governance

3.1. Agency Theory

The agency theory having its roots in economic theory was expounded by Alchian and Demsetz (1972) and further developed by Jensen and Meckling (1976). Agency theory is defined as “*the relationship between the principals, such as shareholders and agents such as the company executives and managers*”. In this theory, shareholders who are the owners or principals of the company, hires the agents to perform work. Principals delegate the running of business to the directors or managers, who are the shareholder's agents (Clarke, 2004).

According to Eisenhardt (1989), the agency theory is concerned with analyzing and resolving problems that occur in the relationship between principals (owners or shareholders) and their agents or top management. The theory rests on the assumption that the role of organizations is to maximize the wealth of their owners or shareholders (Blair, 1995).

The agency theory holds that most businesses operate under conditions of incomplete information and uncertainty. Such conditions expose businesses to two agency problems namely adverse selection and moral hazard. Adverse selection occurs when a principal cannot ascertain whether an agent accurately represents his or her ability to do the work for which he or she is paid to do. On the other hand, moral hazard is a condition under which a principal cannot be sure if an agent has put forth maximal effort (Eisenhardt, 1989).

These agency problems arise because of the impossibility of perfectly contracting for every possible action of an agent whose decisions affect both his own welfare and the welfare of the principal, Brennan (1995b). Arising from this problem is how to induce the agent to act in the best interests of the principal.

Managers bear the entire cost of failing to pursue their own goals, but capture only a fraction of the benefits. Jensen and Meckling (1976) argue that this inefficiency is reduced as managerial incentives to take value maximising decisions are increased. As with any other costs, agency problems will be captured by financial markets and reflected in a company's share price.

Within the agency framework *agency conflicts* arise from divergences of interest between any two parties to a contract within an organisation. As a result, they are almost limitless in nature. Differing researchers have argued over the severity of each of the different types of conflicts described above. Research by Jensen (1986) and Himmelberg, Canella, and Paetzold (1999) amongst others stress the importance of a firm's contracting environment, as vitally important in determining the importance of such problems. For example, while perquisite consumption may be a major problem in larger companies, this may not be the case in smaller firms, where assets can be more easily monitored.

Daily, Dalton and Canella (2003) argued that two factors can influence the prominence of agency theory:

- *the theory is conceptually and simple theory that reduces the corporation to two participants of managers and shareholders.* Shareholders expect the agents to act and make decisions in the principal's interest. On

the contrary, the agent may not necessarily make decisions in the best interests of the principals (Padilla, 2000). Such a problem was first highlighted by Adam Smith in the 18th century and subsequently explored by Ross (1973) and the first detailed description of agency theory was presented by Jensen and Meckling (1976).

- *agency theory suggests that employees or managers in organizations can be self-interested.* The agent may be succumbed to self-interest, opportunistic behavior and falling short of congruence between the aspirations of the principal and the agent's pursuits. Even the understanding of risk defers in its approach.

Therefore, agency theory was introduced basically as a separation of ownership and control. Holmstrom and Milgrom (1994) argued that instead of providing fluctuating incentive payments, the agents will only focus on projects that have a high return and have a fixed wage without any incentive component. Although this will provide a fair assessment, but it does not eradicate or even minimize corporate misconduct. Here, the positivist approach is used where the agents are controlled by principal-made rules, with the aim of maximizing shareholders value. Hence, a more individualistic view is applied in this theory (Clarke, 2004). Indeed, agency theory can be employed to explore the relationship between the ownership and management structure. However, where there is a separation, the agency model can be applied to align the goals of the management with that of the owners.

In summary, the idea of agency theory can be attributed to Coase (1937) but the ideals of the theory have only been applied to directors and boards since the 1980's. According to this theory, people are self-interested rather than altruistic and cannot be trusted to act in the best interests of others. On the contrary, people seek to maximize their own utility. The agency theory presents the relationship between directors and shareholders as a contract. This implies that the actions of directors, acting as agents of shareholders, must be checked to ensure that they are in the best interests of the shareholders.

3.2. Stewardship Theory

The stewardship theory has its roots from psychology and sociology and is defined by

Davis, Schoorman and Donaldson (1997) as *“a steward protects and maximises shareholders wealth through firm performance, because by so doing, the steward's utility functions are maximised”*. In this perspective, stewards are company executives and managers working for the shareholders, protects and make profits for the shareholders.

The stewardship theory, adopts a different approach from the agency theory. Stewardship theory stresses not on the perspective of individualism (Donaldson & Davis, 1991), but rather on the role of top management being as stewards, integrating their goals as part of the organization. The theory starts from the premise that organizations serve a broader social purpose than just maximizing the wealth of shareholders.

Agyris (1973) argues agency theory looks at an employee or people as an economic being, which suppresses an individual's own aspirations. However, stewardship theory recognizes the importance of structures that empower the steward and offers maximum autonomy built on trust (Donaldson and Davis, 1991). It stresses on the position of employees or executives to act more autonomously so that the shareholders' returns are maximized. Indeed, this can minimize the costs aimed at monitoring and controlling behaviours (Davis et al., 1997).

On the other end, Daily, Dalton and Canella (2003) argued that in order to protect their reputations as decision makers in organizations, executives and directors are inclined to operate the firm to maximize financial performance as well as shareholders' profits. In this sense, it is believed that the firm's performance can directly impact perceptions of their individual performance. Indeed, Fama (1980) contend that executives and directors are also managing their careers in order to be seen as effective stewards of their organization, whilst, Shleifer and Vishny (1997) insists that managers return finance to investors to establish a good reputation so that that can re-enter the market for future finance.

In summary, stewardship theory suggests unifying the role of the CEO and the chairman so as to reduce agency costs and to have greater role as stewards in the organization. It was evident that there would

be better safeguarding of the interest of the shareholders. It was empirically found that the returns have improved by having both these theories combined rather than separated (Donaldson & Davis, 1991).

3.3. Stakeholder Theory

Stakeholder theory was embedded in the management discipline in 1970 and gradually developed by Freeman (1984) incorporating corporate accountability to a broad range of stakeholders. Wheeler, Colbert and Freeman (2002) argued that stakeholder theory derived from a combination of the sociological and organizational disciplines. Indeed, stakeholder theory is less of a formal unified theory and more of a broad research tradition, incorporating philosophy, ethics, political theory, economics, law and organizational science. This theory holds that corporations are social entities that affect the welfare of many stakeholders.

Stakeholder theory can be defined as “*any group or individual who can affect or is affected by the achievement of the organization’s objectives*”. Unlike agency theory in which the managers are working and serving for the stakeholders, stakeholder theorists suggest that managers in organizations have a network of relationships to serve – this include the suppliers, employees and business partners. And it was argued that this group of network is important other than owner-manager-employee relationship as in agency theory (Freeman, 1999). On the other end, Sundaram and Inkpen (2004) contend that stakeholder theory attempts to address the group of stakeholder deserving and requiring management’s attention. Whilst, Donaldson and Preston (1995) claimed that all groups participate in a business to obtain benefits. Nevertheless, Clarkson (1995) suggested that the firm is a system, where there are stakeholders and the purpose of the organization is to create wealth for its stakeholders.

Freeman (1984) contends that the network of relationships with many groups can affect decision making processes as stakeholder theory is concerned with the nature of these relationships in terms of both processes and outcomes for the firm and its stakeholders. Freeman's theory as presented can be criticized in four ways: inadequate

explanation of process, incomplete linkage of internal and external variables, insufficient attention to the system within which business operates and the levels of analysis within the system, and inadequate environmental assessment.

Therefore, more work has begun to try to attach theory to the stakeholder framework (Donaldson & Preston, 1995; Mitchell et al., 1995). Donaldson and Preston (1995) suggest that stakeholder theory is normative. Also, they argued that this theory focuses on managerial decision making and interests of all stakeholders have intrinsic value, and no sets of interests is assumed to dominate the others.

Thus, stakeholder theory has provided scholars with a clearer tool for knowing, and thus fulfilled one requirement of theory. It has brought greater credibility and acceptance to the tenet of corporate social performance that business is embedded in a system of social relationships that it affects and it is affected by.

In summary, the stakeholder theory suggests that a firm’s board of directors and its CEO, acting as stewards, are more motivated to act in the best interests of the firm rather than for their own selfish interests. This is because, over time, senior executives tend to view a firm as an extension of themselves (Clarke, 2004). Therefore, the stakeholder theory argues that, compared to shareholders, a firm’s top management cares more about the firm’s long term success (Mallin, 2004). Successful organizations are judged by their ability to add value for all their stakeholders. Some scholars consider the natural environment to be a key stakeholder (Dunphy et al., 2003).

3.4. Transaction Cost Theory

Transaction cost theory was an interdisciplinary alliance of law, economics and organizations. This theory attempts to view the firm as an organization comprising people with different views and objectives.

Transaction cost theory is part of the New Institutional Economics research tradition. This theory has become an increasingly important anchor for the analysis of a wide range of strategic and organizational issues of considerable importance to firms (Williamson, 1996). In particular, the transaction cost theory has been employed in

studying firms' boundaries, vertical integration decisions, the rationale for conducting an acquisition, the networks and other hybrid governance forms.

The unit of analysis in transaction cost theory is the transaction. Therefore, the combination of people with transaction suggests that transaction cost theory managers are opportunists and arrange firms' transactions to their interests (Williamson, 1996).

The main focus of transaction cost theory is the definition of the determinants of coordination of the transactions through markets or hierarchies. In this sense, the boundaries of the firm should be a function of the governance structure (Williamson, 2005), especially when we consider that this governance structure would assure the optimal adaptability of the firm to changes in the conditions of supply and demand. One important aspect of transaction cost theory is that it focus not only on the two extremes of transaction governance (hierarchy vs. market), but also on other hybrid forms and long term contracts.

Transaction cost theory argues that there are costs to conduct transactions through the market; these transaction costs can be reduced through mechanisms other than markets (Coase, 1937; Williamson, 1975). Specifically there are costs to "drafting, negotiating, and safeguarding any exchange or transaction" that are "friction" impeding smooth transactions (Williamson, 1985). Transaction cost theory claims that these transaction costs driving economic organization are as important as production costs, or perhaps even more important.

Transaction costs are an important part of the total costs of a firm, because production costs are easier to assess than transaction costs, Transactions costs comprise the ex-ante costs of searching and information, drafting and negotiating na agreement, and costs of safeguarding the agreement. The ex-post costs entail the costs of evaluating the input, measuring the output, and monitoring and enforcement (Williamson, 1985).

4. Conclusion

This review has seen corporate governance from various theoretical perspectives. The emergence of agency

theory, stewardship theory, stakeholder theory and transaction cost theory addresses the cause and effect of variables, such as the configuration of board members, audit committee, independent directors and the role of top management. In addition, ethics in business have been closely associated with corporate governance. Hence, it can be argued that corporate governance is more of a social relationships rather than process orientated structure.

These theories focused on the view that the shareholders' aimed to get a return on their investments. In todays business environment, business process should also focus on other critical factors such as legislation, culture and institutional contexts.

Corporate governance is constantly changing and evolving and changes are driven by both internal and external environmental dynamics. The internal environment has a fixed mindset of shareholders' relationship with stakeholders and maximizing profits. Whilst, issues in the external environment such as the breakup of large conglomerates, mergers and acquisitions of corporation, business collaborations, easier financial funding, human resource diversity, new business start-ups, globalization and business internationalization, and the advance of communication and information technology have directly and indirectly caused the changes in corporate governance.

An effective and good corporate governance cannot be explained by one theory but it is best to combine a variation of theories, addressing not only the social relationships but also emphasize on the rules and legislation and stricter enforcement surrounding good governance practice and going beyond the norms of a mechanical approach towards corporate governance.

Institutionalization of Consumer Protection by Government Involvement and Responsabilization of Business Organizations

Gheorghiu Gabriela

“Ovidius” University of Constanta, Faculty of Economic Sciences

gabrielag3110@yahoo.com

Abstract

The existence of “sovereign consumer”, appealed by the adherents of free market cult, is jeopardized, within the context of economic reality, by the manifestation of some market failures. Consequently, the purpose of this paper is the argumentation of the importance of direct consumer protection as an instrument for assuring his sovereignty within market economy.

Key words: consumer protection, institutions, legislation, government, business organizations

J.E.L. classification: D18, K29, M14

1. Introduction

The internal logic of functioning of market economy, approached from the perspective of the interests and motivations of the consumers in economic activity – producers and consumers, points out the fact that they are in an out of balance proportion, objectively, at the expense of the latter, even if the consumers, with their needs and necessities, should represent the origin and at the same the final point of the production activity. The existence of the “sovereign consumer”, invoked by the supporters of free market, is jeopardized within the context of economic reality, by the failure of the action of spontaneous self-adjustment of the market, which, despite the fact that in many situations it is possible and desirable, in many others it demands the deliberate intervention of public power towards the diminution of this relation which is unfavorable to the consumers up to an acceptable sustainability level.

All the aspects point out the imperative of organizing consumer protection nationally under the form of a complex process, in which both public power – namely the

government, and the market forces, by means of business organizations, and also of the consumers themselves should be involved.

2. Government involvement in consumer protection process

Although often criticized from the point of view of its inefficiency, *government involvement in consumer protection process* represents an irrefutable reality of contemporary economic life and it is done in two ways.

Firstly, one of the assignments presently recognized to public power of each country characterized by a market economy is represented by *the enactment of a legislation that corresponds to the necessities generated by the assurance of an adequate consumer protection*. This assignment is exercised by elaborating and enacting laws which point the regulation of the various aspects and types of relations that may arise within the sale-purchase transactions.

Secondly, the involvement of public power in the consumer protection process is concretized in *the creation of institutions and organizations in charge either with the supervision of the compliance with the legislative framework in the field, or with the granting of specialty assistance to consumer organizations or even directly to the consumer*.

Among the main types of institutions and organizations created and organized by the government on purpose to protect the consumers are the following: consumer protection authorities or services (for example, National Authority for Consumer Protection in Romania or Service for Protection of Consumer Rights in Belgium); councils and offices which supervise trader correctitude within the market (for example, Competition Council in Romania or Federal Office for Competition in the United States

of America); central or regional analysis laboratories (for example, Laboratory for the Analysis of Wine and Spirits Quality in Romania) etc.

A series of ministries, departments, agencies or other governmental bodies are also integrated in consumer protection process with special assignments, acting in the branches or fields in which, in addition to the basic objectives specific to the branch in which they operate, they also encompass tasks connected to consumer protection (for example, General Direction for Competition, Consumption and Frauds punishments within the French Ministry of Economy, Finance and Industry).

Moreover, during the last decades a new type of institutions appeared, institutions that are organized under the form of national centers or institutes of scientific research and created on purpose to grant large specialty assistance (juridical, technical etc.) to all the categories of consumers (for example, National Center for Commodity Testing and Expertise – LAREX in Romania).

The main mission of the mentioned structures points the improvement of consumer life quality by developing informative, protective or even coercive actions. Their customers consist of traders or even other public agencies that require professional training and counseling, in addition to the consumers who require information and assistance.

Same as any other intervention from the public power within the market, the one meant to protect the consumer knows a specific optimal level, beyond which the net marginal benefit of governmental intervention becomes negative. Theoretically, the level considered to be optimum from the social point of view of such an intervention is registered only when the marginal social benefit of the last provided protection unit equals the marginal social cost involved.

The determination in practice of the optimal level is, however, extremely difficult to carry out, and the extent to which it would actually assure an efficient consumer protection is questionable. Under these conditions, the involvement of public power in economy by specific means is entailed to be completed, on one hand, by taking on responsibility toward the observance of consumer rights within the market by

business organizations, and on the other hand, by the active participation of the consumers, starting from their awareness with regard to the rights which come to them within the market and until their exercise in practice on a continuous base.

3. Responsabilization of business organizations toward the consumers

Starting from the specific necessities shown in contemporary economic, social, political and not lastly cultural environment, the need for *the responsabilization of business organizations toward the consumers* is shown more and more intense.

From the ideological point of view, the debates on corporative “responsibility” or “morality” theme are remarkably fervent. Thus, with regard to moral responsibility of business organizations there are two opposed ideas which affirm: on one hand, that any business organization is responsible from the moral point of view for the undertaken actions, and, on the other hand, that generally they cannot be evaluated from the moral point of view, because they do not act on their own, but the individuals within them carry on different activities susceptible of being catalogued as moral or immoral. [1]

Without being able to be totally rejected, we consider that moral responsibility of business organizations is situated, in fact, at the border of the two ideas, because they are not moral entities of the same nature as individuals, but also cannot be disengaged from duties under moral aspect, within free market, as: the obligation not to do harm; the obligation to avoid doing harm; the obligation not to restrict the freedom of the economic activities that lie at the basis of the system; the obligation of correctness in transactions and the observance of the undertaken commitments.

From the practical point of view it is very important for any business organization – no matter whether it is a producer, a service provider or a distributor - to contribute constructively to the good development of market economy, implicitly by consolidating the relations with their clients, appreciating the profit as a reward for the activity provided to their use.

Consequently, in regard to the consumers, a series of responsibilities of different nature

come to business organizations [2,3], respectively: *economic responsibilities* – which assume to offer only the goods and services the consumers need; *legal responsibilities* – they point the supply of goods and services compliant with active legal norms; *ethical responsibilities* – they aim the adoption of a proper attitude toward the consumers, without disappointing their moral or ethical expectations; *discretionary or charitable responsibilities* – they involve voluntary participation in actions meant to promote the awareness by the consumers of the rights they have within the market.

In fact, the acceptance by business organizations of responsibilities meant to protect the consumers has in view the multiple benefits they involve.

Firstly, it is about the fact that social responsibility activities offer to business organizations the opportunity to differentiate from the competition and to obtain consumers loyalty to their brand-type, consolidating their long term profit. Thus, it is estimated that there are two factors which make social responsibility of business organizations a powerful weapon in the construction of a brand name, namely: on one hand, consumers became more and more informed, more capable to express their opinions and more preoccupied with the subjects concerning health, environment or different social problems, and on the other hand, the affirmation of a global market in which an increasingly fierce competition is shown among traders and which assures multiple possibilities of choice to the consumers, forces business organizations to find new and relevant methods to construct emotional bonds with their clients.

Secondly, the success of business organizations depends directly on the confidence and respect granted by the community in which they operate, by the authorities, mass-media or business partners with whom they come in contact and without whom they would be exposed to several risks, as: increased vulnerability in front of protest actions on the part of some consumer groups or organizations; endangerment of the relations with authorities or business partners, who will not want to jeopardize their public image by associating with a company whose practices are socially controversial.

In general, it is estimated that there are several categories of *enterprises by which business organizations can state their social responsibility* [4] and to which they can appeal separately or, the most common variant, they can approach them in a joint manner, depending on the final purpose intended by their promotion, namely: the consolidation of the position held by the company on the market, the acquirement of a better visibility among consumers or the increase of the preference for its offer.

Among these social enterprises, the most important for the consumers refers to the adoption by business organizations of some *socially responsible corporate practices*, by which they voluntarily improve their operation mode, so that to contribute to consumer welfare by: retiring the products that may be considered harmful to them, even if they are not illegal; modifying production technology in order to meet at halfway some specific needs of the consumers; providing the consumers with objective information about their offer; using auditing and external reporting activities, on purpose to release correct information to the consumers with regard to the registered performances etc.

In order insure a favorable environment for the development of the performances associated to corporate social responsibility, there is a large variety of *instruments* [5] in practice, among which those addressed with predilection to consumers are circumscribed in the promotion activities of a *socially responsible management and consumption*.

On one hand, *the activities of socially responsible management* assume the use of instruments by which performance standards and management aspects used by business organizations are established on purpose to incorporate the characteristic values of corporate social responsibility within the developed strategies and activities and to obtain an improvement of their corporate performances.

A prime example is represented by the codes of conduct [5], essentially perceived as an alternative to governmental regulations in the field of consumer protection, which they only complete, without replacing them. To these voluntary instruments of socially responsible management business organizations appeal from various reasons especially connected to a better satisfaction

of the consumers, respectively: in order to make known the ethical values and standards according to which they run their business; in order to inform the consumers with regard to the principles they observe in producing goods and services; in order to respond to public pressure or to prevent the critics that can be brought to them, especially if their sales depend fundamentally on the company identity or on public opinion. The fields of interests for the consumers in which most of the codes of conduct were adopted regard: distance and direct selling, product labeling, advertising and standardization.

The voluntary management standards represent another example, understanding by these internal instruments which business organizations use in order to integrate own values in current activities by means of a series of procedures, stages and specifications to which they appeal to put into operation a process or an activity. Among these, quality management standards and other general procedures associated to social corporate responsibility present a particular importance for consumer protection, because they place in the limelight a high level for satisfying them.

On the other hand, the activities designed to promote a *socially responsible consumption* involves the use of some market instruments addressed directly to consumers, which serve for certifying the fact that the production and trading of the pointed products comply with specific ethical, social or ecological criteria.

An example to this effect is represented by *social and ecologic labels*, which influence consumers' purchasing decisions, still without offering them information with regard to the internal characteristics of the product, as the case of organic or safety labels. These are applied especially on imported products, pointing the producers from the developing countries and resorting to the consumers from the developed countries, in order to offer them the guarantee of using some products which comply with specific internationally recognized standards.

All these instruments specific to corporate social implication have the role of consolidating the strategic approach of business organizations with reference to their economic performances, so that to transform

the implication in an active competitive advantage on purpose to gain consumers' loyalty and confidence in the offered products and services.

Although in international debate forums and in professional literature, social corporate responsibility is tightly connected to the globalization of business environment and considered as the appanage of multinational companies [6,7], the necessity involving in such initiatives small and medium companies was more and more asserted. Unlike large companies in the world, the small and medium ones confront with the problem of supplementary costs involved in such activities and their recovery, whose surmounting is very important, due to the practical and, also, theoretical confirmation enjoyed by corporate social responsibility in the profitable business practice, which supports the financial interests of the companies that promote it by assuring a high level of satisfaction of the consumers.

4. Conclusions

The institutionalization of consumer protection - both nationally, and internationally - as an instrument for assuring his sovereignty within the market economy, presents an extremely complex character, its efficiency in practice being determined by the quality of the partnership established between:

- *the market* – whose signals must be interpreted accordingly in order not to abridge the capacity of their forces to remunerate the producers who are receptive to consumers' needs and to penalize those guilty of adopting incorrect practices;

- *public power* – whose mechanisms especially put in the service of protecting the consumer must be carefully handled and developed so as to complement the specific market mechanisms, potentiating their practical efficiency;

- *the producer* – whose responsibility towards the compliance with consumer rights must be taken over on a continuous base, as a profitable business practice, which supports his financial interests by assuring a high level of satisfaction of the transaction partner;

- *the consumer* – whose capacity of individual self-protection (the consumer becoming aware of his rights within the

market) and associative (the consumer involving actively in the exercise of his rights) must be permanently improved.

Consumer Self-Protection

Gheorghiu Gabriela

“Ovidius” University of Constanta, Faculty of Economic Sciences

Abstract

Whether it is about an imbalance of economic, informational, judicial nature or at the level of the representation of interests, the cleavages which intervene within the market in the relations between producer/trader and consumer unequivocally call for the intervention in favor of the latter. Consequently, the purpose of this paper is the argumentation of the importance of indirect consumer protection as an instrument for assuring his sovereignty within market economy.

Key words: consumer protection, complaint, collective action, consumer organization

J.E.L. classification: D18, D72

1. Introduction

The internal logic of functioning of market economy, approached from the perspective of the interests and motivations of the consumers in economic activity – producers and consumers, points out the fact that they are in an out of balance proportion, objectively, at the expense of the latter, even if the consumers, with their needs and necessities, should represent the origin and at the same the final point of the production activity. The existence of the “sovereign consumer”, invoked by the supporters of free market, is jeopardized within the context of economic reality, by the failure of the action of spontaneous self-adjustment of the market, which, despite the fact that in many situations it is possible and desirable, in many others it demands the deliberate intervention of public power towards the diminution of this relation which is unfavorable to the consumers up to an acceptable sustainability level.

All the aspects point out the imperative of organizing consumer protection nationally under the form of a complex process, in

which both public power – namely the government, and the market forces, by means of business organizations, and also of the consumers themselves should be involved.

2. How consumer can protect himself

We appreciate that the most important role in consumer protection process comes to the consumer himself. Thus, when he is dissatisfied with regard to a provided service or product, the consumer has to make the decision of undertaking something to this effect or not. The simplest choice of the consumer consists in the decision of giving up purchasing the product or service which caused him the state of dissatisfaction or turning his attention to a different producer of goods or service provider, at the risk of being disappointed again.

This hypothesis of the *passive consumer* leads, on one hand, to the accumulation of dissatisfactions in time, through the repetition of such situations, fact which generates the distrust in the virtues of market economy and especially in its role of satisfying his own needs, and, on the other hand, it involves the proliferation of unfair commercial practices from the sellers and which affect other consumers if they are not punished, with negative implications on the overall efficiency of economy.

The consumer still has a different alternative at his disposal, respectively that of *being heard* [1]. In the new hypostasis of *active consumer*, he can make “his voice” heard either *horizontally* – addressing directly to potential consumers, respectively by disclosing to his relatives, friends, acquaintances the dissatisfaction he feels and the cause that generated it, warning them not to purchase that product or service or not to appeal to the supplier who disappointed them, or *vertically* – sense in which he can express individually or collectively, his “voice” taking different forms, as: complaint

formulation; participation in boycotting actions of some suppliers; participation as a member in various involved non-governmental organizations, institutions or organizations, locally or centrally, in the process of adopting the decisions that may affect their interests.

Taken individually, a large part of the consumers either do not have time to make their “voice” heard with regard to a specific problem that may appear and pertains to them, or are discouraged to become active by formulating complaints, for various reasons, as: the product or service being purchased at a low cost, in his mind there is a probability of some inconveniences in using it; the consumer estimates that the problem which arises is minor and, consequently, it is not worth the effort of a complaint; the calculations the consumer makes with reference to the cost of the complaint show that it is too high as compared with the perspective of the benefit that can be obtained, in order to, in some situations, the latter not even exist; many times the consumer is even discouraged by the traders to formulate complaints; the consumer anticipates that after the complaint he would obtain a dissatisfactory answer; not lastly, on the consumer’s part there may exist a profound feeling of lack of force, of power afore traders, generated by low incomes, elderly age or reduced level of training and education.

The consumers who manage to surpass these reasons, manifest actively on the market and formulate complaints individually, being animated by several reasons [2], respectively: the price of the product or service which generated them the state of dissatisfaction is higher or the retrieve of the fault would cost too much so that they opt for its retrieve from their own resources; the social and economic state allows them this step, because they have high incomes, of a superior level of training, knowledge in the field and even time to unfold such an action; the fact they can hereby show their information and knowledge degree of the rights which come to them, proving, at the same time, the power they have within the market.

In extreme cases, there is also the possibility of a more vehement manifestation on the consumer’s part, by taking an attitude

against specific trading practices he disapproves (such as, for example, the excessive bulge of the prices practiced to specific products or their reduced quality), by participating, together with other consumers, in the organization of boycotts, under the form of refraining from doing certain shopping within the market. Such initiatives can point only a specific category of products or exclusively a specific company, their purpose being to alert and determine the abandonment of that trading practice or its modification in favor of the consumers. As a matter of fact, until the appearance of the first consumerist group coherently organized, boycotts represented the most extreme form of manifestation of consumers’ dissatisfaction within the market.

However, the problem that comes up in this case is generated by the fact that boycotts imply the collective action of the consumers for defending specific common interests, situation in which they confront with the “free rider” dilemma, an aspect which was analyzed previously in the context of the discussion connected to public goods. In this situation, consumers can be very numerous, and the result of their collective action represents, in substance, a public instrument, which any consumer can enjoy, without being necessary for him to spend his resources and participate actively in this action. Being that these aspects menace the organizational capacity of consumer groups, boycott actions must exploit only certain weaknesses with which most of the consumers can identify themselves, appealing more and more nowadays to the power of mass communication means (prints, television) in order to exercise a high influence on the general public. [3]

A different form for defending consumers’ interests points their representation by the agency of a negotiator who acts on behalf of the group he represents. To this effect, the concerns of public authorities in the field of consumer protection were also accompanied by the establishment of a legal framework intended to facilitate the development of own organization systems of the consumers which regard *the collective action in favor of the protection of their rights*, as: besides specific social institutions, the organization of consultative councils or the national or international establishment of consumer

organization or association. [4] The efforts of these entities are directed toward the improvement of consumer position within the market, the removal of the opportunities for the promotion of unfair practices on traders' part and the retrieve of the prejudices caused by the proliferation of such practices, goals towards which their action may result in:

- *The constant effectuation and publishing of comparative tests* – whose result materializes in the compilation of a list of parameters and comparative characteristics of different products that currently exist on the market, by groups and areas of use, prices and facilities. Their goal is to offer the consumers objective information, which allows them a rational image and analysis on the products which exist within the market;

- *The organization of selective social investigations among the consumers, on specific fields or subjects, and the periodic publishing of the results obtained in this way* – it purposes to inform the consumers with reference to the way in which market relations between economic agents develop, drawing their attention on certain aspects related to different products and services, in order to improve the position they occupy in the negotiation process with regard to the quality of the necessary products and services and the advantages they are going to profit by;

- *The development of a mass-media campaign for the consumers* – it supposes either the creation and use of instruments specific to mass communication (for example specialized publications), or the recurrence to independent ones (prints, radio and television stations), on purpose to assure the best and the most useful information of the consumers, the refutation of unrighteous practices from the traders and the intimation of supervision courts within the market with regard to these;

- *The contribution to the improvement of legal framework in the field* – it aims to draw producers/traders' attention, and also of public power bodies in order to promulgate specific laws designed to consumer protection;

- *Direct involvement in the settlement of the conflicts that may arise in the relations between consumers and producers/traders* – it can be done either by mediating the negotiations and conciliating the involved

parties, or by arranging the conflicts and reaching an agreement for a specific problem, or by filing a proceeding.

Consumer organization in partnership on purpose to protect the specific interests may hence take several forms. Among these, the simplest one from the point of view of the organizational structure and the form of action is represented by the establishment of some *consultative councils*, which function in conjunction with social institutions, public organizations etc. Their activity is summarized only to counseling actions on different problems that intervene in the decisional process and concern the consumers, and also to polling consumers' opinion with regard to the measures and actions that have already been undertaken or are going to be undertaken by the society or business organizations on purpose to protect them.

Furthermore, the legal framework developed at the national level by each state in the field of consumer protection favored the appearance of a great diversity of *national independent organizations and associations* which intend to inform and defend his rights.

In order to contribute to consumer's information, the organizations and associations constituted in this way have documentation centers, analysis laboratories and own publications, being able to execute and broadcast information to the consumer with regard to studies, researches, analyses, tests and even audits effectuated on their own in relation to different products, the way in which the trading process develops, and also with reference to the observation of the legislation in the field. In the matter of consumer protection, these organizations and associations make a series of representations with the organizations of central power on purpose to improve the quality of production and trading activity of the products for the convenience of consumers. Furthermore, they take legal actions in favor of the consumers prejudiced by the producers or traders who contravene the legislation in the field.

Given the importance of the practices for consumer protection, which exceed the national borders in frequent cases, a series of *international or regional organizations for consumer protection* appeared at the international level. These act either

independently – as, for example, the *International Organization of Consumers' Union* or *Consumers International (CI)*, which presently counts over 220 members from 115 different countries, or with certain regional communities - for example, the case of *Bureau Europeen des Unions des Consommateurs (BEUC)*, which functions within the European Union and reunites 43 independent national organizations of the consumers from 31 European countries.

The purposes of such organizations regard mainly the cooperation among their members for the development of the best practices designed to the consumer protection beyond the national borders and their uniformization at the international level. Examples concerning the way of materializing such objectives developed by international organizations with regard to consumer protection are: the adoption, as early as 1973, by the Council of Europe of the “Consumer Protection Charter”, in 1985, by the United Nations Organization of the Resolution no. 39/248 concerning “Guidelines for consumer protection” or, in 2003, of „Guidelines for consumer protection from fraudulent and deceptive commercial practices across borders” adopted by the Organization for Economic Cooperation and Development.

3. Conclusions

The institutionalization of consumer protection - both nationally, and internationally - as an instrument for assuring his sovereignty within the market economy, presents an extremely complex character, its efficiency in practice being determined by the quality of the partnership established between:

- *the market* – whose signals must be interpreted accordingly in order not to abridge the capacity of their forces to remunerate the producers who are receptive to consumers' needs and to penalize those guilty of adopting incorrect practices;

- *public power* – whose mechanisms especially put in the service of protecting the consumer must be carefully handled and developed so as to complement the specific market mechanisms, potentiating their practical efficiency;

- *the producer* – whose responsibility towards the compliance with consumer rights must be taken over on a continuous base, as a profitable business practice, which supports his financial interests by assuring a high level of satisfaction of the transaction partner;

- *the consumer* – whose capacity of individual self-protection (the consumer becoming aware of his rights within the market) and associative (the consumer involving actively in the exercise of his rights) must be permanently improved.

Explaining the Regional Economic Growth in Romania. Does Foreign Capital Play a Role?

Abstract

The foreign investment acts as a supplement to domestic savings and provides access to newer and improved technology, thus increasing the growth prospects of the receiving economy. This study addresses the understudied issue of regional effects of FDI location in Romania. From the econometric perspective the novelty to earlier research consists in the use of a panel data model instead of the usual cross-sectional or time-series approaches. This technique allowed us to control for region-specific differences in the factors of influence included in the economic growth model.

Key words: foreign direct investment, panel data model, region, Romania.

JEL Classification: J21, J64

1. Introduction

The foreign direct investment (FDI) represents an important factor of growth, especially for the developing economies. In theory, the likely impact of FDI on economic growth occurs in two ways. Firstly, the capital accumulation through new FDI inflows increases the production capacity. Secondly, as a tool for international technology transfer, FDI conveys new technology and management expertise, thus contributing to higher productivity and competitiveness in the receiving region. The empirical evidence on the real FDI impact on output growth and technological progress is however mixed. For instance, de Mello (1999) found that FDI's ability to induce

output growth critically depends on its complementarity and substitution with domestic investment, at least in the short run. In addition, FDI appears to have highly beneficial effects on domestic investment. For instance Alguacil et al (2008) found, based on dynamic panel data models, the existence of a positive contribution of FDI to greater domestic investment and economic growth in the new member states.

The beneficial impact of FDI was especially important for the transition economies in Central and Eastern Europe, in need for additional capital investment, as well as access to foreign technology and management techniques in order to modernise and improve their economies and narrow the development gaps [4]. Foreign capital played a decisive role in the reshaping of the transition economies in Central and Eastern Europe [21]. Among the benefits from FDI there were also some indirect effects on local firms, such as increased local competition that force other firms to improve their economic performance. The countries in Central and Eastern Europe have been recipients of large foreign capital inflows, driven by the lower factor prices and skilled labour force that compensated for transportation costs and loss of accessibility [6].

After 1990, the barriers to foreign capital accession were lifted in Romania as well, creating the potential for rapid reforms to market structures and for the development of the economy. The physical capital stock of Romania was largely obsolete at the end of the communist regime and modernization was urgent. Since Romania opened up for foreign capital, the much needed foreign

influx of investment gradually increased, FDI showing substantial growth rates especially after the accession to EU, with a high of 9.3 bn euro in 2008. Unfortunately, the economic crisis reversed this trend, inducing a sharp decrease in the FDI inflows: 3.49 bn in 2009, 2.22 bn in 2010 and only 1.9 bn euro in 2011.

At regional level the FDI picture is marked by high interregional disparities, showing a major imbalance between Bucharest-Ilfov and the other regions, as well as an important gap between the East and West of Romania. Ranking the regions based on their ability to attract foreign investors, Danciu et al (2011) confirmed the strong domination of the Bucharest-Ilfov region, placed on the first position, followed at a long distance by the West and North East regions.

Considering the potential impact of foreign investments on the economic development of the regions and on narrowing the territorial disparities, it is important to assess the economic effects of the regional inflows of FDI, both in periods of economic growth and during recessions. In this context, our paper seeks to explore the impact of the FDI in Romania, focusing on the development regions. We use a panel data analysis in an attempt to harvest the advantages of both cross-sectional and time series data by bringing together the 8 development regions of Romania over 2001-2008. The time span under consideration is a period of constant and relatively rapid economic growth, allowing us to capture the characteristics of the economic boom.

2. The variables

Our main variable of interest is FDI, as a potentially significant factor of influence on the regional development. Many empirical studies gave preference to the FDI stock, rather than the FDI inflows, as a factor of influence in the economic growth model, as it seems to have a more stable relationship with the economic development [20].

The dependent variable GDP per capita captures the regional development level and can be used as a proxy for economic performance of the regions. We selected the candidate variables for explaining the economic performance of the regions based

on significant factors which had been identified in the literature ([3], [5], [7], [8], [11], [13], [14], [18], [22], [23]) and on available data. The independent variables in our growth model are the production factors strongly influencing the economic development of the regions, hence able to explain the regional and temporal variation of GDP/capita (see Table 1 for the detailed description of all variables).

A potentially major factor in the development of any region is the knowledge economy, captured in our model by two variables: government spending for research and development and business expenditures for research and development. We also included in the model the three variables expressing the technological specialization of a region via employed population structure, namely employment in industrial activities with high to medium-high technological intensity, low to medium low-tech intensity and employment in the knowledge-intensive services. Gross fixed capital formation by regions reflects domestic investment [16] that complements the foreign capital.

Table 1. The variables*

Variable	Description
FDI	Foreign direct investment stock in the region (Euro)
GDP	GDP per capita (Euro/ inhabitant) is gross domestic product (the sum of gross value added by all resident producers in the region plus any product taxes and minus any subsidies not included in the value of the products) divided by midyear population of the region
BERD	Total intramural R&D expenditure of Business enterprise sector by region, as percentage of GDP
GOVERD	Total intramural R&D expenditure of Government sector by region, as percentage of GDP
POHT	Employment in <i>high-technology</i> manufacturing industries: Manufacture of pharmaceuticals, medicinal chemicals and botanical products; Manufacture of office machinery and computers; Manufacture of radio, television and communication

<p>equipment; Manufacture of medical, precision and optical instruments; Manufacture of aircraft and spacecraft and employment in medium-high-technology manufacturing industries: Manufacture of chemicals and chemical product; Manufacture of machinery and equipment; Manufacture of electrical machinery and apparatus; Manufacture of motor vehicles, trailers and semi-trailers; Manufacture of other transport equipment, Building and repairing of ships and boats; Manufacture of aircraft and spacecraft.</p>
<p>POLT Employment in low-technology manufacturing industries: Manufacture of food products, beverages and tobacco; textiles and textile products; leather and leather products; wood and wood products; pulp, paper and paper products, publishing and printing and employment in medium low-technology manufacturing industries: Manufacture of coke, refined petroleum products and nuclear fuel; Manufacture of rubber and plastic products; basic metals and fabricated metal products; other non-metallic mineral products; Building and repairing of ships and boats.</p>
<p>POSI Employment in knowledge-intensive services at the regional level: Air and Water transport; Post and telecommunications; Financial intermediation; Real estate, renting and business activities; Education; Health and social work; Recreational, cultural and sporting activities.</p>
<p>CAPITAL Annual gross fixed capital formation (additions to the fixed assets of the region plus net changes in the level of inventories) in million euro</p>
<p>EMPL The employment rate at the regional level represents the employed persons as a percentage of the population of the region</p>

*The data source for the variables is Eurostat, except for FDI stocks that were provided by Romanian National Trade Register Office

3. Model specification

The literature on the FDI location uses either cross-sectional or time series data,

each option entailing both advantages and drawbacks ([3], [4], [10]). Time series data allow for changes in the long-run factors of influence to be taken into account, for instance the variations in government economic intervention and specific economic policies that affect GDP, while cross-sectional data capture the influence that individual characteristics of the regions may have on the output.

In this paper we are aiming at empirically analysing how significant is the economic impact that FDI is likely to have on the development of Romanian regions, while controlling both for regions' characteristics and for underlying time changes. Therefore we need to include both cross-sectional and time series data in the framework of a panel data model.

Based on the previous selection of variables (Table 1) the general model specification is:

$$\begin{aligned}
 GDP_{it} = & \beta_1 + \beta_2 FDI_{it} + \beta_3 Capital_{it} + \\
 & + \beta_4 POHT_{it} + \beta_5 POLT_{it} + \beta_6 POSI_{it} + \\
 & + \beta_7 GOVERD_{it} + \beta_8 BERD_{it} + \\
 & + \beta_9 EMPL_{it} + e_{it}, \quad (1)
 \end{aligned}$$

where: $i = 1, \dots, 8$ (regions) and
 $t = 2001, \dots, 2008$.

4. The results

The preliminary statistical analysis of model variables showed that in Romania the FDI inflows and stocks are highly correlated to GDP/capita, the R&D indicators (BERD, GOVERD), the employment in knowledge-intensive services, and the capital. Employment rate and the population engaged in industrial high-tech and medium-high activities and the number of employees in industrial activities of low and medium-low technology correlate weakly with the FDI variables. The data also point to the lack of complementarity between advanced and low technologies: the population engaged in industrial high-tech and medium-high activities does not correlate with the number of employees in industrial activities of low and medium-low technology, neither with the employment in knowledge-intensive services. So in Romania seems to prevail regional technological specialization rather than an equal coexistence of sectors with different

technological intensity.

The general model specified in (1) was estimated using EViews 7. The results are illustrated in Appendix 1, where only the significant coefficients were displayed.

Model 1 (pooled data) confirms that the FDI stocks is a significant factor of influence for the economic development of the Romanian regions, but its influence is lower compared to domestic capital, indicating that Romanian regions do not fully exploit the potential benefits from the foreign capital inflows.

The technological level of production also influences the economic performance of the regions: GDP/capita is higher in the regions where a larger part of the population is employed in high-technology and medium high-technology manufacturing industries, as well as in knowledge-intensive services, while. Moreover, the level of public R&D spending seems to have a positive influence on the GDP/capita created in the region. The employment rate, although significant, has an unexpected negative sign, suggesting low labour productivity.

The panel data model allows for a further in-depths exploration of the regional growth factors by using two additional specifications: the fixed-effects model and the random-effects model.

The *fixed-effects model* may reveal the causes of changes within an entity (e.g. region). Each region has its own individual characteristics that potentially affect the dependent variable: for instance the specific business environment and the economic policy of a particular region may influence the economic performance of that region. The fixed-effects model assumes that time-invariant characteristics are unique to each region. Since every region is different, the error term and the constant of a certain region (capturing its specific characteristics) should not be correlated with the others [2]. If the opposite holds true then the fixed-effects model is inappropriate [15] and the random-effects model should be used instead, allowing for properly reflecting that relationship.

The *random-effects model* assumes a random variation across regions; this variation is not correlated with the predictor or independent variables in the model [12, p. 183], therefore this model is appropriate

whenever differences among regions may affect the dependent variable. The random effects model allows for the use of time invariant variables.

The results from the fixed-effects model and the random-effects model are presented in Appendix 1. Although their results are generally in accordance to the initial model, with FDI as a significant but rather weak factor of influence compared to domestic capital, there are also some differences. Employment rate is insignificant both for the fixed and random effects models, while, as expected, employment in low-technology and medium low-technology manufacturing industries exerts a negative impact on the GDP/capita magnitude. The results for the R&D variables are mixed: public expenditures on R&D are significant (but negative) only for the random effects model, while private expenditures on R&D have a negative sign in the fixed effects model, but is positive in the random effects model.

The adjusted coefficient of determination (R^2) shows a very good fit for all three models, with 91-92 percent of GDP/capita explained by the variables in the models.

Finally we ran the Hausman test of significance to decide whether the fixed or random effects model is better. The results from Hausman test indicated that we should accept the fixed effects model as more appropriate. This is in support of regional heterogeneity, indicating that the specific characteristics of the Romanian regions determine their GDP/capita growth.

5. Conclusions

This paper explored the underlying factors that had driven the economic growth of the Romanian regions over 2001-2008, with a focus on the foreign capital, as a vehicle for modernisation, competitiveness and economic development. Our results on the regional determinants of GDP/capita are largely in accordance to the existing empirical literature. The FDI stocks were found to be positively related to GDP/capita, although their rather low influence on the economic performance of the regions suggest that their potential benefits are not entirely harvested. Other important factors of influence on regional growth are the domestic capital and the technological level of production.

Since the fixed effects model has proved to be the best specification for our data, we support the conclusion that the specific characteristics of the Romanian regions determine the GDP growth.

The time span under consideration allowed us to capture the characteristics of a relatively long period of constant economic growth, but the current global crisis brought about specific challenges that have to be addressed as well. Further in depths research is therefore needed to shed more light upon different channels through which FDI impacts the regional economies during and after an economic crisis.

Abstract

In the R&D policy making framework, synthetic innovation indicators were proved to be useful tools in identifying performance issues and general trends. This paper aims at providing empirical evidence on the recent trends in Romanian innovation capacity in an international context, based on the currently available composite innovation indices used in international statistics.

Key words: Knowledge Economy Index, Global Innovation Index, Romania.

JEL Classification: O31, O38

1. Introduction

Innovation is an intangible phenomenon that it is not directly observable and can only be measured by using a selection of proxy variables, such as R&D public and private expenditures, R&D personnel, patents, scientific publications, Internet access, university graduates, etc. [7].

As an effective method for meaningfully combining many individual innovation indicators, both quantitative and qualitative, into a synthetic number, composite indicators are often employed. Composite innovation indicators respond to the needed to summarise large amounts of underlying information and allow for comparing and ranking countries/regions. They are especially useful in the analysis of R&D variables, to measure the performance relative to other countries and to point to innovation areas of poor national performance.

This paper aims at providing empirical evidence on the recent trends in Romanian innovation capacity based on the currently available composite innovation indices used in international statistics.

2. The build-up of composite innovation indices

The construction of composite indicators follows several steps [9]: establishing a theoretical framework; selecting the appropriate variables; standardising the selected variables; weighting the variables/groups of variables; checking the robustness of the results.

The theoretical framework underpins the selection of the most relevant variables in order to correctly reflect the innovation behaviour. As the selected variables usually have different measurement units and variation ranges, in order to put them on a common ground, they need to be standardised or normalised before being aggregated into the composite index. This process avoids domination of extreme values and may correct for poor underlying data.

The normalisation procedure means positioning each original value in relation to the maximum and minimum levels of the corresponding variable. There are several variants of the standardization procedure, such as: ranks, standardization to maximum, the 0-1 range standardization method, the inter-deciles range standardization method, Z-score standardizing.

The weighting procedure is reflecting the relative importance of the variables / groups of variables for the innovation process. The literature indicates different weighting

methods [6]: the equal weighting, “benefit of the doubt” weighting, and principal component analysis weighting, each procedure having both advantages and disadvantages and leading to different results.

The resulting composite indicators inform about the position of a country/region and are also useful for setting benchmarks and designing the R&D and innovation policies.

3. The World Bank methodology for innovation international comparisons

The World Bank Institute has developed a Knowledge Assessment Methodology which benchmarks the knowledge economy performance of an economy or region relative to its neighbours, competitors, or countries. This tool helps to highlight countries progresses and to guide the development of explicit strategies to harness knowledge to improve growth, welfare and increase competitiveness. It wishes to emulate on important aspects related to the knowledge economy.

The World Bank methodology is based on the four pillars of the knowledge economy [2]: 1. Economic Incentive Regime is referring to the economic and institutional conditions that provide incentives for the efficient use of existing and new knowledge and the flourishing of entrepreneurship; 2. Education: an educated and skilled population can create, share, and use knowledge well; 3. Innovation: an efficient innovation system of firms, research units, universities, consultants and other organizations can tap into the growing stock of global knowledge, assimilate and adapt it to local needs, and create new technology; 4. Information Communications & Technology is important because a dynamic information infrastructure can facilitate the effective communication, dissemination, and processing of information.

The Knowledge Economy Index (KEI) represents a composite index which is a measurement of knowledge preparedness of a country and allows for benchmarking and comparison of regions and/or countries, based on the average of the performance scores of a country or region in 76 relevant variables. The set of variables serve as proxies for the conditions that are critical to the development of a knowledge economy

and is structured in 7 groups that compose the KEI: performance indicators, economic regime, governance, education and human resources, innovation system, information infrastructure, gender equality.

The Innovation Index is a part of KEI that consists of the following variables: FDI Outflows and Inflows as % of GDP, Royalty and License Fees Payments and Receipts Science and Engineering Enrolment Ratio, Researchers in R&D total and per Mil. People, Total Expenditure for R&D as % of GDP, Total Expenditure for R&D as % of GDP, University-Company Research Collaboration, S&E Journal Articles total and per mil. People, Availability of Venture Capital, Patents Granted by USPTO total and per Mil. People, High-Tech Exports as % of Manuf. Exports, Private Sector Spending on R&D, Private Sector Spending on R&D, Value Chain Presence, Capital goods gross imports and imports (% of GDP), S&E articles with foreign co-authorship (%), average number of citations per S&E article, Intellectual Property Protection.

The data are collected from World Bank datasets and international literature. Ranks are allocated to countries based on the absolute values (raw data) that describe each one of the variables. The rank equals 1 for a country that performs the best (it has the highest score) among the 121 countries in the sample for a particular variable. The rank equals to 2 for a country that performs second best, and so on. Countries with the same performance are allocated the same rank. The results are presented in the next section.

4. Romania’s innovation performance in an international context

Applying the methodology previously described the normalized scores for the Knowledge Economy Index (KEI) and for the Innovation Index were selected for a number of 20 countries, Romania included. The results are displayed in Tables 1 and 2. One can easily notice that Romania holds a backward position for KEI not only in comparison with all the EU old member countries but, to a great extent, compared to the new member countries as well.

Table 1. The Knowledge Economy Index in selected countries

Country	2010	2000	1995
Finland	9.33	9.22	9.33
Denmark	9.16	9.32	9.48
Norway	9.11	9.25	9.46
Germany	8.90	8.84	8.91
Australia	8.88	9.27	9.27
United States	8.77	9.28	9.53
Belgium	8.71	8.86	8.94
Iceland	8.62	8.68	8.18

Greece	7.51	7.60	7.85
Poland	7.41	7.23	6.85
Romania	6.82	5.66	5.91
Bulgaria	6.80	5.89	6.81
Russian Federation	5.78	5.28	5.67
World	5.12	5.95	n/a

Source: World Bank.

Despite improving its Innovation Index over 1995-2010, Romania is still situated slightly above a score of 6, which is the worst performance among the EU new member states. All other new member states are situated in the 7 – 8 interval, where countries like Spain and Greece are also placed, while most of the old member states have a score over 9. The results also confirm the leading position of Finland, Denmark, United States and Germany which are, according to various international statistics, among world’s leaders in terms of economic innovation and competitiveness.

Table 2. The Innovation Index in selected countries

Country	2010	2000	1995

5. The Eurostat methodology for innovation international comparisons

R&D and innovation are at the heart of the strategy launched by the European Council in Lisbon in 2000, with the objective of the EU becoming the most competitive and dynamic, knowledge-based economy in the world. EU’s competitiveness is strongly linked to its position in innovation, entrepreneurship and the diffusion of ICT.

A series of scoreboard indicators have been launched to provide policy makers with relevant information to measure the performance of each country as regards innovation, entrepreneurship, the use of technology and competitiveness.

The Global Innovation Index (GII) relies on two sub-indices, the Innovation Input Sub-Index and the Innovation Output Sub-Index, each built around pillars.

The GII has five enabler pillars: Institutions, Human capital and research, Infrastructure, Market sophistication, and Business sophistication. Enabler pillars define aspects of the environment conducive to innovation within an economy.

Two output pillars capture actual evidence of innovation outputs: Scientific outputs and Creative outputs. Each pillar is divided into sub-pillars and each sub-pillar is composed of individual indicators.

Sub-pillar scores are calculated as the weighted average of individual indicators;

pillar scores are calculated as the simple average of the sub-pillar scores. Four measures are then calculated: The Innovation Input Sub-Index is the simple average of the first five pillar scores; The Innovation Output Sub- Index is the simple average of the last two pillar scores; The overall GII is the simple average of the Input and Output Sub-Indices; The Innovation Efficiency Index is the ratio of the Output Sub-Index over the Input Sub-Index.

The data are collected from Eurostat datasets and international literature. The *Community Innovation Survey* provides information on innovation activity in the EU. A sample of 125 economies is retained in the final computation of the global GII and the sub-indices.

Table 3. The Global Innovation Index in selected countries, 2011

Rank	Country	Score
1	Switzerland	63.82
2	Sweden	62.12
3	Singapore	59.64
4	China	58.8
5	Finland	57.5
6	Denmark	56.96
7	United States of America	56.57
8	Canada	56.33
9	Netherlands	56.31
10	United Kingdom	55.96
11	Iceland	55.1
12	Germany	54.89
13	Ireland	54.1
20	Japan	50.32
21	Australia	49.85
22	France	49.25
23	Estonia	49.18
24	Belgium	49.05
25	Hungary	48.12
27	Czech Rep.	47.3
28	Cyprus	46.45
29	China	46.43
30	Slovenia	45.07
32	Spain	43.81
33	Portugal	42.4
35	Italy	40.69
36	Latvia	39.8
37	Slovakia	39.05
39	Moldova	38.66
40	Lithuania	38.49
42	Bulgaria	38.42
43	Poland	38.02
50	Romania	36.83

Source: Eurostat.

Romania scores low in the GII hierarchy, with a value of 36.83 in the Global Innovation Index, lagging behind all new members of the EU, and Moldova as well. The hierarchy for the year 2011 is dominated by Switzerland and Sweden, both having almost double scores compared to Romania. This position confirms the previously discussed poor performance of Romania in the Innovation Index calculated by the World Bank and suggest the need of a particular emphasis on the R&D and innovation policy in Romania.

6. Final remarks

Innovation is defined by a mixture of complex and mainly qualitative processes, difficult to capture by statistical measures.

Innovation can only be measured by using a selection of proxy variables that have to be combined into synthetic indicators in order to be useful to the decision makers. The resulting composite indicators inform about the position of a country/region and are useful for setting benchmarks and designing the R&D and innovation policies.

This paper presented and discussed Romanian position and progresses in innovation performance in a larger international context, based on two well-known innovation measures: the Knowledge Economy Index calculated by the World Bank and the Global Innovation Index calculated by Eurostat.

The results point out a pretty weak position of Romania, despite the progress recorded over the 1995-2010 period. The results also suggest the need of increased support for the R&D and innovation policy in Romania, in order to narrow the gaps.

Although the composite indicators are able to convey synthetic information about the position of a country/region, they should be accompanied by more in-depths analysis of individual indicators, as a basis for appropriate R&D and innovation policy decisions.

Abstract

Most of the times health expenditure is considered the main cause for health care systems' lack of performance. On the other side, the existing literature identifies numerous factors (others than expenditure) associated with health outcomes. Life expectancy at birth is one commonly used indicator to measure the population health status and the level of development.

This paper aims at exploring the relationship between health expenditure, socio-economic context and health outcomes, measured with life expectancy at birth and to identify the factors associated with it at the level of EU countries. We also aim at highlighting the similarities and the differences between the countries, with a special focus on Romania, from the point of view of the identified variables. The findings of the research confirm the existence of a strong relationship between the variables and also point out significant differences among EU countries.

Key words: quality of life, life expectancy, health expenditure, socioeconomic context.

JEL Classification: H51, I11, I14, I18

1. Introduction

Health is an essential element of human wellbeing. At society level, good health status is a component of a country's human capital, contributing to its competitiveness [1]. A society is considered superior to another one from the perspective of quality of life if its people live longer, healthier and have more fulfilled lives [2].

The present study approaches health as a dimension of quality of life [3]. In this approach health is the result of a complex combination of factors relevant at individual and macro level ([4] quoted in [3]). At individual level health status is influenced by numerous factors such as, genetic inheritance, social status, life style, behavior, attitudes and values related to health status [3]. At society level the factors influencing health status are those related to the socioeconomic context, governance, macroeconomic, social and health policies, but also the societal norms and cultural values [3].

This paper aims at exploring the relationship between health expenditure, socio-economic context and health outcomes, measured with Life expectancy at birth (years) and to identify the factors associated with it at the level of EU countries. We also aim at highlighting the similarities and the differences between the countries, with a special focus on Romania, from the point of view of the identified variables.

The study uses quantitative secondary data from international databases, registered for 2010 and for all 27 EU members. The statistical methods used are correlation analysis and principal components analysis (PCA).

The findings of the research confirm the existence of a strong relationship between Life expectancy at birth and several identified factors respectively, GDP per capita, Health expenditure per capita, Life long learning, Control of Corruption, and People at-risk-of-poverty or social exclusion. The results also point out significant differences among EU countries.

2. Literature review

Numerous theoretical and empirical studies take into consideration either individual factors or macro social one, or both in order to identify the determinants of health status in different context and different times.

Considering education as a determinant of health status, researches reach the conclusion that the more educated the individuals are, the better their health status [5].

Income and income inequalities are strong explanatory variables for health status. Wilkinson reaches the conclusion that the population health status is determined not only by economic welfare but also by income inequalities and social cohesion [6]. Other studies identify a strong correlation between income inequality and life expectancy [7] and infant mortality [8].

Considering the relationship between public health expenditure and the health outcomes Filmer and Pritchett conclude that an increase in GDP from 3% to 6% leads to a decrease in infant mortality with only 9-13% [9].

Also, a large body of empirical literature is focused on the influence of governance and institutional factors on health outcomes. For example, Kaufman et al. demonstrate that governance indicators (voice and accountability, political stability and absence of violence, government effectiveness, regulatory quality, rule of law, control of corruption) have a strong positive impact on infant mortality [10]. Rajkumar and Swaroop [11] conclude that the effectiveness of health public spending is strongly influenced by the quality of institutions and, much more, an increase in public spending leads to an improvement in health status only in countries with good governance; in countries with weak governance an increase in public health expenditure has no effect on population health status.

Life expectancy at birth is one commonly used indicator to measure the population health status and the level of development [12] because it has the advantage has the advantage of over passing the difficulties of defining health status among different individuals, communities, cultures and between different moments in time [13]. Over the time life expectancy has registered

an ascending trend but the evolution of this indicator also shows large discrepancies between countries ([14], [15]).

Statistics show a 9 years difference among EU countries in 2010, between Romania and Lithuania, the countries with the lowest life expectancy (73 years) and Italy and Spain, the countries with the highest life expectancy (82 years).

The variations in life expectancy are explained by variations of numerous factors, from political regime to socioeconomic status [16]. Lin et al. identify economic factors, literacy rate, undernourishment and political regime as main determinants of life expectancy [17]. Yavari and Mehrnoosh show that there is a positive strong correlation between life expectancy and per capita income, health expenditures, literacy rate and daily calorie intake and a negative strong correlation between life expectancy and number of people per doctor [18]. Crepaz and Crepaz (2004) demonstrate that the low levels of income inequality are connected with shorter life expectancy and, additionally, that the life expectancy is driven by factors like perceived political control, the generosity of the welfare state, life-styles, GDP per capita and the poverty rate [19].

3. Data and methodology

Variables

Using desk research we identified the factors associated in literature with Life expectancy at birth.

We use Life expectancy at birth as dependent variable (health outcome) and five independent variables describing the level of health expenditure (Health expenditure per capita) and the socioeconomic environment (GDP per capita, People at-risk-of-poverty or social exclusion as a share of total population, Control of Corruption and Life long learning, i.e. Percentage of the adult population aged 25 to 64 participating in education and training). Data were obtained from World Bank and Eurostat databases.

Data are recorded at country level for all 27 EU members, for 2010.

Table 1 presents the descriptive statistics for included variables.

Table 1. Descriptive statistics for included variables

	Mean	Min	Max	Std. dev.	Reference year	Source
Life expectancy at birth (years)	78	73	82	3	2010	1
GDP per capita	31320	6333	105195	20826	2010	1
Health expenditure per capita (current US\$)	2975	428	8181	2048	2010	1
People at-risk-of-poverty or social exclusion (% of total population)	23,9	14,4	41,6	7,7	2010	2
Control of Corruption	1,02	-0,18	2,37	0,81	2010	3
Life long learning	9,9	1,2	32,8	7,8	2010	2

Statistical analysis

Correlation analysis

We use correlation analysis in order to study the intensity of the relationships existing between variables and to identify those factors which have a strong influence on Life expectancy at birth. For the sample of 27 countries, we study the bivariate correlation between Life expectancy at birth, the dependent variable and each independent variable using the Pearson correlation coefficient.

The statistical significance of the Pearson correlation coefficient is tested using Student t - test. The statistical hypotheses are: the null hypothesis, the absence of correlation between the two analyzed variables ($H_0 : \rho = 0$), and the alternative hypothesis, the presence of significant correlation ($H_1 : \rho \neq 0$). If Sig probability associated to the calculated value of t statistic is higher than the conventional probability α , $Sig > \alpha$, the null hypothesis is validated. On the contrary, if $Sig < \alpha$, we reject the null hypothesis, with assumed α risk.

Principal components analysis

In order to identify and describe the relationships between variables and also similarities and differences between statistical units, from the perspective of the

analyzed variables, we use a multivariate statistical method, Principal Components Analysis (PCA) [20].

Before applying PCA, a preliminary analysis is performed, aiming at verifying the adequacy of data for a factorial analysis. The χ^2 test is used to test the null hypothesis that the variables in the correlation matrix of the population are uncorrelated, and the indicator MSA of KMO to evaluate in which degree each variable may be predicted by all the other variables.

If Sig value is smaller than 0.05, (conventional value associated to χ^2 test), the null hypothesis is rejected and it can be guaranteed with a risk of 5% that there are significant statistical relationships between the variables. The identification of the relationships is made with KMO statistics. If KMO is higher than 0.5, the PCA can be applied.

After processing the data in SPSS we obtain the Initial Eigen values corresponding to the 6 factorial axes (there are 6 variables included in the analysis), the variance explained by each factorial axis, and the graphical representations which allow us to identify and describe the relationships between variables and statistical units.

4. Results

Results of the correlation analysis

Table 2 presents, for each analyzed correlation the estimated value of Pearson correlation coefficient (r) and Sig probability associated to the computed value of Student statistic.

Table 2. The correlation coefficient between Life expectancy at birth (years) and other factors

Variable	r	Sig
GDP per capita	.631(**)	.000
Health expenditure per capita (current US\$)	.705(**)	.000
People at-risk-of-poverty or social exclusion (% of total population)	-.666(**)	.000
Control of Corruption	.605(**)	.001
Life long learning	.441(*)	.021

** Correlation is significant at the 0.01 level (2-tailed).

* Correlation is significant at the 0.05 level (2-tailed).

For a risk of 5%, we accept the existence of a significant relationship between Life

expectancy at birth and the following determinant factors: GDP per capita, Health expenditure per capita, Control of Corruption, Life long learning and People at-risk-of-poverty or social exclusion. The first four factors are positively correlated with Life expectancy at birth, while People at-risk-of-poverty or social exclusion is negatively correlated with Life expectancy at birth.

Results of principal components analysis

The results obtained with SPSS (Table 3) show a significant value associated to Barlett’s test of sphericity, with χ^2 statistic, Sig = 0.000 that is smaller than 0.05 (conventional value), which means the null hypothesis of variables’ uncorrelation is rejected, and the considered variables are adequate for a PCA. Thus, with a probability of 95%, we can say that there is a significant relationship between the statistical variables. The value of the indicator MSA of KMO (KMO=0.813), higher than 0.5, shows that the solution obtained with PCA can be accepted.

Table 3. Values of KMO test and χ^2 statistic

Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		.813
Bartlett's Test of Sphericity	Approx. Chi-Square	42.252
	df	15
	Sig.	.000

Source: Output obtained in SPSS with PCA

Factorial solution indicates variables’ grouping in two principal components which have an explicative power of 83.227% of the total variance (Table 3).

Table 3. Total Variance Explained

Component	Initial Eigenvalues		
	Total	% of Variance	Cumulative %
1	4.370	72.828	72.828
2	.624	10.400	83.227
3	.552	9.194	92.421
4	.270	4.494	96.915
5	.147	2.455	99.370
6	.038	.630	100.000

Variables coordinates on the first two factorial axes are presented in Table 3. They show variables positioning on the factorial axes. The variables GDP per capita, Health expenditure per capita (current US\$) and Life expectancy at birth (years) are located in the positive quadrants of both factorial axes. The variable People at-risk-of-poverty or social exclusion (% of total population) is located in the negative quadrant of the first factorial axis and the positive quadrant of the second while the variables Life long learning and Control of Corruption are located in the positive quadrant of the first factorial axis and the negative quadrant of the second.

Table 4. Variables’ coordinates on the first two factorial axes

	Component	
	1	2
GDP per capita	.888	.196
Health expenditure per capita (current US\$)	.933	.173
Life expectancy at birth (years)	.787	.422
People at-risk-of-poverty or social exclusion (% of total population)	-.806	.032
Life long learning	.776	-.575
Control of Corruption	.917	-.214

Source: Output obtained in SPSS with PCA

Displaying high values of the coordinates, all variables are strongly correlated with the first factorial axis showing that there are significant differences among the statistical units. Between the variables GDP per capita, Health expenditure per capita (current US\$), Life expectancy at birth (years), Life long learning and Control of Corruption there is a strong positive relationship while between them and the variable People at-risk-of-poverty or social exclusion (% of total population) there is a strong negative relationship.

Variables’ positioning in the plane of the first two factorial axes is presented in Figure 1.

Figure 1. Variables' positioning in the plane of the first two factorial axes

The graphical representation of the statistical units on the factorial map is presented in Figure 2.

Figure 2. Countries' position in the plane of the first two factorial axes

The first factorial axis in Figure 2 above points out the “opposition” between countries like Luxembourg, Netherlands, Denmark, Sweden, Finland on one side and Romania, Bulgaria, Hungary, Latvia and Lithuania, on the other. The most significant differences among the statistical units from the point of view of the analyzed variables are explained by this axis.

Overlapping of graphical representation of countries on the factorial map (Figure 2) and variables map obtained with PCA (Figure 1) allows us to identify several characteristics of life expectancy at birth and socio-economic factors for the EU members. Thus, countries such as Luxembourg, Netherlands, Denmark, Sweden, Finland display high values for Life

expectancy (years), GDP per capita, Health expenditure per capita (current US\$), Life long learning and Control of Corruption and low values for People at-risk-of-poverty or social exclusion (% of total population). On the contrary, countries like Bulgaria, Hungary, Latvia and Lithuania are characterized by low values for Life expectancy and all the variables positively related with it and high values for People at-risk-of-poverty or social exclusion, which is negatively correlated with Life expectancy.

5. Discussions and conclusions

The main aim of this paper was to explore the relationship between health expenditure, socio-economic context and health outcomes, measured with life expectancy at birth.

The results of the correlation analysis are consistent with the ones of previous research in this area namely that, there is a positive correlation between GDP per capita, Health expenditure per capita, Control of Corruption, Life long learning and Life expectancy at birth while poverty negatively impacts upon the latter variable.

The results of the performed PCA confirm the results of the correlation analysis.

Also, the performed PCA shows differences between the EU members from the perspective of life expectancy and its associated factors.

The most significant differences are between Luxembourg, Netherlands, Denmark, Sweden and Finland, on one side and Bulgaria, Hungary, Latvia and Lithuania, on the other. These countries register low values for the indicators positively correlated with life expectancy at birth and high values for poverty which is negatively correlated with quality.

We can state that Life expectancy at birth is higher in those countries characterized by high values for GDP per capita, Health expenditure per capita, Control of Corruption, Life long learning and low levels of poverty.

From Traditional to Behavioral Economics. A Doctrinaire Perspective

Ianole Rodica
Cornescu Viorel

University of Bucharest, Faculty of Business and Administration
ianole.rodica@gmail.com, cornescuviorel@yahoo.com

Abstract

The paper aims to contribute to the building of a more realistic understanding of the new born field of behavioral economics, based on a (fragmented) historical perspective of the psychological influences that can be traced in representative works from important economists.

Exploring the theory of moral sentiments of Adam Smith, the animal spirits of J.M.Keynes and other representative concepts from Thorstein Veblen, Tibor Scitovsky and Herbert Simon, we emphasize the existence of a solid background for current research on similar topics and a sense of coherence that makes a significant link between different periods of economic thought and the actual trends.

Key words: behavioral economics, economic thought, homo economicus, bounded rationality

J.E.L codes: B31, D03

1. Introduction

Labeling economic science as „behavioral” has attracted many critics starting from pure semantics. One of the arguments claimed redundancy on the reason that all economics is, or it should be, about behavior. The paradox appears when we look at the simple definition of the word „behavior” - the aggregate of responses to internal and external stimuli – and compare it with the standard picture of the economic agent. What is essentially missing is the concern for internal stimuli, thus for a normal psychological dimension. In exchange, he benefits from unbounded rationality, unbounded willpower and unbounded selfishness. All of these positivist traits, proven unrealistic in different experimental

and field settings, are generating a „non-behavioral” aura around economics, making a clear proof on why we need a behavioral approach.

However, our intent is not to abandon the traditional structure of economics, but to build upon it. In this sense, the main objective of the paper is to bring into light some behavioral ideas that are highly discussed nowadays but that actually have older roots that were ignored or overshadowed at the time of their appearance. Having this purpose in mind, each section will analyze a particular concept or a certain work pertaining to five economists: Adam Smith, J.M.Keynes, Thorstein Veblen, Tibor Scitovsky and Herbert Simon. Their choice was based on their relevance either as founders of schools of economic thought, either as pioneers in their specific research, due to their unconventionality and interdisciplinary orientation.

2. Adam Smith in the light of moral sentiments

After more than two centuries, Smith’s view on moral sentiments and the wealth of nations seems to be still quite contradictory. The German economists named it `the problem of Adam Smith`, expressing the dilemma concerning the drivers of human motivation: on the one hand self-interest [1] and on the other hand feelings, affects, passions and the impartial spectator who sets the standard for our moral judgment [2]. Nowadays, this dilemma was classified as a false one, generated by an insufficient understanding of the two works, usually focusing more on the Wealth of Nations (generally considered as a seminal work, „the Bible” of economics). Unfortunately, these distinctions were made clear only at a theoretical level and the general public

continues to associate Smith with the father of *Homo Economicus*, thus a fervent promoter of selfishness in order to achieve economic prosperity: *‘It is not from the benevolence of the butcher, the brewer, or the baker that we expect our dinner, but from their regard to their own interest’* [1].

Professor Ion Pohoată [3] underlines the injustice made to Smith when it is placed next to a very rigid rationalism. The idea of acting in its own interest follows a stoic spirit, as it is revealed in the Theory of Moral Sentiments, and recommends loving itself as a condition for self preservation. However, the economist completes this perspective by adding the fact that arrogant forms must be always reduced to humility, in accordance with the judgment of the impartial spectator [2]. In consequence, by accepting that people can pursue their interests and, in the same time, be capable of showing the main virtue of benevolence, the apparent contradiction is solved. This point of view is further applied to commerce and transactions in general, by setting a moral scheme under which they are carried on. In an ideal scenario, the spectrum of economic virtues, including justice, prudence, self-control, selfishness and fidelity, would be enhanced by noble virtues: kindness, generosity, compassion, gratitude, friendship and love.

Taking a very informed look at these matters, Ashraf et al. [4] design an interesting case of Adam Smith as a behavioral economist. They depart from the keen observation that Smith’s psychological approach is extremely similar to the perspective of dual processes revealed on the basis of human brain research. The limits faced by the impartial spectator confronted with emotions and passions stands as a good analogy for this recent theory that provides an account of how a phenomenon can occur in two different ways, or as a result of two different processes: unconscious/implicit/automatic versus conscious/explicit/controlled [5].

The authors argue in a systematic manner that the theory of moral sentiments offers a comprehensive view on human nature, anticipating basic elements of nowadays behavioral economics: loss aversion, fairness, overconfidence, consumption, wellbeing and happiness.

3. The animal spirits of J.M.Keynes

The Keynesian thought has produced huge mutations to the body of economic science but we will focus only on a few central elements for our behavioral analysis, starting with the concept of animal spirits. This well known metaphor stands for the irrational factors that influence many of our decisions: an urge to act which is far from being a simple calculus between benefits and objective probabilities [6]. Keynes used the idea of animal spirits not only to indicate impulsiveness, due to vital energies and vital forces, but also to designate an environment characterized by ambiguity and uncertainty. Thereby, going from investigating macroeconomic fluctuations since the time of the great depression between the years 1929-1933, to decoding the financial crisis started in 2007, the role played by animal spirits seems to be surprisingly similar. Akerlof and Shiller (2010) have delved into this concept presenting it into a behavioral light and underlying its important consequences for economic behavior. Moreover, they have enhanced its theoretical valences by incorporating elements such as trust, equity, corruption, antisocial behavioral, monetary illusion and stories [7]. Expressed slightly different, these are also the inflexion points in which Keynes made strong psychological assumptions, departing its discourse from the neoclassical tradition.

Taking even a more audacious position, Weasley and Marcelo (2009) explain in a methodical address the parallels between some famous cognitive heuristics developed by Kahneman and Tversky [8] in the ‘70 and some useful mental shortcuts described by Keynes. Just to give some specific examples, Keynes discusses on the impact had by the most recent results in decision-making and he also notices the way entrepreneurs use information they consider to be representative in a context or just information which is easy to access or to imagine. Translating this in the ‘jargon’ of behavioral economics, we instantly connect to the availability and representativeness heuristics.

On top, we can add its point of view on overconfidence as an essential condition in expectancies formation and an inherent one for human nature. In practice this can lead to situations where individuals perceived as

experts (based on their knowledge and their previous decisions with a high degree of unpredictability) express a high level of trust in very complex matters positioned in uncertain conditions.

The list can continue with great ease but the same authors mentioned above, among others, give a pertinent explanation for the reason why it is an underexplored research segment: the existence of a certain degree of confusion and divergent interpretations over Keynes view on psychology, sometimes considered absolutely needed and other times appreciated as contrary to rationality or conventional behaviors [9].

4. The institutionalist school of economic thought

The basic concepts of institutionalism are oriented towards the dynamic examination of institutions, habits and rules, from an evolutionary angle. This approach brought to its affiliates the quality of bringing economics on the ground and making it more human [3]. We could not neglect the realism of such a characterization and thus we have chosen to investigate a leading member of this community and its unconventional ideas - Thorstein Veblen.

A first remarkable note is his hedonic (and simultaneously ironic) definition of the rational economic man: *“a lightning calculator of pleasures and pains, who oscillates like a homogenous globule of desire of happiness under the impulse of stimuli”* [10]. This explicit disapproval of the hedonic principles does not represent a rejection of psychology but, at contrary, it expresses the need of finding a more sound psychological basis. Furthermore, this idea was strengthened by the view of other institutionalists, like Mitchell [11], who had understood institutions as psychological entities with thinking and acting habits. In time, it was previewed even the possibility that economists will not also borrow elements from psychology but they will also contribute to its development.

Veblen questioned the static assumptions of economics, its normative models and limited preoccupations for natural rights, utilitarianism and administrative efficiency. He has systematically contested the deterministic spirit of the period, pointing out for example

the relevance of emotions in understanding human action.

Not last, one of his main works, „The Theory of Leisure Class”, offers a comprehensive picture on how the concept of conspicuous pleasure (waste of time), has evolved over time and finally has metamorphosed itself in conspicuous consumption (waste of money). The term was initially coined by the author in order to depict the behavioral characteristics of the wealthy class but nowadays it has a substance of its own, being broadly defined as “the act of buying a lot of things, especially expensive things that are not necessary, in a way that people notice” [12].

Veblen distinguishes two main reasons for this type of consumption: invidious comparison and pecuniary emulation. The first element illustrates the case of an individual from a higher class which consumes to set itself apart from the members of lower social classes. In the second scenario, the positions are switched and an individual from an inferior class consumes in order to be noticed or registered in a superior class. These two signaling mechanism of wealth are clear proofs of the malfunctioning of the law of decreasing marginal utility, a topic extensively researched by behavioral economists. In other words, consumption behavior is determined and influenced by many other neglected variables, apart from the main and rational objective of maximizing utility. Within microeconomic theory, this particular behavior where a consumer is willing to buy a more expensive good when it has an accessible alternative, similar regarding functionality, was named the Veblen effect [13]. The same `lexical` family includes the snob effect and the bandwagon effect. Standard discourse treats them as anomalies but their generalized significance is more and more examined with the tools of experimental economics.

5. T.Scitovsky and his joyless economy

Under the premises of neoclassical economics, mall shoppers, loyal TV watchers and other categories of individuals in search for similar entertainment, are nothing else than rational consumers that act in order to maximize their utility, expressing their

preferences through market behavior.

Tibor Scitovsky was not convinced at all by this explanation, having great doubts on the true origins of consumer behavior. His initiative was materialized in „The Joyless Economy: The Psychology of Human Satisfaction” [14], where he convincingly argues that the lack of joy around economics is caused by the maximizing philosophy.

The tipping point of his work consists of an essential distinction over the way we understand utility: on the one hand there is an approach oriented to search comfort and on the other hand the purpose is to find pleasure. To have a complete perspective we need to mention the link between human motivation and arousal- the state of being awake or reactive to stimuli. In this case, particularly relevant is the correlation arousal – curiosity in the sense that a lower level of arousal than the optimal one can determine a more intense exploring behavior [15].

Within this context, the economist suggests that while reaching a state of comfort implies a reduction of pain or discomfort, pleasure is intrinsically connected with arousal and stimulation. So, if the desire for comfort can be saturated, not the same happens with the desire for pleasure. The search takes the shape of a spiral that grows continuously as we are getting closer to a perfect state of comfort, characterized by a lack of stimulation. At this point, we will compensate this lack by consumption acts that can bring joy and excitement. Deriving from here, there can be identified two categories of goods and services: the ones that produce comfort and the ones that offer stimulation. Scitovsky analyzes more thoroughly this aspect making references to the differences between Americans and Europeans. Thus, he claims that Americans value more the first class of goods, in the sense of saving time, money and effort. The problem is that what they save it is meant to new consumption of the same type. At the other end, he perceives Europeans as a more discerning category of consumers that use their time to obtain more exciting experiences: they prefer long conversations in cafes, go on longer holidays, eat healthier food and so on.

To synthesize this argumentation line, we can say that the boredom generated by the consumption society it is also a driving force

for new consumption. Comfort states assume absolute levels of arousal and pleasure is obtained by fluctuating levels. This tense relationship is revealed by human’s natural tendency of over-searching comfort on the account of pleasure.

On a more technical note, Scitovsky was also disappointed of the non-scientific approach neoclassics had on preferences: people’s tastes and choices are issues that were just observed by economists and not deeply understood as structures [14]. This was an additional reason that gets him closer to work of psychologists and very impressed by their experimental research methodology. Needless to say that he supported the use of experiments in economics, anticipating today’s experimental economics.

6. Herbert Simon between bounded rationality and decision-making

The vast contributions of Herbert Simon to economics, organizational behavior and artificial intelligence are disclosing a visionary spirit, preoccupied to build a human science which will treat in a comfortable manner the dual nature of the individual: social and rational animal.

Departing from the basic structures of the functionalist approach in sociology, Simon emphasize that the notion of rationality described by the theory of rational choice, promoted by economics, is conceptually different than its usual meaning. The critical distinction is made by the maximizing individual construct which, according to Gary Becker, would only read at night in his bed if the value of reading surpasses the value (perceived by him) of the lost sleep of his wife [16]. Extrapolating this sarcastic metaphor of marginal calculus, Simon points out that economic interest is manifested only in relations with the envisaged results of rational choices and it ignores for the most part the choice process. From this observation, he further identifies two types of rationality: substantive rationality and procedural rationality. The first category is the one validated by economics, while the second is utilized by psychologists, thus incorporates aspects of thought, judgment, affectivity and emotions.

With a cooperative intention in mind, Simon imposes the paradigm of bounded

rationality as a comprehensive model that takes in consideration that individuals do not have access to complete information, that they have cognitive limitations in terms of processing and computing, but also physical limitations of available time. In consequence, due to the fact that decision-makers do not have the abilities and resources to make the optimal decision, they apply their rationality only after they simplify as much as they can the decision alternatives. Moreover, they are not following the optimal/maximizing decision but a satisficing decision. This can be translated into a rational behavior in accordance with the simplified model defined by the individual, but far from the rational behavior defined from a mathematical point of view.

To reflect these departures from optimality, Simon considers as instrumental the following attributes of cognitive heuristics [17]:

- Optimizing is replaced by satisficing
- Decision are revealed in a sequential manner
- Individual are formulating and following rules that serves as choice alternatives in recurring situations
- Each rule can be applied to a restricted set of cases
- Each rule can be independently applied.

Finally, the scissor’s metaphor [18] offers some quintessential insights: one blade is represented by cognitive limitations and the other is constituted by the environment structure. Focusing on only one blade is ineffective because we need both of them to cut. So, the bounded rationality logic presents the steps taken to reach a certain judgment or decision (through heuristics or proximal mechanisms) and also the types of environments in which these heuristics will succeed or fail. At the end, this is the ultimate argument for the fact that bounded rationality is not optimization, neither irrationality nor an inferior form of rationality. But what it actually stands for is a self-standing theory that aims at rethinking certain norms and studying real individual and institutional behaviors.

7. Conclusions

Behavioral economics is an emerging sub-discipline which promotes important structural changes, epistemologically and philosophically, at the core of economic science.

Current research streams are abounding with new theoretical structures (prospect theory versus expected utility, mental accounting, social preferences) and new working methodologies (experimental economics, neuroeconomics) that are developing at an extremely fast pace.

However, as history has proven it so many times, the new is somewhat encrypted in the old. Our paper has followed this red line and has discovered unexpected anticipatory resources in the work of traditional economists.

We believe that the numerous behavioral clues that we have found in the writings of Adam Smith (emotions, feelings, affects), J.M.Keynes (animal spirits, overconfidence), Thorstein Veblen (the nature of conspicuous consumption and consumerism), Tibor Scitovsky (the underlying structure of utility and human satisfaction) and Herbert Simon (bounded rationality), have the potential to minimize the gap between neoclassical discourses and behavioral economics.

Cybercrime - Part of the Underground Economy in Romania

Ilincuța Nicu Darius
University of Craiova
Faculty of Economics and Business Administration
ilincutza_darius@yahoo.com

Abstract

In recent years, organized crime has expanded considerably, the presence, complexity and importance, and now threatens many aspects of normal life of citizens in private life, work and business.

Organized crime promotes corruption, violence and other illegal activities threatening the security of borders and cause human injury.

It undermines the integrity of banking systems and financial markets and capital goods and virtual space.

International networks of organized crime are a national security problem that requires a concerted policy response of governments.

Keywords: cybercrime, organized crime, underground economy, counterfeit cards

Classification J.E.L.: E26, K42, O17

1. Introduction

Romania, together with other Member States of the Council of Europe, signed in Budapest on November 21, 2001, the first international treaty aimed at illegal activities conducted on the Internet or other networks, especially those on electronic fraud, unauthorized access the systems and data interception.

This treaty, known as the "Convention on combating cybercrime", was implemented in Romania by the provisions of Title III on "Preventing and combating cybercrime" of the Law no.161/2003.

In addition to appropriate legislation, which allows including strengthening international cooperation in the field, MCIT (Ministry of Communications and Information Technology) has released www.eFrauda.ro site

This portal allows you to receive

notifications regarding activities of an apparently illegal in information society services and carrying out direct interaction between providers and consumers of information society services and authorities with relevant expertise.

www.eFrauda.ro site provides space to complete assisted electronic forms, which contain identification of the depositor and a brief description of the documents seized.

Depending on the type of computer crime at issue, registered complaints reach the Directorate for Combating Organized Crime Prosecutor's Office or the High Court of Cassation and Justice.

Once completed and submitted form content is confidential, it can not be accessed by the authorities than it is intended.

Counterfeit credit card fraud consistently shows an increase in criminal efforts to conserve, specialization and full use of their youth members with real talent in the criminal field, leading to financial gains fabulous, in a very short time and difficult to prove.

For 2011, are deemed to have been rigged about 4 euro in 100 euro traded via electronic payment systems.

In Romania, the figure is several times lower.

Moreover, Romania is known internationally as a small nursery professionals involved in this phenomenon, whose evolution is increasing steadily and very harmful to the financial systems used at the macro-economic in all states.

This has long been intuited and exploited by large organized crime groups, drawing their ranks almost all the major criminal offenders with talent in committing such fraud.

According to statistics recorded by the Directorate for Combating Organized Crime, in 2011, structures cybercrime confiscated and returned to the economic cycle, from

specific activities, the following:

- 219,057 euro;
- 92,173 U.S. \$;
- 117,800,000 lei cash;
- 3,992,000 lei value of other goods.

With reference to those goods in domestic and values, resulting a total of about 132,000,000 lei representing total damage recovered and reintroduced into the economic circuit.

In same context, not to ignore any statistics on human involvement in crime cybercrime represented.

Thus, in 2011, specialized structures within the Directorate for Combating Organized Crime reported issuing 174 indictments, in which 558 people were surveyed, of which 278 in custody.

However, following specific activities were destructured 42 organized criminal groups, composed of 478 persons, of which 220 in custody.

Preventing and combating this type of crime is very complex. Thus, in 2011, organized crime police have made no less than 33,068 computer searches and house searches in 1078.

2. Types of cybercrime

Contains material competence, in accordance with Law nr.39/2003:

Internet scams (most common);

- offenses relating to copyright and related rights achieved through computer systems;

- child pornography through computer systems;

- cloning credit cards and other electronic payment instruments;

- any offense done by computer systems, a phenomenon called generic cyber crime and the modus operandi: "hacking" (unauthorized intrusions into computer systems), "phishing" (Internet identity theft, fraudulently obtaining confidential data etc.), "phreaking" (use of mobile services through systems), "breaking" (unauthorized intrusions into computer systems followed by causing some damage), etc.

I will, in this paper, to deception and fraud on the Internet with counterfeit credit cards.

3. Deception via internet

In general, there is a decrease in addressing such offenses by members of organized crime groups.

If in previous years the phenomenon known a great extent, with time and the emergence of more and more IT specialists, organized crime such as fraud concerns had a computer recycling criminal inclinations, from simple computer fraud, with gains small to large counterfeit credit card fraud, which involves the use of "brain" local, consisting of young members recruited and trained in electronics and IT, leading to much greater financial gain.

Members of organized crime groups with interests in committing such crimes come from young talents in navigation on the Internet, and communication skills and application of persuasive techniques.

Easy access to computer technology work with the network moved the areas of criminal activity by old enclosures internet cafes, in various locations, from particularly motel rooms rented by the day, until they cover areas of parks mobile communication networks to the Internet.

Features:

- offender can not justify the money (their title, nature of transactions worth hundreds of thousands of dollars) shipped by various means banking or financial, on behalf of foreign citizens,

- the offender has no source of income, but has large sums of money,

- complaints are obtained for a small number of these,

- inconsistent sentences imposed, not taking precautionary measures on property owned by criminals - look who permit them, after their sentence to fully enjoy the product of crime,

- although not justify, in terms of lack of income, how to obtain them (luxury cars, expensive property, money, jewelry, etc.), do nothing to encourage the development of this scourge,

- commit old crimes through modern (identity theft, confidential data, cloning sites, etc.), At distances of thousands of kilometers,

- perpetrators were used to migrate to other locations than those of origin, buying electronics and renting property, where they

conduct their criminal activities, lately seen in the real migration in countries like Italy, France, Netherlands, USA, Spain, Germany, Norway, Sweden etc.

From field cybercrime offenses have escalated manifested by purchasing goods from various shops hosted on the Internet, using fictitious data on the identity of the buyer and payment method.

The authors of these types of offenses are not within the classical typology of offenders, it can be summarized as follows: male aged between 14 and 45, good social status, no prior criminal record, intelligent and motivated.

We have therefore to deal with common criminal who commits crimes classic, but with an intelligent person, well trained in informatics, which uses the computer as tool for committing crime.

Subjects who threaten the security of information may belong to different categories, committing crimes more or less serious way it can be broadly classified into insiders and outsiders of an organization that is also a major source of risk, the considerations that are more difficult to detect and investigate only those within organizations.

Ways of achieving diversity offenses through information systems, dynamic and continuous development of walking both require correlation legislation, legal procedures for investigation, the rules of the relevant institutions and the technology required to serve this area.

4. Counterfeit credit card frauds

The card payment instrument specific electronic payment system, it allows the owner to pay for goods and services purchased in various trade points and get cash from vending machines to distribute banknotes based on the existing account balance in the bank.

The development of technical means that have revolutionized every field and of course banking, credit card transactions on their accounts and records as us.

But this means not only reached the endowment of well-meaning people but also the hands of some who use these means for committing illegal acts.

Criminals have become more efficient

than ever. They operate in the world of online communications between computers, sometimes called cyberspace.

Increasingly, many offenders commit their deeds now that is entered electronically on the Internet using a computer.

One reason for choosing this method is often fast and simple operation that can commit such acts.

A track a criminal in the cyberspace is not in any way look like a classic track, where everything is action.

There are tens of thousands of places to visit in cyberspace and as many suitable places to commit crimes, like a city.

It was noted an increase in credit card fraud, recently receiving the signals serious offenders for purposes of reorientation ATMs in Romania, are expected in the near future and a process of specialization on bank cards issued in our country .

Far from being brought under control, this crime phenomenon is growing rapidly, attracting more people eager for quick gains, many of them were not even aware of their contribution to the achievement of crime.

Even now, in the era of computerization and information, the risks are handled responsibly incumbent, which will inevitably lead not only to financial losses, but also to perform more serious one being the unprecedented organized crime.

Offenses are directed at the media card, he was not present in the computer operations. Here are handled data entered on the card and account for these cards (card holder identification data and code specific to any credit card number and issue date thereof).

It should be noted that these cyber-criminals are divided into three categories:

The first category uses cards found, Runcie or expired no more money in the account or have very few, that is more than negligible amounts, and sometimes valid cards were stolen and used as such.

A second category of cyber-criminals use programs that generate numerical codes for credit cards. These programs are most often used by these computer criminals.

The most dangerous mode of operation but the operator is delinquent in various ways to be exposed later to take in numerical codes of valid cards directly from your bank unit.

Increased danger of this mode of operation results from the fact that once entered into

the files of a bank can cause criminal damage million in a very short time.

However the scope of these crimes knows no physical boundaries, a cyber-criminal could ever commit such offense in any state. Therefore it is necessary a very good cooperation in the field both between different Internet service providers and between police from different countries.

This cooperation resulted in the establishment of national training partnership in the field of cybercrime (National Cybercrime Training Partnership - NCTP) is a consortium composed of institutions of the federal police, state, local and international educational institutions and training designed to provide high technology.

Its main function and activity focuses on the design, development and implementation of quality programs and materials on computer crime for investigators and prosecutors working in this field.

Headquarters N.C.T.P. Fairmont State is in West Virginia in the U.S.

5. Suitable person to commit such crimes

Committing offenses of this kind of means we use the latest technology, high performance, and its operation within the cyber-criminal. Such an individual must be familiar with operating languages and programming languages.

For this requirement to be met, this individual would be useful for long periods of study and practice.

For these reasons, we can say that the vast majority of cases, cyber-criminals are represented by young students or students who have a computer at home or the school to which they are legitimated, which are units with profile information or carrying out training courses in this area .

Other representatives are teachers of mathematics, computer science and physics that are connected to the Internet very long time and know very well every aspect of navigation and use of networks.

The fact that these people are connected in network long time, get to know and to procure even different programs that facilitate criminal acts.

Many times they are on the web, where you can find different methods and different ways of deceptive individuals and businesses.

Another coordinated this aspect is that these cyber-criminals acquire their very easily any security problem arising in the ninth to commit the crime, the future managing to avoid further problems in this regard.

Most of these people are in the former communist, because, as policy pursued at that time, being isolated from the Western policy, were not connected to the Internet and even computers were obsolete.

After the establishment of democratic regimes and take last minute technical information and the connection to the Internet, this phenomenon began and proliferation of cybercrimes.

Thus Eastern countries began to commit such offenses citizens Hungarian, Polish, Romanian, Bulgarian and Russian. Most such offenses were recorded in Romania and Russia, most offenders are high school students.

6. Recommendations

Before you enter a credit card number online commerce site should be checked if the site is secure and requested first legitimate. Not used the assumption that if a site claims to be safe, so it is, but we convince ourselves about it.

Be checked each time the list of credit card transactions to prevent any additional revenue.

Perhaps the most important preventive measure is why not enter information about credit cards on any sites or in response to unsolicited emails, as banks issuing cards never use these tools to request information from customers.

7. Conclusions

In the current economic crisis, which affected the macro-economic legacy mainframe systems throughout the world, there is the historical character of flowering repetitive crime in general and especially the organized type, by exploiting the poor population propensity to commit crimes.

In addition to traditional approaches of trafficking in human beings, drugs or weapons, current technology allows organized crime groups to deal with successful inclusion within the scope of

computer crime.

This, due to great financial gains in short time and with minimum investment of capital gains that can be easily included in the national economy underground and potential reintroduction into the economic, money laundering techniques.

Typology of Market Economies

Ion-Bocănete Oana
Faculty of Economic Sciences
“Ovidius” University of Constanta
oana_bocante@yahoo.com

Abstract

The market economy is an economic system characterized by the following:

The objective pursued by the economic agents is the profit maximization. The goal of all the decisions and actions of the management staff is directly or indirectly aimed at having the company they work for obtaining the highest possible profit.

The national economy is made up in predominant proportion by economic (nor administrative) agents, mainly undertakings. By economic agent we understand an organization that aims at profit making, using predominantly economic means, and whose survival and development is conditioned by profit marking. The most frequent economic agent in the market economy conditions is the enterprise or company.

Key words: market economy, economic agents, profit, enterprise.

J.E.L. Classification: A11.

1. Introduction

The management and operation of the economic agents are achieved using *economic levers*: price, salary, credit, interest, investment, profit, etc. These replace the directives, bureaucratic plans, guidelines and other elements specific for the super-centralized communist type economy, whose management is dominated by administrative red-tape and political elements.

The economic pillar of the market economy is the *private property*, which is required to be predominant. As demonstrated by the millenary history of mankind, the private property corresponds to the human nature, and entails multifarious and intense connections, attachments and involvement

between man and the object of man's activity. The private property is the *de facto* guaranteed property, the right of possession, use, disposal and usufruct, in the absence of which there are no genuine economic agents. That is why the predominance of the private property at the level of the economic agents is determinant for the emergence of the market economy.

Further on it will be presented the main types of market economies nowadays implemented in various parts of the world.

2. Anglo-Saxon type of market economy

These economies are the most liberal and less inclined to dirigisme (USA, Canada, United Kingdom, etc.).

The private sector prevails at the level of the economic organizational structures. Its main features are as follows:

a) Concentrates about 90% of the occupied population;

b) The large companies hold a dominant position, occupying the largest share of the industrial production, including the key and strategic industries, the scientific research, investment and foreign trade flows;

c) The State (government administration) initiates and implements an economic policy characterized by flexible and liberal interventionism, aimed at stimulating the private sector;

d) The public sector — productive and service enterprises — occupies a negligible position in the economy;

e) The State intervention is mainly achieved through the instruments of the fiscal budgetary, monetary and credit policies.

3. Western European type economy

This has the following features:

1. It is a market economy with a marked dirigist predisposition (Italy, France).

2. The active intervention of the State in the economy is achieved via the public sector, but also through planning as an instrument of the functioning of the economy, that confers these countries the feature of mixed economies.

3. These economies are competitive, nevertheless the flexibility of the market mechanisms is affected by the State intervention, which brings about a certain rigidity in respect of the functioning of the economy.

4. As regards the economic organizational structure, next to the private sector there is a powerful public sector, and a mixed sector that is not negligible.

5. The small and medium-sized enterprises coexist with the large companies, and enjoy special protection from State.

6. The State-owned enterprises and institutions, as well as those directly controlled by the State, hold a dominant or main position within key sectors or predominant sectors through their driving effect from exterior, and in sectors of general interest (for example, in France and Italy: energy, electronics, pharmaceutical industry, deposit banks, some commercial banks, etc.).

This model represents an approximate application of the Keynesian inspection theories, coexisting with, and combining, private and statist elements in respect of the economic structure and functioning of the economy.

4. Social market economy

This is characterized by the following:

- The reunion between the market freedom and social harmony (Germany, Austria, Netherlands).

- The goals of the social economy are as follows:

I. Attaining the most economic welfare via:

- a) regulation of competition;
- b) continuous and convenient growth, through instruments that restrain as little as possible the economic freedom;
- c) full occupation of the workforce;
- d) guaranteeing the freedom of the foreign trade, the free convertibility of the currency.

II. Safety of price level stability

- a) independent central bank;
- b) “stability” of the State budget;

c) offsetting the balance of payment and external economic balance.

III. Social safety, social justice and social progress, family safety, fair distribution of the income and wealth via:

a) maximization of social product;

b) correction by the State of the initial distribution of the income and wealth in the form of social aids, pensions and indemnities, of subsidies for the building of homes, measures favoring the building of wealth, affecting as little as possible the self-responsibility of the individual and social groups, the freedom and propensity toward performance of the individuals.

5. Northern type of economy

This has the following features:

It is a contractual market economy, in the sense of the cooperation between the private and State sectors, with mutual commitments aimed at satisfying certain economic and social needs (balanced repartition of revenue, social assistance in respect of all the social services, including the gratuity of some of them).

This type of market economy can be found in Sweden, Norway, Denmark, called the “socialized Northern block”, or “countries of the democratic socialism”.

State intervention at social level, the State becoming the “protective State”.

The State intervenes in the relationships between trade unions and employers unions, favoring a limitation of the concentration of wealth and, respectively, of the polarization of the society.

6. Paternalist market economy

This is characterized by the following:

Market economy with strong traditional and national elements (Japan).

Favors the development of the competition, spirit of free initiative and completeness of the economic agents.

The success of this model is mainly related to the following:

- a) promotion of free initiative;
- b) meritocratic management (“The path to the top goes through the highest competence and ability, the richest experience and the longest service”);

c) the government intervention watches over the development of the economy, and controls it by combining the local initiative and a competent central management;

d) high quality of general education and professional training;

e) supreme importance of the information.

The public sector in the form of public enterprises is least developed.

The State concentrates the scientific research, and makes it available to the companies.

Planning is used next to the banking, budgetary and financial levers.

The Japanese planning is unauthorized and indirect, flexible and of medium and long term perspective, gliding, inspirational and optimistic.

The cohesion and solidarity, as expression of paternalism, can be found at the level of the State as well as of the small and medium-sized and also large companies;

The Japanese companies compete each other locally, but not on the external market.

The Japanese companies show solidarity for the foreign capital, for the protection of the national currency, for the balance of payments surplus.

7. Market economy oriented toward and dependent on exterior

This is characterized by the following:

Is specific for certain small independent States or former colonies, developed or underdeveloped. For example, the Ivory Coast, the most important producer and exporter of palm oil, a strategic raw material.

Fundamental principles: economic liberalism and opening towards the external world.

The export is the only solution to the development problems.

The State interventionism is flexible and selective; it is mainly active in the commercial activities, creates the economic and social infrastructure, has participants in private industrial companies, supports the establishment and development of the national private enterprises.

The State investments account for two thirds of the total investments of the Ivory Coast, and the public spending a third part from the gross domestic product.

The plan is the main instrument for directing the activity, and in certain cases it is imperative (economy of planned liberalism).

8. Conclusions

The market plays the decisive role in respect of the guidance and operation of the national economy. As a matter of fact, it is the main regulator of the economic activity. The size of the prices, salaries, credits, interest, and also their progress, are established by the market, contingent upon the demand-supply relationships, obviously within the legal and economic regulations issued by the macro social decision-making factors. Particularly this last aspect is emphasized, since no civilized country worldwide any longer uses the system of spontaneous market, characteristic for the last century, which would make impossible a balanced operation of the economy.

Small Business Management Strategies

Ion-Bocănete Oana
Faculty of Economic Sciences
“Ovidius” University of Constanta
oana_bocanete@yahoo.com

Abstract

Small business management issues have long been ignored by management specialists. University studies related to the development stage of the strategic management have only emerged over the past decade as a new systematic approach of the small business management came into sight as regards this area of the economic agents.

The individual contribution of a small business to assigning the economic situation of a nation is insignificant but the small businesses as a whole play a major role. In countries with a developed market economy, over 95 % of the total number of companies is represented by small and medium-sized undertakings. These involve approximately half of the number of employees in the whole economy and generate 80 % of the new employment. The creativity associated to these companies is comparable to that of large organizations.

Key words: small business, strategic management, market economy, small and medium-sized undertakings.

J.E.L. Classification: D04

1. Introduction

The undertaker is the person assigned to formulate the strategy. The undertaker is defined as the person who creates, organizes, manages and assumes the risks of a company. As a founder, owner and manager, the undertaker bears all the responsibilities which were horizontally or vertically distributed within the organisational structures of a large firm. The three strategic levels merge into one single level and the functional field is absent.

The small business and the entrepreneurial company are two different concepts even though they are sometimes used in order to

define the small-sized undertaking. Both are designated by certain authors by the label “small deal”.

The small business has the following characteristics: it is owned by only one person or small group of persons (individuals), it operates independently, it is not in a dominant position within its field of activity, it is not engaged in innovative practices.

The entrepreneurial company, unlike the small business, has the following characteristics: it applies innovative processes, the fundamental purpose consists in increasing and improving the profitability.

The difference between the two types of organizations is related to the manner in which these are tackling the innovation even though they fabricate the same products. The initial development stages enclose a superposition of the concepts as the entrepreneurial company begins its activity as a small business. Many undertakers prefer to remain in the initial stage without aiming to outrun a certain size of the company. This option is based on the intention to keep control over the growing business sacrificing future growth which might impact this challenge.

The national legislations define the small businesses by using some limitative standards associated to the following criteria: ownership (number of owners); the turnover associated to a well-defined field of activity; the number of employees related to the same field of activity.

If the company succeeds in being registered within these standards it is classified as small and medium-sized undertaking and benefits from a series of advantages (taxes, crediting conditions etc.) destined to encourage the respective field. The stimulation addresses both to the person who has already created such a company and to the person who would like to launch into business in the respective field.

2. Features of the small businesses strategic management

The manner in which small firms behave in terms of their economic activity indicates a visible lack of strategic guidance; this is less conspicuous for entrepreneurial companies as they aim the economic growth by adopting a plan within which innovation plays a very important role. According to the authors R. B. Robinsoni and J. A. Pearce (“Research Thrusts in Small Firm Strategic Planning”, Academy of Management Review, pagw 128-14 1, January 1984) the reasons for which strategic management is neglected by the small businesses are the following: lack of time – daily issues prevent the undertaker from dedicating himself to the drawing up of a long term plan; lack of expertise in the respective field– the managers of the small firms do not have the necessary theoretical knowledge concerning strategic management and lack the necessary resources for their acquiring or for hiring consultants; the unfamiliarity regarding the strategic management – as the managers disregard the related concepts, they are not aware of their utility or deem them as irrelevant for their respective situation; lack of confidence and opening the strategic orientation is impacted by the fact that owners keep for themselves, for the sake of certainty of the company, essential information for the efficiency of a support granted by consultants.

Recent studies shows that small firms engaged in a certain form of strategic planning obtain better performances than the average in the respective industry. This ascertainment could be explained by the fact that the plan denotes an analysis and an option based on a certain reasoning and not only on the people’s intuition.

As compared to large firms, the small business does not formally build up a plan. The manager owning the business could usually display a certain vision concerning the future of his company but he does not deem as necessary a formalized expression or its sharing to the other members of organization. If the specific terms and their definitions are excluded the pattern of the strategic management process proposed for the large organization might also be similarly

conceived by a certain undertaker, owner of a small business.

The business plan

If this plan is written, the undertaker shall make the first step towards what should become a strategic approach of the management. The formalization could be generated by the need to build credibility of the new organization in a certain background, most frequently encountered in the event of requiring a credit or a facility to which the undertaker is legally entitled as regards the small businesses.

The business plan shows how the business idea turns into reality. The summary of the business plan, its content is generally standardized by each bank or institution involved in supporting the small businesses.

The undertakers shall build up at least two plans: one plan for internal use which involves a set of ambitious objectives and a high risk margin while the business plan destined to external presentation shall be conservative and conceived as to avoid any failure. If the objectives aimed are easily tangible a waste of resources might arise and if the objectives are hazardous a high risk might be generated and finally a failure.

The use of experts for drawing up certain points of the business plan, especially the financial and accounting part is highly recommended.

3. Strategic context for small business

In Romanian language the term “context” could be define as “conjuncture, specific situation, circumstance, juncture”, in its figurative meaning. The Webster’s Dictionary explains the same term as “the correlated conditions where something exists or appears”, providing as a synonym the term “environment (circumstance, ambience)”.

The term of “context”, according to authors James Brian and Henry Mintzberg represents “a type of solution where particular structures, power relations, processes, competitive positioning could be found and so forth”. According to their vision, the strategic management approached on the basis of a dichotomy concepts – contexts is different from the classical dichotomy formulation-implementation.

The concepts explain the basic elements: strategy, processes, power, structure,

systems, etc., and the contexts explain the manner in which these elements combine.

The context of the small business is given by the operation on a single market, with a reduced number of products and with low turnovers. The experience accumulated in a certain business matters significantly and the environment is exerting tremendous pressures. The structure of the organization is simple and centered upon the person of the founder-owner who is also the active manager. Practically, there is no organizational structure with functional differences or clearly defined hierarchical levels. The main concern is represented by survival, followed by growing under the circumstances of a permanent need of capital stock.

According to Mintzberg and Quinn (1992) the entrepreneurial context is the result of development focused on innovation, of the strategy for a small business due to the managerial vision. The innovation is not limited only to the product but it may be connected to a new utility, a new organisational structure, a new type of relation initiated with the consumer.

The entrepreneurial context is specific both to developing industries and to fragmented industries but it has been recently associated with large organizations within mature industries under the label „intrapreneurship”, suggesting the development of innovation inside the organization and taking over the role of entrepreneur by some persons different from the top manager.

Therefore, one seek to obtain inside the large organizations some innovational tendencies similar to those growing within the small business. The leader guiding the organization constitutes the determinant element within this context.

According to certain authors of the strategic management courses the context of the firm is highly significant and especially the characteristics of the industry within which it operates. Thus, Porter (Porter, 1980) makes a typological differentiation of the various categories of industries, within which the categories of firms studied are developing – small and medium-sized enterprises, namely the small business and the entrepreneurial company.

The concept of “niche” has been introduced in relation with this context. “The strategic niche” represents a market segment which is too small and insignificant in order to be approached by large organizations specialized in the fabrication of large quantities of standardized products.

The small organization rapidly adapts to some special characteristics imposed by a market segment and obtains particular competitive advantages and economic results becoming a threat for the large organization but coexisting with it.

Also, the developing industries could be also approached as those industries newly created or reformed through technological innovations, subsequent to the emergence of consumption needs or through some other social and economic modifications which determines a new product to enjoy the status of a viable and potential opportunity for a business. In terms of strategical development, such an industry is characterized by the absence of rules governing the competition game. These will gradually appear and the companies will become adjusted and develop along with them.

Although the characteristics of the industries are different there are certain features which are common to developing industries as regards the following fields: structure, early barriers-to-entry, strategic options, the entry moment.

Structure- it refers to the number, the economic power, the typology of the constituent firms of the industry and to the characteristics of their environment. The companies operate under technological and strategic uncertainty: neither technologies, nor strategies with identifiable results are known. Most of them are recently created companies addressing to buyers who acquire for the first time a new type of product. The pressure of time and uncertainty will assess a short planning horizon. High initial costs are suddenly reduced subsequent to the improvement of the product, of the process and of the productivity. The start-ups to enter the industry are usually supported by the state by means of subsidies and other facilities in the event the product holds social significance.

Early barriers-to-entry – could be different from those characterizing the mature industry at a later period. These could be based on the

property over technology, on the access to resources or distribution channels and on costs associated to experience or borrowed capital under high-risk conditions.

Strategic options – shall depend on the risk and uncertainty associated to the industry. The companies should generate a convenient structure for the industry selected. This process also means the change of values held by suppliers or distributors and of the type of barriers-to-entry. Shortly there will be new interested companies classified as large companies which will increase the capital necessary for entry. Gradually, as the industry develops, the entrepreneurial companies might be interested in the standardization of the products.

The entry moment – represents a major option, as the early entry is associated with high risks but with low barriers. The early entry is recommended if advantages related to image, learning curve, consumer’s loyalty or provision of resources could be associated.

The small business will select a developing industry depending on the result of the contextual analysis similar to that above. The activity of this industry will depend on the final structure and not on the initial structure. If the level of strengths within the industry maturing stage shall permit making profit exceeding the economy average than the entry will be advantageous.

Fragmented industries are those industries where no single competitor own a significant market segment. The industry is populated by a large number of companies rated as small and medium-sized undertakings, with specialized products. The causes of the fragmentation range as follows: reduced barriers-to-entry, absence of the economics of scale or of the learning curve, high transport costs for products, high costs associated to stocks or strong sales fluctuations, lack of advantages related to the company’s size in relation with suppliers or consumers, disadvantages related to large-scale production, various needs of the market, the intense differentiation of the products, especially image-based, local rules, government legislation against concentration, novelty.

Under these circumstances, the strategy of the small companies should diminish the detrimental effects of fragmentation and aim at holding a strategic position which might

provide a significant market share during next stage.

4. Innovation sources for the entrepreneurial company

In order to better understand the condition of the entrepreneurial company, one should analyse the manner in which novelty appears, irrespective of whether the elements in question are products, processes, management or a combination of these in a new context. The novelty is traditionally associated with the mobility of the initiative of the undertaker which creates a small firm. The traditional approach is based on statistical data establishing a connection of the type “small business- equivalent to – potential novelty”.

Large companies responded with their own strategies to the credibility of this statistics. If innovation originates in a less formalized environment, self-sufficient in structural and cultural terms, than conditions will be generated for this environment but inside the organization.

The strategy of the organization is a diversification strategy and a differentiation strategy at the business level. The structures selected are based on autonomous teams or groups, with a wide decision-making and initiative. The network-type structure appears as a final structural innovation conferring a maximum mobility of relations. This approach is known in the managerial literature under the term of “entrepreneurship”.

Peter Drucker inventories a number of innovation sources and explains the manner in which they generate the novelty. Each specific case is justified with examples of companies well-known to the Romanian consumer and reader. This sources would be (Drucker, 1993):

The unforeseen

The new business opportunity may come under the form of an unexpected event: success, failure or something unanticipated inside or outside the milieu of the company. The management is rarely habituated to accept and seize the “step-element” which might radically modify the organization.

We can provide the example of the Matsushita company which became a giant because it exploited the desire of the poor to

have a television set in a period when this seemed unapproachable due to its high price or the example of the Ford company which was successful with a new model of motor cars in the '60 when it became aware that the segmentation of the motor car market in “lower” and “middle luxury” is replaced by segmentation according to the life style.

Incongruity

The opportunity might arise due to the difference between reality and the manner people perceive it, namely between “what is” and “what should be”. The discrepancies may appear between the realities of an industry and the assumptions regarding it, between efforts and expected values, between the rhythm and the logic of a process or between different industries. As an example we provide the revolutionary transformations in the field of naval transports, in the middle of the 60', due to the appearance of the container which shortened the operation time and reversed the increase tendency of handling costs and the tendency to supplement transport hours due to delays while performing the operations.

Process requirement

One source of innovation is represented by necessity. It appears in places where there is a weak connection (or lack) within a process. The typical example is provided by the enzyme dissolving the ligament of the cataract. By curiosity, the curing agent of the enzyme turned into a successful product.

Modifications within the industry and market structure

When the structures of the industry and market, which seemed fixed forever, begin to modify, each company seeks to continue the businesses by reason of old habits. Most of these companies will go bankrupt or irremediably lose the positions held before the companies which will use the opportunity for creating new approaches or rules for defining the characteristic elements: product, consumer, industry etc The examples provides are related to the motor vehicle industry, post services and cosmetics;

Demography

Demographical modifications have predictable consequences but sometimes these are ignored by companies which believe they “know better” what will happen in the future. Clients should be listened to all the time and major tendencies related to the

modification of populations' features should be seized. For instance, the ageing of the population irreversibly “displaced” the tastes or the urbanization tendency of the third world turned the large cities, such as Mexico City or Sao Paolo into profitable centers for certain businesses.

Changes of the perception, comprehension or disposition

As the society evolves, changes of peoples' mentality are generated and these changes provide opportunities to develop new businesses. People became more concerned about their own health and consequently issues on medical subjects flourished, private hospitals or companies manufacturing natural products made great strides. Parents spend less time with their children but spend more for accessories destined to their care, entertainment and education which led to the welfare of the companies “manufacturing” games, toys or even educational computers.

New knowledge

The progress of scientific and non-scientific knowledge generates new products or markets. Social innovations have a wider impact than the scientific innovations. For instance, the earl Saint-Simon developed the theory of a new bank which used the investment capital for the purpose of economic development after the napoleonic wars. Only in 1856 the first entrepreneurial bank was opened but the use of the financial capital was currently implemented afterwards. There are numerous examples of scientific innovations which were disregarded in the beginning and afterwards they revolutionized the industry: telephone, nylon, jet aircraft for passengers' transport, and so on.

According to Drucker, the first four sources are specific for the internal milieu of the company and could be seized by people habituated with the respective field. The other three involve changes within the external milieu of the company, especially at the industry level. Although there are specific elements for the above mentioned sources, these might overlap at a certain point as the borders between them are vanishing.

The enterpreneurial organization may be a large company, at a venerable age. More frequently, the innovating organization is a small business.

Drucker recommends five principles of the innovation which might lend a strategic advantage to the undertaker: one should start by studying the opportunities; opportunities are analysed in order to find out if people are interested in using the information; the innovation should be simple and clearly focused on a specific need; efficient innovations start slowly due to the fact that they address to a limited market; thereafter, as the market develops, fine adjustments should be carried out for remaining competitive; the innovation aims at supremacy, otherwise it will not impose upon the market and will create an opportunity for competitors.

5. Conclusions

The approach of a small business according to theories developed for large businesses is, in most cases, a mistake which may have serious consequences. The adoption of the strategic concepts should be carried out with great caution taking into account all elements involved and the particularities occurring in each situation analysed.

Statistics show that approximately half of the small companies are put out of business in the first 5 years of activity, without significant differences between the countries. The causes of these bankruptcies are various, but multiple analyses indicate the fact that in most situations the failure could be attributed to a poor management. In terms of the strategic management, each stage of the process comprises certain zones designated as vulnerable zones commencing with the identification of a consumer for whom a strategy should be advanced and ending with the assessing and checking of the performances obtained during a certain period of time with strategic implications.

Abstract

Sustainable development, a benchmark for the current strategies, is quantified through the human development index. This paper aims at an overview of the global ranking according to this indicator and observing the changes that have influenced the human development index values recorded during 2007 – 2011. Along with the first countries in the world, Romania will be analyzed as well, in an effort to determine the human development index components that influence the most the indicator by the values recorded.

Keywords: human development index, life expectancy, school enrolment, per capita GNI

JEL Classification: O 15

1. Introduction

The human development index enables a ranking of the world states. This paper aims at conducting an analysis of the evolution of the values recorded by this indicator, as well as presenting the states with the best results. The human development index will be analysed referring to three years: 2007, 2010 and 2011. Their choice targeted the comparison of the last years with 2007, the last year before the economic crisis that, in time, affected the whole world. Using this comparison we want to check if the changes that occurred as a result of the crisis led to changes in the human development index

values and if this was done, to establish which of the indicators that make up the human development index was strongly influenced.

The human development index is determined by calculating the following indicators:

- Life expectancy at birth which summarizes the combined influence of various factors on life, such as the individual's state of health, nutrition, housing conditions and providing healthcare, etc.
- The training rate which reflects the amount of knowledge available to the individual, the skills and his/her ability to communicate and participate in the economic and social activities.
- GDP/inhabitant which expresses the average amount of resources to which individuals have access to meet the needs of a decent living.

In literature these are the indicators that enable the calculation of the human development index. With this indicator we can determine the level specific to each state concerning sustainable development.

2. Content

In 2007, the human development index was calculated for 182 countries taking values between 0.971 and 0.340. The first place was held by Norway with an indicator value of 0.971, followed in ranking by Australia, Iceland, Canada and

Ireland. Romania ranked 63 recording a human development index value of 0.837. The ranking positions 6 to 10 were occupied by four European countries, namely: the Netherlands, Sweden, France and Switzerland, and the tenth position was held by Japan. Niger was placed on the last position in this ranking.

Table 1. Ranking of the countries according to HDI in 2007

HDI rank	Country	Value
1	Norway	0,971
2	Australia	0,970
3	Iceland	0,969
4	Canada	0,966
5	Ireland	0,965
6	Netherlands	0,964
7	Sweden	0,963
8	France	0,961
9	Switzerland	0,960
10	Japan	0,960
63	Romania	0,837

Source: Human Development Report 2009

In 2010 the indicator targeted a number of 169 countries and the values recorded were between the 0.938 and 0.140 interval. Norway was ranked first with an indicator value of 0.938. Next to Norway, on the first five places in the ranking there were Australia, New Zealand, the USA and Ireland. On the positions from 6 to 10 we notice four European countries, namely: Lichtenstein, the Netherlands, Sweden and Germany. Romania ranked 50, with a human development index value of 0.767. The last place was held by Zimbabwe.

Table 2. Ranking of the countries according to HDI in 2010

HDI rank	Country	Value
1	Norway	0,938
2	Australia	0,937
3	New Zealand	0,907
4	United States	0,902
5	Ireland	0,895
6	Liechtenstein	0,891
7	Netherlands	0,890
8	Canada	0,888
9	Sweden	0,885
10	Germany	0,885

50	Romania	0,767
----	---------	-------

Source: Human Development Report 2010

In 2011, the ranking consisted of 187 countries and the human development index recorded values between 0.943 and 0.286. The first place is occupied by Norway with an indicator value of 0.943. The following countries in the ranking are Australia, the Netherlands, the USA and New Zealand. The positions from 6 to 10 are held by almost the same European countries, only Ireland ranked 7, being surpassed by the Netherlands. Romania kept its 50th place, with a human development index value of 0.781. The last position was held by the Democratic Republic of Congo.

Table 3. Ranking of the countries according to HDI in 2011

HDI rank	Country	Value
1	Norway	0,943
2	Australia	0,929
3	Netherlands	0,910
4	United States	0,910
5	New Zealand	0,908
6	Canada	0,908
7	Ireland	0,908
8	Liechtenstein	0,905
9	Germany	0,904
10	Sweden	0,903
50	Romania	0,781

Source: Human Development Report 2011

The human development index as discussed above is composed of three indicators, the values that they recorded in the years analysed are presented in the following tables to enable to draw the conclusions. In order to make a comparison between the values of these indicators we shall only present the top five ranked states and Romania, trying to compare the values obtained by those states that maintained their position in the top five.

In 2007 the human development index was measured using the following indicators: life expectancy at birth, expressed in years (1) combined gross enrolment ratio in education, expressed as a percentage (2) and GDP per capita expressed in PPP \$ (3).

The components of the human development index for 2007 for the first five

states present the following maximum values: life expectancy at birth – Iceland recorded 81.7 years, combined gross enrolment ratio in education - Australia obtained 114.2%; and for the GDP per capita - Norway stood out from the other states with a value of \$ 53.433.

Table 4. HDI components in 2007

HDI rank	1	2	3
1	80,5	98,6	53.433
2	81,4	114,2	34.923
3	81,7	96	35.742
4	80,6	99,3	35.812
5	79,7	97,6	44.613
63	72,5	79,2	12.369

Source: Human Development Report 2009

Our country recorded the highest difference as compared with the first ranked in the GDP per capita obtaining only \$ 12.369.

In the last two years the human development index was measured using the following indicators: life expectancy at birth expressed in years (1), the average of the years of schooling, expressed in years (2) and GNI per capita, expressed in PPP \$ (3).

Table 5. HDI components in 2010

HDI rank	1	2	3
1	81	12,6	58.810
2	81,9	12	38.629
3	80,6	12,5	25.438
4	79,6	12,4	47.094
5	80,3	11,6	33.078
50	73,2	10,6	12.844

Source: Human Development Report 2010

The human development index for 2010 for the first five states present the following maximum values: life expectancy at birth - Australia recorded 81.9 years, the average of the years of schooling - Norway had 12.6 years, and for the GDP per capita - Norway stood out from the other states with a value of \$ 58.810.

Our country recorded the highest difference as compared to the first ranked at GNI per capita obtaining only \$ 12.844.

For the last year for which we analysed the indicator by which sustainable development

is expressed the following maximum values occurred: life expectancy at birth - Australia recorded 81.9 years, the average of the years of schooling - Norway had 12.6 years, and for the GDP per capita - Norway recorded \$ 47.557.

Our country recorded the highest difference as compared with the first ranked ones at the same index as in the previous years, namely obtaining \$ 11.046 per capita GNI.

Table 6. HDI components in 2011

HDI rank	1	2	3
1	81,1	12,6	47.557
2	81,9	12	34.431
3	80,7	11,6	36.402
4	78,5	12,4	43.017
5	80,7	12,5	23.737
50	74	10,4	11.046

Source: Human Development Report 2011

In the three years analysed there are two states that have not left the top five positions in the rankings, furthermore, they have been dethroned from the top two places. These countries, in the order found in the ranking, are: Norway and Australia.

Graph 1. GNI per capita

Source: Created by the authors using data from tables 1, 2 and 3

GNI per capita in 2010 and 2011 recorded declines for the first two states in the rankings. In the case of our country, we meet the same evolution, GNI per capita falling by \$ 1.798. The determination of GNI per capita is closely linked to the demographic evolution, thus in the case of Norway the population increased from 4,858,199 inhabitants in 2010 to 4,920,305 inhabitants in 2011. However, the difference between the

values recorded in the two years cannot be supported only by this increase of the population, being also influenced by the reduction of GNI. We meet the same issue in our country, where the population declined from 21,462,186 inhabitants in 2010 to 21,354,396 inhabitants in July 1, 2011, or according to the latest census, the population is of 20,254,866 inhabitants. If in Romania the GNI had maintained the same value as in 2010, the decrease of the population would have caused an increase in the GNI per capita, but this indicator has also decreased in absolute value in 2011 compared to 2010.

Graph 2. Life expectancy at birth

Source: Created by the authors using data from tables 1, 2 and 3

Life expectancy at birth increased between 2007 – 2011 for Norway, Australia and Romania, but there are no significant changes in the values. This indicator has undergone extremely small changes in the period under review and it has not decisively influenced the final value recorded by the human development index.

Graph 3. Average of the years of schooling

Source: Created by the authors using data from tables 1, 2 and 3

The average of the years of schooling for

the first two states in the ranking did not change in the last two years. Unfortunately for Romania, this indicator was slightly reduced, but without decisively influencing the final value of the human development index.

3. Conclusions

It is noted that the main indicator that determined the strongest final result of the human development index is the GNI per capita or GDP per capita (used before 2010).

The other two indicators have recorded relatively modest changes little influencing the human development index value.

The human development index has experienced a high level in 2007, followed by its reduction until 2010, as last year to show a new increase of the indicator. The crisis is one of the factors that triggered this change, leading to reducing the GNI per capita. Nevertheless, the results of 2011 have been seriously affected also because of the calculation method, because a significant drop in the GNI per capita and the maintenance of the values roughly at the same level for the other indicators resulted in a higher value of the human development index.

In 2011 the method of determining the human development index was performed using the geometric mean applied to the three indicators that compose it.

Even if the human development index provides important information to characterise sustainable development, the literature also states other indicators that can be used to complete it. These indicators are: the index of sustainable economic prosperity and the grain consumption per capita. The first indicator is the most comprehensive indicator of the living standards today, because it measures the average consumption and the distribution of environmental degradation, and the second one is generally used for the less developed states.

Abstract

The correlation of the economic growth with the inflation rate in the Romanian economy allows observing the mistakes from the past and avoiding them in the present and future. The analysis of these two indicators demonstrates that the views according to which the economic growth was rapid and healthy are not supported by the changes at the macroeconomic level after 2009. Bridging the gap between the Romanian and the European economy has suffered a strong setback once with the crisis. The reduction of the gaps must be built on sustainable economic growth and on an investment-based economy.

Keywords: GDP, inflation rate, inflationary growth, non-inflationary growth

JEL Classification: E 31, O 47

1. Introduction

In our country’s economy changes there have occurred changes in the past decade, and the period 2009 – 2011 was strongly influenced by the economic – financial crisis.

This paper aims to explore two of the most important macroeconomic indicators recorded in the Romanian economy, indicators that will allow us to see some of the changes in the economic life of Romania.

After 1989, the Romanian economy has experienced three recession episodes:

- the first recession, 1990 – 1992, is

considered a recession caused by the transition from the command economy to the beginning of the market economy;

- the second recession, 1997 – 1999, is considered to be a transformational recession and it occurred because of the lack of currency resources in a period of privatisation;
- the third recession is the one in 2009, being determined by the current account deficit financing.(1)

The crisis of 2009 affected the population by: reducing the net worth, the pressure of adjusting which disposable income has undergone and reducing the confidence in the Romanian economy.

2. Content

The economic growth expressed as GDP rate and inflation rate are the indicators analysed in order to determine the growth pattern specific to the Romanian economy, through the correlations between the monetary and the real economy. These correlations will allow us to explain if in Romania there was a non-inflationary growth or an inflationary growth.

For the period 2000 – 2004 the GDP had an upward trend, reaching the maximum value of 8.5% in 2004. Between 2005 – 2008 the values recorded alternate, without a uniform trend, approaching 8%, but fail to exceed this level. Clearly between 2008 – 2011 the effects of the crisis have very strongly influenced the values recorded by

the GDP, because after a value of 7.3% in 2008, there is a steep decline to -6.6% in the next year.

Table 1. GDP and inflation in Romania

Year	GDP	Inflation rate
2000	2.4	45.7
2001	5.7	34.5
2002	5.1	22.5
2003	5.2	15.3
2004	8.5	11.9
2005	4.2	9.1
2006	7.9	6.6
2007	6.3	4.9
2008	7.3	7.9
2009	-6.6	5.6
2010	-1.6	6.1
2011	2.5	5.8

Source: <http://epp.eurostat.ec.europa.eu>

In Romania, after 2001, the economic growth supported by the credit boom in 2003 and the easing of the fiscal and budgetary policy in 2005 was unable to resist at the end of 2008, when the crisis effects were felt in our country. The high growth rates recorded in the middle of the period analysed failed to be maintained so that they turned in 2009 – 2010 into the negative values.

The economic growth during 2003 – 2008 was supported by the household consumption which increased by 10 to 15% per year and by the gross formation of the fixed capital, which increased by 20 to 30% every year.

The inflation rate seen for the entire period is characterised by a downward trend, the significantly higher values of the first four years being the expression of the changes undergone by the Romanian economy after 1989. The values recorded by the inflation rate during 2000 – 2011 are relatively small compared to the period from 1990 to 1999. For the period analysed in this paper the first five years have produced double-digit inflation rates and in the period 2005 – 2011 the values have fallen below 10%.

The National Bank of Romania has set the inflation target to 3% this year and for 2013 to 2.5%, values relatively small and difficult to achieve given the figures recorded in the last three years.

We can see in Graph 1 that the inflation rate had much higher values as compared to

the real rate of the GDP during 2000 – 2005, especially in the first three years of the period analysed. In 2003, 2004 and 2005 the difference decreased between the two rates, but the inflation rate maintains the high values.

Graph 1. Evolution of GDP and inflation rate between 2000 – 2005

Source: Created by the authors using data from the Table 1

We can see in Graph 1 that the inflation rate had much higher values as compared to the real rate of the GDP during 2000 – 2005, especially in the first three years of the period analysed. In 2003, 2004 and 2005 the difference decreased between the two rates, but the inflation rate maintains the high values.

This evolution of the indicators allows us to conclude that in this period the Romanian economy was characterised by an inflationary growth.

The introduction of the unique quota in 2005 greatly influenced the demand, because the income of people and businesses increased and 82% of these additional revenues were directed towards consumption. The economic growth obtained based on increasing consumption, at Romanian macroeconomic level was also directed towards consumption, forming a real vicious circle.(1)

In 2006 and 2007, the relationship of the dimensions between the indicators changed as the inflation rate was below the GDP rate.

The evolution of the two indicators of the first period of the analysis also continued during 2008 – 2011 when the inflation rate was higher than the GDP rate.

In this situation, we can say that between

2006 – 2007 the Romanian economy was characterised by a non-inflationary growth. In the next period, 2008 – 2011, the inflationary growth comes back.

Graph 2. Evolution of GDP and inflation rate between 2006 – 2011

Source: Created by the authors using data from the Table 1

At EU level, the values of the two indicators did not record significant changes, the variation range being relatively small. The economic growth also recorded the largest decrease in 2009, but it managed to return the following year to positive values. The inflation rate has neither undergone significant changes, recording the highest value of 3.7% in 2008.

Table 2. GDP and inflation in EU

Year	GDP	Inflation rate
2000	3.9	1.9
2001	2.2	2.2
2002	1.3	2.1
2003	1.4	2
2004	2.5	2
2005	2	2.2
2006	3.3	2.2
2007	3.2	2.3
2008	0.3	3.7
2009	-4.3	1
2010	2	2.1
2011	1.5	3.1

Source: <http://epp.eurostat.ec.europa.eu>

Comparing our country-specific figures to the mean values obtained in the European Union we can notice the differences, which are negligible, between the growth rates of the GDP. The figures show that between 2001 – 2008 the GDP growth rate in

Romania was higher than the GDP growth rate in the European Union, allowing the reduction of the gap between our country's economy and the European average. However, the fact that in Romania the economic growth was not a sustainable one was demonstrated by the economic – financial crisis through the difficulties occurred in all areas. Our country's economic growth contracted stronger than the one at European level.

3. Conclusions

The decade 2000 – 2011 was characterised by an inflationary growth. The opinions according to which the economic growth was a healthy growth were shattered in 2009 when the weakness of the Romanian economy was noticed. The evolution of the economic growth did not also lead to an increase in the living standards even if the average net wage increased, but the inflation rates were higher than the growth rates.

The inflation recorded declining values in the period analysed, low values as compared to the first years after 1989, but it still does not equal the average of the lowest inflation rates in Europe. If you want to adopt the euro currency, it is necessary to fulfil the Maastricht criteria, concerning inflation in 2007 we got closer to 2% as compared to the European level, but the changes due to the crisis led to a rise in the inflation rate in Romania as compared to the reference level of the European Union.

The economic growth that allowed reducing the gaps as compared to Europe during 2001 – 2008 was affected by the crisis, showing that for the future a sustainable economic growth is needed, included in a realistic strategy designed on medium and long term. In this respect, the Europe 2020 Strategy states that it wants to achieve an intelligent, sustainable and favourable growth for social inclusion.

Purposes of Informational Systems– Electronic Payment Systems ReGIS, Sent

Jeflea Victor Florin

Faculty of Economics, Ovidius University of Constanta

jefleavf@yahoo.com

Abstract

In Romania there are three payment systems, respectively one for large-value payments in lei (ReGIS), one for retail payment in lei (SENT), and one for large-value payments in Euro (TARGET2-Romania). There is also a system of depositing and settlement of government securities and certificates of deposit issued by the central bank (SaFIR) and two systems of clearing/settlement of mobile values RoClear and SIBEX that settle in ReGIS system. All the afore-mentioned systems ensure the settlement via accounts of the credit institutions opened in NBR.

Keywords: payment system, CSD, SSD, ReGIS, SENT, TARGET2

JEL Classification: D80

1. Introduction

A *payment system* represents an assembly of instruments, banking procedures and rules that assure the funds transfer among the participants in the system (credit institutions and financial institutions). The system relies on the agreement between the participants in the system and the system operator, and the funds transfer is realized via an agreed technical infrastructure. [1]

A *central securities depository*, (CSD) represents a system (or institution) for holding securities that realize the transactions processing with securities on the basis of registration in accounts. The physical securities may be immobilized or dematerialized by the depository (so that they exist only as electronic records). In addition to holding in custody the securities, a central depository for securities may assure also

coupling functions of the transfer, clearing orders and their settlement.

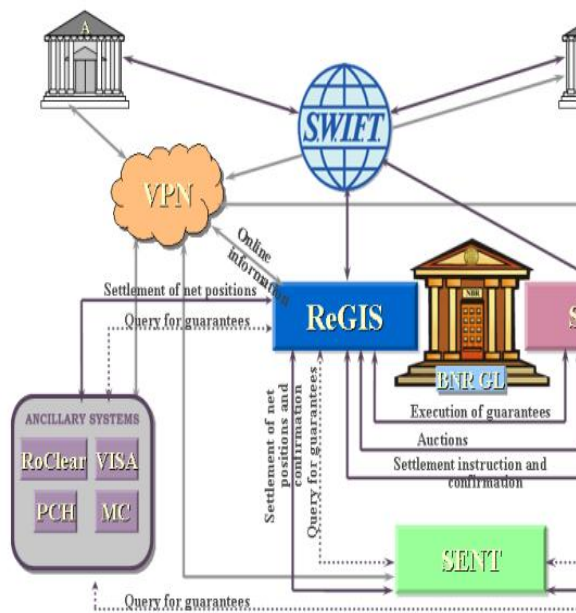

A *securities settlement system* (or SSS) represents a system that allows the transfer of securities *free of payment* (*free delivery* or FoP), as in case of pledge or against payment (*delivery versus payment* or DvP). The securities settlement occurs on securities deposit accounts held with the CSD (a private entity or a central national bank that acts as a CSD), or with the central bank (safe custody operational accounts). In the latter case, the central bank acts as intermediary custodian of the securities. Ordinarily the final custodian is a CSD. The settlement of the funds related to the transaction of securities occurs within an *interbank funds transfer system*" (or IFTS), through a settlement agent. [2]

In Romania there are three payment systems, respectively one for large-value payments in lei (ReGIS), one for retail payment in lei (SENT), and one for large-value payments in Euro (TARGET2-Romania).

There is also a system of depositing and settlement of government securities and certificates of deposit issued by the central bank (SaFIR) and two systems of clearing/settlement of mobile values RoClear and SIBEX that settle in ReGIS system.

All the afore-mentioned systems ensure the settlement via accounts of the credit institutions opened in NBR.

The architecture of the Romanian electronic payment

Source: <http://www.bnr.ro/Mecanisme-de-decontare-3357.aspx>

The Partner of the Romanian National Bank in operation and implementation of Electronic Payment Systems is and TRANSFOND, the excellence centre for banking financial sector from Romania. TRANSFOND is an operator of Electronic Payment System: administrator and operator of SENT system (Automated Clearing House), technical administrator and operator of ReGIS system (gross settlement system in real time), according the commission assigned by NBR, technical operator of SaFIR system (system of depositing and settlement of government securities).

Electronic Payment System (SEP) was implemented by a project financed in common with the European Union through PHARE program and the banking community from Romania, through STFD – TRANSFOND S.A.

The project consisted in:

- Development of software and interfaces related to the systems ReGIS (RTGS), SENT (ACH) and SaFIR (GSRS);
- Purchase and organization of primary and secondary headquarters of the Electronic Payment System;
- Implementation of communication networks SWIFT and VPN;

- Equipments purchase, installation and configuration;
- Regulations and legislation elaboration related to Electronic Payment System performance;
- Training of Electronic Payment systems operators from SEP was implemented by a project financed in common with the European Union through PHARE program and the banking community from Romania, through STFD – TRANSFOND S.A.
- The system implementation was assured by a mixed team formed by 46 specialists of National Bank of Romania and STFD – TRANSFOND S.A.

2. ReGIS System

ReGIS is the national real-time gross settlement system of payments in domestic currency provided by the NBR. The system is used for the settlement of central bank's operations, interbank transfers, as well as of urgent or large-value payments in Romanian Leu (above 50,000 lei). ReGIS ensures the real-time processing (on a continuous basis) and the settlement in the central bank money, with immediate finality.

A real-time gross settlement system (RTGS) is a payment system in which payment instructions are processed and settled individually and continuously (in real time). Thus, transactions may be settled with immediate finality. Gross settlement implies that each transfer is settled on a gross basis, not on a net basis.

ReGIS system is managed by NBR. In this capacity, the NBR manages and controls system operation, authorizes the participation in the system, sets forth and changes the system rules, monitors their observance by the participants, imposing penalties in case of infringement.

3. Participating in ReGIS

The following categories of institutions are eligible for participating in ReGIS:

- credit institutions from the European Economic Area, including when they operate via a branch set up in the European Economic Area;

- credit institutions from outside the European Economic Area, provided that they operate via a branch set up in the European Economic Area;
- the National Bank of Romania;
- the State Treasury;
- organizations based in countries set up in the European Economic Area providing clearing or settlement services that are supervised by a competent authority.

4. Types of transactions

ReGIS processes credit transfers in Romanian Leu, at national level. The types of payment transactions processed via ReGIS are as follows:

- payments related to central bank operations (monetary policy operations, currency market and lending operations, cash operations, etc.);
- settlement of net positions calculated within auxiliary systems processing payments in Romanian Leu (SENT, RoClear, VISA, MasterCard, DSClear);
- urgent or large-value (above 50,000 lei) interbank and customer payments;
- payments for the settlement of funds related to operations with securities;
- direct debiting of fees related to the participation in the three components of the electronic payment system (ReGIS, SaFIR and SENT).

The participants initiate credit transfers in the system via SWIFT messages, using the SWIFT FIN Y-Copy service (MT202, MT202COV and MT103).

5. Low-value and large-volume retail payment SENT System

SENT is an electronic system for multilateral clearing of interbank payments in lei currency, low value and large volume (retail) payments made between the participants during several sessions each day.

The system became operational in 2005 being developed and implemented under

PHARE RO-0005.02 Project titled "Interbank Payment System".

This system processes both low-value, interbank credit transfers, direct debits and debit instruments (as cheques, bills of exchange, promissory notes) among banks, and ensures:

- the exchange of payment instructions among the participants running continuously during the clearing session;
- multilateral netting of the participants' payment instructions running continuously during the clearing session;
- automated initiation of final settlement in ReGIS system of net positions at the end of each clearing session;
- automated management of settlement guarantees (via automated interfaces with ReGIS and SaFIR systems).

6. Conclusions:

As the operator of a payment system, a central bank offers settlement in central bank money. The central bank allows financial institutions to transfer funds which are held in accounts with that central bank among themselves. Central banks' payment systems are typically used for the final settlement of claims originating from interbank operations and so-called ancillary systems.

Purposes of Information Systems – Electronic Payment Systems TARGET2

Jeflea Victor Florin

Faculty of Economics, Ovidius University of Constanta

jefleavf@yahoo.com

Abstract

In Romania there are three payment systems, respectively one for large-value payments in lei (ReGIS), one for retail payment in lei (SENT), and one for large-value payments in Euro (TARGET2-Romania). There is also a system of depositing and settlement of government securities and certificates of deposit issued by the central bank (SaFIR) and two systems of clearing/settlement of mobile values RoClear and SIBEX that settle in ReGIS system. All the afore-mentioned systems ensure the settlement via accounts of the credit institutions opened in NBR.

Keywords: payment system, CSD, SSD, ReGIS, SENT, TARGET2

JEL Classification: D80

1. Introduction

In Romania there are three payment systems, respectively one for large-value payments in lei (ReGIS), one for retail payment in lei (SENT), and one for large-value payments in Euro (TARGET2-Romania).

There is also a system of depositing and settlement of government securities and certificates of deposit issued by the central bank (SaFIR) and two systems of clearing/settlement of mobile values RoClear and SIBEX that settle in ReGIS system.

All the afore-mentioned systems ensure the settlement via accounts of the credit institutions opened in NBR.

2. The Trans-European Automated Real-Time Gross Settlement Express Transfer System

TARGET2 (*Trans-European Automated Real-time Gross settlement Express Transfer system*) represents the real-time gross settlement (RTGS) system for payments in Euro, offered by the Eurosystem (the European Central Bank and the central banks of the Member States that have adopted Euro).

The system is used for the settlement of central banks operations (including the operations of monetary policy of the Eurosystem), large-value interbank transfers in Euro, as well as other payments in Euro. Through the system, the funds transfers related to auxiliary systems (payments systems and clearing-settlement systems of the operations with securities) are also settled.

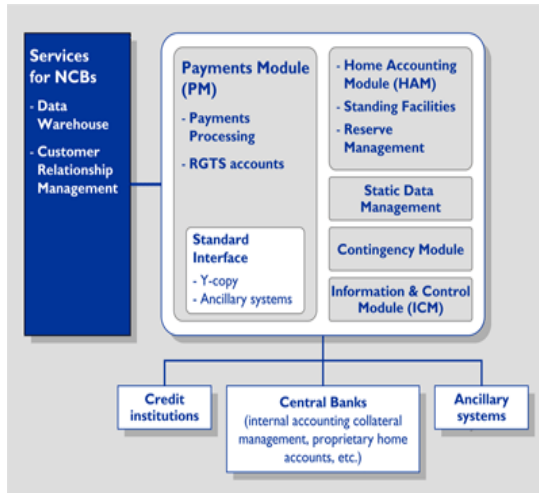

The system provides in real-time the processing of payments and settlement in accounts opened in central banks with immediate finality. TARGET2 system was launched on 19th November 2007, replacing TARGET system (that was functioning since 4th January 1999).

The system offers harmonized services and a common technical infrastructure, with increased efficiency, including in terms of cost recovery. The system was projects to allow ulterior modification because of the technological evolution, the continuous process of development of the Eurosystem.

Legally, TARGET2 system is structured as a multitude of national payment systems (referred to as national TARGET2 components), with harmonized operating rules.

The technical infrastructure and the single commune platform of TARGET2 is provided and technically operated, behalf Eurosystem by Banca d'Italia, Banque de France and Deutsche Bundesbank.

TARGET2 ARCHITECTURE

Source www.bnr.ro

TARGET2 is a system based on a singular platform and offers an improved and harmonized service. The use of system allows costs decrease and obtaining an optimum report between costs and efficiency. For all participants, no matter the place where they are- the services are of high quality, functionality and interfaces, as well as a structure of single price.

A modular approach was adopted for the development of single common platform (SSP). Each module in SSP is close related to a particular service. The payment module, for example, is used for payments processing. Some of these modules (Appropriate accountability module and funds management module) can be operationally used by the individual central banks.

The central bank that don't use these modules offer services, via the applications within the proper internal technical elements. The SWIFT standards are used in the communication harmonized between the system and its participants. Before introducing TARGET2, some central banks had proper payment systems. In the main, these were used to manage the minimum compulsory funds, the permanent facilities and cash retail, but also to settle the transactions of auxiliary systems. We have agreed that in the context of the new system, these types of transactions to be undertaken. However, some countries didn't allow that these systems to be moved quickly in SSP. Therefore, there was a period of transition of four years for affiliation to SSP.

Payment Module (PM) has the role to maintain the settlement accounts (RTGS) of the direct participants, through which all the payments TARGET2 (in Euro) are settled and assure the settlement services, the administration services of cash (cash limits, reservation, etc.).

Information and Control Module (ICM) The information and control module (ICM) allows to the users to access information directly and to obtain information concerning the balances and online payments. Via ICM, the users have access to the payment module and to the function of data management. The ICM users are able to select the information they receive and when. The urgent messages (for example, systems of transmissions from the central banks and notifications concerning the payments with a time indicator of debit) are automatically displayed on the screen.

Standing Facilities Module (SF) This module processes the operations related to the standing facilities in Euro granted by the national central banks to the participants.

The module allows: the administration of the deposits built from day to day and of the lending facilities (Lombard credit), transfer of the liquidities in the accounts built from day to day, credits grant built from day to day "at request" or automatically, the calculation and the settlement of the bonus interest or penalty interest, for the central bank and the commercial banks, deposits and loans repayment built from day to day.

Home Accounting Module (HAM) HAM accounts can be used for the commercial banks that don't participate directly in TARGET2 but they have to constitute minimal compulsory funds and /or they have cash operations (so, they need an account opened at the national central banks, excepting a RTGS system); operations specific for the direct participants depending on the situations of some countries.

The operations that can be made via HAM accounts are:

- Maintenance of liquidities (for example for RMO)
- Transfers between the accounts HAM maintained in the same central bank
- Transfers between the accounts HAM and those of RTGS maintained

- in the same central bank or in different central banks
- Cash retail from the national central banks
- Access to the *Standing facilities* module

Static Data Module (SD) The module offers to the central banks and to the participants a homogenous set of data available in a single database, daily actualized.

3. Conclusions

As the operator of a payment system, a central bank offers settlement in central bank money. The central bank allows financial institutions to transfer funds which are held in accounts with that central bank among

themselves. Central banks' payment systems are typically used for the final settlement of claims originating from interbank operations and so-called ancillary systems.

The Importance of the Study of Algebras of Fuzzy Logic

Jeflea Antoneta
Universitatea "Spiru Haret" Constanța
antojeflea@yahoo.com

Abstract

In this paper I begin a systematic algebraic investigation of some algebras of fuzzy logic: BL-algebras and DRI-monoids; BL-algebras are particular residuated lattices; The origin of BL-algebras is in Mathematical; LogicBL-algebras, introduced by P.Hajek, form an algebraic counterpart of the basic fuzzy logic. In the paper it is shown that BL-algebras are the duals of bounded representable DRI-monoids. This duality enables us to describe some structure properties of BL-algebras.

Keywords: BL-algebra, MV-algebra, bounded DRI-monoid, representable DRI-monoid, prime spectrum.

Jel Classification: C02

1. Introduction

Definition An algebra $A = (A, +, 0, \vee, \wedge, -)$ of signature $\langle 2, 0, 2, 2, 2 \rangle$ is called a DRI-monoid if it satisfies the following conditions ($x, y, z \in A$):

- (1) $(A, +, 0)$ is an abelian monoid;
- (2) (A, \vee, \wedge) is a lattice;
- (3) $(A, +, \vee, \wedge, 0)$ is an l-monoid;
- (4) if \leq denotes the order on A induced by the lattice (A, \vee, \wedge) then $x - y$ the smallest $z \in A$ such that $y + z \geq x$;
- (5) $((x - y) \vee 0) + y \leq x \vee y$.

Note: Condition (4) is equivalent to the system of identities $x + (y - x) \geq y$;

system of identities $x - y \leq (x \vee z) - y$;
 $(x + y) - y \leq x$,

Hence DRI-monoids form a variety of type $\langle 2, 0, 2, 2, 2 \rangle$.

The notion of a DRI-monoid actually includes also other types of algebras.

Definition A BL-algebra is an algebra $A = (A, \wedge, \vee, \bullet, 0, 1)$ of signature $\langle 2, 2, 2, 2, 0, 0 \rangle$ such that

- (i) $(A, \wedge, \vee, 0, 1)$ is a bounded lattice with the least element 0 and the greatest element 1;
- (ii) $(A, \bullet, 1, \vee, \wedge)$ is a commutative lattice ordered monoid;
- (iii) A satisfies the following conditions:
 - (1) $z \leq x \rightarrow y$ iff $x \bullet z \leq y$, for all $x, y, z \in A$,
 - (2) $x \wedge y = x \bullet (x \rightarrow y)$,
 - (3) $(x \rightarrow y) \vee (y \rightarrow x) = 1$.

Remark a) The BL-algebras also form a variety of the type considered.

b) A BL-algebra could be also defined equivalently as an algebra $A = (A, \bullet, \rightarrow, 0)$ of signature $\langle 2, 2, 0 \rangle$

Definition A DRI-monoid $A = (A, +, 0, \vee, \wedge, -)$ is called representable if it is isomorphic to a subdirect product of linearly ordered DRI-monoids (i.e. DRI-chains)

For instance, commutative l-groups and Boolean algebras are representable DRI-monoids. One can prove that a DRI-monoid A is representable if and only if A satisfies the identity $(x - y) \wedge (y - x) \leq 0$.

Remark Comparing two classes of algebras, it will be simpler to use algebras dual to BL-

algebras. Namely, an algebra $A = (A, \vee, \wedge, \oplus, \ominus, 1, 0)$ of type $\langle 2, 2, 2, 2, 0, 0 \rangle$ is called a dual BL-algebra if

- (i)^d $(A, \vee, \wedge, 1, 0)$ is a bounded lattice with the greatest element 1 and the least element 0
- (ii)^d $(A, \oplus, 0, \wedge, \vee)$ is a commutative lattice ordered monoid;
- (iii)^d A satisfies the conditions
 - (1) $z \geq x \ominus y$ iff $x \oplus z \geq y$, for all $x, y, z \in A$,
 - (2) $x \vee y = x \oplus (y \ominus x)$,
 - (3) $(x \ominus y) \wedge (y \ominus x) = 0$.

Let $A = (A, \wedge, \vee, \bullet, \rightarrow, 0, 1)$ be a BL-algebra and let (A, \wedge_d, \vee_d) be the lattice dual the lattice (A, \wedge, \vee) , i.e. $x \wedge_d y = x \vee y$ and $x \vee_d y = x \wedge y$ for any $x, y \in A$. Further, set $x \oplus_d y = x \bullet y$ and $x \ominus_d y = y \rightarrow x$ for each $x, y \in A$. Then

$(A, \vee_d, \wedge_d, \oplus_d, \ominus_d, 0, 1)$ is a dual BL-algebra. Conversely, using the dual considerations, one can obtain a BL-algebra from a given dual BL-algebra. It is obvious that the above processes are mutually inverse and therefore there is a one-to-one correspondence between the BL-algebras and the dual BL-algebras.

Theorem 1 Let $A = (A, +, 0, \vee, \wedge, -)$ be an above bounded DRI-monoid with the greatest element 1. Then $(A, \vee, \wedge, +, -1, 0)$ is a dual BL-algebra if and only if A is representable.

Proof

One can easily prove that if DRI-monoid A is bounded above then it is a bounded below too, and moreover, 0 is the least element in A. If this is the case, then the conditions (i)^d, (ii)^d and (iii)^d (1) are trivially satisfied, and the condition (iii)^d (2) follows from (5) of the definition of a DRI-monoid. If moreover A is representable, the condition (iii)^d (3) holds. Conversely, if A is bounded DRI-monoid such that $(A, \vee, \wedge, +, -1, 0)$ is a dual BL-algebra then A is obviously representable. Comparing the definitions of BL-algebras and representable DRI-monoids we get the following theorem

Theorem 2 If $A = (A, \vee, \wedge, \oplus, \ominus, 1, 0)$ is a dual BL-algebra then $(A, \oplus, 0, \vee, \wedge, \ominus)$ is a bounded representable DRI-monoid with the greatest element 1.

Remark For the class DRl_1 of bounded DRI-monoids (and especially for the class $RDRl_1$ of bounded representable DRI-monoids) we will consider the greatest element 1 as a new nullary operation and thus we will enlarge the type of those DRI-monoids to $(+, 0, \vee, \wedge, -, 1)$ of signature $\langle 2, 0, 2, 2, 2, 0 \rangle$. Hence the class DBL of dual BL-algebras is, from this point of view, a subclass of the class DRl_1 which is, by Theorem 1 and 2, equal to the class $RDRl_1$ of bounded representable DRI-monoids. This means that BL-algebras are in fact the dual algebras of bounded representable DRI-monoids, and therefore one can obtain some results on BL-algebras as consequences of those DRI-monoids.

Definition An algebra $A = (A, \oplus, \neg, 0)$ of signature $\langle 2, 1, 0 \rangle$ is called an MV-algebra if A satisfies the following identities:

- (MV₁) $x \oplus (y \oplus z) = (x \oplus y) \oplus z$;
- (MV₂) $x \oplus y = y \oplus x$;
- (MV₃) $x \oplus 0 = x$;
- (MV₄) $\neg\neg x = x$;
- (MV₅) $x \oplus \neg 0 = \neg 0$;
- (MV₆) $\neg(\neg x \oplus y) \oplus y = \neg(x \oplus \neg y) \oplus x$.

As is known, MV-algebras were introduced by C.C. Chang as an algebraic counterpart of Lukasiewicz infinite-valued proposition logic.

If we put in any MV-algebra A $1 = \neg 0, x \ominus y = \neg(\neg x \oplus y)$,

$$x \vee y = \neg(\neg x \oplus y) \oplus y, x \wedge y = \neg(\neg x \vee \neg y)$$

for each $x, y \in A$, then $(A, \vee, \wedge, \oplus, \ominus, 1, 0)$ is a dual BL-algebra and so also a bounded representable DRI-monoid.

Moreover, MV-algebras are in a one-to-one correspondence with bounded DRI-monoids (the representability is not explicitly

required) which satisfy the identity
 (i) $1 - (1 - x) = x$.

Therefore we get as a consequence a known characterization of MV-algebras in the class of dual BL-algebras:

Corollary 3 A dual BL-algebra A is an MV-algebra if and only if A satisfies
 (i') $1 \ominus (1 \ominus x) = x$.

Note This corollary corresponds to a definition, where MV-algebras are defined as BL-algebras satisfying the law of a double negation $\neg\neg x = x$.

Remark DRI-monoids (similarly as MV-algebras) in general lack additive idempotents. However, in Brouwerian algebras which are special cases of DRI-monoids, the operations + and \vee coincide, and hence, among others, all elements are additive idempotents. It is known that additive idempotents in any MV-algebra form a Boolean algebra. Now we can analogously describe the properties of the set of idempotents in any bounded representable DRI-monoid.

Proposition 4 The set B of additive idempotents of any representable bounded DRI-monoid A is a Brouwerian algebra.

Proof. Let $A = (A, +, 0, \vee, \wedge, -, 1)$ be a bounded representable DRI-monoid and $B = \{x \in A; x + x = x\}$. Obviously $0, 1 \in B$. Let $x, y \in B$. Then
 $(x + y) + (x + y) = x + y$,
 $(x \wedge y) + (x \wedge y) = (x + x) \wedge (x + y) \wedge (y + y)$
 $= x \wedge y \wedge (x + y) = x \wedge y$,
 hence $x + y, x \wedge y \in B$.

For any $x, y \in B$, $x + (x \wedge y) = x \wedge (x + y) = x$, thus $(B, +, \wedge)$ satisfies both absorption laws. Therefore $(B, +, \wedge)$ is a lattice with is distributive by the definition of a DRI-monoid.

Let A be a bounded DRI-chain. The order induced on B by the lattice $(B, +, \wedge)$ is clearly the same as that induced on B by A. Hence $(B, +, \wedge)$ is a chain, and so

$x + y = \sup(x, y) = \max(x, y) = x \vee_A y$
 for any $x, y \in B$.

Moreover, $(B, +, \wedge) = (B, \vee, \wedge)$ is a Brouwerian algebra because for any $x, y \in B$ we have $x - y = 0$ if $x \leq y$, $x - y = x$ if $x > y$.

Let now a DRI-monoid A be a subdirect product of bounded DRI-chains $A_i, i \in I$. If $a = (a_i; i \in I) \in A$, then $a \in B$ if and only if $a_i \in B_i$ for each $i \in I$. (B_i is the set of idempotents of A_i .) Hence, if $a, b \in B$ then
 $a + b = (a_i + b_i; i \in I) = (\max(a_i, b_i); i \in I)$
 $= a \vee b$,

and if we set $a - b = (a_i - b_i; i \in I)$ for any $a, b \in B$, we get that $(B, 0, \vee, \wedge, -, 1)$ is a Brouwerian algebra.

Corollary 5 The set of multiplicative idempotents of any BL-algebra is a Heyting algebra.

If A is a BL-algebra then $\phi \neq F \subseteq A$ is called a filter of A if
 (a) $\forall a, b \in F; a \bullet b \in F$;

(b) $\forall a \in F, x \in A; a \leq x \Rightarrow x \in F$.

Further, recall that $\phi \neq F \subseteq A$ is called a deductive system of a BI-algebra A if

(a') $1 \in F$,

(b') $\forall x, y \in A; x \in F, x \rightarrow y \in F \Rightarrow y \in F$.

One can easily prove that $\phi \neq F \subseteq A$ is a filter of A if and only if F is a deductive system in A.

Let B be an arbitrary DRI-monoid. For any $x, y \in B$ set $x * y = (x - y) \vee (y - x)$. Then $\phi \neq I \subseteq B$ is called an ideal of B if

(c) $\forall a, b \in I; a + b \in I$,

(d) $\forall a \in I, x \in B; x * 0 \leq a * 0 \Rightarrow x \in I$.

It is obvious that $0 \leq x$ implies $x * 0 = x$ for any x in a DRI-monoid B. Therefore if A is a BL-algebra then the filter of A and the ideals of the DRI-monoid A^d dual to A coincide.

Further, the ideals and congruence in any DRI-monoid are in a one-to one

correspondence, therefore this holds also for the filters and congruences of BL-algebras.

Theorem 6 The filters of any BL-algebra form, under the ordering by set inclusion, a complete algebraic Brouwerian lattice.

Corollary 7 The variety BL of BL-algebras is congruence distributive.

2. Some properties of BL-algebra

We denote by $D_s(A)$ the set of all deductive systems of A . For nonempty subset $M \subseteq A$ we denote by $[M]$ the ds of A generated by M (that is, $[M] = \bigcap \{F \in D_s(A) : M \subseteq F\}$).

If $M = \{a\}$ with $a \in A$, we denote by $[a]$ the ds generated by $\{a\}$ ($[a]$ is called principal).

For $F \in D_s(A)$ and $a \in A/F$, we denote by $F(a) = [F \cup \{a\}]$.

Theorem 7 If A is a BL-algebra, then the following assertions are equivalent:

- (i) $(D_s(A), \vee, \wedge, *, \{1\}, A)$ is a Boolean algebra
- (ii) every ds of A is principal and for every $x \in A$, there is $n \in \mathbb{N}$ such that $x \vee (x^n)^* = 1$.

The spectrum of a BL-algebra

For the lattice $D_s(A)$ (which is distributive) we denote by $\text{Spec}(A)$ the set of all (finitely) meet-irreducible (hence meet-prime) elements ($\text{Spec}(A)$ is called the spectrum of A and by $\text{Irc}(A)$ the set of all (completely) meet-irreducible elements of the lattice $D_s(A)$).

Definition A proper ds F of A is called prime if, for any $a, b \in A$, the condition $a \vee b \in F$ implies $a \in F$ or $b \in F$.

Theorem 8 A non-degenerate BL-algebra contains a prime ds.

Theorem 9 A is a BL-chain iff any proper ds of A is a prime ds.

Theorem 10 If P is a prime ds of A and F is a proper ds of A such that $P \subseteq F$, then also F is prime.

Theorem 11 The set of proper deductive systems including a given prime ds P of A is totally ordered with respect the inclusion.

Conclusion

BL-algebras and DRI-monoids have important algebraic properties and they have been intensively studied from an algebraic point of view. BL-algebras form an equational class of residuated lattices.

Structural Changes in the Context of the New Knowledge-Based Economy

Cristina Mihaela Lazar
University „Ovidius” of Constanta
lazarcristinam@yahoo.com
Elena Cerasela Spătariu
University „Ovidius” of Constanta
ebarbu2001@yahoo.com

Abstract

The present research intends to establish and outline the structural changes of the organizations in the context of the knowledge-based economy in order to maintain the human, material and financial resources, and meanwhile being capable to achieve economical growth. These changes were adopted by organizations, especially since changes occur in a dynamic increasingly accelerated where the order of the resources is another one.

The transition to the newly knowledge-based economy has proved that the old traditional structures, where the rigid hierarchies used to dominate, don't allow anymore the coordination of the activities that became increasingly complex. Switching towards a flat structure where the employees are encouraged to self-manage and self-organize themselves allows the organizations to better cope with the current economical environment.

Cuvinte cheie: structural changes, knowledge-based economy, organizations
Clasificare J.E.L.: D8, L1,

1. Introduction

The new type of society that sequences the industrial society makes changes also in the organizational models. Huber (1984) had examined the question of the nature and the designing of the new organizations. He estimates that the knowledge-based organization will make efficient three processes: decision making, innovation and

acquisition and distribution of the information.

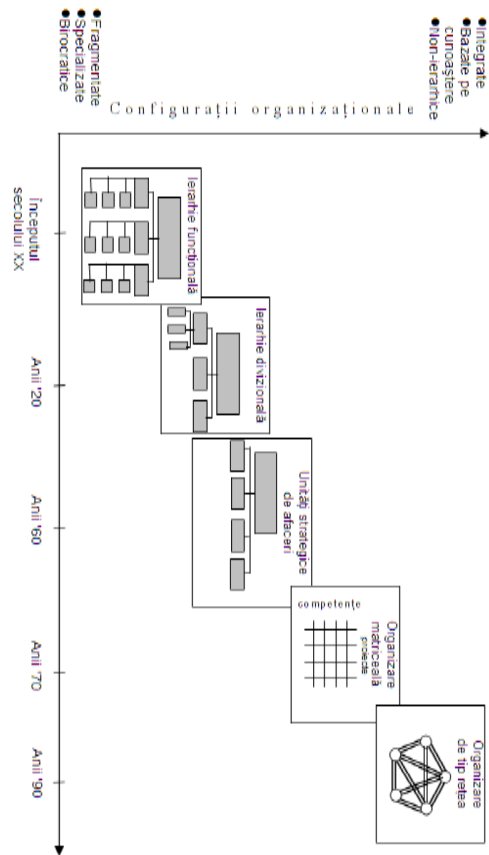

Drucker (1988) considers that the organizational model in the knowledge-based economy must be characterized by: the composition dominated by professionals, the small number of intermediate levels of hierarchy management, ensuring coordination through non-authoritative means.

The organizations of the new economy are based on the knowledge as their main resource, in a deeply and extensive way, with a real impact on the learning and innovation skills. On the basis of these entities are processes such as creation of new knowledge, assimilation of knowledge and sharing them. The sectorial composition of the European countries' economy has changed in the recent years, years when the information and knowledge assets became a priority for creating added value.

2. Models of organizational configurations

Palmer highlights in the figure below the evolution of the organizational structures succeeding from the beginning of the century to the structure of the knowledge-based organizations. It can be noticed how it's passing from functional hierarchy (bureaucratic and fragmented) to the network type organization (integrated, non-hierarchical)

Figure 1 - The evolution of the organizational structures

Source: Palmer J. – The human organization, in Journal of Knowledge, Management, nr.1/1998

3. The sequence of the management practices generations

Further on are presented the characteristics of knowledge-based organization by succeeding the generations of management practice.

Table 1 - Succeeding the generations of management practice

Characteristics of the organisation	1 st Generation	2 nd Generation	3 rd Generation
	Technology oriented	Projects oriented	Organizational oriented
Strategy	Disparate efforts of research and development	Focused on the main activity	Integration between technology and main activity

The powers of changing	Unpredictable	Intra-organizational interdependencies	Systematic effort of research and development
